Introduction

This study analyzes the transportation impacts of the proposed Broadway Bridge between West Sacramento and Sacramento. Notice of preparation for this project occurred in 2017, which represents the baseline condition when data collection occurred. The study analyzes transportation conditions under Existing (2017), Opening Year (2030), and Design Year (2040) conditions.

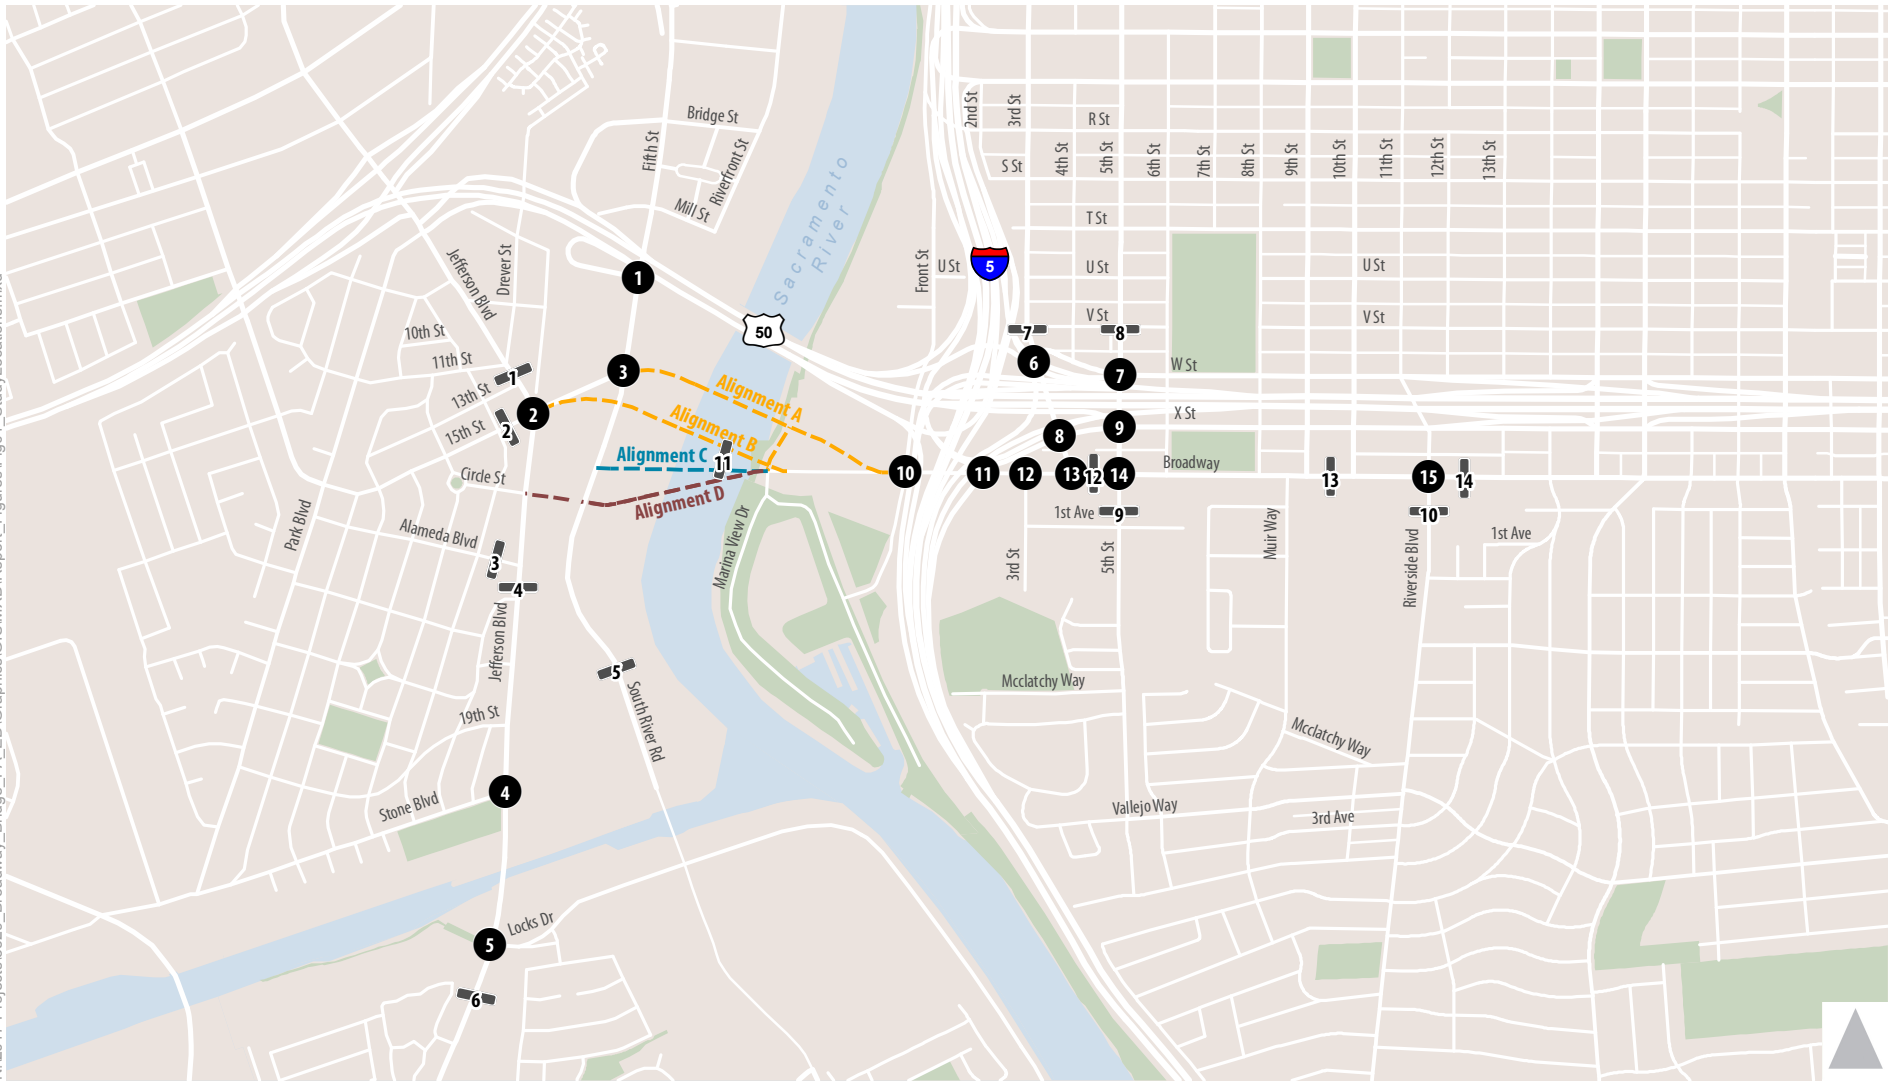

Project Description

The project would provide a new local bridge connection between the cities of West Sacramento and Sacramento just south of the US 50 Pioneer Bridge. On the West Sacramento side, the bridge would connect to the Pioneer Bluff neighborhood, with connection near South River Road, Jefferson Boulevard, and 15th Street. On the Sacramento side, the bridge would connect adjacent to Miller Regional Park with connection to Broadway. Four alignment alternatives were analyzed as part of this study.

Study Area

An extensive study area was developed based on collaborations between the EIR consultants, the City of West Sacramento, and the City of Sacramento staff. The following factors were considered when developing the study area: the project's expected travel characteristics, primary travel routes to/from the project vicinity, and other considerations. Figure 1 shows the study area, bridge location, the 15 existing study intersections, and 10 roadway segments selected for analysis. The study area also includes bicycle, pedestrian, and transit facilities in the project vicinity.

N:\2017 Projects\3529_Broadway_Bridge_PA_ED\Graphics\GISMXD\Report_Figures\Fig01_StudyLocations.mxd

- 1** Study Intersection
- 1-15** Study Roadway Segment
- Broadway Bridge (Alignment A/B)
- Broadway Bridge (Alignment C)
- Broadway Bridge (Alignment D)

Figure 1
Study Locations

The study intersections are listed in Table 1.

ID	Intersection	Jurisdiction	Control Type
1	South River Road / US 50 Eastbound On-Ramp	West Sacramento	Uncontrolled
2	Jefferson Boulevard / 15th Street	West Sacramento	Signal
3	South River Road / 15th Street	West Sacramento	Signal
4	Jefferson Blvd. / Stone Boulevard	West Sacramento	Signal
5	Jefferson Boulevard / Locks Drive	West Sacramento	Signal
6	W Street / 3rd Street	Sacramento	SSSC
7	W Street / 5th Street	Sacramento	Signal
8	X Street / 3rd Street	Sacramento	SSSC
9	X Street / 5th Street	Sacramento	Signal
10	Broadway / Front Street	Sacramento	SSSC
11	Broadway / I-5 Northbound Off-Ramp	Sacramento	SSSC
12	Broadway / 3rd Street (South)	Sacramento	SSSC
13	Broadway / 3rd Street (North)	Sacramento	SSSC
14	Broadway / 5th Street	Sacramento	Signal
15	Broadway / Riverside Boulevard	Sacramento	Signal

Notes: SSSC = Side Street Stop Controlled

Table 2 identifies the list of study freeway off-ramps for reporting maximum queue lengths.

ID	Location
1	I-5 Southbound Off-Ramp at 3 rd Street/X Street
2	US 50 Eastbound Off-Ramp at 5 th Street/X Street
3	I-5 Northbound Off-Ramp at Broadway

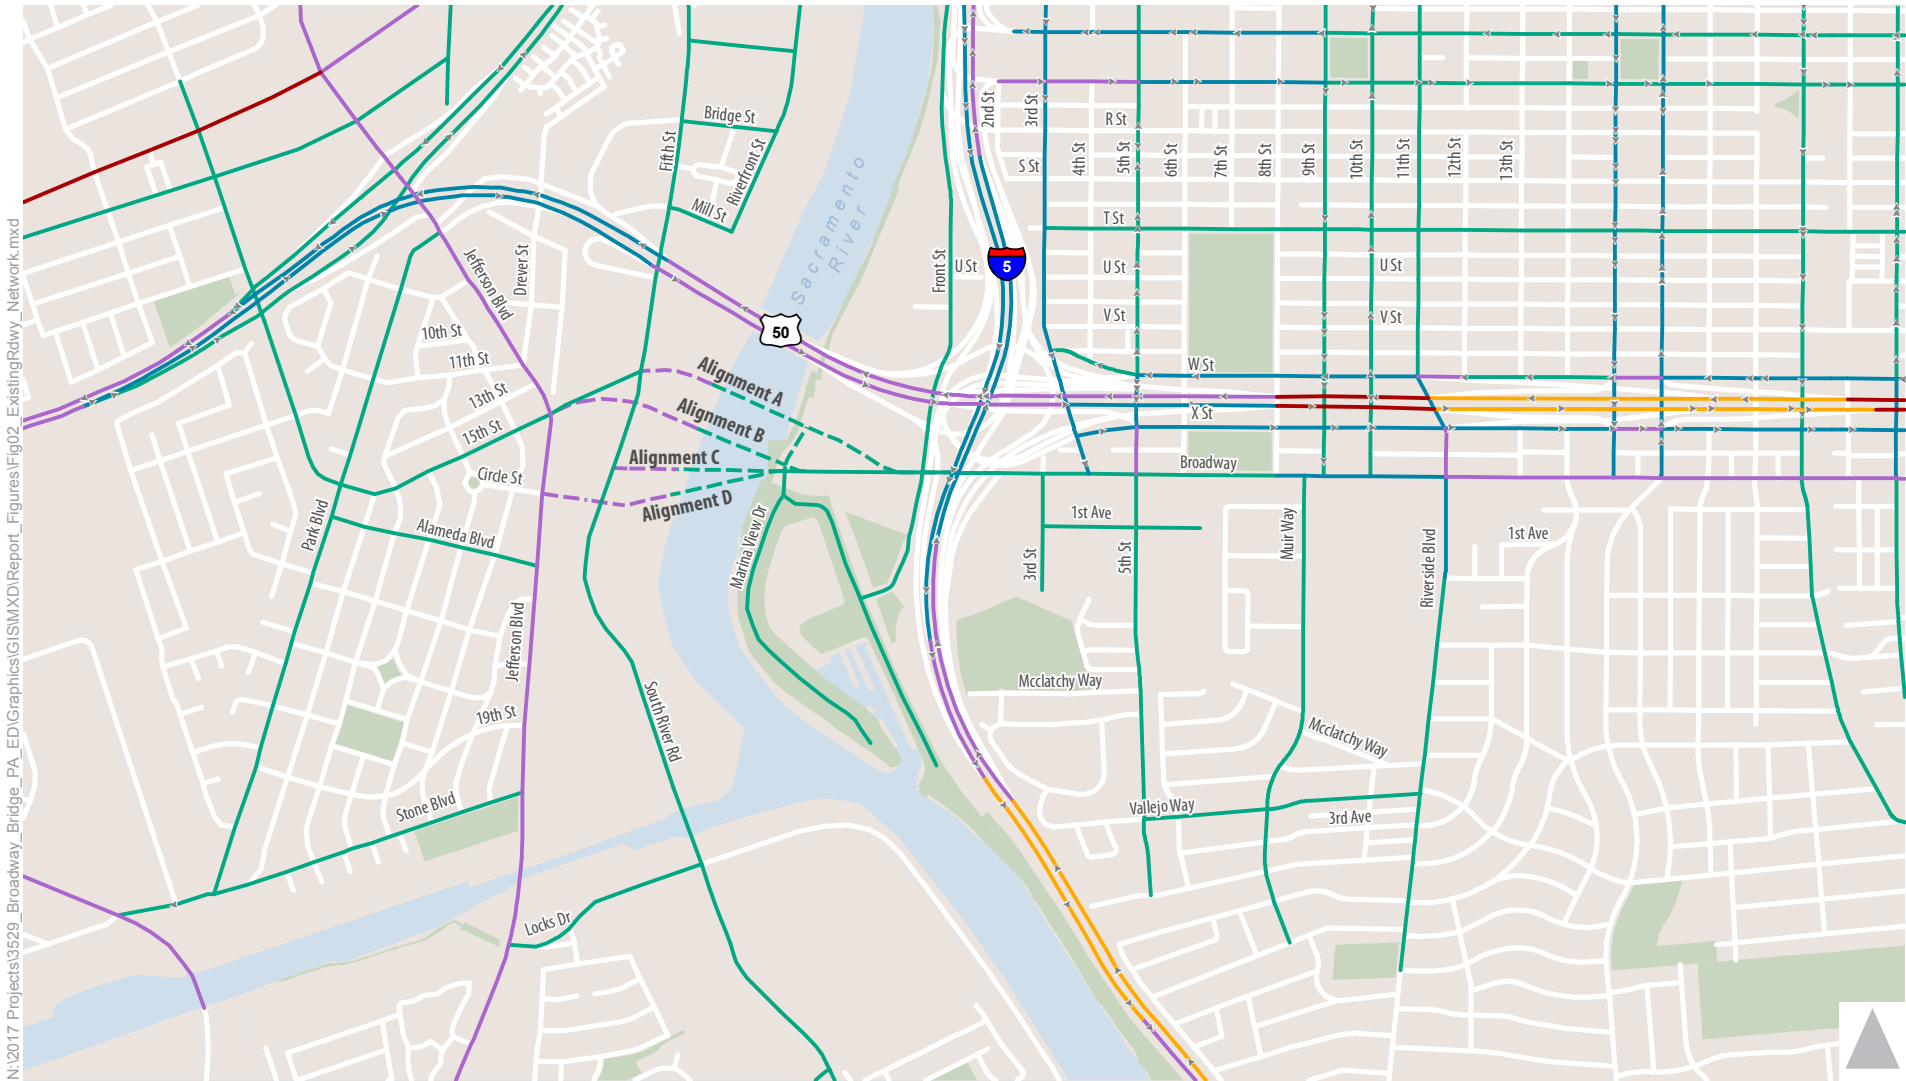

Table 3 lists the study roadway segments and the roadway facility type.

ID	Roadway	Segment	Direction	Jurisdiction	Type
1	Jefferson Boulevard	North of 15th Street	N/S	West Sacramento	Arterial, low access control (4+ stops/miles, many driveways, 25-35 mph)
2	15th Street	West of Jefferson Boulevard	E/W	West Sacramento	Residential collector with access
3	Alameda Boulevard	West of Jefferson Boulevard	E/W	West Sacramento	Residential
4	Jefferson Boulevard	South of Alameda Boulevard	N/S	West Sacramento	Arterial, moderate access control (2-4 stops/miles, few driveways, 35-45 mph)

5	South River Road	South of 15th St (Alameda Boulevard)	N/S	West Sacramento	Arterial, low access control (4+ stops/miles, many driveways, 25-35 mph)
6	Jefferson Boulevard	South of Locks Drive	N/S	West Sacramento	Arterial, moderate access control (2-4 stops/miles, few driveways, 35-45 mph)
7	3rd Street	North of W Street	N/S	Sacramento	Arterial, low access control (4+ stops/miles, frequent driveways, 25-35 mph)
8	5th Street	North of W Street	N/S	Sacramento	Arterial, low access control (4+ stops/miles, frequent driveways, 25-35 mph)
9	5th Street	South of Broadway	N/S	Sacramento	Collector Street - Minor
10	Riverside Boulevard	South of Broadway	N/S	Sacramento	Collector Street - Major
11	Broadway	Broadway Bridge	E/W	Sacramento	Arterial, moderate access control (2-4 stops/miles, limited driveways, 35-45 mph)
12	Broadway	Between 3rd St and 5th St	E/W	Sacramento	Arterial, low access control (4+ stops/miles, frequent driveways, 25-35 mph)
13	Broadway	Between 9th St and 10th St	E/W	Sacramento	Arterial, low access control (4+ stops/miles, frequent driveways, 25-35 mph)
14	Broadway	East of Riverside Blvd	E/W	Sacramento	Arterial, low access control (4+ stops/miles, frequent driveways, 25-35 mph)
<p>Note: Roadway facility types are identified by the City of West Sacramento TIA Guidelines, Table 2 - Level of Service Criteria for Roadway Segments (2006), and the City of Sacramento 2035 General Plan, Table 3-3 - Level of Service Thresholds for City Roadway Segments (2015).</p>					

Roadway Network

This section describes the roadways in the study area. All roadway classifications were designated by the Transportation & Circulation Element of the City of West Sacramento General Plan and City of Sacramento General Plan. The number of lanes and directions for roadways in the study area are also shown in Figure 2.

N:\2017 Projects\3529_Broadway_Bridge_PA_ED\Graphics\GISMXD\Report_Figures\Fig02_ExistingRdwy_Network.mxd

Figure 2
Existing Roadway Network

West Sacramento:

- **Jefferson Boulevard** is a north-south, four-lane major arterial that runs from Sacramento Avenue to the north through the City of West Sacramento into southern Yolo County. In the study area, the roadway has a center turn lane between US 50 ramps to Stone Boulevard, and a raised median south of Stone Boulevard. Bike lanes are provided south of 15th Street, and sidewalks exist along the corridor except on the east side of the roadway south of 15th Street. Street parking is provided on the west side of the roadway. The posted speed is 45 miles per hour (mph).
- **South River Road** is a north-south, two-lane collector, that runs transitions into 5th Street to the north and Village Parkway to the south. The roadway traverses through the currently industrial area of the Pioneer Bluff neighborhood in West Sacramento, and does not include bicycle or pedestrian facilities. The posted speed limit is 35 mph.
- **15th Street** is an east-west, two-lane collector that terminates at South River Road to the east and transitions into Westacre Road to the west. The roadway includes sidewalks and street parking to the west of Jefferson Boulevard. East of Jefferson Boulevard, bicycle lanes exist on both sides of the roadway, and sidewalks only on the north side of the roadway. The posted speed limit is 25 mph.
- **Stone Boulevard** is an east-west, two-lane collector that currently terminates at Jefferson Boulevard to the east and Industrial Boulevard to the west. The roadway includes sidewalks and street parking generally along the corridor. The posted speed limit is 25 mph.
- **Locks Drive** is an east-west, two-lane local roadway that connects Jefferson Boulevard to the west and South River Road/Village Parkway to the east. No sidewalks, bicycle facilities, or parking existing along the corridor. The posted speed limit is 30 mph.

Sacramento:

- **Broadway** is an east-west arterial in Sacramento, extending from the Sacramento River in the west to 65th Street. Broadway transitions from two lanes west of 8th Street, to three lanes between 8th Street and Riverside Boulevard (two eastbound lanes, one westbound lane), and four lanes east of Riverside Boulevard. The roadway includes sidewalks and bicycle lanes east of Front Street, and also street parking generally along the corridor east of 3rd Street. The posted speed limit of 30 mph west of Riverside Boulevard, and 25 mph east of Riverside Boulevard.
- **W Street** is a one-way westbound arterial roadway that travels along the north side of Business 80/US-50, and functions as a frontage road for the freeway. Within the study area, most segments of W Street have three lanes. On-street parking is allowed on the north side of the roadway. W Street has a posted speed limit of 35 mph.
- **X Street** is a one-way eastbound arterial that forms a couplet with W Street. X Street begins at 3rd Street (north), and ends at Alhambra Boulevard. It runs along the south side of Business 80/US-50

and serves as a frontage road for the freeway. X Street has three lanes with on-street parking allowed on the south side. It has a posted speed limit of 35 mph.

- **Front Street** is a two-lane, north-south roadway, on the western side of the study area and adjacent to the Sacramento River. The roadway connects to Downtown and Old Sacramento to the north and the Sacramento Marina to the south of Broadway. Bike lanes exist along both sides of the roadway; however, sidewalks and on-street parking are intermittent. The posted speed limit is 40 mph.
- **3rd Street** is a north-south street on the western side of the study area. 3rd Street is discontinuous on either side of Broadway, creating two nearby intersections. North of Broadway, 3rd Street is a one-way southbound arterial between W Street and X Street. South of Broadway, 3rd Street is a two-lane collector that extends through the specific plan area, terminating south of 1st Avenue.
- **5th Street** is a two-lane collector south of Broadway with a posted speed limit of 30 mph. Portions of this street permit on-street parking. North of Broadway, 5th Street is classified as an arterial. The segment immediately north of Broadway has two lanes in each direction, and north of X Street it becomes a one-way street with three northbound lanes.
- **Riverside Boulevard** is a two to four lane, two-way north-south roadway. The roadway transitions into 11th Street north of W Street. No sidewalks or on-street parking exist along the west side of the roadway adjacent to the Sacramento Historic City Cemetery and Masonic Lawn Cemetery. Bicycle lanes exist along both sides of the street. The posted speed limit is 30 mph.

Freeway Facilities:

- **Business 80/US 50** is a freeway that extends from Interstate 80 in West Sacramento to the State Route 99/US-50 interchange in Midtown Sacramento. Business 80 then extends northward to rejoin Interstate 80 near Watt Avenue, while US-50 continues east to South Lake Tahoe and points beyond. Within the study area, Business 80/US-50 has twelve lanes east of the I-5 interchange with five mainline lanes plus one auxiliary lane in the eastbound direction, and four mainline lanes plus two lanes that exit to I-5 in the westbound direction. On the structure crossing I-5 and the Sacramento River, Business 80/US-50 has eight lanes with four mainline lanes in the eastbound direction, and three mainline lanes plus one auxiliary lane in the westbound direction. Local access from Business 80/US-50 is provided by on and off-ramps at 5th Street, an eastbound on-ramp on X Street, and a westbound off-ramp at W Street.
- **Interstate 5 (I-5)** is a freeway that extends the length of California into Oregon and Washington. Within the study area, I-5 serves as a vital link through Downtown Sacramento. Immediately south of the interchange with Business 80/US-50, I-5 is a ten lane freeway. At its undercrossing of Business 80/US-50, I-5 is a six lane freeway with three mainline lanes in each direction. Local access from I-

5 is provided by a northbound off-ramp at Broadway and a southbound off-ramp at 3rd Street (via the US-50 EB connector ramp).

Data Collection

Intersection turning movement counts were collected during the morning (7 to 9 AM) and evening (4 to 6 PM) peak periods in May, 2017. The counts included bicycles and pedestrians. In addition, 72-hour roadway counts were collected in March and May, 2017.

Based on the traffic data collection, the AM peak hour occurred from 7:30 to 8:30 AM, and the PM peak hour occurred from 4:30 to 5:30 PM.

Project Alternatives

The following bridge alignment alternatives are analyzed, as shown previously in Figure 1:

- **Alignment A/B** is the northern most alignment on the West Sacramento side. The bridge connects directly to the South River Road / 15th Street intersection. Alignment A and B have a slight variation in the actual alignment across the Sacramento River; however, for purposes of comparing and analyzing the effects on transportation and circulation, they are essentially the same and analyzed as one alternative in this report.
- **Alignment C** is the middle alignment on the West Sacramento side. The bridge connects directly to South River Road, creating a T-intersection south of the South River Road / 15th Street intersection.
- **Alignment D** is the southern most alignment on the West Sacramento side. The bridge alignment would create a four-legged intersection at South River Road, and extend west to tie into Jefferson Boulevard / Circle Street.

On the Sacramento side of the bridge, each of the alignments are consistent at Broadway / Front Street. There is some variation in the location of where Marina View Drive would tie into the bridge approach; however, there are no differences in the alignment alternatives on the Sacramento side at the study locations.

Analysis Scenarios

The following scenarios are analyzed under no build and with each bridge alignment alternative:

- Existing Conditions – represents the baseline condition, upon which project impacts are measured. The baseline condition represents conditions in 2017.

- Opening Year 2030 Conditions – reflects conditions under the opening year of the proposed bridge, which include foreseeable land use growth and planned transportation improvement projects expected to be implemented by year 2030.
- Design Year 2040 Conditions – reflects conditions under the design year of the proposed bridge, which include foreseeable land use growth and planned transportation improvement projects expected to be implemented by year 2040.

Analysis Methodology

The analysis was conducted for AM and PM peak hour conditions following the prescribed methodology for each facility type contained in the *Highway Capacity Manual* (Transportation Research Board, 2010). Input variables were based on field observed data, estimates, and parameters specified by the City of West Sacramento and City of Sacramento.

The *Highway Capacity Manual* procedures describe traffic operating conditions from a driver’s perspective based on the concept of level of service (LOS). LOS is a qualitative measure of traffic operating conditions whereby a letter grade, from A (the best) to F (the worst), is assigned. These grades provide an indication of the comfort and convenience associated with driving. In general, LOS A represents free-flow conditions with no congestion, and LOS F represents severe congestion and delay under stop-and-go conditions. Perspectives from other roadway network users such as bicyclists and pedestrians are not accounted for in this methodology.

Table 4 displays the average control delay per vehicle for each LOS threshold for signalized and unsignalized intersections. For signalized and all-way stop-controlled intersections the LOS is based on the average control delay of all vehicles traveling through the intersection. For side-street stop-controlled intersections, the delay and LOS for the movement with the greatest average delay is reported along with the average delay for the entire intersection.

Level of Service	Average Delay (seconds/vehicle)	
	Signalized	Unsignalized
A	< 10	< 10
B	> 10 to 20	> 10 to 15
C	> 20 to 35	> 15 to 25
D	> 35 to 55	> 25 to 35
E	> 55 to 80	> 35 to 50
F	> 80	> 50

Source: *Highway Capacity Manual* (Transportation Research Board, 2010)

These methodologies were applied using the SimTraffic microsimulation software program, which considers the effects of lane utilization, turn pocket storage lengths, upstream/downstream queue spillbacks, coordinated signal timings, pedestrian crossing activity, and other conditions on intersection and overall corridor operations. Utilization of SimTraffic microsimulation analysis is appropriate given the presence of coordinated signal timing plans, close spacing of signalized intersections, and overall levels of traffic and peak-hour congestion within the study area. Reported results are based on an average of 10 runs.

The following procedures and assumptions were applied in the development of the SimTraffic model.

- Roadway geometric data were gathered using aerial photographs and field observations.
- Peak-hour traffic volumes were entered into the model according to the peak hour of the study area section.
- Signal phasing and timings were based on existing signal timing plans provided by the City of West Sacramento and City of Sacramento.
- The peak hour factor (PHF) was entered for each study section. The value based on the traffic counts was used for all scenarios.
- The heavy vehicle percentage was entered for each study section. The value based on the traffic counts was used for all scenarios.
- Bicycle and pedestrian volumes match the count data collected in May 2017.
- Speeds for the model network were based on the posted speed limits.

The study roadway segments in West Sacramento were evaluated using the City of West Sacramento's Traffic Impact Analysis Guidelines (2006). The study area roadways were assigned a roadway type based on their characteristics. The daily volume table in the guidelines was then used to assign the roadway LOS, as reflected in the following Table 5.

Facility Type	Number of Lanes	Maximum Average Daily Traffic per LOS				
		A	B	C	D	E
Residential	2	600	1,200	2,000	3,000	4,500
Residential collector with access	2	1,600	3,200	4,800	6,400	8,000
Residential collector without access	2	6,000	7,000	8,000	9,000	10,000
Arterial, low access control (4+ stops/miles, many driveways, 25-35 mph)	2	9,000	10,500	12,000	13,500	15,000
Arterial, low access control (4+ stops/miles, many driveways, 25-35 mph)	4	18,000	21,000	24,000	27,000	30,000
Arterial, low access control (4+ stops/miles, many driveways, 25-35 mph)	6	27,000	31,500	36,000	40,500	45,000
Arterial, moderate access control (2-4 stops/miles, few driveways, 35-45 mph)	2	10,800	12,600	14,400	16,200	18,000
Arterial, moderate access control	4	21,600	25,200	28,800	32,400	36,000

(2-4 stops/miles, few driveways, 35-45 mph)						
Arterial, moderate access control (2-4 stops/miles, few driveways, 35-45 mph)	6	32,400	37,800	43,200	48,600	54,000
Arterial, high access control (1-2 stops/miles, no driveways, 45-55 mph)	2	12,000	14,000	16,000	18,000	20,000
Arterial, high access control (1-2 stops/miles, no driveways, 45-55 mph)	4	24,000	28,000	32,000	36,000	40,000
Arterial, high access control (1-2 stops/miles, no driveways, 45-55 mph)	6	36,000	42,000	48,000	54,000	60,000
Rural, 2-lane highway	2	2,400	4,800	7,900	13,500	22,900
Rural, 2-lane road, 24-36' paved, shoulder	2	2,200	4,300	7,100	12,000	20,000
Rural, 2-lane road, 24-36' paved, no shoulder	2	1,800	3,600	5,900	10,100	17,000
Note: LOS = Level of Service						
Source: City of West Sacramento TIA Guidelines, Table 2 – Level of Service Criteria for Roadway Segments, 2006.						

Similarly, the roadway segments in Sacramento were evaluated using the City of Sacramento’s General Plan Level of Service Thresholds for City Roadway Segments (2015). The daily volume thresholds for LOS under each roadway type are presented in Table 6.

Operational Class	Number of Lanes	Maximum Average Daily Traffic per LOS				
		A	B	C	D	E
Arterial, low access control (4+ stops/miles, frequent driveways, 25-35 mph)	2	9,000	10,500	12,000	13,500	15,000
Arterial, low access control (4+ stops/miles, frequent driveways, 25-35 mph)	4	18,000	21,000	24,000	27,000	30,000
Arterial, low access control (4+ stops/miles, frequent driveways, 25-35 mph)	6	27,000	31,500	36,000	40,500	45,000
Arterial, moderate access control (2-4 stops/miles, limited driveways, 35-45 mph)	2	10,800	12,600	14,400	16,200	18,000
Arterial, moderate access control (2-4 stops/miles, limited driveways, 35-45 mph)	4	21,600	25,200	28,800	32,400	36,000
Arterial, moderate access control (2-4 stops/miles, limited driveways, 35-45 mph)	6	32,400	37,800	43,200	48,600	54,000
Arterial, high access control (1-2 stops/miles, no driveways, 45-55 mph)	2	12,000	14,000	16,000	18,000	20,000
Arterial, high access control (1-2 stops/miles, no driveways, 45-55 mph)	4	24,000	28,000	32,000	36,000	40,000
Arterial, high access control (1-2 stops/miles, no driveways, 45-55 mph)	6	36,000	43,000	48,000	54,000	60,000
Collector Street - Minor	2	5,250	6,125	7,000	7,875	8,750
Collector Street - Major	2	8,400	9,800	11,200	12,600	14,000
Collector Street - Major	4	16,800	19,600	22,400	25,200	28,000
Local Street	2	3,000	3,500	4,000	4,500	5,000
Note: LOS = Level of Service						
Source: City of Sacramento 2035 General Plan, Table 3-3 – Level of Service Thresholds for City Roadway Segments, 2015.						

Existing Conditions

This section describes the physical and operational characteristics of the existing transportation system within the study area, including the roadway, bicycle, pedestrian, and transit facilities.

Roadway System

The roadway system is analyzed under Existing Conditions at the study intersections, freeway off-ramps, and roadway segment locations previously identified.

Intersection Traffic Volumes

Based on the traffic data collection, the AM and PM peak hour intersection volumes are shown in Figure 3.

Intersection Operations

Table 7 summarizes the Existing AM and PM peak hour intersection operations at the study intersections. As shown, all intersections operate at LOS C or better, reflective of generally light levels of congestion. Key travel patterns during the AM peak hour include high demand of volume entering the US 50 eastbound on-ramp at South River Road, which creates queuing that spills back to the eastbound left-turn and northbound through movements at the Jefferson Boulevard/15th Street intersection. During the PM peak hour, there is a high demand of traffic destined for the I-5 and US 50 on-ramp at X Street/5th Street; however, traffic continues to move smoothly without a high level of delay. The LOS at each study intersection is also reflected in Figure 4.

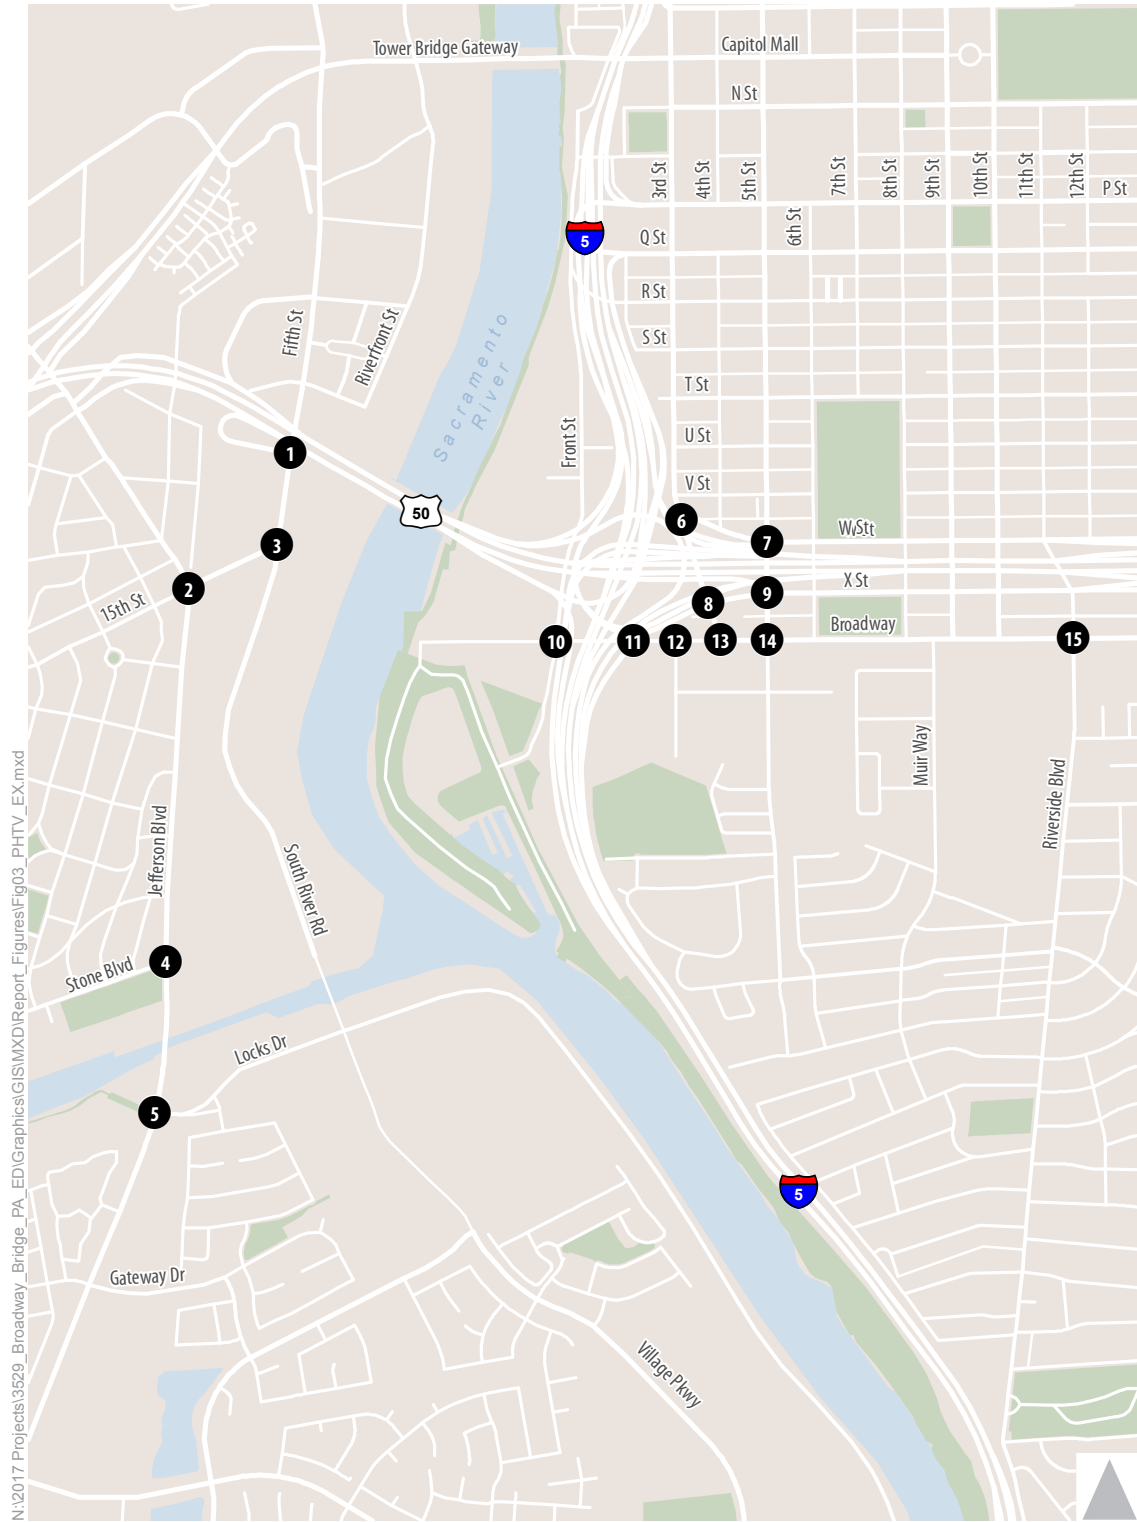

Table 7: Intersection Operations – Existing Conditions

ID	Intersection	Jurisdiction	Control Type	Peak Hour	Existing Conditions	
					Delay	LOS
1	S. River Rd. / US 50 EB On-Ramp	West Sacramento	Uncontrolled	AM	21	C
				PM	11	B
2	Jefferson Blvd. / 15th St.	West Sacramento	Signal	AM	20	B
				PM	23	C
3	S. River Rd. / 15th St.	West Sacramento	Signal	AM	27	C
				PM	24	C
4	Jefferson Blvd. / Stone Blvd.	West Sacramento	Signal	AM	10	A
				PM	15	B
5	Jefferson Blvd. / Locks Dr.	West Sacramento	Signal	AM	6	A
				PM	11	B
6	W St. / 3rd St.	Sacramento	SSSC	AM	1 (5)	A (A)
				PM	1 (9)	A (A)
7	W St. / 5th St.	Sacramento	Signal	AM	10	A
				PM	20	B
8	X St. / 3rd St.	Sacramento	SSSC	AM	3 (7)	A (A)
				PM	3 (9)	A (A)

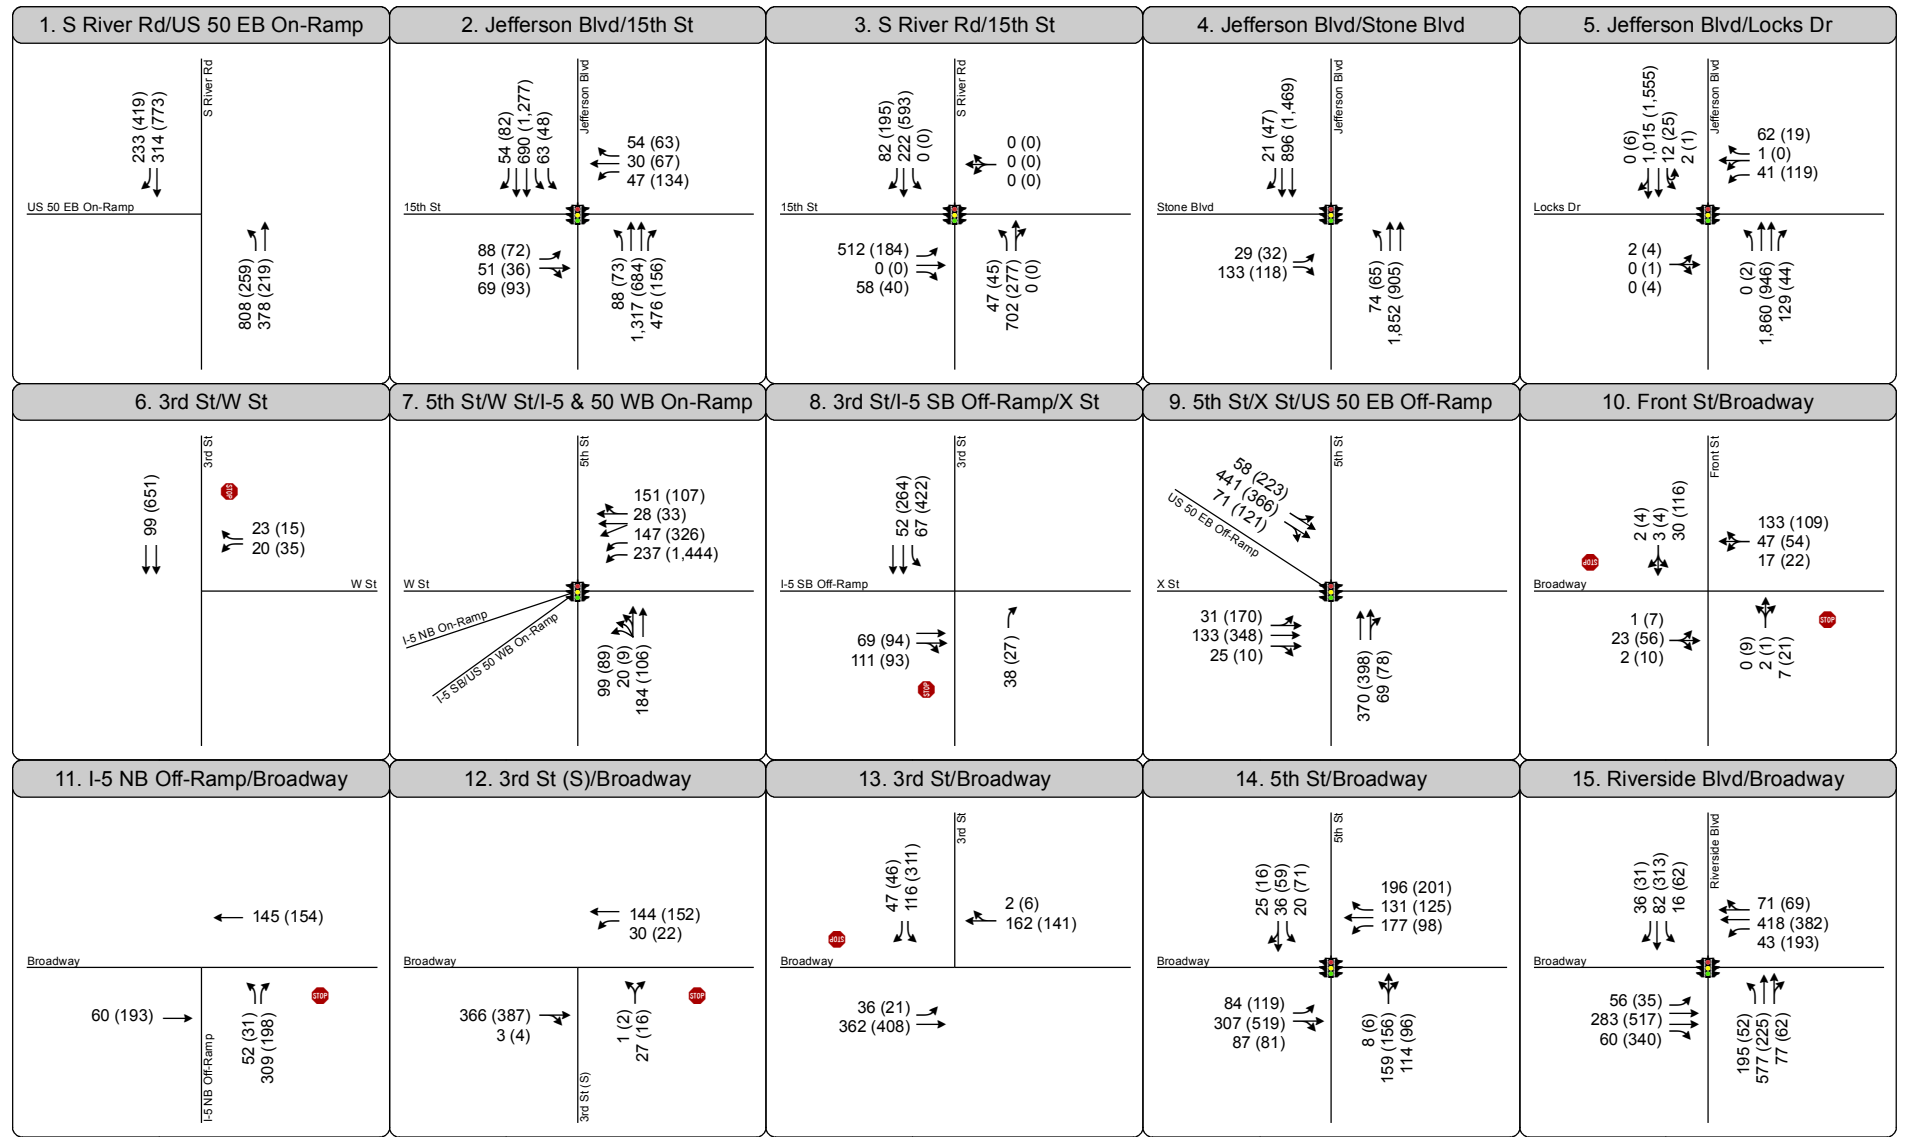

9	X St. / 5th St.	Sacramento	Signal	AM PM	16 25	B C
10	Broadway / Front St.	Sacramento	SSSC	AM PM	1 (5) 2 (5)	A (A) A (A)
11	Broadway / I-5 NB Off-Ramp	Sacramento	SSSC	AM PM	4 (6) 3 (5)	A (A) A (A)
12	Broadway / 3rd St. (South)	Sacramento	SSSC	AM PM	1 (3) 1 (4)	A (A) A (A)
13	Broadway / 3rd St. (North)	Sacramento	SSSC	AM PM	2 (9) 11 (28)	A (A) B (D)
14	Broadway / 5th St.	Sacramento	Signal	AM PM	12 16	B B
15	Broadway / Riverside Blvd.	Sacramento	Signal	AM PM	16 17	B B

Notes: LOS = Level of Service. SSSC = Side Street Stop Controlled
For signalized and uncontrolled intersections, average intersection delay is reported in seconds per vehicle for all approaches. For SSSC intersections, the LOS and control delay for the worst movement is shown in parentheses next to the average intersection LOS and delay. Impacts to intersections are determined based on the overall LOS and average delay. All intersections were analyzed in SimTraffic.

Existing Peak Hour Interseccion LOS

Freeway Off-Ramp Queuing

The freeway off-ramp queues under the Existing AM and PM peak hours are presented in Table 8. All off-ramp queues remain well below the available storage capacity.

ID	Location	Available Storage (feet)	Peak Hour	Existing Conditions
				Queue (feet)
1	I-5 SB Off-Ramp at 3rd St./X St.	1,150	AM	75
			PM	75
2	US 50 EB Off-Ramp at 5th St./X St.	1,300	AM	175
			PM	250
3	I-5 NB Off-Ramp at Broadway	1,000	AM	75
			PM	75

Notes: The available storage length for off-ramp queuing is measured from the noted off-ramp terminal intersection to the freeway off-ramp gore point. Maximum queue length is based upon output from SimTraffic microsimulation software.

Roadway Segment Operations

Table 9 shows the daily roadway segment volumes and operations analysis results. All roadway segments operate at LOS D or better, except for Jefferson Boulevard north of 15th Street in West Sacramento, which operates at LOS E.

ID	Roadway	Segment	Jurisdiction	Lanes	Existing Conditions		
					Daily Volume	LOS	V/C
1	Jefferson Blvd.	North of 15th Street	West Sacramento	4	27,900	E	0.93
2	15th St.	West of Jefferson Blvd.	West Sacramento	2	3,400	C	0.43
3	Alameda Blvd.	West of Jefferson Blvd.	West Sacramento	2	1,100	B	0.24
4	Jefferson Blvd.	South of Alameda Blvd.	West Sacramento	4	30,300	D	0.84
5	S. River Rd.	South of 15th St. (Alameda Blvd.)	West Sacramento	2	9,300	B	0.62
6	Jefferson Blvd.	South of Locks Dr.	West Sacramento	4	30,500	D	0.85
7	3rd St.	North of W St.	Sacramento	2	3,200	A	0.21
8	5th St.	North of W St.	Sacramento	2	2,700	A	0.18
9	5th St.	South of Broadway	Sacramento	2	7,000	D	0.80

12	Broadway	Between 3rd St and 5th St	Sacramento	2	8,000	A	0.53
13	Broadway	Between 9th St and 10th St	Sacramento	2	13,100	D	0.87
14	Broadway	East of Riverside Blvd	Sacramento	4	11,600	A	0.39
Notes: LOS = Level of Service. V/C = Volume to Capacity Ratio Source: Fehr & Peers, 2020							

Bicycle System

Figure 5 displays the existing bicycle infrastructure, which consists of the following facilities as defined by the *Highway Design Manual* (Caltrans, 2012):

- Multi-use paths (Class I) – are paved trails that are separated from roadways and allow for shared use by both cyclists and pedestrians.
- On-street bike lanes (Class II) – are designated for use by bicycles by striping, pavement legends, and signs.
- On-street bike routes (Class III) – are designated by signage for shared bicycle use with vehicles but do not necessarily include any additional pavement width.

As shown, the River Walk Trail (Class 1 multi-use path) runs along the West Sacramento side of the Sacramento River, but terminates at Mill Street. Class II bicycle lanes are intermittent along South River Road as it transitions from 5th Street to the north to Village Parkway to the south. The Sacramento River Bike Trail (Class 1 multi-use path) runs along the Sacramento side of the river, transitioning as a Class III bike route through Miller Regional Park. In addition, bicycle lanes exist on Broadway between Front Street and Muir Way.

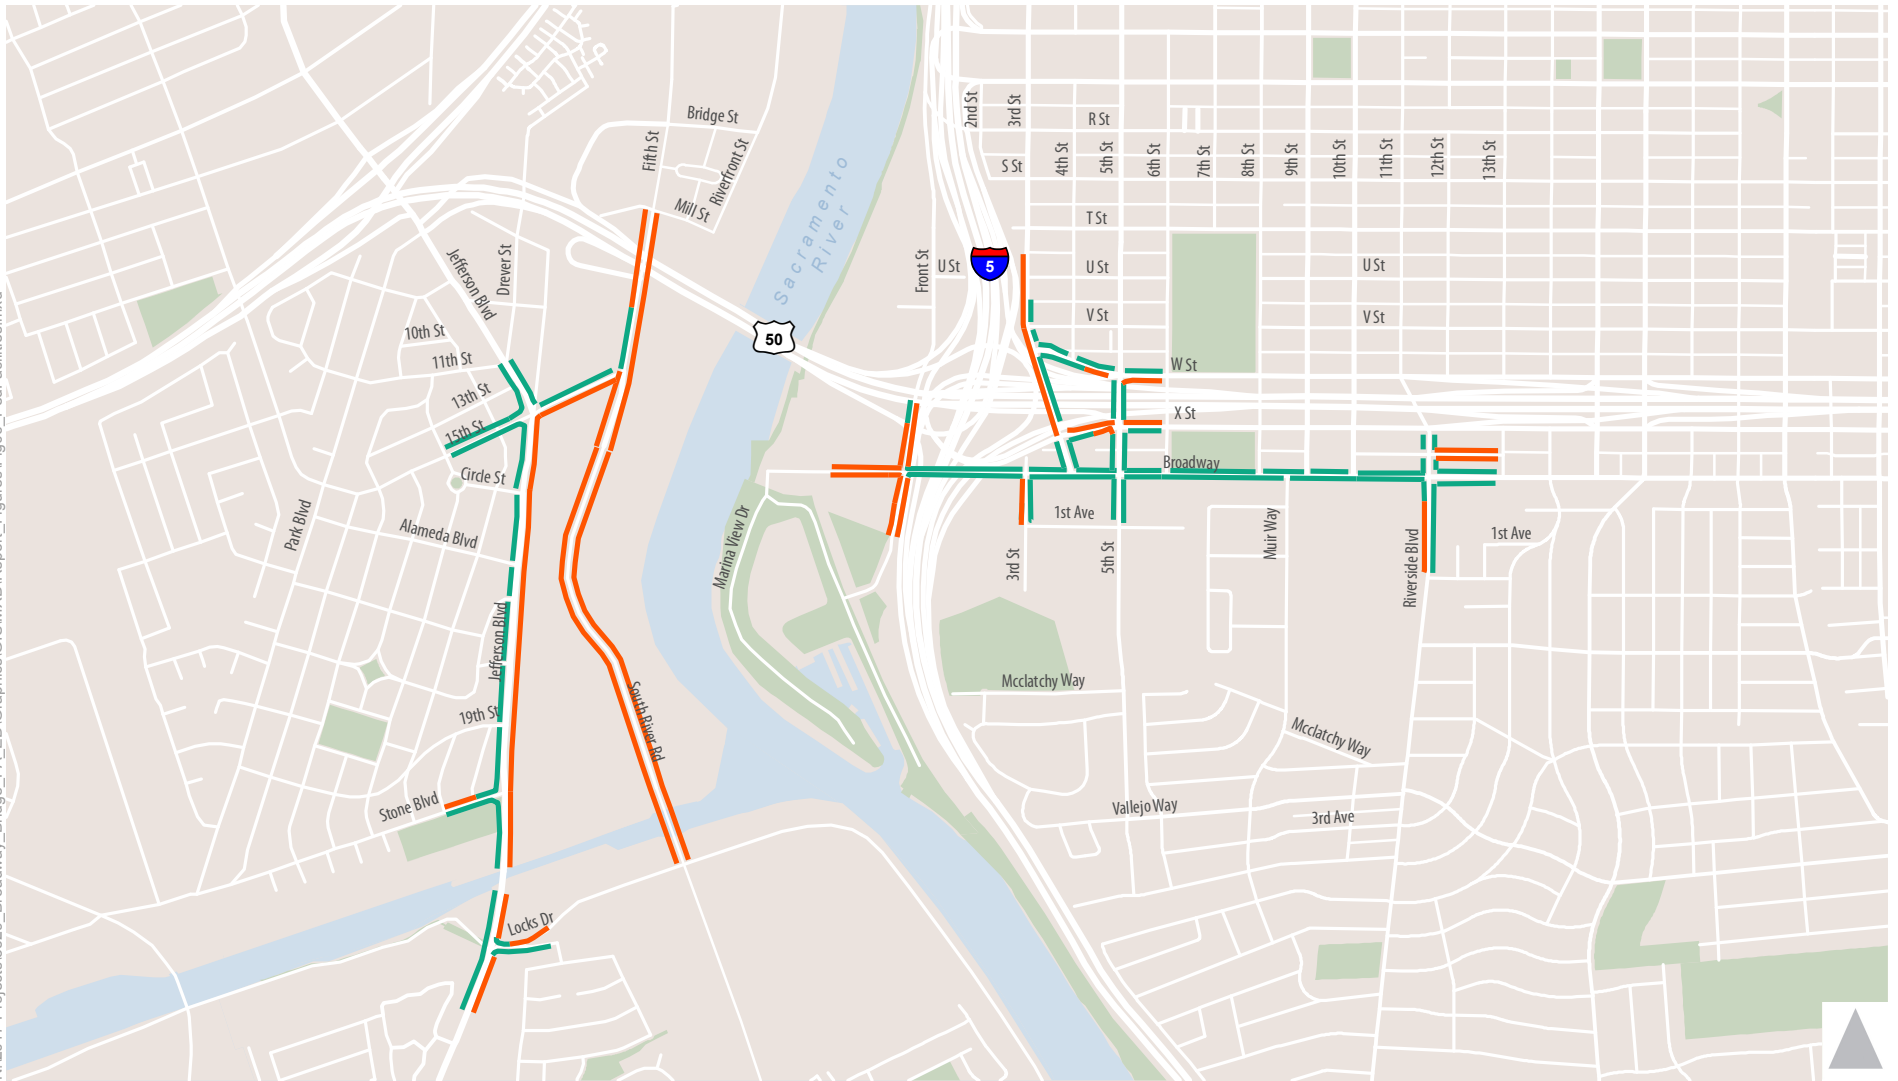

- Existing Bicycle Facilities
- Class I Bike Path
 - Class II Bike Lane
 - Class III Bike Route

Figure 5
Existing Bicycle Facilities

Pedestrian System

Figure 6 shows the existing pedestrian facilities and highlights locations where sidewalks are missing. As shown, sidewalk connectivity within the study area is intermittent. Although some roadways have continuous sidewalks lining both sides of the street, many have discontinuous sidewalks or lack sidewalks on one side. Notable locations where sidewalks are missing include most of South River Road and the east side of Jefferson Boulevard in West Sacramento, and the section of Broadway west of Front Street in Sacramento.

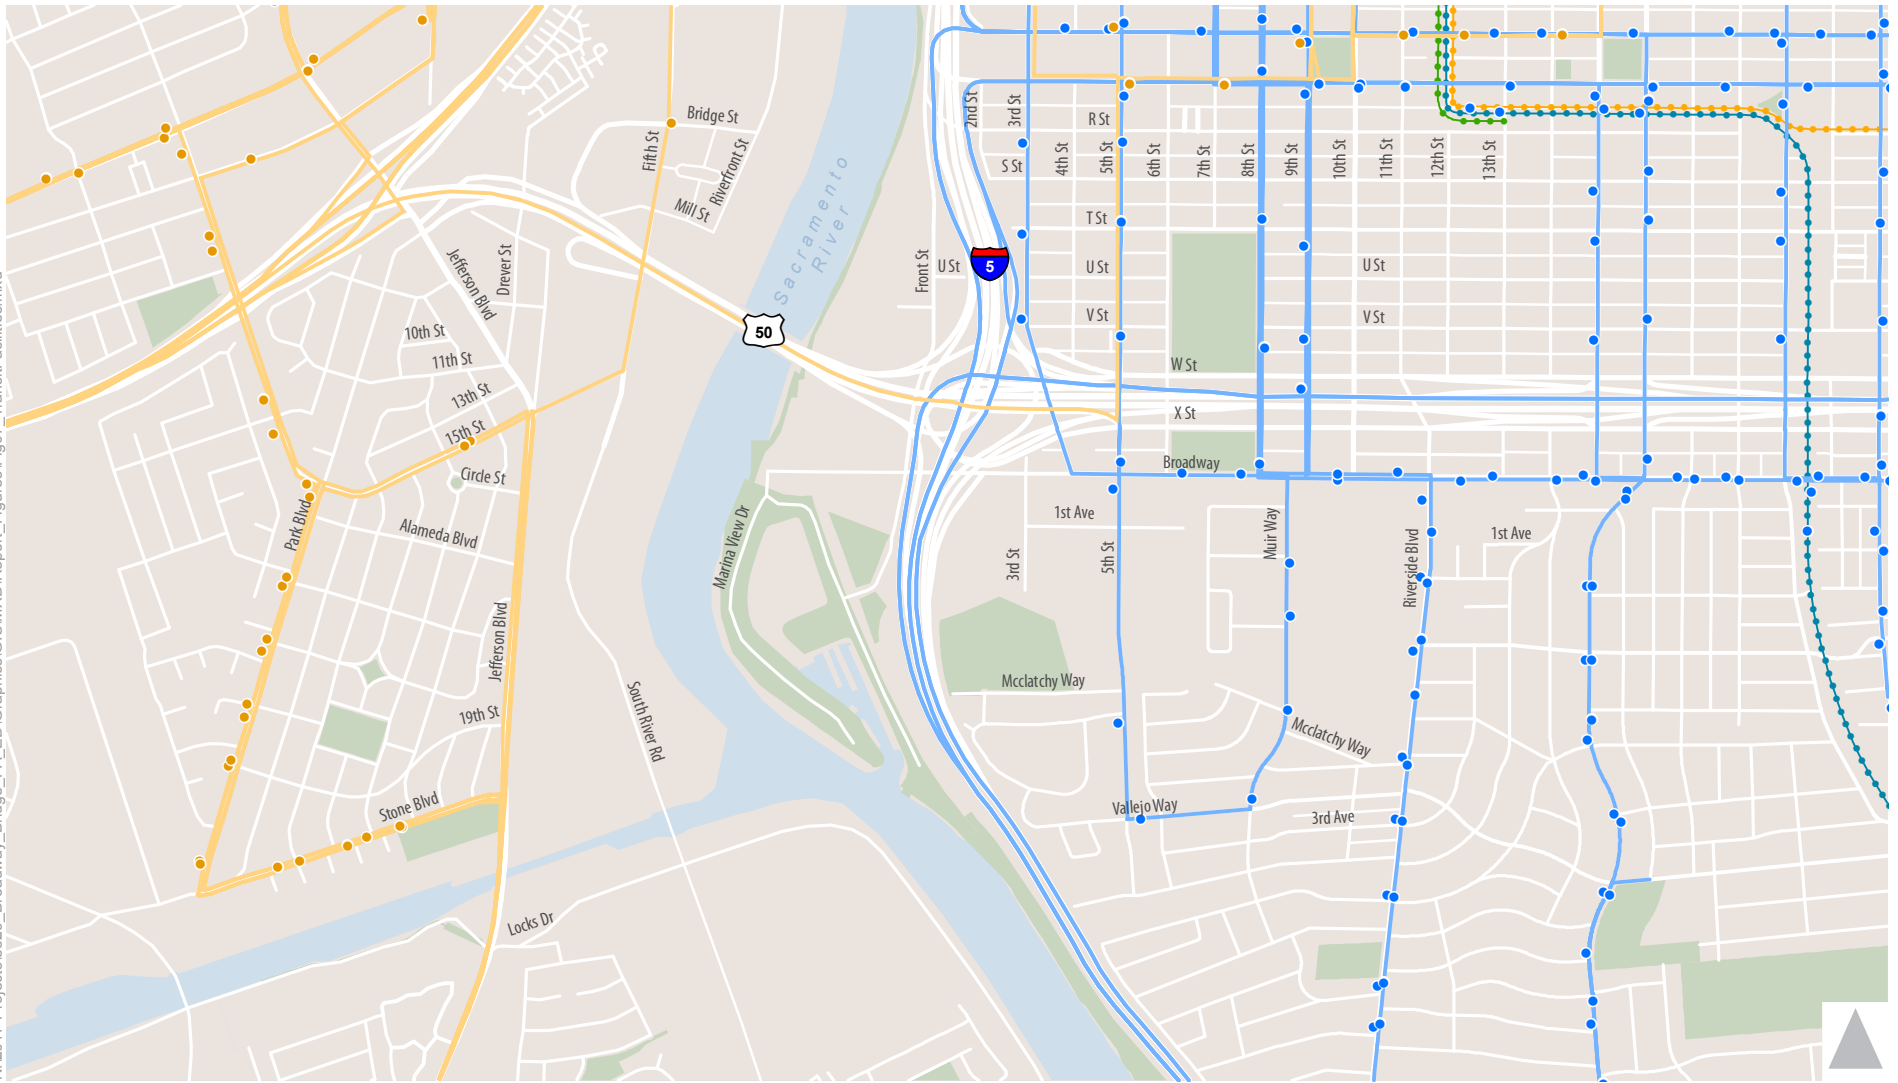

- Missing Sidewalk
- Existing Sidewalk

Figure 6
Existing Pedestrian Facilities

Transit System

Local transit service in the study area is provided by both the Sacramento Regional Transit District (RT) and the Yolo County Transportation District (Yolobus). The transit routes and stops for both RT and Yolobus are shown in Figure 7. Currently, Yolobus route 39, a commuter bus between the Southport area of West Sacramento and Downtown Sacramento, is the only bus that provides connection across the Sacramento River within the study area.

Regulatory Setting

Federal Requirements

Caltrans, as assigned by FHWA, directs that full consideration should be given to the safe accommodation of pedestrians and bicyclists during the development of federal-aid highway projects (see 23 CFR 652). It further directs that the special needs of the elderly and the disabled must be considered in all federal-aid projects that include pedestrian facilities. When current or anticipated pedestrian and/or bicycle traffic presents a potential conflict with motor vehicle traffic, every effort must be made to minimize the detrimental effects on all highway users who share the facility.

In July 1999, the U.S. Department of Transportation (USDOT) issued an Accessibility Policy Statement pledging a fully accessible multimodal transportation system. Accessibility in federally assisted programs is governed by the USDOT regulations (49 CFR Part 27) implementing Section 504 of the Rehabilitation Act (29 USC 794). FHWA has enacted regulations for implementation of the ADA, including a commitment to build transportation facilities that provide equal access for all persons. These regulations require application of the ADA requirements to federal-aid projects, including Transportation Enhancement Activities.

State Requirements

Interstate 5 Transportation Corridor Concept Report

In 2017, the California Department of Transportation (Caltrans) released the Interstate 5 Transportation Concept Report (TCR) that includes portions of Interstate 5 (I-5) within the study area. Figure 1 of this report shows existing operations on I-5 within the study area as being at level of service (LOS) F. The report also indicates a Concept LOS E for this corridor. The ultimate concept LOS represents the minimum acceptable service conditions over the next 20 years. The TCR indicates that the No-Build and Build scenarios will not meet the LOS E ultimate concept LOS, and that targeted operational improvements, intelligent transportation systems, and integrated corridor management will be needed.

US 50 Transportation Concept Report and Corridor System Management Plan

In 2014, Caltrans released the United States Route 50 Transportation Concept Report and Corridor System Management Plan for portions of United States Route 50 (US 50) within the study area. Table 13 of this report shows existing operations on US 50 west of the Sacramento River as being at LOS E, and east of the river at LOS F. The report also indicates a Concept LOS E for this corridor.

The above-referenced Caltrans LOS results are based on daily volume-to-capacity comparisons and do not necessarily consider specific operational characteristics (e.g., length of weave sections, peak hour factors,

etc.) within the I-5 and US 50 corridors. Nevertheless, these data are valuable in understanding Caltrans' expectations of their current and projected operating performance.

Senate Bill 743

Senate Bill (SB) 743, passed in 2013, required the California Governor's Office of Planning and Research (OPR) to develop new CEQA guidelines that address traffic metrics under CEQA. As stated in the legislation, upon adoption of the new guidelines, "automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion shall not be considered a significant impact on the environment pursuant to this division, except in locations specifically identified in the guidelines, if any." OPR recently updated its CEQA Guidelines to implement SB 743 and require that vehicle miles traveled (VMT) be the primary metric used to identify transportation impacts. Local agencies have an opt-in period until July 1, 2020.

Regional Requirements

2036 Metropolitan Transportation Plan/Sustainable Communities Strategy

The Sacramento Area Council of Governments (SACOG) is responsible for the preparation of, and updates to, the 2016 Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) and the corresponding Metropolitan Transportation Improvement Program (MTIP) for the six-county Sacramento region (SACOG 2016). The MTP/SCS provides a 20-year transportation vision and corresponding list of projects. The MTIP identifies short-term projects (7-year horizon) in more detail. The MTP/SCS was adopted by the SACOG board in 2016. Subsequent to the completion of the analysis documented in this report, SACOG adopted the 2040 MTP/SCS in November 2019.

Regional Bicycle, Pedestrian and Trails Master Plan

The Regional Bicycle, Pedestrian and Trails Master Plan (2013) is a comprehensive list of planned projects prepared by SACOG. This is the first plan shaped by the goals and strategies of the Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) adopted in 2012.

Local Requirements

City of West Sacramento General Plan 2035

The *City of West Sacramento General Plan 2035* was adopted in 2016. The Mobility Element of the General Plan outlines goals and policies related to the City's transportation system. The following LOS policy is relevant to this study:

Policy M-3.2 Automobile Level of Service: The City shall endeavor to maintain a Level of Service "C" on all streets within the City, except at intersections and on roadway segments within one-quarter mile of a

freeway interchange or bridge crossing of the Deep Water Ship Channel, barge canal, or Sacramento River, where a Level of Service "D" shall be deemed acceptable, and within pedestrian oriented, high density, mixed use areas, such as the Bridge District Specific Plan area, the Washington Specific Plan area, and West Capitol Avenue from Harbor Blvd. east, where a Level of Service "E" shall be deemed acceptable. For purposes of CEQA impact analyses, Level of Service shall be considered as part of General Plan consistency.

The following policies from the City of West Sacramento 2035 General Plan are also applicable to this study:

Policy M-1.1 Connectivity: The City shall strive to develop a comprehensive, safe, and fully integrated multimodal transportation system that connects residents, visitors, and employees to the city and region through all available modes including connected vehicles, car/bikeshare, and autonomous modes.

Policy M-1.2 Multi-Modal Corridors: The City shall establish multi-modal corridors and hubs within and between urban centers and along major corridors

Policy M-1.3 Reduce Vehicle Miles Travelled: The City shall endeavor to reduce vehicle miles travelled (VMT) and dependence on fossil fuels by continuing to develop a comprehensive multi-modal transportation system and compact, mixed-use development that includes more transit, bicycle, and pedestrian routes.

Policy M-1.5 Transportation Planning Efforts: The City shall continue to participate in State, regional, and local transportation planning efforts to insure coordination of the expansion and improvement of the region's transportation system.

Policy M-1.7 Multimodal Access: As part of the site design during design review for new developments, the City shall incorporate multi-modal access to civic and commercial centers, employment centers, transit stops/stations, schools, parks, recreation areas, and tourist attractions.

Policy M-1.8 Overcoming Barriers to Accessibility: The City shall strive to remove and minimize the effects of natural and manmade barriers, such as the Capital City Freeway, railways, Sacramento River, and the Deep Water Ship Channel, on accessibility between and within existing neighborhoods and districts.

Policy M-1.9 Eliminate Gaps: The City shall strive to eliminate roadway, bikeway, and pedestrian way gaps between neighborhoods and districts to create a completely connected city.

Policy M-1.11 Transportation Impact Studies: The City shall maintain guidelines for Transportation Impact Studies for new developments that identify, evaluate, and address impacts on all modes of travel.

Policy M-2.4 Accessibility: The City shall endeavor to ensure that all streets are safe and accessible to people with disabilities and others with limited mobility. Streets shall be designed and reconstructed to meet the requirements of the Americans with Disabilities Act (ADA).

Policy M-2.5 Street Amenities: The City shall require public transit, bicycle, and pedestrian amenities in street design to promote the walking, bicycling, and public transit use and complement the context of nearby centers, corridors, and neighborhoods.

Policy M-2.7 Complete Streets Requirements: The City, to the extent feasible, shall require that all new street construction and reconstruction be designed to achieve complete streets. Exceptions to complete streets design shall require approval of the Planning Commission.

Policy M-2.9 Street Design Standards: The City shall require that streets be dedicated, widened, extended, and constructed to provide for a well-connected, walkable community (preferably a grid or modified grid), according to City street design standards and complete streets concepts.

Policy M-2.11 Complete Bridges: The City shall ensure, to the extent that bridges and overpasses include infrastructure, features, and amenities to provide a continuous, unbroken system of complete streets within the city and to provide a welcoming entrance at the city's gateways.

Policy M-2.12 Adequate Travel and Crossing of Right of Ways: The City shall ensure that in constructing and reconstructing streets that adequate rights-of-way and crossing of rights-of-way be provided for all users including bicyclists, pedestrians, transit riders, and motorists.

Policy M-2.13 Reduce Conflicts: The City shall endeavor to ensure that bicycle, pedestrian, and public transit facilities are constructed to minimize conflicts among bicyclists, pedestrians, transit operators/users, and motorists.

Policy M-3.1 Safe and Efficient: The City shall ensure that the roadway system, street designs, and access provide for redundant (i.e., multiple routes), safe, and efficient movement of goods and people.

Policy M-4.1 Access to Public Transit: The City shall strive to ensure that all residents have access to adequate and safe public transit options that reduce dependence on fossil fuels and increase physical activity.

Policy M-4.5 Transit-friendly Streets: The City shall ensure that new streets install infrastructure, features, and amenities that support transit use; are safe, convenient, clean, and efficient; are clearly marked and accessible; and include shelters, benches, and adequate lighting.

Policy M-4.9 Light Rail/Street Cars: The City shall cooperate with Sacramento Regional Transit District (RT), Yolo TMA, and the City of Sacramento to support and actively pursue extension of light rail/street cars into West Sacramento to serve the Civic Center/Central Business District, the Washington

neighborhood, and the Bridge District. Considerations for future extensions should be given to areas where development patterns will support streetcar ridership, such as Pioneer Bluff.

Policy M-5.1 Bike and Pedestrian Plan: The City shall maintain and implement a Bike and Pedestrian Plan that requires new development to be consistent with the applicable portions of the Plan as well as the goals and policies of the General Plan.

Policy M-5.3 Bicycle Routes: The City shall develop, adopt and implement a safe and convenient network of identified bicycle routes connecting residential areas with recreation, parks, scenic areas, the riverfront, schools, the Central Business District, public facilities, shopping, and employment areas within the city.

Policy M-5.6 Appropriate Bikeways: The City shall ensure that, to the maximum extent possible, an appropriate system of low-stress bikeways that encourages cyclists of all skill levels that includes Class I, II, and III facilities is maintained in appropriate areas of the city.

Policy M-6.1 Cohesive Network: The City shall develop a cohesive pedestrian network of public sidewalks and street crossings that makes walking a convenient and safe way to travel.

Policy M-6.2 Continuous Network: The City shall provide a continuous pedestrian network in existing and new neighborhoods that facilitates convenient pedestrian travel free of major impediments and obstacles.

Policy M-6.3 Pedestrian-friendly Streets: The City shall ensure that new streets in areas of high pedestrian activity support safe and attractive travel by providing features and amenities such as separated sidewalks, bicycle lanes and separated paths, pedestrian signals, street trees, seats, and pedestrian-scale lighting.

Policy M-6.7 Safe Pedestrian Crossings: The City shall improve pedestrian safety at intersections and mid-block locations by providing pedestrian treatments such as well-marked pedestrian crossings, bulbouts, or median refuges that reduce crossing widths, and/ or audible pedestrian signals.

West Sacramento Bicycle, Pedestrian, and Trails Master Plan

The *2013 West Sacramento Bicycle, Pedestrian, and Trails Master Plan* (Fehr & Peers, 2013) identifies current and proposed bicycle facilities in the City of West Sacramento. The plan proposes to convert the existing Class II on-street bike lanes on West Capitol Avenue from Glide Avenue to Poplar Avenue to a Class III bike route. The Class III route would be provided on future frontage roads that are planned to be added to this section of West Capitol Avenue per the *2007 West Capitol Avenue Streetscape Master Plan*. Class II on-street bike lanes are proposed to be added to Jefferson Boulevard between West Capitol Avenue and Park Boulevard. Elsewhere in the study area, the existing bicycle facilities would remain.

City of Sacramento 2035 General Plan

On March 3, 2015, the City of Sacramento City Council adopted the 2035 General Plan. The Mobility Element of the City of Sacramento's 2035 General Plan outlines goals and policies that coordinate the transportation and circulation system with planned land uses. The following LOS policy is relevant to this study:

Policy M 1.2.2: The City shall implement a flexible context-sensitive Level of Service (LOS) standard and will measure traffic operations against the vehicle LOS thresholds established in this policy. The City will measure vehicle LOS based on the methodology contained in the latest version of the Highway Capacity Manual (HCM) published by the Transportation Research Board. The City's specific vehicle LOS thresholds have been defined based on community values with respect to modal priorities, land use context, economic development, and environmental resources and constraints. As such, the City has established variable LOS thresholds appropriate for the unique characteristics of the City's diverse neighborhoods and communities. The City will strive to operate the roadway network at LOS D or better for vehicles during typical weekday conditions, including AM and PM peak hour, with certain exceptions mapped on Figure M-1 (and listed in the actual General Plan document).

- A. Core Area (Central City Community Plan Area) – LOS F allowed
- B. Priority Investment Areas – LOS F allowed
- C. LOS E roadways (11 distinct segments listed). LOS E is also allowed on all roadway segments and associated intersections located within ½ mile walking distance of a light rail stations.
- D. LOS F roadways (24 distinct segments listed)
- E. If maintaining the above LOS standards would, in the City's judgment, be infeasible and/or conflict with the achievement of other goals, LOS E or F conditions may be accepted provided that provisions are made to improve the overall system, promote non-vehicular transportation and/or implement vehicle trip reduction measures as part of a development project or a city-initiated project. Additionally, the City shall not expand the physical capacity of the planned roadway network to accommodate a project beyond that identified in Figure M4 and M4a (2035 General Plan Roadway Classification and Lanes).

According to Figure M1 (Vehicle Level of Service Exception Areas) of the 2035 City of Sacramento General Plan, the proposed project is located within one of three Priority Investment Areas. The project site is also located within the Core Area, which is bounded by the Sacramento River, American River, Broadway, and Alhambra Boulevard. All study intersections are located within the Core Area as well as a Priority Investment Area; therefore, LOS F is allowed at all study locations. The City's policy was adopted to allow decreased levels of service (i.e., LOS F) in the urbanized Core Area of the City that supports more transportation

alternatives and places residents proximate to employment, entertainment, retail and neighborhood centers and thus reduces overall vehicle miles traveled and results in environmental benefits (e.g., improved air quality and reduced GHG emissions). Based on this evaluation, the City determined that LOS F is considered acceptable during peak hours within the Core Area.

The following policies from the City of Sacramento 2035 General Plan are also applicable to this study:

Policy M 1.1.1: Rights-of-Way. The City shall preserve and manage rights-of-way consistent with: the circulation diagram, the City Street Design Standards, the goal to provide Complete Streets as described in Goal M 4.2, and the modal priorities for each street segment and intersection established in Policy M4.4.1: Roadway Network Development, Street Typology System.

Policy M 1.2.3: Transportation Evaluation. The City shall evaluate discretionary projects for potential impacts to traffic operations, traffic safety, transit service, bicycle facilities, and pedestrian facilities, consistent with the City's Traffic Study Guidelines.

Policy M 1.2.4: Multimodal Access. The City shall facilitate the provision of multimodal access to activity centers such as commercial centers and corridors, employment centers, transit stops / stations, airports, schools, parks, recreation areas, medical centers, and tourist attractions.

Policy M 1.3.1: Grid Network. To promote efficient travel for all modes, the City shall require all new residential, commercial or mixed-use development that proposes or is required to construct or extend streets to develop a transportation network that is well-connected, both internally and to off-site networks preferably with a grid or modified grid-form.

Policy M 1.3.2: Eliminate Gaps. The City shall eliminate "gaps" in roadways, bikeways, and pedestrian networks. To this end:

- A. The City shall construct new multi-modal crossings of the Sacramento and American Rivers.
- B. The City shall plan and pursue funding to construct grade-separated crossings of freeways, rail lines, canals, creeks, and other barriers to improve connectivity.
- C. The City shall construct new bikeways and pedestrian paths in existing neighborhoods to improve connectivity.

Policy M 1.3.3: Improve Transit Access. The City shall support the Sacramento Regional Transit District (RT) in addressing identified gaps in public transit networks by working with RT to appropriately locate passenger facilities and stations, pedestrian walkways and bicycle access to transit stations and stops, and

public rights-of-way as necessary for transit- only lanes, transit stops, and transit vehicle stations and layover.

Policy M 2.1.2: Sidewalk Design. The City shall require that sidewalks wherever possible be developed at sufficient width to accommodate all users including persons with disabilities and complement the form and function of both the current and planned land use context of each street segment (i.e., necessary buffers, amenities, outdoor seating space).

Policy M 2.1.4: Cohesive and Continuous Network. The City shall develop a pedestrian network of public sidewalks, street crossings, and other pedestrian paths that makes walking a convenient and safe way to travel citywide. The network should include a dense pattern of routes in pedestrian-oriented areas such as the Central City and include wayfinding where appropriate.

Policy M 3.1.12: New Facilities. The City shall work with transit providers and private developers to incorporate transit facilities into new private development and City project designs including incorporation of transit infrastructure (i.e., electricity, fiber-optic cable), alignments for transit route extensions, new station locations, bus stops, and transit patron waiting area amenities (i.e., benches, real-time traveler information screens).

Policy M 3.1.14: Direct Access to stations. The City shall ensure that development projects located in the Central City and within ½ mile walking distance of existing and planned light rail stations provide direct pedestrian and bicycle access to the station area, to the extent feasible.

Policy M 3.1.16: Streetcar Facilities. The City shall support the development of streetcar lines and related infrastructure and services in the Central City and other multi-modal districts.

Policy M 4.2.1: Accommodate All Users. The City shall ensure that all new roadway projects and any reconstruction projects designate sufficient travel space for all users including bicyclists, pedestrians, transit riders, and motorists except where pedestrians and bicyclists are prohibited by law from using a given facility.

Policy M 4.2.2: Pedestrian- and Bicycle-Friendly Streets. In areas with high levels of pedestrian activity (e.g., employment centers, residential areas, mixed-use areas, schools), the City shall ensure that all street projects support pedestrian and bicycle travel. Improvements may include narrow lanes, target speeds less than 35 miles per hour, sidewalk widths consistent with the Pedestrian Master Plan, street trees, high-visibility pedestrian crossings, and bikeways (e.g. Class II and Class III bike lanes, bicycle boulevards, separated bicycle lanes and/or parallel multi-use pathways).

Policy M 4.2.5: Multi-Modal Corridors. Consistent with the Roadway Network and Street Typologies established in this General Plan, the City shall designate multi-modal corridors in the Central City, within

and between urban centers, along major transit lines, and/ or along commercial corridors appropriate for comprehensive multimodal corridor planning and targeted investment in transit, bikeway, and pedestrian path improvements if discretionary funds become available.

Policy M 4.4.4: Traffic Signal Management. To improve traffic flow and associated fuel economy of vehicles traveling on city streets, the City shall synchronize the remaining estimated 50 percent of the city's eligible traffic signals by 2035, while ensuring that signal timing considers safe and efficient travel for all modes.

Policy M 5.1.2: Appropriate Bikeway Facilities. The City shall provide bikeway facilities that are appropriate to the street classifications and type, number of lanes, traffic volume, and speed on all rights-of-way.

Policy M 5.1.3: Continuous Bikeway Network. The City shall provide a continuous bikeway network consisting of bike-friendly facilities connecting residential neighborhoods with key destinations and activity centers (e.g., transit facilities, shopping areas, education institutions, employment centers).

Policy M 5.1.5: Motorists, Bicyclists, and Pedestrian Conflicts. The City shall develop safe and convenient bikeways, streets, roadways, and intersections that reduce conflicts between bicyclists and motor vehicles on streets, between bicyclists and pedestrians on multi-use trails and sidewalk, and between all users at intersections.

Policy M 5.1.6: Connections between New Development and Bicycle Facilities. The City shall require that new development provides connections to and does not interfere with existing and proposed bicycle facilities.

Policy M 5.1.7: Bikeway Requirements. The City shall provide bike lanes on all repaved and/ or reconstructed arterial and collector streets to the maximum extent feasible. The appropriate facility type for each roadway segment shall be consistent with the Roadway Network and Street Typologies defined in this General Plan.

Central City Specific Plan

In April of 2018, the City of Sacramento adopted the Central City Specific Plan (CCSP) that establishes a future vision for the Sacramento Central City area, which includes the site of the proposed project. The following policies from the CCSP Mobility section apply to this study.

Policy M.1.1 Neighborhood Connections. Improve connections between the Central City and surrounding neighborhoods, especially for walking, bicycling, and transit trips.

Policy M.1.2 Commercial Corridors. Enhance commercial corridors for safe walking and bicycling while accommodating both through and local traffic.

Policy M.1.3 Grid Connectivity. Preserve and enhance the high level of connectivity provided by the street grid for all travel modes.

Policy M.1.4 Curb Cuts for Driveways. Discourage new curb cuts for driveways for properties with adequate alley access.

Policy M.1.5 Complete Streets. Promote two-way travel, support use of smart technologies to improve mobility, support pilot projects to test out mobility options, and encourage convenient and affordable transit options.

Policy M.1.6 Riverfront Connections. Integrate the Riverfront into the grid through improved connections, emphasizing visibility, wayfinding, and enhanced pedestrian and bicycle routes that highlight the riverfront destination.

Policy M.2.1 Safe Travel Modes. Target safe mobility for all travel modes, working in concert with the Vision Zero Action Plan and the Council-adopted goal of zero traffic fatalities and serious injuries by 2027.

Policy M.2.2 Neighborhood Streets. Ensure neighborhood streets are places where people feel safe to walk and bike.

Policy M.3.1 Minimize Conflicts. Promote safety and efficiency for all travel modes by prioritizing modes by block, minimizing conflicts between competing modes on high volume (transit, bike, motor vehicle) routes.

Policy M.3.2 Balanced Network. Reduce the number of lanes dedicated to automobiles in order to regain right-of-way for other modes to balance the network

Policy M.4.1 Bicycle Network Projects and Improvements. Pursue bicycle network projects and improvements that accomplish the following objectives:

- a. Fill gaps in the existing bicycle network by adding new facilities through travel lane reductions and conversions.
- b. Provide new buffered and/or protected bike lanes.
- c. Complete the bicycle network between the Sacramento and American Rivers consistent with adopted plans.
- d. Establish a more complete Low Stress Bicycle Network with appropriate crossing treatments at high volume streets.

Policy M.5.1 Pedestrian Network Projects and Improvements. Pursue pedestrian network projects and improvements that accomplish the following objectives:

- a. Streetscape projects for commercial/transit streets to improve conditions for walking.
- b. Improve connections between the Central City and surrounding neighborhoods (“Connector Street Enhancements”).
- c. Provide new sidewalks where they don’t currently exist (“Gap Projects”).
- d. Increase sidewalk capacity in areas with high pedestrian volumes (“Activity Center Enhancements”).
- e. Shaded sidewalks and improved street lighting.

Policy M.5.2 Walkability. Preserve a high level of walkability across the grid by minimizing pedestrian delay at intersections.

Policy M.6.1 Transit Connectivity. Promote transit connectivity with transit stops and stations that facilitate attractive and convenient transfers between light rail, streetcar, bus services, and that support active transportation connections.

Policy M.6.2 Regional Transit Hub. Preserve and strengthen the role of the Central City as the hub of the regional transit system.

Policy M.6.3 Transit Network Expansion. Support transit network expansion and improvement and coordinate transit planning and operations between transit operators serving the Central City.

Policy M.6.4 Streetcar. Promote visibility and access to the streetcar line, light rail stations and other key public transit facilities through enhanced pedestrian and bicycle connections, lighting, and wayfinding signage.

Policy M.6.5 Transit Vehicle Movement. Prioritize transit vehicle movement over the private automobile on blocks with high transit vehicle volumes, high transit ridership, or high levels of transit delay, implementing exclusive lanes and priority signalization per the preferred transit network (Figure 3.9-2).

Policy M.6.7 Transit Stop Structures. Ensure that transit stop structures are transparent to provide visibility to and support vibrant and inviting storefronts.

Policy M.6.8 Streetcar Station Design. Ensure streetcar station design that provides a comfortable environment for waiting passengers without compromising the pedestrian and bicycle travel way. A clear pedestrian path should be available when transit is present.

Policy M.6.9 Sidewalks as Streetcar Station Platforms. Allow sidewalks to serve as station platforms provided that the needs of both the streetcar passengers and pedestrians not utilizing the streetcar service are reasonably accommodated.

Policy M.6.10 On-Street Parking Minimization. Locate streetcar stops and design length of streetcar platforms that minimize reduction of on-street parking where possible.

Policy M.6.11 Access to Transit Stations. Support safe and convenient pedestrian and bicycle access to/from light rail and streetcar stations while minimizing conflicts between travel modes.

Policy M.7.1 High Speed Rail. Advance City engagement with high speed rail planning, emphasizing integration with other transportation modes in the Central City.

Policy M.7.2 Rail Stations. Partner with transit agencies in the planning and development of appropriate rail stations, in conjunction with developing intercity rail services.

Policy M.7.3 Regional Rail. Promote the Central City as a regional rail destination connecting Sacramento with the Bay Area, the Central Valley, base of the Sierras and north.

Policy M.8.1 Minimize Impacts to On-Street Parking. Minimize impacts to on-street parking, including residential permit parking, resulting from development with reduced parking requirements.

Policy M.8.2 Electric Vehicle Parking and Charging. Ensure availability of public infrastructure for Zero Emission Vehicles to support multi-family and daytime users, including publicly accessible charging in the right-of-way.

Policy M.8.3 Flexible On-street Curb Space. Promote flexible use of on-street curb space and loading areas in commercial corridors, prioritizing different uses by time of day.

Policy M.10.1 Emerging Transportation Technologies. Support emerging transportation technologies and services to increase transportation system efficiency. Allow for flexibility in the transportation network to take advantage of alternate methods to achieve mobility goals.

Policy M.10.2 Zero-emission and Low-emission Vehicles. Continue to collaborate with State and regional partners to support rapid adoption of zero-emission and low-emission vehicles, which involves the following objectives:

- a. Standardizing infrastructure and regulations for public EV charging stations.
- b. Developing guidelines and standards for dedicated and preferential parking for zero- and low-emission vehicles (including charging stations for plugin EVs, where necessary).

- c. Expanding access to zero emission transportation for multifamily and low income households
- d. Allowing a diversity of business models and approaches to enable zero emission technology (such as free chargers operated by a third party, pay to charge installations, etc.)

Policy M.10.3 Evolving Technologies and Transportation Platforms. Monitor evolving technologies and transportation platforms, such as transportation network companies and autonomous vehicles, and adapt plans and standards to accommodate emerging technologies as appropriate.

Policy M.10.4 Adaptable Transportation Design. Encourage adaptable transportation design, allowing for future reuse of such facilities as parking garages as well as conversion of on-street parking to loading zones for pick-up/drop-off activities.

Policy M.10.5 Intelligent Transportation System (ITS measures). Develop an ITS Master Plan and implement ITS technologies to improve signal timing and efficiency to improve traffic operations and improve the overall mobility system.

I-5 Freeway Subregional Corridor Mitigation Program

The I-5 Freeway Subregional Corridor Mitigation Program (SCMP) is a voluntary development impact fee for new developments within the I-5 corridor between Elk Grove, Downtown Sacramento, and West Sacramento that is intended to be used to construct a set of transportation improvements identified in the SACOG 2016 MTP/SCS. Under the SCMP, a project applicant whose project would generate vehicle trips over the threshold could choose to either pay the fee, which would constitute mitigation of their development project's impacts on the freeway mainline, or conduct a Traffic Impact Study, which would evaluate that project's impact on the freeway system and identify mitigation for those impacts.

According to the Draft Final Nexus Study for the I-5 Freeway Subregional Corridor Mitigation Program (DKS Associates, January 2016), the following roadway improvements would be partially funded by the plan (with the remainder coming from other sources):

- extension of light rail from the Township 9/Richards station to Natomas Center,
- new bridge across the American River,
- two new bridges across the Sacramento River,
- reconstruction of I-5/Richards Boulevard Interchange,
- construction of HOV lanes on I-5 from Elk Grove to US 50, and
- construction of a transition lane on I-5 between the Garden Highway off- and on-ramps.

Page 36 of the study specifies that “Caltrans would consider the fees as an adequate mitigation for freeway mainline impacts.” Table 18 on Page 32 of the Nexus Study shows the proposed fee per dwelling unit, and per thousand square feet of non-residential space.

Significance Criteria

In accordance with CEQA, the lead agency evaluates the effects of a proposed project to determine if they could result in significant adverse impacts on the environment. The standards of significance in this analysis are based upon the thresholds found in the City of West Sacramento's 2035 General Plan and the City of Sacramento's 2035 General Plan. For the purposes of this analysis, an impact is considered significant if implementation of the project would result in any of the following:

Roadway Facilities

In West Sacramento, impacts to the roadway system (intersections and roadway segments) would be significant if:

- traffic generated by the project degrades the overall roadway system operation to the extent that the project would not be consistent with City of West Sacramento General Plan Policy M-3.2 related to the City's allowable Level of Service; or
- traffic generated by the project would cause the average vehicle delay to increase by more than five seconds at an intersection operating at an unacceptable LOS without the project.

All study roadway facilities within West Sacramento are in the pedestrian oriented, high density, mixed use area planned for the Pioneer Bluff area, under which LOS E is acceptable.

In Sacramento, impacts to the roadway system (intersections and roadway segments) would be significant if:

- traffic generated by the project degrades the overall roadway system operation to the extent that the project would not be consistent with City of Sacramento General Plan Policy M 1.2.2 relating to the City's allowable Level of Service; or
- traffic generated by the project substantially degrades operation of intersections and roadway segments, despite compliance with General Plan policies.

All study intersections within Sacramento are in the Core Area, under which LOS F is acceptable during peak hours, provided the project contribute other acceptable improvements to transportation-system-wide roadway capacity, intersections, or non-auto travel modes in furtherance of General Plan goals. Road widening or other improvements to road segments are not required.

In urban environments, such as the study area, roadway capacity is governed by the operations of intersections. For this reason and because roadway segments were included in the traffic analysis for the

2035 General Plan, the City of Sacramento determines impacts to the roadway system based upon the operations of intersections. Therefore, the roadway capacity utilization results contained in this report are for information purposes only, and not utilized for impact analysis.

Freeway Facilities

Impacts to the freeway system would be significant if:

- The project traffic causes off-ramp traffic to queue back to beyond the freeway gore point, or worsens an existing/projected queuing problem on a freeway off-ramp.

Bicycle and Pedestrian Facilities

Impacts to bicycle facilities are considered significant if the project would:

- adversely affect existing or planned bicycle or pedestrian facilities, or
- fail to adequately provide for access for bicyclists or pedestrians bicycle.

Transit Facilities

Impacts to the transit system would be significant if the project would:

- adversely affect public transit operations, or
- fail to adequately provide access to transit.

Vehicle Miles Traveled

Impacts related to VMT would be considered significant if the project would:

- substantially increase VMT per service population (total residents and employees) within the SACOG region.

Existing Plus Project Conditions

This section details the effects of the proposed project on the existing transportation infrastructure.

Traffic Forecasts

The SACMET regional travel demand model, developed and maintained by SACOG, was used to forecast expected changes in daily traffic and peak hour turning movement volumes under Existing Plus Project conditions. Modifications to the base year model were made as part of this project to enhance the ability to accurately forecast changes to travel patterns in the study area, which represents a sub-area of the SACOG region, described as follows:

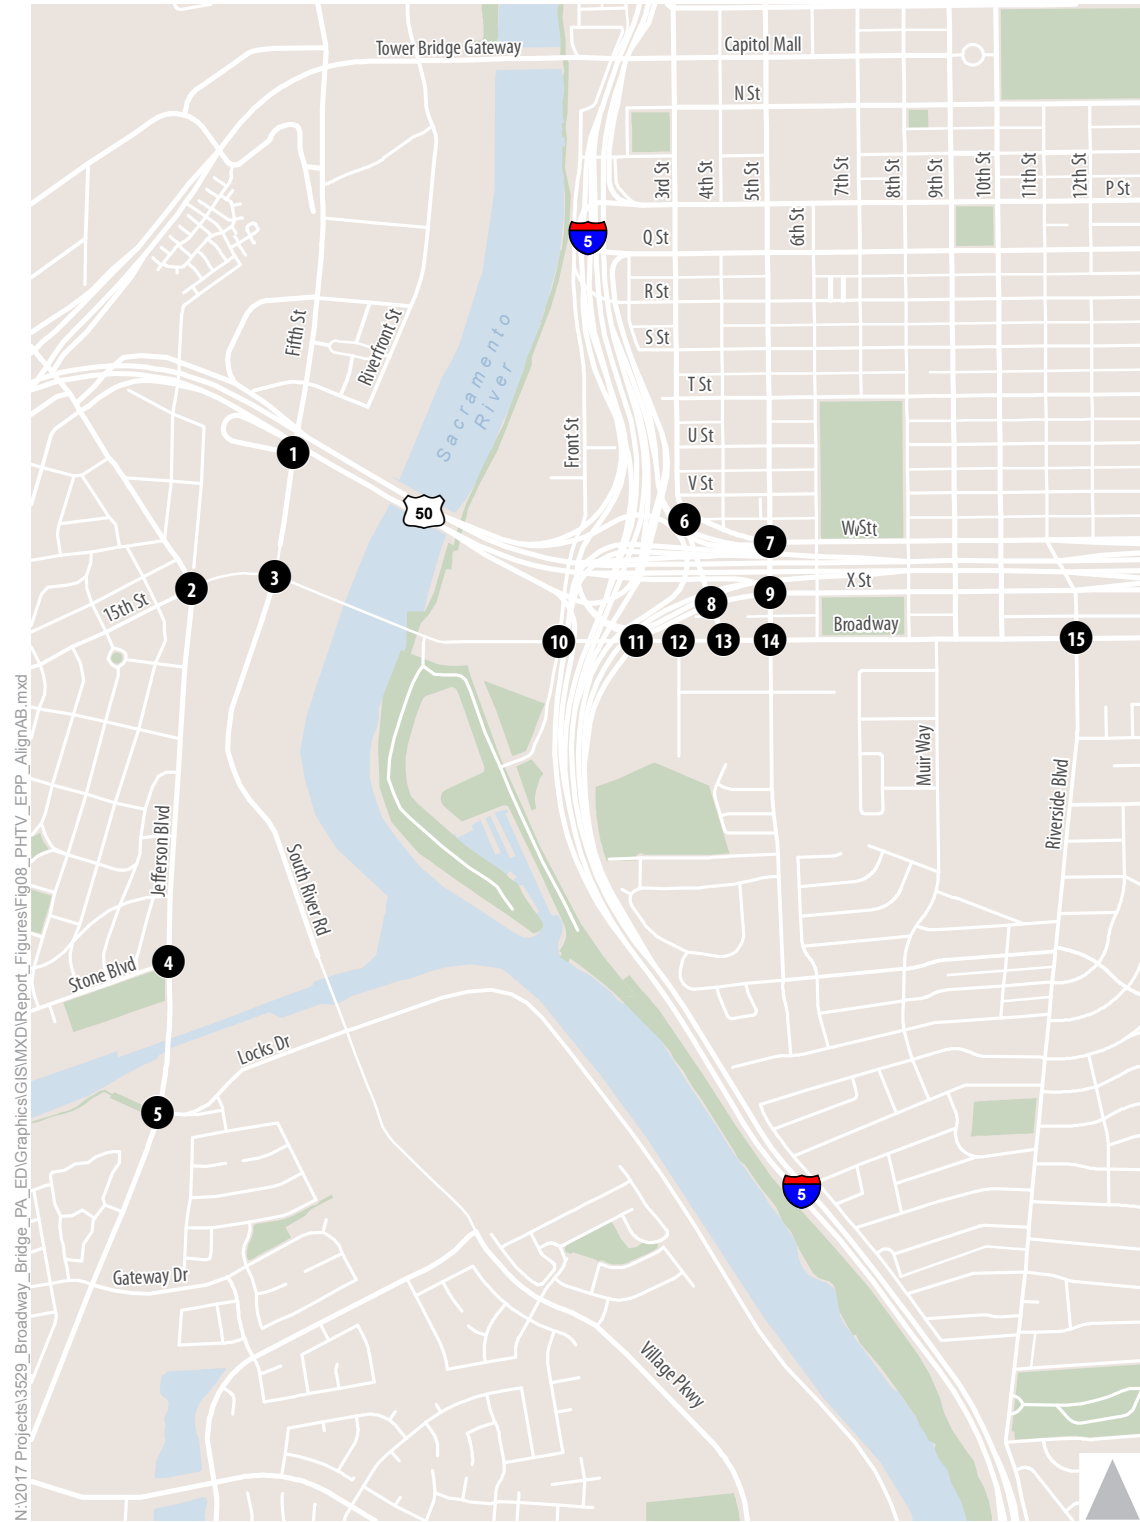

- Additional Land Use Detail – Transportation analysis zones (TAZs) were added to the model to allow for more accurate loading of trips to the transportation network.
- Refined TAZ Loading – Connections between the TAZ network and the transportation network were reviewed and adjusted as necessary to ensure that trips accurately loaded onto the transportation network.
- Additional Transportation Network Detail – Detail was added to the transportation network to account for all study roadways and intersections.
- Transportation Network Coding – The coding of attributes in the model transportation network was reviewed for accuracy and adjusted as appropriate.

The proposed Broadway Bridge was then added to the base year model. The traffic forecasting procedure known as the “difference method” calculation was used to develop the Existing Plus Project forecasts. The procedure adds the difference in traffic between the base year model without and with the project to the existing traffic counts, as displayed below:

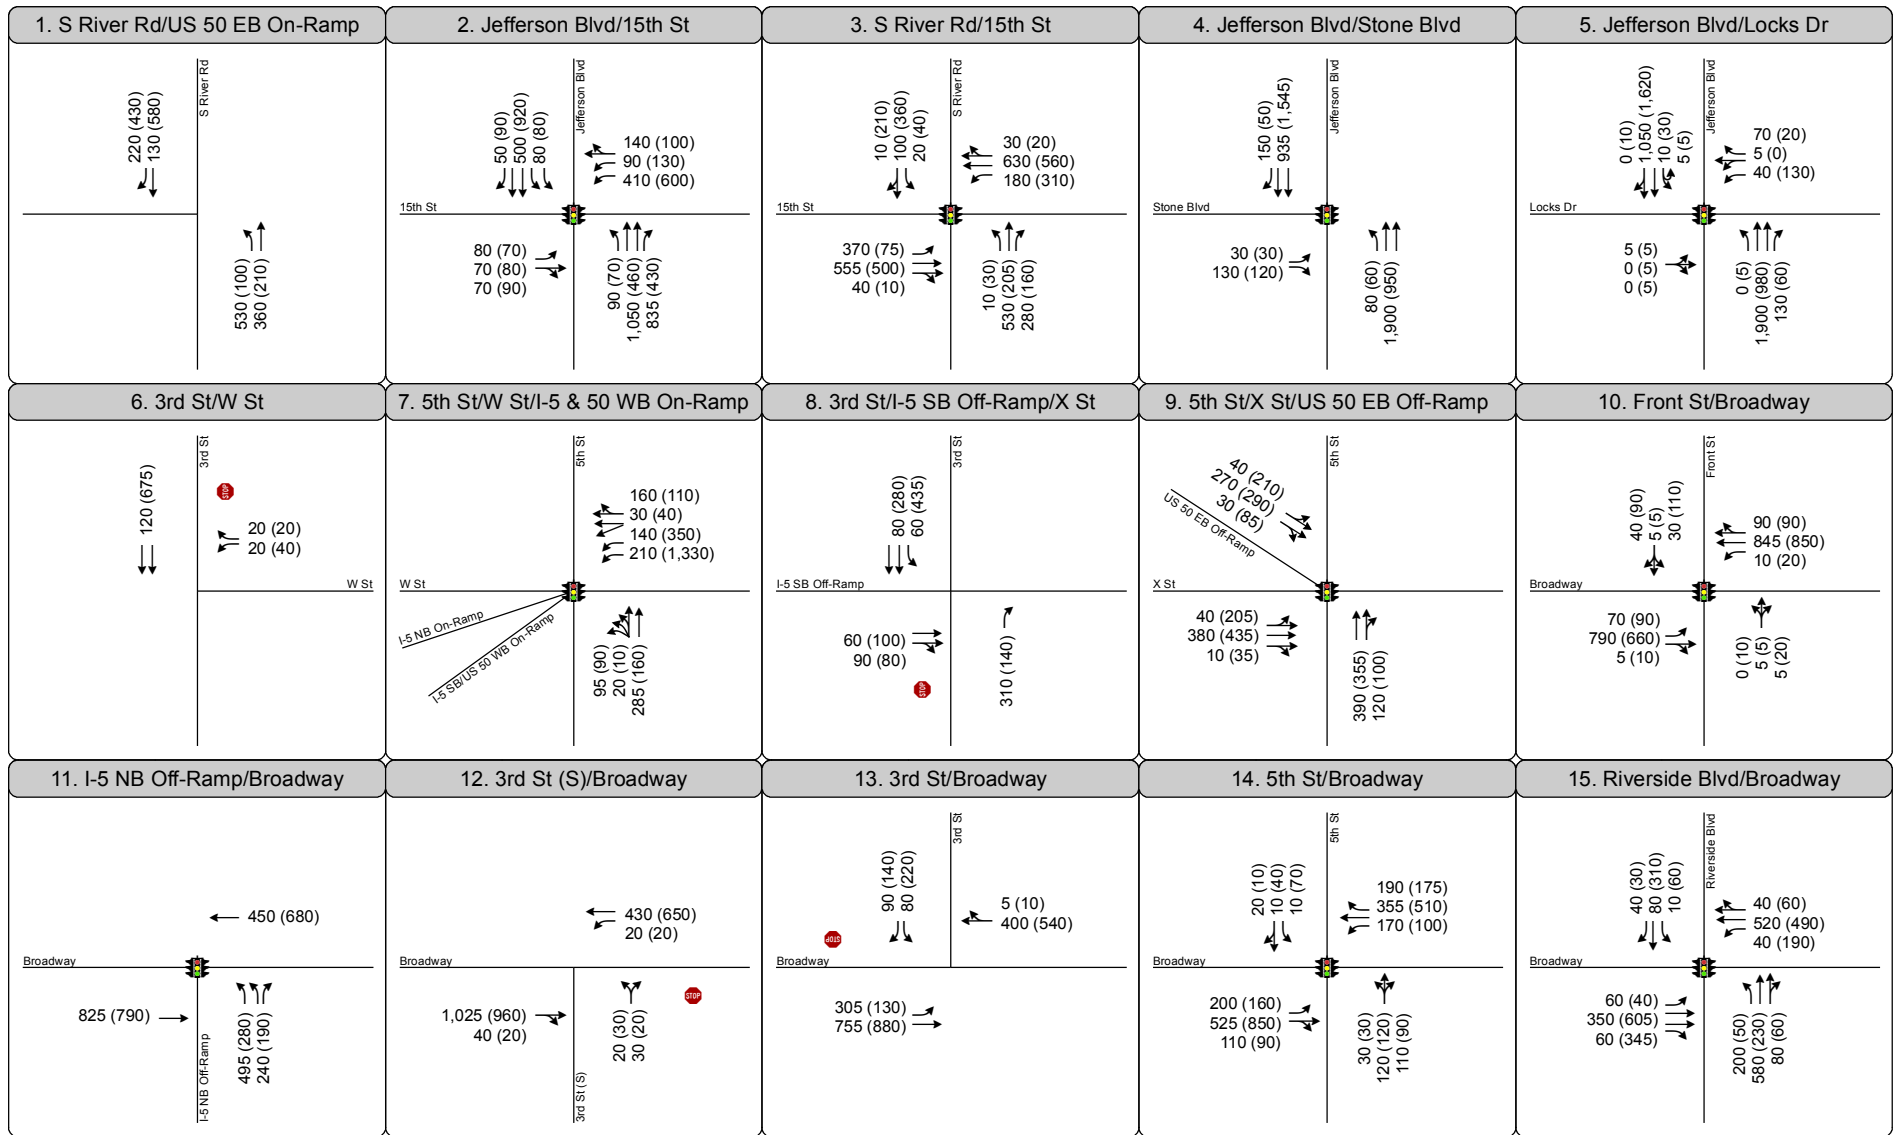

$$\text{Existing Plus Project Forecast} = \text{Existing Volume} + (\text{Base Model} \\ \text{Plus Project} - \text{Base Model})$$

Project Impacts to Intersection Operations

Figures 8, 9, and 10 show the AM and PM peak hour turning movement volumes at the study intersections under Existing Plus Project conditions, with Bridge Alignment A/B, C, and D respectively.

1 Study Intersection

- Turn Lane
- AM (PM) Peak Hour Traffic Volume
- Traffic Signal
- Stop Sign

Figure 10
Peak Hour Traffic Volumes
and Lane Configurations -
Existing With Bridge Alignment D Conditions

As displayed in Table 10, all intersections operate acceptably at LOS E or better under Existing Conditions and continue to operate acceptably under Existing Plus Project conditions for each bridge alignment alternative. Therefore, implementation of the project would not result in impacts to study intersections under each bridge alignment alternative. The level of service results are also displayed in Figures 11, 12, and 13 for each of the with bridge alignment alternatives.

Existing with Bridge Alignment A/B

The addition of the bridge eases queuing leading up to the South River Road / US 50 Eastbound On-Ramp; however, at the South River Road / 15th Street intersection, where the bridge approach is located on West Sacramento for this alignment, the added signal phases and cycle length associated with the addition of the fourth intersection leg (Broadway Bridge) creates additional delay; however, still within acceptable LOS E. Also, with the bridge there is an increase in delay along Broadway, but less traffic utilizing the freeway and passing through the ramp terminal intersections. This alternative would create a **less-than-significant** impact to intersection operations under Existing Plus Project conditions.

Existing with Bridge Alignment C

The bridge creates a T-intersection with South River Road (Intersection 16 – South River Road / Broadway), with the intersection operating at LOS D under both the AM and PM peak hours. Similar increases in delay occur along Broadway, and decrease at the ramp terminal intersections, compared to Alignment A/B. This alternative would create a **less-than-significant** impact to intersection operations under Existing Plus Project conditions.

Existing with Bridge Alignment D

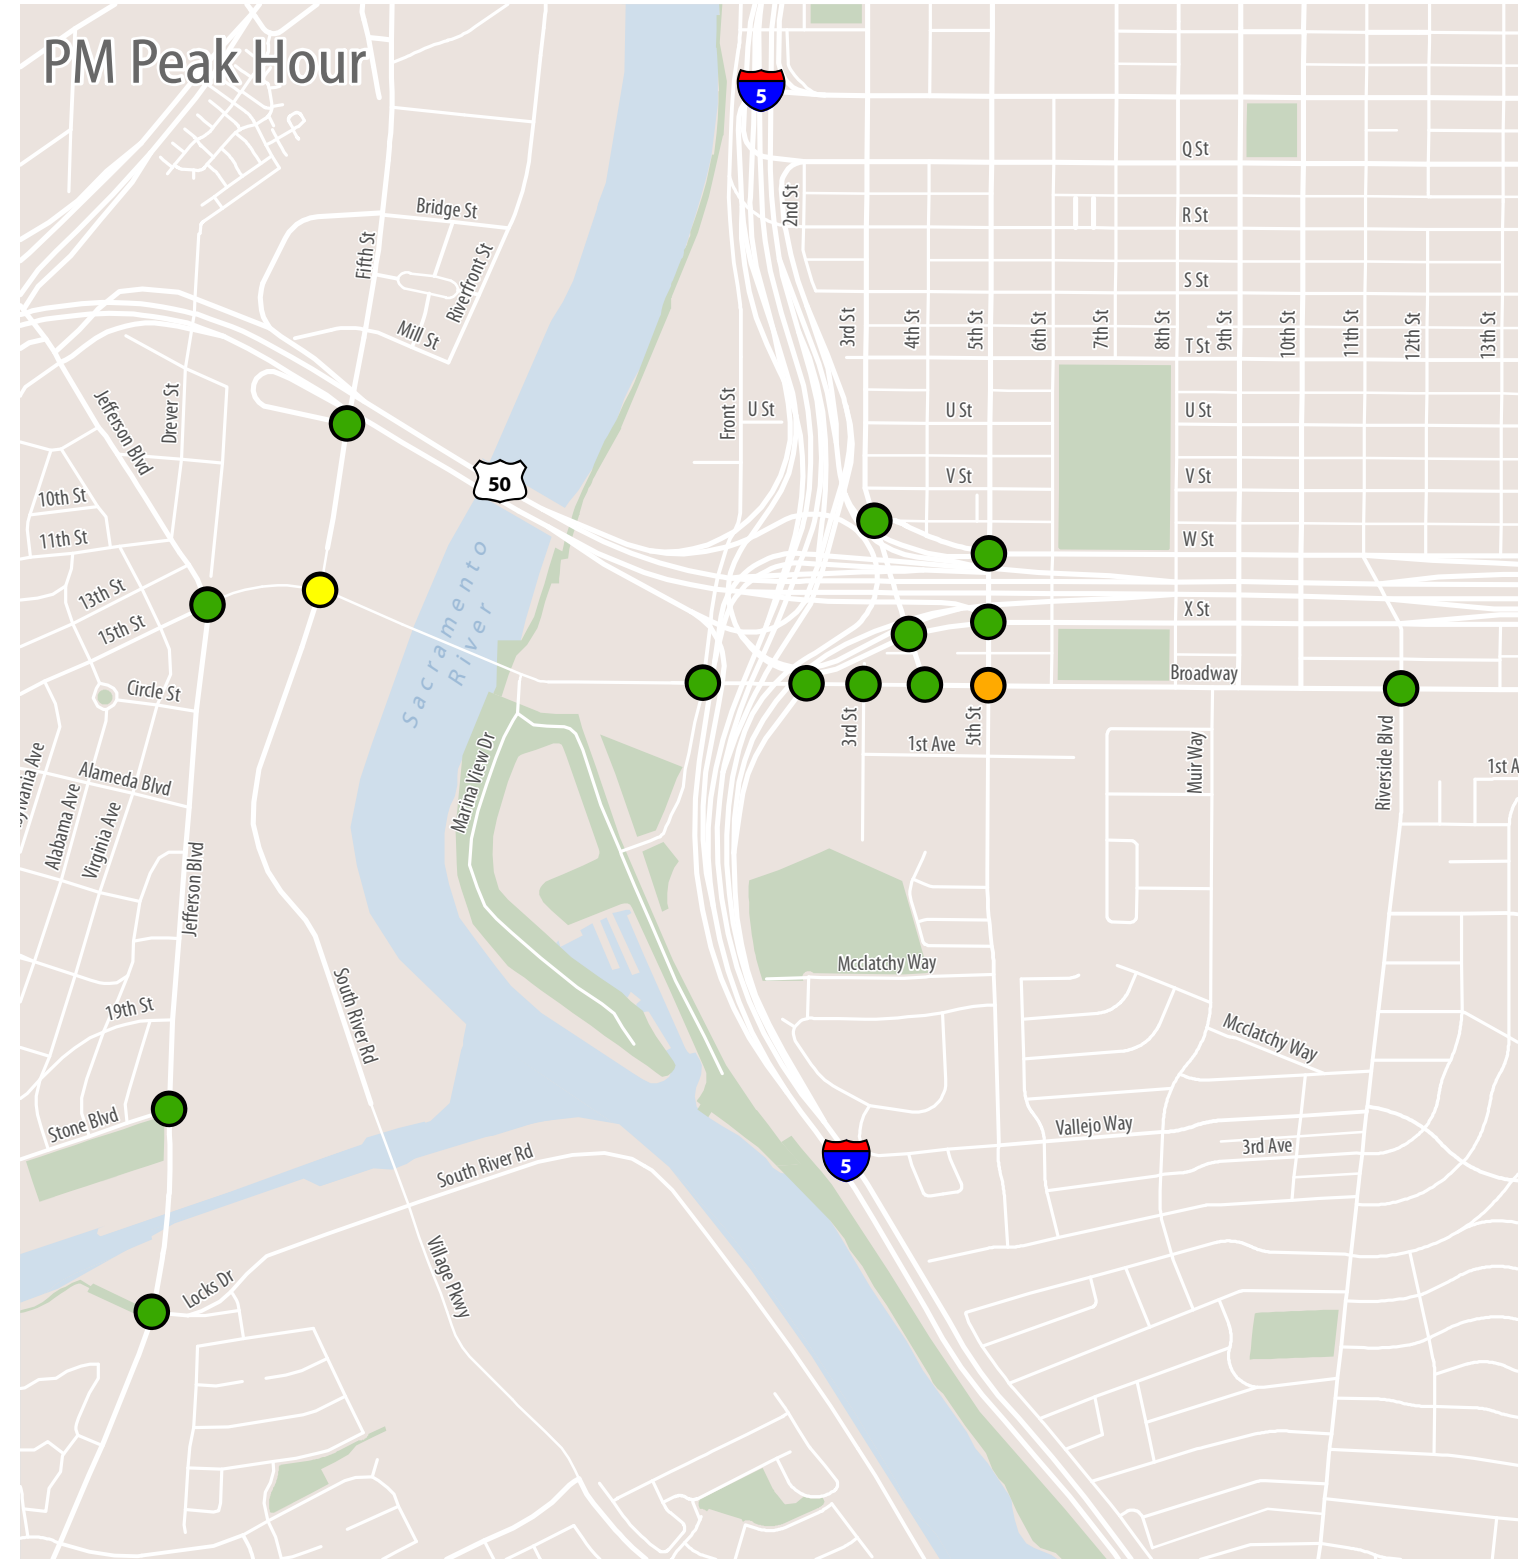

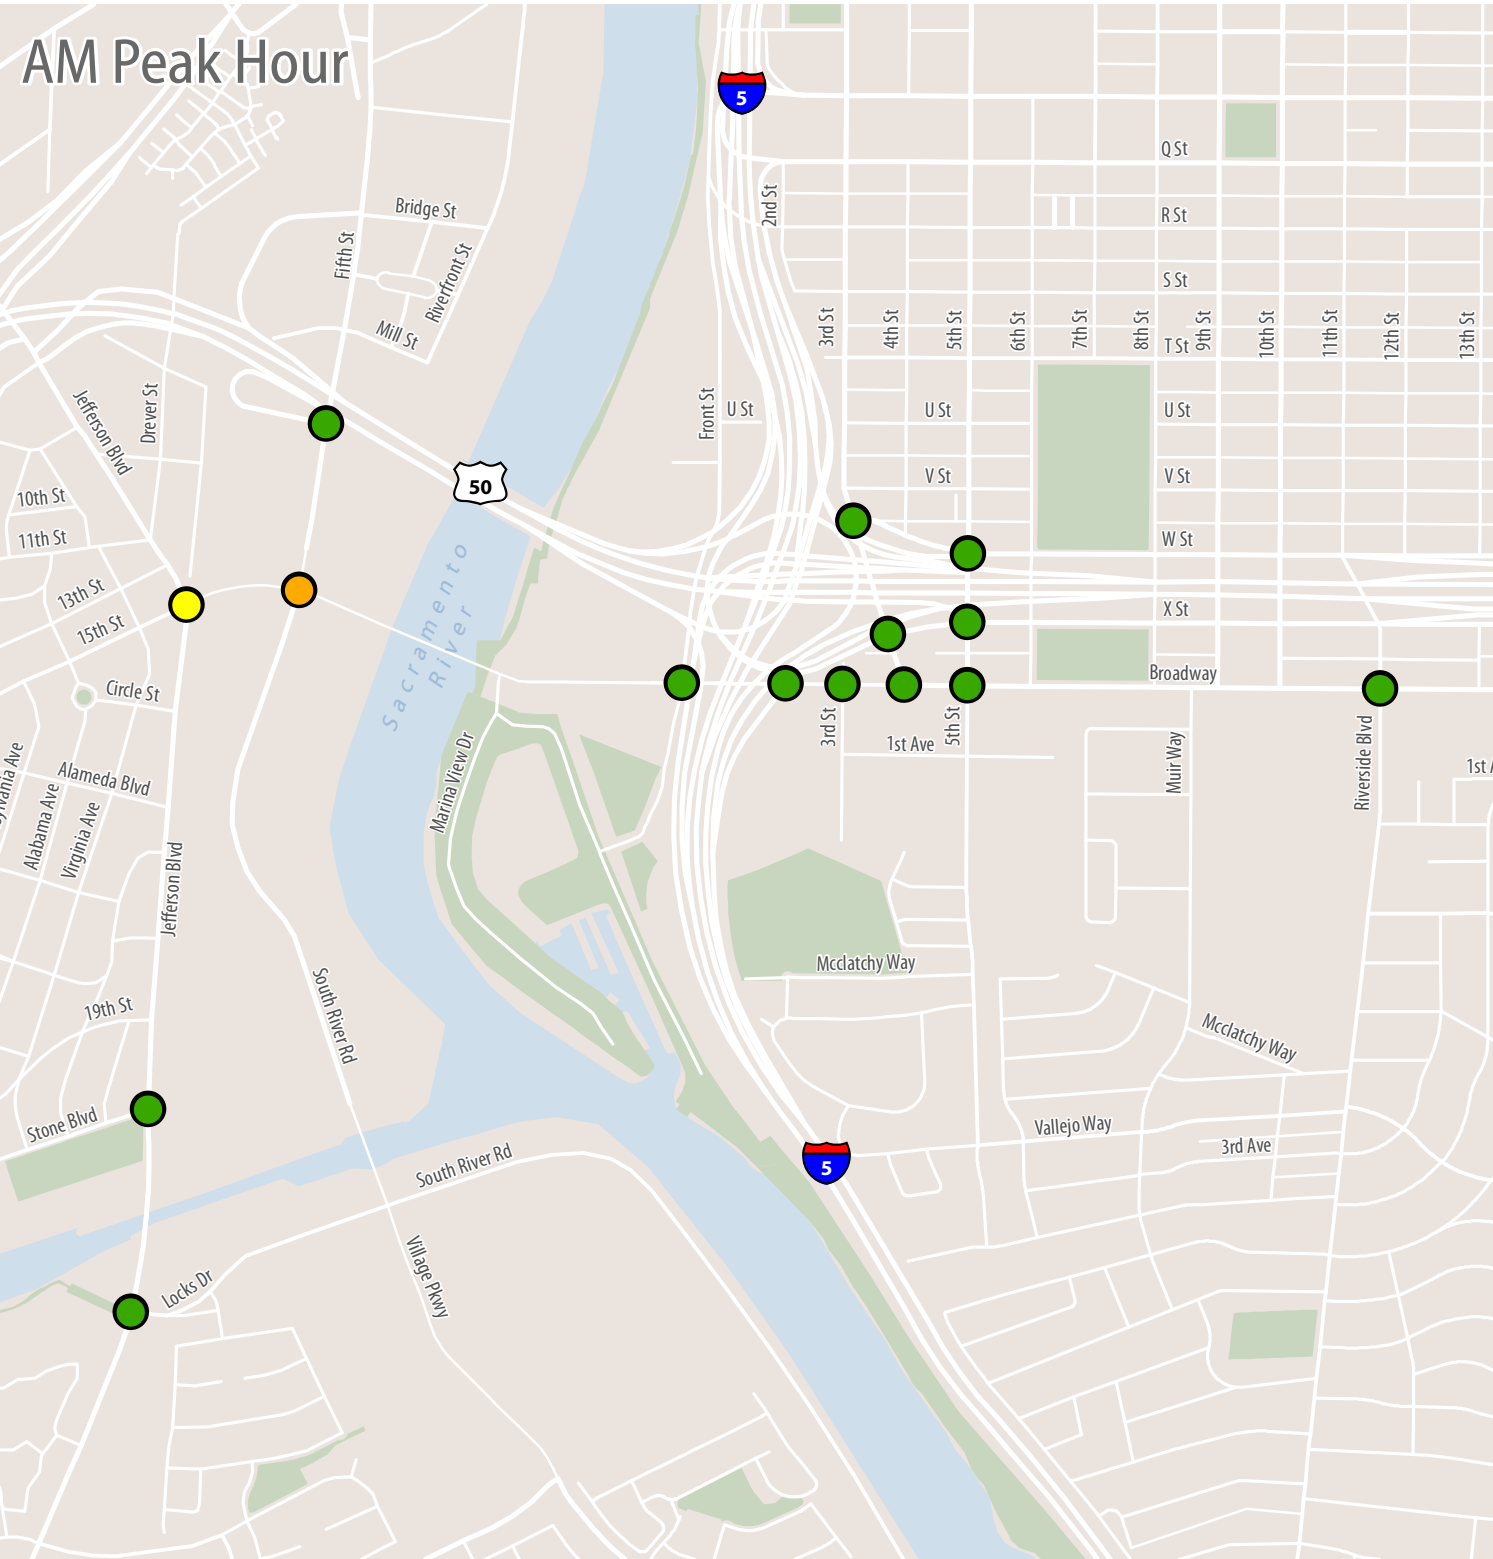

The bridge approach would create two closely spaced intersections of Jefferson Boulevard / Circle Street (Intersection 17) and South River Road / Circle Street (Intersection 18), which would introduce conflicting turning movements that increase the level of delay in this area; however, still operating within acceptable LOS. This alternative would create a **less-than-significant** impact to intersection operations under Existing Plus Project conditions.

Table 10: Intersection Operations – Existing Plus Project

ID	Intersection	Jurisdiction	Control Type	Peak Hour	Existing Conditions		Existing Plus Project

Project Impacts to Freeway Off-Ramp Queuing

Table 11 displays the freeway off-ramp queuing under Existing Plus Project conditions with each bridge alignment alternative.

ID	Location	Available Storage	Peak Hour	Existing Conditions	Existing Plus Project		
					Bridge Alignment A/B	Bridge Alignment C	Bridge Alignment D
					Queue	Queue	Queue
1	I-5 SB Off-Ramp at 3rd St./X St.	1,150	AM	75	75	75	75
			PM	75	75	100	100
2	US 50 EB Off-Ramp at 5th St./X St.	1,300	AM	175	75	75	75
			PM	250	125	175	150
3	I-5 NB Off-Ramp at Broadway	1,000	AM	75	175	175	175
			PM	75	150	150	150

Notes: The available storage length for off-ramp queuing is measured from the noted off-ramp terminal intersection to the freeway off-ramp gore point. Maximum queue length is based upon output from SimTraffic microsimulation software.
Source: Fehr & Peers, 2020

As shown, the inclusion of the bridge would not drastically change queuing at the freeway off-ramps in the study area. The bridge would shift some traffic off of utilizing the freeway facility; thereby, generally decreasing off-ramp queuing. Still, all queues would remain within the available storage capacity for each off-ramp for all of the bridge alignment alternatives under Existing Plus Project; therefore, this would be a **less-than-significant** impact.

Project Impacts to Roadway Operations

Table 12 shows the daily roadway segment volumes, and Table 13 presents the daily roadway segment operations analysis results under Existing Plus Project conditions. All roadway segments would continue to operate within acceptable LOS. Notably, the inclusion of the bridge, for all alignment alternatives, would reduce traffic on Jefferson Boulevard north of 15th Street; thereby, lowering the delay on that roadway segment on a daily basis. Roadway capacity utilization results contained in this section are for information purposes only, and not utilized for impact analysis.

Table 12: Daily Roadway Segment Volumes – Existing Plus Project

Notes: LOS = Level of Service. V/C = Volume to Capacity Ratio
Source: Fehr & Peers, 2020

Project Impacts to Bicycle Facilities

Broadway bridge will include Class II on-street bike lanes. In addition, the bridge will feed into a planned Class I trail along the Sacramento River on the West Sacramento side, and into the existing Class I trail on the Sacramento side. The bridge, for all alignments, would not interfere with existing or planned bicycle facilities; therefore, would have a **less-than-significant** impact to bicycle facilities.

Project Impacts to Pedestrian Facilities

Broadway bridge will include sidewalks, provide access for pedestrians crossing along the bridge. In addition, the bridge would not impede in sidewalks planned along the bridge approach in West Sacramento as part of development in the Pioneer Bluff area, or in Sacramento along Broadway. Therefore, for all alignments, the bridge would have a **less-than-significant** impact to pedestrian facilities.

Project Impacts to Transit Facilities

Since all intersections would operate acceptably under Existing Plus Project conditions for each bridge alignment, the proposed project would not adversely affect transit operation or access to transit facilities. Additionally, the bridge will be designed to accommodate buses; thereby providing an alternative for future bus route realignment or expansion. Plus, the bridge will be designed to accommodate a potential future streetcar line. Therefore, the project would create a **less-than-significant** impacts to transit facilities.

Project Impacts to Vehicle Miles of Travel (VMT)

Table 14 displays the daily vehicle miles of travel under Existing Conditions and each Existing With Bridge Alignment alternative for all trips in the Sacramento Region, analyzed using the SACMET regional travel demand model. Under this scenario, travel patterns are not expected to change drastically; therefore, all With Bridge Alignment alternatives under Existing Plus Project conditions are analyzed as “assignment only” with the same trip distribution patterns as under Existing Conditions.

Scenario	Regional Daily VMT Total	Difference (From Existing)
Existing Conditions	55,823,950	--
Existing With Bridge Alignment A/B	55,816,069	-7,882
Existing With Bridge Alignment C	55,820,862	-3,088
Existing With Bridge Alignment D	55,805,532	-18,418

Source: Fehr & Peers, 2020

In the short-term, the only travel pattern change is the route that vehicle trips take between existing origins and destinations. Therefore, the bridge reflects the opening of a shorter route for existing trips, which is reflected in that all bridge alignment alternatives represent lower daily regional VMT than Existing Conditions.

Opening Year 2030 Conditions

This section describes the anticipated travel conditions under opening year (2030) conditions for the roadway, bicycle, pedestrian, and transit systems. The effect of the proposed project on opening year conditions is measured to identify potential cumulative impacts and recommend further improvements to the transportation infrastructure.

Traffic Forecasts

Opening Year 2030 traffic forecasts were developed using the SACMET regional travel demand model. The model was developed with a linear interpolation of land use growth within the Sacramento region in place by 2030, and specific land use growth assumed for the Pioneer Bluff area as identified by the City of West Sacramento planning staff. The model also assumes roadway infrastructure projects expected to be completed by 2030, as identified by SACOG in the Metropolitan Transportation Plan and Sustainable Communities Strategy (MTP/SCS). Key roadway network improvements include:

- Extensions of Alameda Boulevard and Stone Boulevard between Jefferson Boulevard and South River Road, and widening of South River Road to four lanes from the US 50 ramps to 15th Street in West Sacramento
- Grid 3.0 network changes within Downtown Sacramento
- I-80 HOV lanes from Davis to I-5
- I-5 HOV lanes through Downtown Sacramento

The traffic forecasting procedure known as the “difference method” calculation was used to develop the Opening Year forecasts. The procedure adds the difference in traffic between the base year and opening year model to the existing traffic counts, as displayed below:

$$\text{Opening Year Forecast} = \text{Existing Volume} + (\text{Opening Year Model} - \text{Base Model})$$

The roadway network, including number of lanes and directions, assumed in place by Opening Year (2030) conditions is displayed in Figure 14.

Opening Year No Build

All study intersections operate within acceptable LOS under Opening Year No Build conditions.

Growth in land use in West Sacramento south of the study area adds traffic to Jefferson Boulevard and South River Road, especially northbound on both roadways during the morning commute, and southbound during the afternoon/evening commute. Higher congestion occurs at Jefferson Boulevard / Alameda Boulevard with the addition of the Alameda Boulevard extension to South River Road. The close spacing with the intersection of South River Road / Alameda Boulevard creates minimal storage for turning vehicles to queue without blocking through movements.

In Sacramento, the overall growth in traffic and addition of the 5th Street roadway conversion to two-way, creates added congestion along the roadway, notably in the PM peak hour at the ramp terminal intersections.

Opening Year with Bridge Alignment A/B

All study intersections operate within acceptable LOS under Opening Year with Bridge Alignment A/B conditions. The inclusion of the bridge eases northbound queueing along Jefferson Boulevard and South River Road in West Sacramento, shifting away some traffic that was destined for the US 50 ramps. This alternative would create a **less-than-significant** impact to intersection operations under Opening Year conditions.

Opening Year with Bridge Alignment C

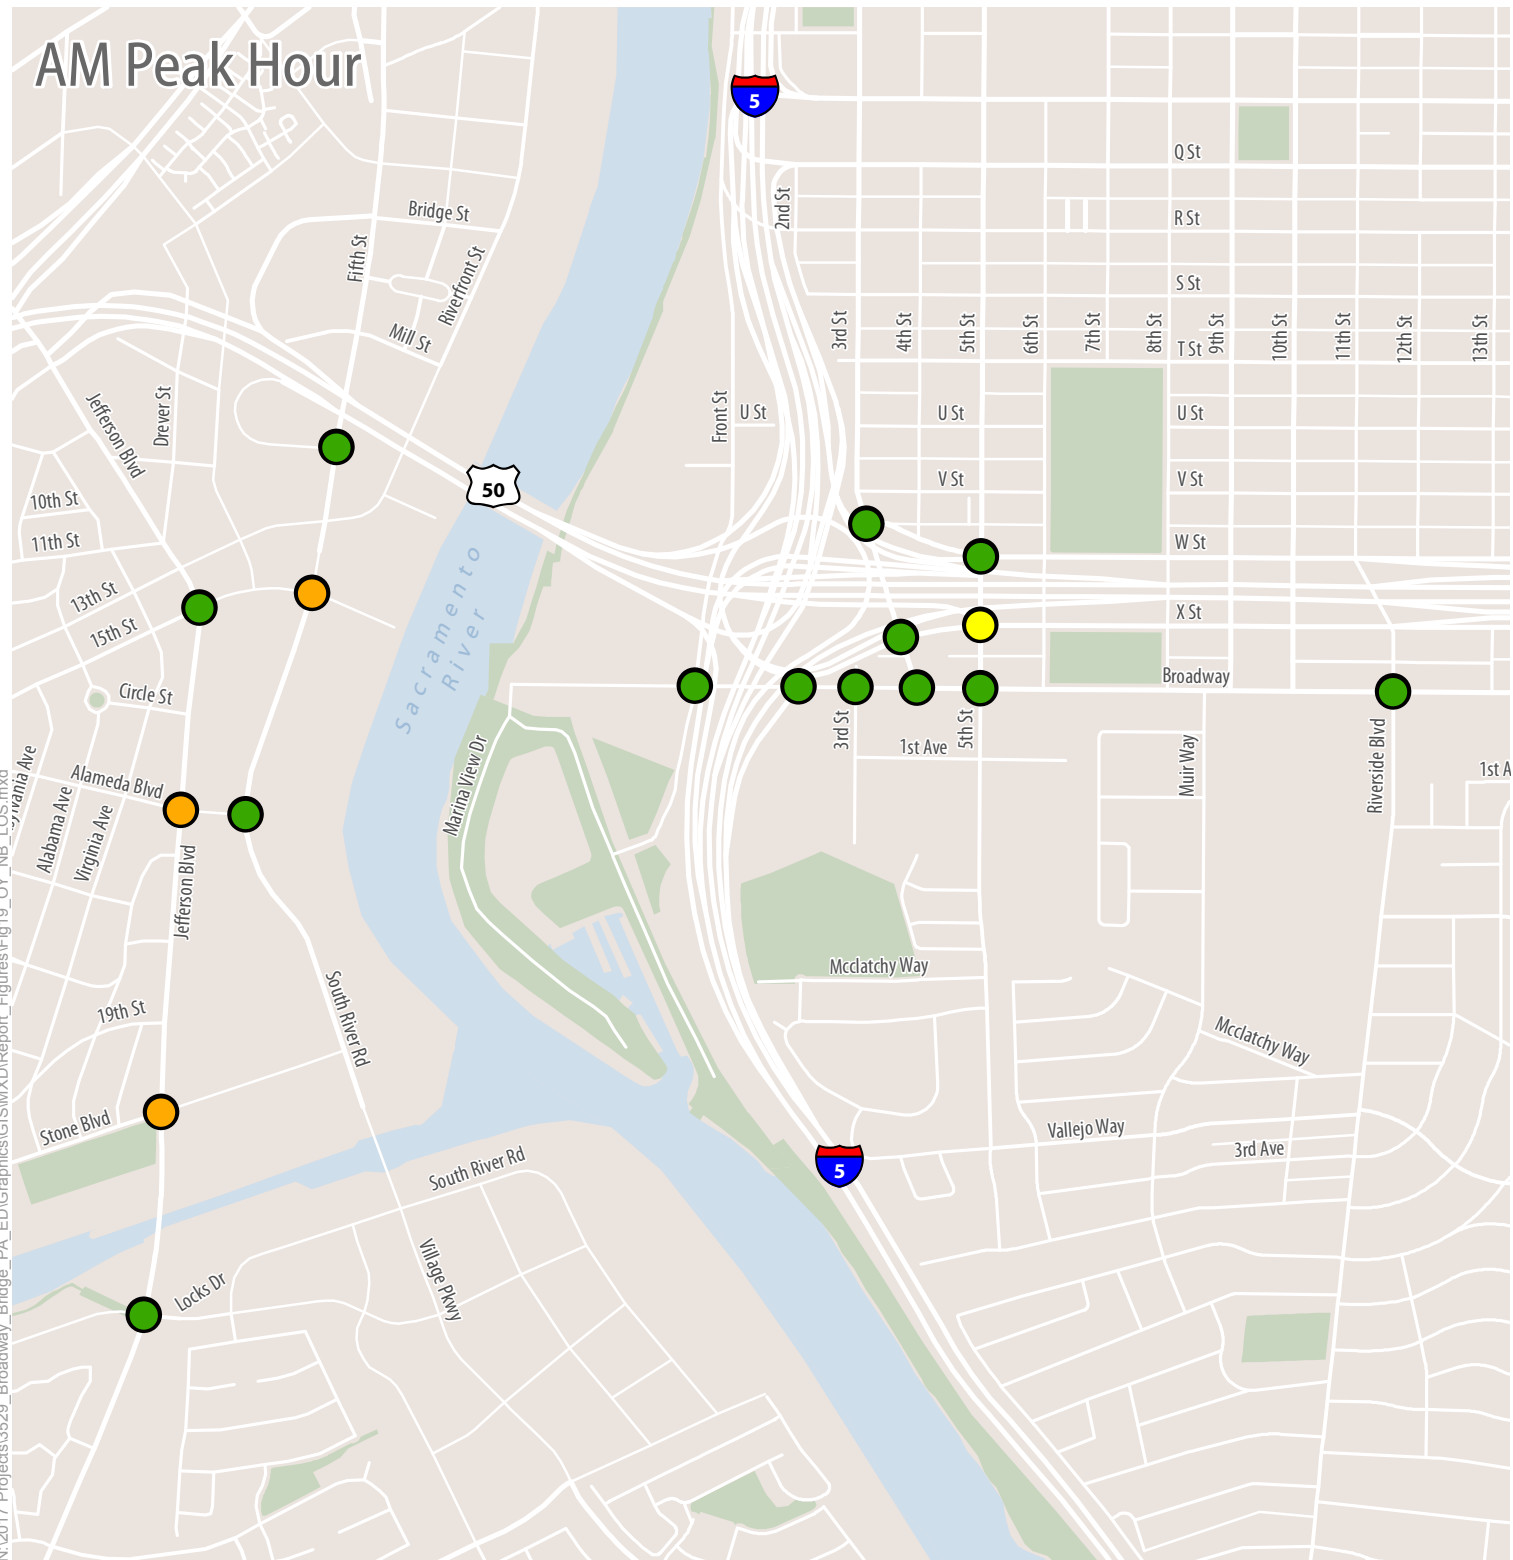

Most study intersections operate within acceptable LOS under Opening Year with Bridge Alignment C conditions, except for intersection 16 (South River Road / Broadway), intersection 17 (Jefferson Boulevard / Alameda Boulevard), and intersection 18 (South River Road / Alameda Boulevard) which operate at LOS F. This would be a **significant** impact.

Within West Sacramento, much of the travel demand for traffic crossing the bridge is destined to Jefferson Boulevard; however, considering Bridge Alignment C does not have a direct connection to Jefferson Boulevard, the demand is shifted to 15th Street and Alameda Boulevard. The closely spaced intersections of Jefferson Boulevard and South River Road with Alameda Boulevard also create limited storage for turning vehicles to queue without blocking the through movements. The high level of delay also creates westbound traffic to queue across the bridge during the both the AM and PM peak hour.

Opening Year with Bridge Alignment D

All study intersections operate within acceptable LOS under Opening Year with Bridge Alignment D. In West Sacramento, intersections operate similarly to Alignment A/B due to the direct connection of the bridge to Jefferson Boulevard via extension of Circle Street between Jefferson Boulevard and South River Road. There is moderate levels of congestion still around the bridge approach intersections around Jefferson Boulevard, South River Road, Circle Street and Alameda Boulevard due to the close spacing of the roadways creating minimal storage space for turning vehicles to queue. This alternative would create a **less-than-significant** impact to intersection operations under Opening Year conditions.

Mitigations

The following mitigations address the significant impact under Opening Year – Alignment C Conditions:

- Intersection 16 (South River Road/Broadway): extending the northbound right-turn pocket to 275 feet, and adding a second southbound left-turn lane.
- Intersection 19 (Jefferson Boulevard/Alameda Boulevard): changing the eastbound and westbound protected left-turns to permitted left-turn signal phasing.
- Intersection 20 (South River Road/Alameda): extending the northbound left-turn pocket to 175 feet, and extending the southbound right-turn pocket to 250 feet.

Table 16 shows the intersection operations under Opening Year – Alignment C conditions with mitigations in the vicinity of the impacted intersections.

ID	Intersection	Jurisdiction	Control Type	Peak Hour	Opening Year 2030					
					No Build		Bridge Alignment C		Bridge Alignment C with Mitigations	
					Delay	LOS	Delay	LOS	Delay	LOS
3	S. River Rd. / 15th St.	West Sacramento	Signal	AM	59	E	52	D	42	D
				PM	29	C	51	D	38	D
10	Broadway / Front St.	Sacramento	SSSC / Signal	AM	5 (13)	A (B)	53	D	56	E
				PM	5 (13)	A (B)	30	C	32	C
16	S. River Rd. / Broadway	West Sacramento	Signal	AM	--	--	103	F	69	E
				PM	--	--	112	F	73	E
19	Jefferson Blvd. / Alameda Blvd.	West Sacramento	Signal	AM	79	E	106	F	73	E
				PM	57	E	88	F	63	E
20	S. River Rd. / Alameda Blvd.	West Sacramento	Signal	AM	29	C	103	F	68	E
				PM	29	C	84	F	38	D

Notes: LOS = Level of Service. SSSC = Side Street Stop Controlled

For signalized and uncontrolled intersections, average intersection delay is reported in seconds per vehicle for all approaches. For SSSC intersections, the LOS and control delay for the worst movement is shown in parentheses next to the average intersection LOS and delay. Impacts to intersections are determined based on the overall LOS and average delay. All intersections were analyzed in SimTraffic.

Intersection 10 (Broadway / Front St.) is analyzed as a side street stop controlled intersection under no build conditions, and signalized under all with bridge alignment alternatives.

LOS in bold font is worse than the LOS minimum for the intersection. LOS in bold and red font is an impact. An impact is a change in LOS between No Build and Alternative scenarios from acceptable to unacceptable or a worsening of an unacceptable condition.

Source: Fehr & Peers, 2020

With the mitigations, the impacted intersections would operate within acceptable LOS, and no other study intersections would worsen to unacceptable conditions. Therefore, this would be a **less-than-significant** impact after mitigations.

Opening Year Impacts to Freeway Off-Ramp Queuing

Table 17 displays the freeway off-ramp queuing under Opening Year 2030 conditions.

ID	Location	Available Storage	Peak Hour	Opening Year 2030			
				No Build	Bridge Alignment A/B	Bridge Alignment C	Bridge Alignment D
				Queue	Queue	Queue	Queue
1	I-5 SB Off-Ramp at 3rd St./X St.	1,150	AM	75	75	75	75
			PM	100	100	75	75
2	US 50 EB Off-Ramp at 5th St./X St.	1,300	AM	525	325	250	275
			PM	800	425	450	450
3	I-5 NB Off-Ramp at Broadway	1,000	AM	150	225	175	275
			PM	75	125	175	150

Notes: The available storage length for off-ramp queuing is measured from the noted off-ramp terminal intersection to the freeway off-ramp gore point. Maximum queue length is based upon output from SimTraffic microsimulation software.
Source: Fehr & Peers, 2020

As shown, off-ramp queues under Opening Year No Build conditions would remain within the available storage. The inclusion of the bridge for each alignment alternative would shift some traffic off of utilizing the freeway facility; thereby, generally decreasing off-ramp queuing. All off-ramp queues would remain within the available storage capacity for each bridge alignment alternative under Opening Year conditions; therefore, this would be a **less-than-significant** impact.

Opening Year Impacts to Roadway Operations

Table 18 shows the daily roadway segment volumes, and Table 19 presents the daily roadway segment operations analysis results under Opening Year 2030 conditions.

<p>Notes: LOS = Level of Service. V/C = Volume to Capacity Ratio LOS in bold font is worse than the LOS minimum for the intersection.</p> <p>Source: Fehr & Peers, 2020</p>												

The growth in land use within West Sacramento south of the study area would increase traffic volume along Jefferson Boulevard and South River Road, worsening the daily roadway operations to LOS F under Opening Year No Build conditions. The inclusion of the bridge would reduce volumes on Jefferson Boulevard north of 15th Street; however, would increase volumes on Jefferson Boulevard and South River Road south of Alameda Boulevard. Roadway capacity utilization results contained in this section are for information purposes only, and not utilized for impact analysis.

Opening Year Impacts to Bicycle, Pedestrian and Transit Facilities

The proposed project would have similar impacts to bicycle, pedestrian, and transit facilities under Opening Year conditions as discussed in the previous section under Existing Plus Project. The project would not interfere with existing or planned bicycle, pedestrian, or transit facilities. This includes sidewalks planned as part of development in the Pioneer Bluff area of West Sacramento and along Broadway in Sacramento. Additionally, the bridge will be designed to accommodate buses and a potential future streetcar line; thereby providing an alternative for future transit realignment or expansion. Therefore, the project would create a **less-than-significant** impacts to bicycle, pedestrian, and transit facilities.

Opening Year Impacts to Vehicle Miles of Travel (VMT)

Table 20 displays the daily regional vehicle miles of travel under Opening Year 2030 conditions. This scenario assumes that the short-term travel response to the bridge being opened is likely limited to route choices; therefore, all regional trip origins and destinations remain constant from the no build scenario. The bridge then reflects the opening of a shorter route for trips that would already occur. For all bridge alignment alternatives, the daily regional VMT total is lower than under the Opening Year 2030 No Build scenario.

Table 20: Daily Regional Vehicle Miles of Travel (VMT) – Opening Year 2030 Conditions

Scenario	Regional Daily VMT Total	Difference (From No Build)
Opening Year 2030 No Build	69,959,845	--
Opening Year 2030 With Bridge Alignment A/B	69,946,445	-13,400
Opening Year 2030 With Bridge Alignment C	69,943,850	-15,995
Opening Year 2030 With Bridge Alignment D	69,939,269	-20,576

Source: Fehr & Peers, 2020

Design Year 2040 Conditions

This section describes the anticipated travel conditions under design year (2040) conditions for the roadway, bicycle, pedestrian, and transit systems. The effect of the proposed project on cumulative conditions is measured to identify potential cumulative impacts and recommend further improvements to the transportation infrastructure.

Traffic Forecasts

Design Year 2040 traffic forecasts were developed using the SACMET regional travel demand model. The model includes the land use growth and roadway infrastructure projects within the Sacramento region assumed under cumulative conditions, as identified by SACOG in the Metropolitan Transportation Plan and Sustainable Communities Strategy (MTP/SCS). Key roadway network improvements, on top of those already in place under Opening Year conditions, include:

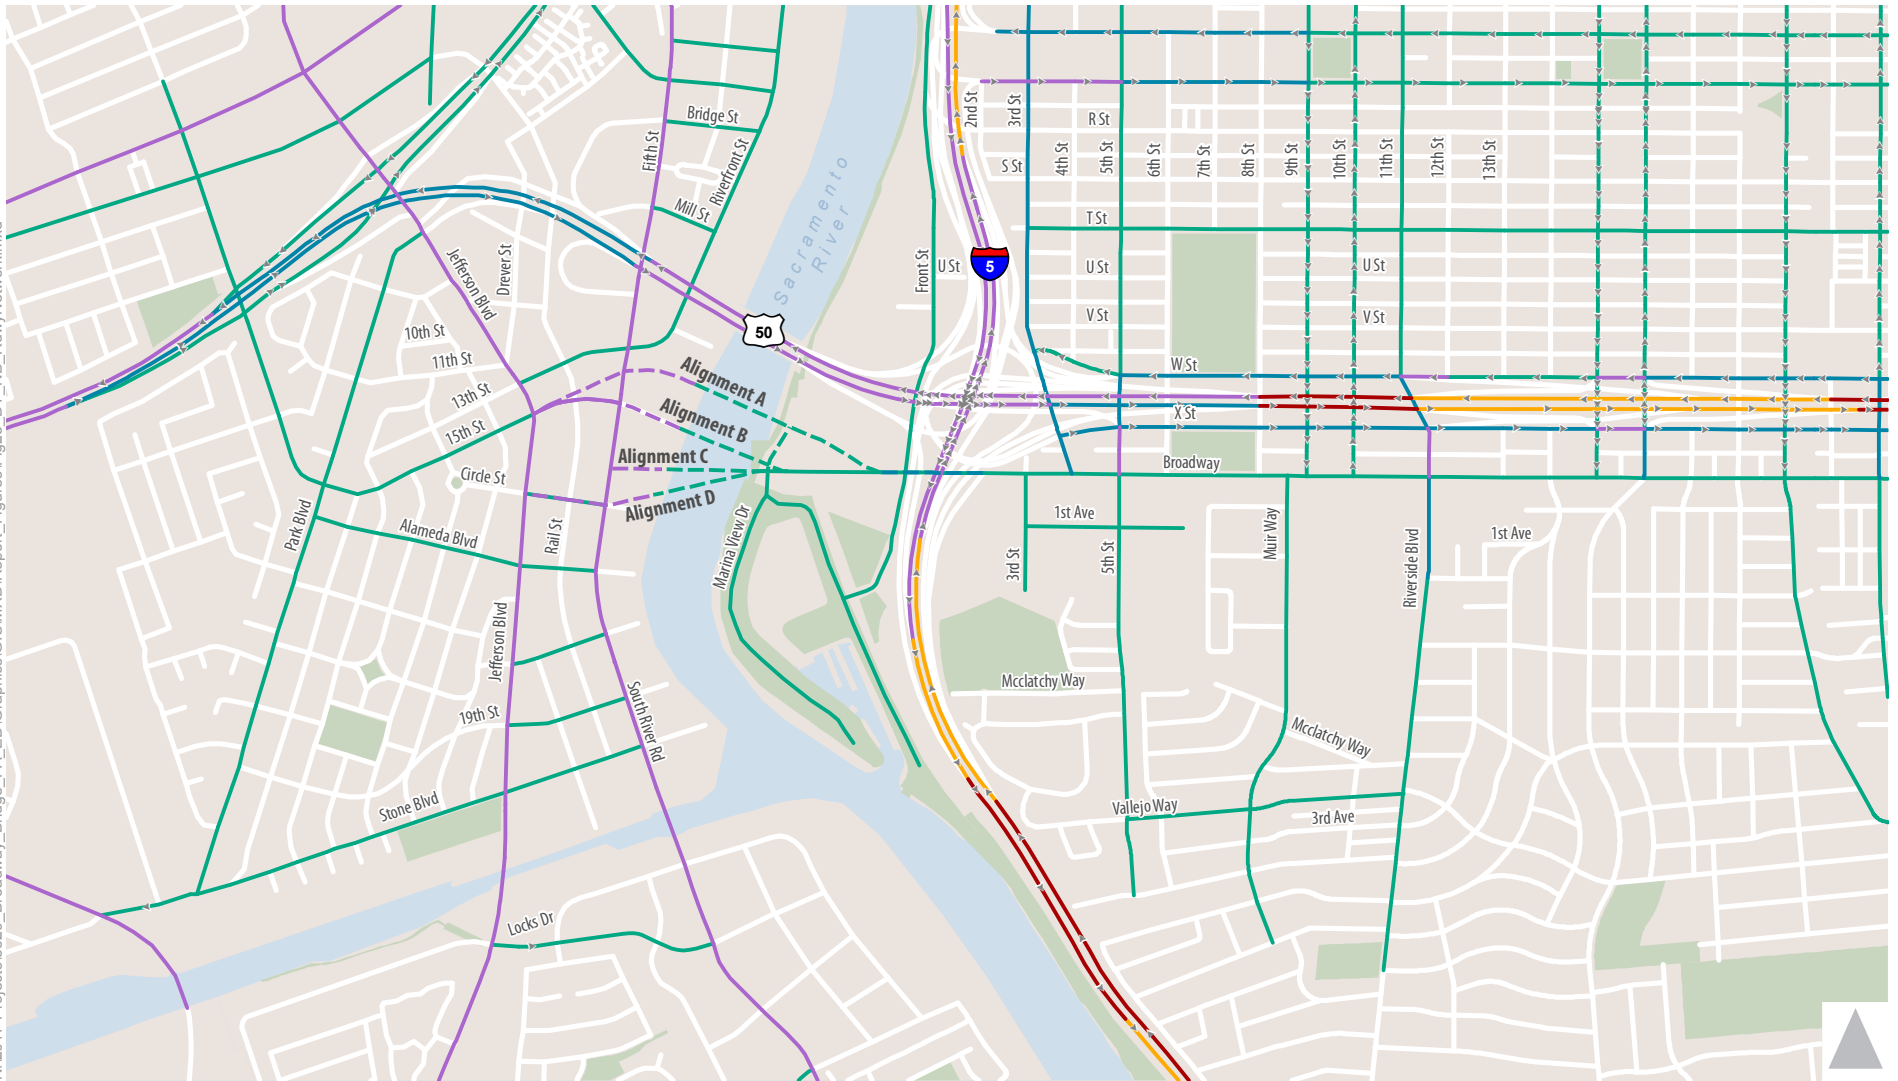

- Realignment of South River Road, between 15th Street and Stone Boulevard, and widening of the roadway to four travel lanes.
- Addition of Rail Street, parallel and between Jefferson Boulevard and South River Road.
- Extensions of Circle Street, 17th Street, and 19th Street between Jefferson Boulevard and South River Road.

The traffic forecasting procedure known as the “difference method” calculation was used to develop the Design Year forecasts. The procedure adds the difference in traffic between the base year and design year model to the existing traffic counts, as displayed below:

$$\text{Design Year Forecast} = \text{Existing Volume} + (\text{Design Year Model} - \text{Base Model})$$

Figure 23 shows the roadway network under design year conditions, including number of lanes and directions.

Notes: LOS = Level of Service. SSSC = Side Street Stop Controlled

For signalized and uncontrolled intersections, average intersection delay is reported in seconds per vehicle for all approaches. For SSSC intersections, the LOS and control delay for the worst movement is shown in parentheses next to the average intersection LOS and delay. Impacts to intersections are determined based on the overall LOS and average delay. All intersections were analyzed in SimTraffic.

Intersection 10 (Broadway / Front St.) is analyzed as a side street stop controlled intersection under no build conditions, and signalized under all with bridge alignment alternatives.

Intersection 17 (Jefferson Blvd. / Circle St.) is analyzed as a side street stop controlled intersection under no build, bridge alignment A/B, and bridge alignment C, and signalized under bridge alignment D.

Intersection 18 (S. River Rd. / Circle St.) is analyzed as a side street stop controlled intersection under no build conditions and bridge alignment A/B, and signalized under bridge alignment C and bridge alignment D.

LOS in bold font is worse than the LOS minimum for the intersection. LOS in bold and red font is an impact. An impact is a change in LOS between No Build and Alternative scenarios from acceptable to unacceptable or a worsening of an unacceptable condition.

Source: Fehr & Peers, 2020

Design Year No Build

Most study intersections operate within acceptable LOS under Design Year No Build conditions, except for Intersection 19 (Jefferson Boulevard / Alameda Boulevard), which operates at LOS F during the AM peak hour.

Growth in land use in West Sacramento south of the study area adds traffic to Jefferson Boulevard and South River Road, especially northbound on both roadways during the morning commute, and southbound during the afternoon/evening commute. Some of the growth in traffic is accommodated by the increase in capacity on South River Road as part of the realignment and widening to four travel lanes; however, congestion increases for intersection along Jefferson Boulevard.

In Sacramento, the overall growth in the area creates an increase in traffic and congestion along 5th Street, notably in the PM peak hour at the ramp terminal intersections.

Design Year with Bridge Alignment A/B

All study intersections operate within acceptable LOS under Design Year with Bridge Alignment A/B conditions. The bridge approach intersection of South River Road / 15th Street in West Sacramento faces a high level of delay; however, within acceptable LOS E conditions during both the AM and PM peak hours. The bridge also shifts some traffic from utilizing the freeway facilities. The shift of traffic to Broadway is most notable at the Broadway / 5th Street intersection compared to No Build. Overall, this alternative would create a **less-than-significant** impact to intersection operations under Design Year conditions.

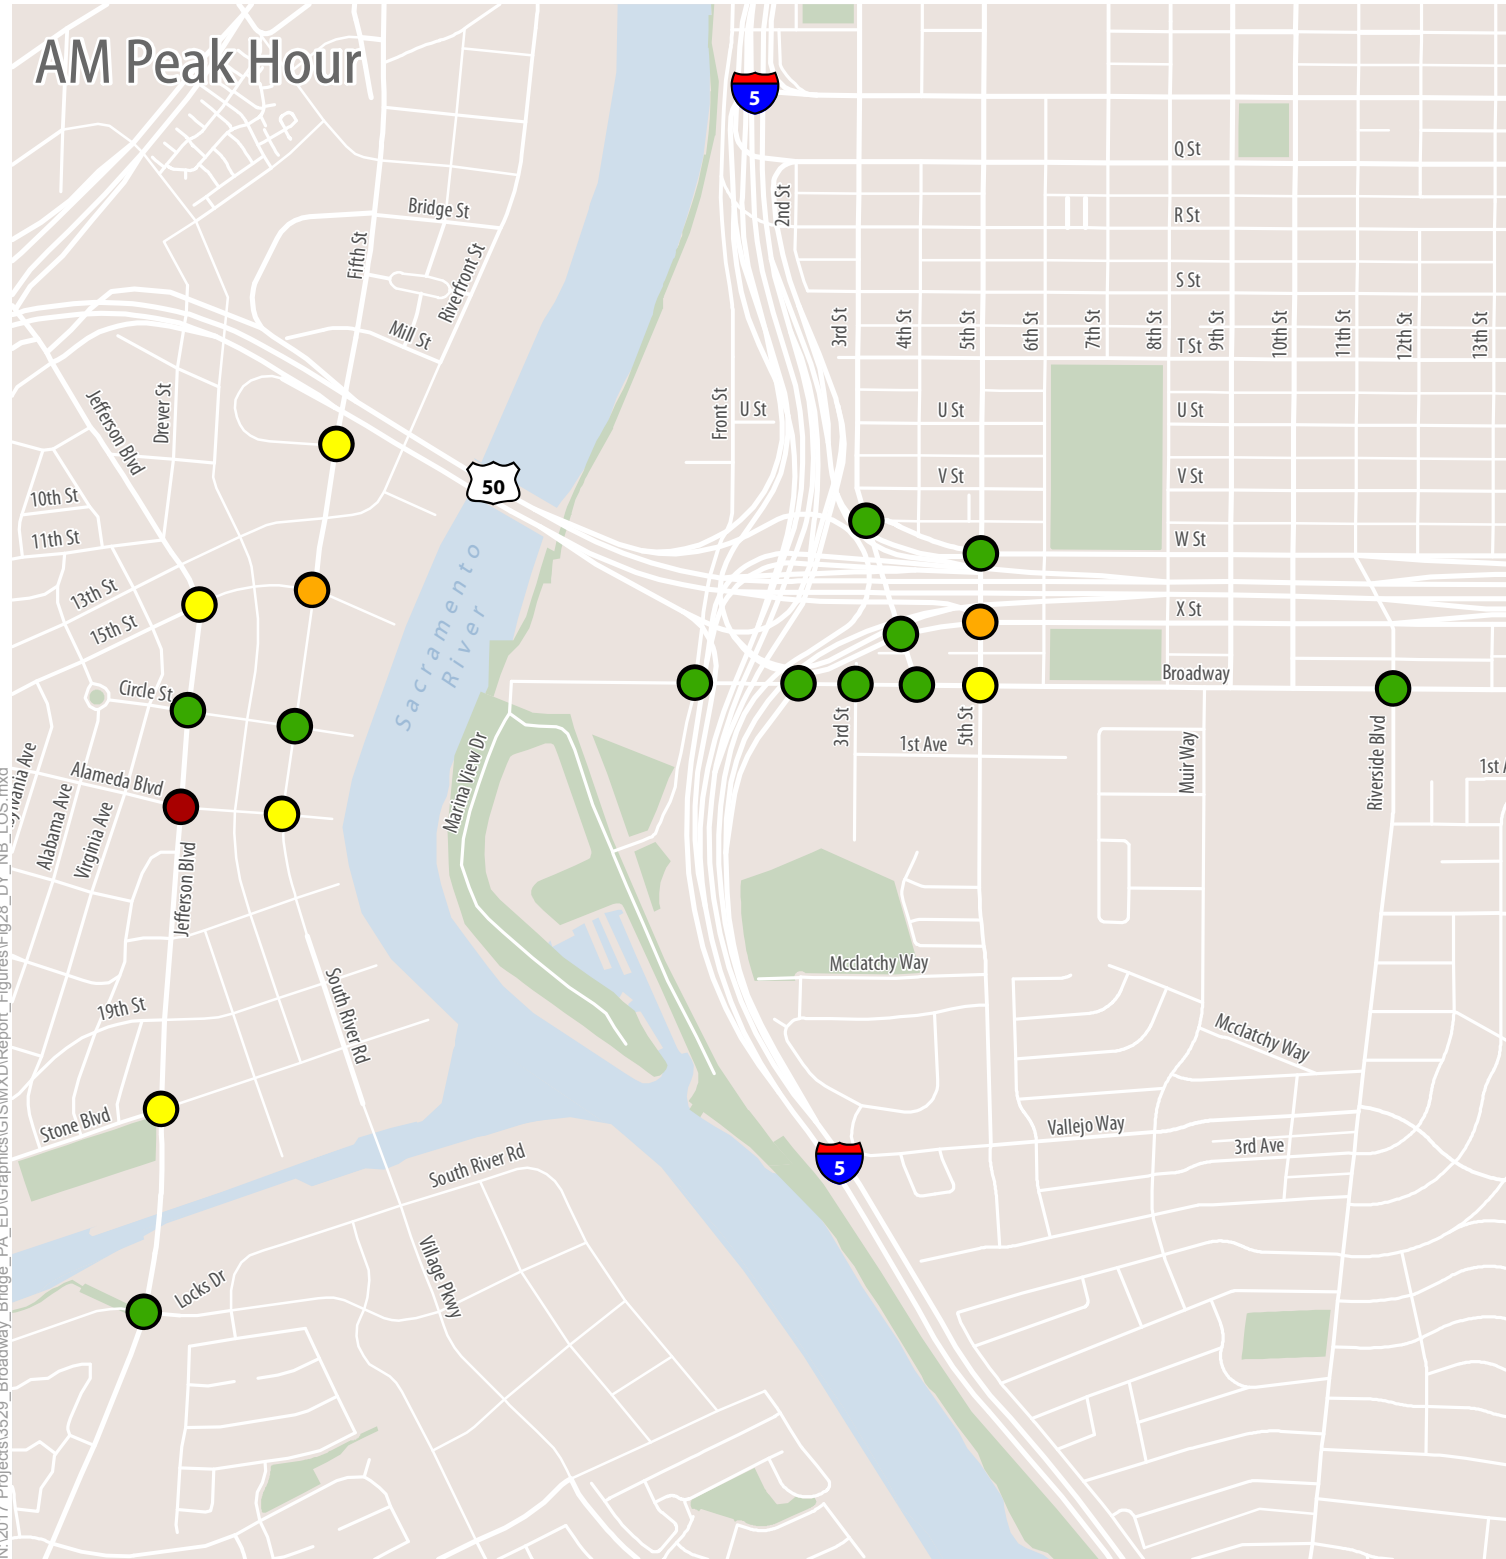

Design Year with Bridge Alignment C

Most study intersections operate within acceptable LOS under Design Year with Bridge Alignment C conditions. Bridge Alignment C creates a T-intersection with South River Road. Due to the lack of a direct connection to Jefferson Boulevard, a high demand of traffic requires traversing multiple turning movements using Circle Street or Alameda Boulevard. This also creates a high demand for conflicting movements at the intersections in this area. Thus, Intersection 19 (Jefferson Boulevard / Alameda Boulevard), operates at LOS F during the AM peak hour, with the average delay worsening by more than five seconds compared to Design Year No Project conditions. This would be a **significant** impact.

Design Year with Bridge Alignment D

All study intersections operate within acceptable LOS under Design Year with Bridge Alignment D. Bridge Alignment D allows for a high demand of traffic a direct route to Jefferson Boulevard via Circle Street. The intersections of Jefferson Boulevard / Circle Street and South River Road / Circle Street require signalization as part of this project alternative. Overall, this alternative would create a **less-than-significant** impact to intersection operations under Design Year conditions.

Mitigations

The following mitigations address the significant impact under Design Year – Alignment C Conditions:

- Intersection 17 (Jefferson Boulevard/Circle Street), installing a traffic signal and adding signal coordination with Intersection 19 (Jefferson Boulevard/Alameda Boulevard)

Table 22 shows the intersection operations under Design Year – Alignment C conditions with mitigations in the vicinity of the impacted intersections.

ID	Intersection	Jurisdiction	Control Type	Peak Hour	Design Year 2040					
					No Build		Bridge Alignment C		Bridge Alignment C with Mitigations	
					Delay	LOS	Delay	LOS	Delay	LOS
3	S. River Rd. / 15th St.	West Sacramento	Signal	AM	71	E	28	C	31	C
10	Broadway / Front St.	Sacramento	SSSC / Signal	AM	8 (25)	A (D)	49	D	49	D
16	S. River Rd. / Broadway	West Sacramento	Signal	AM	--	--	30	C	30	C
17	Jefferson Blvd. / Circle St.	West Sacramento	SSSC / Signal	AM	9 (141)	A (F)	10 (118)	A (F)	34	C
18	S. River Rd. / Circle St.	West Sacramento	SSSC / Signal	AM	19 (223)	C (F)	33	C	36	D
19	Jefferson Blvd. / Alameda Blvd.	West Sacramento	Signal	AM	82	F	94	F	67	E
20	S. River Rd. / Alameda Blvd.	West Sacramento	Signal	AM	39	D	39	D	46	D

Notes: LOS = Level of Service. SSSC = Side Street Stop Controlled

For signalized and uncontrolled intersections, average intersection delay is reported in seconds per vehicle for all approaches. For SSSC intersections, the LOS and control delay for the worst movement is shown in parentheses next to the average intersection LOS and delay. Impacts to intersections are determined based on the overall LOS and average delay. All intersections were analyzed in SimTraffic.

Intersection 10 (Broadway / Front St.) is analyzed as a side street stop controlled intersection under no build conditions, and signalized under all with bridge alignment alternatives.

Intersection 17 (Jefferson Blvd. / Circle St.) is analyzed as a side street stop controlled intersection under no build, bridge alignment A/B, and bridge alignment C, and signalized under bridge alignment D.

Intersection 18 (S. River Rd. / Circle St.) is analyzed as a side street stop controlled intersection under no build conditions and bridge alignment A/B, and signalized under bridge alignment C and bridge alignment D.

LOS in bold font is worse than the LOS minimum for the intersection. LOS in bold and red font is an impact. An impact is a change in LOS between No Build and Alternative scenarios from acceptable to unacceptable or a worsening of an unacceptable condition.

Source: Fehr & Peers, 2020

With the mitigations, the impacted intersections would operate within acceptable LOS, and no other study intersections would worsen to unacceptable conditions. Therefore, this would be a **less-than-significant** impact after mitigations.

Design Year Impacts to Freeway Off-Ramp Queuing

Table 23 displays the freeway off-ramp queuing under Design Year 2040 conditions.

ID	Location	Available Storage	Peak Hour	Design Year 2040			
				No Build	Bridge Alignment A/B	Bridge Alignment C	Bridge Alignment D
				Queue	Queue	Queue	Queue
1	I-5 SB Off-Ramp at 3rd St./X St.	1,150	AM	75	100	75	75
			PM	125	75	75	75
2	US 50 EB Off-Ramp at 5th St./X St.	1,300	AM	850	575	350	375
			PM	1,775	675	1,175	1,000
3	I-5 NB Off-Ramp at Broadway	1,000	AM	200	225	200	300
			PM	100	250	175	275
Notes: The available storage length for off-ramp queuing is measured from the noted off-ramp terminal intersection to the freeway off-ramp gore point. Maximum queue length is based upon output from SimTraffic microsimulation software. Queues noted in bold font are longer than available storage length of the off-ramp.							
Source: Fehr & Peers, 2020							

As shown, off-ramp queues under Opening Year No Build conditions would remain within the available storage except for the US 50 eastbound off-ramp at 5th Street / X Street during the PM peak hour. The inclusion of the bridge for each alignment alternative would shift some traffic off of utilizing the freeway facility; thereby, generally decreasing off-ramp queuing. All off-ramp queues would remain within the available storage capacity for each bridge alignment alternative under Design Year conditions; therefore, this would be a **less-than-significant** impact.

Design Year Impacts to Roadway Operations

Table 24 shows the daily roadway segment volumes, and Table 25 presents the daily roadway operations analysis results under Design Year 2040 conditions.

13	Broadway	Between 9th St and 10th St	Sacramento	2	E	0.97	F	1.15	F	1.13	F	1.12
14	Broadway	East of Riverside Blvd	Sacramento	2	E	0.90	E	0.97	E	0.97	E	0.97
<p>Notes: LOS = Level of Service. V/C = Volume to Capacity Ratio LOS in bold font is worse than the LOS minimum for the intersection.</p> <p>Source: Fehr & Peers, 2020</p>												

The growth in land use within West Sacramento south of the study area would increase traffic volume along Jefferson Boulevard and South River Road. Traffic operations worsen specifically along Jefferson Boulevard to LOS F conditions under Design Year conditions. Roadway capacity utilization results contained in this section are for information purposes only, and not utilized for impact analysis.

Design Year Impacts to Bicycle, Pedestrian and Transit Facilities

Under Design Year conditions, the areas surrounding both sides of the bridge approaches are planned to be redeveloped with the inclusion of bicycle and pedestrian facilities, notably the Pioneer Bluff neighborhood in West Sacramento. The proposed bridge under each alignment alternative is planned to have bicycle, pedestrian, and transit facilities, and would not interfere with any planned facilities in the study area. Additionally, the bridge will be designed to accommodate buses and a potential future streetcar line; thereby providing an alternative for future transit realignment or expansion. Therefore, the project would create a **less-than-significant** impacts to bicycle, pedestrian, and transit facilities.

Design Year Impacts to Vehicle Miles of Travel (VMT)

Table 26 shows the daily regional vehicle miles of travel under Design Year 2040 conditions.

Scenario	Regional Daily VMT Total	Difference (From No Build)
Design Year 2040 No Build	75,314,215	--
Design Year 2040 With Bridge Alignment A/B	75,320,445	6,230
Design Year 2040 With Bridge Alignment C	75,357,106	42,890
Design Year 2040 With Bridge Alignment D	75,327,449	13,234

Source: Fehr & Peers, 2020

The VMT under Design Year conditions for each scenario reflect changes in travel behavior that may change including designation locations and travel modes, which is represented by the full model runs presented in the table above. The VMT is expected to increase slightly within the Sacramento region with the inclusion of the bridge due to the added capacity across a constrained network of options between each side of the Sacramento River. The increase in VMT is highest under Bridge Alignment C compared to No Build conditions; however, the difference is much less than even one percent of the overall VMT within the region.
