

Memorandum

Date: October 21, 2020
To: Christy Cheung, City of San Jose
From: Robert Del Rio, T.E.
Subject: Block 8 Mixed-Use Development Local Transportation Analysis

Hexagon Transportation Consultants, Inc. has completed a Local Transportation Analysis (LTA) for the proposed Block 8 Mixed-Use development in Downtown San Jose. The proposed office project is located on one 1.485-acre parcel (282 South Market Street; APN 259-42-080) located at the northeast corner of the Market Street and San Carlos Street intersection. The project, as proposed, will consist of up to 627,207 square-feet (s.f.) of leasable office space and 16,372 s.f. of ground-floor commercial space. The proposed office building will replace a public surface parking lot accessible from Market Street and a separate surface parking lot accessible from First Street currently used by the Four Points by Sheraton Hotel located north of the project site. Parking for the proposed office project will be provided within six above-ground parking levels with access provided via a garage entrance along the western project frontage on Market Street. The project could include two levels of underground parking if the maximum amount of development identified is constructed. A second project driveway, located along the eastern project frontage on First Street, provides access to an existing drive aisle easement along the north project frontage and will be utilized to access the project's proposed loading docks and trash collection areas for both the office development and the Four Points Hotel. Figure 1 shows the project site location.

The project site is located within the Downtown Growth Area Boundary, for which an Environmental Impact Report (EIR), *Downtown San Jose Strategy Plan 2040 (DTS 2040)*, has been completed and approved. With adoption of DTS 2040, this project is covered under DTS 2040 and no CEQA transportation analysis is required. The project, however, must perform an LTA to identify operational issues.

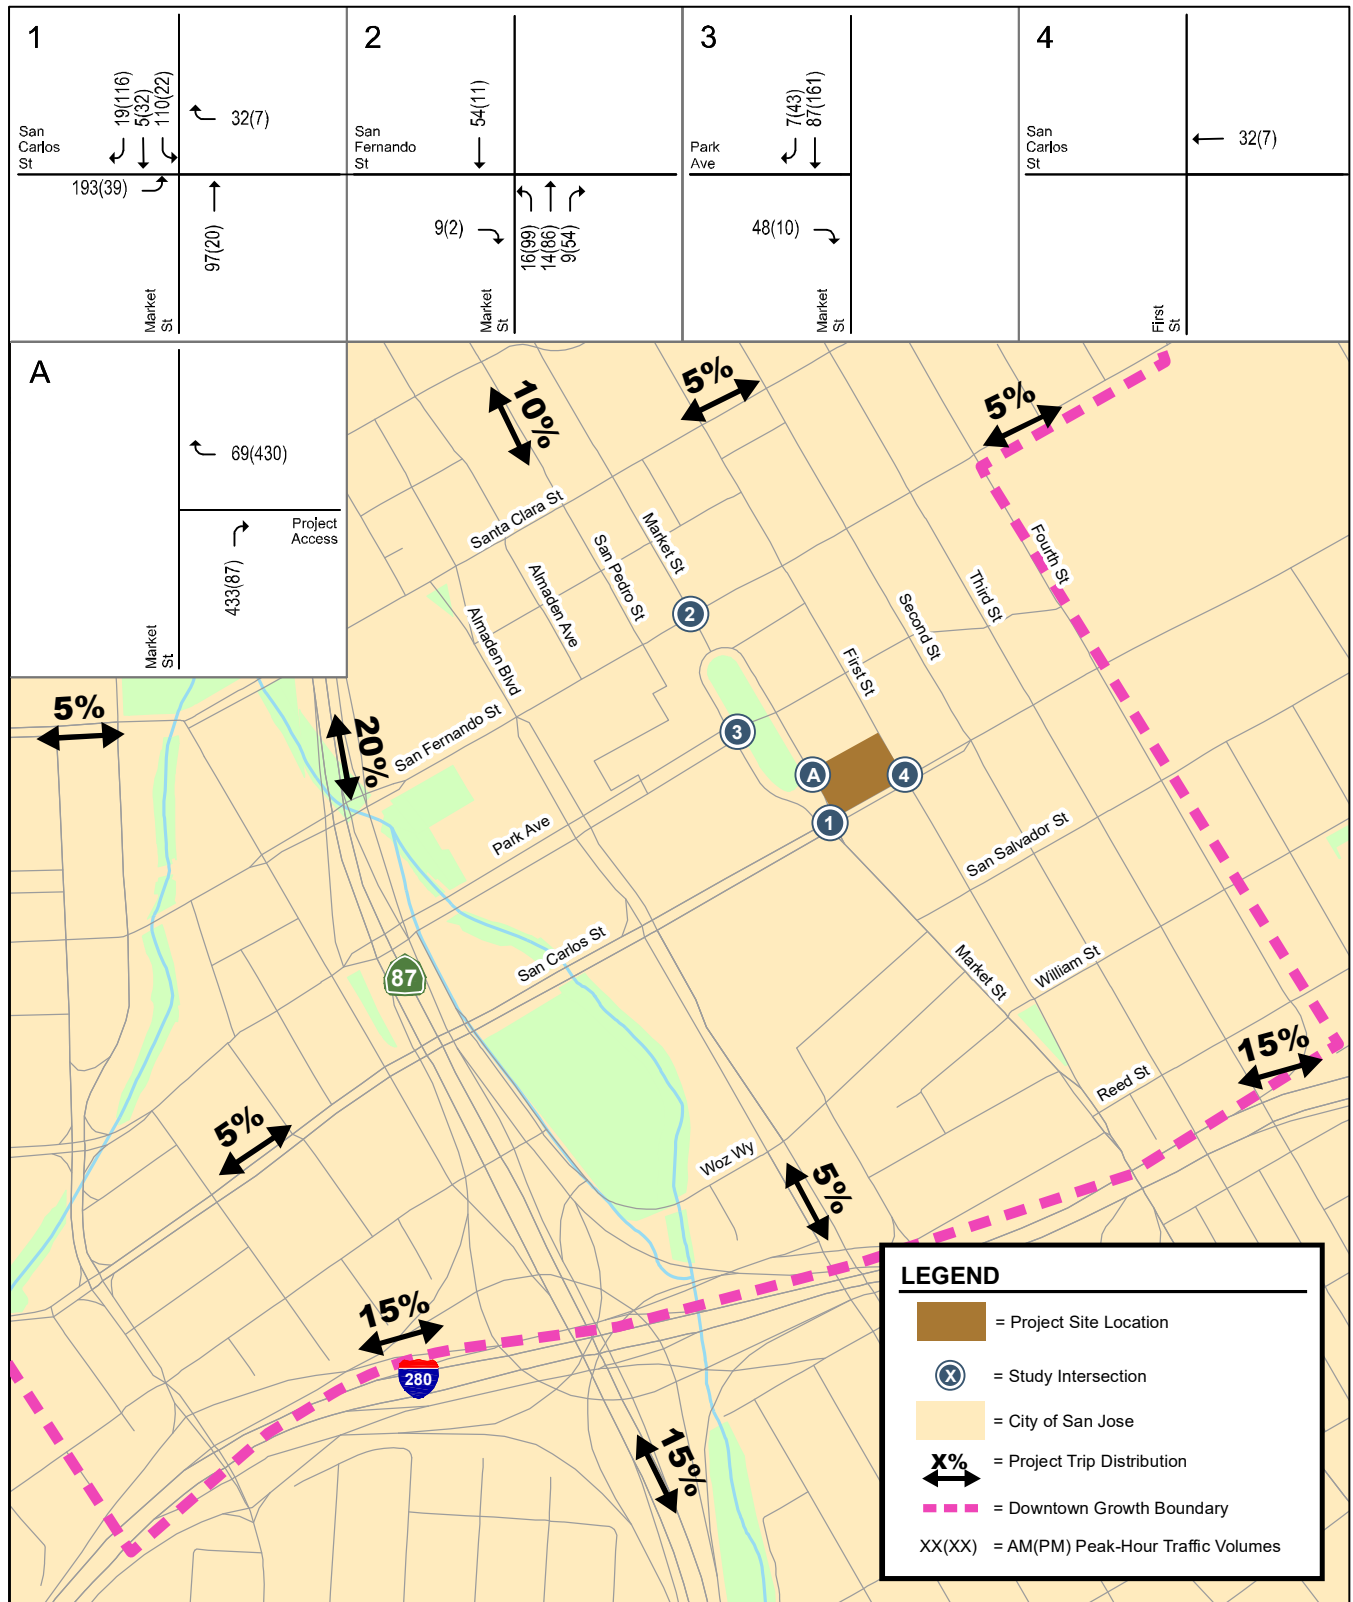

Scope of Study

The purpose of the LTA was to identify any potential operational issues that could occur as a result of the project and to recommend necessary improvements to ensure adequate access to the site is provided. Based on the proposed project size, site-generated traffic was estimated. Vehicular site access was evaluated based on the proposed driveway locations. Truck access, including trash pickup and loading activities, was evaluated. Parking and on-site vehicular circulation also was analyzed. Lastly, bicycle and pedestrian access and safety were evaluated.

Existing Conditions

This section describes the existing conditions for all of the major transportation facilities in the vicinity of the site, including the roadway network, transit service, and bicycle and pedestrian facilities.

Figure 1
Site Location, Study Intersections, Project Trip Distribution, and Project Trip Assignment

Existing Roadway Network

Regional access to the project site is provided by State Route 87 and the Interstate 280/680 freeway. Local site access is provided by Market Street, San Carlos Street, First Street and San Fernando Street. The freeways and local roadways are described below.

State Route 87 is primarily a six-lane freeway (four mixed-flow lanes and two HOV lanes) that is aligned in a north-south orientation within the project vicinity. SR 87 begins at its interchange with SR 85 and extends northward, terminating at its junction with US 101. Connections from SR-87 to the project site are provided via partial interchanges at Park Avenue (ramps to and from north), Auzerais Avenue (ramps to south only), and Woz Way (ramp from south only). SR 87 provides access to I-280/I-680 and US-101.

Interstate 280 connects from US-101 in San Jose to I-80 in San Francisco. It is generally an eight-lane freeway in the vicinity of downtown San Jose. It also has auxiliary lanes between some interchanges. The section of I-280 just north of the Bascom Avenue overcrossing has six mixed-flow lanes and two high-occupancy-vehicle (HOV) lanes. Connections from I-280 to the project site are provided via partial interchanges at First Street (ramps to east only), Almaden Boulevard (ramps to west only), Vine Street (ramps from west), and Seventh Street (ramps from east).

Market Street is a north-south four-lane street located along the west project frontage. In the vicinity of the project site, the northbound and southbound lanes of Market Street are divided by Plaza de Cesar Chavez, between San Fernando Street and San Carlos Street. Market Street transitions into First Street at its intersection with Reed Street. Market Street provides direct access to and from the project parking garage via one right-in and right-out driveway.

San Carlos Street is an east-west four-lane street located along the south project frontage. It extends as West San Carlos Street from 1st Street westward to Bascom Avenue where it transitions into Stevens Creek Boulevard. East of 1st Street, it extends eastward as East San Carlos Street with a break between 4th and 10th Streets (at San Jose State University) and terminating at 17th Street. In the vicinity of the project site, the VTA light rail tracks run along the middle of the street, separating the eastbound and westbound travel lanes. Access to the project site is provided via its intersection with Market Street, at the southwest corner of the project site.

First Street is a two- to four-lane roadway that extends from Alma Avenue (where it transitions from Monterey Road) north to Alviso, where it terminates. Within the Downtown area, First Street is a two-lane northbound-only roadway that consists of one bus-only lane and one shared vehicular/bicycle lane. Northbound VTA light rail tracks run along the east side of the roadway between San Carlos Street and St. James Street. First Street runs along the east project frontage and provides access to the project's parking garage via San Carlos Street and Market Street.

San Fernando Street is an east-west two-lane street located north of the project site that extends through the heart of downtown between Autumn Street to the west and 17th Street to the east. San Fernando Street has sidewalks on both sides and buffered bike lanes in both directions. A striped median with two-way left-turn lanes are provided east of Almaden Boulevard. Access to the project site is provided via Market Street and First Street.

Existing Bicycle Facilities

Class II bicycle facilities are provided along the following roadways within the project area:

- Almaden Boulevard, between Woz Way and Carlisle Street

- Park Avenue, west of Market Street
- Woz Way, between San Carlos Street and Almaden Avenue
- Santa Clara Street, west of Almaden Boulevard
- San Salvador Street, between Market Street and Fourth Street
- Second Street, between Taylor Street and San Carlos Street
- Third Street, between Jackson Street and St. James Street
- Fourth Street, between Jackson Street and Santa Clara Street; between San Salvador Street and Reed Street
- Almaden Avenue, between Alma Avenue and Grant Street
- Vine Street, between Alma Avenue and Grant Street

Designated Class III bike routes with “sharrow” or shared-lane pavement markings and signage are provided along the following roadways:

- San Carlos Street, between Woz Way and Fourth Street (including along the south project frontage)
- San Fernando Street, east of 10th Street
- Second Street, between San Carlos Street and Julian Street
- First Street, between San Salvador Street and St. John Street (including along the east project frontage)
- San Salvador Street, between Fourth Street and Tenth Street (eastbound)
- William Street, between First Street and McLaughlin Avenue

Class IV bicycle facilities (protected bike lanes) are currently being installed throughout the Downtown Area as part of the Better Bikeways project. Protected bike lanes have been implemented along the following roadways:

- San Fernando Street, between Cahill Street and Tenth Street
- Second Street, between San Carlos Street and William Street
- Third Street, between St. James Street and Reed Street
- Fourth Street, between Santa Clara Street and San Salvador Street
- San Salvador Street, between Fourth Street and Tenth Street (westbound)
- Autumn Street, between Santa Clara Street and St. John Street
- Cahill Street, between San Fernando Street and Santa Clara Street

The existing bicycle facilities are shown on Figure 2.

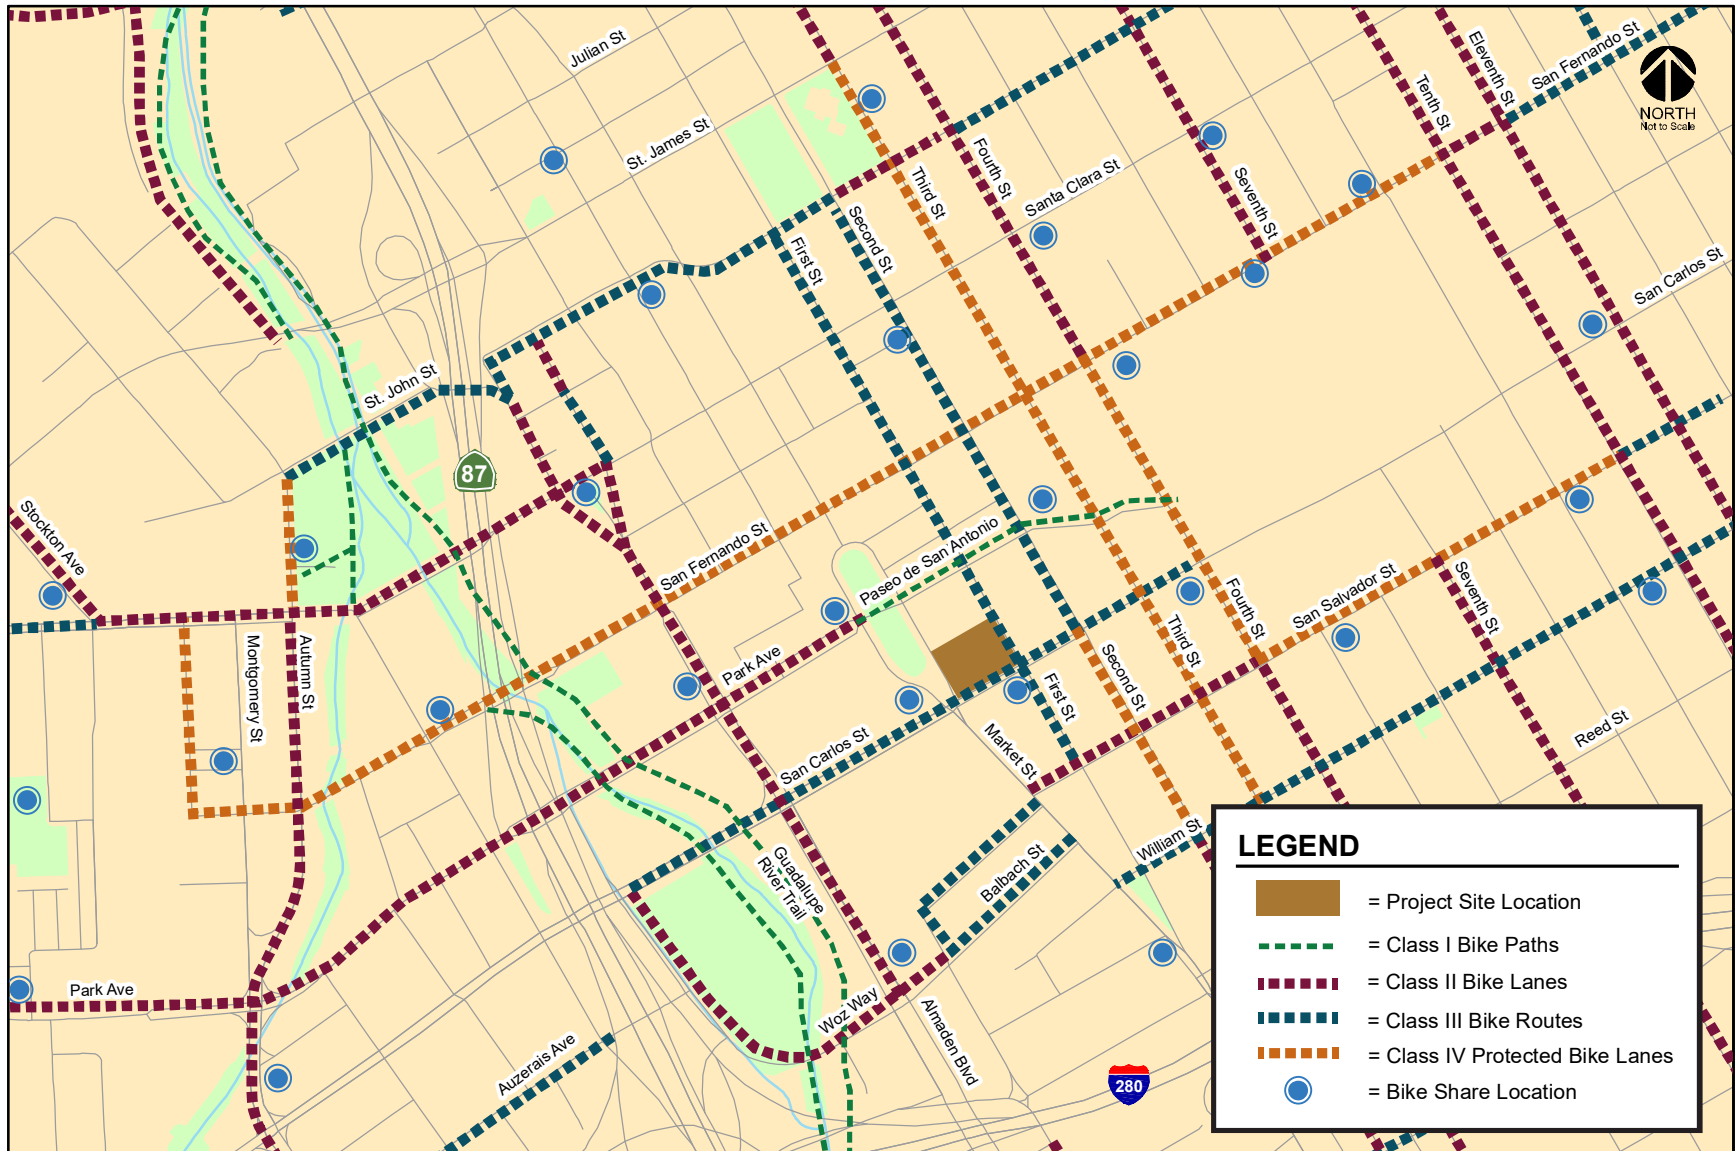

Guadalupe River Park Trail

The Guadalupe River multi-use trail system runs through the City of San Jose along the Guadalupe River and is shared between pedestrians and bicyclists and separated from motor vehicle traffic. The Guadalupe River trail is an 11-mile Class I bikeway from Curtner Avenue to Willow Street, and between Virginia Street and Palm Street to Alviso. This trail system can be accessed just west of the Almaden Boulevard and San Carlos Street intersection, approximately 1,400 feet west of the project site.

Bike and Scooter Share Services

The Bay Wheels (formerly Ford Go Bike) bike share program allows users to rent and return bicycles at various locations. Bike share bikes can be rented and returned at designated docking stations throughout the Downtown area. In addition, dockless bike and scooter rentals are available throughout

Figure 2
Existing Bicycle Facilities

the Downtown area. These services provide electric bicycles and scooters with GPS self-locking systems that allow for rental and drop-off anywhere. Two bike share stations are located within 100 feet of the project site: at the northwest corner of the Market Street/San Carlos Street intersection and at the southwest corner of the First Street/San Carlos Street intersection.

Existing Pedestrian Facilities

Pedestrian facilities in the study area (shown in Figure 3) consist of sidewalks along all the surrounding streets, including the project frontages along Market Street, First Street, and San Carlos Street. Crosswalks and pedestrian signal heads are located at all signalized intersections within the project area. The majority of the crosswalks at signalized intersections in the vicinity of the project site consist of high visibility crosswalks and countdown signal heads that enhance pedestrian visibility and safety while crossing the intersections. Sidewalks in the project area are wide and provide an attractive and continuous pedestrian network.

A mid-block crossing across the northbound side of Market Street provides access between the Plaza de Cesar Chavez Park and the Paseo de San Antonio Walk. This paseo provides pedestrian-only access to shops and business along the Paseo de San Antonio Walk between Market Street and San Jose State University. Another mid-block crossing on San Carlos Street, approximately 400 feet west of the Market/San Carlos intersection, provides access to the Convention Center LRT station located within the median of San Carlos Street.

Overall, the existing sidewalks and paseos provide good pedestrian connectivity and safe routes to the surrounding pedestrian destinations, including nearby transit stops, the Convention Center and Plaza de Cesar Chavez Park, as well as various businesses and restaurants surrounding the project site.

Existing Transit Services

Existing transit services in the study area are provided by the Santa Clara Valley Transportation Authority VTA, Santa Cruz METRO, Monterey Salinas Transit MST, Caltrain, Altamont Commuter Express (ACE), and Amtrak. The project site is located approximately 350 feet south of the San Antonio Light Rail Station platforms on First Street and Second Street, and approximately one mile from the Diridon Transit Center located on Cahill Street. Connections between local and regional bus routes, light rail lines, and commuter rail lines are provided within the Diridon Transit Center. Figure 4 shows the existing transit facilities.

Bus Service

The downtown area is served by many VTA bus routes with high-frequency service. Rapid Bus services provide limited-stop service at frequent intervals (less than 15 minutes) during daytime. Within the Downtown area, Rapid Routes 522 and 523 run along Santa Clara Street and San Carlos Street, respectively. Additionally, Frequent Bus services provide local service with average headways of 12 to 15 minutes during peak commute hours. Express Bus services provide direct service to and from major employment centers during peak commute hours only

The bus lines that operate within ¼-mile walking distance of the project site are listed in Table 1, including their route descriptions and commute hour headways. The nearest bus stops are located at the southwest corner of the project site on San Carlos Street and along First Street and Second Street adjacent to the northbound and southbound platforms of the San Antonio LRT station.

Existing Pedestrian Facilities

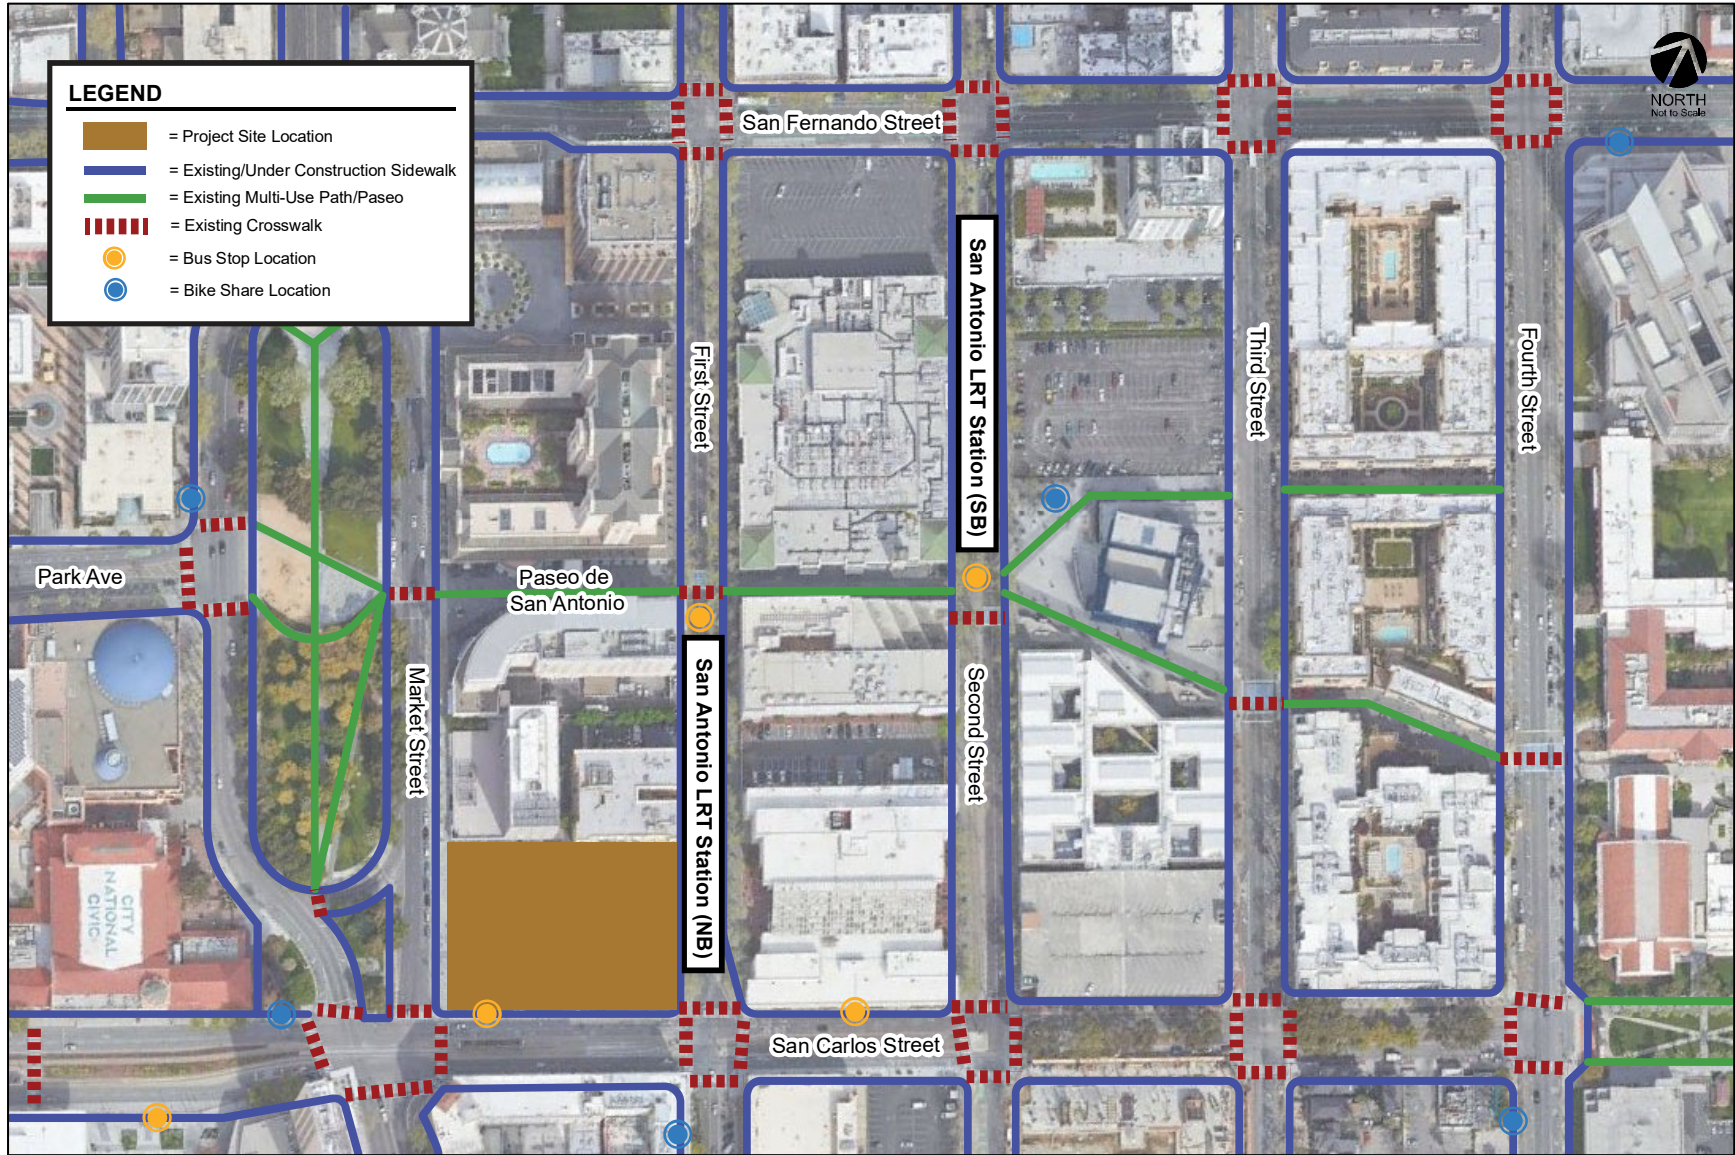

Figure 4
Existing Transit Facilities

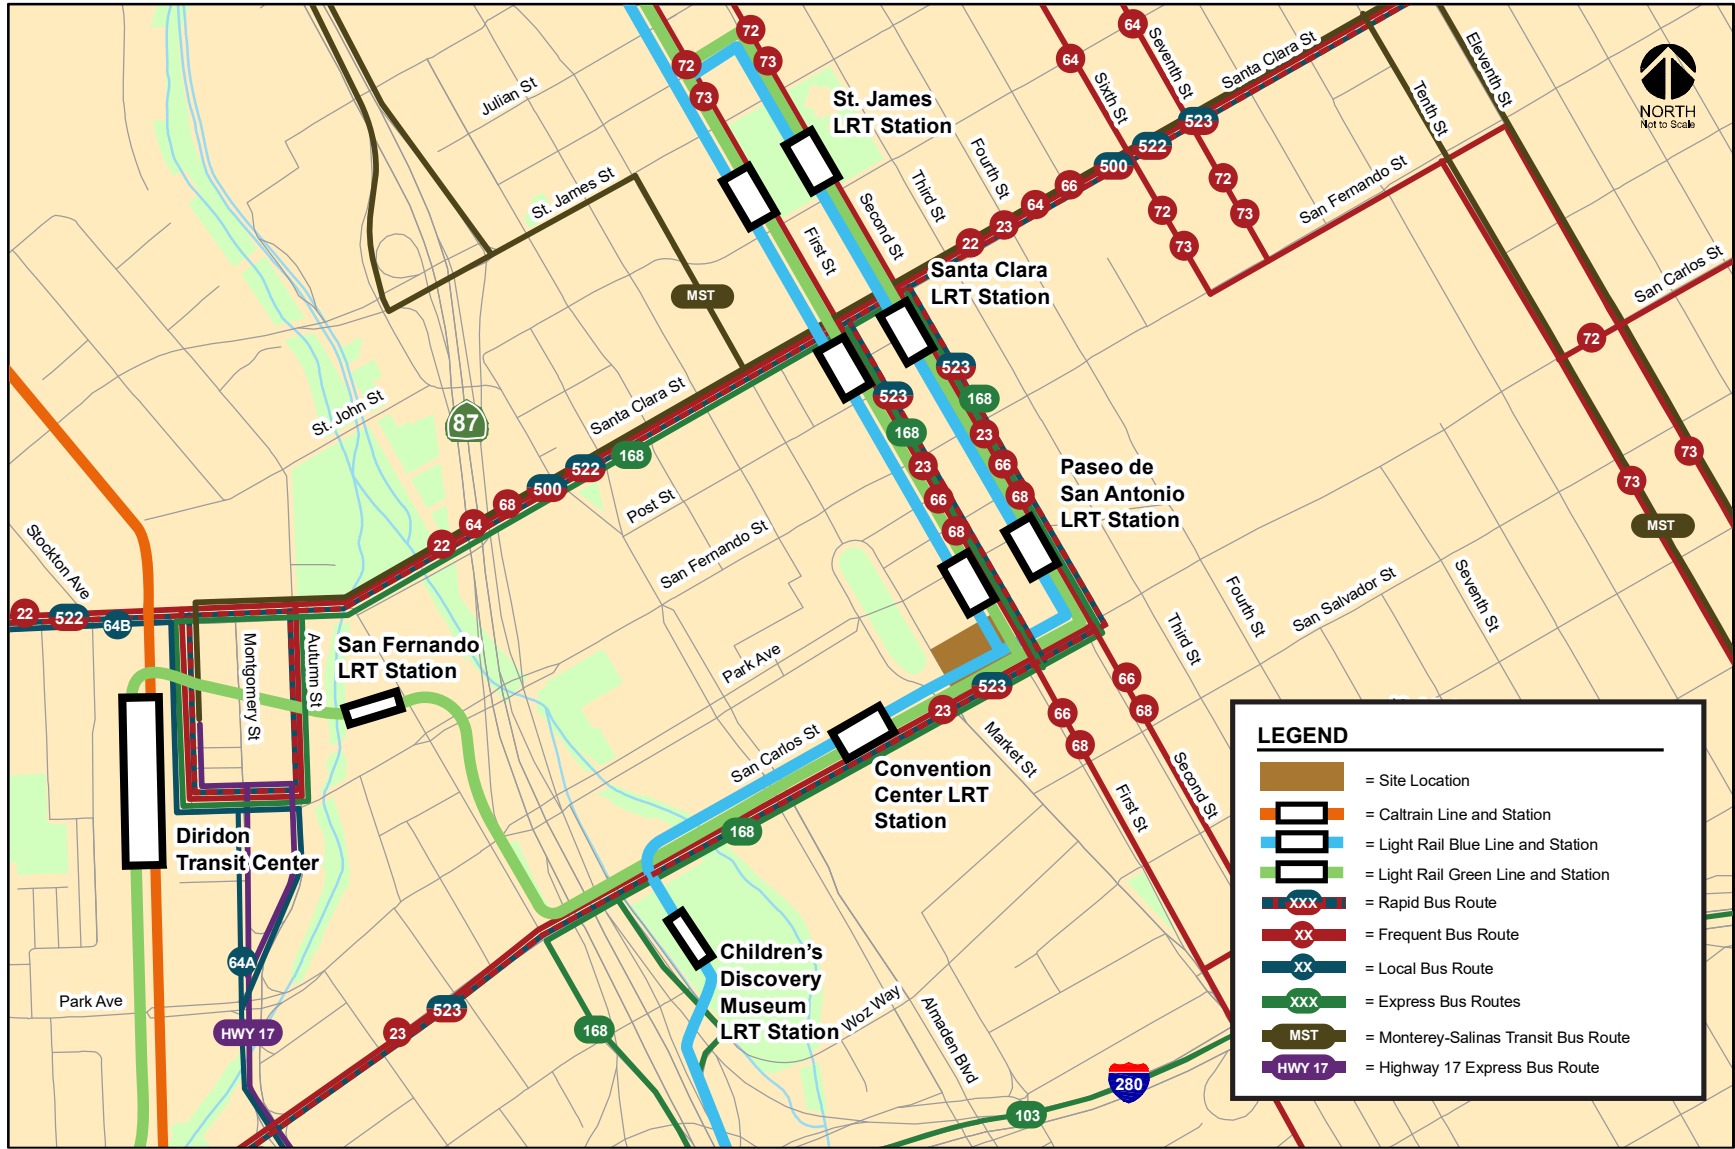

Table 1
Existing Bus Service Near the Project Site

Bus Route	Route Description	Nearest Stop	Headway ¹
Frequent Route 22	Palo Alto Transit Center to Eastridge Transit Center	Santa Clara/First	15 min
Frequent Route 23	DeAnza College to Alum Rock Transit Center via Stevens Creek	San Carlos/Market	12 - 15 min
Local Route 64A	McKee & White to Ohlone-Chynoweth Station	Santa Clara/First	30 min ²
Local Route 64B	McKee & White to Almaden Expressway & Camden	Santa Clara/First	30 min ²
Frequent Route 66	North Milpitas to Kaiser San Jose	First/Paseo de San Antonio	12 - 15 min
Frequent Route 68	San Jose Diridon Station to Gilroy Transit Center	First/Paseo de San Antonio	15 - 20 min
Frequent Route 72	Downtown San Jose to Senter & Monterey via McLaughlin	First/Santa Clara	5 - 20 min
Frequent Route 73	Downtown San Jose to Senter & Monterey via Senter	First/Santa Clara	10 - 15 min
Express Route 168	Gilroy/Morgan Hill to San Jose Diridon Station	Santa Clara/Almaden	15 - 40 min
Rapid Route 500	San Jose Diridon Station to Downtown San Jose	Santa Clara/First	15 - 20 min
Rapid Route 522	Palo Alto Transit Center to Eastridge Transit Center	Santa Clara/First	10 - 15 min
Rapid Route 523	Berryessa BART to Lockheed Martin via De Anza College	First/Paseo de San Antonio	15 - 20 min
Hwy 17 Express (Route 970)	Downtown Santa Cruz / Scotts Valley to Downtown San Jose	Diridon Transit Center	20 - 35 min
MST 55	Monterey – San Jose Express	Santa Clara/Almaden	N/A ³
MST 86	King City – San Jose/SJ Airport	Santa Clara/Almaden	N/A ⁴

Notes:

¹ Approximate headways during peak commute periods.

² Local Routes 64A and 64B provide frequent service between San Jose Diridon Station and McKee/White, with approximately 15-minute headways during peak commute periods.

³ Weekday operation consists of one northbound trip and one southbound trip during morning and afternoon/evening commute periods.

⁴ Weekday operation consists of one northbound trip during morning commute period and one southbound trip during afternoon/evening commute period.

VTA Light Rail Transit (LRT) Service

The Santa Clara Valley Transportation Authority (VTA) currently operates the 42.2-mile VTA light rail line system extending from south San Jose through downtown to the northern areas of San Jose, Santa Clara, Milpitas, Mountain View and Sunnyvale. The service operates nearly 24-hours a day with 15-minute headways during much of the day.

The Green (Winchester-Old Ironsides) and Blue (Baypointe-Santa Teresa) LRT lines operate along San Carlos Street, San Fernando Street, and along First and Second Streets, north of San Carlos Street. The San Antonio LRT station platforms on First and Second Street are located less than 500 feet walking distance of the project site. The San Jose Diridon station is located along the Green LRT line and serves as a transfer point to Caltrain, ACE, and Amtrak services.

Caltrain Service

Commuter rail service between San Francisco and Gilroy is provided by Caltrain, which currently operates 92 weekday trains that carry approximately 47,000 riders on an average weekday. The project site is located about 3/4-mile from the San Jose Diridon station. The Diridon station provides 581 parking spaces, as well as 16 bike racks, 48 bike lockers, and 27 Bay Wheels bike share docks. Trains stop frequently at the Diridon station between 4:28 AM and 10:30 PM in the northbound direction, and between 6:31 AM and 1:38 AM in the southbound direction. Caltrain provides passenger train service seven days a week and provides extended service to Morgan Hill and Gilroy during commute hours.

Altamont Commuter Express Service (ACE)

ACE provides commuter rail service between Stockton, Tracy, Pleasanton, and San Jose during commute hours, Monday through Friday. Service is limited to four westbound trips in the morning and four eastbound trips in the afternoon and evening with headways averaging 60 minutes. ACE trains stop at the Diridon Station between 6:32 AM and 9:17 AM in the westbound direction, and between 3:35 PM and 6:38 PM in the eastbound direction.

Amtrak Service

Amtrak provides daily commuter passenger train service along the 170-mile Capitol Corridor between the Sacramento region and the Bay Area, with stops in San Jose, Santa Clara, Fremont, Hayward, Oakland, Emeryville, Berkeley, Richmond, Martinez, Suisun City, Davis, Sacramento, Roseville, Rocklin, and Auburn. The Capitol Corridor trains stop at the San Jose Diridon Station eight times during the weekdays between approximately 7:38 AM and 11:55 PM in the westbound direction. In the eastbound direction, Amtrak stops at the Diridon Station seven times during the weekdays between 6:40 AM and 7:15 PM.

Project Trip Generation

The trip generation analysis estimates the number of external vehicle-trips that will be generated by the proposed project. Baseline (or gross) vehicle-trips were estimated by using average vehicle-trip rates from the *ITE Trip Generation Manual, 10th Edition* for the office and shopping center land uses. The baseline trip estimates were reduced to account for the predicted vehicle mode share of the project based on its location and surrounding transportation system and land uses.

Internal Trip Reduction Adjustment

A mixed-use development with complementary land uses such as office and commercial, will result in a reduction of external site trips. Thus, the number of vehicle trips generated for each use may be reduced, since a portion of the trips would not require entering or exiting the site. Based on VTA's recommended mixed-use reduction, a maximum three percent trip reduction may be applied for the office and commercial uses, based on the office component. For the AM peak-hour, however, a three percent reduction of inbound office trips (equating to approximately 18 inbound trips) exceeds the total number of outbound trips generated by the commercial use (estimated to be six outbound trips). The estimated six outbound retail trips are all assumed to be internalized with the office use (as inbound office trips) during the AM peak-hour.

Location-Based Adjustment

The location-based adjustment reflects the project's vehicle mode share based on the place type in which the project is located per the San Jose Travel Demand Model. The project's place type was obtained from the *San Jose VMT Evaluation Tool*. Based on the Tool, the project site is located within a designated urban high-transit area. Therefore, the baseline project trips were adjusted to reflect an urban high-transit mode share. Urban high-transit is characterized as an area with high density, good accessibility, high public transit access, low single-family homes, middle-aged and older housing stock. Office and retail uses within urban high-transit areas have a vehicle mode share of 69 percent and 83 percent, respectively. Thus, a 31 percent reduction and 17 percent reduction were applied to the baseline trips estimated to be generated by the office and retail portions of the proposed project, respectively.

**Table 2
Project Trip Generation Estimates**

Land Use	ITE Land Use Code	Location	% of Vehicle Mode Share	% Reduction	Size	Daily		AM Peak Hour					PM Peak Hour							
						Rate	Trip	Pk-Hr Rate	Split		Trip			Pk-Hr Rate	Split		Trip			
								In	Out	In	Out	Total	In	Out	Total					
Proposed Land Uses																				
General Office Building ¹	710				627,207 Square Feet	9.740	6,109	1.160	86%	14%	626	102	728	1.150	16%	84%	115	606	721	
- Employment - Retail Internal Reduction ²				3%			-183				-6	-3	-9				-3	-18	-21	
- Location Based Reduction ³		Urban High-Transit	69%	31%			-1,837				-192	-30	-222				-35	-182	-217	
Shopping Center ¹	820				16,372 Square Feet	37.750	618	0.940	62%	38%	9	6	15	3.810	48%	52%	30	32	62	
- Employment - Retail Internal Reduction ²							-183				-3	-6	-9				-18	-3	-21	
- Location Based Reduction ³		Urban High-Transit	83%	17%			-74				-1	0	-1				-2	-5	-7	
Baseline Vehicle Trips (Before Reductions)							6,727				635	108	743				145	638	783	
Total Project Trips								4,450				433	69	502				87	430	517
Notes:																				
¹ Source: ITE <i>Trip Generation Manual</i> , 10th Edition 2017, average trip generation rates.																				
² As prescribed by the Transportation Impact Analysis Guidelines from VTA (October 2014), the maximum trip reduction for a mixed-use development project with office and retail is equal to 3% off the office component. However, since the number of outbound trips produced by the retail component is less than 3% of the inbound trips into the office component during the AM peak hour, all outbound retail trips during the AM peak hour are assumed to be internalized with the office component.																				
³ The project site is located within an urban high-transit area based on the City of San Jose VMT Evaluation Tool (February 29, 2019). The location-based vehicle mode shares are obtained from Table 6 of the City of San Jose Transportation Analysis Handbook (April 2018). The trip reductions are based on the percent of mode share for all of the other modes of travel besides vehicle.																				

Project Trip Generation

Based on the trip generation rates and reduction, it is estimated that the proposed mixed-use project would generate an additional 4,450 daily trips, with 502 trips (433 inbound and 69 outbound) occurring during the AM peak hour and 517 trips (87 inbound and 430 outbound) occurring during the PM peak hour. The trip generation estimates for the proposed project are shown in Table 2.

The proposed project will not provide replacement parking for the two surface parking lots currently on-site (the first is a paid public parking lot accessible from Market Street and the second is utilized by the Four Points by Sheraton Hotel along First Street). It is assumed that current users of the existing on-site parking will find alternative parking areas within the vicinity of the project site. Therefore, it can be assumed that these trips will continue to appear at Downtown area intersections in the vicinity of the project site. As a conservative measure, credit for existing trips into and out of the surface parking lots was not used to calculate the project trip generation.

Project Trip Distribution and Trip Assignment

The trip distribution pattern for the project was based on previous traffic studies prepared for similar projects in downtown San Jose. The project trips were assigned to the roadway network based on the proposed project driveway location, existing travel patterns in the area, freeway access, and the relative locations of complementary land uses. The project trip distribution pattern and trip assignment for the proposed project is shown on Figure 1.

Vehicular Site Access and Circulation

A review of the project site plan was performed to determine if adequate site access and on-site circulation is provided and to identify any access issues that should be improved. This review is based on site plans dated August 20, 2020 prepared by Arquitectonica, and in accordance with generally accepted traffic engineering standards and City of San Jose requirements. The street level site plan is shown on Figure 5.

Project Driveway/Site Access Design

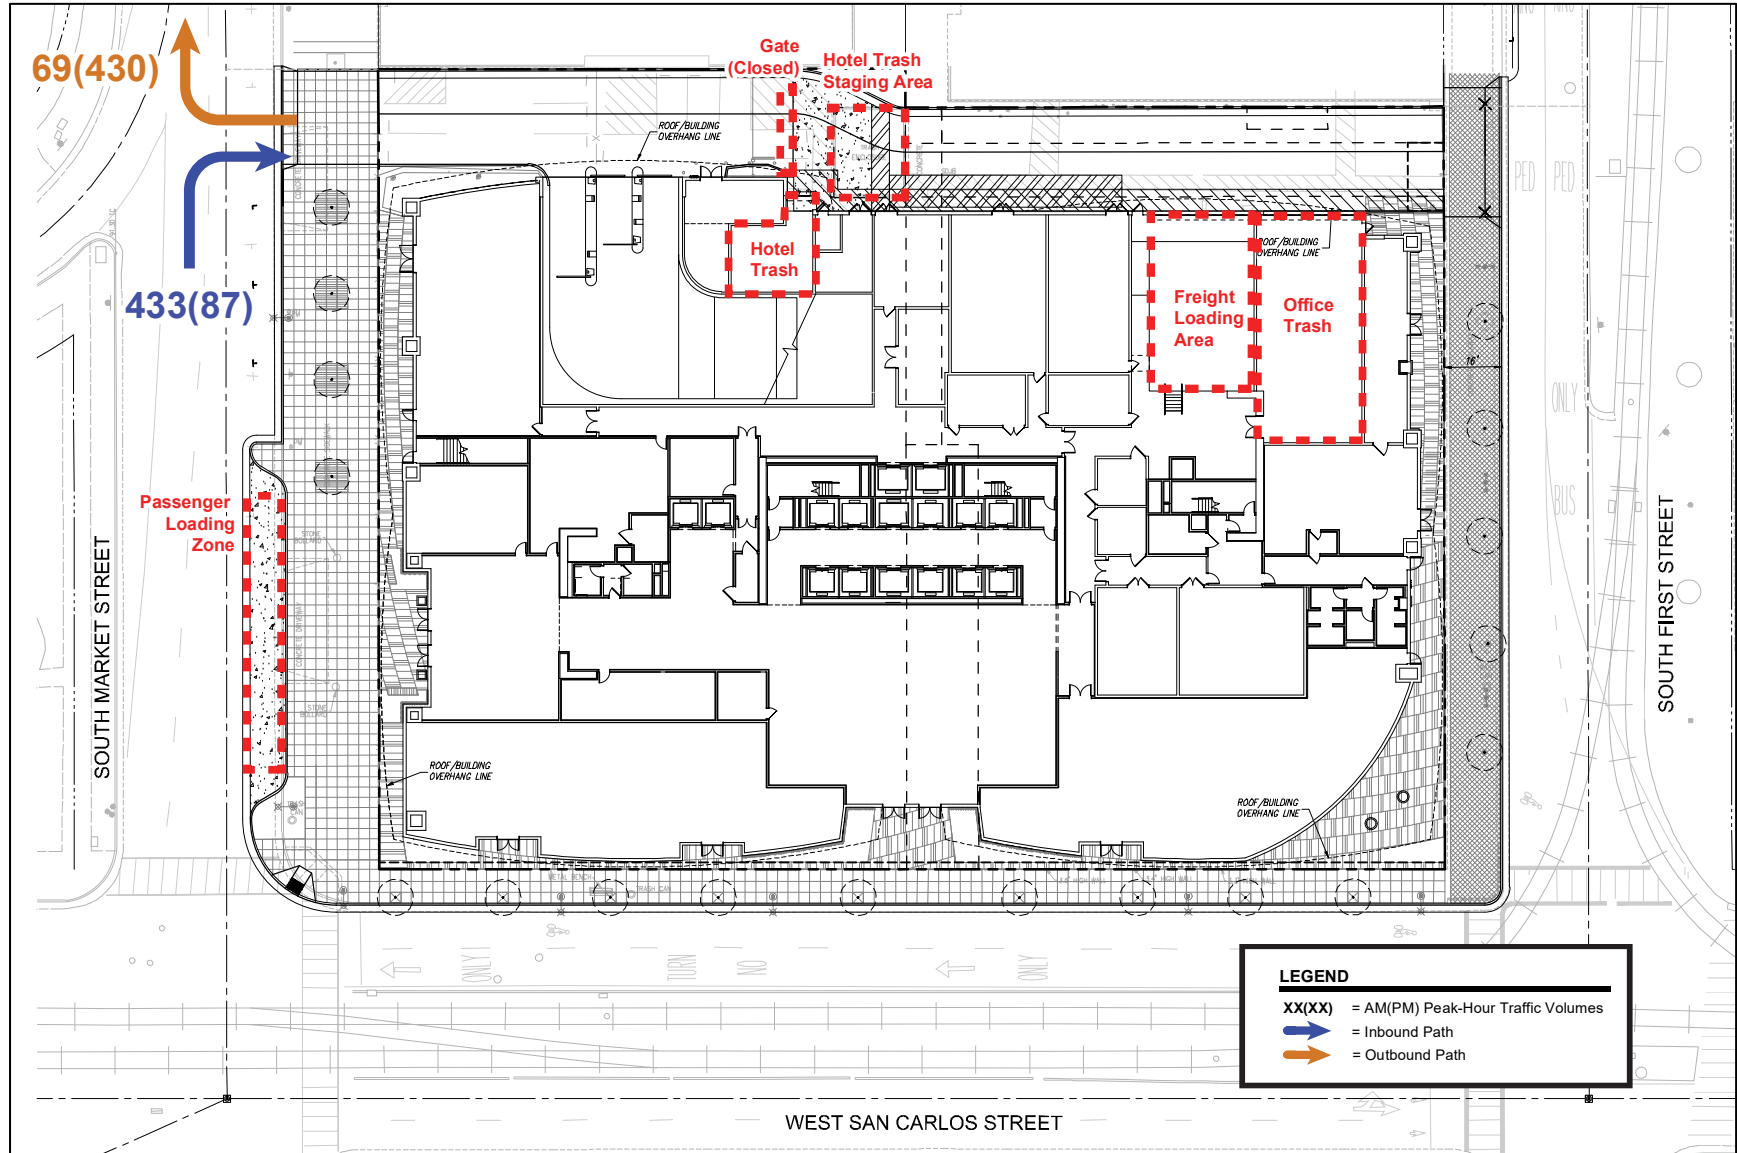

One two-way driveway along Market Street, approximately 225 feet north of San Carlos Street, will provide ingress and egress for the proposed on-site parking garage. The driveway is located along the northbound side of Market Street, east of Cesar Chavez Plaza. Therefore, turn-movements at the driveway will be restricted to right-in/right-out only operations. The proposed driveway curb-cut should meet the City's minimum width of 32 feet for two-way commercial driveways.

A second driveway, located 225 feet north of San Carlos Street along First Street, will primarily provide access to loading docks and trash collection facilities. The existing 16-foot wide driveway curb cut currently serving the Four Points Hotel parking lot will be extended to a width of approximately 38 feet with the proposed project, based on the site plan. Therefore, the proposed driveway would meet the City's 32-foot width requirement for two-way commercial driveways. It should be noted that providing a 38-foot width is necessary to accommodate exiting trucks, as shown in truck turning templates provided below.

Sight Distance at the Driveways Serving the Project

There are no existing trees or visual obstructions along the project frontages that would obscure sight distance at the project driveways. The project access points should be designed to be free and clear of any obstructions to provide adequate sight distance, thereby ensuring that exiting vehicles can see

Figure 5
Ground-Level Site Plan and Trips at Project Driveway

pedestrians on the sidewalk and other vehicles traveling on Market Street and First Street. Any landscaping and signage should be located in such a way to ensure an unobstructed view for drivers exiting the site.

Adequate sight distance (sight distance triangles) should be provided at the project driveway in accordance with the *American Association of State Highway Transportation Officials (AASHTO)* standards. Sight distance triangles should be measured approximately 10 feet back from the traveled way. Providing the appropriate sight distance reduces the likelihood of a collision at a driveway or intersection and provides drivers with the ability to exit a driveway and locate sufficient gaps in traffic. The minimum acceptable sight distance is often considered the AASHTO stopping sight distance. Sight distance requirements vary depending on the roadway speeds. Market Street has a posted speed limit of 25 miles per hour (mph), while First Street has a speed limit of 20 mph. The AASHTO stopping sight distance for a facility with a posted speed limit of 25 mph and 20 mph is 155 feet and 115 feet, respectively. Thus, a driver exiting the proposed Market Street driveway must be able to see 155 feet to the south along Market Street in order to stop and avoid a collision. Trucks exiting the First Street driveway must be able to see 115 feet to the south along First Street in order to stop and avoid a collision.

Based on the project site plan and observations in the field, vehicles exiting either of the project site driveways would be able to see approaching traffic on northbound Market Street and First Street as far away as 225 feet to the south at San Carlos Street. Therefore, it can be concluded that the project driveways would meet the AASHTO minimum stopping sight distance standards.

Project Driveway Operations

The project trip assignment at the proposed project driveways is shown in Figure 5. As mentioned previously, all vehicular project traffic would utilize the Market Street project driveway. Based on the estimated project trips, it is projected that a maximum of 433 inbound trips (during the AM peak-hour) would enter the parking garage. During the PM peak-hour, a maximum of 430 trips would exit the site onto Market Street. Inbound trips would arrive at an average rate of approximately 7 vehicles per minute during the AM peak-hour.

The flow rate at which vehicles enter the garage will depend primarily on the processing ability, or service rate, of the entry gates. Based on the site plan, the entry gates consist of one inbound lane, one outbound lane, and one reversible lane providing inbound access during the AM peak-hour and outbound access during the PM peak-hour. The gates must be able to process a minimum of 433 vehicles (approximately four vehicles per lane per minute, on average) to avoid inbound queueing during the AM peak-hour.

However, it is unlikely that inbound project traffic would be spread out evenly throughout the peak-hour. There would likely be instances where multiple vehicles (two to three vehicles for example) would arrive at the same time. Storage for approximately three vehicles will be provided within the drive aisle between the inbound gates and the driveway on Market Street.

On-Street Passenger Loading Zone

The site plan indicates a proposed passenger loading zone located along the west project frontage on Market Street, located approximately 35 feet north of San Carlos Street. The 80-foot long loading zone would provide space for three to four vehicles to park. The proposed loading zone may require the removal of one existing on-street parking space. There are currently no plans to install bike lanes along northbound Market Street along the west project frontage. Additionally, the total sidewalk width along the loading zone (measured between the loading zone curb to proposed building) would be at least 22 feet wide. Therefore, the proposed loading zone should not interfere with any bicycle or pedestrian facilities.

Additionally, the proposed loading zone would incorporate a half bulb-out at the northeast corner of the San Carlos Street/Market Street intersection and installation of an ADA-compliant curb ramp. The improvement would reduce the crossing distance of the crosswalk between the project site and Market Street island median. The improvement also will require signal modification and relocation of an existing signal pole at the intersection's northeast corner. The proposed passenger loading zone with bulb-out would be consistent with planned City improvements to install a curb extension, discussed within the pedestrian circulation discussion below.

Vehicular On-Site Circulation

The parking garage will provide 90-degree uniform parking stalls (self-parking) and valet-assisted parking along drive aisles and tandem stalls within Levels 2 to 4. Mechanical lift parking spaces are proposed within Levels 5 to 7.

As discussed above, the garage entrance would need to process a minimum of 433 vehicles per hour (approximately four vehicles per lane per minute, on average) during the AM peak-hour to avoid creating an inbound queue. Drivers will need to be directed to park as soon as they arrive, to prevent queueing back onto Almaden Boulevard. A minimum of eight valet staff will be needed to serve the garage entrance during the peak arrival/departure periods for the office use assuming that valets can assist with parking one vehicle each minute during the peak arrival period.

Continuous drive aisles run through the majority of the parking levels, shown in Figure 6. In general, the layout of each parking level provides opportunities for circulating vehicles to loop around without requiring U-turns. A dead-end drive aisle located on Level 7 (Figure 7) should not be problematic, given that drivers will be guided by valets and will not be circulating the garage in search of available parking spaces.

All drive aisles within the parking garage are shown to provide two-way access to 90-degree parking stalls. The drive aisles will meet the City's minimum width of 26 feet for two-way drive aisles with 90-degree parking along both sides. However, within Levels 2 to 4, parallel parking spaces are proposed within the 26-foot drive aisles, thus creating an effective width of approximately 18 feet along most drive aisles when vehicles are parallel-parked. The aisle-parked vehicles will be moved by valet attendants as necessary to retrieve a vehicle from an adjacent 90-degree parking space. The project should work with City staff to ensure that specific requirements for the valet operations and mechanical lifts are met.

Truck Site Access

The project proposes to maintain an existing drive aisle easement that runs along the north project frontage between First Street and an existing trash enclosure utilized by the adjacent Four Points by Sheraton Hotel. The site plan indicates that the drive aisle easement would be approximately 29 feet wide and the First Street driveway would be widened from 16 feet to 38 feet. The existing hotel trash enclosure would be demolished to provide a direct connection between First Street and Market Street. However, passenger vehicles would only be allowed to utilize the Market Street driveway and trucks would only be allowed to utilize the First Street driveway. Since the First Street driveway is proposed to only allow truck traffic, there will be no conflicts with vehicular traffic due to truck activity on-site.

As shown on Figure 5, the easement would serve the following loading and trash collection facilities on-site:

- Loading docks and central trash collection room for the proposed office development
- A trash collection room and staging area for the Four Points by Sheraton Hotel

Figure 6
Typical Parking Level Circulation

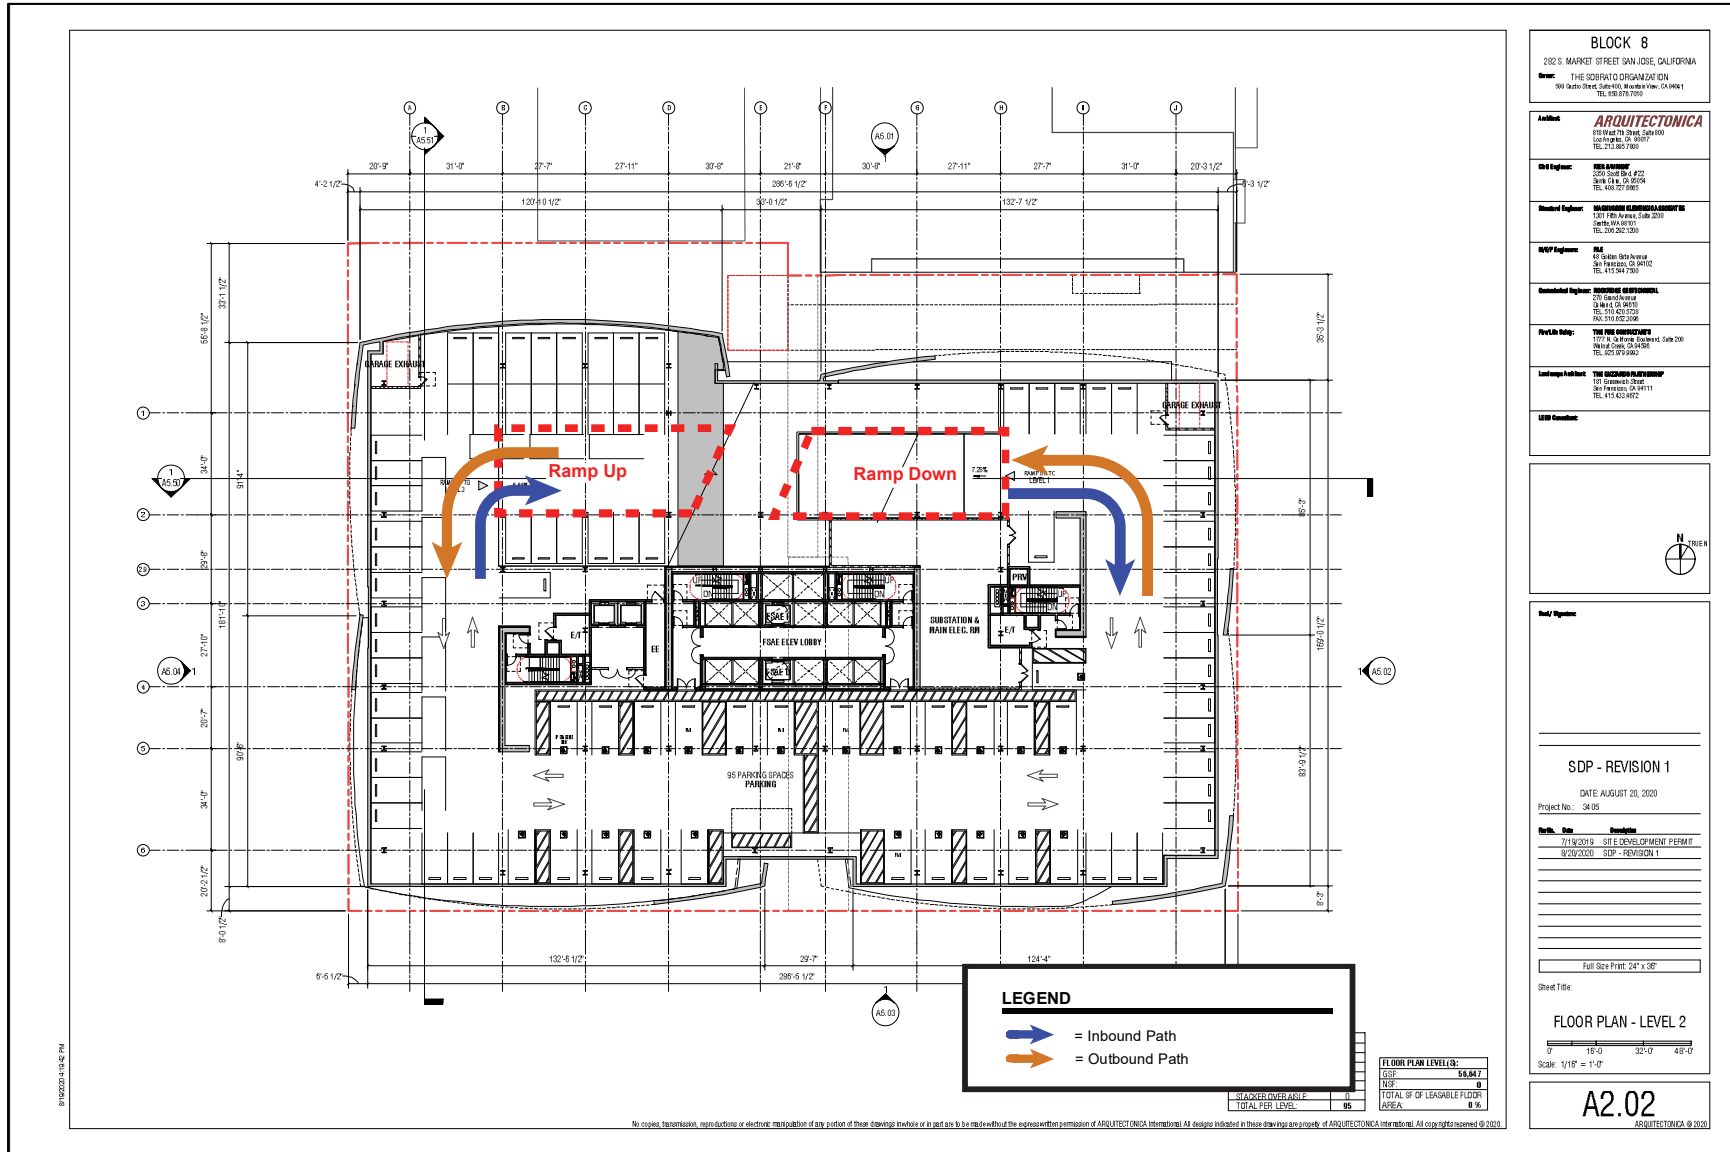

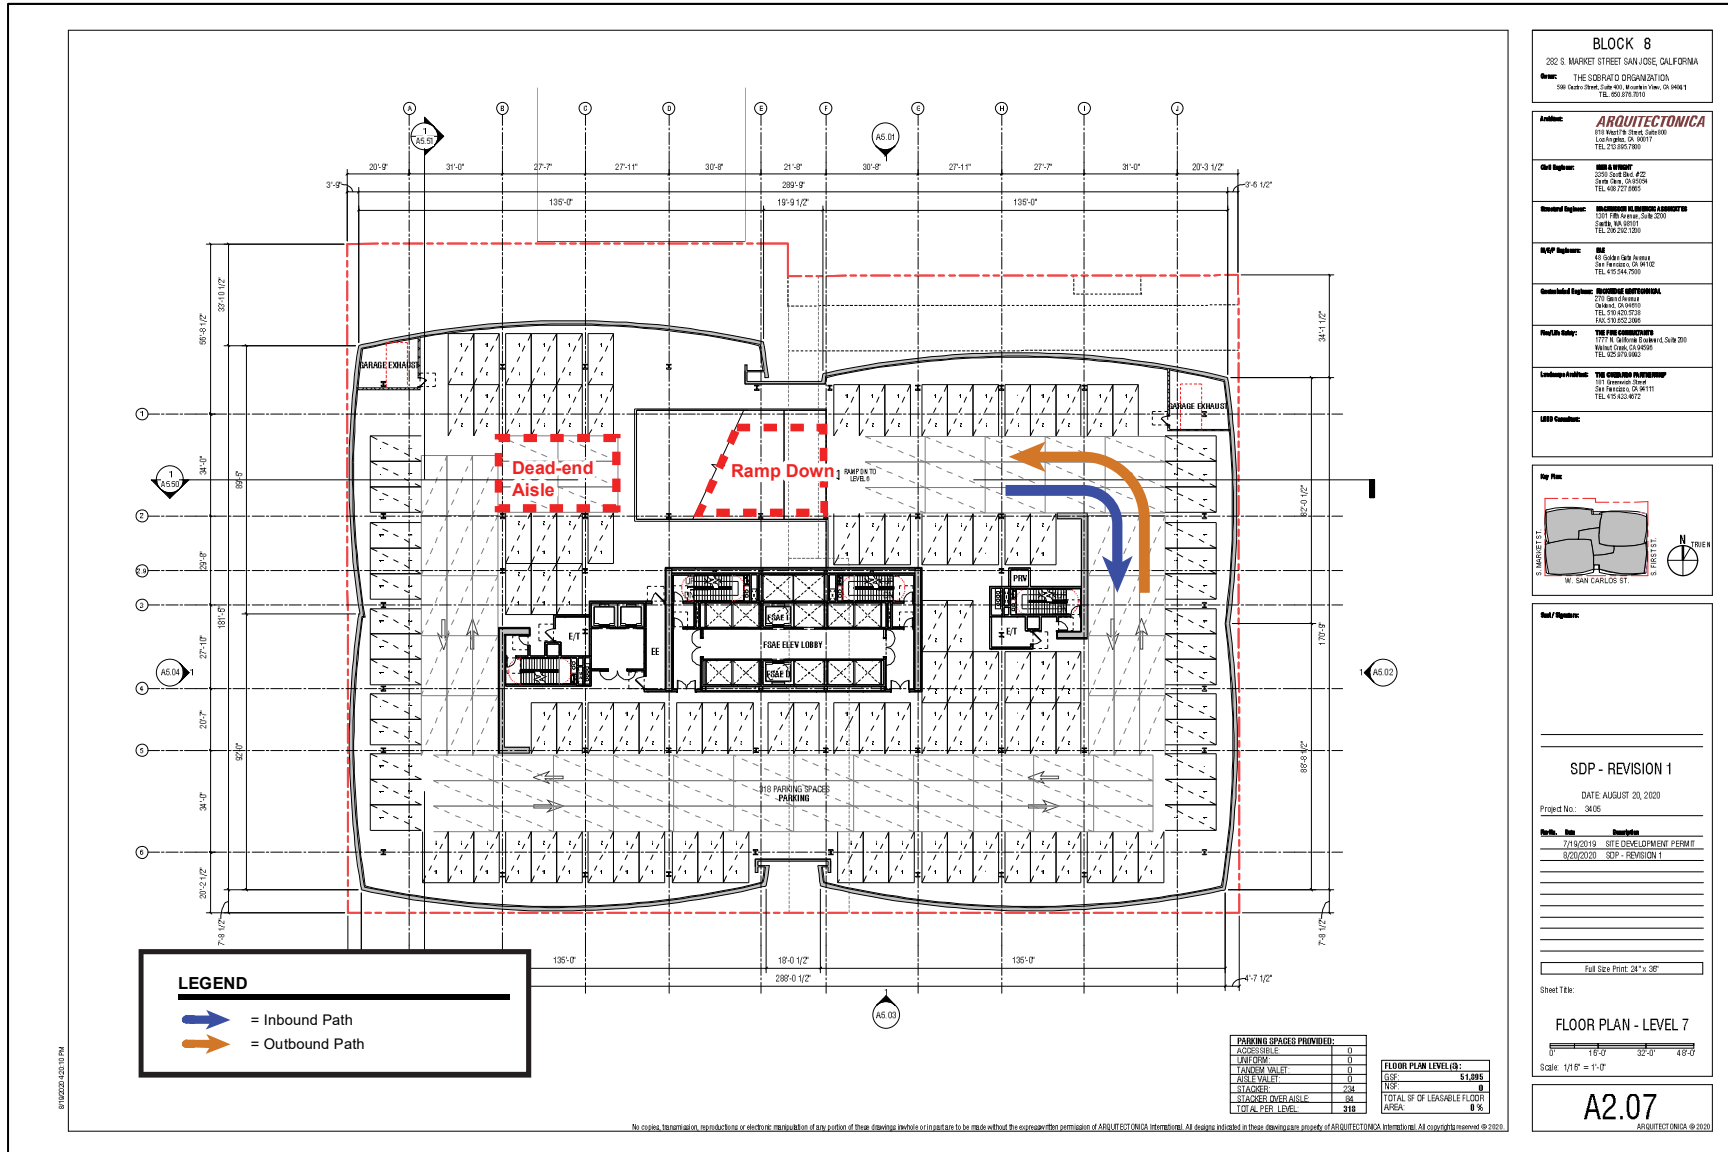

Figure 7
Level 7 Circulation

Trash Collection

A central trash collection area serving the proposed office development will contain trash compactors with roll-off containers. Figure 8 shows that 34-foot roll-off trucks will collect the roll-off containers and will be given sufficient space to reverse into the trash room. The proposed 38-foot wide First Street driveway would be sufficient to accommodate the trucks.

A separate trash room serving the Four Points Hotel will be located further west along the drive aisle easement. Collection vehicles will not enter the hotel trash room. During trash collection days, garbage containers will be moved using forklifts to a staging area located adjacent to the trash room and directly on the drive aisle easement. As shown on Figure 9, a front-load trash collection vehicle will enter from the First Street driveway and reverse out of the same driveway.

Freight Loading

Truck turning template for the freight loading docks are shown on Figure 10. Based on the City of San Jose off-street loading standards within the Downtown Area (20.70.420), offices with 100,000 to 175,000 square feet of total gross floor area shall provide one loading space. One additional loading space shall be included for each one hundred thousand square feet of total gross floor area in excess of 175,000 square feet. The proposed development will have office uses totaling up to 627,207 square feet. Therefore, the project is required to provide a total of six off-street loading spaces. Per section 20.70.450 of the Downtown Zoning Regulations, the Planning Director may authorize the reduction of two on-site loading spaces to one on-site loading space in connection with the issuance of a development permit if the Director finds that sufficient on-street loading space exists to accommodate circulation and manipulation of freight. All loading spaces should be designed to be no less than 10 feet wide, 30 feet long, and 15 feet high per the City code (20.90.420).

Space for two WB-40 trucks is provided within the loading area. However, evaluation of the truck turning operations shows that a second truck cannot physically enter the loading area if another truck is present. Although the project will not meet the City's minimum requirement for the number of loading docks, providing two loading docks may be sufficient. The project should work with City staff to identify the required off-street loading spaces.

Alternative Site Access Scenario

The Market Street project driveway would provide sole access to the project parking garage during most days of operation. Gates located between the parking garage entrance and the hotel trash staging area would be typically closed to prevent vehicles from utilizing the First Street driveway. However, traffic congestion along Market Street could inhibit exit from the Market Street driveway. In addition, traffic restrictions due to special events at Cesar Chavez Park or other nearby attractions also may inhibit the use of the Market Street driveway. Therefore, at the request of the applicant, a qualitative review of the use of the First Street driveway as an alternative access point is provided. Use of First Street as an ingress and egress point would be controlled by the building operator by opening gates east of the parking garage entrance. Figure 11 shows project driveway trips that are expected as a result of providing access through both the Market Street and First Street driveways. The use of the First Street driveway as an alternative access point will have minimal effect on intersection operations along surrounding streets.

As described above, the drive aisle easement would be approximately 29 feet wide and the First Street driveway would be widened from 16 feet to 38 feet. Therefore, the drive aisle and driveway would both meet the City's requirement of 26 feet for two-way driveways and drive aisles.

Figure 8
Truck Turning Template – Office Trash Collection

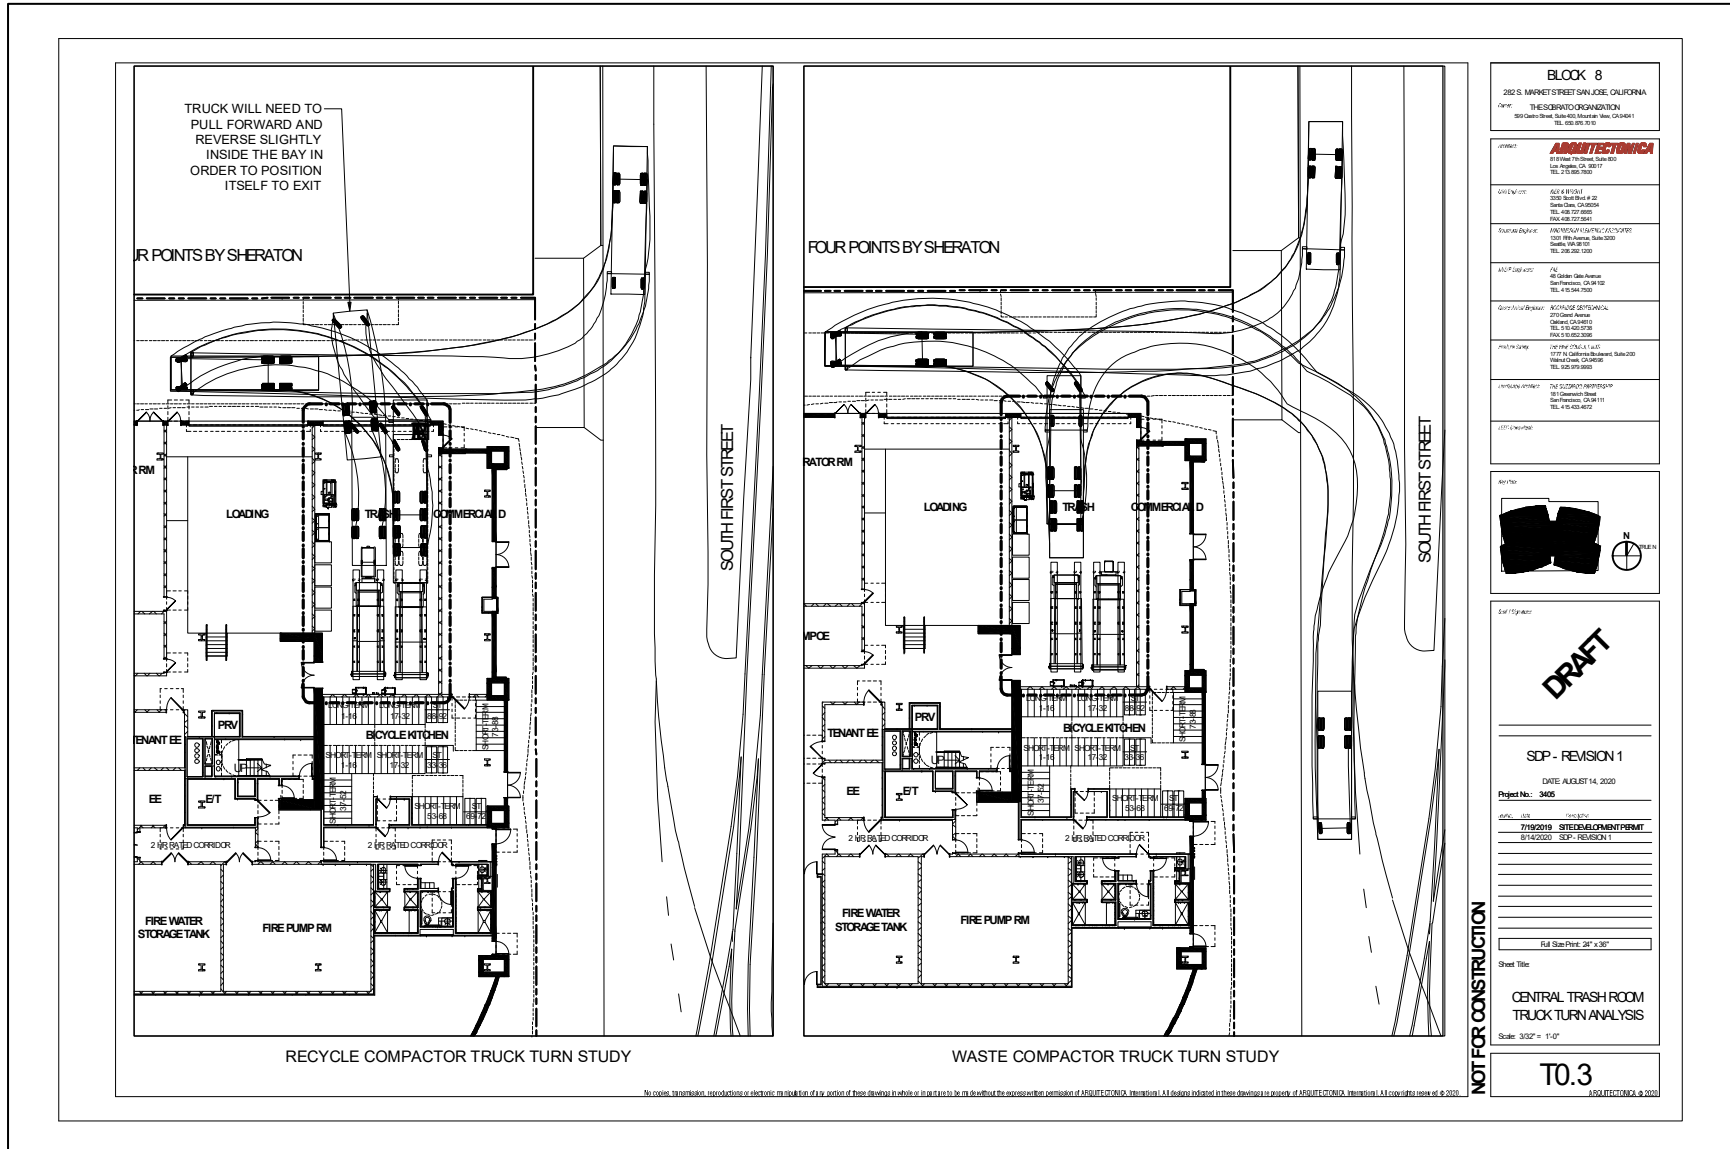

Figure 9
Truck Turning Template – Hotel Trash Collection

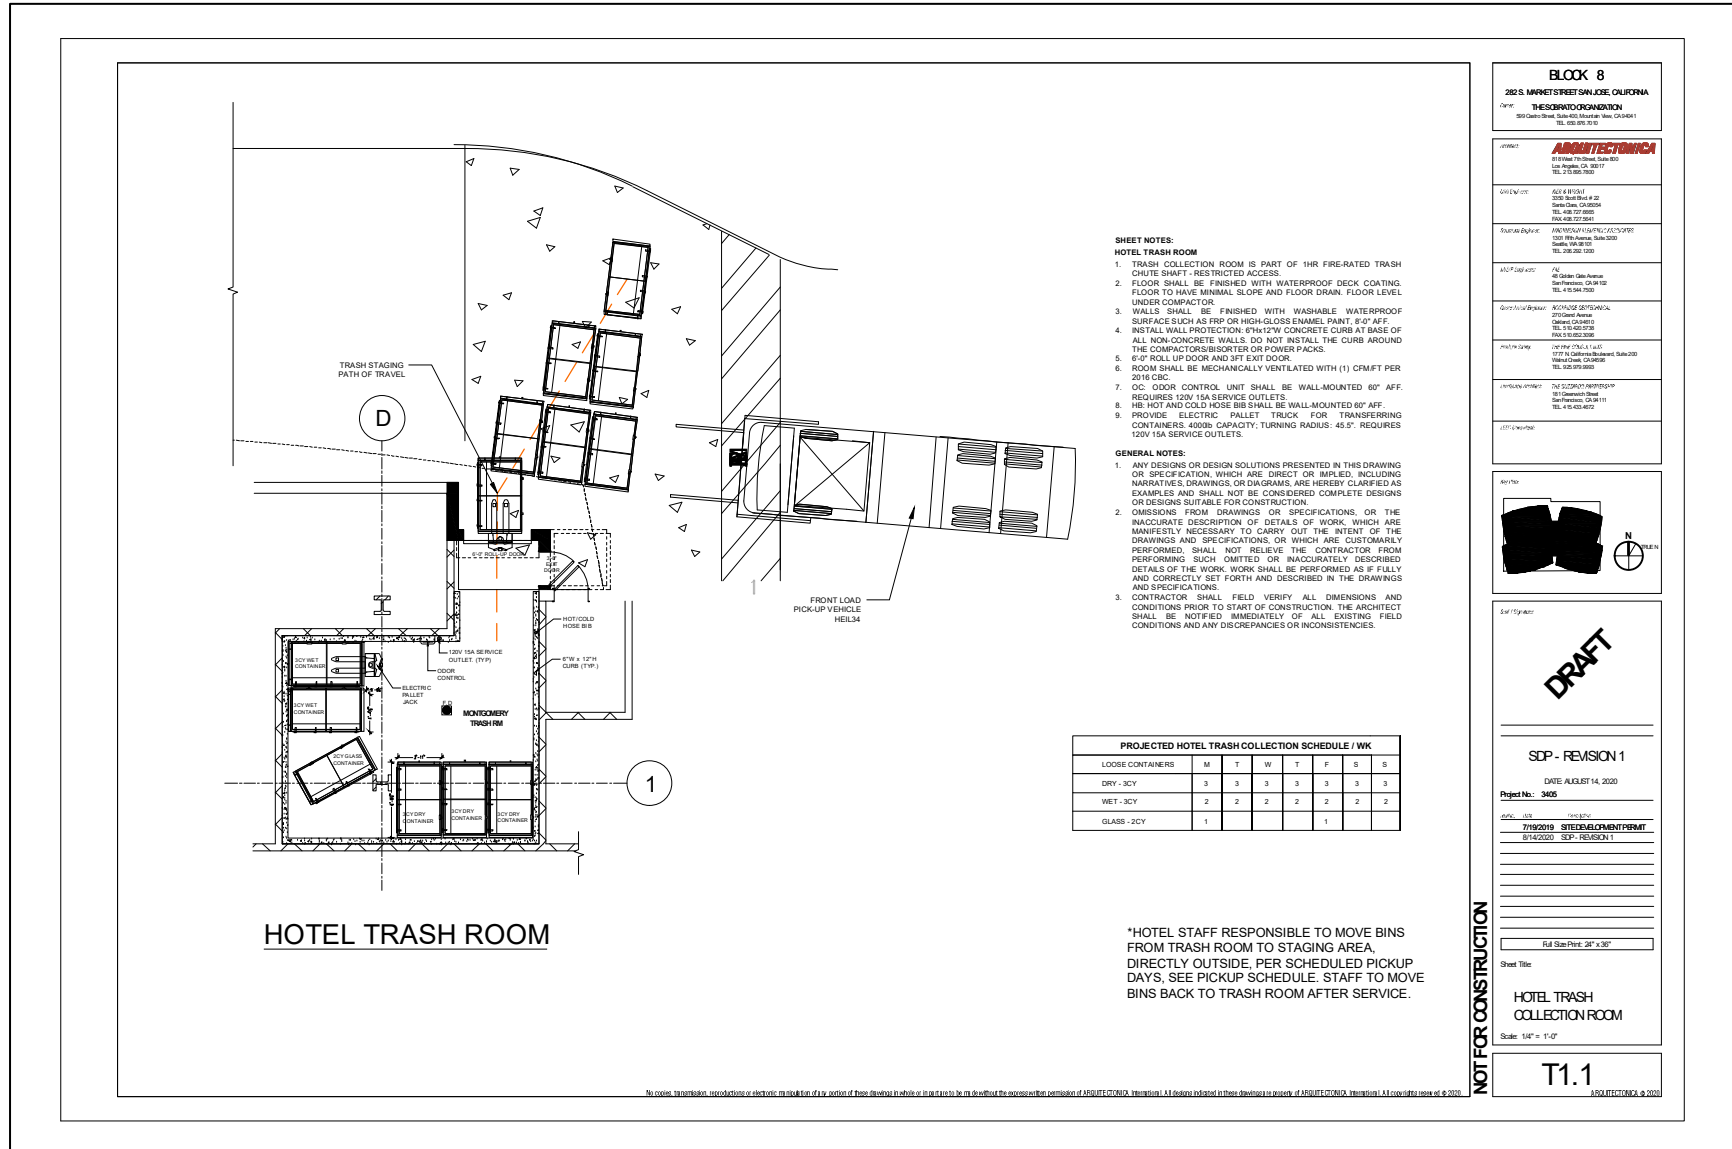

Figure 10
Truck Turning Template – Freight Loading Area

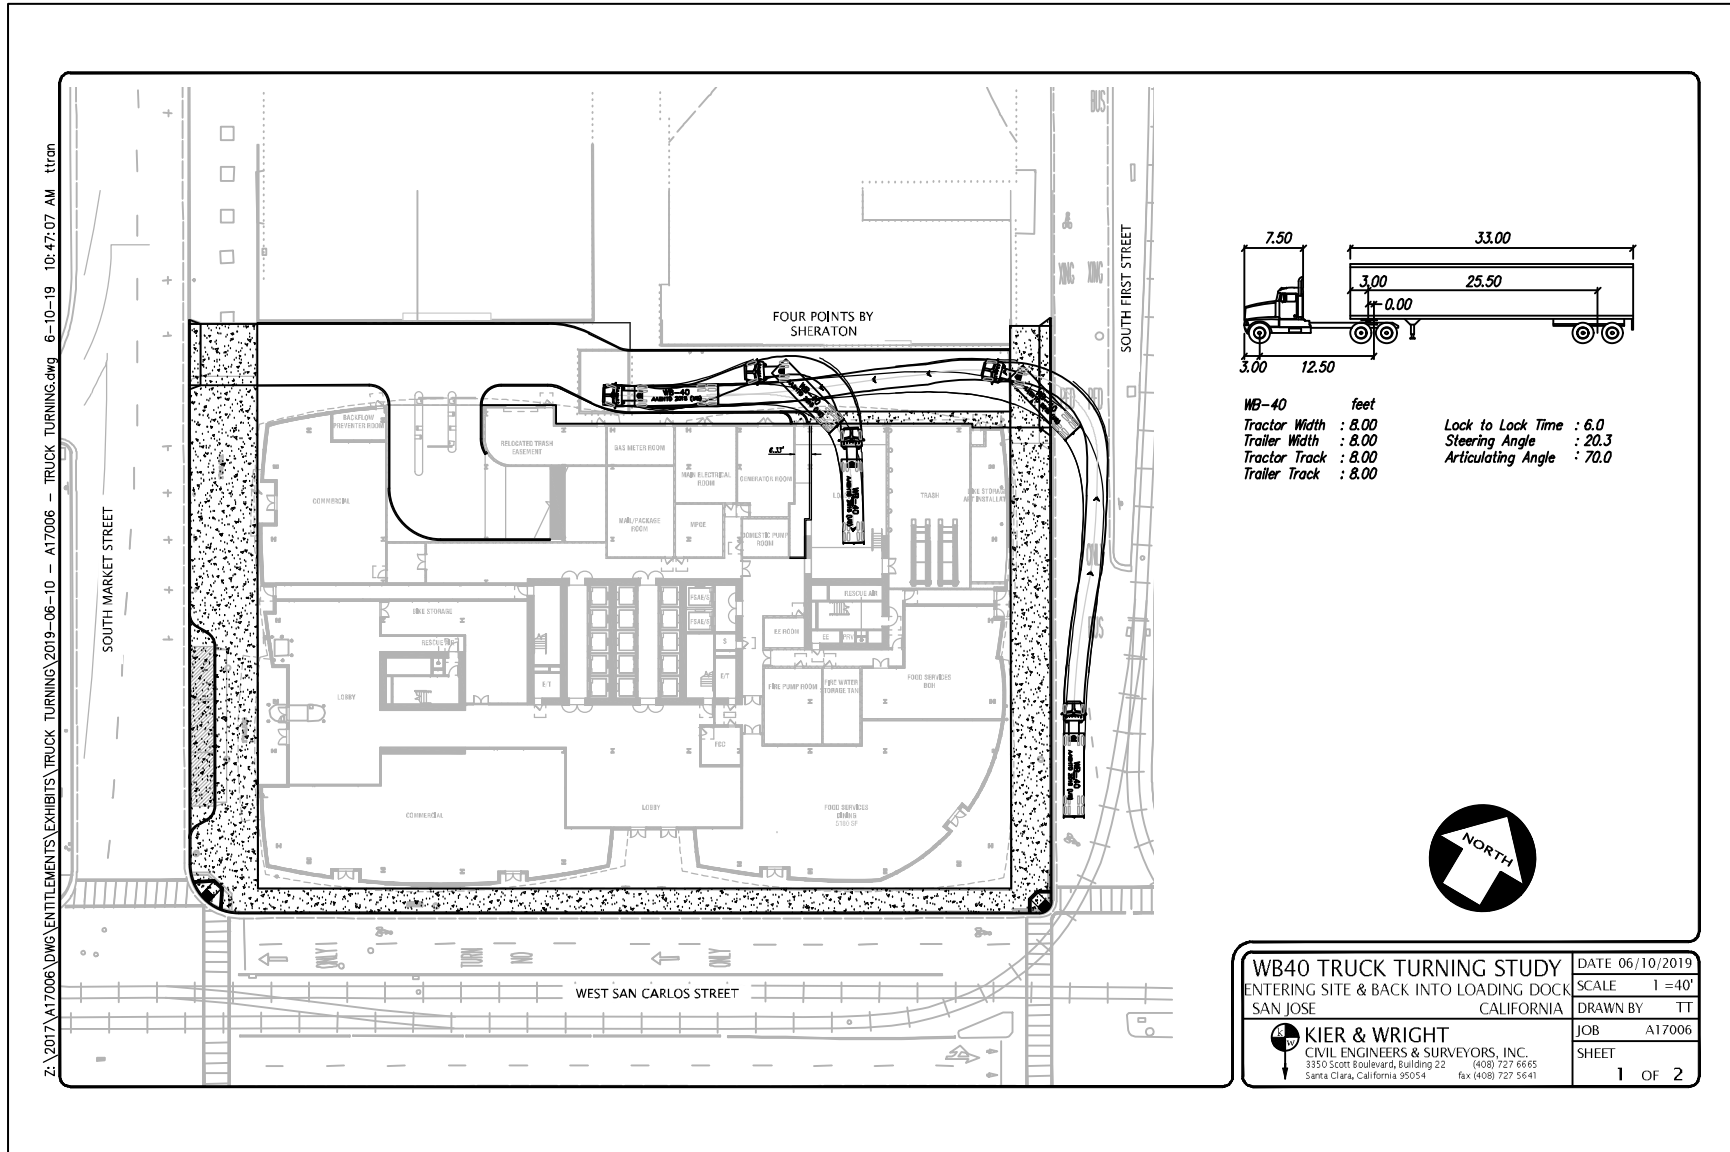

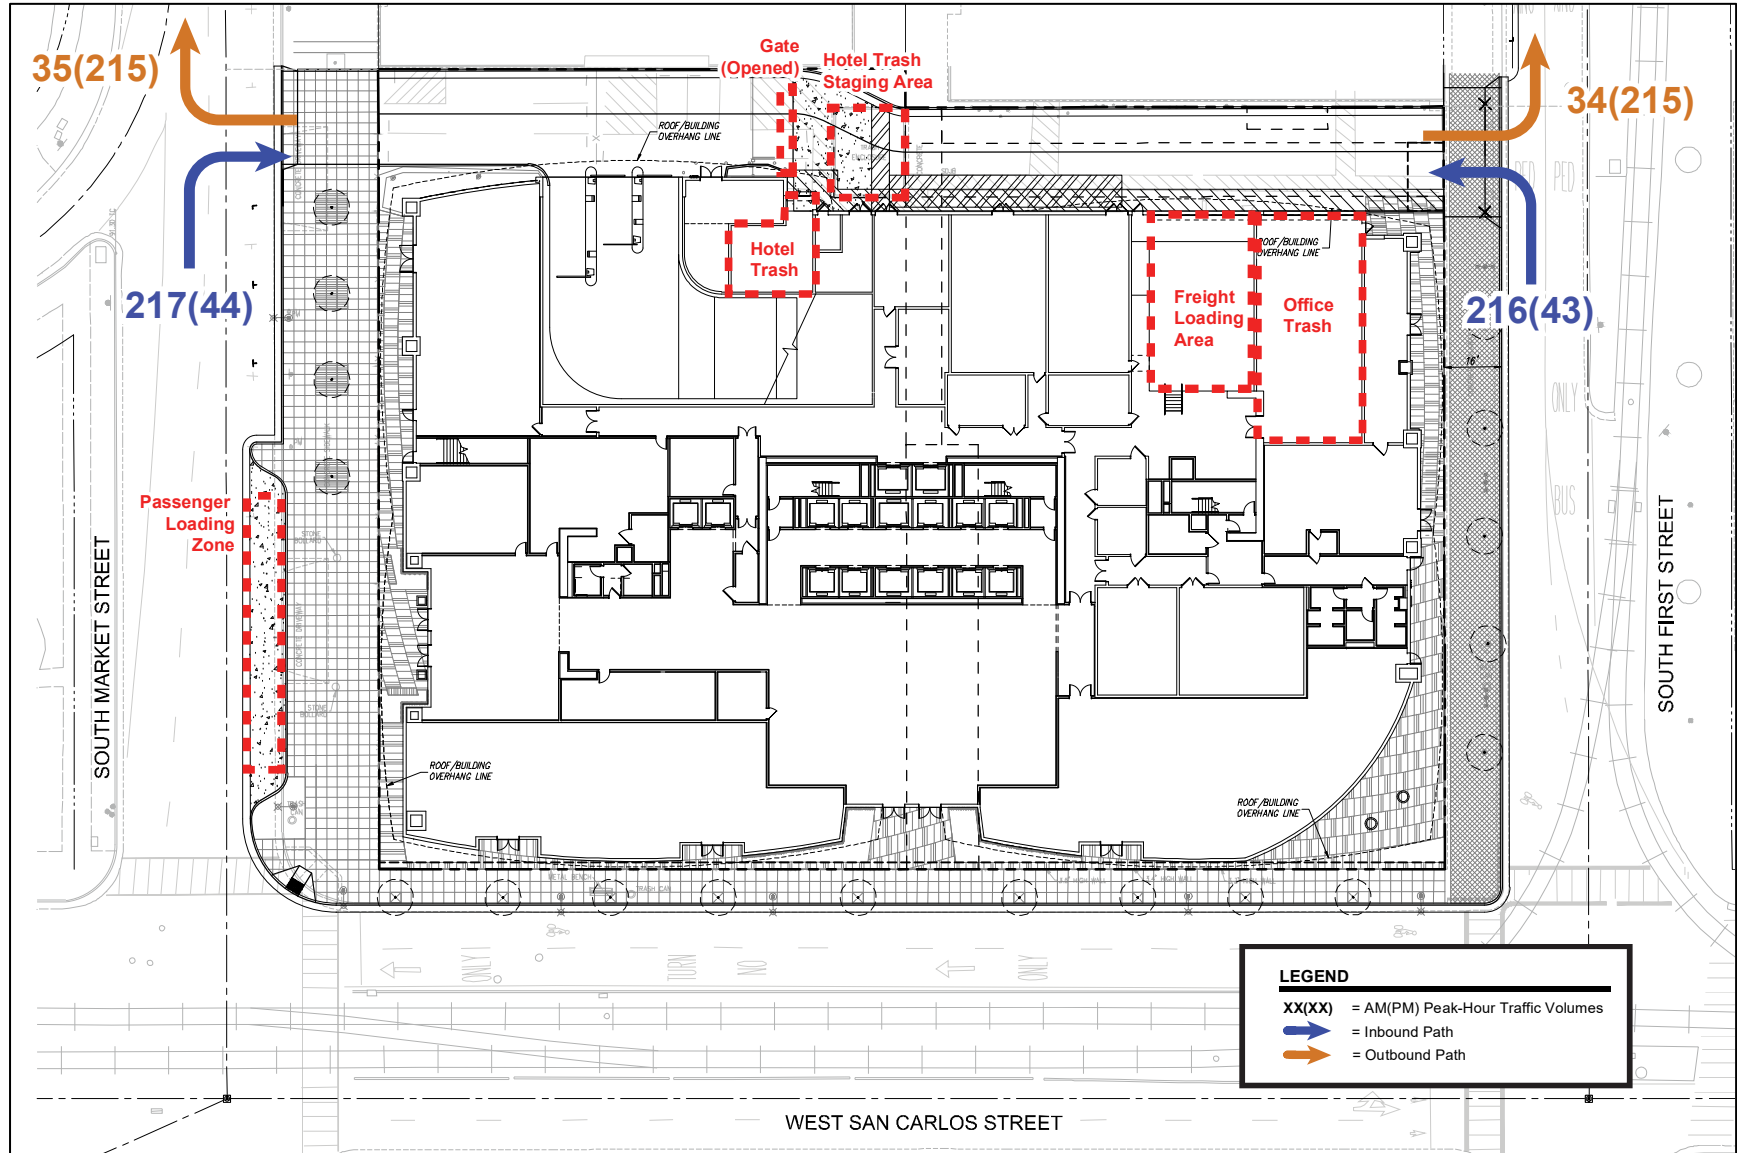

Figure 11
Project Driveway Trips – Site Access Alternative

The hotel trash staging area will be cleared and truck operations at the project loading docks will be managed in coordination with the opening of the gate to ensure a clear path of travel for vehicular traffic is provided.

Recommendations:

- The building operator should ensure that trash bins are cleared from the hotel staging area before allowing access through the First Street driveway.
- To prevent conflicts between trucks and passenger vehicles, truck access into or out of the freight loading docks should be restricted when parking garage access is allowed through the First Street driveway.
- The building operator should not allow access through the First Street driveway if a 26-foot wide path cannot be fully provided between the driveway and parking garage entrance due to trash or freight loading operations.
- Permanent signage should be installed at the First Street driveway to indicate that no inbound access is allowed. During days when access is allowed, the signage should be temporarily covered. Temporary signage should be placed at the First Street driveway and at the intersections of First Street/San Carlos Street and Market Street/San Carlos Street to provide directions to motorists when alternative access is allowed.

Pedestrian and Bicycle Access and Circulation

Pedestrian Circulation

The Downtown Streetscape Master Plan (DSMP) provides design guidelines for existing and future development for the purpose of enhancing the pedestrian experience in the Greater Downtown Area. Per the DSMP and shown in Figure 12, there are many designated Downtown Pedestrian Network Street (DPNS) in the vicinity of the project site, which are intended to support a high level of pedestrian activity as well as retail and transit connections. The DPNS streets provide a seamless network throughout the downtown that is safe and comfortable for pedestrians and connects all major downtown destinations. Design features of a DPNS create an attractive and safe pedestrian environment to promote walking as the primary travel mode.

Existing pedestrian and bicycle facilities throughout downtown provide connections to surrounding downtown destinations. Wide sidewalks are provided along all project frontages on Market Street, San Carlos Street, and First Street. Crosswalks are available at all signalized intersections.

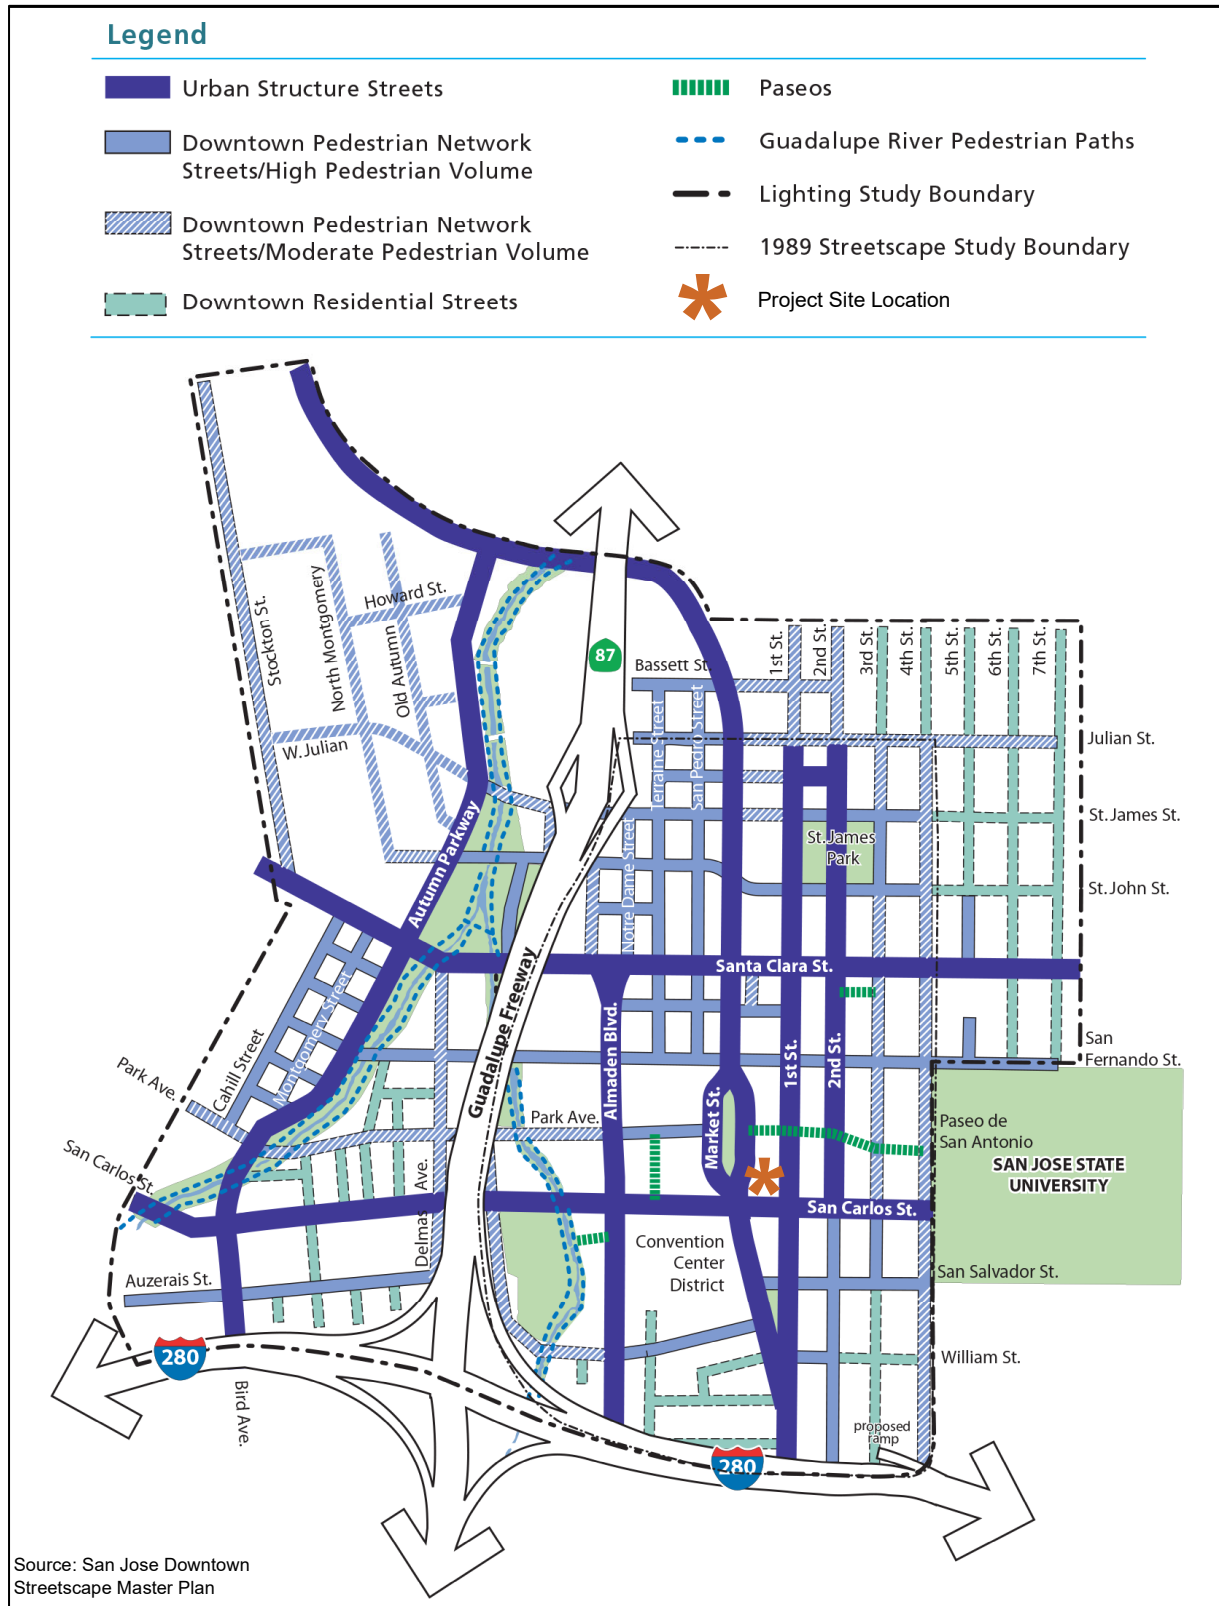

A mid-block crossing across the northbound side of Market Street provides access between the Plaza de Cesar Chavez Park and the Paseo de San Antonio Walk. This paseo provides pedestrian-only access to shops and business along the Paseo de San Antonio Walk between Market Street and San Jose State University. Another mid-block crossing on San Carlos Street, approximately 400 feet west of the Market/San Carlos intersection, provides access to the Convention Center LRT station located within the median of San Carlos Street.

Overall, the existing sidewalks and paseos provide good pedestrian connectivity and safe routes to the surrounding pedestrian destinations, including nearby transit stops, the Convention Center and Plaza de Cesar Chavez Park, as well as various businesses and restaurants surrounding the project site.

Bicycle Circulation

Class II bicycle facilities (striped bike lanes) are not provided along any of the project frontages. However, bike lanes are provided along several roadways within the project area and are listed in the

Figure 12
Downtown Pedestrian Street Network

Existing Bicycle Facilities section. Class III bicycle routes (shared bike lanes) are provided along the San Carlos Street and First Street frontages of the project.

The Guadalupe River multi-use trail system runs through the City of San Jose along the Guadalupe River and is shared between pedestrians and bicyclists and separated from motor vehicle traffic. The Guadalupe River trail is an 11-mile Class I bikeway from Curtner Avenue to Willow Street, and between Virginia Street and Palm Street to Alviso. This trail system can be accessed just west of the Almaden Boulevard and San Carlos Street intersection, approximately 1,400 feet west of the project site.

The Bay Wheels (formerly Ford Go Bike) bike share program allows users to rent and return bicycles at various locations. Bike share bikes can be rented and returned at designated docking stations throughout the Downtown area. Two bike share stations are located within 100 feet of the project site: at the northwest corner of the Market Street/San Carlos Street intersection and at the southwest corner of the First Street/San Carlos Street intersection.

Proposed Park Avenue Paseo

The City is proposing a reduction in width of Park Avenue between Market Street and Almaden Boulevard. The proposed improvements include narrowing Park Avenue to one travel lane in each direction and removal of the existing median island. The improvements would allow sidewalks to be widened, providing additional space for pedestrians and bicyclists. Crossing distances at crosswalks across Park Avenue also would be shortened.

Proposed intersection improvements at the Almaden Boulevard/Park Avenue and Market Street/Park Avenue intersections include a reduction of curb radii and installation of bulb-outs which typically increase visibility of pedestrians at crosswalks and encourage drivers to slow down before making a right-turn. Although the proposed improvements will result in a reduction of vehicular capacity along Park Avenue, they also are expected to improve safety and connectivity of pedestrian and bicycle networks within the vicinity of the proposed office development.

Proposed Bulb-out at Market Street/San Carlos Street

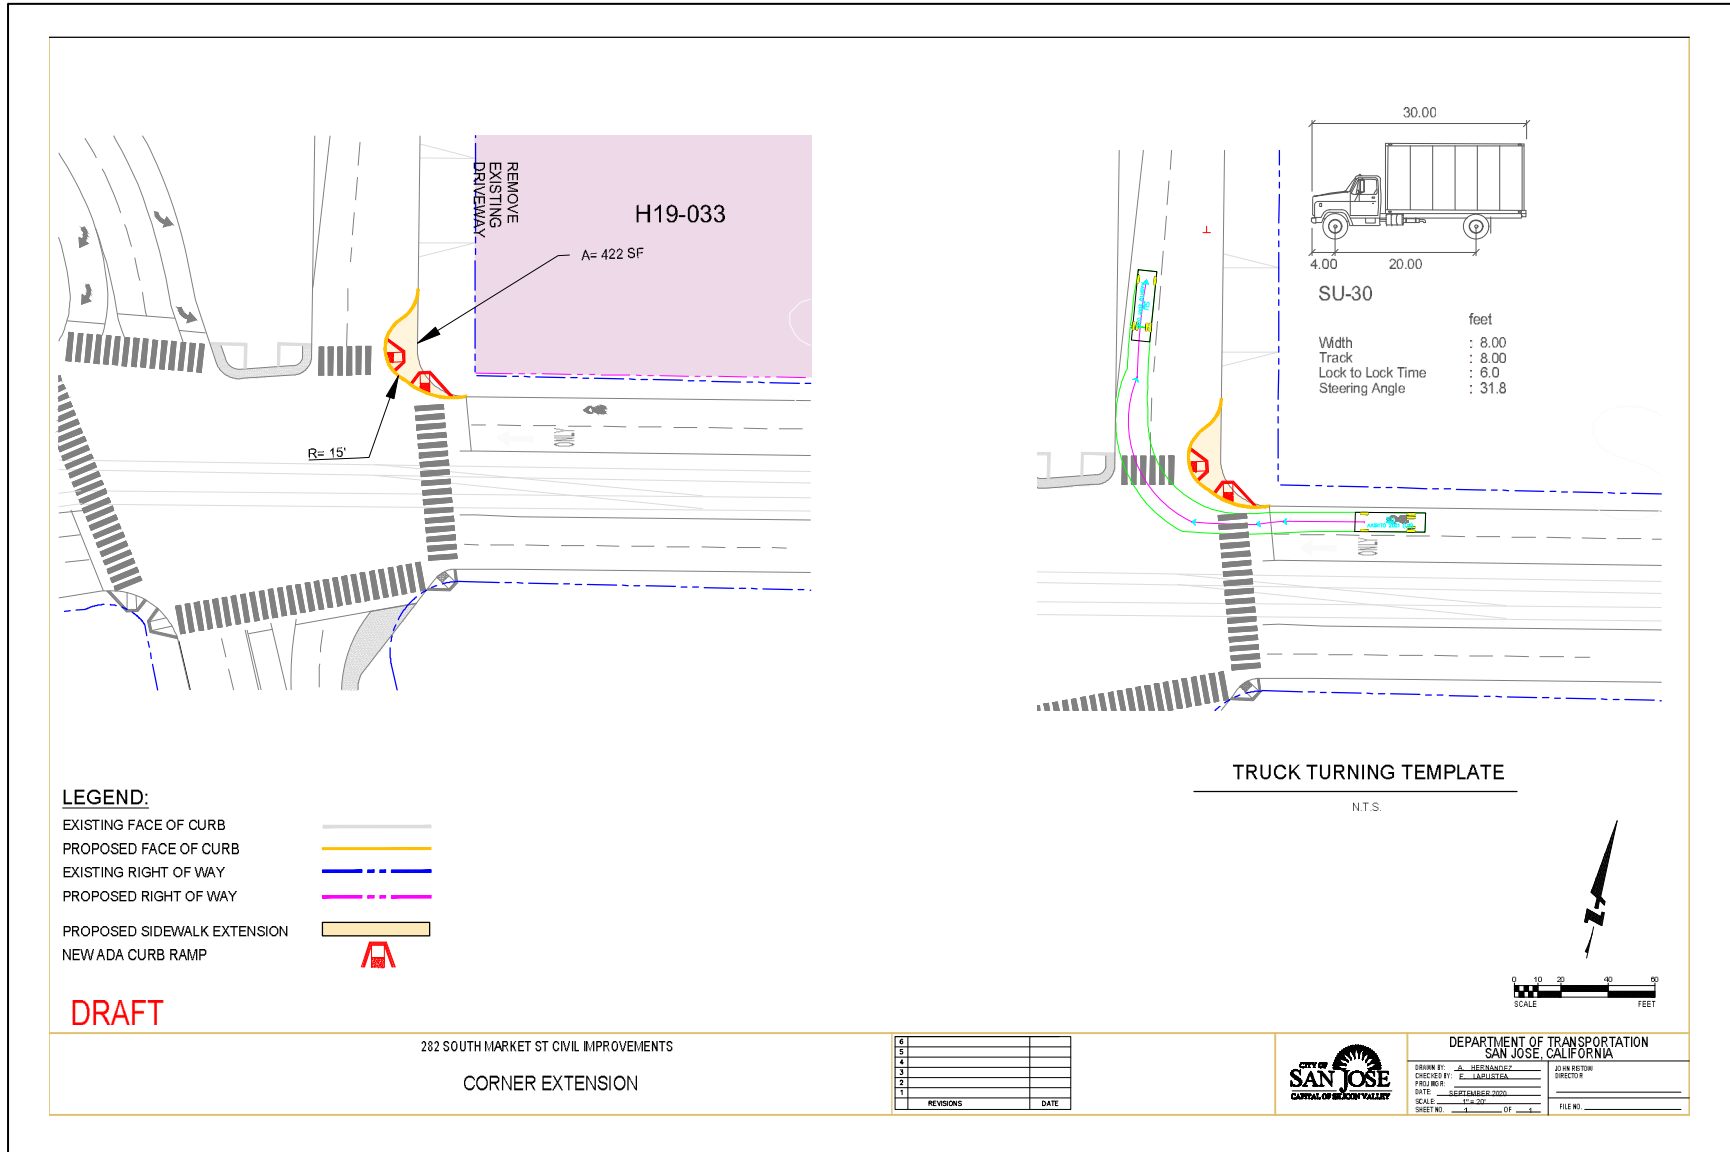

The City is proposing to install a half bulb-out at the northeast corner of the Market Street/San Carlos Street intersection, as shown on Figure 13. The proposed curb extension would reduce the crossing distance of the crosswalk between the project site and Market Street island median. The improvement also would include upgrading existing curb ramps to be ADA-compliant. The proposed improvement would alter the curb radius of the northeast corner of the intersection. An SU-30 design vehicle (i.e. light trucks) would still be able to turn from San Carlos Street onto Market Street, provided that the vehicle turn onto the inner lane of Market Street.

The improvement also will require signal modification and relocation of an existing signal pole at the intersection's northeast corner. The project should work with the City to ensure that any frontage improvements proposed by the project along Market Street (including the proposed passenger loading zone) would be compatible with proposed Market Street/San Carlos Street intersection improvements. The project may be required to construct the proposed Market Street/San Carlos Street intersection improvements (sidewalk extension, ADA compliant ramps, signal modification, and signal pole relocation) or pay a fair-share contribution towards their construction.

Transit Facilities

The project is in close proximity to major transit services that will provide the opportunity for multi-modal travel to and from the project site. The project site is located approximately 350 feet south of the San Antonio Light Rail Station platforms along First Street and Second Street. VTA bus stops are also located adjacent to the light rail platforms.

Figure 13
Proposed Bulb-out Improvement at Market/San Carlos

In addition, the San Jose Diridon Station is located along the Green LRT line and is served by Caltrain, ACE, and Amtrak. The pedestrian and bicycle facilities located adjacent to the project site provide access to major transit stations and provide for a balanced transportation system as outline in the Envision 2040 General Plan goals and policies.

Parking

Projects in the downtown area are located in close proximity to residences, recreation, and retail services, allowing individuals to live and satisfy their daily needs near their place of employment. The availability of bicycle lanes and sidewalks throughout downtown and the project's close proximity to major transit services will provide for and encourage the use of multi-modal travel options (bicycling and walking) and reduce the use of single-occupant automobile travel and demand for on-site parking described below.

Vehicle Parking

Parking for the proposed office project will be provided within six above-ground parking levels with access provided via a garage entrance along the western project frontage on Market Street. The project could include two levels of underground parking if the maximum amount of development identified is constructed.

According to the City of San Jose Downtown Zoning Regulations (Table 20-140), the project is required to provide 2.5 off-street vehicle parking spaces per 1,000 square feet of office use. The project could consist of up to 627,207 square feet of office space. The site plan dated August 20, 2020 indicates, however, that only 481,307 s.f. of net office space is currently proposed. Based on the City's off-street parking requirements, the office use would be required to provide a total of 1,204 off-street parking spaces. No additional parking spaces are required for the commercial/retail use. The project proposes to provide the minimum the number of off-street parking spaces as required by City. Therefore, the project will not be required to submit a TDM program.

Bicycle Parking

Based on the project's downtown location, it is likely that employees of the proposed office use will be able to live in close proximity to the site or will be able to quickly access transit to reach their place of residence. Therefore, the project is required to meet the City's Bicycle Parking requirements. The City Municipal Code (Table 20-190) requires one bicycle parking space per 4,000 square feet of office use. Bicycle parking spaces shall consist of at least eighty percent short-term and at most twenty percent long-term spaces. Per Code 20.70.485, uses which are not required to provide vehicle parking spaces (i.e. the ground-floor commercial use) are required to provide only two short-term bicycle parking spaces and one long-term bicycle parking spaces. Thus, the proposed mixed-use project (481,307 s.f. of net office space) is required to provide a total of 124 bicycle parking spaces: 99 short-term bicycle parking spaces and 25 long-term bicycle parking spaces to meet the City standards. The City's definition of short-term and long-term bicycle parking is described below.

City of San Jose Long-Term and Short-Term Bicycle Parking

Long-term bicycle parking facilities are secure bicycle storage facilities for tenants/employees of a building that fully enclose and protect bicycles and may include:

- A covered, access-controlled enclosure such as a fenced and gated area with short-term bicycle parking facilities,
- An access-controlled room with short-term bicycle parking facilities, and
- Individual bicycle lockers that securely enclose one bicycle per locker.

Short-term bicycle parking facilities are accessible and usable by visitors, guests, or business patrons and may include:

- Permanently anchored bicycle racks,
- Covered, lockable enclosures with permanently anchored racks for bicycles,
- Lockable bicycle rooms with permanently anchored racks, and
- Lockable, permanently anchored bicycle lockers.

The project is proposing 111 short-term parking spaces and 31 long-term parking spaces. The project would therefore meet the City's bicycle parking requirement. The site plan indicates that bicycle parking will be located within a dedicated storage room at ground level and will be easily accessible from sidewalks along the First Street project frontage. From the bicycle storage room, internal walkways provide access to the San Carlos Street and Market Street lobbies.

Vehicular Queuing Analysis

A vehicle queuing analysis was completed for high-demand movements at the study intersections. The study locations were selected based on the number of projected project trips at utilizing left-turning lanes at surrounding intersections. The vehicle queuing analysis was estimated using a Poisson probability distribution, which estimates the probability of "n" vehicles for a vehicle movement using the following formula:

$$P(x=n) = \frac{\lambda^n e^{-\lambda}}{n!}$$

Where:

$P(x=n)$ = probability of "n" vehicles in queue per lane

n = number of vehicles in the queue per lane

λ = average number of vehicles in the queue per lane (vehicles per hour per lane/signal cycles per hour)

The basis of the analysis is as follows: (1) the Poisson probability distribution is used to estimate the 95th percentile maximum number of queued vehicles per signal cycle for a particular movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the movement. The results of the queue analysis are summarized in Table 3.

The queuing analysis shows that the eastbound left-turn movement at the Market Street and San Carlos Street intersection currently experiences vehicular queue lengths that exceed the existing storage capacity during both AM and PM peak hours and would continue to do so under background conditions. The addition of project traffic is projected to lengthen the queue during both peak hours. The projected storage deficiencies could only be improved by lengthening the left-turn pocket. However, due to the presence of light rail tracks within the center median of San Carlos Street, no improvements are feasible for the eastbound left-turn pocket.

It is also important to note that the project's close proximity to major transit services and bicycle facilities will provide for and encourage the use of multi-modal travel options and reduce the use of single-occupant automobile travel. It is expected that the auto trips ultimately generated by the project would be less than those estimated within this study and the identified operational deficiencies (queues

at intersections) reduced as development and the planned enhancement of the multi-modal transportation system progresses within the downtown area.

Conclusions

The proposed office building will consist of up to 627,207 square-feet (s.f.) of leasable office space and 16,372 s.f. of ground-floor commercial space. The proposed office building will replace a public surface parking lot accessible from Market Street and a separate surface parking lot accessible from First Street currently used by the Four Points by Sheraton Hotel located north of the project site. Parking for the proposed office project will be provided within six above-ground parking levels with access provided via a garage entrance along the western project frontage on Market Street. The project could include two levels of underground parking if the maximum amount of development identified is constructed. A second project driveway, located along the eastern project frontage on First Street, provides access to an existing drive aisle easement along the north project frontage and will be utilized to access the project's proposed loading dock and trash collection areas for both the office development and the Four Points Hotel.

The project site is located within the Downtown Growth Area Boundary, for which an Environmental Impact Report (EIR), *Downtown San Jose Strategy Plan 2040 (DTS 2040)*, has been completed and approved. With adoption of DTS 2040, this project is covered under DTS 2040 and no CEQA transportation analysis is required.

The availability of bicycle lanes and sidewalks throughout downtown and the project's proximity to major transit services will provide for and encourage the use of multi-modal travel options (bicycling and walking) and reduce the use of single-occupant automobile travel. Therefore, the estimates of trips to be generated by the proposed project as presented and evaluated within this study may represent an over-estimation of traffic and impacts associated with the proposed project. It is expected that the auto trips ultimately generated by the project would be less and the identified operational issues reduced with the use of the multi-modal transportation system within the Downtown area.

A summary of the site access and circulation review along with recommended adjustments is provided below.

Recommendations

- A minimum of eight valet staff will be needed to serve the garage entrance during the peak arrival/departure periods for the office use assuming that valets can assist with parking one vehicle each minute during the peak arrival period.
- The project should work with City staff to ensure that specific requirements for the valet operations and mechanical lifts are met.
- The project is required to provide a total of six off-street loading spaces per the City code. Although the project will not meet the City's minimum requirement for the number of loading docks, providing two loading docks may be sufficient. The project should work with City staff to identify the required off-street loading spaces.
- Alternative Site Access Recommendations:
 - The building operator should ensure that trash bins are cleared from the hotel staging area before allowing access through the First Street driveway.
 - To prevent conflicts between trucks and passenger vehicles, truck access into or out of the freight loading docks should be restricted when parking garage access is allowed through the First Street driveway.

- The building operator should not allow access through the First Street driveway if a 26-foot wide path cannot be fully provided between the driveway and parking garage entrance due to trash or freight loading operations.
- Permanent signage should be installed at the First Street driveway to indicate that no inbound access is allowed. During days when access is allowed, the signage should be temporarily covered. Temporary signage should be placed at the First Street driveway and at the intersections of First Street/San Carlos Street and Market Street/San Carlos Street to provide directions to motorists when alternative access is allowed.
- The project should work with the City to ensure that any frontage improvements proposed by the project along Market Street (including the proposed passenger loading zone) would be compatible with proposed Market Street/San Carlos intersection improvements. The project may be required to construct the proposed Market Street/San Carlos Street intersection improvements (sidewalk extension, ADA compliant ramps, signal modification, and signal pole relocation) or pay a fair-share contribution towards their construction.
