Hi Todd and Jer,

Please see the comment below from the Transportation Department.

Thank you,

Dionne Harris, MArch

Subject: SMP00159R2 IS study

Dionne,

I have one comment to the SMP00159R2 IS study transmitted to Transp/drainage (Benjie Cho) on May 15, 2018:

d) Would the proposed Project result in changes in the amount of surface water in any water body?

Under existing conditions, runoff from areas subject to mining in the northern portions of the site are conveyed to one of two sedimentation basins, which detain and provide water quality treatment for runoff prior to being discharged via natural drainage channels near the southwestern corner of the site. These conditions would be maintained during on-going mining activities under the proposed Project. Nonetheless, a site-specific hydrology study shall be prepared to determine whether the Project's interim drainage conditions would result in changes in the amount of surface water in any water body.

Following reclamation, all runoff from areas subject to mining would be conveyed to a permanent sedimentation basin and fully retained on site and allowed to infiltrate into the groundwater basin. Although total runoff from the site ultimately would reach the same bodies of water as under existing conditions, the required EIR shall nonetheless evaluate the Project's potential to reduce the amount of water in any downstream water body.

Page 4-36 should show "Potentially significant Impact" not "No Impact"

I can add to blue beam if you let me know the BB number,

Thanks,

Everett Duckworth, P.E.,
