Appendix D2: Future Year (2025) Cumulative Projects

EXECUTIVE SUMMARY

In support of the Environmental Impact Report (EIR) being prepared in accordance with the California Environmental Quality Act (CEQA), this study analyzes the potential transportation impacts of the proposed Ocean Avenue Project (Project) in the City of Santa Monica (City). This study describes existing transportation network conditions, identifies the assumptions and methodologies used to analyze the proposed Project's impacts on intersection operations and vehicle miles traveled (VMT), and provides a comparative analysis of the transportation impacts for the proposed Project and its alternatives. Potential impacts to transit, bicycle and pedestrian facilities, other operational issues are discussed in the EIR.

PROJECT DESCRIPTION

The Project site is located on two parcels separated by 1st Court, refer to herein as the "Ocean Avenue Parcel" and the "2nd Street Parcel." The Ocean Avenue Parcel is approximately 52,500 square feet (sf) (1.2 acres), bounded by Ocean Avenue to the west, Santa Monica Boulevard to the south, 1st Court to the east, and 1301 Ocean Avenue to the north. The 2nd Street Parcel is approximately 30,000 sf (0.69 acres), bounded by 1st Court to the west, Santa Monica Boulevard to the south, 2nd Street to the east, and 1332 2nd Street to the north. Collectively, these two parcels (along with the portion of 1st Court adjacent to and between the two parcels) are considered the "Project site." Project components include:

- A hotel building consisting of 120 rooms and associated meeting, banquet, and spa space located in the central portion the Ocean Avenue Parcel
- 100 residential apartments (including 19 replacement rent-controlled apartments plus deed-restricted affordable units and market-rate units) located on the upper floors of the buildings located at the corner of Ocean Avenue and Santa Monica Boulevard and on the 2nd Street Parcel.
- Approximately 36,110 sf of retail and restaurant uses (including outdoor dining areas)
- An approximately 35,500-sf Cultural Use Campus located at the northern end of the Ocean Avenue Parcel consisting of two existing City-designated landmarks located at 1333 and 1337 Ocean Avenue that will be rehabilitated and relocated on the northern portion of the Project site along Ocean Avenue and a new building located behind (i.e., to the east of) the City-designated landmark buildings
- An approximately 5,000-sf public observation deck (including approximately 1,000 sf of restrooms and lobby area) will be provided on the roof of the Hotel Building
- A subterranean parking garage with capacity for up to 285 vehicles

Vehicular access to the Project site would be provided via 1st Court (ingress) and 2nd Street (egress). 1st Court is a one-way alley that currently runs north-south from Arizona Avenue to Santa Monica Boulevard. Under the proposed Project 1st Court would be rerouted into an "L"-shaped configuration and vehicles traveling

south from Arizona Avenue would turn the east through a tunnel beneath proposed structures across the northern portion of the 2nd Street Parcel to 2nd Street.

Vehicular egress from the proposed subterranean parking garage would be provided via a driveway out to 2nd Street adjacent to the new alley across the 2nd Street Parcel. Vehicular egress from both the re-routed alley and the subterranean parking garage would be restricted to right-turn only onto 2nd Street.

SUMMARY OF IMPACTS

This study analyzed 40 intersections for potential impacts related to intersection operations and vehicle delay. California law regarding transportation impacts is in the midst of a transition from intersection vehicle delay-based criteria to measuring impacts based on VMT (see Chapter 4). However, the City has not yet adopted VMT-based impact significance criteria and is not required to do so until July 1, 2020. Nevertheless, this study includes analysis of both intersection delay-based level of service (LOS) and VMT effects of the proposed Project.

Based on locally developed trip generation rates (see Chapter 3), it is estimated that the proposed Project would generate a total of approximately 186 weekday AM peak hour trips, 248 weekday PM peak hour trips and 259 weekend midday peak hour trips. Taking into account the removal of the existing uses, the proposed Project is expected to generate net-new travel of approximately 146 trips in the weekday AM peak hour, 146 trips in the weekday PM peak hour and 168 trips in the weekend midday peak hour.

Approval Year (2020) Plus Project Intersection Analysis

Based on the City's adopted impact significant criteria, the addition of project traffic is expected to result in significant traffic impacts at four locations under Approval Year (2020) Plus Project traffic conditions:

1. Palisades Beach Road & California Incline
2. Ocean Avenue & California Avenue
11. 2nd Street & Wilshire Boulevard
16. Main Street & Olympic Drive

**TABLE ES-1
SUMMARY OF PROPOSED PROJECT INTERSECTION IMPACTS**

No.	INTERSECTION	PEAK HOUR	APPROVAL YEAR (2020)	FUTURE YEAR (2025)
1	PALISADES BEACH ROAD & CALIFORNIA INCLINE	AM PM WKND	X	X
2	OCEAN AVENUE & CALIFORNIA AVENUE	AM PM WKND	X X	X X X
11	SECOND STREET & WILSHIRE BOULEVARD	AM PM WKND	X	
12	SECOND STREET & ARIZONA AVENUE	AM PM WKND		X
13	SECOND STREET & SANTA MONICA BOULEVARD	AM PM WKND		X
16	MAIN STREET & OLYMPIC DRIVE	AM PM WKND	X X	X X
19	FOURTH STREET & ARIZONA AVENUE	AM PM WKND		X X
Total Impacted Intersections:			4	6

Future Year (2025) Plus Project Intersection Analysis

Based on the City's adopted impact significance criteria, the addition of project traffic is expected to result in significant traffic impacts at six locations under Future Year (2025) Plus Project traffic conditions:

1. Palisades Beach Road & California Incline
2. Ocean Avenue & California Avenue
12. 2nd Street & Arizona Avenue
13. 2nd Street & Santa Monica Boulevard
16. Main Street & Olympic Drive
19. 4th Street & Arizona Avenue

Intersection #11, 2nd Street & Wilshire Boulevard, is impacted under Approval Year (2020) Plus Project, but under the Future Year (2025) Plus Project traffic conditions, primarily due to a nearby cumulative development project which substantially increases the average delay at this intersection. As a result, under future conditions, the addition of this proposed Project traffic is relatively minor and does not trigger an impact, even though the intersection is projected to operate at LOS F.

Intersection Mitigation Measures

Mitigation measures for the seven significantly impacted intersection under the Approval Year (2020) Plus Project and Future Year (2025) Plus Project were considered. One impact could be mitigated to less than significant levels at 2nd Street & Wilshire Boulevard through the restriping of travel lanes. All other impacts cannot be fully mitigated without potential secondary impacts related to pedestrian safety goals and policies outlined in the City's Land Use and Circulation Element (LUCE) and Downtown Community Plan (DCP). Therefore, under both the Approval Year (2020) and Future Year (2025) conditions, the proposed Project would result in significant and unavoidable impacts at six intersections.

Vehicle Miles Traveled

Based on Office of Planning and Research (OPR) guidance, the proposed Project could be assumed to generate a less than significant level of VMT, given that it falls in a high-quality transit priority area (TPA) (including the Los Angeles County Metropolitan Transportation Authority [Metro] E Line (Expo) Light Rail as well as numerous Metro and Big Blue Bus lines operating at headways of 15 minutes or less throughout the day). The proposed Project provides a mix of residential, retail, and other uses in an area with low VMT, and proposes to build no more than the maximum parking allowed by the City in the Downtown. As previously described, the City has not, at the time of this report, finalized criteria or analysis methods for evaluating VMT. Despite these factors, this study provides an evaluation of the potential VMT effects of the project for informational purposes in Chapter 4.

1. INTRODUCTION

Fehr & Peers evaluated the potential transportation impacts of the proposed Ocean Avenue Project (proposed Project) in the City of Santa Monica (City). This study identifies the existing conditions of the City's transportation network, describes the assumptions and methodologies for the analysis, and summarizes the findings of this study, which was conducted as part of the Environmental Impact Report (EIR) for the proposed Project.

PROJECT DESCRIPTION

The Project site is located on two parcels separated by 1st Court, refer to herein as the "Ocean Avenue Parcel" and the "2nd Street Parcel." The Ocean Avenue Parcel is approximately 52,500 square feet (sf) (1.2 acres), bounded by Ocean Avenue to the west, Santa Monica Boulevard to the south, 1st Court to the east, and 1301 Ocean Avenue to the north. The 2nd Street Parcel is approximately 30,000 sf (0.69 acres), bounded by 1st Court to the west, Santa Monica Boulevard to the south, 2nd Street to the east, and 1332 2nd Street to the north. Collectively, these two parcels (along with the portion of 1st Court adjacent to and between the two parcels) are considered the "Project site." Project components include:

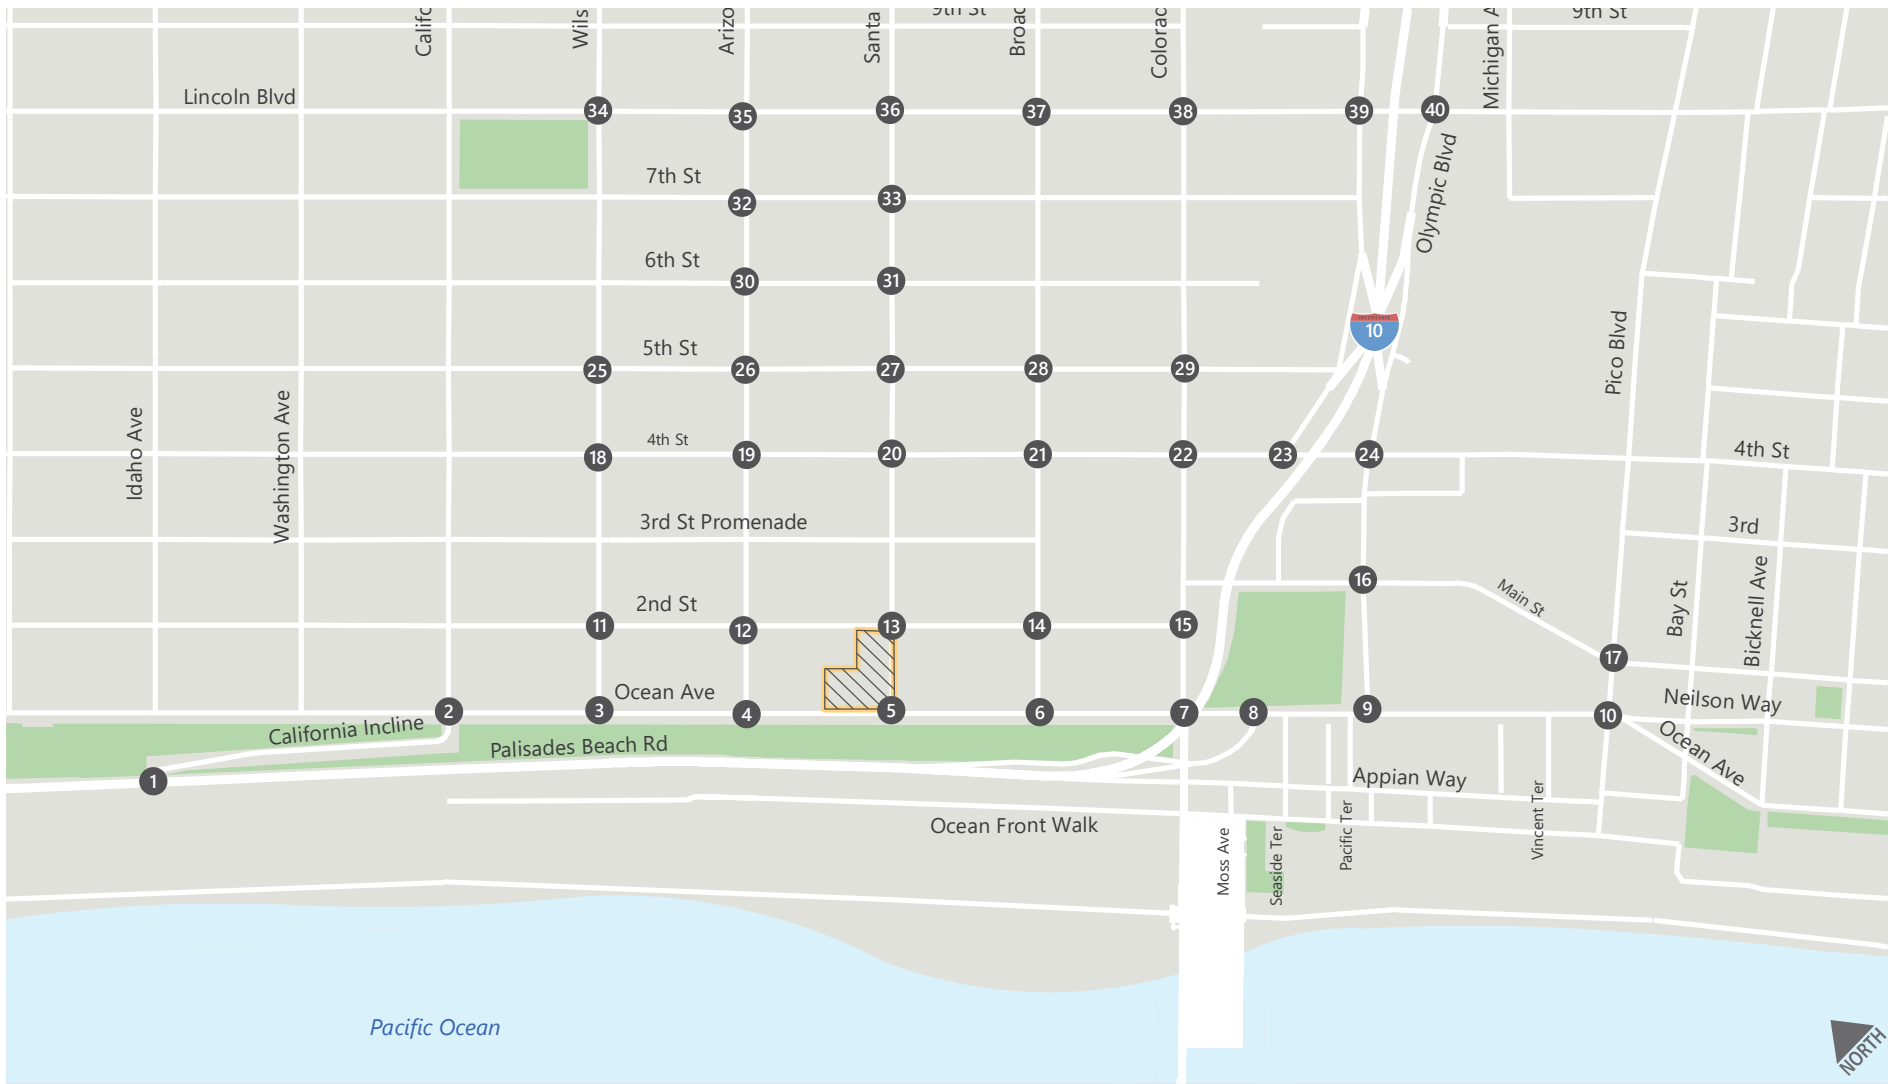

- A hotel building consisting of 120 rooms and associated meeting, banquet, and spa space located in the central portion the Ocean Avenue Parcel
- 100 residential apartments (including 19 replacement rent-controlled apartments plus deed-restricted affordable units and market-rate units) located on the upper floors of the buildings located at the corner of Ocean Avenue and Santa Monica Boulevard and on the 2nd Street Parcel.
- Approximately 36,110 sf of retail and restaurant uses (including outdoor dining areas)
- An approximately 35,500-sf Cultural Use Campus located at the northern end of the Ocean Avenue Parcel consisting of two existing City-designated landmarks located at 1333 and 1337 Ocean Avenue that will be rehabilitated and relocated on the northern portion of the Project site along Ocean Avenue and a new building located behind (i.e., to the east of) the City-designated landmark buildings
- An approximately 5,000-sf public observation deck (including approximately 1,000 sf of restrooms and lobby area) will be provided on the roof of the Hotel Building
- A subterranean parking garage with capacity for up to 285 vehicles

Vehicular access to the Project site would be provided via 1st Court (ingress) and 2nd Street (egress). 1st Court is a one-way alleyway that currently runs north-south from Arizona Avenue to Santa Monica Boulevard. Under the proposed Project 1st Court would be rerouted into an "L"-shaped configuration and vehicles traveling south from Arizona Avenue would turn the east through a tunnel beneath proposed structures across the northern portion of the 2nd Street Parcel to 2nd Street.

Vehicular egress from the proposed subterranean parking garage would be provided via a driveway out to 2nd Street adjacent to the new alley across the 2nd Street Parcel. Vehicular egress from both the re-routed alley and the subterranean parking garage would be restricted to right-turn only onto 2nd Street.

STUDY SCOPE

In accordance with the California Environmental Quality Act (CEQA) and City transportation study requirements, this study covers a range of various topics, including intersection operations, vehicle miles traveled, and project alternatives.

In the past, this study might have included an analysis of regional transportation network operations under California's Congestion Management Program (CMP). However, as of July, 2019, a majority of jurisdictions falling under the region's CMP adopted opt-out resolutions in accordance with Metro Board action in June 2018¹. Based on conversations Fehr & Peers held with Metro in late 2019, the CMP requirements are no longer in effect for Los Angeles County.

Intersection Operations

This study evaluates the potential of the proposed Project to impact surrounding intersections as a result of Project-generated vehicle trips. Specifically, the proposed Project's peak hour traffic impacts during the typical weekday AM (7:30 to 9:30 AM) and weekday PM (5:00 to 7:00 PM) peak hours were evaluated. In addition, since the Project site is located in the popular Downtown where weekend traffic volumes tend to be relatively high, the study also analyzed traffic impacts during the weekend midday (1:00 to 5:00 PM) peak hour for all locations on and west of Lincoln Boulevard.

In consultation with City staff, 40 intersections in the vicinity of the Project site were selected for analysis. These intersections were selected as the ones most likely to be affected by Project-generated vehicle trips. Per City transportation study requirements, all 40 study intersections were analyzed using the *Highway Capacity Manual* (HCM) (Transportation Research Board 2010) operations methodology. All study intersections are currently controlled by traffic signals. The intersections are listed below and illustrated in Figure 1:

1. Palisades Beach Road & California Incline
2. Ocean Avenue & California Avenue
3. Ocean Avenue & Wilshire Boulevard
4. Ocean Avenue & Arizona Avenue
5. Ocean Avenue & Santa Monica Boulevard
6. Ocean Avenue & Broadway
7. Ocean Avenue & Colorado Avenue
8. Ocean Avenue & Moomat Ahiko Way

Ocean Avenue Project Transportation Impact Analysis
April 2020

9. Ocean Avenue & Olympic Boulevard
10. Ocean Avenue/Neilson Way & Pico Boulevard
11. 2nd Street & Wilshire Boulevard
12. 2nd Street & Arizona Avenue
13. 2nd Street & Santa Monica Boulevard
14. 2nd Street & Broadway
15. 2nd Street/Main Street & Colorado Avenue
16. Main Street & Olympic Drive
17. Main Street & Pico Boulevard
18. 4th Street & Wilshire Boulevard
19. 4th Street & Arizona Avenue
20. 4th Street & Santa Monica Boulevard
21. 4th Street & Broadway
22. 4th Street & Colorado Avenue
23. 4th Street & I-10 Westbound Off-Ramp
24. 4th Street & I-10 Eastbound On-Ramp
25. 5th Street & Wilshire Boulevard
26. 5th Street & Arizona Avenue
27. 5th Street & Santa Monica Boulevard
28. 5th Street & Broadway
29. 5th Street & Colorado Avenue
30. 6th Street & Arizona Avenue
31. 6th Street & Santa Monica Boulevard
32. 7th Street & Arizona Avenue
33. 7th Street & Santa Monica Boulevard
34. Lincoln Boulevard & Wilshire Boulevard
35. Lincoln Boulevard & Arizona Avenue
36. Lincoln Boulevard & Santa Monica Boulevard
37. Lincoln Boulevard & Broadway
38. Lincoln Boulevard & Colorado Avenue
39. Lincoln Boulevard & I-10 Westbound Off-Ramp
40. Lincoln Boulevard & I-10 Eastbound On-Ramp

The following traffic scenarios were analyzed in the study to determine the potential for impacts to the 40 study intersections:

- Existing Year (2017) – The analysis of existing traffic conditions provides the basis for the assessment of Approval Year (2020) and Future Year (2025) traffic conditions. The Existing Year (2017) traffic conditions are based on the Citywide weekday and weekend traffic counts collected by the City in 2017 and 2018. The analysis of existing traffic conditions includes a description of key area streets and highways, traffic volumes at intersections, and operating conditions of the intersections.

- Approval Year (2020) No Project Traffic Conditions – This scenario reflects the traffic conditions expected in the anticipated Approval Year (2020) without Project-generated vehicle trips and provides the baseline by which the impacts of the proposed Project in the Approval Year (2020) were evaluated. It includes cumulative development projects that have been or will be completed between the 2017 and 2018 traffic counts and 2020. The latest version of the City's Travel Demand Forecasting Model (TDFM) was used to forecast the Approval Year (2020) No Project traffic conditions.
- Approval Year (2020) Plus Project Traffic Conditions – This scenario reflects the traffic conditions expected in the anticipated Approval Year (2020) with inclusion of the Project-generated vehicle trips. This scenario identifies the potential traffic impacts of the proposed Project on Approval Year (2020) traffic conditions by adding Project-generated vehicle trips to the Approval Year (2020) No Project traffic conditions. The City's TDFM was used to inform Project trip distribution and trip assignment under Approval Year (2020) conditions.
- Future Year (2025) No Project Traffic Conditions – This scenario reflects the future traffic conditions expected in the Future Year (2025) without Project-generated vehicle trips. This scenario identifies future operating conditions of the study intersections as a result of regional growth and known "cumulative projects" in the study area by 2025. This scenario also accounts for future street network changes that would affect traffic conditions. The Future Year (2025) No Project traffic conditions were also developed using the City's TDFM.
- Future Year (2025) Plus Project Traffic Conditions – This analysis reflects the traffic conditions expected in the Future Year (2025) with inclusion of the Project-generated vehicle trips. This scenario was developed using the same methodology described for the Approval Year (2020) Plus Project traffic conditions.

Vehicle Miles Traveled

Authorized in September of 2013, Senate Bill (SB) 743 directed the Office of Planning and Research (OPR) to revise the CEQA Guidelines (California Code of Regulations, Title 14) to establish new criteria for determining the significance of transportation impacts and define alternative metrics for intersection delay-based level of service (LOS). OPR adopted final guidelines in December 2018, and the provisions of SB 743 are now in effect, with agencies having an opt-in period until July 1, 2020. At the time of this publication, the City has not adopted VMT-based impact criteria. A general discussion of VMT analysis is included in this report for informational purposes only.

The estimates of VMT for the proposed Project are based on the OPR guidance, which recommend evaluating each component of a mixed-use project independently. For residential uses, the suggested metric is VMT per capita. Guidance is provided for several broad land use types that account for majority of the development projects that are proposed (i.e., residential, office, and retail). The proposed Project includes hotel, a Cultural Use Campus (anticipated to be similar to a museum), retail, restaurant, and residential. While there is no office-type land use for the proposed Project, employee VMT estimates were

also calculated.

Project Alternatives

Additionally, in accordance with CEQA Guidelines Section 15126.6, this study analyzes the transportation impacts of alternatives to the proposed Project.² As permitted by CEQA, the alternatives are evaluated at a lesser level of detail than the project.

- Alternative 1 – No Project
- Alternative 2 – Tier 2 Mixed-Use Housing Projects Compliant with Ocean Transition and Bayside Conservation District
- Alternative 3 – Reduced Height and Density
- Alternative 4 – Retention of Existing City-Designated Landmarks and 101 Santa Monica Boulevard
- Alternative 5 – Modified Access

Further descriptions of these alternatives are provided in Chapter 6.

ORGANIZATION OF REPORT

This report is divided into six chapters, including this introduction. Chapter 2 describes the existing circulation system (including the roadway network, public transit, bicycle/pedestrian facilities), traffic volumes at intersections, and operating conditions of the intersections in the study area. Chapter 3 describes the assumptions and methodologies used to develop future cumulative traffic forecasts and project traffic volumes. Chapter 4 presents an assessment of potential project traffic impacts on intersection operations in the vicinity of the Project site and an informational evaluation of project VMT. Chapter 5 presents a discussion of potential mitigation measures to address the identified intersection traffic impacts. Chapter 6 analyzes the potential traffic impacts that could result from the alternatives and compares them to the proposed Project.

² As required by CEQA, the study analyzes a range reasonable alternatives to the project and include ones that are potentially feasible, would "feasibly attain most of the basic objectives of the project," and would avoid or substantially lessen any of the project's significant effects.

2. EXISTING TRANSPORTATION CONDITIONS

The Project site is located in the Downtown, which includes a dense urban mix of residential, retail, restaurant, office, entertainment, recreational, and institutional uses. A network of streets, sidewalks, and bikeways provide circulation throughout the City, intermixing automobiles, buses, and people walking and bicycling. The City, and particularly the Downtown, is highly walkable, with sidewalks on every street, traffic signals that prioritize pedestrian activity, and several streets where part or all of the street is given over exclusively to pedestrian activity (e.g., Third Street Promenade and Colorado Esplanade). Most sidewalks throughout Downtown are between 10 and 20 feet wide, varying from block to block or side of the street. Many streets also have visually or physically separated space for bicycles in the form of green-painted bicycle lanes or protected bikeways. These bikeways are heavily used year-round, particularly on Ocean Avenue, Main Street, and intersecting bikeways.

The City's Big Blue Bus network generally converges Downtown around 4th Street, and the western terminus for the Metro E Line (Expo) Light Rail is the Downtown Santa Monica Station, located at 4th Street/Colorado Avenue, approximately 0.5 mile from the Project site.

Due to the proximity of the Project site to popular destinations such as the Third Street Promenade, the Santa Monica Pier, and the oceanfront, nearby intersections can become congested during peak hours including weekends, holidays and events, as vehicles, bicycles, and pedestrians navigate the Downtown. A discussion of the key circulation facilities in the study area is provided below:

EXISTING STREET AND FREEWAY SYSTEM

The Project site is bounded by Santa Monica Boulevard to the south, Arizona Avenue to the north, Ocean Avenue to the west, and 2nd Street to the east in the Downtown. The adjacent streets are described below:

- Santa Monica Boulevard is an east-west roadway that provides surface street access to the Downtown and connects with nearby Los Angeles neighborhoods such as West LA and Sawtelle. Santa Monica Boulevard includes 350 feet of frontage along the southern edge of the Project site. Between Ocean Avenue and 5th Street, Santa Monica Boulevard has a bus-only lane in the eastbound direction, which permits other vehicles for right turns only. Otherwise, there are two vehicle lanes in each direction. In the Downtown, Santa Monica Boulevard features a dense mix of ground floor commercial business with offices or residences above.
- Arizona Avenue is a two-lane (one lane in each direction) east-west roadway. Arizona Avenue is located north of the Project site and is physically separated from the Project site by existing development. In the Downtown, Arizona Avenue features a dense mix of ground floor commercial business with offices or residences above. To the east, particularly beyond Lincoln Avenue, Arizona Avenue becomes predominantly residential. Arizona Avenue hosts regular farmer's markets on Wednesdays and Saturdays, which closes all vehicular access between 3rd Court (alleyway) and 2nd

Street. The Wednesday farmer's market also closes access west to 1st Court, and a portion of 2nd Street (described below). The farmer's market street closures begin in the early morning and end by 2:00 PM. During this time, vehicle traffic is rerouted to parallel streets such as Wilshire Boulevard and Santa Monica Boulevard.

- 2nd Street is a two-lane (one vehicle lane in each direction) north-south roadway that serves provides one-way access from Arizona Avenue to Santa Monica Boulevard. 2nd Street provides approximately 300 feet of frontage along the eastern edge of the Project site. In the Downtown, 2nd Street features a dense mix of ground floor commercial business with offices or residences above, as well as three large City-owned parking structures (#2, #4, and #6). North of Wilshire Boulevard, 2nd Street is predominantly residential. 2nd Street continues south as Main Street at the intersection with Colorado Avenue. A portion of 2nd Street is also closed on Wednesdays to host a farmer's market, which extends between City-owned parking structures #4 (to the south) and #2 (to the north). Vehicle access to both parking structures is maintained during this time, with turn restrictions (i.e., bollards) removed. The farmer's market street closure begins at 7:00 AM or earlier and ends by 2:00 PM. North-south vehicle traffic passing through is rerouted to parallel streets such as Ocean Avenue or 4th Street.
- Ocean Avenue is a four-lane (two vehicle lanes in each direction) north-south roadway that runs along the western edge of the City of Santa Monica. In the Downtown, the east side of Ocean Avenue features mix of ground floor commercial business with offices, hotels or residences above, including several of the taller buildings in the City. The west side of Ocean Avenue, from Colorado Avenue northwards, features Palisades Park, a linear public open space with walking and bicycling paths, trees, and various other recreational amenities. Ocean Avenue provides 300 feet of frontage along the western edge of the Project site.

The Project site has regional vehicle access via nearby arterials and freeways. Regional access is also available by passenger rail in the form of the Metro E Line (Expo) Light Rail. The Pacific Coast Highway (PCH) is located at the foot of the Palisades Bluff at the west of Ocean Avenue. The California Incline (at California Avenue) provides direct access to PCH, and PCH in turn, provides access to Interstate (I-) 10 (Santa Monica Freeway), which is located approximately 0.75 miles southeast of the California Incline, and the Pacific Palisades community to the north. Access between I-10 and the Project site is also available to the south via 2nd Street or Ocean Avenue, which each intersect with Olympic Drive, an east-west connector roadway that intersects with the freeway at 4th Street. I-10 in turn provides regional north-south access via I-405. Highways including PCH, I-10, and I-405 are heavily congested with vehicle traffic for much of the day throughout most of the year. I-10 is heavily congested westbound throughout weekday morning hours and becomes congested eastbound in the afternoons and throughout much of the evening. PCH is particularly heavily congested through the summer months with both local and tourism-based traffic in both directions.

The City's Land Use and Circulation Element (LUCE) defines the street system according to its use by various modes including walking, biking, transit, and automobile. These street types include Boulevard, Special Streets, Downtown Commercial, Neighborhood Commercial, Major Avenue, Secondary Avenue, Minor

Avenue, Industrial Avenue, Neighborhood Street, Shared Street, Parkway, Pathway, Bikeway, Highway, and Alley. City streets, particularly near Downtown, are generally posted with 25 or 30 miles per hour (mph) speed limits. The City streets surrounding the proposed Project are described below based on their designations in the LUCE:

- Boulevard – Boulevards are regional transportation corridors with continuous mixed-use and commercial land uses. Boulevards provide access for all forms of transportation but emphasize transit and walking. Regional automobile traffic is also accommodated along Boulevards in order to minimize regional traffic on parallel local streets. Boulevards in the study area include Wilshire Boulevard, Santa Monica Boulevard, Lincoln Boulevard (Wilshire Boulevard to Pico Boulevard), Ocean Avenue (California Avenue to Pico Boulevard), Main Street (Colorado Avenue to Pico Boulevard), and 4th Street (Wilshire Boulevard to Pico Boulevard). Boulevards typically provide two vehicle lanes in each direction, often have metered on-street parking, and typically do not have bicycle lanes although bicycle routes or “sharrows” may be posted, such as along 4th Street through Downtown.
- Special Streets – These streets are unique and ceremonial streets requiring special consideration. In the study area, the Third Street Promenade is a Special Street between Wilshire Boulevard and Broadway. The Third Street Promenade is a pedestrian-only marketplace (all vehicles, bicycles, skateboards, and scooters/e-scooters are prohibited), bisected by Arizona Avenue and Santa Monica Boulevard with signalized pedestrian crossings.
- Commercial: Downtown – These streets prioritize the pedestrian environment in the Downtown, recognizing that there is often a high level of “competition” among all modes on these streets. Downtown Commercial streets in the study area include Wilshire Boulevard (Ocean Avenue to 11th Street), Arizona Avenue (Ocean Avenue to Lincoln Boulevard), Santa Monica Boulevard (Ocean Avenue to 11th Street), 2nd Street (Wilshire Boulevard to Colorado Avenue), 5th Street (Wilshire Boulevard to Olympic Boulevard), 6th Street (Wilshire Boulevard to Colorado Avenue), 7th Street (Wilshire Boulevard to Olympic Boulevard), and Lincoln Boulevard (Wilshire Boulevard to Pico Boulevard). This designation acts as an “overlay” (e.g., Wilshire Boulevard is both a Boulevard and a Downtown Commercial street in the study area). These streets generally feature metered on-street parking, but the LUCE advises that parking or travel lanes be removed when necessary to reduce transit delay, improve pedestrian quality, or provide bicycle lanes.
- Avenue: Major – These streets serve regional automobile trips and provide access for all modes of transportation. They are designed to discourage regional auto traffic from using Secondary or Minor Avenues. The Major Avenues in the study area include the California Incline and Olympic Boulevard (4th Street to Lincoln Boulevard). Neilson Way is also a nearby Major Avenue, south of Pico Boulevard. These streets are each unique; the California Incline provides only a single vehicle lane in each direction, while Olympic Boulevard between 4th Street and Lincoln Boulevard provides one or two lanes in each direction, on opposite sides of the freeway. These streets typically do not allow on-street parking or stopped vehicles.

- Avenue: Secondary – These streets distribute automobile trips onto Minor Avenues and Neighborhood Streets and often serve regional bicycle trips. Secondary Avenues in the study area include Broadway, Colorado Avenue, and Olympic Drive (Ocean Avenue to 4th Street). These streets are generally a single vehicle lane in each direction. Colorado Avenue is unique in that it hosts the Metro E Line (Expo) Light Rail in the center between 5th Street and 17th Street, allowing only one vehicle lane in either direction with turning restrictions at most intersections and no crossing of the tracks between intersections. West of 5th Street, Colorado Avenue becomes one-way westbound and features the Colorado Esplanade, an extra-wide pedestrian gateway to the Santa Monica Pier and oceanfront. These streets may include on-street parking, such as along Broadway and a short portion of Olympic Drive.
- Avenue: Minor – These streets serve local automobile and bicycle trips. Minor Avenues in the study area include 4th Street (Wilshire Boulevard to northern city limits), 7th Street (Wilshire Boulevard to northern city limits), and 11th Street (Wilshire Boulevard to Ocean Park Boulevard). These streets typically provide a single vehicle lane in each direction and typically provide on-street parking for residents, visitors and loading zones. Some streets, particularly 7th and 11th Streets, provide bicycle lanes.
- Neighborhood Street – These streets primarily serve adjacent buildings. Neighborhood Streets in the study area include Moomat Ahiko Way, 2nd Street (Wilshire Boulevard to Montana Avenue) and other numbered streets not designated as Minor Avenues north of Wilshire Boulevard, Arizona Avenue (Lincoln Boulevard to 11th Street), and Lincoln Boulevard (Wilshire Boulevard to northern City limits). These streets provide a single vehicle lane in each direction and typically have on-street parking for residents, visitors, and loading zones. Some streets have bicycle lanes, such as 2nd Street.
- Parkway – Parkways serve as linear parks incorporating continuous landscaping, recreational bikeways and pedestrian paths. The Pacific Palisades Parkway in the study area is west of Ocean Avenue.

Lane configurations at the study intersections are illustrated in Appendix B1.

EXISTING PUBLIC TRANSIT SERVICE

The City's Big Blue Bus and the Los Angeles County Metropolitan Transportation Authority (Metro) provide a dense network of public transit service throughout the study area. The Project site is directly accessible via transit links between most areas of the City and much of the Los Angeles metropolitan area including Downtown Los Angeles, University of California, Los Angeles (UCLA) / West Los Angeles, Century City, Los Angeles International Airport (LAX), Venice, Culver City. Weekday peak hour transit ridership vary by bus line, as described below, but generally the peak hour falls between 6:00 AM to 9:00 AM and 4:00 PM to 7:00 PM. Transit operators adjust bus schedules and headways typically two or three times a year, particularly in the case of Big Blue Bus as service changes coincide with class schedules at Santa Monica Community College and UCLA. During these schedule updates, service is sometimes reallocated between routes to match demand and changing travel patterns; the route descriptions below are from late 2019 and can be considered representative of the existing schedules and headways.

Metro E Line (Expo) Light Rail and Downtown Santa Monica Station

The Project site is located approximately 0.5 mile northwest from the Downtown Santa Monica Station, the western terminus of the Metro E Line (Expo) Light Rail. The Downtown Santa Monica Station is located at 4th Street/Colorado Avenue. Formerly known as the Expo Line or Expo LRT, service began operation in Santa Monica in May 2016, extending the line from Culver City that had opened in 2012, and continuing to Downtown Los Angeles. The Metro E Line (Expo) Light Rail makes 19 stops and connects with other Metro rail service in Downtown Los Angeles. Service operates daily from approximately 4:00 AM through 2:00 AM, with peak headways of 6 minutes in both directions and off-peak headways between 12 and 20 minutes. A new connecting line along Crenshaw Boulevard is under construction and is projected to open in late 2020 or early 2021, providing service south towards LAX and connecting with the Metro C Line (Green). In the future, Metro's "Regional Connector" subway project in Downtown Los Angeles will extend the E Line through downtown and connect with the existing L Line (Gold) towards East Los Angeles, creating a single-seat transit trip that currently requires multiple connections. This project is anticipated to open sometime after 2023.

All Big Blue Bus and Metro lines operating in the Downtown have a connecting stop within a block of the Downtown Santa Monica Station. Bikesharing stations, bicycle lane facilities, and bicycle service facilities are located either adjacent or very close to the station as well.

Public Buses

Figure 3 shows the transit lines and stops near the Project site. There are 13 fixed-route bus lines within 0.25 mile of the Project site:

- Big Blue Bus Line 1 (Santa Monica Boulevard) – Line 1 runs from Venice through Downtown Santa Monica to UCLA. Service headways of approximately 10 minutes are provided during the weekday peak hour and service headways of approximately 15 minutes are provided during weekday off peak

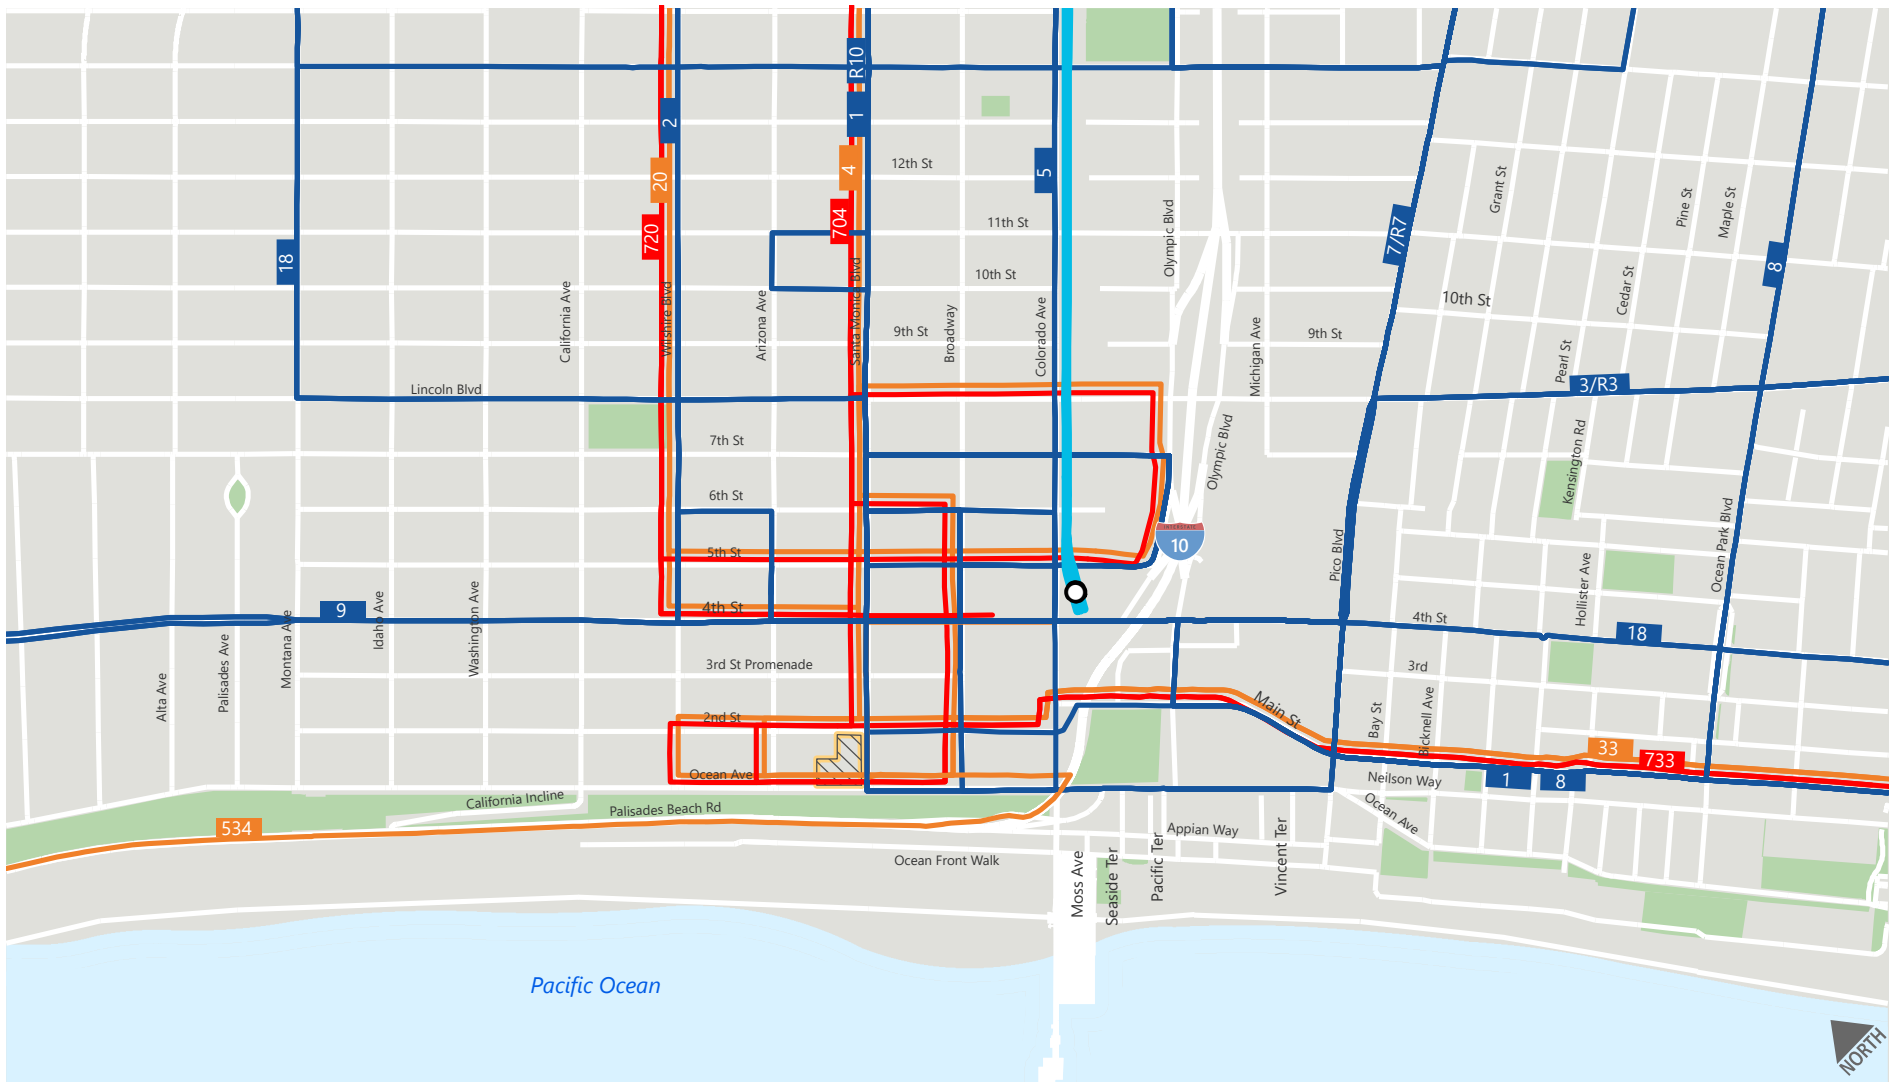

hour and on weekends. The stop closest to the Project site is along Santa Monica Boulevard near 4th Street.

- Big Blue Bus Line 2 (Wilshire Boulevard) – Line 2 runs from the Civic Center through Downtown Santa Monica to UCLA. Headways are approximately 15 to 20 minutes. The stop closest to the Project site is along 4th Street near Santa Monica Boulevard
- Big Blue Bus Line 3 / Rapid 3 (Lincoln Boulevard) – Line 3 runs from the Metro C Line (Green) Aviation Station along Lincoln Boulevard to Downtown via Lincoln Boulevard and 4th Street. Headways are approximately 10 minutes during weekday and weekend peak hours and 15 to 20 minutes during the off peak hour. The stop closest to the Project site is along 4th Street near Santa Monica Boulevard.
- Big Blue Bus Line 5 (Olympic Boulevard) – Line 5 runs between Downtown and Century City via Colorado Avenue and Olympic Boulevard and continues from Century City to the Metro E Line (Expo) Palms Station. Headways are every 20 to 30 minutes during the weekdays. The stop closest to the Project site is along 3rd Street near Santa Monica Boulevard.
- Big Blue Bus Line 7 / Rapid 7 (Pico Boulevard) – Line 7 runs from 6th Street/Broadway in Downtown to Rimpau Transit Center via Pico Boulevard. In the study area, Line 7 provides service with 10-minute headways during weekday peak hours and 15 minutes on weekends. The stop closest to the Project site is along 4th Street near Colorado Avenue.
- Big Blue Bus Line 8 (Ocean Park Boulevard) – Line 8 runs from 7th Street/Olympic Boulevard through Downtown to UCLA via Main Street, Ocean Park Boulevard, National Boulevard, and Westwood Boulevard. In the study area, Line 8 operates on Santa Monica Boulevard and Broadway with headways of 15 to 30 minutes during the weekday peak hours and 30 minutes during the weekend peak hour. The stop closest to the Project site is along 4th Street near Broadway.
- Big Blue Bus Line 9 (Pacific Palisades) – Line 9 runs from the Civic Center through downtown Santa Monica to Pacific Palisades. In the study area, Line 9 operates on 4th Street with headways of 30 minutes during the weekday and weekend peak hours. The stop closest to the Project site is along 4th Street near Wilshire Boulevard.
- Big Blue Bus Rapid 10 (Downtown LA Freeway Express) – Rapid 10 provides express service via the I-10 (Santa Monica Freeway) from Santa Monica to Downtown Los Angeles. This line operates with headways of approximately 30 minutes during the weekday peak hours. This line does not operate on weekends. The line provides limited-stop pick-up or drop-off in the peak direction along Santa Monica Boulevard and Bundy Drive. The bus stop closest to the Project site is along Santa Monica Boulevard near 4th Street.
- Big Blue Bus Line 18 – Line 18 runs from Marina del Rey to UCLA through Downtown on 4th Street. The line serves Venice neighborhoods, Montana Avenue in Santa Monica, Brentwood, and the VA Hospital. Headways are approximately every 30 minutes throughout the day on weekdays and weekends. The stop closest to the Project site is along Santa Monica Boulevard near 4th Street.

- Metro Line 4 / Rapid 704 (Santa Monica Boulevard) – Line 4/704 runs from Downtown Santa Monica to Downtown Los Angeles via Santa Monica and Sunset Boulevards. Daytime service on line 704 is Rapid (limited stop) service with 15-minute headways throughout the day. Off-peak local service on Santa Monica Boulevard in the study area with headways of 15 to 30 minutes and is provided overnight when Big Blue Bus Line 1 is not operating. The stop closest to the Project site is on Santa Monica Boulevard at 4th Street.
- Metro Line 20 / Rapid 720 (Wilshire Boulevard) – Line 20/720 operates on Wilshire Boulevard between the City and Downtown Los Angeles. Rapid 720 service is limited-stop operating throughout the day with 10-minute headways in the peak hours and peak directions and approximately 15- to 20-minute headways at other times. Overnight, local service on Line 20 operates on approximately 20- to 30-minute headways after Big Blue Bus Line 2 ceases operation. The stop closest to the Project site along 2nd Street near Wilshire Boulevard.
- Metro Line 33 / Rapid 733 (Venice Boulevard) – Line 33/733 provides service on Venice Boulevard and Main Street between the City and Downtown Los Angeles. The Rapid 733 operates with 15- to 20-minute headways throughout the day. Line 33 extends local service along Main Street to Santa Monica from Venice during the late evening and overnight periods. The closest stop to the Project site is along 2nd Street near Santa Monica Boulevard.
- Metro Line 534 (Malibu) – Line 534 operates local service between Downtown and Malibu along PCH. Service headways are approximately 20 to 40 minutes throughout the day. The closest stop to the Project site is along Santa Monica Boulevard near Ocean Avenue.

Transit Lines

- Expo Line
- Metro Rapid
- Metro Local

Figure 1
Ocean Avenue EIR - Existing Transit

EXISTING BICYCLE AND PEDESTRIAN FACILITIES

Bicycle Network

The Downtown provides a dense network of bicycle facilities including some immediately adjacent to the Project site. Bicycle lanes extend in both directions on 2nd Street from Montana Avenue and continuing onto Main Street to the southern City limits. Ocean Avenue is also a highly popular north-south bikeway with lanes extending the length of the roadway. Arizona Avenue features an east-west bikeway with lanes that extend to the City limits and continue into Los Angeles. Based on existing bicycle count data collected in 2017 and 2018, bike volumes on Ocean Avenue can number between 200 and 300 in the PM peak hour in the summer tourist season. On 2nd Street and Arizona Avenue near the Project site, bicycle volumes were around 100 during the PM peak hour. The following streets near the Project site have marked bicycle lanes separating bicyclists from vehicles:

- Ocean Avenue between San Vicente Boulevard and Bicknell Avenue
- 2nd Street between Montana and Colorado Avenue, serving the City's Bike Center
- Main Street between Colorado Avenue and the Santa Monica southern City boundary
- 6th Street between Montana Avenue and Colorado Avenue
- 7th Street between Wilshire Boulevard and Olympic Boulevard
- Broadway between 5th Street and Centinela Avenue
- California Avenue between Ocean Avenue and 26th Street
- The California Incline includes a two-way cycletrack (physically separated from vehicle traffic, although partially shared with pedestrians), with a connecting bridge across PCH for beach access
- Arizona Avenue between Ocean Avenue and the eastern City limit
- Colorado Avenue between Ocean Avenue and 5th Street (physically separated cycletrack from both vehicles and pedestrians)

In addition to these facilities, the City has recently marked various streets in the Downtown area as shared-vehicle/bicycle lanes and included bicycle detection zones at signalized intersections. These lanes have been painted with "sharrow" markings. Streets with these markings include 4th Street, Broadway, and Colorado Avenue. Additional designated future bicycle routes with shared lane marking are proposed in the City's 20-Year Bicycle Implementation Plan. A number of intersections in Downtown have also been equipped with bicycle detection cameras.

Bicycle Parking

Bicycle parking is available throughout the study area, including in many parking structures, on-street racks, and at public and private facilities. For example, indoor bicycle parking and lockers are provided in City-owned parking structures #1, #3, #5, #6, and #7 in Downtown. The City also continues to install racks throughout the Downtown. In addition, the Bike Center, located on Colorado Avenue at parking structure #8 of the Santa Monica Place Mall provides secure bicycle parking and a variety of mobility services,

including retail, bicycle repair, bicycle rental, attended bicycle parking, public information on alternative transportation, and a variety of additional related service.

Bike Share

The City also offers the Breeze Bike Share service, which allows residents, visitors, and employees to ride a public bicycle for their travel needs within the City. The bikeshare program makes several hundred "smart" bicycles available at more than 80 stations Citywide including Downtown, and in Venice in the City of Los Angeles.

Pedestrian Facilities

Sidewalks are generally present on all streets throughout the Downtown. Generally, sidewalks throughout downtown are a minimum of 10 feet wide, with many stretches of much wider sidewalks depending on the street and block. A review of existing (2017 and 2018) pedestrian counts shows that hourly pedestrian volumes at Ocean Avenue and Santa Monica Boulevard range between 200 to over 800 in the AM and PM peak hours. Pedestrian activity can be even higher on peak summer tourism days at the busiest intersections, particularly those connecting the Downtown Santa Monica Station at 4th Street with the oceanfront and the Santa Monica Pier. Adjacent to the Project site, the sidewalks on 2nd Street, Arizona Avenue, and Santa Monica Boulevard average approximately 12 feet in width. Sidewalks on Ocean Avenue average approximately 20 feet in width.

In 2016, the City converted pedestrian crossings and signals at the following Downtown intersections to "scramble" types, in which pedestrians are given an exclusive phase to cross in any direction while vehicles hold:

- Ocean Avenue & Colorado Boulevard
- 2nd Street & Wilshire Boulevard
- 2nd Street & Arizona Avenue
- 2nd Street & Santa Monica Boulevard
- 2nd Street & Broadway
- 2nd Street & Colorado Avenue
- 3rd Street & Wilshire Boulevard
- 4th Street & Wilshire Boulevard
- 4th Street & Arizona Avenue
- 4th Street & Santa Monica Boulevard
- 4th Street & Broadway
- 4th Street & Colorado Avenue

Santa Monica also recently updated many other traffic signals in the study area to include a "leading pedestrian interval" (LPI), which holds all vehicle movements (red signal) for several seconds at the start of a pedestrian phase to improve safety by giving pedestrians a head start and improve their visibility to

motorists. Signals (other than those listed above) along Wilshire Boulevard, Ocean Avenue, and elsewhere have been updated with LPIs since 2017. The new LPI timings are incorporated in this analysis.

Signalized intersections throughout the study area have marked or textured crosswalks and pedestrian countdown signals. Signalized pedestrian walk signals are either automatic at the intersection or actuated by pedestrians by push-button. All intersections have accessible curb ramps.

OTHER TRANSPORTATION CHOICES

Shared Mobility Technologies

The growth of privately-operated Transportation Network Companies (TNCs) like Lyft and Uber has also changed the way people move in and around the City. TNC's provide app-based platforms to connect passengers with drivers who use personal, non-commercial vehicles. Lyft and Uber have become the most recognized and ubiquitous forms of shared mobility. Research around the nation in recent years suggests that usage of Lyft and Uber is generating an increase in vehicle traffic.³ Other research has suggested this result is in part because many users are making trips they would not have made previously, and in some cases replacing transit trips.

Since late 2017, the City has seen the burgeoning of dockless mobility devices, including Bird and Lime electric scooters (e-scooters), on City streets. These dockless mobility devices become increasingly popular in the City. Dockless systems allow scooters and bicycles to be left in any location. In June 2018 the City adopted new regulations to address safety concerns associated with dockless mobility devices. Santa Monica City Council unanimously approved a 16-month pilot program (which was extended to June 2020) for dockless, shared mobility devices, including electric scooters and bicycles. The pilot is intended to inform the development of long-term policy solutions to expand sustainable mobility options equitably while protecting public safety on City streets and sidewalks. The City's program has included rules and regulations for the permitting and operation of dockless mobility devices. The City has experimented with stenciling "drop zones" on wide sidewalks, where users are encouraged to park when they finish a trip, to reduce sidewalk clutter and prevent obstructions to the sidewalk, which can significantly impact the Americans with Disabilities Act (ADA) provisions for providing clear path of travel. The City also worked with permitted operators to designate sensitive high-pedestrian areas as "no-ride" zones, including the Third Street Promenade and Palisades Park.

Ocean Avenue Project Transportation Impact Analysis
April 2020

The e-scooters are included in existing count data as bicycles, but no assumption of changes to mobility behavior are included in the analysis given the new and rapidly changing circumstances as well as lack of available data.

EXISTING YEAR (2017) INTERSECTION LEVELS OF SERVICE

The following section describes Existing Year (2017) peak hour traffic volumes at the 40 study intersections, the methodology used to analyze operating conditions at the intersections and resulting LOS for the selected study intersections. LOS is a method for characterizing vehicle delay at intersections and on roadways accounting for measures such as speed, travel time, freedom to maneuver, traffic interruptions, and comfort and convenience.

Existing Traffic Volumes

The most recent traffic volume count data was collected in 2017 by the City of Santa Monica and Fehr & Peers. Counts were collected in the fall (when school was in session) for weekday AM and PM peak hours and in the summer for weekend midday peak hour (additional weekend counts were collected in 2018 for two intersections that were not collected in 2017 and are considered comparable in volume to nearby 2017 counts). The highest 1-hour volume in each period at each intersection was selected for use in this study, providing a conservative, worst-case analysis for delay-based intersection LOS. The existing traffic volumes for the analyzed peak hours and the lane geometry of each intersection are shown in Appendix B1.

Level of Service (LOS) Methodology/Definition

In accordance with the City's adopted impact significance criteria, the "Operational Analysis" method from the HCM (Transportation Research Board 2010) was employed to perform signalized intersection LOS analysis at all signalized study intersections.

The Operational Analysis method from the HCM (Transportation Research Board 2010) determines two key operating characteristics of signalized intersections. The first characteristic is the average stopped delay experienced per vehicle. The second is the volume-to-capacity (V/C) ratio at intersections. Both metrics are based on the amount of traffic traveling through the intersection, the turning movements of that traffic, the lane geometries, and other factors affecting capacity such as pedestrian volumes at the street crosswalks. These characteristics are used to evaluate the operation of each signalized intersection, which is described generally in terms of LOS.

LOS categories range from excellent, nearly free-flow traffic at LOS A, to overloaded, stop-and-go conditions at LOS F. Table 2 provides LOS definitions for signalized intersections using the Operational Analysis method from the HCM (Transportation Research Board 2010). The LOS definitions and ranges of delay shown in this table represent average conditions for all vehicles at an intersection across an entire hour. Delays longer than the average condition are experienced by motorists on certain movements and/or during peak times within the peak hour.

All of the 40 study intersections are signalized. Of these intersections, 33 are classified as Arterial intersections, and 7 are classified as Collector intersections.⁴ The City's adopted criteria has designated LOS D as the minimum desirable LOS at arterial intersections and LOS C as the minimum desirable LOS at collector street intersections. The minimum desirable LOS – the design condition – allows for some queuing and delays at intersections during the weekday and weekend midday peak hours. At intersections operating at an undesirable LOS, delays and queuing are greater than what is considered acceptable.

Existing Year (2017) Levels of Service

The results of the analysis of weekday AM and PM and weekend midday peak hour conditions at the study intersections using the Operational Analysis method of the HCM 2010 are summarized in Table 2. As shown, 7 of the 40 study intersections currently operate at poor (LOS E) or failure (LOS F) during at least one of the analyzed peak hours under the Existing Year (2017) traffic conditions:

1. Palisades Beach Road & California Incline (LOS E in the AM and weekend midday peak hour)
2. Ocean Avenue & California Avenue (LOS F in the PM and weekend midday peak hour)
11. 2nd Street & Wilshire Boulevard (LOS E in the PM, LOS F in the weekend midday peak hour)
13. 2nd Street & Santa Monica Boulevard (LOS F in the PM, LOS E in the weekend midday peak hour)
16. Main Street & Olympic Drive (LOS F in the AM, LOS E in weekend midday peak hour)
38. Lincoln Boulevard & Colorado Avenue (LOS E in the AM peak hour)
39. Lincoln Boulevard & I-10 Westbound Off-Ramp (LOS F in the AM peak hour)

⁴ Functional street classifications used with respect to LOS are based on the City's previous Circulation Element. The 2010 LUCE has adopted a different typology for streets in the City, but the significance criteria have not yet been revised.

**TABLE 1
 LEVEL OF SERVICE DEFINITIONS FOR SIGNALIZED INTERSECTIONS
 HCM 2010 METHODOLOGY**

Level of Service	Average Stopped Delay per Vehicle (seconds)	Definition
A	≤ 10	EXCELLENT. No vehicle waits longer than one red light and no approach phase is fully used.
B	> 10 and ≤ 20	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	> 20 and ≤ 35	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	> 35 and ≤ 55	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	> 55 and ≤ 80	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 80	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths

3. TRAFFIC FORECASTS

TRAFFIC PROJECTIONS

Travel Demand Forecasting Model (TDFM) Projections

The LUCE provides a framework for integrating land use and transportation to reduce vehicle trips; encourage walking, bicycling and transit use; and create active, pedestrian-oriented neighborhoods. The LUCE establishes the goal of achieving no net new PM peak hour vehicle trips generated within the City. There are three ways that trip generation rates are reduced in response to future conditions: the D's (i.e., development density, diversity, destination),⁵ the Metro E Line (Expo) Light Rail, and LUCE Transportation Demand Management (TDM) strategies.

As part of the LUCE, the City developed its first comprehensive, Citywide TDFM. The City's TDFM was calibrated to a base year of 2013, based on 2013 land use data and 2013 traffic counts. The City's land use data is supplemented by Southern California Association of Governments (SCAG) traffic analysis zone (TAZ)-based data for areas in the City of Los Angeles bordering the City of Santa Monica. The City's TDFM forecasts future conditions for the City's transportation network in the form of traffic volumes for daily, as well as weekday AM, weekday PM, and weekend midday peak hours. The model contains the major roadways in the City and considers the trip reduction effects of walking, bicycling, and transit, including the Metro E Line (Expo) Light Rail. The model also includes all identified development projects and street network changes. Additional details are provided in Appendix C.

The City's TDFM contains several enhancements that allow it to capture the effects of land use and circulation element policy initiatives on traffic congestion. These enhancements include the effects of sustainable development patterns (e.g., mixed-use and transit-oriented development), urban streetscape design factors, alternative transportation networks, parking pricing and management, and TDM programs.

The City's TDFM outputs forecasted traffic volume estimates for intersections in the study area. These forecast volumes are loaded into the City's Vistro database for intersection delay-based LOS analysis. PTV Vistro is a software tool that evaluates intersection delay based on traffic turning volumes, bicyclists, and pedestrians at intersections.

⁵The D's are a simple means of quantifying the transportation benefits of smart growth. They predict reductions in per-capita vehicle trips and miles in response to increases in development density, diversity, design and destination and other patterns within a region.

Approval Year and Future Year Traffic Conditions

To evaluate the potential impacts of the proposed Project on intersections for the surrounding street system, it was necessary to develop estimates of Approval Year (2020) and Future Year (2025) traffic conditions in the area both without and with Project-generated vehicle trips:

- To develop the Approval Year (2020) No Project traffic conditions, the land use file in the TDFM was updated to include the development projects with the model area that were completed or anticipated to be completed between the time of the model base year (2013) and Approval Year (2020). The model forecast informs the travel pattern changes, which are then applied to the Existing Year (2017) to develop the Approval Year (2020) No Project traffic conditions. These projections provide the baseline for the Approval Year (2020) Plus Project traffic impact analysis. Appendix D1 lists the development projects included in the Approval Year (2020) land use forecasts.
- To develop the Future Year (2025) No Project traffic conditions, the land use file in the TDFM was updated to include the list of approved and pending projects. These projects are conservatively assumed to all be completed between 2013 and Future Year (2025). Similar to the Approval Year (2020) traffic conditions, land use and through vehicle trips outside the City were linearly interpolated. These projections provide the baseline for the Future Plus (2025) Plus Project traffic impact analysis. Appendix D2 lists the development projects included in the Future Year land use forecasts.
- The traffic generated by the proposed Project was estimated and assigned to the surrounding street system. The TDFM was run to provide information on trip distribution patterns for retail, residential and other land uses in this part of the City and that information was used as a guide to assign Project-generated vehicle trips to the roadway network. The Project-generated vehicle trips were added to the Approval Year (2020) No Project traffic conditions and Future Year (2025) No Project traffic conditions to form the Approval Year (2020) Plus Project and Future Year (2025) Plus Project traffic conditions respectively.

Once these traffic conditions were developed, analyses were conducted to determine the effect of the proposed Project on study area intersections. The difference between No Project and Plus Project traffic conditions represents the incremental changes in traffic attributable to the proposed Project.

TRIP GENERATION ESTIMATES

Santa Monica Trip Generation Rates

The City is generally characterized by compact urban development, high levels of public transit service, walkable and bicycle-friendly streets, and employer-sponsored TDM programs. The unique local characteristics of the City (e.g., compact density, availability of transit, diversity of land uses) require the development of specific trip generation rates. These City-specific trip generation rates are more appropriate than standard Institute of Transportation Engineers (ITE) trip generation rates, which are more reflective of suburban locations.

Local trip generation rates were developed and calibrated for existing conditions as part of the City's TDFM development for a variety of land use types, including residential, retail, and restaurant. As part of the model development, these "existing" trip generation rates were initially based on local residential trip generation surveys, the SCAG regional model, the San Diego Association of Governments' (SANDAG) trip generation survey, models in similar areas, and *Trip Generation, 8th Edition* (ITE 2010). The rates were then modified to account for local conditions based on counts, production-to-attraction balancing, and the difference between ITE and model land use definitions.

The existing City trip generation rates are unique to the City's TDFM, and they are ultimately based on the results of model calibration and validation. Two sets of rates were developed reflecting the different levels of vehicle trip reduction effectiveness for different areas of the City. The first includes areas of the Downtown and the Special Office District, which are determined to have lower trip generation rates through calibration and validation of the City's TDFM (reflecting characteristics such as higher built environment density, numerous transit lines, and a greater share of pedestrian trips). The second rate includes the remainder of the City.

As part of the development of the TDFM, existing calibrated trip generation rates were modified to reflect the effectiveness of the TDM/trip reduction strategies required by the City (and consistent with what was envisioned in the LUCE). Since the City's trip generation rates assume a robust TDM program, the Applicant will be required to prepare and implement a TDM plan that achieves the targeted levels of vehicle trip reductions as set forth in the Development Agreement.

Project Trip Generation

Residential (Affordable Housing), Retail, and Restaurant Trip Generation

Trip generation rates for the new residential, retail, and restaurant uses are based on Table 18 of the *Santa Monica Travel Demand Forecasting Model Trip Generation Rates*, so that the rates account for the proximity to the Downtown Santa Monica Station. The inbound-outbound split of trips in each peak hour is applied based on *Trip Generation Manual, 10th Edition* (ITE 2017). The inbound/outbound splits for residential land

use are from #220 Apartments; the restaurant use are from #932 High-Turnover Restaurant; the retail use are applied from #820 Shopping Center.

Cultural Uses Trip Generation

The trip generation for this land use was sourced from trip generation rates that were developed for six museum/cultural use spaces in California, including a range of types such as art museums, historical museums, and children's museums, and a variety of sizes and visitor levels. The six museums include the Los Angeles County Museum of Art (LACMA), the Museum of Tolerance, the California African-American Museum, the HABITOT Children's Museum in the City of Berkeley, the Santa Barbara Children's Science Museum (MOXI), and the Orange County Museum of Art. The sources for these rates are documented in the references for this study. The rates and in/out splits for all six museums were averaged together to develop a conservative estimate for this use in the absence of a specific program identified for the Cultural Use Campus.

Public Open Space Trip Generation

The trip generation rate for the proposed public open space is from the *Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region* (April 2002). Use of these trip generation rates is consistent with analysis of other recent park and open space projects in the City.

Hotel Trip Generation

The trip generation rate for the hotel was empirically derived from observations at six hotels in the Downtown. The City conducted counts at two hotels in the Downtown in 2017, which Fehr & Peers reviewed and used to refine the rate based on data collection conducted study in 2010 at four hotels in the area to produce updated local trip generation rates for this land use.

Existing Land Use Trip Generation

The Project site is currently occupied by residential units, restaurants, office space, spa, and hair salon. Residential, restaurant, and office trip generation rates from the City's TDFM (described above) were applied to develop trip generation estimates for existing uses. The spa and hair salon trip generation rates were developed using ITE trip generation rates (ITE 2017). The existing trip generation was then subtracted from the proposed Project trip generation to develop a "net new" trip generation.

As shown in Table 3, the proposed Project is expected to generate approximately 186 weekday AM peak hour trips, 248 weekday PM peak hour trips and 259 weekend midday peak hour trips. Taking into account the removal of the existing uses, the proposed Project is expected to generate a net new of approximately 146 trips in the weekday AM peak hour, 146 trips in the weekday PM peak hour and 168 trips in the weekend midday peak hour.

Project Traffic Distribution and Trip Assignment

The trip distribution pattern was informed by a select zone analysis of the Project site using the City's TDFM. Following consultation with City staff, it was determined to be appropriate for distributing new trips generated by the proposed Project. Figure 4 shows the trip distribution pattern.

The information described above was used to assign the project-generated traffic to the study intersections, as shown in Appendix B. All Project-generated trips would use driveways on 1st Court (ingress) and 2nd Street (egress).

Existing Site Access

Vehicular access to the Project site is currently available via 1st Court and driveways on Ocean Avenue and Santa Monica Boulevard. Ingress into the Project site is provided from Arizona Avenue and the alley provides one-way southbound travel between Arizona Avenue and Santa Monica Boulevard. In addition to the buildings housing the existing uses described above, the Project site is currently occupied by two privately operated surface parking lots. One parking lot primarily serves the BOA restaurant on-site. The other is a public parking lot occupying the southeast corner of the Project site, which serves other uses that exist on- and off-site.

Vehicle ingress to the BOA surface parking lot is provided via a curb cut on Ocean Avenue. Vehicle egress from the surface parking is southbound along 1st Court to Santa Monica Boulevard. Vehicle ingress to the public parking lot is accessed via a curb cut on Santa Monica Boulevard, approximately halfway between 1st Court and 2nd Street. An exit at the northwest corner of the parking lot provides southbound egress along 1st Court to Santa Monica Boulevard.

Project Site Access

Under the proposed Project, vehicular access to the Project site would be provided via 1st Court (ingress) and 2nd Street (egress). 1st Court would be rerouted into an "L"-shaped configuration approximately where the alleyway meets the existing parking lot on the southeast corner, turning vehicles traveling south from Arizona Avenue east through a tunnel across the northern portion of the 2nd Street Parcel to 2nd Street. The curb cut on Ocean Avenue would be closed, while the 1st Court egress onto Santa Monica Boulevard would be limited to emergency vehicles only. Figure 2 shows the Project site plan including the re-routed alleyway.

Existing counts were conducted at 1st Court and Santa Monica Boulevard to estimate the number of trips exiting the alley from the BOA surface parking lot, from the public parking lot on-site, and southbound from other uses abutting the alley or trips passing through (e.g., service vehicles).

Existing traffic entering the site via 1st Court at Arizona Avenue and exiting on Santa Monica Boulevard were re-routed to exit via the new project driveway onto 2nd Street, and from there redistributed based on their direction of travel from the current alley.

Based on the applicant's shared parking study, the proposed Project would have the capacity to fully park its residents and visitors on-site. Currently, while there is surface parking available to the existing uses on site, it is assumed that only some of those trips are parking on-site, while others take advantage of Santa Monica's "park-once" philosophy in the Downtown by parking in a nearby public parking structure. Using the existing count data described above, vehicle trips currently parking in the BOA and public lots on the Project site were removed from the network and re-assigned using the proposed Project ingress and egress. The remaining existing trips were assumed to park in three nearby City-owned parking structures or on-street parking along 2nd Street. These trips were also removed from the existing network and reassigned as part of the project traffic using the proposed ingress and egress.

Vehicular egress from the Project site's subterranean parking garage would be provided via a driveway out to 2nd Street adjacent to the new eastern leg of alley through the tunnel across the 2nd Street Parcel. Vehicular egress from both the re-routed alley and the Project site driveway would be restricted to right-turn only onto 2nd Street. Although the proposed Project egress is restricted to right-turn only, there are two existing driveways on 2nd Street directly across from the proposed driveway that have no restrictions on exiting turns. The proposed Project driveway design must also account for the relocation or removal of on-street parking to provide adequate visibility towards the southbound direction (looking north from the driveway) for exiting drivers. Currently, on-street parking adjacent to the proposed driveway is a mix of reserved layover space for Metro buses, short-term metered parking and curbside valet parking. The City staff review all proposed site plans for safety and possible geometric hazards for vehicle-vehicle, vehicle-pedestrian, and vehicle-bicycle conflicts. The EIR will evaluate the potential for a CEQA "geometric hazards" impact.

As described in Chapter 2, portions of Arizona Avenue (on Wednesdays and Saturdays between 6:00 AM and 2:00 PM) and 2nd Street (on Wednesdays only, during the same period) are closed to host a farmer's market. During these times, through-traffic must use parallel streets. Access to the Project site via 1st Court and egress onto 2nd Street would not be directly affected by the farmer's market, although arriving at 1st Court some trips that might typically use Arizona Avenue from the east would have to divert to Wilshire Boulevard or Santa Monica Boulevard to Ocean Avenue, and then onto Arizona Avenue. This is a regular event with signage and special traffic barriers that are deployed to redirect traffic, including staff to direct limited traffic through 2nd Court across Arizona Avenue during the market. Because the farmer's market closures take place on relatively minor streets in the Downtown grid network and is a known, regular occurrence that does not preclude vehicle access to neighboring development, it does not significantly disrupt the flow of traffic in the area; therefore, it is not analyzed separately in this report.

TRANSPORTATION DEMAND MANAGEMENT PROGRAM REQUIREMENTS

A TDM plan would be required as a condition of approval for the proposed Project, and the applicant would be required to conduct yearly monitoring and reporting. The specific TDM strategies to be implemented by the applicant would be finalized as part of the Development Agreement process with the City; however, based on the City's TDM ordinance and DCP, the following TDM strategies would be implemented at minimum:

TDM Coordinator – A single transportation coordinator would design, manage and update the project's TDM program. Duties would include:

- Setting up a Transportation Management Association (TMA) on site to administer TDM programs
- Maintaining a Transportation Information Center (TIC)
- Facilitating ride-matching online and through data collection and info boards
- Publishing alerts, resolving emergency issues, evaluating programs, and recommending improvements
- Acting as mechanism to distribute commuter incentives
- Producing promotional and survey materials
- Evaluating TDM program effectiveness
- Advocating for improved transit service
- Developing parking management plans
- Facilitating financial support for formation of vanpools and carpools
- Providing discounted transit fares or passes
- Developing bicycle-to-work and walk-to-work promotions
- Coordinating emergency rides home
- Managing preferential parking for high occupancy vehicles (HOVs)

This is a common position for programs that serve a large number of employees and/or residents. The position would require, at a minimum, a part-time coordinator. The applicant may consult with the City for guidance on how other multi-tenant developments have managed TDM programs.

Areawide Transportation Management Association – The applicant would be required to participate in the establishment of a geographic-based TMA that may be defined by the City. TMAs provide employees, businesses and visitors of an area with resources to increase the amount of trips taken by transit, walking, bicycling, and ridesharing. If the City adopts a requirement that a TMA be formed for this geographic area, the applicant shall attend organizational meetings and provide traffic demand data to the TMA. This element would also require the project to provide the TMA with data related to traffic demand, which could help the City to better understand travel behavior at the Project site.

Transit Pass Subsidy – A transit pass subsidy has the potential to be an effective TDM strategy for employees. The Big Blue Bus and Metro lines provide frequent local bus and regional rail transit service near the Project site. For employees, the most efficient way to incentivize the use of transit is to subsidize monthly transit passes. To do this, employers participate in an employer pass program and subsidize a portion of the cost of a monthly transit pass.

Ridesharing (Carpool and Vanpools) – Ridesharing is typically a primary focus of employee TDM strategies. By providing preferential parking for carpools, the TDM program should actively encourage carpooling among employees at the Project site. Most importantly, the TDM program should implement a ridesharing matching service that coordinates potential carpool opportunities. Metro’s CommuteSmart.info website can easily facilitate this service. Offering incentives to carpools is another means of increasing carpool participation.

Parking Pricing – Pricing parking would help to decrease trips. Since free parking acts as a subsidy for trip making by car, allowing parking to be priced according to market rates would encourage the replacement of auto trips by transit, bicycle, and pedestrian trips when possible.

Parking cash out is another price-based tool for making walking, bicycling, and transit more attractive travel options compared to driving. In a parking cash out program, employers offer commuters who forgo their parking spaces the monthly value of those parking spaces. Although the proposed Project may not be mandated to comply with existing parking cash out legislation, the proposed Project could still choose to implement a parking cash out program as part of the TDM plan.

Unbundled Parking – Unbundled parking would mean that parking spaces in the new building would be leased separately from residential units and commercial space and allow residents of nearby buildings to lease these spaces at comparable rates as nearby building tenants.

Guaranteed Ride Home (GRH) – GRH is a commute trip reduction service that provides emergency rides to participating employees who do not have a private automobile available at the office for use. This may alleviate some of the concerns that employees may have when considering not having their own automobile available for use at the office.

Bicycle Facilities – Commuter bicycle facilities such as secure bicycle parking (e.g., short-term and long-term bicycle racks and lockers), and shower and personal locker facilities help reduce peak hour and daily vehicle trips to and from Project sites. In light of providing bicycle facilities as a TDM strategy, the proposed Project would be subject to the most current zoning code for bicycle parking requirements which includes short term for visitors, on site bicycle share for employees, and secure bicycle parking for employees.

Carshare Service – Make a car sharing service available within the project, if such a service is commercially available from a third-party provider on commercially reasonable and feasible terms.

Bicycle Sharing Area – Provide a reasonable amount of publicly-accessible space for a bicycle sharing program station in conjunction with any bicycle sharing program instituted by the City or other operator.

Transportation Information Center and TDM Web Site Information – A TIC is a centrally-located commuter information center where project employees could obtain information regarding commute programs and obtain real-time information for planning travel without using an automobile. A TIC typically provides information about transit schedules, commute planning, ridesharing, telecommuting, bicycle and pedestrian routes and facilities, on-site services, and local-serving businesses.

Wayfinding Signage – Wayfinding signage is visible, useful signage strategically placed in and around a Project site that conveniently directs pedestrians to project elements and major external destinations (e.g., transit stations, theaters, libraries, etc.) and provides information for transportation options (e.g., taxi, transit maps, bicycle sharing, etc.). Typically, pedestrian-oriented signage is posted at major entrance/exit points to the project and at key internal locations.

Commuter Club – This is a workplace organization that provides incentives for employees to choose alternative modes of transportation to-and-from work. In order to become a member, employees agree to use alternative modes of travel (including walk, bicycle, transit, carpool or vanpool) to travel to work for a minimum number of days per week (e.g., 3 days per week). As a member, employees are entitled to various discounts at local businesses, special offers and monthly raffle prizes. These benefits must be determined and negotiated by the applicant.

The Transit Cooperative Research Program (TCRP) Chapter 19 reports that TDM programs are most effective when people have alternatives to auto travel, such as public transit. There may be some variability between land uses on the Project site, but the success of the TDM program will depend on how well it supports those who want to make trips by a means other than driving alone. The proposed Project's TDM strategies will be most effective at reducing peak hour trips when worker shifts begin or end during peak hours. Converting these auto trips into transit, bicycle, or pedestrian trips would directly remove cars from the street during the AM and PM peak hours. In this way, the TDM program can reduce trips for all employees on the Project site – from restaurant workers to retail salespeople to fitness center staff.

Monitoring, Reporting and Enforcement

In compliance with the LUCE, the applicant would be required to implement TDM measures so as to not exceed the trip generation estimates calculated for the Approval Year (2020) and Future Year (2025) as provided in Table 3. In order to ensure that the trip generation estimated in this study would not be exceeded, a period of annual monitoring and reporting would be required as a condition of approval for the proposed Project and would be incorporated into the Development Agreement. The applicant would be required to summarize the results of the trip monitoring program, determine whether trip reduction goals and/or Average Vehicle Ridership (AVR) targets are being achieved, and describe the TDM efforts in place to reduce vehicular trip making in an annual report delivered to the City.

The City, at its discretion, would determine the type of enforcement and may require implementation of additional TDM strategies and possible monetary (or other) penalties if annual monitoring determined that the trip generation estimates are being exceeded and/or AVR targets were not being met.

Notes: Proposed land uses based on applicant's information and other conversations. Existing land uses were fully occupied in July 2017, when baseline traffic counts were collected. As described in the Santa Monica Travel Demand Forecasting Model (TDFM) Trip Generation Rates, Santa Monica TDM trip generation rates for residential, retail and restaurant space incorporate internal capture and pass-by trips.

[a] It is assumed that the car-ownership per household for studio multi-family residential land use types is zero cars, one-bedroom multi-family residential land use types is one car, while the car-ownership per household for two- bedroom and three-bedroom multi-family residential land use types is two or more cars.

[b] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #220 Multifamily Housing, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[c] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #820 Shopping Center, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[d] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #932 High-Turnover Restaurant, Trip Generation Manual, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[e] Trip generation was sourced from trip generation rates that were developed for six museum/cultural use spaces in Southern California, including a range of types such as art museums, historical museums, and children's museums. The rates and in/out splits for all six museums were averaged together to develop a conservative estimate for this site in the absence of a specific program identified for the cultural use space.

[f] Trip generation rate from "Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region", April 2002.

[g] Trip generation is empirically derived from observations at six other hotels in the downtown Santa Monica area. The trip generation and in/out splits were observed for each hotel on an average weekday during the AM and PM peak hours, and an average weekend midday peak hour while the hotels were near 100% occupancy. The rates and in/out splits reflect the average of all observations.

[h] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 3 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #220 Multifamily Housing, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

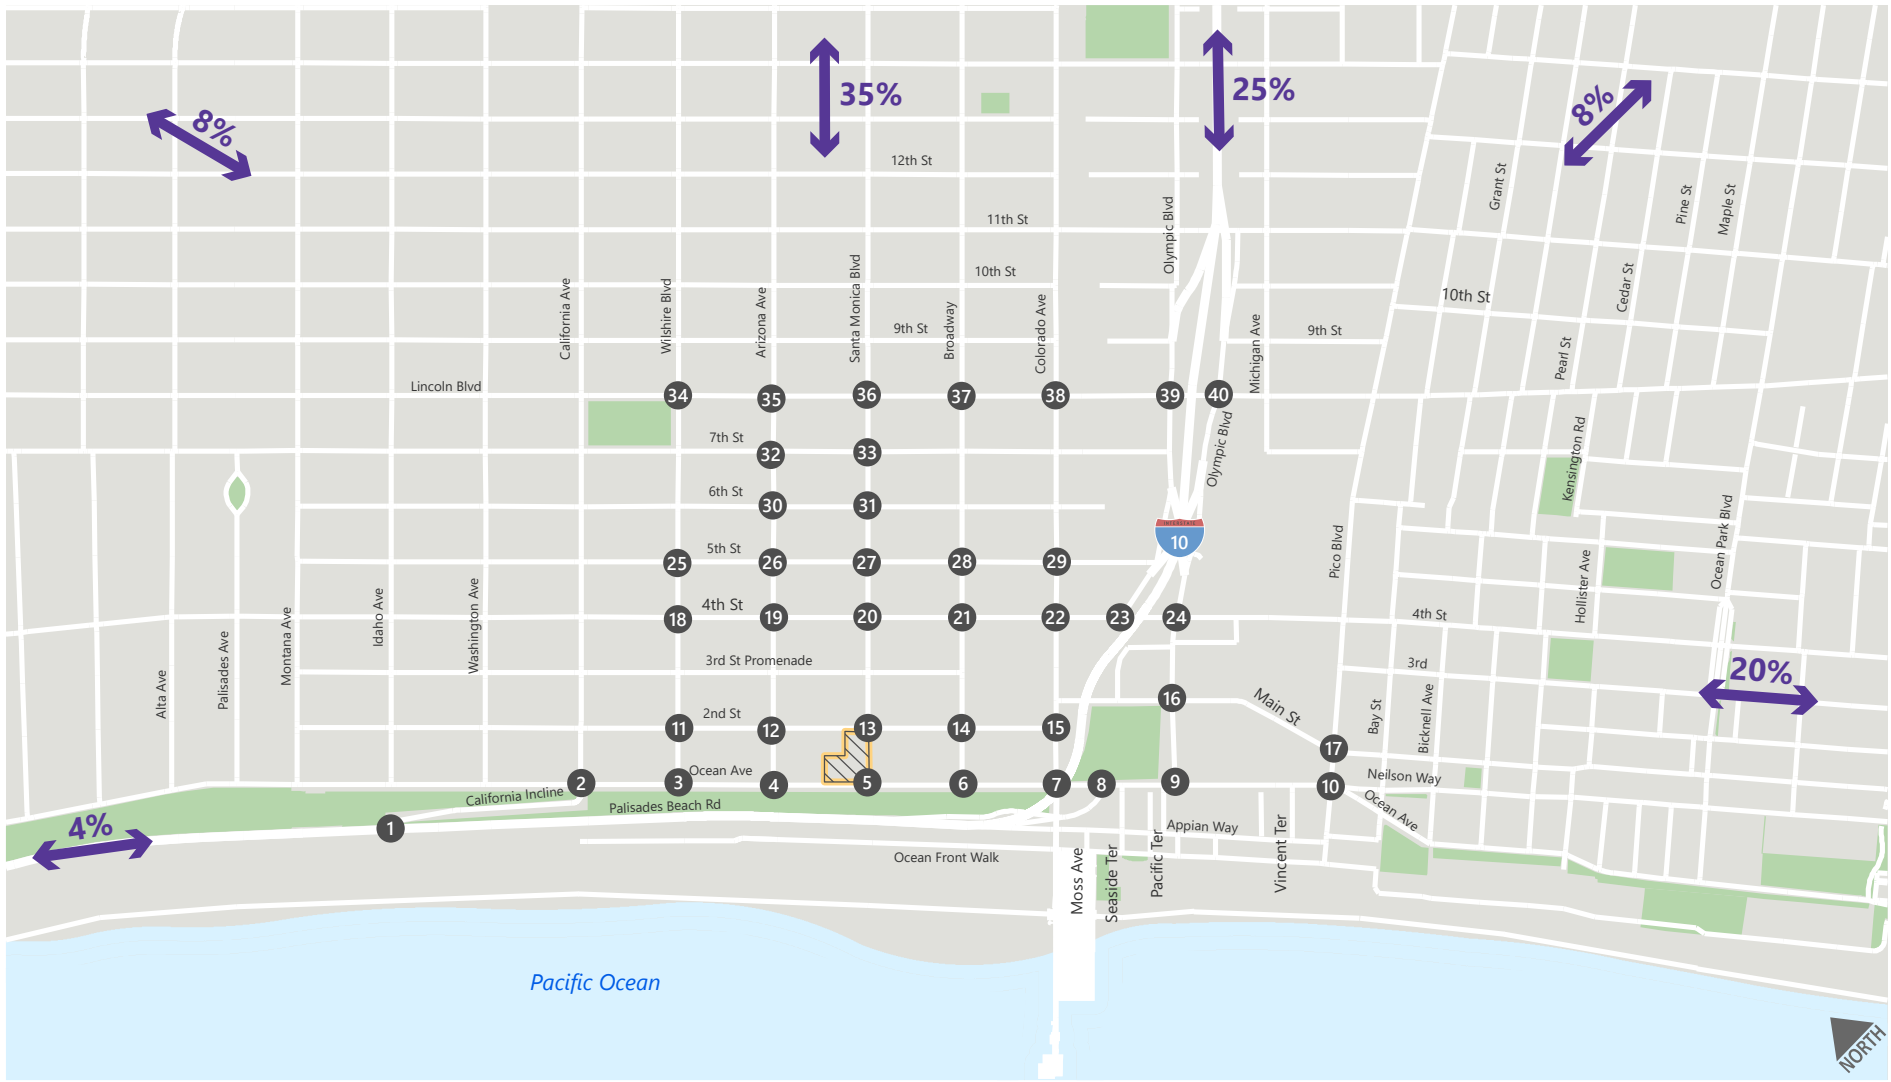

[i] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 3 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #932 High-Turnover Restaurant, Trip Generation Manual, 10th Edition, Institute of Transportation Engineers (ITE), 2017. The AM trip rates are reduced to reflect that most existing restaurants are not open during the AM peak hour, but employees and vendors are likely to be making trips during that time.

[j] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 8 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #710 General Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[k] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 8 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #720 Medical-Dental Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[l] Trip generation and in/out splits for project land use are applied from #492 Health/Fitness Club, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017. The daily rate is assumed to be the same as #720 Medical-Dental Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[m] Trip generation and in/out splits for project land use are applied from #918 Hair Salon, Trip Generation, 9th Edition, Institute of Transportation Engineers (ITE), 2012. The ITE Trip Generation manual does not include a daily rate. The daily rate is based on a phone survey of the existing salon's average number of daily appointments.

FUTURE IMPROVEMENTS ASSUMPTIONS

As part of the adopted DCP, the City envisioned that Wilshire Boulevard would be transformed into a more pedestrian-friendly street. The DCP identified the Wilshire Boulevard streetscape project, which would create widened pedestrian space along this street between Ocean Avenue and 4th Street through a reduction in vehicle lane space. This Wilshire Boulevard improvement is still in the conceptual stages and planning for this improvement has not yet begun. As part of this conceptual improvement, the sidewalk on the south side of Wilshire Boulevard in this segment would be widened to improve the pedestrian environment between the Third Street Promenade and Palisades Park on Ocean Avenue.

Roadway Reconfigurations

The project assumes that there would be a lane reduction on Wilshire Boulevard from two eastbound through lanes between Ocean Avenue and 4th Street to a single eastbound through or shared through-right lane.

Other Improvements

Signal timings at intersections are optimized under Future Year (2025) No Project traffic conditions to balance shifting demand patterns where applicable. Other possible roadway improvements would include the replacement of the Pier Bridge connecting Colorado Avenue with the Santa Monica Pier; however, this pending project has not been finalized, and so no change to the circulation of the Pier area has been assumed.

Bike Improvement Projects

The *City of Santa Monica Bike Action Plan* (October 2011) includes recommended bicycle projects for 5-year implementation and 20-year vision plans. As of 2019, the majority of the 5-year implementation projects have been completed, including those nearest the Project site. The DCP also identified further potential bicycle infrastructure improvements. The following projects, including the following projects in the vicinity of the project study area, are planned in the 20-year vision:

Ocean Avenue Cycle Track

- As called for in the DCP, the City is currently exploring the potential of installing a cycle track on the west side of Ocean Avenue.

Santa Monica Pier Improvements

- Short-term shared lane markings from Ocean Avenue to Santa Monica Pier; include bicycle facilities in the reconstruction of the bridge connecting Downtown with the Santa Monica Pier, which is anticipated within the next several years, and provide a connection from the Santa Monica Pier to the Beach Bike Trail.

Santa Monica Boulevard Bikeway

- Shared lane markings (identified in the *Bike Action Plan* as a green “super-sharrow”) from Ocean Avenue to 6th Street/7th Street.

APPROVAL YEAR (2020) TRAFFIC CONDITIONS

For the Approval Year (2020) analysis, weekday AM peak hour, weekday PM peak hour, and weekend midday peak hour traffic conditions were developed to provide the baseline against which direct impacts associated with the proposed Project were evaluated. The land use file in the City’s TDFM was modified to reflect anticipated near-term development projects that would be implemented through 2020. The City’s TDFM provides a prediction of traffic pattern changes between the model base year (2013) and the Approval Year (2020). These changes are applied to the 2017 traffic counts to develop an Approval Year (2020) No Project traffic conditions. Approval Year (2020) No Project traffic considerations, including lane geometry at each intersection and LOS at each intersection, are shown in Appendix B2 for the analyzed peak hours.

As described above, the traffic conditions associated the proposed Project were developed using the following three steps: estimate the trip generation of the project, determine trip distribution, and assign the project traffic to the roadway system.

Project-generated trips were assigned to the street system and added to the Approval Year (2020) No Project traffic conditions. The Approval Year (2020) Plus Project traffic conditions are shown in Appendix B. The Approval Year (2020) Plus Project traffic conditions include the Project-generated trips as well as the removal of existing trips (shown in Appendix B).

FUTURE YEAR (2025) TRAFFIC CONDITIONS

The City’s TDFM forecasts cumulative traffic conditions for the City’s and surrounding areas of the City of Los Angeles for 2025 and 2030. For consistency with the LUCE, the TDFM was used to forecast Future Year (2025) No Project traffic conditions analyzed in this study. Appendix B shows the Future Year (2025) No Project traffic conditions for the analyzed peak hours. The Future Year (2025) No Project traffic conditions incorporates the assumed future reconfiguration of Wilshire Boulevard between Ocean Avenue and 4th Street (as described in the Future Improvements Assumptions).

Future Year (2025) Year Plus Project traffic conditions represents the Future Year (2025) No Project traffic conditions with the addition of Project-generated trips. The Future Year (2025) Plus Project traffic conditions are shown in Appendix B. The Future Year (2025) Plus Project scenario includes the projected incremental traffic from the development of the proposed Project scenario as well as the shift in existing traffic (shown in Appendix B).

4. TRAFFIC IMPACT ANALYSIS

The previous chapter described sets of traffic conditions - the Approval Year (2020) No Project and Approval Year (2020) Plus Project as well as the Future Year (2025) No Project and Future Year (2025) Plus Project. These traffic conditions were analyzed to determine the Approval Year (2020) and Future Year (2025) operating conditions with and without the addition of Project-generated traffic and to identify the potential impacts of the proposed Project on the surrounding transportation network system. This chapter provides a discussion of the City's impact criteria and methodology used and summarizes the results of the analysis.

CRITERIA FOR DETERMINATION OF A SIGNIFICANT TRAFFIC IMPACT

In 1991, the City established criteria for assessing whether project-related traffic would result in significant impacts on intersection operating conditions using the measure of automobile delay. The thresholds of significance, summarized in Table 4, depends on the classification of the streets at the intersection (e.g., arterial, collector, or local street) and the operating conditions of the intersection under cumulative plus project traffic conditions. Although street classifications were updated in the LUCE, for purposes of this report, streets are classified as arterials, collectors and local streets because these are the categories used in the City's adopted intersection thresholds of significance. The potential significance of a project's impact is measured by either the change in average vehicle delay (measured in seconds) or by a change in the intersection operating conditions to undesirable conditions. If the intersection is projected to operate at LOS F, however, significance is defined in terms of a change in V/C ratio (as calculated by the "Operational Analysis" method from the HCM), since the average vehicular delay cannot be calculated using the "Operational Analysis" method from the HCM if the intersection exhibits oversaturated traffic conditions.

Using the City's previously adopted significance criteria summarized in Table 4, a project would not be considered to have a significant impact at an intersection if, for example, it is on an arterial street operating at LOS D with the addition of project traffic and the incremental change in the average vehicle delay is less than 15 seconds. If the intersection is operating at LOS E after the addition of project traffic and the average vehicle delay increases by any amount, however, this would be considered a significant project impact. All impacts on intersections projected to operate at LOS F are based on the V/C ratio, with project-related increases of 0.005 or greater considered significant.

Based on recent legislative changes in the State of California, environmental impact reports are transitioning away from intersection LOS and vehicular delay as an impact criteria and transitioning to measuring the change in VMT. Lead agencies have a July 1, 2020 deadline for adopting new impact criteria. At the time of this publication, the City has not adopted VMT-based impact criteria. More information on the regulatory changes and the project VMT analysis is included later in this report for informational purposes.

**TABLE 4
SIGNIFICANT IMPACT CRITERIA
ARTERIAL AND COLLECTOR INTERSECTIONS***

<p>IF LOS = E</p> <p>== and is a collector or arterial intersection</p>	<p>SIGNIFICANT IMPACT IF:</p> <p>Any net increase in average seconds of delay per vehicle</p>
<p>IF LOS = F</p> <p>== and is a collector or arterial intersection</p>	<p>SIGNIFICANT IMPACT IF:</p> <p>HCM V/C ratio net increase is \geq 0.005</p>

Notes:

* Functional street classifications for Santa Monica Intersections in this table are from the City's previous Circulation Element. The 2010 Land Use and Circulation Element (LUCE) has adopted a different typology for streets within the City but the significance criteria have not yet been revised.

APPROVAL YEAR (2020) NO PROJECT INTERSECTION CONDITIONS

The Approval Year (2020) No Project peak hour traffic conditions described in Chapter 3 and shown in Appendix B were analyzed using the methodologies described in Chapter 2 to forecast LOS at the study intersections during the analyzed peak hours. Table 5 provides a summary of the Approval Year (2020) intersection LOS. Detailed Vistro LOS calculation worksheets are provided in Appendix B2.

As shown in Table 5, of the 40 study intersections, the following seven study intersections are projected to operate at LOS E or F during at least one of the analyzed peak hours:

1. Palisades Beach Road & California Incline (LOS E in the AM, LOS F in the weekend midday peak hour)
2. Ocean Avenue & California Avenue (LOS E in the AM, LOS F in the PM and weekend midday peak hours)
11. 2nd Street & Wilshire Boulevard (LOS E in the PM, LOS F in the weekend midday peak hour)
13. 2nd Street & Santa Monica Boulevard (LOS F in the PM and weekend midday peak hours)
16. Main Street & Olympic Drive (LOS F in the AM and weekend midday peak hours)
38. Lincoln Boulevard & Colorado Avenue (LOS E in the AM peak hour)
39. Lincoln Boulevard & I-10 Westbound Off-Ramp (LOS F in the AM peak hour)

APPROVAL YEAR (2020) PLUS PROJECT TRAFFIC IMPACT ASSESSMENT

The Approval Year (2020) Plus Project peak hour traffic volumes were analyzed to determine future operating conditions at the study intersections and to identify specific traffic impacts resulting from the addition of Project-generated trips. The results of this analysis are summarized in Table 5 for comparison with the Approval Year (2020) No Project intersection conditions. At some intersections, the average vehicle delay in the future decreases slightly even as Project-generated trips are added. Under the "Operational Analysis" method from the HCM, intersection delay is a calculation whereby the overall delay is not additive, but rather a weighted average of all movements. Adding trips to some movements which are already congested will increase overall delay but adding trips to movements with available capacity could decrease the average delay value slightly.

Of the 40 study intersections, four study intersections were found to be significantly impacted by the proposed Project:

1. Palisades Beach Road & California Incline (LOS E in the AM, LOS F in the weekend midday peak hour)
2. Ocean Avenue & California Avenue (LOS E in the AM, LOS F in the PM and weekend midday peak hours)
11. 2nd Street & Wilshire Boulevard (LOS F in the weekend midday peak hour)
16. Main Street & Olympic Drive (LOS F in the AM and weekend midday peak hours)

FUTURE YEAR (2025) NO PROJECT INTERSECTION CONDITIONS

The Future Year (2025) No Project traffic conditions described in Chapter 3 and shown in Appendix B were analyzed using the LOS methodologies described in Chapter 2 to project future LOS at the study intersections during the analyzed peak hours. The results of this analysis are summarized in Table 6. Detailed Vistro LOS calculation worksheets are provided in Appendix B.

As shown in Table 6, of the 40 study intersections, the following 13 study intersections are projected to operate at LOS E or LOS F during at least one of the analyzed peak hours:

1. Palisades Beach Road & California Incline (LOS E in the AM peak hour)
2. Ocean Avenue & California Avenue (LOS E in the AM, LOS F in the PM and weekend midday peak hours)
3. Ocean Avenue & Wilshire Boulevard (LOS E in the weekend midday peak hour)
6. Ocean Avenue & Broadway (LOS E in the PM and weekend midday peak hours)
11. 2nd Street & Wilshire Boulevard (LOS E in the AM, LOS F in the PM and weekend midday peak hours)
13. 2nd Street & Santa Monica Boulevard (LOS F in the PM and weekend midday peak hours)
16. Main Street & Olympic Drive (LOS F in the AM and weekend midday peak hours)
19. 4th & Santa Monica Boulevard (LOS E in the PM, LOS F in the weekend midday peak hour)
24. 4th Street & I-10 Eastbound On-Ramp (LOS E in the AM peak hour)
35. Lincoln Boulevard & Arizona Avenue (LOS E in the PM peak hour)
38. Lincoln Boulevard & Colorado Avenue (LOS E in the AM peak hour)
39. Lincoln Boulevard & I-10 Westbound Off-Ramp (LOS F in the AM, LOS E in the weekend midday peak hour)
40. Lincoln Boulevard & I-10 Eastbound On-Ramp (LOS E in the weekend midday peak hour)

C Collector intersection

FUTURE YEAR (2025) PLUS PROJECT TRAFFIC IMPACT ASSESSMENT

The Future Year (2025) Plus Project traffic conditions were analyzed to determine future operating conditions at the study intersections and to identify impacts resulting from the addition of Project-generated trips. At some intersections, the average vehicle delay in the future decreases slightly even as Project-generated trips are added. Under the "Operational Analysis" method from the HCM, intersection delay is a calculation whereby the overall delay is not additive, but rather a weighted average of all movements. Adding trips to some movements which are already congested will increase overall delay but adding trips to movements with available capacity could decrease the average delay value slightly.

Table 6 summarizes the results of the Future Year (2025) Plus Project traffic conditions. Of the 40 study intersections, 6 study intersections were found to be significantly impacted by the proposed Project:

1. Palisades Beach Road & California Incline (LOS E in the AM peak hour)
2. Ocean Avenue & California Avenue (LOS E in the AM, LOS F in the PM and weekend midday peak hours)
12. 2nd Street & Arizona Avenue (LOS D in the weekend midday peak hour)
13. 2nd Street & Santa Monica Boulevard (LOS F in the PM and weekend midday peak hours)
16. Main Street & Olympic Drive (LOS F in the AM and weekend midday peak hours)
19. 4th & Santa Monica Boulevard (LOS E in the PM, LOS F in the weekend midday peak hour)

Intersection #11, 2nd Street & Wilshire Boulevard, is impacted under Approval Year (2020) Plus Project, but not under the Future Year (2025) Plus Project traffic conditions, primarily due to a nearby cumulative development project which substantially increases the average delay at this intersection. As a result, under future conditions, the addition of this proposed Project traffic is relatively minor and does not trigger an impact, even though the intersection is projected to operate at LOS F under Future Year (2025) No Project conditions.

VEHICLE MILES TRAVELED (VMT) ANALYSIS

Background

Authorized in September of 2013, Senate Bill (SB) 743 directed the Office of Planning and Research (OPR) to revise the CEQA Guidelines (California Code of Regulations, Title 14) to establish new criteria for determining the significance of transportation impacts and define alternative metrics for traffic LOS. Once the CEQA Guidelines are amended to include those alternative criteria, auto delay will no longer be considered a significant impact under CEQA.

OPR adopted final guidelines in December 2018, and the provisions of SB743 are now in effect, with agencies having an opt-in period until July 1, 2020. At the time of this publication, the City has not adopted VMT-based impact criteria. Project VMT analysis is included in this report for informational purposes.

Screening Thresholds and VMT Significance Thresholds

OPR's CEQA Guidelines includes new Section 15064.3, subdivision (b)(1), which states that *"generally, projects within 0.5 mile of an existing major transit stop or an existing stop along a high quality transit corridor should be presumed to have a less than significant impact on VMT."* Per the Technical Advisory, this presumption would not apply, however, if project-specific or location-specific information indicates that a project would still generate significant levels of VMT. For example, the presumption might not be appropriate if the project:

- Has a Floor Area Ratio (FAR) of less than 0.75
- Includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction (if the jurisdiction requires the project to supply parking)
- Is inconsistent with the applicable Sustainable Communities Strategy (as determined by the lead agency, with input from the Metropolitan Planning Organization)

Additionally, the Technical Advisory states that agencies may screen out VMT impacts using project size and maps:

- Absent substantial evidence indicating that a project would generate a potentially significant level of VMT, or inconsistency with a Sustainable Communities Strategy (SCS) or general plan, projects that generate or attract fewer than 110 trips per day generally may be assumed to cause a less than significant transportation impact.
- Residential and office projects that locate in areas with low VMT, and that incorporate similar features (i.e., density, mix of uses, transit accessibility), will tend to exhibit similarly low VMT. Maps created with data from a travel survey or travel demand model can illustrate areas that are currently below threshold VMT. Because new development in such locations would likely result in a similar

level of VMT, such maps can be used to screen out residential and office projects from needing to prepare a detailed VMT analysis.

The CEQA Guidelines apply prospectively, meaning that projects such as this one are not required to incorporate VMT as the primary transportation impact metric. This information is quantified here for informational purposes. No determination of significance is provided since the City has not yet adopted significance thresholds for VMT or a methodology for determining impacts based on VMT.

The City is in the process of drafting new VMT guidance for CEQA transportation review of projects and will be adopting new VMT based significance thresholds prior to July 1, 2020 in conformance with the new CEQA guidelines. Should the City adopt new significance thresholds based on VMT, the thresholds would apply prospectively to future projects (i.e., pending projects such as this would not be subject to the new thresholds).

VMT Analysis of Project

The VMT estimates for the proposed Project are based on the OPR guidance, which recommend evaluating each component of a mixed-use project independently. Guidance is provided for several broad land use types (i.e., residential, office, retail) that account for majority of the development projects that are proposed. The proposed Project includes hotel, a Cultural Use Campus (anticipated to be similar to a museum), retail, restaurant (which is fundamentally the same as retail from a travel perspective), and residential.

The estimates of VMT are based on the total trip generation estimates presented in Table 4. The proposed Project is estimated to generate a total of 3,479 daily trips among all the proposed uses. For office-type uses, the suggested metric is VMT per employee. While there is no office-type land use for this project, employee VMT estimates were calculated using the applicant's own projection of employees – inclusive of the hotel, condominiums, and restaurant space. For residential uses, the suggested metric is VMT per capita. Finally, VMT for all other visitors to the site (including hotel guests, restaurant and retail visitors, and Cultural Use Campus visitors) are analyzed together and provided for informational purposes.

The following steps were used to estimate Project-generated VMT, which are compared with Citywide averages for context. For each use, the total trips are multiplied by the average trip length for that type of trip from the City's TDFM TAZs at and around the Project site; that number of total miles is divided by the number of people related to that use (i.e., employees, residents, other visitors). The following sections detail the assumptions and VMT calculations for each trip type in this project: employees, residents, and all other visitors.

Employee VMT

- For office/employment VMT, determine the number of employees for the project: The applicant, City staff, and the EIR team provided estimates that total employment would be 212 workers, including 85 retail/restaurant workers, 103 hotel workers, and 24 Cultural Use Campus workers.
 - Apply the average vehicle ridership (AVR) factor of 2.2, which is the AVR target established for this site per Santa Monica Municipal Code Section 9.53.040, resulting in an estimate 193 daily employee trips (212 employees each making a round trip with an AVR of 2.2).
 - City's TDFM, discussed in Chapter 3, includes data on, the average daily trips, VMT, and trip length and by trip purpose for each TAZ, as well as the Citywide averages. While the proposed Project is located in the TAZ 138, it does not include hotel as a land use. Nearby TAZ 78 was referenced instead as it includes hotel and retail land uses. The average home-based work trip attraction in TAZ 78 is 12.6 miles, which is slightly higher than the Citywide average of 12.1 miles.
- Multiply the estimated employee trips by the trip length and divide by the number of employees to calculate average VMT per employee. Thus 193 employee trips of 12.6 miles each equals 2,432 total miles. This equates to 11.5 VMT per employee. This is slightly more than half of the Citywide average of 19.2 VMT per employee.

Residential VMT

- Estimate the total number of people for all residential units for the project. The proposed Project is estimated to include a total of 100 residential units.
 - The average household size for this census tract (Census Tract 7019.02) is 1.53. Applying this factor to the total number of residential units results in 153 people. In this case, the proposed Project residential unit mix includes 2- or 3-bedroom units, which is different from the existing mix of predominantly 1-bedroom housing in the Census tract. Therefore, the Citywide 2017 American Community Survey 5-Year Estimates⁶ for the City provides the estimate of project household size for the residential units. The residential units are estimated to have an average household size of 1.39 for studio and 1-bedroom units, 2.41 for 2-bedroom units, and 3.09 for 3-bedroom units. Applying these factors results in an estimated project population of 180 people.
 - As discussed in Chapter 3, the proposed Project would generate 352 daily residential trips.

⁶ <https://www.census.gov/programs-surveys/acs/data.html>

- City's TDFM, discussed in Chapter 3, includes data on, the average daily trips, VMT, and trip length and by trip purpose for each TAZ, as well as the Citywide averages. The residential use for the proposed Project is located in the TAZ 138. The average home-based productions trip length in TAZ 138 is 5.5 miles, which is slightly higher than the Citywide average of 5.4 miles.
- Multiply the estimated residential trips by the trip length and divide by the total number of people per household to calculate average VMT per capita. Thus 352 residential trips of 5.5 miles each equals 1,936 total miles. This equates to 10.8 VMT per capita. This is slightly higher than the Citywide average of 9.0 VMT per capita.
 - While residential infill in dense urban areas with good walking, biking, and transit access (non-automotive modes) such as the Downtown are known to ultimately decrease VMT, as analyzed this project would result in a VMT per capita higher than the Citywide average. The VMT per capita is affected by the assumptions described above, particularly the assumptions of Project-generated trips and the ultimate residential population of the Project (i.e., the "per capita"). The assumptions for the population associated with the proposed Project were developed as described above.
 - While the trip lengths for this area are short, reflecting the high degree of non-automotive access, the Project-generated trip assumption is based on a conservative approach for the purpose of analyzing intersection LOS, which seeks to evaluate a worst-case scenario for traffic operations per the City's current impact assessment methodology. The worst-case scenario assumptions for the proposed Project assume a trip generation rate (as shown in Table 4) of 2 cars per household for all units of 2 or more bedrooms.
 - Acknowledging the high degree of non-automotive access within the Downtown, the applicant proposes to build the maximum allowable number of residential spaces as defined by the DCP, which is fewer than 1 space per unit. The applicant is not including residential parking permits with units (known as "unbundled parking") allowing for flexibility to provide exactly the number of residential spaces as there is demand for at any given time. This could significantly lower the actual Project-generated trips (estimated to be approximately 282 daily trips compared with the conservatively estimated 353 shown in Table 4). Using the lower trip generation rate assumptions for the affordable units would reduce the VMT per capita to approximately 8.63, less than the Citywide average.

Non-Employee and Non-Residential VMT (All Other Visitors)

- Estimate the number of non-employee and non-residential trips to and from the project. If 545 daily trips are made by employees and residents, then the remaining 2,934 daily trips are made by hotel guests, Cultural Use Campus visitors, and other non-employees/residents.
- The average trip length for “home-based other” trip attractions and “non-home-based” trip attraction in TAZ 138 is 9.1 miles. The average trip length for “non-home-based” trip productions in TAZ 138 is 5.6 miles. These trip types represent all other travel activity that is not directly related to commute trips or home-based trips, which would include hotel guests and Cultural Use Campus visitors. Applying these trip lengths to the estimated non-employee and non-residential inbound and outbound trips yields an estimate of 21,565 miles per day. This likely represents a conservative analysis to estimating VMT for commercial uses since it does not account for the potential that new commercial (i.e., retail and restaurant) development can result in a redistribution of trips rather than the creation of new trips. Thus, it does not account for the potential that some trips would replace trips that would otherwise be made to and from other commercial destinations in the area.

When added to the 2,432 estimated miles of employee trips per day and 1,936 estimated miles of residential trips per day, total daily VMT for the proposed Project is estimated to be 25,933 miles.

5. ANALYSIS OF POTENTIAL INTERSECTION MITIGATION MEASURES

An investigation was conducted for potential mitigation measures to reduce or eliminate the significant intersection impacts identified. The emphasis was to identify physical improvements that could be implemented within the existing roadway right-of-way (ROW). At most locations in Santa Monica, the streets are already built to their maximum potential width. Reconfiguring the streets to provide additional capacity for vehicles could have adverse secondary impacts such as loss of parking, conflicts with bicycle or pedestrian modes, or potential requirements for demolition of improvements such as buildings and would conflict with the LUCE objectives, DCP objectives, and other City policies promoting alternative modes of transportation.

The mitigation measures studied are limited to intersection impacts, because at the time of this study, the City has not adopted thresholds for VMT impacts against which a mitigation could be evaluated. Additionally, as described in Chapter 4, the proposed Project falls within 0.5 mile of an existing major transit stop (i.e., Downtown Santa Monica Station), and OPR guidance is to presume such projects have a less than significant impact on VMT. Finally, the applicant and the City will negotiate a TDM program as part of the Development Agreement, as described in Chapter 3.

As discussed below, physical improvements were considered to reduce the severity of the Approval Year (2020) Plus Project and Future Year (2025) Plus Project traffic impacts. In some cases, retiming of traffic signals and implementation of split phasing or protected left turns could reduce or eliminate impacts; however, the City does not consider signal timing adjustments as appropriate mitigation measures because they may limit the ability to make future adjustments as needed to address the needs of changing travel demands, pedestrians, and bicyclists. For example, the City recently implemented leading pedestrian intervals, as described in Chapter 2, which can increase average vehicle delay somewhat by shifting more time to pedestrian crossings, while improving the safety for people crossing the street.

APPROVAL YEAR AND FUTURE YEAR PLUS PROJECT MITIGATION MEASURES

Tables 5 and 6 summarize the Approval Year (2020) Plus Project and Future Year (2025) Plus Project intersection impacts according to the City's adopted impact significance criteria and further indicate whether the impact can be physically or operationally mitigated. Three impacted intersections in Approval Year (2020) Plus Project are also impacted in Future Year (2025) Plus Project. One intersection, 2nd Street & Wilshire Boulevard, is impacted only under Approval Year (2020) Plus Project traffic conditions, which is discussed further below. All other impacted intersections are only under the Future Year (2025) Plus Project traffic conditions. This section describes the potential mitigation measures that were reviewed for the significantly impacted intersections listed below.

1. Palisades Beach Road (PCH) & California Avenue
2. Ocean Avenue & California Avenue
11. 2nd Street & Wilshire Boulevard
12. 2nd Street & Arizona Avenue
13. 2nd Street & Wilshire Boulevard
16. Main Street & Olympic Drive
19. Lincoln Boulevard & California Avenue

1. Palisades Beach Road (PCH) & California Incline

This intersection experiences a small increase in delay under the Approval Year (2020) Plus Project and Future Year (2025) Plus Project traffic conditions during the weekday AM peak hour, and additionally during the weekend midday peak hour under Future Year (2025) Plus Project traffic conditions. This signal is on a state highway and controlled by the California Department of Transportation (Caltrans). A small percentage of Project-generated trips are forecast to use the California Incline to access the PCH northbound towards Malibu and Ventura, and southbound as the shortest path to reach I-10 eastbound from the Project site. The current signal configuration permits eastbound and westbound movements during the same phase. A feasible mitigation is to reconfigure the signal to operate a split phase eastbound and westbound so that the minimal volumes exiting the Jonathan Club driveway (eastbound approach) are not conflicting with the significantly higher volume turning left from the westbound California Incline. Sometime prior to the 2016 reconstruction of the California Incline, this intersection was operated with split phasing. The split phase and retiming of this signal would reduce the delay to below the Plus Project traffic conditions at LOS E. However, signal phasing and timing changes are not considered an appropriate mitigation measure as it conflicts with the ability of the City in cooperation with Caltrans to make future adjustments to signal timing as needed to improve pedestrian and bicycle safety and access, which are key mobility goals set by City policy. Therefore, the impact remains significant and unavoidable.

2. Ocean Avenue & California Avenue

This intersection is impacted during the PM and weekend midday peak hours under Approval Year (2020) Plus Project and Future Year (2025) Plus Project traffic conditions and during the AM peak hour under Future Year (2025) Plus Project traffic conditions. In 2018, the City adjusted signal timing at this intersection to implement leading pedestrian intervals (described in Chapter 3), which increases all-red time for vehicles in order to improve pedestrian and bicyclist safety. This intersection is also the connection point between heavily used north-south bicycle lanes on Ocean Avenue, east-west bicycle lanes on California Avenue, and a two-way cycletrack on the California Incline that provides pedestrian and bicycle access to the beach over the PCH.

The addition of Project-generated trips at this location increases overall intersection delay. The critical movement is the eastbound through from the California Incline, which shares a lane with left-turning traffic. The westbound approach experiences a similarly saturated condition, with a high volume of left and through movements sharing a lane. The best potential mitigation is to reconfigure and retime the traffic signal to

operate a split phase eastbound and westbound. A split phase would remove conflicts between through and left movements, improving overall delay to LOS E or better in all Plus Project traffic conditions. However, signal phasing and timing changes are not considered an appropriate mitigation measure as described earlier in this section. Therefore, the impact remains significant and unavoidable.

11. 2nd Street & Wilshire Boulevard

This intersection is impacted during the weekend midday peak hour under Approval Year (2020) Plus Project traffic conditions. The southbound approach is impacted by the addition of Project-generated trips, due to a single-lane approach to accommodate all movements. This intersection is anticipated to operate at less than satisfactory conditions (LOS D or worse) under the Approval Year (2020) Plus Project traffic conditions primarily due to the single shared lane on the southbound approach. A possible mitigation is to remove four to eight on-street metered parking spaces on the western side of 2nd Street in order to stripe a two-lane southbound approach with one left-turn lane and one shared through/right-turn lane. Doing so would require the reconfiguration of the southbound bicycle lane on 2nd Street to possibly include a shared lane conflict marking (hatched green bicycle lane) similar to the existing configuration of the northbound approach. With approximately 25- to 30-foot of width from the existing centerline to the curb, it appears that there would be sufficient space following the removal of parking to accommodate a left-turn pocket, a through lane, and the bicycle lane. The addition of a left-turn pocket would improve the intersection V/C to better than the No Project traffic conditions during all peak hours in the Approval Year (2020) Plus Project traffic conditions. Therefore, the impact at this location would be less than significant after mitigation.

This intersection is not impacted under the Future Year (2025) Plus Project traffic conditions, primarily due to a nearby cumulative development project which substantially increases the average delay at this intersection. As a result, under future conditions, the addition of this proposed Project traffic is relatively minor and does not trigger an impact, even though the intersection is projected to operate at LOS F.

The LOS at 2nd Street & Wilshire Boulevard after mitigation are as follows:

- Approval Year (2020) Plus Project with Mitigation (LOS / Delay / V/C):
 - AM: LOS C / 24.73 / 0.260 (this peak hour was not impacted by the proposed Project)
 - PM: LOS D / 44.32 / 0.306 (this peak hour was not impacted by the proposed Project)
 - Weekend Midday: LOS F / 60.95 / 0.375 (this peak hour was impacted at LOS F by the proposed Project increasing V/C by greater than 0.005; the mitigation reduces the V/C to below the Approval Year (2020) No Project traffic conditions)

- Future Year (2025) Plus Project with Mitigation:
 - AM: LOS C / 28.07 / 0.391 (this peak hour was not impacted by the proposed Project; however, the mitigation reduces the delay and V/C to below the Future Year (2025) No Project traffic conditions)

- PM: LOS C / 28.54 / 0.301 (this peak hour was not impacted by the proposed Project; however, the mitigation reduces the delay and V/C to below the Future Year (2025) No Project traffic conditions)
- Weekend Midday: LOS F / > 100 / 1.712 (this peak hour was not impacted by the proposed Project; however, the mitigation reduces the delay and V/C to below the Future Year (2025) No Project traffic conditions)

12. 2nd Street & Arizona Avenue

This intersection is impacted during the weekend midday peak hour under Future Year (2025) Plus Project traffic conditions. The addition of Project-generated trips at this location increases overall intersection delay. The critical movement is the southbound approach. A possible mitigation is to remove on-street metered parking and the bicycle lane on the eastern side of 2nd Street in order to stripe a right-turn only lane, with a left-turn pocket and through lane. The addition of a right-turn only lane would improve the intersection's delay to better than the No Project traffic conditions during all peak hours under Future Year (2025) Plus Project traffic conditions. However, removing the bicycle lane conflicts with the City policy to encourage walking and bicycling in the City. In addition, such mitigation may displace or reduce use of alternative transportation modes that help reduce VMT and those could conflict with the purpose and intent of SB 743. Therefore, the impact remains significant and unavoidable.

13. 2nd Street & Santa Monica Boulevard

This intersection is impacted during the PM peak hour under Future Year (2025) Plus Project traffic conditions. The addition of Project-generated trips at this location increases overall intersection delay. The critical movement is the westbound through, which shares a lane with left-turning traffic. Within the existing right-of-way, there are no possible lane configurations that would fully mitigate the impact of the westbound approach. Therefore, the impact remains significant and unavoidable.

16. Main Street & Olympic Drive

This intersection is impacted during the AM and weekend midday peak hours under Approval Year (2020) Plus Project and Future Year (2025) Plus Project traffic conditions. The addition of Project-generated trips at this location increases overall intersection delay. The critical movement occurs in the westbound or eastbound approach. During the AM peak hour, the northbound approach experiences a similarly saturated condition, with a high volume of right turns sharing a lane. There are no mitigation measures that would fully mitigate the impact. Therefore, the impact remains significant and unavoidable.

19. 4th Street & Arizona Avenue

This intersection is impacted during the PM and weekend midday peak hour under Future Year (2025) Plus Project traffic conditions. The westbound approach is impacted by the addition of Project-generated trips, due to a single-lane approach to accommodate all movements. A possible mitigation is to remove on-street metered parking and the bicycle lane on the northern side of Arizona Avenue and re-stripe the approach to a shared through-right and shared through-left lane. This mitigation would improve the intersection's delay to better than the No Project traffic conditions during all peak hours under Future Year (2025) Plus Project traffic conditions. However, removing the bicycle lane conflicts with the City policy to encourage walking and bicycling in the City. In addition, such mitigation may displace or reduce use of alternative transportation modes that help reduce VMT and those could conflict with the purpose and intent of SB 743. Therefore, the impact remains significant and unavoidable.

6. PROJECT ALTERNATIVES

In addition to the No Project Alternative, five alternatives to the project were evaluated to determine their potential impacts on the surrounding transportation system as compared to the proposed Project. Trip generation for each of the alternatives was estimated and compared with that of the proposed Project, and a qualitative assessment of potential traffic impacts was made. A quantitative analysis of each alternative was not prepared as part of this study. The alternatives to the proposed Project are described below:

1. **No Project.** Under the “No Project” alternative, the proposed redevelopment of the Ocean Avenue Parcel and the 2nd Street Parcel would not occur. The existing uses and surface parking lot would remain and operations would remain the same.
2. **Tier 2 Mixed-Use Housing Projects Compliant with Ocean Transition and Bayside Conservation District.** Alternative 2 assumes a 50-foot height limit and 2.75 FAR for the Ocean Transition zone and a 60-foot height limit and 3.5 FAR for the Bayside Conservation District. In this alternative, 1st Court would not be vacated. In comparison with the proposed Project, there would be 50 more housing units, increased retail and restaurant space, addition of office space, no hotel, no Cultural Use Campus, no public observation deck, and substantially less open space with no publicly-accessible open space provided.
3. **Reduced Height and Density.** This alternative assumes a maximum building height of 84 feet. The proposed Project would include 91 residential units, which is fewer than the proposed Project. The proposed hotel would include 65 residential units, which is fewer than the proposed Project.
4. **Retention of Existing City-Designated Landmarks and 101 Santa Monica Boulevard.** Under this alternative, the existing City-designated landmarks located at 1333 and 1337 Ocean Avenue would remain in their current locations and the building located at 101 Santa Monica Boulevard would also remain in place. 1st Court would not be vacated. In comparison with the proposed Project, there would be 20 less housing units, reduced Cultural Use Campus, increased retail and restaurant space, and the addition of office space. No hotel would be provided and there would be substantially less ground floor open space. This alternative would also not include an observation deck.
5. **Revised Circulation Alternative.** This alternative would include the development of the uses similar to the proposed Project; however, the circulation plan would be revised to address City concerns related to potential vehicle drop-off along Ocean Avenue. Under this alternative, a driveway into the Project site along Ocean Avenue would be added to provide entry into the subterranean garage.

ESTIMATED TRIP GENERATION FOR PROJECT ALTERNATIVES

The trip generation of each of the alternatives was estimated using the same methodology that was used for the proposed Project. The resulting trip generation estimates for each alternative are shown in Tables 7 to 9. Table 10 compares trips generated by the proposed Project with the five project alternatives. The estimated trip generation of each alternative is summarized below.

- Alternative 1 – Under this alternative, the project would not be constructed, and there would be no new trips generated to or from the Project site. Existing uses would continue to generate trips.
- Alternative 2 – The trip generation for Alternative 2 would be 35% to 65% higher than that of the proposed Project during each of the analyzed peak hours. The higher trip generation is due to the increases in retail/restaurant uses in this alternative. As shown in Table 7, this alternative is expected to generate a net increase of 3,694 daily weekday trips, 198 trips in the AM peak hour, 240 trips in the PM peak hour, and 252 trips in the weekend midday peak hour.
- Alternative 3 – The trip generation for Alternative 3 would be 12% to 16% lower than that of the proposed Project during each of the analyzed peak hours. As shown in Table 8, this alternative is expected to generate a net increase of 1,809 weekday daily trips, 127 trips in the AM peak hours, 123 trips in the PM peak hour, and 148 trips in the weekend midday peak hour.
- Alternative 4 – The trip generation for Alternative 4 would be 15% to 36% higher than that of the proposed Project during each of the analyzed peak hours. The higher trip generation is due to the increases in retail/restaurant uses in this alternative. As shown in Table 9, this alternative is expected to generate a net increase of 2,956 daily weekday trips, 170 trips in the AM peak hour, 199 trips in the PM peak hour, and 222 trips in the weekend midday peak hour.
- Alternative 5 – The trip generation for Alternative 5 would be the same to that of the proposed Project.

Notes: Proposed land uses based on applicant's information and other conversations.
Existing land uses were fully occupied in July 2017, when baseline traffic counts were collected.
As described in the *Santa Monica Travel Demand Forecasting Model (TDFM) Trip Generation Rates*, Santa Monica TDFM trip generation rates for residential, retail and restaurant space incorporate internal capture and pass-by trips.
It is assumed that the car-ownership per household for studio multi-family residential land use types is zero cars, one-bedroom multi-family residential land use types is one car, while the car-ownership per household for two- bedroom and three-bedroom multi-family residential land use types is two or more cars.
[a] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #220 Multifamily Housing, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
[b] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #820 Shopping Center, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
[c] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #932 High-Turnover Restaurant, Trip Generation Manual, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
[d] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LR; in/out splits are applied from #710 General Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
[e] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LR; in/out splits are applied from #720 Medical-Dental Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
[f] Trip generation was sourced from trip generation rates that were developed for six museum/cultural use spaces in Southern California, including a range of types such as art museums, historical museums, and children's museums. The rates and in/out splits for all six museums were averaged together to develop a conservative estimate for this site in the absence of a specific program identified for the cultural use space.
[g] Trip generation rate from "Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region", April 2002
[h] Trip generation is empirically derived from observations at six other hotels in the downtown Santa Monica area. The trip generation and in/out splits were observed for each hotel on an average weekday during the AM and PM peak hours, and an average weekend midday peak hour while the hotels were near 100% occupancy. The rates and in/out splits reflect the average of all observations.
[i] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 3 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #220 Multifamily Housing, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
[j] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 3 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #932 High-Turnover Restaurant, Trip Generation Manual, 10th Edition, Institute of Transportation Engineers (ITE), 2017. The AM trip rates are reduced to reflect that most existing restaurants are not open during the AM peak hour, but employees and vendors are likely to be making trips during that time.
[k] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 8 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LR; in/out splits are applied from #710 General Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
[l] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 8 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LR; in/out splits are applied from #720 Medical-Dental Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
[m] Trip generation and in/out splits for project land use are applied from #492 Health/Fitness Club, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017. The daily rate is assumed to be the same as #720 Medical-Dental Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
[n] Trip generation and in/out splits for project land use are applied from #918 Hair Salon, Trip Generation, 9th Edition, Institute of Transportation Engineers (ITE), 2012. The ITE Trip Generation manual does not include a daily rate. The daily rate is based on a phone survey of the existing salon's average number of daily appointments.

Notes: Proposed land uses based on applicant's information and other conversations.
Existing land uses were fully occupied in July 2017, when baseline traffic counts were collected.
As described in the *Santa Monica Travel Demand Forecasting Model (TDFM) Trip Generation Rates*, Santa Monica TDFM trip generation rates for residential, retail and restaurant space incorporate internal capture and pass-by trips.
It is assumed that the car-ownership per household for studio multi-family residential land use types is zero cars, one-bedroom multi-family residential land use types is one car, while the car-ownership per household for two- bedroom and three-bedroom multi-family residential land use types is two or more cars.

[a] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #220 Multifamily Housing, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[b] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #820 Shopping Center, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[c] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #932 High-Turnover Restaurant, Trip Generation Manual, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[d] Trip generation was sourced from trip generation rates that were developed for six museum/cultural use spaces in Southern California, including a range of types such as art museums, historical museums, and children's museums. The rates and in/out splits for all six museums were averaged together to develop a conservative estimate for this site in the absence of a specific program identified for the cultural use space.

[e] Trip generation rate from "Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region", April 2002

[f] Trip generation is empirically derived from observations at six other hotels in the downtown Santa Monica area. The trip generation and in/out splits were observed for each hotel on an average weekday during the AM and PM peak hours, and an average weekend midday peak hour while the hotels were near 100% occupancy. The rates and in/out splits reflect the average of all observations.

[g] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 3 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #220 Multifamily Housing, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[h] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 3 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #932 High-Turnover Restaurant, Trip Generation Manual, 10th Edition, Institute of Transportation Engineers (ITE), 2017. The AM trip rates are reduced to reflect that most existing restaurants are not open during the AM peak hour, but employees and vendors are likely to be making trips during that time.

[i] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 8 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LR; in/out splits are applied from #710 General Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[j] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 8 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LR; in/out splits are applied from #720 Medical-Dental Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[k] Trip generation and in/out splits for project land use are applied from #492 Health/Fitness Club, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017. The daily rate is assumed to be the same as #720 Medical-Dental Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[l] Trip generation and in/out splits for project land use are applied from #918 Hair Salon, Trip Generation, 9th Edition, Institute of Transportation Engineers (ITE), 2012. The ITE Trip Generation manual does not include a daily rate. The daily rate is based on a phone survey of the existing salon's average number of daily appointments.

Notes: Proposed land uses based on applicant's information and other conversations.
 Existing land uses were fully occupied in July 2017, when baseline traffic counts were collected.
 As described in the *Santa Monica Travel Demand Forecasting Model (TDFM) Trip Generation Rates*, Santa Monica TDM trip generation rates for residential, retail and restaurant space incorporate internal capture and pass-by trips.
 [a] It is assumed that the car-ownership per household for studio multi-family residential land use types is zero cars, one-bedroom multi-family residential land use types is one car, while the car-ownership per household for two- bedroom and three-bedroom multi-family residential land use types is two or more cars.
 [b] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #220 Multifamily Housing, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
 [c] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #820 Shopping Center, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
 [d] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #932 High-Turnover Restaurant, Trip Generation Manual, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
 [e] Trip generation for project land use in 2030 from TDFM (Area Type 1), with Expo reduction from Table 18 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LR; in/out splits are applied from #710 General Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
 [f] Trip generation was sourced from trip generation rates that were developed for six museum/cultural use spaces in Southern California, including a range of types such as art museums, historical museums, and children's museums. The rates and in/out splits for all six museums were averaged together to develop a conservative estimate for this site in the absence of a specific program identified for the cultural use space.
 [g] Trip generation rate from "Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region", April 2002.
 [h] Trip generation is empirically derived from observations at six other hotels in the downtown Santa Monica area. The trip generation and in/out splits were observed for each hotel on an average weekday during the AM and PM peak hours, and an average weekend midday peak hour while the hotels were near 100% occupancy. The rates and in/out splits reflect the average of all observations.
 [i] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 3 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #220 Multifamily Housing, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
 [j] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 3 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #932 High-Turnover Restaurant, Trip Generation Manual, 10th Edition, Institute of Transportation Engineers (ITE), 2017. The AM trip rates are reduced to reflect that most existing restaurants are not open during the AM peak hour, but employees and vendors are likely to be making trips during that time.
 [k] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 8 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LR; in/out splits are applied from #710 General Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
 [l] Trip generation for project land use in 2020 from TDFM (Area Type 1), with Expo reduction from Table 8 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LR; in/out splits are applied from #720 Medical-Dental Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
 [m] Trip generation and in/out splits for project land use are applied from #492 Health/Fitness Club, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017. The daily rate is assumed to be the same as #720 Medical-Dental Office Building, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.
 [n] Trip generation and in/out splits for project land use are applied from #918 Hair Salon, Trip Generation, 9th Edition, Institute of Transportation Engineers (ITE), 2012. The ITE Trip Generation manual does not include a daily rate. The daily rate is based on a phone survey of the existing salon's average number of daily appointments.

POTENTIAL TRAFFIC IMPACTS OF PROJECT ALTERNATIVES

Based on the projected trip generation of the proposed alternatives and a review of the incremental changes in delay and V/C under the proposed Project, the following general conclusions can be made with regard to anticipated traffic impacts:

- Alternative 1 – By definition, no traffic impacts would occur under this alternative, as no new development and associated vehicle trips would occur on the Project site.
- Alternative 2 – Under Approval Year (2020) conditions, impacts would occur at the same intersections found under the proposed Project, and the severity of those impacts would be greater. An additional impact would occur at the intersection of 2nd Street & Santa Monica Boulevard during the weekend midday peak hour. Under Future Year (2025) conditions, the severity of impacts that would occur would be slightly greater than that of the proposed Project. There would be an additional impact at the intersection of Lincoln Boulevard & Colorado Avenue during the AM peak hour.
- Alternative 3 – Under Future Year (2025) conditions, the significant impact at the intersection of 2nd Street & Arizona Avenue during the weekend midday peak hour would not be expected to occur. All other impacts under Approval Year (2020) and Future Year (2025) would remain the same, however the severity of the impacts that occur with the proposed Project would be reduced but still be considered significant. No additional significant impacts would occur under this alternative.
- Alternative 4 – Under Approval Year (2020) conditions, impacts would occur at the same intersections found under the proposed Project, and the severity of those impacts would be greater. An additional impact would occur at the intersection of 2nd Street & Santa Monica Boulevard during the weekend midday peak hour. Under Future Year (2025) conditions, the severity of impacts that would occur would be slightly greater than that of the proposed Project. There would be an additional impact at the intersection of Lincoln Boulevard & Colorado Avenue during the AM peak hour.
- Alternative 5 - This alternative would generate the same level of trips as the proposed Project but includes an additional driveway for access to the parking garage on Ocean Avenue. However, the addition of the driveway on Ocean Avenue is not expected to divert vehicles away from impacted intersections. The diverted traffic is also not anticipated to impact any additional intersections. Therefore, each of the significant impacts that would occur with the proposed Project would also occur with Alternative 5.

Ocean Avenue Project Transportation Impact Analysis
April 2020

As summarized in Table 11, Alternative 1 would avoid all of the significant intersection impacts associated with the proposed Project. Under Alternatives 2 and 4, there would be one additional significant intersection impact in the Approval Year (2020) and Future Year (2025) compared with the proposed Project. Under Alternative 3, there would be one less significant intersection impact in the Future Year (2025) compared with the proposed Project, though the number and location of significant intersection impacts under Approval Year (2020) conditions would be unchanged. The number and location of significant impacts for Alternative 5 would remain the same under Approval Year (2020) and Future Year (2025) traffic conditions.
