similar to the conditions calculated from the existing average daily traffic volumes that were calculated before the COVID-19 pandemic.

**4.10.3.2 Construction Noise and Vibration**

This section addresses the methodology to assess potential noise and vibration impacts associated with operating equipment and construction-related traffic during the various phases of construction. The construction traffic and equipment assumptions are provided in the **Appendix 3.0.4: Inglewood Transit Connector Project Baseline Construction Phasing Narrative, August 2021**. The construction footprint for each phase is described in *Section 4.10.7* of this topical section.

Federal methodologies for assessing noise and vibration impact are defined in the FTA's *Transit Noise and Vibration Impact Assessment Manual*. As updated in 2018, the FTA Assessment Manual provides procedures and impact criteria for noise and vibration from transit sources and the criteria apply to transit projects that seek federal funds.

These criteria include procedures for evaluating transit projects, including guidelines for evaluating the impact of operational noise on sensitive land uses as shown in **Table 4.10-2: FTA Land Use Categories and Metrics for Transit Noise Impact Criteria**.

**Table 4.10-2  
Land Use Categories and Metrics for Transit Noise Impact Criteria**

Land Use Category	Land Use Type	Noise Metric, dBA	Description of Land Use Category
1	High Sensitivity	Outdoor Leq (1hr) <sup>1</sup>	Land where quiet is an essential element of its intended purpose. Example land uses include preserved land for serenity and quiet, outdoor amphitheaters and concert pavilions, and national historic landmarks with considerable outdoor use. Recording studios and concert halls are also included in this category.
2	Residential	Outdoor DNL	This category is applicable all residential land use and buildings where people normally sleep, such as hotels and hospitals.
3	Institutional	Outdoor Leq (1hr) <sup>1</sup>	This category is applicable to institutional land uses with primarily daytime and evening use. Example land uses include schools, libraries, theaters, and churches where it is important to avoid interference with such activities as speech, meditation, and concentration on reading material. Places for meditation or study associated with cemeteries, monuments, museums, campgrounds, and recreational facilities are also included in this category.

Source: Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018

Note:

<sup>1</sup> Leq(1hr) for the loudest hour of project-related activity during hours of noise sensitivity.

Additionally, the FTA Assessment Manual provides guidance on how to evaluate the level of impact of noise levels from transit projects in relation to human annoyance, as shown in **Table 4.10-3: FTA Levels of Impact**.

**Table 4.10-3  
FTA Levels of Impact**

Level of Impact	Description
No Impact	Project-generated noise is not likely to cause community annoyance. Noise projections in this range are considered acceptable by FTA and mitigation is not required.
Moderate Impact	Project-generated noise in this range is considered to cause impact at the threshold of measurable annoyance. Moderate impacts serve as an alert to project planners for potential adverse impacts and complaints from the community. Mitigation should be considered at this level of impact based on project specifics and details concerning the affected properties.
Severe Impact	Project-generated noise in this range is likely to cause a high level of community annoyance. The project sponsor should first evaluate alternative locations/alignments to determine whether it is feasible to avoid severe impacts altogether. In densely populated urban areas, evaluation of alternative locations may reveal a trade-off of affected groups, particularly for surface rail alignments. Projects that are characterized as point sources rather than line sources often present greater opportunity for selecting alternative sites. This guidance manual and FTA's environmental impact regulations both encourage project sites which are compatible with surrounding development when possible. If it is not practical to avoid severe impacts by changing the location of the project, mitigation measures must be considered.

Source: Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018.

The FTA Assessment Manual identifies noise significance thresholds which are a function of existing ambient noise levels and the land use category of sensitive receptors. As illustrated in **Figure 4.10-1: FTA Noise Impact Criteria for Transit Projects**, the thresholds at which a moderate or severe impact occur vary as the existing noise environment changes. The FTA Assessment Manual also provides guidance on evaluating cumulative noise impacts.

According to the FTA Assessment Manual, project construction noise criteria should account for the existing noise environment, the absolute noise levels during construction activities, the duration of construction, and the adjacent land use. As such, the FTA Assessment Manual provides the following reasonable criteria for assessment for residential, commercial, and industrial land uses:

- Residential: 90 dBA Leq (1-hour) during the daytime; 80 dBA Leq (1-hour) during the nighttime.
- Commercial: 100 dBA Leq (1-hour) during the daytime and nighttime.
- Industrial: 100 dBA Leq (1-hour) during the daytime and nighttime.

**Construction Phasing**

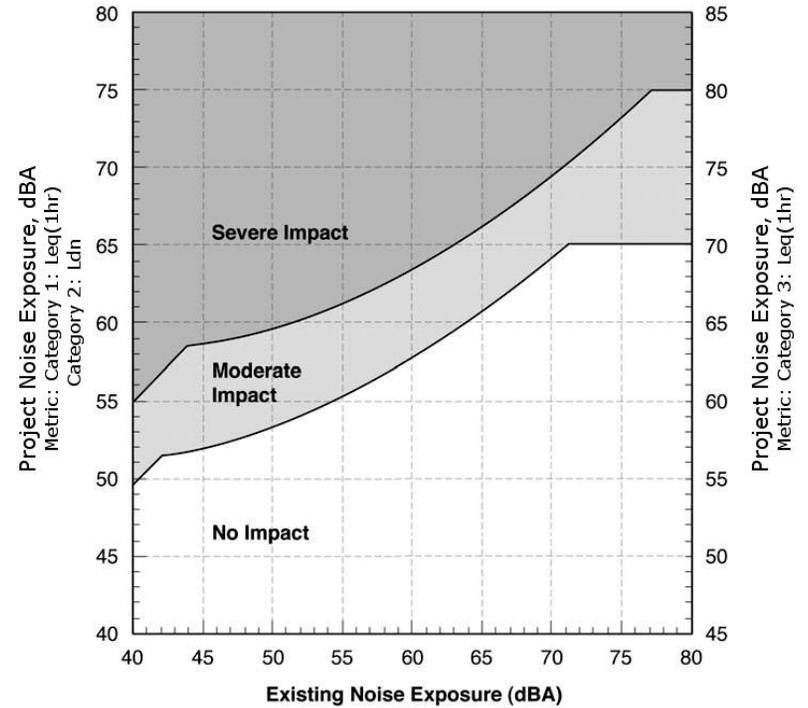

Construction of the proposed Project would occur in eight (8) phases over approximately 46 months between January 2024 and November 2027. It is likely that these construction phases will overlap to provide the most efficient construction schedule once a contractor is selected for the delivery of the proposed Project. The construction phasing described below will likely be refined as design and implementation of the Project progresses and a contractor is selected. A summary description of construction phasing is provided below.

Prior to Phase 1 construction activities being initiated on the MSF site, the owner/operator of the Vons supermarket currently located on this site would demolish the existing Vons gas station on the corner of Manchester Boulevard and Spruce Avenue and pave this area for use as a parking area for the new Vons store to be built on the corner of Manchester Boulevard and Hillcrest Boulevard. This construction would occur over an approximate 10-month period prior to Phase 1 of the ITC construction.

**Phase 1**

Phase 1 would include demolition of buildings and site improvements on properties acquired for construction of the project, the beginning of construction of the MSF, trenching and installation of primary power duct bank, and preparatory work on the east side of Prairie Avenue to allow for the roadway shift. Phase 1 construction would start in January 2024. Phase 1 construction would include the following:

- Demolition of buildings and site improvements on property acquired for the project. As noted below, portions of the areas to be demolished will be used for construction staging.
- Utility locations for protection in place, possible utility relocations, and new utility installation for utilities such as electrical, water, gas, storm drains, sewer, temporary traffic signals, and streetlights.
- Removal and disposal of existing sidewalks, roadways, landscape, and medians as needed, including the installation of new or temporary pavement and asphalt for road work and sidewalks, along the east side of Prairie Avenue.
- Site preparation for installation of the power distribution system (PDS) substations , electrical equipment, and subsystems will occur at the MSF site and Prairie Avenue/Hardy Street Station Site.
- Installation of the primary power duct bank along Prairie Avenue.
- Installation of the power duct bank for the SCE power feed from the SCE Inglewood Substation to the MSF site.

SOURCE: TRANSIT NOISE AND VIBRATION IMPACT ASSESSMENT MANUAL, FEDERAL TRANSIT ADMINISTRATION

FIGURE 4.10-1

#### 4.10 Noise and Vibration

The properties where existing buildings and site improvements will be demolished include at the existing retail commercial center at Market Street and Regent Street, the commercial buildings located at 500 Manchester Boulevard, the commercial building at 150 S. Market Street on the northeast corner of Manchester and Market Street, the retail commercial center at northwest corner of Prairie Avenue and Hardy Street, , the commercial building at 925 S. Prairie Avenue, and the commercial building at 1003 S. Prairie Avenue.

After demolition, the remaining asphalt flatwork areas at the commercial plaza at Market Street and Regent Street, the commercial building at 150 S. Market Street, and the retail commercial center at northwest corner of Prairie Avenue and Hardy Street, will provide space for construction staging, including but not limited to, space for equipment storage, material staging and storage, contractor jobsite trailers, and on-site parking for construction staff throughout the entire project duration.

#### Phase 2

Phase 2 would include activities to enable the construction sequence of the guideway along Prairie Avenue from Hardy Street to Manchester Boulevard, and work at the MSF site. Phase 2 construction would occur in 2024 through 2025. Phase 2 construction would include the following:

- Removal of existing sidewalks, roadways, landscaping, and demolition of other improvements as needed along the guideway alignment. This work includes new or temporary pavement and asphalt for road work and sidewalks.
- Utility work including potential relocations, protection in place where feasible, and new utility installations including but not limited to electrical, water, gas, storm drains, sewer, temporary traffic signals, and streetlights.
- Drilling of the foundations for the MSF building.
- Construct new pavement, sidewalks, streetlights, traffic signals, and other infrastructure on Prairie Avenue, and shift the roadway east to its new alignment.
- The installation of a K-Rail system on the west side of Prairie Avenue to delineate the construction area. The K-Rail system will be installed approximately twenty-two feet into the public right-of-way (ROW) from the westerly face of curb on Prairie Avenue, excluding sidewalks, from Hardy Street to Manchester Boulevard and maintained until construction in this area is completed. The area within the K-Rail system will be used for the mobilization of equipment, drilling, crane operations and concrete pump outriggers for the excavation and installation of concrete foundations, concrete piles, single and double concrete columns, beam girders and cantilevered bents for the aerial construction.
- Installation of buildings for the electrical equipment and subsystems at each of the two PDS sites.

#### 4.10 Noise and Vibration

#### Phase 3

Phase 3 would include foundation work for the Automated Transit System (ATS) guideway, foundation work for the Market Street/Florence Ave Station, and construction for the support structure of the MSF building. Phase 3 work will include utility relocation (if necessary), foundations, cast-in-place (CIP) columns, and setting of prefabricated buildings at the PDSs. Phase 3 construction would occur in 2024 through 2025. Phase 3 construction would include the following:

- Utility work including potential relocations, protection in place where feasible, and new utility installations including but not limited to electrical, water, gas, storm drains, sewer, temporary traffic signals, and streetlights.
  - Removal of existing sidewalks, roadways, landscaping, and demolition as needed. This work includes new or temporary pavement and asphalt for road work and sidewalks.
  - The installation of a K-Rail system on the south side of Manchester Boulevard to delineate the construction area. The K-Rail system will be installed approximately twenty-two feet into the public ROW from southerly face of curb, excluding sidewalks, along Manchester Boulevard from Prairie Avenue to Market Street and maintained until construction in this area is completed. The area within the K-Rail system will be used for the mobilization of equipment, drilling, crane operations and concrete pump outriggers for the excavation and installation of concrete foundations, concrete piles, single and double concrete columns, beam girders and cantilevered bents for the aerial construction.
  - Installation of buildings for the electrical equipment and subsystems at each of the two PDS sites.
  - Construction of the support structure, columns, and cross girders for MSF building.
  - The installation of two rows of K-Rail system along Market Street to delineate the construction area. The K-Rail system will be installed approximately twenty-five feet into the public ROW in the center of Market Street, from Manchester Boulevard to Florence Avenue. The area within the K-Rail system will be used for the mobilization of equipment, drilling, crane operations and concrete pump outriggers for the excavation and installation of concrete foundations, concrete piles, single and double concrete columns, beam girders and for supports directly under the guideway.
  - Drill foundations for the ATS guideway along the west side of Prairie Avenue from Hardy Street to Manchester Boulevard, the south side of Manchester Boulevard from Prairie Avenue to Market Street, Market Street from Manchester Boulevard to Florence Avenue.
  - Drill foundations for the Market Street/Florence Ave Station.
  - Drill foundations for the Prairie Ave/Manchester Boulevard Station.
  - Drill foundations for the Prairie Ave/Hardy Street Station.

**Phase 4**

Phase 4 construction would include foundation work for the ATS guideway, guideway column caps along Market Street, and the MSF building deck and shell. Phase 4 activities will include utility relocation (if necessary), foundations, CIP columns, guideway column caps, and installation of equipment at the TPDSS. Phase 4 construction would occur in 2025 through 2026. Phase 4 construction would include the following:

- Removal of existing sidewalks, roadways, landscaping, and demolition of other improvements on Manchester as needed along the guideway alignment. This work includes new or temporary pavement and asphalt for road work and sidewalks.
- Utility work including potential relocations, protection in place where feasible, and new utility installations including but not limited to electrical, water, gas, storm drains, sewer, temporary traffic signals, and streetlights.
- Installation on of the building deck, shell, and steel roof members on the MSF building.
- Construction of the support structure, columns, and cross girders, for Market Street/Florence Ave Station.
- Construction of the support structure, columns, and cross girders, for Prairie Ave/Hardy Street Station.
- Construction of the guideway columns and column caps along Market Street.
- Installation of electrical equipment in the PDS buildings.
- Reconstruct sidewalk, curb, and gutter on the west side of Prairie Avenue and south side of Manchester Boulevard.
- After construction activities on the west side of Prairie Avenue are completed, construction of the east side of Prairie Avenue would begin. A K-rail system would be installed to delineate the construction area on the east side of Prairie Avenue. The K-Rail system will be installed approximately fifteen-feet into the public ROW starting from the easterly face of curb, excluding sidewalk, from Hardy Street to Manchester Boulevard. If needed, a temporary easement or utility setback may be utilized to secure staging areas. The area within the K-Rail system will be used for the installation of foundations, CIP columns, single and double concrete columns, beam girders and cantilevered bents for the aerial construction.
- After construction activities on the south side of Manchester Boulevard are completed, construction of the north side of Manchester Boulevard would begin. A K-rail system would be installed to delineate the construction area on the north side of Manchester Boulevard. The area within the K-Rail system will be used for the installation of foundations, CIP columns, single and double concrete columns, beam girders and cantilevered bents for the aerial construction.
- Drill foundations for the ATS guideway along the east side of Prairie Avenue from Hardy Street to Manchester Boulevard, and the north side of Manchester Boulevard from Prairie Avenue to Market Street

**Phase 5**

Phase 5 construction would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, guideway girder along Market Street, and MSF building interior construction. Phase 5 activities will include guideway girders, guideway straddle caps, and installation of equipment at the PDSs. Phase 5 construction would occur in 2025 through 2026. Phase 5 construction would include the following:

- Aerial construction of the guideway on Market Street, with precast segments and/or formwork with precast trapezoidal troughs and girders. This work would include temporary closure of Market Street during the following activities for safety measures:
  - During the formwork phase, traffic would not be allowed to pass underneath the structure.
  - Traffic would not be allowed to pass underneath precast segments while they are being moved and set.
  - During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms, temporary lane closures would be necessary.
  - The staging and holding area for the delivery of precast segments, girders, and beams will be located in the Market Street/Florence Avenue Station staging area; delivery to the construction area may require street closures.
- Construction on the interior of the MSF building.
- Aerial construction of the guideway formwork for Prairie Avenue/Manchester Boulevard Station with precast trapezoidal troughs and steel girders, and construction of platform, mezzanine, and vertical circulation elements.
- Aerial construction of the guideway formwork for Prairie Avenue/Hardy Street Station with precast trapezoidal troughs and steel girders, and construction of platform, mezzanine, and vertical circulation elements.
- Aerial construction of the guideway straddle cap formwork on Manchester Boulevard. This work would include temporary closure of Manchester Boulevard during the following activities for safety measures:
  - During the formwork phase, traffic would not be allowed to pass underneath the structure.
  - During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms. Temporary lane closures would be necessary.
  - The staging and holding area for the delivery of girders and beams will be located in the MSF staging area; delivery to the construction area may require street closures.

#### 4.10 Noise and Vibration

- Aerial construction of the guideway straddle cap formwork on Prairie Avenue. This work would include temporary closure of Prairie Avenue during the following activities for safety measures:
  - During the formwork phase, traffic would not be allowed to pass underneath the structure.
  - During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms. Temporary lane closures would be necessary.
  - The staging and holding area for the delivery of girders and beams will be located in the MSF staging area; delivery to the construction area may require street closures.
- Installation of electrical equipment in the PDS buildings.

#### Phase 6

Phase 6 construction would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, completion of Prairie Avenue/Manchester Boulevard Station, completion of Prairie Avenue/Hardy Street Station, and completion of the MSF building, and the elevated passenger walkway to the Metro K Line Downtown Inglewood Station. Phase 6 construction would occur in 2025 through 2026. Phase 6 construction would include the following:

- Aerial construction of the guideway on Manchester Boulevard, with precast segments and/or formwork with precast trapezoidal troughs and girders. This work would include temporary closure of Manchester Boulevard during the following activities for safety measures:
  - During the formwork phase, traffic would not be allowed to pass underneath the structure.
  - Traffic would not be allowed to pass underneath precast segments while they are being moved and set.
  - During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms. Temporary lane closures would be necessary.
  - The staging and holding area for the delivery of precast segments, girders, and beams will be located in the MSF staging area; delivery to the construction area may require street closures.
- Completion of the MSF facility including building commissioning.
- Aerial construction of the guideway on Prairie Avenue, with precast segments and/or formwork with precast trapezoidal troughs and girders. This work would include temporary closure of Prairie Avenue during the following activities for safety measures:
  - During the formwork phase, traffic would not be allowed to pass underneath the structure.

#### 4.10 Noise and Vibration

- Traffic would not be allowed to pass underneath precast segments while they are being moved and set.
- During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms. Temporary lane closures would be necessary.
- The staging and holding area for the delivery of precast segments, girders, and beams will be located in the MSF staging area; delivery to the construction area may require street closures.
  - Completion of the electrical equipment in the PDS substation buildings.
  - Aerial construction of the guideway formwork with precast trapezoidal troughs and steel girders, and completion of platform, mezzanine, and vertical circulation elements for Prairie/Manchester Station.
  - Aerial construction of the guideway formwork with precast trapezoidal troughs and steel girders, and completion of platform, mezzanine, and vertical circulation elements for Hardy Station.
  - Construction of the overhead bridge across Florence Avenue, providing a passenger access walkway from the Market Street/Florence Avenue Station to the Metro K Line Downtown Inglewood Station.

#### Phase 7

Phase 7 construction would include final site work and completion of the stations. Phase 7 would occur in 2026. Phase 7 construction would include the following:

- Final site work and paving on Manchester Boulevard.
- Completion of the Prairie Avenue/Hardy Street Station.
- Completion of the Prairie Avenue/Manchester Boulevard Station.
- Completion of the Market Street/Florence Avenue Station.
- Final site work at the MSF site.
- Final site work at the Market Street/Florence Avenue Station.
- Construction of all surface parking lots.
  - Final roadway improvements and modifications, and re-striping of streets as required.

#### Phase 8

Phase 8 construction would occur for the guideway along the entire length of the alignment and primarily includes installation of the operating systems and testing and commissioning of the ATS trains. Phase 8 construction would occur in 2025 through 2027, with the primary construction activities occurring in 2026 and some installation of equipment starting towards the end of Phase 3 construction when sufficient aerial

4.10 Noise and Vibration

structure is available for the installation of the equipment. Phase 8 construction would include the following:

- Installation of the ATS track work.
- Installation, testing, and commissioning of the operation and control systems
- Installation of the station platform equipment and systems, such as platform doors, passenger information systems, and ticket vending.
- Installation, testing, and commissioning of the PDSs and power systems.
- Testing and commissioning of the ATS trains
- Station commissioning.
- This work will involve periodic temporary lane closures as needed to allow access to the aerial construction platforms, installation of equipment, completion of platforms, stations, and electrical systems, and completing roadway improvements and modifications.

**Construction Equipment Noise**

Construction activities typically generate noise from the operation of equipment required for demolition, site preparation, grading, construction, paving, and application of architectural coatings. Noise impacts from construction and staging of construction equipment were evaluated by determining cumulative noise levels generated by construction activity, calculating the construction-related noise level at nearby noise-sensitive receptor locations, and comparing these construction-related noise levels to existing ambient noise levels (i.e., noise levels without Project-related construction noise). The actual noise level would vary, depending upon the equipment type, model, the type of work activity being performed, and the condition of the equipment. Over the course of construction, activities would occur over a 16 hour/day schedule with two shifts, either a morning shift from approximately 7:00 AM to 3:00 PM and an evening shift from approximately 3:00 PM to 11:00 PM, or a morning shift from approximately 7:00 AM to 3:00 PM and a night shift from approximately 11:00 PM to 7:00 AM. The night shift would be used for material deliveries, export of soil and debris and other light construction activities. Construction during the nighttime period would require a permit from the Permits and Licenses Committee of the City.

The Construction Phasing Narrative (see **Appendix F**) identifies the anticipated construction equipment for on- and off-site construction activities and is shown in **Table 4.10-4: Proposed Project Anticipated Construction Equipment by Phase**.

**Off-Road On-Site Equipment:** Off-road construction equipment includes dozers, loaders, sweepers, and other heavy-duty construction equipment that is not licensed for travel on public highways.

4.10 Noise and Vibration

4.10-20

Inglewood Transit Connector Project  
November 2021

4.10 Noise

**On-Road On-Site Equipment:** On-road on-site equipment on-site water trucks, dump trucks, haul trucks and other on-road vehicles licensed to travel on public roadways.

**On-Road Off-Site Equipment:** On-road on-site equipment includes shuttle vans transporting construction employees to and from the site(s), on-site pick-up trucks, and crew vans

**Construction Noise Modeling**

The following were used to calculate construction noise levels:

- Ambient noise levels at surrounding noise-sensitive receptor locations were modeled based on existing noise in proximity to the nearby noise-sensitive receptors.
- Typical noise levels for each type of construction equipment were obtained from the Federal Highway Administration’s (FHWA) Roadway Construction Noise Model (RCNM). A sample of typical construction equipment noise levels is shown in **Table 4.10-4**.

An inventory of possible construction equipment, including number and types of equipment, was identified for each phase/component of construction and all equipment was assumed to operate simultaneously. It is highly unlikely that all pieces of construction equipment identified in **Table 4.10-4** would operate simultaneously in any specific location during construction because equipment is generally operated only when needed and space constraints limit the equipment that can be used at any one time in a specific location. Therefore, this modeling approach is considered a conservative approach to calculate the maximum noise levels that would be generated.

Moreover, as discussed more fully below, the project proposes PDF-NOISE-1 Construction Noise Control Plan as part of the Construction Commitment Program for the project. PDF-NOISE-1 requires the contractor to prepare a Construction Noise Control Plan, and to incorporate numerous measures as construction requirements that will reduce construction noise, such as installing noise barriers and muffling equipment. The noise modeling reported below does not account for these noise-reducing project features. The calculated average sound power levels (refer to **Appendix N-4.1**) were inputted as area sources into the SoundPLAN model<sup>10</sup> each for the eight (8) construction phases:

- Phase 1: 84.8 dBA (Leq-1hour) per square meter (dB/m, m<sup>2</sup>) with an Lmax of 85.4 dBA
- Phase 2: 83.1 dBA (Leq-1hour) dB/m, m<sup>2</sup> with an Lmax of 84.9 dBA
- Phase 3: 84.1 dBA (Leq-1hour) dB/m, m<sup>2</sup> with an Lmax of 84.6 dBA
- Phase 4: 84.7 dBA (Leq-1hour) dB/m, m<sup>2</sup> with an Lmax of 84.6 dBA

<sup>10</sup> SoundPLAN model is in compliance with ISO 9613-2 standards for assessing attenuation of sound propagating outdoors and general calculation method.

- e) Phase 5: 84.9 dBA (Leq-1hour) dB/m, m<sup>2</sup> with an Lmax of 84.8 dBA
- f) Phase 6: 83.0 dBA (Leq-1hour) dB/m, m<sup>2</sup> with an Lmax of 82.3 dBA
- g) Phase 7: 84.0 dBA (Leq-1hour) dB/m, m<sup>2</sup> with an Lmax of 82.1 dBA
- h) Phase 8: 90.0 dBA (Leq-1hour) dB/m, m<sup>2</sup> with an Lmax of 85.2 dBA

Distances between construction activities for each of the phases and staging area locations (noise source), and surrounding noise-sensitive receptors were measured using concept plans for the proposed Project and aerial imagery.

Construction traffic and equipment noise levels were calculated for noise-sensitive receptor locations (see **Section 4.0: Environmental Impact Analysis, 4.0.6 Sensitive Receptors**) based on the conventional standard point source noise-distance attenuation factor of 4.5 to 6.0 dBA for each doubling of distance. Construction noise levels were quantified at predetermined distances from the site using the L<sub>eq</sub> metric.

Calculated noise levels associated with the proposed Project's construction at noise-sensitive receptor locations were then compared to estimated existing noise levels and the construction noise significance thresholds.

**Table 4.10-5: Estimate of Hourly Construction Activity Levels** presents the construction activity shifts that would occur during the 24-hour period. Construction activity would primarily occur over a 16 hour daily schedule with two shifts, either a Morning/Evening shift from approximately 7:00 AM to 3:00 PM and an evening shift from approximately 3:00 PM to 11:00 PM, or a Morning/Night shift from approximately 7:00 AM to 3:00 PM during the day and a night shift from approximately 11:00 PM to 7:00 AM.<sup>11</sup> There will be periods when construction activities are scheduled to occur from approximately 11:00 PM to 7:00 AM to accommodate work activities that cannot be accomplished during the daytime shifts (i.e., during large-scale pours of concrete when it would be necessary to maintain a continuous stream of concrete deliveries through multiple shifts). Construction work is assumed to occur seven days a week.

For purposes of this analysis, a hybrid construction shift was derived from **Table 4.10-5** to calculate maximum construction noise levels. Conservatively, the construction noise analysis assumed the equipment use activity factor for morning/night shift during the nighttime period (10:00 PM – 6:59 AM), morning/evening shift during the daytime period (7:00 AM – 6:59 PM), and the morning/evening shift during the evening period (7:00 PM – 9:59 PM). 24-hour CNEL, daytime (7:00 AM to 8:00 PM) and nighttime (8:00 PM to 7:00 AM) construction noise levels are provided in **Appendix N.4-2** through **4.10.4-5** for each construction phase. Maximum hourly construction noise levels are provided in the tables below.

<sup>11</sup> **Appendix F:** Construction Phasing Narrative for this Recirculated Draft EIR, August 2021.

Due to site constraints, primarily along Prairie Avenue and Manchester Boulevard, just-in-time deliveries of construction materials would be required during off-peak hours and/or night hours. Additionally, construction of the guideway, columns and station components that could impact Prairie Avenue and Manchester Boulevard would be primarily constructed during the off-peak hours and night hours in order to minimize impacts to daily commuter traffic and potential event traffic. Delivery of construction materials would occur during the night shift, as would most lane closures. Construction activities during the day shift would primarily consist of work that could proceed without requiring lane closures or significant disruption to daily commuter traffic and potential event traffic along Prairie Avenue and Manchester Boulevard. Additionally, it can be anticipated that some minor activity would occur during periods in between construction shifts for logistics, moving equipment, etc. An adjusted workload intensity is assumed for these periods of minor activity.

**Table 4.10-5**  
**Estimate of Hourly Construction Activity Levels**

	Hour	Equipment Use Activity Factor	
		Morning/Evening Shift (7:00 AM – 3:00 PM, 3:00 PM – 11:00 PM)	Morning/Night Shift (7:00 AM – 3:00 PM, 11:00 PM – 7:00 AM)
Nighttime	12:00 AM – 1:00 AM	25%	50%
	1:00 AM – 2:00 AM	25%	50%
	2:00 AM – 3:00 AM	25%	50%
	3:00 AM – 4:00 AM	25%	50%
	4:00 AM – 5:00 AM	25%	50%
	5:00 AM – 6:00 AM	25%	50%
Daytime	6:00 AM – 6:59 AM	25%	50%
	7:00 AM – 8:00 AM	100%	100%
	8:00 AM – 9:00 AM	100%	100%
	9:00 AM – 10:00 AM	100%	100%
	10:00 AM – 11:00 AM	100%	100%
	11:00 AM – 12:00 PM	100%	100%
	12:00 PM – 1:00 PM	100%	100%
	1:00 PM – 2:00 PM	100%	100%
	2:00 PM – 3:00 PM	100%	100%
	3:00 PM – 4:00 PM	100%	50%
	4:00 PM – 5:00 PM	100%	50%
	5:00 PM – 6:00 PM	100%	50%
Evening	6:00 PM – 6:59 PM	100%	50%
	7:00 PM – 8:00 PM	75%	38%
	8:00 PM – 9:00 PM	75%	38%
Nighttime	9:00 PM – 9:59 PM	75%	38%
	10:00 PM – 11:00 PM	50%	25%
	11:00 PM – 12:00 AM	25%	50%

Source: **Appendix F:** Construction Phasing Narrative for the EIR, August 2021.

Construction equipment noise was evaluated by determining the noise levels generated by typical outdoor construction activity and calculating the potential for exposure to noise-sensitive uses. Construction equipment noise impacts were assessed by identifying the closest noise-sensitive receptors to each construction area.

### **Construction Traffic Noise**

The analysis of construction traffic noise impacts focuses on off-site Project construction activity by:

- Identifying major roadways that may be used for construction worker commute routes or truck haul routes;
- Identifying the nature and location of noise-sensitive receptors along those routes; and
- Evaluating the traffic characteristics along those routes, specifically as related to existing traffic volumes.

The primary haul and delivery routes include Florence Avenue, Manchester Boulevard, Prairie Avenue and Century Boulevard which have been designated by the City as Truck Routes.<sup>12</sup> To minimize traffic impacts to streets in and around the proposed Project area, excavated dirt materials/spoils will be hauled during off-peak and night hours.

Construction traffic volume data was provided for multiple segments along each roadway. According to FHWA, traffic noise levels increase by 3 dBA where traffic volumes double (100 percent increase). Therefore, where Project construction traffic along a haul route results in the doubling of ADT, a significant impact would occur.

### **Construction Equipment Vibration**

For quantitative construction vibration assessments related to building damage and human annoyance, vibration source levels for construction equipment were taken from the FTA *Transit Noise and Vibration Impact Assessment Manual*.<sup>13</sup> Building damage would be assessed for each piece of equipment individually and assessed in terms of peak particle velocity (PPV). Ground-borne vibration related to human annoyance is assessed in terms of rms velocity levels.

Ground-borne vibration measurements (refer to **Appendix N.3**) were collected in accordance with FTA guidance<sup>14</sup> at each of the five noise monitoring locations that were measured over a 24-hour period. Outdoor field measurements were taken using remote monitoring systems and an accelerometer on

<sup>12</sup> City Municipal Code, Section 3-85. Truck Routes Established.

<sup>13</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

<sup>14</sup> FTA *Transit Noise and Vibration Impact Assessment Manual*.

November 16, 2018. Accelerometers were placed on smooth surfaces on the ground to ensure that vertical vibration was accurately captured. The vibration intervals were set to 1 second at each location.

Existing vibration monitoring was conducted to provide data on ambient ground-borne vibration generated by traffic and operation of activities. The locations of the vibration monitoring selected were either adjacent to sensitive land uses (residences and hotels) or buildings that were close to where the components of the proposed Project would be constructed. Vibration data was acquired with a flat frequency response range from 6 Hertz (Hz) to 400 Hz.

### **4.10.3.3 Operational Noise and Vibration**

This section addresses the methodology to assess potential noise impacts associated with changes in roadway traffic attributable to the operation of the proposed Project. Additionally, this section addresses noise and vibration impacts associated with operation of trains and stationary uses (MSF and PDSS).

#### **Traffic Noise**

The analysis evaluates the extent to which ambient exterior noise levels at noise-sensitive uses located along major roadways within the Project vicinity may change due to traffic associated with the operation of the proposed Project, and noise generated from the ATS trains and stationary sources such as the MSF.

The noise evaluation addressed the following scenarios:

- Adjusted Baseline Conditions during typical non-event Weekday without the ITC Project
- Adjusted Baseline Conditions during typical non-event Weekday with the ITC Project
- Opening Year (2027) Conditions with NFL event Weekday without the ITC Project
- Opening Year (2027) Conditions with NFL event Weekday with the ITC Project
- Future Horizon Year (2045) Conditions with NFL event Weekday without the ITC Project
- Future Horizon Year (2045) Conditions with NFL event Weekday with the ITC Project

#### **Traffic Data Conversions**

The traffic study (see **Appendix O**) evaluated an extensive network of roadway intersections to be assessed for increases in traffic volumes within the area surrounding the proposed Project. Existing ADTs were estimated using the validated Inglewood Travel Demand Forecasting Model (ITDF). The ITDF Model was utilized along with existing transportation networks for each of the four time periods (AM, Mid-Day, PM, Nighttime) and the associated socio-economic database consistent with the SCAG 2020–2045 RTP/SCS Regional Model. The results for all four time periods were aggregated to reflect the average daily conditions. The resulting ADT volumes reflect typical weekday operations under the existing (2020) conditions.

4.10 Noise

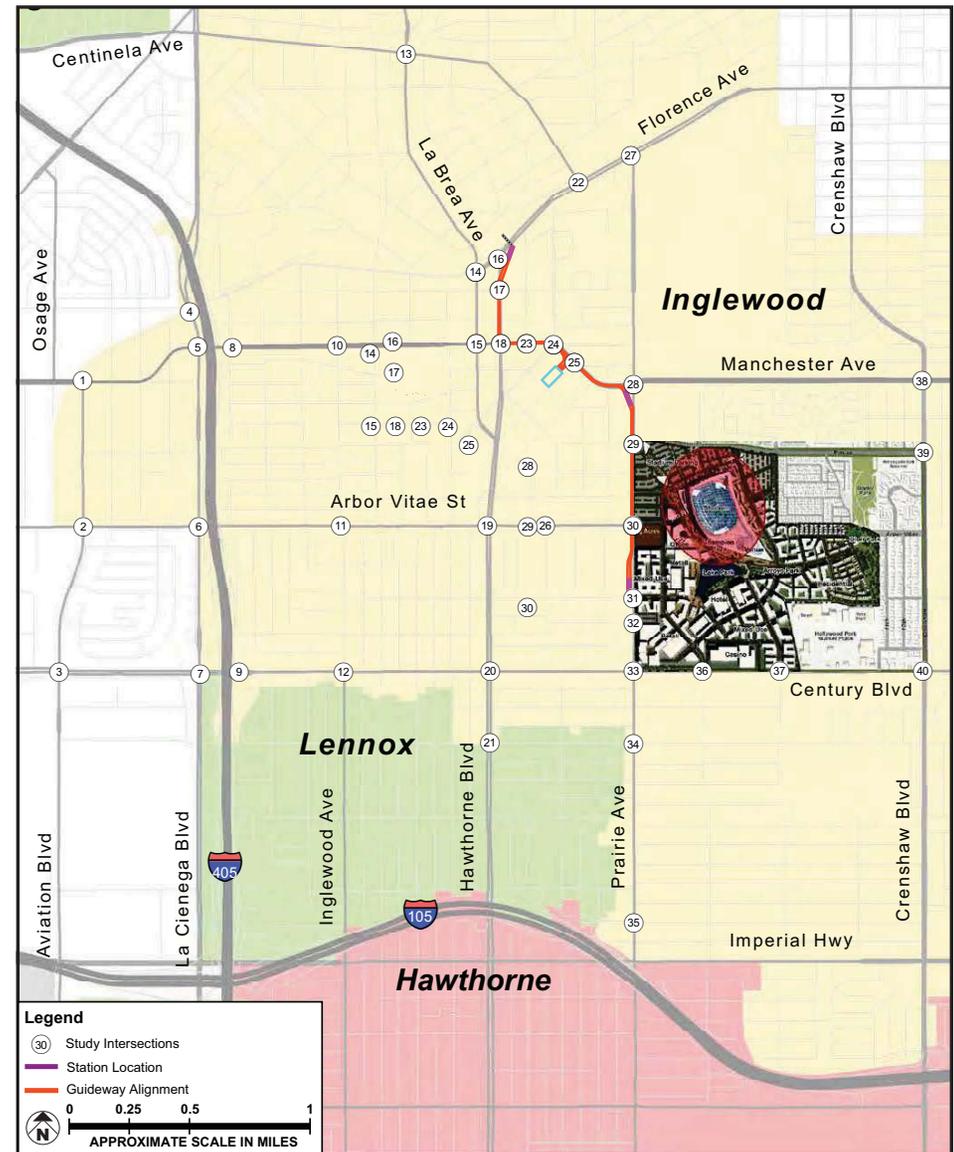

This area is generally bound by Florence Avenue to the north, Century Boulevard and 104<sup>th</sup> Street to the south, Crenshaw Boulevard to the east and La Brea Avenue to the west. A total of 26 intersections were studied that may be subjected to an increase or decrease in ambient roadway traffic noise as a result of the proposed Project (see **Appendix O**). These intersections are identified on **Table 4.10-6: Proposed Project Study Intersections** and shown on **Figure 4.10-2: Traffic Study Areas and Intersections**. At each intersection, turning movements were recorded during the morning and afternoon peak traffic hours. The collected turning movement data was converted into estimated road traffic noise levels using the FHWA traffic noise model (TNM) methodology.<sup>15</sup>

**Traffic Study Areas and Intersections**

### Traffic Volume Data

The process of assessing potential road traffic noise impacts that would be generated by implementation of the Project requires that estimates of current road traffic noise levels be prepared to establish existing conditions as a baseline for noise impact analyses. The traffic turning movement counts collected as part of the Transportation Study (see **Appendix O**) were used to calculate estimates of daytime (7:00 AM to 10:00 PM) and nighttime (10:00 PM to 7:00 AM) ADT volumes on the roadway segments between traffic study intersections (refer to **Appendix N.2-1**). These ADT values were inputted into the FHWA traffic noise model.

### Traffic Noise Modeling

Traffic volume and road parameter data were inputted via the SoundPLAN<sup>16</sup> noise model to the FHWA TNM 2.5 model,<sup>17</sup> which is the road traffic noise model preferred by the California Department of Transportation (Caltrans). The TNM model calculates the average noise levels at the specific locations based on nearby roadway traffic volumes, average vehicle speeds, roadway geometry, and physical site conditions. The modeled noise levels for each of the scenarios described above is the average CNEL<sup>18</sup> calculated for the daytime and nighttime periods by the model for sensitive receptors assumed to be located adjacent to the street. These values represent the maximum potential noise levels to which sensitive receptors could be exposed to from road traffic noise.

### FTA Vibration Guidelines

The FTA has published a technical manual, *Transit Noise and Vibration Impacts Assessment Manual*, which provides ground-borne vibration impact criteria with respect to building damage during construction activities.<sup>19</sup> Building vibration damage is measured in PPV. According to the FTA guidelines, a vibration criterion of 0.20 PPV should be considered as the significant impact level for nonengineered timber and masonry buildings. Structures or buildings constructed of reinforced concrete, steel, or timber have a vibration damage criterion of 0.50 PPV based on the FTA guidelines.

The human reaction to various levels of vibration is highly subjective and varies from person to person.

**Table 4.10-7: Ground-borne Vibration Criteria—Human Annoyance** shows the FTA's vibration criteria to evaluate vibration-related annoyance due to resonances of the structural components of a building. These

<sup>16</sup> SoundPLAN <https://www.soundplan.eu/en/>

<sup>17</sup> Federal Highway Administration, Traffic Noise Model Version 2.5, [https://www.fhwa.dot.gov/environment/noise/traffic\\_noise\\_model/tnm\\_v25/](https://www.fhwa.dot.gov/environment/noise/traffic_noise_model/tnm_v25/).

<sup>18</sup> Community Noise Equivalent Level (CNEL) is a weighted average of noise level over time. It is used to compare the noisiness of neighborhoods. CNEL is frequently used in regulations of airport noise impact on the surrounding community. A CNEL exceeding 65db is generally considered unacceptable for a residential neighborhood.

<sup>19</sup> Federal Transit Administration (USDOT, FTA), *Transit Noise and Vibration Impact Assessment*, FTA report no. 0123 (September 2018), accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf).

criteria are based on extensive research that suggests humans are sensitive to vibration velocities in the range of 8 to 80 Hz.<sup>20</sup>

Structures amplify ground-borne vibration, and wood-frame buildings, such as typical residential structures, are more affected by ground vibration than are heavier buildings. The level at which ground-borne vibration is strong enough to cause architectural damage has not been determined conclusively. The most conservative estimates are reflected in the FTA standards, shown in **Table 4.10-8: Ground-borne Vibration Criteria—Architectural Damage**.<sup>21</sup>

**Table 4.10-7**  
**Ground-borne Vibration Criteria—Human Annoyance**

Land Use Category	Max Lv (VdB)	Description
Workshop	90	Distinctly felt vibration; appropriate to workshops and non-sensitive areas
Office	84	Felt vibration; appropriate to offices and non-sensitive areas
Residential: Daytime	78	Barely felt vibration; adequate for computer equipment
Residential: Nighttime	72	Vibration not felt, but ground-borne noise may be audible inside quiet rooms

Source: United States Department of Transportation, Federal Transportation Authority, *Transit Noise and Vibration Impact Assessment (May 2006)*.

Note: For Max Lv (VdB), Lv is the velocity level in decibels as measured in 1/3 octave bands of frequency over the frequency ranges of 8 to 80 Hz

**Table 4.10-8**  
**Ground-borne Vibration Criteria—Architectural Damage**

Building Category	PPV (ips)	Lv (VdB)
I. Reinforced concrete, steel, or timber (no plaster)	0.5	102
II. Engineered concrete and masonry (no plaster)	0.3	98
III. Nonengineered timber and masonry buildings	0.2	94
IV. Buildings extremely susceptible to vibration damage	0.12	90

Source: United States Department of Transportation, Federal Transportation Authority, *Transit Noise and Vibration Impact Assessment (May 2006)*.

Note: For Max Lv (VdB), Lv = the velocity level in decibels as measured in 1/3 octave bands of frequency over the frequency ranges of 8 to 80 Hz; VdB = vibration decibels; Hz = hertz; ips = inches per second.

### Transit Noise and Vibration

The proposed Project will be a “pinched loop” system, whereby trains operate back and forth from the Market Street/Florence Avenue Station to the Prairie Avenue/Hardy Street Station, stopping at each station along the way and reversing at “turnbacks” at each end of the system.<sup>22</sup> Trains will crossover to the adjacent guideway prior to entering the Market Street/Florence Avenue Station and reverse direction when leaving the station. At the Prairie Avenue/Hardy Street Station end of the line, trains will also crossover prior to entering the station and reverse direction when leaving the station.

The proposed Project is planned to operate from 6:00 AM to 11:59 PM (midnight) for normal weekday/weekend service, with the possibility to add trains and extend hours, as needed, to serve special events. Generally, additional service will be provided before the start of an event to bring passengers to the venue, and again at the end of the event to bring passengers back to the Metro K Line.

As part of the proposed Project, the Operating Systems Report<sup>23</sup> technical requirements identified large, automated monorail, and rubber-tire ATS trains as the technology to be maintained for consideration. The review confirmed that rubber-tire ATS train and large automated monorail technologies are applicable and appropriate for the proposed Project. The requirements for rubber-tire ATS train and large monorail technologies were used in this analysis.<sup>24</sup>

The ATS trains would be either a rubber-tire, steel-wheel system, or a monorail system, or a cable or pulley system. The technical requirements for large, automated monorail, rubber-tire ATS train, and automated steel-wheel/steel-rail, also known as automated light rail transit (ALRT) were reviewed against the public rights of-way and property availability to determine the technologies best applicable for the proposed Project. While rubber tired ATS trains, including monorail systems, can meet the defined physical requirements for the Project, steel wheel/steel rail technologies and cable or pulley systems may also be viable provided this technology can comply with the defined requirements for the Project, including the ability to fit within the defined physical space available for the Project and maximum limits on noise. A steel wheel/steel rail or cable or pulley system may be applied to the project provided it can be demonstrated that the noise that would be generated by this system would be within the maximum limits defined for rubber tired ATS Systems in the ASCE APM Standards Section 2.2.1, Exterior Airborne Noise, ASCE 21-05.<sup>25</sup> Accordingly if steel wheel/steel rail technologies or cable or pulley systems are applied, the

22 Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021. Section 5, System Operations.

23 Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021. Section 3, Technology Assessment.

24 Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021. Section 3, Technology Assessment.

25 American Society of Civil Engineers, Automated People Mover Standards – Part 2 Section 2.2.1, Exterior Airborne Noise, ASCE 21-05.

Project the noise levels generated would not be greater than the noise levels from a rubber tire system. As required by PDF-Noise-3, the exterior noise level generated by the ATS train, with all contributing noise sources in operation, would not exceed the levels specified in Section 2.2.1, Exterior Airborne Noise, ASCE 21-05.

The estimated fleet size considers the operating fleet, which is the number of vehicles required to provide the necessary line capacity to meet the projected demand, as well as the spare fleet, comprised of the hot standby and maintenance trains to ensure that the number of trains required for operations is always available.<sup>26</sup> Rubber-tire ATS train are typically used at airports around the world as well as urban areas. Typical characteristics of such ATS trains include speeds of up to 50 miles per hour and vehicle dimensions of approximately 40 to 42 feet long and approximately 9 feet wide.<sup>27</sup> Monorail technologies are typically used in urban environments. Typical characteristics of both ATS trains and monorails include train speeds of up to 50 miles per hour and vehicle dimensions of approximately 55 to 65 feet long by approximately 9.5 feet to 10.3 feet wide.<sup>28</sup>

### Exterior ATS Train Noise

Noise from ATS trains is generated primarily from electric control systems and traction (electric) motors, gear systems, wind shear, and contact between wheels and the rails. While train horns and crossing notification systems can also be typical noise sources for ATS trains, the guideway would be completely grade-separated, with no vehicle or passenger walkway along the routes.

The Automated People Mover Standards Committee of the Standards Council of the Transportation and Development Institute of ASCE<sup>29</sup> has developed the Automated People Mover Standards, ANSI/ASCE/T&DI 21-13,<sup>30</sup> which establishes the minimum requirements necessary to achieve an acceptable level of safety and performance for an ATS train. An ATS train is defined as a guided light-rail transit train mode that is fully automated, featuring vehicles that operate on guideways with exclusive ROW. The ASCE Standard covers design, construction, operation, and maintenance of ATS trains. Top ATS train speed of 50 mph is achievable, but the actual operational speed will be limited to a maximum of 45 mph for passenger comfort and will be further governed by the speed restrictions imposed by the City as

a condition of operation. Conservatively, this analysis assumes a maximum top speed of 50 miles per hour and travel speeds of 45 miles per hour for the rubber tire ATS trains and monorails.

As required by PDF-Noise-3, the exterior noise level generated by the ATS train, with all contributing noise sources in operation, would not exceed the levels specified in Section 2.2.1, Exterior Airborne Noise, ASCE 21-05.<sup>31</sup> The design of any barrier-type noise reducing devices along the guideway would be subject to the limits noted in **Table 4.10-9: Exterior ATS Train Noise Limits**.

**Table 4.10-9**  
**Exterior ATS Train Noise Limits**

Condition	Maximum dBA Level	Measurement Location
Maximum length train entering and leaving station	76 (slow response)	In the station, 5 feet from the platform edge and 5 feet above the station floor.
Maximum length train stopped in station	74 (slow response)	In the station, 5 feet from the platform edge and 5 feet above the station floor, with vehicle doors and platform doors fully open.
Maximum length train traveling along the entire guideway under any normal velocity, acceleration, and deceleration operating condition	76 (fast response)	At any point* on a cylindrical envelope co-axial with, and 50 feet from, the centerline of each guideway lane (track), whichever is closer.
Maximum length train traveling at 10 mph	74 (fast response)	At any point* on a cylindrical envelope co-axial with, and 50 feet from, the centerline of each guideway lane (track).

Source: American Society of Civil Engineers, Automated People Mover Standards - Part 2 Section 2.2.1, Exterior Airborne Noise, ASCE 21-05

Potential operational transit noise levels for operation of ATS trains are calculated with the computer noise model SoundPLAN, which generates computer simulations of noise propagation from sources such as rail noise. SoundPLAN creates noise contour maps and forecast noise levels at specific receptors using sound power data and three-dimensional topographical data. Rail noise is modeled according to the industry standard rail noise prediction methodologies adopted by the Federal Railroad Administration (FRA).<sup>32</sup> The FRA noise prediction model calculates an A-weighted noise level at a receiver location through direct propagation or by taking into account shielding provided by barriers.

31 American Society of Civil Engineers, Automated People Mover Standards - Part 2 Section 2.2.1, Exterior Airborne Noise, ASCE 21-05.

32 Federal Railroad Administration, High-Speed Ground Transportation Noise and Vibration Impact Assessment, September 2012.

### Operational Vibration

Ground-borne vibration measurements were collected in accordance with guidance provide in the FTA *Transit Noise and Vibration Impact Assessment Manual*.<sup>33</sup> Under the FTA *Transit Noise and Vibration Impact Assessment Manual*, land use types in determining noise impact criteria are designated into three land use categories:

- **Category 1 (high vibration sensitivity)** includes uses where quiet is an essential element in their intended purpose, such as indoor concert halls or outdoor concert pavilions, or National Historic Landmarks where outdoor interpretation routinely takes place.
- **Category 2 (residential)** includes residences and buildings where people sleep, and
- **Category 3 (institutional)** includes institutional land uses with primarily daytime and evening uses, such as school, places of worship, and libraries.

These categories are developed to determine the level of vibration (VdB) that would disturb people during various activities and at various locations. The basic approach for a General Vibration Assessment is to define a curve, or set of curves, which predicts the overall ground-surface vibration as a function of distance from the source, apply adjustment to those vibration curves to account for site- or system-specific factors such as speed and system design, and estimate the vibration levels for uses located along the transit corridor.

**Figure 4.10-3: Generalized Ground-Surface Vibration Curves** presents the generalized ground-surface vibration curves at representative North American transit systems. These curves assume typical ground-borne vibration levels, equipment in good condition, and speeds of 50 miles per hour (mph) for the rail systems and 30 mph for buses. The top curve applies to trains that are powered by diesel or electric locomotives, which includes intercity passenger trains and commuter rail trains. The curve for rapid transit rail cars covers both heavy- and light-rail vehicles on at-grade and subway tracks. The curve for rubber-tired vehicles is for vehicles that rarely create ground-borne vibration problems unless there is a discontinuity or bump in the road that causes the vibration. Adjustment factors related to speed and distance determine the base curve for assessment of the guideway.

As shown in **Figure 4.10-3**, based on adjustment factors presented in the FTA *Transit Noise and Vibration Impact Assessment Manual*<sup>34</sup> each base curve was reduced by 10 dB to account for the design of the proposed Project to operate on an elevated structure. Speed adjustments were also made, with 0.9 dB being subtracted to the vibration curve (red dotted line) for rapid transit or light rail vehicles to reduce the default speed of 50 mph to 45 mph, and 3.5 dB was added to rubber-tired ATS trains vibration curve (blue dotted line) to increase the default speed of 30 mph to 45 mph.

33 Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, FTA Report No. 0123, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

Generalized Ground-Surface Vibration

4.10.4 REGULATORY FRAMEWORK

Federal, State, and local agencies regulate different aspects of environmental noise. Federal and State agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies.

Local regulation of noise involves implementation of general plan policies and noise ordinance standards. Local general plans identify general principles intended to guide and influence development plans; local noise ordinances establish standards and procedures for addressing specific noise sources and activities.

4.10.4.1 Federal Regulations and Directives

Noise Control Act

In 1972, the Noise Control Act<sup>35</sup> was passed by congress to promote limited noise environments in support of public health and welfare. It also established the USEPA Office of Noise Abatement and Control to coordinate federal noise control activities.

USEPA established guidelines for noise levels that would be considered safe for community exposure without the risk of adverse health or welfare effects.

In a 1974 study,<sup>36</sup> USEPA found that to prevent hearing loss over the lifetime of exposure, the yearly average Leq should not exceed 70 dBA. To prevent interference and annoyance, the USEPA found that the DNL should not exceed 55 dBA outdoors or 45 dBA indoors. In 1982, noise control was largely passed to State and local governments.

Office of Safety and Health Administration

With regard to noise exposure and workers, the Office of Safety and Health Administration (OSHA) regulations safeguard the hearing of workers exposed to occupational noise. OSHA is responsible for the protection against the effects of noise exposure when sound levels exceed those, listed in **Table 4.10-10: Permissible Noise Exposures for Workers**, when measured on the A scale of a standard sound level meter at slow response.<sup>37</sup>

<sup>35</sup> Noise Control Act (42 United States Code section 4901 et seq.)  
<sup>36</sup> US Environmental Protection Agency, 1974. Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety. March 1974. p. 34.

### Federal Vehicle Noise Regulations

Federal regulations establish noise limits for medium and heavy trucks (more than 4.8 tons, gross vehicle weight rating) under 40 Code of Federal Regulations (CFR), Part 205, Subpart B.<sup>38</sup> The federal truck pass-by noise standard is 80 dBA at 50 feet (approximately 15 meters) from the vehicle pathway centerline under specified test procedures. These requirements are implemented through regulatory controls on truck manufacturers. There are no comparable federal standards for vibration, which tend to be specific to the roadway surface, the vehicle load, and other factors.

**Table 4.10-10**  
**Permissible Noise Exposures for Workers**

Work Duration per Day (hours)	Sound level (dBA)
8	90
6	92
4	95
3	97
2	100
1.5	102
1	105
0.5	110
0.25 or less	115

#### 4.10.4.2 State Regulations and Directives

##### State Noise Standards

The State of California has adopted noise compatibility guidelines for general land use planning as shown in **Figure 4.10-4: State Criteria for Noise Compatible Land Use**. The types of land uses addressed by the State and the acceptable noise categories for each land use are included in the *State of California General Plan Guidelines* guidance document, which is published and updated by the Governor's Office of Planning Research.<sup>39</sup> The level of acceptability of the noise environment is dependent on the activity associated with the particular land use. In addition, Section 65302(f) of the California Government Code requires each county and city in the State to prepare and adopt a comprehensive long-range general plan for its physical

<sup>38</sup> Code of Federal Regulations (CFR), Title 40. Protection of Environment, Environmental Protection Agency, Subchapter G. Noise Abatement Programs, Part 205. Transportation Equipment Noise Emission Controls.

<sup>39</sup> Governor's Office of Planning and Research, State of California General Plan Guidelines (2017), [http://www.opr.ca.gov/docs/OPR\\_COMPLETE\\_7.31.17.pdf](http://www.opr.ca.gov/docs/OPR_COMPLETE_7.31.17.pdf).

development, with Section 65302(g) requiring a noise element to be included in the general plan. The noise element must (1) identify and appraise noise problems in the community, (2) recognize Office of Noise Control guidelines, and (3) analyze and quantify current and projected noise levels.

DHS's Office of Noise Control has established guidelines to provide communities with noise environments that it deems to be generally acceptable based on land-use categories. These guidelines serve as a primary tool for a city to use to assess the compatibility between land uses and outdoor noise. Noise exposure for single-family uses is normally acceptable when the noise level at exterior residential locations is equal to or below 60 dBA (CNEL or Ldn), conditionally acceptable when noise levels are between 55 to 70 dBA (CNEL or Ldn), and normally unacceptable when noise levels exceed 70 dBA (CNEL or Ldn). Some overlap exists between these categories as shown in **Figure 4.10-4**. These guidelines apply to noise sources such as vehicular traffic, aircraft, and rail movements.

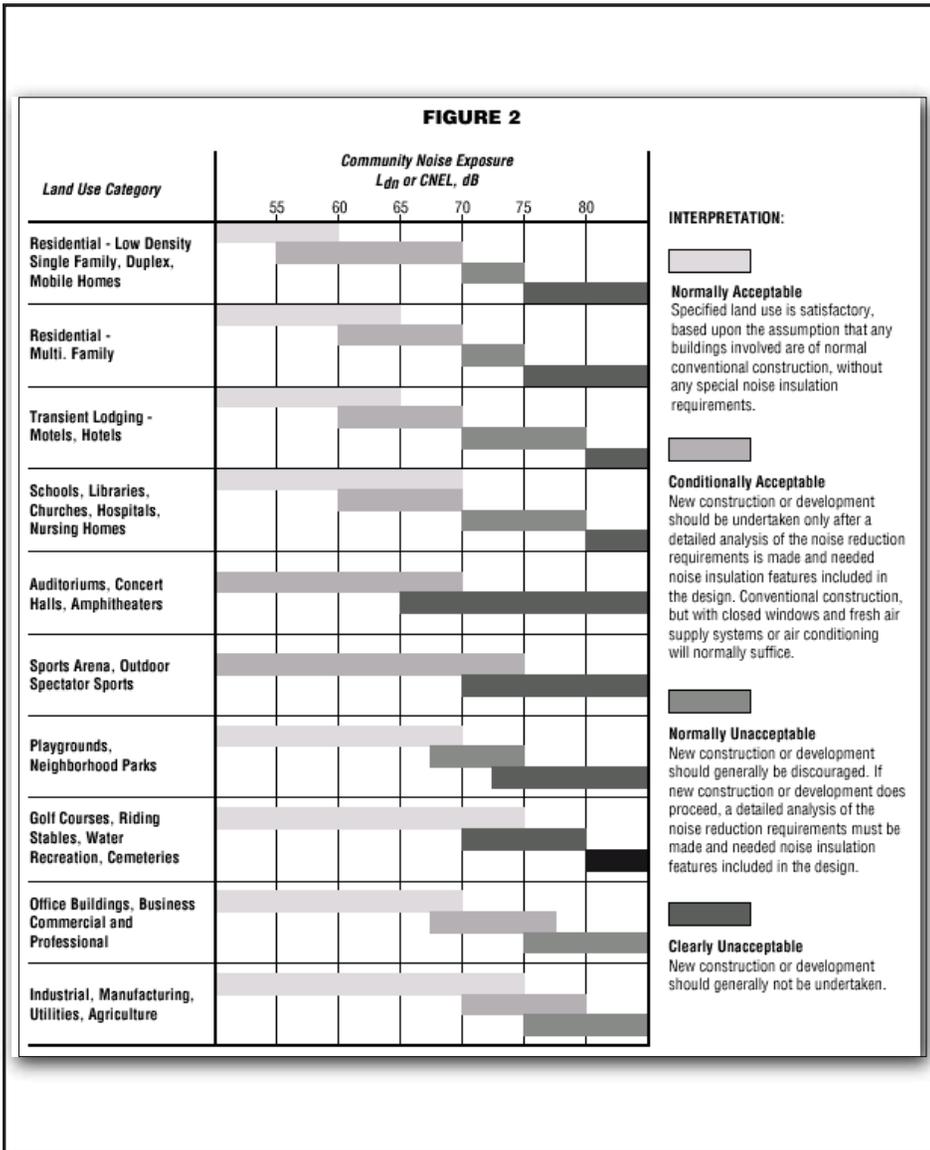

The Department of Housing and Community Development has required that new residential units should not be exposed to outdoor ambient noise levels in excess of 65 dBA (CNEL or Ldn), and, if necessary, sufficient noise insulation must be provided to reduce interior ambient levels to 45 dBA. Within a 65 dBA exterior noise environment, interior noise levels are typically reduced to acceptable levels (to at least 45 dBA CNEL) through conventional construction, but with closed windows and fresh air apply systems or air conditioning.

Because typical noise attenuation within residential structures with closed windows is at least 20 dB, an exterior noise exposure of 65 dB CNEL is generally the noise land-use compatibility guideline for new residential dwellings in California. Because commercial and industrial uses are not occupied on a 24-hour basis, the exterior noise exposure standard for less-sensitive land uses generally is somewhat less stringent.

##### Vehicle Noise Standards

The State of California establishes noise limits for vehicles licensed to operate on public roads.<sup>38F40</sup> For heavy trucks, the State pass-by standard is consistent with the federal limit of 80 dBA. The State pass-by standard for light trucks and passenger cars (less than 4.8 tons, gross vehicle rating) is also 80 dBA at 50 feet (approximately 15 meters) from the centerline. These standards are implemented through controls on vehicle manufacturers and by legal sanction of vehicle operators by State and local law enforcement officials.

4.10.4.3 Regional Regulations and Directives

Los Angeles County Airport Land Use Plan

Pursuant to the California Public Utilities Code,<sup>41</sup> each county in California in which there is an airport served by a scheduled airline and each county with an airport operated for the benefit of the general public, with certain exceptions, is required to establish an airport land use commission (ALUC). Each ALUC must develop a plan for promoting and ensuring compatibility between each airport in the county and surrounding land uses.

In Los Angeles County, the Los Angeles County Regional Planning Commission also acts as the ALUC. ALUC's purpose is to coordinate planning for the area around public airports to protect the public health, safety and welfare from land uses that do not minimize the public's exposure to excessive noise and safety hazards. This is achieved through review of proposed development surrounding airports and through policy and guidance provided in the Los Angeles County Airport Land Use Plan (ALUP).<sup>42</sup>

In formulating the Los Angeles County ALUP, the ALUC establishes provisions to ensure safe airport operations, through the delineation of Runway Protections Zones (RPZs) and height restriction boundaries, and to reduce excessive noise exposure to sensitive uses through noise insulation or land reuse. The extent of the planning boundary designated for the airports in the Los Angeles County ALUP is determined by CNEL noise contours. The Los Angeles County ALUP employs a land use compatibility table to identify the level of compatibility for particular land uses within the planning area boundaries/ AIAs for the County's airports based on community noise exposure level

Per the CFR Part 150 Land Use Compatibility Guidelines,<sup>43</sup> residential uses are identified as noncompatible land uses for parcels exposed to 65 dBA CNEL or higher. Commercial land uses are identified as compatible with 65 and 70 dBA CNEL noise levels. The CFR Part 150 Land Use Compatibility Guidelines categorizes hotel uses as a transient lodging form of residential.

4.10.4.4 Local Regulations and Directives

Inglewood General Plan Noise Element

The General Plan includes a Noise Element<sup>44</sup> which identifies a program for noise control in the planning process and a tool for achieving and maintaining environmental noise levels compatible for land use. The

41 California Public Utilities Code, Division 9, Part 1, Chapter 4, Article 3.5, Sections 21670-21679.5.

42 Los Angeles County Airport Land Use Commission, Los Angeles County Airport Land Use Plan, adopted December 1991, <http://planning.lacounty.gov/view/alup/>

43 Federal Aviation Administration, Land Use Compatibility and Airports. p.V-10.

44 City, General Plan, "Noise Element" (September 1, 1987).

#### 4.10 Noise

Element includes goals and policies to help control noise through land use planning decisions and by developing measures to control non-transportation noise impacts.

As stated in the City's General Plan, the sources of noise in Inglewood can be divided into two basic categories, transportation sources (traffic and aircraft) and non-transportation sources. The most effective method the City has to mitigate transportation noise is through reducing the impact of the noise onto the community (i.e., noise barriers and site design review). Mitigation through the design and construction of a noise barrier (wall berm, or combination wall/berm) is the most common way of alleviating transportation noise impacts.

Noise concerns are incorporated into land use planning to reduce future noise and land use compatibilities. This is achieved by establishing standards and criteria that specify acceptable limits of noise for various land uses throughout the City.

The City has established standards and criteria that specify acceptable limits of noise for various land uses. These criteria are designed to integrate noise considerations into land use planning to prevent noise/land use conflicts. The City's noise standards correlate with land-use zoning classifications to maintain identified ambient noise levels and to limit, mitigate, or eliminate intrusive noise that exceed the ambient noise levels within a specified zone. These guidelines are set forth in the City's Noise Element in terms of the CNEL and include the following:

- Residential uses normally incompatible in areas where the ambient noise levels exceed 70 dB CNEL; and residential uses are clearly and normally compatible in areas where the ambient noise levels range between 55 to 70 dB CNEL.
- Commercial/professional office buildings and land uses are normally incompatible in areas where the ambient noise levels exceed 75 dB CNEL and are normally compatible within areas where the ambient noise levels range from 65 dB CNEL to 75 dB CNEL (for commercial/professional offices only).
- Industrial uses are normally incompatible in areas where the ambient noise levels exceed 75 dB CNEL; and are normally compatible in areas where the ambient noise level ranges between 65 to 75 dB CNEL.
- Institutional land uses are normally incompatible in areas where the ambient noise levels exceed 65 dB CNEL and are normally compatible within areas where the ambient noise levels range from 60 to 65 dB CNEL.
- Hospitals, churches, libraries, and school classrooms are normally incompatible in areas where the ambient noise levels exceeds 65 dB CNEL; and are clearly and normally compatible in areas where the ambient noise level ranges between 50 to 65 dB CNEL.

The following goals from the City General Plan Noise Element are applicable to the proposed Project:

#### 4.10 Noise

**Goal 1:** Provide for the reduction of noise where the noise environment represents a threat to public health and welfare. In those areas where the environment represents a threat to the public health and welfare, it is the objective of the City to reduce environmental hazards to levels consistent with the protection of the public health and welfare.

**Goal 3:** Protect and maintain those areas having acceptable noise environments. In those areas where a quality environment now exists, it is the objective of the City to prevent degradation of that environment.

**Goal 4:** Provide sufficient information concerning the community noise levels so that noise can be objectively considered in land use planning decisions. Noise and land use compatibilities can be avoided for new developments when noise is properly considered in the planning and design of the project. It is the objective of the City to prevent future land use and noise conflicts through the planning process.

#### ***Inglewood Municipal Code (IMC)***

City Municipal Code Chapter 5 (Offenses, Miscellaneous), Article 2 (Noise Regulations) establishes "criteria and standards for the regulation of noise levels within the community." Rather than being adopted to assist the City in guiding land use decisions, like the Noise Element of the General Plan, the City's Noise Regulations are intended to protect "the comfort, repose, health, or peace of residents in the area," and define noise levels that are considered public nuisances and are subject to abatement through the City's exercise of its enforcement authority. Section 5-27 establishes base ambient noise levels within respective times and zones. Where actual noise measurements exceed base ambient noise levels as designated by Section 5-27, the measured noise level shall be employed as the base ambient noise level.

- **Section 5-27: Base Ambient Noise Level:** establishes base ambient noise levels within respective times and zones. Where actual noise measurements exceed base ambient noise levels as designated by Section 5-27, the measured noise level shall be employed as the base ambient noise level.
- **Sections 5-29: Excessive Noise. Unlawful and 5-30: Maximum Residential Noise Levels:** establish the City's authority to regulate noise that "disturbs the peace or quiet of any neighborhood or which causes discomfort or annoyance to any reasonable person residing in the area," and identifies maximum lawful noise levels and maximum duration periods that may be generated on residential and nonresidential properties.
- **Section 5-31: Maximum Nonresidential Noise Levels:** Measured on the exterior of nonresidential properties, no noise level is permitted to exceed the respective base ambient noise levels for commercial and industrial land uses for a maximum cumulative duration of 30 minutes in any hour.
- **Section 5-39: Machinery, Equipment, Fans and Air-Conditioning, Noise Regulated:** states that it is unlawful for any person to operate, cause to operate or permit the operation of any machinery, equipment, device, pump, fan, compressor, air-conditioning apparatus, or similar mechanical device

in any manner so as to create any noise which would cause the noise level at the property line of any property to exceed the ambient noise base level by 5 dBA.

- **Section 5-41: Construction of Building and Projects, Noise Regulated:** states that is unlawful for any person within a residential zone, or within a radius of 500 hundred feet therefrom, to operate equipment or perform any outside construction or repair work on buildings, structures, or projects or to operate any pile driver, pneumatic hammer, derrick, excavation or earth moving equipment, or other construction equipment between the hours of 8:00 PM and 7:00 AM of the next day in such a manner that a reasonable person residing in the area is caused discomfort or annoyance unless a permit has been obtained from the Permits and Licenses Committee of the City.
- **Section 5-43: Motor Driven Vehicles. Noise Regulated:** prohibits the operation of any motor driven vehicle due to the nature of the operation of the vehicle, condition of the vehicle, or modification made to the vehicle, that would generate noise so that a reasonable person is caused discomfort or annoyance.
- **Section 5-45: Excessive Train Horn Noise Prohibited:** states that it is unlawful for any person to operate or sound, or cause to be operated or sounded, between the hours of 10:00 PM and 7:00 AM of the next day, a train horn or train whistle which creates a noise in excess of 90 dBA at any place or point 300 hundred feet or more distant from the source of such sound.

#### 4.10.5 EXISTING CONDITIONS

##### 4.10.5.1 Adjusted Baseline

The noise analysis assumes the Adjusted Baseline Environmental Setting as described in **Section 4.0**; refer to **Table 4.0-1** for the details of the Adjusted Baseline. Related to noise, the changes associated with the Hollywood Park Specific Plan (HPSP) Adjusted Baseline projects, currently under development and anticipated to be operational prior to construction of the proposed Project, include vehicle trips associated with new uses in the HPSP area. Accordingly, the roadway noise associated with this development within the HPSP area are considered as part of the Adjusted Baseline. No other changes to the existing environmental setting related to noise would occur under the Adjusted Baseline.

##### 4.10.5.2 Summary of Surrounding Land Uses

The proposed Project is located in the central portion of the City, partly within the Downtown TOD Plan area,<sup>45</sup> and extends south along Market Street to Manchester Boulevard, along Manchester Boulevard to

<sup>45</sup> City, New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines, (adopted November 1, 2016), accessed September 2021, [https://www.cityofinglewood.org/DocumentCenter/View/16438/Adopted-DT-and-FV-TOD-Plan\\_low-resolution](https://www.cityofinglewood.org/DocumentCenter/View/16438/Adopted-DT-and-FV-TOD-Plan_low-resolution).

Prairie Avenue, and then south along Prairie Avenue to Hardy Street. The southern portion of the proposed Project is adjacent to the HPSP<sup>46</sup> development site.

The Downtown TOD Plan areas contain a variety of building types and designs and architectural styles. Open spaces within the Downtown TOD Plan area consist of man-made parks, plazas, the Inglewood Cemetery, and landscaped areas that also have an urban and developed character.

Land uses are well balanced in downtown Inglewood with the concentration of commercial retail uses in the historic core. Land uses within Downtown TOD consists of residential uses; retail commercial, and office; and the remainder consists of public services/facilities, industrial, and vacant parcels. The residential neighborhoods in Downtown Inglewood contain a mix of single-family homes, duplexes, or triplexes, along with apartments or townhomes.

The HPSP area is located along Prairie Avenue from Pincay Street to Century Boulevard. The HPSP is an existing and proposed large mixed-use development, including SoFi Stadium, high density residential, retail space, office development, a relocated casino, hotel, four acres of civic uses, and 25 acres of new public parks, including a large lake.

The properties immediately to the west of the HPSP (across Prairie Avenue) are several single-story retail/commercial and multifamily residential uses.

##### 4.10.5.3 Sensitive Receptors

Some land uses are considered more sensitive to intrusive noise than others based on the types of activities typically involved at the receptor location. Land uses considered to be noise sensitive, as identified in the City's General Plan Noise Element<sup>47</sup>, include residences, schools, hospitals, libraries, and parks. Residential land uses are considered especially noise sensitive because (1) considerable time is spent by individuals at home, (2) significant activities occur outdoors, and (3) sleep disturbance is most likely to occur in a residential area. The Federal Highway Administration (FHWA) considers uses where people normally sleep, such as residences, hotels, and motels, noise-sensitive land uses.<sup>48</sup> Commercial and industrial uses are not considered noise-sensitive by either the City or FHWA. However, for purposes of this analysis, adjacent commercial and industrial uses that are considered vibration-sensitive are listed below.

<sup>46</sup> City of Inglewood, Hollywood Park Specific Plan, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015.

<sup>47</sup> City of Inglewood, Inglewood General Plan: Noise Element, September 1987, <https://www.cityofinglewood.org/DocumentCenter/View/130/Noise-Element-1987-PDF>. Accessed September 2021.

<sup>48</sup> Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, p. 23, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

4.10 Noise

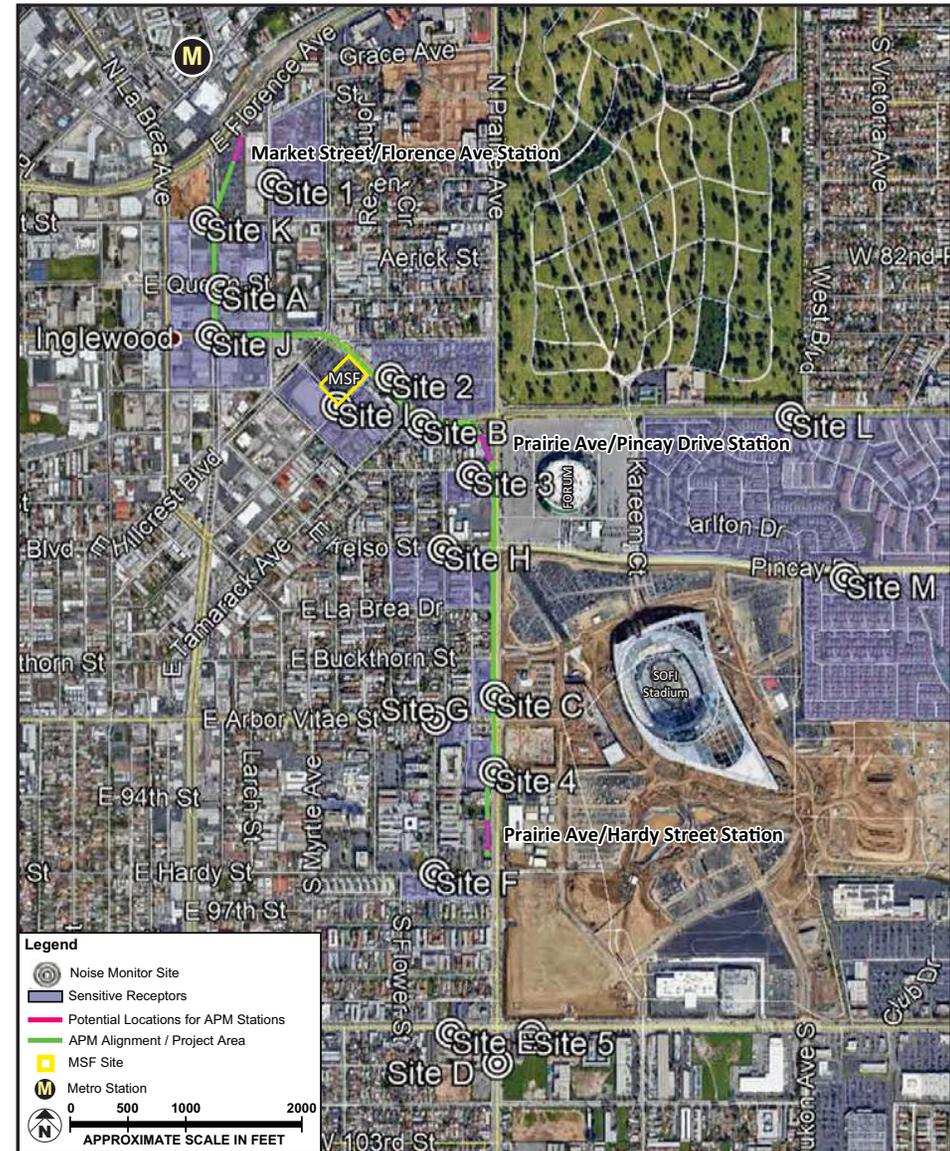

Land uses adjacent to and within a quarter mile radius of the proposed Project consisting of the guideway, stations and the MSF, include noise sensitive receptors where people normally sleep such as hotels and single and multifamily residences (identified as Category 2 uses), schools, places of worship, medical offices (identified as Category 3 uses). For the purpose of presenting the results of the potential noise impact analyses in this Recirculated Draft EIR, the land uses nearest to the proposed Project have been organized into groups by geographic proximity as shown in **Figure 4.10-5: Noise Sensitive Receptor Groups**. These receptor groups are used in this Recirculated Draft EIR to provide a representation of the potential noise impacts on noise-sensitive receptors around the proposed Project and represent the areas where baseline noise monitoring was conducted. Although the receptor groups shown do not include all the receiver points evaluated in the noise modeling analyses, these identified groups include all noise-sensitive receptors nearest to the proposed Project and represent the greatest potential for noise impacts. Adjacent commercial and industrial uses that are not noise-sensitive (specifically, receptor groups Site A – Commercial uses along E. Queen Street, Site D – Commercial uses along Prairie Avenue; lodging uses along W. Century Boulevard, Site E – Commercial and lodging uses along the southern portion of W. Century Boulevard, Site J – Commercial uses along E. Manchester Boulevard, and Site K – Commercial uses along E. Regent Street) but considered vibration-sensitive (as discussed in more detail below), are also listed in the prior locations for informational purposes. As such, the areas where noise and vibration monitoring was conducted along the proposed alignment and stations are comprised of the following uses:

**Market Street Segment**

- **Site 1:** Residential uses on the east side of N. Locust Street including the Holy Faith Episcopal Church, commercial uses on the west side of N. Locust Street;
- **Site A:** Commercial uses along E. Queen Street; and
- **Site K:** Commercial uses along E. Regent Street.

**Manchester Boulevard Segment**

- **Site 2:** Residential uses along E. Manchester Boulevard, Manchester Drive and S. Osage Avenue;
- **Site B:** Residential uses on the northern portion of E. Manchester Boulevard, commercial uses on the southern portion of E. Manchester Boulevard;
- **Site I:** Residential uses on the eastern portion of E. Spruce Avenue, commercial uses on the western portion of E. Spruce Avenue;
- **Site J:** Commercial uses along E. Manchester Boulevard; and
- **Site L:** Residential uses along W. Manchester Boulevard.

FIGURE 4.10-5

251-003-20

Noise Sensitive Receptor Groups

### Prairie Avenue Segment

- **Site 3:** Residential uses along E. Nutwood Street, educational facilities along Prairie Avenue;
- **Site 4:** Mixed-use residential along west side of Prairie Avenue;
- **Site H:** Residential uses on the northern and southern portion of E. Kelso Street; educational uses on the corner of Prairie Avenue and Kelso Street;
- **Site G:** Residential uses along E. Arbor Vitae Street;
- **Site M:** Residential uses along Pincay Drive;
- **Site F:** Multifamily residential uses along E. Hardy Street;
- **Site C:** SoFi Stadium to the west of Prairie Avenue, commercial and lodging uses to the east of Prairie Avenue;
- **Site 5:** Lodging uses on the southern portion of W. Century Boulevard;
- **Site D:** Commercial uses along Prairie Avenue; lodging uses along W. Century Boulevard; and
- **Site E:** Commercial and lodging uses along the southern portion of W. Century Boulevard.

#### 4.10.5.4 Noise

##### Ambient Noise

The immediate area surrounding the proposed Project is highly urbanized with multiple noise sources including, but not limited to, traffic on local and arterial streets, aircraft arrivals to and departures from LAX, and commercial and industrial activity (e.g., truck loading/unloading).

To establish baseline noise conditions, long-term 24-hour noise levels (refer to **Appendix N.1-1**) were monitored at five representative receptor locations (identified as Sites 1 to 5) in the vicinity of the proposed guideway and stations, and at the proposed MSF site. Thirteen (13) additional locations (Site A through M) were monitored on two non-successive days, measured as one-hour measurements (refer to **Appendix N.1-1**). The daytime (AM peak) ambient noise levels were measured between 7:00 AM and 10:00 AM, and the evening (PM peak) ambient noise levels were measured between 4:00 PM and 7:00 PM.

**Table 4.10-11: Long-term (24-hour) Ambient Noise Measurements** provides a summary of the ambient noise measurements conducted at the five selected noise receptor locations for a 24-hour period. Based on field observations, the ambient noise at the measurement locations is dominated by local vehicular traffic and, to a lesser extent, airplane flyovers and other typical urban noises. As shown, the existing 24-CNEL at the off-site noise receptor locations ranged from a low of 63.7 dBA CNEL at residential use at Site 1 (Residential uses to the west of N. Locust Street including the Holy Faith Episcopal Church, commercial uses to the east of N. Locust Street) to a high of 80.6 dBA CNEL at the residential uses at Site 4 (Mixed-use

residential along west side of Prairie Avenue). In terms of the City's land use noise compatibility categories, locations range from clearly compatible to clearly incompatible. Specifically, the noise exposure compatibility categories are summarized as follows:

- **Clearly Compatible:** Locations where residential uses are dominant along Locust Avenue (Site 1) and Manchester Boulevard (Site 2) with nighttime averages falling within this category.
- **Normally Compatible:** Locations where residential uses are dominant along Locust Avenue (Site 1) and Manchester Boulevard (Site 2) with daytime averages and 24-hour CNEL falling within this category. Additionally, nighttime averages of the residential uses along Nutwood Street (Site 3) and lodging uses along Century Boulevard (Site 5) fall within this category.
- **Normally Incompatible:** Locations where residential uses are dominant along Nutwood Street (Site 3) and lodging uses along Century Boulevard (Site 5) with daytime averages and 24-hour CNEL falling within this category. Additionally, locations where commercial uses are dominant along Prairie Avenue (Site 4) with daytime and nighttime averages falling with this category.
- **Clearly Incompatible:** Locations where commercial uses are dominant along Prairie Avenue (Site 4) with 24-hour CNEL averages falling within this category.

**Table 4.10-12: Short-term (1-hour) Ambient Noise Measurements (Daytime)** provides the one-hour measurements during the AM and PM peak hours at the 13 selected noise receptor locations (refer to **Appendix N.1-2**). As shown, the existing 1-hour ambient noise levels (dBA Leq) at the off-site noise receptor locations ranged from a low of 62.7 dBA Leq at the residential uses at Site F (Multifamily residential uses along E. Hardy Street) during the AM period to a high of 76.6 dBA Leq at the residential uses at Site M (Residential uses along Pincay Drive) during the PM period. In terms of the City's land use noise compatibility categories, locations range from clearly compatible to clearly incompatible. Specifically, the noise exposure compatibility categories are summarized as follows:

- **Clearly Compatible:** Locations where public uses are dominant along Market Street (Site K).
- **Normally Compatible:** Locations where residential uses are dominant along Queen Street (Site K), Manchester Boulevard (Site I), Arbor Vitae Street (Site G), Kelso Street (Site H) and Hardy Street (Site F).
- **Normally Incompatible:** Land uses where commercial uses are dominant along Market Street (Site J), where residential uses are dominant along Manchester Boulevard (Site L), where lodging uses are dominant along Prairie Avenue (Site D) and Century Boulevard (Site E), and where education uses are dominant along Manchester Boulevard (Site B) and Kelso Street (Site H).
- **Clearly Incompatible:** Land uses where places of worship are dominant on Prairie Avenue (Site C).

**Table 4.10-13: Short-term (15-minute) Ambient Noise Measurements (Nighttime)** provides the 15-minute measurements during the nighttime period after 8:00 PM at the 13 selected noise receptor locations (refer to **Appendix N.1-3**). As shown, the existing short-term 15-minute noise levels during the

4.10 Noise

nighttime ranged from a low of 56.6 dBA Leq at Site H (Residential uses on the northern and southern portion of E. Kelso Street; educational uses on the corner of Prairie Avenue and Kelso Street) to a high of 72.8 dBA Leq at Site L (Residential uses along W. Manchester Boulevard). In terms of the City's land use noise compatibility categories, locations range from clearly compatible to clearly incompatible. Specifically, the noise exposure compatibility categories are summarized as follows:

- **Clearly Compatible:** Land uses where residential uses are dominant along Queen Street (Site A), Manchester Boulevard (Site I), Kelso Street (Site H), and Hardy Street (Site F). Additionally, where commercial uses are dominant along Market Street (Site J and K).
- **Normally Compatible:** Land uses where residential uses are dominant along Arbor Vitae Street (Site G), Chapman Lane (Site M). Additionally, where lodging uses are dominant along Prairie Avenue (Site D) and Century Boulevard (Site E).
- **Normally Incompatible:** Land uses where residential uses are dominant along Manchester Boulevard (Site L). Additionally, where educational uses are dominant along Manchester Boulevard (Site B) and where place of worship uses are dominant along Prairie Avenue (Site C).
- **Clearly Incompatible:** None.

**Roadway Noise**

Adjusted baseline conditions include socio-economic and demographic components, and transportation network components that are currently under construction or have building permits issued by the City in the immediate vicinity of the ITC Project alignment. Accordingly, as explained in Transportation Study (refer to **Appendix O**) the travel demand forecasting model used in the process was updated as required to reflect these assumptions.

The adjusted baseline traffic noise on local roadways in the surrounding areas was calculated to quantify the daytime and nighttime noise levels using information provided by the Transportation Study (see **Appendix O**). As previously noted, a total of 26 intersections and corresponding roadway segments were selected for the existing off-site traffic noise analysis, based on proximity to noise sensitive uses along the roadway segments and potential increases in traffic volume from the proposed Project.

Trip generation associated with the buildout and operation of the Adjusted Baseline projects (see **Section 4.0, 4.0.5: Adjusted Baseline**) has been estimated and traffic volumes in the area surrounding the proposed Project have been projected to establish the Adjusted Baseline traffic environment along the roadway segments selected for analysis. Additionally, trip generation associated with events at the SoFi Stadium, The Forum, and concurrent events at both venues has been estimated and traffic volumes projected to establish the combined traffic environment during which one or more events are being held.

4.10-52

Inglewood Transit Connector Project  
November 2021

Appendix N.2-1 provides the roadway noise levels for the adjusted baseline traffic levels in details. As shown, adjusted baseline roadway noise levels during the daytime ranged from a low of 55.8 dBA along Market Street from Florence Avenue to Regent Street to a high of 72.5 dBA along Century Boulevard between Grevillea Avenue and La Brea Avenue/Hawthorne Boulevard. Additionally, nighttime roadway noise levels ranged from a low of 48.2 along Market Street from Florence Avenue to Regent Street to a high of 64.3 dBA along Century Boulevard from Club Drive to Crenshaw Boulevard.

### Aircraft Noise

The nearest public use airport to the proposed Project is LAX. There are no private airstrips located in the vicinity of the proposed Project.

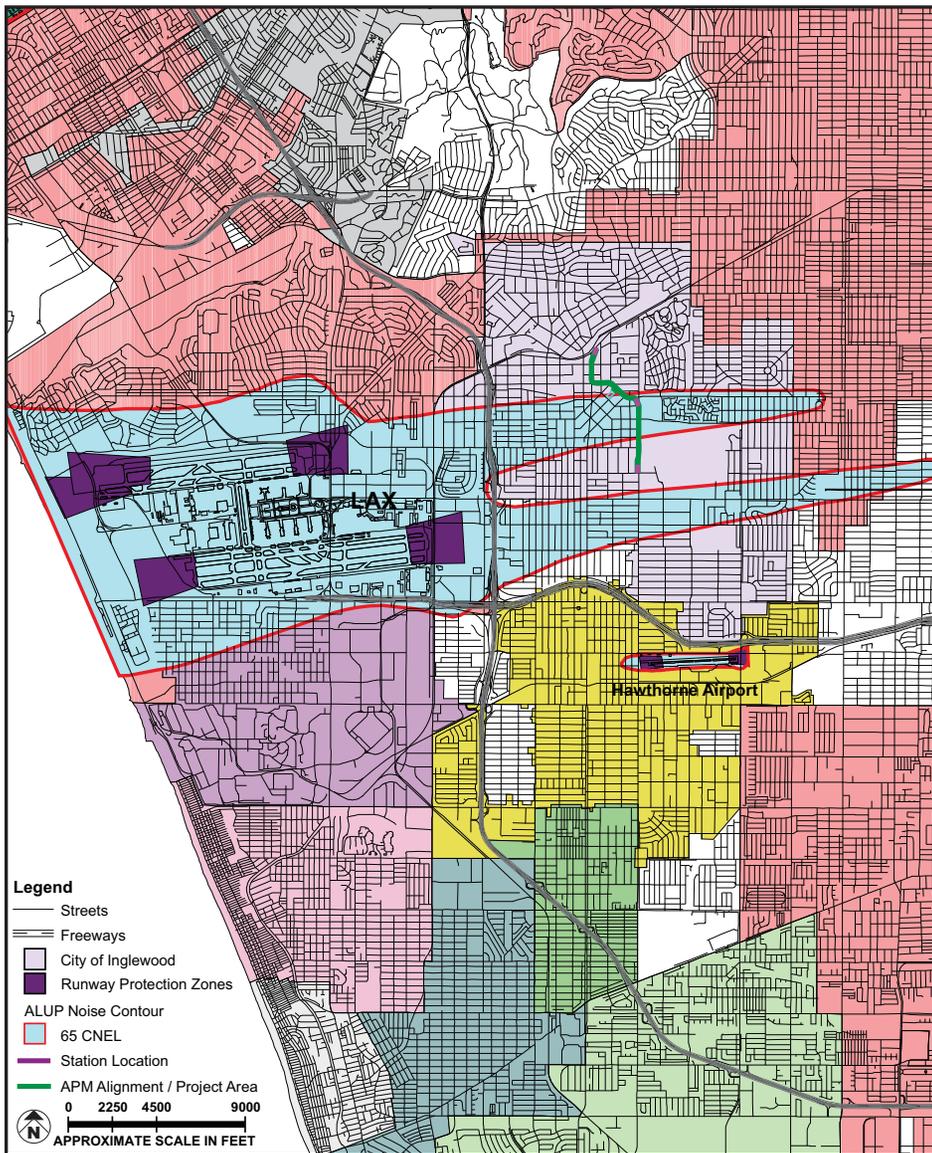

The Planning Boundary for LAX represents the combined areas around the airport subject to potential noise impacts and safety hazards associated with airport operations. The ALUP<sup>49</sup> provides noise and safety policies governing development of compatible future land uses in areas around LAX. Portions of the alignment between south Market Street, along Manchester Boulevard and south Prairie Avenue are located within the Planning Boundary/Airport Influence Area established for LAX in the Los Angeles County ALUP Map for LAX as shown in Figure 4.10-6: ALUP Noise Contours. Portions of the proposed Project between south Market Street, along Manchester Boulevard and south Prairie Street are located within the CNEL 65 dBA contour established for LAX in the ALUP (see Figure 4.10-4).

### Groundborne Noise

Groundborne noise levels in residential areas similar to the Project area would generally be 20 to 50 decibels lower than the velocity level depending on the frequency level of the source.<sup>50</sup> With a background groundborne vibration level in residential areas of 50 VdB or lower, groundborne noise levels would be approximately 0 to 30 dBA. A bus traveling at a distance of 50 feet would generate groundborne noise levels of approximately 23 to 38 dBA.

4.10.5.5 Vibration

**Groundborne Vibration**

The groundborne vibration level in residential areas is usually 50 VdB or lower, well below the threshold of perception for humans, which is around 65 VdB.<sup>51</sup> Most perceptible indoor vibration is caused by sources within buildings such as operation of mechanical equipment, movement of people or slamming of doors. Typical outdoor sources of perceptible groundborne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If the roadway is smooth, the vibration from traffic is rarely perceptible. Although not sources of groundborne vibration, noise-induced building responses such as rattling of windows and walls from aircraft flyovers contribute to the existing vibration setting. The primary sources of existing groundborne vibration in the area surrounding the Project area would be from adjacent industrial activities, including truck travel, heavy-duty vehicular travel (bus, refuse trucks, delivery trucks, etc.) on local roadways, and aircraft flyovers. A bus traveling at a distance of 50 feet typically generates groundborne vibration velocity of 63 VdB (approximately 0.006 in/sec PPV).<sup>52</sup> Aircraft flyovers could generate vibration levels that would cause human annoyance; however, they would not generate building vibration levels that would cause building damage.<sup>53</sup>

**Ambient Vibration**

An ambient vibration monitoring survey was undertaken to establish existing ground-borne vibration levels at various locations near the proposed Project. Existing vibration monitoring was conducted to provide data on ambient ground-borne vibration generated by traffic and operation of activities. The locations of the vibration monitoring selected were either adjacent to sensitive land uses (residences and hotels) or buildings that were close to where the components of the proposed Project would be constructed. Five ground vibration monitoring locations were established, as shown on Figure 4.10-5.

**Table 4.10-14: 24-hour Vibration Measurements in Project Vicinity** shows vibration velocities attributed to road traffic and normal operations of establishments in the area. The vibration velocity is expressed in vibration decibels (VdB) and is the maximum RMS value measured on the frequency range between 8 and 80 Hz. As shown, the average vibration velocities ranged from a low of 52 VdB at Site 1 at 220 Locust Avenue to a high of 67 VdB at Site 5 at 3940 Century Boulevard. It is important to note, Site 5 is located outside of the guideway of the proposed Project. The maximum vibration velocities within the proposed

Note: Vibration measurements were conducted on November 16, 2018.

#### 4.10.6 THRESHOLDS OF SIGNIFICANCE

Criteria outlined in the CEQA Guidelines were used to determine the level of significance of potential noise and vibration impacts. The proposed Project would have a significant impact in relation to noise and vibration if it were to result in:

**Threshold NOI-1:** Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

**Threshold NOI-2:** Generation of excessive groundborne vibration or groundborne noise levels.

##### 4.10.6.1 Construction Noise

The City's General Plan and Municipal Code do not establish numeric maximum acceptable source noise levels or noise level increases at potentially affected receivers. Section 5-41 of the City's Municipal Code<sup>55</sup> regulates construction noise and specifies restrictions for work occurring within a residential zone or within a radius of 500 feet between the hours of 8:00 PM and 7:00 AM. Pursuant to Section 5-41, it is unlawful for any person within a residential zone, or within a radius of 500 hundred feet therefrom, to

<sup>54</sup> Federal Transit Administration, Transit Noise and Vibration Impact Assessment, FTA report no. 0123 (September 2018), accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf).

<sup>55</sup> City of Inglewood, Municipal Code, Article 2, Noise Regulations. Section 5-41, Construction of Building and Projects, Noise Regulated 41http://www.qcode.us/codes/inglewood/?view=desktop&topic=5-2

operate equipment or perform any outside construction or repair work on buildings, structures, or projects or to operate any pile driver, pneumatic hammer, derrick, excavation or earth moving equipment, or other construction equipment between the hours of 8:00 PM and 7:00 AM of the next day in such a manner that a reasonable person residing in the area is caused discomfort or annoyance unless a permit has been obtained from the Permits and Licenses Committee of the City. The prohibition of nighttime construction in or near residential zones, without first obtaining a permit authorizing such nighttime construction (8:00 PM to 7:00 AM), reflects that the City does not regulate construction noise during daytime hours (7:00 AM to 8:00 PM).

The FTA *Transit Noise and Vibration Impact Assessment Manual*<sup>56</sup> provides a general noise assessment guideline to assess potential noise impacts construction of transit projects. A general noise assessment is suitable and appropriate given the current stage of planning and evaluation for this Project. The FTA's General Assessment Construction Noise Criteria identifies daytime and nighttime thresholds for residential, commercial, and industrial land uses, which are considered reasonable criteria for use in assessing the potential for adverse community reaction to noise generated by construction activities.

The construction noise criteria threshold for residential uses is 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period. Additionally, construction noise thresholds for commercial and industrial uses are 100 dBA (Leq-1hour) during both the daytime and nighttime periods. Since the construction-related noise level threshold represents the energy average of the noise source over a given time, they are expressed as Leq noise levels. With regard to increases in A-weighted noise levels, a 10 dBA change is subjectively heard as approximately doubling in loudness and can cause adverse response.<sup>57</sup> As such, in addition to the FTA General Assessment Construction Noise Criteria for residential, commercial, and industrial uses, an increase of 10 dBA or more above ambient noise levels is considered significant.

The use of these thresholds in this Recirculated Draft EIR responds to the unique circumstances of the proposed Project and its alignment along the fixed guideway corridor. By utilizing these quantitative thresholds in this Recirculated Draft EIR, the City is not making a decision whether to use these thresholds in CEQA documents on other proposed projects in the future. The City would, however, retain its authority as CEQA lead agency to utilize these or other thresholds, including relying exclusively on the provisions of Municipal Code Section 5-41 for the consideration of construction noise, as appropriate to the circumstances of other projects in the future.

<sup>56</sup> Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

<sup>57</sup> California Department of Transportation, *Technical Noise Supplement*, September 2013, accessed September 2021, <https://dot.ca.gov/-/media/dot-media/programs/environmental-analysis/documents/env/tens-sep2013-a11y.pdf>

#### 4.10.6.2 Operational Noise

As discussed previously, the City has established criteria that specify acceptable limits of noise for various land uses. These criteria are designed to integrate noise considerations into land use planning to prevent noise/land use conflicts.

For operational impacts, the City recognizes that such impacts occur on the long-term, and, as a result, the City has determined that in this case the significance threshold should be more conservative, specifically in areas where sensitive receptors are already exposed to above acceptable levels. As such, an increase in noise level of 3 dBA Leq to or within the “normally unacceptable” or “clearly unacceptable” land use compatibility categories is considered significant. For residential – low density single-family, duplex, mobile home and multifamily uses and schools, libraries, churches, hospitals, and nursing homes – the upper limit for Conditionally Acceptable noise exposures is 70 dBA DNL or CNEL. For office buildings, business commercial and professional uses the upper limit for Conditionally Acceptable noise exposures is 75 dBA DNL or CNEL.

As described previously, the City has adopted Noise Regulations<sup>58</sup> that prohibit noise in excess of specified levels, depending on base ambient noise levels, the nature of the use where noise levels are measured, and the duration period of such noise. The Noise Regulations may prohibit any increase in ambient noise levels under specified circumstances. The City has not previously relied on the Noise Regulations to serve as significance thresholds for operational noise. The City has determined that the Noise Regulations should not serve as operational noise thresholds for the proposed Project. The reason for this determination is that an increase in ambient noise would be imperceptible, or at most barely perceptible, where that increase is less than 3 dBA. Such an increase in ambient noise levels would not have a significant effect on the physical environment. The City has instead determined that the threshold should be set at a level that is actually perceivable. Additionally, the more a new source of noise exceeds the ambient noise level, the less acceptable the new noise will be judged by those hearing it. As explained previously, a 10 dBA change is subjectively heard as approximately a doubling in loudness that can result in an adverse community response. As such, in the event the resulting noise levels remain within acceptable noise limits, an increase of 10 dBA or more is considered significant.

In the cumulative context, the proposed Project’s noise and vibration impacts are considered in conjunction with other reasonably foreseeable development, using the same thresholds set forth above.

#### 4.10.6.3 Groundborne Noise

Ground-borne noise occurs when vibration radiates through a building interior and creates a low-frequency sound, often described as a rumble, as a train passes by. Groundborne noise that accompanies

<sup>58</sup> City, Municipal Code, Article 2, Noise Regulations. <http://www.qcode.us/codes/inglewood/?view=desktop&topic=5-2>.

the building vibration is usually perceptible only inside buildings and typically is only an issue at locations with subway or tunnel operations where there is no airborne noise path or for buildings with substantial sound insulation such as a recording studio. The proposed Project does not include subway or tunnel operations and there are no substantially insulated indoor receptors located within the area surrounding the proposed guideway vicinity. For typical buildings with at-grade or elevated transit operations, the interior airborne noise levels are often higher than the ground-borne noise levels. As an example, groundborne noise generated by a large bulldozer within five feet of a receptor building would reach an approximate level of 58 dBA, which is not greater than the airborne noise levels generated by construction equipment discussed below. As such, impacts related to groundborne noise are not discussed further.

#### 4.10.6.4 Groundborne Vibration

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods employed. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Buildings founded on the soil near the construction site respond to these vibrations with varying results, ranging from no perceptible effects at the lowest levels, low rumbling sounds and perceptible vibrations at moderate levels, and slight damage at the highest levels.

There are no adopted City standards or thresholds of significance for vibration. The evaluation of potential building damage impacts related to construction vibration levels is based on the published data in the FTA guidance.<sup>59</sup> While ground vibrations from construction activities do not often reach the levels that can damage structures, fragile buildings must receive special consideration. As such, the vibration damage criteria adopted by the FTA and applied in this analysis are listed below. Vibration impacts could be potentially significant if the vibration velocity exceeds the following:

- Reinforced-concrete, steel, or timber (no plaster) would exceed 0.5 PPV (inches per second);<sup>60</sup>
- Engineered concrete and masonry (no plaster) would exceed 0.3 PPV;
- Nonengineered timber and masonry buildings would exceed 0.2 PPV;
- Buildings extremely susceptible to vibration damage would exceed 0.12 PPV.

The PPV is defined as the maximum instantaneous positive or negative peak of the vibration and is often used in monitoring of vibration because it is related to the stresses experienced by structures. The FTA has also adopted standards associated with human annoyance for groundborne vibration impacts for the

<sup>59</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, FTA report no. 0123 (September 2018), accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf).

<sup>60</sup> When assessing vibration source levels from construction equipment, vibration is generally assessed in terms of PPV. PPV is defined as the peak signal value of an oscillating vibration velocity waveform, expressed in inches per second.

following three-land use categories: (1) Category 1, High Sensitivity; (2) Category 2, Residential; and (3) Category 3, Institutional.

- **Category 1** refers to buildings where vibration would interfere with operations within the building, including vibration-sensitive research and manufacturing facilities, hospitals with vibration-sensitive equipment, and university research operations. Vibration-sensitive equipment includes, but is not limited to, electron microscopes, high-resolution lithographic equipment, and normal optical microscopes.
- **Category 2** refers to all residential land uses and any buildings where people sleep, such as hotels and hospitals.
- **Category 3** refers to institutional land uses such as schools, churches, other institutions, and quiet offices that do not have vibration-sensitive equipment, but still have the potential for activity interference.

For purposes of this analysis, the human annoyance threshold is 72 VdB for residences and buildings where people normally sleep and 75 VdB for commercial uses, industrial uses, and churches with primarily daytime use.

It is important to note, it is extremely rare for vibration from train operations to cause substantial or even minor cosmetic building damage. However, damage to fragile historic buildings located near the ROW may be of concern. Even in these cases, damage is unlikely except when the track is located very close to the structure.

#### 4.10.8 IMPACT ANALYSIS

As discussed in **Section 3.0**, the proposed project includes a Construction Commitment Program (CCP) to proactively address the potential effects of the Project on the community during construction. The CCP, which includes PDF Noise-1 and PDF Noise-2 described below, addresses various effects including noise and vibration that would occur during construction.

##### 4.10.8.1 Project Design Features

As part of the CCP, the City will designate a Community Affairs Liaison to be responsible for responding within 24 hours to any local complaint or question about construction activities. A website will be established with project construction information and contact information for the Community Affairs Liaison. A toll-free phone line (available 24 hours a day) and website will be made a part of all construction notices and shall be posted in prominent public facing locations around the Project area and in adjacent public spaces.

The Community Affairs Liaison shall receive all public complaints, investigate the cause of the complaint and develop/implement feasible measures to address and resolve the cause of the complaint.

#### PDF-NOISE-1 Construction Noise Control Plan (CCP)

A Construction Noise Control Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works prior to construction. The Plan shall include measures demonstrating that construction noise levels will be below FTA's General Assessment Construction Noise Criteria. The following construction noise reduction measures shall be incorporated into the Plan:

- Install temporary noise barriers that reduce sound at receptors;
- For any idling that is expected to take longer than five minutes, the engine shall be shut off;
- All equipment shall be equipped with optimal muffler systems;
- Use solar, battery powered, or hybrid equipment whenever practical;
- Locate staging areas as far away from sensitive receptors as feasible;
- Locate stationary noise sources as far away from sensitive receptors as feasible;
- Enclose stationary noise sources, such as diesel-or gasoline-powered generators, with acoustical barriers where necessary and required;
  - If stationary equipment cannot be enclosed within a shed or barrier, such equipment must be muffled and located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- Pole power shall be utilized to the maximum extent feasible in lieu of generators.
- Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible. Additionally, use of "quiet" pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions shall be considered.
- Coordinate with the Inglewood Unified School District administrators to avoid disruptive noise during school hours.

#### 4.10 Noise

In order to ensure that construction noise levels will be below the established standards, the following shall be incorporated into the Plan:

- A monitoring plan shall be implemented during demolition and construction activities. Warning thresholds shall be defined that are 5 dBA below the specified noise limits to allow sufficient time for the Contractor to take actions to reduce noise. A monitoring record that documents all alarms and actions taken to comply with these measures shall be provided to the City upon request.
- In the event the warning level (dBA) is exceeded, construction activities shall be temporarily halted in the vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the established standards. Noise measurements shall be gathered after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels:
  - Halting/staggering concurrent construction activities in certain locations;
  - Reducing the speed or intensity of the heavy-duty construction equipment being operated simultaneously;
  - Operating equipment at the lowest possible power levels;
  - Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.

#### PDF NOISE-2 Construction Vibration Reduction Plan (CCP)

Prior to the issuance of any demolition or construction permit for each phase of the Project, a Construction Vibration Reduction Plan shall be prepared to minimize construction vibration at nearby sensitive receptors from vibration created by construction activities. The Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works. The Plan shall include but not be limited to the following elements to ensure impacts from ground borne vibration are less than significant:

- A Pre-Demolition and Construction Plan that includes but is not limited to:
  - Photos of current conditions of buildings and structures that could be damaged from construction activities. This crack survey shall include photos of existing cracks and other material conditions present on or at the surveyed buildings. Images of interior conditions shall be included if possible. Photos in the report shall be labelled in detail and dated.
  - Identify representative cracks in the walls of existing buildings, if any, and install crack gauges on such walls of the buildings to measure changes in existing cracks during project activities.
  - Crack gauges shall be installed on multiple representative cracks, particularly on sides of the building facing the Project.

#### 4.10 Noise

- Determine the number and placement of vibration sensors at the affected buildings in consultation with a qualified architect. The number of units and the locations of these sensors shall take into account proposed demolition and construction activities to ensure that adequate measurements can be taken illustrating vibration levels during the course of the Project, and if/when levels exceed the established threshold.
- A line and grade pre-construction survey at the affected buildings shall be conducted.
- A Vibration Plan During Demolition and Construction that includes the following:
  - Regularly inspect and photograph crack gauges, maintaining records of these inspections to be included in postconstruction reporting. Gauges shall be inspected every two weeks, or more frequently during periods of active project actions in close proximity to crack monitors.
  - The vibration monitoring system shall measure and continuously store the peak particle velocity (PPV) in inches/second. Vibration data shall be stored on a one-second interval. The system shall also be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA's threshold of significance for a building given its conditions, and a warning level that is 0.05 inch/second (PPV) less than the regulatory level. The system shall also provide real-time alert when the vibration levels exceed either of the two preset levels.
  - In the event the warning level (PPV) is triggered, the contractor shall identify the source of vibration impacts and establish steps to reduce the vibration levels, including but not limited to halting or staggering concurrent activities and using lower vibratory techniques.
  - In the event the regulatory level (PPV) is triggered, halt the construction activities in the vicinity of the trigger area and visually inspect the building for any damage. Results of the inspection must be logged. Identify the source of vibration generation and provide steps to reduce the vibration level. Vibration measurement shall be made with the new construction method to verify that the vibration level is below the warning level (PPV). Construction activities may then restart.
  - In the event work occurs in the proximity of identified historic uses, the system shall be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA threshold of significance 0.12 inch/second for a building given its conditions, and a warning level that is 0.012 inch/second (PPV) less than the regulatory level.
  - Collect vibration data from receptors and report vibration levels to the City Chief Building Official on a daily basis. The reports shall include annotations regarding project activities as necessary to explain changes in vibration levels.
- Post-Construction Reporting and Repairs:
  - Provide a report to the City Chief Building Official regarding crack and vibration monitoring conducted during demolition and construction. In addition to a narrative summary of the monitoring activities and their findings, this report shall include photographs illustrating the post-construction state of cracks and material conditions that were presented in the pre-construction assessment report, along with images of other relevant conditions showing the impact, or lack of

impact, of project activities. The photographs shall sufficiently illustrate damage, if any, caused by the Project and/or show how the Project did not cause physical damage to the buildings. The report shall include analysis of vibration data related to project activities, as well as summarize efforts undertaken to avoid vibration impacts. Finally, a postconstruction line and grade survey shall also be included in this report.

- Perform repairs to buildings if damage is caused by vibration or movement during the demolition and/or construction activities. Repairs may be necessary to address, for example, cracks that expanded as a result of the Project, physical damage visible in post-construction assessment, or holes or connection points that were needed for shoring or stabilization. Repairs shall be directly related to project impacts and will not apply to general rehabilitation or restoration activities of the buildings.
- To minimize the risk of potential structural and building damage:
  - Limit the location of pile driving and vibratory roller activity to not be within 55 feet and 30 feet of the nearest off-site sensitive receptor, respectively.
  - Limit the number of jackhammers operating simultaneously to one (1) piece operating within 45 feet of off-site sensitive receptors.
  - In the event impact pile driving is required, equipment shall only be used from the hours of 7:00 AM to 7:00 PM. If feasible, pile driving should use alternative technology such as vibration or hydraulic insertion.
- To minimize the risk of related to human annoyance:
  - Limit the location of pile driving to 310 feet of off-site vibration sensitive receptors.
  - Limit the location of vibratory roller to 150 feet of off-site vibration sensitive receptors.
  - Limit the location of large bulldozer to 85 feet of off-site vibration sensitive receptors.
  - Limit the location of caisson drilling to 85 feet of off-site vibration sensitive receptors.
  - Limit the location of loaded trucks to 75 feet of off-site vibration sensitive receptors.
  - Limit the location of jackhammers to 45 feet of off-site vibration sensitive receptors.
  - Limit the location of small bulldozer to 25 feet of off-site vibration sensitive receptors.

#### PDF NOISE-3 Operational (CCP)

The exterior noise level generated by the ATS train, inclusive of all contributing noise sources, shall not exceed the levels specified in Section 2.2.1, Exterior Airborne Noise, ASCE 21-05 (American Society of Civil Engineers, Automated People Mover Standards - Part 2 Section 2.2.1, Exterior Airborne Noise, ASCE 21-05.).

The design of any barriers along the guideway designed to reduce noise shall be subject to the limits noted in **Table 4.10-9** above.

**Impact NOI-1: Would the project result in a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?**

#### Construction

##### *Proposed Project Construction Activities*

As previously described, construction activity would primarily occur over a 16-hour per day schedule with two shifts, either a Morning/Evening shift from approximately 7:00 AM to 3:00 PM and an evening shift from approx. 3:00 PM to 11:00 PM, or a Morning/Night shift from approximately 7:00 AM to 3:00 PM and a night shift from approximately 11:00 PM to 7:00 AM.<sup>61</sup> There will also be periods when construction activities are scheduled to occur from approximately 11:00 PM to 7:00 AM to accommodate work activities that cannot be accomplished during the daytime shifts (i.e., during large-scale pours of concrete when it would be necessary to maintain a continuous stream of concrete deliveries through multiple shifts). Construction work is assumed to occur seven days a week.

Construction noise impacts due to construction activities were determined by comparing the calculated construction-related noise levels of the proposed Project to the measured existing ambient noise levels (i.e., noise levels without construction noise from the proposed Project). Construction noise levels were calculated for each phase of construction (Phases 1 through 8) at the adjacent land uses.

#### Phase 1

As described previously, Phase 1 includes demolition of buildings and site improvements on properties acquired for construction, the beginning of construction of the MSF, trenching and installation of primary power duct bank, and preparatory work on the east side of Prairie Avenue to allow for the roadway shift. Prior to Phase 1 construction activities being initiated on the MSF, the owner/operator of the Vons supermarket currently located on this site would demolish the existing Vons gas station on the corner of Manchester Boulevard and Spruce Avenue and pave this area for use as a parking area for the new Vons store to be built on the corner of Manchester Boulevard and Hillcrest Boulevard. This construction would occur over an approximate 10-month period prior to Phase 1 of the ITC construction. These construction activities would be limited to the northern portion of the MSF site along Manchester Boulevard and Hillcrest Boulevard and would be located approximately 465 feet to the west of the existing residential

<sup>61</sup> Appendix 3.0.4: Construction Phasing Narrative in this Recirculated Draft EIR, August 2021.

uses along Spruce Avenue. Currently, the Vons building is located approximately 30 feet to the west of the existing residential uses along Spruce Avenue and would act as a barrier during construction of the new building that is located further away from these sensitive uses. Demolition of the current Vons building won't occur until after the new Vons building has been constructed. Additionally, construction would be conducted in accordance with all standards and requirements applicable to construction in the Inglewood Municipal Code. For these reasons, these construction activities will not result in significant noise impacts.

**Table 4.10-15: Phase 1 Proposed Project Construction Noise Levels** presents the forecasted demolition and construction noise levels for Phase 1 of the ITC construction that would be generated by construction equipment at nearby adjacent sensitive receptors. As shown, construction noise levels during the daytime period would range from a low of 55.0 dBA (Leq1-hour) at the residential areas along Pincay Drive to the east of the Prairie Avenue/Manchester Boulevard Station (Site M) to a high of 77.6 dBA (Leq1-hour) at the residential uses along Locust Street to the east of the Market Street/Florence Avenue Station (Site 1) and the residential uses along Spruce Avenue to the east of the MSF (Site I). Additionally, construction noise levels during the nighttime period would range from a low of 52.0 dBA (Leq1-hour) at the residential uses along Pincay Drive to the east (Site M) to a high of 74.6 dBA (Leq1-hour) at the residential uses along Locust Street to the east of the Market Street/Florence Avenue Station (Site 1) and the residential uses along Spruce Avenue to the east of the MSF (Site I). When considering the existing noise environment and the absolute noise levels during construction activities, noise levels would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period for residential uses. Additionally, noise levels would be below the FTA criteria threshold of 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses.

As mentioned previously, a 10 dBA change is subjectively heard as approximately doubling in loudness and can cause adverse response. Construction noise levels during the daytime period would result in maximum increases of 15.8 dBA above ambient at the residential uses along Locust Street to the east of the Market Street/Florence Avenue Station (Site 1). Additionally, construction noise levels during the nighttime period would result in maximum increases of 19.6 dBA above ambient at the residential uses along Locust Street to the east of the Market Street/Florence Avenue Station (Site 1). **PDF NOISE-1** includes implementation of a Construction Noise Control Plan which proactively addresses the potential effects of noise during construction. The measures required by the Construction Noise Control Plan can reduce noise levels by 10 dBA or more. For example, using optimal muffler systems on all equipment would reduce construction noise levels by 10 dBA or more.<sup>62</sup> Temporary abatement techniques such as the use of a noise barrier can achieve a 5-dBA noise level reduction when it is tall enough to break the line-of-sight to the receiver. Modifications such as dampening of metal surfaces or the redesign of a particular piece of equipment can

62 FHWA, *Special Report—Measurement, Prediction, and Mitigation*, updated June 2017, [https://www.fhwa.dot.gov/Environment/noise/construction\\_noise/special\\_report/hcn04.cfm](https://www.fhwa.dot.gov/Environment/noise/construction_noise/special_report/hcn04.cfm), Accessed January 2021.

achieve noise reduction of up to 5 dBA.<sup>63</sup> Moving stationary equipment away from sensitive receptors will reduce noise levels at the receptor as every doubling of distance will reduce noise by 4 to 6 dBA. Thus, with the measures required by the CCP, construction noise will not increase ambient noise levels by more than 10 dBA. Furthermore, the Construction Noise Control Plan would include a monitoring plan during demolition and construction activities to ensure noise levels are below the specified noise limits. With implementation of **PDF NOISE-1**, Phase 1 construction noise levels would be less than significant.

### Phase 2

Phase 2 would include activities to enable the construction sequence of the guideway along Prairie Avenue from Hardy Street to Manchester Boulevard, and work at the MSF site. **Table 4.10-16: Phase 2 Proposed Project Construction Noise Levels** presents the forecasted construction noise levels generated by construction equipment during Phase 2 at the nearby adjacent sensitive receptors. As shown, construction noise levels during the daytime period would range from a low of 51.1 dBA (Leq1-hour) at the commercial uses along Regent Street south of the Market Street/Florence Avenue Station (Site K) to a high of 75.8 dBA (Leq1-hour) at the residential uses along Spruce Avenue to the east of the MSF (Site I). Additionally, construction noise levels during the nighttime period would range from a low of 48.1 dBA (Leq1-hour) at the commercial uses along Regent Street south of the Market Street/Florence Avenue Station (Site K) to a high of 72.8 dBA (Leq1-hour) at the residential uses along Spruce Avenue to the east of the MSF (Site I). When taking into account the existing noise environment and the absolute noise levels during construction activities, noise levels would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period for residential uses. Additionally, noise levels would be below the FTA criteria threshold of 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses.

Construction noise levels during the daytime period would result in maximum increases of 8.5 dBA above ambient at the residential uses along Spruce Avenue to the east of the MSF (Site I). Additionally, construction noise level increases during the nighttime period would result in maximum increases of 14.5 dBA above ambient at the residential uses along Spruce Avenue to the east of the MSF (Site I). **PDF NOISE-1** includes implementation of a Construction Noise Control Plan which proactively addresses the potential effects of noise during construction. The measures required by the Construction Noise Control Plan can reduce noise levels by 10 dBA or more as discussed above for Phase 1. Furthermore, the Construction Noise Control Plan would include a monitoring plan during demolition and construction activities to ensure noise levels are below the specified noise limits. With implementation of **PDF NOISE-1**, Phase 2 construction noise levels would be less than significant.

63 FHWA, *Special Report—Measurement, Prediction, and Mitigation*, updated June 2017, accessed July 2019, [https://www.fhwa.dot.gov/Environment/noise/construction\\_noise/special\\_report/hcn04.cfm](https://www.fhwa.dot.gov/Environment/noise/construction_noise/special_report/hcn04.cfm).

4.10-71

Inglewood Transit Connector Project  
November 2021

**Phase 3**

Phase 3 would include foundation work for the ATS guideway, foundation work for the Market Street/Florence Ave Station, and construction for the support structure of the MSF building. Phase 3 work will include utility relocation (if necessary), foundations, CIP columns, and setting of prefabricated buildings at the PDSs. **Table 4.10-17: Phase 3 Proposed Project Construction Noise Levels** presents the forecasted construction noise levels generated by construction equipment during Phase 3 of the nearby adjacent sensitive receptors. As shown, construction noise levels during the daytime period would range from a low of 50.1 dBA (Leq1-hour) at the residential and commercial uses along Century Boulevard south of the Prairie Avenue/Hardy Street Station (Site E) to a high of 77.1 dBA (Leq1-hour) at the residential uses along Spruce Avenue to the east of the MSF (Site I). Additionally, construction noise levels during the nighttime period would range from a low of 47.1 dBA (Leq1-hour) at the residential and commercial uses along Century Boulevard south of the Prairie Avenue/Hardy Street Station (Site E) to a high of 74.1 dBA (Leq1-hour) at the residential uses along Spruce Avenue to the east of the MSF (Site I). When taking into account the existing noise environment and the absolute noise levels during construction activities, noise levels would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period for residential uses. Additionally, noise levels would be below the FTA criteria threshold of 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses.

Construction noise level increases during the daytime period would result in maximum increases of 9.6 dBA above ambient at the residential uses along Spruce Avenue to the east of the MSF (Site I). Additionally, construction noise level increases during the nighttime period would result in maximum increases of 15.7 dBA at the residential uses along Spruce Avenue to the east of the MSF (Site I). **PDF NOISE-1** includes implementation of a Construction Noise Control Plan which proactively addresses the potential effects of noise during construction. The measures required by the Construction Noise Control Plan can reduce noise levels by 10 dBA or more as discussed above for Phase 1. Furthermore, the Construction Noise Control Plan would include a monitoring plan during demolition and construction activities to ensure noise levels are below the specified noise limits. With implementation of **PDF NOISE-1**, Phase 3 construction noise levels would be less than significant.

**Phase 4**

Phase 4 construction would include foundation work for the ATS guideway, guideway column caps along Market Street, and the MSF building deck and shell. Phase 4 activities will include utility relocation (if necessary), foundations, CIP columns, guideway column caps, and installation of equipment at the TPDSS. **Table 4.10-18: Phase 4 Proposed Project Construction Noise Levels**, presents the forecasted construction noise levels generated by construction equipment during Phase 4 of the nearby adjacent sensitive

receptors. As shown, construction noise levels during the daytime period would range from a low of 56.2 dBA (Leq1-hour) at the residential along Pincay Drive to the east of the Prairie Avenue/Manchester Boulevard Station (Site M) to a high of 77.8 dBA (Leq1-hour) at the residential uses along Spruce Avenue to the east of the MSF (Site I). Additionally, construction noise levels during the nighttime period would range from a low of 53.2 dBA (Leq1-hour) at the residential along Pincay Drive to the east of the Prairie Avenue/Manchester Boulevard Station (Site M) to a high of 74.8 dBA (Leq1-hour) at the residential uses along Spruce Avenue to the east of the MSF (Site I). When taking into account the existing noise environment and the absolute noise levels during construction activities, noise levels would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period for residential uses. Additionally, noise levels would be below the FTA criteria threshold of 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses.

Construction noise level increases during the daytime period would result in maximum increases of 10.2 dBA above ambient at the residential uses along Spruce Avenue to the east of the MSF (Site I). Additionally, construction noise level increases during the nighttime period would result in maximum increases of 16.4 dBA at the residential uses along Spruce Avenue to the east of the MSF (Site I). **PDF NOISE-1** includes implementation of a Construction Noise Control Plan which proactively addresses the potential effects of noise during construction. The measures required by the Construction Noise Control Plan can reduce noise levels by 10 dBA or more as discussed above for Phase 1. Furthermore, the Construction Noise Control Plan would include a monitoring plan during demolition and construction activities to ensure noise levels are below the specified noise limits. With implementation of **PDF NOISE-1**, Phase 4 construction noise levels would be less than significant.

4.10-77

Inglewood Transit Connector Project  
November 2021

**Phase 5**

Phase 5 construction would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, guideway girder along Market Street, and MSF building interior construction. Phase 5 activities will include guideway girders, guideway straddle caps, and installation of equipment at the PDSs. **Table 4.10-19: Phase 5 Proposed Project Construction Noise Levels**, presents the forecasted construction noise levels generated by construction equipment during Phase 5 of the nearby adjacent sensitive receptors. As shown, construction noise levels during the daytime period would range from a low of 55.8 dBA (Leq1-hour) at the residential uses along Manchester Boulevard to the east of the Prairie Avenue/Manchester Boulevard Station (Site L) to a high of 74.6 dBA (Leq1-hour) at the residential and commercial uses along Manchester Boulevard (Site B). Additionally, construction noise levels during the nighttime period would range from a low of 52.8 dBA (Leq1-hour) at the residential uses along Manchester Boulevard to the east of the Prairie Avenue/Manchester Boulevard Station (Site L) to a high of 71.6 dBA (Leq1-hour) at the residential and commercial uses along Manchester Boulevard (Site B). When taking into account the existing noise environment and the absolute noise levels during construction activities, noise levels would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period for residential uses. Additionally, noise levels would be below the FTA criteria threshold of 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses.

Construction noise level increases during the daytime period would result in maximum increases of 9.6 dBA above ambient at the commercial uses along Queen Street and Market Street (Site A). Additionally, construction noise level increases during the nighttime period would result in maximum increases of 12.6 dBA above ambient at the commercial uses along Queen Street and Market Street (Site A). **PDF NOISE-1** includes implementation of a Construction Noise Control Plan which proactively addresses the potential effects of noise during construction. The measures required by the Construction Noise Control Plan can reduce noise levels by 10 dBA or more as discussed above for Phase 1. Furthermore, the Construction Noise Control Plan would include a monitoring plan during demolition and construction activities to ensure noise levels are below the specified noise limits. With implementation of **PDF NOISE-1**, Phase 5 construction noise levels would be less than significant.

**Phase 6**

Phase 6 construction would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, completion of Prairie/Manchester Station, completion of Hardy Station, and completion of the MSF building, and the elevated passenger walkway to the Metro Crenshaw/LAX Line Downtown Inglewood

Station. **Table 4.10-20: Phase 6 Proposed Project Construction Noise Levels**, presents the forecasted construction noise levels generated by construction equipment during Phase 6 of the nearby adjacent sensitive receptors. As shown, construction noise levels during the daytime period would range from a low of 54.0 dBA (Leq1-hour) at the residential uses along Pincay Drive to the southeast of the Prairie Avenue/Manchester Boulevard Station (Site M) to a high of 75.0 dBA (Leq1-hour) at the residential uses along Spruce Avenue to the east of the MSF (Site I). Additionally, construction noise levels during the nighttime period would range from a low of 51.0 dBA (Leq1-hour) at the residential uses along Pincay Drive to the southeast of the Prairie Avenue/Manchester Boulevard Station (Site M) to a high of 72.0 dBA (Leq1-hour) at the residential uses along Spruce Avenue to the east of the MSF (Site I). When taking into account the existing noise environment and the absolute noise levels during construction activities, noise levels would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period for residential uses. Additionally, noise levels would be below the FTA criteria threshold of 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses.

Construction noise level increases during the daytime period would result in maximum increases of 7.8 dBA above ambient at the residential uses along Spruce Avenue to the east of the MSF (Site I). Additionally, construction noise level increases during the nighttime period would result in maximum increases of 13.7 dBA above ambient at the residential uses along Spruce Avenue to the east of the MSF (Site I). **PDF NOISE-1** includes implementation of a Construction Noise Control Plan which proactively addresses the potential effects of noise during construction. The measures required by the Construction Noise Control Plan can reduce noise levels by 10 dBA or more as discussed above for Phase 1. Furthermore, the Construction Noise Control Plan would include a monitoring plan during demolition and construction activities to ensure noise levels are below the specified noise limits. With implementation of **PDF NOISE-1**, Phase 6 construction noise levels would be less than significant.

4.10-83

Inglewood Transit Connector Project  
November 2021

**Phase 7**

Phase 7 construction would include final site work and completion of the stations. **Table 4.10-21: Phase 7 Proposed Project Construction Noise Levels**, presents the forecasted construction noise levels generated by construction equipment during Phase 7 of the nearby adjacent sensitive receptors. As shown, construction noise levels during the daytime period would range from a low of 51.3 dBA (Leq1-hour) at the residential uses along Pincay Drive to the southeast of the Prairie Avenue/Manchester Boulevard Station (Site M) to a high of 75.6 dBA (Leq1-hour) at the residential uses along Spruce Avenue to the east of the MSF (Site I). Additionally, construction noise levels during the nighttime period would range from a low of 48.3 dBA (Leq1-hour) at the residential uses along Pincay Drive to the southeast of the Prairie Avenue/Manchester Boulevard Station (Site M) to a high of 72.6 dBA (Leq1-hour) at the residential uses along Spruce Avenue to the east of the MSF (Site I). When taking into account the existing noise environment and the absolute noise levels during construction activities, noise levels would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period for residential uses. Additionally, noise levels would be below the FTA criteria threshold of 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses.

Construction noise level increases during the daytime period would result in maximum increases of 9.0 dBA above ambient at the residential uses along Locust Street to the east of the Market Street/Florence Avenue Station (Site 1). Additionally, construction noise level increases during the nighttime period would result in maximum increases of 14.3 dBA above ambient at the residential uses along Spruce Avenue to the east of the MSF (Site I). **PDF NOISE-1** includes implementation of a Construction Noise Control Plan which proactively addresses the potential effects of noise during construction as discussed above for Phase 1. Furthermore, the Construction Noise Control Plan would include a monitoring plan during demolition and construction activities to ensure noise levels are below the specified noise limits. With implementation of **PDF NOISE-1**, Phase 7 construction noise levels would be less than significant.

**Phase 8**

Phase 8 construction would occur for the guideway along the entire length of the alignment and primarily includes installation of the operating systems and testing and commissioning of the ATS trains. **Table 4.10-22: Phase 8 Proposed Project Construction Noise Levels**, presents the forecasted construction noise levels generated by construction equipment during Phase 8 of the nearby adjacent sensitive receptors. As shown, construction noise levels during the daytime period would range from a low of 60.9 dBA (Leq1-hour) at the residential uses along Manchester Boulevard to the east of the Prairie Avenue/Manchester Boulevard Station (Site L) to a high of 79.6 dBA (Leq1-hour) at the residential uses along Manchester Drive to the northeast of the MSF (Site 2). Additionally, construction noise levels during the nighttime period would range from a low of 57.9 dBA (Leq1-hour) at the residential uses along Manchester Boulevard to

the east of the Prairie Avenue/Manchester Boulevard Station (Site L) to a high of 76.5 dBA (Leq1-hour) at the residential uses along Manchester Drive to the northeast of the MSF (Site 2). When taking into account the existing noise environment and the absolute noise levels during construction activities, noise levels would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period for residential uses. Additionally, noise levels would be below the FTA criteria threshold of 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses.

Construction noise level during the daytime period would result in maximum increases of 14.4 dBA above ambient at the commercial uses along Queen Street and Market Street (Site A). Additionally, construction noise level increases during the nighttime period would result in maximum increases of 18.3 dBA above ambient at the residential uses along Locust Street to the east of the Market Street/Florence Avenue Station (Site 1). **PDF NOISE-1** includes implementation of a Construction Control Plan which proactively addresses the potential effects of noise during construction. The measures required by the Construction Noise Control Plan can reduce noise levels by 10 dBA or more as discussed above for Phase 1. Furthermore, the Construction Noise Control Plan would include a monitoring plan during demolition and construction activities to ensure noise levels are below the specified noise limits. With implementation of **PDF NOISE-1**, Phase 2 construction noise levels would be less than significant.

4.10-89

Inglewood Transit Connector Project  
November 2021

### **Potential Health Effects of Proposed Project Construction Noise**

As mentioned previously, construction is planned to occur in multiple phases over approximately 46 months between January 2024 and November 2027. Construction noise levels were based on acoustical use factor, maximum noise levels, and the logarithmic sum of all pieces of equipment operated simultaneously within a specified area. As detailed in **Tables 4.10-15** through **4.10-22**, construction noise levels would not exceed the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period for residential uses and 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses. Additionally, **PDF NOISE-1** includes implementation of a Construction Noise Control Plan which proactively addresses the potential effects of noise during construction. The measures required by the Construction Noise Control Plan can reduce noise levels by 10 dBA or more. As shown in **Table 4.10-1** above, when measured on the A-scale of a standard sound level meter, short-term noise levels constituting the threshold of pain and hearing damage are between 130 dBA and 140 dBA.

With respect to potential nighttime disturbance from construction noise, the areas along the proposed alignment for the ATS system where there is the potential for sleep disturbance during nighttime construction has been identified. Construction activities will occur adjacent to residential uses, especially adjacent to the MSF site and other areas along the proposed Project.

According to the Acoustical Society of America, receivers that would experience an indoor SEL of 50 dBA or lower would have an awakening probability of zero.<sup>64</sup> Based on the assumption that standard building construction in a warm climate area such as southern California offers an exterior-to-interior attenuation rate of 12 dB, it is assumed that indoor SEL would be 12 dB lower than exterior construction noise levels.<sup>65</sup> The area surrounding the proposed Project that would experience an indoor SEL of greater than 50 dBA (exterior construction noise level of greater than 62 dBA Leq) during a worst-case or loudest maximum nighttime construction noise level event was identified. This does not take into account the existing indoor SEL currently experienced due to aircraft flyovers from LAX and/or other existing noise sources in the area such as traffic and industrial operations. Based on the preceding impact analyses provided in **Tables 4.10-15** through **4.10-22**, exterior noise levels at all analyzed locations would be above 62 dBA Leq prior to the addition of construction noise.

Due to the high variability of each individual's sensitivity to nighttime noise, uncertain factors related to nighttime construction activity such as number of peak noise level occurrences, and lack of an established or adopted threshold designating acceptable occurrences of awakenings, the estimated area for awakenings presented in this analysis represents the City's best effort to disclose the potential sleep

<sup>64</sup> Acoustical Society of America, 2018. Rationale for Withdrawing ANSI/ASA S12.9-2008/Part 6. Annex 3. July 22, 2018.

<sup>65</sup> United States Environmental Protection Agency, Protective Noise Levels, 1978, p.11

disturbance effects of nighttime construction, but do not represent predictions of sleep awakenings for any specific location or population.

There are no established thresholds with regard to an acceptable level of short-term sleep disturbance. While exposure to high levels of noise during sleep can result in physiological responses, it is not possible to predict such effects in any particular population. As such, due to the lack of established thresholds and noise levels that do not exceed the threshold of pain and hearing damage, construction activities from the proposed Project would not result in adverse health effects related to pain and hearing loss and are not considered significant for this reason.

### **Off-Site Construction Traffic**

Construction traffic would generate noise along access routes to and from the proposed Project's construction areas. Construction activities would require the movement of heavy equipment throughout the Project area during respective construction phases and for each specialized construction activity (e.g., demolition, grading). Construction staging, parking and equipment storage areas will be on-site within the proposed fenced in yards or within each phasing area.

Delivery of construction materials would occur during the night shift, as would most lane closures. Construction activities during the day shift would primarily consist of work that could proceed without requiring lane closures or significant disruption to daily commuter traffic and potential event traffic along Prairie Avenue and Manchester Boulevard. Additionally, it can be anticipated that some minor activity would occur during periods in between construction shifts for logistics, moving equipment, etc.

Construction employee parking would be provided within the construction areas and may also serve as temporary parking for construction personnel. As identified in the CCP, construction activities would be required to be conducted in conformance with the Parking Management Plan which states parking, staging, or queuing of Project-related vehicles, including workers' personal or project assigned vehicles, trucks and heavy vehicles, shall be prohibited on City streets at all times, outside of a permitted workspace unless otherwise approved by the City. If the use of residential permit parking spots is necessary for construction, provide for equivalent overnight replacement parking for removed residential permit parking spots at the nearest possible area to the location where parking has been removed.

Designated delivery and haul routes would be established for the proposed Project consistent with the City's General Plan roadway designations and the haul routes currently used for local projects. As shown in **Figure 3.0-35: Proposed Construction Staging Areas and Haul Routes**, the primary delivery and haul routes proposed during construction of the proposed Project would utilize Florence Avenue, Manchester Boulevard, Prairie Avenue, and Century Boulevard, which have been designated by the City as appropriate

#### 4.10 Noise

for heavy truck use.<sup>66</sup> These routes would convey materials to and from regional routes, including the I-405 (Glen Anderson Freeway) and I-405 (San Diego Freeway).

The construction contractor would be required to utilize the haul routes and overload/oversized vehicle routes reviewed and approved by the City. As identified in the CCP, truck deliveries of bulk materials such as aggregate, bulk cement, dirt, etc. to the project site, and hauling of material from the project site, shall be scheduled during off-peak hours to avoid the peak commuter traffic periods on designated haul routes. For dirt, aggregate, bulk cement, and all other materials and equipment, truck deliveries would be on designated routes only (freeways and non-residential streets).

As shown in the Construction Phasing Narrative, a variety of heavy trucks will travel to and from the proposed Project during various phases of construction. The total trucks per phase is shown in **Table 4.10-4** above. The proposed Project is expected to generate a maximum of approximately 32 trips per day which includes both on-road on- and off-site equipment.

Although it is unlikely that all Project construction related heavy-duty construction trucks would travel along the same haul route, due to the uncertainty of the route trucks would take it has been conservatively assumed that the maximum anticipated number of heavy-duty construction trucks could potentially travel along the same route.

Traffic volume data was provided for multiple segments along each roadway, resulting in multiple different daily volumes. The lowest adjusted baseline average daily traffic (ADTs) volumes along West Century Boulevard, Manchester Boulevard, South Prairie Avenue and Florence Avenue are 33,189 trips, 18,821 trips, 22,089 trips, and 16,835 trips respectively, (refer to **Appendix N.2-1**) and the highest adjusted baselines volumes along West Century Boulevard, Manchester Boulevard, South Prairie Avenue and Florence Avenue are 50,609 trips, 36,748 trips, 38,953 trips, and 40,740 trips respectively.<sup>67</sup>

The sound power from one heavy-duty truck is greater than the sound power from one passenger vehicle (i.e., car). According to Caltrans, the noise levels from one heavy-duty truck at a speed of 35 miles per hour is equivalent to 19 passenger vehicles traveling at a speed of 35 miles per hour. Applying this multiplier to a maximum of approximately 32 trips per day, construction would generate a potential maximum sound power equivalency of up to 608 passenger vehicle trips per day. Additionally, the maximum workforce estimate range between 210 – 240 persons during Phase 4 and 5, as such resulting in 848 passenger trips per day.

<sup>66</sup> City of Inglewood, Municipal Code, Section 3-95, Truck Routes Established.  
[https://www.qcode.us/codes/inglewood/view.php?topic=3-3-3\\_85&frames=on](https://www.qcode.us/codes/inglewood/view.php?topic=3-3-3_85&frames=on)  
<sup>67</sup> Traffic data provided in the Transportation Study available in **Appendix O**.

#### 4.10 Noise

According to FHWA, assuming all other factors remain the same, it takes a doubling of traffic volumes (100 percent increase) in order to increase traffic noise levels by 3 dBA.<sup>68</sup> As compared to adjusted baseline average daily traffic volumes along the roadways mentioned above, the sound power generated by the maximum anticipated number of construction trucks would not be equivalent or greater to a doubling of both the minimum and maximum ADT along West Century Boulevard, Manchester Boulevard or South Prairie Avenue and therefore would not result in a 5 dBA (Leq-1hour) increase along those roadways.

Therefore, noise impacts from off-site construction traffic from trucks would be less than significant.

#### **Operation**

##### **Road Traffic Noise**

As the City transforms into a major regional activity center, the ITC Project is designed to meet the City's goals and objectives related to reducing the City's traffic congestion and alleviating growing demand on the existing roadway network by encouraging and providing the use of intermodal transportation systems. Thus, the Project is intended to reduce vehicle trips and roadway noise levels, resulting in negligible increases in the roadway network as discussed below.

##### **Adjusted Baseline Conditions During Typical Non-Event Weekdays With and Without ITC Project**

**Appendix N.2-1** and **4.10.2-2** illustrates the change in daytime (7:00 AM to 10:00 PM) and nighttime (10:00 PM to 7:00 AM) noise levels for the Adjusted Baseline Conditions during typical Non-Event Weekday with ITC Project traffic noise levels in detail. The difference in traffic noise between Adjusted Baseline Without ITC Project and Adjusted Baseline With ITC Project represents the increase (or decrease) in noise attributable to Project-related traffic area. As shown, roadway levels would result in a decrease in noise due to removal and redistribution of trips as a result of the Project. Therefore, the roadway noise level during the daytime or nighttime periods would not exceed the threshold of significance of an increase in noise level of 3 dBA Leq to or within the "normally unacceptable" or "clearly unacceptable" land use compatibility categories or result in an increase of 10 dBA when noise levels remain within acceptable limits. Impacts of the proposed Project related to traffic generated noise for the Adjusted Baseline Conditions during typical non-event weekdays with ITC Project would be less than significant.

##### **Opening Year (2027) Conditions With NFL Event With and Without ITC Project**

**Appendix N.2-3** and **4.10.2-4** compares the daytime and nighttime noise levels from Opening Year (2027) Conditions With NFL Event Without ITC Project to the Opening Year (2027) Conditions With NFL Event With ITC Project. As shown, roadway levels would result in a decrease in noise due to removal and redistribution of trips as a result of the Project. Therefore, the roadway noise level during the daytime or

<sup>68</sup> Federal Highway Administration, FHWA Highway Traffic Noise Prediction Model, December 1978,  
<https://ia801807.us.archive.org/3/items/fhwahighwaytraff00barr/fhwahighwaytraff00barr.pdf>.

#### 4.10 Noise

nighttime periods would not exceed the threshold of significance of an increase in noise level of 3 dBA Leq to or within the “normally unacceptable” or “clearly unacceptable” land use compatibility categories or result in an increase of 10 dBA when noise levels remain within acceptable limits. Impacts of the proposed Project related to traffic generated noise for the Opening Year (2027) Conditions with NFL Event With ITC Project would be less than significant.

##### Future Horizon Year (2045) With NFL Event With and Without ITC Project

**Appendix N.2-5 and 4.10.2-6** compares the daytime and nighttime noise levels from traffic generated by the Future Horizon Year (2045) With NFL Event Without ITC Project to the Future Horizon Year (2045) With NFL Event With Project conditions. As shown, roadway levels would result in a decrease in noise due to removal and redistribution of trips as a result of the Project. Therefore, the roadway noise level during the daytime or nighttime periods would not exceed the threshold of significance of an increase in noise level of 3 dBA Leq to or within the “normally unacceptable” or “clearly unacceptable” land use compatibility categories or result in an increase of 10 dBA when noise levels remain within acceptable limits. Impacts of the proposed Project related to traffic generated noise for the Future Horizon Year (2045) With NFL Event without and with the ITC Project would be less than significant.

##### ATS Train Transit Noise

As mentioned previously, for analysis purposes it is assumed that the proposed Project would either utilize large, automated monorail technologies or rubber-tire vehicles operating along a fixed guideway. **Table 4.10-23: ATS Trains Exterior Noise Levels** below provides the predicted noise levels of both the rubber-tired ATS train and monorail.

It is important to note, the Project would be required to implement **PDF NOISE-3**, which requires the ATS train to not exceed the levels specified in Section 2.2.1, Exterior Airborne Noise, ASCE 21-05 (American Society of Civil Engineers, Automated People Mover Standards - Part 2 Section 2.2.1, Exterior Airborne Noise, ASCE 21-05.). The design of the any barriers along the guideway designed to reduce noise shall be subject to the limited noted in **Table 4.10-9** above. Therefore, whether the Project implements steel-wheel rail technology or operates with a cable or pulley system, it would comply with maximum noise level requirements

##### Rubber-tired ATS Train Noise

As shown in **Table 4.10-23**, when compared to ambient conditions, daytime noise level increases from the rubber-tired ATS trains would range from 0.1 dBA Leq (Lday) at various sites to a high of 0.2 dBA Leq (Lday) at Site 1 (Residential uses to the west of N. Locust Street including the Holy Faith Episcopal Church, commercial uses to the east of N. Locust Street). Additionally, nighttime noise level increases would range from a low of 0.1 dBA Leq (Lnight) at Site K (commercial uses along Regent Street) to a high of 0.9 dBA Leq

#### 4.10 Noise

(Lnight) at Site 1. It is important to note that the majority of the noise monitoring locations identified are not predicted to experience any increase resulting from operation of the rubber-tired ATS trains. As such, operational noise levels would not result in increases of 3 dBA to or within the “normally unacceptable” or “clearly unacceptable” compatibility category for land uses or result in an increase of 10 dBA or greater when noise levels remain within acceptable limits.

##### Monorail Noise

As shown in **Table 4.10-23**, when compared to ambient conditions, daytime noise level increases from the monorail technology would range from a low of 0.1 dBA Leq (Lday) at various sites to a high of 0.5 dBA Leq (Lday) at the residential uses to the east of the Market Street/Florence Avenue Station (Site 1). Additionally, nighttime noise level increases would range from a low of 0.1 dBA Leq (Lnight) at various sites to a high of 1.8 dBA Leq (Lnight) at Site 1. However, similar to the rubber-tired ATS trains, the majority of locations monitored are not predicted to experience any increases resulting from operation of the monorail technology trains. As such, operational noise levels from the monorail technology would not result in increases of 3 dBA Leq to or within the “normally unacceptable” or “clearly unacceptable” compatibility category for land uses or result in an increase of 10 dBA or greater when noise levels remain within acceptable limits.

**Table 4.10-23**

Inglewood Transit Connector Project  
November 2021

### Stationary Source Noise

#### MSF Site Operations

The proposed MSF facility will be located on a site containing an existing retail commercial building at 500 E. Manchester Boulevard containing a Vons grocery store, a gym, a bank branch, and a gas station operated by Vons. The MSF is proposed on the eastern portion of this site and a new replacement Vons store, which would include amenities similar to the existing store will be built on the corner of Manchester Boulevard and Hillcrest Boulevard. A detailed description of the MSF is provided in **Section 3.0, 3.5.4: Maintenance and Storage Facility (MSF)**.

The MSF is a large facility (approximately 75,000 SF), spread out over considerable area with various noise levels and would be sized to accommodate the ATS train rolling stock and operating equipment. The MSF building would be elevated from ground level, with double height clearance over the maintenance tracks, and a largely unenclosed ground floor. The maintenance level for ATS train cars would be located on the second floor to match the guideway track elevation. The maintenance level will contain mezzanine administrative office space. The ground level would include multiple rows of columns and support beams for structural support.

The MSF site is bordered on three sides by residential and commercial uses across E. Hillcrest Boulevard, E. Spruce Avenue and E. Nutwood Street. In addition, there are commercial and residential uses to the east/northeast across Manchester Boulevard. Using the general assessment of FTA's Noise and Vibration Impacts Assessment Manual, reference noise levels for activities that would be associated with the MSF include 20 train movements during the peak hour for a typical maintenance and operations facility. The SoundPLAN noise propagation model was used to calculate area noise sources within the MSF and Vons site. The model accounts for multiple receiver points, resulting in varying impacts due to distance of each point and the location of any intervening existing structures that serve as shields or noise barriers. As shown in **Table 4.10-24: Modeled Operational Noise Levels**, operational noise level increases during the daytime would range from no change at the majority of the identified receptors listed below to a high of 2.1 dBA Leq (Lday) at Site I (residential uses along Spruce Ave across from the MSF). Taking into account the ambient environment, exterior noise levels during the daytime period at Site I would be 70.1 dBA. Increases in daytime noise levels would not exceed the 3 dBA Leq to or within the "normally unacceptable" or "clearly unacceptable" land use compatibility categories or result in an increase of 10 dBA or greater when noise levels remain within acceptable limits. Additionally, nighttime noise level increases would range from no change at the majority of the identified receptors listed below to a high of 3.9 dBA Leq (Lnight) at Site I. Taking into account the ambient environment, exterior noise levels during the nighttime period at Site I would be 62.4 dBA. Although nighttime noise levels would increase by more than 3 dBA Leq, nighttime noise levels would not result in an exterior environment that exceeds the "normally

unacceptable" or "clearly unacceptable" land use compatibility categories or result in an increase of 10 dBA or greater when noise levels remain within acceptable limits.

The MSF will be designed in accordance with the ITC Design Standards and Guidelines (Design Guidelines) which address the massing, façade, materials, colors, roof, and lighting for this facility, how the MSF will engage with the pedestrian and vehicular circulation around it, and sustainability features. Building elements would include screens to shield all exterior equipment including equipment at the rooftop and ground level, so that it is not visible from the street or accessible areas of adjacent properties.

Impacts related to stationary noise sources from the MSF would be less than significant.

**Table 4.10-24  
Modeled Operational Noise Levels**

Inglewood Transit Connector Project  
November 2021

### **PDS Substation Site Operations**

The proposed Project will include two PDS substations. The identified PDS substation locations are the proposed MSF site and the Prairie Avenue/Hardy Street station. Each PDS substation includes equipment to transform the medium- to high-voltage power feed provided from the power companies to the required 750-volt direct current (VDC) needed to power the vehicles and other ancillary equipment. A description of the PDS substations is provided in **Section 3.0, 3.5.5: Power Distribution System Substations**.

Noise from transformers and similar equipment at substations is usually a low-frequency (60 Hz) humming sound. Noise from fans and ventilation equipment at substation sites can also contribute to this source. Transformer noise will “transmit” and attenuate at different rates depending on the transformer size, voltage rating, and design. The substation would be the source of noise from what is termed corona discharge. Noise from corona discharge and similar electrical phenomena associated with high voltage transmission lines is heard as a cracking or hissing sound, which commonly varies with the humidity. While distinctive at a short distance, this noise is typically only about 40 to 50 dBA or less and would not be loud enough to cause a significant increase in noise levels at both the proposed MSF site and the Prairie Avenue/Hardy Street station. When taking into account the noise from the transmission line ranging from 40 to 50 dBA, this results in a maximum increase of 0.1 dBA Leq, which is technically considered not perceivable. With the concurrent operation of noise generated from the proposed MSF site and the Prairie Avenue/Hardy Street station, the noise levels generated by the transformers would be negligible. Additionally, as described previously, implementation of PDF NOISE-1 would require stationary noise source generated from mechanical equipment to be enclosed within a shed or barrier that would further reduce noise levels. Thus, the off-site PDS substations would result in a less than significant noise impact.

### **Backup Generators**

To assure the ability to allow ATS trains to reach the nearest stations to offload riders in the event of loss of electrical supply, each PDS substation will be equipped with backup power generators. The proposed Project would include up to two stationary standby generators, one at each of the two PDS substation sites, with an estimated total capacity rated at approximately 4,000 kilowatts (kW) to provide emergency power primarily for ATS train operation, lighting, and other emergency systems.

Community response to noise and vibration correlates with the frequency of events and, intuitively, more frequent events of low noise and vibration levels may evoke the same responses as fewer high vibration level events. This effect is accounted for in the ground-borne noise and vibration impact criteria by characterizing projects by frequency of events. According to the FTA *Transit Noise and Vibration Impact Assessment Manual*, frequent events are defined as more than 70 events per day and infrequent events are defined as fewer than 30 events per day. For maintenance purposes, each standby generator would be tested and operated for 2 hours per day during 24 days per year (twice a month) for a total of not more

than 50 hours per year. Each standby generator would be tested during different days; if needed for emergency operation, both generators would operate for up to 2 hours each and operation could occur simultaneously.

Reference noise levels for emergency generators from the SoundPLAN source library range from 60 dB to 75 dB at 10 meters (32.8 feet) from the source. Assuming the maximum emergency generator noise level of 75 dB, sensitive receptors within this distance without the use of shields or barriers would exceed the upper limit for the Normally Acceptable noise exposure to residential residences of 70 dBA. As mentioned previously, based on conventional standard point source noise-distance attenuation factors, noise levels would be reduced by a factor of 4.5 to 6.0 dBA for each doubling distance. Assuming the lowest end of the attenuation factor of 4.5 dBA per doubling distance, emergency generator noise levels within 100 feet would be reduced to 67.6 dBA, below the normally acceptable noise exposure for residential residences. Additionally, as described in the Design Guidelines, screens will be provided to shield all exterior equipment, so that it is not visible from the street or accessible areas of adjacent properties. These screens would act as barrier to further reduce noise levels from the emergency generator. A barrier can achieve a 5-dB noise level reduction when it is tall enough to break the line-of-sight to the receiver. As such, due to the infrequent use of the generator and the use of barriers for stationary noise sources, a less-than-significant noise impact is anticipated for the use of emergency generators.

### **Station Operation Noise**

The proposed Project includes three stations: at Market Street/Florence Avenue, Prairie Avenue/Manchester Boulevard and Prairie Avenue/Hardy Street. All platforms would be elevated at least 16 feet above ground level and would include three levels (street level, mezzanine level, and platform level); a typical station design is shown in **Figure 3.0-5**. Additional details of the stations are discussed in **Section 3.0, 3.5.3: Stations**. All three stations would include elevated passenger walkways with a height up to 65 feet measured from the existing grade to top of structure.

Moderate noise impacts from ATS train or monorail passbys have been analyzed along each of the guideway segments (Market Street, Manchester Boulevard and Prairie Avenue) including noise from the trains/monorails entering and exiting stations. The exterior noise level generated by the ATS trains, with all contributing noise sources in operation, would conform to **PDF NOISE-3** which provides noise levels specified in Section 2.2.1, Exterior Airborne Noise, ASCE 21-05 and not exceed the exterior noise standards set forth therein.<sup>69</sup> As such, the guideway would be designed to meet these noise levels and have noise

<sup>69</sup> American Society of Civil Engineers, Automated People Mover Standards - Part 2 Section 2.2.1, Exterior Airborne Noise, ASCE 21-05.

limiting barriers to limit train noise as noted in **Table 4.10-9** above as appropriate. The FTA noise limits for trains entering or leaving stations is 76 dBA.<sup>70</sup>

Furthermore, as shown in **Table 4.10-23** above, operation of the proposed Project would result in noise level increases from a low of 0.1 dBA Leq to a high of 1.8 dBA Leq for the monorail technology, which results in a higher increase when compared to the rubber-tired ATS trains. Additionally, exterior noise levels from the ATS trains would range from 37.6 dBA Leq (Lday) at Site A (commercial uses along Queen Street and Market Street) to a high of 54.8 dBA Leq (Lday) at Site K (residential uses along N. Locust Street). Additionally, nighttime noise levels from the ATS trains at the Market Street Station would range from a low of 36.7 dBA Leq (Lnight) at Site A to a high of 54.0 dBA Leq (Lnight) at Site K.

Noise from passengers that would use the elevated passenger walkways at all three stations would not be a substantial noise source in that the crossover would be elevated from the ground floor and removed from any adjacent buildings. In addition, the noise would be muffled by existing background noise from vehicle traffic from the surrounding streets.

The anticipated noise increase from operation of the stations would not result in an increase in noise level of 3 dBA to or within the “normally unacceptable” or “clearly unacceptable” land use compatibility categories or result in an increase of 10 dBA or greater when noise levels remain within acceptable limits.

#### **Composite Traffic and Proposed Project Noise**

As discussed previously, implementation of the proposed Project would result in changes to existing road traffic noise, transit noise, and noise from the MSF site. The combined noise of these Project noise sources is analyzed below

#### **Operation**

As discussed, and shown in **Appendix N.2-6**, operation of the proposed Project would not result in significant impacts related to noise from roadway traffic levels, resulting in maximum increases of 0.1 dBA; in some areas, noise would actually decrease. Additionally, as shown in **Table 4.10-23**, operation of the proposed Project would result in noise level increases from a low of 0.1 dBA Leq to a high of 1.8 dBA Leq for the monorail technologies, which results in a higher increase when compared to the rubber-tired ATS trains.

As shown in **Table 4.10-24**, anticipated noise levels from stationary sources from the proposed MSF would range from no increase to a high of 3.9 dBA Leq. Taking into account the ambient environment, exterior noise levels during the nighttime period at Site I would be 62.4 dBA Leq (Lnight). Although nighttime noise

<sup>70</sup> American Society of Civil Engineers, Automated People Mover Standards - Part 2 Section 2.2.1, Exterior Airborne Noise, ASCE 21-05.

levels would increase by more than 3 dBA Leq, nighttime noise levels would not result in an exterior environment that exceeds the “normally unacceptable” or “clearly unacceptable” land use compatibility categories or result in an increase of 10 dBA or greater when noise levels remain within acceptable limits.

**Table 4.10-25: Composite Operational Noise (Roadway, ATS Trains, and Stationary Sources)** presents the composite operational noise levels at each of the sensitive receptors. The impacts are indicative of the impacts that would be experienced taking into account the change in roadway noise levels, operation of the ATS trains and stationary noise from the proposed MSF site. As a result, impacts within each receptor group may vary depending on the distance of each receiver point within the specific receptor group and the location of any shielding or barriers.

As shown in **Table 4.10-25**, maximum composite noise level increases above ambient during the daytime period range from a low of 0.1 dBA Leq (Lday) to a high of 4.5 dBA Leq (Lday). Additionally, maximum composite noise level increases above ambient during the nighttime period from a low of 0.2 dBA Leq (Lnight) to a high of 5.8 dBA Leq (Lnight). Although exterior noise levels would increase by more than 3 dBA Leq during both the daytime and nighttime period, increases would not cause noise levels to be within the “normally unacceptable” or “clearly unacceptable” land use compatibility ranges for residential uses or result in an increase of 10 dBA or greater when noise levels remain within acceptable limits. Composite noise levels impacts would be less than significant.

4.10-107

Inglewood Transit Connector Project  
November 2021

### Mitigation Measures

Noise impacts from construction and operation of the Project would be less than significant and do not require any mitigation.

**Impact NOI-2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?**

### Construction

Construction activities can generate varying degrees of ground vibration, depending on the construction phase (e.g., site preparation, grading, etc.) and the type of construction equipment used. The operation of construction equipment generates vibrations that spread through the ground and diminish in amplitude with distance from the source. The effect on buildings located near the construction site often varies depending on soil type, ground strata, and construction characteristics of the receptor buildings. The results from vibration can range from no perceptible effects at the lowest vibration levels to low rumbling sounds and perceptible vibration at moderate levels.

Ground-borne vibration impacts due to proposed Project construction activities were evaluated by identifying potential vibration sources (i.e., construction equipment), estimating the vibration levels at potentially affected receptors, and comparing the proposed Project's vibration levels to the applicable vibration significance thresholds.

Vibration levels were calculated based on the FTA published standard vibration velocities for various construction equipment operations.<sup>71</sup> Vibration levels with regard to potential building damage are evaluated at the nearest off-site buildings to the Project area, whereas the potential for human annoyance associated with construction-related vibration are evaluated at the identified receptor locations. In addition, vibration impacts, in accordance with FTA and Caltrans guidance, are evaluated based on the maximum peak vibration levels generated by each type of construction equipment. This differs from the analysis of noise impacts which is based on the average/equivalent (Leq) levels, which are dependent on the total number of construction equipment operating during the analysis period (i.e., 1 hour).

### Construction Related Vibration Impacts from On-Site Activities

The proposed Project will involve the use of heavy equipment as discussed in the Construction Phasing Narrative (see **Appendix 3.0.4**). The anticipated construction equipment for on- and off site-construction activities and is shown in **Table 4.10-4**.

<sup>71</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, FTA Report No. 0123, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

**Off-Road On-Site Equipment:** Off-road construction equipment includes dozers, loaders, sweepers, and other heavy-duty construction equipment that is not licensed for travel on public highways.

**On-Road On-Site Equipment:** On-road on-site equipment includes shuttle vans transporting construction employees to and from the site(s), on-site pick-up trucks, crew vans, water trucks, dump trucks, haul trucks and other on road-road vehicles licensed to travel on public roadways.

**Table 4.10-26: Proposed Project Construction Related Vibration Impacts – Building Damage** presents the construction vibration impacts associated with construction in terms of building damage. As shown in **Table 4.10-26**, the forecasted vibration levels due to construction activities would exceed the building damage significance threshold of 0.2 PPV inches per second (ips) at the locations described below. These impacts are primarily caused by impact pile drivers located within 55 feet of the nearest receptor.

### Market Street and Market Street/Florence Avenue Station

- **Site 1** (Residential uses to the west of N. Locust Street including the Holy Faith Episcopal Church, commercial uses to the east of N. Locust Street) with an estimated vibration velocity level at the nearest off-site structures of 0.267 PPV ips;
- **Site A** (Commercial uses along E. Queen Street) with an estimated vibration velocity level at the nearest off-site structures of 0.318 PPV ips; and
- **Site K** (Commercial uses along E. Regent Street) with an estimated vibration velocity level at the nearest off-site structures of 0.228 PPV ips.

### Manchester Boulevard and MSF Site

- **Site B** (Residential uses on the northern portion of E. Manchester Boulevard, commercial uses on the southern portion of E. Manchester Boulevard) with an estimated vibration velocity level at the nearest off-site structures of 0.318 PPV ips; and
- **Site I** (Residential uses on the eastern portion of E. Spruce Avenue, commercial uses on the western portion of E. Spruce Avenue) with an estimated vibration velocity level at the nearest off-site structures of 0.228 PPV ips; and

### Prairie Avenue and Prairie Avenue/Manchester Boulevard and Prairie Avenue/Hardy Street Stations

- **Site 4** (Mixed-use residential along west side of Prairie Avenue) with an estimated vibration velocity level at the nearest off-site structures of 0.490 PPV ips;
- **Site C** (SoFi Stadium to the west of Prairie Avenue, commercial and lodging uses to the east of Prairie Avenue) with an estimated vibration velocity level at the nearest off-site structures of 0.318 PPV ips

Table 4.10-26

Refer to **Appendix N-5** for Construction Vibration Worksheets

Note: **Boldface type** indicates noise level in exceedance of the significance threshold.

As mentioned previously, as required by the CCP, a Community Affairs Liaison would be identified who would be responsible for responding within 24 hours to any local complaints about construction activities related to noise and vibration. Additionally, implementation of **PDF NOISE-2** would require preparation of a Construction Vibration Reduction Plan to ensure minimization of construction vibration at nearby sensitive receptors from vibration created by construction activities. The Construction Vibration Reduction Plan would require continuous monitoring and collection of vibration data to verify vibration levels are below the warning level PPV. In the event the regulatory levels of PPV are triggered, construction activities would halt to visually inspect sensitive buildings for damage. **PDF NOISE-2** also requires vibration-generating equipment to be located at specified distances from adjacent noise receptors. More specifically, to limit the risk of potential structural and building damage, **PDF NOISE-2** would limit the location of pile driving and vibratory roller activity to not be within 55 feet and 30 feet of the nearest off-site sensitive receptor, respectively. **PDF NOISE-2** would limit the number of jackhammers operating

simultaneously to one (1) piece operating within 45 feet of off-site sensitive receptors. Implementation of these construction management practices would limit the potential for impacts from construction vibration to result in building damage with adjusted distance of construction equipment. Impacts would be less than significant and below the significance threshold for building damage of 0.2 PPV IPS with implementation of **PDF NOISE-2**.

As shown in **Table 4.10-27: Proposed Project Construction Related Vibration Impacts—Human Annoyance**, without implementation of **PDF NOISE-2** the forecasted vibration levels from construction activities would exceed the human annoyance significance threshold of 72 PPV ips for various types of equipment at:

#### **Market Street and Market Street/Florence Avenue Station**

- **Site 1** (Residential uses to the west of N. Locust Street including the Holy Faith Episcopal Church, commercial uses to the east of N. Locust Street) with an estimated maximum vibration velocity level at the nearest off-site structures of 96 VdB.
- **Site A** (Commercial uses along E. Queen Street) with an estimated maximum vibration velocity level at the nearest off-site structures of 98 VdB.
- **Site K** (Commercial uses along E. Regent Street) with an estimated maximum vibration velocity level at the nearest off-site structures of 95 VdB.

#### **Manchester Boulevard and MSF Site**

- **Site 2** (Residential uses along E. Manchester Boulevard, Manchester Drive and S. Orange Avenue) with an estimated maximum vibration velocity level at the nearest off-site structures of 91 VdB.
- **Site B** (Residential uses on the northern portion of E. Manchester Boulevard, commercial uses on the southern portion of E. Manchester Boulevard) with an estimated maximum vibration velocity level at the nearest off-site structures of 98 VdB.
- **Site I** (Residential uses on the eastern portion of E. Spruce Avenue, commercial uses on the western portion of E. Spruce Avenue) with an estimated maximum vibration velocity level at the nearest off-site structures of 95 VdB.
- **Site J** (Commercial uses along E. Manchester Boulevard) with an estimated maximum vibration velocity level at the nearest off-site structures of 93 VdB.

#### **Prairie Avenue and Prairie Avenue/Manchester Boulevard and Prairie Avenue/Hardy Street Stations**

- **Site 3** (Residential uses along E. Nutwood Street, education facilities along Prairie Avenue) with an estimated maximum vibration velocity level at the nearest off-site structures of 82 VdB.

- **Site 4** (Mixed-use residential along west side of Prairie Avenue) with an estimated maximum vibration velocity level at the nearest off-site structures of 102 VdB.
- **Site 5** (Lodging uses on the southern portion of W. Century Boulevard) with an estimated maximum vibration velocity level at the nearest off-site structures of 90 VdB.
- **Site C** (SoFi Stadium to the west of Prairie Avenue, commercial and lodging uses to the east of Prairie Avenue) with an estimated maximum vibration velocity level at the nearest off-site structures of 98 VdB.
- **Site F** (Multifamily residential uses along E. Hardy Street) with an estimated maximum vibration velocity level at the nearest off-site structures of 82 VdB.
- **Site G** (Residential uses along E. Arbor Vitae Street) with an estimated maximum vibration velocity level at the nearest off-site structures of 77 VdB.

Table 4.10-27

Proposed Project Construction Related Vibration Impacts – Human Annoyance

Nearest Off-Site Building Structures	Estimated Vibration Velocity Levels at the Nearest Off-Site Structures from Proposed Project Construction Equipment							Significance Threshold (VdB)	Significant Impacts?

Source: US Department of Transportation, Federal Transportation Authority, Transit Noise and Vibration Impact Assessment  
 Refer to **Appendix N-5** for Construction Vibration Worksheets  
 Note: **Boldface type** indicates noise level in exceedance of the significance threshold.

The sites that exceed the human annoyance significance threshold of 72 PPV ips for forecasted vibration

levels due to construction activities from heavy equipment would range from 73 PPV ips for large dozers and drilling equipment at Site 5 (lodging uses on the southern portion of W. Century Boulevard) to 102 PPV ips for piles drivers at Site 4 (mixed-use residential along west side of Prairie Avenue).

As mentioned previously, the CCP includes the designation of a Community Affairs Liaison who would be responsible for responding within 24 hours to any complaints about construction activities related to noise and vibration. Additionally, implementation of **PDF NOISE-2** would require preparation of a Construction Vibration Reduction Plan to ensure minimization of construction vibration at nearby sensitive receptors from vibration created by construction activities. The Construction Vibration Reduction Plan would require continuous monitoring and collection of vibration data to verify vibration levels are below the warning level PPV. In the event the regulatory levels of PPV are triggered, construction activities would halt to visually inspect sensitive buildings for damage. Additionally, **PDF NOISE-2** would require vibration-generating equipment to be located at specified distances from adjacent noise receptors.

**Table 4.10-28: Proposed Project Construction Related Vibration Impacts (PDF NOISE-2) – Human Annoyance** implements **PDF NOISE-2** and provides the adjusted distances required to reduce vibration to below the perceptible levels of 72 VdB. As shown, impacts related to construction vibration impacts to human annoyance with adjusted distance of construction equipment would be less than significant with implementation of **PDF NOISE-2**.

Table 4.10-28

Proposed Project Construction Related Vibration Impacts (PDF NOISE-2) – Human Annoyance

Equipment	Without PDF NOISE-2		With PDF NOISE-2		Exceeds Significance Threshold of 72 VdB?
	Distance (feet)	Estimated Vibration Velocity Levels (PPV ips)	Distance (feet)	Estimated Vibration Velocity Levels (PPV ips)	
Pile Driver (impact)	25	104	310	71	No
Vibratory Roller	25	94	150	71	No
Large Bulldozer	25	87	85	71	No
Caisson Drilling	25	87	85	71	No
Loaded Trucks	25	86	75	71	No
Jackhammer	25	79	45	71	No
Small bulldozer	25	58	25	58	No

### Construction Haul Route Related Vibration Impacts

In addition to on-site construction activities, construction delivery/haul trucks would generate ground-borne vibration as they travel along the proposed Project's anticipated off-site truck travel routes. Based on FTA data,<sup>72</sup> the vibration generated by a typical heavy-duty truck would be approximately 63 VdB (0.00566 PPV) at a distance of 50 feet from the truck.

Existing buildings along the proposed Project's anticipated off-site truck travel routes (Florence Avenue, Manchester Boulevard, Prairie Avenue, and Century Boulevard) that are situated approximately 35 feet from the truck travel pathway would be exposed to ground-borne vibration levels of approximately 0.01 PPV. This forecasted vibration level would be below the most stringent building damage criteria of 0.12 PPV.<sup>73</sup> Therefore, vibration impacts with respect to building damage from off-site construction truck travel on public roadways would be less than significant.

In addition, vibration sensitive uses (e.g., residential, hotel uses) are located along Florence Avenue, Manchester Boulevard, Prairie Avenue, and Century Boulevard. Ground-borne vibration levels generated by proposed Project off-site construction truck travel would be below the FTA 72 VdB significance threshold,<sup>74</sup> as these uses are located more than 25 feet from the truck travel pathway. Therefore, vibration impacts with respect to human annoyance from off-site construction truck travel would be less than significant for the vibration sensitive land uses located along these roadways.

### Operation

The condition of the rails, type of guideway construction, other proposed Project components, and the mass and stiffness of the guideway structure would have an influence on the level of ground-borne vibration. Jointed rail, worn rail, and wheel impacts at special track work can all cause substantial increases in ground-borne vibration. It is rare for ground-borne vibration to be a problem with elevated railways except when guideway supports are located within 50 feet of buildings.<sup>75</sup> For rubber-tired ATS trains, the smoothness of the roadway/guideway is the critical factor; if the surface is smooth, vibration problems are unlikely.

<sup>72</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, FTA Report No. 0123, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

<sup>73</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, FTA Report No. 0123, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

<sup>74</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, FTA Report No. 0123, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

<sup>75</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

The vibration sensitive land uses nearest to the guideway include commercial and residential uses along Market Street, Manchester Boulevard and Prairie Avenue which would be approximately 30 feet from the guideway centerline. Based on the adjusted vibration level curve, the estimated ground-borne vibration levels would be approximately 67 VdB for monorail trains (rapid transit or light rail vehicles) and 64 VdB for rubber-tired ATS trains. Consequently, the maximum vibration level of the uses along the guideway would be below the FTA recommended maximum acceptable level threshold of 72 VdB.<sup>76</sup>

As such, transit-related ground-borne vibration for rubber-tired ATS train vehicles would be less than significant.

### Mitigation Measures

Vibration impacts from construction and operation of the Project would be less than significant and do not require any mitigation.

## 4.10.9 CUMULATIVE IMPACTS

The analysis of changes to the community noise environment based on cumulative conditions considers development of the proposed Project in combination with ambient growth and other development projects located near the Project area. The potential for cumulative noise impacts is primarily related to the distance between each related project's stationary noise sources, as well as both the presence of existing structures in the Project area and the cumulative traffic that the cumulative development would add to the surrounding roadway network. As discussed in **Section 4.0, 4.0.6: Cumulative Scenario**, there are 74 cumulative projects within the City.

### 4.10.9.1 Noise

#### Construction

##### Equipment Noise

Noise from the construction of development projects is typically localized and has the potential to affect noise-sensitive uses within 500 feet of the construction site. Thus, noise from construction activities for two projects within 1,000 feet of each other can contribute to a cumulative noise impact for receptors located midway between the two construction sites. The cumulative projects located within 1,000 feet of the Project area are Project Nos. 7, 8, 20, 30, 35, 44, 37, 48, 60, and 73.

As shown in **Table 4.10-15** through **4.10-21**, construction noise impacts would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period

<sup>76</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, FTA Report No. 0123, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

for residential uses and 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses. The timing of the construction activities for cumulative projects cannot be defined, as Projects would be required to obtain a permit if nighttime construction is proposed. Therefore, any quantitative analysis of those projects to assume concurrent construction during the nighttime period would be entirely speculative. Should construction activities during the nighttime period of any phase of construction occur concurrently with construction of the cumulative projects, it could reasonably be assumed that cumulative projects would implement noise reduction features and mitigation measures to lessen to the extent feasible potential noise impacts from construction. Therefore, the cumulative construction equipment noise impact would be less than significant.

#### Off-Site Construction Noise

In terms of off-site construction-related noise, the location of the cumulative projects suggests that off-site construction truck travel associated with the related projects would occur along portions of the same travel routes as those anticipated to be used by the proposed Project's off-site construction trucks.

As mentioned previously, the primary delivery and haul routes proposed during construction of the proposed Project would utilize Florence Avenue, Manchester Boulevard, Prairie Avenue, and Century Boulevard, which have been designated by the City as appropriate for heavy truck use. Should use of the same designated haul routes by any of the cumulative projects overlap with use of those haul routes during the same period, traffic volumes could potentially increase such that the resulting cumulative noise increase due to construction traffic along the haul routes would exceed 3 dBA over ambient noise levels at noise-sensitive receptors along those routes. However, similar to the proposed Project, related projects would likely designate construction routes to freeway and major arterials, avoiding minor arterials.

As mentioned previously, it takes a doubling of traffic volumes (100 percent increase) in order to increase traffic noise levels by 3 dBA. As compared to adjusted baseline average daily traffic volumes along the roadways mentioned above, the sound power generated by the maximum anticipated number of construction trucks would not be equivalent or greater to a doubling of the maximum ADT along West Century Boulevard, Manchester Boulevard or South Prairie Avenue. In combination with the cumulative projects within 1,000 feet, construction-related traffic would not result in a double or tripling of existing daily traffic volumes on streets around the proposed Project. As such, the cumulative exceedances of related project construction truck traffic would not be considered cumulative considerable. Therefore, cumulative impacts associated with off-site construction noise would not be cumulatively considerable and would be less than significant.

## Operation

### Roadway Noise

Noise and vibration for the six operational scenarios was based on VMTs with and without the proposed Project. The Opening Year (2027) and Future Horizon Year (2045) scenarios include the development of the related projects identified in **Section 4.0, 4.0.6**. In addition, the Transportation Study (see **Appendix O**) used the SCAG 2020–2045 RTP/SCS<sup>77</sup> socio-economic data (SED) for base year (2016) and Future baseline (2045) constrained conditions were utilized as the basis for developing the socio-economic data for use with the Inglewood Travel Demand Forecast (TDF) model. Updates to the socioeconomic data include those associated with known related projects from various cities and adjacent jurisdictions. Opening year (2027) SED database was used for the Inglewood TDF developed using interpolation of the 2016 and 2045 databases from SCAG 2020–2045 RTP/SCS data updated for related projects. Therefore, the Opening Year (2027) and Future Horizon Year (2045) scenarios account for the growth associated with related project and future growth as provided by SCAG.

As detailed in **Appendix N.2-6**, roadway noise levels from Opening Year (2027) Conditions With NFL Event With and Without ITC Project would result in a decrease in noise due to removal and redistribution of trips as designed by the Project. Therefore, the roadway noise level during the daytime or nighttime periods would not exceed the threshold of significance of an increase in noise level of 3 dBA Leq to or within the “normally unacceptable” or “clearly unacceptable” land use compatibility categories or result in an increase of 10 dBA when noise levels remain within acceptable limits.

As detailed in **Appendix N.2-6**, roadway noise levels from Future Horizon Year (2045) With NFL Event With and Without ITC Project would result in a decrease in noise due to removal and redistribution of trips as designed by the Project. Therefore, the roadway noise level during the daytime or nighttime periods would not exceed the threshold of significance of an increase in noise level of 3 dBA Leq to or within the “normally unacceptable” or “clearly unacceptable” land use compatibility categories or result in an increase of 10 dBA when noise levels remain within acceptable limits.

Therefore, noise impacts resulting from the proposed Project related to traffic generated noise for both the Opening Year (2027) and Future Horizon Year (2045) with NFL Event With ITC Project are less than significant and would not be cumulatively considerable.

<sup>77</sup> Southern California Association of Governments (SCAG), Connect SoCal: 2020-2045 Regional Transportation Plan/Sustainable Communities Strategies Draft, “Chapter 1,” <https://www.connectsocial.org/Pages/Connect-SoCal-Draft-Plan.aspx>, accessed on September 2021.

#### 4.10.9.2 Vibration

##### Construction

Cumulative development in the Project vicinity may result in the exposure of people to or the generation of excessive ground-borne vibration. The nearest cumulative project is located at 101, 125, 139, 140, and 150 Market Street (Project No. 30) located approximately 100 feet from the proposed guideway. As shown in **Table 4.10-25** above, construction vibration impacts to building damage would occur with impact pile drivers located within 55 feet of the nearest receptor. Should construction of Project No. 30 overlap with the proposed Project, impacts to vibration sensitive receptors would be potentially significant.

As previously discussed for vibration, the forecasted vibration levels due to construction vibration velocities would exceed the structural damage threshold of 0.2 in/sec PPV at certain sensitive receptors during various construction phases.

**Table 4.10-26** shows the forecasted vibration levels due to construction activities would exceed the building damage significance threshold at certain locations along the proposed Project. Additionally, **Table 4.10-27** shows the forecasted vibration levels due to construction activities would exceed human annoyance significance thresholds. The CCP would provide a community affairs liaison to investigate noise disturbance and undertake all feasible measures are implemented to reduce construction vibration levels as deemed appropriate. Implementation of **PDF-Noise-2** would require a preparation of a Construction Vibration Reduction Plan to ensure minimization of construction vibration at nearby sensitive receptors from vibration created by construction activities. Additionally, **PDF-Noise-2** would require vibration-generating equipment to be located at specified distances from adjacent noise receptors.

**Table 4.10-28** provides the adjusted distances required to reduce vibration to below the perceptible levels of 72 VdB. Additionally, there are no vibration-sensitive receptors that would be adjacent to both the proposed Project and Project No. 30, as the area mostly consists of commercial uses. Therefore, Proposed Project impacts would not be affected by cumulative project construction activity. Cumulative impacts related to construction vibration would be less than significant.

##### Operation

Cumulative noise impacts attributable to stationary sources that operate on a daily basis occur when these sources are located in relative proximity to one another. The cumulative projects located in the proximity to the Project area mentioned above generally consist of residential, retail, or other types of commercial uses. These types of uses are not typically associated with excessive exterior stationary source noise. Noise levels from stationary sources within each cumulative project development site would also be reduced to less-than-significant levels at the property line due to IMC requirements limiting noise from stationary sources, such as Section 5-39.

Additionally, the vibration sensitive land uses nearest to the guideway include commercial and residential uses along Market Street, Manchester Boulevard and Prairie Avenue which would be approximately 30 feet from the guideway centerline. Based on the adjusted vibration level curve, the estimated ground-borne vibration levels would be approximately 67 VdB for monorail trains (rapid transit or light rail vehicles) and 64 VdB for rubber-tired ATS trains. Consequently, the maximum vibration level of the uses along the guideway would be below the FTA recommended maximum acceptable level threshold of 72 VdB.<sup>78</sup> As such, transit-related ground-borne vibration for rubber-tired ATS train vehicles would be less than significant.

The proposed Project would not increase vibration in the area; as such impacts are considered less than significant. When combined with other related project within the immediate area (see **Section 4.0, 4.0.6**) the effects of vibration would not be cumulatively considerable.

#### 4.10.10 CONSISTENCY WITH CITY OF INGLEWOOD GENERAL PLAN

##### Noise Element

The proposed Project is consistent with goals listed in the Noise Element as discussed below:

**Goal 1:** *Provide for the reduction of noise where the noise environment represents a threat to public health and welfare. In those areas where the environment represents a threat to the public health and welfare, it is the objective of the City to reduce environmental hazards to levels consistent with the protection of the public health and welfare.*

**Consistent.** As discussed in **Table 4.10-15** through **4.10-22**, construction noise levels would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period for residential uses and below 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses. Additionally, the CCP includes various noise reduction strategies for construction, which integrates several features to further reduce noise levels. The CCP is meant to proactively address potential effects of the construction of the Project on the community, to protect and maintain acceptable limits and prevent degradation of the environment. For these reasons, construction noise would be consistent with Goal 1.

**Goal 3:** *Protect and maintain those areas having acceptable noise environments. In those areas where a quality environment now exists, it is the objective of the City to prevent degradation of that environment.*

**Consistent.** As discussed in **Table 4.10-15** through **4.10-22**, construction noise levels would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and

<sup>78</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, FTA Report No. 0123, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

#### 4.10 Noise

80 dBA (Leq-1hour) during the nighttime period for residential uses and below 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses. Additionally, the CCP includes various noise reduction strategies for construction, which integrates several features to further reduce noise levels. The CCP is meant to proactively address potential effects of the construction of the Project on the community, to protect and maintain acceptable limits and prevent degradation of the environment. For these reasons, construction noise would be consistent with Goal 3.

**Goal 4:** *Provide sufficient information concerning the community noise levels so that noise can be objectively considered in land use planning decisions. Noise and land use compatibilities can be avoided for new developments when noise is properly considered in the planning and design of the project. It is the objective of the City to prevent future land use and noise conflicts through the planning process.*

**Consistent.** As shown in **Table 4.10-23**, operational noise levels from either the Rubber-tired ATS Train or monorail would not result in increase of 3 dBA to or within the “normally unacceptable” or “clearly unacceptable” compatibility category for land uses. Consistent with Goal 4, the proposed Project would not result in noise conflicts concerning community noise levels.

#### Environmental Justice Element

The proposed Project is consistent with goals listed in the Environmental Justice Element as discussed below:

**Policy EJ-2.11:** *Continue to enforce the City's Noise Ordinance to ensure compliance with noise standards.*

**Consistent.** As discussed in **Table 4.10-15** through **4.10-22**, construction noise levels would be below the FTA criteria threshold of 90 dBA (Leq-1hour) during the daytime and 80 dBA (Leq-1hour) during the nighttime period for residential uses and below 100 dBA (Leq-1hour) during the daytime and nighttime periods for commercial and industrial uses. Additionally, the CCP includes various noise reduction strategies for construction, which integrates several features to further reduce noise levels. The CCP is meant to proactively address potential effects of the construction of the Project on the community, to protect and maintain acceptable limits and prevent degradation of the environment. For these reasons, construction noise would be consistent with Policy EJ-2.11.

## 4.11 POPULATION, EMPLOYMENT, AND HOUSING

### 4.11.1 INTRODUCTION

This section of the Draft Recirculated Environmental Impact Report (Recirculated Draft EIR) evaluates the potential effects of the Inglewood Transit Connector Project (proposed Project) on population, housing, and employment conditions. This section identifies and describes existing and projected levels of population, employment, and housing in the City of Inglewood (City) and analyzes the effects that would be caused by development of the proposed Project. The existing and projected population, employment data, and housing stock as well as a description of the methodology and framework guide the evaluation of the proposed Project's potential population, housing, and employment impact.

The Revised Initial Study (included in **Appendix A.2** of this Recirculated Draft EIR) prepared prior to the preparation of the December 2020 Draft EIR utilizes the California Environmental Quality Act (CEQA) Environmental Checklist to assess the Project's potential environmental impacts associated with population, employment, and housing. For one of these screening thresholds, the Revised Initial Study concluded the proposed Project would have a “Less than Significant Impact;” thus, no further analyses of this topic was required in an EIR. The following impact does not require any additional analysis in this Recirculated Draft EIR:

- Potential impacts related to displacement of housing which would necessitate the construction of replacement housing elsewhere. Development of the proposed Project would not require the removal of existing or proposed housing uses.

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the proposed Project in response to consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. Specific changes to the proposed Project include raising the height of the ATS guideway along Market Street to preserve existing views of historic buildings, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue. As it relates to employment impacts, these changes resulted in fewer jobs displaced due to the proposed Project compared to the December 2020 Draft EIR.

These changes to the design of the proposed Project do not create the potential for significant impacts related to the impacts above. The revised proposed Project would result in additional property acquisitions that would require demolition prior to construction of the proposed Project. Additionally, the revised proposed Project would include a Vons store replacement which would be developed prior to construction of the proposed Project. These changes would not alter the level of significance for the impact discussed above.

Impacts related to population, employment, and housing found to be less than significant are further discussed in **Section 6.3: Effects Found Not to Be Significant**.

Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Recirculated Draft EIR.

#### 4.11.2 OVERVIEW OF POPULATION, EMPLOYMENT, AND HOUSING

The proposed Project is located within the Southern California Association of Governments (SCAG) region which includes six counties. With more than 19 million in population, 6 million in households, and 8 million jobs, the SCAG region is the nation's largest metropolitan planning organization.<sup>1</sup> In line with national trends, annual population growth in the SCAG region has slowed and is anticipated to continue slowing from an annual growth rate of about 0.85 percent in 2020 to 0.45 percent by 2045. The decrease in annual population growth rate is driven by a combination of several factors: 1) women are having fewer children and are doing so at a later age, leading to a decline in fertility, 2) high housing costs, 3) an aging population, and 4) a decrease in net-migration.

The employment landscape in the region has followed a “boom and bust” cycle that is in line with the employment trends in Southern California. This trend is exemplified by the growth in housing development in the 2000s and the following bust starting in 2008 in the housing construction and service sectors. Despite this, the SCAG region has shown great resilience as the number of jobs in the region continues to grow overall. In 2019, there were approximately 8.7 million jobs in the region and every county in the region has experienced a net increase in jobs between the years 2000 and 2019.<sup>2</sup>

Housing in the SCAG region has traditionally followed the trend of lower-density development, which has occurred farther from employment-rich areas, increasing congestion, automobile dependency, leapfrog development and air pollution, and limiting the effectiveness of public transit. This trend has been shifting with a push-and-pull between new single-family development in traditionally suburban or formerly rural areas and multi-family residential developments in higher-density communities. A continued need for housing development is clear from the region's population trend as an additional 930,000 people moved into Southern California from 2006 to 2016.

<sup>2</sup> SCAG. *Certified Final Connect SoCal PEIR*. [https://www.connectsocial.org/Documents/PEIR/draft/dPEIR\\_ConnectSoCal\\_3\\_14\\_PopulationHousing.pdf](https://www.connectsocial.org/Documents/PEIR/draft/dPEIR_ConnectSoCal_3_14_PopulationHousing.pdf). Accessed September 2, 2021.

#### 4.11.3 METHODOLOGY

The following analysis is based on information on construction and operation of the proposed Project and information on City population, employment, and housing data and characteristics. Sources of information for population-, employment-, and housing-related estimates include the City General Plan and Housing Element,<sup>3</sup> Southern California Association of Governments' (SCAG) 2019 Local Profiles (SCAG 2019 Local Profiles),<sup>4</sup> SCAG's 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (SCAG 2020–2045 RTP/SCS),<sup>5</sup> and SCAG's 6th Cycle Regional Housing Needs Allocation (6th Cycle RHNA).<sup>6</sup>

The information contained in this section is used as a basis for analysis of project and cumulative impacts. However, changes in population and housing, in and of themselves, are social and economic effects and under CEQA are not physical effects on the environment. CEQA provides that economic or social effects are not considered significant effects on the environment unless the social and/or economic effects are connected to physical environmental effects. A social or economic change related to a physical change may serve as a linkage between the proposed Project and a physical environmental effect or may be considered in determining whether the physical change is significant.<sup>7</sup> The direction for treatment of economic and social effects is stated in CEQA Guidelines section 15131(a):

*Economic or social effects of a project shall not be treated as significant effects on the environment. An EIR may trace a chain of cause and effect from a proposed decision on a project through anticipated economic or social changes resulting from the project to physical changes caused in turn by the economic or social changes. The intermediate economic or social changes need not be analyzed in any detail greater than necessary to trace the chain of cause and effect. The focus of the analysis shall be on physical changes.<sup>8</sup>*

#### 4.11.4 REGULATORY FRAMEWORK

##### 4.11.4.1 State Regulations and Directives

###### *California Housing Element Requirement*

California law requires cities and counties to include a housing element as one of the nine State-mandated elements of the General Plan.<sup>9</sup> The housing element must address housing conditions and housing needs

<sup>3</sup> City of Inglewood, *Housing Element 2013-2021*, <https://www.cityofinglewood.org/DocumentCenter/View/127/2013-2021-Housing-Element-Adopted-January-28-2014-PDF>. Accessed September 2, 2021.

<sup>4</sup> SCAG. *2019 Local Profiles*. <https://www.scag.ca.gov/Documents/Inglewood.pdf>. Accessed September 2, 2021.

<sup>5</sup> SCAG. *Adopted Final Connect SoCal*. <https://connectsocial.org/Pages/Connect-SoCal-Final-Plan.aspx>. Accessed September 2, 2021.

<sup>7</sup> CEQA Guidelines section 15382.

<sup>8</sup> CEQA Guidelines section 15131(a).

<sup>9</sup> Government Code Section 65580, et seq.

in the community. Cities and counties are required to update their housing elements every 8 years following the implementation of SB 375.<sup>10</sup> The housing element must identify and analyze existing and projected housing needs and “make adequate provision for the existing and projected needs of all economic segments of the community,” among other requirements. The City’s Housing Element was updated on January 28, 2014.<sup>11</sup>

### **California Relocation Assistance**

California Government Code Sections 7260-7277 establish a uniform policy for fair and equitable treatment of people or businesses displaced as a direct result of programs or projects undertaken by a public entity.<sup>12</sup> The primary purpose is to ensure that these persons shall not suffer disproportionate injuries as a result of programs and projects designed for the benefit of the public and to minimize the hardship of those displaced.

#### **4.11.4.2 Regional Regulations and Directives**

##### **Regional Housing Needs Assessment**

The Regional Housing Needs Assessment (RHNA) is mandated as part of the periodic process of updating local housing elements of the General Plan. The RHNA quantifies the need for housing within each jurisdiction during specified planning periods. The current planning period, 2021 to 2029, is considered the 6th RHNA Planning Cycle. Local jurisdictions received the draft RHNA Allocations on September 4th, 2020.<sup>13</sup> The City is planning to approve an updated Housing Element before March 2022 to account for the SCAG 6th Cycle RHNA projections as amended by the adoption of SB 375 in 2008.<sup>14</sup> Jurisdictions have until October 15, 2021, to submit housing elements to the HCD. The City’s Housing Element 2021–2029 is currently pending submittal to HCD for approval.

Communities use the RHNA numbers in land use planning, prioritizing local allocation, and in deciding how to address identified existing and future housing needs resulting from population, employment, and housing growth. The RHNA does not encourage or promote growth, but rather is designed to enable communities to anticipate growth, so that collectively the region and sub-region can grow in ways that enhance quality of life, improve access to jobs, promotes transportation mobility, and addresses social equity and fair share housing needs.

### **SCAG 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy**

SCAG’s Regional Council adopted the 2020–2045 RTP/SCS<sup>15</sup> on September 3rd, 2020. The 2020–2045 RTP/SCS was adopted as part of SCAG’s planning obligations. The 2020–2045 RTP/SCS is a long-range visioning plan that serves as an important planning document for the region that balances future mobility and housing needs with economic, environmental, and public health goals. The plan charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The 2020–2045 RTP/SCS includes land use policies to guide the region’s development, including planning for additional housing and jobs near transit, and planning for changing demand in types of housing. Analysis for housing needs in the region as a whole and in individual cities is also completed as part of the metropolitan planning organization’s obligation under the State mandate. One goal of the 2020–2045 RTP/SCS is to encourage land use and growth patterns that facilitate transit and active transportation.

SCAG is working with Los Angeles County Metropolitan Transportation Authority (Metro) and the City to ensure inclusion of the ITC project in SCAG’s Federal Transportation Improvement Program (FTIP), which would be subsequently included in the Federal Statewide Improvement Program (FSTIP).

#### **4.11.4.3 Local Regulations and Directives**

##### **City General Plan**

The City General Plan is a comprehensive policy document that sets forth goals, objectives, and policies for the future development of the City. The General Plan also designates the location of desired future land uses within the City. A summary of the General Plan Elements is provided under **Section 4.9: Land Use and Planning**. Goals, objectives, and policies of the City’s General Plan Housing and Land Use Elements are applicable to this Population, Employment, and Housing section of the Recirculated Draft EIR and is outlined as follows:

##### **Housing Element**

The City General Plan Housing Element 2013–2021<sup>16</sup> covering the 5th cycle of RHNA was adopted on January 28, 2014. The Housing Element presents a framework upon which the City can implement a comprehensive housing program to provide its residents with decent and affordable housing.

15 SCAG. *Adopted Final Connect SoCal*. <https://www.connectsocial.org/Pages/Connect-SoCal-Final-Plan.aspx>. Accessed September 2, 2021.

16 City of Inglewood. *Housing Element 2013-2021*. <https://www.cityofinglewood.org/DocumentCenter/View/127/2013-2021-Housing-Element-Adopted-January-28-2014-PDF>. Accessed September 2, 2021.

#### 4.11 Population, Employment, and Housing

The program established policies to create and preserve quality residential neighborhoods along with establishing policies and programs to mitigate housing shortages.

The Housing Element established the following goals for housing which are applicable to the proposed Project:

- Goal 2:** Maintain the existing housing stock and neighborhoods by promoting the maintenance, rehabilitation, modernization, and energy efficient upgrades of existing housing as well as the beautification and security of residential neighborhoods.
- Goal 3:** Encourage the Production and Preservation of Housing for All Income Categories, particularly around high-quality transit, including workers in the City that provide goods and services.
- Goal 7:** Encourage Energy Efficiency and Greenhouse Gas Reductions.

#### Land Use Element

The City's Land Use Element<sup>17</sup> was adopted in 1980 and subsequently amended in 1986, 2009, 2016, and 2020. Applicable Land Use goals for the Population, Employment, and Housing section are as follows:

##### General

- Goal:** Help promote sound economic development and increase employment opportunities for the City's residents by responding to changing economic conditions.
- Goal:** Develop a land use element that facilitates the efficient use of land for conservation, development, and redevelopment.
- Goal:** Promote Inglewood's image and identify as an independent community within the Los Angeles Metropolitan area.

##### Commercial

- Goal:** Create and maintain a healthy economic condition within the present business community and assist new business to located within the City.
- Goal:** Protect local businessmen and encourage the importance of maintaining a strong commercial district in the downtown.
- Goal:** Promote the development of commercial/recreational uses which would complement those which already are located in Inglewood.

<sup>17</sup> City of Inglewood. *Land Use Element*. <https://www.cityofinglewood.org/DocumentCenter/View/132/Land-Use-Element-1980-Amended-1986-2009-2016-PDF>. Accessed September 7, 2021.

#### 4.11 Population, Employment, and Housing

#### Downtown Transit Oriented District

- Goal 1:** Downtown is a place to live, work, shop, recreate, and be entertained.
- Goal 3:** Downtown provides a unique mix of accessibility options including light rail, pedestrians, bicycles, autos, buses, and advanced technology local transit.
- Goal 4:** Downtown is a major economic engine providing jobs, sales tax, and other revenues.
- Goal 5:** Downtown is a model for sustainable development.

#### Environmental Justice Element

The City's Environmental Justice Element<sup>18</sup> was adopted on June 30, 2020. Applicable Environmental Justice goals for the Population, Employment, and Housing section are as follows:

- Goal:** The community's exposure to pollution in the environment is minimized through sound planning and public decision making.
- Goal:** Adequate and equitably distributed public facilities are available in the community.

### 4.11.5 EXISTING CONDITIONS

#### 4.11.5.1 Existing Setting

##### Population

The City is located in Los Angeles County (County) and became an incorporated City on February 8th, 1908, with a population of 1,200.<sup>19</sup> The City has continued to expand and develop to reach an estimated population of 113,559 in 2018.<sup>20</sup> The City's population has stabilized over recent years. According to SCAG's 2019 Local Profile's report the net increase in population from 2000 to 2018 was approximately 979 and the SCAG 2020–2045 RTP/SCS growth forecast estimates the City's population to increase to 137,100 by 2045. With over 19 million people in the region as of January 2019, the SCAG region is the nation's second-largest combined statistical area<sup>21</sup> in the nation. The population growth trend within the larger SCAG region has averaged approximately 0.82 percent per year from 2000 to 2016, which is about

<sup>18</sup> City of Inglewood. *Environmental Justice Element*. <https://www.cityofinglewood.org/DocumentCenter/View/14211/Environmental-Justice-Element#:~:text=The%20Inglewood%20General%20Plan%20Environmental,City%2C%20particularly%20for%20disadvantaged%20communities>. half of the 1.65 percent annual population growth rate of the region from 1970 to 2000. This decrease in population growth rate is expected to continue with 2016 to 2045 averaging 0.61 percent annual population growth rate.<sup>22</sup> The City is one of 191 cities in the SCAG region and resides within one of the six counties within the metropolitan planning organization (MPO).<sup>23</sup>

**Table 4.11-1: Population Growth in the City** summarizes the population trends for the City from 2000 to 2018, including growth forecast for 2040 and 2045. According to SCAG, forecasted population growth for the City would be approximately 20 percent between 2016 and 2045.

### Housing

Similar to the population trend in the City, the number of households in the City stayed relatively stable throughout the 2000s, with a net increase of 213 units in the number of households from 2000 to 2018. The increase accounts for an approximately 0.6 percent net increase during the 2000 to 2018 time period. The household numbers reached 37,018 households in 2018.<sup>24</sup>

The SCAG region that includes the proposed Project is expecting to add 1.6 million households between the years 2016 to 2045.

**Table 4.11-2: Number of Households in the City** summarizes the number of households trend from the year 2000 and includes forecast data from the 2020–2045 RTP/SCS for the number of projected households in 2045.<sup>25</sup> According to SCAG, forecasted housing growth for the City would be approximately 27 percent between 2016 and 2045.

22 SCAG. 2020-2045 Connect SoCal Demographics And Growth Forecast. [https://www.connectsocial.org/Documents/Draft/dConnectSoCal\\_Demographics-And-Growth-Forecast.pdf](https://www.connectsocial.org/Documents/Draft/dConnectSoCal_Demographics-And-Growth-Forecast.pdf). Accessed September 7, 2021.

The RHNA is another source for predicting housing growth in a region. According to SCAG's 6th cycle RHNA numbers, the City must provide plans for a total of 7,439 units from the years 2021 to 2029. The total housing unit requirement includes 1,813 units for very-low income, 955 units for low income, 1,112 units for moderate income, and 3,559 units for above moderate income.<sup>26</sup>

### Employment

As of 2017, the City had an estimated 34,962.<sup>27</sup> This number includes wage and salary jobs and jobs held by business owners and self-employed persons and excludes unpaid volunteers, family workers, and private household workers.

Employment trend in the City can be found in **Table 4.11-3: Number of Jobs in the City**. According to SCAG, forecasted employment growth for the City would be approximately 36 percent between 2016 and 2045.

**Table 4.11-3  
Number of Jobs in the City**

Year	2007	2010	2013	2016	2017	2045
Number of Jobs	34,598	32,241	32,152	33,800*	34,962	45,900*

The number of jobs available is further divided into the following sectors: manufacturing, construction, retail trade, and professional and management. **Table 4.11-4: 2017 Job Numbers by Sector in the City** presents the number of jobs available in each sector in the year 2017. According to SCAG 2020–2045

26 SCAG. Regional Housing Needs Assessment & Housing. <http://www.scag.ca.gov/programs/Pages/Housing.aspx>. Accessed September 7, 2021.

27 SCAG. 2019 Local Profiles. <https://www.scag.ca.gov/Documents/inglewood.pdf>. Accessed September 7, 2021.

RTP/SCS,<sup>28</sup> there were an estimated 411,000 jobs in the region in 2016 and the number of construction jobs is expected to increase to 536,000 in the region in 2045.

As presented by the SCAG 2019 Local Profiles’ Report, only 8 percent of the commuters in the City are also employed within the City limits.<sup>29</sup> The remaining 92 percent of the commuting workers travel to adjacent employment centers for work.

**Table 4.11-4  
2017 Job Numbers by Sector in the City**

Sector	Manufacturing	Construction	Retail Trade	Professional and Management
Number of Jobs	1,476	810	3,249	3,209

 \*\*\*Employment numbers in these sectors are estimates for analysis purposes only and does not include all jobs available within the City.

**Table 4.11-5: Employment Centers for Inglewood Residents** provides a list of where the residents of Inglewood are employed. While construction would generate a temporary workforce, construction personnel are commonly supplied by the existing construction industry within the local area. Over 800 construction jobs currently exist within the City limits according to SCAG 2019 Local Profiles.<sup>30</sup> As noted, these jobs are typically temporary for any specific project and the various trades and professions migrate as needed between construction projects.

Based on data from California Employment Development Department, the City’s unemployment rate is higher than the County and the State of California. The unemployment rate in the City is 12.8 percent<sup>31</sup> as of July 2021, as compared to the County at 10.2 percent<sup>32</sup> and the State of California at 7.9 percent.<sup>33</sup>

28 SCAG. Draft 2020-2045 Connect SoCal Demographics And Growth Forecast. These unemployment rates were obtained in the midst of the COVID-19 pandemic, with widespread business closures throughout the City and the State of California. Therefore, the unemployment numbers are much higher than the unemployment numbers that would usually occur on a State and local level. For comparison purposes, the City had an unemployment rate of 5.1 percent in January 2020, before the COVID-19 pandemic. In the same period, the County and the State had an unemployment rate of 4.5 percent and 4.3 percent, respectively.<sup>34</sup>

**4.11.5.2 Existing Project Area**

**Market Street Segment**

The Market Street Segment begins at the current location of the retail commercial center on the northeast corner of Market Street and Regent Street, between the intersections of Florence Avenue/Locust Street and Market Street/Regent Street. The parcels containing this existing retail commercial center to be acquired as part of the Project are currently zoned Transit Oriented Development Mixed Use 1 (MU-1). This existing commercial center is surrounded by businesses to the north and south and residential homes to the east. The vacant lot west of the commercial center at the northeast corner of Regent Avenue and Market Street is planned for development of a multi-family residential complex. Other properties along

34 EDD. Unemployment Rates (Labor Force). <https://www.labormarketinfo.edd.ca.gov/cgi/dataanalysis/labForceReport.asp?menuchoice=LABFORCE>. Accessed August 24, 2020.

this segment, including 115, 139 and 158 North Market Street and are planned for redevelopment with uses consistent with the City's New Downtown Inglewood and Fairview Heights Transit Oriented Development Plan. Adaptive reuse of the Fox Theater building in accordance with this plan is also planned. The Market Street Segment continues south on Market Street where existing businesses line the roadway on both sides. The segment continues south on Market Street until its intersection with Manchester Boulevard, where it turns east. (refer to **Figure 3.0-3: Project Vicinity Map**).

### **Manchester Boulevard Segment**

The Manchester Boulevard Segment begins at the intersection of Market Street and Manchester Boulevard and continues east along Manchester Boulevard. This segment includes private property at 150 S. Market Street, which contains an existing commercial building on the northeast corner of the intersection. Further east of 150 S. Market Street is the existing Vons commercial plaza south of Manchester Boulevard, between Hillcrest Boulevard and Spruce Avenue (refer to **Figure 3.0-3**). The majority of the uses along this segment are commercial uses, with some residential and religious uses toward the eastern end of the segment near Prairie Avenue. The segment turns south at the intersection of Manchester Boulevard and Prairie Avenue.

### **Prairie Avenue Segment**

The Prairie Avenue Segment begins at the intersection of Manchester Boulevard and Prairie Avenue at an existing commercial parcel at the southeast corner of Manchester Boulevard and Prairie Avenue. Existing businesses, multi-family residential buildings, Kelso Elementary School, and hotels are adjacent to Prairie Avenue on the west side of the roadway. The Forum, SoFi Stadium, and HPSD developments are adjacent to Prairie Avenue on the east side of the roadway. The segment terminates at the intersection of Prairie Avenue and Hardy Street.

### **Existing Employment**

The proposed Project includes the proposed acquisition of several private properties along the alignment to accommodate components of the proposed Project, as identified in **Table 3.0-5: Anticipated Project Acquisitions** in **Section 3.0: Project Description**. The existing uses on these properties include a variety of retail and general commercial uses.

These existing uses are currently operating and have existing employees. A list of the existing facilities and the number of employees currently being employed is provided in **Table 4.11-6: Estimated Existing Employment**.

**Table 4.11-6**  
**Estimated Existing Employment**

Parcel No.	Property Address	Type of Employments	Est. SF in Area	Est. Number of Employees
4015-027-030	310 E. Florence Avenue	Restaurant	1,200 SF	3
4015-027-031	300 E. Florence Avenue	Restaurant	4,762 SF	11
4015-027-032	254 N. Market Street	Restaurant	4,608 SF	10
4015-027-033	250 N. Market Street	Auto Service	44,000 SF	98
4015-027-038	240 N. Market Street	Shopping Center	12,300 SF	28
4015-027-040	230 N. Market Street	Store	22,194 SF	50
4015-027-041	224 N. Market Street	Store	5,000 SF	11
4015-027-049	222 N. Market Street	Shopping Center	25,500 SF	57
4015-027-050	210 N. Market Street	Shopping Center	7,348 SF	16
4021-010-015	150 S. Market Street	Store	16,575 SF	37
4021-024-015	500 E. Manchester Boulevard	Supermarket	76,402 SF	171 <sup>a</sup>
4021-024-015	510 E. Manchester Boulevard	Gas Station	202 SF	1
4024-008-015	923 South Prairie Avenue	Retail	9,744 SF	22
4024-009-005	945 South Prairie Avenue	Office	8,357 SF	29
4024-009-008	1003 South Prairie Avenue	Office	5,522 SF	19
4024-009-015	1011 South Prairie Avenue	Office	1,098 SF	4
4024-009-028033	1035 South Prairie Avenue	Shopping Center	26,228 SF	59
4024-009-028033	1035 South Prairie Avenue	Restaurant	3,954 SF	9
<b>Total Estimated Number of Employees</b>				<b>635</b>

Calculation Factor for 2.2371 (commercial/retail/restaurant, etc.) and 3.4965 (office only) employees per 1,000 SF are found in: Inglewood Unified School District, 2018. [https://www.lbschools.net/Asset/Files/Business\\_Services/Developer\\_Fees/2018/2018-Commercial-Fee-Justification-Study.pdf](https://www.lbschools.net/Asset/Files/Business_Services/Developer_Fees/2018/2018-Commercial-Fee-Justification-Study.pdf). Accessed September 7, 2021.

<sup>a</sup>Land areas and number of employees are rounded and estimates for analysis only.

<sup>b</sup>It should be noted that a replacement Vons store would be developed prior to construction of the proposed Project. It is anticipated that the replacement Vons store would utilize the same number of employees as the existing Vons store.

As shown, the existing uses currently have an estimated number of 635 employees. It should be noted however, that a replacement Vons store would be developed prior to construction of the proposed Project. It is anticipated that the replacement Vons store would utilize the same number of employees as the existing Vons store. Therefore, the net total of existing employees would be 464.

### 4.11.5.3 Adjusted Baseline Conditions

This section assumes the Adjusted Baseline Environmental Setting as described in **Section 4.0: Environmental Impact Analysis, 4.0-5: Adjusted Baseline**. The residential, office, retail, and entertainment uses associated with the Hollywood Park Specific Plan (HPSP) Adjusted Baseline projects would result in changes to the City's population, employment, and housing stock. **Table 4.11-7: Adjusted Baseline Projects Employment Characteristics**, details the land uses and associated residential and employment generation for the HPSP Adjusted Baseline projects.

**Table 4.11-7  
Adjusted Baseline Projects Employment Characteristics**

Land Use	Size	Generation Rate	Employee Population	Residential Population
Stadium <sup>a</sup>	70,240 seats	-	6,000 <sup>d</sup>	-
Performance <sup>b</sup> venue	6,000 seats	2.24 emp/1,000 SF	683	-
Retail <sup>c</sup>	518,077 SF	2.24 emp/1,000 SF	1,161	-
Office <sup>c</sup>	466,000 SF	3.49 emp/1,000 SF	1,626	-
Housing Units	314 units	2.99 person/unit	-	939
<b>Total</b>			<b>9,470</b>	<b>939</b>

**Notes:**

a "Stadiums" are not common land uses, and the City and surrounding jurisdictions do not have an existing employment generation rates for this use. Therefore, the employment total for the stadium was based on that provided in the San Francisco 49ers Stadium, which had a similar seat count (68,500 seats). See City of Santa Clara, 2009. *The 49ers Stadium Project EIR*. p. 176.

b "Performance Venues" are not common land uses, and the City and surrounding jurisdictions do not have an existing employment generation rates for these uses. Consistent with the City's Hollywood Park Redevelopment Draft Environmental Impact Report, and to be conservative, the "Performance" land use is assumed to use the "Retail Use" for the City generation rates. The square footage for this Performance Venue was based off of the proposed Project, which has approximately triple the seat count of the HPSP performance venue (18,000 seats or 915,000 sf). Thus, this analysis assumes square footage for Performance Venue is that of the proposed Project divided in by three, to become 305,000 sf.

c Based on employment generation factors from Inglewood Unified School District, 2018 Developer Fee Justification Study, Table 4. Assumes employee generation rate of 2.24 employee per square foot for Retail and Service uses, and 3.49 employee per square foot for Office uses.

d Anticipated Peak Stadium employment under HPSP is provided by Appendix K, Transportation Data. It is assumed that the vast majority of these jobs are event-related employment and were estimated for the purposes of transportation analysis. Although details are not available to the City, an assessment of full-time-equivalent employment at the Stadium would be materially less than the total of 6,000.

**Sources:**

City of Santa Clara, 2009. *49ers Santa Clara Stadium Project EIR*. Available: <http://santaclaraca.gov/home/showdocument?id=12770>;  
City of Inglewood, 2008, *Hollywood Park Redevelopment Draft Environmental Impact Report*; and Inglewood Unified School District, 2018. *Commercial/Industrial Development School Fee Justification Study Employment Impacts Per St. P. ES-1*.

Overall, the HPSP Adjusted Baseline projects would generate an increase of approximately 9,470 jobs and 314 residential units. By using the City's average household size of 2.99 persons per household,<sup>35</sup> the addition of 314 residential units would generate an estimated 939 people. Overall, as shown, under

35 U.S. Census, QuickFacts, Inglewood City, California, <https://www.census.gov/quickfacts/fact/table/inglewoodcitycalifornia/RHI125219>. Accessed September 7, 2021.

Adjusted Baseline conditions, the City has a residential population of 121,739<sup>36</sup> persons, employment of 44,270 jobs,<sup>37</sup> and a housing stock of 35,114 units.<sup>38</sup> As noted above, the City is currently coordinating with SCAG to update the RTP/SCS socio-economic data to reflect the growth anticipated in the City's New Downtown Inglewood and Fairview Heights Transit Oriented Development Plan and Hollywood Park Specific Plan Areas.

### 4.11.6 THRESHOLDS OF SIGNIFICANCE

Criteria outlined in the CEQA Guidelines were used to determine the level of significance of population, employment, and housing resource impacts. As discussed previously in *Section 4.11.1: Introduction*, two screening criteria related to population and housing of Appendix G of the CEQA Guidelines were eliminated from further analysis in this EIR. The Recirculated Initial Study concluded, however, that the Project could have a potentially significant impact related to population and housing if the Project would:

**Threshold POP-1:** Induce substantial unplanned population or employment growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).

### 4.11.7 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

**Impact POP-1:** Would the Project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

#### Construction

##### Population and Housing

According to SCAG's 2020–2045 RTP/SCS,<sup>39</sup> the City currently projects a population of 137,100 and 47,700 households in the year 2045. It is anticipated that the short-term construction labor needs for the proposed Project can be met by the existing construction labor force available in the greater Los Angeles

36 SCAG. 2016-2040 RTP/SCS Final Growth Forecast by Jurisdiction. [https://scag.ca.gov/sites/main/files/file-attachments/2016\\_2040rtpscsc\\_finalgrowthforecastbyjurisdiction.pdf?1605576071](https://scag.ca.gov/sites/main/files/file-attachments/2016_2040rtpscsc_finalgrowthforecastbyjurisdiction.pdf?1605576071). Adding 939 from an increase in population from HPSP to the 2020 population numbers.  
37 SCAG. 2016-2040 RTP/SCS Final Growth Forecast by Jurisdiction. [https://scag.ca.gov/sites/main/files/file-attachments/2016\\_2040rtpscsc\\_finalgrowthforecastbyjurisdiction.pdf?1605576071](https://scag.ca.gov/sites/main/files/file-attachments/2016_2040rtpscsc_finalgrowthforecastbyjurisdiction.pdf?1605576071). Adding 9470 from an increase in population from HPSP to the 2020 jobs numbers.  
38 SCAG. 2016-2040 RTP/SCS Final Growth Forecast by Jurisdiction. [https://scag.ca.gov/sites/main/files/file-attachments/2016\\_2040rtpscsc\\_finalgrowthforecastbyjurisdiction.pdf?1605576071](https://scag.ca.gov/sites/main/files/file-attachments/2016_2040rtpscsc_finalgrowthforecastbyjurisdiction.pdf?1605576071). Adding 314 from an increase in population from HPSP to the 2020 housing numbers.  
39 SCAG. *2020-2045 Connect SoCal Demographics And Growth Forecast*. [https://www.connectsocial.org/Documents/Draft/dConnectSoCal\\_Demographics-And-Growth-Forecast.pdf](https://www.connectsocial.org/Documents/Draft/dConnectSoCal_Demographics-And-Growth-Forecast.pdf). Accessed September 7, 2021.

and southern California areas. For this reason, the temporary increase in construction jobs associated with the Project is not expected to result in an increase in the population of the City. In addition, the proposed Project does not include any existing residential uses that would be replaced or removed. Since no residential or housing stocks would be constructed or demolished, construction the proposed Project would have no direct impact on population or housing stock.

### Employment

The SCAG 2020–2045 RTP/SCS projects the City will have 45,900 jobs by 2045.<sup>40</sup> The proposed Project would generate a temporary workforce during the construction period between 2024 and 2027. Construction would take place over from 2024 through 2027, employing varying numbers of construction personnel as appropriate for each phase. Descriptions of the construction phases are in **Section 3.0**; aspects of construction relevant to employment are briefly summarized below:

- **Phase 1** of construction includes demolition of buildings and site improvements acquired to accommodate the proposed Project. Phase 1 construction would start in January 2024, including demolition of the existing retail commercial center at Market Street and Regent Street, the commercial buildings located at 500 Manchester Boulevard, the commercial building at 150 S. Market Street on the northeast corner of Manchester and Market Street, the retail commercial center at northwest corner of Prairie Avenue and Hardy Street, the commercial building at 401 S. Prairie Avenue, the commercial building at 945 S. Prairie Avenue, and the commercial building at 1003 S. Prairie.
- **Phase 2** would begin with construction of the elevated portion of the proposed Project (guideway and stations) along Prairie Avenue from Hardy Street to Manchester Boulevard, and work at the MSF site. Construction would occur from 2024 to 2025.
- **Phase 3** foundation work for the ATS guideway, foundation work for the Market Street/Florence Avenue Station, and construction for the support structure of the MSF building and would begin in 2024 and finish in 2025.
- **Phase 4** would occur from 2025 to 2026. Phase 4 primarily includes foundation work for the ATS guideway, guideway column caps along Market Street, and the MSF building deck and shell.
- **Phase 5** would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, guideway girder along Market Street, and MSF building interior construction. Construction would occur in 2025 through 2026.
- **Phase 6** include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, completion of the Prairie Avenue/Manchester Boulevard Station, completion of the Prairie Avenue/Hardy Street

<sup>40</sup> SCAG. 2020-2045 Connect SoCal Demographics And Growth Forecast. [https://www.connectsocial.org/Documents/Draft/dConnectSoCal\\_Demographics-And-Growth-Forecast.pdf](https://www.connectsocial.org/Documents/Draft/dConnectSoCal_Demographics-And-Growth-Forecast.pdf). Accessed September 7, 2021.

Station, and completion of the MSF building, and the elevated passenger walkway to the Metro K Line Downtown Inglewood Station. Construction would occur in 2025 through 2026.

- **Phase 7** would include final site work and completion of the stations and would occur in 2026.
- **Phase 8** would occur for the guideway along the entire length of the alignment and primarily includes installation of the operating systems and testing and commissioning of the ATS trains. Phase 8 construction would occur in 2025 through 2027, with the primary construction activities occurring in 2026 and some installation of equipment starting towards the end of Phase 3 construction when sufficient aerial structure is available for the installation of the equipment.

The estimated construction workforce during each phase is provided in the **Table 4.11-8: Construction Workforce by Phase**.

**Table 4.11-8**  
**Construction Workforce by Phase**

Phase	Time Period	Duration	Estimated Number of Employees
1	2024	7 months	100 - 140
2	2024 – 2025	5 months	100 - 140
3	2024 – 2025	6 months	165 - 190
4	2025 – 2026	8 months	210 - 240
5	2025 – 2026	10 months	210 - 240
6	2025 – 2026	6 months	165 - 190
7	2026	7 months	90 - 125
8	2025 - 2027	22 months	50 - 100
<b>Total Number of Employees During Construction</b>			<b>1,090 - 1,365</b>

Source: **Appendix F: ITC Construction Scenarios**.

\* Note: Some Phase 8 activities could start as early as 2025 or when there is enough aerial structure available for the installation of equipment. However, majority of the construction activities for Phase 8 would happen between 2025 to 2026. For analysis purposes, 2025–2026 for construction duration is used.

While construction would generate a temporary workforce, construction personnel are commonly supplied by existing construction industry within the local area. Therefore, construction personnel for the proposed Project would likely be filled by existing construction employees within the City or the greater Los Angeles area. According to SCAG 2019 Local Profiles,<sup>41</sup> over 800 construction jobs currently exist in the City. As noted, these jobs are typically temporary for any specific project and the various trades and professions migrate as needed between construction sites.

<sup>41</sup> SCAG. 2019 Local Profiles. <https://www.scag.ca.gov/Documents/Inglewood.pdf>. Accessed September 7, 2021.

#### 4.11 Population, Employment, and Housing

The existing construction workforce estimates in the City exceeds the number of construction personnel required for each phase of the proposed Project. Approximately 411,000 construction jobs exist in the SCAG region in 2016 and the number of construction jobs is expected to increase to 536,000 construction jobs in 2045.<sup>42</sup>

The proposed Project would only require approximately 0.3 percent of the existing regional workforce for the entire duration of the construction period.

Since the construction industry does not generally have a regular place of business and construction workers are highly specialized, most construction workers would most likely commute to the job site from locations within the City and throughout the surrounding region. As such, construction personnel do not normally relocate to the location of the construction project.

Based on the existing construction workforce that resides in the City and the surrounding region, the impact on workforce to meet the needs of the proposed Project would not induce substantial population growth in the City or the region.

Impacts would be less than significant.

#### Operation

##### **Population and Housing**

As previously discussed, the proposed Project would not include any residential uses or housing development, and therefore, would have no direct impact on housing as a result. However, indirect impacts on population and housing can still occur through employment, discussed under a separate heading below, or through critical infrastructure improvements that encourage development around the improvements.

The proposed Project would expand transportation options and provide a reliable and low-cost transportation method for existing local communities. As discussed previously, the SCAG projects a growth rate of approximately 0.45 percent by 2045. The proposed Project would be crucial in reducing local roadway congestion and ensuring there is sufficient transportation capacity to accommodate future population growth. Similarly, SCAG projects the population in the region would increase from approximately 18,832,418 in 2016 to 22,507,188 in 2045, resulting in an increase of approximately 0.61 percent or approximately 115,290 population annually. As the entire ATS guideway and related facilities

<sup>42</sup> SCAG. 2020-2045 Connect SoCal Demographics And Growth Forecast. [https://www.connectsoocal.org/Documents/Draft/dConnectSoCal\\_Demographics-And-Growth-Forecast.pdf](https://www.connectsoocal.org/Documents/Draft/dConnectSoCal_Demographics-And-Growth-Forecast.pdf). Accessed September 7, 2021.

#### 4.11 Population, Employment, and Housing

would be located in or adjacent to disadvantaged communities, the proposed Project would provide a reliable and low-cost option for traveling within the local area and to the greater Los Angeles region, connecting job centers such as downtown Los Angeles, The Forum, and the SoFi Stadium to existing disadvantaged communities and providing economic support for these communities.

The proposed Project may generate indirect population growth through an improvement in access to housing and employment opportunities in the greater Los Angeles region. However, reasonably foreseeable growth from an improvement in access and quality of life is anticipated to be within the growth projection under SCAG's 2019 Local Profiles and within the regional projection under SCAG's 2020–2045 RTP/SCS. Furthermore, since the existing roadway network currently provides access to all areas that would benefit from the alignment in the urban setting, the proposed Project is not expected to contribute development and population growth to any new undeveloped areas. Therefore, indirect impacts to population growth through an improvement to access and quality of life would be less than significant.

#### **Employment**

The proposed Project is anticipated to have a total direct employment of up to 150 full-time equivalent people. This would include workforce requirements for the operation and maintenance necessary for the proposed Project, including system engineers, operators, maintenance personnel, janitorial crews, security, and other jobs. These jobs would extend beyond construction and into oversight of long-term operations.

The proposed Project would also require the replacement of certain existing uses in order to accommodate various Project components. Existing sites to be replaced include the commercial/retail center at the southeast corner of Florence Avenue and Market Street that would be removed for the Market Street/Florence Avenue station, the office uses at the southwest corner of Prairie Avenue and Manchester Boulevard, the commercial/retail space at the northwest corner of Prairie Avenue and Hardy Street, the commercial uses at 500 and 510 Manchester Boulevard that would be removed for the proposed MSF, other than the commercial uses at 500 E. Manchester Boulevard that would be replaced when the new Vons store is built and opened, and the commercial building that would be removed to allow for the encroachment of the guideway at 150 S. Market Street. As discussed previously, the existing work force to be removed includes 464 employees, not including the existing Vons store which would be replaced prior to construction of the proposed Project.

The proposed Project would provide funding for the support and transition of jobs through the California Climate Investments (CCI) which facilitate GHG emission reductions and deliver a suite of economic, environmental, and public health co-benefits, including job co-benefits. The job co-benefits refer to California jobs supported, not created, by CCI. A job is defined as one full-time equivalent (FTE) employee

4.11 Population, Employment, and Housing

position over one year, equal to approximately 2,000 hours of work. Jobs supported by CCI include direct, indirect, and induced employment.<sup>43,44</sup> The Job Co-benefit Modeling Tool was created by the California Air Resources Board using regional input-output models to characterize the relationships between all industries in an economy, with the foundational assumption that an initial change in economic activity prompts additional spending. For instance, increased demand for the outputs of one industry generates demand for intermediate inputs from supporting industries. Greater employment and earnings in the affected industries lead to higher household spending, resulting in additional demand for goods and services throughout the region.

In 2009, the University of Utah's Metropolitan Research Center reviewed a wide set of literature and data on the job and economic impacts of transportation spending and reported five conclusions relevant to choosing transportation stimulus projects.<sup>45</sup> The key findings included investing in areas with high job needs improves employment faster than investing elsewhere. Putting or keeping public transportation in communities with high unemployment produces up to 2.5 times more jobs than putting public transportation in communities with low unemployment. CCI facilitate GHG emission reductions and deliver a suite of economic, environmental, and public health co-benefits, including job co-benefits.<sup>46</sup> A different mix of spending on materials, equipment, and labor is expected across various CCI project types and match funding arrangements. As such, some project types would support more jobs than others.

The proposed Project provided project inputs for assessment using the Job Co-benefit Modelling Tool under transit mode. The project input categories include the following:<sup>47</sup>

- The type of region that best encompasses the geographic location for the proposed Project type;
- TIRCP Funds Requested (\$)/Total amount of TIRCP GGRF funds requested from this solicitation to implement the project;
- Total Project Cost (\$) or Total amount of funding required to implement the project;

43 California Air Resources Board. CCI Co-benefit Assessment Methodologies. Job Co-Benefit Assessment Methodology. <https://ww2.arb.ca.gov/resources/documents/cci-methodologies>. Accessed 09/7/2021.

44 The three types of jobs supported by CCI are the following- Directly supported jobs refer to labor to complete California Climate Investments projects, through direct employment or contracted work paid with GGRF dollars; Indirectly supported jobs exist in the supply chains supporting California Climate Investments projects. Funding a project generates demand for intermediate inputs of materials and equipment needed to complete the project, leading to expanded production and employment in the relevant upstream industries; Induced jobs are linked to the spending of income from directly and indirectly supported jobs. The personal consumption expenditures of workers in jobs directly and indirectly supported by California Climate Investments projects (i.e., increased household spending) stimulate demand for goods and services in the wider California economy.

45 Arthur C. Nelson et al., *The Best Stimulus for the Money: Briefing Papers on the Economics of Transportation Spending*, University of Utah's Metropolitan Research Center and Smart Growth America, April 2009. <https://smarthgrowthamerica.org/wp-content/uploads/2016/08/thebeststimulus.pdf>.

46 California Climate Change Investments, *About Climate Change Investments*. <http://www.caclimateinvestments.ca.gov/about-cci> accessed September 7, 2021.

47 City of Inglewood. Inglewood Transit Connector TIRCP Grant Application. January 16, 2020.

4.11 Population, Employment, and Housing

- The first year of service or the first year the facility or rolling stock would be in use;
- The final year of service or the final year the facility or rolling stock's useful life;
- The increase in unlinked passenger trips directly associated with the proposed Project in the first year;
- The increase in unlinked passenger trips directly associated with the proposed Project in the final year;
- Discount factor applied to annual ridership to account for transit-dependent riders; and the
- Annual passenger miles over unlinked trips directly associated with the proposed Project.

Calculation based on project inputs generated approximately 11,516 full time equivalent jobs which would be benefitted through these funds and programs. The benefits would be provided through either directly supported jobs, indirectly supported jobs, or induced jobs. Estimated jobs supported by the CCI through the proposed Project are set forth in the **Table 4.11-9: Estimated Job Co-Benefits**.<sup>48</sup>

**Table 4.11-9  
Estimated Job Co-Benefits**

Category	Number of Jobs Co-Benefits
Total Full-Time Equivalent Jobs Supported by Project Budget	9,759
Total Full-Time Equivalent Jobs Supported by the Project GGRF* Funds	878
Full-Time Equivalent Jobs Directly Supported by the Project GGRF* Funds	413
Full-Time Equivalent Jobs Indirectly Supported by the Project GGRF* Funds	190
Full-Time Equivalent Induced Jobs Supported by the Project GGRF* Funds	276
<b>Total Number of Jobs Supported</b>	<b>11,516</b>

\*Greenhouse Gas Reduction Funds  
Source: City of Inglewood. *Transit and Intercity Rail Program Application for the Inglewood Transit Connector Project* January 2020.

The proposed Project would directly generate approximately 150 full-time jobs associated with the operation and maintenance of the ATS trains and would indirectly contribute to the creation of 11,516 additional jobs. As described above, the proposed Project may also displace up to 464 jobs associated with uses that would be removed on properties to be acquired as part of the Project if these uses do not relocate within the City. This would result in the Project directly and indirectly creating approximately net 11,052<sup>49</sup> FTE jobs. Furthermore, ongoing, and planned development along the proposed ATS alignment as described in **Section 4.0, 4.0-5: Adjusted Baseline**, including development in the HPSP area would also benefit from the implementation of the proposed Project. The growth in employment associated with the Adjusted Baseline growth would offset any net loss of jobs resulting from the proposed Project.

48 City of Inglewood. *Transit and Intercity Rail Program Application for the Inglewood Transit Connector Project*. January 2020.

49 11,516 minus 464 in numbers of jobs displaced.

#### 4.11 Population, Employment, and Housing

As previously discussed, approximately 92 percent of the residents in the City currently commute to work outside of the City, with the remaining 8 percent of residents working within the City (Table 4.11-5). This pattern points to a regional spread in work locations for the City residents. Because of this, local fluctuations in job generation are unlikely to directly impact population growth within the City. Even though the proposed Project would either directly or indirectly support 11,052 jobs, the implementation of the proposed Project would only directly create 150 full-time equivalent jobs. Therefore, not all jobs supported by the proposed Project would translate into an increase in population growth for the local area or the region.

Additionally, according to SCAG 2020–2045 RTP/SCS, approximately 8,389,000 jobs were available in 2016 across industries in the region and the number of jobs available would increase to 10,050,000 by 2045, an increase of approximately 0.62 percent or approximately 52,700 annually in jobs.<sup>50</sup> The proposed Project would provide benefits to approximately 0.13 percent of the jobs in the region based on the 2016 jobs number or approximately 20 percent of new jobs added to the region annually. The jobs that would be supported by the proposed Project in the region is within the regional trends provided by the SCAG 2020–2045 RTP/SCS data and the jobs that would benefit from the proposed Project does not directly translate into population growth.

Based on SCAG's growth estimates<sup>51</sup> an adequate workforce exists and is projected to remain in existence, creating capacity to meet the employment needs of the proposed Project during operation. Further, with the current development of new employment opportunities in the City as well as the region, displacement of any existing workers would be absorbed.

Additionally, any businesses displaced would be compensated in accordance with California Government Code Section 7260-7277, the California Relocation Assistance Program. Compensation and compliance with the California Relocation Assistance Program would further minimize the effect of business displacement on business owners and the local community. As such, the estimate of up to 464 jobs that may be displaced from the proposed Project is a maximum estimate and would likely be less due to relocation of existing uses under the California Relocation Assistance program. It is important to note economic and social effects of a project are not treated as significant effects on the environment as stated previously per CEQA Guidelines Section 15131(a). Nonetheless, the changes in employment identified in this section are used to trace a chain of cause and effect from a proposed decision on a project through

51 SCAG. 2020-2045 Connect SoCal Demographics And Growth Forecast. [https://www.connectsocial.org/Documents/Draft/dConnectSoCal\\_Demographics-And-Growth-Forecast.pdf](https://www.connectsocial.org/Documents/Draft/dConnectSoCal_Demographics-And-Growth-Forecast.pdf). Accessed September 7, 2021.  
51 SCAG. 2020-2045 Connect SoCal Demographics And Growth Forecast. [https://www.connectsocial.org/Documents/Draft/dConnectSoCal\\_Demographics-And-Growth-Forecast.pdf](https://www.connectsocial.org/Documents/Draft/dConnectSoCal_Demographics-And-Growth-Forecast.pdf). Accessed September 7, 2021.

#### 4.11 Population, Employment, and Housing

anticipated economic or social changes resulting from the project to physical changes, such as population growth.

As a result of this analysis, the proposed Project would not substantially induce population growth beyond the regionally projected value. Therefore, there is a less than significant impact on employment and population growth from the operation of the proposed Project.

#### Summary of Impacts

The proposed Project does not include any constructing or removing any residential uses or housing developments. Therefore, construction of the proposed Project would not directly contribute to population increase or an increase or loss of housing stock.

Construction activities would generate a temporary workforce for the duration of the construction period. However, due to the temporary and variable nature of construction activities, construction would not create temporary or permanent population increase at the City. Additionally, construction workforce needs for the proposed Project could be met by the existing local work force and would not contribute to population increase through relocation. Therefore, construction employment would not result in any significant impacts in terms of population increase.

Employment generated by the operation of the proposed Project would be less than the current jobs displaced for uses that would be removed. However, the proposed Project would either directly or indirectly benefit 11,052 jobs. The number of jobs that would be supported by the proposed Project is within the growth projections provided by existing studies. Therefore, operational impacts on substantially inducing employment and population growth is less than significant.

Impacts from construction and operation on substantially inducing population and employment growth would be less than significant.

#### Mitigation Measures

No mitigation is required.

#### Level of Significance after Mitigation

The proposed Project would have a less than significant impact on inducing substantial population or employment growth. Impacts would be less than significant.

#### 4.11.8 CUMULATIVE IMPACTS

Cumulative impact analysis for population, employment, and housing considers whether the impacts of a project and related projects, when taken as a whole, would induce substantial unplanned population growth. The geographic scope of this cumulative impact analysis is the City and the region. If the

#### 4.11 Population, Employment, and Housing

cumulative projects listed in **Section 4.0, 4.0.6: Cumulative Assumptions** would result in a significant impact, then the proposed Project's contribution would need to be determined. The proposed Project would not directly create population or employment growth in the City or region. The proposed Project does not include residential elements or housing development which would directly contribute to population growth. Moreover, related projects and the additional growth considered as part of the Adjusted Baseline is consistent with the City's approved land use plans and approved projects. As discussed above, the City is currently coordinating with SCAG to update the RTP/SCS socio-economic data to reflect the growth anticipated in the City's New Downtown Inglewood and Fairview Heights Transit Oriented Development Plan and Hollywood Park Specific Plan Areas.

Since the proposed Project would not significantly induce population, employment, or housing growth in the region, the proposed Project would not substantially contribute to cumulative population, employment, or housing growth in the area. The proposed Project, combined with other reasonably probable future related development would not result in a significant cumulative impact related to population, employment, and housing because the cumulative growth would not exceed the growth anticipated in City-wide and regional planning documents, including the 2020–2045 RTP/SCS.

#### 4.11.9 CONSISTENCY WITH CITY OF INGLEWOOD GENERAL PLAN

The City's General Plan contains goals within its Housing Element and Land Use Element that relates to the population, employment, and housing resources.

##### Housing Element

The Housing Element for the City<sup>52</sup> establishes policies to create and preserve quality residential neighborhoods along with establishing policies and programs to mitigate housing shortages. The following goals within the Housing Element directly relates to population, employment, and housing resources within the City:

- Goal 2:** Maintain the existing housing stock and neighborhoods by promoting the maintenance, rehabilitation, modernization, and energy efficient upgrades of existing housing as well as the beautification and security of residential neighborhoods.
- Goal 3:** Encourage the Production and Preservation of Housing for All Income Categories, particularly around high-quality transit, including workers in the City that provide goods and services.
- Goal 7:** Encourage Energy Efficiency and Greenhouse Gas Reductions.

<sup>52</sup> City of Inglewood. *Housing Element 2013-2021*. <https://www.cityofinglewood.org/DocumentCenter/View/127/2013-2021-Housing-Element-Adopted-January-28-2014-PDF>. Accessed September 7, 2021.

#### 4.11 Population, Employment, and Housing

Goals 2 and 3 relate directly to housing production, preservation, and upgrades. Since the proposed Project does not include any residential uses, housing development, or removal of existing housing stock, Goals 2 and 3 do not apply.

The proposed Project aligns with Goal 7 in improving local mass transit availability and providing transit to local neighborhoods, encouraging energy efficiency and greenhouse gas reduction by providing an alternative to travelling by automobiles. As such, the proposed Project is consistent with this goal.

##### Land Use Element

The Land Use Element for the City<sup>53</sup> also contains goals that apply to population, employment, and housing. The goals relating to population, employment and housing are listed below:

##### General

- Goal:** Help promote sound economic development and increase employment opportunities for the City's residents by responding to changing economic conditions.
- Goal:** Develop a land use element that facilitates the efficient use of land for conservation, development, and redevelopment.
- Goal:** Promote Inglewood's image and identify as an independent community within the Los Angeles Metropolitan area.

##### Commercial

- Goal:** Create and maintain a healthy economic condition within the present business community and assist new business to located within the City.
- Goal:** Protect local businessmen and encourage the importance of maintaining a strong commercial district in the downtown.
- Goal:** Promote the development of commercial/recreational uses which would complement those which already are located in Inglewood.

##### Downtown Transit Oriented District

- Goal 1:** Downtown is a place to live, work, shop, recreate, and be entertained.
- Goal 3:** Downtown provides a unique mix of accessibility options including light rail, pedestrians, bicycles, autos, buses, and advanced technology local transit.

<sup>53</sup> City of Inglewood. *Land Use Element*. <https://www.cityofinglewood.org/DocumentCenter/View/132/Land-Use-Element-1980-Amended-1986-2009-2016-PDF>. Accessed September 7, 2021.

#### 4.11 Population, Employment, and Housing

**Goal 4:** Downtown is a major economic engine providing jobs, sales tax, and other revenues.

**Goal 5:** Downtown is a model for sustainable development.

The proposed Project is consistent with the Land Use Element goals by enhancing connectivity for the new commercial and residential developments. The proposed Project would provide a mass transit connection within the City and the new LASED and HPSF, as well as connect them to the broader region and the Metro K Line. The location of the proposed Project in the City's downtown area along Market Street would assist in encouraging the importance of maintaining a strong commercial district in the downtown area.

The proposed Project would connect the Metro K line with new commercial and entertainment developments in the City such as LASED, Sofi Stadium, and the Hollywood Park Specific Plan mixed-use development, promoting these entertainment and commercial developments to the region. The connection to entertainment, commercial, and residential developments would also assist in reducing future impacts associated with traffic, air quality, greenhouse gas, and noise from employees and patrons of these uses. Increasing existing mobility options would also remove vehicle traffic in downtown Inglewood, promoting sustainable development values.

#### Environmental Justice Element

The City's Environmental Justice Element<sup>54</sup> was adopted on June 30, 2020. Applicable Environmental Justice goals for the Population, Employment, and Housing section are as follows:

**Goal:** The community's exposure to pollution in the environment is minimized through sound planning and public decision making.

**Goal:** Adequate and equitably distributed public facilities are available in the community.

The proposed Project is consistent with the Environmental Justice Element goals through the reduction in community exposure to air pollutants by reducing VMT and vehicle related air pollutant emissions and providing adequate and equitably distributed public facilities in the community. The proposed Project would provide public transportation services to the local community from Downtown Inglewood to south Inglewood and connect the communities from Inglewood to the larger Los Angeles area through the connection with Metro K line.

<sup>54</sup> City of Inglewood. *Environmental Justice Element*. <https://www.cityofinglewood.org/DocumentCenter/View/14211/Environmental-Justice-Element#:~:text=The%20Inglewood%20General%20Plan%20Environmental,City%2C%20particularly%20for%20disadvantaged%20communities.> Accessed September 7, 2021.

## 4.12 TRANSPORTATION

### 4.12.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) evaluates the surface transportation and circulation system in the Project area and the potential for the construction and operation of the proposed Inglewood Transit Connector Project (proposed Project or ITC Project) to result in transportation impacts. The assessment of transportation and circulation system impacts considers the existing traffic conditions, including existing street system, public transit service, and bicycle facilities, which may be affected by the ITC Project. The ITC Project is proposed to increase use of transit, reduce vehicle trips, and reduce per-capita vehicle miles traveled (VMT) associated with travel to and from the City's major housing, employment, and activity centers, with corresponding improvements in air quality, public health, and reductions in greenhouse gas emissions from transportation sources.

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the Project in response to consultation with key stakeholders in the community and comments received on the Draft EIR. Changes to the Project relevant to the potential effects of the Project on transportation and traffic include further definition of Project design features in the Construction Commitment Program addressing the transit and access program, construction staging and traffic control program, preliminary haul and overload routes, passenger access program, and Parking Management Plan as described below in *Section 4.12.5.1: Project Design Features*.

Specific changes to the Project related to transportation include refinement of the construction phasing, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue. The transportation analysis in this section has been updated to reflect these changes to the project. Additional updates to the transportation analysis from the December 2020 Draft EIR include updates to the vehicle miles traveled (VMT) analysis, daily traffic volumes, existing transit frequency minutes during peak commute hours, and construction transportation analysis to reflect the more specific phases of construction compared to simpler phases presented in the December 2020 Draft EIR. The changes and revisions to the ITC Project and the transportation analysis do not alter the level of significance of any transportation impacts previously disclosed in the December 2020 Draft EIR.

Transportation impacts are analyzed for both construction and operations of the proposed Project. Transportation impacts are analyzed using a variety of modeling techniques detailed within **Appendix O: Transportation Assessment Study**.

Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Recirculated Draft EIR.

#### 4.12.2 REGULATORY FRAMEWORK

State, regional, and local laws, regulations, and policies pertaining to traffic and transportation in the Project area are summarized here. These provide the regulatory framework for addressing all aspects of transportation, planning, and infrastructure that would be affected by implementation of the proposed Project.

##### 4.12.2.1 State Regulations and Directives

###### **Senate Bill 743**

Senate Bill (SB) 743, passed in 2013, required that the California Governor’s Office of Planning and Research (OPR) develop new California Environmental Quality Act (CEQA) guidelines that address traffic performance metrics. Per the legislation, “automobile delay characterized solely by level of service or similar measures of vehicular capacity or traffic congestion shall not be considered a significant impact on the environment.”

The Natural Resources Agency subsequently adopted CEQA Guidelines Section 15064.3. Under this guideline, VMT was chosen as the most appropriate performance metric used to identify transportation impacts.

The primary goals of SB 743 are:

1. Reduction of Greenhouse Gas (GHG) emissions
2. Development of multimodal transportation networks; and
3. A diversity of land uses (mixed use development)

In December 2018, OPR published final technical guidance for implementing SB 743. The latest OPR technical guidance<sup>1</sup> specifically states that:

*Transit and Active Transportation Projects generally reduce VMTs and therefore are presumed to cause a less-than-significant impact on transportation. This presumption may apply to all passenger rail projects, bus and bus rapid transit projects, bicycle, and passenger infrastructure projects. Streamlining transit and other active transportation projects align with each of the statutory goals contained in SB 743 by reducing GHG emissions, increasing multimodal networks and facilitating mixed-use development.*

<sup>1</sup> Governor’s Office of Planning and Research. *Technical Advisory on Evaluating Transportation Impacts in CEQA*. December 2018.

#### **Assembly Bill 1358**

Assembly Bill (AB) 1358, and the Complete Streets Act of 2008 require that cities and counties identify how they will provide for the routine accommodation of all users of roadways, including motorists, passengers, bicyclists, individuals with disabilities, seniors, and users of public transportation. Planning and building complete streets is one way that cities and counties can meet this requirement. A complete street is a transportation facility that is planned, designed, operated, and maintained to enable safe access for all roadway users. Passengers, bicyclists, motorists, and transit riders of all ages and abilities must be able to safely move along and across a complete street.

##### 4.12.2.2 Regional Regulations and Directives

###### **Southern California Association of Governments: 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy**

As the metropolitan planning organization for the region’s six counties and 191 cities, Southern California Association of Governments (SCAG) develops a long-term regional transportation and sustainability plan every four years, as mandated by law. In September 2020, the Regional Council of Southern California Association of Governments adopted the 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The 2020–2045 RTP/SCS is a long-range visioning plan for the region’s transportation system over the next 25 years that balances mobility and housing needs with economic, environmental, and public health goals. The 2020–2045 RTP/SCS includes over 4,000 transportation projects ranging from highway improvements, railroad grade-separations, bicycle lanes, new transit hubs and replacement bridges to reduce bottlenecks, improve the efficiency of the region’s network and expand the mobility choices for everyone in the six-county southern California region.

The 2020–2045 RTP/SCS groups its goals into four core categories—economy, mobility, environment, and healthy/complete communities. The plan explicitly addresses goals associated with housing, transportation technologies, equity and resilience reflecting enhanced importance of these topics in the region linking them to potential performance measures and targets.

4.12 Transportation

The following ten goals are identified in the 2020–2045 RTP/SCS:

1. Encourage regional economic prosperity and global competitiveness
2. Improve mobility, accessibility, reliability, and travel safety for people and goods
3. Enhance the preservation, security, and resilience of the regional transportation system
4. Increase person and goods movement and travel choices within the transportation system
5. Reduce greenhouse gas emissions and improve air quality
6. Support healthy and equitable communities
7. Adapt to a changing climate and support an integrated regional development pattern and transportation network
8. Leverage new transportation technologies and data-driven solutions that result in more efficient travel
9. Encourage development of diverse housing types in areas that are supported by multiple transportation options
10. Promote conservation of natural and agricultural lands and restoration of habitats

4.12.2.3 Local Regulations and Directives

City of Inglewood Circulation Element

As part of the General Plan, the City adopted a Circulation Element in December 1992. The Circulation Element works to ensure that adequate street access and traffic capacity is considered for current and future land use needs. In order to accomplish this, the Circulation Element includes formal arterial and collector designations for street classifications and identifies specific street improvement efforts as needed.

City of Inglewood Environmental Justice Element

The Environmental Justice Element, adopted on June 30, 2020, provides guidelines to minimize pollution and its effects on the community, and ensure that all residents have a say in decisions that may affect their quality of life. Goals and policies applicable to the transportation planning are identified below:

4.12 Transportation

Goal 2: The community’s exposure to pollution in the environment is minimized through sound planning and public decision making.

Policy: General Environmental Health

- EJ-2.4: Create land use patterns and public amenities that encourage people to walk, bicycle and use public transit.
  - EJ-2.5: Concentrate medium to high density residential development in mixed-use and commercial zones that can be served by transit.
  - EJ-2.7: Regularly update IMC Chapter 12 Transportation Demand Management requirements to reflect current transportation technologies in support of alternative modes of transportation.
  - EJ-2.8: Encourage new development to reduce vehicle miles traveled to reduce pollutant emissions.
- Goal 6: Adequate and equitably distributed public facilities are available in the community.
- EJ-6.2: Prioritize the City’s capital improvement program to address the needs of disadvantaged communities.
  - EJ-6.3: Plan for the future public improvement and service needs of underserved communities.
  - EJ-6.8: Ensure that new public facilities are well designed, energy efficient and compatible with adjacent land uses.
  - EJ-6.10: Coordinate with the Inglewood Unified School District, transit agencies and other public agencies to provide adequate public facilities, improvements, and programs to the City of Inglewood.

City of Inglewood Land Use Element

The Land Use Element<sup>2</sup> also includes goals related to the City’s transportation system, including the following:

- Goal: Ensure that proposed new uses can be accommodated by adequate and safe streets.
- Goal: Promote and support adequate public transportation within the City and the region.
- Goal: Develop modified traffic systems that would discourage through traffic from utilizing neighborhood streets.
- Goal: Develop a safe and adequate passenger circulation system which is barrier-free for the handicapped.

<sup>2</sup> City of Inglewood General Plan, “Land Use Element” (1980).

### Imagine Inglewood

The City of Inglewood is in the process of developing *Imagine Inglewood*, an Active Transportation Plan (ATP) that incorporates bicycle, passenger, Americans with Disabilities Act (ADA) considerations and Safe Routes to School (SRTS) analysis and planning. The ATP is intended to improve access and increase public transit connections to the rest of the Los Angeles region to promote improvements that encourage the community to walk, bike, or take a bus.<sup>3</sup> The City is currently engaging community stakeholders in order to further develop ATP goals and initiatives.

#### 4.12.3 EXISTING CONDITIONS

As shown in **Figure 4.12-1: Study Area**, the study area is generally bounded by Florence Avenue on the north, Lennox Boulevard – 108th Street on the south, La Brea Avenue – Hawthorne Boulevard on the west, and Van Ness Avenue on the east. The study area includes major corridors providing access to the proposed Project, encompassing approximately 6 square miles. The existing street system in the vicinity of the study area consists of a regional roadway system including freeways, major and minor arterials and a local street system including collectors and local streets. The freeway network providing access to and from the study area includes the San Diego (I-405) Freeway, the Glenn M. Anderson (I-105) Freeway and the Harbor (I-110) Freeway as shown in **Figure 4.12-2: Freeways in Study Area**. The Average Daily Traffic volume (ADT) estimates at all roadway facilities within approximately ½ mile from the proposed Project alignment have also been prepared for all analysis scenarios, discussed further below, to quantify the potential reduction in ADTs with the ITC Project.

##### 4.12.3.1 Existing Street System

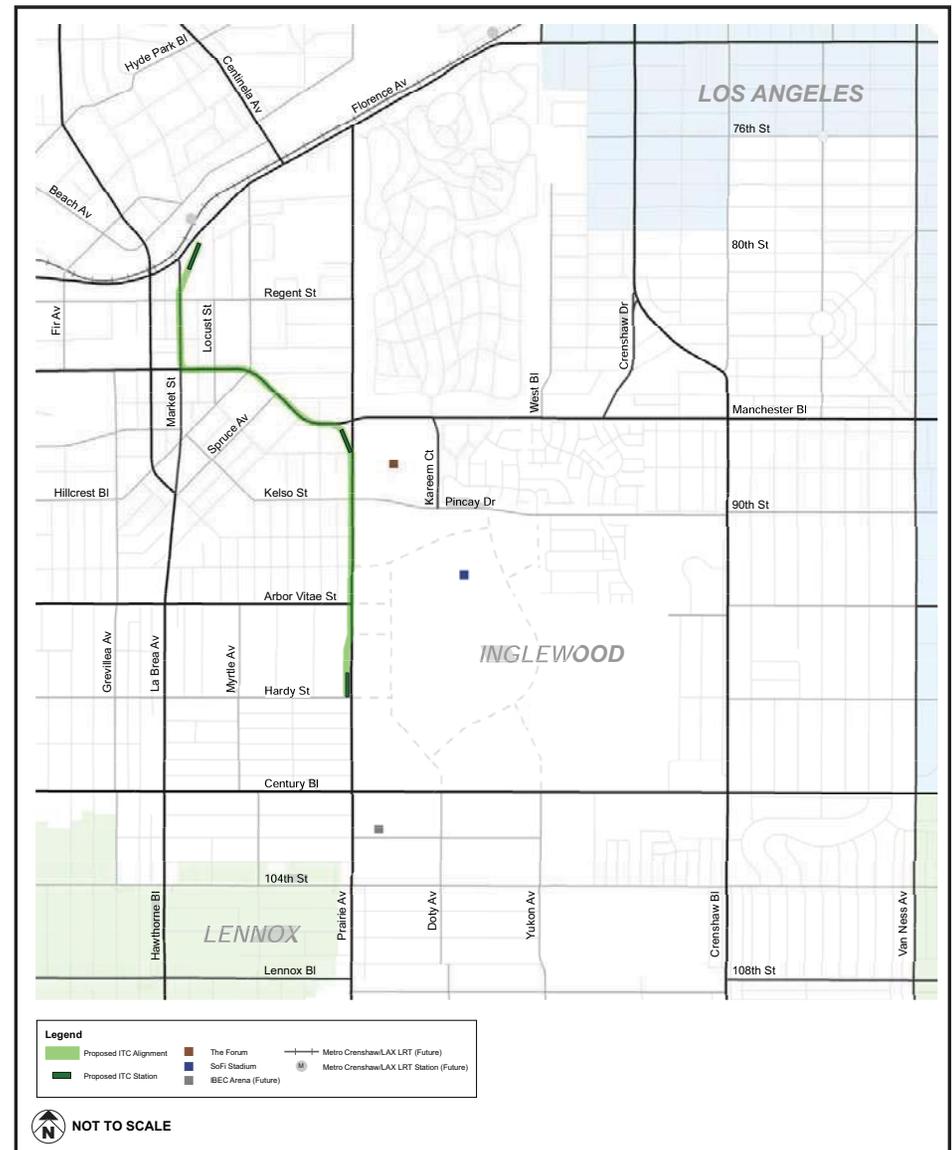

The existing street system within and near the study area consists of a regional roadway system including freeways, major and minor arterials and a local street system including collectors and local streets. The freeway network providing access to and from the study area includes of the San Diego (I-405) Freeway, the Glenn M. Anderson (I-105) Freeway, and the Harbor (I-110) Freeway.

Brief descriptions of these facilities and additional collectors and local streets serving the study area including number of lanes, speed limits, parking availability, and functional classes are provided below.

##### Freeways

- **San Diego (I-405) Freeway** – The I-405 Freeway is a north-south freeway that transverses the Southern California region from its northern terminus at the I-5 Freeway in Sylmar to its southern terminus at the I-5 Freeway in Irvine. In the vicinity of the study area, this freeway provides six lanes (including one HOV lane) in each direction. There are ramps at Manchester Boulevard, La Cienega Boulevard, Century Boulevard, Imperial Highway, I-105 Freeway in the vicinity of the study area.

3 City of Inglewood, *Imagine Inglewood*, <http://www.imagineinglewood.com/>, accessed October 19, 2021.

SOURCE: Raju Associates, Inc. – September 2021

FIGURE 4.12-1

#### 4.12 Transportation

travel lanes in each direction plus left-turn channelization at major intersections. Parking is generally allowed along this roadway, and the posted speed limit is 40 mph.

- **Florence Avenue** – Florence Avenue is classified as a major arterial in the City of Inglewood and as a secondary arterial (Avenue I) in the City of Los Angeles. It runs east-west with two to three lanes in each direction with left-turn channelization at major intersections through the study area. Parking is generally not allowed along this roadway, although some parking is permitted east of West Boulevard. Bike lanes are provided along some stretches of this roadway between Locust Street and West Boulevard. The posted speed limit is 40 mph west of West Boulevard and 35 mph east of West Boulevard.
- **Manchester Boulevard** – Manchester Boulevard is classified as a major arterial roadway in the study area. It runs east-west and has generally two lanes in each direction west of Prairie Avenue and three lanes in each direction east of Prairie Avenue, plus left-turn channelization at major intersections through the study area. Parking is allowed along most of Manchester Boulevard with some restricted segments. The posted speed limit along Manchester Boulevard is 35 mph west of Prairie Avenue and 40 mph east of Prairie Avenue. Manchester Boulevard provides access to the I-405 Freeway and I-110 Freeway.
- **Arbor Vitae Street** – Arbor Vitae Street west of Prairie Avenue is classified as a major arterial roadway that runs in an east-west direction. Arbor Vitae Street between Prairie Avenue and Van Ness Avenue is classified as a collector roadway. Within the study area, this roadway west of Prairie Avenue generally provides one to two lanes in each direction with parking on both sides of the street. The posted speed limit is 35 mph.
- **Century Boulevard** – Century Boulevard is classified as a major arterial roadway in the study area and runs in an east-west direction. It provides one of the major direct access options into the LAX Central Terminal Area (CTA). Within the study area, this roadway generally provides three to four lanes in each direction with left-turn lanes at key intersections. The posted speed limit is 40 mph. There is no parking allowed on either side of the street within the study area. Century Boulevard provides access to the I-405 Freeway and I-110 Freeway.

#### Minor Arterial / Secondary Arterial

- **Market Street** – Market Street is classified as a minor arterial roadway and runs in a north-south direction, beginning at Florence Avenue and terminating at La Brea Avenue. This roadway provides one lane in each direction between Florence Avenue and Hillcrest Boulevard, and two lanes in each direction between Hillcrest Boulevard and La Brea Avenue. On-street parking is permitted on both sides of the street. The prima facie speed limit is 25 mph.

#### Collectors & Local Streets

- **Locust Street** – Locust Street runs in a north-south direction beginning at Florence Avenue and terminating at the intersection of Hillcrest Boulevard and Nutwood Street. The roadway is classified as a collector roadway between Regent Street and Hillcrest Boulevard, and as a local street between Florence Avenue and Regent Street. This roadway provides one lane in each direction, with on-street

#### 4.12 Transportation

parking generally permitted on both sides of the street. Bike lanes are generally provided on both sides of the street between Florence Avenue and Manchester Boulevard. The posted speed limit is 30 mph.

- **Myrtle Avenue** – Myrtle Avenue is a north-south roadway that is classified as a collector roadway between Arbor Vitae Street and Century Boulevard, and as a local street between Kelso Street and Arbor Vitae Street. This roadway generally provides one lane in each direction, with on-street parking available on both sides of the street. The posted speed limit is 30 mph.
- **Doty Avenue** – Doty Avenue is a north-south roadway that is classified as a collector roadway. The roadway provides one lane in each direction. On-street parking is available on both sides of the street south of 102nd Street. The prima facie speed limit is 25 mph.
- **Yukon Avenue** – Yukon Avenue is a north-south roadway that is classified as a collector roadway. The roadway generally provides one to two lanes in each direction. On-street parking is available on the west side along some restricted segments in the study area. The posted speed limit is 30 mph.
- **Regent Street** – Regent Street is classified as a collector roadway and runs in an east-west direction, beginning west of Oak Street and terminating at Inglewood Park Cemetery. This roadway provides one lane in each direction with on-street parking available between La Brea Avenue and Prairie Avenue. It provides two lanes in each direction with on-street parking prohibited between Fir Avenue and La Brea Avenue. The posted speed limit is 35 mph.
- **Hillcrest Boulevard** – Hillcrest Boulevard is classified as a collector roadway. It runs in an east-west direction between Aviation Boulevard and Grevillea Avenue, diagonally between Grevillea Avenue and Manchester Boulevard, and in a north-south direction between Manchester Boulevard and Florence Avenue. Within the study area, Hillcrest Boulevard generally provides one travel lane in each direction and has on-street parking on both sides of the street. The posted speed limit is 30 mph.
- **Spruce Avenue** – Spruce Avenue is classified as a collector roadway that runs diagonally between La Brea Avenue and Manchester Boulevard and runs in an east-west direction between Hindry Avenue and Fir Avenue. This roadway generally provides one lane in each direction with on-street parking on both sides of the street. The prima facie speed limit is 25 mph.
- **Kelso Street** – Kelso Street runs generally in an east-west direction and is classified as a collector roadway. It runs diagonally between Market Street and Myrtle Avenue. The roadway ends at Prairie Avenue where the street name changes to Pincay Drive. This roadway generally provides one lane in each direction with on-street parking on both sides of the street. The prima facie speed limit is 25 mph.
- **Pincay Drive** – Pincay Drive is classified as a collector roadway that begins at Prairie Avenue and ends at Crenshaw Boulevard where the street name changes to 90th Street. It runs in an east-west direction. This roadway generally provides two lanes in each direction. On-street parking is available on the south side of the street between Carlton Drive and Crenshaw Boulevard. The posted speed limit is 45 mph.
- **Hardy Street** – Hardy Street is classified as a collector roadway that runs in an east-west direction. West of the Los Angeles Sports and Entertainment District (LASED), it begins at Inglewood Boulevard and terminates at Prairie Avenue. East of LASED, it begins at Crenshaw Boulevard and ends at Van Ness

4.12 Transportation

Avenue. Hardy Street is discontinuous between Prairie Avenue and Crenshaw Boulevard. This roadway generally provides one lane in each direction with on-street parking available on both sides of the street. The posted speed limit is 30 mph.

- **Queen Street** – Queen Street is a local street that runs in an east-west direction. The roadway provides one lane in each direction with on-street parking available on both sides of the street. The posted speed limit is 25 mph.

4.12.3.2 Existing Average Daily Traffic Volumes

Seventy-five (75) segments within the study area were identified as key roadway segments for evaluation. The existing ADT on roadway segments were estimated using the Inglewood Travel Demand Forecasting (ITDF) Model for four time periods: Morning Peak Hour (AM), Midday (MD), Evening Peak Hour (PM) and Nighttime (NT).

The ITDF, which is based on the SCAG Regional Travel Demand Model, was used to forecast the number daily trips on the roadway system. The SCAG 2020-2045 RTP/SCS socio-economic data was used as the base input and updated to include all the growth associated with the related projects. The ITDF Model, similar in structure to the SCAG Regional Travel Demand Model involves four-step models including Trip Generation, Trip Distribution, Mode Split, and Traffic Assignment procedures.

The results for all four time periods were aggregated to reflect the average daily conditions. The resulting ADT volumes, which reflect typical weekday operations under existing (2020) conditions, are presented in

Table 4.12-1: Weekday Daily Traffic Volumes – Existing Conditions.

Source: Transportation Assessment Study for the Inglewood Transit Connector Project DEIR, Raju Associates, Inc., September 2021; refer to Table 2 (refer to Appendix O of this Recirculated Draft EIR).

Daily traffic volumes along Prairie Avenue between Florence Avenue and Lennox Boulevard range between approximately 21,800 to 37,250 vehicles per day; along Manchester Boulevard between Grevillea Avenue and Van Ness Avenue range between approximately 18,800 to 36,400 vehicles per day; and along Century Boulevard between Grevillea Avenue and Van Ness Avenue range between approximately 33,000 to 50,500 vehicles per day.

4.12.3.3 Existing Public Transit Service

Fourteen (14) bus lines provide services in the study area including thirteen bus lines operated by the Los Angeles County Metropolitan Transportation Authority (Metro), and one bus line operated by the County

4.12 Transportation

of Los Angeles. Additionally, the Metro C Line (Green Line) is located south of the study area. These transit lines are shown in **Figure 4.12-3: Existing Transit System** and briefly described below:

- **MTA 40 – Line 40** is a local north/south line that provides service from Downtown Los Angeles to Redondo Beach and travels primarily along La Brea Avenue, Florence Avenue and Crenshaw Boulevard within the study area.
- **MTA 111 - Line 111** is a local east/west line that provides service from Norwalk to the Los Angeles International Airport and travels primarily along Arbor Vitae Street, La Brea Avenue and Florence Avenue within the study area.
- **MTA 115 - Line 115** is a local east/west line that provides service from Norwalk to Playa del Rey and travels primarily along Manchester Boulevard within the study area.
- **MTA 117 – Line 117** is a local east/west line that provides service from Downey to the LAX Bus Center and travels primarily along Century Boulevard within the study area.
- **MTA 126 - Line 126** is a local east/west line that provides service from Manhattan Beach to Hawthorne, and travels along Prairie Avenue, Lennox Boulevard, and Hawthorne Boulevard within the study area.
- **MTA 209 – Line 209** is a local north/south line that provides service from Jefferson Park to Hawthorne and travels primarily along Van Ness Avenue in the proximity of the study area.
- **MTA 210 – Line 210** is a local north/south line that provides service from Hollywood to Redondo Beach and travels primarily along Crenshaw Boulevard within the study area.
- **MTA 211/215 - Lines 211 and 215** are local north/south lines that provide service from Redondo Beach to Inglewood and travel primarily along Locust Street, Prairie Avenue, Manchester Boulevard, and Grace Avenue within the study area.
- **MTA 212/312 – Line 212** is a local north/south line that provides service from Hollywood to Hawthorne and travels primarily along La Brea Avenue, Manchester Boulevard, Prairie Avenue, Lennox Boulevard, and Hawthorn Boulevard within the study area.
- **MTA 442 – Line 442** is a north/south express line that provides service from Downtown Los Angeles to Hawthorne and travels primarily along La Brea Avenue and Manchester Boulevard within the study area. Per Metro, this line has been discontinued as of 2021.
- **MTA 607 – Line 607** is a circulator route that begins at the Inglewood Transit Center in Inglewood and goes clockwise with major stops at the intersections of Slauson Avenue / La Brea Avenue in Windsor Hills, and Crenshaw Boulevard/54th Street in Los Angeles. Per Metro, this line has been discontinued as of 2021.
- **MTA 710 – Line 710** is a north/south ‘Rapid Bus’ line that provides service from Koreatown to Redondo Beach and travels along Crenshaw Boulevard within the study area. Per Metro, this line has been discontinued as of 2021.

4.12 Transportation

- **MTA 740 – Line 740** is a north/south ‘Rapid Bus’ line that provides service from Jefferson Park to Redondo Beach and travels primarily along La Brea Avenue, Hawthorne Boulevard, Crenshaw Boulevard, and Florence Avenue within the study area. Per Metro, this line has been discontinued as of 2021.
- **Los Angeles County Lennox Link** is a circulator route that begins at Lennox Park and travels in a counter-clockwise direction along Lennox Boulevard, Burin Avenue, 111th Street, Freeman Avenue, 104th Street, Yukon Avenue, Century Boulevard, Flower Street, Hardy Street, Myrtle Avenue and La Brea Avenue.
- **Metro C Line (Green Line)** – The Metro C Line is an east/west light rail line that provides service to Norwalk, Lynwood, Willowbrook, Hawthorne, El Segundo, and Redondo Beach. The C Line’s Hawthorne / Lennox Station lies approximately 0.8 miles south of Century Boulevard.

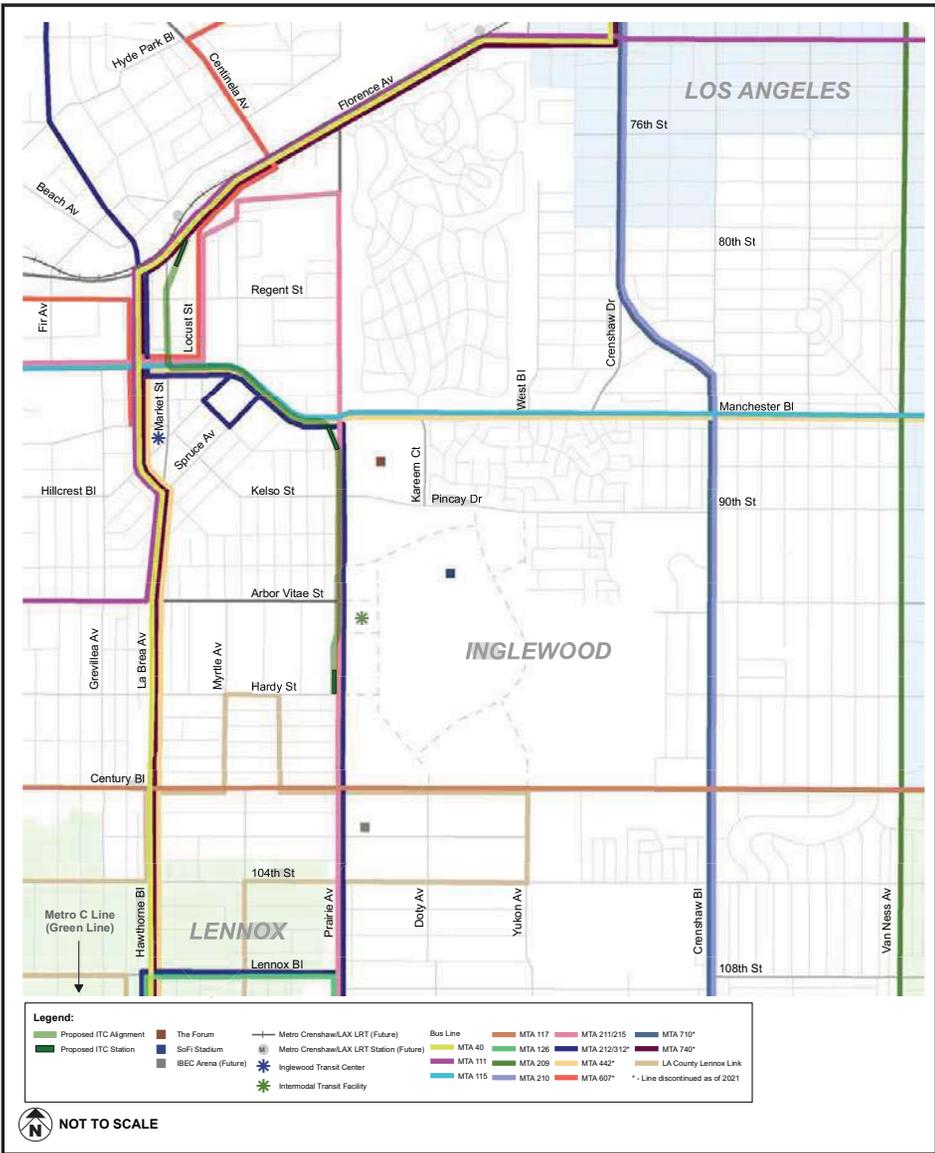

The average ridership for Metro bus lines serving the study area was compiled using data provided by Metro in 2019. Metro Bus Lines 40, 111 and 115 have an average daily bus ridership ranging from 14,561 (Line 40) to 15,653 (Line 111) passenger trips; while Metro Bus Lines 126, 209, 211/215, 442 and 607 have an average daily ridership ranging from 62 (Line 607) to 911 (Line 209) daily passengers. Additionally, Metro C Light Rail Transit (LRT) line (Green) has an average of 30,236 daily ridership.

Metro is constructing the Metro K Line from the existing Metro E Line (Exposition Line) at Crenshaw Boulevard/Exposition Boulevard, 8.5 miles south to connect with the Metro C Line (Green Line) at the Aviation/Imperial Station.

The K Line is projected to be completed and commence operations shortly. The K line includes the Fairview Heights, Downtown Inglewood, Westchester-Veteran and Crenshaw/Imperial stations. The Market Street/Florence Avenue Station will serve as the transfer point between the proposed Project and the K Line.

**Transit Ridership Along Corridors**

Transit ridership data for average weekday in October 2019 (pre-COVID 19) for transit lines serving the study area were obtained from Metro. This data includes the average daily bus boardings and deboardings at each stop and provided in **Table 4.12-2: Average Weekday Ridership at Bus Stops within Study Area**. Crenshaw Boulevard at the Florence Avenue stop has the highest boarding and alighting activities with 997 boardings and 904 alightings compared to other bus stops within the study area. La Brea Avenue – Hawthorne Boulevard appears to be the busiest transit corridors within the study area; the corridor has a daily average of 259 boardings and 269 alightings.

#### 4.12.3.4 Existing Bicycle Facilities

The Draft Inglewood Active Transportation and Safe Routes to School Plan (City of Inglewood, June 2019) identifies existing bicycle facilities within the City. These facilities are classified as Bike Paths (Class I), Bike Lanes/Buffered Bike Lanes (Class II), Bike Routes/Bike Boulevards (Class III), and Protected Bike Lanes (Class IV).

Bicycle facilities are identified along the following streets:

##### **Class II Bike Lanes / Buffered Bike Lanes**

- Bike Lanes
  - Hawthorne Boulevard from Lennox Boulevard to 111th Street
  - Locust Street from Florence Avenue to Manchester Boulevard
  - Van Ness Avenue from 81st Street to Manchester Boulevard
  - Florence Avenue from Locust Street to Hillcrest Boulevard
  - Florence Avenue from Prairie Avenue to mid-way between Prairie Avenue and West Boulevard
- Buffered Bike Lanes
  - Florence Avenue from Hillcrest Boulevard to Centinela Avenue (westbound only)

##### **Class III Bike Routes / Bike Boulevard**

- Bike Routes with Sharrows
  - Van Ness Avenue from Century Boulevard to Imperial Highway
  - Florence Avenue from Hillcrest Boulevard to Centinela Avenue (eastbound only)
  - Florence Avenue from Centinela Avenue to Prairie Avenue
  - Florence Avenue from mid-way between Prairie Avenue and West Boulevard to West Boulevard
  - 76th Street from Crenshaw Drive to Vermont Avenue

#### 4.12.3.5 Existing Pedestrian Facilities

The pedestrian circulation system includes crosswalks, crosswalk push buttons, intersection traffic control, and sidewalks available to serve pedestrians. Sidewalks are generally provided along all streets in the study area. Florence Avenue, Market Street, Locust Street and Regent Street offer access and circulation possibilities to the proposed Market Street/Florence Avenue Station. Currently, sidewalks are available on the south side of Florence Avenue and on both sides of Market Street, Locust Street and Regent Street adjacent to and in the vicinity of the Market Street/Florence Avenue Station. Pedestrian crosswalks to the proposed station are available at adjacent intersections of Florence Avenue/Market Street and Florence Avenue/Locust Street.

Prairie Avenue, Manchester Boulevard, and Kelso Street-Pincay Drive offer pedestrian access and circulation possibilities to the proposed station at the Forum. Sidewalks are available on both sides of Prairie Avenue, Manchester Boulevard, and Kelso Street-Pincay Drive adjacent to and in the vicinity of the proposed Project station. Passenger crosswalks to the proposed station are available at adjacent intersections of Prairie Avenue/Manchester Boulevard and Prairie Avenue/Kelso Street-Pincay Drive.

Prairie Avenue and Hardy Street offer pedestrian access and circulation possibilities to the proposed Prairie Avenue/Hardy Street station. Sidewalks are available on both sides of Prairie Avenue and Hardy Street adjacent to and in the vicinity of the station. Passenger crosswalks to the proposed station are available at adjacent intersections of Prairie Avenue/Hardy Street and Prairie Avenue/Arbor Vitae Street.

The majority of intersections near the proposed alignment and stations are signalized and generally provide pedestrian amenities.

A brief description of the pedestrian crossing locations and amenities, including traffic signals, intersection crosswalks, and crosswalks with push buttons, along the proposed Project alignment follows:

### **Pedestrian Crossing Locations along Market Street**

- Intersection of Market Street/Florence Avenue – This intersection is signalized with pedestrian indications. Standard parallel crosswalks are available on the west and south legs of the intersection. Crosswalks are not provided on the east leg of the intersection. Call pushbuttons are provided on the west leg of the intersection. Pedestrian indications are actuated / automated on the south leg of the intersection.
- Intersection of Market Street/Regent Street – This intersection is signalized with pedestrian indications. Standard parallel crosswalks are available on the north, west and east legs of the intersection and a crosswalk with decorative design is available on the south leg. Call pushbuttons are provided on all approaches.
- Intersection of Market Street/Queen Street – This intersection is signalized with pedestrian indications. Decorative crosswalks are available on all four legs. Call pushbuttons are provided on all approaches.

### **Pedestrian Crossing Locations along Manchester Boulevard**

- Intersection of Market Street/Manchester Boulevard – This intersection is signalized with pedestrian indications. Decorative crosswalks are available on all four legs. Call pushbuttons are provided on all approaches of the intersection.
- Intersection of Locust Street/Manchester Boulevard – This intersection is signalized with pedestrian indications. Standard parallel crosswalks are available on all four legs of the intersection. Call pushbuttons are provided on the west and east legs of the intersection. Pedestrian signal calls are actuated/automated on the north and south legs of the intersection.
- Intersection of Hillcrest Boulevard/Manchester Boulevard – This intersection is signalized with pedestrian indications. Standard parallel crosswalks are available on all four legs of the intersection. Call pushbuttons are provided on the west and east legs of the intersection. Pedestrian signal calls are actuated/automated on the north and south legs of the intersection.
- Intersection of Spruce Avenue/Manchester Boulevard – This intersection is signalized with pedestrian indications. Standard parallel crosswalks are available on west and south legs of the intersection. Crosswalks are not provided on the east leg of the intersection. Call pushbuttons are provided on the west and south legs of the intersection.

### **Pedestrian Crossing Locations along Prairie Avenue**

- Intersection of Prairie Avenue/Manchester Boulevard – This intersection is signalized with pedestrian indications. Standard parallel crosswalks are available on all four legs of the intersection. Call pushbuttons are provided on all approaches of the intersection.

- Intersection of Prairie Avenue/Nutwood Street – This intersection is unsignalized with the eastbound approach stopped at the intersection. A continental (ladder) crosswalk is available on the west leg of the intersection.
- Intersection of Prairie Avenue/Kelso Street–Pincay Drive – This intersection is signalized with pedestrian indications. Yellow school crosswalks are available on all four legs of the intersection. Call pushbuttons are provided on all approaches of the intersection.
- Intersection of Prairie Avenue/La Palma Drive – This intersection is unsignalized and stop controlled on the eastbound approach. A continental crosswalk is available on the west leg of the intersection.
- Intersection of Prairie Avenue/Buckthorn Street–Touchdown Drive – This intersection is signalized with pedestrian indications. Standard parallel crosswalks are available on all four legs of the intersection. Call pushbuttons are provided on all approaches of the intersection.
- Intersection of Prairie Avenue/Arbor Vitae Street – This intersection is signalized with pedestrian indications. Standard parallel crosswalks are available on all four legs of the intersection. Call pushbuttons are provided on all approaches of the intersection.
- Prairie Avenue/Hardy Street – This intersection is signalized with standard parallel crosswalks being available on the north and west legs of the intersection, and east leg from the Hollywood Park Specific Plan (HPSP) area. A crosswalk is not provided on the south leg of the intersection. Call pushbuttons are provided on the north, west, and east legs of the intersection.

### **4.12.3.6 Existing On-Street Parking**

A summary of the number of on-street parking spaces and parking restrictions along Market Street, Manchester Boulevard, and Prairie Avenue along the proposed alignment are described below:

There are currently 104 on-street parking spaces located along Market Street between Florence Avenue and Manchester Boulevard with parking restrictions listed below.

Metered 2-hour on-street parking is allowed on both sides of Market Street between Florence Avenue and Regent Street, all day except from 3:00 AM to 7:00 AM. There are 30 on-street parking spaces on west side of the street and 14 on-street parking spaces on the east side of the street.

Metered 2-hour on-street parking is allowed on both sides of Market Street between Regent Street and Manchester Boulevard. There are 31 on-street parking spaces on the west side of the street and 29 on-street parking spaces on the east side of the street.

There are currently 70 on-street parking spaces located along Manchester Boulevard between Market Street and Prairie Avenue with the parking restrictions listed below.

On-street parking is prohibited on both sides of Manchester Boulevard between Market Street and the alley to the east.

Metered 2-hour on-street parking is allowed on both sides of Manchester Boulevard between the alley (west of Locust Street) and Locust Street all day except from 3:30 AM to 7:00 AM. There are four on-street parking spaces on the south side of the street and seven on-street parking spaces on the north side of the street.

Metered 2-hour on-street parking is allowed on both sides of Manchester Boulevard between Locust Street and Hillcrest Boulevard all day, except from 3:30 AM to 7:00 AM. There are nine on-street parking spaces on the south side of the street and six on-street parking spaces on the north side of the street.

On-street parking is prohibited on south side of Manchester Boulevard between Hillcrest Boulevard and Spruce Avenue; metered 2-hour on-street parking is allowed on north side of Manchester Boulevard between Hillcrest Boulevard and Spruce Avenue all day, except from 3:30 AM to 7:00 AM. There are 12 on-street parking spaces located on the north side of the street.

Metered 2-hour on-street parking is allowed on south side of Manchester Boulevard between Spruce Avenue and Tamarack Avenue with the exception of no parking allowed during the evening peak hours from 4:00 PM to 6:00 PM. Metered 2-hour on-street parking is allowed on the north side of Manchester Boulevard between Spruce Avenue and Tamarack Avenue all day, except from 3:30 AM to 7:00 AM. There are 10 on-street parking spaces on the south side of the street and 14 on-street spaces on the north side of the street.

Non-metered 2-hour on-street parking is allowed on south side of Manchester Boulevard between Tamarack Avenue and Osage Avenue with the exception of no parking allowed during the evening peak period (4:00 PM to 6:00 PM); metered 2-hour on-street parking is allowed on north side of Manchester Boulevard between Tamarack Avenue and Osage Avenue all day, except from 3:30 AM to 7:00 AM. There are approximately four on-street parking spaces on the south side of street and four on-street parking spaces on the north side of the street.

On-street parking is prohibited on both sides of Manchester Boulevard between Osage Avenue and Prairie Avenue. There are no on-street parking spaces along Prairie Avenue between Manchester Boulevard and Hardy Street.

#### 4.12.4 ADJUSTED BASELINE CONDITIONS

Adjusted Baseline conditions are discussed below in 4.12.5.2: *Methodology*.

#### 4.12.5 THRESHOLDS OF SIGNIFICANCE

Pursuant to SB 743, the latest Technical Advisory from OPR explicitly states that transit projects including passenger rail projects (like the proposed ITC Project) would be presumed to not cause significant impacts since they would reduce VMTs, encourage development of multimodal transportation networks and encourage development of mixed-use projects (diversity of land uses), the three primary goals of SB 743. However, to quantify the magnitude of reduction of VMTs, and consequently GHG emissions and potential operational benefits associated with the proposed Project, the Project is evaluated based on the following thresholds derived from Appendix G of the CEQA Guidelines relative to transportation impacts. Significant transportation impacts would occur if the proposed Project would result in the following:

- Threshold T-1: Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and passenger facilities.**
- Threshold T-2: Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).**
- Threshold T-3: Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).**
- Threshold T-4: Result in inadequate emergency access.**

CEQA Guidelines section 15064.3 establishes that, generally, VMT is the appropriate measure of transportation impacts. Construction impacts are temporary in nature and therefore are typically not considered as significant impacts for purposes of CEQA. While no quantitative significance criteria are established for evaluation of construction impacts, potential effects associated with construction are evaluated based on the duration of construction and the extent of disruption during various construction activities.

#### 4.12.5 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

##### 4.12.5.1 Project Design Features

The proposed Project includes the following Project Design Features (PDFs) related to the transportation and traffic effects of the Project.

##### PDF TRANS-1 Transit Access and Circulation Program

The Project Task Force [as identified in the Construction Commitment Program (CCP)] will be responsible for the following:

#### 4.12 Transportation

- Ensuring that access to bus transit stops and bus circulation are always maintained, unless infeasible and closure is approved by the City.
- Coordinating with Metro and any other transit service providers to:
  - Relocate bus stop(s) if necessary, during construction with appropriate wayfinding signage and information dissemination, with all temporarily relocated bus stops located as close as feasible to the original bus stop location.
  - Reroute transit bus lines if necessary, during construction with appropriate wayfinding signage and information dissemination.

#### PDF TRANS-2 Construction Staging and Traffic Control Program

A Construction Staging and Traffic Control Program will be developed by members of the Project Task Force (as defined in the CCP), subject to review and acceptance by the City and/or the JPA, and will address the following topics:

- Coordination with other public infrastructure projects within the City's boundaries.
- Detour routes, including analysis of impacts to pedestrian, business, bicycle, and traffic flow.
- Coordination of closures and restricted access during the construction period with special attention during periods of expected heavy traffic from events scheduled at SoFi Stadium and other venues in the Los Angeles Sports and Entertainment District at Hollywood Park, the Forum, and the Inglewood Basketball and Entertainment Center.
- Coordination with the City, police, and fire services department regarding maintenance of emergency access and response times.
- Monitoring and coordination of construction materials deliveries.
- Notification to businesses and residents on upcoming construction activities including but not limited to the establishment of a website with project construction information, signage, and web-based media.

The Traffic Control Program will be updated as needed based on the following principals:

- Minimize traffic impacts on residential streets.
- Establish minimum traffic lane requirements for Manchester Boulevard, Florence Avenue, and Prairie Avenue during construction such that at least the full number of traffic lanes in the peak direction, and if feasible, one traffic lane in the off-peak direction is available, with additional capacity provided through appropriate detour routes. The directional traffic lanes may be reversible to maintain the peak directional capacity in either direction as necessitated by traffic demands. For all other streets potentially affected by construction, maintain at least one lane of traffic in each direction unless otherwise approved by the City.

#### 4.12 Transportation

- Maintain access to and from all alleys at one or both ends of the alley when possible. If an alley is obstructed such that a turnaround by any vehicle is not feasible, traffic flaggers shall be provided to control access to/from the alley.
- Maintain access for all public safety vehicles (such as police, fire, and emergency response).
- Maintain bicycle and pedestrian access within the Project area or approved detours at all times.
- Provide adequate street access to City service vehicles, including but not limited to trash pickup and street sweeping service vehicles, during planned service times.
- Sidewalk closures should be avoided to the degree feasible and are permitted only when approved by the City. Accessible detours shall be provided if sidewalk closures are necessary.
- Use traffic control officers/flaggers as appropriate to minimize the degree and duration of impacts and maintain safety.
- Establish and maintain wayfinding signage.
- Maintain vehicular and pedestrian access to all businesses and residents impacted by construction activities including roadway closures.
- Hold quarterly community outreach meetings with businesses and residents to provide updates on temporary, full, or partial street closures necessary for construction. Website will be updated 45 to 60 days prior to planned dates of any street closures.
- All closures, full or partial, are subject to City review and approval which shall consider measures to minimize the degree and duration of street and lane closures.

#### PDF TRANS-3 Preliminary Haul and Overload Routes

- Haul routes and overload/oversized vehicle routes are subject to review and approval by the City.
- To the extent possible, truck deliveries and hauling of bulk materials such as aggregate, bulk cement, dirt, etc. to the Project area, and hauling of material from the Project area, shall be scheduled during off-peak hours to avoid the peak commuter traffic periods on designated haul routes.
- Truck deliveries and hauling of dirt, aggregate, bulk cement, and all other materials and equipment, shall be on designated routes only (freeways and non-residential streets).

#### PDF TRANS-4 Pedestrian Access Program

A Pedestrian Access Program will be developed by members of the Project Task Force (as defined in the CCP), subject to review and acceptance by the City and/or the JPA, and will adhere to the following principles:

- Pedestrian access to buildings shall be maintained at all times.

#### 4.12 Transportation

- Maintain all crosswalks to the extent feasible. Whenever a crosswalk is removed from service, establish and maintain temporary accessible replacement crosswalks as close as practicable to the original crosswalk locations unless the City determines that a replacement crosswalk is not necessary to maintain an adequate level of service. Replacement crosswalks shall be identified and controlled by wayfinding signs approved by the City.
- Establish and maintain passenger wayfinding signage.
- Maintain sidewalk access for pedestrians, including providing temporary sidewalks if existing sidewalks are disrupted during construction. Any sidewalk closures are subject to review and approval by the City.
- Sidewalks that are being maintained in a temporary condition shall meet all applicable safety standards, including but not limited to the requirements of the Federal Americans with Disabilities Act and similar California laws for sidewalks being maintained in a temporary condition.
- Protect pedestrians from construction-related debris, dust, and noise; such protection may include the use of dedicated pedestrian barriers.
- Coordinate with the Inglewood Unified School District and the City to provide crossing guards at locations requested by IUSD or the City when crosswalks or sidewalks are closed. Identify temporary alternate routes to school, working closely with IUSD and the City, and disseminate this information to schools and stakeholders affected by construction.

#### PDF TRANS-5 Parking Management Plan

A Parking Management Plan (as defined in the CCP) will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and shall adhere to the following principles:

- Parking, staging, or queuing of Project-related vehicles, including workers' personal or project-assigned vehicles, trucks, and heavy vehicles, shall be prohibited on City streets at all times, outside of a permitted workspace unless otherwise approved by the City. If the use of residential permit parking spots is necessary for construction, provide for equivalent overnight replacement parking for removed residential permit parking spots at the nearest possible location to the location where parking has been removed.
- Replace loss of metered parking spaces by making available an equivalent number of parking spaces in an off-street parking facility located near the lost parking. The parking spaces shall be provided for public use at a rate no greater than the metered parking rate.
- Provide public notice of the availability of the alternative parking spaces through outreach to businesses and residents with signage.

#### 4.12 Transportation

#### 4.12.5.2 Methodology

The ITDF, which is based on the SCAG Regional Travel Demand Model, was used to estimate VMT in the City and assess the effect of the Project on VMT. The geographic scope for the evaluation of VMT included all of the traffic analysis zones (TAZs) within the City of Inglewood such that all trips and consequently, VMTs to and from areas within the City are included. Since the ITDF is based on the SCAG Regional Travel Demand Model, regional conditions are reflected in the model and the VMT analysis conducted with the model.

The ITDF Model and an event model, described in the following paragraph, were used to forecast the number of daily trips on the roadway system for both non-event and event-based traffic for the scenarios evaluated in this Recirculated Draft EIR. Socio-economic data from the SCAG's 2020–2045 RTP/SCS was used as the base input and updated to include all the growth associated with related projects. The ITDF, which is similar in structure to the SCAG Regional Travel Demand Model involves four-step models including Trip Generation, Trip Distribution, Mode Split and Traffic Assignment procedures, implemented using TransCAD software package.

The event model includes a series of spreadsheet-based pivot tables using the Metro Mode-Split Model. The event model includes total attendance, average vehicle ridership, transit accessibility for both walk-access and drive-access and modal-split parameters to estimate the ITC ridership values for each of the different types of events at each of the major event venues in the area including the Forum, SoFi Stadium, and the Inglewood Basketball and Entertainment Center (IBEC). Vehicular traffic generation estimated in the event model was then distributed utilizing trip distribution based on season ticket data or mobile source data for each type of event at the various venues, and then assigned on the roadway network using specialized procedures in ArcGIS' network analyst extension.

The ITDF Model and the Metro Mode-Split Model were used to estimate the non-event based travel demand without and with the ITC Project, while the event model was utilized to estimate the event travel forecasts without and with the ITC Project. The non-event and event-based travel forecasts were aggregated on the various roadway segments identified within the study area to obtain ADT estimates for the following scenarios:

- Adjusted Baseline Conditions Non-Event Weekdays without Project
- Adjusted Baseline Conditions Non-Event Weekdays with Project
- Future Opening Year (2027) Conditions with Event without Project
- Future Opening Year (2027) Conditions with Event with Project
- Future Horizon Year (2045) Conditions with Event without Project
- Future Horizon Year (2045) Conditions with Event with Project

For evaluation of VMTs for these scenarios, the ITDF model was used with all Inglewood TAZs used as ‘select-zones’ in the model to determine the trips and associated VMTs to and from the City TAZs for non-event conditions under each of the scenarios analyzed in this study. For events of all types at each of the venues, VMTs were estimated including private vehicles, shuttles, and TNCs for both attendees and employees in the event model spreadsheets.

The methodology for evaluating each of the above scenarios is described below:

#### **Adjusted Baseline Conditions**

The Adjusted Baseline Environmental Setting is described in **Section 4.0: Environmental Analysis**. These environmental conditions included in the Adjusted Baseline Conditions include socio-economic and demographic components, and transportation network components that are currently under construction or have building permits issued by the City of Inglewood in the immediate vicinity of the ITC Project alignment. Accordingly, the travel demand forecasting model used in the process was updated as required to reflect these assumptions. The socio-economic databases used in the ITDF model were updated to include portions of Phase 1 of the HPSP. The City has issued permits for a substantial portion of HPSP Phase 1 uses including the 70,240-seat SoFi Stadium, the 6,000-seat Performance Venue, approximately 518,000 SF of retail and restaurant uses, approximately 466,000 SF of office use, 314 dwelling units and approximately 12 acres of open space. Additionally, the Metro K line is assumed to be completed and operational as part of the Adjusted Baseline Conditions. The primary socio-economic data including population, households and employment within the City of Inglewood are estimated to be approximately 117,688, 38,958 and 37,763, respectively under Adjusted Baseline Conditions.

ITC ridership projections for Adjusted Baseline conditions were simulated using the latest SCAG Regional Model and Metro Mode Split Model including updates to the socio-economic databases and transit networks to reflect the ITC Project, and the other transit network changes noted previously. The estimated non-event daily ITC ridership under Adjusted Baseline conditions is approximately 1,844 daily passengers.

The projected weekday daily traffic volumes along the analyzed street segments in the study area for Adjusted Baseline non-event conditions without the Project were estimated using the model output on each of the individual segments of each of the arterials (major and minor) and collector streets within the study area.

Adjusted Baseline non-event conditions with Project scenario also projected weekday daily traffic volumes along the analyzed street segments using the model output on each of the individual segments of each of the arterials (major and minor) and collector streets within the study area.

Utilizing the updated socio-economic/demographic data and the transportation network detailed above, the ITDF model simulations were conducted to obtain Adjusted Baseline daily traffic volume forecasts and VMT estimates. These daily traffic volumes were estimated using the model output on each of the individual segments of each of the arterials (major and minor) and collector streets within the study area.

#### **Future Opening Year (2027) Conditions**

The ITDF Model was updated to reflect changes in demographic/economic and transportation network characteristics based on the latest SCAG 2020-2045 RTP/SCS model-based socio-economic databases and network assumptions. Next, socio-economic data growth associated with related projects identified in the area of influence of the study area was verified within the socio-economic data and further updated where required. Additional special generator input such as LAX-related trip tables including the forecasted Million Annual Passengers (MAP-level) growth, consistent with the SCAG 2020-2045 RTP/SCS, were also included in the ITDF in the overall estimation of travel demands under future opening year conditions.

The National Football League (NFL) Game event-day traffic model under future opening year conditions was utilized to prepare the NFL game day event traffic forecasts. A sold-out NFL afternoon game event on a weekday at the NFL Stadium (70,240 attendees and 6,000 employees per game) was assumed in the model. The NFL-Game event-day VMT model was also used to estimate the NFL game event-generated VMT. Attendee and employee vehicle trips by private vehicles, transportation network company (TNCs), and shuttles to and from the parking facilities to the Stadium, were included in both the event traffic demand and VMT models.

Forecasts from the Future Opening Year (2027) ITDF model and NFL-Game event-day traffic model was aggregated to reflect event-day ADTs as well as the event-day daily VMTs under future opening year conditions.

Future 2027 Conditions also reflect related development projects anticipated to be constructed and occupied prior to the opening year of the proposed Project. A total of 395 related projects were identified. Of these related projects, 74 are located in the City of Inglewood, 91 are within the City of Los Angeles to the east and west of the City of Inglewood, 73 are in the City of Culver City to the north, 120 are in the South Bay cities of El Segundo, Lawndale, Hawthorne, and Gardena to the south and south-west, and 37 projects are located within the unincorporated area of the County of Los Angeles scattered in the neighboring areas.

Notable among these development projects within the City of Inglewood is HPSP Phase 2. When combined with the baseline development in Phase 1, it is assumed that there will be a total of 890,000 SF of retail

space, approximately 4.03 million SF of office space, 2,500 dwelling units and a 300-room hotel, in addition to the SoFi stadium and the Performance Venue.

The primary socio-economic data variables including population, households and employment within the City of Inglewood are estimated to be approximately 152,774, 51,251, and 61,327, respectively, under future opening year conditions.

#### **Future Opening Year (2027) Conditions with Event without Project**

Future Opening Year (2027) non-event forecasted daily traffic volumes from the updated ITDF model were combined with a sold-out NFL Game Event-Only daily traffic volumes to obtain Future Opening Year (2027) with Event Day without ITC Project weekday daily traffic volumes.

#### **Future Opening Year (2027) Conditions with Event with Project**

Weekday 2027 non-event conditions with the ITC Project were simulated using the updated ITDF and Event Travel Demand Model (ETDM) models, including updates to socio-economic databases and transit networks to reflect the ITC Project, as well as associated transit base-network changes and operational parameters.

NFL Game event day conditions with the ITC Project were simulated using a spreadsheet-based model based on the METRO mode-split model and actual data related to the event attendees' zip-code information.

#### **Future Horizon Year (2045) Conditions**

The ITDF model was updated to reflect changes in demographic/socio-economic data and transportation network characteristics based on the latest SCAG 2020-2045 RTP/SCS based model data. Additional special generator input such as LAX-related trip tables including projected MAP growth, consistent with the latest SCAG 2020-2045 RTP/SCS were also included in the ITDF to produce travel demands under future horizon year conditions.

The NFL-Game event-day traffic model under future horizon year conditions was developed to prepare the event traffic forecasts. A sold-out NFL afternoon game event on a weekday at the NFL Stadium (70,240 attendees and 6,000 employees per game) was assumed in the model. Metro's mode-split model was used along with the event day characteristics. The NFL-Game event-day VMT model was also used to estimate the event-generated VMT. Attendee and employee vehicle trips including private vehicles, transportation network company (TNCs) vehicles, and shuttles to and from the parking facilities to the Stadium, were included in both the event travel demand and VMT models.

Results from the Future Horizon Year (2045) updated ITDF and NFL-Game event-day traffic models were combined to reflect event-day daily traffic under future horizon year conditions. Similarly, results from the 2045 ITDF model and NFL-Game event-day VMT model were combined to reflect cumulative event-day daily VMT under future horizon year conditions.

The socio-economic data describing demographic and socio-economic characteristics within the model area was updated based on the 2045 socio-economic databases from the 2020 SCAG RTP/SCS Regional Model data. This data was updated to account for growth from related projects. In addition to the list of development projects used under the Future Opening Year (2027) conditions, the HPSP Phase 2 was included in the socio-economic databases used in the ITDF model for the future horizon year 2045 conditions. It has been assumed that by 2045, a total of 6.03 million SF of office use would be in place in the overall HPSP area.

The primary socio-economic data variables including population, households and employment within the City of Inglewood are estimated to be approximately 165,618, 56,952 and 69,280, respectively, under Future Horizon Year (2045) conditions.

#### **Future Horizon Year (2045) Conditions with Event Without Project**

Weekday 2045 non-event conditions without the ITC Project were simulated using the ITDF model updated to include the latest SCAG 2020–2045 RTP / SCS Model data and growth associated with related projects in the study area.

Next, NFL Game event conditions without the ITC Project were simulated using the ETDM model based on the Metro's mode-split model and actual data related to the event attendees' zip-code information.

Future Horizon Year (2045) non-event forecasted daily traffic volumes from the updated ITDF model were combined with a sold-out NFL Game Event-Only daily traffic volumes without the ITC Project to obtain the cumulative Future Horizon Year (2045) with NFL Event without ITC Project weekday daily traffic volumes.

#### **Future Horizon Year (2045) Conditions with Event with Project**

Weekday 2045 non-event conditions with the ITC Project were simulated using the ITDF model updated to include data from the latest SCAG 2020–2045 RTP / SCS Model and transit network including the ITC Project and associated operational scenarios. NFL Game event with the ITC Project conditions were simulated using the ETDM model.

### **Travel Demand Model for Events**

An ETDM, a multistep model based on the Metro Mode-Split Model output including transit accessibility parameters, was used to estimate traffic generated by events at the event venues in the study area. The ETDM utilizes event type, attendance, and mode splits to provide estimates of the proposed Project transit ridership, as well as modal trip generation estimates for use in generating vehicle trip assignments on the roadway network.

The specific event-day traffic conditions were simulated using trip generation estimates from the ETDM and a trip distribution profile developed based on ticket sales or mobile source data that identified the zip codes of event attendees.

#### **4.12.5.3 Project Improvements**

The ITC Project components include an elevated grade-separated guideway and three stations that traverse along Market Street, Manchester Boulevard, and Prairie Avenue. A brief description of the existing and proposed characteristics of these roadway segments including number of lanes, intersection geometry, traffic control, on-street parking, sidewalks/crosswalks, and speed limits is provided below.

##### **Market Street Segment**

Market Street between Florence Avenue and Manchester Boulevard will include the same number of lanes as existing conditions (one lane in either direction). No change to roadway throughput or capacity is proposed as part of the Project. The speed limit along Market Street will remain at 25 mph, similar to existing conditions.

Lane configurations and traffic control at intersections will mostly remain similar to existing conditions at the intersections of Market Street/Florence Avenue and Market Street/Manchester Boulevard, resulting in very little to no changes to intersection capacities. Changes to intersection lane configurations due to the proposed Project would occur at the intersections of Market Street/Regent Street and Market Street/Queen Street. No changes to intersection traffic control are proposed at these intersections.

##### **Manchester Boulevard Segment**

Manchester Boulevard between Market Street and Prairie Avenue will include the same number of lanes as existing conditions, i.e., two lanes in either direction with turn lanes at intersections between Market Street and Hillcrest Boulevard; and two lanes / three lanes in the westbound / eastbound directions, respectively, with turn lanes at intersections between Hillcrest Boulevard and Prairie Avenue. No change to roadway capacity or traffic control is proposed as part of the Project. The speed limit along Manchester Boulevard will remain at 35 mph, similar to existing conditions.

Lane configurations at intersections will mostly remain similar to existing conditions at all locations within that stretch, resulting in no changes to intersection capacities. Additionally, little to no reductions in turn-lane storage lengths are proposed at any of the intersections within this stretch as part of the ITC Project. Minor modifications to lane configurations at the intersection of Manchester Boulevard and Prairie Avenue may be required or desired based on prevailing demands at the time of construction of the Project. This could be achieved by restriping at the time of implementation of the Project.

##### **Prairie Avenue Segment**

Prairie Avenue between Manchester Boulevard and Hardy Street will include the same number of lanes as existing conditions (three lanes in either direction with a central turn lane including the turn lanes at intersections). No change to roadway capacity is proposed as part of the Project. The speed limit along Prairie Avenue will remain at 40 mph, similar to existing conditions. No on-street parking will be allowed along Prairie Avenue within this stretch similar to existing conditions.

Lane configurations and traffic control at intersections will mostly remain similar to existing conditions at all locations within that stretch, resulting in no changes to intersection capacities. Additionally, no reductions in storage lengths are proposed at the intersection turn lanes as part of the ITC Project. Minor modifications to lane configurations at the Manchester Boulevard / Prairie Avenue intersection may be required or desired, based on prevailing traffic demands at the time of implementation of the Project.

##### **Pick-Up/Drop Off Areas and Surface Parking Lots**

Pick-up/Drop-off areas would be provided along the west side of Locust Street south of Florence Avenue, as well as along the north-side of Regent Street between Locust Street and Market Street. A reduction in on-street parking spaces of approximately thirteen (13) spaces along Regent Street and seventeen (17) spaces along Locust Street would occur due to the Pick-up/Drop-off areas and the surface parking lot driveways proposed as part of the Project.

A surface parking lot with approximately 650 public parking spaces is proposed at the adjacent Market Street/Florence Avenue station site. This surface parking lot would provide the replacement parking spaces for the reduced parking along Locust Street and Regent Street where Pick-up/Drop-off areas are proposed and additional public parking to support use of the ITC and Downtown Inglewood in general.

There are currently 104 on-street parking spaces along Market Street between Florence Avenue and Manchester Boulevard. The Market Gateway Project (D3 Project) would reduce the on-street parking by 11 spaces along the west side of Market Street between Florence Avenue and Regent Street. The proposed Project would reduce an additional 37 on-street parking spaces along Market Street between Florence

#### 4.12 Transportation

Avenue and Manchester Boulevard. These spaces will be relocated to the surface parking lot at the Market Street/Florence Avenue station site.

There are currently 81 on-street parking spaces along Manchester Boulevard between Prairie Avenue and La Brea Avenue. The Project would result in reduction of approximately 48 metered on-street parking spaces. An additional off-street surface parking lot will also be provided at the northeast corner of Market Street and Manchester Boulevard to provide approximately 50 additional public parking spaces, replacing six (6) existing spaces, and obtaining access off of the alley east of the site.

Finally, a surface parking lot is proposed at the Prairie Avenue/Hardy Street station. This parking lot would have approximately 80 parking spaces and a shuttle bus pick-up and drop-off area. This lot would be used for public parking, TNCs and shuttle bus pick-up and drop-off operations during events.

In addition, the City is considering building a parking structure on the City's Inglewood Transit Facility (ITF) site located on the southeast corner of Prairie Avenue and Arbor Vitae Street within the Hollywood Park Specific Plan area. This parking structure would provide additional public parking near event venues in the LASED and for the IBEC. The ITF site is currently improved as a surface parking lot and bus transit facility. This planned parking structure would provide up to 2,500 parking spaces in a six-level building.

While this proposed parking facility would be located within the Hollywood Park Specific Plan area and is not proposed as part of the Project, it is considered herein as part of the potential circulation system in which the Project will operate.

#### 4.12.5.4 Impact Analysis

An evaluation of the impact criteria for the proposed Project under construction and in operation is provided in the following sections.

**Impact T-1:** **Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?**

#### Construction

Construction of the proposed Project would occur in eight phases over approximately 46 months between January 2024 and November 2027. The detailed construction phasing is described in **Section 3.0: Project Description** and represents a conservative set of assumptions for analysis of the maximum potential impacts from construction of the Project. It is likely that these construction phases will overlap to provide the most efficient construction schedule. Prior to construction of the proposed Project, reconstruction of

#### 4.12 Transportation

the existing Vons store proposed to be demolished to allow construction of the MSF is proposed on the corner of Manchester Boulevard and Hillcrest Boulevard.

A summary description of construction phasing is provided below:

- **Phase 1** would include, but not limited to, demolition of buildings and site improvements on properties acquired for construction of the Project and the beginning of construction of the Maintenance and Storage Facility (MSF), trenching and installation of primary power duct bank, and preparatory work on the east side of Prairie Avenue to allow for the roadway shift. Phase 1 construction would start in January 2024. After demolition of existing buildings and site improvements, the remaining asphalt flatwork areas at the commercial plaza at Market Street and Regent Street, the commercial building at 150 S. Market Street, and the retail commercial center on the northwest corner of Prairie Avenue and Hardy Street will provide space for construction staging and on-site parking for construction staff throughout the entire project duration.
- **Phase 2** would include activities to enable the construction sequence of the guideway along Prairie Avenue from the Hardy Street intersection to Manchester Boulevard and work at the MSF site. Phase 2 construction would also include removal of existing sidewalks, roadways, landscaping, and demolition of other improvements as needed along the guideway alignment and the installation of buildings for the electrical equipment and subsystems at each of the two Power Distribution System (PDS) Substation sites. The second phase of construction would occur in 2024 through 2025. This phase will include the construction of the primary power feed from utility provider Southern California Edison (SCE). The feed would extend from the SCE's Inglewood substation at the northwest corner of Florence Avenue and Ivy to the MSF. The feed will consist of an underground duct bank of medium voltage conductors located in the public right way, routed from the Inglewood substation: south along Fir Avenue to Regent Street; east on Regent Street to Market Street; south on Market Street to Manchester Boulevard; east on Manchester Boulevard to the MSF site.
- **Phase 3** would include foundation work for the Automated Transit System (ATS) guideway, foundation work for the Market Street/Florence Avenue station, and construction for the support structure of the MSF building. Phase 3 work will also include removal of existing sidewalks, roadways, landscaping, and demolition of other improvements as needed along the guideway alignment; the installation of buildings for the electrical equipment and subsystems at each of the two PDS substation sites; construction of the support structure, columns, and cross girders for the MSF building; and drill foundations for the three stations would occur during Phase 3. The third phase of construction would occur in 2024 through 2025.
- **Phase 4** would include foundation work for the ATS guideway, guideway column caps along Market Street, and the MSF building deck and shell. Phase 4 activities will include utility relocation (if necessary), foundations, CIP columns, guideway column caps, and installation of equipment at the PDSs. Similar to Phases 1-3, removal of existing sidewalks, roadways, landscaping, and demolition of other improvements as needed along the guideway alignment (including new or temporary pavement

#### 4.12 Transportation

and asphalt for road work and sidewalks) and utility work would also occur in this phase. The fourth phase of construction would occur in 2025 through 2026.

- **Phase 5** construction would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, guideway girder along Market Street, and MSF building interior construction. Phase 5 activities will include guideway girders, guideway straddle caps, and installation of equipment at the PDSs. Aerial construction of the guideway on Market Street, including temporary closure of Market Street, would occur during this phase. Phase 5 construction would occur in 2025 through 2026.
- **Phase 6** construction would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, completion of Prairie Avenue/Manchester Boulevard station, completion of Prairie Avenue/Hardy station, and completion of the MSF building, and the elevated passenger walkway to the Metro K Line Downtown Inglewood Station. Aerial construction of the guideway on Manchester Boulevard and Prairie Avenue, including temporary closure of Manchester Boulevard and Prairie Avenue. Phase 6 would also involve location of the staging and holding area for the delivery of precast segments, girders, and beams on the MSF staging area and completion of the MSF facility. Phase 6 construction would occur in 2025 through 2026.
- **Phase 7** would include final site work and completion of the stations including final site work and paving on Manchester Boulevard; completion of the Prairie Avenue/Hardy Street station; completion of the Prairie Avenue/Manchester Boulevard station; completion of the Market Street/Florence Avenue station; final site work at the MSF site; final site work at the Market Street/Florence Avenue station; construction of all surface parking lots; and final roadway improvements and modifications, and re-striping of streets as required. Phase 7 would occur in 2026.
- **Phase 8** construction would occur for the guideway along the entire length of the alignment and primarily includes installation of the operating systems and testing and commissioning of the ATS trains. Phase 8 construction would occur in 2025 through 2027, with the primary construction activities occurring in 2026 and some installation of equipment starting towards the end of Phase 3 construction when sufficient aerial structure is available for the installation of the equipment.

The document *Inglewood Transit Connector Project: Baseline Construction Phasing Narrative*, Gannett Fleming, Inc., June 2021, provides an estimate of the quantities of construction debris and spoils generated, and the resulting volume of truck trips, which are estimated as follows:

- Demolition of existing commercial buildings and site improvements on the site of the Market Street/Florence Avenue station and MSF site will yield approximately 40,308 cubic yards (CY) of debris generating approximately 2,686 truck haul trips.
- Each vertical support column would be supported by a reinforced concrete shaft foundation and pile cap, which would yield spoils to be trucked away. The volume to be disposed of would total approximately 124,474 cubic yards, generating approximately 5,186 truck haul trips.

#### 4.12 Transportation

- On the properties proposed for acquisition and easement areas, including the retail plaza and the gas station properties, approximately 7,884 cubic yards of soil will be required to be disposed of, which will generate approximately 328 truck haul trips.
- Staging of the trucks would occur on the north side of Manchester east of Prairie with spaced intervals scheduling for in-time loading. Approximately 260 trucks on any given day would enter the construction zone areas inside the K-rails and exit the areas per the noted truck haul routes. The majority of the hauling will occur during the night shift to avoid traffic congestion and would use designated truck routes.
- Street sweepers would be employed for controlling dust and for keeping the streets clean. Flag persons would be present controlling the flow of traffic during the exporting activity.

Assuming arrival patterns consistent with anticipated shift times at construction sites of this nature, most of the manpower workforce trips would occur outside of the peak hours of adjacent street traffic. Construction activity would occur 24 hours a day, seven days a week. Heavy construction activities (those involving the use of large equipment on site) would over a 16-hour day schedule with two shifts, either a morning shift from approximately 7:00 AM to 3:00 PM and an evening shift from approx. 3:00 PM to 11:00 PM, or a morning shift from approximately 7:00 AM to 3:00 PM and a night shift from approximately 11:00 PM to 7:00 AM. The night shift would be used for material deliveries, export of soil and debris, and other light construction activities. However, certain heavy construction activities that necessitate temporary road closures could occur at nighttime to minimize traffic impacts.

Additionally, construction of the ATS guideway, columns and station components that could affect Prairie Avenue and Manchester Boulevard would involve construction-related traffic occurring during the off-peak hours and night hours in order to minimize effects to daily commuter traffic and potential event traffic. Delivery of construction materials could occur during the night shift. Construction activities during the day shift would primarily consist of work that could proceed without substantial disruption to daily commuter traffic and potential event traffic along Prairie Avenue and Manchester Boulevard. Additionally, some minor activity could potentially occur during periods in between construction shifts for logistics, moving equipment, etc.

The primary delivery routes include Florence Avenue, Manchester Boulevard, Prairie Avenue and Century Boulevard as shown in **Figure 4.12-4: Construction Haul/Delivery Routes and Staging Areas**. For materials delivered to and stored at designated construction staging areas, the contractor's haul routes to and from the Project area would be generally located on public streets. To minimize traffic effects to streets in and around the proposed Project area, **PDF TRANS-3** would be implemented, which would ensure excavated dirt materials/spoils will be hauled during off-peak and late-night hours to the extent possible.

SOURCE: Raja Associates, Inc. - September 2021

FIGURE 4.12-4

**Construction Haul / Delivery Routes and Staging Areas**

251-003-20

**Market Street, Market Street/Florence Avenue Station, and Public Parking Lot Construction**

The construction area along the Market Street corridor extends from Florence Avenue to Manchester Boulevard and includes the Market Street/Florence Avenue station site and the surface parking site on the northeast corner of Market Street/Manchester Boulevard. Construction along Market Street between Florence Avenue and Manchester Boulevard includes enabling the construction sequence of the ATS alignment components. Construction activities along this stretch of Market Street would occur in Phases 3 through 5 and Phases 7 and 8.

Construction of the Market Street/Florence Avenue station includes the demolition of the existing commercial building structures at the southeast corner of the intersection of Market Street and Florence Avenue and the construction of an elevated passenger walkway over Florence Avenue. After demolition of the structures, the remaining asphalt flatwork areas at the commercial plaza at Market Street and Regent Street will provide suitable space for construction staging, including but not limited to space for equipment storage, material staging and storage, contractor jobsite trailers, and on-site parking for construction staff throughout the entire construction duration. Construction activities at the Market Street/Florence Avenue station site occurs in Phases 1, 3, 4, 6, 7 and 8.

**Vehicle Circulation and On Street Parking**

Construction along Market street would include drilling foundations for the ATS guideway, construction of the guideway columns and column caps. Construction procedures/plans include the installation of two rows of K-Rail systems along Market Street to delineate the construction area, which includes approximately 25 feet of public right-of-way along the center-line of Market Street between Manchester Boulevard and Florence Avenue. This construction area will allow for maintenance of one travel lane in each direction. On-street (metered) parking would not be accessible within staging sections of the construction area during construction. A temporary full street closure along Market Street within the formwork phase, traffic would not be allowed to pass underneath the structure. To minimize traffic effects, all closures, full or partial are subject to City review and approval which shall consider measures to minimize the degree and duration of street and lane closures (see PDF TRANS-2 in Section 4.12.5.1: Project Design Features, above). Final roadway improvements and modifications, and re-striping of the streets as required would occur during Phase 7. Phase 8 would involve periodic temporary lane closures as needed to allow access to the aerial construction platforms, installation of equipment, completion of platforms, stations, and electrical systems, and completing roadway improvements and modifications.

In the vicinity of the construction area, traffic flow along Florence Avenue, Market Street, Regent Street and Locust Street are generally not constrained and would continue to operate the same way during

#### 4.12 Transportation

construction. The conceptual construction procedures/plans do not include long-term closure of any travel lanes along these roadways during construction of the Market Street/Florence Avenue station. However, intermittent short-term curb lane closures potentially may occur. Also, the construction of the elevated passenger walkway to the Metro K Line Downtown Inglewood Station may require temporary closure of Florence Avenue. All closures, full or partial are subject to City review and approval which shall consider measures to minimize the degree and duration of street and lane closures (see **PDF TRANS-2** in *Section 4.12.5.1: Project Design Features*, above). The staging and holding area for the delivery of precast segments, girders, and beams would be located in the Market Street staging area. Deliveries to the construction area may require temporary street closures. Vehicular access to alleys and driveways along Market Street, Florence Avenue, Regent Street and Locust Street within the construction area will be maintained at all times during construction.

The construction activities potentially may result in the temporary removal of on-street parking spaces along the construction area frontages. A Construction Staging and Traffic Control Program and a Parking Management Plan would be prepared (see **PDF TRANS-2** and **PDF TRANS-5** in *Section 4.12.5.1: Project Design Features*, above) as part of the Project's CCP and would minimize construction-related traffic and parking effects.

Vehicular access to alleys and driveways along Market Street within the construction area will be maintained at all times. Therefore, construction activities would not result in the loss of vehicular access to alleys, parcels and various land uses in the vicinity of construction area.

#### **Pedestrian Facilities**

The construction area along Market Street would be located in the center of the roadway and would not interfere with existing sidewalks. Existing sidewalks would remain open and pedestrian circulation would be maintained along the construction area. The pedestrian access and circulation to all adjacent parcels will be maintained at all times. Potential intermittent closure of the sidewalks within the construction area may occur due to safety measures. These closures would mostly occur at night and late in the evenings.

Sidewalks along the construction area's frontages generally will not be closed during construction of the Market Street/Florence Avenue station. However, during certain construction activities (i.e., concrete pours), there may be potentially intermittent closure of the construction area's frontage sidewalks. Pedestrian access to buildings will be maintained at all times during construction. Stretches of sidewalks along the west side of Locust Street and north side Regent Street would be closed during construction of pick-up/drop-off areas. All existing crosswalks will be maintained unless infeasible, in which case the contractor will obtain permission from the City to close the crosswalk.

#### 4.12 Transportation

Potential intermittent closure of the sidewalks within the construction area may occur due to safety measures. Generally, a major portion of the common passenger routes to school will not be affected by the construction activities. However, the contractor would coordinate with the Inglewood Unified School District (IUSD) and provide crossing guards at locations requested by the City or IUSD when crosswalks or sidewalks are closed. Further, temporary alternate routes to school could be identified working closely with IUSD and the City, and this information will be disseminated to all schools and stakeholders affected by construction.

#### **Bicycle Facilities**

There are currently no bicycle facilities provided along Market Street or Regent Street. Also, no bike parking is provided in the immediate vicinity of the construction area along Market Street or the site of the Market Street/Florence Avenue station.

Potential temporary closure of the southbound bicycle lane along Locust Street between Florence Avenue and Regent Street may occur due to Market Street/Florence Avenue station construction activities. The contractor may provide "sharrow" pavement marking along the southbound Locust Street to allow shared use of the travel lane by vehicles and bicycles.

#### **Transit Facilities**

There are no bus routes traveling along Market Street, Regent Street, or Queen Street within the vicinity of the construction area. It is anticipated that no bus stops would be removed or relocated due to the construction activities along Market Street. Additionally, no transit bus rerouting would be required along Market Street during construction along Market Street.

The bus stop on the west side of Locust Street serving MTA Bus Lines 211 and 607 and the bus stop on the south side of Florence Avenue serving MTA Bus Lines 40 and 111 may need to be temporarily relocated during certain Market Street/Florence Avenue station construction activities. Therefore, the Project Task Force would be responsible for coordination with the Metro and any other transit providers to temporarily relocate these bus stops or reroute transit bus lines if necessary (see **PDF TRANS-1** in *Section 4.12.5.1: Project Design Features*, above).

### **Manchester Boulevard, MSF Structure Site, and Prairie Avenue/Manchester Boulevard station Construction**

Construction along Manchester Boulevard between Market Street and Prairie Avenue includes enabling the construction sequence of the ATS alignment components. Construction activities along this stretch of Manchester Boulevard would occur in Phases 3 through 8.

Construction of the MSF structure includes the demolition of the existing supermarket (Vons) building, gas station, and other buildings that would allow the construction of the MSF building and structure and PDS substation. The construction area is bounded by Manchester Boulevard on the north, Nutwood Street on the south, Hillcrest Boulevard on the west and Spruce Avenue on the east. Construction activities at the MSF site occurs in all phases of construction.

Construction of the Prairie Avenue/Manchester Boulevard station includes the demolition of the existing commercial building at 401 S. Prairie Avenue. The construction area is bounded by Manchester Boulevard on the north, Nutwood Street on the south and Prairie Avenue on the east. Construction activities at the Prairie Avenue/Manchester Boulevard station site would occur in Phases 1, 3, 5, 6, 7 and 8.

#### **Vehicle Circulation and On-Street Parking**

The construction area along the south side of Manchester Boulevard would include approximately 22 feet of public right-of-way from southerly face of curb, excluding sidewalks, from Prairie Avenue to Market Street, and would be delineated with K-rails. The 22-foot construction area on the south side of Manchester Boulevard between Hillcrest Boulevard and Prairie Avenue would result in the loss of two travel lanes in the eastbound direction. An additional eastbound lane can be provided by removal of the raised medians and on-street parking within the construction area during this phase of construction. Therefore, within this stretch, two lanes along Manchester Boulevard in each direction can be maintained during construction at most times. To minimize traffic effects, in the event that partial lane closures are necessary for a longer duration, lane reversals (or contra flow) and restriction of turns may be implemented to facilitate the peak hour traffic flow. Additionally, traffic control at intersections within the construction areas at intersections would be maintained similar to existing conditions at all times. Construction activities also include drilling foundations for the ATS guideway along southside of Manchester Boulevard from Market Street to Prairie Avenue.

Once the work on the south side of the street is completed, the contractor would then switch to the north side of Manchester Boulevard and install a K-rail system to delineate the construction area. This construction area would potentially include up to 22 feet of public right-of-way starting from the northerly face of curb, excluding sidewalks, from Prairie Avenue to Market Street. The 22-foot construction area on

the north side of Manchester Boulevard between Market Street and Locust Street would remove on-street parking and one travel lane in the westbound direction. This would result in four travel lanes with no left-turn lanes within the construction area section. Therefore, two lanes per direction along Manchester Boulevard can be maintained with removal of left-turn lanes during construction at most times.

The construction area on the north side of Manchester Boulevard between Locust Street and Hillcrest Boulevard would result in the loss of on-street parking and one travel lane in the westbound direction. Two travel lanes in each direction could be maintained by utilizing the left- turn lanes and removing the on-street parking on the south side of the street. The construction area on the north side of Manchester Boulevard between Hillcrest Boulevard and Prairie Avenue would also result in the loss of on-street parking and one travel lane in the westbound direction. To minimize traffic effects, in the event that partial lane closures are necessary for a longer duration, lane reversals (or contra-flow) may be implemented to facilitate the peak hour traffic direction. Additionally, traffic control at intersections within the construction areas would be implemented as needed to minimize the degree and duration of impacts and maintain safety (see **PDF TRANS-2** in *Section 4.12.5.1: Project Design Features*, above).

Finally, following the work on the north side of Manchester Boulevard between Market Street and Prairie Avenue, the contractor would switch to construction along the median of Manchester Boulevard. This construction area would potentially include up to 25 feet of public right-of-way and would result in the loss of on-street parking and one travel lane in each direction. Therefore, one westbound travel lane and two eastbound travel lanes would be maintained during this construction activity along the median of Manchester Boulevard. Additionally, traffic control at intersections within the construction areas at intersections would be maintained similar to existing conditions at all times.

Temporary full street closure along Manchester Boulevard within the construction area would occur during aerial construction of the railway formwork. To minimize traffic effects, all closures, full or partial are subject to City review and approval which shall consider measures to minimize the degree and duration of street and lane closures (see **PDF TRANS-2** in *Section 4.12.5.1: Project Design Features*, above). Additionally, a Construction Staging Plan and Traffic Control Program will be developed and designed to minimize traffic effects on residential streets. Final roadway improvements and modifications, and restriping of the streets as required would occur during Phase 7. Phase 8 will involve periodic temporary lane closures as needed to allow access to the aerial construction platforms, installation of equipment, completion of platforms, stations, and electrical systems, and completing roadway improvements and modifications.

As indicated previously, construction activities would result in the temporary removal of all on-street parking spaces along Manchester Boulevard within the construction area, although not all at the same

#### 4.12 Transportation

time. Access to and from all alleys at one or both ends of the alley when possible. If an alley is obstructed such that a turnaround by any vehicle is not feasible, traffic flaggers shall be provided to control access to/from the alley (see **PDF TRANS-2** in *Section 4.12.5.1: Project Design Features*, above). Therefore, construction activities would not result in the loss of vehicular access to parcels and various land uses in the vicinity of construction area.

Closure of travel lanes along Manchester Boulevard, Hillcrest Boulevard, Spruce Avenue, and Nutwood Street is not anticipated during construction of the MSF, which would include the demolition of the commercial buildings (existing Vons building and gas station) at 500 E. Manchester Boulevard. However, intermittent short-term curb lane closures potentially may occur. The construction activities also potentially may result in the temporary removal of the non-metered on-street parking spaces along the Spruce Avenue construction area frontage. Construction would not affect the vehicular driveways along Manchester Boulevard, Hillcrest Boulevard, Spruce Avenue and Nutwood Street within the construction area. Therefore, construction activities would not result in the loss of vehicular access to parcels and various land uses in the vicinity of construction area.

Construction of the Prairie Avenue/Manchester Boulevard station would not include long-term closure of travel lanes along these roadways during the duration of construction. However, intermittent short-term curb lane closures potentially may occur. The construction activities may also potentially result in the temporary removal of the non-metered on-street parking spaces along the Nutwood Street construction area frontage. Construction would not affect the vehicular driveways to parcels along Manchester Boulevard, Prairie Avenue, and Nutwood Street within the construction area. Therefore, construction activities would not result in the loss of vehicular access to parcels and various land uses in the vicinity of the construction area.

#### Pedestrian Facilities

Construction along Manchester Boulevard would include removal of existing sidewalks as needed to be replaced with new or temporary sidewalks. Existing sidewalks generally would be closed within construction area staging sections. However, pursuant to the Construction Staging and Traffic Control Program, there would be temporary pedestrian sidewalks for the duration of the construction, in order to maintain pedestrian circulation to the degree feasible. Under **PDF TRANS-2**, sidewalk closures should be avoided to the degree feasible and are permitted only when approved by the City with accessible detours provided if sidewalk closures are necessary. Pedestrian access to buildings would be maintained at all times and any sidewalk closures are subject to review and approval by the City (see **PDF TRANS-4** in *Section 4.12.5.1: Project Design Features*, above). Crosswalks would be maintained unless otherwise authorized for temporary closure by the City. During certain construction activities (i.e., concrete pours), intermittent

#### 4.12 Transportation

closure of the sidewalks within the construction area may be required. The contractor would coordinate with IUSD and provide crossing guards at locations requested by the City when crosswalks or sidewalks are closed. Further, temporary alternate routes to school could be identified working closely with IUSD and the City, and this information would be disseminated to all schools and stakeholders affected by the construction. The pedestrian access and circulation to all adjacent parcels would be maintained within the construction areas to the degree feasible with some access, including pedestrian common routes to school, would generally be maintained at all times; intermittent closure of the sidewalks within the construction area may occur due to safety measures. Generally, the pedestrian common routes to school would not be affected by the construction activities due to temporary sidewalks, maintaining crosswalks and providing crossing guards when crosswalks or sidewalks are closed.

Sidewalks along the frontages of the construction areas generally would not be closed during construction of the MSF and Prairie Avenue/Manchester Boulevard station. During certain construction activities (i.e., concrete pours), intermittent closure of the sidewalks within the construction area may occur. However, pursuant to **PDF TRANS-4**, pedestrian access to adjacent buildings will be maintained at all times. All existing crosswalks will be maintained to the extent feasible. Under the **PDF TRANS-4**, if a crosswalk is removed from service, temporary accessible replacement crosswalks as close as practicable to the original crosswalk locations would be provided, unless the City determines that a replacement crosswalk is not necessary to maintain an adequate level of service. Replacement crosswalks would be identified and controlled by wayfinding signs approved by the City.

#### Bicycle Facilities

There are no bicycle facilities along Manchester Boulevard within the construction area, Hillcrest Boulevard, Spruce Avenue, Nutwood Street, and Prairie Avenue. Also, no bike parking is provided in the immediate vicinity of the construction area. Therefore, no temporary closures of bicycle facilities along Market Street, Manchester Boulevard, Hillcrest Boulevard, Spruce Avenue, Nutwood Street, or Prairie Avenue would occur due to construction activities.

#### Transit Facilities

The bus stops within the construction area may potentially need to be temporarily relocated. Pursuant to **PDF TRANS-2**, such temporary relocation of bus stops would be coordinated with Metro. Rerouting of transit along Manchester Boulevard would need to occur during temporary full closure of Manchester Boulevard. Full street closures would occur mostly during off-peak late-night hours. Additionally, rerouting of transit to La Brea Avenue would need to occur during temporary full closure of Prairie Avenue and Manchester Boulevard. It is not currently known if these bus lines will continue to operate along the same

#### 4.12 Transportation

routes when the Metro K Line commences operation. If these bus lines are shortened, terminated, or re-routed when the K Line commences operations, then no transit circulation/access would be affected.

No bus stops would be removed or relocated during the construction of the MSF. Additionally, no transit bus rerouting would be required during construction.

#### ***Prairie Avenue and Prairie Avenue/Hardy Street Station Construction***

Construction along Prairie Avenue between Manchester Boulevard and Hardy Street includes enabling the construction sequence of the ATS alignment components. Construction activities along this stretch of Prairie Avenue will occur in all phases of construction.

Construction of the Prairie Avenue/Hardy Street station includes the demolition of the existing retail commercial center at northwest corner of Prairie Avenue and Hardy Street, the commercial building at 923 S. Prairie Avenue, and the commercial building at 1003 S. Prairie Avenue. The construction area is bounded by Prairie Avenue on the east and Hardy Street on the south.

#### **Vehicle Circulation and On-Street Parking**

Construction activities to allow for the realignment of Prairie Avenue include removal and disposal of existing sidewalks, roadways, landscape, and medians as needed, including the installation of new or temporary pavement and asphalt for road work and sidewalks, along the east side of Prairie. Construction would then include new pavement, sidewalks, streetlights, traffic signals, and other infrastructure on Prairie Avenue, and then shifting the roadway east to its new alignment. A K-rail system delineating the construction area would be installed including approximately 22 feet of public right-of-way from the westerly face of curb, excluding sidewalks, along Prairie Avenue from Hardy Street to Manchester Boulevard. Because a new temporary roadway on the east side of Prairie Avenue is constructed prior to installing the K-rail system, the roadway lanes in the southbound direction along Prairie Avenue would be maintained. Additionally, traffic control at intersections within the construction areas would be maintained similar to existing conditions at all times.

Construction activities include drilling foundations for the ATS guideway along the west side of Prairie Avenue from Manchester Avenue to Hardy Street. Once the work on the west side of the street is completed, work would then switch to the east side of Prairie Avenue between Manchester Boulevard and Kelso Street / Pincay Drive. This work would entail installation of a K-rail system to delineate the construction area. To minimize traffic effects under **PDF TRANS-2**, all closures, full or partial, would be subject to City review and approval, which would include consideration of measures to minimize the degree and duration of street and lane closures

#### 4.12 Transportation

Temporary full street closure along Prairie Avenue would be needed from a safety perspective, during aerial construction of the railway formwork. To minimize traffic effects, as part of **PDF TRANS-2**, temporary full closures would be coordinated with the City of Inglewood and emergency response personnel. Detour routes are included in **PDF TRANS-2** and would be updated as necessary to minimize traffic impacts on residential streets. **PDF TRANS-2** includes coordination with the City, police, and fire services department regarding maintenance of emergency access and response times and require access be maintained for public safety vehicles (e.g., police, fire, and emergency response). Final roadway improvements and modifications, and re-striping of the streets as required would occur during Phase 7.

Periodic temporary lane closures would be needed to allow access to the aerial construction platforms, installation of equipment, completion of platforms, stations, and electrical systems, and completing roadway improvements and modifications. Vehicular access to driveways to parcels along Prairie Avenue within the construction area would be maintained at all times. Therefore, construction activities would not result in the loss of vehicular access to parcels and various land uses in the vicinity of construction area.

There are no on-street parking spaces along Prairie Avenue between Manchester Boulevard and Hardy Street and therefore, construction activities would not result in the temporary loss of on-street parking spaces. The off-street parking spaces on the site of the Forum within the setback area on the east side of Prairie Avenue between Manchester Boulevard and Kelso Street/Pincay Drive would be affected and re-configuration of parking spaces would be required. A loss of approximately 95 spaces would be anticipated in this area.

Construction of the Prairie Avenue/Hardy Street station would not require long-term closure of any travel lanes along these roadways during the duration of construction. However, intermittent short-term curb lane closures may occur. The construction activities also may result in the temporary removal of the non-metered on-street parking spaces along the Hardy Street construction area frontage. Construction would not affect the vehicular driveways to parcels along Prairie Avenue and Hardy Street within the construction area. Therefore, construction activities would not result in the loss of vehicular access to parcels and various land uses in the vicinity of construction area.

#### **Pedestrian Facilities**

Construction activities include removal of existing sidewalks as needed and replacement with new or temporary sidewalks. Existing sidewalks generally will be closed within the construction area staging section. However, temporary sidewalks would be provided for the duration of the construction, in order to maintain pedestrian circulation. Temporary sidewalks will meet all applicable safety standard including a minimum sidewalk width of five feet. Pedestrian access to buildings will be maintained at all times. All

#### 4.12 Transportation

existing crosswalks will be maintained unless it is infeasible to do so. During certain construction activities (i.e., concrete pours), there may be intermittent closure of the sidewalks within the construction area. Under **PDF TRANS-2**, closures, and restricted access during the construction period with special attention during periods of expected heavy traffic from events scheduled at SoFi Stadium and other venues in the Los Angeles Sports and Entertainment District at Hollywood Park, the Forum, and the Inglewood Basketball and Entertainment Center would be coordinated. Intermittent closure of the sidewalks within the construction area may occur due to safety measures.

Sidewalks along the Prairie Avenue/Hardy Street station construction area frontages would not be closed during construction. During certain construction activities (i.e., concrete pours), there may be intermittent closure of the sidewalks within the construction area. However, pedestrian access to adjacent buildings will be maintained at all times. All existing crosswalks will be maintained unless infeasible. The contractor would provide crossing guards at locations requested by the City when crosswalks or sidewalks are closed.

Generally, a major portion of the passenger common routes to school will not be affected by the construction activities. However, the contractor will coordinate with IUSD to provide appropriate information and alternative routes to school away from construction areas during the period of construction and this information will be disseminated to all schools and stakeholders affected by the construction. The contractor would coordinate with IUSD and provide crossing guards at locations requested by the City when crosswalks or sidewalks are closed.

#### **Bicycle Facilities**

There are no bicycle facilities along Prairie Avenue, Hardy Street, or along any cross-streets within the construction area. Also, no bike parking is provided in the immediate vicinity of the construction area. Therefore, no temporary closures of bicycle facilities along Prairie Avenue or Hardy Street would occur due to construction activities.

#### **Transit Facilities**

The bus stops within the construction area may need to be temporarily relocated. Coordination with transit providers regarding the need to temporarily relocate bus stops and reroute transit to La Brea Avenue would need to occur during temporary full closure of Prairie Avenue. Full street closure would occur during late night hours. It is not currently known, if these bus lines will continue to operate along the same routes when the Metro K Line commences operation. If these bus lines are shortened, terminated, or re-routed when the K Line commences operations, then no transit circulation/access would be affected.

#### 4.12 Transportation

The City would continue outreach efforts during the construction period to inform communities and businesses of the latest project construction updates, to coordinate mitigation measures to local businesses for parking and access, and to provide additional signage, advertisements, and support throughout the construction duration. While construction of the Project will have temporary effects on roadway, passenger, bicycle, and transit facilities, **PDF TRANS-1** through **PDF TRANS-5** in *Section 4.12.5.1: Project Design Features*, above, would be implemented to ensure access and circulation remains adequate for all modes of travel (vehicular, passenger, bicycle, and transit) and uses along the Project alignment during construction.

Implementation of **PDF TRANS-2** would ensure adequate circulation and access for all uses located along the proposed alignment of the ATS system, including providing adequate vehicular access to businesses at all times. Transportation related inconveniences would be reduced to the extent feasible. **PDF TRANS-2** would also establish minimum traffic lane requirements for Manchester Boulevard, Florence Avenue, and Prairie Avenue during construction such that at least the full number of traffic lanes in the peak direction, and if feasible, one traffic lane in the off-peak direction is available, with additional capacity provided through appropriate detour routes. Thus, efforts would be made to keep all traffic lanes open for peak directional travel. If all lanes cannot remain open, one lane would be kept open for peak direction and supplemented by detour options.

**PDF TRANS-1** would also be implemented to ensure access to bus transit stops and bus circulation are always maintained, unless infeasible and closure is approved by the City, and coordination with Metro and any other transit service providers where the Project could affect transit services.

While access to some uses would be disrupted and detoured for short periods of time during construction, through implementation of **PDF TRANS-1** through **PDF TRANS-5**, adequate access and circulation would continue to be available at all times and construction of the Project would not conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and passenger facilities. With implementation of **PDF TRANS-1** through **PDF TRANS-5**, impacts during construction would be less than significant.

#### **Operation**

The proposed Project is consistent with the goals of Senate Bill 743 for reduction of GHG emissions, developing multimodal transportation networks; and encouraging and supporting mixed-use development.

The ITC Project is consistent with Goals 1, 2, 4, 5, 6, 7 and 8 identified in the 2020–2045 RTP/SCS because the Project will promote regional economic prosperity; improve mobility, accessibility, reliability and travel

safety; increase travel choices for movement of people; reduce greenhouse gases and improving air quality; support active transportation and consequently support healthy and equitable communities; support integrated mixed-use development and transportation networks; and leverage new transportation technologies. Goals 3, 9, and 10 are not applicable to the proposed Project. The proposed Project would further the objectives of the plan by increasing local and regional transportation options while reducing VMT and greenhouse gas emissions locally and in the region. The increase in transportation service capacity would promote regional economic prosperity and competitiveness while serving major regional activity centers including Downtown Inglewood, SoFi Stadium, the Forum and the IBEC. Additional analysis of the consistency of the Project with the 2020–2045 RTP/SCS is presented in **Section 4.9: Land Use and Planning**.

The proposed Project would decrease local VMT and improve local air quality (See **Section 4.2: Air Quality**) in the City of Inglewood and reduce greenhouse gas emissions (See **Section 4.7: Greenhouse Gas Emissions**) and would be consistent with the RTP/SCS Goals and Policies.

Additionally, **Section 4.9** and **4.12.7: Consistency with City General Plan** below, discuss the Project’s consistency with the goals in the General Plan related to transportation. An amendment to the Circulation Element is proposed as part of the proposed Project that includes changes to text and diagrams. As discussed further below, with the changes to the text and diagrams, the proposed Project would continue to be consistent with the Circulation Element. The proposed Project would further the goals and objectives stated within the Circulation Element by providing reliable transit service and improving mobility of the local City residents while reducing the number of vehicles on the existing roadway. As described in **Section 4.9**, the proposed Project would support and be consistent with the Environmental Justice Element. The proposed Project is consistent with the Land Use Element because it will increase existing capacity and provide additional access to public transportation within the City and the region by adding a transit system to connect visitors and residents with Downtown Inglewood and activity centers in the City to the regional light rail system.

The proposed Project would not conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and passenger facilities and impacts associated with operation of the Project would be less than significant.

**Mitigation Measures**

No mitigation is required.

**Level of Significance after Mitigation**

Impacts would be less than significant.

**Impact T-2: Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?**

An evaluation of the reduction in VMT due to the proposed Project was prepared using the ITDF Model as discussed previously in **4.12.5.1: Methodology**. For events of all types at each of the venues, VMT was estimated including private vehicles, shuttles, and TNCs for both attendees and employees. Changes in VMT and traffic volumes on streets in the study area are discussed below.

**Adjusted Baseline Non-Event with Project Traffic Conditions**

As discussed previously, the primary socio-economic data variables including population, households and employment within the City of Inglewood are estimated to be 117,688, 38,958 and 37,763, respectively, under Adjusted Baseline conditions without the ITC Project. Under Adjusted Baseline conditions with the ITC Project, the population and household data are estimated to remain at 117,688 and 38,958, respectively (no change compared to Adjusted Baseline without ITC Project), while the employment socio-economic data is estimated to change to 37,192 due to the acquisition and demolition of existing commercial properties to accommodate the construction of the Project. As previously discussed, a new Vons grocery store will be built on the MSF site to replace the existing grocery store building that would be demolished to accommodate the MSF.

As presented in **Table 4.12-3: Weekday Daily Traffic Volumes Adjusted Baseline Without and With Project**, with implementation of the ITC Project, daily traffic volumes are projected to decrease along key corridors including Prairie Avenue, Manchester Boulevard and Century Boulevard within the study area, thereby improving traffic flows. Overall, the analyzed corridors would experience less congestion on a system-wide basis, particularly during the peak periods, with implementation of the ITC Project.

**Table 4.12-3  
Weekday Daily Traffic Volumes Adjusted Baseline Without and With Project**

Source: Transportation Assessment Study for the Inglewood Transit Connector Project DEIR, Raju Associates, Inc., September 2021; refer to Table 8 (refer to Appendix O of this Recirculated Draft EIR).

**Future Opening Year (2027) with Event and Project**

As discussed previously, the primary socio-economic data variables including population, households and employment within the City of Inglewood are estimated to be 152,774, 51,251 and 61,327, respectively, under Future Opening Year (2027) conditions without ITC Project. Under Future Opening Year (2027) conditions with the ITC Project, population, and household socio-economic data variables do not change, while the employment socio-economic data is estimated to be 60,756 due to the acquisition of existing commercial properties to accommodate the construction of the Project.

NFL game event conditions with the ITC Project is estimated to generate approximately 23,540 daily trips. As presented in **Table 4.12-4: Weekday Daily Traffic Volumes Future Opening Year (2027) With Event and Project**, with implementation of the ITC Project, daily traffic volumes would decrease along these key corridors ranging between approximately 1,550 to 2,160 vehicle trips per day along Prairie Avenue between Manchester Boulevard and Century Boulevard; approximately 840 to 1,210 vehicle trips per day along Manchester Boulevard between La Brea Avenue and Crenshaw Boulevard; and approximately 1,120 to 1,640 vehicle trips per day along Century Boulevard between La Brea Avenue and Crenshaw Boulevard. Overall, the analyzed corridors would experience less congestion on a system-wide basis with the implementation of the ITC Project.

**Future Opening Year (2027) with Event Project Ridership**

The estimated non-event daily ridership under Future Opening Year (2027) conditions is 3,574 daily passengers.

The Future Opening Year (2027) with Event conditions includes a sold-out NFL football game at the SoFi Stadium. A sold-out NFL Game Event consist of 70,240 attendees and 6,000 employees on a weekday at the SoFi Stadium. As shown in Table 4.12-5: ITC Weekday Daily Ridership Future Opening Year (2027), the estimated daily ridership under Future Opening Year (2027) with Event (NFL) conditions is 29,280 daily passengers.

**Table 4.12-5  
ITC Weekday Daily Ridership Future Opening Year (2027)**

Scenario	Weekday Daily Ridership	
	Non-Event	with NFL Event*

\* Includes ridership associated with non-event weekday conditions.

Source: Transportation Assessment Study for the Inglewood Transit Connector Project DEIR, Raju Associates, Inc., September 2021; refer to Table 22 (refer to Appendix O of this Recirculated Draft EIR).

Additionally, the ETDM model, was applied for each type of event at each of the venues in Inglewood to estimate the proposed Project ridership. The proposed Project ridership per event, daily and annually, under Future Opening Year (2027) conditions is presented in Table 4.12-6: ITC Ridership Per Event – Future Opening Year (2027) Conditions.

**4.12-6

**Future Horizon Year (2045) with Event and Project**

As discussed previously, the primary socio-economic data variables including population, households and employment within the City of Inglewood are estimated to be 165,618, 56,952 and 69,280, respectively, under Future Horizon Year (2045) conditions without the ITC Project. Under Future Horizon Year (2045) conditions with the ITC Project, the population and household socio-economic data variables do not change, while the employment socio-economic data is estimated to be 68,709 due to the acquisition of existing commercial properties to accommodate the construction of the Project.

As shown in **Table 4.12-7 Future Horizon Year (2045) With Event and Project**, daily traffic volumes would decrease along key corridors with implementation of the proposed Project. The decreases in daily traffic range between approximately 1,710 to 2,470 vehicles per day along Prairie Avenue between Manchester Boulevard and Century Boulevard; approximately 980 to 1,410 vehicles per day along Manchester Boulevard between La Brea Avenue and Crenshaw Boulevard; and approximately 1,390 to 1,870 vehicles per day along Century Boulevard between La Brea Avenue and Crenshaw Boulevard. Overall, the analyzed corridors would experience less congestion on a system-wide basis resulting in improved flow during the peak periods with the implementation of the proposed Project.

**Future Horizon Year (2045) with Event Project Ridership**

A summary of the proposed Project ridership under non-event conditions is presented in **Table 4.12-8: ITC Weekday Daily Ridership Future Horizon Year (2045)**. The estimated non-event daily ridership under Future Horizon Year (2045) conditions is 4,462 daily passengers. The Future Horizon Year (2045) with NFL Game Event conditions includes a sold-out event with 70,240 attendees and 6,000 employees on a weekday at the Sofi Stadium. The event-day proposed Project ridership was estimated using the ETDM

4.12 Transportation

model. The daily ridership under Future Horizon Year (2045) with NFL Game Event conditions is estimated at approximately 34,650 daily passengers.

**Table 4.12-8  
ITC Weekday Daily Ridership Future Horizon Year (2045)**

Scenario	Weekday Daily Ridership	
	Non-Event	with NFL Event*

<b>Total</b>	<b>421</b>	<b>-</b>	<b>2,397,248</b>

[1] Based on list of events as shown in Inglewood Basketball and Entertainment Center DEIR, ESA, December 2019 - Table 3.14-2: Overview of Common Event Types, Frequency, and Timing at Project, NFL Stadium, and The Forum.

Source: Transportation Assessment Study for the Inglewood Transit Connector Project DEIR, Raju Associates, Inc., September 2021; refer to Table 14 in Appendix O of this Recirculated Draft EIR.

Based on the analysis of these scenarios, the proposed Project would reduce daily traffic volumes along key roadway corridors on an average weekday basis. When an NFL game event at the Sofi Stadium is

evaluated, the reduction is more substantial. This analysis demonstrates that traffic volumes would also be substantially reduced when events are held at the other sports and entertainment venues that would be served by the Project, including the Forum, IBEC, and the 6,000 seat entertainment venue at Hollywood Park. Additionally, the proposed Project is an ATS System that would provide “first-mile / last-mile” connection to the rest of the regional mass-transit system to and from major activity centers and adjacent uses in the City of Inglewood.

### Operation

#### Adjusted Baseline with Project Conditions Non-Event Daily VMT Analysis

An evaluation of the reduction in VMT due to the proposed Project was prepared for typical weekday conditions using the ITDF Model as discussed previously in 4.12.5.1. For events of all types at each of the venues, VMTs were estimated including private vehicles, shuttles, and TNCs for both attendees and employees. Daily VMTs are shown in **Table 4.12-10: Daily VMT Adjusted Baseline Without and With Project**. As presented in **Table 4.12-10: Daily VMT Adjusted Baseline Without and With Project**, the daily VMT in the City of Inglewood would be reduced by approximately 40,400 vehicle-miles with the implementation of the proposed Project under Adjusted Baseline conditions.

**Table 4.12-10**  
Daily VMT Adjusted Baseline Without and With Project

Scenario	Daily VMT	
	Without ITC	With ITC
Adjusted Baseline	3,132,256	3,091,889

Source: Transportation Assessment Study for the Inglewood Transit Connector Project DEIR, Raju Associates, Inc., September 2021; refer to Table 9 (refer to **Appendix O** of this Recirculated Draft EIR).

#### Future Opening Year (2027) with Project Conditions Daily VMT Analysis

As discussed previously in 4.12.5.1, an evaluation of the reduction in VMT due to the proposed Project was prepared for Future Opening Year (2027) with an NFL Game Event at SoFi Stadium. The daily VMTs presented in **Table 4.12-11: Daily VMT Future Opening Year (2027) Without and With Project** are calculated with and without the proposed Project, for all trips to and from the City of Inglewood for a typical day when no major events are being held at the sports and entertainment venues in the City and for days when an NFL Game is hosted at SoFi Stadium. The weekday daily VMT would be reduced by approximately 247,550 vehicle-miles (4.7%) with the implementation of the proposed Project under Future Opening Year (2027) with an NFL Game Event.

**Table 4.12-11**  
Daily VMT Future Opening Year (2027) Without and With Project

Scenario	Daily VMT	
	Without ITC	With ITC
Future Opening Year (2027) Non-Event	3,906,593	3,854,924
NFL Game Event	1,368,495	1,172,624
Future Opening Year (2027) with NFL Game Event	5,275,088	5,027,548

Source: Transportation Assessment Study for the Inglewood Transit Connector Project DEIR, Raju Associates, Inc., September 2021; refer to Table 21 in **Appendix O** of this Recirculated Draft EIR).

#### Future Horizon Year (2045) with Project Conditions Daily VMT Analysis

An evaluation of the reduction in VMT due to the proposed Project was prepared for Future Horizon Year (2045) with Event conditions. The daily VMTs were calculated with and without the proposed Project including all trips to and from the City of Inglewood. As shown in **Table 4.12-12: Daily VMT Future Horizon Year (2045) Without and With Project**, the weekday VMT would be reduced by approximately 316,900 vehicle-miles (5.6%), with the implementation of the proposed Project under cumulative Future Horizon Year (2045) with an NFL Game Event.

**Table 4.12-12**  
Daily VMT Future Horizon Year (2045) Without and With Project

Scenario	Daily VMT	
	Without ITC	With ITC
Future Horizon Year (2045) Non-Event	4,293,802	4,236,825
NFL Game Event	1,368,495	1,108,591
Future Horizon Year (2045) with NFL Game Event	5,662,297	5,345,416

Source: Transportation Assessment Study for the Inglewood Transit Connector Project DEIR, Raju Associates, Inc., September 2021; refer to Table 29 in **Appendix O** of this Recirculated Draft EIR).

The proposed Project would result in a reduction of VMT under all scenarios and would not, therefore, conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b). Impacts would be less than significant.

**Mitigation Measures**

No mitigation is required.

**Level of Significance after Mitigation**

Impacts would be less than significant.

**Impact T-3: Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?**

The proposed Project is an ATS System that would provide “first-mile / last-mile” connection to the rest of the regional mass-transit system to and from major activity centers and adjacent uses in the City of Inglewood.

The ITC Project alignment traverses along Market Street, Manchester Boulevard and Prairie Avenue and would require certain changes to the location of the curb-to-curb roadways. Lane configurations and traffic control at intersections will mostly remain similar to existing conditions at the intersections of Market Street/Florence Avenue and Market Street/Manchester Boulevard, resulting in very little to no changes to intersection capacities. Changes to intersection lane configurations due to the Project would occur at the intersections of Market Street/Regent Street and Market Street/Queen Street. The Project would result in the removal of the existing northbound left-turn lane at the intersection of Market Street/Regent Street. The northbound approach would provide a shared left/through/right-turn lane. The Project would not change the southbound, eastbound and westbound approaches. The eastbound and westbound approaches both provide a left-turn lane and a shared through/right-turn lane. Given the low traffic volumes at this intersection, this intersection would continue to operate satisfactorily. No change to the traffic signal controlling this intersection is proposed with the ITC Project.

The Project would include a reconfiguration of the northbound approach at the intersection of Market Street/Queen Street would provide a shared left/through/right-turn lane and the southbound approach would provide a shared left-turn/through lane and a separate right-turn lane. Given the low traffic volumes at this intersection, this intersection would continue to operate satisfactorily. The Project would not change the eastbound and westbound approaches. The eastbound and westbound approaches would both provide a shared left-/through/right-turn lane. No change to the traffic signal controlling this intersection is proposed with the ITC Project.

At Manchester Boulevard between Market Street and Prairie Avenue, lane configurations at intersections will mostly remain similar to existing conditions at all locations within that stretch, resulting in no changes to intersection capacities. Additionally, no reductions in turn-lane storage lengths are proposed at any of the intersections within this stretch, as part of the ITC Project. Minor modifications to lane configurations

at the Manchester Boulevard / Prairie Avenue intersection may be required or desired based on prevailing demands at the time of construction of the Project. This could be achieved by restriping at the time of implementation of the Project. Lane configurations and traffic control at intersections along Prairie Avenue between Manchester Boulevard and Hardy Street will mostly remain similar to existing conditions at all locations within that stretch, resulting in no changes to intersection capacities. Additionally, no reductions in storage lengths are proposed at the intersection turn lanes as part of the ITC Project. Minor modifications to lane configurations at the Manchester Boulevard / Prairie Avenue intersection may be required or desired, based on prevailing traffic demands at the time of implementation of the Project. However, the lane capacities along all these streets will be retained to current conditions once the ITC Project is completed.

The proposed Project consists of an aerial guideway and stations, MSF, and PDS substations. The proposed Project would include passenger access improvements, including a mezzanine level at each station to provide connectivity to elevated passenger walkways over adjacent streets. These elevated passenger walkways will be designed to improve both passenger access and comfort between the stations and the street level, in addition to providing multimodal access to adjacent bus facilities, pick-up and drop-off areas, and other adjacent resources. The proposed Project will also upgrade the existing sidewalks to ensure consistent ADA appliance along the transit corridor. These elevated passenger walkways and upgrades to existing sidewalks as part of the Project would minimize passenger-vehicle interactions. The City is proposing specific plan amendments and clarifications to the HPSP to address any potential conflict or inconsistency between the proposed Project and the HPSP related to streetscape improvements as the proposed Project would be located along approximately 0.5 miles of street frontage along Prairie Avenue within the HPSP area. Under the ITC Design Standards and Guidelines, which identify objectives for the various project components and provides design guidance to help achieve the objectives, the streetscape in downtown Inglewood would be consistent with the street furniture items which currently exists on Market Street and the historic core and in accordance with the Downtown TOD Plan.<sup>4</sup> Accordingly, the proposed Project would not create or substantially increase safety hazards due to a design feature or incompatible uses. Impacts would be less than significant.

**Mitigation Measures**

No mitigation is required.

**Level of Significance after Mitigation**

Impacts would be less than significant.

<sup>4</sup> City of Inglewood. New Downtown And Fairview Heights Transit Oriented Development Plan and Design Guidelines. <http://inglewood.arroyogroup.com/wp-content/uploads/2017/01/The-New-Downtown-Fairview-Heights-TOD-Plan-Design-Guidelines-lo-res.pdf>. November 1, 2016.

**Impact T-4: Would the project result in inadequate emergency access?****Construction**

Construction of the proposed Project would have the potential to result in temporary impacts on access and circulation. As discussed previously under **Impact T-1, PDF TRANS-1** through **PDF TRANS-5** would be implemented to ensure access and circulation remains adequate at all times along the Project alignment during construction. As part of **PDF TRANS-2**, consultation will be conducted with City police and fire personnel to ensure that emergency access and response times are maintained. Traffic Control Program Updates under **PDF TRANS-2** will require access to be maintained during construction for public safety vehicles (including police, fire, and emergency response). **PDF TRANS-2** would also require coordination of closures and restricted access during the construction period with special attention during periods of expected heavy traffic from events scheduled at SoFi Stadium and other venues in the Los Angeles Sports and Entertainment District at Hollywood Park, the Forum, and the Inglewood Basketball and Entertainment Center. Updates to the Traffic Control Plan under **PDF TRANS-2** would require the City to review all closures (full and partial) and consider measures to minimize the degree and duration of street and lane closures. The program would also require use traffic control officers/flaggers as appropriate to minimize the degree and duration of impacts and maintain safety.

**Operation**

The Project has been designed to add the ATS system in the public right-of-way on Market Street, Manchester Boulevard, and Prairie Avenue while maintaining the existing number of travel lanes on these streets. As discussed previously, the Project will reduce traffic volumes on streets throughout Inglewood and reduce roadway congestion. The proposed Project would not affect existing roadway lane capacities and the speed limits. For these reasons, the proposed Project would not result in inadequate emergency access or impede existing emergency. Impacts during operation would be less than significant.

**Mitigation Measures**

No mitigation is required.

**Level of Significance after Mitigation**

Impacts would be less than significant.

**4.12.6 CUMULATIVE IMPACTS**

As discussed previously, a list of related development projects was compiled in consultation with the City of Inglewood and other surrounding jurisdictions and traffic from these projects was considered in the transportation modeling along with growth in the area based on the socio-economic databases from the 2020 SCAG RTP/SCS Regional Model data to evaluate the potential for cumulative impacts. As discussed

previously under the discussion for **Impact T-1**, the Project will not contribute to any significant cumulative impacts.

**4.12.7 CONSISTENCY WITH CITY GENERAL PLAN**

The City's General Plan contains goals within its Circulation Element and Land Use Element that relates to transportation.

**4.12.7.1 Circulation Element**

The Circulation Element discusses other modes of transportation as alternatives to the individual automobile and an evaluation of Inglewood's street environment and possible improvements. As an ATS system, the proposed Project would add to the City's range of alternative modes of transportation.

An amendment to the Circulation Element is proposed as part of the Project that includes changes to text and diagrams related to the following:

*First, Market Street, between Florence Avenue to the north and La Brea Avenue to the south currently has two lanes of traffic in each direction with a center turn lane. With the Project, Market Street, will be altered from its current configuration to have one lane of traffic in each direction between Regent Street and Manchester Boulevard with a center island. The Circulation Element currently classifies Market Street as a Minor Arterial street. Minor Arterial streets contain two lanes of traffic in each direction; this section of Market Street will be reclassified as a Collector street; Collector streets have one lane of traffic in each direction.*

The Circulation Element identifies typical street sections for common right-of-way widths and sections of streets planned for widening. The second component of the proposed amendment includes defining the maximum right of way for Prairie Avenue, between Manchester Boulevard to the north and Hardy Street to the south, as 132 feet.

Third, a description of the proposed Project, including its connection to the Metro Crenshaw/LAX Line, would be added to the description of light rail facilities in the City.

Fourth, changes to the descriptions of the street environment, parkways, medians, and on-street parking on Market Street, Manchester Boulevard, and Prairie Avenue that would be affected by the Project would be made.

Fifth, because insufficient right-of-way is available on Prairie Avenue between Manchester Boulevard and Century Boulevard to accommodate a bicycle lane, modification of the Bike Route Plan is proposed to preserve multimodal transportation options and connections for residents and employees along this section of Prairie Avenue. With these proposed amendments, the proposed Project would continue to be consistent with the Circulation Element.

#### 4.12.7.2 Land Use Element

##### Circulation

- Goal:** Ensure that proposed new uses can be accommodated by adequate and safe streets.
- Goal:** Promote and support adequate public transportation within the City and the region.
- Goal:** Develop modified traffic systems that would discourage through traffic from utilizing neighborhood streets.
- Goal:** Develop a safe and adequate passenger circulation system which is barrier-free for the handicapped.

The proposed Project is consistent with these Land Use Element goals by increasing existing capacity and providing additional access to public transportation within the City and the region by adding an extension of transit facilities to connect visitors and residents with Downtown Inglewood and activity centers in the City to the regional light rail system.

During construction of the proposed Project, right-of-way closures or diversions may occur along the length of the guideway. However, such closures would be temporary in nature and would adhere to **PDF TRANS-2** as approved by the City of Inglewood's established Project Task Force. Upon implementation of the proposed Project, the existing number of travel lanes in the area would be maintained and area roadways would continue to accommodate a range of transportation options.

The proposed Project would include passenger access at the ground level surrounding the stations along the proposed Project. Access to the stations would be accomplished through ADA-compliant passenger amenities such as escalators, elevators, stairs, signage, walkways, and mezzanine areas. Streetscape improvements along the guideway would ensure that sidewalks/walkways would be ADA-compliant surrounding stations, support columns, and other facilities. Implementation of the proposed Project would increase transit choices and reduce vehicle trips in the City.

Furthermore, as discussed previously under **Impact T-2** the proposed Project would reduce daily traffic volumes along key roadway corridors on an average weekday basis. When an NFL game event at the Sofi Stadium is evaluated, the reduction is more substantial. Furthermore, the proposed Project would connect the activity center within the City of Inglewood with the Metro's K Line at the Downtown Inglewood Station. For these reasons, the proposed Project would not conflict with Inglewood General Plan policies related to transportation.

#### 4.13 TRIBAL CULTURAL RESOURCES

##### 4.13.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) evaluates the potential for implementation of the proposed Inglewood Transit Connector Project (proposed Project or ITC Project) to impact tribal cultural resources within the footprint of the proposed Project and in the immediate surrounding area.

Tribal cultural resources may include sites, features, places, cultural landscapes, sacred places, or objects with cultural value to a California Native American tribe that are listed or determined to be eligible for listing in the California Register of Historic Places (CRHR) or included in a local register of historical resources, or a resource determined by the lead California Environmental Quality Act (CEQA) agency, in its discretion and supported by substantial evidence, to be significant and eligible for listing on the CRHR. Such resources provide information on scientific progress, environmental adaptations, group ideology, or other human advancements.

Information from the following study of the proposed Project is incorporated into this section:

- *Cultural Resource Investigation*, Roberta Thomas, RPA, and Gena Granger, M.A., RPA, PaleoWest Archaeology, December 12, 2018 (**Appendix I.1**).

Information regarding the AB 52 process is provided in the following appendices:

- AB 52 Summary of the AB 52 Consultation Process for the Inglewood Transit Connector Project, Meridian Consultants LLC, December 6, 2018, (**Appendix P.1**); and
- *AB 52 Meeting Summary*, Meridian Consultants LLC, February 6, 2019 (**Appendix P.2**).

Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Recirculated Draft EIR.

Prior to the preparation of the December 2020 Draft EIR, a Revised Initial Study (included as **Appendix A.2** of this Recirculated Draft EIR) was prepared using the CEQA Guidelines Environmental Checklist Form to assess potential environmental impacts resulting from construction and operation of the proposed project associated with tribal cultural resources.

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the Project in response consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. Specific changes to the proposed Project include raising the height of the ATS

guideway along Market Street to preserve existing views of historic buildings, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue.

These changes to the design of components of the Project will not change the potential for impacts tribal cultural resources. The Revised Project would result in impacts to tribal cultural resources similar to those discussed in the December 2020 Draft EIR. Thus, the *AB 52 Meeting Summary* (see **Appendix P.2**) of consultation would still apply to this Recirculated Draft EIR.

According to the requirements of Public Resources Code (PRC) Section 21080.3.1 (Assembly Bill [AB] 52),<sup>1</sup> Native American tribes have the right to consult on a proposed public or private project prior to the release of an EIR should the tribe(s) be concerned there are potential impacts to tribal cultural resources.

#### 4.13.2 TRIBAL CONSULTATION

As part of the AB 52 process, the City has been notified by tribes that may have interest in tribal cultural resources in the region. Four tribes had previously notified the City and requested future notification of, with the possibility of providing consultation on, any projects that proceed under CEQA. These tribes include the Gabrielino–Tongva Tribe, Gabrielino Tongva Indians of California Tribal Council, Gabrielino/Tongva Nation, and the Gabrieleno/Tongva San Gabriel Band of Mission Indians. Additionally, the Gabrieleno Band of Mission Indians–Kizh Nation (Tribe) was identified as a relevant party.

In accordance with AB 52, the City sent notification letters on July 31, 2018, notifying the four tribes identified above that the City was planning the proposed Project. Each tribe notified has 30 days from receipt of the letter to notify the City that they wish to engage in the AB 52 consultation process on the proposed Project. As of December 6, 2018, the City had received only one response requesting consultation via email from Brandy Salas, Administrative Specialist for the Tribe.<sup>2</sup> The Tribe indicated that if there were to be any ground disturbance activity associated with the proposed Project, they would like to consult. Additionally, the Tribe was mailed the Notice of Preparation and Revised Notice of Preparation for the December 2020 Draft EIR (**Appendix A.1**).

Consultation between the Tribe and the City, and the City's consultant team was initiated via conference call on February 6, 2019.<sup>3</sup> As part of the consultation, the City noted that it completed record searches to

<sup>1</sup> State of California, Public Resources Code Section 21080.3.1.

<sup>2</sup> See **Appendix P.1**, *AB 52 Tribal Notification and Outreach Summary Memorandum*.

<sup>3</sup> *AB 52 Consultation Summary*, Meridian Consultants LLC, February 6, 2019. **Appendix P.2**.

date to identify existing archaeological records, and that that information would be made available to the Tribe if they requested. A summary of the AB 52 meeting with the Tribe is provided in **Appendix P.2**.

Members of the Tribe provided an overview of the Tribe's experience with other projects in the Los Angeles Basin, including work that the Tribe has completed for LA Metro and other transit efforts. As part of the other projects, the Tribe noted that artifacts had been unearthed as part of ground disturbing activities. The Tribe also noted that many of these discoveries were the result of many of the transit routes following historic roads and routes in the Los Angeles Basin. They noted that the existing networks of major roadways followed historic and prehistoric trading routes in the area that were used by Native American tribes that resided in the area and along the west coast.

As a result of consultation, the Tribe shared information including maps of the area that depict the historic and prehistoric trading routes, and suggested mitigation measures that may be considered to assist in reducing potential impacts from the proposed Project to any cultural resources that could be unearthed during ground disturbing activities. The consultation process between the City and the Tribe has been completed and relevant analysis and mitigation is included in *Section 4.13.7: Impact Analysis for the Proposed Project*.

#### 4.13.3 METHODOLOGY

##### 4.13.3.1 Tribal Cultural Resources

The analysis of impacts to tribal cultural resources is based on the consultation between the City and the Tribe, information provided by the Tribe and a *Cultural Resource Investigation Report* (see **Appendix I.1**). As previously discussed, during the AB 52 consultation (see **Appendix P.2**), information on tribal cultural resources was provided by the Tribe; this was supplemented by the cultural resource records search (i.e., presence and proximity of known resources), the Sacred Lands File (SLF) search, land use history research, subsurface geological conditions, and the proposed excavation parameters for the proposed Project.

##### 4.13.3.2 Archival Research

A records search for the proposed Project was conducted on June 20, 2018, at the South Central Coastal Information Center of the California Historical Resource Information System housed at California State University, Fullerton and is provided as part of the *Cultural Resource Investigation* (see **Appendix I.1**). The records search included a review of all recorded historic, prehistoric archaeological resources and previous studies within the footprint and a 0.5-mile radius of the proposed Project.<sup>4</sup>

<sup>4</sup> The 0.5-mile radius provides a sufficient buffer to include all proposed components of the revised Project design. The minor relocation of components of the Project do not result in any components or features of the Project as currently proposed being outside of the area addressed by the records search.

#### 4.12 Tribal Cultural Resources

The records search results indicate that 21 previous studies have been conducted within a 0.5-mile radius of the proposed Project; however, none of these studies appear to include the Project alignment.<sup>5</sup> The records search results indicate that no archaeological or historical archaeological resources have been previously recorded within the proposed Project or within one half mile.<sup>6</sup>

The California Native American Heritage Commission (NAHC) maintains a confidential SLF which contains sites of traditional, cultural, or religious value to the Native American community. The NAHC was contacted on June 15, 2018, to request a search of the SLF of the area of the proposed Project. Results of the SLF search indicate that there are no known Native American cultural resources within the immediate area of the proposed Project.

#### 4.13.3.3 Human Remains

The analysis of impacts to human remains is based on the consultation between the City and the Tribe and the *Cultural Resource Investigation* (see **Appendix I.1**). The potential for the proposed Project to contain human remains was assessed based on the cultural resource records search (i.e., presence and proximity of known resources), the SLF search, land use history research, subsurface geological conditions, and the proposed excavation parameters.

#### 4.13.3.4 Windshield Survey

A windshield/reconnaissance survey of the Project alignment was conducted on July 20, 2018.<sup>7</sup> No prehistoric or historic archaeological resources were identified during the survey. However, ground visibility in the area was very poor due the high degree of urban development disturbance.

#### 4.13.3.5 Additional Sources

Additional sources consulted during the cultural resource records search include the National Register of Historic Places, the Office of Historic Preservation Archaeological Determinations of Eligibility, and the Office of Historic Preservation Directory of Properties in the Historic Property Data File. There are no listed historical resources recorded within one half mile of the proposed Project.<sup>8</sup>

### 4.13.4 REGULATORY FRAMEWORK

Cultural historic resources are regulated at the federal, State, and local levels of government. Federal laws establish broad frameworks for cultural resource identification and protection, while State and local jurisdictions actively identify, document, and protect resources within their boundaries. The National

<sup>5</sup> See **Appendix I.1** of this Recirculated Draft EIR.  
<sup>6</sup> See **Appendix I.1** of this Recirculated Draft EIR.  
<sup>7</sup> See **Appendix I.1** of this Recirculated Draft EIR.  
<sup>8</sup> See **Appendix I.1** of this Recirculated Draft EIR.

#### 4.12 Tribal Cultural Resources

Historic Preservation Act of 1966,<sup>9</sup> the California Register of Historical Resources, the California Public Resources Code,<sup>10</sup> and CEQA are the primary federal and State laws regulating the preservation of cultural historic resources of national and State significance.

### 4.13.4.1 Federal Regulations

#### ***National Historic Preservation Act***

The National Historic Preservation Act of 1966 (NHPA) authorized formation of the National Register of Historic Places (NRHP) and coordinates public and private efforts to identify, evaluate, and protect the nation's historic and archaeological resources.<sup>11</sup> The NRHP includes districts, sites, buildings, structures, and objects that are significant in American history, architecture, archaeology, engineering, and culture.

Section 106 (Protection of Historic Properties) of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties. A Section 106 Review refers to the federal review process designed to ensure that historic properties are considered during federal project planning and implementation.<sup>12</sup> Section 106 requires tribal consultation in all steps of the process when a federal agency project or effort may affect historic properties that are either located on tribal lands, or when any Native American tribe or Native Hawaiian organization attaches religious or cultural significance to the historic property, regardless of the property's location.

The Advisory Council on Historic Preservation, an independent federal agency, administers the review process, with assistance from State Historic Preservation Offices (SHPOs). If any impacts are identified, the agency undergoing the project must identify the appropriate SHPO to consult with during the process. A tribe may assume all or any part of the functions of SHPO in accordance with subsections (b)(2) and (b)(3) of Section 101 of the NHPA.<sup>13</sup>

<sup>9</sup> National Historic Preservation Act of 1966 amend thru 1992, Public Law. Approved October 15, 1966 (Public Law 89-665; 80 STAT.915; 16 U.S.C. 470) as amended by Public Law 91-243, Public Law 93-54, Public Law 94-422, Public Law 94-458, Public Law 96-199, Public Law 96-244, Public Law 96-515, Public Law 98-483, Public Law 99-514, Public Law 100-127, and Public Law 102-575)  
<sup>10</sup> California Public Resources Code Sections 5020-5029.5, 5079-5079.65, and 5097.9-5097.998  
<sup>11</sup> National Historic Preservation Act of 1966 amend thru 1992, Public Law. Approved October 15, 1966 (Public Law 89-665; 80 STAT.915; 16 U.S.C. 470) as amended by Public Law 91-243, Public Law 93-54, Public Law 94-422, Public Law 94-458, Public Law 96-199, Public Law 96-244, Public Law 96-515, Public Law 98-483, Public Law 99-514, Public Law 100-127, and Public Law 102-575)  
<sup>12</sup> U.S. General Services Administration, "NHPA Section 106 Tribal Consultation," accessed September 2021, <https://www.gsa.gov/resources-for/native-american-tribes/nhpa-section-106-tribal-consultation>  
<sup>13</sup> U.S. General Services Administration, "NHPA Section 106 Tribal Consultation," accessed September 2021, <https://www.gsa.gov/resources-for/native-american-tribes/nhpa-section-106-tribal-consultation>

### **National Register of Historic Places**

Section 106 of the NRHP<sup>14</sup> requires federal agencies to take into account the effects of an undertaking on historic properties, which are defined as cultural resources included in or eligible for listing in the NRHP. Determination of NRHP eligibility for cultural resources prior to making a finding of effect is made according to the following criteria:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and,

- a. that are associated with events that have made a significant contribution to the broad patterns of our history; or
- b. that are associated with the lives of persons significant in our past; or
- c. that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- d. that have yielded, or may be likely to yield, information important in prehistory or history.

If cultural resources do not meet the above criteria, they are not historic properties and are not further considered in the Section 106 process. In addition to having significance, resources must have integrity for the period of significance. The period of significance is the date or span of time within which significant events transpired or significant individuals made their important contributions.

### **Secretary of the Interior's Standards**

The Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards) are intended to promote responsible preservation practices that help protect irreplaceable cultural resources.<sup>15</sup> They cannot be used to make essential decisions about which features of the historic building should be saved and which can be changed. Choosing the appropriate treatment Standard, or approach, requires careful decision making and depends on a number of considerations, including level of historical significance, physical condition, proposed use, and code or regulatory requirements. Once the Standard is selected,

<sup>14</sup> U.S. General Services Administration, Section 106, 16 U.S.C. 470(f) accessed September 2021, <https://www.gsa.gov/reference/statutes/16-usc-470>.

<sup>15</sup> U.S. Department of the Interior, National Park Services, Technical Preservation Services, *The Secretary of The Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring & Reconstructing Historic Buildings*, 2017, accessed September 2021 at <https://www.nps.gov/tps/standards/treatment-guidelines-2017.pdf>.

whether it's preservation, rehabilitation, restoration, or reconstruction, the Standards provide philosophical consistency when treatment work is undertaken.

Rehabilitation, the most common treatment approach, is the process of making possible a compatible use for a property through repair, alterations, and additions while preserving those portions or features which convey its historical, cultural, or architectural values. The Standards for Rehabilitation are as follows:

1. A property shall be used for its historic purpose or be placed in a new use that requires minimal change to the defining characteristics of the building and its site and environment.
2. The historic character of a property shall be retained and preserved. The removal of historic materials or alteration of features and spaces that characterize a property shall be avoided.
3. Each property shall be recognized as a physical record of its time, place, and use. Changes that create a false sense of historical development, such as adding conjectural features or architectural elements from other buildings, shall not be undertaken.
4. Most properties change over time; those changes that have acquired historic significance in their own right shall be retained and preserved.
5. Distinctive features, finishes, and construction techniques or examples of craftsmanship that characterize a property shall be preserved.
6. Deteriorated historic features shall be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature shall match the old in design, color, texture, and other visual qualities and, where possible, materials. Replacement of missing features shall be substantiated by documentary, physical, or pictorial evidence.
7. Chemical or physical treatments, such as sandblasting, that cause damage to historic materials shall not be used. The surface cleaning of structures, if appropriate, shall be undertaken using the gentlest means possible.
8. Significant archeological resources affected by a project shall be protected and preserved. If such resources must be disturbed, mitigation measures shall be undertaken.
9. New additions, exterior alterations, or related new construction shall not destroy historic materials that characterize the property. The new work shall be differentiated from the old and shall be compatible with the massing, size, scale, and architectural features to protect the historic integrity of the property and its environment.
10. New additions and adjacent or related new construction shall be undertaken in such a manner that if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

#### 4.13.4.2 State Regulations

##### Office of Historic Preservation

The Office of Historic Preservation (OHP), an office of the California Department of Parks and Recreation, implements the policies of the NRHP on a Statewide level. The OHP works to preserve California's heritage resources by ensuring that projects and programs carried out or sponsored by federal, State, and local agencies comply with federal and State historic preservation laws.

##### California Register of Historical Resources

The California Register of Historical Resources (CRHR)<sup>16</sup> is the authoritative guide to the State's significant archaeological and historical resources. It closely follows the eligibility criteria of the NRHP but deals with State and local-level resources. The CRHR serves to identify, evaluate, register, and protect California's historical resources. For purposes of CEQA, a historical resource is any building, site, structure, object, or historic district listed in or eligible for listing in the CRHR (Public Resources Code, Section 21084.1). A resource is considered eligible for listing in the CRHR if it meets any of the following criteria:

- a. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- b. Is associated with the lives of persons important in our past.
- c. Embodies the distinctive characteristics of type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
- d. Has yielded, or may be likely to yield, information important in prehistory or history [Public Resources Code Section 5024.1(c)].<sup>17</sup>

Historical resources meeting one or more of the criteria listed above are eligible for listing in the CRHR. In addition to significance, resources must have integrity for a period of significance—the date or span of time within which significant events transpired or significant individuals made important contributions. Important archaeological resources are required to be at least 50 years old to be considered. "Integrity is the authenticity of a historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance." Simply put, resources must "retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance."

<sup>16</sup> State of California, Office of Historic Preservation, California Historical Resources, accessed September 2021 at <https://ohp.parks.ca.gov/listedresources>.

<sup>17</sup> Public Resources Code (PRC), *Division 5. Parks and Monuments*[5001 - 5873], "CHAPTER 1. State Parks and Monuments," Article 2. Historical Resources (5024.1).

#### California Environmental Quality Act

CEQA also requires the lead agency to consider whether there is a significant effect on unique archaeological resources that are not eligible for listing in the California Register. As defined in CEQA,<sup>18</sup> a unique archaeological resource is:

*an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:*

1. *Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.*
2. *Has a special and particular quality such as being the oldest of its type or the best available example of its type.*
3. *Is directly associated with a scientifically recognized important prehistoric or historic event or person.*

If an archaeological resource is found eligible for listing in the CRHR, then it is considered under CEQA to be a historic resource that needs to be protected. This may also apply to unique archaeological resources. If a historic resource may be impacted by activity, under CEQA, avoidance and preservation in place is the preferred alternative. If that is not possible, then a data recovery plan will need to be created and enacted to lessen impacts to the environment to a less-than-significant level. If the archaeological resource is not eligible for listing in the CRHR, and it is not a unique archaeological resource, then no further action is required to protect or mitigate possible impacts to it.

#### California Health and Safety Code

The discovery of human remains is regulated per California Health and Safety Code, Section 7050.5,<sup>19</sup> which states the following:

*In the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation...until the coroner...has determined...that the remains are not subject to...provisions of law concerning investigation of the circumstances, manner and cause of any death, and the recommendations concerning the treatment and disposition of the human remains have been made to the person responsible... The coroner shall make his or her determination within two working days from the time the person responsible for the excavation, or his or her authorized representative, notifies the coroner of the discovery or recognition of the human remains. If the coroner determines that the remains are not subject to his or her authority and...has reason to believe that they are those of a Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage Commission.*

<sup>18</sup> PRC Section 21083.2(a)

<sup>19</sup> California Health and Safety Code, Division 7, Dead Bodies, Section 7050.5

### California Public Resources Code Section 5097.98

Tribal cultural resources are protected pursuant to a number of State policies and regulations enumerated under PRC Section 5097.98.<sup>20</sup> In addition, tribal cultural resources are recognized as a nonrenewable resource.

Section 5097.98 provides procedures in the event human remains of Native American origin are discovered during project implementation. The statute requires that no further disturbances occur in the immediate vicinity of the discovery, that the discovery is adequately protected according to generally accepted cultural and archaeological standards, and that further activities take into account the possibility of multiple burials. The statute further requires the NAHC, upon notification by a County Coroner, designate and notify a Most Likely Descendant (MLD) regarding the discovery of Native American human remains. Once the MLD has been granted access to the site by the landowner and inspected the discovery, the MLD then has 48 hours to provide recommendations to the landowner for the treatment of the human remains and any associated grave goods.

In the event that no descendant is identified, or the descendant fails to make a recommendation for disposition, or if the landowner rejects the recommendation of the descendant, the landowner may, with appropriate dignity, reinter the remains and burial items on the property in a location that will not be subject to further disturbance.

### Assembly Bill 52

AB 52 applies specifically to projects for which a Notice of Preparation or a Notice of Intent to Adopt a Negative Declaration or Mitigated Negative Declaration (MND) is filed.<sup>21</sup> The primary intent of AB 52 is to include California Native American tribes early in the environmental review process and to establish a new category of resources related to Native Americans, known as tribal cultural resources, which require consideration under CEQA. CEQA defines tribal cultural resources as “sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe” that are either included or determined to be eligible for inclusion in the California Register or included in a local register of historical resources, or a resource that is determined to be a tribal cultural resource by a lead agency, in its discretion and supported by substantial evidence.<sup>22</sup> PRC Section 21080.3.1<sup>23</sup> requires that within 14 days of a lead agency determining that an application for a project is complete, or a decision by

<sup>20</sup> Public Resources Code, *Division 5. Parks and Monuments*, “Chapter 1.75. Native American Historical, Cultural, and Sacred Sites,” Section 5097.98.

<sup>21</sup> AB-52 Native Americans: California Environmental Quality Act., An act to amend Section 5097.94 of, and to add Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3 to, the Public Resources Code, relating to Native Americans.

<sup>22</sup> PRC, Division 13. Environmental Quality Section 21080.3.2, “Chapter 2.4. Definitions.”

<sup>23</sup> PRC, Division 13. Environmental Quality Section 21080.3.1, “Chapter 2.6. General, Tribal Consultation.”

a public agency to undertake a project, the lead agency provide formal notification to the designated contact, or a tribal representative, of California Native American tribes that are traditionally and culturally affiliated with the geographic area of the project (as defined in PRC section 21073) and who have requested in writing to be informed by the lead agency (PRC section 21080.3.1(b)). Tribes interested in consultation must respond in writing within 30 days from receipt of the lead agency’s formal notification and the lead agency must begin consultation within 30 days of receiving the tribe’s request for consultation (PRC sections 21080.3.1(d) and 21080.3.1(e)).

PRC section 21080.3.2(a)<sup>24</sup> identifies the following as potential consultation discussion topics: the type of environmental review necessary; the significance of tribal cultural resources; the significance of the project’s impacts on the tribal cultural resources; project alternatives or appropriate measures for preservation; and mitigation measures. Consultation is considered concluded when either: (1) the parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or (2) a party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached (PRC section 21080.3.2(b)).

If a California Native American tribe has requested consultation pursuant to PRC section 21080.3.1 and has failed to provide comments to the lead agency, or otherwise failed to engage in the consultation process, or if the lead agency has complied with Section 21080.3.1(d) of the statute and the California Native American tribe has failed to request consultation within 30 days, the lead agency may certify an EIR or adopt an MND.<sup>25</sup> The statute further states that any information, including, but not limited to, the location, description, and use of the tribal cultural resources, that is submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public without the prior consent of the tribe that provided the information. If the lead agency publishes any information submitted by a California Native American tribe during the consultation or environmental review process, that information shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public.

<sup>24</sup> PRC, *Division 13. Environmental Quality* Section 21080.3.2, “Chapter 2.6.”

<sup>25</sup> PRC, *Division 13. Environmental Quality* Section 21080.3.2, “Chapter 2.6.”

### Senate Bill 18

Senate Bill 18 (SB 18),<sup>26</sup> which went into effect January 1, 2005, requires local governments (city and county) to consult with Native American tribes prior to making certain planning decisions and to provide notice to tribes at certain key points in the planning process. The intent is to “provide California Native American tribes an opportunity to participate in local land use decisions at an early planning stage, for the purpose of protecting, or mitigating impacts to, cultural places.”

The purpose of involving tribes at these early planning stages is to allow consideration of cultural places in the context of broad local land use policy, before individual site-specific, project-level, land use designations are made by a local government. The consultation requirements of SB 18 apply to general plan or specific plan processes proposed on or after March 1, 2005.

According to the *Tribal Consultation Guidelines: Supplement to General Plan Guidelines*,<sup>27</sup> the following are the contact and notification responsibilities of local governments:

- Prior to the adoption or any amendment of a general plan or specific plan, a local government must notify the appropriate tribes (on the contact list maintained by the NAHC) of the opportunity to conduct consultations for the purpose of preserving, or mitigating impacts to, cultural places located on land within the local government’s jurisdiction that is affected by the proposed plan adoption or amendment. Tribes have 90 days from the date on which they receive notification to request consultation unless a shorter timeframe has been agreed to by the tribe.
- Prior to the adoption or substantial amendment of a general plan or specific plan, a local government must refer the proposed action to those tribes that are on the NAHC contact list and have traditional lands located within the city or county’s jurisdiction. The referral must allow a 45-day comment period. Notice must be sent regardless of whether prior consultation has taken place. Such notice does not initiate a new consultation process.
- Local governments must send a notice of a public hearing at least 10 days prior to the hearing to tribes who have filed a written request for such notice.

<sup>26</sup> Senate Bill No. 18 (Burton), An act to amend Section 815.3 of the Civil Code, to amend Sections 65040.2, 65092, 65351, 65352, and 65560 of, and to add Sections 65352.3, 65352.4, and 65562.5 to the Government Code, relating to traditional tribal cultural places.

<sup>27</sup> State of California, Office of Planning and Research, *Tribal Consultation Guidelines, Supplement to General Plan Guidelines*, November 2005.

### 4.13.4.3 Local Regulations

#### City of Inglewood

The City of Inglewood’s (City) General Plan does not identify any goals or policies related specifically to tribal resources or tribal cultural preservation ordinance or program in effect.

### 4.13.5 EXISTING CONDITIONS

#### 4.13.5.1 Environmental Setting

##### Geological Setting

The City is located in the Los Angeles Basin, a structural depression approximately 50 miles long and 20 miles wide in the northernmost Peninsular Ranges Geomorphic Province.<sup>28</sup> The Los Angeles Basin developed as a result of tectonic forces and the San Andreas fault zone, with subsidence occurring 18–3 million years ago (Ma).<sup>29</sup> While sediments dating back to the Cretaceous (66 Ma) are preserved in the basin, continuous sedimentation began in the middle Miocene (around 13 Ma).<sup>30</sup> Since that time, sediments have been eroded into the basin from the surrounding highlands, resulting in thousands of feet of accumulation. Most of these sediments are marine, as they eroded from surrounding marine formations, until sea level dropped in the Pleistocene Era and deposition of the alluvial sediments that compose the uppermost units in the Los Angeles Basin began.

The Los Angeles Basin is subdivided into four structural blocks, with the proposed Project occurring in the Central Block, where sediments range from 32,000 to 35,000 feet thick.<sup>31</sup> The Central Block is wedge-shaped, extending from the Santa Monica Mountains in the northwest, where it is about 10 miles wide, to the San Joaquin Hills to the southeast, where it widens to around 20 miles across. Specifically, however, in the Baldwin and Rosecrans hills are geomorphic features associated with uplift along the Newport–Inglewood structural zone.

The Quaternary rocks consist of shallow marine sandstone and siltstone as well as continental siltstone, mudstone, and gravel.<sup>32</sup> Older Quaternary units are exposed in these strongly dissected hills, and

#### 4.12 Tribal Cultural Resources

elevations range from approximately 75 feet to over 400 feet.<sup>33</sup> To the east, Holocene alluvium lies upon the regional coastal basin, also known as the Downey Plain. The sediments overlie an erosional surface of late Pleistocene age. To the west of the Rosecrans Hills is an elevated plain underlain by older Quaternary alluvium.

This area contains a drainage basin, with Holocene sediments, which narrows to the south into the Dominguez Channel. Southwest of the Project alignment, Pleistocene dune sand overlies older alluvial deposits. The main drainage courses within the area are the Dominguez Channel, Compton Creek, and Centinela Creek.<sup>34</sup>

#### Prehistoric Setting

According to recent research in the region,<sup>35</sup> the following prehistoric chronology has been divided into four general time periods: the Paleocoastal Period (12,000 to 8,000 Before Present [B.P.]), the Millingstone Period (8,000 to 3,000 B.P.), the Intermediate Period (3,000 to 1,000 B.P.), and the Late Period (1,000 B.P. to the time of Spanish contact in A.D. 1542).

While it is not certain when humans first came to California, their presence in Southern California by about 11,000 B.P. has been well documented. At Daisy Cave, on San Miguel Island, cultural remains have been radiocarbon dated to between 11,100 and 10,950 B.P.<sup>36</sup> During the Paleocoastal period, the climate of Southern California became warmer and more arid and the human population, residing mainly in coastal or inland desert areas, began exploiting a wider range of plant and animal resources.<sup>37</sup>

During the Millingstone period, there is evidence for the processing of acorns for food and a shift toward a more generalized economy. The first definitive evidence of human occupation in the Los Angeles area dates to at least 9,000 years B.P. and is associated with the Millingstone cultures.<sup>38,39</sup>

#### 4.12 Tribal Cultural Resources

Millingstone cultures were characterized by the collection and processing of plant foods, particularly acorns, and the hunting of a wider variety of game animals.<sup>40,41</sup> Millingstone cultures also established more permanent settlements that were located primarily on the coast and in the vicinity of estuaries, lagoons, lakes, streams, and marshes where a variety of resources, including seeds, fish, shellfish, small mammals, and birds, were exploited. Early Millingstone occupations are typically identified by the presence of handstones (manos) and millingstones (metates), while those Millingstone occupations dating later than 5,000 B.P. contain a mortar and pestle complex as well, signifying the exploitation of acorns in the region.

During the Intermediate period, many aspects of Millingstone culture persisted, but a number of socioeconomic changes occurred.<sup>42,43,44</sup> The native populations of Southern California were becoming less mobile and populations began to gather in small sedentary villages with satellite resource-gathering camps. Increasing population size necessitated the intensified use of existing terrestrial and marine resources.<sup>45</sup> Evidence indicates that the overexploitation of larger, high-ranked food resources may have led to a shift in subsistence, towards a focus on acquiring greater amounts of smaller resources, such as shellfish and small-seeded plants.<sup>46</sup>

This period is characterized by increased labor specialization, expanded trading networks for both utilitarian and nonutilitarian materials, and extensive travel routes. Although the intensity of trade had already been increasing, it now reached its zenith, with asphaltum (tar), seashells, and steatite being traded from Southern California to the Great Basin. Use of the bow and arrow spread to the coast around 1,500 B.P, largely replacing the dart and atlatl.<sup>47</sup> Increasing population densities, with ensuing territoriality and resource intensification, may have given rise to increased disease and violence between 3,300 and 1,650 B.P.<sup>48</sup>

The Late Period is associated with the florescence of the Gabrielino, who are estimated to have had a population numbering around 5,000 in the pre-contact period. The Gabrielino occupied what is presently Los Angeles County and northern Orange County, along with the southern Channel Islands, including Santa Catalina, San Nicholas, and San Clemente.<sup>49</sup> This period saw the development of elaborate trade networks and use of shell-bead currency. Fishing became an increasingly significant part of subsistence strategies at this time, and investment in fishing technologies, including the plank canoe, are reflected in the archaeological record.<sup>50,51</sup> Settlement at this time is believed to have consisted of dispersed family groups that revolved around a relatively limited number of permanent village settlements that were located centrally with respect to a variety of resources.

### ***Ethnographic Setting***

The ethnographic history ranges from A.D. 1542 to 1771 and is referred to as the Protohistoric period. This period covers the occupation of the area by native American tribes. The City is located in a region traditionally occupied by the Gabrielino Indians.

Traditionally, the Gabrielino occupied a large territory, including the entire Los Angeles Basin, the coast from Malibu to Aliso Creek, parts of the Santa Monica Mountains, the San Fernando Valley, the San Gabriel Valley, the San Bernardino Valley, the northern part of the Santa Ana Mountains, and much of the middle and lower Santa Ana River reaches. In addition, the Gabrielino also inhabited the islands of Santa Catalina, San Clemente, and San Nicolas. The term “Gabrielino” is a general term that refers to those Native Americans who were administered by the Spanish at the Mission San Gabriel Arcángel. Their neighbors included the Chumash and Tataviam to the north, the Juañeno to the south, and the Serrano and Cahuilla to the east. The Gabrielino are reported to have been second only to the Chumash in terms of population size and regional influence.<sup>52</sup> The Gabrielino language is part of the Takic branch of the Uto-Aztecan language family.

Trade was an important element of the Gabrielino economy. While the principal Gabrielino-produced commodity—steatite vessels from centers on Catalina Island—originated well outside the defined study region, trade in steatite items was conducted throughout local territory and involved external relations with desert, Southwestern, mountain, and coastal groups beyond Gabrielino borders.<sup>53</sup> Additionally, Olivella shell callus beads, manufactured on the northern Channel Islands by the Chumash and their

53 See **Appendix I.1** of this Recirculated Draft EIR.

predecessors, were reportedly used quite frequently as a currency or as a status symbol by the Gabrielino and other Southern California groups.<sup>54</sup>

At the time of Spanish contact in A.D. 1542, also the beginning of what is known as the Protohistoric Period (A.D. 1542 to 1771), many Gabrielino practiced a religion that was centered around the mythological figure Chinigchinich.<sup>55</sup> This religion may have been relatively new when the Spanish arrived, and at that time was spreading to other neighboring Takic groups. The Gabrielino practiced both cremation and inhumation of their dead. A wide variety of grave offerings, such as stone tools, baskets, shell beads, projectile points, bone and shell ornaments, and other skins, were interred with the deceased.

Coming ashore on Santa Catalina Island in October of 1542, Juan Rodriguez Cabrillo was the first European to make contact with the Gabrielino; the 1769 expedition of Portolá also passed through Gabrielino territory.<sup>56</sup> Native Americans suffered severe depopulation and their traditional culture was radically altered after Spanish contact. Nonetheless, Gabrielino descendants still reside in the greater Los Angeles and Orange County areas and maintain an active interest in their heritage.

### ***Historic Setting***

#### **Spanish Period**

Although Spanish explorers made brief visits to the region in 1542 and 1602, sustained contact with Europeans did not commence until the onset of the Spanish Period. In 1769 Gaspar de Portolá led an expedition from San Diego, passing through the Los Angeles Basin and the San Fernando Valley, on its way to the San Francisco Bay.<sup>57</sup> Father Juan Crespi, who accompanied the 1769 expedition, noted the suitability of the Los Angeles area for supporting a large settlement. This was followed in 1776 by the expedition of Father Francisco Garcés.<sup>58</sup>

In the late 18th century, the Spanish began establishing missions in California and forcibly relocating and converting native peoples as well as exposing them to diseases that they had no resistance to. Mission San Gabriel Arcángel was founded on September 8, 1771, and Mission San Fernando Rey de España on September 8, 1797. By the early 1800s, the majority of the surviving Gabrielino had entered the mission system, either at San Gabriel or San Fernando. Mission life offered some degree of security in a time when

traditional trade and political alliances were failing and epidemics and subsistence instabilities were increasing. This lifestyle change also brought with it significant negative consequences for Gabrielino health and cultural integrity.

A Gabrielino village, or “rancheria” (known as Guaspel, Guasna, or Gaucha), appears to have been located northwest of the City. Based on mission baptism records, the rancheria appears to have been occupied from about 1790 to 1820. At least 193 people are known to have lived at the rancheria and been baptized. Records suggest that recruitment into the mission system did not occur until native populations in closer proximity to Mission San Gabriel had been assimilated, and after grazing expanded into the vicinity of the Project area, bringing native inhabitants of the region into closer contact with Spanish-era ranchers.

A 1938 map titled The Kirkman-Harriman Pictorial and Historical Map of Los Angeles County 1860 A.D.-1937 A.D. (Kirkman map) depicts approximate locations of Gabrielino villages in Los Angeles. It depicts the location of unnamed villages about 2 to 5 miles north of the Project area, but does not show any roads, landforms, or locations overlapping with the Project area.

#### Mexican Period

After Mexico gained its independence from Spain in 1821, Los Angeles became the capital of the California territory in 1835.<sup>59</sup> Mexico continued to promote settlement of California with the issuance of land grants. In 1833, Mexico began the process of secularizing the California missions, reclaiming the majority of mission lands, and redistributing them as land grants throughout California. According to the terms of the Secularization Law of 1833 and Regulations of 1834, at least a portion of the lands would be returned to the Native populations, but this did not always occur.<sup>60</sup> Because of the disbursement that the Gabrielino populations suffered during the Mission period no land was returned to the Gabrielino Tribes.

During the Mexican Period, many ranchos continued to be used by settlers for cattle grazing. Hides and tallow from cattle became a major export for Mexican settlers in California, known as Californios, many of whom became wealthy and prominent members of society. The Californios led generally easy lives, leaving the hard work to vaqueros and Indian laborers.<sup>61,62</sup>

#### American Period

Mexico ceded California to the United States as part of the Treaty of Guadalupe Hildalgo in 1848. California officially became one of the United States in 1850. While the treaty recognized the right of Mexican citizens to retain ownership of land granted to them by Spanish or Mexican authorities, the claimant was required to prove their right to the land before a patent was given. The process was lengthy and generally resulted in the claimant losing at least a portion of their land to attorney’s fees and other costs associated with proving ownership.<sup>63</sup>

When the discovery of gold in northern California was announced in 1848, an influx of people from other parts of North America flooded into California and the population of Los Angeles tripled between 1850 and 1860. The increased population led to additional demand of the Californios’ cattle. As demand increased, the price of beef skyrocketed and Californios reaped the benefits. However, a devastating flood in 1861, followed by droughts in 1862 and 1864, led to a rapid decline of the cattle industry; over 70 percent of cattle perished during these droughts.<sup>64,65</sup>

These natural disasters, coupled with the burden of proving ownership, caused many Californios to lose their lands during this period. Former ranchos were subsequently subdivided and sold for agriculture and residential settlement.<sup>66,67</sup>

During the rancho period, the City was part of the *Rancho Aguaje de la Centinela* and the *Rancho Sausal Redondo*. A year after Mexico gained independence from Spain and control of California in 1822, Los Angeles resident Antonio Avila received a land grant for *Rancho Sausal Redondo* and grazed cattle there as well. The rancho encompassed the areas that are now the Cities of Redondo Beach, Inglewood, Hawthorne, El Segundo, Lawndale, Manhattan Beach and Hermosa Beach. In 1834, Ygnacio Machado, one of the original leather jacket soldiers that escorted settlers to Los Angeles, built the Centinela Adobe. The Centinela Adobe, located approximately 2.5 miles from the Project area was in the center of what became a 2,200-acre ranch on a portion of the *Rancho Sausal Redondo*. Machado had moved onto what he claimed was still public land, which was granted to him as the *Rancho Aguaje de la Centinela*. Soon after, Machado traded the *Rancho Aguaje de la Centinela* for a keg of whiskey and a home in the Pueblo of Los Angeles. The property traded hands many times and was eventually acquired by a Scottish noble man named Robert Burnett who eventually added the much larger *Rancho Sausal Redondo* to his holdings, once again combining the ranchos. Burnette eventually returned to Scotland and leased the ranch to a Canadian immigrant who was considered by many to be the founding father of Inglewood: Daniel Freeman. In spite

<sup>67</sup> McWilliams, Carey, *Southern California: An Island on the Land*, Gibbs Smith, Layton, Utah, 1946.

of drought and other hardship Freeman successfully farmed barley on the ranch and purchased it from Burnette with gold in 1885. Freeman went on to become a major land developer in Inglewood.<sup>68</sup>

Centinela Springs (California Historical Landmark 363), or *Aguaje de Centinela*, was a valued source of spring water for the *Rancho Aguaje de la Centinela* and the spring is described as continuously existing since the Pleistocene Era. The spring is memorialized and is still located at the corner of Centinela Avenue and Florence Boulevard, approximately 2 miles north of the Project area.<sup>69</sup>

#### 4.13.5.2 Adjusted Baseline

This section assumes the Adjusted Baseline Environmental Setting as described in **Section 4.0: Environmental Impact Analysis, 4.0.4: Adjusted Baseline**. Related to tribal cultural resources, the changes associated with the Adjusted Baseline projects include excavation and construction of new uses on the Hollywood Park Specific Plan (HPSP) site.

There is no evidence that development in the HPSP would affect the baseline for analysis of the tribal cultural resources. No tribal resources have been discovered and documented during construction of the Adjusted Baseline projects that would provide additional information on the presence or sensitivity of these resources in the area.

#### 4.13.5.3 Project Setting

The proposed Project is located within the fully urbanized City, and thus includes a high degree of development disturbance. The proposed Project would connect to the Metro K Line Downtown Inglewood station at the northern end of the Project alignment. The guideway alignment is elevated and travels from the southeast corner of Market Street and Florence Avenue southwest towards the corner of Market Street and Regent Street where it runs along the center of Market Street until it turns east on Manchester Boulevard. The guideway would extend from the station, situated diagonally over the current location of the retail commercial center on the northeast corner of Market Street and Florence Avenue, and travel south through downtown Inglewood along Market Street, where it be adjacent to existing commercial retail, office, restaurant, parking, residential, and mixed uses. The guideway would turn east onto Manchester Boulevard and be bordered by commercial retail, office, mixed-use, and residential uses on both sides of the Manchester Boulevard segment. After turning south onto Prairie Avenue, the guideway would be bordered by commercial and multifamily residential uses to the west, while uses to the east include commercial/recreational uses associated with the Forum and entertainment, retail, and residential uses under development within the HPSP as part of the Los Angeles Stadium and Entertainment District (LASED). The guideway would terminate at the intersection of Prairie Avenue and Hardy Street and the proposed Prairie Avenue/Hardy Street Station just north of Hardy Street.

<sup>68</sup> Kielbasa, John, 1998. *Historic Adobes of Los Angeles County*. Dorrance Publishing Co. Pittsburg, Pennsylvania.

<sup>69</sup> Office of Historic Preservation, 2019. <http://ohp.parks.ca.gov/ListedResources/Detail/363>. Accessed January 9, 2019.

There are no known tribal resources within the footprint of the proposed Project. However, as part of the AB 52 tribal consultation process,<sup>70</sup> it was noted that the existing networks of major roadways followed historic and prehistoric trading routes in the area that were used by Native American tribes that resided in the area and along the west coast. It was added that there are known streams to the east and trading routes to the west. Significant among these historic and pre-historic trading routes were those that Rancho Sausal Redondo (translated as “round clump of willows”), Rancho Ajuaje de la Centinela (the name means “Sentinel of Waters” in Spanish, and refers to the artesian water in the area exemplified by Centinela Springs).<sup>71</sup> Rancho Ajuaje de la Centinela included parts of present-day Westchester and Inglewood; and Rancho Centinela included the present-day cities of El Segundo, Gardena, Hawthorne, Hermosa Beach, Inglewood, Lawndale, Manhattan Beach, and Playa del Rey.

The natural steams of the area near the La Brea tar pits were used to collect materials that would line baskets and boats. The traditional landscape, which including the tribal trading routes, have numerous burial sites that have been discovered as part of other projects and excavations in the area. The tribal traditions were to bury individuals who died on the trading route at the location of their passing.

#### 4.13.6 THRESHOLDS OF SIGNIFICANCE

Criteria outlined in Appendix G of the *CEQA Guidelines* were used to determine the level of significance of impacts to tribal cultural resources. A project would have a significant impact if it would:

- Threshold TCR-1:** Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code § 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
- i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k); or
  - ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code § 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code § 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

<sup>70</sup> AB 52 Consultation Summary, Meridian Consultants LLC, February 6, 2019 (refer to **Appendix P.2**).

<sup>71</sup> Centinela Springs was registered as Historical Landmark on October 9, 1939 and is located in the City of Inglewood. It’s description on the Office of Historic Preservation (OHP) website notes that bubbling springs once flowed here from their source in a deep water basin that has existed continuously since the Pleistocene Era. Prehistoric animals, Indians, and early Inglewood settlers were attracted here by the pure artesian water. The springs and valley were named after sentinels guarding cattle in the area.

### 4.13.7 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

**Impact TCR-1:** Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code § 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

- i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k); or
- ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code § 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code § 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

For purposes of this impact analysis, a Tribal Cultural Resources (TCR) is considered a site, feature, place, cultural landscape, sacred place, or object which is of cultural value to a California Native American Tribe and is either on or eligible for the California Register or a local historic register.

As previously noted, the Tribe shared with the City that the location of the proposed Project may be surrounded by historic and pre-historic trading routes and village activity. Tribal members described historical landmarks in the region, including Rancho Sausal Redondo (translated as “round clump of willows”) and Rancho Ajuaje de la Centinela (translated as “Sentinel of Waters,” and refers to the artesian water in the area exemplified by Centinela Springs),<sup>72</sup> which included parts of present-day Westchester and Inglewood, and Rancho Centinela, which included the present-day cities of El Segundo, Gardena, Hawthorne, Hermosa Beach, Inglewood, Lawndale, Manhattan Beach, and Playa del Rey. The Tribe further added that there are known streams to the east and trading routes to the west of the proposed Project that could contain TCRs.<sup>73</sup> The Tribe stated that, due to these trading routes and historical activity centers and the tribal tradition of burying their deceased along the routes and near waterways over thousands of years, these activities could result in the proposed Project having a high sensitivity for TCRs and human remains.

<sup>72</sup> Centinela Springs was registered as Historical Landmark on October 9, 1939 and is located in the City of Inglewood. It’s description on the OHP website notes that bubbling springs once flowed here from their source in a deep water basin that has existed continuously since the Pleistocene Era. Prehistoric animals, Indians, and early Inglewood settlers were attracted here by the pure artesian water. The springs and valley were named after sentinels guarding cattle in the area.

<sup>73</sup> See **Appendix P.2** of this Recirculated Draft EIR.

The Tribe explained that railroads were placed on top of traditional tribal trade routes due to the favorable topographical conditions of the paths, having been flattened by human travel over thousands of years.

Inland and coastal waterways, the Tribe described, create unique habitats and riparian corridors that provide an abundance of food and medicine resources along with aesthetically peaceful areas with running water, shade trees, and shelter. The Tribe stated that areas near watercourses and water bodies housed seasonal or permanent hamlets, seasonal or permanent trade depots, ceremonial and religious prayer sites, and burials and cremation sites of their ancestors. Larger water bodies were high attractants for human activity and the banks and shores of these water bodies have a higher-than-average potential for encountering TCRs of artifacts and human remains during ground disturbing activities. A waterway immediately east of the proposed Project is a landscape feature that was heavily used for life sustenance, homesites, ceremonies, and regular daily activities.

Since the Project area was a land area of confluence, it would have been heavily used for human travel, movement of trade items, visiting of family, going to ceremonies, accessing recreation areas, and accessing foraging areas. Further, within and around these routes contained seasonal or permanent ramadas or trade depots, seasonal and permanent habitation areas, and often still contain isolated burials and cremations from Tribal members who died along the trail. These isolated burials are not associated with a village community burial site or ceremonial burial site, rather the location is simply where the person died and was buried where they died. Therefore, isolated burials are more concentrated and likely to occur in proximity to Tribal trade routes, particularly near major trade routes.

Because the proposed Project is located within a known area of historic and pre-historic trading routes and village activity, adjacent to sacred water courses, and within a sacred landscape for ceremonies and homesites, the Tribe indicated that there is a high potential to impact TCRs still present within the soil from the thousands of years of prehistoric activities that occurred within and around these Tribal cultural landscapes.

#### **Construction**

Implementation of the proposed Project would include demolition, grubbing, and grading, possible subterranean utility relocation and installation, and excavation and installation of piles for the guideway and stations, including structural support columns and excavations for guideway and station foundations, and, as part of the construction of support facilities, including the maintenance and storage facility (MSF) and power distribution system (PDS) substations.

Historic maps provided to the City by the Tribe were reviewed as part of the background research for the proposed Project to identify previous geographical features and historic land uses, including the location

#### 4.12 Tribal Cultural Resources

of historical Native American trading routes and villages.<sup>74</sup> Because the Project alignment is located in the vicinity of areas identified during the AB 52 tribal consultation, there may be unanticipated discovery of TCRs as defined in Public Resources Code Section 21074. As such, there is the potential for loss of artifact and TCR and/or the diminishment in value to the Tribe of TCRs to occur during ground disturbing activities. As such, the proposed Project could result in a substantial adverse change in the significance of a TCR pursuant to the criteria in subdivision (c) of PRC Section 5024.1. These potential impacts would be potentially significant.

During the Rancho period, the settlers resided near Centinela Creek north of the proposed Project. The likelihood of unmarked graves associated with the Rancho period is low as the preference would have been to bury family members at the Mission or in the Pueblo near the church. The area was developed around the turn of the century, at which time (i.e., in 1905) the Inglewood Park Cemetery was established. The cemetery is still in operation and located near the proposed Project at the northeast corner of Manchester Boulevard and Prairie Avenue. Because the cemetery is close by, available, and in use, the likelihood of unmarked historic-age graves is low. Furthermore, lands within the footprint of the proposed Project are not known to contain any unmarked graves or human remains. However, due to the current development and disturbance in the cumulative context area, it is not currently possible to identify any sites or resources that may exist subsurface.

Ground disturbing activities that would be employed during construction of the proposed Project may encounter buried human remains. As a result, these activities may disturb human remains, including those interred outside of dedicated cemeteries. Therefore, the loss of any previously unknown human remains, including native American remains, may be significant, and the proposed Project would have a potentially significant impact.

#### **Operation**

While the operations of the proposed Project would introduce different land uses, these uses would not involve activities related to ground disturbance. As such, impacts related to a substantial adverse change in the significance of a TCR that would occur from the operation of the proposed Project would be less than significant.

---

<sup>74</sup> See **Appendix P.2**.

#### 4.12 Tribal Cultural Resources

#### **Mitigation Measures**

As indicated previously, impacts related to TCRs during ground disturbing construction activities would be potentially significant. The following Mitigation Measures (MMs) have been identified and are based on information and suggestions received from the Tribe during the AB 52 consultation process with the City.

#### **Construction**

##### **MM TCR-1: Retention of a Tribal Cultural Resources Monitor/Consultant.**

Prior to the commencement of any ground disturbing activity at the Project alignment, the Project contractor, in consultation with the City, shall retain a qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (US Department of the Interior, 2008) to carry out all mitigation related to cultural resources. In addition, a Native American Monitor shall be designated by the Gabrieleno Band of Mission Indians-Kizh Nation – the tribe that consulted on this project pursuant to Assembly Bill AB 52 (the "Tribe" or the "Consulting Tribe"). If no Native American Monitor is designated within a reasonable period of time (not to exceed 30 days), the activity can commence without the designated Monitor. A copy of the executed contract(s) with the qualified archaeologist and Native American Monitor shall be submitted to the City of Inglewood Planning and Building Department prior to the issuance of any permit necessary to commence a ground-disturbing activity. The Native American Monitor will only be present on-site during the construction phases that involve ground-disturbing activities. Ground disturbing activities are defined by the Tribe as activities that may include, but are not limited to, pavement removal, potholing or auguring, grubbing, tree removals, boring, grading, excavation, drilling, and trenching, within the Project area. The Native American Monitor will complete daily monitoring logs that will provide descriptions of the day's activities, including construction activities, locations, soil, and any cultural materials identified. The on-site monitoring shall end when all ground-disturbing activities on the Project alignment are completed, or when the Native American Representatives and Native American Monitor have indicated that all upcoming ground-disturbing activities at the Project alignment have little to no potential for impacting Tribal Cultural Resources. Upon discovery of any Tribal Cultural Resources, construction activities shall cease in the immediate vicinity of the find (not less than the surrounding 50 feet) until the find can be assessed. All Tribal Cultural Resources unearthed by project activities shall be evaluated by the qualified archaeologist and the Native American Monitor. If the resources are Native American in origin, the Consulting Tribe will retain it/them in the form and/or manner the Tribe deems appropriate, for educational, cultural and/or historic purposes.

4.12 Tribal Cultural Resources

If human remains and/or grave goods are discovered or recognized at the Project alignment, all ground disturbance shall immediately cease, and the county coroner shall be notified per Public Resources Code Section 5097.98, and Health & Safety Code Section 7050.5. Human remains and grave/burial goods shall be treated alike per California Public Resources Code section 5097.98(d)(1) and (2). Work may continue on other parts of the Project alignment while evaluation and, if necessary, mitigation takes place (CEQA Guidelines Section 15064.5[f]). If a non-Native American resource is determined by the qualified archaeologist to constitute a "historical resource" or "unique archaeological resource," time allotment and funding sufficient to allow for implementation of avoidance measures, or appropriate mitigation, must be available. The treatment plan established for the resources shall be in accordance with CEQA Guidelines Section 15064.5(f) for historical resources and Public Resources Code Sections 21083.2(b) for unique archaeological resources. Preservation in place (i.e., avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery excavations to remove the resource along with subsequent laboratory processing and analysis. Any historic archaeological material that is not Native American in origin shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes.

MM TCR-2 through MM TCR-5 will supplement MM TCR-1.

**MM TCR-2: Monitoring and Mitigation Program.**

Prepare, design, and implement an Archaeological Monitoring and Mitigation Program for the proposed Project. The Monitoring and Mitigation Program shall define pre-construction coordination, construction monitoring for excavations based on the activities and depth of disturbance planned for each portion of the Project area, data recovery (including halting or diverting construction so that archaeological remains can be evaluated and recovered in a timely manner), artifact and feature treatment, procurement, and reporting. The Monitoring and Mitigation Program shall be prepared and approved by a qualified archaeologist prior to the issuance of the first grading permit.

**MM TCR-3: Cultural Resources Sensitivity Training.**

The qualified archaeologist and Native American Monitor shall conduct construction-worker archaeological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.) and will present the Archaeological Monitoring and Mitigation Program as outlined in **MM TCR-2**, for all construction personnel conducting, supervising, or

4.12 Tribal Cultural Resources

associated with demolition and ground disturbance, including utility work, for the Project. In the event construction crews are phased or rotated, additional training shall be conducted for new construction personnel working on ground-disturbing activities. Construction personnel shall be informed of the types of prehistoric and historic archaeological resources that may be encountered, and of the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains. Documentation shall be retained by the qualified archaeologist demonstrating that the appropriate construction personnel attended the training.

**MM TCR-4: Archaeological and Native American Monitoring**

The qualified archaeologist will oversee archaeological and Native American monitors who shall be retained to be present and work in tandem, monitoring during construction excavations such as grading, trenching, or any other excavation activity associated with the Project and as defined in the Monitoring and Mitigation Program. If, after advanced notice of potential ground-disturbing activities, the Native American representative declines, is unable, or does not respond to the notice, construction can proceed under supervision of the qualified archaeologist. The frequency of monitoring shall be based on the rate of excavation and grading activities, the materials being excavated, and the depth of excavation, and if found, the quantity and type of archaeological resources encountered. Full-time monitoring may be reduced to part-time inspections, or ceased entirely, if determined adequate by the qualified archaeologist and the Native American Monitor.

1. In the event of the discovery of any archaeological materials during implementation of the Project, all work shall immediately cease within 50 feet of the discovery until it can be evaluated by the qualified archaeologist. Construction shall not resume until the qualified archaeologist has made a determination on the significance of the resource(s) and provided recommendations regarding the handling of the find. If the resource is determined to be significant, the qualified archaeologist will confer with the City and contractor regarding recommendation for treatment and ultimate disposition of the resource(s).
2. If it is determined that the discovered archaeological resource constitutes a historical resource or a unique archaeological resource pursuant to CEQA, avoidance and preservation in place is the preferred manner of mitigation. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement.
3. In the event that preservation in place is demonstrated to be infeasible and data recovery through excavation is the only feasible mitigation available, a Cultural Resources Treatment Plan shall be prepared and implemented by the qualified

#### 4.12 Tribal Cultural Resources

archaeologist in consultation with the City and contractor, and appropriate Native American representatives (if the find is of Native American origin). The Cultural Resources Treatment Plan shall provide for the adequate recovery of the scientifically consequential information contained in the archaeological resource through laboratory processing and analysis of the artifacts. The Cultural Resources Treatment Plan will further make recommendations for the ultimate curation of any archaeological materials, which shall be curated at a public, non-profit curation facility, university, or museum with a research interest in the materials, if such an institution agrees to accept them. If resources are determined to be Native American in origin, they will first be offered to the Tribe for permanent curation, repatriation, or reburial, as directed by the Tribe. If no institution or Tribe accepts the archaeological material, then the material shall be donated to a local school or historical society in the area for educational purposes.

4. If the resource is identified as a Native American, the qualified archaeologist and the City shall consult with appropriate Native American representatives, as identified through the AB 52 consultation process in determining treatment for prehistoric or Native American resources to ensure cultural values ascribed to the resource, beyond that which is scientifically important, are considered.
5. Prepare a final monitoring and mitigation report for submittal to the City, and the South Central Coastal Information Center (SCCIC), in order to document the results of the archaeological and Native American monitoring. If there are significant discoveries, artifact and feature analysis and final disposition shall be included with the final report, which will be submitted to the SCCIC and the City. The final monitoring report shall be submitted to the City within 90 days of completion of excavation and other ground disturbing activities that require monitoring.

#### MM TCR-5: Inadvertent Discoveries Related to Human Remains.

In the event of the unanticipated discovery of human remains during excavation or other ground disturbance related to the proposed Project, all work shall immediately cease within 150 feet of the discovery and the County Coroner shall be contacted in accordance with PRC Section 5097.98<sup>75</sup> and Health and Safety Code Section 7050.5.<sup>76</sup> Additionally, the contractor shall notify the City, and the tribal cultural resources monitor and archaeological monitor.

<sup>75</sup> NAGPRA, Title 43. Public Lands: Interior, Subtitle A. Office of the Secretary of the Interior, Part 10. Native American Graves Protection and Repatriation Regulations, § 5097.98 – Notification of discovery of Native American human remains, descendants; disposition of human remains and associated grave goods.

<sup>76</sup> California / Health and Safety Code - HSC / CHAPTER 2. General Provisions [7050.5. - 7055.] / Section 7050.5.

#### 4.12 Tribal Cultural Resources

The City, as the Project sponsor, and the contractor shall ensure that the immediate vicinity where the discovery occurred is not disturbed by further activity, is adequately protected according to generally accepted cultural and tribal standards or practices, and that further ground-disturbing activities take into account the possibility of multiple burials.

No further excavation or disturbance of the discovery or any nearby area reasonably suspected to overlie adjacent remains (as determined by the qualified archaeologist and/or tribal cultural resources monitor) shall occur until the coroner has made the necessary findings as to origin and disposition pursuant to PRC Section 5097.98. If such a discovery occurs, a temporary construction exclusion zone shall be established surrounding the area of the discovery so that the area would be protected (as determined by the qualified archaeologist and/or cultural resources monitor), and consultation and treatment could occur as prescribed by law. As required by law, the coroner would determine within two working days of being notified if the remains are subject to his or her authority.

If the coroner recognizes the human remains to be those of a Native American or has reason to believe that they are those of a Native American, he or she shall contact, by telephone within 24 hours, the NAHC. In accordance with Health and Safety Code Section 7050.5, subdivision (c), and PRC Section 5097.98 (as amended by AB 2641), the NAHC would make an MLD determination.

If the Tribe is designated MLD, the following standards shall apply and the following requirements and treatment measures shall be implemented.

1. To the Tribe, the term “human remains” encompasses more than human bones. In ancient as well as historic times, Tribal Traditions included, but were not limited to, the burial of funerary objects with the deceased, and the ceremonial burning of human remains. These remains are to be treated in the same manner as bone fragments that remain intact. Associated funerary objects are objects that, as part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later; other items made exclusively for burial purposes or to contain human remains can also be considered as associated funerary objects.
2. Prior to the continuation of ground disturbing activities, the landowner shall arrange a designated site location within the footprint of the project for the respectful reburial of the human remains and/or ceremonial objects. In the case where discovered human remains cannot be fully documented and recovered on the same day, the remains shall be covered with muslin cloth and a steel plate that can be moved by heavy equipment placed over the excavation opening to protect the remains. If this

#### 4.12 Tribal Cultural Resources

type of steel plate is not available, a 24-hour guard should be posted outside of working hours. As stated by the Tribe as part of the Project's AB 52 consultation:

*The Tribe will make every effort to recommend diverting the project and keeping the remains in situ and protected. If the project cannot be diverted, it may be determined that burials will be removed. The Tribe will work closely with the qualified archaeologist to ensure that the excavation is treated carefully, ethically, and respectfully.*

3. If data recovery is approved by the Tribe, documentation shall be taken which includes at a minimum detailed descriptive notes and sketches. The Tribe shall approve additional types of documentation for data recovery purposes. Cremations must either be removed in bulk or by means as necessary to ensure completely recovery of all material. If the discovery of human remains includes four or more burials, the location is considered a cemetery and a separate treatment plan shall be created. Once complete, a final report of all activities is to be submitted to the Tribe and the NAHC. Scientific study or the utilization of any invasive diagnostics on human remains of Native American origin.
4. Each occurrence of human remains and associated funerary objects will be stored using opaque cloth bags. All human remains, funerary objects, sacred objects and objects of cultural patrimony will be removed to a secure container on site if feasible. These items shall be retained and reburied within six months of recovery if feasible. The site of reburial/repatriation shall be on the Project area, but at a location agreed upon between the Tribe and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered.

If the Tribe is not designated MLD, each occurrence of human remains and associated funerary objects shall be stored using opaque cloth bags. All human remains, funerary objects, sacred objects, and objects of cultural patrimony shall be preserved in place where feasible and to consult with the tribal cultural resources monitor and/or the MLD about appropriate treatment if removal is required. If remains are removed, they shall be removed to a secure container on site, if possible, with consultation with of the qualified archaeologist and/or tribal cultural resources monitor. These items shall be retained and reburied within six months of recovery or as directed by the qualified archaeologist and/or tribal cultural resources monitor. The site of reburial/repatriation shall be within the proposed Project footprint, or at a location agreed upon between the MLD and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered.

#### 4.12 Tribal Cultural Resources

##### Operation

No mitigation is required during operation of the proposed Project.

##### Level of Significance after Mitigation

##### Construction

With implementation of **MMs TCR-1, TCR-2, TCR-3, TCR-4, and TCR-5**, potentially significant impacts to TCRs, including related, unanticipated discovery of human remains, would be reduced to a level that is less than significant. These measures would work to prevent the destruction and loss of sensitive TCRs and ensure the proper disposition of human remains.

##### Operation

There are no significant impacts associated with the operation of the proposed Project; impacts would be less than significant.

#### 4.13.8 CUMULATIVE IMPACTS

In addition to the proposed Project, there are numerous projects within the City of Inglewood and within the corresponding ethnographic territory of the Gabriellino Tribe, 74 of which are in the City of Inglewood, which have been taken into consideration when developing the cumulative context, as described in **Section 4.0, 4.0-5: Cumulative Assumptions**.

The closest active cumulative projects are the SoFi Stadium and associated developments, located adjacent to the proposed Project east of Prairie Avenue, and the Inglewood Basketball and Entertainment Center (Intuit Dome) located south of the proposed Project along Century Boulevard.

#### Tribal Cultural Resources

The City implements the AB 52 process on all projects as required CEQA Section 21080.3.1.<sup>77</sup> This requires that prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report for a project, the City, as lead agency, shall begin consultation with a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project if: (1) the California Native American tribe requested to the lead agency, in writing, to be informed by the lead agency through formal notification of proposed projects in the geographic area that is traditionally and culturally affiliated with the tribe, and (2) the California Native American tribe responds, in writing, within 30 days of receipt of the formal notification, and requests the consultation. Further, within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a

<sup>77</sup> CEQA Section 21080.3.1.

#### 4.12 Tribal Cultural Resources

project, the City, as lead agency provides formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice. Based on the individual consultations with Tribes, the City incorporates into the conditions and mitigation of each project, as applicable, considerations for the protection of TRCs.

The cumulative context for TRCs is within the Gabrielino Tribal territory which encompasses land within Los Angeles County north to Thousand Oaks, east to Pomona, west to the coast and south to Long Beach. Their territory also extends into Orange County as far south as Costa Mesa. The City is included within the Gabrielino Tribal territory and has been subject to historic development within the City since the rancho period, with more wide scale development occurring at the turn of the century. The Gabrielino Tribal territory has been subject to wide scale development and redevelopment projects over the past several decades and is currently experiencing a high level of redevelopment projects. Known Tribal village locations, trade routes, and known significant prehistoric archaeological sites that have a higher potential to represent a TCR are mapped and documented between 2 and 5 miles from the proposed Project. As such, development in these areas could have a significant impact to a TCR. Cumulatively, the large amount of development within the Tribal territory, especially development within known village locations, trade routes, and known significant prehistoric archaeological sites could have a cumulatively significant impact to TRCs. All related projects would, like the proposed Project, be required to comply with regulatory requirements governing TRCs, including consultation with California Native American Tribes where required under AB 52. Should an impact be identified, the related projects would be required to comply with PRC section 21084.3, which would require avoidance and preservation or mitigation as defined in PRC section 21084.3(b).

As described previously, construction of the proposed Project could result in a potentially significant impact on a previously unknown TRCs. While there are no TRCs identified within the proposed Project, the City has consulted with Tribal representatives and recognizes the potential sensitivity.

Some of the cumulative development projects in the vicinity of the proposed Project are near historical Native American trade routes or villages or waterways and could result in potentially significant due to substantial adverse changes in the significance of TRCs. Prior to mitigation, the proposed Project would result in similar potentially significant impacts. Cumulatively, this large amount of development within the Tribal territory could have a cumulatively significant impact to TRCs.

Based on the above considerations, the proposed Project, in conjunction with cumulative development within the vicinity and in the City, could result in cumulatively significant impacts to TRCs. However, because the proposed Project would include mitigation to prevent or substantially minimize the destruction or loss of TRCs, consistent with the mitigation measures recommended by the Tribe through

#### 4.12 Tribal Cultural Resources

the Project's AB 52 consultation, the proposed Project's incremental contribution to this potential cumulatively significant impact would be less than cumulatively considerable.

With regulatory adherence and incorporation of required mitigation the proposed Project would not result in a cumulatively considerable impact on TRCs.

#### Unknown Human Remains

In regard to impacts to previously unknown human remains, including those buried outside a formal cemetery, there are no known burial grounds or unmarked cemeteries within the footprint of the proposed Project or a 0.5-mile radius based on the SLF search and sensitivity analysis for cultural resources. The proposed Project and other cumulative projects would be required to comply with Health and Safety Code Section 7050.5, subdivision (c), and PRC Section 5097.98 (as amended by AB 2641) related to the proper disposition of human remains.

The related projects would, like the proposed Project, be required to comply with regulatory requirements governing TRCs, including consultation with California Native American Tribes where required under AB 52. Should an impact be identified, the related projects would be required to comply with PRC Section 21084.3 which would require avoidance and preservation or mitigation as defined in PRC Section 21084.3(b). As such, with regulatory adherence and incorporation of required mitigation, other area projects in combination with the proposed Project would have a less-than-significant cumulative impact on human remains associated with TRCs.

#### 4.13.9 CONSISTENCY WITH CITY OF INGLEWOOD GENERAL PLAN

The City's General Plan does not identify any goals or policies related specifically to TRCs. Accordingly, the proposed Project would not conflict with any goals, objectives, strategies, or policies of the City's General Plan related to this topic area.

## 4.14 UTILITIES AND SERVICE SYSTEMS

### 4.14.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) addresses the available capacities of existing utility-related infrastructure, including water and wastewater services, storm water drainage, dry utilities (electrical, natural gas, and telecommunications), and solid waste management, as well as the potential for conflicts between the proposed Inglewood Transit Connector Project (proposed Project) and utility-related infrastructure that would result in environmental impacts. The existing conditions relevant to utilities in the proposed Project area are described, along with the methodology and the regulatory framework that guided the evaluation of utility-related infrastructure. Impacts to utilities and service systems that would result from the proposed Project are identified. Information from the Gannett Fleming *Utilities Engineering Report*, August 2021, is incorporated into **Appendix Q: Utility Impact Data**.

The Revised Initial Study (included in **Appendix A.2** of this Recirculated Draft EIR) prepared prior to preparation of the December 2020 Draft EIR utilizes the California Environmental Quality Act (CEQA) Environmental Checklist to assess the Project's potential environmental impacts on utilities and service systems. For five of these screening thresholds, the Revised Initial Study found that the proposed Project would have a "Less than Significant Impact;" thus, no further analyses of these topics were required in an EIR. The following impacts do not require any additional analysis in this Recirculated Draft EIR:

- Potential impacts related to a substantial adverse effect on the proposed Project's ability to comply with wastewater treatment requirements of the Los Angeles Regional Water Quality Control Board (LARWQCB) were determined to have a less-than-significant impact. Though the Project would generate more wastewater than is currently generated within the footprint of the Project, pollutant loads would be typical of urban wastewater already processed by the Los Angeles Bureau of Sanitation's Joint Water Pollution Control Plant (JWPCP) and no significant impacts to wastewater treatment requirements of the LAWQCB would occur.
- Potential impacts related to a substantial adverse effect on the permitted capacity of water or wastewater treatment facilities were determined to have a less-than-significant impact. Although water and wastewater lines may need to be relocated, no aspect of the construction or operation of the proposed Project would require new or expanded water or wastewater treatment facilities.
- Potential impacts related to a substantial adverse effect on the availability of water supplies were determined to have a less-than-significant impact. The City's Urban Water Management Plan determined that sufficient water supplies existed so that a nonwater-intensive project, such as the Project, would not result in a strain on existing water supplies. Because water supplies in the area are more than sufficient, impacts would be less than significant.

- Potential impacts related to a substantial adverse effect on the capacity of wastewater treatment provider which serves or may serve the proposed Project to accommodate the projected demand in addition to the provider's existing commitments were determined to have a less-than-significant impact. The proposed Project includes an elevated guideway, stations and support facilities (maintenance and storage facility [MSF] and Power Distribution System [PDS] substations) that would not involve water-intensive activities. Therefore, impacts regarding wastewater treatment would be less than significant.
- Potential impacts related to a substantial adverse effect on the permitted capacity of Los Angeles County (County) landfills that would accommodate the proposed Project's solid waste disposal needs were determined to have a less-than-significant impact. The total remaining permitted inert waste capacity in the County is sufficient to accommodate the proposed Project's solid waste disposal needs from construction and demolition activities. Further, the proposed Project would comply with federal, State of California (State), and local statutes and regulations related to solid waste and no significant impacts to landfill capacity would occur.
- Potential impacts related to a substantial adverse effect on the proposed Project's ability to comply with federal, State, and local statutes and regulations related to solid waste were determined to have a less-than-significant impact. The proposed Project would comply with federal, State, and local statutes and regulations related to solid waste and no significant impact related to compliance with solid waste statutes and regulations would occur.

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the proposed Project in response to consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. Specific changes to the proposed Project include raising the height of the ATS guideway along Market Street to preserve existing views of historic buildings, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue. As it relates to impacts to utilities, these changes include updated construction and operational details which increased utility line conflicts with proposed Project columns. However, impacts would remain less than significant with mitigation similar to the December 2020 Draft EIR.

These changes to the design of the proposed Project do not create the potential for significant impacts related to the impacts above. The revised proposed Project would result in additional property acquisitions that would require demolition prior to construction of the proposed Project. Additionally, the revised proposed Project would include a Vons store replacement which would be developed prior to construction of the proposed Project. These changes would not alter the level of significance for the impacts discussed above.

Impacts found to be less than significant are further discussed in **Section 6.0: Other Environmental Considerations** of this Recirculated Draft EIR.

Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Recirculated Draft EIR.

#### 4.14.2 METHODOLOGY

The analysis contained in this section represents identification of existing utilities based on information and record drawings acquired from utility providers and the City. Obtained data included existing and planned major utilities within the area of the proposed Project. Data and utility maps were prepared for major identified utilities using existing information. A distance of 10 feet was used to identify utilities that may be impacted from construction activities that involve excavation. All utility locations are approximate based on best available map data. Available data did not provide for exact utility locations in terms of plan and profile; rather, exact utility locations would be determined prior to construction by potholing, utilizing ground penetrating radar, and/or other methods.

The locations of Project components have been compared to the locations of existing utility infrastructure to identify potential points of conflict. This analysis also considers the ability of the proposed Project to avoid or reduce demand placed on utilities and service systems through conservation programs and efficiency features.

#### 4.14.3 REGULATORY FRAMEWORK

##### 4.14.3.1 Federal Regulations and Directives

###### *Clean Water Act*

The Clean Water Act<sup>1</sup> established the basic structure for regulating discharges of pollutants into “waters of the U.S.” The act specifies a variety of regulatory and nonregulatory tools to manage stormwater runoff. Clean Water Act Section 402 is relevant to drainage within the footprint of the proposed Project. Section 402 regulates point- and nonpoint-source discharges to surface waters through the National Pollutant Discharge Elimination System (NPDES) program. In California, the State Water Resources Control Board (SWRCB) oversees the NPDES program, which is administered by the regional water quality boards (RWQCBs). The NPDES program provides for both general permits (those that cover a number of similar or related activities) and individual permits.

1 USEPA, *Summary of the Clean Water Act*, accessed September 2021, <https://www.epa.gov/laws-regulations/summary-clean-water-act>.

#### *Safe Drinking Water Act*

The United States Environmental Protection Agency (USEPA) administers the Safe Drinking Water Act<sup>2</sup> (SDWA), which is the primary federal law that regulates the quality of drinking water and establishes standards to protect public health and safety. The Department of Health Services (DHS) implements the requirements of the SDWA and oversees public water system quality Statewide. DHS establishes legal drinking water standards for contaminants that could threaten public health.

#### *National Pollutant Discharge Elimination System*

The NPDES<sup>3</sup> is a program created to implement the Clean Water Act. In November 1990, USEPA published final regulations that establish requirements for specific categories of industries, including construction projects that encompass greater than or equal to 5 acres of land. The Phase II Rule became final in December 1999, expanding regulated construction sites to those greater than or equal to 1 acre. The regulations require that stormwater and nonstormwater runoff associated with construction activity, which discharges either directly to surface waters or indirectly through municipal separate storm sewer systems (MS4), must be regulated by an NPDES permit.

The EPA has delegated management of California’s NPDES program to the SWRCB and the nine RWQCB offices, which grant permits to regulate point source discharges of industrial and municipal wastewater into the waters of the United States. The NPDES program was established in 1972 to regulate the quality of effluent discharged from easily detected point sources of pollution such as wastewater treatment plants and industrial discharges. The 1987 amendments to the Clean Water Act recognized the need to address nonpoint-source stormwater runoff pollution and expanded the NPDES program to operators of municipal separate MS4s, construction projects, and industrial facilities.<sup>4</sup>

The State of California adopted an NPDES Permit for General Construction Activity (Construction General Permit) on September 2, 2009 (Order No. 2009-0009-DWQ, as amended by 2010-0014-DWQ and 2012-0006-DWQ).<sup>5</sup> The last Construction General Permit amendment became effective on February 16, 2012. The Construction General Permit regulates construction site storm water management. Dischargers whose projects disturb one or more acres of soil, or whose projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the general permit for discharges of storm water associated with construction activity.

2 USEPA, *Safe Drinking Water Act (SDWA)*, accessed September 2021, <https://www.epa.gov/sdwa>.

3 USEPA, *National Pollutant Discharge Elimination System (NPDES)*, accessed September 2021, <https://www.epa.gov/npdes>.

4 *Clean Water Act, 33 Code of Federal Regulations*, sec. 402(p) (2008).

5 State Water Resources Control Board (SWRCB), *Storm Water*, accessed September 2021, [https://www.waterboards.ca.gov/water\\_issues/programs/stormwater/constpermits.shtm](https://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtm).

The proposed Project is under the jurisdiction of the Los Angeles Regional Water Quality Control Board (LARWQCB), also known as Region 4. The SWRCB administers the NPDES permit program regulating stormwater from construction activities for projects greater than 1 acre in size. This is known as the General Permit for Storm Water Discharges Associated with Construction Activities, Order No. 2009-0009-DWQ, as amended by Order No. 2012-0006-DWQ, NPDES No. CAS000002.<sup>6</sup>

The main compliance requirement of NPDES permits is the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). The purpose of a SWPPP is to identify potential pollutants and identify and implement appropriate stormwater pollution prevention measures to reduce or eliminate discharge of pollutants to surface water from stormwater and nonstormwater discharges. Stormwater BMPs to be implemented during construction and grading, as well as post-construction BMPs, will be outlined in the SWPPP prepared for the proposed Project.

#### **Resource Conservation and Recovery Act**

The Resource Conservation and Recovery Act<sup>7</sup> (RCRA) is the nation's primary law governing the disposal of solid and hazardous waste. The RCRA set national goals for reducing the amount of waste generated and for ensuring that wastes are managed in an environmentally sound manner. The Solid Waste Program encourages states to develop comprehensive plans to manage nonhazardous industrial solid waste and municipal solid waste, sets criteria for municipal solid waste landfills, and prohibits the open dumping of solid waste. RCRA regulations encourage source reduction and recycling and promote the safe disposal of municipal waste.

#### **4.14.3.2 State Regulations and Directives**

##### **State Drinking Water Act**

The 2014 transfer of the California Department of Public Health Drinking Water Program<sup>8</sup> (DWP) to the SWRCB brought with it not only the primary enforcement authority to enforce federal and State SDWAs, and the regulatory oversight of approximately 8,000 public water systems throughout California, but also the responsibility for completing the next Safe Drinking Water Plan.

With the transfer of DWP to the SWRCB, while the role and responsibility remained unchanged, the name was changed to the Division of Drinking Water (DDW). DDW has been granted primary enforcement responsibility for the federal SDWA. California enacted its own SDWA. The DDW is responsible for

<sup>6</sup> SWRCB, *Storm Water*, accessed September 2021, [https://www.waterboards.ca.gov/water\\_issues/programs/stormwater/constpermits.shtml](https://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml).

<sup>7</sup> USEPA, *Resource Conservation and Recovery Act (RCRA) Laws and Regulations*, accessed September 2021, <https://www.epa.gov/rcra>.

<sup>8</sup> SWRCB, "Drinking Water Programs," accessed September 2021, [https://www.waterboards.ca.gov/drinking\\_water/programs/](https://www.waterboards.ca.gov/drinking_water/programs/).

implementing the federal SDWA and its updates, as well as California statutes and regulations related to drinking water. As part of their efforts, the DDW inspects and provides regulatory oversight for public water systems within California. The RWQCB also has the responsibility for protecting the beneficial uses of the State's waters, including groundwater, and these include municipal drinking water supply, as well as various other uses.

California Administrative Code Title 22,<sup>9</sup> establishes DDW authority and stipulates drinking water quality and monitoring standards. These standards are equal to, or more stringent than, the federal standards. Public water system operators are required to monitor their drinking water sources regularly for microbiological, chemical, and radiological contaminants to show that drinking water supplies meet the regulatory requirements listed in California Code of Regulations (CCR) Title 22 as primary maximum contaminant levels.

#### **Recycled Water Policy (Policy for Water Quality Control for Recycled Water)**

The Recycled Water Policy<sup>10</sup> was first adopted in 2009, and then subsequently amended in 2013 and 2018. The purpose of the Recycled Water Policy is to increase the use of recycled water from municipal wastewater sources that meets the definition in California Water Code (CWC) section 13050(n),<sup>11</sup> in a manner that implements federal and State water quality laws. More specifically, recycled water is the reuse of treated wastewater derived from municipal sources (i.e., water that is covered under CCR Title 22, Water Recycling Criteria).<sup>12</sup> The Recycled Water Policy provides goals for recycled water use in California, guidance for use of recycled water that considers protection of water quality, criteria for streamlined permitting of recycled water projects, and requirements for monitoring recycled water for constituents of emerging concern (CECs).

#### **Title 22**

The CWC requires the DDW to establish water reclamation criteria. In 1975, the DDW prepared Title 22<sup>13</sup> regulations to satisfy this requirement. Title 22 regulates production and use of reclaimed water in California by establishing three categories of reclaimed water: primary effluent, secondary effluent and tertiary effluent. Primary effluent typically includes grit removal and initial sedimentation or settling tanks.

<sup>9</sup> California Department of Substances Control, *Official California Code of Regulations (CCR), Title 22, Division 4.5*, accessed September 2021, <https://dtsc.ca.gov/title22/>.

<sup>10</sup> SWRCB, *Recycled Water Policy*, accessed September 2021, [https://www.waterboards.ca.gov/water\\_issues/programs/water\\_recycling\\_policy/](https://www.waterboards.ca.gov/water_issues/programs/water_recycling_policy/).

<sup>11</sup> California Legislative Information, *Water Code*, accessed September 2021, [https://leginfo.ca.gov/faces/codes\\_displaySection.xhtml?lawCode=WAT&sectionNum=13050#:~:text=\(d\)%20E2%80%9CWaste%2%80%9D%20includes,nature%20prior%20to%2C%20and%20for](https://leginfo.ca.gov/faces/codes_displaySection.xhtml?lawCode=WAT&sectionNum=13050#:~:text=(d)%20E2%80%9CWaste%2%80%9D%20includes,nature%20prior%20to%2C%20and%20for).

<sup>12</sup> SWRCB, *California Drinking Water-Related Laws*, accessed September 2021, [https://www.waterboards.ca.gov/drinking\\_water/certlic/drinkingwater/Lawbook.html](https://www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/Lawbook.html).

<sup>13</sup> California Department of Substances Control, *Official California Code of Regulations (CCR), Title 22, Division 4.5*, accessed September 2021, <https://dtsc.ca.gov/title22/>.

Secondary effluent is adequately disinfected, oxidized effluent, which typically involves aeration and additional settling basins. Tertiary effluent is adequately disinfected, oxidized, coagulated, clarified, filtered effluent which typically involves filtration and chlorination. In addition to defining reclaimed water uses, Title 22 also defines requirements for sampling and analysis of effluent and specifies design requirements for treatment facilities.

#### **California Green Buildings Standards Code**

Adopted in 2010, and updated annually, the California Green Building Standards Code (CALGreen) is found in Part 11, Title 24 of the CCR.<sup>14</sup> The purpose of CALGreen is to cause a reduction in GHG emissions; promote environmentally responsible, cost effective, healthier places to live and work; and reduce energy and water consumption. CALGreen identifies mandatory building measures and voluntary measures that may be incorporated into the design of buildings. Relative to water usage, CALGreen contains specific requirements for plumbing fixtures and general requirements for indoor and outdoor water usage. Effective January 1, 2017, CALGreen requires developers of newly constructed buildings to develop a waste management plan to divert 65 percent of the construction waste generated by construction. Builders or developers are required to submit a construction waste management plan to the appropriate jurisdiction's enforcement agency.

#### **Urban Water Management Planning Act**

The State of California's Urban Water Management Planning Act<sup>15</sup> of 1983 requires all public water suppliers that provide municipal and industrial water to more than 3,000 customers, or supply more than 3,000 acre-feet per year (AFY) of water, to prepare and adopt a UWMP. The UWMP must be prepared every 5 years and submitted to the Department of Water Resources (DWR) for review. A UWMP is intended to forecast future water demand and supply under normal and dry conditions. The Urban Water Management Planning Act has been modified several times in response to water shortages, droughts, and other factors. The Water Conservation Act of 2009 amended the Urban Water Management Act to call for a Statewide reduction of 20 percent in urban water use by the year 2020. An amendment in 2014 requires water suppliers to provide narrative descriptions of their water demand management measures and account for system water losses.

14 California Department of General Services, CalGreen, accessed September 2021, <https://www.dgs.ca.gov/BSC/Resources/Page-Content/Building-Standards-Commission-Resources-List-Folder/CALGreen>.  
15 California Legislature, Urban Water Management Planning Act (Division 6 Part 2.6 of the Water Code §§10610 – 10656).

#### **Senate Bill 7 of the Seventh Extraordinary Session of 2009**

SB 1 (or SB X7 1)<sup>16</sup> from the Extraordinary Legislative Session of the fall of 2009 established a statutory framework intended to achieve the co-equal goals of providing a more reliable water supply to California and restoring and enhancing the Sacramento-San Joaquin River Delta ecosystem. The co-equal goals will be achieved in a manner that protects the unique cultural, recreational, natural resource, and agricultural values of the Delta.

The Water Conservation Act of 2009 (SB X7-7) amended and repealed CWC section 10631.5 to add Part 2.55 (commencing with section 10608)<sup>17</sup> to CWC Division 6, and repealed and added Part 2.8 (commencing with section 10800) of CWC Division 6, relating to water. Specific text from CWC Part 2.55 for urban water suppliers as it relates to water conservation and water use efficiencies is listed below.

Specifically, SB X7-7 from this Extraordinary Session requires each urban retail water supplier to develop urban water use targets to help meet the 20 percent reduction goal by 2020 (20x2020), and an interim water reduction target by 2015.

#### **Model Water Efficient Landscape Ordinance, CCR Title 23, Waters Division 2, Department of Water Resources Chapter 2.7**

In 2015, Executive Order B-29-15<sup>18</sup> charged DWR with revising the 2010 MWELO to increase water efficiency standards for new and retrofitted landscapes through encouraging the use of more efficient irrigation systems, graywater usage, and stormwater capture, and by limiting the portion of landscapes that can be covered in turf. The Executive Order B-29-15 also required that agencies report on their implementation and enforcement of local ordinances.

#### **Making Conservation a Way of Life, Implementing Executive Order B-37-16**

In 2018 the California State Legislature enacted two policy bills: SB 606 and Assembly Bill (AB) 1168<sup>19</sup> to establish a new foundation for long-term improvements in water conservation goals and drought planning to adapt to the longer and more intense droughts climate change is causing in California.

16 California Legislative Information, SB-1 Public resources, accessed September 2021, [https://leginfo.ca.gov/faces/billTextClient.xhtml?bill\\_id=200920107SB1](https://leginfo.ca.gov/faces/billTextClient.xhtml?bill_id=200920107SB1).

17 SWRCB, SB X7-7, accessed September 2021, <https://water.ca.gov/Programs/Water-Use-And-Efficiency/SB-X7-7>.

18 SWRCB, Governor's Conservation Executive Orders and Proclamations, accessed September 2021, [https://www.waterboards.ca.gov/water\\_issues/programs/conservation\\_portal/executive\\_orders.html](https://www.waterboards.ca.gov/water_issues/programs/conservation_portal/executive_orders.html).

19 SWRCB, California Statutes Making Conservation a California Way of Life, accessed September 2021, [https://www.waterboards.ca.gov/water\\_issues/programs/conservation\\_portal/california\\_statutes.html](https://www.waterboards.ca.gov/water_issues/programs/conservation_portal/california_statutes.html).

Collectively, these efforts provide a road map for all Californians to work together to ensure that we will have enough water now and in the future. The 2018 legislation applies to the actions of DWR, the SWRCB, and water suppliers.

Urban water suppliers must stay within annual water budgets based on these standards for their service areas. The 2018 legislation also supports drought planning. In urban areas, drought plans will be primarily led by local water suppliers. DWR and the SWRCB will develop recommendations to strengthen drought planning in rural areas and areas served by small water systems by coordinating with counties and other stakeholders.

#### **Sustainable Groundwater Management Act**

The Sustainable Groundwater Management Act<sup>20</sup> (SGMA) is a legislative package to establish a framework for sustainable groundwater management that can be planned for, implemented, and maintained without undesirable results in the future.

SGMA requires governments and water agencies of high and medium priority basins to halt overdraft and bring groundwater basins into balanced levels of pumping and recharge. Under SGMA, these basins should reach sustainability within 20 years of implementing their sustainability plans. For critically over-drafted basins that will be 2040. For the remaining high and medium priority basins, 2042 is the deadline. In his signing statement, the governor emphasized that “groundwater management in California is best accomplished locally.” Through the Sustainable Groundwater Management Program, DWR provides ongoing support to local agencies through guidance and financial and technical assistance.

SGMA empowers local agencies to form Groundwater Sustainability Agencies (GSAs) to manage basins sustainably and requires those GSAs to adopt Groundwater Sustainability Plans (GSPs) for crucial groundwater basins in California.

#### **Sewer System Management Plan**

The federal Clean Water Act requires the City to adopt a wastewater facilities plan in accordance with USEPA Rules and Regulations, 40 CFR, Section 35.917. In addition, the Statewide General Waste Discharge Requirements<sup>21</sup> (WDRs) for publicly owned sanitary sewer systems requires the City to develop and implement a Sewer System Management Plan (SSMP). In 2015, the City adopted the Sewer System Management Plan in order to comply with State and federal requirements, setting forth goals and actions

20 California Department of Water Resources, “SGMA Groundwater Management,” accessed September 2021, <https://water.ca.gov/Programs/Groundwater-Management/SGMA-Groundwater-Management>.

21 SWRCB, Waste Discharge Requirements Program, accessed September 2021, [https://www.waterboards.ca.gov/water\\_issues/programs/waste\\_discharge\\_requirements/](https://www.waterboards.ca.gov/water_issues/programs/waste_discharge_requirements/).

to be followed and guidelines for various activities involved in managing, operating, maintaining, repairing, replacing and expanding the sewer system.<sup>22</sup>

#### **California Water Resources Control Board Low Impact Development Policy**

The SWRCB adopted the Low Impact Development (LID) Policy<sup>23</sup> which, at its core, promotes the idea of “sustainability” as a key parameter to be prioritized during the design and planning process for future development. The SWRCB has directed its staff to consider sustainability in all future policies, guidelines, and regulatory actions. LID is a proven approach to manage stormwater. The RWQCBs are advancing LID in California in various ways, including provisions for LID requirements in renewed Phase I municipal stormwater NPDES permits.

#### **California Integrated Waste Management Act of 1989 (AB 939)**

In response to reduced landfill capacities, the State of California passed AB 939, the California Integrated Waste Management Act,<sup>24</sup> in 1989. This legislation requires cities and counties to reduce the amount of solid waste entering existing landfills through recycling, reuse, and waste prevention efforts. AB 939 also established the California Integrated Waste Management Board (CIWMB), the State agency designated to oversee, manage, and track California’s solid waste generation each year. AB 939 requires jurisdictions to maintain 50 percent waste diversion. The purpose of AB 939 is to “reduce, recycle, and reuse solid waste generated in the State to the maximum extent feasible.” AB 939 requires jurisdictions to utilize “integrated waste management,” which includes a variety of waste management practices to handle the municipal solid waste stream safely and effectively, with the least adverse impact on human health and the environment.

CalRecycle is the State of California department concerned with the State’s recycling and waste reduction efforts, including the implementation of AB 939. Officially known as the Department of Resource Recycling and Recovery, CalRecycle is a part of the California Natural Resources Agency and administers programs formerly managed by the California Integrated Waste Management Board and Division of Recycling.

22 City of Inglewood, *Sewer System Management Plan*, August 31, 2015, accessed September 2021, <https://www.cityofinglewood.org/DocumentCenter/View/986/Sewer-System-Management-Plan-PDF>.

23 SWRCB, Low Impact Development – Sustainable Storm Water Management, accessed September 2021, [https://www.waterboards.ca.gov/water\\_issues/programs/low\\_impact\\_development/](https://www.waterboards.ca.gov/water_issues/programs/low_impact_development/).

24 CalRecycle, Enforcement, accessed September 2021, <https://www.calrecycle.ca.gov/lcentral/enforcement>.

### **California Solid Waste Reuse and Recycling Access Act of 1991 (AB 1327)**

The California Solid Waste Reuse and Recycling Access Act of 1991,<sup>25</sup> as amended, requires each local jurisdiction to adopt an ordinance requiring commercial, industrial, or institutional buildings; marinas; or residential buildings having five or more living units to provide an adequate storage area for the collection and removal of recyclable materials. The sizes of these storage areas are to be determined by the appropriate jurisdictions' ordinance. If no such ordinance exists with the jurisdiction, the CalRecycle model ordinance shall take effect. The City of Los Angeles passed such an ordinance in 1997.

### **Assembly Bill 341**

AB 341,<sup>26</sup> which took effect on July 1, 2012, was designed to help meet California's recycling goal of 75 percent by the year 2020. AB 341 makes "a legislative declaration that it is the policy goal of the State that not less than 75 percent of solid waste generated be source reduced, recycled, or composted by the year 2020." AB 341 requires a business, defined to include a commercial or public entity that generates more than 4 cubic yards of commercial solid waste per week or a multifamily residential dwelling of 5 units or more to arrange for recycling services. Such business/residential development must: 1) source separate recyclable materials from the solid waste they are discarding, and either self-haul or arrange for separate collection of the recyclables; and 2) subscribe to a service that includes mixed waste processing that yields diversion results comparable to source separation.

### **Construction and Demolition Waste Materials Diversion Requirements (SB 1374)**

Construction and Demolition Waste Materials Diversion Requirements<sup>27</sup> passed in 2002 added Section 42912 to the California Public Resources Code. SB 1374 requires that jurisdictions include in their annual AB 939 report a summary of the progress made in diverting construction and demolition waste. The legislation also requires that CalRecycle adopt a model ordinance for diverting 50 to 75 percent of all construction and demolition waste from landfills.

### **Zero Waste California**

Zero Waste California is a State program launched by CalRecycle in 2002 to promote a new vision for the management of solid waste. Zero Waste provides that wasting resources is inefficient and that the efficient use of natural resources should be achieved. The concept requires maximizing existing recycling and reuse

25 California Legislative Information, California Solid Waste Reuse and Recycling Access Act of 1991 [42900 - 42912], accessed September 2021, [https://leginfo.ca.gov/faces/codes\\_displayText.xhtml?lawCode=PRC&division=30.&title=&part=3.&chapter=18.&article=1](https://leginfo.ca.gov/faces/codes_displayText.xhtml?lawCode=PRC&division=30.&title=&part=3.&chapter=18.&article=1).

26 CalRecycle, Mandatory Commercial Recycling, accessed September 2021, <https://www.calrecycle.ca.gov/recycle/commercial>.

27 CalRecycle, *Construction and Demolition (C&D) Diversion Informational Guide*, accessed September 2021, <https://www.calrecycle.ca.gov/Igcentral/library/canddmodel>.

efforts, while ensuring that products are designed for the environment and have the potential to be repaired, reused, or recycled. The Zero Waste California program promotes the goals of market development, recycled product procurement, and research and development of new and sustainable technologies.

### **4.14.3.3 Regional Regulations and Directives**

#### **Metropolitan Water District of Southern California Planning Efforts**

The Metropolitan Water District of Southern California (Metropolitan) is a regional wholesaler that delivers water to 26-member public agencies—14 cities, 11 municipal water districts, one county water authority—which, in turn provide water to 19 million people in Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties.<sup>28</sup> Metropolitan is governed by a 38-member board of directors who represent their respective member agencies ensuring each member agency is part of the governance of Metropolitan. The West Basin Municipal Water District's (WBMWD) water supply is predominantly supplied through imported water from Metropolitan,<sup>29</sup> which, in turn supplies the City with potable water (approximately 67 percent of its supply as recently as 2020).<sup>30</sup> Metropolitan has undertaken a number of planning and reporting efforts focused on regional water supply reliability, including as follows:

#### **Integrated Water Resources Plan**

The Integrated Water Resources Plan (IRP) is a blueprint for long-term water supply reliability in Southern California. It was first developed in 1996 to address the complexity of developing, maintaining, and delivering water to meet changing demands in the face of growing challenges. It established targets for a diversified portfolio of supply investments. Water Tomorrow works to balance the use of local resources and conservation with imported supplies to meet future needs.<sup>31</sup> The IRP has been updated several times since its inception.

The most recent update occurred in 2015 and focused on ascertaining how conditions have changed in the region since 2010 when the last IRP was adopted. The 2015 Update involved developing new reliability targets to meet the evolving outlook of the region's reliability needs, assessing strategies for managing

28 Metropolitan Water District of Southern California, "Overview," accessed September 2021, <http://www.mwdh2o.com/WhoWeAre/Mission/Pages/default.aspx>.

29 West Basin Municipal Water District (WBMWD), *2020 Urban Water Management Plan*, September 2021.

30 City of Inglewood, *2020 Urban Water Management Plan*, July 2021.

31 Metropolitan, "Planning Documents," accessed September 2021, <http://www.mwdh2o.com/AboutYourWater/Planning/Planning-Documents/Pages/default.aspx>.

short and long-term uncertainty and communicating technical findings. The 2015 IRP Update also identified areas where policy development and implementation approaches are needed.<sup>32</sup>

#### Urban Water Management Plan

Metropolitan's 2020 UWMP<sup>33</sup> describes and evaluates sources of water supply, efficient uses of water, demand management measures, implementation strategies and schedules, and other relevant information and programs. The plan is updated every 5 years.

Information from Metropolitan's UWMP is used by local water suppliers in the preparation of their own plans. The information included in Metropolitan's UWMP represents the district's most current planning projections of demand and supply capability developed through a collaborative process with the member agencies.

#### Water Surplus and Drought Management Plan

Metropolitan's Water Surplus and Drought Management Plan<sup>34</sup> was developed to outline policies that guide water surplus and shortage management and establish a basis for dealing with shortages in an equitable and efficient manner. It provides policy guidance for managing regional water supplies during surplus and shortage conditions. It identifies a sequence of management actions to minimize the probability of severe shortages and reduce the possibility of extreme shortages and water allocations. Each year Metropolitan evaluates available water supplies and existing water storage levels to determine the appropriate management actions identified in the WSDM Plan.

#### Long-Term Conservation Plan

Metropolitan's Long-term Conservation Plan<sup>35</sup> provides a framework for achieving the water use efficiency goals in the 2010 Integrated Resources Plan. Through market transformation, the plan seeks to reduce per capita water use 20 percent by 2020 using several key strategies:

- Providing incentives to guide consumer choice;
- Encouraging action through outreach and education;
- Developing regional technical capabilities;

<sup>32</sup> Metropolitan, "Planning Documents," accessed September 2021, <http://www.mwdh2o.com/AboutYourWater/Planning/Planning-Documents/Pages/default.aspx>.

<sup>33</sup> Metropolitan, "Planning Documents," accessed September 2021, <http://www.mwdh2o.com/AboutYourWater/Planning/Planning-Documents/Pages/default.aspx>.

<sup>34</sup> Metropolitan, "Planning Documents," accessed September 2021, <http://www.mwdh2o.com/AboutYourWater/Planning/Planning-Documents/Pages/default.aspx>.

<sup>35</sup> Metropolitan, "Planning Documents," accessed September 2021, <http://www.mwdh2o.com/AboutYourWater/Planning/Planning-Documents/Pages/default.aspx>.

- Building strategic alliances; and
- Advancing water efficiency standards.

#### West Basin Municipal Water District Planning Efforts

The WBMWD is a wholesale water agency that provides imported drinking water to 17 cities and unincorporated areas of Los Angeles County throughout its 185 square mile service area.<sup>36</sup> WBMWD currently manages a water supply portfolio that includes imported water from the Colorado River and Northern California, locally-produced recycled water, desalted groundwater and conserved water. WBMWD develops viable plans and initiatives to ensure reliability of the region's water supplies and work to reduce the region's dependence on imported water by expanding the local water supply portfolio in an economically feasible manner. As mentioned previously, WBMWD supplies the City with 80 percent of its potable water supply. WBMWD has undertaken a number of planning and reporting efforts focused on regional water supply reliability, including as follows:

#### Water Use Report

The WBMWD Water Use Report,<sup>37</sup> last completed for FY 2016–2017, outlines the WBMWD service area; accomplishments and strategies regarding finance, water recycling operations; the capital improvement program; public information; water policy and resource development; conservation; the water quality monitoring program; water use tabulations; facilities overview; and water rates.

#### Drought Rationing Plan

Based closely on Metropolitan's methodology, WBMWD's Drought Rationing Plan model,<sup>38</sup> adopted by the Board of Directors in April 2009 and amended in March 2015, determines each customer agency's share of WBMWD's allocation from MWD. Fairness in allocation and minimizing regional hardship to retail water consumers remained central themes in the development of a specific formula for allocating shortages across Southern California. The formula uses different adjustments and credits to balance impacts of shortage at the retail level, where local supplies can vary dramatically, and provide equity on the wholesale level among member agencies. It also attempts to take into account; growth in demand, local investments, changes in local supply conditions, the reduction in potable water demand from recycled water, and the implementation of water conservation programs.

<sup>36</sup> WBMWD, "About Us," accessed September 2021, <http://www.westbasin.org/about-us>.

<sup>37</sup> WBMWD, Water Use Report: Fiscal Year 2016–2017, November 9, 2017.

<sup>38</sup> WBMWD, "Reports & Plans," accessed September 2021, <http://www.westbasin.org/policy-planning/reports-plans>.

### Urban Water Management Plan

In compliance with the Urban Water Management Planning Act, WBMWD's 2020 Urban Water Management Plan<sup>39</sup> provides a detailed summary of present and future water resources and demands within WBMWD's service area and assesses West Basin's water resource needs. Specifically, the UWMP provides water supply planning for a 25-year planning period in five-year increments and identifies water supplies needed to meet existing and future demands. The demand analysis must identify supply reliability under three hydrologic conditions: an average year, a single dry year, and multiple dry years. West Basin's 2020 UWMP updates the 2015 UWMP in compliance with the requirements of the UWMPA.

### Enhanced Watershed Management Programs (EWMP)

The Los Angeles County MS4 Permit<sup>40</sup> allows Permittees the flexibility to develop Watershed Management Programs (WMPs) or Enhanced Watershed Management Programs (EWMPs) to implement the requirements of the Permit on a watershed scale through customized strategies, control measures, and best management practices (BMPs). Participation in a Watershed Management Program is voluntary and allows a Permittee to address the highest watershed priorities. The City is a Permittee to the following two EWMPs: the Ballona Creek Watershed EWMP and the Dominguez Channel Watershed Management Area EWMP.

### Los Angeles County Standard Urban Storm Water Mitigation Plan

Development in the City is subject to the Los Angeles County Standard Urban Storm Water Mitigation Plan<sup>41</sup> (SUSMP), adopted March 2000, which provides drainage regulations for specific types of development projects.

The County lists example BMPs to be implemented that would aid in stormwater drainage; examples of these include using minimum pavement widths and permeable pavement, directing of rooftop runoff to pervious areas, and including vegetated swales and strips and infiltration basins throughout the development.<sup>42</sup>

<sup>39</sup> WBMWD, *2020 Urban Water Management Plan*, June 2021.

<sup>41</sup> SWRCB, *Standard Urban Storm Water Mitigation Plan (SUSMP)*, accessed September 2021, [https://www.waterboards.ca.gov/losangeles/water\\_issues/programs/stormwater/susmp/susmp\\_details.shtml](https://www.waterboards.ca.gov/losangeles/water_issues/programs/stormwater/susmp/susmp_details.shtml).

<sup>42</sup> County of Los Angeles, *Standard Urban Storm Water Mitigation Plan For Los Angeles County and Cities In Los Angeles County*, March 8, 2000.

### County of Los Angeles Integrated Waste Management Plan

The County of Los Angeles Integrated Waste Management Plan<sup>43</sup> (ColWMP), approved by the CIWMB in June 1999, is a set of planning documents that sets forth a regional approach for the management of solid waste through source reduction, recycling and composting, and environmentally safe transformation and disposal. The ColWMP recognizes that landfills will remain an integral part of the County's solid waste management system in the foreseeable future and ensures that the waste management practices of cities and other jurisdictions in the County are consistent with the solid waste diversion goals of AB 939. The ColWMP includes approaches such as source reduction, recycling and composting programs, household hazardous waste management programs, and public education awareness programs. The plan concludes that landfill disposal will remain an integral part of the waste management system and calls for the establishment of 50 years of in-County permitted landfill capacity, as well as the County's support for the development of disposal facilities out of the County.

The County continually evaluates landfill needs and capacity through the preparation of the ColWMP annual reports. Within each annual report, future landfill disposal needs over the next 15-year planning horizon are addressed, in part, by determining the available landfill capacity. Landfill capacity is determined by several factors, including: (1) the expiration of various landfill permits (e.g., land use permits, waste discharge requirements permits, solid waste facilities permits, and air quality permits); (2) restrictions to accept waste generated only within a landfill's particular jurisdiction and/or watershed boundary; and (3) operational constraints. The most recent annual report is the 2019 report, completed in September 2020.

As part of the ColWMP, the County prepared the Countywide Siting Element, which identifies goals, policies, and strategies for the proper planning and siting of solid waste disposal and transformation facilities for the next 15 years. The Siting Element was approved by CalRecycle in June 1998. The County is currently updating the Siting Element to reflect remaining landfill disposal capacities and the County's current strategy for maintaining adequate disposal capacities. The Los Angeles County Department of Public Works is currently revising the Siting Element.<sup>44</sup>

<sup>43</sup> Los Angeles County Public Works, *County of Los Angeles Countywide Integrated Waste Management Plan*, accessed September 2021, <https://dpw.lacounty.gov/epd/swims/ShowDoc.aspx?id=14372&hp=yes&type=PDF>.

<sup>44</sup> Los Angeles County Public Works, "Countywide Siting Element," accessed September 2021, <https://dpw.lacounty.gov/epd/cse/AboutUs/>.

#### 4.14.3.4 Local Regulations and Directives

##### City of Inglewood General Plan

The City General Plan Conservation Element contains several policies related to water production and wastewater that can assist in the maintenance of water standards and the efficient utilization of water as a scarce resource. These policies fall under the following three categories:<sup>45</sup>

- Protect aquifers and water sources by preventing contamination of ground water from surface contaminants and treating ground water pumped from City wells to ensure the water meets safe drinking water standards.
- Reduce the ever-increasing demand being placed on the aquifers and on the Statewide water sources through cumulative conservation efforts, reuse of water, and using reclaimed water where potable water is not needed (namely, irrigation and landscaping).
- Maintain a water quality monitoring system to ensure continues compliance with State standards.

Further, the General Plan Conservation Element includes the following policies related to stormwater relevant to the proposed Project:

- Visit businesses to educate owners about stormwater regulations and the penalties for illegally dumping into storm drains.
- Require periodic sweeping to remove oil, grease, and debris from parking lots of 25 spaces or more.
- Increase the frequency of sampling storm drain pollution by County agencies to assess which measures are more successful.
- Continue to stencil warnings over individual storm drain openings that advise against discarding litter into the drains.

Additionally, the General Plan Conservation Element discusses ways to achieve solid waste conservation. This includes conserving remaining landfill capacity and reducing the generation of waste materials through measures such as charging for refuse pickup by weight for commercial and industrial businesses and residences, instituting commercial and residential curbside recycling pickup services, linking waste generators with commercial recyclers, and educating the public about the benefits of composting.<sup>46</sup>

<sup>45</sup> City of Inglewood General Plan, "Conservation Element" (1997).

<sup>46</sup> City of Inglewood General Plan, "Conservation Element" (1997).

##### Inglewood Municipal Code

City of Inglewood Municipal Code (IMC) Stormwater Management and Discharge Control, Section 10-208, Low Impact Development Requirements for New Development and Redevelopment<sup>47</sup> provides for the use of LID requirements and additional revisions pursuant to the NPDES permit requirements for the municipal separate sewer system. Among the provisions of the LID ordinance are requirements for existing properties, industrial/commercial and construction activities to prevent runoff and the maintenance of a *Low-Impact Development (LID) Standards Manual* (LID Manual)<sup>48</sup> for development and redevelopment activities within the City. Appropriate erosion-control BMPs may include but are not limited to silt fencing, fiber rolls, sandbag barriers, gravel bag berms, stabilized construction site entrances/exits, and any other practices laid out in the City's LID Manual.

In regard to wastewater, IMC Section 10-89,<sup>49</sup> Determination of Capacity, states that the size and grade of each public sewer must be such as to provide at all times sufficient capacity for peak flow rates of discharge. The Public Works Director shall determine what capacity is necessary in each public sewer to provide for the proper collection of sewage in the City. In the event a lot in the City is to undergo development or redevelopment, and the anticipated sewage from the proposed use is found by the Public Works Director to exceed the capacity available in the public sewer, the building permit for such development or redevelopment shall not be issued until such time as capacity in the public sewer is available or can be made available before the building is occupied.

IMC Section 10-89,<sup>50</sup> Determination of Capacity, establishes a basis for computing average daily flow to the sanitary sewer. All other land uses not included are classified by the occupancy it most nearly resembles as determined by the Public Works Director or computed by him or her in accordance with the anticipated use. The daily flow to the sanitary sewer for a building containing mixed occupancies is determined by adding the peak flow characteristics of the various occupancies as set forth in the above table. The daily flow from a room or building which is used for different occupancies at different times as determined by the occupancy which gives the largest peak flow.

City Ordinance No. 18-10<sup>51</sup> established a Construction and Demolition Recycling Program (CDRP) which requires applicants to divert a minimum of 65 percent, or the State-mandated diversion percentage, whichever is greater, of the Construction and Demolition Debris from all covered projects as defined in IMC Section 7-63, 100 percent of land clearing debris from nonresidential newly constructed buildings,

<sup>47</sup> City of Inglewood, IMC, Ordinance No. 15-14 revised Article 16 of "Chapter 10, Stormwater Management and Discharge Control," Section 10-208, Low Impact Development Requirements for New Development and Redevelopment.

<sup>48</sup> Inglewood, California, *Municipal Code*, "Chapter 10, Article 16, Stormwater Management and Discharge Control," Section 10-208, Low Impact Development Requirements for New Development and Redevelopment.

<sup>49</sup> Inglewood, California, *Municipal Code*, "Chapter 10, Article 7, Sewer Connect, Section 10-89. Determination of Capacity."

<sup>50</sup> Inglewood, California, *Municipal Code*, "Chapter 10, Article 7, Sewer Connect, Section 10-89. Determination of Capacity."

<sup>51</sup> Inglewood, California, *Municipal Code*, "Chapter 7, Article 7, Construction and Demolition Recycling Program (CDRP)."

and all universal waste from nonresidential and alteration projects, in compliance with State and local statutory goals and policies and to create a mechanism to secure compliance with the stated diversion requirement.

### **City of Inglewood Urban Water Management Plan**

In compliance with the Urban Water Management Planning Act<sup>52</sup> (Water Code Section 10610-10610.4), the City most recently adopted the 2020 Urban Water Management Plan (UWMP) which serves as a master plan for water supply and resources management consistent with the City's goals and objectives.<sup>53</sup> The UWMP provides a framework for long term water planning and informs the public of the suppliers' plans to ensure adequate water supplies for existing and future demands. The UWMP projects sufficient supply to meet all reliability requirements.

#### **4.14.4 EXISTING CONDITIONS**

The existing utility and service system infrastructure networks are described herein pertaining to water supply and demand, wastewater, stormwater, and solid waste. Current demands placed on these systems and their respective carrying capacities are identified. In addition, existing conditions relative to specific utility locations in the area.

##### **4.14.4.1 City of Inglewood**

#### **Water Supply and Demand**

##### **City of Inglewood Water Supply Overview**

The City's potable water system includes 156 miles of pipe varying in diameter from 2 to 42 inches, four groundwater wells, two booster pump stations, a groundwater treatment plant, two reservoirs, two imported water connections to Metropolitan, and a total of eight emergency interties with the Los Angeles DWP and the Golden State Water Company (GSWC).<sup>54</sup>

The City provides water to 86 percent of the residences and businesses in the City. Water is provided in the remaining areas by Golden State Water Company and Cal America Water.<sup>55</sup> The water provided by the City is pumped from City-owned wells, treated, and blended with water purchased from the WBMWD through MWD pipe connections. The City also purchases recycled water from WBMWD which is used for irrigation and landscaping purposes at City parks, cemeteries, and schools. Recently, the City

<sup>52</sup> Urban Water Management Planning Act, Water Code Section 10610-10610.4.

<sup>53</sup> City of Inglewood, *2020 Urban Water Management Plan*, July 2021.

<sup>54</sup> City of Inglewood, *2020 Urban Water Management Plan*, July 2021.

<sup>55</sup> City of Inglewood. Water Works. <https://www.cityofinglewood.org/463/Water-Works>.

Council approved the use of recycled water for street sweeping and sewer flushing purposes. The City purchases approximately 700 acre-feet per year (AFY) of recycled water on average per year.

The City has two reservoirs: North Inglewood and Morningside. The North Inglewood Reservoir was constructed in 1974 and has a total capacity of 4.6 million gallons; the North Inglewood Reservoir is a covered, underground concrete water storage reservoir with an associated pump station containing four pumps. The Morningside Reservoir, currently out of service due to structural issues, was constructed in 1954 and has a total capacity of 16 million gallons. This facility is an above-ground, concrete water storage reservoir with an associated pump station containing ten pumps.

The Sanford M. Anderson Treatment Plant (Anderson Treatment Plant), located in northern Inglewood, processes raw groundwater pumped from the City's wells for the removal of iron and manganese<sup>56</sup> and monitors water for 103 federally-regulated possible contaminants.<sup>57</sup> The Anderson Treatment Plant has a treatment capacity of 8.64 million gallons per day (mgd) and storage capacity of 500,000 gallons. Treated groundwater leaving the Anderson Treatment Plant is pumped into one of the two storage reservoirs, when active. While in route to the reservoirs, treated water supply from the MWD enters through the two imported water connections and blends with the treated groundwater leaving the Anderson Treatment Plant. Water is then distributed from the City reservoirs to users.

In 2020, 67 percent of the City's potable water supply—5,972 acre-feet (af)—came from imported water purchased from MWD through its regional water supplier and the WBMWD. The remaining 33 percent of the City's potable water supply came from groundwater pumping from the West Coast Groundwater Basin (Basin) and the purchase of recycled water from the WBMWD for nonpotable uses (2,312 af and 806 af, respectively). Recycle water is distributed to 35 recycled water users within the City, constituting approximately 9 percent of its total water supply.

The amount of water the City is permitted to pump from the Basin is limited by a 1961 Order of the Los Angeles Superior Court (adjudication) to 4,450 AFY. Generally, the City is entitled to pump up to its maximum allowable extraction right along with any carryover or unused water rights from the previous years and any net leases or exchanges of water rights per agreements with other parties owning those rights.<sup>58</sup>

In 2020, the City pumped 3,062 AFY of water from the Basin, which left 1,388 AFY (32 percent) of the City's water pumping rights unused. With well rehabilitation and new construction, City groundwater production capacity is forecast to maintain approximately 2,200 AFY through 2045. The City will rehabilitate and

<sup>56</sup> City of Inglewood, *2020 Urban Water Management Plan*, July 2021.

<sup>57</sup> City of Inglewood, "Water Works," accessed September 2021, <https://www.cityofinglewood.org/463/Water-Works>.

<sup>58</sup> City of Inglewood, *2020 Urban Water Management Plan*, July 2021.

replace wells as required to maintain average annual well supply at approximately 4,450 AFY.<sup>59</sup> Due to the Basin adjudication, groundwater supplies are actively managed pursuant to regulations that prevent the occurrence of overdraft conditions. Under multiple dry year conditions, imported supplies can be purchased to meet an annual increase in demand.

The City's UWMP provides projections for water supply and demand for years 2025 through 2045. In 2025, for multiple dry water year (5-year) conditions it is estimated that the City would have a total water supply (including recycled water) of 12,000 AFY and a total demand of 11,510 AFY. Furthermore, it is forecasted that the WBMWD would have a water surplus for all years through 2045 during normal year, single dry year, and multiple dry year conditions. The City's projected water supplies and demands in multiple dry years are shown in **Table 4.14-1: Projected Water Supply and Demand in Multiple Dry Years**. Given WBMWD's determination that it can meet all full-service demands of its member agencies through 2045 with surplus supplies, and the City's goal to regularly upgrade and rehabilitate its well supply system to maintain groundwater supply equivalent to its groundwater rights of 4,500 AFY, it is projected the City can meet all normal year, single dry year, and multiple dry year demands through the year 2045.<sup>60</sup>

**Table 4.14-1**  
**Projected Water Supply and Demand in Multiple Dry Years**

	2025	2030	2035	2040	2045
	afy				
Total Supply	12,000	12,000	12,000	12,000	12,000
Total Demand	11,510	11,593	11,702	11,831	11,975
Difference	490	407	298	169	25

Source: City of Inglewood 2020 UWMP.

**Existing Water Consumption**

The proposed Project is located within a heavily developed area of the City which utilizes water supplies for a variety of land uses. Moreover, there are several existing developments which contribute to existing water demand that would be removed and demolished as part of the proposed Project. Specifically, development of the Market Street/Florence Avenue Station would remove a variety of commercial, restaurant, and retail uses. Additionally, development of the MSF site would result in the reconstruction of a grocery store and removal of a gas station. The proposed Project would require a number of full and partial property acquisitions and easements or leases for construction and operation of the guideway, stations, MSF, and other support facilities included in the proposed Project. These existing uses currently

<sup>59</sup> City of Inglewood, 2020 Urban Water Management Plan, July 2021.  
<sup>60</sup> City of Inglewood, 2020 Urban Water Management Plan, July 2021.

generate water demand for building operation as well as landscaping irrigation. These uses total approximately 303,023 SF of operational space.

In the absence of any standard water usage factors, water consumption estimates were developed for long-term existing operational use based on land use wastewater generation factors developed by the Los Angeles County Sanitation District (LACSD), with 20 percent added to account for evaporation and absorption losses. As shown in **Table 4.14-2: Water Demand from Existing Uses to be Removed**, notes that currently existing uses to be removed consume approximately 77,862 gallons of water per day (gpd) or 0.08 million gallons per day (mgd); this is equivalent to 87.2 AFY. It should be noted that prior to construction of the proposed Project, a new Vons store would be developed to replace the existing store located on the site for the proposed MSF, which would have a demand of approximately 8,352 gpd (9.36 afy) of water.

**Wastewater**

The City served a population of approximately 118,000 in 2008.<sup>61</sup> The City's Public Works Department manages the City's sanitary sewer collection system. The sewer collection system consists of about 145 miles of gravity sewer pipe ranging in size from 4 to 16 inches in diameter and approximately 3,100 manholes. The sewers are primarily constructed of vitrified clay pipe with approximately 95 percent of the pipes sized at 8-inch in diameter. The majority of the existing sewer system was constructed before 1960. Due to the general age of the sewer system, the City is implementing a proactive sewer rehabilitation program that prioritizes and replaces sewer lines that have been identified as deficient, through its sewer inspection program. The City inspected 91 miles of sewer lines (62 percent of the system) in 2008 and is initiating a new inspection program for the remaining portion of the sewer system so that needed rehabilitation of sewer lines can be identified. In addition, the City performs video inspection of its entire sewer system every 5 years.

Wastewater flow via gravity and is generally from north to south and east to west. The majority of sewers tie directly into one of the LACSD trunk sewers crossing through the City, which are located primarily in larger streets and convey sewage to LACSD sewage treatment plants. There are approximately 203 connections to the LACSD, which convey the City's wastewater out of the City to the south and continue to flow by gravity to the LACSD Joint Water Pollution Control Plant located in the City of Carson for treatment and disposal.<sup>62</sup> The JWPCP facility processes both primary and secondary treatment for an average flow of 256.8 MGD with a design capacity of 400 MGD. Prior to discharge, the treated wastewater is disinfected with sodium hypochlorite and sent to the Pacific Ocean through a network of outfalls. These

<sup>61</sup> City of Inglewood, 2015 Sewer System Management Plan, August 31, 2015.  
<sup>62</sup> City of Inglewood, 2015 Sewer System Management Plan, August 31, 2015.

outfalls extend 1½ miles off the coast of Southern California into the Palos Verdes Peninsula to a depth of 200 feet.<sup>63</sup>

<sup>a</sup> All water consumption factors are wastewater generation factors provided by LACSD, with 20 percent added to account for evaporation and absorption losses.  
<sup>b</sup> Prior to construction of the proposed Project, a 46,400 square-foot replacement Vons store would be developed which would have a demand of approximately 8,352 gpd (9.36 afy) of water.

63 City of Inglewood, Final Environmental Impact Report for the Transit Oriented Development Plan for Downtown Inglewood and Fairview Heights, September 2016. Prepared by Metis Environmental Group.

**Existing Wastewater Generation**

There are several existing developments which contribute to existing wastewater generation that would be demolished as previously noted. Wastewater generation estimates were developed for long-term existing operational use by LACSD. **Table 4.14-3: Wastewater Generation from Existing Uses to be Removed** notes that currently existing uses within the footprint of the proposed Project that will be removed generate approximately 65,885 gpd or 0.07 mgd (72.7 afy) of wastewater.

**Table 4.14-3**  
**Wastewater Generation from Existing Uses to be Removed**

Property Address	Use Type	Quantity	Generation Factor (GPD/1,000 SF)	Daily Generation (gpd)	Daily Generation (mgd)	Annual Generation (afy)

Note: SF = square feet; gpd = gallons per day; mgd = million gallons per day; afy = acre-feet per year  
 Source: LACSD, Will Serve Program, accessed September 2021, <https://www.lacsd.org/services/wastewater-programs-permits/will-serve-program>.  
<sup>a</sup> Prior to construction of the proposed Project, a 46,400 square-foot replacement Vons store would be developed which would generate approximately 6,960 gpd (7.80 afy) of wastewater.

It should be noted that prior to construction of the proposed Project, a replacement Vons store would be developed which would generate approximately 6,960 gpd (7.80 afy) of wastewater.

### **Stormwater**

The main storm drain lines within the area of the proposed Project are owned and maintained by the Los Angeles County Flood Control District (LACFCD) and the City. The City owns and maintains approximately 12 miles of drainage pipelines and 464 catch basins; and the LACFCD has approximately 42 miles of storm drain pipelines and 889 catch basins within the City.<sup>64</sup>

The proposed Project is located within two watersheds in the southern California Coastal Subregion. The portion located north of Market Street is located approximately 1.3 miles (as the crow flies) from the headwaters of Centinela Creek, in the Ballona Creek Watershed. Centinela Creek flows to Ballona Creek Reach 2, which eventually flows to the Santa Monica Bay. The remaining portions along Manchester Boulevard and Prairie Avenue are located approximately 1.3 miles upstream of the headwaters of the upper Dominguez Channel watershed. The Dominguez Channel eventually drains south toward Alamitos and ultimately the Los Angeles Harbor.

There are existing storm drain inlets and storm drains along the proposed Project. The drains would convey stormwater runoff downstream, and ultimately, to the respective water bodies. The stormwater drainage system drains into the various tributaries of each watershed discussed above. Typically, these areas are predominately channelized and highly developed with both commercial and residential properties. Most of the drainage networks are controlled by structural flood control measures, including debris basins, storm drains, underground culverts, and open concrete channels.

### **Electrical Power**

As further discussed in **Section 4.5: Energy**, electricity within the City is supplied by Southern California Edison (SCE), which serves approximately 15 million people in a 50,000-square-mile service area.<sup>65</sup> Electricity within the area of the proposed Project is primarily used for lighting, cooling, and operation of businesses and restaurants. Electricity is also used indirectly in the delivery, treatment, and distribution of water used within the Project boundary, as well as for the treatment of wastewater. There are several electrical lines documented along the proposed Project as further discussed below.

64 City of Inglewood, *Final Environmental Impact Report for the Transit Oriented Development Plan for Downtown Inglewood and Fairview Heights*, September 2016. Prepared by Metis Environmental Group.

65 Southern California Edison, "Newsroom Fact Sheet," April 29, 2019, accessed September 2021, [https://newsroom.edison.com/internal\\_redirect/cms.ipressroom.com.s3.amazonaws.com/166/files/20193/SCE%20Service%20Area%20Fact%20Sheet\\_Ver2\\_04252019.pdf](https://newsroom.edison.com/internal_redirect/cms.ipressroom.com.s3.amazonaws.com/166/files/20193/SCE%20Service%20Area%20Fact%20Sheet_Ver2_04252019.pdf).

### **Natural Gas**

As further discussed in **Section 4.5**, Southern California Gas Company (SoCalGas) is the natural gas purveyor within the City. The SoCalGas service area reaches 21.8 million consumers through 5.9 million meters in more than 500 communities, covering an area of approximately 24,000 square miles throughout Central and Southern California.<sup>66</sup> Natural gas is primarily used within the Project boundary for space heating, food preparation, and maintenance activities. There are several natural gas lines documented along the proposed Project as further discussed below.

### **Telecommunications**

The Telecommunications Division of the Information Technology and Communications Department is responsible for all of the voice-related services for the City of Inglewood. There are 22 locations, both large and small which require service from the Telecommunications staff. Moreover, the Telecommunications Division has over 1,100 phones, 850 voice mailboxes, and many incoming and outgoing lines, which provide service to the citizens of Inglewood.<sup>67</sup> Additionally, Spectrum Business is the primary cable provider in the area and may provide telecommunication services to the proposed Project. Telecommunications cable lines along the proposed Project would be installed in the same utility trenches as undergrounded electrical service.

### **Solid Waste**

#### **City of Inglewood Solid Waste Generation and Collection**

The City's Department of Public Works is responsible for developing plans and strategies to manage solid waste disposal and recycling for the City. Solid waste is collected curbside from properties within the City by Consolidated Waste Services (CDS), a private waste handler, and processed at CDS's American Waste Transfer Station in the City of Gardena, where it is sorted; residual garbage is taken to the Consolidated Volume Transport Disposal and Recycling Center (CVT) in the City of Anaheim; and recycling and green waste is taken to CDS's Compton Transfer Station in the City of Compton.<sup>68</sup>

There are three types of disposal facilities for nonhazardous waste within Los Angeles County: Class III Landfills (Municipal Solid Waste Landfills); Unclassified (Inert) Landfills; and Transformation (waste to energy) Facilities. A Class III Landfill accepts nonhazardous household waste. Unclassified Landfills accept materials such as soil, concrete, asphalt, and other construction and demolition debris. Transformation

66 Southern California Gas Company, "Company Profile," Accessed September 2021, <https://www.socalgas.com/about-us/company-profile>.

67 City of Inglewood, "Telecommunications," accessed September 2021, <https://www.cityofinglewood.org/327/Telecommunications>.

68 City of Inglewood, "Waste Collection FAQs," accessed September 2021, <https://www.cityofinglewood.org/FAQ.aspx?TID=30>.

Facilities involve the incineration, pyrolysis, destructive distillation, gasification, or the chemical or biological processing of municipal solid waste in order to generate energy, reduce volume, or produce synthetic fuel. Materials Recovery Facilities are available to recover recyclable materials from waste to provide for the efficient transfer of the residual waste to permitted landfills for proper disposal. Hazardous waste cannot be disposed of at Class III or Unclassified Landfills. The California Hazardous Waste Control Law requires that these hazardous materials be transported and disposed of or treated at a licensed facility.

#### Regional Landfill Capacity

The County of Los Angeles (County) is responsible for regional landfill services. The County of Los Angeles provides regional planning for landfill services. In response to the 1989 California Integrated Waste Management Act, the County prepared and administers a ColWMP.

The County continually evaluates landfill disposal needs and capacity through preparation of ColWMP annual reports. Within each annual report, future landfill disposal needs over the ensuing 15-year planning horizon are addressed, in part by determining the available landfill capacity.<sup>69</sup> As discussed in the ColWMP, while the economy has shown signs of improvement in recent years, the amount of waste that residents and businesses have generated and disposed of in the County continues to remain relatively low.

In 2019, the County disposed of approximately 11 million tons of materials.<sup>70</sup> The County estimates that this disposal amount represents the generation of approximately 30.1 million tons with a 65 percent diversion rate. Of that amount, the majority was accommodated by in-County Class III landfills (5.20 million tons), followed by exports to out-of-County landfills (5.0 million tons), and transformation facilities (0.34 million tons). The 2019 County average daily disposal rate was 17,145 tons per day, and the maximum daily capacity was 35,159 tons per day. The remaining disposal capacity for the County's Class III landfills is estimated at approximately 148.40 million tons as of December 31, 2019. The County estimates that in 2034 cumulative demand for disposal will be approximately 178.6 million tons.

Of the various landfills serving the City of Los Angeles, Sunshine Canyon Landfill is the largest recipient of nonhazardous solid waste disposal materials (i.e., Class III waste materials). This landfill had a remaining capacity of 55.2 million tons in 2019, with an expected life expectancy of 18 years. The maximum daily capacity for the landfill is 12,100 tons per day and the 2019 disposal rate was 6,387 tons per day.<sup>71</sup> In 2019, the annual amount of inert waste materials, such as earth, landscaping, concrete and asphalt,

<sup>69</sup> Los Angeles County Department of Public Works, *Los Angeles County Integrated Waste Management Plan, 2019 Annual Report*, September 2020.

<sup>70</sup> Los Angeles County Department of Public Works, *Los Angeles County Integrated Waste Management Plan, 2019 Annual Report*, September 2020.

<sup>71</sup> Los Angeles County Department of Public Works, *Los Angeles County Integrated Waste Management Plan, 2019 Annual Report*, September 2020.

disposed of within the County was 0.267 million tons. The Azusa Land Reclamation is the primary Inert Waste Landfill serving the County. The remaining capacity of this landfill is estimated at 58.84 million tons. Given the remaining permitted capacity and the 2019 average disposal rate of 1,038 tons per day, this capacity would be exhausted in approximately 26 years.

In addition to the County-permitted facility, there are a number of inert debris engineered fill operation facilities operating under State permit provisions that provide additional capacity in the County, processing approximately 3.35 million tons in 2019.<sup>72</sup> Countywide waste reduction and diversion programs have reduced disposal levels at the County's landfills. The County is updating its ColWMP, including annual reports and a master plan for meeting waste disposal needs for a 15-year planning period.

The most recent Annual Report indicates that the County can adequately meet future Class III disposal needs through 2034 through scenarios that include a combination of all or some of the following: (1) utilizing the permitted in-county disposal capacity only, (2) keeping to the status quo (3) meeting CalRecycle's Statewide Disposal Target of 2.7 PPD (Pounds per Person per Day); (4) meeting Senate Bill 1383 Organic Waste Disposal Targets; (5) utilization of additional alternative technology capacity; (6) increase in exports to out-of-County landfills; and (7) all solid waste management options considered become available.<sup>73</sup>

**Table 4.14-4: County of Los Angeles Annual Disposal Tonnage for 2019** provides a list of solid waste facilities, including transfer stations, compost facilities, and disposal sites and indicates that approximately 10,969,522 tons of solid waste was disposed of in these facilities.

**Table 4.14-5: In-County Class III Landfills Servicing the City of Inglewood** shows four landfills located in the County which could serve the proposed Project. As of 2019, the four landfills had a combined estimated remaining capacity of approximately 134.16 million tons. Waste that is currently generated in the area is disposed of at the Sunshine Canyon landfill. As described in the County's most recent landfill disposal capacity report, a shortfall in permitted solid waste disposal capacity within the County is not anticipated to occur under forecasted growth and ongoing municipal efforts at waste reduction and diversion within the next 15 years.<sup>74</sup>

## Existing Solid Waste Generation

The proposed Project is located within a heavily developed area of the City which generates solid waste from a variety of land uses. As previously noted, there are several existing developments which generate solid waste that would be demolished and removed.

As shown in **Table 4.14-6: Existing Solid Waste Generation from Existing Uses to be Removed**, the existing uses to be removed currently generate approximately 5,460.4 pounds (2.7 tons) of solid waste per day, and approximately 996.5 tons of solid waste per year. It should be noted that prior to construction of the

proposed Project, a replacement Vons store would be developed which would generate approximately 1,448 pounds (0.7 tons) of solid waste per day and 264 tons of solid waste per year.

Table 4.14-6

## Existing Solid Waste Generation from Existing Uses to be Removed

<sup>a</sup> Prior to construction of the proposed Project, a 46,400 square-foot replacement Vons store would be developed which would generate approximately 1,448 lbs (0.7 tons) per day and 264 tons per year of solid waste.

## 4.14.4.2 Project Area

The proposed Project would begin at the Market Street/Florence Avenue Station, largely situated in the public right-of-way in between Florence Avenue and Regent Street and would extend south along Market Street. At Market Street's intersection with Manchester Boulevard, the guideway would shift onto Manchester Boulevard and proceed east. At Manchester Boulevard's intersection with Prairie Avenue, the guideway then shifts onto Prairie Avenue and proceeds south until its intersection with Hardy Street. A

number of utility lines follow and transect the roadways in the area due to their status as major rights-of-way.

As discussed in 4.14.2: *Methodology* above, the following is a discussion of utilities known to be located within the rights-of-way of streets in the area and their approximate location. Since this represents the best available information at the time of analysis, there may be additional utility lines within the area, or specific locations of identified utility lines may slightly differ. As mentioned previously, exact utility locations would be determined prior to construction by potholing, utilizing ground penetrating radar, and/or other methods. Discussions related to water, wastewater, stormwater, electrical, and gas lines and infrastructure are included below.

### **Water, Wastewater, and Stormwater Infrastructure**

#### **Market Street Segment**

The Market Street segment starts from the intersection with the Metro K Line north of downtown Inglewood, southwest for approximately a quarter of a mile to the intersection of Market Street and Regent Street, continuing south on Market Street until Manchester Boulevard.

Within this portion of the alignment, water and wastewater lines ranging from 4 to 24 inches in diameter are located in the streets and alleys following and traversing the alignment. The existing water lines are generally older pipelines made of asbestos cement; however, some pipelines consist of cast iron, polyvinyl chloride (PVC), reinforced concrete cylinder, or galvanized steel. Additionally, a number of storm drains fed by on-street storm drain inlets are located within this segment.

#### **Water Lines**

As shown in **Table 4.14-7: Existing Water and Sewer Utilities**, several different water lines exist within the right-of-way of the Market Street segment. These include:

- A 24-inch east–west water distribution line follows Florence Avenue and transitions to an 8-inch water line at the Florence Avenue and Market Street intersection, proceeding south along the western side of Market Street. The line then transitions to the eastern side of Market Street approximately 75 feet south of the Florence Avenue and Market Street intersection and continues south, within approximately 25 feet of the eastern curb face.
- An 8-inch water line, 6-inch recycled water line, and storm drain run east–west along the northern side of Regent Street and all transect Market Street at the intersection of those streets; the north–south traveling water line ties into the 8-inch east–west water line at this point.
- An additional 24-inch east–west water line runs along the southern side of Regent Street through the Market Street intersection.

- A 12-inch water line continues out of the 8-inch east–west line and proceeds south along Market Street from Regent Street to Queen Street, transitioning from the eastern side of Market Street to the western side within 12 feet of the curb and approximately 100 feet north of Queen Street; this water line continues along Market Street past Manchester Boulevard.
- An 8-inch east–west water line runs along the northern side of Queen Street and transects the segment at that street’s intersection with Market Street.

#### **Wastewater Lines**

As shown in **Table 4.14-7**, within the Market Street segment an 8-inch east–west sewer line runs along the southern side of portions of Regent Street to the east and west of Market Street, approximately 100 feet and 25 feet from the curb line on Market Street, respectively.

No sewer lines transect the alignment along the Market Street segment.

#### **Stormwater Lines**

Within the Market Street segment, the following stormwater drains occur:<sup>75</sup>

- An east–west stormwater main drain runs along the southern side of Queen Street and transects Market Street at the intersection of those two roadways.
- a lateral connection to the northeastern corner of the Market Street and Queen Street intersection. Storm drain inlets are situated along curbs on Market Street at the northeastern and southeastern corners of that street’s intersection with Queen Street.<sup>76</sup>
- At the intersection of Market Street and Manchester Boulevard, an east–west stormwater main drain follows the northern side of Manchester Boulevard and transects Market Street; this drain contains lateral connections to both the northeastern corner of the intersection where storm drain inlets are situated on both Market Street and Manchester Boulevard, and the northwestern corner where a storm drain inlet is situated on Market Street.

4.14-38

Inglewood Transit Connector Project  
November 2021

### Manchester Boulevard Segment

The Manchester Boulevard segment runs within the right-of-way from Market Street east on Manchester Boulevard, turning south on Prairie Avenue.

#### Water Lines

As shown in **Table 4.14-7**, several different water lines exist within the Manchester Boulevard segment. These include:

- A 12-inch east–west water pipe runs along the southern side of Manchester Boulevard within 12 feet of the southern curb face, then continues throughout the Manchester Boulevard segment until it meets a tie-in at the Manchester Boulevard and Prairie Avenue intersection.
- At the Manchester Boulevard and Locust Street intersection, a 24-inch north–south water line runs along the western side of Locust Street and transects Manchester Boulevard at the intersection of the two roadways.
- A 12-inch north–south water line runs along the eastern side of Locust Street, crosses Manchester Boulevard at this intersection, and continues along Locust Street in both directions.
- An 8-inch north–south water line follows the eastern side of Hillcrest Boulevard and transects Manchester Boulevard at the intersection of those two roadways.
- Proceeding east on Manchester Boulevard, the alignment is transected at Manchester Terrace by a 6-inch east–west water line that ties into the 12-inch east–west water line along the southern/southwestern edge of Manchester Boulevard; the 6-inch east–west water line continues east along the southern curb of Manchester Terrace.
- At Manchester Boulevard’s intersection with Manchester Drive, the alignment is again transected by a 6-inch east–west water line that ties into the 12-inch water line along the southern/southwestern edge of Manchester Boulevard; the 6-inch water line continues east along the southern curb of Manchester Drive.

#### Wastewater Lines

As shown in **Table 4.14-7**, within the Manchester Boulevard segment the following wastewater lines occur within the right-of-way:

- A 10-inch north–south sewer line follows the alley approximately midpoint in between Market Street and Locust Street; this sewer line transects Manchester Boulevard approximately 210 feet east of Market Street.
- An 8-inch east–west sewer line ties into this north–south sewer line and extends east along the approximate centerline of Manchester Boulevard. This sewer line also connects with two north-south sewer lines at Locust Street and Hillcrest Boulevard as described below.

- The above noted 8-inch east–west sewer line in the centerline of Manchester Boulevard ties in with another 8-inch north–south sewer at Locust Street, which continues northbound on the eastern side of Locust Street.
- The above noted 8-inch east–west sewer line on Manchester Boulevard extends east from Locust Street until Hillcrest Boulevard, where it proceeds north and follows the approximate centerline of Hillcrest Boulevard.
- An 8-inch north–south sewer line follows the eastern side of Hillcrest Boulevard south of Manchester Boulevard, approximately 35 feet southwest of the proposed Project.
- An 8-inch east–west sewer line branch is located along the southern/southwestern edge of Manchester Boulevard beginning at the Manchester Terrace intersection and continuing until Spruce Avenue.
- At Spruce, the above east–west 8-inch sewer line meets three additional sewer lines which proceed within the roadway rights-of-way in the following directions: 1) a branch extending northeast to properties across Manchester Boulevard, 2) a branch extending southeast to the Manchester Drive centerline, and 3) a sewer line main extending southwest along the Spruce Avenue centerline.
- At Tamarack Avenue an 8-inch east–west sewer line extends in a northeastern–southwestern direction into the alignment. This line follows the southern edge of the Manchester Boulevard right-of-way and proceeds east. Approximately 80 feet before Prairie Avenue, this line shifts to the northern side of Manchester Boulevard and extends to the northeast towards Inglewood Park Cemetery.

#### Stormwater Lines

Within the Manchester Boulevard segment, the following stormwater drains occur:<sup>77</sup>

- At the Locust Street and Manchester Boulevard intersection, an east–west storm drain parallels the northern edge of Manchester Boulevard for approximately 100 feet; additionally, storm drain inlets are located at the northeastern and southeastern corners of this intersection along Manchester Boulevard.
- At the Manchester Boulevard and Spruce Avenue intersection, a northeast–southwest storm drain transects the alignment and parallels the sewer line extending northeast to properties across Manchester Boulevard, while to the southwest the storm drain borders the side and rear property line for the parcel located at the southern corner of the Manchester Boulevard and Spruce Avenue intersection. Storm drain inlets are located on Manchester Boulevard at the eastern and southern points of this intersection.

<sup>77</sup> Los Angeles County Department of Public Works, *Los Angeles County Storm Drain System*, interactive map, accessed September 2021, <https://pw.lacounty.gov/fcd/StormDrain/index.cfm>.

### Prairie Avenue Segment

The Prairie Avenue segment extends from its intersection with Manchester Boulevard south to the intersection at Hardy Street, as shown in **Figure 3.0-3: Project Vicinity Map**. The proposed Project would not extend past the Prairie Avenue and Hardy Street intersection.

### Water Lines

As shown in **Table 4.14-7**, The following water lines occur within the right-of-way of the Prairie Avenue segment:

- A 60-inch north–south DWP water pipe runs along Prairie Avenue for the length of the alignment segment. The DWP line runs just east of the centerline on Prairie Avenue until approximately 250 feet south of the Kelso Street/Pincay Drive intersection. At this point, the line shifts to the eastern side of Prairie Avenue beneath the existing sidewalk and continues in this location until Century Boulevard.
- From Manchester Boulevard, an 8-inch north–south water pipe travels south down Prairie Avenue towards the western side of the street approximately 25 feet from the western curb, transitioning further west under the western curb of Prairie Street at the Arbor Vitae Street intersection.
- This 8-inch water pipe continues down Prairie Avenue until it terminates just south of 99th Street and north of Century Boulevard. Along its length on Prairie Avenue, water lines of varying diameters tie into the 8-inch water pipe from its west at Nutwood Street, Kelso Street, La Palma Drive, Buckthorn Street, Arbor Vitae Street, Hardy Street, 97th Street, and 99th Street.
- An east–west running water line follows the southern side of Kelso Street/Pincay Drive beneath the sidewalks; this water line pivots south of the Kelso Street/Pincay Drive intersection and extends approximately 200 feet south on both sides of Prairie Avenue before transecting the right-of-way and joining the other side.

### Wastewater Lines

The following wastewater lines occur with the right-of-way of the Prairie Avenue segment:

- From Manchester Boulevard until Kelso Street/Pincay Drive a 10-inch sewer line and a 24-inch north–south sewer line run on the eastern and western edges of Prairie Avenue, respectively, whereupon they tie into an east–west sewer line that follows Kelso Street/Pincay Drive.
- Along Pincay Drive east of Prairie Avenue, the east–west sewer line follows the approximate centerline; west of Prairie Avenue along Kelso Street this sewer line follows the northern edge of the roadway. This east–west sewer line also includes sewer line branch that extends from the center of the Prairie Avenue and Kelso Street/Pincay Drive intersection to the southeastern corner of the Prairie Avenue and Kelso Street/Pincay Drive intersection.
- Past the Kelso Street/Pincay Drive intersection, the 10-inch north–south sewer line extends south for approximately 180 feet along the eastern side of the right-of-way before proceeding east into the

adjacent Hollywood Park property. The 10-inch sewer line continues south within the adjacent Hollywood Park property, approximately 43 feet east of the existing eastern curb line along Prairie Avenue, until Arbor Vitae Street, whereupon it continues east along the centerline of Arbor Vitae Street.

- A 36-inch north–south recycled water pipe runs along Prairie Avenue in the centerline from Manchester Boulevard until it shifts to the eastern portion of the right-of-way just north of the Hardy Street intersection in between the 60-inch DWP line and storm main (discussed below); this 36-inch line extends further south through the segment past Century Boulevard and 102nd Street.

### Stormwater Lines

Similar to other segments along the Project alignment, all storm drains and mains in this segment are gravity flow and consist of reinforced concrete pipe.<sup>78</sup> The following stormwater drains occur along the Prairie Avenue segment:

- Approximately midway between Manchester Boulevard and Nutwood Street, a storm drain transects the alignment in an east–west direction. This drain diverges in the southeastern direction into the Forum property after exiting the right-of-way.
- At Buckthorn Street’s intersection with Prairie Avenue, a 33-inch north–south storm drain begins in the eastern portion of the right-of-way, approximately 30 feet from the eastern curb line, and extends through the length of the Manchester Boulevard segment. The storm drain includes branch tie-ins at multiple points along its length; these consist of points at Arbor Vitae Street, Hardy Street, 97th Street, 99th Street, Century Boulevard, 101st Street, and 102nd Street. Additionally, the storm drain increases in diameter as it proceeds south; the pipe expands from 33 inches to 39 inches at Hardy Street. Previously mentioned branch tie-ins to the storm drain are described as follows:
  - At Arbor Vitae Street, three stormwater drain branches tie into the main drain at the Arbor Vitae Street intersection. At the northern portion of Prairie Avenue and Arbor Vitae Street, two of these branches tie into the main line; the remaining branch extends to the northeastern corner of the intersection and the other to the northwest. At the southern portion of the intersection, a third branch ties in and extends to the northeastern corner of the intersection. Storm drain inlets are located along Prairie Avenue at the northeastern and northwestern corners of the intersection and along Arbor Vitae Street at the northwestern corner.
  - At Hardy Street, a stormwater drain branch tie-in is located approximately 400 feet north of the Hardy Street intersection and extends northeast into the Hollywood Park property. Approximately 25 feet after this point the storm drain main expands to a 39-inch line.
  - The Hardy Street intersection includes two branch tie-ins to the main drain at northern and southern points of the intersection; the northern tie-in extends to the northwestern corner of the

<sup>78</sup> County of Los Angeles Department of Public Works, *Los Angeles County Storm Drain System*, interactive map, accessed September 2021, <https://pw.lacounty.gov/fcd/StormDrain/index.cfm>.

intersection while the southern tie-in extends to the northeast and follows the Hardy Street centerline into the adjacent Hollywood Park property.

- Storm drain inlets are located on the eastern side of Prairie Avenue approximately 400 feet north of Hardy Street, as well as on the northeastern and northwestern corners of the Hardy Street intersection along Prairie Avenue.
- Moving south, an 8-inch north–south sewer pipe begins along Prairie Avenue approximately 100 feet south of the Arbor Vitae Street intersection and travels under the western curb. The 8-inch sewer pipe continues south in the same location and would continue under Hardy Street where the guideway would end at the Prairie Avenue/Hardy Street Station.

**Electrical Utilities**

Within the proposed Project’s alignment, electrical lines occur as noted.

**Market Street Segment**

The guideway would begin at the Market Street/Florence Avenue station, situated in the public right-of-way in between Florence Avenue and Regent Street, and would extend south along Market Street. According to SCE, there is one existing 16 kilo-volt-ampere (kva) circuit currently available along Market Street.<sup>79</sup>

**Manchester Boulevard Segment**

The guideway would shift east onto Manchester Boulevard at the intersection with Market Street. As shown in **Table 4.14-8: Existing Electrical Utilities**.

**Prairie Avenue Segment**

At Prairie Avenue, the guideway would then proceed south until Hardy Street. As shown in **Table 4.14-8**, three large electrical lines, sizes 16 kva, 17.5 kva, and 50 kva, run north-south under Prairie Avenue from Manchester Boulevard to Hardy Street where the guideway would end at the Prairie Avenue/Hardy Street station.

<sup>79</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

**Table 4.14-8  
Existing Electrical Utilities**

Source: Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

**Gas Utilities**

**Market Street Segment**

The guideway would begin at the Market Street/Florence Avenue station, situated in the public right-of-way in between Florence Avenue and Regent Street, and would extend south along Market Street. There are no existing gas utilities within the Market Street segment.

**Manchester Boulevard Segment**

The guideway then shifts to run down Manchester Boulevard at the intersection with Market Street. As shown in **Table 4.14-9: Existing Gas Utilities**, a gas line runs across the alley between Market Street and Locust Street, tie-ins are shown stemming west for approximately 100 feet along the southern curb and east for approximately 100 feet along the northern curb of Manchester Boulevard. A gas line runs down the eastern side of Locust Street; a tie-in stems off under the southern curb of Manchester Boulevard and extends for approximately 185 feet. A gas line follows Hillcrest Boulevard in a northeast–southwest direction and transects Manchester Boulevard at the intersection of the two roadways; this gas line contains a tie-in to the proposed MSF along Hillcrest Boulevard, approximately 275 feet southwest of the Manchester Boulevard and Hillcrest Boulevard intersection.

The north–south gas line along Hillcrest Boulevard contains a tie-in to an east–west gas line which follows under the northern curb of Manchester Boulevard; this tie-in travels under the northern sidewalk of Manchester Boulevard in between Hillcrest Boulevard and Manchester Terrace.

An east–west gas line enters the segment from Manchester Drive and crosses along Manchester Boulevard just south of Spruce Avenue. The line continues under the southern curb of Manchester Boulevard throughout the remainder of the segment and terminates approximately 195 feet of the Prairie Avenue intersection.

### Prairie Avenue Segment

The guideway then shifts to run down Prairie Avenue at the intersection with Manchester Boulevard. As shown in **Table 4.14-9**, a gas line travels south along the western side of Prairie Avenue, continuing throughout the segment past Century Boulevard.

There are no high-pressure distribution lines within the footprint of the proposed Project. The closest high-pressure distribution line is located within the street right-of-way along Pincay Drive, starting from the intersection at Crenshaw Boulevard and ending approximately 500 feet before the intersection at South Prairie Avenue. Minor laterals connect these lines to points of service. Two 30-inch gas transmission lines run beneath the rights-of-way of local roadways; one runs along Crenshaw Boulevard from north to south, approximately 1 mile east of South Prairie Avenue and the other runs along West 104th Street from east to west, approximately 0.25 miles south of West Century Boulevard.<sup>80</sup>

A gas line tie-in from the northern curb of Kelso Street/Pincay Drive extends just north onto the western curb of Prairie Avenue but does not transect the alignment. The north-south gas line contains an additional gas line tie-in from its west at Arbor Vitae Street, which follows the northern portion of that roadway.

#### 4.14.4.3 Adjusted Baseline

This section assumes the Adjusted Baseline Environmental Setting as described in **Section 4.0: Environmental Impact Analysis, 4-5: Adjusted Baseline**. Specifically, operation of land uses included in the Hollywood Park Specific Plan (HPSP) would require additional utility services for water, wastewater treatment or storm water drainage, electric power, natural gas, and telecommunications. The HPSP would utilize similar service providers as the proposed Project for utility supplies and infrastructure. Similar to the proposed Project, the HPSP was required to analyze impacts to utility services and infrastructure prior to approval.

As shown in **Figure 3.0-2: Project Location Map** a segment of the proposed Project would be adjacent to the HPSP along Prairie Avenue. The HPSP provides guidelines and standards for improvements in the public right-of-way within the HPSP, which includes approximately 0.5 miles of street frontage along Prairie Avenue. Within the HPSP, minimum building setback requirements involve 30 feet of separation from the roadway along Prairie Avenue extending from Pincay Drive/Kelso Street to approximately midblock between Hardy Street and 97th Street.<sup>81</sup>

<sup>80</sup> Southern California Gas Company, "Los Angeles County: Gas Transmission and High Pressure Distribution Pipeline Interactive Map," accessed September 2021, <https://socialgas.maps.arcgis.com/apps/webappviewer/index.html?id=c85ced1227af4c8aae9b19d677969335>.

<sup>81</sup> City of Inglewood, *Hollywood Park Specific Plan*, "Exhibit 6-5- Minimum Building Setbacks," 6-30, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015.

Nutwood Avenue to Kelso Street/Pincay Drive	<ul style="list-style-type: none"> <li>A gas line tie-in from the northern curb of Kelso Street/Pincay Drive extends just north onto the western curb of Prairie Avenue but does not transect the alignment.</li> </ul>

Source: Utilities Engineering Report, Gannett Fleming, August 2021.

Currently, no operational utility infrastructure is located within the 30-foot setback area; however, an abandoned oil line has been identified within the setback area south of Arbor Vitae Street and north of Hardy Street. This abandoned line would not require any action for use of this area.

### 4.14.5 THRESHOLDS OF SIGNIFICANCE

Criteria outlined in CEQA Guidelines were used to determine the level of significance of potential impacts from the relocation or construction of new or expanded utilities. As discussed in *Section 4.14.1*, seven

screening criteria related to utilities and service systems of Appendix G of CEQA Guidelines were eliminated from further analysis in this EIR. The below threshold identified in the Initial Study indicates that a project would have a significant impact in relation to the relocation or construction of new or expanded utilities if it were to:

**Threshold U-1: Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.**

Impacts found to be less than significant for the seven screening thresholds are further discussed in **Section 6.3** of this Recirculated Draft EIR.

#### 4.14.6 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

**Impact U-1: Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?**

The proposed Project is a fully elevated guideway and stations that accommodate an Automated Transit System (ATS system). The guideway spans a total length of approximately 1.6 miles with dual set of tracks (for train travel in both directions and connecting three, center-platform stations, as shown in **Figures 3.0-4a** through **3.0-4i: Proposed Project Alignment Plans and Profiles**). The technology will be self-propelled, rubber-tire ATS train or monorail.

The ATS train tracks are spaced as close together as possible with tracks diverging at approaches to/from stations and at stations and to accommodate switches. The elevated guideway would be supported by single or double column/bents (depending on the train track separations and the guideway location relative to potential column placements). While the final column locations and designs will be by the selected design/build/finance/operate/maintain (DBFOM) contractor, the alignment has been optimized to minimize the number of columns and potential double column/bents to the extent feasible. The procurement documents for the DBFOM contractor would identify the known utility locations and require the DBFOM contractor to locate columns to avoid and/or minimize impacts to existing utilities.

As noted in **Tables 4.14-7, 4.14-8, and 4.14-9**, multiple utilities exist under Market Street, Manchester Boulevard, and Prairie Avenue.

## Construction

### Relocation or Construction of Utilities

The Utility Report evaluated potential conflicts with the proposed Project columns and the existing utility lines along the Project alignment.<sup>82</sup> Existing roadways and infrastructure along the Project alignment will require some reconfiguration to accommodate new elevated guideway structures and stations. In addition to surface improvements, utility infrastructure under the roadway surface may need to be relocated to accommodate the guideway columns, footings, and other components. As discussed in **Section 3.0: Project Description, 3.5.6: Roadway Improvements** of the Project Description, roadway reconfiguration along Market Street, Manchester Boulevard and Prairie Avenue are necessary to ensure that the existing roadway travel capacity is not diminished or reduced in the final as-built conditions for the proposed Project. The column locations and spacings will be defined by the DBFOM contractor as part of their final designs to be guided by aesthetic principles defined and adopted as part of the EIR. The columns, for the most part, will be required to be located within the public right of way, either within sidewalks or parking lanes.

#### Market Street/Florence Avenue Segment

The Market Street/Florence Avenue station would be supported by dual columns per span from the northern terminus to just north of Regent Street. At this point, the dual lane tracks are separated to accommodate the Market Street/Florence Avenue station's center platform and turn-back switches that facilitate in-bound ATS trains to switch to the other track for its outbound journey. As the guideway approaches Regent Street, the dual lane tracks converge and are supported by single columns until Manchester Boulevard. The columns would be primarily located in the existing median along Market Street between Regent Street to Manchester Boulevard. As discussed previously, the column locations and spacings will be defined by the DBFOM contractor as part of their final designs to be guided by aesthetic principles defined and adopted as part of the EIR.

There are several major utility lines identified within the Market Street segment of the proposed Project including water, sewer, stormwater, and electrical lines. The Utility Report indicates that there would be potential column conflicts with streetlights at the intersection of Market Street and Regent Street. Moreover, along Market Street and north of Regent Street, there is a water line that would potentially conflict with a proposed column. Between Regent Street and Queen Street along Market Street, there is a water line that would potentially conflict with a proposed column. South of Queen Street and along Market Street, there are three water lines that would potentially conflict with a proposed column. At the northeast

<sup>82</sup> *Utilities Engineering Report*, Gannett Fleming, August 2021.

#### 4.14 Utilities and Service Systems

corner of Manchester Boulevard and Market Street, there is an AT&T telecommunications line that would potentially conflict with a proposed column. Additionally, several storm drains have been identified along Market Street which may require relocation due to column placement.

In addition, SCE has determined that the proposed Project would likely utilize the existing 16 kva circuit located within the right-of-way of Market Street to provide power for the proposed Project. SCE has also noted that utilization of this existing circuit would require infrastructure upgrades to accommodate the proposed Project.<sup>83</sup>

As the proposed Project columns would potentially conflict with several existing utility lines along Market Street, impacts would be potentially significant.

##### Manchester Boulevard Segment

As the guideway turns east onto Manchester Boulevard, the guideway would transition from single columns to one half straddle bent to support the turn onto Manchester Boulevard before going back to single columns in a new median located in Manchester Boulevard. As the guideway approaches the MSF it will widen and require straddle bents that will span across northern and eastern portions of the intersection of Market Street and Manchester Boulevard. From the intersection of MSF to Prairie Avenue, a combination of single column supports and straddle bents across Manchester Boulevard will be used. The intersection of Market Street and Manchester Boulevard to Locust Street, singular columns would also be arranged within the public right-of-way on the southern side of Manchester Boulevard. Some columns may be located within the existing parking lane on the southern side of Manchester Boulevard, requiring the elimination of parking.

Straddle bent columns will be placed in sidewalks and/or parking lanes so as to not reduce the existing roadway capacity of Manchester Boulevard. Single column supports will be located in a median within Manchester Boulevard that will not restrict existing traffic capacity or turning movements at intersections to other City streets.

Several major utility lines have been identified within the Manchester Boulevard segment of the Project alignment including water, sewer, wastewater, stormwater, and gas lines. The Utility Report indicates that there would be potential column conflicts with streetlights at the northeast corner of Market Street and Manchester Boulevard and along the north and south sides of Manchester Boulevard from Locust Street to Hillcrest Boulevard. Along Manchester Boulevard from Hillcrest Boulevard to Prairie Avenue, streetlights would potentially conflict with nearly all south/west-side and some north/east-side straddle-bent

<sup>83</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

#### 4.14 Utilities and Service Systems

columns. A street light line runs directly through the proposed station on the southwest corner of Manchester Boulevard and Prairie Avenue. There are underground SCE lines that would potentially affect all four proposed columns in the corners at the intersection of Hillcrest Boulevard and Manchester Boulevard. There is a sewer line running north-south across Manchester Boulevard between the intersections of Market Street and Locust Street that is in close proximity to a proposed column. The line connects to a City sewer which runs east-west along Manchester Boulevard and is in close proximity to five proposed columns. Along Manchester Boulevard between Market Street and Locust Street, there is a water line which would potentially conflict with a proposed column. On Manchester Boulevard, south of Manchester Drive, there are two water line laterals which would potentially conflict with a guideway column. Along Manchester Boulevard between Market Street and Locust Street, there is a 3-inch gas line running north-south that would potentially conflict with one proposed column. On the southern side of Manchester Boulevard, just south of Spruce Street, there is a 2-inch gas line which would potentially conflict with one proposed column and is in closer proximity to several others leading east to Prairie Avenue. As discussed previously, at the northeast corner of Manchester Boulevard and Market Street, there is an AT&T telecommunications line that would potentially conflict with a proposed column.

As the proposed Project columns would potentially conflict with several existing utility lines along Manchester Boulevard, impacts would be potentially significant.

##### Prairie Avenue Segment

Three straddle bent columns will support the guideway as it proceeds south onto Prairie Avenue just past Nutwood Street. As the guideways converge, they will transition to single column supports located on the western side of Prairie. The guideway begins diverging south of Victory Street to the west of Prairie Avenue on its approach to the Prairie Ave/Hardy Street station and will be supported by straddle bents in the sidewalk and west of the public right of way.

Several major utility lines have been identified within the Prairie Avenue segment of the alignment including water, sewer, wastewater, stormwater, electrical, and gas lines. The proposed Project's Utility Report indicates that a street light line runs directly through the proposed station on the southwest corner of Manchester Boulevard and Prairie Avenue. At the intersections of Kelso Street, Touchdown Drive, and Arbor Vitae Street, with Prairie Avenue, street light lines would potentially conflict with at least one proposed column. Along the west side of Prairie Avenue beginning at Manchester Boulevard, an underground SCE line would potentially affect the station and every proposed column until Arbor Vitae Street. Along Prairie Avenue from Arbor Vitae Street to Hardy Street, there are underground SCE lines which either directly impact, or are very close to, almost every proposed column. There is an overhead SCE line running east-west across the Kelso Street and Prairie Avenue intersection which would potentially

conflict with the proposed guideway depending on height. There is a 12-inch LACSD sewer line which runs north-south along Prairie Avenue and is very close proximity to several proposed columns from Manchester Boulevard to Kelso Street. South of Arbor Vitae Street, along the western sidewalk of Prairie Avenue, there is a City 8-inch sewer line that would potentially affect every proposed column until Victory Street. Along Prairie Avenue there is an 8-inch water line which would potentially conflict with, or is in very close proximity to, every proposed column from Victory Street to Hardy Street. South of Kelso Street there is an 8-inch gas line on the west side of Prairie Avenue which would potentially affect every proposed column up until Victory Street. South of Victory Street and west of Prairie Avenue, there is a gas line of unidentified dimension which would potentially affect one proposed column on each straddle bent to the end of the line. There is a telecommunications line on the west side of Prairie Avenue from La Palma Drive to Buckthorn Street that would potentially conflict with four columns.

As the proposed Project columns would potentially conflict with several existing utility lines along Prairie Avenue, impacts would be potentially significant.

#### **Solid Waste**

The City is served by CDS, which transfers solid waste to the Sunshine Canyon Landfill in Sylmar, California. The Sunshine Canyon Landfill currently receives an average of 3 million tons per year of solid waste and is permitted to receive a maximum of 4.4 million tons per year of solid waste. The landfill has approximately 62,082,860 tons of remaining capacity. Based on the landfill's throughput and availability of land, the landfill has a cease operation date of 2037. Construction of the proposed Project would include demolition of existing buildings as previously noted and would result in the generation of various construction waste including scrap lumber, scrap finishing materials, various scrap metals, and other recyclable and nonrecyclable construction-related wastes. Recyclable construction materials, including concrete, metals, wood, and various other recyclable materials would be diverted to recycling facilities. Given the remaining existing capacity at the Sunshine Canyon Landfill, the proposed Project would not require construction of new or expanded solid waste facilities.

The City is required to maintain the 50 percent diversion rate required by the State through the California Solid Waste Management Act. The DBFOM contractor would contract with CDS for bin removal activities. Compliance with construction and operational debris removal and recycling requirements would occur with the City's Environmental Services Department and CDS's Sunshine Canyon Landfill. The proposed Project would not conflict with federal, State, or local statutes and regulations related to management and reduction of solid waste. Therefore, the impact of solid waste generated by construction of the Project would be less than significant.

#### **Operation**

##### **Telecommunication**

The MSF command, control, and communications (CCC) facilities, including the CCR and the CCC equipment room, are planned to be co-located at the MSF.<sup>84</sup> CCC equipment is required for train control and supervision, power control and supervision, station doors, dynamic graphics, closed-circuit television (CCTV), public address, radio, fire detection, and other system-related elements. Additional CCC equipment is located at stations and along the wayside. The CCR provides for the supervision of the overall ATS operation. It houses all display, safety, and communications equipment required to monitor and control the ATS system. Typical equipment includes large work consoles and monitor banks (for system overview, CCTV, etc.). The CCC equipment room would be adjacent to the CCR and houses all servers and equipment for the control of the ATS system. The equipment room is also sized to house the uninterruptible power supplies (UPS) required for the operation of the system equipment. The UPS powers low voltage system equipment at the CCR and CCC equipment rooms. Once operational, the proposed Project would not require additional telecommunication infrastructure and no upgrades to off-site telecommunication facilities are anticipated. Any work that may affect services to the telecommunication lines would be coordinated with service providers. Therefore, this impact would be less than significant.

##### **Water and Wastewater**

Existing utility lines for water and sewer lines are located within the footprint of the proposed Project along Market Street, Manchester Boulevard, and Prairie Avenue. Project components including the MSF and stations would utilize these existing water and sewer lines as needed to connect for restrooms, water fountains and janitorial cleaning purposes.

The MSF would also provide for cleaning via an automatic washing of the vehicle exteriors at a Vehicle Wash Facility. The vehicle wash is typically a stationary system located in/near/adjacent to the MSF building where trains can be either manually or automatically moved through the wash facility. Assuming each car gets washed 1 time per week, it is estimated that on average, 230 gallons of water per day (gpd) will be used per day.<sup>85</sup> An on-site water recycling system will be used to collect and recycle water at the wash facility only (for estimation purposes, a recycling value of 80 percent is assumed); the amount of water recycling is determined by the ATS System operator and local requirements. Based on the 280 gpd and 80 percent recycling; the annual water usage for the ATS wash system is approximately 0.5 acre-feet

<sup>84</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

<sup>85</sup> Email correspondence with Iris Yuan, Lea+Elliott, June 29, 2020.

per year.<sup>86</sup> The ATS procurement documents will specify the amount to water recycling that is required. The MSF would connect to existing water and sewer lines located along Manchester Boulevard.

Other water demand requirements for the MSF would include restrooms, water fountains, showers, cleaning, etc. Water demand for the stations would include janitor's closets and water fountains. Water demand for the proposed Project is shown in **Table 4.14-10: Proposed Project Water Demand**. Based on the 75,000 square feet of the MSF, and approximately 9,200 SF for each of the three stations (for a total of 27,600 SF), the total water demand for the Project would be approximately 15.36 afy.

The existing commercial center on the site of the proposed MSF is currently served by existing utility lines. Existing water demand for the existing uses to be removed (see **Table 4.14-2**) is approximately 87.22 afy. The proposed Project (stations and MSF) would use approximately 71.86 afy less water than the current uses. Therefore, this impact would be less than significant.

**Table 4.14-10**  
**Proposed Project Water Demand**

Project Component	Square Footage	Demand Factor (gpd)	Water Demand (gpd)
Stations (3 total)	9,200 SF each 27,600 SF total	0.05	1,380
MSF	75,000 SF	0.05	4,200
MSF Train wash			230
Vons Replacement	46,400 SF	0.18	8,352
Total Daily Demand			13,712
Total Annual Demand			5,004,880 gal/yr. 15.36 afy

*Demand factor is based on LADWP demand factors for industrial uses of 0.05 gpd per SF. Stations and MSF use include restrooms, showers and water fountains and janitorial water use.*

### Electrical Power

In 2019, SCE was contacted to begin coordination related to the power demand requirements for the proposed Project (including the stations, MSF and ATS trains).<sup>87</sup> The following requirements and assumptions were given to SCE regarding the proposed Project:

<sup>86</sup> Annual water demand is calculated as 280 gpd reduced by 80 percent to account for recycled water. The result is 56 gpd of fresh water per day for 365 days, or approximately 20,440 gallons of water per year.

<sup>87</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

- The proposed Project would require approximately 10 MVA to power the system (trains, traction power, etc.) and infrastructure (station lighting and vertical circulation, guideway lighting, etc.)
- Fully redundant power feeds are requested; and
- Feeds to be provided at a single location; the proposed Project would distribute power as needed.

Using these assumptions, SCE completed a high-level Distribution Study to determine the amount of load that SCE could accommodate and required infrastructure upgrades in order to meet the proposed Project's recommended full redundancy design.<sup>88</sup> SCE's analysis assumed the use of the existing single (nonredundant) 16 kva circuit currently available along Market Street as it may be the most likely used circuit for the proposed Project.

The results of SCE's analysis found that:<sup>89</sup>

- The maximum load that can be accommodated at the present time is 10 MVA.
- To accommodate the 10 MVA load with full redundancy, the following upgrades would be required:
  - 1,500 feet of new civil work/duct banks,
  - 1,860 feet of new 1000 JCN cable,
  - 1,700 feet of upgrading/re-cabling the existing SCE primary cable to 1000 JCN, and
  - Two new gas switches.

Moreover, SCE estimated that normal operation of the proposed PDS substation at the MSF Site would have a peak power load flow of 2,008 kilowatts (kW) and normal operation of the proposed PDS substation at the Prairie Avenue/Hardy Street station would have an estimated peak power load flow of 2,119 kW for a total of 4,127 kW.

SCE would complete the aforementioned upgrades and would be subject to its procedures and requirements for construction and environmental clearance. Therefore, this impact would be less than significant. Although this impact is considered less than significant, **Mitigation Measure MM UT-2** is recommended to ensure that the proposed Project is re-evaluated by SCE so as to allow for final design.

### Stormwater

Existing storm drains are located within the alignment along Market Street, Manchester Boulevard, and Prairie Avenue. It is anticipated that the proposed Project would not interfere with these storm drains

<sup>88</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

<sup>89</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

during operation. Moreover, storm drains would be kept and maintained by the LACFCD and the City. Therefore, this impact would be less than significant.

#### **Natural Gas**

No new gas connections to serve the proposed Project elements would be required except at the proposed MSF. Natural gas would be used at the MSF to serve the pressure wash system, and for space and water heating. It is anticipated that the MSF would connect to existing gas infrastructure along Manchester Boulevard at the discretion of the SoCalGas. As further discussed in **Section 4.5**, the proposed Project would result in a net decrease in natural gas usage compared to the current uses. Therefore, this impact would be less than significant.

#### **Summary**

Based on current information and analysis by utility providers for operations, the proposed Project would have potential column conflicts with several existing utility lines along Market Street, Manchester Boulevard, and Prairie Avenue. As such, impacts would be potentially significant.

#### **Mitigation Measures**

The following mitigation measures have been identified to reduce potentially significant impacts.

#### **Construction**

**MM UT-1:** Prior to the award of the DBFOM contract, and start of any demolition or construction activities, the City shall be responsible for identifying the locations of existing utilities potentially affected by the Project. This shall include coordinating with all existing utility providers for wet and dry utilities (water, sewer, gas, electric, and telecommunications) to obtain documentation of existing utility locations. Field verification (i.e., potholing and other methods as appropriate) shall be conducted to document the locations of all utilities within 20 feet of the proposed Project's guideway and station foundations.

Based on the information from the field investigations, the DBFOM contractor shall be responsible for coordinating with the appropriate utility owners/operators to determine specific set back requirements for each utility line and the need for any stabilization for protection in place or relocation measures.

#### **Operation**

**MM UT-2:** Prior to the award of the DBFOM contract, and start of construction, the City shall contact Southern California Edison (SCE) and request an updated system Distribution Study to determine the amount of load that SCE could accommodate and required infrastructure upgrades in order to meet the proposed Project's recommended full redundancy design.

Should SCE determine that additional system upgrades are required, such upgrades shall be the responsibility of the DBFOM contractor and/or the City to complete (including design and any additional environmental clearance), subject to the review and approval of SCE and the City, as applicable.

#### **Level of Significance After Mitigation**

#### **Construction**

With the implementation of **MM UT-1**, impacts related to the relocation or replacement of utilities would be less than significant.

#### **Operation**

Impacts would be less than significant.

Implementation of **MM UT-2** would ensure that the Project is re-evaluated by SCE so as to allow for final design.

#### **4.14.7 CUMULATIVE IMPACTS**

Implementation of the proposed Project including the related projects identified in **Section 4.0**, **4.0.6: Cumulative Assumptions**, would further increase demands for utilities and may require the construction or relocation of utility lines.

#### **Water**

As discussed previously, the City of Inglewood provides water to 86 percent of the residences and businesses in the City. Water is provided in the remaining areas by Golden State Water Company and Cal America Water.<sup>90</sup> There are approximately 74 related projects within the City of Inglewood that would be within the same service area as the Project. Development of the proposed Project and related projects could cumulatively increase demands on the existing water infrastructure system. However, each project will require a site-specific assessment to determine any impacts to existing water infrastructure. Specifically, all related projects would be required to assess impacts to existing water infrastructure and coordinate with the City prior to project approval. Moreover, utility upgrades would be determined and completed by the City and would be subject to its procedures and requirements for construction and environmental clearance. Additionally, under multiple dry year conditions, imported supplies can be purchased to meet an annual increase in demand. Additional water would be purchased through the City's Metropolitan member agency WBMWD. The purchase will draw primarily through two major water supply

<sup>90</sup> City of Inglewood. Water Works. <https://www.cityofinglewood.org/463/Water-Works>.

systems: the Colorado River Aqueduct and through the State Water Project.<sup>91,92</sup> The proposed Project (stations and MSF) would use approximately 71.86 afy less water than the current uses. Therefore, cumulative impacts related to water infrastructure would be less than significant.

### Wastewater

As discussed previously, the City's Public Works Department manages the City's sanitary sewer collection system. There are approximately 74 related projects within the City of Inglewood that would be within the same service area as the Project. Development of the proposed Project and related projects could cumulatively increase demands on the existing wastewater infrastructure system. However, each project will require a site-specific assessment to determine any impacts to existing wastewater infrastructure. Specifically, all related projects would be required to assess impacts to existing water infrastructure and coordinate with the City prior to project approval. Moreover, utility upgrades would be determined and completed by the City and would be subject to its procedures and requirements for construction and environmental clearance. Moreover, the proposed Project (stations and MSF) would use approximately 71.86 afy less water than the current uses. As such, the proposed Project would generate less wastewater than current uses. Therefore, cumulative impacts related to wastewater infrastructure would be less than significant.

### Stormwater

As discussed previously, the main storm drain lines within the area of the proposed Project are owned and maintained by the LACFCD and the City. There are approximately 394 related projects within the County of Los Angeles that would be within the same service area as the Project. Development of the proposed Project and related projects could cumulatively increase demands on the existing stormwater infrastructure system. However, each project will require a site-specific assessment to determine any impacts to existing stormwater infrastructure. Specifically, all related projects would be required to assess impacts to existing water infrastructure and coordinate with the LACFCD and the City prior to project approval. Moreover, utility upgrades would be determined and completed by the LACFCD and the City and would be subject to their procedures and requirements for construction and environmental clearance. Therefore, cumulative impacts related to stormwater infrastructure would be less than significant.

### Electric Power

As discussed previously, electricity within the City is supplied by SCE. There are approximately 304 related projects that would be within the same service area as the Project. Development of the proposed Project

<sup>91</sup> City of Inglewood Public Works. Urban Water Management Plan 2020. <https://www.cityofinglewood.org/DocumentCenter/View/16221/20210616-Public-Review-Draft-2020-UWMP>. Accessed September 15, 2021.

<sup>92</sup> Colorado River Aqueduct was constructed and operated by Metropolitan, which transports water from the Colorado River. The State Water Project is owned and operated by the Department of Water Resources, which transports water from the Sacramento-San Joaquin Delta through the California Aqueduct.

and related projects could cumulatively increase demands on the existing electrical infrastructure system. However, each project will require a site-specific assessment to determine any impacts to existing electrical infrastructure. Specifically, all related projects would be required to assess impacts to existing electrical infrastructure and coordinate with SCE prior to project approval. Similar to the Project, utility upgrades for the related projects would be determined and completed by SCE and would be subject to its procedures and requirements for construction and environmental clearance. Therefore, cumulative impacts related to electrical infrastructure would be less than significant.

### Natural Gas

As discussed previously, SoCalGas is the natural gas purveyor within the City. There are approximately 394 related projects that would be within the same service area as the Project. Development of the proposed Project and related projects could cumulatively increase demands on the existing natural gas infrastructure system. However, each project will require a site-specific assessment to determine any impacts to existing natural gas infrastructure. Specifically, all related projects would be required to assess impacts to existing natural gas infrastructure and coordinate with SoCalGas prior to project approval. Similar to the Project, utility upgrades for the related projects would be determined and completed by SoCalGas and would be subject to its procedures and requirements for construction and environmental clearance. Therefore, cumulative impacts related to natural gas infrastructure would be less than significant.

### Telecommunications

As discussed previously, the Telecommunications Division of the Information Technology and Communications Department is responsible for all of the voice-related services for the City. Moreover, Spectrum Business is the primary cable provider in the Project area. There are approximately 74 related projects within the City of Inglewood that would be within the Telecommunications Division service area. An additional 320 related projects would be within the Spectrum Business service area. Development of the proposed Project and related projects could cumulatively increase demands on the telecommunication systems. However, each project will require a site-specific assessment to determine any impacts to existing telecommunication infrastructure. Similar to the Project, utility upgrades for the related projects would be determined and completed by the appropriate utility service provider and would be subject to its procedures and requirements for construction and environmental clearance. Therefore, cumulative impacts related to telecommunication infrastructure would be less than significant.

## 4.14.8 CONSISTENCY WITH CITY OF INGLEWOOD GENERAL PLAN

The City's General Plan includes policies that relate to utilities including water production and wastewater and pertinent to utilities and service systems. These include:<sup>93</sup>

<sup>93</sup> *City of Inglewood General Plan, "Conservation Element" (1997).*

#### 4.14 Utilities and Service Systems

- Protect aquifers and water sources by preventing contamination of groundwater from surface contaminants and treating groundwater pumped from City wells to ensure the water meets safe drinking water standards.
- Reduce the ever-increasing demand being placed on the aquifers and on the Statewide water sources through cumulative conservation efforts, reuse of water, and using reclaimed water where potable water is not needed (namely, irrigation and landscaping).
- Maintain a water quality monitoring system to ensure continues compliance with State standards.

Further, the General Plan Conservation Element includes the following policies related to stormwater relevant to the proposed Project:

- Visit businesses to educate owners about stormwater regulations and the penalties for illegally dumping into storm drains.
- Require periodic sweeping to remove oil, grease, and debris from parking lots with 25 spaces or more.
- Increase the frequency of sampling storm drain pollution by County agencies to assess which measures are more successful.
- Continue to stencil warnings over individual storm drain openings that advise against discarding litter into the drains.

Additionally, the General Plan Conservation Element discusses ways to achieve solid waste conservation. These policies seek to ensure the City maintains a diversity of water sources to prevent over-reliance on aquifers and Statewide water sources, and to attain safe drinking water standards for water pumped from City wells, in part through monitoring, periodic maintenance measures, and public education efforts.

The proposed Project responds to the City's vision by incorporating a range of both mandatory and potential but feasibly-integrated sustainability measures (see **Section 3.0 Project Description, 3.5.9: Sustainability Features**) for the proposed Project related to the areas of energy efficiency and renewable energy, water efficiency and conservation, material conservation and resource efficiency, environmental quality, planning and integrated design, and site planning. These measures apply on a component-by-component basis for the guideway and stations, MSF, and PDS substations. Among the sustainability measures related to limiting water consumption and preventing wastewater generation are mandatory efforts to filter and reuse wash/rinse water from the ATS train wash, xeriscape landscaping, weather-based irrigation control, low flow faucets and fixtures, and using best available water efficiency technologies for cooling towers, among others.

Given that the proposed Project includes the aforementioned features and components, it is consistent with the policies of the General Plan.

## 5.0 ALTERNATIVES

### 5.1 INTRODUCTION

The California Environmental Quality Act (CEQA) Guidelines require an Environmental Impact Report (EIR) to include a discussion of a reasonable range of alternatives to a project that would "feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the proposed Project and evaluate the comparative merits of the alternatives" (State CEQA Guidelines Section 15126.6). An EIR is not required to consider every conceivable alternative to a proposed project. Rather, a reasonable range of potentially feasible alternatives needs to be considered that will foster informed decision-making and public participation.

Key provisions of the State CEQA Guidelines on alternatives (Section 15126.6(b) through (f)) are excerpted below to explain the foundation and legal requirements for the analysis of alternatives in this Recirculated Draft EIR.

- *[T]he discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the proposed objectives or would be more costly. (15126.6(b))*
- *The specific alternative of "no project" shall also be evaluated along with its impact. (15126.6(e)(1))*
- *The "no project" analysis shall discuss the existing conditions at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, as well as what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services. If the environmentally superior alternative is the "no project" alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives. (15126.6(e)(2))*
- *The range of alternatives required in an EIR is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice. The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project. Of those alternatives, the EIR need examine in detail only the ones that the lead agency determines could feasibly attain most of the basic objectives of the project. The range of feasible alternatives shall be selected and discussed in a manner to foster meaningful public participation and informed decision making. (15126.6(f))*
- *Among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries, and whether the proponent can reasonably acquire, control, or otherwise have access to the alternative site (or the site is already owned by the proponent). (15126.6(f)(1))*

- [For alternative locations,] only locations that would avoid or substantially lessen any of the significant effects of the project need be considered for inclusion in the EIR. (15126.6(f)(2)(A))
- If the lead agency concludes that no feasible alternative locations exist, it must disclose the reasons for this conclusion, and should include the reasons in the EIR. For example, in some cases there may be no feasible alternative locations for a geothermal plant or mining project which must be in close proximity to natural resources at a given location. (15126.6(f)(2)(B))
- An EIR need not consider an alternative whose effect cannot be reasonably ascertained and whose implementation is remote and speculative. (15126.6(f)(3)).

**5.2 SIGNIFICANT IMPACTS OF THE INGLEWOOD TRANSIT CONNECTOR PROJECT**

In accordance with Section 15126.6(b) of the State CEQA Guidelines, the alternatives in this section have been selected to evaluate means for avoiding or substantially reducing the significant impacts of the proposed Inglewood Transit Connector Project (proposed Project or ITC Project) identified in **Section 4.0: Environmental Impact Analysis** of this Recirculated Draft EIR.

**Table 5.0-1: Environmental Impact Summary** presents a summary of findings for each topic analyzed in this EIR for the proposed Project. As shown, impacts related to biological resources, hazards and hazardous materials, hydrology and water quality, noise and vibration, tribal cultural resources, and utilities and service systems were determined to have significant impacts prior to mitigation.

**Table 5.0-1  
Environmental Impact Summary**

Topic	Significant Impact?	Mitigated to Less than Significant?	Unavoidable Significant Impact?
Aesthetics	No	No	No
Air Quality	Yes	Yes	No
Biological Resources	Yes	Yes	No
Cultural Resources	No	No	No
Energy Resources	No	N/A	No
Geology and Soils	Yes	Yes	No
Greenhouse Gas Emissions	No	N/A	No
Hazards and Hazardous Materials	No	N/A	No
Land Use and Planning	No	N/A	No
Noise and Vibration	No	Yes	No
Population, Employment and Housing	No	N/A	No
Transportation	No	N/A	No
Tribal Cultural Resources	Yes	Yes	No
Utilities and Service Systems	Yes	Yes	No

Measures are identified to mitigate Project impacts to less than significant, with the exception of short term air emissions during construction of the Project.

**5.3 PROJECT OBJECTIVES**

As identified in the State CEQA Guidelines, the achievement of Project objectives was considered in determining potentially feasible alternatives that would avoid or substantially lessen any significant effects of the proposed Project.

The City’s goals and objectives for the Inglewood Transit Connector Project are as follows:

- Provide direct and convenient connection to the Metro regional transit system for local residents and the region to access the City’s new major employment, commercial, and activity centers;
- Close the “last mile gap” to the regional transit system by providing passengers with the ability to transfer to or from destinations and the Metro K Line;
- Provide sufficient transit connection capacity between the Metro regional transit system and the City’s new major activity centers with enhanced travel time certainty and sufficient capacity to meet peak ridership demands to encourage transit as a travel mode choice;
- Maintain existing roadway capacity;
- Reduce the City’s traffic congestion and alleviate growing demand on the existing roadway network on both major arterials and residential streets for both nonevent and event days;
- Encourage intermodal transportation systems by providing convenient, reliable time-certain transit;
- Increase transit mode split, reduce vehicle trips, and reduce per-capita vehicle miles traveled to the City’s major activity centers, with corresponding improvement in air quality, public health, and reductions in greenhouse gas emissions from transportation sources in accordance with the City’s goals, the SCAG 2020-2045 RTP/SCS, and State policies with respect to climate change and land use;
- Support the ongoing economic revitalization, including through the creation of public parking facilities;
- Encourage redevelopment and investment within the City in areas served by the proposed Project;
- Provide safe, reliable, and convenient access to businesses in the City so that they are accessible to their workforce and customers;
- Connect the Inglewood community and citizens to jobs, education, services, and destinations within the City and within the region by providing transit within safe and accessible walking distances; and
- Support regional efforts to become more efficient, economically strong, equitable, and sustainable.

## 5.4 ALTERNATIVES

Alternatives presented in this section consist of potential alternatives that were initially considered but screened-out from further consideration due to their infeasibility or inability to meet the basic objectives of the Project, and design alternatives/ variations selected for further evaluation. As required by CEQA, the No Project alternative is also addressed in this section.

### 5.4.1 Alternatives Eliminated from Further Consideration

This section describes preliminary alternatives to the proposed Project initially considered early in the planning process for the ITC Project and the reasons why these alternatives are not evaluated further in this EIR.

#### *Alternative Alignments*

As part of the Envision Inglewood planning study,<sup>1</sup> the City evaluated several independent last-mile, fixed-guideway transit connector options in the Locally Preferred Alternative (LPA) Report,<sup>2</sup> comparing these options against key screening criteria and evaluating each option against the City's stated goals and objectives. The LPA Report evaluated the following four conceptual transit alternatives, all consisting of an elevated Automated Transit System (ATS):

- Alternative A: Market-Manchester Street Alignment (proposed Project)
- Alternative B: Fairview Heights Alignment
- Alternative C: Arbor Vitae Alignment
- Alternative D: Century Blvd Alignment

Alternative A was selected based on the review of these alternatives as the proposed Project.

As described in detail below, Alternatives B, C, and D were eliminated from further consideration.

#### **Alternative B: Fairview Heights Alignment**

The City identified an independent elevated ATS alternative connecting directly to the Fairview Heights Metro K (Crenshaw/LAX) Line station along Prairie Avenue as shown in **Figure 5.0-1: Location of Alternative Alignments in the LPA Report**. The Fairview Heights Alignment (Alternative B) would be an aerial alignment running approximately one-half mile along Florence Avenue between Prairie Avenue and

<sup>1</sup> City of Inglewood, *Envision Inglewood: Connecting People, Places, and the Future (May 2018)*, accessed March 2019, <http://envisioninglewood.org/>.

<sup>2</sup> City of Inglewood, *Envision Inglewood: Locally Preferred Alternative Report (June 2018)*, accessed March 2019, <http://envisioninglewood.org/wp-content/uploads/2018/07/Envision-Inglewood-Locally-Preferred-Alternative-Report.pdf>.

West Boulevard, transitioning south and then running along Prairie Avenue for approximately 1.75 miles between Florence Avenue to Century Boulevard for a total length of approximately 2.2 miles providing service to the Forum, the Los Angeles Sports and Entertainment District (LASED), and the Inglewood Basketball and Entertainment Center (IBEC).

This alternative would be dual lane and include four stations. The station locations were identified based on connections to traffic generators/development. This alternative includes potential intermodal center locations to capture road-based traffic, such as buses, transportation network companies (TNCs), taxis, and private vehicles, and facilitate a convenient transfer to the ITC. These potential intermodal centers would provide an opportunity to limit the amount and type of road-based traffic into the area, especially during special events.

As outlined in the LPA Report, this alternative was eliminated from further consideration for a variety of reasons including conflicts with, and impacts to, a variety of utility facilities. Based on preliminary research, utilities as well as lateral connections to these pipes from adjacent properties were identified along Florence Avenue. These existing utilities include sewer, gas, and water mains along these streets, which would pose obstacles for placement of guideway columns. In addition, various utility crossings at the curve alignment transition at Florence Avenue and Prairie Avenue would need to be avoided. While Alternative B would be located primarily within the street right-of-way, limited roadway width exists on Prairie Avenue between Florence Avenue and Manchester Boulevard to accommodate the elevated ATS structure. Potentially significant property impacts to the Inglewood Cemetery are anticipated because the alignment transitions from Florence Avenue, which has a wide right-of-way of 125 feet, to Prairie Avenue, which has a right-of-way of 78 feet. Furthermore, the right-of-way on Prairie Avenue decreases to less than 70 feet south of Regent Street. This would potentially further impact the Inglewood Cemetery and potentially conflict with utility infrastructure.

#### **Alternative C: Arbor Vitae Alignment**

The Arbor Vitae Alignment (Alternative C) concept would be an aerial alignment running approximately 2 miles along Arbor Vitae Street from Aviation Boulevard to Prairie Avenue, where it transitions north to the Forum, and south along Prairie Avenue for approximately one-half mile to Century Boulevard as shown in

**Figure 5.0-1.** This alignment would provide service to the Forum, LASED and SoFi Stadium and the IBEC. Additionally, Alternative C presents the opportunity to directly connect to the Los Angeles International Airport (LAX) and its Landside Access Modernization Program (LAMP), which includes parking opportunities; a consolidated rental car center; and a planned regional multimodal hub served by Metro's K and C (Green) Lines, various Metro, and municipal bus lines, and the LAX ATS. Although this alternative

5.0 Alternatives

connects to a planned multimodal hub, it would not provide development opportunities are limited in the downtown/commercial district of Inglewood because it will not serve the area.

As with other alternatives, Alternative C also provides opportunities for possible intermodal center locations to capture road-based traffic, such as buses, TNCs, taxis, and private vehicles, and to facilitate a convenient transfer to the ITC.

As outlined in the LPA Report, this alternative was eliminated from further consideration for the following reasons:

- Crossing over and under the I-405 would require coordination with the California Department of Transportation, Los Angeles Department of Transportation, and Los Angeles World Airports. This alignment does not present the opportunity for integration with local economic activity, current and future transit-oriented development, and other initiatives in the downtown/commercial district of Inglewood.
- The right-of-way along Arbor Vitae ranges from 100 feet to 66 feet, with a narrowing of the right-of-way east of Eucalyptus Avenue. Given the narrow right-of-way, this concept would potentially require acquisition of existing small business and possibly cause residential displacement. While the proposed Project would require some small business acquisition, the scale of the acquisition for this alternative, and its impact to residential properties, would be more extensive.
- Alternative C may potentially have adverse economic and fiscal impacts to local businesses along Arbor Vitae Street due to potentially reduced visibility, potential loss of on-street parking during construction, and potential permanent removal of on-street parking spaces to accommodate the alignment. The narrow width of the right-of-way would further reduce visibility of with project implementation as compared to the proposed alignment. Additionally, while the proposed Project is anticipated to remove some on-street parking spaces as well, the narrow right-of-way of this alternative is anticipated to impact existing on-street parking more extensively.
- Substantial utility lines were identified as part of preliminary research for this alignment alternative in addition to overlapping footprints with the selected alignment, including an 8- to 10-inch sewer pipe along the centerline of Arbor Vitae Street between Eucalyptus Avenue and La Brea Avenue. Therefore, impacts to utilities would be more significant than the proposed alignment.
- Together, these utilities pose significant obstacles as they may require either realignment of the ATS guideway or utility relocation would not be considered infeasible at this stage. Underground electrical lines, including vaults, are primarily concentrated along or adjacent to sidewalks and do not pose a major impediment. Nongravity-flow utilities, including water service lines, may be required to be relocated.

SOURCE: City of Inglewood - 2018; Meridian Consultants - 2019

FIGURE 5.0-1

Location of Alternative Alignments in the LPA Report

### Alternative D: Century Boulevard Alignment

The Century Boulevard Alignment (Alternative D) would be an aerial alignment running for approximately two miles along Century Boulevard from Aviation Boulevard to Prairie Avenue, where it transitions north along Prairie Avenue for approximately 1 mile to south of Manchester Boulevard (see **Figure 5.0-1**). This alternative would provide service to the Forum, LASED, and IBEC. Alternative D provides the opportunity to directly connect to a regional multimodal hub served by Metro's K and C Lines, various Metro, and municipal bus lines, and the LAX ATS system.

As with other alternatives, Alignment D also provides opportunities for possible intermodal center locations to capture road-based traffic, such as buses, TNCs, taxis, and private vehicles, and to facilitate a convenient transfer to the ITC.

As outlined in the LPA Report, this alternative was eliminated from further consideration for the following reasons:

- To connect to the multimodal hub, Alternative D would be required to cross the I-405 on the south side of the new consolidated rental car facility under development west of the I-405 Freeway and north of Century Boulevard as part of the LAX Landside Access Modernization. The transition from an elevated segment to below grade under the I-405 or above-grade over the I-405 would not be feasible due to the short distance available and the real estate constraints between Century Boulevard and the LAX Manchester Square development. Additionally, a bridge crossing over I-405 onto Century Boulevard would impede over or under clearance.
- Crossing over and under the I-405 would require coordination with the California Department of Transportation, Los Angeles Department of Transportation, and Los Angeles World Airports. This alignment does not present the opportunity for integration with local economic activity, current and future transit-oriented development, and other initiatives in the downtown/ commercial district of Inglewood.

### ATS At-Grade Alignment

An at-grade transit system along Market Street was initially considered but determined to be infeasible because it would result in significant traffic impacts, would not have the capacity to meet peak ridership demands, and would be more costly to build and/or operate than the proposed Project. The at-grade system presented many engineering challenges. An at-grade transit system was considered from Florence with a trench into a tunnel at Manchester Blvd to avoid traffic impact intersections. The 700-1,000 feet transition trench from at-grade to a tunnel would bifurcate Market Street with 20-25 feet track level change, and the direct transition from grade to an elevated guideway was deemed infeasible given the minimum ramp length required 700-1,000 feet (not including transitions).

East/west traffic from Manchester Boulevard to the 405 freeway would be significantly impacted by an at-grade system. Congestion during peak periods could create conflicts with an at-grade, fixed-guideway transit service, which would degrade transit service. Controlled crossings would be required for pedestrians across the at-grade line. An at-grade system would also bifurcate Market Street from just south of Regent Street to Manchester Avenue, creating a long guideway trench and physical barrier in downtown Inglewood since the structure of the tracks would physically disconnect existing connections between different parts of a community. To avoid these impacts, a tunnel would be needed to allow Manchester Boulevard to cross under the at-grade guideway. Construction of this tunnel would increase the construction cost for this alternative and also result in indirect land use impacts to the character of Market Street, particularly to the southern portion of Market Street in downtown. Tunneling may also adversely impact existing faults in and around the City.

An at-grade system would require a 3-car train at least 210 to 270 feet long. The capacity of this train would require headways during events that could not be achieved. Due to this constraint, this system could not meet peak capacity demands. A Driver/Operator would also be required for an at-grade system, which would further add to the cost to operate the system.

### Interlined Operability (Subway) Scenario

An Interlined Operability Scenario was also initially studied by LA Metro and the City of Inglewood and determined to be infeasible due to the cost and complexity of this type of system and extension of the Metro K Line. The scenario studied included a connection from the K Line in a subway under Prairie Avenue, which also would jointly operate on a portion of the K Line.

Existing and proposed operations on the Metro K and C (Green) Lines constrain the modification or expansion of service required to allow an interlined system. The K Line is designed to support up to 5-minute minimum headways. This maximizes the service potential for these lines but does not allow for additional capacity to serve a new branch for the Project. For this reason, Metro concluded that any scenario involving integration with the K Line or the C Line would require upgrades to the entire Metro system to accommodate increased train frequency. City's activity centers at the Forum and LASED area; and was ultimately determined to be infeasible.

### Alternative Technologies

The City evaluated a range of driverless transit technologies to determine the viable classes of technologies that could potentially meet the anticipated requirements for the ITC, as outlined in the LPA Report.<sup>3</sup> These requirements include the ability to meet projected ridership demand in terms of peak

3 City of Inglewood, *Envision Inglewood: Locally Preferred Alternative Report*.

hour demand or line capacity. The projected ridership demands vary between 500 passengers per hour per direction (pphd) during the weekday commute hours to approximately 9,000-10,000 pphpd during special events.

Only driverless technologies were analyzed because their shorter (more frequent) headways are more likely to meet the anticipated line capacity demands, as well as fit within the geometric constraints given the short system route and the high peak ridership demands from special events and game days at the key ridership generators. The range of such technologies are considered to be a class of Automated Guideway Transit or ATS Systems. Differentiation is primarily based on the size of the vehicles, guideway mounting, and propulsion and guidance systems.

The Project's transit technology is a form of light rail technology that can be steel-wheel/steel rail, rubber tired or magnetically levitated, supported on dual rails (that may be steel rail or concrete plinths) or straddling or suspended from a single beam/rail such as in a monorail type technology that will operate within a dedicated trainway. Power distribution will be through a third rail instead of overhead catenary to avoid additional visual impacts due to the overhead catenary system wires and support structures. It will be fully automated (i.e., driverless) which is necessary to operate at the tight headways to meet the projected ridership needs. The vehicles are smaller than traditional heavy rail technology so as to successfully maneuver the tight curves driven by the site-specific conditions. This type of technology is often times also referred to as automated guideway transit, automated people movers or simply monorails; regardless of the terminology used, it is a form of a light rail technology.

The driverless technologies considered were evaluated against the following criteria to provide a preliminary assessment of viable systems suitable for further evaluation and consideration:

- Ability to fit within the site-specific constraints;
- Ability to meet anticipated ridership demand in terms of peak-hour demand or line capacity;
- Flexibility of operations in terms of different train lengths, which would be longer during peak periods and shorter during off-peak periods to maintain the appropriate frequency and service levels.
- Ability to expand the fleet size with minimal or no disruption to ongoing normal passenger service during peak operational hours;
- Technical ability to meet the intended purpose; and
- Viability/availability of technology suppliers as measured by (1) longevity of business providing new systems and continued operations and maintenance; (2) at least one technology application proven in passenger service; and (3) applications of comparable size/scale to the proposed ITC Project.

As discussed in the LPA Report and summarized below, transit technologies ruled out from further consideration included Personal Rapid Transit (PRT) and Small Monorail ATSS.

#### Personal Rapid Transit (PRT)

PRT systems are designed to provide nonstop, origin-to-destination service to individuals or small groups of passengers via multiple cars operating in a network. Vehicles are typically 10 to 15 feet long, include a four- to six-passenger seated capacity, and have low headroom. PRT systems operate at low speeds (less than 25 miles per hour [mph]) and, to date, network size has been very limited.

To accommodate such a high-vehicle volume that would be necessary for anticipated ridership of the proposed Project, the infrastructure at the stations and bypass lanes would be substantially larger than for larger vehicle ATS systems. For these reasons, this alternative technology was eliminated from further consideration.

The City's Downtown TOD Plan envisioned an aerial personal rapid transit system, noted as SKY Tran, and stated that it could travel at-grade and at slow speeds along Market Street, could detach from guideway and run on wheels on the ground, and then system could then travel above-grade or in a dedicated lane on Manchester Blvd and through the Forum and Hollywood Park parking lots. The system could then return to a low-speed, at-grade alignment through the commercial areas of Hollywood Park. Finally, the system could continue in an aerial alignment east along Century Boulevard, serving the shopping centers there, and south along Crenshaw Boulevard to the Metro Green Line Crenshaw station. Additionally, the Downtown TOD Plan noted that a potential route would be along La Brea Avenue instead of Market Street and had a capacity of 12,000 persons per hour per direction and could cost up to \$10 million per mile.

The SKY Tran is a suspended system that uses small pods suspended from a monorail. While there are some agreements for future installations, SKY Tran does have an operational system either in the US or abroad at this time. Additionally, it is not proven that Sky Tran's capability has the capacity to carry 12,000 pphpd and the dual-mode (suspended and street modes) operations. Additionally, SKY Tran's current design does not meet the American Society of Civil Engineers' ATS standards and does not have any provisions for emergency evacuation from the pods, as is recommended by the National Fire Protection Association. While not the SKY Tran is not precluded from future procurement, all technology providers must demonstrate compliance with technical specifications, proven track record and demonstrate is capable of carrying about 500 pphpd to 9,000 pphpd.

It should be noted that in the last decade other innovative technologies such as autonomous vehicles (AVs) have proposed very high frequency operations, but they have not been able to meet the anticipated timeline of development and the projected performance. AVs are currently in pilot projects and have been

able to demonstrate very limited operations and very low capacities (about 300- 500 pphpd). These pilot AV systems run on simple dedicated routes outside public roads and typically have speeds limited to 15 mph. For these reasons, this alternative technology was eliminated from further consideration.

#### Small Monorail

Small monorail technology provides line-haul-type service connecting multiple stations. These systems may be operated as a shuttle or pinched loop, with multiple trains following each other and stopping at every station before turning back at the end of the line. Small monorail systems are applied in geographically compact areas and may either operate on top of the guideway or be suspended from the guideway. Vehicles on these systems are typically 15 to 20 feet long and include capacity for 12 to 20 passengers, with operating speeds ranging from 20 to 30 mph.

As determined in the LPA Report, small monorail systems would not be able to meet peak-hour ridership demand and are not a sufficiently flexible length for train operation; thus, such a system would provide adequate capacity. For these reasons, this alternative technology was eliminated from further consideration.

#### **Maintenance and Storage Facility (MSF) Relocation Alternative**

The Maintenance and Storage Facility (MSF) Relocation Alternative was initially considered but not carried forward for further analysis because it would not avoid or substantially lessen any of the significant impacts identified for the proposed Project.

With this alternative, the MSF and power distribution system (PDS) substations would be located on the 9-acre site at 250 N. Market Street adjacent to the proposed Market Street/Florence Avenue station rather than at the 5.5-acre site at 500 E. Manchester Boulevard. All other Project components would remain the same.

Under the proposed Project, the site at 500 E. Manchester Boulevard would be partially acquired and the existing commercial building containing the Vons grocery store and other businesses and site improvements would be demolished to accommodate the MSF and PDS substations (with the Vons to be rebuilt at the corner of Manchester Boulevard and Hillcrest Boulevard). Under the MSF Relocation Alternative, the partial property acquisition at 500 E. Manchester Boulevard would not be required. This would avoid the temporary construction impacts associated with these demolition activities and the construction of the MFS and PDS substations at this location. However, demolition of the commercial buildings and site improvements would occur at 250 N. Market Street and the new MSF and PDS substation would be built on this property. As a result, the temporary construction impacts resulting from demolition activities and construction of the MSF and PDS substation would not be avoided or substantially lessened

but would occur at the property as 250 N. Market Street. Additionally, the MSF and PDS substation would reduce the proposed public parking in the Market Street area that is designed to support ridership and access to the ITC Project and the downtown Market Street area.

#### 5.4.2 Alternatives Considered

Alternatives carried forward for further consideration include the following:

- Alternative 1: No Project
- Alternative 2: Bus Rapid Transit (BRT) System
- Alternative 3: Market Street Pedestrian Promenade
- Alternative 4: 4th Station Alternative
- Alternative 5: Prairie Avenue Single Station Alternative
- Alternative 6: Maintenance and Storage Facility (MSF) Site Alternative

##### 5.4.2.1 Alternative 1: No Project

The No Project Alternative considers conditions if the proposed Project is not built. No new transportation infrastructure would be built within the Project study area, aside from transportation projects that are currently under construction or funded for construction and operation by 2027. These projects include transit projects funded by Measure R, Measure M, and specified in the Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). Existing infrastructure and future planned and funded projects assumed under the No Project alternative include:

- Metro K Line –Currently under construction (2021), operating start date (Fall 2022)
- Implementation of the Citywide Event Transportation Management and Operations Plan
- Street improvements being constructed as part of the Los Angeles International Airport Landside Access Modernization Program and the Inglewood Basketball and Entertainment Center (IBEC) projects.
- Existing Bus Service – Metro Rapid and Metro Local

Existing public transit and private transportation operators would continue to provide service. Public transit operators would likely increase service in response to the projected growth in the number of visitors and residents that would occur as result of new and proposed major activity centers being developed in the City in the Downtown and Hollywood Park areas.

The LASED at Hollywood Park includes SoFi Stadium and additional development allowed by the Hollywood Park Specific Plan. Higher density mixed-use development is also planned in the vicinity of the

Metro Downtown Inglewood station near Florence Avenue and Market Street being developed within the Crenshaw/Imperial TOD Plan Area. These projects and improvements would reasonably be expected to occur in the foreseeable future if the proposed Project were not approved based on current plans.

Throughout 2020, the City of Inglewood developed a Citywide Transportation Management and Operations Plan (TMOP) focused on addressing future traffic demands that may result from events at the stadium. The Inglewood TMOP establishes a plan that provides public information, reduces unwarranted traffic through adjacent neighborhoods, and promotes the use of alternative modes of transportation as described below.

#### **City of Inglewood Event Park and Ride Shuttle Program and Intermodal Transit Facility at Hollywood Park**

To address the limited pre-sold on-site parking available at SoFi Stadium, the City has established a remote parking and shuttle program, known as the I Park & Go Program, that considers comprehensive access, circulation and traffic management for residents, visitors, and businesses on NFL game days and during large special events.

Given the growing event-day demand of the City's I Park & Go Program, the City would not only continue the use at the ITF Lot but also utilize the vacant lot at the southwest corner of Prairie Avenue and Manchester Boulevard given the limited capacity for increased shuttles at the City's ITF Lot.

#### **Event Transit Service**

The City has established a partnership and received support from Metro, Big Blue Bus (Santa Monica), GTrans (Gardena), and Torrance Transit to expand transit service. Under the No Project alternative, the City would work cooperatively with Metro and other municipal bus operators to increase and enhance transit service to City of Inglewood destinations through more frequent headways, additional route options, and other improvements by 2021, if possible. The TMOP addresses both Pre-Event and Post-Event conditions associated with SoFi Stadium at Hollywood Park. The Pre-Event scenario includes bus routes along Pincay Drive, Kareem Court, and Century Boulevard. The Post-Event scenario includes bus routes along Prairie Avenue, Manchester Avenue, Crenshaw Boulevard, Pincay Drive, Kareem Court, and Century Boulevard.

#### **5.4.2.2 Alternative 2: Bus Rapid Transit (BRT) System**

Bus rapid transit (BRT) is a public transit system designed to provide improved capacity and reliability relative to a conventional bus system. Typically, a BRT system includes roadway lanes that are dedicated to buses, with signal priority to buses at intersections where buses may interact with other traffic, with

enhanced coordinated flow. BRT systems typically include design features to optimize passenger boarding and alighting activities, as well as ticket purchases. A BRT corridor is a section of roadway or contiguous roadways served by the uniquely-branded buses along routes with a minimum length of approximately 1.5 to 2 miles.

Under this alternative, the City would construct and operate a BRT system that would connect the Forum, the SoFi Stadium, the Performance Arena, the IBEC and the Hollywood Park mixed uses to the Metro K Line Downtown Inglewood station. The proposed route of this alternative would be a loop route starting along Florence Avenue to travel east to North Prairie Avenue where it would turn south along Prairie Avenue to the Inglewood Transit Center Facility at Prairie Avenue and Arbor Vitae adjacent to the Hollywood Park site, and then return via Prairie Avenue northbound to travel westbound along Manchester Boulevard to Market Street to traverse northbound to Florence Avenue. The BRT would be located entirely within the public right-of-way. This route is generally consistent with the route as described in the City's New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines.<sup>4</sup>

Along the alignment, one eastbound travel lane along Florence Avenue between Market Street and Prairie Avenue; one southbound travel lane along Prairie Avenue between Florence Avenue and Manchester Boulevard; two lanes (one lane in each direction) along Prairie Avenue between Manchester Boulevard and the Inglewood Transit Center Facility; one westbound travel lane along Manchester Boulevard between Prairie Avenue and Market Street; and one northbound lane along Market Street between Manchester Boulevard and Florence Avenue would all be converted (from the existing mixed flow traffic lanes) to provide the Bus-only lane to accommodate the BRT alternative thereby reducing roadway lane capacities for mixed-flow traffic.

BRT systems typically include the following features:

- Dedicated lanes and alignment:
  - Separate lanes to avoid congested roadways.
  - Dedicated bus-only lanes for faster travel and ensure that buses are not delayed by mixed traffic congestion. Separate rights of way may be used. Transit malls or 'bus streets' may also be created in city centers.

<sup>4</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, November 1, 2016

- Off-board fare collection
  - Fare prepayment at the station, instead of on board the bus, eliminates the delay caused by passengers paying on board.
- Intersection treatment
  - Prohibit turns for mixed-flow traffic across the bus lane to reduce delays to the buses, in most cases. Transit Bus priority will often be provided at signalized intersections (using Transit Priority System (TPS) modules at all upgraded signal controllers at intersections along the alignment) to coordinate them to reduce delays by extending the green phase or reducing the red phase in the required direction compared to the normal sequence. Potential additional communication equipment to transmit and receive signals between the intersections and the City's Transportation Management Center may also be provided, as part of this alternative. Equipment to track the locations of the buses and closed-circuit television cameras may also be required / provided at the intersections along the alignment to provide the required monitoring.
- Platform-level boarding
  - Station platforms/stops would be convenient for quick and easy boarding, making them fully accessible for wheelchairs and baby strollers, with minimal delays.

Passenger loading areas would include stops at the following locations:

- Market Street/Florence Avenue in close proximity to the Metro K Line Downtown Inglewood Station. This BRT stop would provide connections to and from the regional light rail system;
- The Forum on Prairie Avenue;
- The City's Intermodal Transit Facility at Hollywood Park providing access to the SoFi Stadium, Hollywood Park Development Site, and IBEC.

High-capacity bus vehicles such as articulated buses may be used; these may have multiple doors for fast entry and exit. To reduce greenhouse gas emissions, vehicles may be electric or alternative fuel technology.

Under the BRT alternative, the proposed Project would not be built and none of the transit infrastructure, street provisions and activities would occur.

#### **5.4.2.3 Alternative 3: Market Street Pedestrian Promenade**

Under the Market Street Pedestrian Promenade Alternative, the proposed Project and all of its components would be constructed and would operate. With this alternative, Market Street between Florence Avenue and Manchester Boulevard would be entirely closed to vehicular traffic as shown in **Figure 5.0-2: Alternative 3: Market Street Pedestrian Promenade**. Regent and Queen streets would have barricades to prevent traffic turning onto Market Street in both directions. East-west traffic along Regent Street and Queen Street would be allowed without being able to turn on to Market Street. Traffic would

be diverted to surrounding streets including La Brea Avenue and Locust Street. The establishment of this pedestrian promenade would encourage pedestrian activity by improving walkability within Downtown Inglewood.

#### **5.4.2.4 Alternative 4: 4<sup>th</sup> Station Alternative**

This alternative considers the addition of a fourth station to the ATS as proposed at Manchester Boulevard, east of the Market Street/Manchester Boulevard intersection as shown in **Figure 5.0-3: Alternative 4: 4<sup>th</sup> Station Alternative – Manchester Boulevard Station**.

The station configuration would consist of a center platform with vertical circulation to an elevated passenger walkway located under the station platform level. Passengers would have access to the station through an elevated passenger walkway. As with the other ITC stations, this additional station would consist of a center platform configuration with the platform located at level 3 (approximately 50 feet above the existing grade). Passengers would access the platform from a mezzanine (at level 2) connected by elevated passenger walkways to vertical circulation elements to provide access to the sidewalk (at level 1) on the north side of Manchester Boulevard. Providing this additional station in Downtown would:

1. Support ongoing economic revitalization in Downtown Inglewood;
2. Provide a direct connection from Downtown Inglewood to the regional rail system, the Forum, the LASED, including SoFi Stadium, and the IBEC; and
3. Enhance the connection of Inglewood and residents to jobs, education, services, and destinations within the City and within the region; and support regional efforts to become more efficient, economically strong, equitable, and sustainable.

#### **5.4.2.5 Alternative 5: Prairie Avenue Single Station Alternative**

The proposed Project modifies and relocates Prairie Avenue to the east to maintain the current roadway capacity. The relocation of Prairie Avenue and the need for a passenger station connection on the sidewalk/ground level affects properties located east of Prairie Avenue. This Alternative avoids affecting these properties by consolidating the two proposed stations on Prairie Avenue into a single station that would be located adjacent to the City's Intermodal Transit Facility at the City's Civic Center site. Passengers would connect to the ground/sidewalk level within the City-owned Civic Center site. **Figure 5.0-4: Alternative 5: Prairie Avenue Single Station Alternative** illustrates this alternative.

This Alternative maintains Prairie Avenue within its existing right-of-way; however, one to two lanes would be lost, thereby reducing the capacity of the roadway. Specifically, one travel lane in each direction along Prairie Avenue between Arbor Vitae and La Palma, one lane in the southbound direction between

5.0 Alternatives

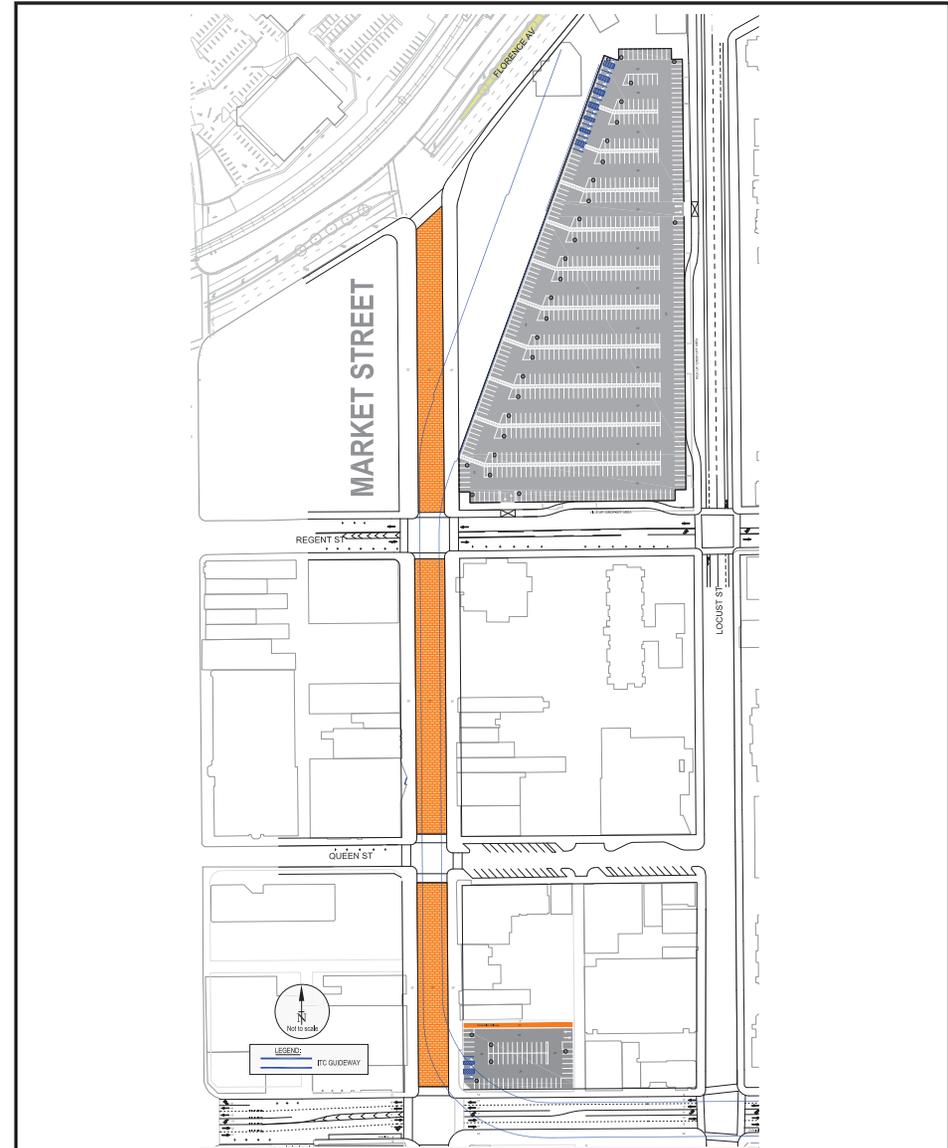

La Palma and Pincay Drive, and one lane in each direction between Pincay Drive and Manchester Boulevard would be lost under this Alternative 5: Prairie Avenue Single Station Alternative.

**5.4.2.6 Alternative 6: Maintenance and Storage Facility (MSF) Site Alternative**

The proposed Project involves siting the MSF within the southeastern portion of the site at 500 E. Manchester Boulevard closest to the corner of Nutwood Street and Spruce Avenue that contains a Vons grocery store and gas station, with other businesses, including a private gym, bank branch and coffee shop located in the building with Vons. This siting of the MSF requires removal of the gas station currently located on the Vons site in order to provide for short-term construction staging to construct the MSF and, thereafter, to provide parking.

This Alternative moves the MSF to the northwestern portion of this property closest to the south corner of Hillcrest Boulevard and Manchester Boulevard as shown in **Figure 5.0-5: Alternative 6: Maintenance and Storage Facility Alternative**. The site containing the MSF would be approximately 14,000 SF in size.

This alternative would have the same elevated profile and footprint of the MSF and its supporting facilities (e.g., access, circulation, employee parking, etc.). With this alternative, the existing gas station would remain on the site. Under this Alternative, the building containing the grocery store and other businesses would be demolished. With the Project, a replacement Vons store would be built on the corner of Manchester Boulevard and Hillcrest Boulevard. With this alternative a replacement Vons store would not be built on this site.

## 5.5 EVALUATION OF ALTERNATIVES

### 5.5.1 Alternative 1: No Project

#### 1. Aesthetics

The proposed Project would not result in significant impacts to the aesthetic character of the community during construction or operation with implementation of the project design features in the ITC Construction Commitment Program (CCP) and ITC Design Standards and Guidelines (Design Guidelines). With Alternative 1, the proposed Project would not be built and existing visual characteristics along Market Street, Manchester Boulevard and Prairie Avenue would be maintained. As such, there would be no impact to the existing aesthetic character of the community because construction and operation of the Project would not occur. The Project would change the visual characteristics of the areas located along the proposed alignment but would not result in significant impacts. For this reason, neither this alternative or the Project would result in significant aesthetic impacts.

#### 2. Air Quality

Under the proposed project, mitigation measures would be required to reduce construction-related air quality impacts to less-than-significant levels. Under Alternative 1, no emissions related to construction activities and associated vehicular travel from construction activities or construction-related vehicle trips would occur. For this reason, even without mitigation, Alternative 1 would not conflict with implementation of the applicable air quality plan or exceed the thresholds established by the SCAQMD for criteria air pollutants.

Operation of the proposed Project would reduce vehicle miles traveled (VMTs) throughout the City which would result in the beneficial effect of reducing air quality emissions from vehicle trips. Under Alternative 1e, the proposed Project would not be built and VMTs throughout the City and region would not be reduced. As such, operational air quality emissions would be greater with the Alternative 1.

#### 3. Biological Resources

There are approximately 502 trees located along the proposed Project alignment. Removal and/or trimming of trees could result in significant impacts to protected migratory or nesting birds, or raptors. Measures are identified to mitigate these impacts to less than significant for the proposed Project. Alternative 1 would avoid these impacts. Thus, no impacts associated with biological resources would occur with Alternative 1, and impacts would be reduced in comparison to the proposed Project.

#### 4. Cultural Resources

The proposed Project would not result in significant impacts to historic resources on Market Street or the other segments. Alternative 1 would maintain the existing views and structures of the historic buildings and would result in no impacts to existing historical resources within the Project area since construction and operation of the proposed Project would not occur. Neither this alternative nor the Project would result in significant impacts to cultural resources.

#### 5. Energy Resources

Under Alternative 1, no energy resources such as electricity, natural gas, or petroleum would be consumed for construction. Operation of the proposed Project would consume a maximum net increase of 23,852,3876 kilowatt-hours (kWh) of electricity per year. As such, Alternative 1 would reduce operational electricity impacts. However, once operational, the proposed Project would result in a net decrease of 3,608,205 thousand British thermal units (kBTU) of natural gas per year.

The proposed Project would be consistent with the Inglewood Energy and Climate Action Plan (ECAP) and General Plan which sets goals to reduce emissions through increased energy efficiency, renewable energy generation, improved transit options, and reduced consumption and waste. The proposed Project would reduce VMTs which would reduce annual petroleum-based fuel consumption by 580,949 to 1,379,509 gallons per year. As such, Alternative 1 would increase impacts related to natural gas and petroleum-based fuel consumption Compared in comparison to the proposed Project.

#### 6. Geology and Soils

Alternative 1 would not involve the construction of any new transportation facilities. The Project is proposed in an area subject to groundshaking from earthquake events that may occur on faults in the region. Potentially active faults cross the proposed alignment for the Project. Measures are identified to mitigate potential impacts associated with these conditions to less than significant. Impacts related to construction of the Project, including the potential for construction activities to encounter and impact paleontological resources and an increase in the potential for erosion, would be avoided. Measures are identified to mitigate the potential impacts of the Project on paleontological resources to less than significant. Under Alternative 1, no new transportation infrastructure would be built within the project study area, aside from related transportation projects that are currently under construction or funded for construction and operation by 2027. This alternative would avoid these potential impacts.

#### 7. Greenhouse Gas Emissions

Alternative 1 would not involve any construction activity that would generate greenhouse gas (GHG) emissions. Operation of the proposed Project would reduce VMTs which would result in a beneficial effect

on GHG emissions. Under this alternative, the proposed Project would not be built and VMTs would not be reduced. As such, operational GHG emissions would be greater with the No Project Alternative. The proposed Project would be consistent with the CARB 2017 Scoping Plan Update, SCAG's 2020-2045 RTP/SCS, the ECAP, and General Plan which sets goals to reduce GHG emissions by increasing energy efficiency and improving transit infrastructure. While Alternative 1 would not be inconsistent with these plans, it would not achieve the goals of these plans as well as the proposed Project.

#### 8. Hazards and Hazardous Materials

With the No Project Alternative, no new construction would occur along the proposed Project alignment that could result in the potential for exposure to hazards or hazardous materials and all existing uses would continue to operate. Construction of the Project would include the demolition of existing buildings that may contain asbestos-containing materials (ACM) and lead based paint (LBP). Construction activities may also encounter underground storage tanks and soil that may be contaminated. The ITC CCP requires the preparation of plans defining protocols and actions to address this potential and avoid significant impacts. Alternative 1 would not involve the demolition of the existing buildings that would be removed to implement the Project, which may have the potential release hazardous materials, such as ACMs, LBP, and other potentially hazardous building materials. Additionally, Alternative 1 would not generate any construction emissions which may release Toxic Air Contaminants (TACs) at schools within one-quarter mile. Under this alternative, no construction activities would occur that would have the potential to conflict with emergency response plans or evacuation routes due to street and/or lane closures. As such, Alternative 1 would reduce the potential for impacts associated with hazards and hazardous materials in comparison to the proposed Project. The Project does, however, include project design features that would avoid impacts related to hazards and hazardous materials and, for this reason, this alternative would not lessen or avoid any significant impacts.

#### 9. Land Use and Planning

The No Project Alternative would not include the construction of the ATS and no changes to the land use pattern and character of the community would result from the construction or operation of additional transportation facilities. The proposed Project would remove traffic from existing roadways without diminishing the existing traffic capacity or the number of lanes that would exist with Alternative 1. Without the Project, congestion on roadways would increase more than with the Project, which would have an indirect effect on the character of the community.

Alternative 1 would be consistent with policies and goals in applicable plans as the existing character of the community would be maintained. The primary purpose of the Circulation Element of the City's General Plan is to ensure the provision of adequate street access and traffic capacity. The proposed Project would

further this goal by reducing congestion on the City's street network. As street congestion will increase without the proposed Project, the No Project Alternative would not achieve policies and goals related to reducing congestion.

#### 10. Noise and Vibration

No construction from the Project would occur along the proposed Project alignment with the No Project Alternative. No noise or groundborne vibration impacts from construction would occur and temporary noise and vibration impacts during construction impacts would be avoided. Therefore, Alternative 1 would avoid the noise and vibration impacts during Project construction. Operation of the proposed Project would reduce the amount of vehicle traffic on streets throughout the City, which would reduce roadway noise compared to this Alternative. Operation of the Project proposed trains would result in potential noise level increases from a low of 0.1 A-weighted decibel (dBA) to a high of 1.8 dBA, and operation of the proposed MSF would result in potential increases in noise levels around this facility ranging from no increase to a high of 3.9 dBA. Under Alternative 1, the Project would not be built or operate and these noise increases would not occur. As such, Alternative 1 would have a less than significant noise and vibration impact, and reduced construction and operational impacts in comparison to the proposed Project.

#### 11. Population, Employment, and Housing

The proposed Project would have no direct impact on housing as the proposed Project does not include the construction or demolition of any housing units. The proposed Project would impact existing employment opportunities in the City as commercial uses that would be displaced by the proposed Project are estimated to be approximately 464 jobs. However, the proposed Project would result in a net increase of for approximately 11,052<sup>5</sup> Full Time Equivalent (FTE) jobs through the Greenhouse Gas Reduction Funds, as estimated by the Job Co-Benefits calculation (see **Section 4.11 Population, Employment, and Housing**). The number of jobs that will be supported by the proposed Project in the region is within the projected regional trends in the SCAG 2020-2045 RTP/SCS data and the jobs that will benefit from the proposed Project will not directly translate into additional population growth in the region. As such the proposed Project would have a less than significant impact on employment and population growth.

No changes to existing population, employment, and housing trends within the City and the region would occur with the No Project Alternative. As such, Alternative 1 would not directly or indirectly substantially induce population or employment growth in the City or the region. While the No Project Alternative would avoid the direct loss of local employment opportunities that would result from the Project, the additional

<sup>5</sup> 11,516 minus 464 in numbers of jobs displaced.

jobs that would be supported by the construction and operation of the Project would not occur. Thus, more jobs would be created and supported under the proposed Project than under Alternative 1, and like Alternative 1, the proposed Project would not significantly impact population or housing.

#### 12. Transportation

Under Alternative 1, the proposed Project would not be built and none of the transit infrastructure and street improvements and activities would occur. Existing public transit operators and private transportation would continue to provide service in the City, and these services would likely expand operations in response to the expected growth in visitors and residents within the major activity centers in the City of Inglewood. The less than significant construction transportation effects or disturbances from the proposed Project would not occur with Alternative 1.

The City would implement its TMOP to provide future transit connectivity. The TMOP addresses traffic conditions and transportation needs before and after events at SoFi Stadium at Hollywood Park. While transit modes such as buses will be critical transportation options to access the City's event centers, these modes will still compete with existing roadway traffic and may not provide a convenient time-certain connectivity compared to an elevated rail connection such as the proposed Project. This alternative will not provide any operational benefits in comparison to those provided by the proposed Project. The congestion and delays on the roadway system areawide would remain under Alternative 1 compared to the improvement in congestion and roadway traffic flows anticipated as part of the proposed Project.

In addition, the substantial reductions in VMT and related reductions in GHG and air pollutant emissions that would be provided by the proposed Project would not be realized with the No Project Alternative. No operational benefits associated with reduction in VMT, reduced traffic flows or reduction in congestion would occur compared to the proposed Project, and a critical first/last mile gap between the City's housing, employment and activity centers and the regional Metro regional system would still exist

#### 13. Tribal Cultural Resources

The proposed Project would have a less than significant impact on Tribal Cultural Resources (TCRs). No TCRs were identified in the records around the Project site and no sensitive resources were identified. Nonetheless, the proposed Project would include construction which would have the potential to unearth subsurface resources not previously identified. Given the level of urban development in Inglewood, the likelihood of unearthing TCRs is low, but it is still a possibility. With the No Project Alternative, no construction would occur and this potential impact to TCRs would be avoided.

## 14. Utilities and Service Systems

With the No Project Alternative, no new construction would occur along the proposed Project alignment and all existing uses would continue to operate as they currently do. As such, no utility lines would need to be removed or relocated along Market Street, Manchester Boulevard, or Prairie Avenue. Alternative 1 would avoid construction impacts on utilities. Once operational, the proposed Project would not require further utility upgrades or relocation of utility infrastructure.

Operation of the proposed Project would consume a maximum net increase of 23.85 million kWh of electricity per year. Operation of the proposed Project would also result in a net decrease of 3.61 million kBtu of natural gas per year, and a net decrease of 71.86 acre-feet per year (afy) of water per year. With the No Project Alternative, this increase in electricity use would not occur, but the decrease in natural gas and water use that would result from the proposed Project would also not occur.

### Relationship to Project Objectives

The No Project Alternative would not meet any of the City's objectives for the proposed Project, except that it would maintain existing roadway capacity along Market Street.

## 5.5.2 Alternative 2: Bus Rapid Transit (BRT) System

### 1. Aesthetics

The proposed Project would not result in significant impacts to the aesthetic character of the community during construction or operation with implementation of the project design features in the ITCCCP and ITC Design Guidelines.

With Alternative 2, the proposed ATS guideway would not be built and existing visual characteristics along Market Street, Manchester Boulevard and Prairie Avenue would generally be maintained. As such, there would generally be little to no impact to the aesthetic character of the community because the BRT would be contained within the existing roadway system. For this reason, no potentially significant impact to the visual character of the area would occur with Alternative 2. The proposed Project would change the visual characteristics of the areas located along the proposed alignment but would not result in significant impacts. While Alternative 2 would result in fewer changes to the visual character of the area than the proposed Project, neither this alternative nor the proposed Project would result in significant aesthetic impacts.

### 2. Air Quality

The BRT System would require some modifications to existing streets in order to create dedicated transit lanes and stops but this construction would be less than the demolition and construction activities

associated with the proposed Project. This alternative would not conflict with implementation of the applicable air quality plans and unmitigated construction emissions would be substantially reduced compared to the proposed Project.

Though this Alternative would reduce VMTs, it would only be able to provide approximately 20 percent of the ridership capacity compared to the proposed Project. Moreover, Alternative 2 would reduce daily traffic volumes (ADTs) along key roadway corridors and VMTs on an average weekday basis to a lesser degree than the proposed Project. Specifically, typical weekday nonevent and daily VMT in the City would be reduced by an amount equivalent to 20 percent to 25 percent of those of the proposed Project. Moreover, under Alternative 2 the existing uses that would be removed by the proposed Project would remain operational and would not be replaced by the proposed Project components which generate less air pollutant emissions than the existing uses. As such, Alternative 2 would increase operational air quality impacts in comparison to the proposed Project.

### 3. Biological Resources

Approximately 502 trees are present along the proposed Project alignment which may require removal during construction of the proposed Project. The BRT System Alternative would only involve minor modifications to existing streets along the public right-of-way where BRT-only lanes along the route are implemented and BRT stops are constructed. Alternative 2 would not, therefore, require the same amount of potential tree removals as the proposed Project. Similar to the proposed Project, operation of Alternative 2 would not diminish the chances for long-term survival of bird species or their habitats and no additional tree and/or ornamental vegetation removals would occur. As such, Alternative 2 would result in similar operational impacts compared to the proposed Project.

### 4. Cultural Resources

The proposed Project would not result in significant impacts to historic resources on Market Street or the other segments. Alternative 2, which would involve minor modifications of existing streets, construction of bus stops, and the operation of a Bus Rapid Transit system, would also not result in significant impacts to cultural resources. For this reason, neither this alternative nor the Project would result in significant impacts to cultural resources.

### 5. Energy Resources

With Alternative 2, the proposed Project would not be built. No demolition or construction activities, which would consume energy resources would occur, except along the public right-of-way where BRT-only lanes and bus stops along the route would be located. As such, Alternative 2 would reduce construction impacts to energy resources. Operation of the proposed Project would consume a maximum

net increase of 23.85 million kWh of electricity per year. Alternative 2 would reduce operational electricity impacts. However, the proposed Project would result in a net decrease of 3.61 million kBtu of natural gas per year. Alternative 2 would not require demolition of existing land uses and would reduce traffic along key roadway corridors and VMT on an average weekday basis to a lesser degree than the proposed Project. For this reason, Alternative 2 would increase impacts related to natural gas and petroleum-based fuel consumption. The proposed Project would be consistent with the ECAP and General Plan which sets goals to reduce emissions through increased energy efficiency, renewable energy generation, improved transit options, and reduced consumption and waste. Alternative 2 would address the goals and policies within these plans by improving transit options but to a lesser degree than the proposed Project.

## 6. Geology and Soils

Under Alternative 2, impacts related to geology and soil conditions, including paleontological resources, would be less compared to the proposed Project. The Project is proposed in an area subject to groundshaking from earthquake events that may occur on faults in the region. Potentially active faults cross the proposed alignment for the Project. Measures are identified to mitigate potential impacts associated with these conditions to less than significant. Because Alternative 2 would occur in the location as the proposed Project, the geological and soils conditions that would be encountered in construction of Alternative 2 would be the similar as with the proposed Project, but because substantially less construction would be required, potential risks associated with ground-shaking would be reduced as compared to the proposed Project. During operations, potential risks from seismic events would be reduced with an at-grade system as no aerial structures would be built. Because there would be substantially less construction with an at-grade BRT system, the potential for accidental discovery of paleontological resources would decrease.

## 7. Greenhouse Gas Emissions

Under Alternative 2, the proposed Project would not be built. No demolition or construction activities which would produce GHG emissions would occur, except along the public right-of-way where BRT-only lanes and bus stops along the route would be located. As such, Alternative 2 would reduce construction GHG impacts compared to the proposed Project.

Though this alternative would reduce VMT, it would only be able to provide approximately 20 percent of the ridership capacity of the proposed Project. Alternative 2 would reduce traffic along key roadway corridors and VMT on an average weekday basis to a lesser degree than the proposed Project. Specifically, typical weekday nonevent and daily VMT in the City would be reduced by an amount equivalent to 20 percent to 25 percent of those of the proposed Project. Additionally, dedicated bus lanes would take away roadway carrying capacity for private vehicles and increase local traffic congestion. As such, Alternative 2

would not decrease operational GHG emissions to the same degree as the proposed Project.

Similar to the proposed Project, Alternative 2 would be consistent with the CARB 2017 Scoping Plan Update, SCAG 2020-2045 RTP/SCS, the ECAP, and General Plan which sets goals to reduce GHG emissions by improving transit infrastructure. However, Alternative 2 would improve transit infrastructure at a lesser degree compared to the proposed Project and would not result in more energy efficient uses being developed in place of the less energy efficient existing uses.

## 8. Hazards and Hazardous Materials

With the BRT Transit system alternative, the proposed Project would not be built. No construction of the guideway and stations in conjunction with the MSF and PDS substations would occur. Construction of the Project would include the demolition of existing buildings that may contain ACM and LBP. Construction activities may also encounter underground storage tanks and soil that may be contaminated. The ITC CCP requires the preparation of plans defining protocols and actions to address this potential and avoid significant impacts. Alternative 2 would not involve the demolition of existing buildings, which may have the potential release hazardous materials, such as ACMs, LBP, and other potentially hazardous building materials. Additionally, Alternative 2 would generate a lower amount of construction emissions which may release TACs at schools within one-quarter mile. Transportation of hazardous materials during construction of the proposed Project would also not likely occur with this alternative. The potential for accidental release of hazardous materials in the environment would be significantly lessened when compared to the proposed Project.

Operation of the proposed Project would include the use and storage hazardous materials during operation typical of those used in an industrial setting. Compliance with federal, State, and local laws and regulations relating to transport, storage, disposal, and handling of hazardous materials would minimize any potential for accidental release or upset of hazardous materials during station operation. Under Alternative 2, operation of a BRT system would include the use and storage of similar materials. As such, operational impacts under Alternative 2 would be similar to those of the proposed Project.

## 9. Land Use and Planning

Alternative 2 would not include the construction of the ATS system or any of the associated supporting facilities. The proposed Project would remove traffic from existing roadways without diminishing the existing traffic capacity or the number of lanes. With the BRT system alternative, an existing lane of travel would be dedicated for use by buses along the route, which would reduce the lane capacity for other vehicles and increase local traffic congestion for passenger vehicles in the community. This increase in

congestion on roadways under Alternative 2 would have an indirect effect on the character of the community.

Alternative 2 would be generally consistent with all existing goals, plans, and policies as it would maintain the majority of the infrastructure in the surrounding communities, allowing the goals and objectives of the existing plans to be carried out generally. Notwithstanding, in certain locations there could be conflicts with the design of existing roadways, roadway capacity, and the City's circulation element and amendments to City documents may be needed to avoid these conflicts. Land use impacts would be similar with this alternative and the proposed Project.

### 10. Noise and Vibration

Under Alternative 2 the proposed Project would not be built. No demolition or construction activities which would produce noise or groundborne vibration impacts would occur, except along the public right-of-way where BRT-only lanes and bus stops are located. As such, construction noise and vibration impacts would be reduced. Though this alternative would reduce VMT, it would only be able to provide approximately 20 percent of the ridership capacity compared to the proposed Project. Alternative 2 would reduce traffic volumes along key roadway corridors and VMT on an average weekday basis to a lesser degree than the proposed Project. Specifically, typical weekday nonevent and daily VMT in the City would be reduced by an amount equivalent to 20 percent to 25 percent of those of the proposed Project. With the proposed Project, operation of the ATS trains would result in noise levels increases from a low of 0.1 dBA to a high of 1.8 dBA, and operation of the proposed MSF would result in noise increases ranging from no increase to a high of 3.9 dBA. Under Alternative 2, the ATS would not be built or operate and these noise increases would not occur. However, increased bus traffic on these roadways would increase the local noise levels and, as such, noise and vibration impacts associated with operation of Alternative 2 would be similar to the proposed Project.

### 11. Population, Employment, and Housing

The proposed Project would have no direct impact on housing as the proposed Project does not include the construction or demolition of any housing units. The proposed Project would impact existing employment opportunities in the City as commercial uses that would be displaced by the proposed Project are estimated to be approximately 464 jobs. However, the proposed Project would result in a net increase of approximately 11,052<sup>6</sup> FTE jobs, as estimated by the Job Co-Benefits calculation (see **Section 4.11 Population, Employment, and Housing**). The number of jobs that will be supported by the proposed Project in the region is within the projected regional trends in by the SCAG 2020-2045 RTP/SCS data and

<sup>6</sup> 11,516 minus 464 in numbers of jobs displaced.

the jobs that will benefit from the proposed Project will not directly translate into additional population growth in the region. As such the proposed Project would have a less than significant impact on inducing employment and population growth.

Alternative 2 would maintain the existing population and housing trends within the City and the region while having a minor impact on employment by hiring personnel for the BRT System construction and operation. As such, Alternative 2 would not significantly impact population or employment growth in the City or the region. As such, Alternative 2 would have similar impacts on population and housing conditions, although the beneficial effects of this alternative would be substantially reduced as compared to the proposed Project.

### 12. Transportation

Under Alternative 2, the City would construct and operate a BRT system that would connect the LASED, including the Performance Arena, other mixed uses in the Hollywood Park Specific Plan area, SoFi Stadium, the Forum, and the IBEC to the K Line Downtown Inglewood station. Under this alternative, the proposed Project would not be built. No demolition or construction activities would occur, except along the public right-of-way where BRT-only lanes and bus stops along the route would be located. As such, Alternative 2 would reduce impacts associated with the construction of transportation facilities.

One to two roadway lanes would be lost to mixed traffic flow along the BRT alternative route depending upon location. With a maximum potential headway of approximately 3 minutes at peak times, Alternative 2 would only be able to provide approximately 20 percent of the capacity compared to the proposed Project. The proposed plan amendments included in the proposed Project would not occur. The area would continue to be used by the existing commercial, recreational, and other uses.

Alternative 2 would provide operational benefits by reducing traffic volumes along key roadway corridors and VMT on an average weekday basis to a lesser degree than the proposed Project. Specifically, typical weekday nonevent and daily VMT in the City would be reduced by an amount equivalent to 20 percent to 25 percent of those of the proposed Project. The estimated daily BRT ridership with Event Conditions would be approximately 20 percent of the projected proposed Project ridership. Sufficient transit connection capacity between the Metro's regional transit system and the City's new major activity centers and entertainment venues would not be provided by this alternative. Additionally, this alternative would reduce the roadway capacities along Florence Avenue, Prairie Avenue, Manchester Boulevard and Market Street, consequently, increasing traffic congestion areawide. In comparison, the proposed Project would not reduce roadway capacities compared to existing conditions and would improve congestion and traffic flows areawide. As such, Alternative 2 would obtain limited operational benefits while substantially

worsening traffic flows and congestion Transportation impacts of Alternative 2 would be increased as compared to the proposed Project.

### 13. Tribal Cultural Resources

The proposed Project would have a less than significant impact on Tribal Cultural Resources (TCRs), No TCRs were identified in the records around the Project site and no sensitive resources were identified. Nonetheless, the proposed Project would include construction which would have the potential to unearth subsurface resources not previously identified. Given the level of urban development in Inglewood, the likelihood of unearthing TCRs is low but it is still a possibility. Alternative 2 would eliminate the need to construct the ATS and this potential impact to TCRs would be avoided. TCR impacts for Alternative 2 would be reduced as compared to the proposed Project.

### 14. Utilities and Service Systems

Under Alternative 2 the proposed Project would not be built. No demolition or construction activities would occur, except along the public right-of-way where BRT-only lanes and bus stops along the route are located. As such, no utility lines would need to be removed or relocated along Market Street, Manchester Boulevard, or Prairie Avenue, which would reduce construction impacts.

Once operational, the proposed Project and Alternative 2 would not require further utility upgrades or relocation of utility infrastructure, except for potential electric charging infrastructure. However, as discussed previously, operation of the proposed Project would consume a maximum net increase of 23.85 million kWh of electricity per year. Alternative 2 would reduce operational electricity demands in comparison to the proposed Project. However, operation of the proposed Project would result in a net decrease of 3.61 million kBTU of natural gas per year, and a net decrease of 71.86 afy of water per year. Alternative 2 would not result in similar reductions in utility demands.

### ***Relationship to Project Objectives***

The BRT System Alternative would meet some, but not all of the City's objectives for the proposed Project. The objectives to provide a direct and convenient connection to the Metro regional transit system, encourage intermodal transportation systems by providing convenient, safe, and reliable transit and convenient access to businesses in the City would be met by this alternative. However, the objective related to providing sufficient transit connection capacity between Metro's regional transit system and the City new major activity centers would, although not be met by this alternative, would still result in limited increased transit mode split, limited reduction in vehicle trips, and consequently, limited reduction in per-capita vehicle miles traveled to the City's major activity centers. The BRT System Alternative would also partially meet the City's objectives to support the ongoing economic revitalization within the

Downtown TOD Plan area and encourage redevelopment and investment within the City in areas served by the proposed Project, but not to the same degree as the proposed Project.

This alternative would partially meet the City's objective to support regional efforts to become more efficient, economically strong, equitable, and sustainable. Though the BRT System Alternative would provide limited operational benefits by reducing traffic volumes along key roadway corridors, it would also reduce the roadway capacities along Florence Avenue, Prairie Avenue, Manchester Boulevard and Market Street, consequently increasing traffic congestion throughout the City. As such, this alternative would not meet the City's objectives to maintain existing roadway capacity or reduce the City's traffic congestion and alleviate growing demand on the existing roadway network on both major arterials and residential streets for both nonevent and event days.

### 5.5.3 Alternative 3: Market Street Pedestrian Promenade

#### 1. Aesthetics

With this alternative, the proposed Project and all of its components would be constructed and operate, but Market Street between Florence Avenue and Manchester Boulevard would be closed to vehicular traffic. Alternative 3 would require the placement of barricades to prevent vehicle access. These barricades would need to be designed in a manner which would not degrade the existing visual character of Downtown. As the ATS system as proposed would be constructed with this alternative, the aesthetic impacts of the proposed Project would be similar to the proposed Project.

#### 2. Air Quality

Construction under Alternative 3 would be similar to the proposed Project. During construction, the proposed Project would not exceed the significance threshold for any criteria pollutant after mitigation, and impacts would be less than significant. Therefore, similar to the proposed Project, Alternative 3 would not conflict with implementation of the applicable air quality plans and would not exceed thresholds established by the SCAQMD for criteria air pollutants.

Operational impacts associated with Alternative 3 would be similar to the proposed Project as the Pedestrian Promenade would not generate additional air quality emissions. Moreover, reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis with event would occur similar in magnitude to those associated with the proposed Project. As such, Alternative 3 would result in similar operational impacts compared to the proposed Project.

### 3. Biological Resources

Approximately 502 trees along the proposed Project alignment may require removal during construction of the proposed Project. The addition of a Pedestrian Promenade would not require tree removals and would likely include the planting of additional trees. As such, impacts to biological resources during construction would be reduced compared to the proposed Project. Alternative 3 would not diminish the chances for long-term survival of bird species or their habitats and no additional tree and/or ornamental vegetation removals would be required. As such, Alternative 3 would result in similar operational impacts compared to the proposed Project.

### 4. Cultural Resources

Closing a portion of Market Street in downtown Inglewood to vehicle use, which would occur with Alternative 3, would not result in any significant impacts to historic resources located on Market Street. Conversion of this portion of Market Street to a pedestrian mall would not result in any additional direct or indirect impacts to historic or other cultural resource impacts compared to the proposed Project, nor would it substantially reduce the cultural resources impacts of the proposed Project. Neither this alternative nor the Project would result in significant impacts to cultural resources.

### 5. Energy Resources

Energy demand from construction activities under Alternative 3 would be similar to the proposed Project as the ATS system would be built as proposed. The additional construction required to create the pedestrian mall would only increase these impacts incrementally. Reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis would occur similar in magnitude to those associated with the proposed Project. As such, Alternative 3 would result in similar operational impacts compared to the proposed Project.

### 6. Geology and Soils

Under Alternative 3, the proposed Project would be built but would include a pedestrian promenade on Market Street between Florence Avenue and Manchester Boulevard. Impacts related to geology and soils conditions, including paleontological resources, would be similar to those identified for the proposed Project. Geology and soils conditions that would be encountered in construction of Alternative 3 would be the same as with the proposed Project. The Potrero Fault lies approximately one-quarter mile to the east of the project study area; however, compliance with the California Building Code would avoid the creation of seismic hazards. Ground-disturbing activity and the potential for accidental discovery of paleontological resources would continue to be potentially significant with Alternative 3. Alternative 3

would implement similar measures as the proposed Project to mitigate the potential impacts on paleontological resources to less than significant.

### 7. Greenhouse Gas Emissions

Construction under Alternative 3 would be similar to the proposed Project and would result in a similar level of GHG emissions. Reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis would occur similar in magnitude to those associated with the proposed Project. Therefore, similar to the proposed Project, Alternative 3 would be consistent with the CARB 2017 Scoping Plan Update, SCAG's 2020-2045 RTP/SCS, the ECAP, and General Plan which sets goals to reduce GHG emissions by increasing energy efficiency and improving transit infrastructure. Operational GHG impacts would be similar to the proposed Project.

### 8. Hazards and Hazardous Materials

Under Alternative 3, the proposed Project would be built but would include the pedestrian promenade. Construction under Alternative 3 would be similar to the proposed Project. Construction of the guideway and stations in conjunction with the MSF and PDS substations would involve the demolition of existing buildings, which may have the potential release hazardous materials, such as ACMs, LBP, and other potentially hazardous building materials. The additional construction activities required to create the pedestrian promenade would be minor. Similar to the proposed Project, construction activities under Alternative 3 would likely cause the temporary closure of travel lanes, roadway segments, and sidewalks along the elevated guideway and stations within the street rights-of-way.

Under Alternative 3, operation of the ATS would include the use and storage of hazardous materials typical of those used in an industrial setting, similar to the proposed Project. Alternative 3 would not interfere or impair with the City's ability to increase public awareness or make any improvements to emergency services and warning systems during operation. Converting this portion of Market Street to a pedestrian promenade would not involve the use of handling of any hazardous materials. With adherence to the federal, State, and local safety requirements, Alternative 3 would not conflict with the requirements of an emergency response plan or emergency evacuation plan, similar to the proposed Project. As such, operational impacts under Alternative 3 would be similar to the proposed Project.

### 9. Land Use and Planning

Alternative 3 would modify existing traffic patterns and connections within the community. Vehicular connections would be reduced as Market Street between Florence Avenue and Manchester Boulevard would be closed. Vehicular traffic would need to be rerouted around the closed pedestrian promenade which may increase local traffic volume for adjacent streets. The connection between different parts of

the community would not be diminished in a substantial manner as the street segment that would be closed only includes three blocks. Alternative 3 would not, therefore, divide the community physically but may contribute to additional ground level traffic surrounding the closure.

Alternative 3 would be generally consistent with all existing goals, plans, and policies as it would maintain the majority of the infrastructure in the surrounding community, allowing the goals and objectives of the existing plans to be carried out generally. Additionally, closure of Market Street would enable the activation and programming of Market Street, which could include open air markets, creative retail and concession spaces, recreational and open space areas, and locations for public art and locations for public gathering. This Alternative could achieve City's objective for economic development of Market Street. Conflicts with the design of existing roadways, roadway capacity, and the City's circulation element may exist and appropriate design and amendments proposed for City documents would be needed to avoid conflicts with existing plans and policies. The land use impacts of this alternative and the proposed Project would be similar and less than significant.

#### 10. Noise and Vibration

Construction under Alternative 3 would be similar to the proposed Project. It is anticipated that the development of a Pedestrian Promenade along Market Street would not result in substantial noise or vibration impacts as it would eliminate vehicle travel along Market Street between Florence Avenue and Manchester Boulevard which would reduce roadway noise. Moreover, reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis with event would occur similar in magnitude to those associated with the proposed Project. The operational impacts of the Project would be less than significant. As such, operational noise and vibration impacts would be reduced in comparison to the proposed Project.

#### 11. Population, Employment, and Housing

The proposed Project would have no direct impact on housing as the proposed Project does not include the construction or demolition of housing units. The proposed Project would impact existing employment opportunities in the City as commercial uses that would be displaced by the proposed Project are estimated to be approximately 464 jobs. However, the proposed Project would result in a net increase of approximately 11,052<sup>7</sup> FTE jobs through the Greenhouse Gas Reduction Funds, as estimated by the Job Co-Benefits calculation (see **Section 4.11 Population, Employment, and Housing**). The number of jobs that will be supported by the proposed Project in the region is within the projected regional trends in the SCAG 2020-2045 RTP/SCS data and the jobs that will benefit from the proposed Project will not directly

<sup>7</sup> 11,516 minus 464 in numbers of jobs displaced.

translate into additional population growth in the region. As such the proposed Project would have a less than significant impact on inducing employment and population growth.

Converting a portion of Market Street to a pedestrian mall would not result in any additional direct or indirect impacts to population, employment, and housing. Alternative 3 would maintain the existing population, employment, and housing trends within the City and the region. As such, Alternative 3 would not directly or indirectly substantially induce population in the City or the region. Employment support and would be similar to the proposed Project under Alternative 3.

#### 12. Transportation

Construction under Alternative 3 would be similar to the proposed Project. The proposed Project and all of its components would be constructed and operational. Market Street between Florence Avenue and Manchester Boulevard would be reconfigured to eliminate vehicular traffic north and south on Market Street. Cross traffic would be allowed on Regent Street and Queen Street without any turns to/from Market Street. The closure of Market Street would divert traffic to the surrounding streets including La Brea Avenue and Locust Street. Since the current traffic along Market Street is very low, this diversion of Market Street traffic can be accommodated along adjacent parallel streets. The operation of the ATS would be the same as planned for the proposed Project.

Similar to the proposed Project, Alternative 3 would result in operational benefits. Reductions to daily traffic volumes along key roadway corridors and reductions to VMTs on an average weekday basis would occur similar in magnitude to those associated with the proposed Project. Additionally, this alternative is estimated to result in transit ridership similar to the proposed Project. Finally, Alternative 3 would provide similar operational benefits as those of the proposed Project relative to reduction in traffic congestion and improvement of traffic flows along key roadway facilities areawide.

#### 13. Tribal Cultural Resources

The proposed Project would have a less than significant impact on Tribal Cultural Resources (TCRs), No TCRs were identified in the records around the Project site and no sensitive resources were identified. Nonetheless, the Project as proposed would include construction which would have the potential to unearth subsurface resources not previously identified. Given the level of urban development in Inglewood, the likelihood of unearthing TCRs is low but it is still a possibility. Converting a portion of Market Street to a pedestrian promenade would not result in any additional impacts.

## 14. Utilities and Service Systems

Construction and operation under Alternative 3 would be similar to the proposed Project. Closing a portion of Market Street to vehicle traffic would only involve minor above ground street improvements. For this reason, impacts related to the construction or relocation of water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities would be similar compared to the proposed Project.

### ***Relationship to Project Objectives***

The Market Street Pedestrian Promenade Alternative would meet most of the City's objectives for the proposed Project since the proposed Project would still be built and reductions to daily traffic volumes along key roadway corridors and reductions to VMTs on an average weekday basis with event would occur similar in magnitude to those associated with the proposed Project. However, Alternative 3 would have not meet the City's objective to maintain existing roadway capacity along Market Street.

## 5.5.4 Alternative 4: 4<sup>th</sup> Station Alternative

### 1. Aesthetics

Under the 4<sup>th</sup> station alternative, impacts to visual character under aesthetics would be similar to the proposed Project. The proposed Project would not result in significant impacts to the aesthetic character of the community during construction or operation with implementation of the project design features in the CCP and Design Guidelines. The addition of a 4<sup>th</sup> station east of the intersection of Market Street and Manchester Boulevard would not result in any additional visual impacts as this station would be integrated into the design of the ATS consistent with the Design Guidelines.

### 2. Air Quality

Under Alternative 4, the proposed Project would be built but would include an additional station along Manchester Boulevard. During construction, the proposed Project would not exceed the significance threshold for any criteria pollutant after mitigation, and impacts would be less than significant. The construction of a 4<sup>th</sup> station would require additional construction activities including operation of off-road heavy-duty equipment and on-road trucks for hauling which would increase air quality emissions. Though Alternative 4 would implement similar mitigation measures as the proposed Project, it would increase construction impacts.

Operation of the ATS with a 4<sup>th</sup> station would not result in any additional operational air quality emissions. Operational air quality impacts would be similar with this alternative and the proposed Project.

## 3. Biological Resources

Approximately 502 trees are located along the proposed ATS alignment that may require removal during construction of the proposed Project. The 4<sup>th</sup> station would be located along the guideway within the public right-of-way along Manchester Boulevard. With Alternative 4, no additional properties would need to be acquired and no additional demolition of buildings or site improvements would be required. Alternative 4 would not require an increase in tree removals or disturbance of nesting raptors or migratory birds. For this reason, impacts to biological resources during construction would be similar compared to the proposed Project. Moreover, operation of Alternative 4 would not diminish the chances for long-term survival of bird species or their habitats and no additional tree and/or ornamental vegetation removals would be planned. As such, Alternative 4 would result in similar operational impacts compared to the proposed Project.

## 4. Cultural Resources

Alternative 4 would have impacts on cultural resources similar to the proposed Project. Alternative 4 would construct the ATS guideway on the same alignment with the same dimensions as the proposed Project. The additional station would not result in any additional impacts because the additional station and this segment of the guideway would be constructed above the nearby historic resource, the Bank of America building at 320 Manchester Boulevard. The Bank of America building would retain its ability to convey its historical significance without additional indirect impact to the view of its primary façade. As such impacts to cultural resources would be similar for Alternative 4 and the proposed Project.

## 5. Energy Resources

Under Alternative 4, the proposed Project would be built but would include an additional station along Manchester Boulevard. Construction of a 4<sup>th</sup> station would result in an incremental increase in energy resource consumption for electricity and petroleum-based fuels for construction of this station. However, this increase would be minimal and temporary, similar to the proposed Project. Nonetheless construction impacts to energy resources would increase incrementally compared to the proposed Project.

Operation of a 4<sup>th</sup> station would increase consumption of energy resources including electricity and natural gas. This alternative would result in reductions to daily traffic volumes along key roadway corridors and VMT on an average weekday basis would occur similar in magnitude to those estimated for the proposed Project, although the addition of a 4<sup>th</sup> station could incrementally increase ridership. As such, this alternative would result in a reduction of petroleum-based fuel consumption from vehicle travel similar or to a slightly greater degree than the proposed Project. The addition of one station would not increase energy resource consumption to a level of significance.

## 6. Geology and Soils

Under Alternative 4, the proposed Project would be built but would include an additional station along Manchester Boulevard. Impacts related to geology and soils conditions, including paleontological resources, and potential conflict with an emergency evacuation plan, would be similar to those described for the proposed Project. Geology and soils conditions that would be encountered in construction of Alternative 4 would be the same as with the proposed Project. The Potrero Fault lies approximately one-quarter mile to the east of the project study area; however, compliance with the California Building Code would avoid the creation of seismic hazards. Ground-disturbing activity and the potential for accidental discovery of paleontological resources would continue to be potentially significant under Alternative 4. Alternative 4 would implement similar measures as the proposed Project to mitigate the potential impacts on paleontological resources to less than significant.

## 7. Greenhouse Gas Emissions

Under Alternative 4, the proposed Project would be built but would include an additional station along Manchester Boulevard. Construction of a 4th station would require additional construction activities including operation of off-road heavy-duty equipment and on-road trucks for hauling which would increase GHG emissions. However, similar to the proposed Project, these emissions would be temporary in nature and cease once the Project is complete. Nonetheless, construction related GHG emissions would increase under Alternative 4.

Operation of a 4th station would incrementally increase operational GHG emissions. However, this alternative would result in reductions to daily traffic volumes along key roadway corridors and VMT on an average weekday basis would occur similar in magnitude to those estimated for the proposed Project. As such, this alternative would result in a net negative GHG emissions associated with vehicle travel. The addition of one station would not increase operational GHG emissions to a level of significance. Moreover, similar to the proposed Project, Alternative 4 would be consistent with the CARB 2017 Scoping Plan Update, SCAG 2020-2045 RTP/SCS, the ECAP, and General Plan which sets goals to reduce GHG emissions by increasing energy efficiency and improving transit infrastructure. Nonetheless, operational GHG emissions would increase incrementally with Alternative 4.

## 8. Hazards and Hazardous Materials

Under Alternative 4, the proposed Project would be built but would include an additional station along Manchester Boulevard. Although construction of an additional station would increase construction activities compared to the proposed Project, construction impacts under Alternative 4 would be similar to those of proposed Project. Construction of the guideway and four stations in conjunction with the MSF and PDS substations would still involve the demolition of existing buildings, which may have the potential

release hazardous materials, such as ACMs, LBP, and other potentially hazardous building materials. Furthermore, excavations of potentially contaminated soils may occur during construction of Alternative 4 as a result of prior uses on some of the sites, similar to the proposed Project.

Under Alternative 4, operation would include the use and storage of hazardous materials typical of those used in an industrial setting, similar to the proposed Project. Alternative 4 would not interfere with or impair the City's ability to increase public awareness or make any improvements to emergency services and warning systems during operation. With adherence to the federal, State, and local safety requirements, Alternative 4 would not conflict with the requirements of an emergency response plan or emergency evacuation plan, similar to the proposed Project. As such, operational impacts under Alternative 4 would be similar when compared to the proposed Project.

## 9. Land Use and Planning

Alternative 4 would build an ATS similar to the proposed Project with a 4<sup>th</sup> station located on Manchester Boulevard. The proposed Project would not physically divide the community with its elevated guideways and maintenance of existing roadway capacity and roadway connections. Alternative 4 would have an alignment and elevated guideways similar to the proposed Project. As such, Alternative 4 would also maintain the existing roadway capacity and roadway connections. Alternative 4 could activate foot traffic and interest on Market Street and help reinvigorate the Downtown business area. Alternative 4 will have a similar impact on physically dividing the community as the proposed Project.

Alternative 4 would be generally consistent with the existing plans, policies and guidelines in the City and the greater region. Alternative 4 would require the same amendments to the Land Use Element, Circulation Element, Safety Element, Environmental Justice Element, and the Inglewood Municipal Code as the proposed Project to incorporate the ATS into the language of the existing plans, policies, and guidelines within the City. As such, land use impacts of Alternative 4 would be similar to the proposed Project with neither this alternative nor the proposed Project resulting in significant land use impacts.

## 10. Noise and Vibration

Under Alternative 4, the proposed Project would be built but would include an additional station along Manchester Boulevard. Construction of a 4th station would require additional construction activities including operation of off-road heavy-duty equipment and on-road trucks for hauling which could increase construction noise and vibration levels. Though Alternative 4 would implement similar mitigation measures as the proposed Project, it would increase construction noise and vibration impacts.

Alternative 4 would result in reductions to daily traffic volumes along key roadway corridors and VMT on an average weekday basis would occur similar or slightly increased in magnitude to those estimated for

the proposed Project. As such, this alternative would result in similar or slightly increased roadway noise levels as the proposed Project. The addition of one station would not increase operational noise or vibration levels to a level of significance.

### 11. Population, Employment, and Housing

The proposed Project would have no direct impact on housing as the proposed Project does not include the construction or demolition of any housing units. The proposed Project would impact existing employment opportunities in the City as commercial uses that would be displaced by the proposed Project are estimated to be approximately 464 jobs. However, the proposed Project would result in a net increase of for approximately 11,052<sup>8</sup>FTE jobs as estimated by the Job Co-Benefits calculation (see **Section 4.11 Population, Employment, and Housing**). The number of jobs that will be supported by the proposed Project in the region is within the projected regional trends in the SCAG 2020-2045 RTP/SCS data and the jobs that will benefit from the proposed Project will not directly translate into additional population growth in the region. As such the proposed Project would have a less than significant impact on inducing employment and population growth.

Alternative 4 would have a similar effect on the population and employment trend as the ATS would be constructed and the same displacement of jobs and hiring of ATS personnel would occur. As such, Alternative 4 would have similar population, employment, and housing impacts as the proposed Project.

### 12. Transportation

Under Alternative 4, the proposed Project would be built but would include an additional station along Manchester Boulevard. Construction of a 4th station would require additional construction activities including operation of off-road heavy-duty equipment and on-road trucks for hauling which could increase transportation effects and disruptions.

The weekday daily VMT would be reduced in the Future Opening Year (2027) with Event conditions similar to the VMT reductions estimated for the proposed Project. The estimated daily ITC ridership during Future Opening Year (2027) with NFL Event conditions are estimated to be approximately 29,300 passengers similar to the proposed Project. The weekday daily VMT would be reduced in the Future Horizon Year (2045) with Event conditions similar to the VMT reductions estimated for the proposed Project. The estimated daily ITC ridership during Future Horizon Year (2045) with an NFL Event conditions are estimated to be approximately 34,650 passengers, similar to the proposed Project. Additionally, daily traffic volumes would decrease along key travel corridors such as Prairie Avenue, Manchester Boulevard

<sup>8</sup> 11,516 minus 464 in numbers of jobs displaced.

and Century Boulevard, thereby reducing congestion and improving travel conditions on a system-wide basis.

Similar to the proposed Project, Alternative 4 would result in operational benefits. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur similar in magnitude to those estimated for the proposed Project. This alternative is estimated to result in ITC ridership similar to the proposed Project. Improved traffic flows and reduction in congestion along key travel corridors, similar to those associated with the proposed Project would occur with Alternative 4.

### 13. Tribal Cultural Resources

The proposed Project would have a less than significant impact on Tribal Cultural Resources (TCRs). No TCRs were identified in the records around the Project site and no sensitive resources were identified. Nonetheless, the Project as proposed would include construction which would have the potential to unearth subsurface resources not previously identified. Given the level of urban development in Inglewood, the likelihood of unearthing TCRs is low but it is still a possibility. The 4<sup>th</sup> station alternative would have a similar impact to TCRs as the proposed Project since extensive construction and excavation of soil would be required to construct the ATS structure and the 4<sup>th</sup> station. Similar impacts to the TCRs would result from the proposed Project and Alternative 4.

### 14. Utilities and Service Systems

The 4<sup>th</sup> station would be located along the guideway within the public right-of-way along Manchester Boulevard. Under Alternative 4, no additional properties would need to be acquired and no additional demolition of buildings and site improvements would be required. As such impacts related to the construction or relocation of water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities would be similar to the proposed Project.

### *Relationship to Project Objectives*

The 4<sup>th</sup> Station Alternative would meet all of the City's objectives for the proposed Project since the proposed Project would still be built and reductions to daily traffic volumes along key roadway corridors and reductions to VMTs on an average weekday basis with event would occur similar in magnitude to those associated with the proposed Project.

## 5.5.5 Alternative 5: Prairie Avenue Single Station Alternative

### 1. Aesthetics

Under Alternative 5, the proposed Project would not result in significant impacts to the aesthetic character of the community during construction or operation with implementation of the project design

features in the ITCCCP and Design Guidelines. Similarly, Alternative 5 would travel down the same alignment with the same proposed and elevated guideway across the frontage of the buildings on Market Street. No additional impacts on the visual character of downtown would result from the consolidation and relocation of the single station along Prairie Avenue.

## 2. Air Quality

Under Alternative 5, the proposed Project would be built but the two proposed stations along Prairie Avenue would be consolidated into a single station that would be located adjacent to the City's Civic Center site. The construction of a single station along Prairie Avenue instead of two stations would result in less construction activities compared to the proposed Project. Similar to the proposed Project, Alternative 5 would not conflict with implementation of the applicable air quality plans or exceed thresholds established by the SCAQMD for criteria air pollutants. Moreover, Alternative 5 would implement similar mitigation measures as the proposed Project and would reduce construction air quality emissions.

Operation of a single station along Prairie Avenue instead of two stations would slightly decrease operational air quality emissions. However, under Alternative 5, mobile operational benefits would be less than those associated with the proposed Project. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur, but approximately 15 percent less in magnitude than those associated with the proposed Project. As such, operational air quality emissions associated mobile sources would increase compared to the proposed Project.

## 3. Biological Resources

Approximately 502 trees which may require removal during construction of the proposed Project exist along the proposed Project alignment. With Alternative 5, no additional properties would need to be acquired and no additional demolition of buildings or site improvements would be required. The guideway would still be constructed along the same segment of Prairie Avenue compared to the proposed Project. As such, Alternative 5 would not require an increase or decrease in tree removals or disturbance of nesting raptors or migratory birds. As such, impacts to biological resources during construction would be similar compared to the proposed Project. Similar to the proposed Project, operation of Alternative 5 would not diminish the chances for long-term survival of bird species or their habitats and no additional tree and/or ornamental vegetation removals would be planned. As such, Alternative 5 would result in similar operational impacts compared to the proposed Project.

## 4. Cultural Resources

Alternative 5 would have a less than significant impact on cultural resources, similar to the proposed Project. The consolidated and relocated station on Prairie Avenue would have no impact and would not be located near any identified historical resources. As such, impacts to cultural resources would be similar for Alternative 5 and the proposed Project.

## 5. Energy Resources

Under Alternative 5, the proposed Project would be built but the two proposed stations along Prairie Avenue would be consolidated into a single station that would be located adjacent to the City's Civic Center site. Construction of a single station in place of two stations would result in an incremental decrease of energy resource consumption for electricity and petroleum-based fuels associated with operation of the station.

Operation of a single station along Prairie Avenue instead of two stations would also slightly decrease operational energy resource consumption. However, under Alternative 5, mobile operational benefits would be less than those associated with the proposed Project. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur, but approximately 15 percent less in magnitude than those associated with the proposed Project. As such, Alternative 5 would result in an increase in petroleum-based fuel consumption compared to the proposed Project.

## 6. Geology and Soils

Under Alternative 5, the proposed Project would be built but the two proposed stations along Prairie Avenue would be consolidated into a single station that would be located adjacent to the City's Civic Center site. Impacts related to geology and soils conditions, including paleontological resources, and potential to conflict with an emergency evacuation plan, would be similar to those described for the proposed Project. Geology and soils conditions that would be encountered in construction of Alternative 5 would be the same as with the proposed Project. The Potrero Fault lies approximately one-quarter mile to the east of the project study area; however, compliance with the California Building Code would avoid the creation of seismic hazards. Ground-disturbing activity and the potential for accidental discovery of paleontological resources would continue to be potentially significant under Alternative 5 and would require the same mitigation measures as identified for the proposed Project in order to reduce the impact to less than significant.

## 7. Greenhouse Gas Emissions

The construction of a single station along Prairie Avenue instead of two stations would result in a reduction in the level of construction activities compared to the proposed Project. As such Alternative 5 would reduce construction related GHG emissions.

Operation of a single station along Prairie Avenue instead of two stations would also slightly decrease GHG emissions resulting from operation of the stations. However, under Alternative 5, mobile operational benefits would be less than those associated with the proposed Project. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur, but approximately 15 percent less in magnitude than those associated with the proposed Project. However, similar to the proposed Project, Alternative 5 would be consistent with the CARB 2017 Scoping Plan Update, SCAG 2020-2045 RTP/SCS, the ECAP, and General Plan which sets goals to reduce GHG emissions by increasing energy efficiency and improving transit infrastructure. Nonetheless, operational GHG emissions associated mobile sources would increase compared to the proposed Project.

## 8. Hazards and Hazardous Materials

While construction of a single station along Prairie Avenue instead of two stations would result in a reduction in the level of construction activities compared to the proposed Project, construction impacts under Alternative 5 would be similar to those of the proposed Project. Construction of the guideway and stations in conjunction with the MSF and PDS substations would still involve the demolition of existing buildings, which may have the potential release hazardous materials, such as ACMs, LBP, and other potentially hazardous building materials. Furthermore, excavations of potentially contaminated soils may occur during construction of Alternative 5 as a result of prior uses on some of the sites, similar to the proposed Project. Similar to the proposed Project, construction activities under Alternative 5 would likely cause the temporary closure of travel lanes, roadway segments, and sidewalks along the elevated guideway and stations within the street rights-of-way.

Under Alternative 5, operation would include the use and storage of hazardous materials typical of those used in an industrial setting, similar to the proposed Project. Alternative 5 would not interfere or impair with the City's ability to increase public awareness or make any improvements to emergency services and warning systems during operation. With adherence to the federal, State, and local safety requirements, Alternative 5 would not conflict with the requirements of an emergency response plan or emergency evacuation plan, similar to the proposed Project. As such, operational impacts under Alternative 4 would be similar when compared to the proposed Project.

## 9. Land Use and Planning

Alternative 5 would involve building and operating an ATS system similar to the proposed Project while consolidating the two proposed stations on Prairie Avenue to one single station adjacent to the Civic Center Site on Prairie Avenue. The proposed Project would not physically divide the community with its elevated guideways and maintenance of existing roadway capacity and roadway connections. Alternative 5 would have a similar alignment and elevated guideways similar to the proposed Project. As such, Alternative 5 would also maintain the existing roadway capacity and roadway connections. Alternative 5 would have a similar impact on physically dividing the community as the proposed Project.

Alternative 5 would be generally consistent with the existing plans, policies and guidelines in the City and the greater region. Alternative 5 would include the same amendments to the Land Use Element, Circulation Element, Safety Element, Environmental Justice Element, and the Inglewood Municipal Code as the proposed Project to incorporate the ATS into the language of the existing plans, policies, and guidelines within the City. As such, the policy consistency impacts of Alternative 5 would be similar to the proposed Project.

## 10. Noise and Vibration

The construction of a single station along Prairie Avenue instead of two stations would result in a reduction in the level of construction activities compared to the proposed Project. For this reason, Alternative 5 would reduce construction related noise and vibration levels.

Operation of a single station along Prairie Avenue instead of two stations would also slightly decrease operational noise and vibration levels. However, under Alternative 5, mobile operational benefits would be less than those associated with the proposed Project. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur, but approximately 15 percent less in magnitude than those associated with the proposed Project. As such, operational noise and vibration impacts associated mobile sources would increase compared to the proposed Project.

## 11. Population, Employment, and Housing

The proposed Project would have no direct impact on housing as the proposed Project does not include the construction or demolition of any housing units. The proposed Project would impact existing employment opportunities in the City as commercial uses that would be displaced by the proposed Project are estimated to be approximately 464 jobs. However, the proposed Project would result in a net increase of for approximately 11,052<sup>9</sup>FTE jobs through the Greenhouse Gas Reduction Funds, as estimated by the

<sup>9</sup> 11,516 minus 464 in numbers of jobs displaced.

Job Co-Benefits calculation (see **Section 4.11 Population, Employment, and Housing**). The number of jobs that will be supported by the proposed Project in the region is within the projected regional trends in the SCAG 2020-2045 RTP/SCS data and the jobs that will benefit from the proposed Project will not directly translate into additional population growth in the region. As such the proposed Project would have a less than significant impact on inducing employment and population growth.

Alternative 5 would have a similar effect on the population and employment trend as the ATS would be constructed as planned. Alternative 5 would have a similar impact to the population, employment, and housing resource as compared to the proposed Project.

## 12. Transportation

Under Alternative 5, the proposed Project would be built but the two proposed stations along Prairie Avenue would be consolidated into a single station that would be located adjacent to the City's Civic Center site. The proposed Project modifies and relocates Prairie Avenue to the east to maintain the current roadway capacity. This relocation in conjunction with the need for a passenger station connection to the sidewalk/ground level affects properties located east of Prairie Avenue. Alternative 5 avoids affecting these properties by consolidating the two proposed stations along Prairie Avenue into a single station that would be located adjacent to the Intermodal Transit Facility at the City's Civic Center site. This alternative maintains Prairie Avenue within its existing right-of-way; however, one to two lanes would be lost reducing the capacity of the roadway. Specifically, one travel lane in each direction along the Prairie Avenue roadway between Arbor Vitae and La Palma, one lane in the southbound direction between La Palma and Pincay Drive, and one lane in each direction between Pincay Drive and Manchester Boulevard would be lost under Alternative 5.

Under Alternative 5, operational benefits would be less than those associated with the proposed Project. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur, but approximately 15 percent less in magnitude than those associated with the proposed Project. Alternative 5 is estimated to result in transit ridership equivalent to approximately 75 percent of the transit ridership associated with the proposed Project. However, due to a reduction in capacities along Prairie Avenue, traffic flow and congestion in the surrounding area would be worse under Alternative 5 compared to the proposed Project.

## 13. Tribal Cultural Resources

The proposed Project would have a less than significant impact on Tribal Cultural Resources (TCRs), No TCRs were identified in the records around the Project site and no sensitive resources were identified. Nonetheless, the Project as proposed would include construction which would have the potential to

unearth subsurface resources not previously identified. Given the level of urban development in Inglewood, the likelihood of unearthing TCRs is low but it is still a possibility. Alternative 5 would result in similar potential impacts to TCRs as the proposed Project since excavation of soil would be required to construct the ATS system along the proposed alignment, including a single station on Prairie Avenue. Similar impacts to the TCRs are anticipated for the proposed Project and Alternative 5.

## 14. Utilities and Service Systems

The proposed Prairie station under Alternative 5 would be located within the City's Civic Center site. The guideway would still be constructed along the same segment of Prairie Avenue compared to the proposed Project. As such, impacts related to the construction or relocation of water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities would be similar compared to the proposed Project.

### Relationship to Project Objectives

Alternative 5 would meet, or partially meet, most of the City's objectives for the proposed Project. Alternative 5 would reduce the City's traffic congestion and alleviate growing demand on the existing roadway network, although to a slightly lesser degree than the proposed Project. Specifically, the Prairie Avenue Single Station Alternative would result in a reduction in capacities along Prairie Avenue, and traffic flow and congestion on a system-wide basis would be increased compared to those estimated for the proposed Project. However, several of the City's objectives would be met to the same extent as under the proposed Project. For example, by eliminating one of the stations, Alternative 5 would not meet the objective of encouraging intermodal transportation systems by providing convenient, reliable time-certain transit to the same degree as would the proposed Project. Eliminating a station would also not meet the objective of providing convenient access to businesses, and to connect the City by providing transit within safe and accessible walking distances to the same degree as would the proposed Project.

## 5.5.6 Alternative 6: Maintenance and Storage Facility Relocation Alternative

### 1. Aesthetics

The proposed Project would not result in significant impacts to the aesthetic character of the community during construction or operation with implementation of the project design features in the ITC CCP and Design Guidelines. Similarly, Alternative 6 would travel down the same alignment with the same proposed and elevated guideway across the frontage of the buildings on Market Street. No additional impacts on the visual character of downtown would result from moving the MSF to the northwestern portion of the Vons site closest to the south corner of Hillcrest Boulevard and Manchester Boulevard.

## 2. Air Quality

Construction under Alternative 6 would be similar to the proposed Project. During construction, the proposed Project would not exceed the significance threshold for any criteria pollutant after mitigation, and impacts would be less than significant. Similar to the proposed Project, Alternative 6 would not conflict with implementation of the applicable air quality plans and would not exceed thresholds established by the SCAQMD for criteria air pollutants.

Operational impacts associated with Alternative 6 would be similar to the proposed Project as the ATS would be built as proposed. Moreover, reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis with event would occur similar in magnitude to those associated with the proposed Project. As such, Alternative 6 would result in similar operational impacts compared to the proposed Project.

## 3. Biological Resources

Approximately 502 trees which may require removal during construction of the proposed Project exist along the proposed Project alignment. With Alternative 6, no additional properties would need to be acquired and no additional demolition of buildings or site improvements would be required. As such, impacts to biological resources during construction would be similar compared to the proposed Project. Similar to the proposed Project, operation of Alternative 6 would not diminish the chances for long-term survival of bird species or their habitats and no additional tree and/or ornamental vegetation removals would be planned. As such, Alternative 6 would result in similar operational impacts compared to the proposed Project.

## 4. Cultural Resources

Alternative 6 would have a less than significant impact on cultural resources, similar to the proposed Project. The relocated MSF on the northwest portion of its site would have no impact on cultural resources and would not be located near any identified historical resources. For this reason, impacts to cultural resources would be similar for Alternative 6 and the proposed Project.

## 5. Energy Resources

Energy demand from construction activities under Alternative 6 would be similar to the proposed Project as the ATS would be built as proposed. Reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis would occur similar in magnitude to those associated with the proposed Project. As such, Alternative 6 would result in similar operational impacts compared to the proposed Project.

## 6. Geology and Soils

Impacts related to geology and soils conditions, including paleontological resources, would be similar to those identified for the proposed Project. Geology and soils conditions that would be encountered in construction of Alternative 6 would be the same as with the proposed Project. The Potrero Fault lies approximately one-quarter mile to the east of the project study area; however, compliance with the California Building Code would avoid the creation of seismic hazards. Ground-disturbing activity and the potential for accidental discovery of paleontological resources would continue to be potentially significant with Alternative 6. Alternative 6 would implement similar measures as the proposed Project to mitigate the potential impacts on paleontological resources to less than significant.

## 7. Greenhouse Gas Emissions

Construction under Alternative 6 would be similar to the proposed Project and would result in a similar level of GHG emissions. Reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis would occur similar in magnitude to those associated with the proposed Project. Therefore, similar to the proposed Project, Alternative 6 would be consistent with the CARB 2017 Scoping Plan Update, the SCAG 2020-2045 RTP/SCS, the ECAP, and General Plan which sets goals to reduce GHG emissions by increasing energy efficiency and improving transit infrastructure. Operational GHG impacts would be similar to the proposed Project.

## 8. Hazards and Hazardous Materials

Under Alternative 6, the MSF would be relocated to the northwestern portion of the Vons site. Construction under Alternative 6 would be similar to the proposed Project. Construction of the guideway and stations in conjunction with the MSF and PDS substations would involve the demolition of the existing building, which may have the potential release hazardous materials, such as ACMs, LBP, and other potentially hazardous building materials. Similar to the proposed Project, construction activities under Alternative 6 would likely cause the temporary closure of travel lanes, roadway segments, and sidewalks along the elevated guideway and stations within the street rights-of-way. Construction of Alternative 6, however, would not involve demolition of the existing gas station at the MSF site, thereby resulting in a slightly reduced potential for the potential release of hazardous materials.

Under Alternative 6, operation of the ATS would include the use and storage of hazardous materials typical of those used in an industrial setting, similar to the proposed Project. Alternative 6 would not interfere or impair with the City's ability to increase public awareness or make any improvements to emergency services and warning systems during operation. With adherence to the federal, State, and local safety requirements, Alternative 6 would not conflict with the requirements of an emergency response

plan or emergency evacuation plan, similar to the proposed Project. As such, operational impacts under Alternative 3 would be similar to the proposed Project.

### 9. Land Use and Planning

Alternative 6 would include the construction and operation of an ATS system similar to the proposed Project while moving the MSF along Hillcrest Boulevard between Manchester Boulevard and Nutwood Street. With this alternative the existing gas station on this property would be retained, but the existing commercial building containing the grocery store and other businesses would be demolished. Under the proposed Project a replacement Vons store would be constructed on the corner of Manchester Boulevard and Hillcrest Boulevard. Under Alternative 6, however, a replacement grocery store would not be provided on this site. Nevertheless, the community is served by other grocery stores and the loss of this store is not considered a significant land use impact for this reason.

The proposed Project would not create a physical division of the existing community as the ATS guideway and stations would be elevated and the existing configuration of travel lanes on Market Street, Manchester Boulevard and Prairie Avenue would be maintained.

Alternative 6 would be generally consistent with the existing regional and local land use plans and policies. Alternative 6 would require the same amendments to the Land Use Element, Circulation Element, Safety Element, Environmental Justice Element, and the Inglewood Municipal Code as the proposed Project to incorporate the ATS system into these plans and regulations.

### 10. Noise and Vibration

Construction under Alternative 6 would be similar to the proposed Project and would result in similar noise levels. Moreover, Alternative 6 would implement similar mitigation measures as the proposed Project to reduce construction noise and vibration impacts to less than significant. Alternative 6 would result in reductions to daily traffic volumes along key roadway corridors and VMT on an average weekday basis would occur similar in magnitude to those estimated for the proposed Project. As such, this alternative would result in similar roadway noise levels as the proposed Project. Neither this alternative or the proposed Project would result in significant noise and vibration impacts.

### 11. Population, Employment, and Housing

The proposed Project would have no direct impact on housing as the proposed Project does not include the construction or demolition of housing units. The proposed Project would impact existing employment opportunities in the City as commercial uses that would be displaced by the proposed Project are estimated to be approximately 464 jobs. However, the proposed Project would result in a net increase of

approximately 11,052<sup>10</sup> FTE jobs through the Greenhouse Gas Reduction Funds, as estimated by the Job Co-Benefits calculation (see **Section 4.11 Population, Employment, and Housing**). The number of jobs that will be supported by the proposed Project in the region is within the projected regional trends in the SCAG 2020-2045 RTP/SCS data and the jobs that will benefit from the proposed Project will not directly translate into additional population growth in the region. As such the proposed Project would have a less than significant impact on inducing employment and population growth.

Alternative 6 would result in the demolition of the existing Vons grocery store and other businesses on site (with the exception of the existing gas station). It is possible that these businesses might choose not to relocate, which would result in corresponding job losses. Overall, alternative 6 would maintain the existing population, employment, and housing trends within the City and the region. As such, Alternative 6 would not directly or indirectly substantially induce population in the City or the region. Employment support and would be similar to the proposed Project under Alternative 6.

### 12. Transportation

Construction under Alternative 6 would be similar to the proposed Project. The proposed Project and all of its components would be constructed and operate. The operation of the ATS would be the same as planned for the proposed Project.

Similar to the proposed Project, Alternative 6 would result in operational benefits. Reductions to daily traffic volumes along key roadway corridors and reductions to VMTs on an average weekday basis would occur similar in magnitude to those associated with the proposed Project. Additionally, this alternative is estimated to result in transit ridership similar to the proposed Project. Finally, Alternative 6 would provide similar operational benefits as those of the proposed Project relative to reduction in traffic congestion and improvement of traffic flows along key roadway facilities areawide.

### 13. Tribal Cultural Resources

The proposed Project would have a less than significant impact on Tribal Cultural Resources (TCRs), No TCRs were identified in the records around the Project site and no sensitive resources were identified. Nonetheless, the Project as proposed would include construction which would have the potential to unearth subsurface resources not previously identified. Given the level of urban development in Inglewood, the likelihood of unearthing TCRs is low but it is still a possibility. Relocating the MSF to the northwestern portion of the Vons site would not result in any additional impacts.

---

<sup>10</sup> 11,516 minus 464 in numbers of jobs displaced.

**14. Utilities and Service Systems**

Construction and operation under Alternative 6 would be similar to the proposed Project. For this reason, impacts related to the construction or relocation of water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities would be similar compared to the proposed Project.

**Relationship to Project Objectives**

Alternative 6 would meet most of the City’s objectives since the proposed Project would still be built and reductions to daily traffic volumes along key roadway corridors and reductions to VMTs on an average weekday basis with event would occur similar in magnitude to those associated with the proposed Project. Alternative 6, however, would not meet the objective to encourage redevelopment and investment within the City in areas served by the Project to the same degree as would the proposed Project because Alternative 6 would not include replacement of the existing Vons grocery store on the MSF site.

**5.6 ENVIRONMENTALLY SUPERIOR ALTERNATIVE**

An EIR is required to identify the Environmentally Superior Alternative from among the range of reasonable alternatives that are evaluated. CEQA Guidelines section 15126.6(e)(2) requires that an environmentally superior alternative be designated and states that if the Environmentally Superior Alternative is the No Project alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.

**Table 5.0-2: Alternatives Summary**, identifies the ability of the Alternatives to meet the Project Objectives.

**Table 5.0-2  
Alternatives Summary**

Project Objectives	Does the Alternative meet the Project Objectives?					
	Alternative 1 No Project	Alternative 2 Bus Rapid Transit System	Alternative 3 Market Street Promenade	Alternative 4 4th Station Alternative	Alternative 5 Prairie Single Alternative	Alternative 6 Maintenance and Storage Facility Alternative
1 Provide direct and convenient connection to the Metro regional transit system for local residents and the region to access the city’s new major employment, commercial, and activity centers;	No	Yes	Yes	Yes	Yes	Yes
2 Close the “last mile gap” to the regional transit system by providing Metro Line;	No	Yes	Yes	Yes	Yes	Yes
3 Provide sufficient transit connection capacity between the Metro regional transit system and the major activity centers to meet peak ridership demands to encourage transit as a travel mode choice;	No	Partial	Yes	Yes	Yes	Yes
4 Maintain existing roadway capacity;	Yes	Partial	Yes, except on Market Street	Yes	Yes, except on Prairie Ave	Yes
5 Reduce the City’s traffic congestion and alleviate growing demand on the existing roadway network on both major arterials and residential streets for both nonevent and event days	No	Partial	Yes	Yes	Partial	Yes
6 Encourage intermodal transportation systems by providing convenient, reliable certain transit	No	Yes	Yes	Yes	Yes	Yes
7 Increase transit mode split, reduce vehicle trips, and reduce per-capita vehicle miles traveled to the City’s major activity centers, with corresponding improvement in air quality, public health, and reductions in greenhouse gas emissions from transportation sources in accordance with the City’s goals, the SCAG 2020-2045 RTP/SCS, and State policies with respect to climate change and land use;	No	Yes	Yes	Yes	Yes	Yes
8 Support the ongoing economic revitalization, including through the creation of public parking facilities;	No	Partial	Yes	Yes	Yes	Yes
9 Encourage redevelopment and investment within the City in areas served by the proposed Project;	No	Yes	Yes	Yes	Yes	Partial
10 Provide safe, reliable, and convenient access to businesses in the City so that they are accessible to their workforce and customers;	No	Yes	Yes	Yes	Yes	Yes
11 Connect the Inglewood community and citizens to jobs, education, services, and destinations within the City and within the region by providing transit within safe and accessible walking distances; and	No	Yes	Yes	Yes	Yes	Yes
12 Support regional efforts to become more efficient, economically strong, equitable, and sustainable.	No	Yes	Yes	Yes	Yes	Yes

## 5.0 Alternatives

Of the alternatives evaluated in this Recirculated Draft EIR, the Environmentally Superior Alternative is considered to be Alternative 2, the Bus Rapid Transit (BRT) System Alternative. The Project would not result in any significant impacts and, for this reason, Alternative 2 would not avoid any significant impact that would result from the Project as proposed. Alternative 2 is considered the Environmentally Superior Alternative because it would lessen impacts to the greatest degree of the alternatives evaluated. The BRT System Alternative would, however, not meet the City's basic objectives for the proposed Project.

With the BRT System Alternative, the proposed Project would not be constructed. No demolition or construction activities would occur, except along the public right-of-way where BRT-only lanes along the route are implemented. The BRT System Alternative would avoid all significant construction related effects and impacts identified for the proposed Project.

Unlike the No Project Alternative, the BRT System Alternative would meet some of the City's objectives including providing a direct and convenient connection to the Metro regional transit system, encouraging intermodal transportation systems by providing convenient transit, and providing safe, reliable, and convenient access to businesses in the City. The BRT System Alternative would also meet the City's objectives to support the ongoing economic revitalization, growth opportunities within the Downtown TOD Plan area, and encourage redevelopment and investment within the City in areas served by the proposed Project. The BRT System Alternative would not, however, create additional public parking to support ongoing economic revitalization efforts. The proposed Project would create additional public parking facilities in three locations along the proposed Alignment. In addition, the objective to provide sufficient transit connection capacity between Metro's regional transit system and the City's new major activity centers would not be met by this BRT alternative, resulting in limited increased transit mode split, limited reduction in vehicle trips, and consequently, limited reduction in per-capita vehicle miles traveled to the City's major activity centers. The estimated daily BRT ridership with Event Conditions would be approximately 20 percent of the projected ridership for the proposed ATS, providing transit options, increasing transit mode split, reducing vehicle trips, and reducing per capita vehicle miles traveled to the City's major activity centers. The BRT System Alternative would also not meet the City's objectives to maintain existing roadway capacity, reduce the City's traffic congestion and alleviate growing demand on the existing roadway network on both major arterials and residential streets for both nonevent and event days.

## 6.0 OTHER ENVIRONMENTAL CONSIDERATIONS

### 6.1 INTRODUCTION

California Environmental Quality Act (CEQA) Guidelines section 15126<sup>1</sup> requires that all phases of a project must be considered when evaluating its impact on the environment, including planning, acquisition, development, and operation. Further, CEQA Guidelines section 15126.2(a) requires that the evaluation of significant impacts consider direct and reasonably foreseeable indirect effects of the proposed Project over the short-term and long-term. The Environmental Impact Report (EIR) must identify (1) significant environmental effects that cannot be avoided if the proposed Project is implemented, (2) significant irreversible environmental changes that would result from implementation of the proposed Project, (3) effect found not to be significant, and (4) growth-inducing effects of the proposed Project.

### 6.2 SIGNIFICANT UNAVOIDABLE IMPACTS

CEQA Guidelines section 15126.2(c) requires that an EIR describe any significant impacts that cannot be avoided, even with the implementation of feasible mitigation measures. The proposed Project would not result in significant environmental impacts with implementation of the mitigation measures identified in this Recirculated Draft EIR.

### 6.3 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

Under CEQA, an EIR must evaluate the extent to which the Proposed Project primary and secondary effects would generally commit future generations to the allocation of nonrenewable resources and to irreversible environmental damage. Specifically, CEQA Guidelines section 15126.2(d)<sup>2</sup> states:

*Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible, since a large commitment of such resources makes removal or nonuse thereafter unlikely. Primary impacts and, particularly, secondary impacts (such as highway improvement which provides access to a previously inaccessible area) generally commit future generations to similar uses. Also, irreversible damage can result from environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.*

The evaluation below addresses whether the proposed Project would result in significant irreversible environmental changes if they would:

---

1 CEQA Guidelines sections 15126.2(a), (c-e).  
2 EQA Guidelines sections 15126.2(d).

## 6.0 Other Environmental Considerations

- Involve a large commitment of nonrenewable resources;
- Result in primary or secondary impacts that would generally commit future generations to similar uses;
- Involve uses in which irreversible damage could result from any potential environmental accidents associated with the project; or
- Result in consumption of resources that is not justified (e.g., the project involves the wasteful use of energy).

Each of these issues is discussed below for the proposed Project.

### Commitment of the Project for Future Generations

Development of the proposed Project would result in the commitment of the Project area to a transit use along with accompanying support facilities uses, thereby precluding other uses for the lifespan of the proposed Project, a period of time anticipated to be at least 50 years.

### Irreversible Environmental Damage

The CEQA Guidelines also require a discussion of the potential for irreversible environmental damage that could be caused by an environmental accident associated with the proposed Project. While the proposed Project could result in the use, transport, storage, and disposal of limited amounts of hazardous wastes during construction and operation, all activities would comply with applicable State and federal laws related to hazardous materials, which significantly reduce the likelihood and severity of the occurrence of accidents that could result in irreversible environmental damage.

Over the past decade, the understanding of global climate change and the role that communities can play in mitigating and/or adapting to it has grown tremendously. There is broad scientific consensus that recent changes in climatic conditions, including increases in global temperatures, are associated with corresponding increases of greenhouse gases (GHGs). Temperature increases are beginning to affect regional climates and continued increases are expected result in impacts to the southern California region and the world. Climate change is anticipated to have profound implications for the availability of the natural resources on which economic prosperity and human development depend.

Greenhouse Gas Emissions, the emission of GHGs is known to have long-term effects on atmospheric conditions that affect the global climate, with resultant changes in sea level, hydrological conditions in rivers, heat island effects, and a range of other conditions. While these changes are not considered irreversible, they could last for generations. The proposed Project could result in short-term increases in GHG emissions during construction, but through the implementation of mitigation measures identified in

## 6.0 Other Environmental Considerations

this Draft EIR, the construction-related GHG emissions would be reduced. Operation of the proposed Project would result in a decrease in GHG emissions as it would provide for the conversion of vehicles trips in the area to ridership on the ATS trains. As such, the proposed Project would not contribute to global climate changes and related irreversible environmental damage.

### Unjustified Consumption of Resources

Resources that would be permanently and continually consumed by implementation of the proposed Project include water, electricity, natural gas, and fossil fuels; however, the amount and rate of consumption of these resources would not result in the unnecessary, inefficient, or wasteful use of resources.

### Project Construction

As shown in **Table 4.5-3** and **Table 4.5-4** in **Section 4.5: Energy Resources**, a total of approximately 165,115 kWh of electricity and 163,734,871 gallons of petroleum during the morning/evening shift construction scenario, and 151,002,831 gallons of petroleum during the morning/night shift construction scenario is estimated to be consumed during construction of the proposed Project. Construction activities do not typically involve the consumption of natural gas, as construction equipment and staging rely heavily on electricity and transportation fuels. Accordingly, natural gas would likely not be needed to support construction activities; thus, there would be little to no demand generated by construction.

Construction of the proposed Project would result in the irretrievable commitment of construction materials (e.g., steel products, cement, glass). While construction of the proposed Project would result in the irretrievable commitment of nonrenewable energy resources, primarily in the form of fossil fuels (including fuel oil), natural gas, and gasoline for automobiles and construction equipment, the consumption of fossil fuels would occur on a temporary basis during the construction period.

Construction of the proposed Project would employ fuel-efficient equipment consistent with State and federal regulations, such as fuel efficiency regulations in accordance with the California Air Resources Board (CARB) Pavley Phase II standards, the anti-idling regulation in accordance with section 2485 in Title 13 of the (CCR), and fuel requirements for stationary equipment in accordance with section 93115 (concerning Airborne Toxic Control Measures) in Title 17 of the CCR. Use of construction equipment that is compliant with these regulations would result the use of more fuel-efficient engines and associated fuel savings.

The proposed Project would divert mixed construction and demolition debris to City-certified construction and demolition waste processors using City-certified waste haulers, which would reduce truck trips to landfills, and increase the amount of waste recovered (e.g., recycled, reused, etc.) at material recovery

facilities, thereby further reducing transportation fuel consumption. As such, the consumption of energy during project construction would not be wasteful, inefficient, or unnecessary.

### Project Operation

Operation of the Proposed Project would result in the demand for electricity and natural gas for project operations, and gasoline and diesel fuel for transportation and backup generation functions.

As shown in **Table 4.5-6** in **Section 4.5**, the electricity demand for the proposed Project during normal operation would result in a net increase of 20,625,176 kWh (20.6 GWh) per year. In the event the MSF PDS is unable to operate, the electricity demand would result in a net increase of 20,789,426 kWh (20.8 GWh) per year. In the event the Prairie Avenue/Hardy Street station PDS is unable to operate, the electricity demand would result in a net increase of 22,109,996 kWh (22.1 GWh) per year.

As shown in **Table 4.5-7** in **Section 4.5**, the proposed Project would result in a net decrease of 4,561,725 kBTU of natural gas per year.

As shown in **Table 4.5-9** in **Section 4.5**, implementation of the proposed Project would reduce annual petroleum-based fuel under all scenarios. Specifically, under the Adjusted Baseline scenario, the proposed Project would reduce annual fuel consumption from 45,338,712 gallons to 44,754,415 gallons, a decrease of 584,297 gallons. Under the Future (2027) Non-Event scenario, the proposed Project would reduce annual fuel consumption from 47,071,377 gallons to 46,448,809 gallons, a decrease of 622,567 gallons. Under the Future (2027) All Event scenario, the proposed Project would reduce annual fuel consumption from 50,876,477 gallons to 49,507,575 gallons, a decrease of 1,368,902. Under the Future (2045) Non-Event scenario, the proposed Project would reduce annual fuel consumption from 43,780,331 gallons to 43,199,383 gallons, a decrease of 580,949 gallons. Under the Future (2045) All Event scenario, the proposed Project would reduce annual fuel consumption from 47,000,246 gallons to 45,620,737 gallons, a decrease of 1,379,509 gallons.

Additionally, the proposed Project would include up to two stationary standby generators with an estimated total capacity rated at approximately 4,000 kilowatts (kW) to provide emergency power primarily for lighting and other emergency building systems. The estimated annual fuel usage assuming each generator operates of 50 hours per year (2 hours per day) is 27,440 gallons of diesel fuel.<sup>3</sup>

Operation of the proposed Project would comply with all applicable building codes, including the 2019 Title 24 building energy efficiency standards, CAFE fuel economy standards, consistency with the SCAG

<sup>3</sup> Vender Specifications for Standby Generator, [https://www.cat.com/en\\_US/products/new/power-systems/electric-power.html](https://www.cat.com/en_US/products/new/power-systems/electric-power.html). Accessed October 2021.

2020-45 RTP/SCS, compliance with the County's Low Impact Development (LID) Development Standards Manual, compliance with the City's Low Impact Development Requirements for New Development and Redevelopment, the City's Green Street Policy, the City's Water Conservation and Water Supply Shortage Program, as well as mitigation measures included in this Draft EIR, would ensure that natural resources are used efficiently and conserved to the maximum extent possible. Further, it is expected that, over time, new technologies or systems will emerge, or will become more cost-effective or user-friendly, to further reduce the reliance upon nonrenewable natural resources. For example, future implementation of the Clean Fuel Standard and the Renewable Portfolio Standard are expected to decrease the use of nonrenewable fossil fuels.

Collectively, the incorporation of the above described conservation measures and features, operation of the proposed Project would minimize the consumption of electricity, natural gas, and transportation fuels. Therefore, as proposed operation of the proposed Project would not result in the wasteful, inefficient, or unnecessary consumption of electricity, natural gas, and transportation fuels, and thus would not result in the unjustified consumption of natural resources.

### 6.4 EFFECTS FOUND NOT TO BE SIGNIFICANT

Section 15128 of the CEQA Guidelines<sup>4</sup> requires that an EIR "contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and therefore were not discussed in detail in the EIR."

The Original Initial Study (Original IS) was published in July 2018 and determined that an EIR would be prepared in compliance with CEQA to analyze potentially significant impacts that may result from the Project. As such, an Original Notice of Preparation (Original NOP) was circulated and comments were received from the public and agencies following a 30-day comment period that ended on August 15, 2018.

As a result of the comments received and refinements and modifications to proposed Project identified in the Original NOP and Original IS, a Revised NOP and IS were circulated. Subsequent to the circulation of the Original IS, the State of California Office of Planning and Research (OPR) updated and revised the thresholds contained in the State CEQA Guidelines Appendix G.<sup>5</sup> The Revised IS was updated to address the updated Appendix G checklist that became effective on December 28, 2018. The following analysis is based on the Revised Initial Study (Revised IS) recirculated on September 10<sup>th</sup>, 2020.

<sup>4</sup> California Environmental Quality Act (CEQA) Guidelines, Section 15128.  
<sup>5</sup> California Environmental Quality Act (CEQA) Guidelines, Appendix G.

Impacts determined by the Initial Study to be potentially significant, as well as included in this Draft EIR are addressed in detail in **Section 4.0: Environmental Impact Analysis**. The discussion below presents the analysis of the effects related to specific thresholds for the impacts identified in the Revised Initial Study that were not found to be significant. All impacts for the issues discussed in this section would be less than significant or have no impact.

#### 6.4.1 Aesthetics

Except as provided in Public Resources Code Section 21099, would the Project:

**Threshold:** Have a substantial adverse effect on a scenic vista?

A significant impact regarding a scenic vista could occur if the proposed Project were to introduce incompatible visual elements within a field of view containing a scenic vista or substantially blocked views of a scenic vista. Scenic vistas are generally described in two ways: panoramic views (visual access to a large geographic area, for which the field of view can be wide and extend into the distance) and focal views (visual access to a particular object, scene, or feature of interest). Scenic resources typically include natural open spaces, topographic formations, and landscapes that contribute to a high level of visual quality. They also can include ridgelines, parks, trails, nature preserves, sculpture gardens, and similar features.

The proposed Project would include an elevated guideway for the ATS system that would be located along segments of 3 major streets in Inglewood; Market Street, Manchester Boulevard and Prairie Avenue. The proposed alignment would extend from a point near the under-construction Metro K Line, which will run south along North and South Market Street, east along East Manchester Avenue, and south along South Prairie Avenue before terminating near the intersection of South Prairie Avenue and Hardy Street.

The proposed Project is located entirely within the City in a highly developed urban area characterized by commercial, residential, and industrial uses. The existing level of development on the site and in the surrounding area limits views across and beyond the site from surrounding roadways. The City's General Plan states that no forest resources, wildlife, fisheries, shorelines, or agricultural land are present in the City,<sup>6</sup> nor does the General Plan designate any scenic vistas within the City or its vicinity. Additionally, the proposed Project is not near any designated wild or scenic rivers pursuant to the National Wild and Scenic Rivers System.<sup>7</sup> The nearest surrounding mountains, the Santa Monica Mountains, are more than 10 miles

<sup>6</sup> City of Inglewood, General Plan, "Conservation Element" (1997), 1.

<sup>7</sup> National Wild and Scenic Rivers System, <https://www.rivers.gov>. Accessed October 2021.

to the north.<sup>8</sup> No views of these mountains or of any other focal points or broad panoramic view corridors are available from public rights-of-way along the proposed Project.

Based on the above, the proposed Project would not have a substantial adverse effect on a scenic vista. Impacts would be less than significant.

**Threshold:** Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?

A significant impact would occur if the proposed Project were to substantially damage identified scenic resources bordered by or within the viewshed of a State-designated scenic highway.

There are no designated scenic highways near the proposed Project. In addition, although the City Municipal Code (IMC) has a tree protection ordinance that requires any street trees affected by project implementation be replaced at a 1:1 ratio, the appended tree inventory does not identify any federally or State-listed trees that would be affected by proposed Project's implementation. None of the trees inventoried is located within a State scenic highway. Historic buildings located in the vicinity of the proposed Project also do not fall within a State scenic highway, and no rock outcroppings are present on or near the proposed Project. As such, impacts would be less than significant.

#### 6.4.2 Agricultural and Forestry Resources

Would the proposed Project:

**Threshold:** Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?

Significant impacts would occur if the proposed Project were to adversely impact Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. The location of the proposed Project is surrounded by commercial, commercial recreation, single- and multifamily residential, and entertainment uses (within the Hollywood Park Specific Plan).

According to the California Department of Conservation's Farmland Mapping and Monitoring Program, the location of the proposed Project has not been previously mapped.<sup>7</sup> However, the City is highly developed and entirely urbanized; no portion of the City, including the proposed Project location and

<sup>8</sup> Google Maps <https://www.google.com/maps>. Accessed October 2021.

surrounding development, is currently in agricultural use. As such, no portion of the proposed Project's location would qualify for designation as Prime Farmland, Farmland of Statewide Importance, Unique Farmland, or Farmland of Local Importance. No impacts would occur.

**Threshold: Conflict with existing zoning for agricultural use, or Williamson Act contract?**

Significant impacts would occur if the proposed Project were to conflict with existing agricultural zoning or a Williamson Act contract.

As previously noted, the proposed Project's location and surrounding development are not used for agricultural, nor can they support agricultural use. The area is not subject to a Williamson Act contract. No impacts would occur.

**Threshold: Conflict with existing zoning for, or cause rezoning of, forestland (as defined in PRC section 12220(g)), timberland (as defined by PRC section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?**

The proposed Project's location is not designated or zoned for forest or timberland. No timber operations exist in the area. Additionally, the area is highly urbanized area and is not within any forestland area. No impacts would occur.

**Threshold: Would the Project result in the loss of forest land or conversion of forest land to non-forest use?**

As previously noted, the proposed Project's location does not contain any farmland or forestland. Development of the proposed Project would occur in an existing highly urbanized and developed area. No impacts would occur.

**Threshold: Involve other changes in the existing environment, which, due to their location or nature, could result in conversion of Farmland to nonagricultural use, or conversion of forestland to nonforest use?**

The proposed Project's location is not designated or zoned for forest or timberland. No timber operations exist in the area. Additionally, the area is highly urbanized area and is not within any forestland area. No impacts would occur.

### 6.4.3 Air Quality

Would the proposed Project:

**Threshold: Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?**

Impacts would be considered potentially significant if the proposed Project were to result in the creation of objectionable odors with the potential to affect substantial numbers of people, or if construction or operation of the proposed Project would result in the creation of nuisance odors that would be noxious to a substantial number of people as codified in South Coast Air Quality Management District (SCAQMD) Rule 402 (Nuisance).<sup>9</sup>

Odors are typically associated with industrial projects involving the use of chemicals, solvents, petroleum products, and other strong-smelling elements used in manufacturing processes, as well as sewage treatment facilities and landfills.

During construction, activities associated with the operation of equipment, the application of asphalt, and the application of architectural coatings and other interior and exterior finishes may produce discernible odors typical of most construction sites. As construction-related emissions dissipate from the area, odors associated with these emissions would also decrease, dilute, and become unnoticeable.

According to the SCAQMD CEQA Air Quality Handbook, land uses that are associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting refineries, landfills, dairies, and fiberglass molding.<sup>10</sup> The proposed Project would not include any of these odor-producing uses. Odors associated with the proposed Project's operation would be limited to on-site waste generation and disposal, as well as cleaning operations at the MSF. All trash receptacles would be covered and properly maintained in a manner as to minimize odors, as required by City and Los Angeles County Health Department regulations and be emptied on a regular basis.<sup>11</sup>

Implementation of the proposed Project would not generate objectionable odors affecting a substantial number of people. Impacts related to odors would be less than significant.

<sup>9</sup> SCAQMD, "Rule 402: Nuisance" (adopted May 7, 1976), <http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-402.pdf>. Accessed October 2021.

<sup>10</sup> SCAQMD, Air Quality Handbook, <http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook>. Accessed October 2021.

<sup>11</sup> County of Los Angeles Department of Public Health, "Solid Waste Management Program," accessed July 2020, [http://publichealth.lacounty.gov/eh/EP/solid\\_waste/solid\\_waste\\_main.htm](http://publichealth.lacounty.gov/eh/EP/solid_waste/solid_waste_main.htm). Accessed October 2021.

#### 6.4.4 Biological Resources

Would the project:

**Threshold:** Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service?

A significant impact would occur if the proposed Project were to lead to adverse effects on any species identified as a candidate, sensitive, or special status species according to any adopted plan, policy, or regulation. This includes effects caused by habitat modification.

The proposed Project is located entirely within a highly developed urban area characterized by commercial and residential uses. The proposed Project's location consists of paved and active streets with various landscaping, as well as developed or previously developed parcels where the MSF and PDS facilities may be located. The existing level of development in the area and in the surrounding area is not compatible with supporting wildlife and natural plant communities.

A biological assessment for the proposed Project's location was completed to determine the presence or absence of any sensitive biological resources. As part of the biological assessment, the California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDDB)<sup>12</sup> was used to conduct a 9-quadrant survey. In the Inglewood quadrant, 29 species were previously identified as seen in **Table 6.0-1: CNDDDB Inglewood Quadrant Species List**.

There were no species listed on the CNDDDB that have been observed within the area of proposed Project. Fourteen of the species listed in **Table 6.0-1** were no closer than 1.89 miles from the proposed Project. The only plant species on site were landscaping as well as weeds and ruderal vegetation. Of these species, none listed is a candidate, sensitive, or special-status species. None of the species listed in the CNDDDB was found to be present within or surrounding the proposed Project during the field survey on May 23, 2018.

The sensitive species listed in quadrants are not within the proposed Project's footprint. The species listed tend to only occur in specific habitats that do not present within the City; suitable habitats for these species tend to occur in area beyond the City, such as the Santa Monica Mountains to the northwest and the coastal regions to the west. The proposed Project area is completely urbanized and has no natural open space natural plant communities.

12 California Department of Fish and Wildlife (CDFW), California Natural Diversity Database (CNDDDB), "Maps and Data," <https://www.wildlife.ca.gov/Data/CNDDDB>. Accessed October 2021.

6.0 Other Environmental Considerations

The proposed Project is not located in a significant ecological area defined in the County of Los Angeles (the County) General Plan.<sup>13</sup> Moreover, the City's General Plan states that no forest resources, wildlife, fisheries, shorelines, or agricultural land are present in the City.<sup>14</sup>

Impacts would be less than significant.

**Threshold:** Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service?

Significant impacts would occur if the proposed Project were to cause adverse effects on any riparian habitat or other sensitive natural community identified in an adopted plans, policies, or regulations.

The proposed Project is located in an area that consists of paved rights-of-way, as well as developed or previously developed urban parcels adjacent to the proposed Project. As such, no riparian habitat or sensitive natural community is located in the area.<sup>15</sup> In addition, the proposed Project is not located in a significant ecological area defined in the County's General Plan<sup>16</sup> or the City's General Plan.<sup>17</sup>

No impacts would occur.

**Threshold:** Have a substantial adverse effect on State or federally protected wetlands (including but not limited to marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

A significant impact would occur if the proposed Project were to adversely affect federally protected wetlands under Section 404 of the Clean Water Act.

The proposed Project is not in proximity to, nor does it contain, wetland habitat or a blue-line stream that is subject to the jurisdiction of the US Army Corps of Engineers or the CDFW. The National Wetlands Mapper does not show any federally protected streams, wetlands, or other water bodies, or any riparian habitat on site or adjacent to the proposed Project.<sup>18</sup>

15 CDFW, CNDDDB, "Maps and Data."  
16 LA County DRP, General Plan 2035, "General Plan Update Program—Interactive Map (GP-NET)."  
17 City of Inglewood, General Plan, "Conservation Element."  
18 US Fish and Wildlife Service (USFWS), National Wetlands Inventory, "National Wetlands Mapper," <https://www.fws.gov/wetlands/data/mapper.html>. Accessed October 2021

6.0 Other Environmental Considerations

Because the proposed Project would not have any effect on federally protected wetlands, and would not result in any removal, filling, hydrological interruption, or other means of disruption to a watercourse, no impact would occur.

**Threshold:** Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or State habitat conservation plan?

Significant impacts would occur if the proposed Project were to conflict with a Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or another approved plan designed to conserve habitat.

No adopted HCP, NCCP, or similar plan applies to the proposed Project's area.<sup>19</sup> Consequently, implementation of the proposed Project would not conflict with the provisions of any adopted conservation plan and therefore no impacts would occur.

6.4.5 Geology and Soils

Would the proposed Project:

**Threshold:** Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction?

Significant impacts would occur if the proposed Project were to expose people or structure to the effects of liquefaction.

Liquefaction is a seismic phenomenon in which loose, saturated, granular soils behave similarly to a fluid when subjected to high-intensity ground shaking. Liquefaction occurs when three general conditions exist: shallow groundwater; low-density, fine, clean sandy soils; and strong ground motion. The effects of liquefaction can include sand boils, settlement, and bearing-capacity failures below structural foundations.

According to the CGS, the location of the proposed Project is not within an area susceptible to liquefaction.<sup>20</sup> Based on previous investigations and available geologic data, liquefaction zones are not mapped or known to exist beneath the proposed Project.

19 CDFW, "NCCP Plan Summaries," <https://www.wildlife.ca.gov/conservation/planning/nccp/plans>. Accessed October 2021.  
20 CDC, CGS, Earthquake Zones of Required Investigation, interactive map, <https://maps.conservation.ca.gov/cgs/EQZApp/app/>. Accessed October 2021.

The following materials were consulted regarding potential liquefaction for the proposed Project:<sup>21</sup>

- Mapped liquefaction areas on the Inglewood Quadrangle,
- The City of Los Angeles Safety Element, and
- The County of Los Angeles Seismic Safety Element.

Based on a review of the above, it was determined that the proposed Project is not located within areas identified as having a potential for liquefaction according to these source materials. Furthermore, the regional geologic map and subsurface conditions reported in previous geotechnical investigations, and the absence of shallow groundwater, the Pleistocene age sediments underlying the proposed Project (generally dense silty sand and firm silty clay silts) are not considered prone to liquefaction. Therefore, the potential for liquefaction and its secondary effects are considered low and a Project area-specific study in accordance with the Seismic Hazards Mapping Act<sup>22</sup> will not be required. The design and construction of the proposed Project would conform to California Building Code requirements related to seismic standards, as approved by the City Building Safety Division.

Impacts related to seismic related liquefaction would be less than significant.

**Threshold:** **Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?**

Significant impacts would occur if the proposed Project were to expose people or structures to adverse impacts associated with landslides.

The proposed Project is located on level terrain. Based on the topographic setting and a review of previous geotechnical evaluations in the proposed Project's vicinity, no historical landslides are known to have occurred that could potentially impact the proposed Project. According to the CGS,<sup>23</sup> the proposed Project is not located within an Earthquake-Induced Landslide Zone as shown on the Earthquake Zones of Required Investigation, Inglewood Quadrangle map. The probability of seismically induced landslides occurring within the area of the proposed Project is not significant due to the general lack of elevation difference in slope geometry across or adjacent to the site. In addition, development of the proposed Project would not substantially alter the existing topography of the area.

<sup>21</sup> Inglewood Transit Connector, Technical Memorandum (DRAFT), Geology and Soils, Geosyntec Consultants, June 25, 2018.

<sup>22</sup> 2018 California Code, Public Resources Code – PRC, Division 2 – Geology, Mines and Mining, Chapter 7.8, Seismic Hazards Mapping, Section 2690, Seismic Hazards Mapping Act.

<sup>23</sup> California Department of Conservation, California Geological Survey, DC, CGS, Earthquake Zones of Required Investigation.

As such, no impacts related to slope instability or landslides would occur.

**Threshold:** **Result in substantial soil erosion or the loss of topsoil?**

Significant impacts would occur if the proposed Project were to result in substantial soil erosion or the loss of topsoil.

The location of the proposed Project has been substantially developed with impermeable surfaces with only small areas of vegetative planters, and no areas of the site are susceptible to erosion under existing conditions. The area is highly urbanized and developed; the land is relatively flat and contains minimal rises or changes in elevation. No major slopes or bluffs are on or adjacent to the site. Although development of the proposed Project has the potential to result in the erosion of soils during construction activities, erosion would be reduced through implementation of SCAQMD Rule 403—Fugitive Dust to minimize wind- and waterborne erosion.

The proposed Project's construction would temporarily expose on-site soils to surface water runoff. Compliance with construction-related best management practices (BMPs), as detailed in a Storm Water Pollution Prevention Plan (SWPPP), would control, and minimize erosion and siltation. Appropriate erosion control BMPs may include but are not limited to silt fencing, fiber rolls, sandbag barriers, gravel bag berms, stabilized construction site entrances/exits, and any other practices laid out in the City's Low-Impact Development (LID) Standards Manual.<sup>24</sup> Following construction activities, treated runoff would be directed into existing storm drains that receive surface water runoff under existing conditions, and runoff would not encounter unprotected soils.

Because the proposed Project is greater than 1 acre in size, the proposed Project will implement a SWPPP in accordance with the National Pollutant Discharge Elimination System (NPDES) General Permit for Discharges of Storm Water Associated with Construction Activity and Land Disturbance Activities. The site specific SWPPP would be prepared prior to earthwork activities and would be implemented during the proposed Project's construction. The SWPPP would include BMPs and erosion control measures to prevent pollution in stormwater discharge. Typical BMPs that could be used during construction include good housekeeping practices (e.g., street sweeping; proper waste disposal; vehicle and equipment maintenance; concrete washout area; materials storage; minimization of hazardous materials; proper handling and storage of hazardous materials; etc.) and erosion- and sediment-control measures (e.g., silt fences, fiber rolls, gravel bags, stormwater inlet protection, soil stabilization measures, etc.). The SWPPP would be subject to review and approval by the City.

<sup>24</sup> IMC, ch. 10, Public Works, art. 16, LID Standards Manual, incorporated by reference.

6.0 Other Environmental Considerations

The proposed Project's construction activities would comply with the City's grading permit regulations, which require the implementation of grading and dust control measures, including a wet-weather erosion control plan if construction occurs during the rainy season. Through compliance with these existing regulations, the proposed Project would not result in any significant impacts related to soil erosion during the construction phase.

During the proposed Project's operational phase, the proposed Project's surface areas would be developed with impervious surfaces, and all stormwater flows would be directed to storm drainage features and would not come into contact with bare soil surfaces. In addition, no native topsoil is present on the site because it has been previously disturbed and developed. Therefore, soil erosion impacts associated with construction and operation of the proposed Project would not occur, and soil erosion impacts would be less than significant.

**Threshold: Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?**

Significant impacts would occur if the proposed Project were based on unstable soils that could result in landslides, lateral spreading, subsidence, liquefaction, or soil collapse.

Subsidence and ground collapse generally occur in areas with active groundwater withdrawal or petroleum production. The extraction of groundwater or petroleum from sedimentary source rocks can cause the permanent collapse of the pore space previously occupied by the removed fluid. The proposed Project does not involve the creation of new groundwater wells, nor are there active groundwater activities in the vicinity of the proposed Project.<sup>25</sup>

According to the California Energy Management Division (CalGEM) (formerly the Division of Gas and Geothermal Resources (DOGGR)), the area of the proposed Project is not located within the limits of any existing or former oil fields.<sup>26</sup> The area does not contain existing oil production wells, and no plugged or abandoned oil exploration wells are known to be located within the proposed Project area. The closest known oil production well is located approximately 1,00 feet east of Prairie Avenue and is categorized as

<sup>25</sup> Los Angeles County Public Works. Groundwater Wells. <https://dpw.lacounty.gov/general/wells/>. September 1, 2020.

<sup>26</sup> California Division of Gas and Geothermal Resources (DOGGR), Well Finder, <https://maps.conservation.ca.gov/doggr/wellfinder/#openModal/-118.32073/33.94064/15>. Accessed October 2021.

6.0 Other Environmental Considerations

"idle."<sup>27</sup> Therefore, while there is some history of oil extraction in the area, no oil extraction occurs or is known to have historically occurred within the area of the proposed Project.

Subsidence and ground collapse can also occur during dewatering activities. However, dewatering is not necessary for the proposed Project. US Geological Survey groundwater measurements indicate that nearby groundwater is at least 85 feet below grade. Given that the proposed Project does not include substantial excavation or subterranean structures, groundwater would not be encountered during construction. The proposed Project's design features and construction would comply with all applicable building codes and standards.

A site-specific geotechnical study would be performed by a licensed engineer that would outline structural design elements to ensure structural integrity is maintained and account for site specific soil conditions. In addition, the design and construction of the proposed Project would conform to California Building Code requirements related to site specific soil conditions, as approved by the City Building Safety Division.

With adherence to existing regulations, impacts related to geological failure—including lateral spreading, off-site landslides, liquefaction, or collapse—would be less than significant.

**Threshold: Be located on expansive soil, as defined in Table 18 1-B of the Uniform Building Code (1994), creating substantial risks to life or property?**

Significant impacts could occur if the proposed Project were located on expansive soil that could create substantial risks to life or property.

Expansive soils include clay minerals characterized by their ability to undergo significant volume change (shrink or swell) due to variation in moisture content. Sandy soils are generally not expansive, while clayey soils generally are expansive. Changes in soil moisture content can result from rainfall, irrigation, pipeline leakage, perched groundwater, drought, or other factors. Volumetric change of expansive soil may cause excessive cracking and heaving of structures with shallow foundations, concrete slabs-on-grade, or pavements supported on these materials.

Soil materials in the area tend to include: (1) artificial fill, consisting primarily of silty sand and sand with silt and gravel; (2) alluvial deposits consisting of sand, gravel, and cobbles; and (3) alluvial deposits consisting of silty sand, sand, silty clay, and sandy clay. Typically, sandy soils have a low expansion potential

<sup>27</sup> California Division of Gas and Geothermal Resources (DOGGR), Well Finder, <https://maps.conservation.ca.gov/doggr/wellfinder/#openModal/-118.32073/33.94064/15>. Accessed October 2021.

6.0 Other Environmental Considerations

while clayey soils can have a high expansion potential. The predominance of granular content in the soils in the area including gravels, sands, and cobbles indicate a generally low potential for expansive soils.

A site-specific geotechnical study would be performed by a licensed engineer that would outline structural design elements to ensure structural integrity is maintained and account for site specific soil conditions. In addition, the design and construction of the proposed Project would conform to California Building Code requirements related to site specific soil conditions, as approved by the City Building Safety Division.

The proposed Project would incorporate standard construction practices to maintain the integrity of the proposed Project's structures. Additionally, the proposed Project's design features and construction would comply with all applicable building codes and standards. With adherence to existing regulations, impacts related to expansive soils would be less than significant.

**Threshold: Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?**

The proposed Project would result in significant impacts if it were located on soils incapable of supporting septic tanks or other alternative systems in the event that the proposed Project were not connected to existing sewer systems.

The proposed Project is located in a highly urbanized area where wastewater infrastructure is currently in place. The proposed Project would connect to the City's existing sewer system and would not require the use of septic tanks or alternative wastewater disposal systems. Thus, the proposed Project would not result in any impacts related to soils that are incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems.

No impacts would occur.

#### 6.4.6 Hazards and Hazardous Materials

Would the proposed Project:

**Threshold: Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?**

##### Construction

During construction activities, excavation of soil impacted with petroleum hydrocarbons or dry-cleaning solvents or other contaminants may be encountered. In addition, common construction materials, such

6.0 Other Environmental Considerations

as fuels, paints, oils, transmission fluids, solvents, and other acidic and alkaline solutions, would be utilized. The potential encounter and usage of contaminants and hazardous materials would require special handling, transport, and disposal. Hazardous materials used during construction would typically be packaged in consumer quantities with handling instructions from the manufacturers. Manufacturer instructions will be followed during required usage of hazardous materials to minimize the risk of exposure to workers and the environment.

In addition, the construction of the MSF and PDSs will necessitate the demolition of existing structures. Demolition activities have the potential to release hazardous materials, such as asbestos containing materials (ACM), lead-based paint (LBP), and other potentially hazardous building materials in some form such as polychlorinated biphenyl, mercury, or chlorofluorocarbons found in fluorescent lighting and electrical switches. Potential exposure to hazardous materials during demolition will be limited only to the duration of demolition activities. Prior to demolition, existing buildings are required to be inspected for the presence of hazardous materials, including asbestos containing materials, lead based paint, polychlorinated biphenyl (PCB) materials and mercury.

The identification, removal, and disposal of ACM is regulated under 8 CCR 1529 and 5208. The identification, removal, and disposal of LBP is regulated under 8 CCR 1532.1. A State-certified professional would be required to conduct all work related to the identification, removal, and disposal of both ACM and LBP. If either ACM or LBP are found, a site-specific hazard control plan must be prepared and submitted to the appropriate agency detailing removal methods and specific instructions for protective clothing and equipment for abatement personnel. A State-certified LBP and an asbestos removal contractor would be retained to conduct the appropriate abatement measures and be retained for the removal of the hazardous material in compliance with all federal, State, and local laws and regulations. Once all abatement measures have been implemented and the hazardous material has been removed, a written documentation will be submitted to the City.

The identification, removal, and disposal of PCBs is regulated by the EPA under the Toxic Substances Control Act<sup>28</sup> and 22 CCR 66263.44. Electrical transformers and older fluorescent light ballasts, along with other suspect material will need to be tested and verified for PCB content prior to demolition. If PCBs are detected above action levels, a material must be disposed of at a licensed facility permitted to accept the materials. The identification, removal, and disposal of PCBs must follow all federal, State, and local laws and regulations. Upon completion of abatement measures, the contractor will submit written documentation to the City.

---

28 Title 40, Chapter 1, Subchapter R, Part 761

6.0 Other Environmental Considerations

All hazardous material identification, removal, and disposal activities will be carried out in accordance with all federal, State, and local laws and regulations in combination with enforcement mechanisms by agencies including SCAQMD and Cal/OSHA. Compliance with applicable laws and regulations will minimize the potential for exposure of individuals and the environment to hazards during the construction, demolition, and disposal process.

The transport of hazardous material is regulated by US Department of Transportation, Caltrans, and the California Highway Patrol. The enforcement agencies have established driver-training requirements, load labeling requirements, and container specifications designed to minimize the exposure of hazardous materials. Manchester Boulevard and Prairie Avenue are major roadways along the elevated guideway that are designated truck routes.<sup>29</sup> These routes are permitted for use by any vehicle exceeding a maximum gross weight of 3 tons and includes the routine transport of hazardous materials by such trucks. While hazardous materials, with some exceptions, can be transported on all City roadways, Section 31303 of the California Vehicle Code and US Department of Transportation regulations require that hazardous materials be transported by routes with the least overall travel time, ensuring that freeways and major boulevards are primarily used for the transport of hazardous materials. Prior to the commencement of construction, haul routes will be reviewed and approved of by the City.

Additionally, the NPDES General Construction Permit described above in **Section 4.6: Geology and Soils**, would include the submittal of a SWPPP, identifying various BMPs and other measures, including proper material storage, prevention, and containment of accidental spills of hazardous materials and wastes, to ensure hazardous materials are contained. All materials will also be stored, handled, transported, and disposed of in accordance with all applicable local, State, and federal regulations. Therefore, the proposed Project would not create a significant impact related to routine transport, use, or disposal of hazardous materials during construction. Impacts would be less than significant.

**Operation**

The types and amounts of hazardous materials that would be used in connection with operation of the proposed Project, including along the elevated guideway and at the stations, but particularly at the MSF, would be typical of those used in an industrial setting (e.g., cleaning solutions, solvents, pesticides for landscaping, painting supplies, and petroleum products used in normal vehicle fleet operations, coolants, absorbents, oil and fuel products, and machining wastes). All potentially hazardous materials would be used and stored in accordance with applicable federal, State, and local regulations, and the proposed Project would comply with planning and emergency response regulations pertaining to the presence of

<sup>29</sup> IMC, ch. 3, Motor Vehicles and Traffic, art. 3, Truck Route Regulations, sec. 3-85, Truck Routes Established (1985).

6.0 Other Environmental Considerations

such materials. The potential for a significant hazardous impact to occur during operation of the proposed Project is considered low. Impacts would be less than significant.

**Threshold: Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?**

Significant impacts would occur if the proposed Project were located on a site that is included on a list of hazardous materials sites.

California Government Code Section 65962.5 requires various State agencies, including but not limited to the Department of Toxic Substances Control (DTSC) and the State Water Resources Control Board (SWRCB), to compile lists of hazardous waste disposal facilities, unauthorized releases from underground storage tanks, contaminated drinking water wells and solid waste facilities where there is known migration of hazardous waste and submit such information to the Secretary for Environmental Protection on at least an annual basis.<sup>50</sup> The State of California maintains the Hazardous Waste and Substances Site List, also known as the Cortese List, as a planning document that assists Lead Agencies with CEQA compliance as it relates to hazardous materials and sites.

Section 65962.5(a)(1) requires that DTSC “shall compile and update as appropriate, but at least annually, and shall submit to the Secretary for Environmental Protection, a list of all the following: (1) [a]ll hazardous waste facilities subject to corrective action pursuant to Section 25187.5 of the Health and Safety Code (HSC).” The hazardous waste facilities, identified in HSC Section 25187.5, are those where DTSC has taken or contracted for corrective action because a facility owner/operator has failed to comply with a date for taking corrective action in an order issued under HSC Section 25187, or because DTSC determined that immediate corrective action was necessary to abate an imminent or substantial endangerment.

No portions of the of the proposed Project are currently on the active Cortese list of sites compiled pursuant to Government Code Section 65962.5. Any site that was within the area of the proposed Project areas that were previously on the Cortese list has been sufficiently remediated to meet DTSC, SWRCB, and other agency requirements, and no longer pose a significant hazard to the public and the environment. Therefore, impacts would be less than significant.

**Threshold:** For a project located within an airport land use plan or, where such plan has not been adopted, within two miles of a public airport or public use airport, would the Project result in a safety hazard for people residing or working in the Project area?

A significant impact would occur if the proposed Project were located in an airport land use plan or within 2 miles of a public airport and would result in a safety hazard as a result of that location.

The proposed Project is not subject to the Los Angeles County Airport Land Use Plan, which was adopted in December 1991 and revised in December 2004. Los Angeles International Airport (LAX) is located more than 2 miles southwest of the proposed Project, and the Hawthorne Municipal Airport is located approximately 1.5 miles south of the proposed Project. The proposed Project is not located near a private airstrip.

Airport operation hazards include incompatible land uses or features such as power transmission lines, wildlife hazards, and tall structures that can interfere with aircraft operations. The proposed Project would not construct any buildings or structures to a height that would interfere with or obstruct any local airport operations. Therefore, impacts would be less than significant.

**Threshold:** Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Significant impacts would occur if the proposed Project were to expose people or structures to significant risks associated with wildland fires.

The City is highly developed and entirely urbanized and is without an urban/wildland interface. The proposed Project is not within a Moderate, High, or Very High Fire Hazard Severity Zone as designated by CAL FIRE. As such, the proposed Project would not increase or create the potential for wildland fires to occur near the proposed Project. No impacts would occur.

### 6.4.7 Hydrology and Water Quality

Would the proposed Project:

**Threshold:** Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?

A significant impact would occur if project discharges (either urban or stormwater runoff) to surface water or groundwater were to violate the conditions of any of the guiding federal, State, regional, or local requirements.

#### Construction

During construction, the proposed Project could disturb areas that require development outside of the transportation rights-of-way, including excavation, site preparation, and infrastructure improvements. Removing existing pavement, importing/exporting soil, grading, and stockpiling could potentially result in soils being exposed, loosened, and transported by stormwater to downstream receiving waters. Additional pollutants, including oil and grease, metals, and pH-altering materials, may also be introduced to the receiving water(s) during the construction phase. However, to reduce the potential for the above impacts during the construction phase, the proposed Project will comply with the SWRCB Construction General Permit (CGP). Under the CGP, the proposed Project will prepare an approved SWPPP and implement construction BMPs. The CGP will be enforced through the City's construction, grading, and excavation permitting process.

Therefore, impacts related to water quality standards and waste discharge requirements during the construction phase would be less than significant.

#### Operation

The proposed Project's elevated guideway is located within existing transportation rights-of-way. The proposed Project component would be constructed on impervious surfaces. The proposed Project structures would also be constructed in compliance with the applicable City's and County's Municipal Separate Storm Sewer System (MS4) Permits and LID Ordinance requirements to address any potential pollutant or pollutant loading impacts.

The proposed MSF site has nearly fully impervious surfaces with the exception of a few landscape areas. The MSF site would be constructed in full compliance with the City's and County's MS4 Permits and LID Ordinance requirements to address any potential pollutant or pollutant loading impacts.

6.0 Other Environmental Considerations

The proposed Project is located over the West Coast Basin, which is a confined aquifer, and is located approximately 220 ft below the ground surface. Urban and stormwater runoff infiltrated on site is unlikely to reach this groundwater aquifer. As a result, even if infiltration BMPs are incorporated into the proposed Project as required LID measures, such BMPs would extend to such a depth as to enter the basin. Therefore, infiltrated runoff would be unlikely to cause adverse impact to the local groundwater quality. Any potential impacts would be reduced to acceptable levels with implementation of infiltration BMPs.

Therefore, impacts related to surface water and groundwater quality standards and waste discharge requirements during both the construction and operations phases would be less than significant.

**Threshold:** Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management of the basin?

A significant impact would occur if the proposed Project were to substantially deplete groundwater or interfere with groundwater recharge.

**Construction**

The proposed Project's water supply needs during the construction phase will be provided by the City's municipal system (MS4). There would be no impact on groundwater supplies during the construction phase of the proposed Project. Because the underlying water basin is a confined aquifer, and the water table is located approximately 50 to 200 feet below ground surface, dewatering is not anticipated during the construction phase.

Therefore, impacts related to groundwater supply depletion during the construction phase would be less than significant.

**Operation**

The proposed Project could result in increased demand of potable and nonpotable water from proposed Project operation and addition of commercial sites. The proposed Project's water supply during the operation phase will be provided by the City, which depends on a combination of extracted groundwater from City-owned wells and potable and nonpotable water purchased from WBMWD.

However, according to the City's 2015 Urban Water Management Plan Update (UWMP), the City cannot meet increased water demand through an increase in groundwater extraction due to limitations in water rights. Therefore, projected demands are anticipated to be met through a combination of conservation of

6.0 Other Environmental Considerations

local surface water, imported water, graywater, stormwater capture, ocean desalination, and/or other nongroundwater sources.

Impacts related to groundwater supply depletion during the operation phase would be less than significant.

**Threshold:** Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on or off site?

- i. Result in substantial erosion or siltation on or off site;
- ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;
- iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
- iv. Impede or redirect flood flows?

A significant impact could occur if the proposed Project were to substantially alter the drainage pattern of an existing stream or river such that substantial erosion or siltation would result.

**Construction**

No existing surface streams or rivers pass within the proposed Project's extent. The nearest open channel is Centinela Creek, approximately 1.3 miles downstream of the proposed Project. In the existing condition, stormwater runoff is collected in curbs, gutters, and inlets, and conveyed through the storm drain network. No topographic changes are proposed as part of the proposed Project. If the construction phase of the proposed Project results in increased runoff or any modifications to existing drainage patterns, the existing stormwater facilities will be analyzed in the context of the proposed additional flow and upgraded if needed.

Activities during construction may expose and/or loosen soils, potentially resulting in erosion and topsoil loss. The average slopes of the proposed Project extents within the Ballona Creek and Dominguez Channel Watersheds were 0.5 and 0.9 percent, respectively. Because the slopes in the proposed Project extents are relatively flat, the majority of soil disturbance is expected to be related to importing and exporting of soil, grading, and stockpiling. All potential impacts related to these activities are expected to be reduced

6.0 Other Environmental Considerations

to acceptable levels under the CGP-required SWPPP. The SWPPP will identify any potential sources of sedimentation during construction and detail required BMPs to reduce or eliminate erosion and/or any potential alterations to drainage patterns. BMPs may include silt fencing, fiber rolls, sandbag barriers, gravel bag berms, and/or stabilized construction site entrances/exits. A Qualified SWPPP Practitioner will ensure compliance with the SWPPP by conducting regular monitoring and inspections of construction activities.

Any storm drain upgrades required to address increases in peak flow or runoff volumes would be made as part of the proposed Project's drainage design. BMPs as required by the SWPPP and the MS4 Permit would preclude any additional sources of polluted runoff during both construction and operations.

Therefore, impacts related to the creation or contribution of runoff water exceeding the capacity of existing or planned stormwater drainage systems, or providing substantial additional sources of polluted runoff, during both the construction and operation phases would be less than significant.

No streams or rivers run within the proposed Project's location. The proposed Project does not propose any changes to existing drainage patterns. During construction, BMPs (required and monitored under the SWPPP) would be used to reduce the volume and velocity of stormwater runoff, thereby mitigating the potential for flooding due to construction. Any accumulated sediment observed during inspection of temporary BMPs or permanent stormwater network devices would be removed to prevent flooding. The proposed Project is located outside the 100-year Federal Emergency Management Agency (FEMA) flood hazard area.<sup>30</sup>

Impacts related to altering the existing drainage pattern of the proposed Project's structural and support facilities that would result in erosion or siltation during the construction phase would be less than significant.

**Operation**

No topographic changes or altered drainage patterns are currently proposed as part of the proposed Project, and any increases in runoff would be handled through compliance with MS4 Permit requirements.

Surface drainage will continue to be collected via the storm drain network to be ultimately conveyed to Ballona Creek and Dominguez Channel. Should the proposed Project result in increased runoff or peak flows, the existing stormwater facilities will be analyzed in the context of the proposed additional flow and

---

<sup>30</sup> County of Los Angeles, Department of Public Works, Flood Zone Determination Website, <http://dpw.lacounty.gov/floodzone/>.

6.0 Other Environmental Considerations

upgraded if needed. In the proposed condition, stormwater runoff would not encounter unprotected soils within landscaped areas.

The proposed Project will not modify the existing drainage patterns and would address any increases in runoff through compliance with the MS4 Permits and upgrades to existing stormwater infrastructure, if needed.

Impacts related to altering the existing drainage pattern of the area of the proposed Project that would result in erosion or siltation during the operation phase would be less than significant.

**Threshold: In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?**

A significant impact would occur if the proposed Project were located within an area susceptible to flooding because of the failure of a levee or dam. A significant impact could occur if the proposed Project were located in an area subject to inundation by seiche, tsunami, or mudflow. A seiche is an oscillation of a body of water in an enclosed or semi-enclosed basin, such as a reservoir, harbor, or lake. A tsunami is a sea wave produced by a significant undersea disturbance. Mudflows result from the down-slope movement of soil and/or rock under the influence of gravity.

**Construction and Operation**

The proposed Project is located within FEMA unshaded Zone X, which is defined as an area outside the 0.2 percent annual chance floodplain. Further, the proposed Project is outside of the floodplain of any nearby flood control channel (Centinela Creek and Dominguez Channel). Any increase in peak flow or runoff volumes in the proposed condition would be addressed through compliance with the MS4 Permit and drainage system upgrade as part of the proposed Project.

The proposed Project is not located in any established tsunami inundation area, liquefaction zone, or landslide zone. The proposed Project is at least 1.3 miles away from any open water feature and, therefore, would not be subjected to seiche events. As stated above, the proposed Project proposed is relatively flat within both the Ballona Creek and Dominguez Channel Watersheds, and it is not adjacent to any exposed or steep grades.

Therefore, the proposed Project would have no impact related to exposing people or structures to loss, injury, or death involving flooding during either the construction or operational phases.

**Threshold:** Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

#### Construction

Regular construction activities have the ability to result in the degradation of water quality, most noticeably from erosion and sedimentation. Loose sediment itself may degrade water quality and has the capacity to carry such pollutants as heavy metals, nutrients, pathogens oil and grease, and fuels. Additionally, construction may expose the proposed Project's location and stormwater to trash, solvents, paint, etc. The CGP requires the implementation of BMPs to eliminate or reduce the discharge of pollutants in stormwater discharges and prohibits the discharge of nonstormwater from construction sites because these nonstormwater discharges are likely to carry pollutants to receiving waters. The BMPs detailed in the SWPPP will minimize potential for impacts from erosion and sedimentation during construction. The SWPPP will also detail use of BMPs to minimize the potential for spills of toxic or hazardous chemicals or substances into surface or ground waters.

Impacts related to otherwise substantially degrading water quality during the construction phase would be less than significant.

#### Operation

The Project will address proposed changes in land use, which often results in changes in pollutant contributions, through an analysis of the anticipated pollutant concentrations and loads under both the existing and proposed condition. Any projected increase in pollutant concentrations or loads will be addressed through compliance with the MS4 Permit, as well as site-specific BMPs to address any increases in pollutant concentrations or loads.

Impacts related to substantially degrading water quality during the operation phase would be less than significant.

### 6.4.8 Mineral Resources

Would the project:

**Threshold:** Result in the loss of availability of a known mineral resource that would be of future value to the region and the residents of the State?

Significant impacts would occur if the proposed Project's implementation would result in the loss of availability of a known mineral resource.

The proposed Project is located within a Mineral Resources Zone 3 (MRZ-3), which is an area where significant mineral deposits cannot be evaluated based on current and available data.<sup>31</sup> The State of California has not classified or designated mineral resource zones within the area, and the Bureau of Land Management mineral potential maps also indicate no prospective valuable deposits.<sup>32</sup>

In addition, the proposed Project is located entirely within a highly developed urban area characterized by commercial, industrial, and residential land uses. No records exist with respect to the presence of valuable mineral resources within the proposed Project's area or the immediate surrounding area, and no mining is currently taking place in the City.<sup>33</sup>

No impacts would occur.

**Threshold:** Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

Significant impacts would occur if the proposed Project were to result in the loss of availability of a locally important mineral resource recovery site.

The proposed Project is located within MRZ-3 and, as such, information is not available to determine whether valuable mineral resources are deposited on site.

As mentioned above, the proposed Project is located entirely within a highly developed urban area characterized by commercial and residential uses and no mining operations are currently being conducted in the City. There are no records of valuable mineral resources within the proposed Project's footprint or the immediate surrounding area.<sup>34</sup>

No impacts would occur.

34 LA County DRP, General Plan 2035, "General Plan Update Program—Interactive Map (GP-NET)."

### 6.4.9 Noise

Would the proposed Project:

**Threshold:** For a project within an airport land use plan or, where such a plan has not been adopted within 2 miles of a public airport or public use airport, would the Project expose people residing or working the Project area to excessive noise levels?

A significant impact would occur if the proposed Project were to expose people residing or working in the proposed Project area to excessive noise levels from a public airport or public use airport.

The Federal Aviation Administration (FAA) requires airports to prepare noise contour maps to assess the effects of aircraft noise to surrounding land uses. These maps can be used as an indicator of potential impacts. The closest airports to the proposed Project are the Hawthorne Municipal Airport (HHR), approximately 1.5 miles to the south, and Los Angeles International Airport (LAX), approximately 2 miles to the west of the proposed Project. Noise contours for the Hawthorne Municipal Airport remain confined within the runway of the airports and not within the proposed Project immediate area.<sup>35</sup>

The proposed Project is partially located within the Planning Boundary/Airport Influence Area for the LAX Airport, as designated within the Los Angeles County ALUP.<sup>36</sup> The proposed Project falls within the Airport Influence Area and Airport Compatibility Zone for LAX for the southern LAX runway. Portions of the proposed Project are within the 65 dBA CNEL noise contour. This includes a portion of the proposed Project located within street rights-of-way on E. Manchester Boulevard and Prairie Avenue. The proposed Project is not considered a noise sensitive use in and of itself; therefore, noise associated with LAX would not create any impacts. Further, according to the Los Angeles World Airports' Noise Contour Map for the first quarter of 2018, the proposed Project is not located within noise contours associated with LAX as determined by studies by Los Angeles World Airports.<sup>37</sup>

Therefore, the proposed Project would not expose people to excessive noise levels associated with airport uses. As such, impacts would be less than significant.

<sup>35</sup> LA County DRP, Hawthorne Airport: Airport Influence Area (May 13, 2003), [http://planning.lacounty.gov/assets/upl/project/aluc\\_airport-hawthorne.pdf](http://planning.lacounty.gov/assets/upl/project/aluc_airport-hawthorne.pdf).

### 6.4.10 Population, Employment, and Housing

Would the proposed Project:

**Threshold:** Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

A significant impact would occur if the proposed Project were to displace substantial numbers of existing housing. The proposed Project would be constructed entirely within the existing public rights-of-way along City streets except for the MSF and the PDSs. These features would be built on sites that are either currently vacant or being used for commercial or industrial purposes. As such, no housing would be displaced because of the proposed Project's implementation, and no impacts would occur. As noted above, portions of the proposed Project would be constructed and operated in areas that are proximate to residential uses. The proposed Project's elevated guideway and stations would be constructed almost entirely within existing public rights-of-way along existing City streets. The potential sites for the MSF and PDS facilities are either vacant or are currently occupied by nonresidential uses. The EIR will address whether the proposed Project may have an indirect effect on these uses as a result of noise or vibration.

In addition, the proposed Project is consistent with the City's General Plan and Downtown TOD Plan and will assist the City in achieving the goals of these plans by supporting economic development in areas located along the proposed alignment by providing an additional transit option and reducing congestion on streets throughout the City. The existing number of travel lanes and traffic capacity of these streets will be maintained. Access and circulation to existing businesses and residences located along the proposed alignment will be maintained at all times during construction and the ITC Construction Commitment Program includes program to support local businesses during construction including the provision of funding for temporary signage and advertising during construction to help businesses affected by construction.

The ATS guideway and stations will be located within the public right of way and designed in accordance with the ITC Design Standards and Guidelines (Design Guidelines) to ensure the Project is integrated into the streets it is located on in a complementary manner. For these reasons, it is not expected that the project will result in business closures or vacancies. If any commercial property vacancies occur along the proposed alignment, these vacancies are expected to be short term and would not result in changes to the character of the community that would result in physical impacts to the environment that would be significant.

### 6.4.11 Public Services

**Threshold:** Would the Project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:

**i) Fire protection?**

The proposed Project would have a significant impact on fire protection if it were to require the addition of a new fire station or the expansion, consolidation, or relocation of an existing facility to maintain service. Services include fire suppression; hazardous materials protection; emergency medical treatment, including basic and advanced life support transportation; earthquake and fire safety planning; fire inspections; and building plan reviews.

The City is served by Battalion 20 within Division 6 of LACFD. Battalion 20 operates six stations in total; four of these serve the City (Fire Stations 170, 171, 172, and 173). Fire Station 171 is located approximately 0.25 miles west of the proposed Project at 141 W. Regent Street; Station 172 is approximately 0.7 miles north at 810 Centinela Avenue; Station 173 is approximately 1 mile east at 9001 S. Crenshaw Boulevard; and Station 170 is approximately 1.1 miles southeast at 10701 S. Crenshaw Boulevard. The stations are staffed in three rotating shifts (A, B, and C). A three-platoon schedule is based on 24-hour shifts that start at 8 AM. Standard company staffing is generally a minimum of 25 personnel per shift. An assistant deputy chief oversees each of the three divisions.

Although the proposed Project would help accommodate large numbers of persons attending events at adjacent sports and entertainment venues, these people would likely be in the proposed Project's vicinity due to events at LASED or proposed IBEC. The reduction in vehicle traffic that would directly result from the proposed Project's implementation could potentially reduce the amount of fire services required in the area. Therefore, implementation of the proposed Project would not represent an increase in the need for these services.

Impacts would be less than significant.

**ii) Police protection?**

The proposed Project would have a significant impact on police protection services if it were to require expanded police services in the area as a result of the proposed Project's implementation.

Law enforcement services in the City are provided by the Inglewood Police Department (IPD). IPD operates one police station that houses most of the department's offices, located adjacent to Inglewood City Hall at One Manchester Boulevard. The Office of the Chief of Police, the Patrol Bureau, the Detective Bureau, the Records Division, the Custody Division, and the pistol range are all located at the police station. The Communications Division is located in the basement of the station, known as the Emergency Operations Center. The offices for the Traffic Division, the Training Section, and the Personnel Section are located on the second floor of the City Hall Building. IPD has 186 sworn officers and approximately 92 civilian personnel. The department comprises three major offices: Administrative Services, Criminal Investigative Services, and Patrol Services.

Although the proposed Project would help accommodate large numbers of persons attending events at adjacent sports and entertainment venues associated with LASED and proposed IBEC, these people would likely be in the proposed Project's vicinity regardless of the proposed Project's implementation. The proposed Project would provide an alternative mode of transit for persons attending such events but would not result in greater attendance than would otherwise be expected to occur. Because the proposed Project would divert some attendees who would otherwise travel by private vehicle, the proposed Project will reduce vehicle traffic. The reduction in surface vehicle traffic could potentially reduce the amount of police services required in the area. Therefore, the implementation of the proposed Project would not increase the need for police services.

Impacts would be less than significant.

**iii) Schools?**

Significant impacts would occur if the Project were to necessitate the construction or expansion of schools in the proposed Project's area.

The proposed Project would not result in an increase in the number of residents; thus, there would be no increase in demand for school facilities. Because the proposed Project will primarily serve to accommodate persons attending one-day events at adjacent sports and entertainment venues, the construction or expansion of schools would not be required because of the proposed Project's implementation.

No impacts would occur.

**iv) Parks?**

Significant impacts would occur if the proposed Project were to result in a need for new or expanded parks facilities.

6.0 Other Environmental Considerations

The proposed Project would not result in an increase in the number of residents; thus, there would be no increase in demand for parks and recreational facilities. Because the proposed Project will primarily serve to accommodate persons attending one-day events at adjacent sports and entertainment venues, the construction or expansion of parks or recreational facilities would not be required because of the proposed Project's implementation.

No impacts would occur.

v) **Other public services?**

Significant impacts would occur if the proposed Project were to result in an increased need in public services other than those described above.

The proposed Project would not result in an increase in the number of residents; thus, there would be no increase in demand for other public services such as libraries. Because the Project will primarily serve to accommodate persons attending one-day events at adjacent sports and entertainment venues, the construction or expansion of library facilities would not be required because of the proposed Project's implementation.

No impacts would occur.

**6.4.12 Recreation**

Would the project:

**Threshold:** **Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?**

Significant impacts would occur if the proposed Project were to result in an increased use of existing recreational facilities such that these facilities would need to be expanded or new ones constructed.

The proposed Project would primarily serve special events at the existing, under-construction, and proposed sports and entertainment venues associated with LASED. As such, most of ridership would use the proposed Project for events at those facilities and would not visit existing neighborhood or regional parks. In addition, weekday commuter ridership on nonevent days would not increase the use of neighborhood and regional parks.

No impacts would occur.

6.0 Other Environmental Considerations

**Threshold:** **Include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?**

Significant impacts would occur if the proposed Project were to include recreational facilities or required the expansion or construction of existing residential facilities.

The proposed Project does not include recreational facilities. Because it will primarily serve to accommodate persons attending one-day events at adjacent sports and entertainment venues, the construction or expansion of recreational facilities would not be required because of the proposed Project's implementation.

**6.4.13 Utilities and Service Systems**

Would the proposed Project:

**Threshold:** **Have sufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry, and multiple dry years?**

A significant impact could occur if a project were to increase water consumption to such a degree that new water sources would need to be identified.

Water supply to the City is provided through WBMWD and the West Coast Groundwater Basin via City wells.<sup>38</sup> The City's UWMP concludes that Inglewood has sufficient existing water supplies so that a nonwater-intensive project, such as the one proposed, would not result in a strain on existing water supplies. Because water supplies in the proposed Project area are more than sufficient, impacts would be less than significant.

**Threshold:** **Result in a determination by the wastewater treatment provider which serves or may serve the Project that it has adequate capacity to serve the Project's projected demand in addition to the provider's existing commitments?**

A significant impact would occur if a project were to increase water consumption or wastewater generation to such a degree that the capacity of the existing facilities would be exceeded.

Water is provided to the proposed Project via WBMWD as well as City-owned wells. Wastewater generated by the proposed Project would be treated at the JWPCP.

---

<sup>38</sup> City of Inglewood, Final Draft 2015 Urban Water Management Plan, <https://www.cityofinglewood.org/DocumentCenter/View/1061/2015-Urban-Water-Mangement-Plan-PDF?bidid=>

6.0 Other Environmental Considerations

Development of the proposed Project would not significantly increase the demand for water and wastewater treatment services within the City. The ATS trains are electrified systems; the operation of the trains would not require significant water resources because none of its constituent components is water dependent. In addition, activities at the MSF and PDS sites would not require additional water demands such that existing facilities would need expansion or new facilities constructed. The routine maintenance and storage of parts of the ATS trains at the MSF would not require significant amounts of water except for train washing. Activities that would take place at the MSF includes service activities to the ATS train cars, vehicle storage, loading platforms, and a paint booth. Although water and wastewater lines may need to be relocated, no aspect of the construction or operation of the proposed Project would require new or expanded water or wastewater treatment facilities.

Impacts would be less than significant

**Threshold: Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?**

A significant impact would occur if a project were to increase solid waste generation to a degree such that the existing and projected landfill capacity would be insufficient to accommodate the additional solid waste.

Solid waste services in the City are provided by Consolidated Disposal Service (CDS); trash collected in the City is taken to CDS's American Waste Transfer Station in the City of Gardena, where it is sorted; residual garbage is taken to the Consolidated Volume Transport Disposal and Recycling Center (CVT) in the City of Anaheim, and recycling and green waste is taken to CDS's Compton Transfer Station in the City of Compton.<sup>66</sup> Solid waste generated in the City is ultimately disposed of at various landfill facilities located throughout Los Angeles County.

The proposed Project would generate additional solid waste from construction debris, activities, and site preparation, as well as during operation of the proposed Project. Solid waste generated during construction and operation of the proposed Project would have to be separated and recycled. As described in Los Angeles County's most recent landfill disposal capacity report, a shortfall in permitted solid waste disposal capacity within the County is not anticipated to occur under forecasted growth and ongoing municipal efforts at waste reduction and diversion. The proposed Project would not drastically change the amount of solid waste disposal projected by the County due to the fact that the operations phase would generate minimal waste. Impacts would be less than significant.

6.0 Other Environmental Considerations

**Threshold: Comply with federal, State, and local management and reduction statutes and regulations related to solid waste?**

A significant impact would occur if a project were to generate solid waste that was not disposed of in accordance with applicable regulations.

Assembly Bill (AB) 939 requires every city and county to divert 50 percent of its waste from landfills by the year 2000 through such means as recycling, source reduction, and composting.<sup>39</sup> In addition, AB 939 requires each county to prepare a countywide siting element for a 15-year period, specifying areas for transformation or disposal sites to provide capacity for solid waste generated in the county that cannot be reduced or recycled. Further, AB 1327, the California Solid Waste Reuse and Recycling Access Act of 1991, requires local agencies to adopt ordinances mandating the use of recyclable materials in development projects.<sup>40</sup>

The proposed Project would generate solid waste during both construction and operation that is typical of the development of a mechanical transportation system and industrial uses. This includes typical construction waste such as wood, concrete, and asphalt, as well as operational waste such as that collected from pedestrians and employees.

The proposed Project would fully comply with all federal, State, and local statutes and regulations regarding proper disposal. Impacts would therefore be less than significant.

**6.4.14 Wildfire**

If located in or near State responsibility areas or lands classified as very high fire hazard severity zones, would the project:

**Threshold: Substantially impair an adopted emergency response plan or emergency evacuation plan?**

Significant impacts would occur if the proposed Project were to impair the implementation of an adopted emergency response or emergency evacuation plan.

The City is located in a fully developed urban area that is not associated with wildland fires. According to the Fire Hazard Severity Zone mapping done by the California Department of Forestry and Fire Protection, the proposed Project is located in an incorporated city that is considered to be in the Non Very High Fire

<sup>39</sup> CalRecycle, "Assembly Bill 939," <http://www.calrecycle.ca.gov/laws/legislation/calhist/1985to1989.htm>. Accessed October 2021.

<sup>40</sup> CalRecycle, "Ordinances, Resolutions, and Policies," <http://www.calrecycle.ca.gov/LGCentral/Library/LocalDocs/Policy.htm>. Accessed October 2021.

6.0 Other Environmental Considerations

Hazard Safety Zone (non-VHFHSZ).<sup>41</sup> The City is responsible for fire protection in the area, which is implemented in part by enforcement of the Fire Code requirements contained within the Building Code, as well as fire protection services provided by the City Fire Department.

As described in **Section 4.8: Hazards and Hazardous Materials**, the proposed Project is located largely within public rights-of-way. For this reason, construction activities associated with the proposed Project would likely cause the closure of travel lanes in streets along the elevated guideway. The City has planned evacuation routes that assume worst-case displacement and surface rupture from a seismic event in the region along the Newport-Inglewood Fault or Potrero Fault, as described in the Safety Element of the City's General Plan.<sup>42</sup>

However, the closure of lanes would be temporary and such closures would only be associated with the construction phase of the proposed Project. A Traffic Management Plan will be prepared to ensure that interference with area traffic is minimized. This would include ensuring that routes to the emergency room at the adjacent Centinela Hospital Medical Center would be maintained. The plan will require that emergency access be maintained throughout the proposed Project's construction. Therefore, the proposed Project's impacts on emergency response or evacuation plans would be less than significant.

**Threshold:** Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

Significant impacts would occur if the proposed Project were to exacerbate wildfire risks, and thereby expose Project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire due to slope, prevailing winds, and other factors.

The City is a fully developed urban area that is not associated with wildland fires. As mentioned previously, the proposed Project is located in an area considered to be non-VHFHSZ.<sup>43</sup> The City is responsible for fire protection in the area, which is implemented in part by enforcement of Fire Code requirements contained within the Building Code, as well as fire protection services provided by the City Fire Department.

As described in **Section 4.7: Greenhouse Gas Emissions**, the proposed Project is located on level terrain. Based on the topographic setting and a review of previous geotechnical evaluations in the proposed Project's vicinity, no historical landslides are known to have occurred that could potentially impact the

42 City of Inglewood, General Plan (adopted July 1995).  
43 California Department of Forestry and Fire Protection, 2011. Fire and Resource Assessment Program. Very High Fire Hazard Severity Zones in LRA as Recommended by CAL FIRE. Los Angeles County.

6.0 Other Environmental Considerations

proposed Project. The nearest surrounding mountains, the Santa Monica Mountains, are more than 10 miles to the north.<sup>44</sup>

According to the CGS,<sup>45</sup> the proposed Project is not located within an Earthquake-Induced Landslide Zone as shown on the Earthquake Zones of Required Investigation, Inglewood Quadrangle map. The probability of seismically induced landslides occurring within the area of the proposed Project is not significant due to the general lack of elevation difference in slope geometry across or adjacent to the site. In addition, development of the proposed Project would not substantially alter the existing topography of the area.

Therefore, the proposed Project's impacts on exacerbation of wildfire risks, and thereby exposure of Project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire would be less than significant due to slope, prevailing winds, and other factors.

**Threshold:** Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

Significant impacts would occur if the proposed Project were to require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.

As discussed above in **Section 4.14: Utilities and Service Systems**, the proposed Project will require utility systems improvements, upgrades, and possible relocations to accommodate and serve the various project related components. The design and construction of the proposed Project's elevated guideway structures, stations and support facilities will avoid existing utility and other infrastructure to the degree possible. In addition to surface improvements, some utility infrastructure that cannot be avoided may need to be relocated to accommodate the guideway columns and foundations. As mentioned above, the City is a fully developed urban area that is not associated with wildland fires. According to the Fire Hazard Severity Zone mapping done by the California Department of Forestry and Fire Protection, the proposed Project is located in an incorporated city that is considered to be non-VHFHSZ.<sup>46</sup> The City is responsible for fire protection in the area, which is implemented in part by enforcement of Fire Code requirements contained within the Building Code, as well as fire protection services provided by the City Fire Department. With

44 Google Maps, <https://www.google.com/maps>. Accessed October 2021.  
45 CDC, CGS, Earthquake Zones of Required Investigation.  
46 California Department of Forestry and Fire Protection, 2011. Fire and Resource Assessment Program. Very High Fire Hazard Severity Zones in LRA as Recommended by CAL FIRE. Los Angeles County.

adherence to Fire Code requirements contained within the Building Code and implementation of fire protection services provided by the City Fire Department, any potential infrastructure-induced fire risk or ongoing environmental impacts would be less than significant.

**Threshold: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?**

Significant impacts would occur if the proposed Project were to expose people or structures to impacts associated with downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes. The City is a fully developed urban area that is not associated with wildland fires. According to the Fire Hazard Severity Zone mapping done by the California Department of Forestry and Fire Protection, the proposed Project is located in an incorporated city that is considered to be non-VHFHSZ.<sup>47</sup> The City is responsible for fire protection in the area, which is implemented in part by enforcement of Fire Code requirements contained within the Building Code, as well as fire protection services provided by the City Fire Department.

As discussed in **Section 4.7**, the proposed Project is located on level terrain. Based on the topographic setting and a review of previous geotechnical evaluations in the proposed Project's vicinity, no historical landslides are known to have occurred that could potentially impact the proposed Project.

According to the CGS,<sup>48</sup> the proposed Project is not located within an Earthquake-Induced Landslide Zone as shown on the Earthquake Zones of Required Investigation, Inglewood Quadrangle map. The probability of seismically induced landslides occurring within the area of the proposed Project is not significant due to the general lack of elevation difference in slope geometry across or adjacent to the site. In addition, development of the Project would not substantially alter the existing topography of the area.

No streams or rivers run within the proposed Project's location, nor does it propose any changes to existing drainage patterns. During construction, BMPs (required and monitored under the SWPPP) would be used to reduce the volume and velocity of stormwater runoff, thereby mitigating the potential for flooding due to construction. Any accumulated sediment observed during inspection of temporary BMPs or permanent stormwater network devices would be removed to prevent flooding. The proposed Project is located outside the 100-year Federal Emergency Management Agency (FEMA) flood hazard area.<sup>49</sup> No

<sup>47</sup> California Department of Forestry and Fire Protection, 2011. Fire and Resource Assessment Program. Very High Fire Hazard Severity Zones in LRA as Recommended by CAL FIRE. Los Angeles County.

<sup>48</sup> California Department of Forestry and Fire Protection, 2011. Fire and Resource Assessment Program. Very High Fire Hazard Severity Zones in LRA as Recommended by CAL FIRE. Los Angeles County.

<sup>49</sup> County of Los Angeles, Department of Public Works, Flood Zone Determination Website, <http://dpw.lacounty.gov/floodzone/>.

topographic changes or altered drainage patterns are currently proposed as part of the proposed Project, and any increases in runoff would be handled through compliance with MS4 Permit requirements during operation.

As such, no impacts associated with downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes would occur.

## 6.5 GROWTH INDUCING EFFECTS

As required CEQA Guidelines section 15126.2(e),<sup>50</sup> an EIR must discuss ways in which a project could foster economic or population growth or the construction of additional housing, either directly or indirectly, in the surrounding environment. Also, an EIR must discuss the characteristics of a project that could encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. Growth can be induced in a number of ways, such as through the elimination of obstacles to growth, through the stimulation of economic activity within the region, or through the establishment of policies or other precedents that directly or indirectly encourage additional growth. The purpose of this section is to evaluate the potential growth-inducing effects resulting from the implementation of the proposed Project in the greater Los Angeles area. Additional analysis of the effects of the proposed Project on population and employment growth is provided in **Section 4.11: Population, Employment, and Housing**.

In general, a project may foster spatial, economic, or population growth in a geographic area if the project removes an impediment to growth (e.g., the establishment of an essential public service, the provision of the new access to or infrastructure capacity that serves an area; a change in zoning or general plan designations that increase density for areas outside the boundaries of a project site); or indirectly stimulates economic expansion or growth that occurs in an area in response to the project (e.g., changes in revenue base, employment expansion, etc.). These circumstances are further described below:

- **Elimination of Obstacles to Growth:** This refers to the potential for a project to remove infrastructure limitations or provide infrastructure capacity, or remove regulatory constraints that could result in growth unforeseen at the time of project approval; and
- **Economic Effects:** This refers to the potential for a project to cause increased activity in the local or regional economy. Economic effects can include such effects as the Multiplier Effect. A "multiplier" is an economic term used to describe inter-relationships among various sectors of the economy. The Multiplier Effect provides a quantitative description of the direct employment effect of a project, as well as indirect and induced employment growth. The multiplier effect recognizes that the on-site employment and population growth of each project may not be the complete picture of growth caused by the project.

<sup>50</sup> CEQA Guidelines sections 15126.2(e).

### Elimination of Obstacles to Growth

The elimination of physical obstacles to growth is considered a growth-inducing effect. The proposed Project is located in a highly urbanized area in the vicinity of other facilities designed to accommodate large sporting and entertainment events. Common factors that limit growth include limited capacities of local or regional utility infrastructure, such as storm drainage systems, or wastewater conveyance and treatment systems. Transportation infrastructure can also be a factor that limits growth.

The proposed Project is located within a fully urbanized landscape, with extensive transportation and utility infrastructure designed to accommodate urban development in the City and the larger South Bay region.

### Economic Effects

**Section 4.11, Population, Employment, and Housing** describes potential employment of the proposed Project. The proposed Project is anticipated to have a total direct employment of up to 150 full-time equivalent people. This would include workforce requirements for the operation and maintenance necessary for the proposed Project, including system engineers, operators, maintenance personnel, janitorial crews, security, and other jobs. These jobs would extend beyond construction and into oversight of long-term operations.

Additionally, the proposed Project will provide funding for the support and transition of jobs through the California Climate Investments which facilitate GHG emission reductions and deliver a suite of economic, environmental, and public health co-benefits, including job co-benefits. Approximately 11,516 jobs will be benefitted through these funds and programs. Estimated jobs supported by the California Climate Investments through the proposed Project can be found in the **Table 4.11-8**.

The proposed Project would also result in some existing uses located on properties proposed for acquisition in order to accommodate the various Project components (guideway, stations, and MSF). Existing uses located on these properties include the commercial/retail center at the southeast corner of Florence Avenue and Market Street that would be removed for the Market Street/Florence Avenue station, the office uses at the southwest corner of Prairie Avenue and Manchester Boulevard, the commercial/retail space at the northwest corner of Prairie Avenue and Hardy Street, the commercial uses at 500 and 510 Manchester Boulevard that would be removed for the proposed MSF, and the commercial building that would be removed to allow for the encroachment of the guideway at 150 S. Market Street. The existing work force for these uses include:

- The retail commercial center at Market Street and Florence Avenue with an estimated 284 workers employed at the various commercial and retail uses.
- The private property at the southwest corner of Prairie Avenue and Manchester Boulevard with an estimated 98 workers employed under office uses.

- The private property at the northwest corner of Prairie Avenue and Hardy Street with an estimated 123 workers employed at the various commercial/retail/office uses.
- The commercial use at 150 S. Market Street with an estimated 37 workers; and
- Existing businesses at the commercial center at 500 and 510 Manchester Boulevard (grocery store, café, gym, bank, and a gas station) which have a combined estimated workforce of 172 workers.<sup>51</sup>

In total, the existing businesses on these properties which would be displaced by the construction of the proposed Project employs approximately 733 workers (for existing employment details refer to **Table 4.11-6**). To the extent these businesses relocate in Inglewood, these existing jobs would be retained.

The proposed Project would generate approximately 150 full-time jobs for the operation and maintenance of the ATS trains and will either directly or indirectly benefit 11,516 jobs. This results in a net support for approximately 10,783<sup>52</sup> jobs with the implementation of the proposed Project. Furthermore, ongoing, and proposed developments along the elevated guideway would also benefit from the implementation of the proposed Project. Nearby projects such as the Hollywood Park Specific Plan (HPSP) and the Los Angeles Sports and Entertainment District (LASED) would also provide additional jobs and employment opportunities. The HPSP is projected to generate approximately 517 net new jobs<sup>53</sup> while the IBEC is projected to generate 833 net new jobs,<sup>54</sup> resulting in a combined 1,350 net new jobs from adjacent projects. Since jobs supported by the implementation of the proposed Project does not directly correlate to the number of new jobs created, the number of jobs created does not directly correlate to population growth within the area.

As previously discussed, approximately 92 percent of the residents in the City currently commutes to work outside of the City, with the remaining 8 percent of residents working within the City (**Table 4.11-5**). This pattern points to a regional spread in work locations for the City residents. Because of this, local fluctuations in job generation are unlikely to directly impact population growth within the City. Even though the proposed Project will either directly or indirectly support 10,783 jobs, the implementation of the proposed Project will only directly create 150 full-time equivalent jobs. Therefore, not all jobs

51 Number of employees generated by each commercial plaza area are calculated using the square footage of the facilities multiplied by a set factor. The factor used is 2.2371 employees per 1,000 SF, which is found in Inglewood Unified School District's Commercial Fee Justification Study 2018. The report can be located at: [https://www.lbschools.net/Asset/Files/Business\\_Services/Developer\\_Fees/2018/2018-Commercial-Fee-Justification-Study.pdf](https://www.lbschools.net/Asset/Files/Business_Services/Developer_Fees/2018/2018-Commercial-Fee-Justification-Study.pdf). Accessed September 7, 2021. It is important to note that land areas and number of employees are rounded numbers used for estimates for analysis purposes only.

52 11,516 minus 733 in numbers of jobs displaced.

53 Hollywood Park Specific Plan. "Introduction Executive Summary." <https://www.cityofinglewood.org/DocumentCenter/View/125/1-Introduction-Executive-Summary-PDF>. Accessed October 2021.

54 City of Inglewood. Summary. <https://www.cityofinglewood.org/DocumentCenter/View/13888/03-Summary>. Accessed October 2021.

supported by the proposed Project will translate into an increase in population growth for the local area or the region.

Additionally, according to SCAG 2020-2045 RTP/SCS, approximately 8,389,000 jobs were available in 2016 across industries in the region and the number of jobs available would increase to 10,050,000 by 2045, an increase of approximately 0.62 percent or approximately 52,700 annually in jobs.<sup>55</sup> The proposed Project would provide benefits to approximately 0.13 percent of the jobs in the region based on the 2016 jobs number or approximately 20 percent of new jobs added to the region annually. The jobs that would be supported by the proposed Project in the region is within the regional trends provided by the SCAG 2020-2045 RTP/SCS data and the jobs that would benefit from the proposed Project does not directly translate into population growth.

As a result of this analysis, the proposed Project will not substantially induce population growth beyond the regionally projected value. Therefore, there is a less than significant impact on employment and population growth from the operation of the proposed Project.

### Environmental Effects of Induced Growth

The proposed Project's is a transit system that spans the length of approximately 1.6 miles and would be located near existing residential, office, retail, and commercial land uses which generate vehicle trips on local roadways within the City. The proposed Project would provide direct connections between regional transit provided by Metro, specifically at the Metro K line, and other transit providers as well as the City's major activity centers, such as The Forum, the LASED and HPSP. Implementation of the proposed Project would provide an alternate mode of transportation within the City and decrease vehicle ridership and thereby resulting in a corresponding decrease in VMTs.

The proposed Project would be designed to accommodate a projected demand of approximately 11,450 travelers during the peak hour in each direction for special-events service, which occurs during a three event night.<sup>56</sup> In addition, the operations to serve the normal weekday peak-hour ridership outlined in the Lea+Elliott Report would be approximately 414 pedestrians per hour per direction (pphpd). At 2.0 minutes headway, the system capacity is approximately 11,000 pphpd. **Table 4.12-8** shows the projected ridership numbers for the proposed Project.

VMT estimates are derived from the Transportation Study (see **Appendix O**) and are shown in **Table 4.7-7** for the six operational scenarios with and without the proposed Project. As shown, the proposed Project daily and annual VMT are less than the daily and annual VMT without the proposed Project.

<sup>56</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition, August 2021.

<sup>56</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition, August 2021.

Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce VMT accordingly.

The proposed Project will help manage and support the City's projected growth by providing transit within a safe and accessible walking distance to thousands of new residents, housing units and jobs. The proposed Project's connection from the City's new housing and employment centers, and sports and entertainment venues, to the Metro K Line and larger regional and State rail system will result in significant benefits for both the City and southern California region. The housing and employment growth projected in the City, together with the proposed Project, are generating approximately 6.9 million annual boardings on the regional transportation system in 2026 and increase to approximately 13.9 million annual boardings in 2076;<sup>57</sup> the resulting reduction in VMT in 2026 is approximately 30 million, and in 2076 will reach 67.4 million. These reductions will improve air quality through reduced emissions and generate a significant reduction in the generation of GHG emissions throughout the region.

The incremental changes in economic activity created by the indirect and induced employment associated with the proposed Project would be a small part of the overall future growth in economic activity in the City or the greater Los Angeles metropolitan region. The City is approving additional employment-generating land uses such as the LASED and HPSP, which would benefit from the proposed Project. Through their planning and entitlement actions, the future actions of the City and other surrounding local agencies would be subject to environmental review under CEQA and would be required to be consistent with regional and State plans and regulations. To the extent that future development that accommodates indirect and induced growth from the proposed Project is undertaken in a manner consistent with the multitude of planning and regulatory documents referred to throughout the technical sections of this EIR, many of the potential adverse environmental consequences would be reduced in magnitude or avoided altogether.

Although the economic effect of indirect and induced employment can be predicted because the adverse physical environmental impacts of these economic effects could occur at locations throughout the City and the Los Angeles metropolitan region, the environmental consequences of this type of economic growth are too speculative to evaluate or predict. Pursuant to CEQA Guidelines section 15145, no further analysis of the environmental consequences of indirect or induced growth associated with the proposed Project is required under CEQA.

<sup>57</sup> City of Inglewood, Transit, and Intercity Rail Program (TIRCP) Application for the City of Inglewood Transit Connector Project, January 16, 2020. Table 6.

## 7.0 ORGANIZATIONS AND PERSONS CONSULTED

The City of Inglewood, with assistance from Meridian Consultants LLC, prepared this Recirculated Draft Environmental Impact Report (Recirculated Draft EIR). The report preparers and consultants are identified as follows, along with agencies, organizations, and individuals that provided information used to prepare this Recirculated Draft EIR.

### 7.1 LEAD AGENCY

The City of Inglewood is the Lead Agency for the preparation of this Draft EIR.

City of Inglewood  
One West Manchester Boulevard  
Inglewood, CA 90301

#### City of Inglewood

##### Administrative Office

Artie Fields: City Manager  
Louis A. Atwell, P.E.: Assistant City Manager/Public Works Department Director

##### Public Works Department

Eloy Castillo, Principal Civil Engineer  
Peter Puglese, P.E. T.E.: Principal City Traffic Engineer  
Elsa Moreno, GIS Analyst

##### Economic and Community Development Department

Christopher E. Jackson, Sr.: Director  
Mindy Wilcox, AICP: Planning Division, Planning Manager  
Fred Jackson: Planning Division, Senior Planner  
Taylor Kay: Planning Division, Assistant Planner

### 7.2 EIR PREPARERS

The following participated in the preparation of this document:

#### Meridian Consultants LLC

920 Hampshire Road, Suite A5  
Westlake Village, California 91361

Tony Locacciato, AICP, Partner, Principal-in-Charge  
Joe Gibson, Partner  
Christ Kirikian, Principal/Director, Air Quality and Acoustics  
Chris Hampson, Principal  
Barbara Wu Heyman, Associate Principal  
Christine Lan, AICP, Senior Project Manager

Leanna Williams, Senior Project Manager  
Holly Galbreath, Project Planner  
Evan Sensible, Project Planner  
Dillan Murray, Staff Planner  
Jeannie Ma, Staff Planner  
Jesse McCandless, Field Environmental Supervisor  
Marina Barton, Staff Planner/Biologist  
Lisa Maturkanic, Administrative Services Manager  
Matt Lechuga, Marketing Manager  
Tom Brauer, Graphics Specialist  
Rachel Bastian, Production Coordinator

### 7.3 ORGANIZATIONS CONSULTED

The following organizations provided information used in the preparation of this Draft EIR:

#### Trifiletti Consulting, Inc.

1541 Wilshire Boulevard, Suite 560  
Los Angeles, CA 90017

Lisa Trifiletti, Principal  
Desiree De La O, Director of Operations  
Omar Pulido, Senior Project Director  
Julie Soic, Senior Project Director  
Derek O'Hara, Project Director  
Todd Osborne, Project Manager  
Perla Solis, Planning Associate  
Elliott Cobb, Project Engineer  
Ellen Wright, Strategic Advisor

#### Sanjeev Shah, Inc.

1172 South Dixie Highway #527  
Coral Gables, FL 33146

HI	Hazard Index
HMBP	Hazardous materials business plan
HOT	High occupancy toll
HPSP	Hollywood Park Specific Plan
HRA	Health Risk Assessment
HRG	Historic Resources Group
HSWA	Hazardous and Solid Waste Amendments
Hz	Hertz
IBEC	Inglewood Basketball and Entertainment Center
ICT	Innovative Clean Transit Program
IEC	International Electrotechnical Commission
IHPA	Inglewood Historic Preservation Alliance
IIPP	Injury and Illness Prevention Program
IMC	City of Inglewood Municipal Code

*8.0 Terms, Definitions, and Acronyms*

IPCC	Intergovernmental Panel on Climate Change
IPD	Inglewood Police Department
ips	Inches per second
IRP	Integrated Water Resources Plan
ITC	Inglewood Transit Connector
ITDF	Inglewood Travel Demand Forecasting Model
ITF	Inglewood intermodal transit facility
JWPCP	Joint Water Pollution Control Plant
LACDRP	Los Angeles County Department of Regional Planning
LACFD	Los Angeles County Fire Department
LACM	Natural History Museum of Los Angeles County
LACSD	Los Angeles County Sanitation District
LADOT	Los Angeles Department of Transportation
LADWP	City of Los Angeles Department of Water and Power
LAMP	Landside Access Modernization Program
LARWQCB	Los Angeles Regional Water Quality Control Board
LASED	Los Angeles Sports and Entertainment District
LAWA	Los Angeles World Airports
LAX	Los Angeles International Airport
LAX ALUP	LAX Airport Land Use Plan
LCFS	Low Carbon Fuel Standard
LDP	Lead-based paints
LED	Light-emitting diode
LEPC	Local emergency planning center
LPA	Locally Preferred Alternative
LID	low-impact development
Lmax	Maximum noise level
LRT	Light Rail Transit
Lv	velocity level in decibels as measured in 1/3 octave bands of frequency over the frequency ranges of 8 to 80
MATES IV	Multiple Air Toxics Exposure Study
MBTA	Migratory Bird Treaty Act
MD	Midday

8.0 Terms, Definitions, and Acronyms

MDAB	Mojave Desert Air Basins
MDE	Maximum design element
MDR LCP	Marina Del Rey Local Coastal Program
Metro	Los Angeles County Metropolitan Transportation Authority
MEI	Maximally exposed individual
MHMP	Multi-Hazard Mitigation Plan
MM	Mitigation measure
MMRP	Mitigation monitoring and reporting program
MPO	Metropolitan planning organization
MRZ-3	Mineral Resources Zone 3
MS4	Municipal Separate Storm Sewer System
MSF	Maintenance and storage facility
MTA	Metropolitan Transportation Authority
MTD	Memo to designers
MTBE	methyl tertiary-butyl ether
NAAQS	National Ambient Air Quality Standards
NAHC	California Native American Heritage Commission
National Register/NR	National Register of Historic Places
NBA	National Basketball Association
NCCP	Natural Community Conservation Plan
NEHRPA	National Earthquake Hazards Reduction Program
NFL	National Football League
NFRAP	No Further Remedial Action Planned
NHPA	National Historic Preservation Act
NHTSA	National Highway Traffic Safety Administration
NIFZ	Newport-Inglewood Fault Zone
NIST	National Institute of Standards and Technology
NPPA	California Naive Plant protect act
NPS	National Park Service
NO	Nitric oxide
NOx	Nitrogen Oxide
NPDES	National Pollutant Discharge Elimination System
NSF	National Science Foundation

8.0 Terms, Definitions, and Acronyms

NSR	New Source Review
OEHHA	Office of Environmental Health Hazard Assessment
OES	Office of Emergency Services
OHP	Office of Historic Preservation
OPR	Office of Planning and Research
OSHA	Occupational Safety and Health Act
PCB	polychlorinated biphenyl
PCE	Perchloroethylene
PDS	Power Distribution System
PEM	Premium Efficiency Motors
PFA	Public Financing Authority
PHBT	Puente Hills Blind Thrust fault
PM	Evening Peak Hour
PM	Particulate Matter
PPV	Peak particle velocity
PRC	Public Resources Code
PSC	Property-specific Soil Criteria
PVC	Polyvinyl chloride
RCRA	Resource Conservation and Recovery Act
RFS	Renewable Fuel Standard
RHNA	Regional Housing Needs Allocation
RMS	Root mean square
ROGs	Reactive organic gases
ROW	Right-of-way
RPS	Renewable Portfolio Standards
RPZ	Reduced pressure zone
RTP/SCS	Regional Transportation Plan/Sustainable Communities Strategy
RWQCB	Regional Water Quality Control Board
SAFE Vehicles Rule	Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks
SAR	Second Assessment Report
SB	Senate Bill
SBCCOG	South Bay Cities Council of Governments
SCAB	South Coast Air Basin

8.0 Terms, Definitions, and Acronyms

SCAG	Southern California Association of Governments
SCAQMD	South Coast Air Quality Management District
SCCIC	South Central Coastal Information Center
SCE	Southern California Edison
SCP	Site Cleanup Program
SCS	Sustainable Communities Strategy
SEL	Sound exposure level
SERC	State Emergency Response Center
SGMA	Sustainable Groundwater Management Act
SHRC	State Historical Resources Commission
SLF	Sacred Lands File
SLMs	Sound level meters
SMFZ	Santa Monica Fault Zone
SMP	Soils Management Plan
SOx	Sulfur oxide
SP	Service population
SRTS	Safe Routes to Schools
SSMP	Sewer System Management Plan
SUSMP	Standard Urban Storm Water Mitigation Plan
SVP	Society of Vertebrate Paleontology
SWPPP	Storm Water Pollution Prevention Plan
SWRCB	State Water Resources Control Board
TAC	Toxic air contaminants
TBA	tert-Butyl alcohol
TCR	Tribal cultural resource
TIRCP	Transit and Intercity Rail Capital Program
TNC	Transportation network company
TNM	Traffic noise model
TOD	Transit Oriented Development
TOD Plan	City of Inglewood 2016 <i>New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines</i>
TPZ	Tree Protective Zone
TSA	Thomas Safran & Associates
TSCA	Toxic Substances Control Act

8.0 Terms, Definitions, and Acronyms

UPS	Uninterruptible power supplies
USDOE	US Department of Energy
USDOT	US Department of Transportation
USEPA	United States Environmental Protection Agency
USFWS	United States Fish and Wildlife Service
USGS	US Geological Survey
UWMP	City of Inglewood <i>2015 Urban Water Management Plan Update</i>
UST	Underground storage tank
VdB	Vibration decibels
VDC	Volt direct current
VMT	Vehicle miles traveled
VOC	Volatile organic compound
WBMWD	West Basin Municipal Water District
WMPs	Watershed Management Programs
YOLA	Youth Orchestra Los Angeles
ZE	Zero emissions

**Project Description:** (please use a separate page if necessary)

The Inglewood Transit Connector Project (ITC Project) is a 1.6-mile, three-station, fully elevated, electrically powered light-rail transit system, including, among other things, an Automated People Mover (APM) mass-transit line, proposed by the City to close the last-mile gap and connect passengers between the Metro Crenshaw/LAX Line and Downtown Inglewood to major event and activity centers, including the Forum, the Los Angeles Sports and Entertainment District (which includes SoFi Stadium) and the Inglewood Basketball and Entertainment Center. The ITC Project also includes a maintenance storage facility (MSF) for maintaining APM trains, two traction power substations (TPSSs) for providing power to the APM system, and surface parking facilities at the Market Street/Florence Avenue station, the MSF, and at 150 Market Street.

Note: The State Clearinghouse will assign identification numbers for all new projects. If a SCH number already exists for a project (e.g. Notice of Preparation or previous draft document) please fill in.

### **NOTICE OF AVAILABILITY OF A RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT**

NOTICE IS HEREBY GIVEN that the City of Inglewood (City or Inglewood) has prepared a Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) for the Inglewood Transit Connector Project (ITC Project). The Recirculated Draft EIR is being distributed for public review. Pursuant to the California Public Resources Code and the California Environmental Quality Act (CEQA) Guidelines, the City of Inglewood is the Lead Agency for the ITC Project.

**PROJECT TITLE: Inglewood Transit Connector Project**

**STATE CLEARINGHOUSE NO.: 2018071034**

**PROJECT DESCRIPTION:** The Inglewood Transit Connector Project (ITC Project) is a 1.6-mile, three-station, fully elevated, electrically powered light-rail transit system, including, among other things, an Automated Transit System (ATS) mass-transit line, proposed by the City to close the last-mile gap and connect passengers between the Metro K (Crenshaw/LAX) Line and Downtown Inglewood to major event and activity centers, including the Forum, the Los Angeles Sports and Entertainment District, including SoFi Stadium, and the Inglewood Basketball and Entertainment Center (Intuit Dome). Three stations are proposed: (1) The Market Street/Florence Avenue station generally located between Market Street and Locust Street; (2) The Prairie Avenue/Manchester Boulevard station located on the southwest corner of Prairie Avenue and Manchester Boulevard; and (3) The Prairie Avenue/Hardy Street station located on the northwest corner of Prairie Avenue and Hardy Street. The ITC Project also includes a maintenance storage facility (MSF) for maintaining ATS trains, two power distribution substations (PDSs) for providing power to the ATS system, and public parking along the proposed alignment at the Market Street/Florence Avenue station, 150 South Market Street and the Prairie Avenue/Hardy Street station. The proposed Project is planned to operate from 6:00 AM to 12:00 AM during the week and on weekends, with the possibility of extending operation hours as needed during special events.

**PROJECT LOCATION:** The proposed Project is located entirely in the central portion of the City, east of the San Diego Freeway (I-405) and north of the Glen Anderson Freeway (I-105) in Los Angeles County, California. The proposed alignment for the Project would be primarily located within the public right of way along Market Street, Manchester Boulevard, and Prairie Avenue, with limited encroachments on adjacent private property (See **Figure 1: Project Vicinity Map**).

**Environmental Topics Evaluated/Potentially Significant Impacts:** The Recirculated Draft EIR examines the potential impacts that would be generated by the ITC Project for the following environmental topics: Aesthetics, Air Quality, Biological Resources, Cultural Resources, Energy, Geology and Soils, Greenhouse Gas Emissions, Hazards and Hazardous Materials, Land Use and Planning, Noise and Vibration, Population, Employment, and Housing, Transportation, Tribal Cultural Resources, and Utilities and Service Systems. Less than significant impacts are identified for the following topics: Aesthetics, Energy, Greenhouse Gas Emissions, Hazards and Hazardous Waste, Noise and Vibration, Land Use and Planning, Population, Employment, and Housing, and Transportation. Potentially

November 11, 2021

significant impacts are identified related to the following topics: Air Quality, Biological Resources, Cultural Resources, Geology and Soils, Tribal Cultural Resources, and Utilities and Service Systems. Measures are identified to mitigate all potentially significant impacts to less than significant.

**Alternatives Evaluated:** (1) No Project, (2) Bus Rapid Transit (BRT) System, (3) Market Street Pedestrian Promenade, (4) 4th Station Alternative, (5) Prairie Avenue Single Station Alternative and (6) Maintenance and Storage Facility Relocation Alternative.

A portion of the Project Site, the MSF site located at 500 Manchester Boulevard, is included on the following list compiled pursuant to Section 65962.5 of the California Government Code: Historical Cortese list. The sites in this list are designated by the State Water Resource Control board [i.e., LUST sites], the Integrated WasteBoard [i.e., active, closed and inactive landfills, SWF/LF], and the Department of Toxic Substances Control [i.e., sites contain potential or confirmed hazardous substance release, CALSITES]. This list is no longer updated by the state.

### **Public Meeting**

A Public Meeting will be held at the date and time below to provide project information on the Project and Recirculated Draft EIR:

- **Date:** Monday, November 22, 2021
- **Time:** 6:00PM to 7:00PM

Please see below for instructions on how to join this meeting.

- **Zoom Meeting Weblink:**  
<https://trifiletticonsulting.zoom.us/j/86733559092?pwd=YWw3SFFSQUIZHRUeEU5Wml3U0tzQT09>
  - **Meeting ID:** 867 3355 9092      **Passcode:**1970
- **Join By Phone:**
  - **Number:** (253) 215-8782
  - **Number:** (346) 248-7799

**Public Comment Period:** The Recirculated Draft EIR and its technical appendices are available for public review and comment as required by Section 15105 of the CEQA Guidelines from November 12, 2021, through December 27, 2021. Written comments on the Recirculated Draft EIR and technical appendices must be received **no later than 5:00 p.m. on December 27, 2021.**

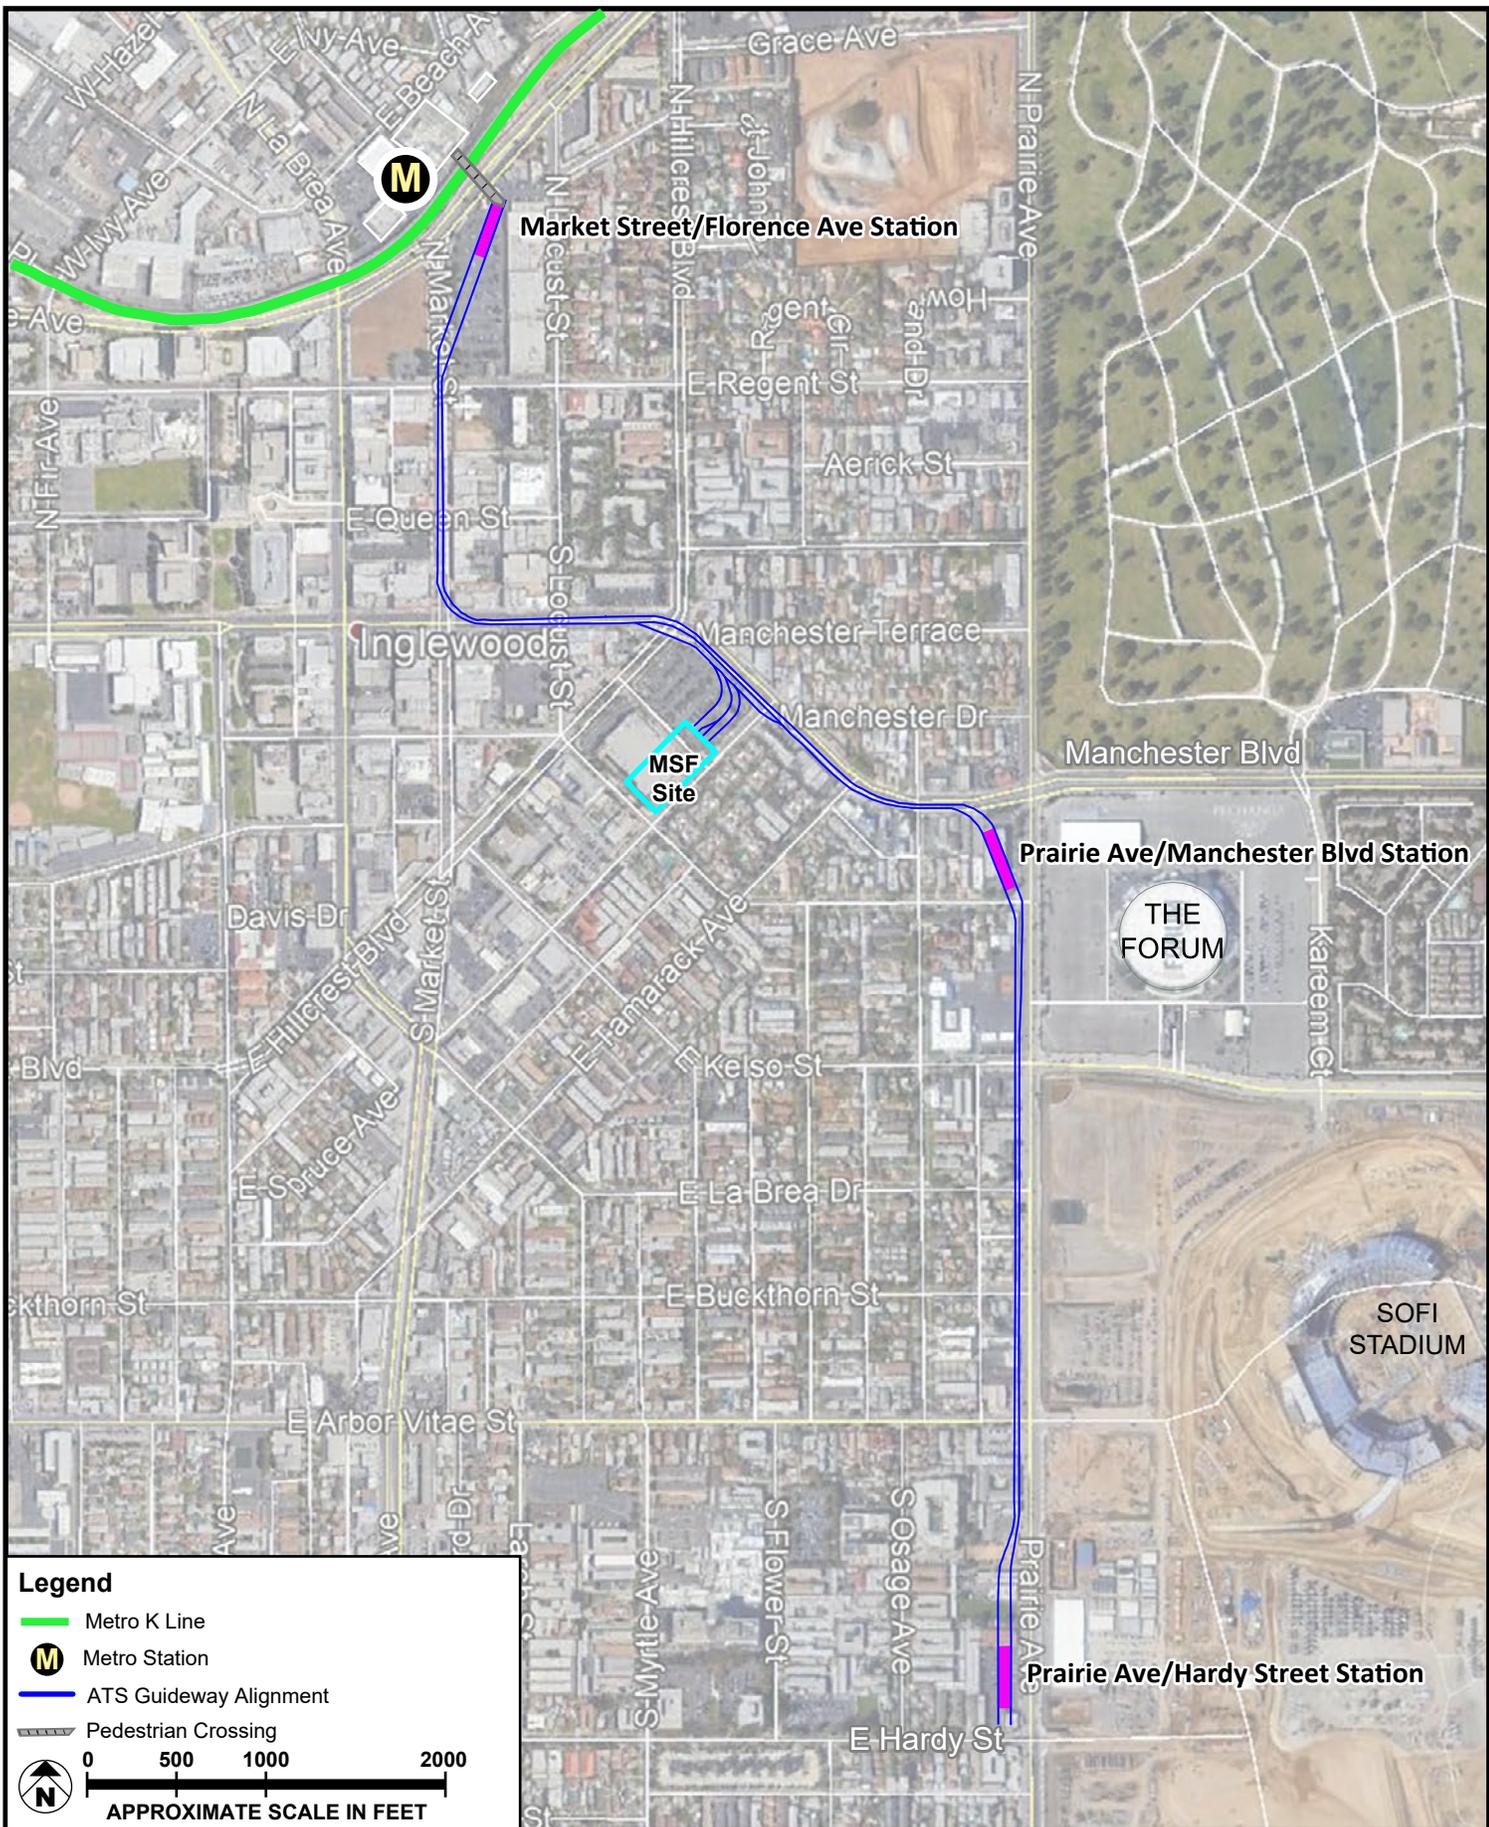

The Recirculated Draft EIR and technical appendices are available for review at the City of Inglewood website at:

<https://www.cityofinglewood.org/1016/Environmental-Documents>

## 1.0 INTRODUCTION AND LIST OF COMMENTERS

### 1.1 PURPOSE OF THIS DOCUMENT

This document includes all agency and public comments received on the Recirculated Draft Environmental Impact Report [Draft EIR, State Clearinghouse (SCH) #2018071034] for the Inglewood Transit Connector (ITC) Project (proposed Project). Written comments were received by the City of Inglewood during the public comment period from November 12, 2021 through December 27, 2021. This document includes written responses to each comment received on the Recirculated Draft EIR. The responses correct, clarify, and amplify text in the Recirculated Draft EIR, as appropriate. These changes do not alter the conclusions of the Recirculated Draft EIR. This Final EIR document has been prepared in accordance with the California Environmental Quality Act (CEQA) and together with the Recirculated Draft EIR (and Appendices) constitutes the EIR for the proposed Project that will be used by the decision makers during project hearings.

### 1.2 SUMMARY OF THE PROPOSED PROJECT

The proposed Project is an Automated Transit System (ATS) which would include an approximately 1.6-mile-long, elevated guideway located within current and to-be-acquired public right-of-way along Market Street, Manchester Boulevard, and Prairie Avenue. Three stations are proposed adjacent to the guideway on privately owned land that is proposed to be acquired as part of the proposed Project. The elevated guideway will contain dual lanes to allow trains to travel continuously in each direction. Several trains would likely be operating at the same time, depending on ridership demand.

As part of the City's collaboration and partnership with Metro, the proposed Project is proposed as an extension of the Metro regional rail system to the City's activity centers, closing the critical first/last mile transit gap in Inglewood, increasing passenger service along the Metro system by facilitating a seamless transfer of passengers between the ITC and the Metro K Line.

The ATS technology may be a self-propelled technology, including rubber-tire ATS systems, monorails, large steel-wheel ATS systems, also known as automated light rail transit (ALRT), or a cable propelled ATS system. The system will be fully automated (i.e., driverless) to operate at the headways to meet the projected peak ridership needs. The vehicles are smaller than traditional heavy rail technology and can maneuver the tight curves required for the site-specific conditions. This type of technology is oftentimes also referred to as automated guideway transit, automated people mover or monorail; regardless of the terminology used in the industry, it is a form of light rail technology without an overhead catenary.

1.0 Introduction and List of Commenters

The ATS trains will operate in a pinched-loop mode on dual tracks along the alignment, wherein trains follow each other and switch back at the end-of-line stations to make the return journey on the other track. As planned, the trains can be operated in multiple different configurations, ranging from a one-car train to multiple-car length trains with a maximum train length of approximately 200 feet. Depending on the technology (self-propelled or cable propelled) and ridership demands, which include time of day and are event day dependent, multiple trains of up to the maximum train length can be operated at varying headways for self-propelled systems, as close as 1.5 minutes apart, to provide the necessary peak and reserve capacity.

Three stations are proposed on private property proposed for acquisition as part of the proposed Project. These stations are:

- The *Market Street/Florence Avenue* station generally located between Market Street and Locust Street providing connections to the Metro K Line and Downtown Inglewood;
- The *Prairie Avenue/Manchester Boulevard* station located on the southwest corner of the intersection of Prairie Avenue and Manchester Boulevard providing service to the Forum and the LASED at Hollywood Park including SoFi Stadium and existing and future local businesses and residences.
- The *Prairie Avenue/Hardy Street* station located on the northwest corner of the intersection of Prairie Avenue and Hardy Street providing service to the LASED at Hollywood Park, including SoFi Stadium, the IBEC, and other existing and future local businesses and residences.

These station locations were chosen to be near major employment, housing, and retail centers, including the Forum, the LASED, including SoFi Stadium, and other employment, housing and retail commercial uses in the Hollywood Park Specific Plan (HPSP), the IBEC, and employment, housing and retail commercial uses in Downtown Inglewood, which the City is seeking to enhance and activate.

Existing roadways and infrastructure along the transit alignment will require reconfiguration to accommodate the new elevated transit guideway structures and stations. In addition to surface improvements, utility infrastructure located under roadways may need to be relocated to accommodate the guideway columns, footings, and other components. The roadway reconfigurations proposed along Market Street, Manchester Boulevard, and Prairie Avenue are necessary to assure that the existing roadway travel capacity is not reduced to accommodate the proposed Project.

The proposed Project includes a Maintenance and Storage Facility (MSF) to provide regular and preventive maintenance for the ATS trains, vehicle storage, and an operations control center located on the eastern half of the block bound by Manchester Boulevard, Hillcrest Boulevard, Nutwood Street and Spruce Avenue. An existing commercial building containing a Vons grocery store, a fitness center, and a bank branch, is located on the southern portion of this site. A gas station operated by Vons is located on the northeast portion of this site. Demolition of the existing commercial building and gas station are proposed

1.0 Introduction and List of Commenters

as part of the Project. A new Vons replacement store is proposed on the corner of Manchester Boulevard and Hillcrest Boulevard.

The proposed Project also includes two power distribution system (PDS) substations. These PDS substations will provide the necessary power for the proposed Project including traction power, auxiliary power, and housekeeping power for the stations and related infrastructure. One of the PDS substations will be located on the MSF site, where the Southern California Edison (SCE) service connection will be provided. The second PDS substation will be located on the Prairie Avenue/Manchester Boulevard Station site or the Prairie Avenue/Hardy Street station site.

Additional public parking would be provided as part of the proposed Project at three locations that are proposed for acquisition for use as construction staging areas. After construction, these sites will be improved as public parking lots:

- Approximately 650 parking spaces would be provided in a surface parking lot at the Market Street/Florence Avenue Station along with pick-up and drop-off areas on Locust Avenue and Regent Street.
- Approximately 50 parking spaces would be provided in a surface parking lot at 150 S. Market Street.
- Approximately 80 parking spaces and a shuttle bus pick-up and drop-off area are proposed at the Prairie Avenue/Hardy Street Station. This lot would be used for public parking, TNCs and shuttle bus pick-up and drop-off operations during events.

These parking areas will provide public parking needed in the City to support use of the proposed Project, businesses, and the City's efforts to help revitalize the retail areas along Market Street. The proposed Project is designed and intended to extend the transit service provided by the Metro K Line to the major event venues and existing and planned residential and commercial uses in the City, and these parking facilities are proposed to support transit use. On non-event days, the parking is designed to allow the City's residents to become transit riders and use the Metro Rail system, providing local convenient parking adjacent to the ITC and Metro K Line. Moreover, on event days, the City recognizes that many visitors may still drive to the City in search of convenient parking with proximity to commercial uses and access to a direct transportation connection to the City's major event venues. To help with overall traffic congestion and improve circulation on local streets, and to help reduce visitors parking in residential areas, the City proposes to provide parking in close proximity to the proposed Project stations and downtown Market Street area. These parking areas will also provide replacement parking for public parking on streets that may be removed as part of the proposed Project.

### 1.3 PROJECT ACTIONS

The proposed Project would require a number of actions and reviews by the City, acting as Lead Agency, and other local, regional, and state agencies acting as Responsible Agencies as described below.

- Although the Proposed Project is exempt from CEQA under Public Resources Code section 21080, subdivision (b)(12), if the City approves the Project, the City would voluntarily certify the Final EIR for the Inglewood Transit Connector Project and adopt of the Mitigation Monitoring and Reporting Plan, CEQA Findings of Fact, and, if there are significant and unavoidable environmental impacts, adopt a Statement of Overriding Considerations;
- Approval of the proposed General Plan Amendment, consisting of changes to the City General Plan Land Use Element, Circulation Element, and Safety Element;
- Approval of an amendment to Chapter 12 (Planning and Zoning) of the Inglewood Municipal Code to:
  - Add the Transportation Corridor Overlay (T-C-O) Zone; and
  - Amend the Medical Enterprise Overlay Zone to exclude properties within the Project alignment.
- Approval of amendments to the Forum Development Agreement to reflect the acquisition of frontage along Prairie (including loss of Forum parking);
- Approval of a Special Use Permit required for demolition of a gas station, Design Review for the new supermarket, and any other discretionary approval required for a new supermarket at 500 and 510 East Manchester Boulevard;
- Approval of amendments and clarifications to the Hollywood Park Specific Plan and associated Development Agreement;
- Preparation of a Project-specific Stormwater Management Plan or Standard Urban Stormwater Mitigation Plan for approval;
- Approvals of lot line adjustment(s), parcel map(s), and tract map(s) as needed;
- Approval of agreements and/or resolutions necessary to acquire the property necessary for construction and operation of the Project, in fee simple or through easements, licenses, air rights, leases, or other means of access, including through eminent domain;
- Approval of the ITC Design Guidelines;
- Approval of a contract or contracts for the design, finance, construction, and operation of the proposed Project; and
- Approvals for federal, State, or local financing plans or grants.

In addition to the above, ministerial approvals may be required as follows:

- Grading permits, building permits, haul route approval, and other permits issued by the Department of Building and Safety for the Project and any associated Department of Public Works permits (including encroachment permits) for infrastructure improvements;
- Tree removal permits; and
- Noise permit for Construction and Building Hours extension.
- Other federal, State, or local approvals, permits, or actions that may be deemed necessary for the Project including, but not limited to, the following:
  - California Public Utilities Commission;
  - Los Angeles County Fire Department.

### 1.4 ORGANIZATION OF THE FINAL EIR

**Section 1.0: Introduction and List of Commenters.** This section summarizes the Project under consideration and describes the contents of the Final EIR. This chapter also contains a list of all of the agencies or persons who submitted comments on the Recirculated Draft EIR during the public review period, presented in order by federal, State, and local agency; tribal entity; organization; individual; and date received.

**Section 2.0: Revisions to the Recirculated Draft EIR.** This section describes changes and refinements made to the proposed Project since publication of the Recirculated Draft EIR. These refinements, clarifications, amplifications, and corrections, which are described in the beginning of the section, would not change the environmental analysis and conclusions presented in the Recirculated Draft EIR for the reasons discussed in this section. This section also summarizes text changes made to the Recirculated Draft EIR in response to comments. Changes to the text of the Recirculated Draft EIR are shown by either ~~strike through~~ where text has been deleted, or double underline where new text has been inserted.

**Section 3.0: Comments and Responses.** This section contains the comment letters received on the Recirculated Draft EIR, followed by responses to individual comments.

This section includes copies of the comment letters received by the City of Inglewood (City) on the Recirculated Draft EIR. Each letter is numbered and identified for reference and the individual comments in each letter are also identified by number. Each comment letter is followed by written responses to each of the comments in that letter.

Some comments that were submitted to the City do not pertain to substantial environmental issues or do not address the adequacy of the analysis contained in the Recirculated Draft EIR. Responses to such comments, though not required, are included to provide additional information. When a comment does

not directly pertain to environmental issues analyzed in the Recirculated Draft EIR, does not ask a question about the adequacy of the analysis contained in the Recirculated Draft EIR, expresses an opinion related to the merits of the proposed Project, or does not question an element of or conclusion of the Recirculated Draft EIR, the response notes the comment and may provide additional information where appropriate. Many comments express opinions about the merits or specific aspects of the proposed Project and these are included in the Final EIR for consideration by the decision makers.

**Section 4.0: Mitigation Monitoring and Reporting Program.** This section contains the Mitigation Monitoring and Reporting Program (MMRP) to guide the City in its implementation and monitoring of measures adopted in the EIR, and to comply with the requirements of Public Resources Code section 21081.6, subdivision (a).

## 1.5 PUBLIC PARTICIPATION AND REVIEW

The City of Inglewood has complied with all noticing and public review requirements of CEQA. This compliance included notification of all responsible and trustee agencies and interested groups, organizations, and individuals that the Recirculated Draft EIR was available for review. The following list of actions took place during the preparation, distribution, and review of the Recirculated Draft EIR:

- In 2017, the City partnered with Metro to address the City's critical mobility issues by analyzing viable transit connection options from the Metro K Line to the LASED, which includes SoFi Stadium. With the City's input, Metro conducted a study<sup>1</sup> to explore how best to extend the Metro Rail system via a high-capacity transit connection to the LASED.
- In early 2018, the City also initiated stakeholder outreach to understand the City's need for a comprehensive long-range mobility plan, potential project goals and objectives, potential project benefits and impacts, and stakeholder concerns.
- In July 2018, pursuant to the requirements of the California Environmental Quality Act (CEQA), the City as the Lead Agency prepared a Notice of Preparation (Original NOP) and an Initial Study (Original IS) (SCH 2018071034).
- The Original NOP and IS were circulated and comments were received from the public and agencies following a 30-day comment period that ended on August 15, 2018.
- A scoping meeting was held on July 26, 2018, from 6 PM to 8 PM at the Inglewood Senior Citizens Center, 111 N. Locust Street, Inglewood, CA 90301. The City provided the opportunity for comments to be submitted at the scoping meeting.

<sup>1</sup> Los Angeles County Metropolitan Transportation Authority, *City of Champions/Inglewood (NFL) Focused Analysis of Transit Connection* (August 2017).

- As a result of the comments received and refinements and modifications to the proposed Project identified in the Original NOP and Original IS after circulation of the July 2018 Notice of Preparation, a Revised NOP and IS were circulated for public review and comment from September 10, 2020 to October 12, 2020. The City submitted both the Original and Revised NOPs and Initial Studies to the Governor's Office of Planning and Research (OPR); applicable trustee or responsible federal, State, regional, and local agencies identified for the proposed Project, including adjacent cities and counties; the County of Los Angeles; relevant Native American tribes; and all interested parties requesting such notice to allow for comment on the IS during the 30-day comment period. In addition, copies of the Original and Revised NOPs and ISs were made available for review at Inglewood City Hall and the Inglewood Public library, as well as on the City's website, to give the public the opportunity to comment during the respective 30-day comment periods.
- The City prepared and released a Draft EIR for public review in December 2020. Based on additional feedback received during the Draft EIR circulation period the City continued further collaboration with key stakeholders on the design of the Project. City also conducted additional technical analysis and due diligence on potential utility conflicts, property impacts, and potential impacts to historical resources, and refined the project to reduce the project footprint where feasible.
- As a result of this ongoing consultation process, the City has further refined the Project and revised the Draft EIR to evaluate these changes to the Project. The City prepared and released a Recirculated Draft EIR for public review in November 2021. The Project remains an approximately 1.6-mile long alignment with 3 stations beginning at the intersection of Market Street and Florence Avenue, continuing along Manchester Avenue and Prairie Avenue, and ending at the intersection of Prairie Avenue and Hardy Street.
- A Notice of Completion (NOC) and copies of the Draft EIR were filed with SCH on November 12, 2021. An official 45-day public review period for the Draft EIR was established by SCH, ending on December 27, 2021. A Notice of Availability (NOA) for the Draft EIR was published on November 11, 2021 and sent to appropriate public agencies, including SCH and Los Angeles County Clerk, and all entities who requested to be notified about the Proposed Project and/or EIR. The Recirculated Draft EIR was also published on the City's website.
- A virtual public meeting to provide project information on the Project and Recirculated Draft EIR was held on November 11, 2021, from 6 PM to 7 PM.

## 1.6 PROJECT MODIFICATIONS IN THE FINAL EIR

Project modifications implemented as part of the Final EIR include: (1) revisions to the location of power distribution system (PDS) substations, and (2) revisions to the Construction Commitment Program (CCP), specifically the Business Assistance Fund Program, Construction Staging & Traffic Control Program, Air Quality Program, Visual Resources Program, Hazardous Materials Program, and Noise and Vibration Control Program.

1.0 Introduction and List of Commenters

These minor modifications to the Proposed Project do not necessitate further recirculation of the Recirculated Draft EIR. Under section 15088.5 of the CEQA Guidelines,<sup>2</sup> recirculation of an EIR is required when “significant new information” is added to the EIR after public notice is given of the availability of the Draft EIR for public review but prior to certification of the Final EIR. The term “information” can include changes in the project or environmental setting, as well as additional data or other information. New information added to an EIR is not “significant” unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project’s proponents have declined to implement. “Significant new information” requiring recirculation includes, for example, a disclosure showing that:

1. A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
2. A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
3. A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project’s proponents decline to adopt it.
4. The DEIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

Recirculation is not required to address the modifications to the Proposed Project. The modifications, which were made as a result of public and stakeholder feedback on the Proposed Project and the Recirculated Draft EIR, primarily further reduce the Proposed Project’s potential impacts and do not increase any of the significant impacts of the Proposed Project identified in the Recirculated Draft EIR or result in any new previously unidentified significant impact. Therefore, recirculation of the Recirculated Draft EIR is not required to address the modifications to the Proposed Project.

1.7 LIST OF COMMENTERS

The City of Inglewood received 21 comments in response to the Recirculated Draft EIR. **Table 1: Comment Letters Regarding the Recirculated Draft EIR** displays the numerical designation, entity, author, and date of each comment.

2 CEQA Guidelines, Section 15088.5, subd. (a).

Inglewood Transit Connector Project  
February 2022

2.0 REVISIONS TO THE RECIRCULATED DRAFT EIR

2.1 INTRODUCTION

The City of Inglewood (City), acting as the Lead Agency for the planning and environmental review of the proposed Project, has prepared this Final Environmental Impact Report (EIR) pursuant to the requirements of the California Environmental Quality Act (CEQA). In accordance with the CEQA Guidelines Section 15132 (a), this section of the Final EIR provides changes to the Recirculated Draft EIR (RDEIR) that have been made to clarify, correct, or supplement the environmental impact analysis for the proposed Project. Such changes are a result of recognition of inadvertent errors or omissions as well as public and agency comments received in response to the RDEIR. The changes described in this section do not result in any new or increased significant environmental impacts that would result from the proposed Project.

2.2 TEXT CHANGES TO THE RECIRCULATED DRAFT EIR

Provided below are corrections and additions to the RDEIR including, where appropriate, the associated technical appendices. Changes are identified below by the corresponding Recirculated Draft EIR section and subsection, if applicable, and the page number. Additions are double underlined and deletions are shown in ~~strikethrough~~ format. It should also be noted that in response to comments received on the Recirculated Draft EIR and community and stakeholder outreach, modifications to the Construction Commitment Program (CCP), provided in **Appendix D** were made. These changes are summarized in the relevant responses to comments, as applicable.

Section 1.0 Executive Summary

The following revision has been made to Page 1.0-11, List Bullets 2, 5, 9 and 10 of the RDEIR:

As part of the Project, the City of Inglewood has developed a Construction Commitment Program to proactively address the effects of the construction of the Project on the community. This program, provided in **Appendix D**, includes the following programs and plans:

- Business Community and Support Program
- Business ~~Interruption~~ Assistance Program
- Transit Access and Circulation Program
- Construction Staging and Traffic Control Program
- Pedestrian Access Program
- Parking Management Plan
- Air Quality Program

Meridian Consultants  
251-004-20

2.0-1

Inglewood Transit Connector Project  
February 2022

2.0 Revisions to the Draft EIR

- Visual Resources Program
- Hazardous Materials Program
- Construction Noise Control Plan
- Construction Vibration Reduction Plan
- Tree Removal and Replacement Plan

The following revision has been made to Page 1.0-13, List Bullet 8 of the RDEIR:

- Power Distribution System (PDS) substations located on the MSF and the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station sites to provide traction/propulsion power, auxiliary power, and housekeeping power:

The following revision has been made to Page 1.0-18, Paragraph 2, Line 9 of the RDEIR:

During construction, the proposed Project would generate a demand for 165,115 kWh of electricity and up to 163.7 million gallons of petroleum each year. Electricity for operation of the proposed ATS system would be provided via two power distribution system (PDS) substations. One of the PDS substations would be located on the MSF site. The second PDS substation would be located on the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station site. The electricity demand for the proposed Project during normal operation would be 27.1 million kWh (27.1 GWh) per year.<sup>1</sup>

The following revision has been made to PDF AES-1 in **Table 3.0-1** on Page 1.0-37 of the RDEIR:

**PDF AES-1 Construction (CCP)**

Construction activities during evening and nighttime hours may require the use of temporary lighting. To minimize the impact of temporary lighting on adjacent properties, the following measures shall be implemented:

- Temporary lighting will be limited to the amount necessary to safely perform the required work and will be directed downwards and shielded. Care shall be taken in the placement and orientation of portable lighting fixtures to avoid directing lights toward sensitive receptors, including automobile drivers. Motorists and sensitive receptors shall not have direct views of construction light sources. Light sensitive receptors include but are not limited to residential areas and transient occupancy uses.

1 Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

2.0 Revisions to the Draft EIR

- Construction night lighting shall be shielded to prevent a direct view of the light sources from residential properties with a property boundary that is within 150 feet of the construction site.
- Light trespass shall not exceed one foot-candle above ambient light level as measured at any adjacent residential and transient properties.
- Temporary sidewalks and any sidewalk adjacent to construction activities shall be illuminated to City Standards to protect public safety.
- To minimize the visual effects of construction the following measures shall be implemented:
  - Visually obtrusive erosion control devices, such as silt fences, plastic ground cover, and straw bales should be removed as soon as the area is stabilized.
  - Stockpile areas should be located in less visibly sensitive areas and pre-approved by the City. Stockpile locations, laydown, and staging areas shall be accessed by construction vehicles with minimal disruption near residential neighborhoods.

The following revision has been made to PDF AQ-1 in **Table 3.0-1** on Page 1.0-46 of the RDEIR:

**PDF AQ-1 Construction Air Quality Program**

At a minimum, use equipment that meets the U.S. Environmental Protection Agency (USEPA)'s Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity, unless it can be demonstrated to the City Planning Division with substantial evidence that such equipment is not available. To ensure that Final Tier 4 construction equipment or better shall be used during the proposed Project's construction, the City shall include this requirement in applicable bid documents, purchase orders, and contracts. The City shall also require periodic reporting and provision of written construction documents by construction contractor(s) and conduct regular inspections to the maximum extent feasible to ensure and enforce compliance.

Such equipment will be outfitted with Best Available Control Technology devices including a California Air Resources Board (CARB)-certified Level 3 Diesel Particulate Filters (DPF). Level 3 DPF are capable of achieving at least 85 percent reduction in particulate matter emissions. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by Final Tier 4 emissions standards for a similarly sized engine, as defined by the CARB's regulations. Successful contractors must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. The proposed Project representative will make available to the lead agency and Southern California Air Quality Management District (SCAQMD) a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, which will be used during construction. The inventory will include the horsepower rating, engine production year, and

certification of the specified Tier standard. A copy of each unit's certified tier specification, best available control technology (BACT) documentation, and CARB or SCAQMD operating permit shall be maintained on site at the time of mobilization for each applicable piece of construction equipment.

If any of the following circumstances listed below exist and the Contractor provides written documentation consistent with project contract requirements, the Contractor shall submit an Alternative Compliance Plan that identifies operational changes or other strategies that can reduce a comparable level of NOx emissions as Tier 4-certified engines during construction activities.

- The Contractor does not have the required type of off-road construction equipment within its current available inventory as to a particular vehicle or equipment by leasing or short-term rent, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
- The Contractor has been awarded funding by SCAQMD or another agency that would provide some or all of the cost to retrofit, repower, or purchase a piece of equipment or vehicle, but the funding has not yet been provided due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
- Contractor has ordered equipment or vehicle to be used on the construction project in compliance at least 60 days before that equipment or vehicle is needed at the Project alignment, but that equipment or vehicle has not yet arrived due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
- Construction-related diesel equipment or vehicle will be used on the Project for fewer than 20 calendar days per calendar year. The Contractor shall not consecutively use different equipment or vehicles that perform the same or a substantially similar function in an attempt to use this exception to circumvent the intent of this measure.
- Documentation of good faith efforts and due diligence regarding the previous exceptions shall include written record(s) of inquiries (i.e., phone logs) to at least three leasing/rental companies that provide construction on-road trucks and off-road equipment, documenting the availability/unavailability of the required types of truck/equipment. The City will, from time-to-time, conduct independent audit of the availability of such vehicles and equipment for lease/rent within a 120-mile radius of the Project

area, which may be used in reviewing the acceptability of the Contractor's good faith efforts and due diligence.

- Equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts shall be electric or alternative-fueled (i.e., nondiesel). Pole power shall be utilized to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel-powered generators, must be operated continuously, such equipment must be Final Tier 4 construction equipment or better and located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- At a minimum, require that construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export with a gross vehicle weight rating of at least 14,001 pounds), or best commercially available equipment, that meet CARB's 2010 engine emissions standards at 0.01 g/hp-hour of particulate matter and 0.20 g/hp-hour of NOx emissions or newer, cleaner trucks, unless the Contractor provides written documentation consistent with project contract requirements the circumstances exist as described above and the Contractor submits the Plan. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards. The City shall include this requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards and make the records available for inspection.
- Require the use of electric or alternatively fueled (e.g., natural gas) sweepers with high-efficiency particulate air (HEPA) filters.
- A publicly visible sign shall be posted with the Community Affairs Liaison's contact information to contact regarding dust complaints. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.
- Dust shall be controlled per local ordinances. The Contractor shall be responsible for excessive dust or construction debris that results in impacts to adjacent residences or private vehicles, including taking responsibility for clean-up and addressing complaints brought to the project.
- All trucks carrying fill materials, debris, or similar materials shall secure and cover loads to prevent dust or debris while travelling on public right of ways.
- All trucks removing materials from the site will be loaded within the site perimeter and will be required to cover loads as deemed necessary for dust control.
- Material stockpiles and construction area surfaces shall be covered and/or watered as needed to prevent dust at designated construction areas.
- All roadways, driveways, sidewalks, etc., being installed as part of the Project should be completed as soon as practicable; in addition, building pads should be laid as soon as practicable after grading.
- To the extent feasible, allow construction employees to commute during off-peak hours.

- Make access available for on-site lunch trucks during construction, as feasible, to minimize off-site construction employee vehicle trips.
- Every effort shall be made to utilize grid-based electric power at any construction site, where feasible.
- Contractors shall maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.
- Require in all applicable bid documents, purchase orders, and contracts of the requirement to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB's policy. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify construction vendors, contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the Project area. To further ensure that drivers understand the vehicle idling requirement, post signs at the proposed Project entry gates and throughout the Project alignment, where appropriate, stating that idling longer than five minutes is not permitted.

The following revision has been made to PDF HAZ-1 in **Table 3.0-1** on Page 1.0-63 of the RDEIR:

**PDF HAZ-1 Hazardous Materials Program**

The following practices will be followed during construction to address the potential for encountering hazardous materials during construction of the Project.

- Building Demolition Plan – Prior to any demolition occurring, conduct an evaluation of all buildings built prior to 1980 to be demolished to identify the presence of asbestos containing materials (ACMs) and lead-based paint (LBP). Remediation shall be implemented in accordance with the recommendations of these evaluations to ensure that no ACMs or LBP remain present and to ensure ACMs and LBP are removed to levels established for public safety.
- Hazardous Materials Contingency Plan – Prior to construction, prepare a plan addressing the potential for discovery of unidentified underground storage tanks (USTs), hazardous materials, petroleum hydrocarbons, or hazardous or solid wastes encountered during construction. This Plan shall address UST decommissioning, field screening and materials testing methods, contaminant management requirements, and health and safety requirements to ensure no exposure to hazards or hazardous materials occurs on site and to ensure any materials encountered during construction are removed to levels established for public safety.
- Soil Management Plan – After final construction plans are prepared showing the lateral and vertical extent of soil excavation during construction are prepared, prepare a Soil Management Plan to establish soil reuse criteria, define a sampling plan for stockpiled materials, describe the disposition of materials that do not satisfy the reuse criteria, and specify guidelines for imported materials.

- Health and Safety Plan – Prior to construction, prepare a Health and Safety Plan to address the potential for exposure to any constituents of concern that may be encountered during construction.
- Utility Relocation Work - All Project utility relocations in the vicinity of Kelso Elementary School shall be designed and constructed to remain within the public right-of-way and not impact school property. Relocations shall be located further away from the school as feasible and designed and constructed to current standards to assure that they create no unacceptable hazards to the school. During Project construction, any open trenches and construction equipment shall be marked and barricaded such that they are not accessible by the students or create any potential hazard to school operations. Project utility relocations or cut overs that may require disruption to school normal utility services shall be scheduled to occur outside of normal school hours with advanced notification to the School District.

The following revision has been made to PDF NOISE-1 in **Table 3.0-1** on Page 1.0-66 of the RDEIR:

**PDF-NOISE-1 Construction Noise Control Plan (CCP)**

A Construction Noise Control Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works prior to construction. The Plan shall include measures demonstrating that construction noise levels will be below FTA's General Assessment Construction Noise Criteria. The following construction noise reduction measures shall be incorporated into the Plan:

- Install temporary noise barriers that reduce sound at receptors;
- For any idling that is expected to take longer than five minutes, the engine shall be shut off;
- All equipment shall be equipped with optimal muffler systems;
- Use solar, battery powered, or hybrid equipment whenever practical;
- Locate staging areas as far away from sensitive receptors as feasible;
- Locate stationary noise sources as far away from sensitive receptors as feasible;
- Enclose stationary noise sources, such as diesel or gasoline-powered generators, with acoustical barriers where necessary and required;
  - If stationary equipment cannot be enclosed within a shed or barrier, such equipment must be muffled and located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- Pole power shall be utilized to the maximum extent feasible in lieu of generators.
- Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used

where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible. Additionally, use of “quiet” pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions shall be considered.

- Staging of construction material deliveries behind fencing to minimize noise emitting from idling vehicles.
- On site-signage reminding workers to minimize noise generation.
- When not in use or being staged, heavy equipment shall be located as far as practicable from sensitive receptors.
- For project foundations, consider the use of drilled piles or sonic pile drivers or vibratory pile drivers instead of traditional impact pile drivers, as permitted by geological conditions.
- Sequence noisy activities to occur during the same general time period during daytime hours to the extent practical.
- Select quieter demolition methods where appropriate and feasible such that demolition activities can remain within the project specified noise levels.
- Unless deemed infeasible for a particular construction activity, the Contractor shall utilize rubber tire earth moving equipment in lieu of track mounted earth moving equipment.
- Construction material deliveries shall take place within designated construction staging areas as far from residential sites as practical to minimize noise impacts.
- Provide signage at active construction sites and staging areas reminding workers, equipment operators and delivery vehicles to minimize noise levels to the extent possible.
- Rumble strips or signage shall be provided at roadway access points into contractor laydown and staging areas to slow construction vehicles and limit vehicle noise.
- Coordinate with the Inglewood Unified School District administrators to avoid disruptive noise during school hours, including scheduling heavy equipment such as cranes, haul trucks, concrete trucks, concrete pumps, pneumatic equipment, earth moving vehicles or similar to operate outside of school hours. The City shall require that the Project's construction noise during school hours would be limited to 5 dBA Leq 1-hour above the measured ambient noise levels at Kelso School property line as identified in the RDEIR. Activities that would exceed this threshold shall be scheduled to occur outside of normal school hours or mitigated with specific mitigation measures such as temporary sound walls, sound blankets, or other sound-attenuating devices. The City shall monitor the Project's construction noise levels during school hours to assure compliance. As requested by the District, monthly noise monitoring reports on noise levels during school hours at Kelso School will be provided to the District.

In order to ensure that construction noise levels will be below the established standards, the following shall be incorporated into the Plan:

- A monitoring plan shall be implemented during demolition and construction activities. Warning thresholds shall be defined that are 5 dBA below the specified noise limits to allow sufficient time for the Contractor to take actions to reduce noise. A monitoring record that documents all alarms and actions taken to comply with these measures shall be provided to the City upon request.
- In the event the warning level (dBA) is exceeded, construction activities shall be temporarily halted in the vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the established standards. Noise measurements shall be gathered after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels:
  - Halting/staggering concurrent construction activities in certain locations;
  - Reducing the speed or intensity of the heavy-duty construction equipment being operated simultaneously;
  - Operating equipment at the lowest possible power levels;
  - Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.

The following revision has been made to PDF NOISE-2 in **Table 3.0-1** on Page 1.0-69 of the RDEIR:

#### **PDF NOISE-2 Construction Vibration Reduction Plan (CCP)**

Prior to the issuance of any demolition or construction permit for each phase of the Project, a Construction Vibration Reduction Plan shall be prepared to minimize construction vibration at nearby sensitive receptors from vibration created by construction activities. The Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works. The Plan shall include but not be limited to the following elements to ensure impacts from ground borne vibration are less than significant:

- A Pre-Demolition and Construction Plan that includes but is not limited to:
  - Photos of current conditions of buildings and structures that could be damaged from construction activities. This crack survey shall include photos of existing cracks and other material conditions present on or at the surveyed buildings. Images of interior conditions shall be included if possible. Photos in the report shall be labelled in detail and dated.
  - Identify representative cracks in the walls of existing buildings, if any, and install crack gauges on such walls of the buildings to measure changes in existing cracks during project activities.
  - Crack gauges shall be installed on multiple representative cracks, particularly on sides of the building facing the Project.

- Determine the number and placement of vibration sensors at the affected buildings in consultation with a qualified architect. The number of units and the locations of these sensors shall take into account proposed demolition and construction activities to ensure that adequate measurements can be taken illustrating vibration levels during the course of the Project, and if/when levels exceed the established threshold.
- A line and grade pre-construction survey at the affected buildings shall be conducted.
- A Vibration Plan During Demolition and Construction that includes the following:
  - Regularly inspect and photograph crack gauges, maintaining records of these inspections to be included in postconstruction reporting. Gauges shall be inspected every two weeks, or more frequently during periods of active project actions in close proximity to crack monitors.
  - The vibration monitoring system shall measure and continuously store the peak particle velocity (PPV) in inches/second. Vibration data shall be stored on a one-second interval. The system shall also be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA's threshold of significance for a building given its conditions, and a warning level that is 0.05 inch/second (PPV) less than the regulatory level. The system shall also provide real-time alert when the vibration levels exceed either of the two preset levels.
  - In the event the warning level (PPV) is triggered, the contractor shall identify the source of vibration impacts and establish steps to reduce the vibration levels, including but not limited to halting or staggering concurrent activities and using lower vibratory techniques.
  - In the event the regulatory level (PPV) is triggered, halt the construction activities in the vicinity of the trigger area and visually inspect the building for any damage. Results of the inspection must be logged. Identify the source of vibration generation and provide steps to reduce the vibration level. Vibration measurement shall be made with the new construction method to verify that the vibration level is below the warning level (PPV). Construction activities may then restart.
  - In the event work occurs in the proximity of identified historic uses, the system shall be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA threshold of significance 0.12 inch/second for a building given its conditions, and a warning level that is 0.012 inch/second (PPV) less than the regulatory level.
  - Collect vibration data from receptors and report vibration levels to the Joint Powers Authority and/or the City Chief Building Official on a daily basis. The reports shall include annotations regarding project activities as necessary to explain changes in vibration levels.
- Post-Construction Reporting and Repairs:
  - Provide a report to the Joint Powers Authority and/or the City Chief Building Official regarding crack and vibration monitoring conducted during demolition and construction. In addition to a narrative summary of the monitoring activities and their findings, this report shall include photographs illustrating the post-construction state of cracks and material conditions that were presented in the pre-construction assessment report, along with images of other relevant conditions showing the impact, or lack of impact, of project activities. The photographs shall

- sufficiently illustrate damage, if any, caused by the Project and/or show how the Project did not cause physical damage to the buildings. The report shall include analysis of vibration data related to project activities, as well as summarize efforts undertaken to avoid vibration impacts. Finally, a postconstruction line and grade survey shall also be included in this report.
- Perform repairs to buildings if damage is caused by vibration or movement during the demolition and/or construction activities. Repairs may be necessary to address, for example, cracks that expanded as a result of the Project, physical damage visible in post-construction assessment, or holes or connection points that were needed for shoring or stabilization. Repairs shall be directly related to project impacts and will not apply to general rehabilitation or restoration activities of the buildings.
- To minimize the risk of potential structural and building damage:
  - Limit the location of pile driving and vibratory roller activity to not be within 55 feet and 30 feet of the nearest off-site sensitive receptor, respectively.
  - Limit the number of jackhammers operating simultaneously to one (1) piece operating within 45 feet of off-site sensitive receptors.
  - In the event impact pile driving is required, equipment shall only be used from the hours of 7:00 AM to 7:00 PM. If feasible, pile driving should use alternative technology such as vibration or hydraulic insertion.
- To minimize the risk of related to human annoyance:
  - Limit the location of pile driving to 310 feet of off-site vibration sensitive receptors.
  - Limit the location of vibratory roller to 150 feet of off-site vibration sensitive receptors.
  - Limit the location of large bulldozer to 85 feet of off-site vibration sensitive receptors.
  - Limit the location of caisson drilling to 85 feet of off-site vibration sensitive receptors.
  - Limit the location of loaded trucks to 75 feet of off-site vibration sensitive receptors.
  - Limit the location of jackhammers to 45 feet of off-site vibration sensitive receptors.
  - Limit the location of small bulldozer to 25 feet of off-site vibration sensitive receptors.

The following revision has been made to PDF TRANS-2 in Table 3.0-1 on Page 1.0-74 of the RDEIR:

**PDF TRANS-2 Construction Staging and Traffic Control Program**

A Construction Staging and Traffic Control Program will be developed by members of the Project Task Force (as defined in the CCP), subject to review and acceptance by the City and/or the JPA, and will address the following topics:

- Coordination with other public infrastructure projects within the City's boundaries.

2.0 Revisions to the Draft EIR

- Detour routes, including analysis of impacts to pedestrian, business, bicycle, transit and traffic flow.
- Coordination of closures and restricted access during the construction period with special attention during periods of expected heavy traffic from events scheduled at SoFi Stadium and other venues in the Los Angeles Sports and Entertainment District at Hollywood Park, the Forum, and the Inglewood Basketball and Entertainment Center.
- Coordination with the City, police, and fire services department regarding maintenance of emergency access and response times.
- Monitoring and coordination of construction materials deliveries.
- Notification to businesses and residents on upcoming construction activities including but not limited to the establishment of a website with project construction information, signage, and web-based media.

The Traffic Control Program will be ~~updated~~ developed as needed based on the following principles:

- Minimize traffic impacts on residential streets.
- Establish minimum traffic lane requirements for Manchester Boulevard, Florence Avenue, and Prairie Avenue during construction such that at least the full number of traffic lanes in the peak direction, and if feasible, one traffic lane in the off-peak direction is available, with additional capacity provided through appropriate detour routes. The directional traffic lanes may be reversible to maintain the peak directional capacity in either direction as necessitated by traffic demands. For all other streets potentially affected by construction, maintain at least one lane of traffic in each direction unless otherwise approved by the City.
- Maintain access to and from all alleys at one or both ends of the alley when possible. If an alley is obstructed such that a turnaround by any vehicle is not feasible, traffic flaggers shall be provided to control access to/from the alley.
- Maintain access for all public safety vehicles (such as police, fire, and emergency response).
- Maintain bicycle and pedestrian access within the Project area or approved detours at all times.
- Provide adequate street access to City service vehicles, including but not limited to trash pickup and street sweeping service vehicles, during planned service times.
- Sidewalk closures should be avoided to the degree feasible and are permitted only when approved by the City. Accessible detours shall be provided if sidewalk closures are necessary.
- Use traffic control officers/flaggers as appropriate to minimize the degree and duration of impacts and maintain safety.
- Establish and maintain wayfinding signage.
- Maintain vehicular and pedestrian access to all businesses and residents impacted by construction activities including roadway closures.

2.0 Revisions to the Draft EIR

- Hold quarterly community outreach meetings with businesses and residents to provide updates on temporary, full, or partial street closures necessary for construction. Website will be updated 45 to 60 days prior to planned dates of any street closures.
- All closures, full or partial, are subject to City review and approval which shall consider measures to minimize the degree and duration of street and lane closures.
- Entry and exit to the Market Street/Florence Avenue construction site shall be limited to right turns to/from Florence Avenue for large trucks, construction equipment, and material deliveries. An entrance off Locust Street between Florence Avenue and Regent Street will also be required to serve the contractor's offices and staging area. If required for phasing, the Locust Street entrance may also be used for large trucks, construction equipment, and material deliveries as approved by the City.

The following revision has been made to PDF TRANS-4 in **Table 3.0-1** on Page 1.0-77 of the RDEIR:

**PDF TRANS-4 Pedestrian Access Program**

A Pedestrian Access Program will be developed by members of the Project Task Force (as defined in the CCP), subject to review and acceptance by the City and/or the JPA, and will adhere to the following principles:

- Pedestrian access to buildings shall be maintained at all times.
- Maintain all crosswalks to the extent feasible. Whenever a crosswalk is removed from service, establish and maintain temporary accessible replacement crosswalks as close as practicable to the original crosswalk locations unless the City determines that a replacement crosswalk is not necessary to maintain an adequate level of service. Replacement crosswalks shall be identified and controlled by wayfinding signs approved by the City.
- Establish and maintain passenger wayfinding signage.
- Maintain sidewalk access for pedestrians, including providing temporary sidewalks if existing sidewalks are disrupted during construction. Any sidewalk closures are subject to review and approval by the City.
- Sidewalks that are being maintained in a temporary condition shall meet all applicable safety standards, including but not limited to the requirements of the Federal Americans with Disabilities Act and similar California laws for sidewalks being maintained in a temporary condition.
- Protect pedestrians from construction-related debris, dust, and noise; such protection may include the use of dedicated pedestrian barriers.
- Coordinate with the Inglewood Unified School District and the City to provide crossing guards at locations requested by IUSD or the City when crosswalks or sidewalks are closed. Identify temporary alternate routes to school, working closely with IUSD and the City, and disseminate this information to schools and stakeholders affected by construction.

**Section 2.0 Introduction**

The following revision has been made to Page 2.0-8, Paragraph 2, Line 8 of the RDEIR:

The City has also collaborated with the property and business owners along Market Street to refine the ITC Urban Design Guidelines and Standards to enhance harmony of the surrounding context and align with the City’s efforts to help revitalize the downtown Market Street area.

**Section 3.0 Project Description**

The following revision has been made to Page 3.0-5, Paragraph 5, Line 9 of the RDEIR:

The MSF will be designed in accordance with the Inglewood Transit Connector (ITC) Design Standards and Guidelines (Design Guidelines) (see section 3.5.8) which address the massing, façade, materials, colors, roof, and lighting for this facility, how the MSF will engage with the passenger and vehicular circulation around it, and sustainability features (see Appendix C: ITC Design Standards and Guidelines). The proposed Project also includes two power distribution system (PDS) substations. These PDS substations will provide the necessary power for the proposed Project including traction power, auxiliary power, and housekeeping power for the stations and related infrastructure. One of the PDS substations will be located on the MSF site, where the Southern California Edison (SCE) service connection will be provided. The second PDS substation will be located—either on the Prairie Avenue/Hardy Street station, or on the Prairie Avenue/Manchester Boulevard station site. The final location of the second PDS substation will be determined at time of design. The difference in impacts resulting from either PDS substation location option is negligible.

The following revision has been made to Page 1.0-13, List Bullet 2, Line 3 of the RDEIR:

- PDS substations located on the MSF and the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station sites to provide traction/propulsion power, auxiliary power, and housekeeping power;

The following revision has been made to Table 3.0-1 on Page 3.0-14 of the RDEIR:

**Table 3.0-1  
ITC Project Component Locations and Sizes (Conceptual)**

Project Component	General Location	Approximate Size
<b>Guideway</b>	<ul style="list-style-type: none"> <li>• Located predominantly within the existing public right-of-way of Market Street, Manchester Boulevard, and Prairie Avenue</li> <li>• The Prairie/Manchester and Prairie Hardy stations are proposed to be located on private property located west of Prairie Avenue proposed for acquisition as part of the Project.</li> </ul>	<ul style="list-style-type: none"> <li>• Approximately 1.6 miles dual lane, end to end</li> <li>• The guideway will vary in height from a minimum of ~35 feet to a maximum of ~60 feet measured from existing grade to top of guideway deck</li> <li>• The dual-lane guideway width will vary from a minimum of ~30 feet to a maximum of ~75 feet. Maximum widths are at stations and approaches to stations.</li> </ul>
<b>stations</b>		
<i>Market Street/ Florence Avenue Station</i>	<ul style="list-style-type: none"> <li>• Located on private property (to be acquired by the City) at the southeast corner of Market Street/Florence Avenue</li> </ul>	<ul style="list-style-type: none"> <li>• Up to ~80 feet in height measured from existing grade to top of station canopy</li> <li>• ~75 feet wide (station structure and guideway only; not including vertical circulation)</li> <li>• ~200-foot long platform for train berthing</li> <li>• ~420-foot long mezzanine level for back of house and circulation</li> </ul>
<i>Prairie Avenue/ Manchester Boulevard Station</i>	<ul style="list-style-type: none"> <li>• Located on private property (to be acquired by the City) at the southwest corner of Prairie Avenue/Manchester Boulevard</li> </ul>	<ul style="list-style-type: none"> <li>• Up to ~80 feet in height measured from existing grade to top of station canopy</li> <li>• ~75 feet wide (station structure and guideway only; not including vertical circulation)</li> <li>• ~200-foot long platform for train berthing</li> <li>• ~360-foot long mezzanine level for back of house and circulation</li> </ul>
<i>Prairie Avenue/ Hardy Street Station</i>	<ul style="list-style-type: none"> <li>• Located on private property (to be acquired by the City) at the northwest corner of Prairie Avenue/Hardy Street</li> </ul>	<ul style="list-style-type: none"> <li>• Up to ~80 feet in height measured from existing grade to top of station canopy</li> <li>• ~75-foot wide (station structure and guideway only, not including vertical circulation)</li> <li>• ~200-foot long platform for train berthing</li> <li>• ~340-foot long mezzanine level for back of house and circulation</li> </ul>
<b>Vertical Circulation Elements</b>	<ul style="list-style-type: none"> <li>• Located at each station within the public right-of-way, easements, or private property to be acquired</li> <li>• Locations will depend on station specific requirements to connect to existing sidewalk/passenger walkways.</li> </ul>	<ul style="list-style-type: none"> <li>• Vertical circulation elements will exist at each station to provide access from the platform level to the mezzanine level and ground level</li> </ul>
<b>Elevated Passenger Walkways</b>	<ul style="list-style-type: none"> <li>• Location 1: above Florence Avenue connecting the Market Street/Florence Avenue Station to the Metro K Line Downtown Inglewood Station.</li> <li>• Location 2: above Prairie Avenue from Prairie/Manchester station to the Forum site</li> <li>• Location 3: above Prairie Avenue from Prairie/Hardy</li> </ul>	<ul style="list-style-type: none"> <li>• Height will be up to ~65 feet in height measured from existing grade to top of structure</li> <li>• ~30 feet wide maximum for passenger walkway</li> <li>• ~280 feet long for location 1 and ~160 feet long for locations 2 and 3</li> <li>• Minimum vertical clearance of 10 feet within the walkway interior</li> </ul>

Project Component	General Location	Approximate Size
Maintenance and Storage Facility (MSF)	station to the Hollywood Park site	
	<ul style="list-style-type: none"> <li>Specific locations will be determined at time of design and coordinated with stakeholders</li> </ul>	
Power Distribution System (PDS) Substation	<ul style="list-style-type: none"> <li>Primarily located on private property to be acquired by the City as part of the Project with potential for portions of the MSF to be located within an easement at 500 E. Manchester Boulevard</li> </ul>	<ul style="list-style-type: none"> <li>~75,000 sf building area</li> <li>Up to ~75 feet in height measured from existing grade to top of roof</li> <li>Surface parking area under building containing 50 spaces for employees and visitors</li> </ul>
	<ul style="list-style-type: none"> <li>Two PDS substations; one located at the MSF site and the second at the <del>Prairie/Hardy Station site</del> the Prairie Avenue/Hardy Street Station or the <u>Prairie Avenue/Manchester Boulevard Station</u>.</li> <li>Specific locations within each site will be determined during the design phase</li> </ul>	<ul style="list-style-type: none"> <li>~30 feet wide x ~100 feet long</li> <li>Up to ~20 feet clearance height measured from floor to ceiling</li> <li>If located below grade, an additional space of ~30 feet wide x ~30 feet long for vertical circulation</li> <li>~20 feet wide x ~40 feet long additional space for auxiliary equipment such as a backup generator, if necessary</li> </ul>
Roadway Improvements	<ul style="list-style-type: none"> <li>Market Street, Manchester Boulevard and Prairie Avenue</li> </ul>	<ul style="list-style-type: none"> <li>New roadway striping, lane re-configurations, partial relocation, on-street parking adjustments, new sidewalks, lighting improvements, traffic signal adjustments, landscaping, and streetscape</li> </ul>
Pick-Up/Drop-Off Areas, Surface Parking Lots and Staging Areas During Construction	<ul style="list-style-type: none"> <li>Market Street/Florence Avenue Station site</li> <li>150 S. Market Street</li> </ul>	<p>Surface level parking at each site:</p> <ul style="list-style-type: none"> <li>~650 spaces at Market Street/Florence Station</li> <li>~50 spaces at 150 S. Market Street</li> <li>~100 spaces at Prairie/Hardy Station</li> </ul> <p>Pick-Up/Drop-Off Area:</p> <ul style="list-style-type: none"> <li>Market Street/Florence Avenue Station site on Locust Street south of Florence Avenue, and Regent Street between Locust Street and Market Street</li> <li>Prairie/Hardy Street Station within the station site</li> </ul>

The following revision has been made to Page 3.0-36, Paragraph 1, Line 3-4 of the RDEIR:

Propulsion power which includes the power to run the train on the guideway and power for auxiliary and housekeeping needs would be provided by two Power Distribution System (PDS) substations located along the alignment. The two PDS substations would be located at the MSF and the Prairie Avenue/Hardy Street station or the Prairie Avenue/Manchester Boulevard station sites. The SCE service connection for the system would be provided to the PDS substation on the MSF site.

The following revision has been made to Page 3.0-75, List Bullets 2, 5, 9 and 10 of the RDEIR:

As part of the Project, the City of Inglewood has developed a Construction Commitment Program to pro-actively address the effects of the construction of the Project on the community. This program, provided in Appendix D, includes the following programs and plans:

- Business Community and Support Program
- Business Interruption Assistance Program
- Transit Access and Circulation Program
- Construction Staging and Traffic Control Program
- Pedestrian Access Program
- Parking Management Plan
- Air Quality Program
- Visual Resources Program
- Hazardous Materials Program
- Construction Noise Control Plan
- Construction Vibration Reduction Plan
- Tree Removal and Replacement Plan

The following revision has been made to Page 3.0-81, Lines 10 and 16 of the RDEIR:

The Prairie Avenue/Manchester Boulevard station and accompanying surface parking lot is proposed on two contiguous private parcels under common ownership that are on the southwest corner of the intersection of Prairie Avenue and Manchester Boulevard. Acquisition of these parcels is proposed. An elevated passenger walkway across Prairie Avenue to provide access to the Forum would also require an easement or partial acquisition on the Forum property for this passenger walkway connection. A PDS substation is proposed on this site or, in the alternative, on the Prairie Avenue/Hardy station site.

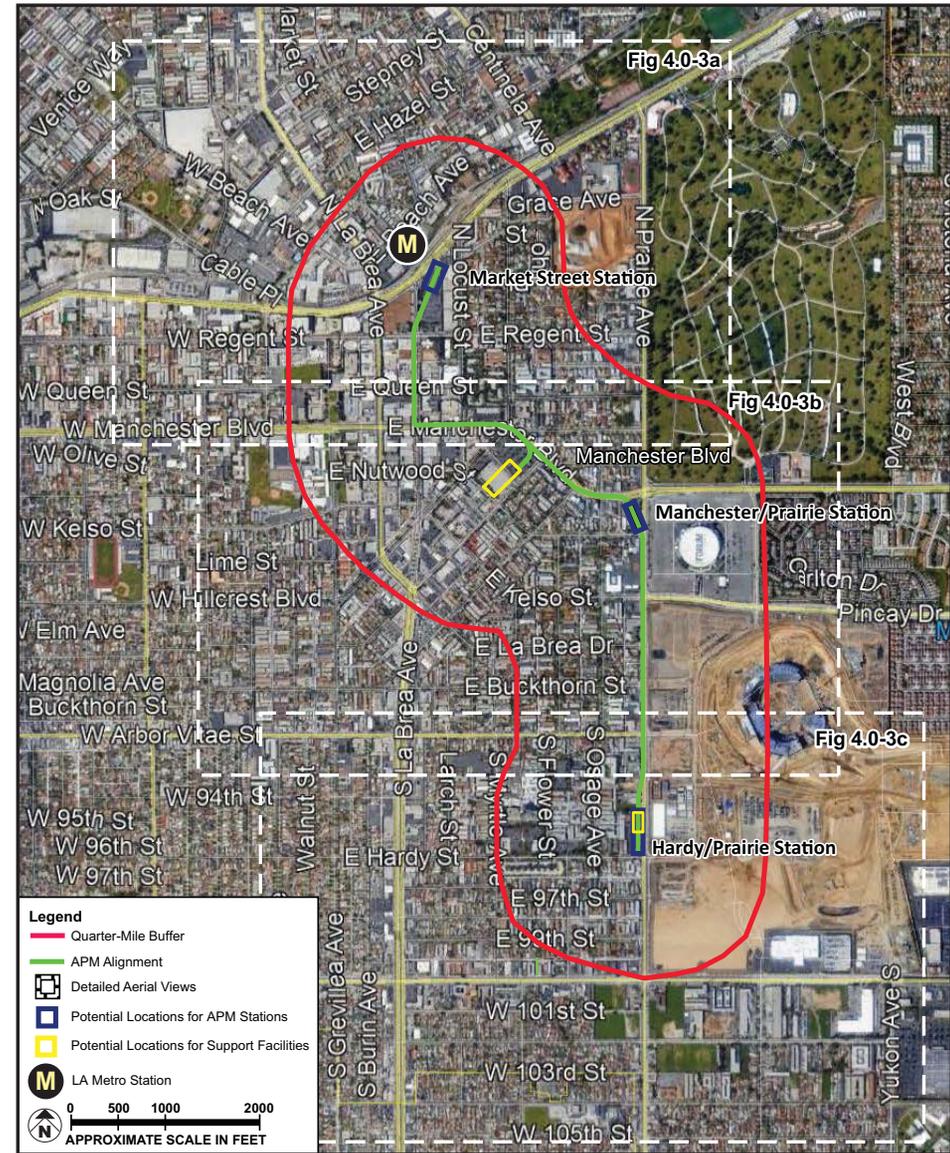

The Prairie Avenue/Hardy Street station and accompanying surface parking lot is proposed on two contiguous private parcels under common ownership located on the southwest corner of the intersection of Prairie Avenue and Hardy Street. Acquisition of these parcels is proposed. As shown in Table 3.0-5 and discussed in Section 3.6.1 above, acquisition (partial or full) of 7 additional parcels north of 1035 S. Prairie Avenue is also proposed to accommodate the guideway north of this station. A PDS substation is proposed on this site or, in the alternative, on the Prairie Avenue/Manchester Boulevard station site.

The following revision has been made to Page 3.0-83, List Bullet 4 of the RDEIR:

- Site preparation for installation of the PDS substations, electrical equipment, and subsystems will occur at the MSF site and the Prairie Avenue/Hardy Street Station or the Prairie Avenue/Manchester Boulevard Station Site.

### Section 4.0 Environmental Impact Analysis

The revision has been made to correct the potential location of PDS substations in **Figure 4.0-2: Map of Sensitive Receptors - Index**, **Figure 4.0-3b: Sensitive Receptors within a Quarter-Mile of the Project Area**, and **Figure 4.0-3c: Sensitive Receptors within a Quarter-Mile of the Project Area** on Pages 4.0-31, 4.0-33, and 4.0-34 of the RDEIR.

SOURCE: Google Earth - 2021; Meridian Consultants LLC - 2021

FIGURE 4.0-2

Map of Sensitive Receptors - Index

### Section 4.1 Aesthetics

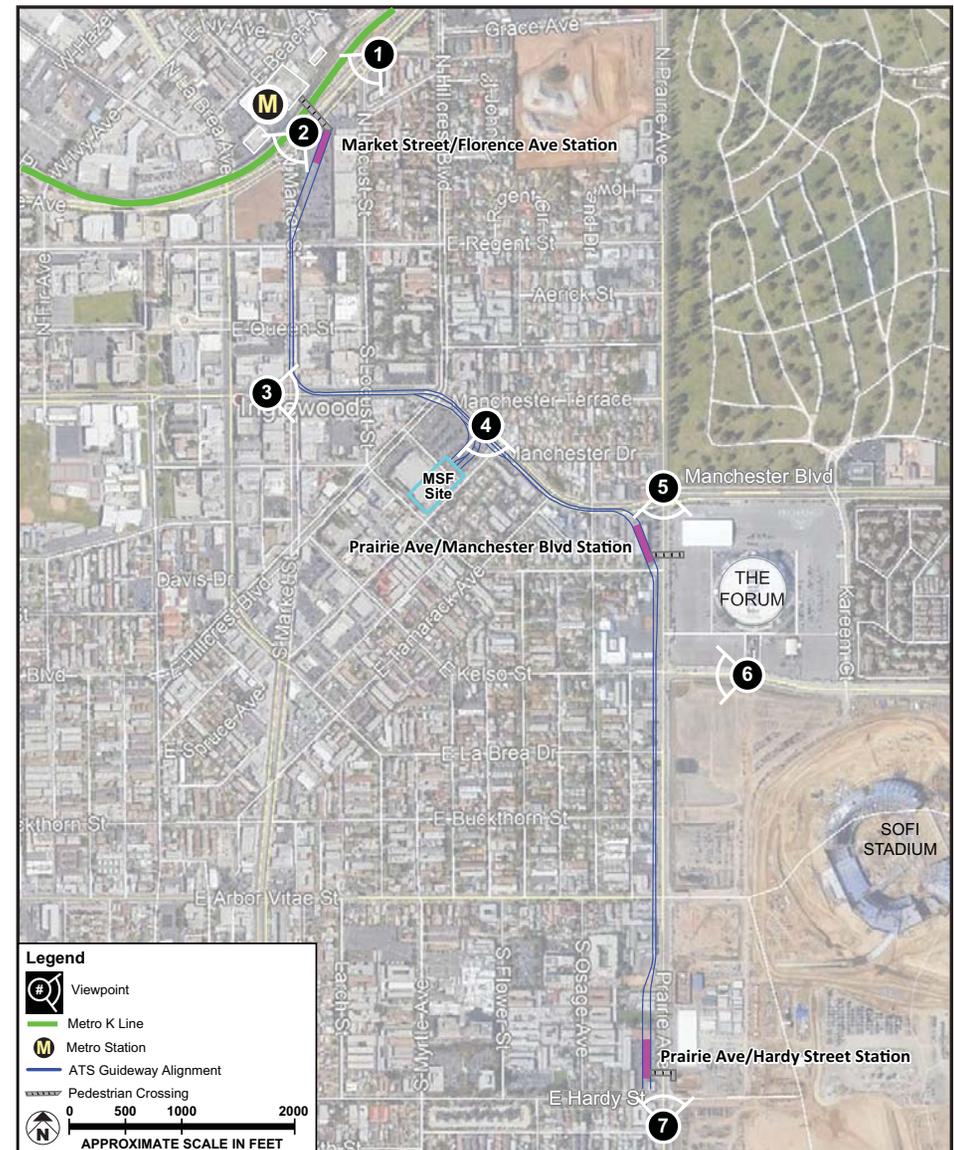

The following revision has been made to PDF AES-1 on Page 4.1-16 of the RDEIR:

**PDF AES-1 Construction (CCP)**

Construction activities during evening and nighttime hours may require the use of temporary lighting. To minimize the impact of temporary lighting on adjacent properties, the following measures shall be implemented:

- Temporary lighting will be limited to the amount necessary to safely perform the required work and will be directed downwards and shielded. Care shall be taken in the placement and orientation of portable lighting fixtures to avoid directing lights toward sensitive receptors, including automobile drivers. Motorists and sensitive receptors shall not have direct views of construction light sources. Light sensitive receptors include but are not limited to residential areas and transient occupancy uses.
- Construction night lighting shall be shielded to prevent a direct view of the light sources from residential properties with a property boundary that is within 150 feet of the construction site.
- Light trespass shall not exceed one foot-candle above ambient light level as measured at any adjacent residential and transient properties.
- Temporary sidewalks and any sidewalk adjacent to construction activities shall be illuminated to City Standards to protect public safety.
- To minimize the visual effects of construction the following measures shall be implemented:
  - Visually obtrusive erosion control devices, such as silt fences, plastic ground cover, and straw bales should be removed as soon as the area is stabilized.
  - Stockpile areas should be located in less visibly sensitive areas and pre-approved by the City. Stockpile locations, laydown, and staging areas shall be accessed by construction vehicles with minimal disruption near residential neighborhoods.

The revision has been made to correct the location of Viewpoint 3 in **Figure 4.1-1: Viewpoint Location Map** on Page 4.1-24 of the RDEIR.

SOURCE: Google Earth - 2021; Meridian Consultants LLC - 2021 Illustrative and subject to adjustments as part of finalization during final design

**FIGURE 4.1-1**

251-004-21

**Viewpoint Location Map**

The following revision has been made on Page 4.1-20, Paragraph 5, Line 5 of the RDEIR.

After construction, the components of the proposed ATS system that would change the existing visual character along the proposed alignment would include the ATS guideway; stations including vertical circulation elements, elevated passenger walkways, parking and Pick-up/Drop-off sites; the MSF; two PDS substations proposed on the MSF site and Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard Station site; and the new Vons supermarket at the MSF site. The trains moving on the elevated ATS guideway, station structures, and associated signage would be visible from adjacent land uses and the surrounding neighborhoods. The shift of one of the existing travel lanes on Prairie Avenue by no more than thirty (30) feet into the existing setback area would also affect the existing visual character of this portion of Prairie Avenue.

The following revision has been made to Table 4.1-1 on Page 4.1-32 of the RDEIR:

**Table 4.1-1  
ITC Project Component Locations and Sizes (Conceptual)**

Project Component	General Location	Approximate Size

The following revision has been made to PDF AQ-1 on Page 4.2-48 of the RDEIR:

### PDF AQ-1 Construction Air Quality Program

At a minimum, use equipment that meets the U.S. Environmental Protection Agency (USEPA)’s Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity, unless it can be demonstrated to the City Planning Division with substantial evidence that such equipment is not available. To ensure that Final Tier 4 construction equipment or better shall be used during the proposed Project’s construction, the City shall include this requirement in applicable bid documents, purchase orders, and contracts. The City shall also require periodic reporting and provision of written construction documents by construction contractor(s) and conduct regular inspections to the maximum extent feasible to ensure and enforce compliance.

Such equipment will be outfitted with Best Available Control Technology devices including a California Air Resources Board (CARB)-certified Level 3 Diesel Particulate Filters (DPF). Level 3 DPF are capable of achieving at least 85 percent reduction in particulate matter emissions. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by Final Tier 4 emissions standards for a similarly sized engine, as defined by the CARB’s regulations. Successful contractors must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. The proposed Project representative will make available to the lead agency and Southern California Air Quality Management District (SCAQMD) a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, which will be used during construction. The inventory will include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each unit’s certified tier specification, best available control technology (BACT) documentation, and CARB or SCAQMD operating permit shall be maintained on site at the time of mobilization for each applicable piece of construction equipment.

If any of the following circumstances listed below exist and the Contractor provides written documentation consistent with project contract requirements, the Contractor shall submit an Alternative Compliance Plan that identifies operational changes or other strategies that can reduce a comparable level of NOx emissions as Tier 4-certified engines during construction activities.

- The Contractor does not have the required type of off-road construction equipment within its current available inventory as to a particular vehicle or equipment by leasing or short-term rent, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
- The Contractor has been awarded funding by SCAQMD or another agency that would provide some or all of the cost to retrofit, repower, or purchase a piece of equipment or vehicle, but the funding has not yet been provided due to circumstances beyond the Contractor’s control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
- Contractor has ordered equipment or vehicle to be used on the construction project in compliance at least 60 days before that equipment or vehicle is needed at the Project alignment, but that equipment or vehicle has not yet arrived due to circumstances beyond the Contractor’s control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or

short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.

- Construction-related diesel equipment or vehicle will be used on the Project for fewer than 20 calendar days per calendar year. The Contractor shall not consecutively use different equipment or vehicles that perform the same or a substantially similar function in an attempt to use this exception to circumvent the intent of this measure.
- Documentation of good faith efforts and due diligence regarding the previous exceptions shall include written record(s) of inquiries (i.e., phone logs) to at least three leasing/rental companies that provide construction on-road trucks and off-road equipment, documenting the availability/unavailability of the required types of truck/equipment. The City will, from time-to-time, conduct independent audit of the availability of such vehicles and equipment for lease/rent within a 120-mile radius of the Project area, which may be used in reviewing the acceptability of the Contractor's good faith efforts and due diligence.
- Equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts shall be electric or alternative-fueled (i.e., nondiesel). Pole power shall be utilized to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel-powered generators, must be operated continuously, such equipment must be Final Tier 4 construction equipment or better and located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- At a minimum, require that construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export with a gross vehicle weight rating of at least 14,001 pounds), or best commercially available equipment, that meet CARB's 2010 engine emissions standards at 0.01 g/hp-hour of particulate matter and 0.20 g/hp-hour of NOx emissions or newer, cleaner trucks, unless the Contractor provides written documentation consistent with project contract requirements the circumstances exist as described above and the Contractor submits the Plan. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards. The City shall include this requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards and make the records available for inspection.
- Require the use of electric or alternatively fueled (e.g., natural gas) sweepers with high-efficiency particulate air (HEPA) filters.
- A publicly visible sign shall be posted with the Community Affairs Liaison's contact information to contact regarding dust complaints. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.
- Dust shall be controlled per local ordinances. The Contractor shall be responsible for excessive dust or construction debris that results in impacts to adjacent residences or private vehicles, including taking responsibility for clean-up and addressing complaints brought to the project.

- All trucks carrying fill materials, debris, or similar materials shall secure and cover loads to prevent dust or debris while travelling on public right of ways.
- All trucks removing materials from the site will be loaded within the site perimeter and will be required to cover loads as deemed necessary for dust control.
- Material stockpiles and construction area surfaces shall be covered and/or watered as needed to prevent dust at designated construction areas.
- All roadways, driveways, sidewalks, etc., being installed as part of the Project should be completed as soon as practicable; in addition, building pads should be laid as soon as practicable after grading.
- To the extent feasible, allow construction employees to commute during off-peak hours.
- Make access available for on-site lunch trucks during construction, as feasible, to minimize off-site construction employee vehicle trips.
- Every effort shall be made to utilize grid-based electric power at any construction site, where feasible.
- Contractors shall maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.
- Require in all applicable bid documents, purchase orders, and contracts of the requirement to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB's policy. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify construction vendors, contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the Project area. To further ensure that drivers understand the vehicle idling requirement, post signs at the proposed Project entry gates and throughout the Project alignment, where appropriate, stating that idling longer than five minutes is not permitted.

### Section 4.3 Biological Resources

The following revision has been made on Page 4.3-41, Paragraph 1, Lines 5 and 8 of the RDEIR.

The proposed Project would include two power distribution system (PDS) substations. These PDS substations will provide the necessary power for the proposed Project including traction power, auxiliary power, and housekeeping power for the stations and related infrastructure. One of the PDS substations will be located on the MSF site and the second PDS substation will be located on the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station site. As discussed above, the MSF site which includes the first PDS substation would be developed within an area included in the Downtown TOD Plan and would be subject to the tree requirements for this plan. The second PDS substation would be located

within the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station site which ~~is~~ are not located within a City plan but ~~is~~ are subject to the provisions of the IMC.

The following revision has been made on Page 4.3-49, Paragraph 4, Line 2 of the RDEIR.

As discussed previously, the PDS substations would be located within the MSF site and the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station site which are analyzed above. The PDS substations would involve the construction of new buildings and structures, some of which would have windows that could pose obstacles to migratory birds. However, as there are no native or nonnative vegetated corridors in the proximity of the proposed Project, the potential impact of these structures on migratory birds is anticipated to be minimal. During operation of the PDS substations, it is possible that migratory or nesting birds would build nests within or near the area. However, operation of the PDS substations would not substantially interfere with these nests once built as the majority of the Project components would remain stationary with exception of the ATS train cars.

The following revision has been made on Page 4.3-59, Paragraph 1, Line 2 of the RDEIR.

The proposed Project would include two PDS substations located at the MSF site and the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station site which are analyzed above.

**Section 4.4 Cultural Resources**

The following revision has been made on Page 4.4-2, Paragraph 2, Line 11 of the RDEIR.

Figure 4.4-1: Historic Resource Study Area identifies the Project Area and Expanded Study Area defined for purposes of the historic resource investigation. The Project Area includes all areas and parcels where new construction will occur. This includes the public rights-of-way along Market Street, Manchester Boulevard, and Prairie Avenue where the elevated ATS guideway will be constructed; the block bounded by Market Street, Florence Avenue, Locust Street, and Regent Street where the Market Street/Florence Avenue station would be constructed; parcels north of Florence Avenue where a pedestrian bridge from the Market Street/Florence Avenue station to the existing Metro K Line Downtown Inglewood station will land; the block bounded by Manchester Boulevard, Hillcrest Boulevard, Nutwood Street, and Spruce Avenue where the MSF and a PDS substation will be built; the parcel at the corner of southwest corner of Manchester Boulevard and Prairie Avenue where a station will be located; parcels at the northwest corner of Prairie Avenue and Hardy Street and of Prairie Avenue and Manchester Boulevard where a stations and a PDS substation will be located; and parcels east of Prairie Avenue between Manchester and Hardy where the travel lanes will be relocated to the east.

**Section 4.5 Energy Resources**

The following revision has been made on Page 4.5-2, Paragraph 4, Line 9 of the RDEIR.

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the proposed Project in response to consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. Specific changes to the proposed Project include raising the height of the ATS guideway along Market Street to preserve existing views of historic buildings, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue. In addition, the two power distribution system (PDS) substations are now proposed to be located on the MSF and Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station sites. As it relates to energy impacts, these changes include updated construction and operational details which resulted in reductions of energy resource consumption compared to the December 2020 Draft EIR.

The following revision has been made on Page 4.5-27, Paragraph 2, Line 9 of the RDEIR.

Propulsion power (i.e., the power to run the train on a guideway) would be provided via two PDS substations located along the guideway alignment. Each PDS substation includes equipment to transform the medium- to high-voltage power feed provided from the power companies to the required 750-volt direct current (VDC) needed to power the vehicles and other ancillary equipment. The proposed Project's operating components would utilize electrical energy for the operation of the related support features, such as the ATS trains, stations, and MSF via electricity from the two PDS substations. For normal operations, the required load flow for power of the proposed Project would be divided between the two PDS substations. One of the PDS substations would be located on the MSF site. The second PDS substation would be located on the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station site. This includes operation of all interior and exterior lighting features included for the proposed Project. Power requirements for each PDS substation are provided in **Table 4.5-7: Proposed Project Normal Operation Load Flow.**

The following revision has been made to **Table 4.5-7** on Page 4.5-27 of the RDEIR.

**Table 4.5-7  
Proposed Project Normal Operation Load Flow**

PDS Site	Peak Power (KW)	RMS Power (KW)	Average Power (KW)	RMS Current (A)
MSF	2,008	834	755	1,067
Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station	2,119	777	639	996

Source: Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021. Table 9-2.

Notes:  
 KW – kilowatt  
 RMS –The substitution load calculation output provides both per second and root mean squared (RMS) KVA loads for each substation.

The following revision has been made on Page 4.5-27, Paragraph 3, Line 2 of the RDEIR.

As shown, the proposed MSF PDS substation is estimated to have a peak power load flow of 2,008 kW, and the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station PDS substation is estimated to have a peak power load flow of 2,119 kW for a total of 4,127 kW.<sup>2</sup> The ATS trains would operate for 18 hours per day which would generate a total electricity demand of 74,286 kWh per day or 27,114,390 kWh (27.1 GWh) per year.<sup>3</sup>

The following revision has been made on Page 4.5-28, Paragraph 2, Lines 1 and 4 of the RDEIR.

In the event the MSF PDS substation is unable to operate, the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station PDS substation is estimated to have a peak power load of 4,152 kW which would generate a total electricity demand of 74,736 kWh per day or 27,278,640 kWh (27.3 GWh) per year. Similarly, in the event the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station PDS substation is unable to operate, the MSF PDS substation is estimated to have a peak power load of 4,353 kW which would generate a total electricity demand of 78,354 kWh per day or 28,599,210 kWh (28.6 GWh) per year.

The following revision has been made on Page 4.5-28, Paragraph 3, Line 7 of the RDEIR.

The electrical demand from the existing land uses to be removed to implement the Project is 6,489,214 kWh per year. As noted previously, the Vons store replacement would use 1,742,391 kWh of electricity per year. As shown in Table 4.5-8: Annual Electricity Use from Proposed Project Operation, the electricity demand for the proposed Project during normal operation would result in a net increase of 22,367,567 kWh (22.4 GWh) per year. In the event the MSF PDS substation is unable to operate, the electricity demand would result in a net increase of 22,531,817 kWh (22.5 GWh) per year. In the event the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station PDS substation is unable to operate, the electricity demand would result in a net increase of 23,852,387 kWh (23.9 GWh) per year. Should any of the uses that would be removed to implement the Project relocate within the City, the net

2. Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.  
 3. Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

increase in energy shown in Table 4.5-8 would be reduced but in no event would the amount of electricity required exceed the total shown for the ATS system.

The following revision has been made to Table 4.5-8 on Page 4.5-28 of the RDEIR.

**Table 4.5-8  
 Annual Electricity Use from Proposed Project Operation**

Operation Scenario	Annual Electricity Usage (kWh/yr)		
	ATS System <sup>a</sup>	Existing <sup>b</sup>	Net Increase
Normal Operation	27,114,390	4,746,823	22,367,567
Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station PDS Only	27,278,640	4,746,823	22,531,817
MSF PDS Only	28,599,210	4,746,823	23,852,387

Notes: kWh/yr = kilowatt-hours per year.  
<sup>a</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.  
<sup>b</sup> Existing data accounts for operation of the Vons store replacement.

### Section 4.6 Geology and Soils

The following revision has been made to Mitigation Measure (MM) GEO-1 on Page 4.6-22 of the RDEIR.

**MM GEO-1:** Project Design. The proposed Project shall be designed to accommodate fault rupture where present in accordance with applicable Caltrans guidelines, including MTD 20-8, Analysis of Ordinary Bridges that Cross Faults, dated January 2013; and MTD 20-10, Fault Rupture, dated January 2013, where any portion of a structure falls within an APEFZ, or where any portion of a structure falls within approximately 100 meters (330 feet) of well-mapped active faults, or within 300 meters (1,000 feet) of an un-zoned fault (not in an APEFZ) that is Holocene or younger in age.

Stations and elevated structures for the Automated Transit System (ATS) guideway shall be located to avoid or accommodate the fault rupture hazard where present with refinement of station and ATS guideway placement worked into final design as needed based on project specific geologic surveys, recommendations and criteria. Bridge type structures, such as the ATS guideway, shall be designed to take into account potential displacement from a fault offset, dynamic response due to ground shaking, and any other fault-induced hazards (e.g., creep) that may occur. The design shall be in accordance with the Caltrans MTD 20-8, which defines a method for determining the potential

displacement at columns and abutments at fault crossings and designing the structure so it can slide without falling.

## Section 4.8 Hazards and Hazardous Materials

The following revision has been made to PDF HAZ-1 on Page 4.8-26 of the RDEIR:

### PDF HAZ-1 Hazardous Materials Program

The following practices will be followed during construction to address the potential for encountering hazardous materials during construction of the Project.

- Building Demolition Plan – Prior to any demolition occurring, conduct an evaluation of all buildings built prior to 1980 to be demolished to identify the presence of asbestos containing materials (ACMs) and lead-based paint (LBP). Remediation shall be implemented in accordance with the recommendations of these evaluations to ensure that no ACMs or LBP remain present and to ensure ACMs and LBP are removed to levels established for public safety.
- Hazardous Materials Contingency Plan – Prior to construction, prepare a plan addressing the potential for discovery of unidentified underground storage tanks (USTs), hazardous materials, petroleum hydrocarbons, or hazardous or solid wastes encountered during construction. This Plan shall address UST decommissioning, field screening and materials testing methods, contaminant management requirements, and health and safety requirements to ensure no exposure to hazards or hazardous materials occurs on site and to ensure any materials encountered during construction are removed to levels established for public safety.
- Soil Management Plan – After final construction plans are prepared showing the lateral and vertical extent of soil excavation during construction are prepared, prepare a Soil Management Plan to establish soil reuse criteria, define a sampling plan for stockpiled materials, describe the disposition of materials that do not satisfy the reuse criteria, and specify guidelines for imported materials.
- Health and Safety Plan – Prior to construction, prepare a Health and Safety Plan to address the potential for exposure to any constituents of concern that may be encountered during construction.
- Utility Relocation Work - All Project utility relocations in the vicinity of Kelso Elementary School shall be designed and constructed to remain within the public right-of-way and not impact school property. Relocations shall be located further away from the school as feasible and designed and constructed to current standards to assure that they create no unacceptable hazards to the school. During Project construction, any open trenches and construction equipment shall be marked and barricaded such that they are not accessible by the students or create any potential hazard to school operations. Project utility relocations or cut overs that may require disruption to school normal utility services shall be scheduled to occur outside of normal school hours with advanced notification to the School District.

The following revision has been made to PDF TRANS-4 on Page 4.8-29 of the RDEIR:

### PDF TRANS-4 Pedestrian Access Program

A Pedestrian Access Program will be developed by members of the Project Task Force (as defined in the CCP), subject to review and acceptance by the City and/or the JPA, and will adhere to the following principles:

- Pedestrian access to buildings shall be maintained at all times.
- Maintain all crosswalks to the extent feasible. Whenever a crosswalk is removed from service, establish and maintain temporary accessible replacement crosswalks as close as practicable to the original crosswalk locations unless the City determines that a replacement crosswalk is not necessary to maintain an adequate level of service. Replacement crosswalks shall be identified and controlled by wayfinding signs approved by the City.
- Establish and maintain passenger wayfinding signage.
- Maintain sidewalk access for pedestrians, including providing temporary sidewalks if existing sidewalks are disrupted during construction. Any sidewalk closures are subject to review and approval by the City.
- Sidewalks that are being maintained in a temporary condition shall meet all applicable safety standards, including but not limited to the requirements of the Federal Americans with Disabilities Act and similar California laws for sidewalks being maintained in a temporary condition.
- Protect pedestrians from construction-related debris, dust, and noise; such protection may include the use of dedicated pedestrian barriers.
- Coordinate with the Inglewood Unified School District and the City to provide crossing guards at locations requested by IUSD or the City when crosswalks or sidewalks are closed. Identify temporary alternate routes to school, working closely with IUSD and the City, and disseminate this information to schools and stakeholders affected by construction.

The following revision has been made on Page 4.8-36, List Bullet 3 of the RDEIR.

- Power Distribution System (PDS) Substations and Backup Power Generators. The MSF and Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard Station would each operate a PDS substation and power generator. Various chemicals would be used and stored, including but not limited to dielectric fluid, transformer oil, insulating oils, sulfuric acid, and sulfur hexafluoride in order to insulate and cool electrical conductors and operate the PDS substations. Diesel fuel would also be stored for the operation of the power generators.

The following revisions have been made on Page 4.8-41, List Bullets 2 and 3 of the RDEIR.

- Operations of the MSF and Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard Station would be subject to the requirements of programs administered by the LACoFD for storage of

all hazardous materials on site, including diesel fuel for the emergency generators, which would be required to adhere to a facility-specific HMBP.

- The MSF would require the use of equipment, tools, and materials for maintenance activities; these may also require the use of various materials and substances that would be considered hazardous. The PDS substations at the MSF and Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard Station would use and store bulk quantities of hazardous materials—such as fuel, solvents, oil, transmission fluid, paints, and other chemicals—that would have the potential to be released into the environment if not properly handled and stored. The proposed Project would comply with existing regulations governing the storage and handling of such chemicals, and applicable regulations to responding to accidental release of such chemicals.

## Section 4.9 Land Use

The following revision has been made on Page 4.9-24, Paragraph 5, Line 5 of the RDEIR.

Support facilities would include two power distribution system (PDS) substations. These substations would be the service connection point and would provide the necessary power for the proposed Project including traction power, auxiliary power and housekeeping power for the stations and infrastructure. One of the PDS substations would be co-located with the MSF and another would be located at Prairie Avenue/Hardy Street Station or Prairie Avenue/Manchester Boulevard.

The following revision has been made on Page 4.9-26, Paragraph 2, Line 5 of the RDEIR.

The Prairie Avenue Segment extends from the intersection of Prairie Avenue and Manchester Boulevard to just northwest of the intersection of Prairie Avenue and Hardy Street. As the guideway turns south, the Manchester Boulevard/Prairie Avenue station would be located on a vacant commercial site located on the southwest corner of Manchester Boulevard and Prairie Avenue at 401 Prairie Avenue that would be acquired as part of the Project. A PDS substation would also be located on this segment at the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard Station.

The following revisions have been made on Page 4.9-43, Paragraph 2, Line 4 of the RDEIR.

The CCP includes the measures described below to minimize traffic interruptions during construction. Implementation of the Construction Staging and Traffic Control Program will maintain pedestrian and vehicular access throughout construction of the Project. Other measures included in the CCP, including the Business and Community Support Program and Business ~~Interruption~~ Assistance Program, will also minimize the effects of the construction of the Project on the community. While construction of the Project will result in temporary disruptions, construction of the Project will not create a physical division of the community that will result in a significant land use impact

The following revisions have been made on Page 4.9-42, Paragraph 3, Line 3 of the RDEIR.

The requirements set forth in the CCP, including the Transit Access and Circulation Program (CCP, Section 5.0), the Construction Staging & Traffic Control Program (CCP, Section 6.0), and the Business and Community Support Program (CCP, Section 2.0) and Business ~~Interruption~~ Assistance Program (CCP, Section 3.0) (see Appendix D) would continue to allow access within the Project area, including access to businesses at all times, and transportation related inconveniences would be reduced to the extent feasible and provide additional support for businesses. Efforts would be made to keep all traffic lanes open for peak directional travel. If all lanes cannot remain open, one lane would be kept open for peak direction and supplemented by detour options. Advanced notice of road closures and detours would be provided to the City and the community.

The following revisions have been made on Page 4.9-43, Paragraph 5, Line 4 of the RDEIR.

While access to some neighborhoods would be disrupted and detoured for short periods of time during construction, through implementation of the CCP access would continue to be available to neighborhoods for both residents and emergency response. In addition, the funding assistance provided as part of the CCP's Business ~~Interruption~~ Assistance Program would avoid indirect impacts on existing businesses from construction of the ITC Project. For these reasons, the proposed Project would not physically divide the existing community during construction and this impact is less than significant.

The following revisions have been made on Page 4.9-68, Line 3 of the RDEIR.

The conclusion of this economic study is that the ITC Project will not negatively impact the factors, including access and parking, visibility and safety, and quality of the public realm that will contribute to the economic viability of downtown Inglewood. This study also included a review of elevated transit systems with similar design features implemented in U.S. cities, which found no evidence that the introduction of these systems alone may lead to economic decline in downtowns. There is a potential for temporary effects on economic conditions in downtown during the approximate 46-month construction period for the Project. As noted under Impact LU-1, the Construction Commitment Program includes a Business and Community Support Program and a Business ~~Interruption~~ Assistance Program to assist all businesses financially affected by construction activities.

## Section 4.10 Noise

The following revisions have been made on Page 4.10-10, List Bullet 4 of the RDEIR.

- Site preparation for installation of the power distribution system (PDS) substations, electrical equipment, and subsystems will occur at the MSF site and Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard Station Site.

The following revision has been made on Page 4.10-44, Paragraph 1, Line 15 and List Bullet 3 of the RDEIR:

Land uses adjacent to and within a quarter mile radius of the proposed Project consisting of the guideway, stations and the MSF, include noise sensitive receptors where people normally sleep such as hotels and single and multifamily residences (identified as Category 2 uses), schools, places of worship, medical offices (identified as Category 3 uses). For the purpose of presenting the results of the potential noise impact analyses in this Recirculated Draft EIR, the land uses nearest to the proposed Project have been organized into groups by geographic proximity as shown in Figure 4.10-5: Noise Sensitive Receptor Groups. These receptor groups are used in this Recirculated Draft EIR to provide a representation of the potential noise impacts on noise-sensitive receptors around the proposed Project and represent the areas where baseline noise monitoring was conducted. Although the receptor groups shown do not include all the receiver points evaluated in the noise modeling analyses, these identified groups include all noise-sensitive receptors nearest to the proposed Project and represent the greatest potential for noise impacts. Adjacent commercial and industrial uses that are not noise-sensitive (specifically, receptor groups Site A – Commercial uses along E. Queen Street, Site D – Commercial uses along Prairie Avenue; lodging uses along W. Century Boulevard, Site E – Commercial and lodging uses along the southern portion of W. Century Boulevard, Site J – Commercial uses along E. Manchester Boulevard, and Site K – ~~Commercial~~ Residential uses along E. Regent Street) but considered vibration-sensitive (as discussed in more detail below), are also listed in the prior locations for informational purposes. As such, the areas where noise and vibration monitoring was conducted along the proposed alignment and stations are comprised of the following uses:

### Market Street Segment

- Site 1: Residential uses on the east side of N. Locust Street including the Holy Faith Episcopal Church, commercial uses on the west side of N. Locust Street;
- Site A: Commercial uses along E. Queen Street; and
- Site K: ~~Commercial~~ Residential uses along E. Regent Street.

The following revision has been made to PDF NOISE-1 on Page 4.10-61 of the RDEIR:

### PDF-NOISE-1 Construction Noise Control Plan (CCP)

A Construction Noise Control Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works prior to construction. The Plan

shall include measures demonstrating that construction noise levels will be below FTA's General Assessment Construction Noise Criteria. The following construction noise reduction measures shall be incorporated into the Plan:

- Install temporary noise barriers that reduce sound at receptors;
- For any idling that is expected to take longer than five minutes, the engine shall be shut off;
- All equipment shall be equipped with optimal muffler systems;
- Use solar, battery powered, or hybrid equipment whenever practical;
- Locate staging areas as far away from sensitive receptors as feasible;
- Locate stationary noise sources as far away from sensitive receptors as feasible;
- Enclose stationary noise sources, such as diesel- or gasoline-powered generators, with acoustical barriers where necessary and required;
  - If stationary equipment cannot be enclosed within a shed or barrier, such equipment must be muffled and located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- Pole power shall be utilized to the maximum extent feasible in lieu of generators.
- Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible. Additionally, use of "quiet" pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions shall be considered.
- Staging of construction material deliveries behind fencing to minimize noise emitting from idling vehicles.
- On site-signage reminding workers to minimize noise generation.
- When not in use or being staged, heavy equipment shall be located as far as practicable from sensitive receptors.
- For project foundations, consider the use of drilled piles or sonic pile drivers or vibratory pile drivers instead of traditional impact pile drivers, as permitted by geological conditions.
- Sequence noisy activities to occur during the same general time period during daytime hours to the extent practical.
- Select quieter demolition methods where appropriate and feasible such that demolition activities can remain within the project specified noise levels.

- Unless deemed infeasible for a particular construction activity, the Contractor shall utilize rubber tire earth moving equipment in lieu of track mounted earth moving equipment.
- Construction material deliveries shall take place within designated construction staging areas as far from residential sites as practical to minimize noise impacts.
- Provide signage at active construction sites and staging areas reminding workers, equipment operators and delivery vehicles to minimize noise levels to the extent possible.
- Rumble strips or signage shall be provided at roadway access points into contractor laydown and staging areas to slow construction vehicles and limit vehicle noise.
- Coordinate with the Inglewood Unified School District administrators to avoid disruptive noise during school hours, including scheduling heavy equipment such as cranes, haul trucks, concrete trucks, concrete pumps, pneumatic equipment, earth moving vehicles or similar to operate outside of school hours. The City shall require that the Project's construction noise during school hours would be limited to 5 dBA Leq 1-hour above the measured ambient noise levels at Kelso School property line as identified in the RDEIR. Activities that would exceed this threshold shall be scheduled to occur outside of normal school hours or mitigated with specific mitigation measures such as temporary sound walls, sound blankets, or other sound-attenuating devices. The City shall monitor the Project's construction noise levels during school hours to assure compliance. As requested by the District, monthly noise monitoring reports on noise levels during school hours at Kelso School will be provided to the District.

In order to ensure that construction noise levels will be below the established standards, the following shall be incorporated into the Plan:

- A monitoring plan shall be implemented during demolition and construction activities. Warning thresholds shall be defined that are 5 dBA below the specified noise limits to allow sufficient time for the Contractor to take actions to reduce noise. A monitoring record that documents all alarms and actions taken to comply with these measures shall be provided to the City upon request.
- In the event the warning level (dBA) is exceeded, construction activities shall be temporarily halted in the vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the established standards. Noise measurements shall be gathered after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels:
  - Halting/staggering concurrent construction activities in certain locations;
  - Reducing the speed or intensity of the heavy-duty construction equipment being operated simultaneously;
  - Operating equipment at the lowest possible power levels;
  - Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.

The following revision has been made to PDF NOISE-2 on Page 4.10-63 of the RDEIR:

#### **PDF NOISE-2 Construction Vibration Reduction Plan (CCP)**

Prior to the issuance of any demolition or construction permit for each phase of the Project, a Construction Vibration Reduction Plan shall be prepared to minimize construction vibration at nearby sensitive receptors from vibration created by construction activities. The Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works. The Plan shall include but not be limited to the following elements to ensure impacts from ground borne vibration are less than significant:

- A Pre-Demolition and Construction Plan that includes but is not limited to:
  - Photos of current conditions of buildings and structures that could be damaged from construction activities. This crack survey shall include photos of existing cracks and other material conditions present on or at the surveyed buildings. Images of interior conditions shall be included if possible. Photos in the report shall be labelled in detail and dated.
  - Identify representative cracks in the walls of existing buildings, if any, and install crack gauges on such walls of the buildings to measure changes in existing cracks during project activities.
  - Crack gauges shall be installed on multiple representative cracks, particularly on sides of the building facing the Project.
  - Determine the number and placement of vibration sensors at the affected buildings in consultation with a qualified architect. The number of units and the locations of these sensors shall take into account proposed demolition and construction activities to ensure that adequate measurements can be taken illustrating vibration levels during the course of the Project, and if/when levels exceed the established threshold.
  - A line and grade pre-construction survey at the affected buildings shall be conducted.
- A Vibration Plan During Demolition and Construction that includes the following:
  - Regularly inspect and photograph crack gauges, maintaining records of these inspections to be included in postconstruction reporting. Gauges shall be inspected every two weeks, or more frequently during periods of active project actions in close proximity to crack monitors.
  - The vibration monitoring system shall measure and continuously store the peak particle velocity (PPV) in inches/second. Vibration data shall be stored on a one-second interval. The system shall also be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA's threshold of significance for a building given its conditions, and a warning level that is 0.05 inch/second (PPV) less than the regulatory level. The system shall also provide real-time alert when the vibration levels exceed either of the two preset levels.
  - In the event the warning level (PPV) is triggered, the contractor shall identify the source of vibration impacts and establish steps to reduce the vibration levels, including but not limited to halting or staggering concurrent activities and using lower vibratory techniques.

- In the event the regulatory level (PPV) is triggered, halt the construction activities in the vicinity of the trigger area and visually inspect the building for any damage. Results of the inspection must be logged. Identify the source of vibration generation and provide steps to reduce the vibration level. Vibration measurement shall be made with the new construction method to verify that the vibration level is below the warning level (PPV). Construction activities may then restart.
- In the event work occurs in the proximity of identified historic uses, the system shall be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA threshold of significance 0.12 inch/second for a building given its conditions, and a warning level that is 0.012 inch/second (PPV) less than the regulatory level.
- Collect vibration data from receptors and report vibration levels to the Joint Powers Authority and/or the City Chief Building Official on a daily basis. The reports shall include annotations regarding project activities as necessary to explain changes in vibration levels.
- Post-Construction Reporting and Repairs:
  - Provide a report to the Joint Powers Authority and/or the City Chief Building Official regarding crack and vibration monitoring conducted during demolition and construction. In addition to a narrative summary of the monitoring activities and their findings, this report shall include photographs illustrating the post-construction state of cracks and material conditions that were presented in the pre-construction assessment report, along with images of other relevant conditions showing the impact, or lack of impact, of project activities. The photographs shall sufficiently illustrate damage, if any, caused by the Project and/or show how the Project did not cause physical damage to the buildings. The report shall include analysis of vibration data related to project activities, as well as summarize efforts undertaken to avoid vibration impacts. Finally, a postconstruction line and grade survey shall also be included in this report.
  - Perform repairs to buildings if damage is caused by vibration or movement during the demolition and/or construction activities. Repairs may be necessary to address, for example, cracks that expanded as a result of the Project, physical damage visible in post-construction assessment, or holes or connection points that were needed for shoring or stabilization. Repairs shall be directly related to project impacts and will not apply to general rehabilitation or restoration activities of the buildings.
- To minimize the risk of potential structural and building damage:
  - Limit the location of pile driving and vibratory roller activity to not be within 55 feet and 30 feet of the nearest off-site sensitive receptor, respectively.
  - Limit the number of jackhammers operating simultaneously to one (1) piece operating within 45 feet of off-site sensitive receptors.
  - In the event impact pile driving is required, equipment shall only be used from the hours of 7:00 AM to 7:00 PM. If feasible, pile driving should use alternative technology such as vibration or hydraulic insertion.

- To minimize the risk of related to human annoyance:
  - Limit the location of pile driving to 310 feet of off-site vibration sensitive receptors.
  - Limit the location of vibratory roller to 150 feet of off-site vibration sensitive receptors.
  - Limit the location of large bulldozer to 85 feet of off-site vibration sensitive receptors.
  - Limit the location of caisson drilling to 85 feet of off-site vibration sensitive receptors.
  - Limit the location of loaded trucks to 75 feet of off-site vibration sensitive receptors.
  - Limit the location of jackhammers to 45 feet of off-site vibration sensitive receptors.
  - Limit the location of small bulldozer to 25 feet of off-site vibration sensitive receptors.

The following revisions have been made on Page 4.10-102, Paragraph 1, Line 2 of the RDEIR.

The proposed Project will include two PDS substations. The identified PDS substation locations are the proposed MSF site and the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station. Each PDS substation includes equipment to transform the medium- to high-voltage power feed provided from the power companies to the required 750-volt direct current (VDC) needed to power the vehicles and other ancillary equipment. A description of the PDS substations is provided in Section 3.0, 3.5.5: Power Distribution System Substations.

The following revisions have been made on Page 4.10-102, Paragraph 3, Lines 9 and 12 of the RDEIR.

Noise from transformers and similar equipment at substations is usually a low-frequency (60 Hz) humming sound. Noise from fans and ventilation equipment at substation sites can also contribute to this source. Transformer noise will “transmit” and attenuate at different rates depending on the transformer size, voltage rating, and design. The substation would be the source of noise from what is termed corona discharge. Noise from corona discharge and similar electrical phenomena associated with high voltage transmission lines is heard as a cracking or hissing sound, which commonly varies with the humidity. While distinctive at a short distance, this noise is typically only about 40 to 50 dBA or less and would not be loud enough to cause a significant increase in noise levels at both the proposed MSF site and the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station. When taking into account the noise from the transmission line ranging from 40 to 50 dBA, this results in a maximum increase of 0.1 dBA Leq, which is technically considered not perceivable. With the concurrent operation of noise generated from the proposed MSF site and the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station, the noise levels generated by the transformers would be negligible. Additionally, as described previously, implementation of PDF NOISE-1 would require stationary noise source generated from mechanical equipment to be enclosed within a shed or barrier that would further reduce noise levels. Thus, the off-site PDS substations would result in a less than significant noise impact.

2.0 Revisions to the Draft EIR

The following revision has been made to change the existing land use at monitoring location “Site K” from “Public” to “Residential” in Tables 4.10-12, 4.0-13, 4.0-15, 4.0-16, 4.0-17, 4.0-18, 4.0-19, 4.0-20, 4.0-21, 4.0-22, 4.0-23, 4.0-24, and 4.10-25 on Pages 4.10-50, 4.10-52, 4.10-69, 4.10-71, 4.10-75, 4.10-77, 4.10-81, 4.10-83, 4.10-87, 4.10-89, 4.10-96, 4.10-100, 4.10-106 of the RDEIR.

February 2022

## Section 4.12 Transportation

The following revision has been made to PDF TRANS-2 on Page 4.12-26 of the RDEIR:

### PDF TRANS-2 Construction Staging and Traffic Control Program

A Construction Staging and Traffic Control Program will be developed by members of the Project Task Force (as defined in the CCP), subject to review and acceptance by the City and/or the JPA, and will address the following topics:

- Coordination with other public infrastructure projects within the City's boundaries.
- Detour routes, including analysis of impacts to pedestrian, business, bicycle, transit and traffic flow.
- Coordination of closures and restricted access during the construction period with special attention during periods of expected heavy traffic from events scheduled at SoFi Stadium and other venues in the Los Angeles Sports and Entertainment District at Hollywood Park, the Forum, and the Inglewood Basketball and Entertainment Center.
- Coordination with the City, police, and fire services department regarding maintenance of emergency access and response times.
- Monitoring and coordination of construction materials deliveries.
- Notification to businesses and residents on upcoming construction activities including but not limited to the establishment of a website with project construction information, signage, and web-based media.

The Traffic Control Program will be updated, developed as needed based on the following principles:

- Minimize traffic impacts on residential streets.
- Establish minimum traffic lane requirements for Manchester Boulevard, Florence Avenue, and Prairie Avenue during construction such that at least the full number of traffic lanes in the peak direction, and if feasible, one traffic lane in the off-peak direction is available, with additional capacity provided through appropriate detour routes. The directional traffic lanes may be reversible to maintain the peak directional capacity in either direction as necessitated by traffic demands. For all other streets potentially affected by construction, maintain at least one lane of traffic in each direction unless otherwise approved by the City.
- Maintain access to and from all alleys at one or both ends of the alley when possible. If an alley is obstructed such that a turnaround by any vehicle is not feasible, traffic flaggers shall be provided to control access to/from the alley.
- Maintain access for all public safety vehicles (such as police, fire, and emergency response).
- Maintain bicycle and pedestrian access within the Project area or approved detours at all times.

- Provide adequate street access to City service vehicles, including but not limited to trash pickup and street sweeping service vehicles, during planned service times.
- Sidewalk closures should be avoided to the degree feasible and are permitted only when approved by the City. Accessible detours shall be provided if sidewalk closures are necessary.
- Use traffic control officers/flaggers as appropriate to minimize the degree and duration of impacts and maintain safety.
- Establish and maintain wayfinding signage.
- Maintain vehicular and pedestrian access to all businesses and residents impacted by construction activities including roadway closures.
- Hold quarterly community outreach meetings with businesses and residents to provide updates on temporary, full, or partial street closures necessary for construction. Website will be updated 45 to 60 days prior to planned dates of any street closures.
- All closures, full or partial, are subject to City review and approval which shall consider measures to minimize the degree and duration of street and lane closures.
- Entry and exit to the Market Street/Florence Avenue construction site shall be limited to right turns to/from Florence Avenue for large trucks, construction equipment, and material deliveries. An entrance off Locust Street between Florence Avenue and Regent Street will also be required to serve the contractor's offices and staging area. If required for phasing, the Locust Street entrance may also be used for large trucks, construction equipment, and material deliveries as approved by the City.

The following revision has been made to PDF TRANS-4 on Page 4.12-28 of the RDEIR:

### PDF TRANS-4 Pedestrian Access Program

A Pedestrian Access Program will be developed by members of the Project Task Force (as defined in the CCP), subject to review and acceptance by the City and/or the JPA, and will adhere to the following principles:

- Pedestrian access to buildings shall be maintained at all times.
- Maintain all crosswalks to the extent feasible. Whenever a crosswalk is removed from service, establish and maintain temporary accessible replacement crosswalks as close as practicable to the original crosswalk locations unless the City determines that a replacement crosswalk is not necessary to maintain an adequate level of service. Replacement crosswalks shall be identified and controlled by wayfinding signs approved by the City.
- Establish and maintain passenger wayfinding signage.
- Maintain sidewalk access for pedestrians, including providing temporary sidewalks if existing sidewalks are disrupted during construction. Any sidewalk closures are subject to review and approval by the City.

- Sidewalks that are being maintained in a temporary condition shall meet all applicable safety standards, including but not limited to the requirements of the Federal Americans with Disabilities Act and similar California laws for sidewalks being maintained in a temporary condition.
- Protect pedestrians from construction-related debris, dust, and noise; such protection may include the use of dedicated pedestrian barriers.
- Coordinate with the Inglewood Unified School District and the City to provide crossing guards at locations requested by IUSD or the City when crosswalks or sidewalks are closed. Identify temporary alternate routes to school, working closely with IUSD and the City, and disseminate this information to schools and stakeholders affected by construction.

#### Section 4.14 Utilities and Service Systems

The following revision has been made on Page 4.14-54, Paragraph 2, Line 3 of the RDEIR.

Moreover, SCE estimated that normal operation of the proposed PDS substation at the MSF Site would have a peak power load flow of 2,008 kilowatts (kW) and normal operation of the proposed PDS substation at the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station would have an estimated peak power load flow of 2,119 kW for a total of 4,127 kW.

The following revision has been made to **Mitigation Measure (MM) UT-1** on Page 4.14-55 of the RDEIR.

**MM UT-1:** Prior to the award of the DBFOM contract, and start of any demolition or construction activities, the City or DBFOM shall be responsible for identifying the locations of existing utilities potentially affected by the proposed Project. This shall include coordinating with all existing utility providers for wet and dry utilities (water, sewer, gas, electric, and telecommunications) to obtain documentation of existing utility locations. Field verification (i.e., potholing and other methods as appropriate) shall be conducted to document the locations of all utilities within 20 feet of the proposed Project's guideway and station foundations.

Based on the information from the field investigations, the DBFOM contractor shall be responsible for confirming the location of existing utilities and coordinating with the appropriate utility owners/operators to determine specific set back requirements for each utility line and the need for any stabilization for protection in place or relocation measures.

#### Section 6.0 Other Environmental Considerations

The following revision has been made on Page 6.0-4, Paragraph 3, Line 4 of the RDEIR.

As shown in Table 4.5-6 in Section 4.5, the electricity demand for the proposed Project during normal operation would result in a net increase of 20,625,176 kWh (20.6 GWh) per year. In the event the MSF PDS substation is unable to operate, the electricity demand would result in a net increase of 20,789,426 kWh (20.8 GWh) per year. In the event the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station PDS substation is unable to operate, the electricity demand would result in a net increase of 22,109,996 kWh (22.1 GWh) per year.

#### Section 7.0 Organizations and Persons Consulted

The following revision has been made on Page 7.0-2, Subheading 7.3 of the RDEIR.

Trifiletti Consulting, Inc.

Marietta Torriente, Projects + Outreach Specialist

### 3.0 COMMENTS AND RESPONSES

This section includes copies of the comment letters received by the City of Inglewood (City) on the Recirculated Draft Environmental Impact Report (EIR). Each letter is numbered and identified for reference and the individual comments in each letter are also identified by number. Each comment letter is followed by written responses to each of the comments in that letter.

#### 3.1 INTRODUCTION

This section of the Final EIR contains the comment letters that the City received on the Recirculated Draft EIR. The letters and responses are organized by public agencies, private organizations, public businesses, and individuals. Following each comment letter is a response by the City that supplements, clarifies, or amends information provided in the Recirculated Draft EIR; that refers the reader to the appropriate place in the document where the requested information can be found; or that otherwise responds to the comment. Comments that are not directly related to environmental issues may be discussed or noted for the record. Where text changes in the Recirculated Draft EIR are warranted based upon comments on the Recirculated Draft EIR, those changes are included following the response to comment; changes to the text of the Recirculated Draft EIR are also shown in **Section 2.0: Revisions to the Recirculated Draft EIR**, where all the text changes can be found.

RE: Inglewood Transit Connector Project –  
Recirculated Draft Environmental Impact  
Report (RDEIR)  
SCH # 2018071034  
GTS # 07-LA-2018-03767  
Vic. LA-405/PM: 23.331

Dear Mindy Wilcox:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced DEIR. The Inglewood Transit Connector Project (ITC Project) is a 1.6-mile, three-station, fully elevated, electrically powered light-rail transit system, including, among other things, an Automated Transit System (ATS) mass-transit line, proposed by the City to close the last-mile gap and connect passengers between the Metro K (Crenshaw/LAX) Line and Downtown Inglewood to major event and activity centers, including the Forum, the Los Angeles Sports and Entertainment District, including SoFi Stadium, and the Inglewood Basketball and Entertainment Center (Intuit Dome). Three stations are proposed: (1) The Market Street/Florence Avenue station generally located between Market Street and Locust Street; (2) The Prairie Avenue/ Manchester Boulevard station located on the southwest corner of Prairie Avenue and Manchester Boulevard ; and (3) The Prairie Avenue/Hardy Street station located on the northwest corner of Prairie Avenue and Hardy Street. The ITC Project also includes a maintenance storage facility (MSF) for maintaining ATS trains, two power distribution substations (PDSs) for providing power to the ATS system, and public parking along the proposed alignment at the Market Street/Florence Avenue station, 150 South Market Street and the Prairie Avenue/Hardy Street station. The proposed Project is planned to operate from 6:00 AM to 12:00 AM during the week and on weekends, with the possibility of extending operation hours as needed during special events.

1-1

The project is located approximately 1.5 miles away from the Interstate 405 (I-405) and Manchester Boulevard interchange, and approximately 2 miles away from the Interstate 105 (I-105) ramps at Prairie Avenue in Inglewood.

After reviewing the RDEIR, Caltrans concurs with the following statement: "The proposed Project would result in a reduction of VMT [Vehicle Miles Traveled] under all scenarios and would not, therefore, conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b). Therefore, impacts during operation related to VMT would be less than significant." Thus, the following information is included for your consideration.

1-2

The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability. Furthermore, Caltrans encourages Lead Agencies to

*"Provide a safe and reliable transportation network that serves all people and respects the environment"*

3.0 Comments and Responses  
Comment Letter No. 1

Mindy Wilcox  
December 14, 2021  
Page 2 of 2

implement Transportation Demand Management (TDM) strategies that reduce VMT and Greenhouse Gas emissions. For examples of TDM options to further reduce this project's VMT, please refer to:

- The 2010 *Quantifying Greenhouse Gas Mitigation Measures* report by the California Air Pollution Control Officers Association (CAPCOA), available at <http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf>, or
- *Integrating Demand Management into the Transportation Planning Process: A Desk Reference* (Chapter 8) by the Federal Highway Administration (FHWA), available at <https://ops.fhwa.dot.gov/publications/fhwahop12035/index.htm>.

Also, any transportation of heavy construction equipment and/or materials which requires use of oversized-transport vehicles on State highways such as I-405 will need a Caltrans transportation permit. Caltrans supports limiting project construction traffic to off-peak periods to the greatest extent possible to minimize potential impacts on State facilities. If construction traffic is expected to cause delays on any State facilities, please submit the Worksite Traffic Control Plans detailing these delays for Caltrans' review.

If you have any questions about these comments, please contact Emily Gibson, the project coordinator, at [Emily.Gibson@dot.ca.gov](mailto:Emily.Gibson@dot.ca.gov), and refer to GTS # 07-LA-2018-03767.

Sincerely,

MIYA EDMONSON  
IGR/CEQA Branch Chief

**COMMENT LETTER NO. 1:**

Miya Edmonson, IGR/CEQA Branch Chief  
California Department of Transportation  
District 7 – Office of Regional Planning  
100 S. Main Street, MS 16  
Los Angeles, CA 90012

**Response 1-1:**

This introductory comment contains a description of the proposed ITC Project. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require a response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 1-2:**

The concurrence of Caltrans with the conclusion in the Recirculated Draft EIR with the Proposed Project will result in the reduction of VMT [Vehicles Miles Traveled] is noted.

**Response 1-3:**

This comment providing information on the mission of Caltrans does not raise significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 1-4:**

A Caltrans transportation permit will be obtained before the transport of heavy construction equipment and/or materials which requires use of oversized-transport vehicles on State highways as requested in this comment. The Construction Commitment Program (CCP) included as a component of the Proposed Project limits construction traffic to off-peak periods to the greatest extent feasible consistent with this comment. If construction traffic is expected to cause delays on any State facilities, a Worksite Traffic Control Plan will be submitted for review by Caltrans as requested in this comment.

Comments for Inglewood Transit Connector Project - ingewoodtransitconnector

## Comments for Inglewood Transit Connector Project

Mach, David <DMach@TorranceCA.gov>

Tue 11/30/2021 12:26 PM

To:ingewoodtransitconnector <ingewoodtransitconnector@cityofinglewood.org>;

Hi Mindy,

At the most recent public meeting on November 22, 2021 for the Inglewood Transit Connector Project, we were informed by the presenters that all comments would need to be sent directly to you at this email address by no later than December 23, 2021, in order for the comments to be included in the Draft EIR.

I would like to comment on the fact that Torrance Transit has been planning our service expansion on our bus Line 10 from Crenshaw C (Green Line) Station to Florence Ave at Locust St. This route will be called Torrance to Florence. Locust St at Florence Ave. will also become our terminus for the route and a layover stop for our operators to take breaks and use the restroom. Currently LA Metro route 211 is using this location as well. I hope that we would still be able to utilize this location for bus layover and stop in the future as part of your EIR study. This would allow seamless connections to the new Crenshaw/LAX Line and the Inglewood People Mover as well.

2-1

Our agency would also welcome discussions with your team and LA Metro regarding what will happen to this location as part of the Inglewood Transit Connector project stakeholders outreach.

Respectfully,

**David Mach (He/Him/His)**  
Senior Business Manager, Transit Planning  
City of Torrance | 20500 Madrona Avenue | Torrance, CA 90503 | 310.781.6974 voice | 310.618.6294 fax | [DMach@TorranceCA.Gov](mailto:DMach@TorranceCA.Gov)

3.0 Comments and Responses

### COMMENT LETTER NO. 2:

David Mach, Senior Business Manager, Transit Planning  
City of Torrance  
20500 Madrona Avenue  
Torrance, CA 90503

#### Response 2-1:

The ITC Recirculated Draft EIR Project Description provides details of the grade-separated pedestrian connection from the ITC's Market Street Station to the Metro K (Crenshaw-LAX )Line. The La Brea-Downtown Station design of the Metro K Line includes provision for a bus transfer plaza including multiple bus bays with a signalized access/egress on the north side of Florence Avenue allowing for buses traveling both eastbound and westbound to access the plaza. The existing lay over space on Locust Street will continue to be made available. The City will continue to coordinate with Torrance Transit and all other transit agencies to increase transit use. The proposed ITC Project proposes a grade-separated pedestrian connection to the Metro K Line La Brea-Downtown Inglewood Station to provide a connection from the proposed ITC Project to and from the bus plaza as well, further enhancing transit connectivity to passengers between Torrance Line 10 and other bus lines. With the proposed ITC Project Station at the Market Street Station, enhanced accessibility, amenities and safe connectivity for patrons of multiple modes (Metro's K Line, Torrance Line 10, Metro's bus lines and other municipal operators' bus lines) will be available.

Dear Ms. Wilcox:

Ernesto Castillo  
Member, Trustee Area 5

**ADMINISTRATION**

Raphael Guzman  
Chief Business Official

The Inglewood Unified School District (“District”) thanks the City of Inglewood (“City”) for providing the District with the opportunity to comment on the proposed Inglewood Transit Connector Project’s (“Project”) Recirculated Draft Environmental Impact Report (“Draft EIR”) and for Mayor James Butts and his staff meeting with District’s County Administrator and District staff to discuss the potential impacts of the Project on the District’s schools.

Bernadette Lucas, Ed.D.  
Chief Academic Officer

Norberto J. Perez  
Chief Operating Officer

After reviewing the Recirculated Draft EIR and having follow up discussions with the City’s project team, we believe that with the City’s commitments, discussed below, the Revised ITC Project will support the District’s goal of increasing safe public transit, increasing access to community events, and reducing vehicle congestion in, and around, the Inglewood community. In bringing this important Project into reality, and to accomplish the City’s and District’s further shared goals of protecting the health, safety, welfare, and access to quality education of the District’s students, this letter seeks to share the district’s support of the ITC Project, and confirm the following City commitments established during conversations with the City’s project team to ensure the Project will not significantly impact Kelso Elementary School.

VACANT  
Chief Human Resources Officer

1. Construction Noise mitigation at Kelso Elementary School: The City shall require that the Project’s construction noise would not cause more than a 5 dB L<sub>MAX</sub> increase over the typical ambient noise level at the School property line during normal school hours. Activities that would exceed this threshold shall be scheduled to occur outside of normal school hours or mitigated with specific mitigation measures such as temporary sound walls, sound blankets, or other sound-attenuating devices. The City shall monitor the Project’s construction noise levels during school hours to assure compliance and shall provide monthly reports to the District.

Inglewood Transit Connector Recirculated Environmental Impact Report Comment Letter  
December 19, 2021  
Page 2

2. Utility relocations in Kelso Elementary School Vicinity: All Project utility relocations in the school vicinity shall be designed and constructed to remain within the public right-of-way and not impact school property. Relocations shall be located further away from the school as feasible and designed and constructed to current standards to assure that they create no unacceptable hazards to the school. During Project construction, any open trenches and construction equipment shall be marked and barricaded such that they are not accessible by the students or create any potential hazard to school operations. Project utility relocations or cut overs that may require disruption to school normal utility services shall be scheduled to occur outside of normal school hours with advanced notification to the District.

3-3

The District looks forward to continuing to work collaboratively with the City on this and many other projects to benefit the students and Inglewood community. If you have any questions, please contact me at [erika.torres@inglewoodusd.com](mailto:erika.torres@inglewoodusd.com).

Sincerely,

Dr. Erika F. Torres, County Administrator  
Inglewood Unified School District

**COMMENT LETTER NO. 3:**

Dr. Erika F. Torres, County Administrator  
 Inglewood Unified School District (IUSD)  
 401 S. Inglewood Avenue  
 Inglewood, CA 90301

**Response 3-1:**

This introductory comment contains a description of the objectives of the proposed ITC Project, support for the proposed ITC Project, and thanks the City of Inglewood for meeting with the District to discuss the potential effects of the Project on the District's schools. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 3-2:**

The Construction Commitment Program (CCP) included as part of the project includes a variety of measures to minimize the effects of construction on the District's schools including:

- Coordinate with the Inglewood Unified School District (IUSD) and the City to provide crossing guards at locations requested by IUSD or the City when crosswalks or sidewalks are closed. Identify temporary alternative routes to schools, working closely with IUSD and the City and disseminate this information to schools and stakeholders affected by construction.
- Coordinate with Inglewood Unified School District administrators to avoid disruptive noise during school hours, including scheduling heavy construction activities outside of school hours. The City shall require that the Project's construction noise during school hours would be limited to 5 dBA Leq 1-hour increase above the measured ambient noise levels at Kelso School property line as identified in the RDEIR. Activities that would exceed this threshold shall be scheduled to occur outside of normal school hours or mitigated with specific mitigation measures such as temporary sound walls, sound blankets, or other sound-attenuating devices. The City shall monitor the Project's construction noise levels during school hours to assure compliance. As requested by the District, monthly noise monitoring reports on noise levels during school hours at Kelso School will be provided to the District.
- Equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts shall be electric or alternative-fueled (i.e., nondiesel). Pole power shall be utilized to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel-powered generators, must be operated continuously, such equipment must be Final Tier 4 construction equipment or better and located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.

- Utility Relocation Work – Utility relocations adjacent to Kelso Elementary School shall be minimized to the extent possible. Any needed relocations shall remain within the public right of way and preferably shall be relocated further away from school property where feasible. The Project will strive to prioritize avoiding utility relocation work adjacent to the School that poses a potential hazard, such as gas or water lines that operate under pressure, versus lower risk dry utilities and gravity wet utilities.
- Enclose stationary noise sources, such as diesel-or gasoline-powered generators, with acoustical barriers where necessary and required.
  - If stationary equipment cannot be enclosed within a shed or barrier, such equipment must be muffled and located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.

The CCP includes a variety of construction management practices that will minimize the effect of noise from any construction during the evening and night. As identified in the responses to the comments below, the Construction Noise Control Plan has been revised to incorporate the requests and recommendations in these comments.

In addition, the CCP requires that a Community Affairs Liaison to be designated for the project respond to any complaint related to construction activities within 24 hours:

*"The Community Affairs Liaison shall be responsible for responding within 24 hours to any local complainant question about construction activities. A website will be established with project construction information and contact information for the Community Affairs Liaison. A toll-free phone line (available 24 hours a day) and website will be made a part of all construction notices and shall be posted in prominent public facing locations around the Project area and in adjacent public spaces.*

*The Community Affairs Liaison shall receive all public complaints, investigate the cause of the complaint and develop/implement feasible measures to address and resolve the cause of the complaint."*

The CCP Construction Noise Control includes a noise monitoring program to ensure that noise levels from construction will be below established standards. The following are required elements of this plan:

- A monitoring plan shall be implemented during demolition and construction activities. Warning thresholds shall be defined that are 5 dBA below the specified noise limits to allow sufficient time for the Contractor to take actions to reduce noise. A monitoring record that documents all alarms and actions taken to comply with these measures shall be provided to the City upon request.
- In the event the warning level (dBA) is exceeded, construction activities shall be temporarily halted in the vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the

3.0 Comments and Responses

established standards. Noise measurements shall be gathered after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels:

- Halting/staggering concurrent construction activities in certain locations.
- Reducing the speed or intensity of the of heavy-duty construction equipment being operated simultaneously.
- Operate equipment at the lowest possible power levels.
- Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.

An independent noise consultant will be retained to implement this program. In addition to the construction management practices identified above that will be implemented to minimize the construction noise effects on Kelso School, noise levels during normal school hours from construction activities on Prairie Avenue will be limited to 5 dBA Leq 1-hour above the ambient 1-hour Leq (dBA) noise measurements for Site C on Prairie Avenue identified in the RDEIR to ensure that noise from construction activities is compatible with Kelso School.

This comment requests that construction noise levels not exceed 5 dBA LMAX above the ambient noise level. The LMAX, or Maximum Sound Level, descriptor is the highest sound level measured during a single noise event, such as a vehicle passing by. The noise analysis in the RDEIR evaluates average 1-hour sound levels (Leq 1-hour) which are more representative of the overall noise environment than the maximum sound level of any single noise event. For this reason, as presented above, the maximum noise level from construction noise during school hours will be limited to 5 dBA Leq 1-hour above the measured ambient noise levels at Kelso School as identified in the RDEIR.

In order to ensure that acceptable noise levels are maintained at Kelso School during the school day, real time noise monitoring will be conducted at Kelso School. Any time the Leq 1 hour noise levels increase by 3 dBA during the school day, an alert message will be sent to the construction manager(s) and contact(s) for the contractor(s) working in the vicinity of the school to allow for adjustments to be made to the work in progress to avoid noise levels reaching or exceeding a 5 dBA 1-hour Leq over ambient noise levels. A contact will also be provided to the Inglewood Unified School District and administration at Kelso school to discuss activities and resulting noise levels at any time during the school day.

As requested by the District, monthly noise monitoring reports on noise levels during school hours at Kelso School will be provided to the District.

3.0 Comments and Responses

**Response 3-3:**

Based on the Inglewood Transit Connector Project Utilities Engineering Report included in Appendix Q.1 of the Recirculated Draft EIR, no conflicts with any existing utilities located near Kelso School have been identified that would require relocation of these utilities. For this reason, no impacts to Kelso School from utility relocations is anticipated.

Should, during final design of the project any utility relocations near Kelso School be determined to be necessary, this work will be conducted consistent with the District's requests marking and barricading any open trenches and construction equipment preclude access by the students or create any potential hazard to school operations. Any project utility relocations or cut overs that may require disruption to school normal utility services will be scheduled to occur outside of normal school hours with advanced notification to the District.

The following has been added to the CCP to manage utility construction work to avoid impacts to Kelso School:

- Utility Relocation Work – All Project utility relocations in the vicinity of Kelso Elementary School shall be designed and constructed to remain within the public right-of-way and not impact school property. Relocations shall be located further away from the school as feasible and designed and constructed to current standards to assure that they create no unacceptable hazards to the school. During Project construction, any open trenches and construction equipment shall be marked and barricaded such that they are not accessible by the students or create any potential hazard to school operations. Project utility relocations or cut overs that may require disruption to school normal utility services shall be scheduled to occur outside of normal school hours with advanced notification to the School District.

Mindy Wilcox, Planning Manager  
City of Inglewood  
Planning Division  
One West Manchester Boulevard, 4<sup>th</sup> Floor  
Inglewood, CA 90301

Dear Ms. Wilcox:

**NOTICE OF AVAILABILITY OF A RECIRCULATED DRAFT ENVIRONMENTAL IMPACT REPORT, "INGLEWOOD TRANSIT CONNECTOR PROJECT," IS A 1.6-MILE, THREE-STATION, FULLY ELEVATED, ELECTRICALLY POWERED LIGHT-RAIL TRANSIT SYSTEM, INCLUDING, AMONG OTHER THINGS, AN AUTOMATED TRANSIT SYSTEM MASS-TRANSIT LINE, PROPOSED BY THE CITY TO CLOSE TO THE LAST-MILE GAP AND CONNECT PASSENGERS BETWEEN METRO K LINE AND DOWNTOWN INGLEWOOD, INGLEWOOD, FFER 2021012110**

The Notice of Availability of a Recirculated Draft Environmental Impact Report has been reviewed by the Planning Division, Land Development Unit, Forestry Division, and Health Hazardous Materials Division of the County of Los Angeles Fire Department.

The following are their comments:

**PLANNING DIVISION:**

We have no comments.

For any questions regarding this response, please contact Kien Chin, Planning Analyst, at (323) 881-2404 or [Kien.Chin@fire.lacounty.gov](mailto:Kien.Chin@fire.lacounty.gov).

4-1

Mindy Wilcox, Planning Manager  
December 8, 2021  
Page 2

**LAND DEVELOPMENT UNIT:**

1. The development of this project must comply with all applicable code and ordinance requirements for construction, access, water mains, fire flows, and fire hydrants. 4-2
2. All proposed structures shall comply with the County of Los Angeles Fire Code for water and access for firefighting purposes. 4-3
3. The proposed Automated People Mover shall comply with NFPA 130; Standard for Fixed Guideway Transit and Passenger Rail Systems. 4-4
4. Changes to the existing public water system such as fire hydrants and water mains for firefighting purposes shall be submitted to the County of Los Angeles Fire Department's Fire Prevention, Land Development Unit for review and approval. 4-5

Should any questions arise regarding subdivision, water systems, or access, please contact the County of Los Angeles Fire Department Land Development Unit's, Inspector Nancy Rodeheffer at (323) 890-4243.

**FORESTRY DIVISION – OTHER ENVIRONMENTAL CONCERNS:**

The statutory responsibilities of the County of Los Angeles Fire Department's Forestry Division include erosion control, watershed management, rare and endangered species, vegetation, fuel modification for Very High Fire Hazard Severity Zones, archeological and cultural resources, and the County Oak Tree Ordinance. Potential impacts in these areas should be addressed.

Under the Los Angeles County Oak tree Ordinance, a permit is required to cut, destroy, remove, relocate, inflict damage or encroach into the protected zone of any tree of the Oak genus which is 25 inches or more in circumference (eight inches in diameter), as measured 4 1/2 feet above mean natural grade. 4-6

If Oak trees are known to exist in the proposed project area further field studies should be conducted to determine the presence of this species on the project site.

The County of Los Angeles Fire Department's Forestry Division has no further comments regarding this project.

For any questions regarding this response, please contact Forestry Assistant, Nicholas Alegria at (818) 890-5719.

**HEALTH HAZARDOUS MATERIALS DIVISION:**

The Health Hazardous Materials Division (HHMD) of the Los Angeles County Fire Department advises that the Los Angeles County Department of Public Works, Environmental Programs Division has jurisdiction for permitting, removing, and installing 4-7

underground storage fuel tanks (USTs) at the project site. HHMD has no other comments for the project at this time.

Please contact HHMD senior typist-clerk, Perla Garcia at (323) 890-4035 or [Perla.garcia@fire.lacounty.gov](mailto:Perla.garcia@fire.lacounty.gov) if you have any questions.

If you have any additional questions, please contact this office at (323) 890-4330.

Very truly yours,

RONALD M. DURBIN, CHIEF, FORESTRY DIVISION  
PREVENTION SERVICES BUREAU

RMD:ac

**3.0 Comments and Responses**

**COMMENT LETTER NO. 4:**

Ronald M. Durbin, Chief of the Forestry Division  
County of Los Angeles Fire Department  
1320 North Eastern Avenue  
Los Angeles, CA 90063-3294

**Response 4-1:**

It is noted that the Planning Division had no comments on the Recirculated Draft EIR.

**Response 4-2:**

The ITC Project will comply with all applicable regulations for fire flows and fire hydrants. As described and documented in the November 2021 Recirculated Draft EIR, the ITC Project is proposed within the City of Inglewood and will be subject to the City's regulations related to construction, access and water mains.

**Response 4-3:**

The ITC Project will comply with all applicable Fire Code standards.

**Response 4-4:**

The ITC Project will comply with all applicable regulations, including the NFPA 130 Standards for Fixed Guideway Transit and Passenger Rail Systems.

**Response 4-5:**

Any changes to fire hydrants and water mains for fire fighting purposes will be submitted for review and approval by the County of Los Angeles Fire Prevention, Land Development Unit, as requested in this comment.

**Response 4-6:**

As described and documented in the November 2021 Recirculated Draft EIR, the ITC Project is proposed within the City of Inglewood and as described and, for this reason, the Project is not subject to the County's statutes and regulations related to erosion control, watershed management, rare and endangered species, vegetation, fuel modification or archeological and cultural resources or the County's Oak Tree ordinance.

As documented in Section 4.3, Biological Resources in the November 2021 Recirculated Draft EIR, the Project in and along streets in developed urbanized portions of the City of Inglewood that do not contain open space or native habitat. The Project will affect existing trees located along the proposed alignment

3.0 Comments and Responses

subject to the City of Inglewood’s Tree Preservation regulations, which address both native and non-native trees.

**Response 4-7:**

As described in the November 2021 Recirculated Draft EIR, the proposed ITC will be electrically powered and, for this reason, no underground storage fuel tanks are currently proposed as part of the Project. Should any underground storage fuel tanks be included as a component of the Project at a future date, permits for installation of these tanks will be obtained from the Los Angeles County Department of Public Works Environmental Programs Division.

Questions re: Vehicle Wash Facility - ingewoodtransitconnector

## Questions re: Vehicle Wash Facility

Huffman, Mandy <mandyhuffman@lacsdc.org>

Thu 12/16/2021 4:08 AM

To:inglewoodtransitconnector <inglewoodtransitconnector@cityofinglewood.org>;

Good morning Ms. Wilcox,

The Los Angeles County Sanitation Districts received a Notice of Availability of a recirculated draft EIR for the Inglewood Transit Connector Project. I am writing to seek clarifications on the Vehicle Wash Facility at the MSF for the ITC Project:

1. Will the Vehicle Wash Facility be exposed to the rain and convey rainwater to the sewer? If so, what is the square footage of the exposed area? ] 5-1
2. Will any chemicals be used to wash the trains? ] 5-2
3. Is there any plan to clean the interior of intermodal containers in the future? ] 5-3

Thank you.

**Mandy Huffman**

Environmental Planner | Wastewater Planning

**COMMENT LETTER NO. 5:**

Mandy Huffman, Environmental Planner  
Facilities Planning Department  
Los Angeles County Sanitation Districts  
1955 Workman Mill Road  
Whittier, CA 90601-1400

**Response 5-1:**

The Vehicle Wash Facility located at the MSF would not be exposed to rain or convey rainwater to the existing sewer system. As described on page 4.14-50 of **Section 4.14: Utilities & Service Systems** in the Recirculated Draft EIR, the vehicle wash will be a stationary facility located in the MSF building where trains can be either manually or automatically moved through the wash facility. The MSF would connect to existing water and sewer lines located along Manchester Boulevard. As described on page 4.5-37 of **Section 4.5: Energy** of the Recirculated Draft EIR, water would be filtered and reused as wash and rinse water for train cars in the MSF.

**Response 5-2:**

No chemicals would be used to wash the ATS trains. As described previously in Response 5-1, the MSF would connect to existing water and sewer lines located along Manchester Boulevard. Water would be filtered and reused as wash and rinse water for train cars in the MSF.

**Response 5-3:**

The proposed Project does not include the use of intermodal containers. The interior of the ATS Trains will be cleaned using standard cleaning products and no additional wastewater will be generated.

**Robert C. Ferrante**  
Chief Engineer and General Manager

1955 Workman Mill Road, Whittier, CA 90601-1400

City of Inglewood  
One West Manchester Boulevard, 4<sup>th</sup> Floor  
Inglewood, CA 90301

Dear Ms. Wilcox:

**Recirculated DEIR Response to the Inglewood Transit Connector Project**

The Los Angeles County Sanitation Districts (Districts) received a Recirculated Draft Environmental Impact Report (DEIR) for the subject project on November 15, 2021. The proposed project is located within the jurisdictional boundaries of District No. 5. Previous comments submitted by the Districts to your agency in correspondences dated August 6, 2018, and February 8, 2021, (copies enclosed) still apply to the subject project with the following information:

1. The proposed Vehicle Wash Facility at the Maintenance and Storage Facility may require a Districts' Industrial Wastewater Discharge Permit. Project developers should contact the Districts' Industrial Waste Section at (562) 908-4288, extension 2900, to reach a determination on this matter. If this permit is necessary, project developers will be required to forward copies of final plans and supporting information for the proposed project to the Districts for review and approval before beginning project construction. For additional Industrial Wastewater Discharge Permit information, go to <https://www.lacsd.org/services/wastewater-programs-permits/industrial-waste-pretreatment-program/industrial-wastewater-discharge-permits>.
2. Availability of sewer capacity depends upon project size and timing of connection to the sewerage system. Because there are other proposed developments in the area, the availability of trunk sewer capacity should be verified as the project advances. Please submit a copy of the project's build-out schedule to the undersigned to ensure the project is considered when planning future sewerage system relief and replacement projects.
3. The Districts are empowered by the California Health and Safety Code to charge a fee to connect facilities (directly or indirectly) to the Districts' Sewerage System or to increase the strength or quantity of wastewater discharged from connected facilities. This connection fee is used by the Districts for its capital facilities. Payment of a connection fee may be required before this project is permitted to discharge to the Districts' Sewerage System. For more information and a copy of the Connection Fee Information Sheet, go to [www.lacsd.org](http://www.lacsd.org), under Services, then Wastewater (Sewage) and select Rates & Fees. In determining the impact to the Sewerage System and applicable connection fees, the Districts will determine the user category (e.g. Condominium, Single Family home, etc.) that best represents the actual or anticipated use of the parcel(s) or facilities on the parcel(s) in the development. For more specific information regarding the connection fee application procedure and fees, the developer should contact the Districts' Wastewater Fee Public Counter at (562) 908-4288, extension 2727. If an Industrial Wastewater Discharge Permit is required, connection fee charges will be determined by the Industrial Waste Section.

December 23, 2021

4. In order for the Districts to conform to the requirements of the Federal Clean Air Act (CAA), the capacities of the Districts' wastewater treatment facilities are based on the regional growth forecast adopted by the Southern California Association of Governments (SCAG). Specific policies included in the development of the SCAG regional growth forecast are incorporated into clean air plans, which are prepared by the South Coast and Antelope Valley Air Quality Management Districts in order to improve air quality in the South Coast and Mojave Desert Air Basins as mandated by the CAA. All expansions of Districts' facilities must be sized and service phased in a manner that will be consistent with the SCAG regional growth forecast for the counties of Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial. The available capacity of the Districts' treatment facilities will, therefore, be limited to levels associated with the approved growth identified by SCAG. As such, this letter does not constitute a guarantee of wastewater service, but is to advise the developer that the Districts intend to provide this service up to the levels that are legally permitted and to inform the developer of the currently existing capacity and any proposed expansion of the Districts' facilities.

6-4

If you have any questions, please contact the undersigned at (562) 908-4288, extension 2743, or [mandyhuffman@lacsdsd.org](mailto:mandyhuffman@lacsdsd.org).

Very truly yours,

Dear Ms. Wilcox:

**NOP Response for the Inglewood Transit Connector Project**

The Sanitation Districts of Los Angeles County (Districts) received a Notice of Preparation of a Draft Environmental Impact Report (NOP) for the subject project on July 17, 2018. The proposed project is located within the jurisdictional boundaries of District No. 5. We offer the following comment:

- The proposed project may impact existing and/or proposed Districts' facilities (e.g. trunk sewers, recycled waterlines, etc.) over which it will be constructed. Districts' facilities are located directly under and/or cross directly beneath the proposed project alignment. The Districts cannot issue a detailed response to or permit construction of, the proposed project until project plans and specification that incorporate Districts' facilities are submitted for our review. To obtain copies of as-built drawings of the Districts' facilities within the project limits, please contact the Districts' Engineering Counter at [engineeringcounter@lacsd.org](mailto:engineeringcounter@lacsd.org) or (562) 908-4288, extension 1205. When project plans that incorporate our facilities have been prepared, please submit copies of the same to the Engineering Counter for our review and comment.

If you have any questions, please contact the undersigned at (562) 908-4288, extension 2717.

Very truly yours,

Adriana Raza

DOC: #4671386.D05

**COMMENT LETTER NO. 6:**

Mandy Huffman, Environmental Planner  
Facilities Planning Department  
Los Angeles County Sanitation Districts  
1955 Workman Mill Road  
Whittier, CA 90601-1400

**Response 6-1:**

This comment is noted. The Wastewater Ordinance requires any business that desires to discharge industrial wastewater to the Sanitation Districts' sewerage system to first obtain an Industrial Wastewater Discharge Permit. It is noted that under the District's Wastewater Ordinance truck and bus wash facilities with flows less than 1 MGY a year would be exempt from this requirement to obtain an Industrial Wastewater Discharge Permit. The vehicle train wash would be similar to a truck or bus wash facility. A final design for this component of the Project has not been completed as this time. When this facility is designed, if it is determined that the facility will generate 1 MGY or more of wastewater, an Industrial Wastewater Discharge Permit will be obtained before the Project construction as requested in the comment.

**Response 6-2:**

This comment regarding trunk sewer capacity is noted. The information discussed on pages 4.14-52-4.14-53 of **Section 4.14: Utilities & Service Systems** of the Recirculated Draft EIR demonstrates that there is sufficient trunk sewer capacity available at this time, as the proposed Project would generate less wastewater than current uses (see **Table 4.14-10**). The City will consult with LACSD to ensure the Project is considered when planning future sewer relief and/or replacement projects.

**Response 6-3:**

This comment regarding Connection Fees is noted. The ITC Project will comply with all applicable regulations, including the regulation in this comment.

**Response 6-4:**

This comment explaining LACSD's facility expansion capacities being associated with approved growth identified by SCAG is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

Mindy Wilcox - Planning Manager  
City of Inglewood  
One West Manchester Blvd.  
Inglewood, CA 90301  
inglewoodtransitconnector@cityofinglewood.org

Subject: Inglewood Transit Connector Project (SCN #2018071034)

Dear Ms. Wilcox:

Thank you for the opportunity to comment on the Recirculated Draft Environmental Impact Report dated November 15, 2021 for the Inglewood Transit Connector Project (Proposed Project). West Basin Municipal Water District (West Basin), as a wholesale supplier of imported drinking water to the City of Inglewood (City) and a producer of recycled water to the region, understands the impacts of vital development projects such as the need for public transportation, as well as the need for reliable water supplies to meet local water demands.

West Basin has produced and served recycled water to the City for more than 20 years and owns and operates a recycled water distribution system in the area within the City's Proposed Project. It is critical to note that the Proposed Project may affect West Basin recycled water distribution system, including pipelines, service lines, supportive appurtenances and cathodic protection systems currently serving the City.

West Basin looks forward to working with the City to ensure its distribution system is not adversely impacted. West Basin seeks assurance that during the planning, design, and construction phases of the Proposed Project, the City and their contractors will maintain the integrity of West Basin's distribution system and protect existing water resources for the community.

Please feel free to contact me or West Basin Operations Supervisor Frank Fuchs at (310) 660-6255 with further questions. West Basin looks forward to continuing our partnership with the City of Inglewood to deliver drinking and recycled water supplies to the City.

Sincerely,  
  
Uzi Daniel  
Manager of Operations  
West Basin Municipal Water District

7-1

**COMMENT LETTER NO. 7:**

Uzi Daniel, Manager of Operations  
West Basin Municipal Water District  
17140 South Avalon Boulevard  
Carson, CA 90746

**Response 7-1:**

As indicated in this comment, the Recirculated Draft EIR included consideration of West Basin Municipal Water District facilities, which include 4 water lines located in Prairie Avenue and Hardy Street in the vicinity of the proposed project. The Inglewood Transit Connector Project Utilities Engineering Report, provided in Appendix Q.1 of the Recirculated Draft EIR, evaluated the potential for the Project to conflict with and impact existing West Basin Municipal Water District facilities based on the as built drawings for water lines provided by the District. As shown in Table B. Inglewood Transit Connector Utility Conflict Matrix in the Utilities Engineering Report, no conflicts with the West Basin's water lines were identified.

As requested in this comment, the City and its contractors will continue to coordinate with the West Basin Municipal Water District during planning, design, and construction of the project to ensure the integrity of West Basin's distribution system is maintained.

**BOARD OF DIRECTORS**

RE: Inglewood Transit Connector Project  
Recirculated Draft Environmental Impact Report (RDEIR) – Metro Comments

Dear Ms. Wilcox:

Thank you for coordinating with the Los Angeles County Metropolitan Transportation Authority (Metro) regarding the proposed Inglewood Transit Connector Project (Project) located in the City of Inglewood (City). Metro’s aim is to create and maintain a world-class transportation system that focuses on providing an excellent customer experience and enhancing the quality of life for those who live, work, and play within Los Angeles County. As the public mass transportation planner, builder and operator, Metro is constantly working to deliver a regional system that supports increased transportation options and associated benefits, such as improved mobility options, air quality, health and safety, and access to opportunities.

8-1

As such, Metro supports this Project and recognizes its significance to the City and the greater Los Angeles County region. We appreciate the City’s ongoing coordination efforts on the Project, particularly with respect to the interface between the Project and Metro’s Crenshaw/LAX Line (K Line). Metro and the City already enjoy a strong collaborative working relationship on many planning efforts including the K Line, Metro-funded transit-oriented development (TOD) Specific Plans, the Inglewood First/Last Mile Plan, the Centinela/Florence Grade Separation, and event transportation demand management for SoFi Stadium and the Inglewood Basketball and Entertainment Center. We are committed to continuing this collaborative approach with respect to this Project, including the formation of a Joint Powers Authority for implementation of the Project.

Reflecting Metro’s interests in a successful ITC Project, this letter is intended to provide the City with specific comments on the Recirculated Draft EIR for the Project per Metro’s area of statutory responsibility pursuant to the California Environmental Quality Act (CEQA), and to identify opportunities for coordination and implementation of goals and policies to advance a world-class transportation network for the region. Effects of a project on transit systems and infrastructure are within the scope of transportation impacts to be evaluated under CEQA.<sup>1</sup>

**Project Description**

The Inglewood Transit Connector Project (Project) is a 1.6-mile, three-station, fully elevated, electrically powered light-rail transit system, including, among other things, an Automated Transit System (ATS) mass-transit line, proposed by the City to close the last-mile gap and connect passengers between the Metro K (Crenshaw/LAX) Line and Downtown Inglewood to major event and activity centers, including the Forum, the Los Angeles Sports and Entertainment District, including SoFi Stadium, and the Inglewood Basketball and Entertainment Center

8-2

<sup>1</sup> See CEQA Guidelines section 15064.3(a); Governor’s Office of Planning and Research Technical Advisory on Evaluating Transportation Impacts In CEQA, December 2018, p. 19.

Inglewood Transit Connector  
RDEIR – Metro Comments  
December 27, 2021

(Intuit Dome). Three stations are proposed: (1) The Market Street/Florence Avenue station generally located between Market Street and Locust Street; (2) The Prairie Avenue/Manchester Boulevard station located on the southwest corner of Prairie Avenue and Manchester Boulevard; and (3) The Prairie Avenue/Hardy Street station located on the northwest corner of Prairie Avenue and Hardy Street. The Project also includes a maintenance storage facility (MSF) for maintaining ATS trains, two power distribution substations (PDSs) for providing power to the ATS system, and public parking along the proposed alignment at the Market Street/Florence Avenue station, 150 South Market Street and the Prairie Avenue/Hardy Street station. The Project is planned to operate from 6:00 AM to 12:00 AM during the week and on weekends, with the possibility of extending operation hours as needed during special events.

↑

**Comments**

*Interface between Metro Downtown Inglewood Station and APM Station*

Metro appreciates the coordination efforts with the APM design team over the past year regarding the interface between the Market/Florence APM Station and Metro’s Downtown Inglewood Station. As mutually identified already through these collaborations, Metro and the City will continue to coordinate on the following topics to further strengthen and optimize the performance of the APM and the Metro regional system:

- Buses operating in the vicinity of Market/Florence, including the new off-street bus hub;
- Pedestrian volumes, circulation patterns, security, and queuing accommodations for patrons transferring from the APM to the Metro Station, as well as the proposed pedestrian bridge that will link the two stations and any touchdown points for the bridge on Metro’s property;
- Coordination of projected service headways and passenger throughput under different scenarios for the Project, given K Line headways and two-car trains;
- Vertical circulation elements (e.g. escalators, elevators, and staircases);
- Maintenance and upkeep of the proposed pedestrian bridge after construction; and
- Signage for wayfinding and customer information.

8-3

*Bus Service and Intermodal Connections*

As Metro continues to advance our bus services and intermodal connections throughout the region, Metro and the City will continue to coordinate on any changes to bus service, or stops or layover locations proposed by the Project. It should be noted that in December 2021, Metro completed its implementation of the NextGen Bus Plan, a major update to Metro’s bus service network and stop locations. For more information, visit the NextGen Bus Plan’s website at <https://www.metro.net/projects/nextgen/>, as well as the service changes website at <https://mybus.metro.net/>.

8-4

Coordinated network planning will be mutually beneficial in accommodating transfer activity between bus and rail lines, bus-to-bus transfers and access of other modes (e.g., Metro Micro Transit, Metro Bike Share, TNCs, etc.) that will occur along sidewalks and public spaces. Metro has completed the Metro Transfers Design Guide, a best practices document on transit improvements. This can be accessed online at: <https://www.metro.net/about/station-design-projects/>.

*Construction Commitments Program*

Metro appreciates the inclusion of Project Design Feature PDF-TRANS-1 (Transit Access and Circulation Program). Metro respectfully suggests that PDF-TRANS-2 (Construction Staging and Traffic Control Program) be amended as follows:

8-5

- “Detour routes, including analysis of impacts to pedestrian, business, bicycle, transit, and traffic flow”

3.0 Responses to Comments  
Comment Letter No. 8

Inglewood Transit Connector  
RDEIR – Metro Comments  
December 27, 2021

*Centinela/Florence Avenues Grade Separation Project*

The Centinela/Florence Avenues Grade Separation Project, pending project construction funding availability, is projected to occur between Fall 2022 and Summer 2025, and will likely overlap with construction of the APM Project. Metro and the City will endeavor to coordinate and consider construction schedule, right of way (ROW) construction staging, construction site safety and appropriate clearances between properties and operating areas, construction traffic management (roadway closure, traffic detour, relocation of bus stops, temporary bus layover locations); shared utilities (if any), Track Allocation, and other needs as appropriate to ensure the safety and efficient construction of both projects.

8-6

*Special Permits*

Should construction or maintenance of the Project necessitate temporary or ongoing access to Metro ROW, the Project must adhere to Metro Track Allocation requirements. Permits allowing for single tracking or a power shutdown, while possible, are highly discouraged and must be obtained at least two months before start of construction. Permits for special operations, including the use of a pile driver or any other equipment that could come into close proximity or encroach on the ROW's airspace of the Overhead Catenary System (OCS) or support structures must be obtained at least one month before the start of construction. Metro and the City will work together to ensure implementation of these coordination procedures to provide for safety during construction.

8-7

In conclusion, Metro supports the successful delivery of the Inglewood Transit Connector Project and looks forward to continuing coordination with the City as the Project continues to develop. If you have any questions regarding this letter, please contact us at [yoha@metro.net](mailto:yoha@metro.net) or [lings@metro.net](mailto:lings@metro.net).

Re: Inglewood Transit Connector - Recirculated Draft Environmental Impact Report (DEIR)

Dear Ms. Wilcox,

As a co-founder of AERO Collective, with employees and clientele from the City of Inglewood and elsewhere in the County of Los Angeles, I write this letter in support of the Inglewood Transit Connector Project and the elevated, electrically powered, automated people mover. As a business owner, I am committed to keeping our business in the City of Inglewood, and as part of that commitment we back the City's plan to alleviate event day traffic congestion with the proposed Project.

9-1

As Inglewood undergoes a historic transformation into a world-class sports and events destination, I believe the ITC Project will contribute significantly to the city's economic growth by encouraging travel to and from the city via the Metro Crenshaw/LAX line and the automated people mover. In addition to the economic development this will bring, I support the City's commitment to investing in a method of transportation that is sustainable and contributes to the overall protection of the environment.

9-2

The Recirculated Draft EIR also maps out the City's Construction Plan, which promises to work with local businesses to keep potential construction interruptions at a minimum. I support the City's creation a \$5 million dollar Business Interruption fund to provide financial assistance to small "mom and pop" businesses to help offset to the extent possible, business revenue losses or increased expenses that are directly attributable to disruptions during the ITC construction activities within the ITC Project.

9-3

The ITC Project is designed to provide significant connectivity, traffic reduction, economic prosperity, and quality of life benefits to the City of Inglewood. The City needs to close first/last mile gaps between the soon to open Metro K Line (Crenshaw/LAX Line) and the housing and employment centers, and sports and entertainment venues.

9-4

Thank you for moving forward with this project, and for supporting Inglewood businesses.

  
Andrew Crane  
Co-founder Aero Collective

Re: Recirculated Draft Environmental Impact Report (EIR) on the Inglewood Transit Connector (ITC)

Dear Ms. Wilcox,

As Co-owner of Miracle Theater, with employees and clientele from the City of Inglewood and elsewhere in the County of Los Angeles, I write this letter in support of the Inglewood Transit Connector Project and the elevated, electrically powered, automated people mover. As a business owner, I am committed to keeping our business in the City of Inglewood, and as part of that commitment we back the City's plan to alleviate event day traffic congestion with the proposed Project.

10-1

As Inglewood undergoes a historic transformation into a world-class sports and events destination, I believe the ITC Project will contribute significantly to the city's economic growth by encouraging travel to and from the city via the Metro Crenshaw/LAX line and the automated people mover. In addition to the economic development this will bring, I support the City's commitment to investing in a method of transportation that is sustainable, and contributes to the overall protection of the environment. The Recirculated Draft EIR also maps out the City's Construction Plan, which promises to work with local businesses to keep potential construction interruptions at a minimum.

10-2

I support the efforts of the Business Interruption Assistance Program that the city will create a \$5 million dollar Business Interruption fund to provide financial assistance to small "mom and pop" businesses to help offset to the extent possible, business revenue losses or increased expenses that are directly attributable to disruptions during the ITC construction activities within the ITC Project.

10-3

In anticipation of the Governor releasing the new State Budget and the upcoming deliberations by the Legislature, I express my strong support for the City of Inglewood's pursuit of \$400 million for the ITC Project from the forthcoming State budget.

10-4

The ITC Project is designed to provide significant connectivity, traffic reduction, economic prosperity, and quality of life benefits to the City of Inglewood. The City needs to close first/last mile gap between Metro K Line (Crenshaw/LAX Line) and the housing and employment centers, and sports and entertainment venues.

10-5

Thank you for moving forward with this project, and for supporting Inglewood businesses.

Sincerely,

Owen Smith

Re: Inglewood Transit Connector Environmental Impact Report Comment Letter

Dear Ms. Wilcox:

We are writing on behalf of Thomas Safran & Associates (TSA) and Black Equities Group (together, "Owner"), local stakeholders in the Inglewood Community, to provide comment on the Recirculated Draft Environmental Impact Report (RDEIR) for the Inglewood Transit Connector project (ITC, or "Project") by the City of Inglewood ("City").

11-1

TSA and Black Equities own or have an agreement with the City to purchase four properties on Market Street in close proximity to the proposed northern terminus of the ITC: the Fox Theater located at 115 North Market Street, 139 North Market Street, 158 North Market Street, and a mixed use development currently under construction at the property bordered by North Market Street, East Regent Street, North La Brea Avenue, and East Florence Avenue, referred to in the RDEIR as D-3 (collectively, "the Properties"). Each of these properties were purchased from the City with the understanding that TSA would redevelop (or in the case of the Fox Theater, adaptively reuse) them to fulfill the City's priority of establishing residential and commercial uses at these locations.

11-2

TSA and Black Equities are committed to the development and operation of the highest quality communities that enrich the lives of its residents and positively contribute to the community. TSA and Black Equities appreciate their long, positive working relationship with the City and its leaders and are very supportive of all current community development efforts. This includes support of the ITC as a new high-quality transportation option that can be compatible with the community and serve its residents. In that vein, we want to emphasize that our intention is not to stop or delay

11-3

Elisa L. Paster

Email  
epaster@glaserweil.com

the Project, but rather to ensure the Properties, especially D-3, are protected from potential Project impacts.

↑

As D-3 was designed to achieve the City and Owner's common vision to activate and foster a robust pedestrian environment on Market Street, we see the Project as an opportunity to help facilitate that vision. Our goal throughout this process has been to ensure that the Project and Properties are developed harmoniously and to benefit the community.

11-4

After reviewing the RDEIR circulated by the City on November 12, 2021, we are pleased that some of the issues raised in our previous comment letter were addressed in the revisions found in the RDEIR. This comment letter identifies remaining, necessary revisions and mitigation measures which need to be added to the RDEIR pursuant to the California Environmental Quality Act (CEQA).

11-5

The following significant revisions need to be made to the RDEIR:

- It is unclear whether D-3 was fully analyzed as a sensitive receptor for the purposes of noise analysis. Figure 4.10-5 identifies Noise Sensitive Receptor Groups, but it does not include D-3. Given the revisions made to the Air Quality analysis based on our previous comments, this appears to be an oversight but it needs to be addressed with D-3 properly identified on a revised Figure 4.10-5; this is essential to ensuring that 1) any potential noise impacts to D-3 are fully analyzed, and 2) D-3 is treated as a sensitive receptor during the ITC's construction and operation.
- Given the proximity of D-3 to the Market Street/Florence Avenue station and construction staging area (the property bordered by Florence Avenue, Market Street, Regent Street, and Locust Street, referred to as "Construction Staging Area"), baseline noise measurements need to be taken from D-3.
- In Table 4.10-15 of the RDEIR, Site K is identified as a "Public" Existing Land Use as opposed to "Residential." Given the proximity of so many residential properties, including D-3, this should be revised to "Residential."
- The RDEIR identifies three coral trees to be removed at the Southeastern corner of D-3. Due to their size and maturity, these trees are considered *protected* by the Inglewood Municipal Code (IMC), and thus their removal would constitute an environmental impact. (IMC § 12-113(A).) Significantly, these trees appear to be in the ITC's 25 foot buffer as opposed to its actual proposed path. Accordingly, the City should include mitigation to avoid the environmental impact of removing these trees, which provide beauty and character to D-3 and the larger community.

11-6

11-7

11-8

11-9

3.0 Comments and Responses  
Comment Letter No. 11

- There appears to be an error in the Air Quality Analysis in Table 4.2-22 on page 4.2-85 of the RDEIR: the TSA Properties are referred to as “Off-Site Worker” instead of “Proposed Residence.”

11-10

We noticed the RDEIR changed the noise thresholds from *ambient + 5dBA* to a property and use-specific range, such that many activities which the DEIR considered impactful would not be considered an impact under the RDEIR. The RDEIR does not provide a rationale for this change, and it should be revised to reflect *ambient + 5dBA*, as included in the DEIR. Given the Construction Staging Area’s proximity to so many residential uses, we want to ensure proper mitigation is used to minimize the noise generated by the Project. We request that the Project implement the following noise mitigation measures to minimize noise impacts on the Properties, including D-3:

11-11

- Inclusion of a 24 foot sound wall during Project construction along Market Street at the Construction Staging Area.
- Limitation of construction hours where residential properties are within 150 feet of the construction activity, as measured on a property line to property line basis. Construction shall be prohibited between 6:00 pm and 8:00 am.
- During construction, the City shall retain an independent noise consultant to monitor noise impacts on sensitive uses generated by the Project. The noise consultant shall install sound monitoring equipment at the property lines of sensitive uses identified in the EIR. The sound monitoring equipment shall record and upload to the internet on an hourly basis Leq, Lmax, L5, L10, L50, L90, L95. The Independent Noise Monitor shall establish and maintain a website making noise measurements publicly available in real time. The threshold for sensitive uses shall be *ambient + 5dBA*, as set forth in the DEIR. The noise monitor shall be responsible for collecting fines for each violation of the established noise thresholds. Each violation of noise thresholds would be subject to an escalating fine structure of \$500 for the first violation, \$1000 for the second violation, and \$2000 for each subsequent violation over the course of a calendar month, to be paid to an affordable housing trust fund.
- Limitation of non-emergency entry/exit access to the Construction Staging Area to right turns to/from Florence Avenue.
- Use of rubber tire earth moving equipment.
- When not in use or being staged, heavy equipment shall be located as far as practicable from sensitive receptors.

11-12

11-13

11-14

11-15

11-16

11-17

3.0 Comments and Responses  
Comment Letter No. 11

- Staging of construction material deliveries behind fencing to minimize noise emitting from idling vehicles.
- On site-signage at the Construction Staging Area reminding workers to minimize noise generation.
- Use of drill piles or sonic or vibratory pile drivers instead of traditional impact pile drivers, as permitted by geological conditions.
- Sequence noisy activities to occur during the same time period during daytime hours.
- Select quieter demolition methods where appropriate.
- All trucks removing materials from the Construction Staging Area to be loaded within the site perimeter (and will be required to cover loads as deemed necessary for dust control).

11-18

11-19

11-20

11-21

11-22

11-23

In addition to the noise-specific mitigation measures listed above, we have identified the following mitigation measures which should be incorporated into the Project:

11-24

- Funding to rehabilitate the Fox Theater, a historic resource which is listed on the National Register of Historic Places, to address noise, vibration, and aesthetic impacts caused by the construction and operation of the Project.
- Construction night lighting abatement during construction, including light shields. Flood lighting or lighting that creates fugitive light impacts shall be prohibited within 150 feet of sensitive uses, as measured from property line to property line, between 8:00 pm and 7:00 am.
- Dust control - street washing, building cleaning, and resident car washes to be provided by the Project.
- Rumble strips at truck entry/exit ways at the Construction Staging Area, watering down stockpiles and surfaces as required, covering of stocks while minimizing piling of material, and use of street sweepers to maintain adjacent roadways.

11-25

11-26

11-27

11-28

Finally, we are requesting that we be provided notice for all Project notifications. We had previously requested to be added to the list of interested parties, but did not received the Notice of Availability for the RDEIR.

11-29

3.0 Comments and Responses  
Comment Letter No. 11

Thank you for taking the time to consider these comments. TSA and Black Equities remain committed to a productive partnership with the City to realize a vision together for a sustainable and transit-oriented community around the ITC that achieves Project goals in a manner that is sensitive to community and stakeholders that are heavily invested in its success.

Respectfully,

ELISA L. PASTER  
of GLASER WEIL FINK HOWARD AVCHEN & SHAPIRO LLP

ELP:eg

3.0 Comments and Responses

**COMMENT LETTER NO. 11**

Elisa Paster  
Glaser Weil Fink Howard Avchen & Shapiro LLP  
10250 Constellation Boulevard  
19th Floor  
Los Angeles, CA 90067

**Response 11-1:**

This introductory comment stating that the comments in this letter were submitted on behalf of Thomas Safran & Associates (TSA) and Black Equities Group is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 11-2:**

This comment identifying the properties in Inglewood that TSA have an interest in is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 11-3:**

This comment supporting the ITC Project while ensuring that potential impacts from the project on TSA's properties, specifically the mixed-use development currently under construction at the property bordered by North Market Street, East Regent Street, North La Brea Avenue, and East Florence Avenue, referred to in the Recirculated Draft EIR as D-3 are addressed is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 11-4:**

This comment describing the intent of the D3 mixed use project to assist in meeting the City's objectives to create a pedestrian oriented environment on Market Street is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the

Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 11-5:**

This comment recognizes that issues previously raised are addressed in the Recirculated Draft EIR and introduces the following comments, which are addressed below.

**Response 11-6:**

The receptor groups identified in the EIR assess potential noise impacts on representative noise-sensitive receptors where baseline noise monitoring was conducted. Monitoring was not conducted at every sensitive use but instead at the sensitive uses located closest to the proposed alignment for the project. Monitoring to determine ambient noise levels and analysis at the locations of sensitive uses located further away from the proposed alignment is not needed to identify the potential worst-case impacts and appropriate mitigation measures. Noise impacts will be less at all locations further away from the proposed alignment than the closest receptors analyzed in the Recirculated Draft EIR.

The “D-3 property” (site of the Market Gateway Project) is bordered by Market Street, Regent Street, La Brea Avenue, and Florence Avenue. The noise analysis included monitoring at the D-3 property. Monitoring Site K, at 205 N. Market Street, as identified in the Recirculated Draft EIR Noise section, is at the corner of Regent Street and Market Street at the D-3 property. The construction noise impacts at Site K are representative of the noise levels that would be experienced at the D-3 property. For this reason, the Recirculated Draft EIR adequately analyses and discloses the potential noise impacts to sensitive uses at the D-3 property.

Implementation of the construction management measures identified in Section 11.0, Noise and Vibration Control Program of the Construction Commitment Program will minimize noise and vibration impacts from construction of the project on all sensitive uses, including the D-3 property, located along the proposed alignment whether these uses are specifically analyzed in the Recirculated Draft EIR or not. As documented in the Recirculated Draft EIR, impacts from construction noise will be less than significant.

**Response 11-7:**

Please see Response 11-6, additional noise measurements at the D3 site are not necessary as Monitoring Site K is located at the D-3 Property.

**Response 11-8:**

Site K, is located at 205 N. Market Street, which is the corner of the D-3 Property. As recommended in this comment, as a mixed-use residential building has been built at this location, the identification of the existing land use at this location has been revised to “Residential” in Tables 4.10-12, 4.10-13, 4.10-15, 4.10-16, 4.10-17, 4.10-18, 4.10-19, 4.10-20, 4.10-21, 4.10-22, 4.10-23, 4.10-24, and 4.10-25.

Please note that construction of this new mixed-use building had not begun in November 2018 when noise monitoring was first conducted at this location. At that time, a public parking lot was located on the northwest corner of N. Market Street and E. Regent Street and the rest of the block between N. Market Street, E. Regent Street, E Florence Avenue and N. La Brea Avenue was vacant. This monitoring location was identified as “Public” because a public parking lot was the use in November 2018. This parking lot was subsequently removed as part of the construction of the new mixed-use project at this location.

**Response 11-9:**

The Recirculated Draft EIR correctly identifies the coral trees located along the D3 property as protected (see **Table 4.3-5** in the Recirculated Draft EIR). Based on review of the conceptual plans for the ITC Project, these Coral Trees can be retained in place.

**Response 11-10:**

Table **4.2-22** has been corrected as the TSA Properties were identified “Off-Site Worker” in error in this table. **Table 4.2-22** has been corrected to match Table 19 in the Air Quality and Health Risk Assessment Technical Report for the ITC Project in Appendix G.1 of the Recirculated Draft EIR which correctly identifies the TSA Properties as “Proposed Residence (TSA Property)”.

**Response 11-11:**

The rationale for the construction noise thresholds is provided in Section 4.11.6.1 Construction noise on pages 4.10-56 and 4.10-57 of the Recirculated Draft EIR. As discussed in that section, because the City’s General Plan and Municipal Code do not establish maximum noise levels for construction activities, as part of the preparation of the December 2020 Draft EIR, the City reviewed and considered the thresholds of significance used by other jurisdictions and used the significance thresholds for construction noise identified in the City of Los Angeles 2006 L.A. CEQA Thresholds Guide. The City of Los Angeles no longer uses these thresholds and is presently developing new thresholds for use in determining the significance of construction noise.

For this reason, the City identified thresholds for the purpose of determining the significance of construction noise in the Recirculated Draft EIR based on guidance in the FTA *Transit Noise and Vibration*

3.0 Comments and Responses

*Impact Assessment Manual*. As presented in this section. The FTA's General Assessment Construction Noise Criteria identifies daytime and nighttime thresholds for residential, commercial, and industrial land uses, which are considered reasonable criteria for use in assessing the potential for adverse community reaction to noise generated by construction activities. The use of these thresholds in this Recirculated Draft EIR responds to the unique circumstances of the proposed Project and its alignment along the fixed guideway corridor.

It should also be noted that the CCP requires preparation of a Noise Control Plan and also requires that a Community Affairs Liaison to be designated for the project respond to any complaint related to construction activities within 24 hours:

*"The Community Affairs Liaison shall be responsible for responding within 24 hours to any local complainant question about construction activities. A website will be established with project construction information and contact information for the Community Affairs Liaison. A toll-free phone line (available 24 hours a day) and website will be made a part of all construction notices and shall be posted in prominent public facing locations around the Project area and in adjacent public spaces.*

*The Community Affairs Liaison shall receive all public complaints, investigate the cause of the complaint and develop/implement feasible measures to address and resolve the cause of the complaint."*

**Response 11-12:**

Based on the analysis of potential construction noise impacts in the Recirculated Draft EIR, a noise barrier is not required at the location on Market Street to mitigate potential construction noise impacts at the D3 and the other properties identified in this letter. The results of the analysis of construction noise at Site K at the D3 Property for Phases 1 through 8 of construction presented in Tables 4.10-15 through 4.10-22 of the Recirculated Draft EIR indicate that construction noise at this property will not be significant. Ambient plus construction noise at Site K would range from a low of 63.5 Leq 1-hour during the nighttime during Phase 2 to a high of 77.6 dBA 1-hour Leq during the daytime during Phase 2, when construction noise would result in an increase above ambient noise level of approximately 10 dBA.

As discussed in the Recirculated Draft EIR, the Construction Noise Control and Vibration Reduction Plans included in the CCP contain a robust set of construction management practices that will be implemented throughout construction of the project to control and minimize construction noise. PDF NOISE-1 and PDF NOISE-2 incorporate the preparation of the Construction Noise Control and Construction Vibration Reduction Plans identified in the Construction Commitment Program (CCP) as requirements of the project.

3.0 Comments and Responses

With implementation of the construction management measures in the CCP construction noise impacts will be less than significant and, for this reason, no mitigation measures to reduce construction noise, since as the construction of a noise barrier as suggested in this comment, are required.

As identified in the responses to the comments, the Construction Noise Control Plan has been revised to incorporate the requests and recommendations in these comments 11-15, 11-16, 11-17, 11-18, 11-19, 11-20, 11-21, 11-22, 11-23, 11-27, and 11-28 to further reduce the less than significant noise impact during construction.

**Response 11-13:**

See Response 11-12 above regarding the Project's less than significant noise impact during construction. The requested hours limitation is, therefore, not required to mitigate any significant noise impact. Notwithstanding, the CCP includes a variety of construction management practices that will minimize the effect of noise from any construction during the evening and night. As identified in the responses to the comments 11-15, 11-16, 11-17, 11-18, 11-19, 11-20, 11-21, 11-22, 11-23, 11-27, and 11-28 below, the Construction Noise Control Plan has been revised to incorporate the requests and recommendations in these comments.

**Response 11-14:**

As discussed in Response 11-12, the noise analysis in the Recirculated Draft EIR concludes that noise impacts from construction will be less than significant with implementation of the construction management measures in the CCP, which requires the preparation and implementation of a construction noise monitoring plan by an independent noise consultant, in consultation with, and subject to the approval of, the City's Director of Public Works.

The CCP Construction Noise Control Program includes a noise monitoring program to ensure that noise levels from construction will be below the standards of significance. The following are required elements of this plan:

- A monitoring plan shall be implemented during demolition and construction activities. Warning thresholds shall be defined that are 5 dBA below the specified noise limits to allow sufficient time for the Contractor to take actions to reduce noise. A monitoring record that documents all alarms and actions taken to comply with these measures shall be provided to the City upon request.
- In the event the warning level (dBA) is exceeded, construction activities shall be temporarily halted in the vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the established standards. Noise measurements shall be gathered

*3.0 Comments and Responses*

after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels:

- Halting/staggering concurrent construction activities in certain locations.
- Reducing the speed or intensity of the of heavy-duty construction equipment being operated simultaneously.
- Operate equipment at the lowest possible power levels.
- Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.

As described in the Recirculated Draft EIR, a Joint Powers Authority (JPA) has been established to enforce contract requirements, including implementation of all of the construction management measures in the CCP. The JPA will have the authority to stop work and withhold payment if all terms of the contract are not met. For this reason, the establishment of a system of fines for not complying with the noise control program requirements in the CCP is not necessary.

The additional recommendations in this comment were reviewed and considered by the City and determined not to be necessary to ensure that noise from construction noise is controlled in a manner that will avoid significant impacts on noise sensitive uses located along the proposed alignment for the project.

**Response 11-15:**

Consistent with the request in this comment the CCP has been revised by the City to include the following as a courtesy to the commenter. Please note this measure is not mitigation and is not required to mitigate construction noise impacts to a less than significant level.

- Entry and exit to the Market Street/Florence Avenue construction site shall be limited to right turns to/from Florence Avenue for large trucks, construction equipment, and material deliveries. An entrance off Locust Street between Florence Avenue and Regent Street will also be required to serve the contractor's offices and staging area. If required for phasing, the Locust Street entrance may also be used for large trucks, construction equipment, and material deliveries as approved by the City.

Please note this construction management measure is not mitigation and is not required to mitigate construction noise impacts to a less than significant level.

**Response 11-16:**

As requested in this comment the CCP has been revised by the City to include the following as a courtesy to the commenter.

*3.0 Comments and Responses*

- Unless deemed infeasible for a particular construction activity, the Contractor shall utilize rubber tire earth moving equipment in lieu of track mounted earth moving equipment.

**Response 11-17:**

As requested in this comment the CCP has been revised by the City to include the following as a courtesy to the commenter.

- When not in use or being staged, heavy equipment shall be located as far as practicable from residential areas, businesses, and pedestrian pathways.

Please note this construction management measure is not mitigation and is not required to mitigate construction noise impacts to a less than significant level.

**Response 11-18:**

As requested in this comment the CCP has been revised by the City to include the following as a courtesy to the commenter.

- Staging of construction material deliveries behind fencing to minimize noise emitting from idling vehicles.

Please note this construction management measure is not mitigation and is not required to mitigate construction noise impacts to a less than significant level.

**Response 11-19:**

As requested in this comment the CCP has been revised by the City to include the following as a courtesy to the commenter.

- On site-signage reminding workers to minimize noise generation.

Please note this construction management measure is not mitigation and is not required to mitigate construction noise impacts to a less than significant level.

**Response 11-20:**

As requested in this comment the CCP has been revised by the City to include the following as a courtesy to the commenter.

- For project foundations, consider the use of drilled piles or sonic pile drivers or vibratory pile drivers instead of traditional impact pile drivers, as permitted by geological conditions.

Please note this construction management measure is not mitigation and is not required to mitigate construction noise impacts to a less than significant level.

3.0 Comments and Responses

**Response 11-21:**

As requested in this comment the CCP has been revised by the City to include the following as a courtesy to the commenter.

- Sequence noisy activities to occur during the same general time period during daytime hours to the extent practical.

**Response 11-22:**

As requested in this comment the CCP has been revised by the City to include the following as a courtesy to the commenter.

- Select quieter demolition methods where appropriate and feasible such that demolition activities can remain within the project specified noise levels.

Please note this construction management measure is not mitigation and is not required to mitigate construction noise impacts to a less than significant level.

**Response 11-23:**

As requested in this comment the CCP has been revised by the City to include the following as a courtesy to the commenter.

- Staging of construction material deliveries behind fencing to minimize noise emitting from idling vehicles.

Please note this construction management measure is not mitigation and is not required to mitigate construction noise impacts to a less than significant level.

**Response 11-24:**

The additional measures recommended for consideration by the City related to items other than noise are addressed individually in the following responses. Please note that the measures the City is voluntarily adding to the CCP are not mitigation and are not required to mitigate any significant impact as noted in the responses below.

**Response 11-25:**

The City has obtained \$8.5 million of state funding allocations for the City of Inglewood and its efforts to improve Market Street through a Streetscape Improvement Program and a Street Façade & Tenant Improvement Program.

3.0 Comments and Responses

The analysis in the Recirculated Draft EIR in Sections 4.1 Aesthetics, 4.4 Cultural Resources, and 4.10 Noise and Vibration concluded that construction and operation of the ITC Project will not result in significant aesthetic noise or vibration impacts on the Fox Theater building or significant impacts to the historic characteristics of the building and, for this reason, allocation of funds from this program are not required to mitigate significant impacts.

Funds from this program will be available for improvements to buildings located on Market Street, including the Fox Theater Building.

**Response 11-26:**

As requested in this comment the CCP has been revised to include the following measure to limit lighting during construction.

- Construction night lighting shall be shielded to prevent a direct view of the light sources from residential properties with a property boundary that is within 150 feet of the construction site.

Please note this construction management measure is not mitigation and is not required to mitigate construction noise impacts to a less than significant level. The analysis in the Recirculated Draft EIR concluded potential impacts from temporary lighting during construction would be less than significant.

**Response 11-27:**

As requested in this comment, the CCP has been revised to include the following:

- Dust shall be controlled per local ordinances. The Contractor shall be responsible for excessive dust or construction debris that results in impacts to adjacent residences or private vehicles, including taking responsibility for clean-up and addressing complaints brought to the project.

Please note this construction management measure is not mitigation and is not required to mitigate construction air quality impacts during construction to a less than significant level. The analysis in the Recirculated Draft EIR concluded potential impacts from temporary lighting during construction would be less than significant.

**Response 11-28:**

As requested in this comment, the CCP has been revised to include the following:

- Rumble strips or signage shall be provided at roadway access points into contractor laydown and staging areas to slow construction vehicles and limit vehicle noise.
- All trucks carrying fill materials, debris, or similar materials shall secure and cover loads to prevent dust or debris while travelling on public right of ways.

3.0 Comments and Responses

- All trucks removing materials from the site will be loaded within the site perimeter and will be required to cover loads as deemed necessary for dust control.
- Material stockpiles and construction area surfaces shall be covered and/or watered as needed to prevent dust at designated construction areas.

Please note these construction management measures are not mitigation and are not required to mitigate construction air quality impacts to a less than significant level.

**Response 11-29:**

As requested in this comment, the commenter has been added to the City's notification list for this project and will receive all future project notifications.

Comment Letter No. 12

**City of Inglewood Planning Division**  
One W. Manchester Boulevard, 4th Floor, Inglewood, CA 90301  
Attn: Mindy Wilcox, AICP, Planning Manager

December 27<sup>th</sup>, 2021

Dear Ms. Mindy Wilcox,

Leitner-Poma of America, Inc. offers a complete line of cable transportation systems, including chairlifts, aerial gondolas & trams, Automated People Movers, etc., all manufactured in our factories in Colorado and Europe.

We also have more than 80 years of experience in the ropeways design and construction and we have more than 60 references of APM's and funicular railways all over the world. Therefore, we are fully equipped to produce entire cable propelled APM systems, including all designing, engineering, construction, fabrication as well as operation and maintenance of our systems. For example, we built one of the APM in the Miami International Airport APM which we successfully operate with an availability rate of 99.8%.

We have read your technical data and needs in the Recirculated Draft of EIR for the Inglewood Transit Connector Project and we confirm our interest in this project. However, the technical data suggested in the document are very oriented towards a self-propelled APM technology and do not offer any room for a cable propelled system. For this reason, we would like to communicate our comments and suggestions regarding the APM configuration which you will find in the attached pdf presentation. We hope that our suggestions will be taken into account for the upcoming RFP process in order to allow the cable propelled APM technology among the bidders.

Additionally, we have the following questions:

- Do you know which license(s) are needed to perform this project in Inglewood? For instance, is an elevator license needed?
- Is there a RFQ phase before the RFP process? If yes, which is the schedule?
- Will the construction be under a turnkey contract or will you organize a process apart for the APM equipment manufacturer selection? In this case, what will be the exact SOW?
- Is there any possibility that this project will be released as a Public Private Partnership (PPP)?

We appreciate the time you took reading our comments and suggestions and we look forward to receiving your answers.

Sincerely,

Frederic Demoulin

# Inglewood Transit Connector Project Cable Propelled Technology

December 27th, 2021

Meridian Consultants  
2511-004-21

3.0-53

Inglewood Transit Connector Project  
February, 2022

## SYSTEM SPECIFICATION – technical data system performance

Our proposal for the Inglewood Transit Connector project is a cable-propelled system with vehicles, based on well-known and proven POMA technologies: system similar to the ones that our group designed, manufactured, operated and maintained in Pisa and Miami airports. It is a proven technology system which provides an availability rate over 99.5%.

This is a fully automated operating transport system that does not require any manual intervention on board or at the stations. In fact, the control system is automatically operated. The transportation system is controlled by a Central Control Room.

This type of transportation system has been designed taking into account some fundamental criteria that make it more attractive than others.

Its major characteristics, in addition to lightness and flexibility, are:

- the service will be continuous, with short waiting time for passengers;
- the system will ensure maximum comfort (minimal noise and vibrations);
- the system will be accessible to people with disabilities and the elderly;
- this system offers extraordinary service performances;

Meridian Consultants

3.0-54

Inglewood Transit Connector Project  
February, 2022

### SYSTEM SPECIFICATION – technical data system performance

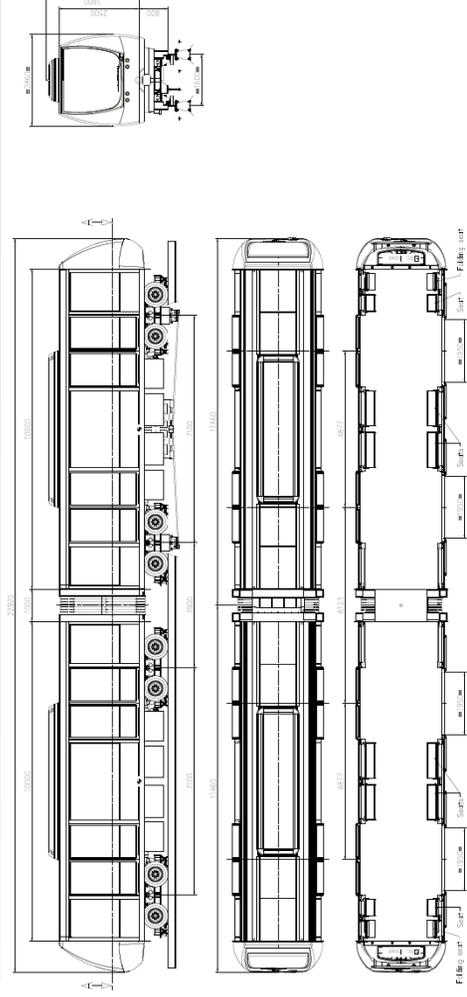

The proposed system operates in a fully automated scheduled mode, with 4 trains operating in **pinched loop mode** on dual lane, achieving a system capacity over 2000 /11000 pphpd.

Schematic diagram

### SYSTEM SPECIFICATION – technical data system performance normal weekday

parameters	during normal weekday
Operating Mode	Pinched Loop
Guideway	Dual lane with switches in front of station
System length (m)	2355
Stations	3
System capacity (pphpd)	<b>2247</b>
Required capacity (pphpd)	1950
Speed (m/s)	8 m/s - 8 m/s
Acc / deceleration (m/s <sup>2</sup> )	0,3
Dwell time (mn)	2,1
Headway (mn)	5,4
Required headway (mn)	6,0
Train configuration.	2-car trains
Fleet size	4 trains
Train capacity	202 pass at 4 pass/m <sup>2</sup> (2,7 sqft/pass)
Drive / propulsion	4 independent drive machines & rope loops

## SYSTEM SPECIFICATION – General Layout

### NORMAL OPERATION

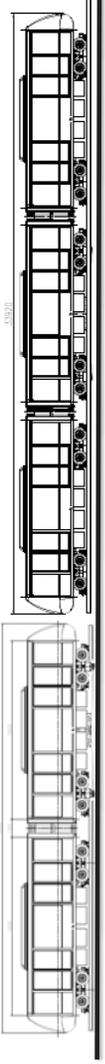

- Two W2 car train : (Meaning of W2: W: Wide cabin; 2 doors per side)
- Floor area with gangway: 50,4m<sup>2</sup>
- Train capacity: 202 pass with 4 passengers/m<sup>2</sup>

## SYSTEM SPECIFICATION – technical data system performance during events

parameters	All Other events	NFL events
<b>Operating Mode</b>	Pinched Loop	Pinched Loop
<b>Guideway</b>	Dual lane with switches in front of station	Dual lane with switches in front of station
<b>System length (m)</b>	2355	2355
<b>Stations</b>	3	3
<b>System capacity (pphpd)</b>	<b>9911</b>	<b>11646</b>
<b>Required capacity (pphpd)</b>	9700	11400
<b>Speed (m/s)</b>	11 m/s (*) - 14 m/s	11 m/s (*) - 14 m/s
<b>Acc / deceleration (m/s<sup>2</sup>)</b>	0,6	0,6
<b>Dwell time (mn)</b>	0,6	0,6
<b>Headway (mn)</b>	3,1	3,1
<b>Required headway (mn)</b>	2,4	2,0
<b>Train configuration.</b>	5-car trains	5-car trains
<b>Fleet size</b>	4 trains	4 trains
<b>Train capacity</b>	502 pass at 4 pass/m <sup>2</sup> (2,7 sqft/pass)	598 pass at 4,7 pass/m <sup>2</sup> (2,3 sqft/pass)
<b>Drive / propulsion</b>	4 independent drive machines & rope loops	4 independent drive machines & rope loops

(\*): Between Florence station and Manchester station, the running tracks in tight radius curves will have super-elevation

### SYSTEM SPECIFICATION – General Layout

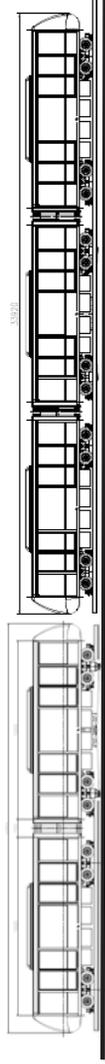

#### OPERATION DURING EVENTS

Five W2 car train : (Meaning of W2: W: Wide cabin; 2 doors per side)

- Floor area with gangway: 509m<sup>2</sup>
- Train capacity: 509 pass at 4 pass/m<sup>2</sup> (others events)
- Train capacity: 598 pass at 4,7 pass/m<sup>2</sup> (NFL events )

### SYSTEM SPECIFICATION – Train fleet

The train fleet is composed of Four 5-car-trains  
 Each train is composed of one 2-car train and one 3-car train

	Trains in operation	Trains in garage and/or in Maintenance
normal weekday	Peak period	Four 3-car trains
	Off-peak period	Four 3-car trains + Two 2-car trains
All Other events	Four 5-car trains	0
NFL events	Four 5-car trains	0

## SYSTEM SPECIFICATION – how the system works?

### Haul rope performs all critical functions

#### Haul rope performs propulsion

- The haul rope is propelled by a stationary drive unit

#### Passive trains

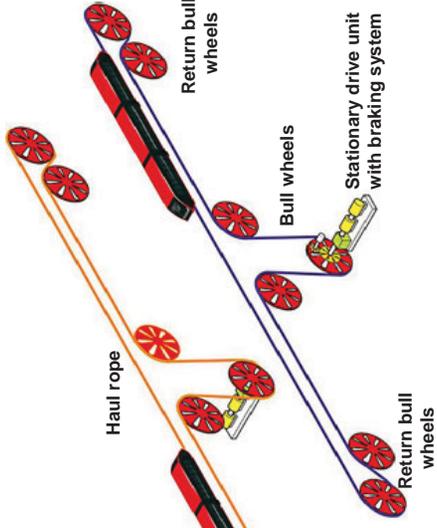

- no on-board engines or braking systems

#### Connection via grip

- Trains are directly connected to the cable via a detachable grip

#### Proven technology

- more than 100 years, in similar applications

## SYSTEM SPECIFICATION – technical data system performance

### Rope system principle:

The ATC system supervises all systems of the APM. All systems are controlled and commanded to guarantee the maximum of safety, reliability and availability of the APM.

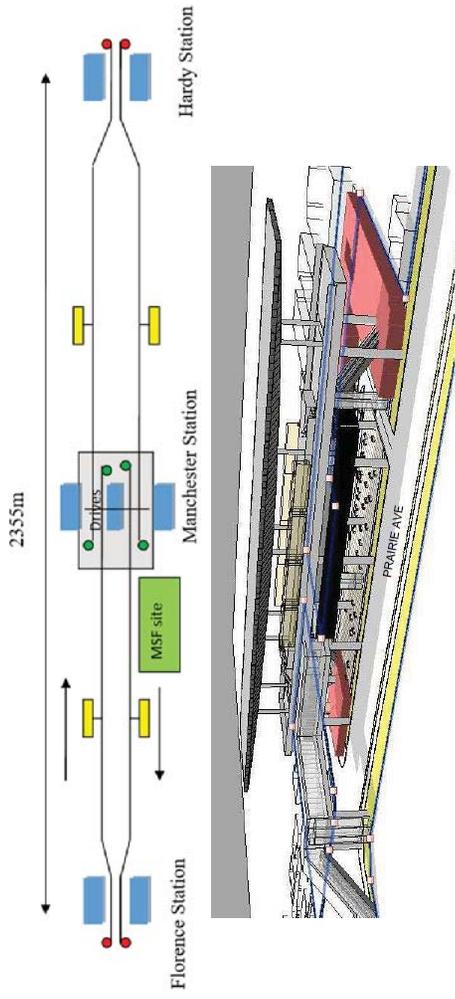

**The main link of all components in our system is the rope. This means that:**

- 1) **Acceleration and deceleration are not depending anymore on the friction between the track and the tires. The rope is insuring this function properly in any weather conditions**
- 2) **The exact position and speed of each train is always well known and properly monitored**

The rope is driven by an electrical motor. The drive bull wheels in the drive machine room and the sheaves all along the track connect the passenger vehicle to the machine. The vehicles are operated with simple technology and can be adapted to provide an aesthetic appeal and in accordance with the project specifications.

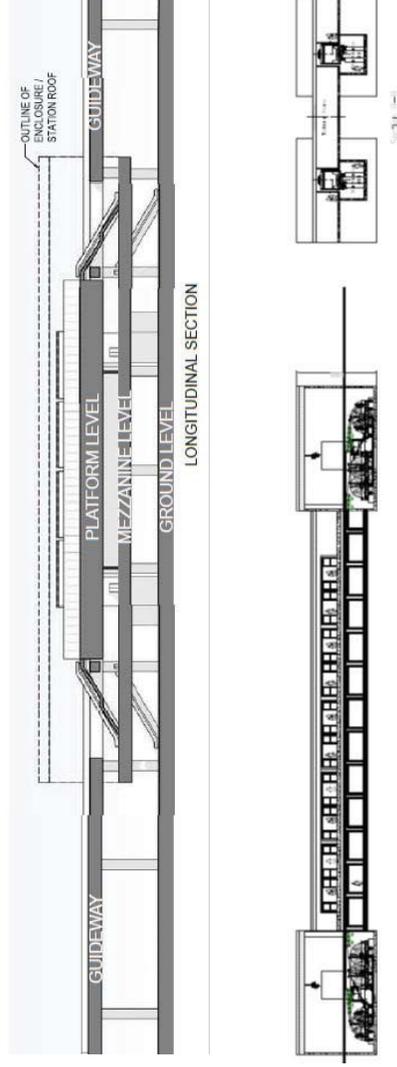

### SYSTEM SPECIFICATION – General Layout

With rope technology, drive machineries, returns and tensioning rooms are necessary in stations and can be located below the APM track at mezzanine level or ground level.

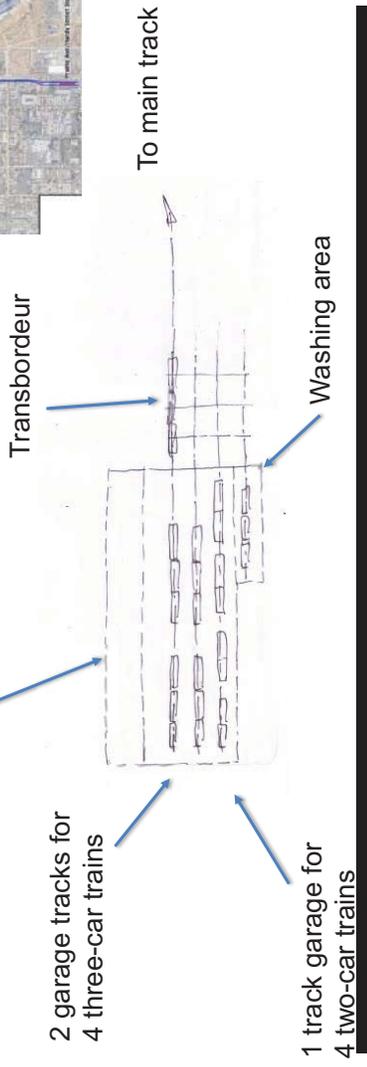

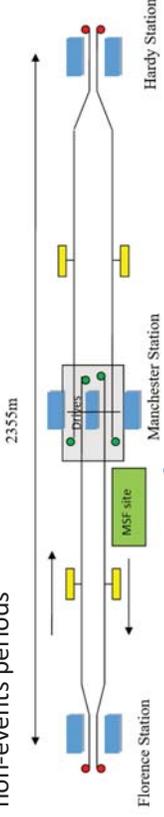

### SYSTEM SPECIFICATION – General Layout

With rope technology, drive machineries, returns and tensioning rooms are necessary in stations and can be located below the APM track at mezzanine level or ground level.

### SYSTEM SPECIFICATION – General Layout

In the Inglewood system, MSF site is needed to park the trains during non-events periods

2 garage tracks for  
4 three-car trains

1 track garage for  
4 two-car trains

### SYSTEM SPECIFICATION – subsystem - Bogie

- The bogie is passive
- It is a mechanical steel frame bogie with few moving parts
- No engines, no brakes → **no maintenance**
- **Integrated running surface and guiderail**

## SYSTEM SPECIFICATION – subsystem - bogie

### Cable-propulsion bogie

Simple mechanical steel frame bogie  
Few moving parts  
Low weight  
Low maintenance  
NO off-line maintenance depot required

### Self-propulsion bogie

Complex bogie  
Heavy weight due to integrated systems  
integrated drive, braking and hydraulic components  
Maintenance intensive  
Requires off-line maintenance depot

## SYSTEM SPECIFICATION – subsystem – propulsion machinery

### DIRECT DRIVE TECNOLOGY

The Direct Drive technology (Direct Drive type) has been developed and established since 1999 on our machines.

The operational availability rate and the reliability have been the mains axes of its development.

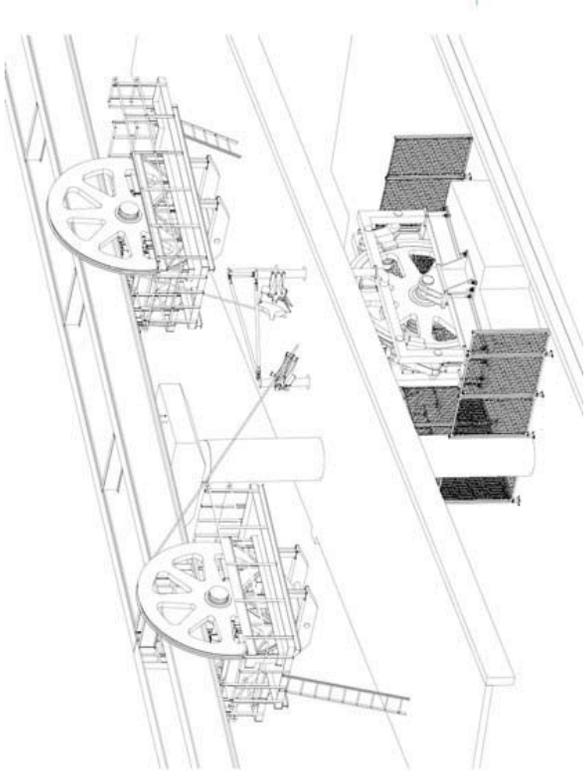

The Direct Drive technology highly improved the ease of the passengers and the security of the workers.

### ADVANTAGES AND SOLUTIONS

- Gains in energy consumption (from +5% until 8% of consumption savings)
- Financial gains on Maintenance (saving maintenance costs and gearbox maintenance)
- A greater safety for the operating staff (No visible rotating part, everything is integrated in the frame)
- Upgrade of operational availability rate (in case of failure of some part(s) of the permanent magnets and/or windings, the engine is running normally with 50% until 75% of the nominal torque (depending on the configuration)
- Ecological (No gear reducer oil)

SYSTEM SPECIFICATION – subsystems – drive propulsion lay-out

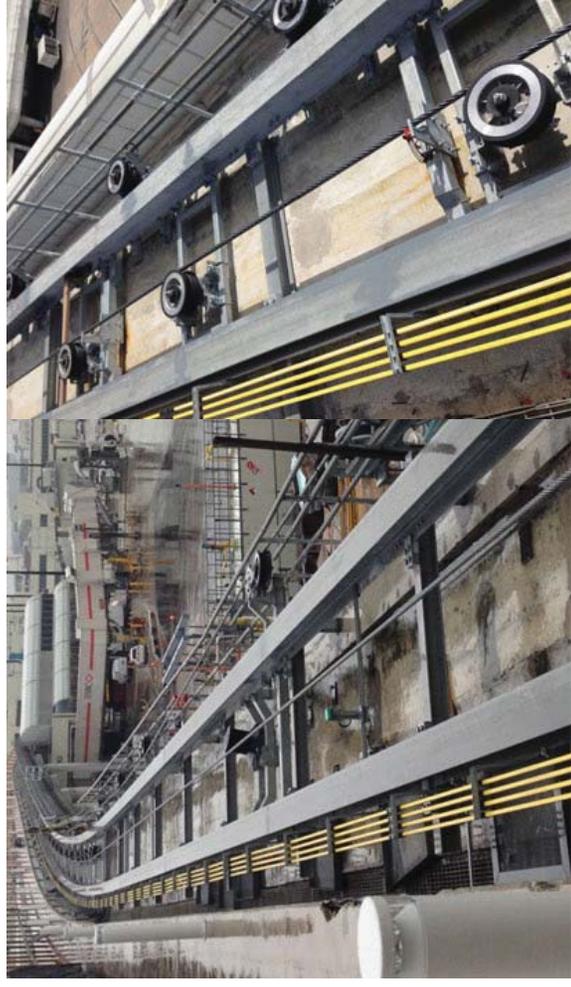

Meridian Consultants  
251-004-21

3.0-69

SYSTEM SPECIFICATION – subsystem - guideway equipment

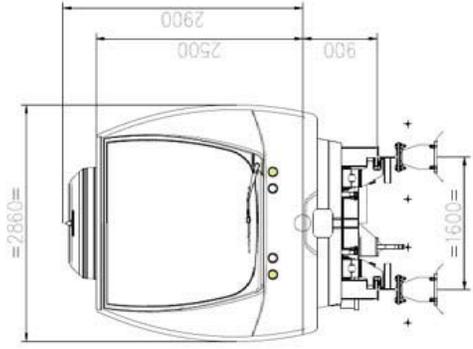

Meridian Consultants  
251-004-21

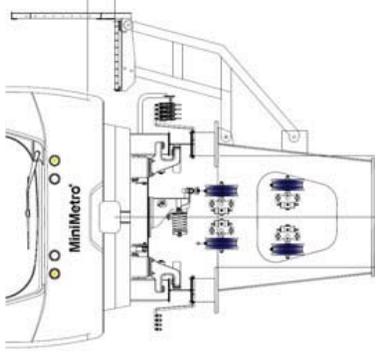

3.0-70

### SYSTEM SPECIFICATION – guideway running surface

Base running track  
section

Guideway structure: Leitner-Poma  
development

### SYSTEM SPECIFICATION – guideway running surface

Principle  
section

(\*): Between Florence station and Manchester station, the running tracks in tight radius curves will have superelevation to accept the 11 m/s speed.

These superelevation's are necessary to preserve the passengers' comfort and respect the maximum transversal accelerations.

The maximum slope of the superelevation is 10%.

## SYSTEM SPECIFICATION – subsystem - trains

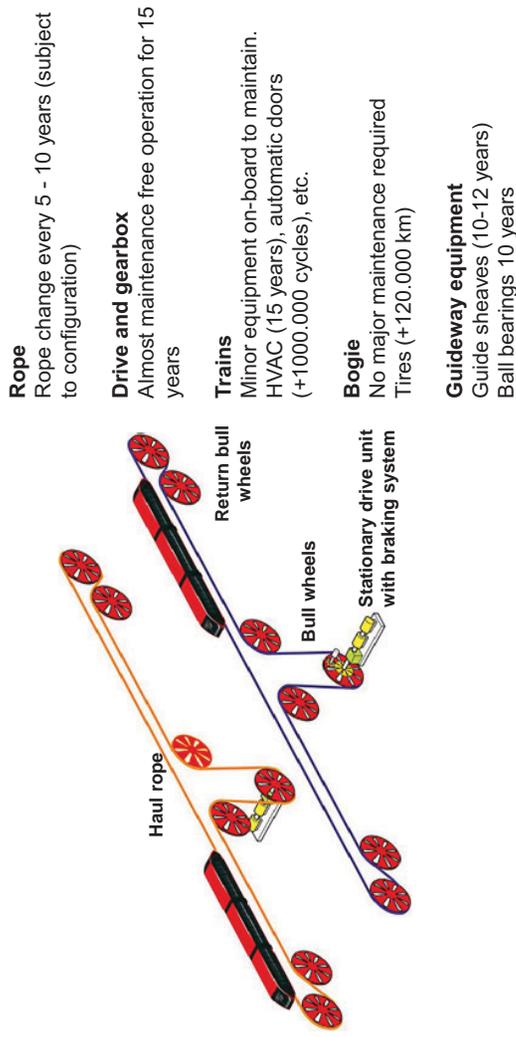

Cable-propulsion trains	Self-propulsion trains
Low loads → light weight guideway Few moving parts → low cost maintenance Passive train → no off-line maintenance depot required	Heavy trains → high load expensive guideway superstructure Active trains with on-board equipment → Requires off-line Maintenance depot (high cost) → Require spare vehicle

## METHODS OF WORK – manufacturing capacity (train control)

### LEITNER-POMA train control

## OPERATION & MAINTENANCE – major maintenance items

Frederic Demoulin  
Urban Ropeways Project Manager  
Leitner-Poma of America, Inc.  
2746 Seeber Drive, Building A  
Grand Junction, CO 81506

**Response 12-1:**

Please see page 3.0-15 of **Section 3.0: Project Description** which discusses the suitability of cable-propelled systems for the ITC Project. Cable-propelled technologies are identified as potentially viable for the provided the established Project requirements can be met. In addition, please see page 7 of the Inglewood Transit Connector Operating System Conceptual Planning Report in **Appendix E** of the Recirculated Draft EIR, which states that cable-propelled technologies are potentially viable and not precluded from proposing on the project. Additional information on the urban cable-propelled systems supplied by Leitner-Poma is provided on page 20 of Inglewood Transit Connector Operating System Conceptual Planning Report in **Appendix E**.

**Response 12-2:**

This comment includes questions on the procurement process the City will conduct for the project and raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

December 2, 2021

Mindy Wilcox  
City of Inglewood - Planning Division  
One West Manchester Blvd.  
Inglewood, CA 90301

Re: Inglewood Transit Connector - Recirculated Draft Environmental Impact Report (DEIR)

Dear Ms. Wilcox,

As a co-founder of FASTSIGNS Inglewood/LAX, with employees and clientele from the City of Inglewood and elsewhere in the County of Los Angeles, I write this letter in support of the Inglewood Transit Connector Project and the elevated, electrically powered, automated people mover. As a business owner, I am committed to keeping our business in the City of Inglewood, and as part of that commitment we back the City's plan to alleviate event day traffic congestion with the proposed Project.

13-1

As Inglewood undergoes a historic transformation into a world-class sports and events destination, I believe the ITC Project will contribute significantly to the city's economic growth by encouraging travel to and from the city via the Metro Crenshaw/LAX line and the automated people mover. In addition to the economic development this will bring, I support the City's commitment to investing in a method of transportation that is sustainable and contributes to the overall protection of the environment.

13-2

The Recirculated Draft EIR also maps out the City's Construction Plan, which promises to work with local businesses to keep potential construction interruptions at a minimum. I support the City's creation of a \$5 million dollar Business Interruption Assistance fund to provide financial assistance to small "mom and pop" businesses to help offset to the extent possible, business revenue losses or increased expenses that are directly attributable to disruptions during the ITC construction activities within the ITC Project.

13-3

The ITC Project is designed to provide significant connectivity, traffic reduction, economic prosperity, and quality of life benefits to the City of Inglewood. The City needs to close first/last mile gaps between the soon to open Metro K Line (Crenshaw/LAX Line) and the housing and employment centers, and sports and entertainment venues.

13-4

Thank you for moving forward with this project, and for supporting Inglewood businesses.

Eric Bailles  
Owner of FASTSIGNS Inglewood/LAX  
403 S. La Brea  
Inglewood, CA 90301

**COMMENT LETTER NO. 13:**

Eric Baines, Owner  
FASTSIGNS Inglewood/LAX  
403 South La Brea Avenue  
Inglewood, CA 90301

**Response 13-1:**

This comment supporting the ITC Project is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 13-2:**

This comment supporting the City's objectives for the ITC Project is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 13-3:**

This comment supporting the Construction Commitment Program, including the Business Assistance Fund included as part of the project is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 13-4:**

This comment supporting the ITC Project is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

ITC Zoom Meeting - inglewoodtransitconnector

## ITC Zoom Meeting

Arthur Dawson <edawsoncorp@gmail.com>

Mon 11/22/2021 4:26 PM

To:inglewoodtransitconnector <inglewoodtransitconnector@cityofinglewood.org>;

Hello Ms. Wilcox,

We own a complex with thirteen tenants at the southeast corner of Market and Manchester and a few questions came to mind during your presentation. 14-1

1. How will this completed project impact our property? 14-2
2. Is there any discussion about a stop at this inter-section and why not go all the way to Century? 14-3
3. How long do you think construction will take? 14-4
4. How will traffic on Manchester be impacted during and after construction? Will we lose a lane? 14-5
5. Is anyone talking about a traffic signal at Osage Ave.? There have been several accidents there. 14-6
6. Will the rail be above the center of the street or on the north or south side of Manchester? 14-7
7. How long do you think it will take to complete? 14-8
8. Are any funds coming from the just approved infrastructure bill passed by Congress? 14-9
9. Lastly, what do you think are the chances that this project gets approved? 14-10

Thank you. I enjoyed your presentation.

**COMMENT LETTER NO. 14:**

Arthur Dawson  
302 East Manchester Boulevard #2  
Inglewood, CA 90301

**Response 14-1:**

This introductory comment has been noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 14-2:**

The ITC Project will have no direct impact on the property located at 302 E Manchester Boulevard. Air Quality, Noise, and other analyses in the Recirculated Draft EIR determined there will be no significant impacts after mitigation. There are measures identified in Construction Commitment Program (CCP) to proactively address the potential effects of the construction of the Project on the community. This Program addresses business and community support plans, construction staging and traffic control requirements, maintenance of access to parking, businesses, residences, and pedestrian facilities, noise and vibration measures, air quality measures, and other vital measures during construction.

**Response 14-3:**

As discussed in **Section 3.0: Project Description** in the Recirculated Draft EIR the ITC Project is proposed to meet the Project objectives described on pages 3.0-10–3.0-11, which include closing the last mile gap to regional transit systems by connecting the Metro K Line to the activity centers in the LASED including SoFi Stadium, the commercial uses at Hollywood Park, the IBEC as well as existing and future local businesses and residences. The system does not need to extend to Century Boulevard to meet these objectives.

**Response 14-4:**

As described on page 3.0-82 of **Section 3.0: Project Description** of the Recirculated Draft EIR, construction of the ITC Project would take approximately 46 months.

**Response 14-5:**

As described in **Section 3.0: Project Description** and **Section 4.12: Transportation** of the Recirculated DEIR, the CCP addresses temporary transportation impacts during construction such as construction staging and

traffic control requirements and maintenance of access to parking, businesses, residences, and pedestrian facilities. As described on page 3.0-64 of **Section 3.0** and on page 47 of **Appendix O: Transportation Assessment Study**, there will be no changes to the lane configurations or traffic control due to the ITC Project at Market Street/Manchester Boulevard signalized intersection compared to existing conditions. The northbound and southbound approaches will provide a left-turn lane and a shared through/right-turn lane. The eastbound and westbound approaches will both provide a left-turn lane, one through lane and a shared through/right-turn lane. One of the Project's objectives is to maintain existing roadway capacity to the extent feasible, as described on page 3.0-10 of **Section 3.0**.

**Response 14-6:**

This comment is noted. As described on page 48 of **Appendix O**, there will be no changes to the existing stop-signs at Osage Avenue from the Project.

**Response 14-7:**

As described on page 3.0-32 of **Section 3.0: Project Description**, single column supports for the ATS guideway will be located in the median of Manchester Boulevard that will not restrict existing traffic capacity or turning movements at intersections. As described previously in Response 14-5, one of the Project's objectives is to maintain existing roadway capacity to the extent feasible, as described on page 3.0-10 of **Section 3.0**.

**Response 14-8:**

As described on page 3.0-82 of **Section 3.0: Project Description** of the Recirculated Draft EIR, construction of the ITC Project would take approximately 46 months.

**Response 14-9:**

This comment addressing funding from a recently approved Infrastructure Investment and Jobs Act. Funding specific to the referenced Act has not been decided as this time. The City intends to apply for available federal funding.

**Response 14-10:**

The Project will be considered for approval by the City Council in February 2022. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

Re: Recirculated Draft Environmental Impact Report (EIR) on the Inglewood Transit Connector (ITC)

Dear Ms. Wilcox,

As a member of the Inglewood Airport Area Chamber of Commerce and Executive Director of the South Bay Workforce Investment Board (SBWIB), with employees and clientele from the City of Inglewood and elsewhere in the County of Los Angeles, I write this letter in support of the Inglewood Transit Connector Project and the elevated, electrically powered, automated people mover. I am committed to ensuring that Inglewood residents and those throughout the South Bay region who may visit the City for employment, retail or entertainment purposes are able to enjoy the full benefits of the City, and as part of that commitment we back the City's plan to alleviate event day traffic congestion with the proposed Project. 15-1

As Inglewood undergoes a historic transformation into a world-class sports and events destination, I believe the ITC Project will contribute significantly to the city's economic growth by encouraging travel to and from the city via the Metro Crenshaw/LAX line and the automated people mover. In addition to the economic development this will bring, I support the City's commitment to investing in a method of transportation that is sustainable, and contributes to the overall protection of the environment. The Recirculated Draft EIR also maps out the City's Construction Plan, which promises to work with local businesses to keep potential construction interruptions at a minimum. 15-2

I support the efforts of the Business Interruption Assistance Program that the City will create a \$5-million-dollar Business Interruption fund to provide financial assistance to small "mom and pop" businesses to help offset to the extent possible, business revenue losses or increased expenses that are directly attributable to disruptions during the ITC construction activities within the ITC Project. 15-3

In anticipation of the Governor releasing the new State Budget and the upcoming deliberations by the Legislature, I express my strong support for the City of Inglewood's pursuit of \$400 million for the ITC Project from the forthcoming State budget. 15-4

The ITC Project is designed to provide significant connectivity, traffic reduction, economic prosperity, and quality of life benefits to the City of Inglewood. The City needs to close first/last mile gap between Metro K Line (Crenshaw/LAX Line) and the housing and employment centers, and sports and entertainment venues. 15-5

Thank you for moving forward with this project, and for supporting Inglewood businesses.

Sincerely,  
  
Jan Vogel  
Executive Director

Re: Recirculated Draft Environmental Impact Report (EIR) on the Inglewood Transit Connector (ITC)

Dear Ms. Wilcox,

I write today to express my strong support for the Inglewood Transit Connector (ITC) project and Automated People Mover.

The members of our church and the many churches and congregations we serve are committed to a brighter future for their families and the broader community, and the Inglewood Transit Connector helps support that commitment by adding a much-needed connection between the Metro Crenshaw/LAX line and our new sports centers along the Prairie corridor.

As the City undergoes a game-changing transformation, we believe the ITC Project and the elevated, electrically powered automated people mover, will help alleviate the anticipated increase in visitors and vehicles to and from Downtown Inglewood/Market Street The Forum, SoFi Stadium, Hollywood Park, and future Intuit Dome. The ITC Project is designed to provide significant connectivity, traffic reduction, economic prosperity, and quality of life benefits to the City of Inglewood. The City needs to close first/last mile gap between Metro K Line (Crenshaw/LAX Line) and the housing and employment centers, and sports and entertainment venues

We fully support the City's commitment to investing in new methods of transportation that are sustainable, improve air quality, reduce greenhouse gas emissions, and contribute to the overall health and well-being of Inglewood residents as indicated in the Recirculated Draft EIR. Thank you for moving forward with this project, and for supporting the growth and prosperity of our city.

Sincerely,

Bishop Robert Douglas, Jr.  
Director, Inglewood Are a Ministers Association

Inglewood, CA 90301

Re: Inglewood Transit Connector (ITC) Recirculated EIR

Dear Ms. Wilcox,

I write on behalf of The Forum, a world-class concert venue located at 3900 W Manchester Boulevard, in connection with the City of Inglewood's recirculated Draft Environmental Impact Report (EIR) for the ITC project. The transit connector is an important project that will provide a critical connection between the LA Metro system and Inglewood's entertainment district. The Forum very much appreciates the changes to the project as delineated in the EIR. It is clear that the new station location at Manchester and Prairie, and the revised westside alignment of the guideway, improves the design of the system and reduces impacts to The Forum's access, circulation and property.

19-1

We nonetheless note that the project is described in the EIR as having "no more than three straddle bent columns for a switch zone located immediately south of Nutwood Street. These three straddle bents would span Prairie Avenue, and potentially require acquisition of private property from the Forum." We are hopeful that the number of straddle bents ultimately required can be reduced, as they are intrusive and have a negative impact on the parking supply and circulation for the Forum. We also want to closely collaborate with the City on coordination of construction activities, as well as pedestrian access.

19-2

We applaud the City's modification to the ITC project. The increased mobility from the ITC will have an immediate and significant impact on the community, alleviating congestion and connecting residents with jobs, educational opportunities, and entertainment. This type of smart infrastructure investment enhances the quality of life for residents, and allows the city to build on its successes by attracting new private sector investment to the region. We look forward to working with the City to continue to reduce project impacts and bring this exciting project to fruition.

19-3

Sincerely,

Digitally signed by

General Manager & Senior Vice President  
Forum Entertainment LLC

**COMMENT LETTER NO. 19:**

Geni Lincoln, General Manager & Senior Vice President

Email: [inglewoodtransitconnector@cityofinglewood.org](mailto:inglewoodtransitconnector@cityofinglewood.org)

**RE: Inglewood Transit Connector Project, Recirculated Draft Environmental Impact Report**

Dear Ms. Wilcox:

On behalf of the Los Angeles Conservancy, I am writing to comment on the Inglewood Transit Connector Project and its Recirculated Draft Environmental Impact Report (Draft EIR). This is follow-up to our previous comments submitted on February 8, 2021.

20-1

The recirculated DEIR addresses some of our previously raised questions and comments, and reflects substantial modifications to the project scope. The Conservancy greatly appreciates consideration of our comments as we provide them with the intent of improving and making this proposed project better. We thank the City of Inglewood for including us in conversations regarding the proposed project's impacts to historic resources.

20-2

The Conservancy is not opposed to the basis for the proposed project or an APM, as a means to increase transportation efficiencies and access. Our concerns have centered on potential adverse impacts to historic resources due to this proposed undertaking, specifically those in the historic downtown portions of Inglewood along Market Street. We appreciate the sensitivity to listening to our concerns and attempts to offset potential harm, namely through a proposed design review process, design guidelines, and securing funding to help with future downtown revitalization efforts. This includes streetscape, façade improvements, and specific financial assistance to help rehabilitate the long-shuttered historic Fox Theatre.

20-3

The Fox Theatre, a National Register listed property, has been cited as having significant direct impacts caused by interrupted view sheds as a

20-4

3.0 Comments and Responses  
Comment Letter No. 20

result of the construction of the APM. This is a highly significant historic resource, built in the late '40s and designed by theatre architect S. Charles Lee. Improvements to the alignment and height of the APM have reduced impacts to this theatre, which we greatly appreciate.

As this proposed project moves forward, much attention will need to remain focused on Market Street to ensure the APM actually helps and reinforces the vitality of downtown Market Street corridor. We urge the City to not lose focus, and continue seeking funding and support for this initiative as downtown is poised for an economic revitalization and can continue to serve as the heart of the community. We look forward to seeing Market Street reactivated with programming and pedestrian amenities, and urge the City to continue to revitalize this important commercial corridor.

The Conservancy has no additional comments regarding the recirculated DEIR and the proposed project.

**About the Los Angeles Conservancy:**

The Los Angeles Conservancy is the largest local historic preservation organization in the United States, with nearly 5,000 members throughout the Los Angeles area. Established in 1978, the Conservancy works to preserve and revitalize the significant architectural and cultural heritage of Los Angeles County through advocacy and education.

Please do not hesitate to contact me at (213) 430-4203 or [afine@laconservancy.org](mailto:afine@laconservancy.org) should you have any questions or concerns.

Sincerely,

Adrian Scott Fine  
Senior Director of Advocacy

**COMMENT LETTER NO. 20:**

Adrian Scott Fine, Senior Director of Advocacy  
Los Angeles Conservancy  
523 West Sixth Street, Suite 826  
Los Angeles, CA 90014

**Response 20-1:**

This introductory comment contains a description of the contents of this letter. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 20-2:**

This comment expressing appreciation for the City consulting with the LA Conservancy and revising the design of the project to address comments on the project as originally proposed is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 20-3:**

This comment expressing appreciation for the City addressing the concerns of the LA Conservancy regarding the potential for the project to affect historic resources is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 20-4:**

This comment acknowledging that the revised design as described in the Recirculated Draft EIR reduces the potential for the project to impact the Fox Theater, a historic resource, is noted. With implementation of Project Design Feature (PDF) CUL-1, the Project will have a less than significant impact on the Fox Theater. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines

3.0 Comments and Responses

section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 20-5:**

This comment requesting that the City continue to focus on the revitalization of Market Street is noted. This comment raises neither significant environmental issues nor specific questions about the analyses or information in the Recirculated Draft EIR that require response pursuant to CEQA Guidelines section 15088. This comment is included as a part of the record and is available to the decision makers for their consideration prior to consideration of approval of the Proposed Project.

**Response 20-6:**

It is noted that the Los Angeles Conservancy has no additional comments on the Recirculated Draft EIR and proposed project.

Re: Support for Westside Alignment of the Inglewood Transit Connector (ITC)

Dear Ms. Wilcox,

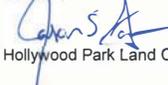

On behalf of Hollywood Park Land Company, LLC, I write in support of the western alignment of the Inglewood Transit Connector (ITC) as described in the City of Inglewood's recirculated Draft Environmental Impact Report (EIR) for the project, and we also support the City's efforts to pursue additional funding from the Governor's new State Budget. We appreciate the City's willingness to listen to multiple stakeholders and strive to make the ITC the best possible project. As revised and described in the EIR, the westside alignment reduces the impacts of the project, while enhancing the mobility. This much-needed investment in our infrastructure will significantly benefit the entire Inglewood community.

The ITC project is a 1.6 mile fully elevated, electronically powered automated transit system, which will provide a safe and reliable connection from the planned Metro improvements to Inglewood's most popular destinations, including the SoFi Stadium, the Forum, and the Intuit Dome. Having spent many years working to build relationships and trust within the Inglewood community, I understand that traffic congestion is a top concern for many local residents and business owners. By taking thousands of cars off the road every year, the ITC will not only cut down on traffic, it will significantly reduce smog and pollution in the area.

This project will also help to realize the City's goals of bringing meaningful employment opportunities to local Inglewood residents. The ITC project will bring hundreds of good-paying jobs to Inglewood, helping to ensure the City will remain prosperous for many years to come. This type of smart infrastructure investment enhances the quality of life for residents, and allows the city to build on its successes by attracting new private sector investment to the region.

The City of Inglewood has an impressive track record when it comes to bringing transformative and innovative ideas to fruition. The ITC is no exception. There is still much work to do, and details to work out. But we look forward to working with the City to make the western alignment of the ITC a reality.

Sincerely,

  
Hollywood Park Land Company, LLC

## 4.0 MITIGATION MONITORING AND REPORTING PROGRAM

### 4.1 INTRODUCTION

Public Resources Code section 21081.6 and section 15097 of the California Environmental Quality Act (CEQA) Guidelines require public agencies to establish monitoring or reporting programs for projects approved by a public agency whenever approval involves the adoption of either a mitigated negative declaration or specified environmental findings related to environmental impact reports.

This is the Mitigation Monitoring and Reporting Program (MMRP) for the Inglewood Transit Connector (ITC, or Project). The intent of the MMRP is to ensure the successful implementation of the mitigation measures identified in the Final Environmental Impact Report (Final EIR) for the Project.

### 4.2 MITIGATION MEASURES

The mitigation measures from the Final EIR are assigned the same title as in the Final EIR. The MMRP describes the actions to be taken to implement each mitigation measure, the timing of these actions, the entities responsible for implementing and monitoring the actions, and, where appropriate, the entities responsible for ensuring that reporting responsibilities are carried out. The mitigation measures identify the Project as the "Proposed Project"; this same terminology is used here in order to ensure that the measures in this MMRP are consistent with those identified in the Final EIR.

In some instances, mitigation measures require a monitor or community liaison to be retained or designated. In those instances, the person or entity designated to perform this task shall be identified to the City, and the City will review that person or entity's qualifications to confirm that the designated party has the requisite expertise or qualifications.

The MMRP also includes a table identifying "Project Design Features" (PDFs). This information is included for convenience and comprehensiveness. These PDFs are not "mitigation measures" as defined by CEQA. PDFs consist of elements or features that have been incorporated into the Project that may reduce the environmental effects of the Project. These PDFs are included in a separate table in order to ensure that these features are implemented.

### 4.3 MMRP COMPONENTS

The components of the attached tables, which contain applicable mitigation measures and project design features, are addressed briefly, below:

- **Impact:** This column summarizes the impact stated in the Draft EIR, as revised in the Final EIR.

4.0 Mitigation Monitoring and Reporting Program

- **Mitigation Measure:** All mitigation measures identified in the Draft EIR, as revised in the Final EIR, are presented and titled accordingly.
- **Implementing Party:** The column entitled “Implementing Party” identifies the entity that will undertake the required action. The Implementing Party is most often the Contractor/Operator, who will be responsible for the design, construction or operation of each site, phase, or component of the Project. The Contractor/Operator responsible for undertaking a required action may include the owner or operator of the Project component, as appropriate. In some instances, the required action will or should be undertaken by another party. This column therefore provides clarity regarding the entity that is primarily responsible for carrying out the action.
- **Monitoring Party:** This column identifies the specific party responsible for monitoring. The City of Inglewood (the City) is primarily responsible for monitoring that mitigation measures are successfully implemented. Within the City, the Public Works Department would have responsibility for monitoring some aspect of the overall project. The City of Inglewood proposed the formation of a joint powers authority (JPA) with the Los Angeles County Metropolitan Transportation Authority (Metro) to implement and operate the ITC Project. In March 2021, Metro’s Board approved and voted to form the JPA. Upon formation, the JPA would assume responsibility for oversight of the Project. Therefore, although the JPA does not yet exist, it has been added as a Monitoring Party where the JPA would have that role once the JPA is constituted. Other entities, such as the DBFOM Contractor, or other agencies, such as the Los Angeles Regional Water Quality Control Board, may also be responsible for monitoring the implementation of mitigation measures.  
  
The department within the City who is identified as a monitoring party includes the: (1) the Public Works Department, which helps to plan, design, inspect, and administer contracts for capital infrastructure construction and facility improvements projects (Engineering Division); manage the City’s municipal solid waste services (Environmental Services Division); and assures that City transportation improvements and systems are functional and safe (Transportation & Traffic Division).
- **Timing:** Implementation of the action must occur prior to or during some part of project approval, project design or construction, or during ongoing project operations. The timing for each measure is identified in this column.
- **Notes:** Certain measures identify reporting responsibility. In those instances, the MMRP identifies the party that must prepare a report so that the monitoring party can confirm that the required action(s) have been implemented. This column also notes where the mitigation measure will be enforced in part by another agency or provides additional information that provide clarity concerning how the measure will be carried out.
- **Acronyms:** The MMRP uses various acronyms to refer to various City Departments or other agencies or entities. In some instances, the full name of the department or agency is used. The following agency or department acronyms are used throughout the MMRP:

4.0 Mitigation Monitoring and Reporting Program

Name of Department or Agency	Acronym
<i>City of Inglewood, Public Works Department</i>	
Engineering Division	DPW-Engineering Division

4.0 Mitigation Monitoring and Reporting Program

Impact	Mitigation Measures	Implementing Party	Monitoring Party	Timing	Notes
--------	---------------------	--------------------	------------------	--------	-------

4.2 Air Quality

**Impact AQ-1:** Conflict with or obstruct implementation of the applicable air quality plan.

See **PDF AQ-1** in Project Design Features table below.

See **PDF AQ-1** in Project Design Features table below.

JPA/DPW  
Contractor/  
Operator

**Impact AQ-2:** Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard.

**Impact AQ-3:** Expose sensitive receptors to substantial pollutant concentrations.

4.3 Biology Resources

**Impact BIO-1:** Interfere substantially with the movement of any resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

**BIO-1 Conservation of Faunal Resources: Nesting Birds/Raptors:** The City shall require demolition and construction contractors to implement the following measures:

- Prior to initiating any demolition and/or construction activities, a nesting bird survey shall be conducted to determine the presence of any nesting birds within 500 feet of demolition and/or construction activities. In addition, nesting bird surveys shall be conducted at least every six (6) months until the completion of construction activities, as specified below.

Nesting bird survey shall include:

Contractor/  
Operator

JPA/DPW

Prior to tree removal activities that would occur between January 1 through September 1 for raptors and March 1 to September 15 for nesting birds, preconstruction surveys would be conducted by a qualified biologist no earlier than 30 days prior to the commencement of

Measure applies for tree removal activities occurring between January 1 through September 1 for raptors and March 1 to September 15 for nesting birds. Biologist retained by Contractor/Operator subject to review and approval by City to confirm that biologist is qualified to perform survey.

4.0 Mitigation Monitoring and Reporting Program

Impact	Mitigation Measures	Implementing Party	Monitoring Party	Timing	Notes
--------	---------------------	--------------------	------------------	--------	-------

– Prior to any demolition and/or construction, and a least every six (6) months during and prior to the raptor nesting season until the completion of construction activities, January 1 to September 1, a qualified biologist shall conduct a site survey for active nests no more than 30 days prior to any scheduled clearing, demolition, grading, or construction activities. The survey shall be conducted within all trees, manmade structures, and any other potential raptor nesting habitat.

construction activities. If active nests are found during preconstruction surveys, the qualified biologist shall utilize the appropriate buffer (300 feet for nesting birds and 500 feet for raptors) to avoid the nest and the City shall be notified. The requirement to establish a buffer applies if active nests or raptors are found during construction.

Biologist to prepare report of pre-construction survey, and to submit report to ECDD-Planning Division. Biologist shall notify ECDD-Planning Division if active nests are found.

– Prior to any vegetation disturbance between March 1 and September 15, and a least every six (6) months until the completion of construction activities, a qualified biologist shall conduct a survey for nesting birds in all breeding/nesting habitat within the construction or demolitions areas and within 300 feet of all disturbance areas. The surveys shall be conducted within trees and structures, wherever nesting bird species may be located. Nesting bird surveys shall be conducted no earlier than 30 days prior to the initiation of ground or vegetation disturbance. If no breeding/nesting birds are observed, site preparation, demolition and construction activities may begin. If breeding activities and/or an active bird nest

4.0 Mitigation Monitoring and Reporting Program

Impact	Mitigation Measures	Implementing Party	Monitoring Party	Timing	Notes
	<p>is located, the breeding habitat/nest site shall be fenced by the biological monitor a minimum of 300 feet (500 feet for raptors) in all directions, and this area shall not be disturbed until the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, and/or the young shall no longer be impacted. If the qualified biologist determines that a narrower buffer between the demolition and/or construction activities and the observed active nests is warranted, the biologist may submit a written explanation as to why (e.g., species-specific information; ambient conditions and bird's habituation to them; terrain, vegetation, and birds' lines of sight between the demolition and/or construction activities and the areas) to the City and, upon request, the CDFW. Based on the submitted information, the City, acting as the lead agency (and CDFW, if CDFW requests) shall determine whether to allow a narrower buffer.</p> <p>-</p> <p>During the year prior to demolition and/or construction, a survey shall be conducted by a qualified biologist for bat habitat areas within the construction footprint of the proposed Project between March 1</p>	4.0-6

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>emission standards. The City shall include this requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards and make the records available for inspection.</p> <ul style="list-style-type: none"> <li>Require the use of electric or alternatively fueled (e.g., natural gas) sweepers with high-efficiency particulate air (HEPA) filters.</li> <li>A publicly visible sign shall be posted with the Community Affairs Liaison's contact information to contact regarding dust complaints. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.</li> <li>All roadways, driveways, sidewalks, etc., being installed as part of the Project should be completed as soon as practicable; in addition, building pads should be laid as soon as practicable after grading.</li> <li>To the extent feasible, allow construction employees to commute during off-peak hours.</li> <li>Make access available for on-site lunch trucks during construction, as feasible, to minimize off-site construction employee vehicle trips.</li> <li>Every effort shall be made to utilize grid-based electric power at any construction site, where feasible.</li> <li>Contractors shall maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.</li> </ul>				
<p><i>Meredian Consultants</i> 251-004-20</p>	4.0-37			<p><i>Inglewood Transit Connector Project</i> February 2022</p>

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<ul style="list-style-type: none"> <li>Require in all applicable bid documents, purchase orders, and contracts of the requirement to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB's policy. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify construction vendors, contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the Project area. To further ensure that drivers understand the vehicle idling requirement, post signs at the proposed Project entry gates and throughout the Project alignment, where appropriate, stating that idling longer than five minutes is not permitted.</li> </ul>				
<b>4.4 Cultural Resources</b>				
<p><b>PDF CUI-1 Historic Resources (Design Guidelines)</b></p> <p>The final Project design must consider design variables (elevation of guideway, width of guideway, distance of the guideway from the resources, and the dimensions, placement, and spacing of support columns) and resource variables (building's height, scale, number of street-facing facades, width of primary facade, front setback, project elements overhanging the sidewalk, and viewpoints from which the resource can best be discerned in its entirety). The final Project design shall ensure minimal impacts to the setting of historical resources, and little or no visual obstruction of the resource's street-facing facades from the optimal viewpoints. In order to meet these performance-based standards, the following Project Design Features shall be incorporated into the final Project design:</p> <ul style="list-style-type: none"> <li>The guideway's elevation and distance from the façade of the historical resource will be sufficient for the guideway to visually clear the top of the historical resources' street-facing</li> </ul>	Contractor/ Operator	JPA/ DPW- Engineering Division	Guideway and support column design, elevation, and distance from known resources shall be shown on building plans for the ATS, prior to the issuance of building permits for the ATS.	
<p><i>Meredian Consultants</i> 251-004-20</p>	4.0-38			<p><i>Inglewood Transit Connector Project</i> February 2022</p>

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>façade(s) when viewed from the optimal viewpoints. The final Project design is expected to achieve no visual obstruction of any of the identified historical resources from the guideway.</p> <ul style="list-style-type: none"> <li>At the former Fox Theatre, and for 100 feet on either side of the resource, the guideway elevation (measured from the ground plane to the underside of the guideway structure) will be a minimum of 52 feet from grade in order to achieve unobstructed views of this resource, including its monumental sign pylon.</li> <li>The dimensions, placement, and spacing of the guideway support columns will be such that the obstruction of views of the historical resources' street-facing façade(s) when viewed from the optimal viewpoints will be minimized. For five of the identified historical resources—Holy Faith Episcopal Church, former United Bank of California (now Broadway Federal Bank), former Fox Theatre, Professional Building, and Inglewood Park Cemetery—the final Project design is expected to completely avoid visual obstructions from support columns.</li> <li>For five of the historical resources—the former Bank of Inglewood, former J.C. Penney, Bank of America, the Forum, and Lighthouse McCormick Mortuary Mortuary—views that are completely unobstructed by support columns are not necessary for the resource to convey its significance. A small portion of the resources' primary façades will be intermittently obscured depending on the position of the viewer. However, due to the scale and/or setback of these resources, their primary façades will remain readily discernable.</li> </ul>				
<b>4.5 Energy</b>

4.0 Mitigation Monitoring and Reporting Program

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<ul style="list-style-type: none"> <li><b>Energy Efficiency</b> - Where California Energy Standards apply, the project should be more energy efficient than allowed. For energy-using equipment not governed by California Energy Efficiency Standards, best available energy efficient technologies should be used. Advanced commissioning of building systems should be conducted to ensure systems are operating as designed.</li> <li>To achieve energy use reduction, passive strategies taking advantage of the favorable local climate should be considered where feasible. The use of solar canopies as shade structures in addition to roof-mounted solar is another energy saving strategy.</li> <li><b>Water Efficiency</b> - In order to reduce excessive water consumption, the project should identify and implement appropriate opportunities to reduce or eliminate potable water use indoors and in landscape areas.</li> <li><b>Material Conservation And Resource Efficiency</b> - In order to reduce the environmental impact from the use of construction materials the project should minimize the use of virgin materials. This can be accomplished by increasing the use of materials that are reused, recycled, rapidly renewable, locally sourced, and durable. In order to determine the best approach to reducing the overall environmental impact from use of materials, a life cycle assessment (LCA) could be used.</li> <li><b>Environmental Quality</b> - In order to protect and enhance the health and comfort of occupants, the project should provide a high quality, sustainable indoor environment that is designed to maximize natural daylighting and views of the outdoors where feasible. Indoor spaces should use high efficiency air filtration and should create a comfortable indoor acoustical environment. Materials and systems should be selected that will provide for a healthy indoor environment.</li> </ul>	Operator	Division	building plans for the ATS, prior to the issuance of building permits for the ATS.

vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the established standards. Noise measurements shall be gathered after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels:

- Halting/staggering concurrent construction activities in certain locations;
- Reducing the speed or intensity of the of heavy-duty construction equipment being operated simultaneously.
- Operate equipment at the lowest possible power levels.
- Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.

**PDF NOISE-2 Construction Vibration Reduction Plan (CCP)**

Prior to the issuance of any demolition or construction permit for each phase of the Project, a Construction Vibration Reduction Plan shall be prepared to minimize construction vibration at nearby sensitive receptors from vibration created by construction activities. The Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works. The Plan shall include but not be limited to the following elements to ensure impacts from ground borne vibration are less than significant:

- A Pre-Demolition and Construction Plan that includes but is not limited to:
  - Photos of current conditions of buildings and structures that could be damaged from construction activities. This crack survey shall include photos of existing cracks and

other material conditions present on or at the surveyed buildings. Images of interior conditions shall be included if possible. Photos in the report shall be labelled in detail and dated.

- Identify representative cracks in the walls of existing buildings, if any, and install crack gauges on such walls of the buildings to measure changes in existing cracks during project activities.
- Crack gauges shall be installed on multiple representative cracks, particularly on sides of the building facing the Project.
- Determine the number and placement of vibration sensors at the affected buildings in consultation with a qualified architect. The number of units and the locations of these sensors shall take into account proposed demolition and construction activities to ensure that adequate measurements can be taken illustrating vibration levels during the course of the Project, and if/when levels exceed the established threshold.
- A line and grade pre-construction survey at the affected buildings shall be conducted.
- A Vibration Plan During Demolition and Construction that includes the following:
  - Regularly inspect and photograph crack gauges, maintaining records of these inspections to be included in post-construction reporting. Gauges shall be inspected every two weeks, or more frequently during periods of active project actions in close proximity to crack monitors.
  - The vibration monitoring system shall measure and continuously store the peak particle velocity (PPV) in inches/second. Vibration data shall be stored on a one-

## INGLEWOOD TRANSIT CONNECTOR PROJECT CONSTRUCTION COMMITMENT PROGRAM

### 1.0 INTRODUCTION

The Inglewood Transit Connector (ITC) Project includes this Construction Commitment Program to proactively address the potential effects of the construction of the Project on the community. This Program addresses:

- Business and community support plans
- Construction staging and traffic control requirements
- Maintaining access to parking, businesses, residences, and pedestrian facilities
- Noise and vibration measures
- Air quality measures
- Other vital measures during construction
- Tree removal and replacement

A Project Task Force will be established for the ITC Project. The Project Task Force will include representation from the following entities:

- City of Inglewood (City)
- The ITC Joint Powers Authority (JPA) – that will be responsible for the oversight of the DBFOM Contractor during the design, construction and subsequent operations and maintenance of the ITC Project.

The DBFOM Contractor (responsible for the design, build/construct, finance, operations, and maintenance of the ITC Project)

### 2.0 BUSINESS AND COMMUNITY SUPPORT PROGRAM

The Project Task Force will be responsible for developing a Business and Community Support Program for the purpose of assisting those businesses financially affected by the construction that addresses the following:

- Advertising support for local businesses in local or regional newspapers and social media.
- Notice of plans to all affected property owners of the schedule for specific planned construction activities, changes in traffic flow, and required short-term modifications to property access.
- Notice of plans to all affected property owners if utilities would be disrupted for short periods of time and ensuring major utility shut-offs are scheduled during low-use periods of the day.
- Methods by which business owners can convey their concerns about construction activities and the effectiveness of measures during the construction period so activities can be modified to reduce adverse

effects.

- Access plans that ensure that all businesses, service providers, and residents are provided with adequate access during construction. Where there is a significant limited English population, signage shall be provided in various languages (as appropriate).
- Funding for temporary signage during construction to help businesses that are partially blocked or that have inconvenient access due to construction activity.

### 3.0 BUSINESS ~~INTERRUPTION~~ASSISTANCE FUND PROGRAM

The City is committed to providing financial assistance to small “mom and pop” businesses to help offset to the extent possible, business revenue losses or increased expenses that are directly attributable to disruptions during the ITC construction activities within the ITC Project area. The City will create a \$5 million dollar Business ~~Interruption~~Assistance Fund (~~BIF~~BAF) to provide financial assistance through grants to eligible businesses for eligible expenses as established by the ~~BIF~~BAF Program Administrator. Similar to the LA Metro BIF model, businesses may file multiple requests for financial assistance through the BIF; but in no event will the amount paid exceed the lesser total amount of \$50,000, or 60% of annual business revenue losses per business. The financial assistance is expected to cover eligible fixed operating expenses such as utilities, insurance, rent or mortgage (excluding the principal amount portion of the mortgage payment), fixed payroll, and certain other documented business-related expenses as determined by the ~~BIF~~BAF Program Administrator. ~~Consistent with Metro’s program, commercial property owners may file, however property owners may only file a claim for mortgage (excluding the principal amount portion of the mortgage payment), utilities, insurance, and other expenses as determined eligible by the BIF Program Administrator.~~ The City will develop Administrative Guidelines to establish program eligibility requirements targeted to businesses that are directly impacted by the ITC Project construction, are located within the eligible geographic area in proximity to the ITC Project, and that meet the definition of small “mom and pop” businesses; ~~anticipated~~ Anticipated requirements to participate in the program, include:

- Businesses must be in continuous operation for at least two years within the eligible geographic area.
- Businesses must provide financial records (e.g., gross receipts, payroll taxes, bank statements or other financial information as requested) to demonstrate the business revenue losses or increased expenses are directly attributable to the ITC construction activities during the period of disruption.
- Businesses must be financially solvent and have a good faith plan and commitment to remain in business within the eligible geographical area; and
- Businesses must be in good standing with all local, state and federal taxing and licensing authorities.

### 4.0 COMMUNITY AFFAIRS LIAISON

The Community Affairs Liaison shall be responsible for responding within 24 hours to any local complaint or question about construction activities. A website will be established with project construction information and contact information for the Community Affairs Liaison. A toll-free phone line (available 24 hours a day) and website will be made a part of all construction notices and shall be posted in prominent public facing locations around the Project area and in adjacent public spaces.

The Community Affairs Liaison shall receive all public complaints, investigate the cause of the complaint and develop/implement feasible measures to address and resolve the cause of the complaint.

### 5.0 TRANSIT ACCESS AND CIRCULATION PROGRAM

The Project Task Force will be responsible for the following:

- Ensuring that access to bus transit stops and bus circulation are always maintained, unless infeasible and closure is approved by the City.
- Coordinating with Metro and any other transit service providers to:
  - Relocate bus stop(s) if necessary, during construction with appropriate wayfinding signage and information dissemination, with all temporarily relocated bus stops located as close as feasible to the original bus stop location.
  - Reroute transit bus lines if necessary, during construction with appropriate wayfinding signage and information dissemination.

### 6.0 CONSTRUCTION STAGING & TRAFFIC CONTROL PROGRAM

The Construction Staging and Traffic Control Program will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and will address the following topics:

- Coordination with other public infrastructure projects within the City’s boundaries
- Detour routes, including analysis of impacts to pedestrian, business, bicycle, transit and traffic flow
- Coordination of closures and restricted access during the construction period with special attention during periods of expected heavy traffic from events scheduled at SoFi Stadium and other venues in the Los Angeles Sports and Entertainment District at Hollywood Park, the Forum, and the Inglewood Basketball and Entertainment Center.
- Coordination with the City, police, and fire services department regarding maintenance of emergency access and response times
- Monitoring and coordination of construction materials deliveries
- Notification to businesses and residents on upcoming construction activities including but not limited to the establishment of a website with project construction information, signage, and web-based media.

#### 6.1 Traffic Control Program Updates

The Traffic Control Program will be ~~updated~~ developed based on the following principles:

- Minimize traffic impacts on residential streets.
- Establish minimum traffic lane requirements for Manchester Boulevard, Florence Avenue, and Prairie Avenue during construction such that at least the full number of traffic lanes in the peak direction, and if feasible, one traffic lane in the off-peak direction is available, with additional capacity provided through appropriate detour routes. The directional traffic lanes may be reversible to maintain the peak directional capacity in either direction as necessitated by traffic demands. For all other streets potentially affected by construction, maintain at least one lane of traffic in each direction unless

otherwise approved by the City.

- Maintain access to and from all alleys at one or both ends of the alley when possible. If an alley is obstructed such that a turnaround by any vehicle is not feasible, traffic flaggers shall be provided to control access to/from the alley.
- Maintain access for all public safety vehicles (such as police, fire, and emergency response).
- Maintain bicycle and pedestrian access within the Project area or approved detours at all times.
- Provide adequate street access to City service vehicles, including but not limited to trash pickup and street sweeping service vehicles, during planned service times.
- Sidewalk closures should be avoided to the degree feasible and are permitted only when approved by the City. Accessible detours shall be provided if sidewalk closures are necessary.
- Use traffic control officers/flaggers as appropriate to minimize the degree and duration of impacts and maintain safety.
- Establish and maintain wayfinding signage.
- Maintain vehicular and pedestrian access to all businesses and residents impacted by construction activities including roadway closures.
- Hold quarterly community outreach meetings with businesses and residents to provide updates on temporary, full, or partial street closures necessary for construction. Website will be updated 45 to 60 days prior to planned dates of any street closures.
- All closures, full or partial, are subject to City review and approval which shall consider measures to minimize the degree and duration of street and lane closures.
- Entry and exit to the Market Street/Florence Avenue construction site shall be limited to right turns to/from Florence Avenue for large trucks, construction equipment, and material deliveries. An entrance off Locust Street between Florence Avenue and Regent Street will also be required to serve the contractor's offices and staging area. If required for phasing, the Locust Street entrance may also be used for large trucks, construction equipment, and material deliveries as approved by the City.

#### 6.12 Preliminary Haul And Overload Routes

- Haul routes and overload/oversized vehicle routes are subject to review and approval by the City.
- To the extent possible, truck deliveries and hauling of bulk materials such as aggregate, bulk cement, dirt, etc. to the Project area, and hauling of material from the Project area, shall be scheduled during off-peak hours to avoid the peak commuter traffic periods on designated haul routes.
- Truck deliveries and hauling of dirt, aggregate, bulk cement, and all other materials and equipment, shall be on designated routes only (freeways and nonresidential streets)

#### 6.23 Pedestrian Access Program

△ Pedestrian Access Program will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and will adhere to the following principles:

- Pedestrian access to buildings shall be maintained at all times.

- Maintain all crosswalks to the extent feasible. Whenever a crosswalk is removed from service, establish and maintain temporary accessible replacement crosswalks as close as practicable to the original crosswalk locations unless the City determines that a replacement crosswalk is not necessary to maintain an adequate level of service. Replacement crosswalks shall be identified and controlled by wayfinding signs approved by the City.
- Establish and maintain pedestrian wayfinding signage.
- Maintain sidewalk access for pedestrians, including providing temporary sidewalks if existing sidewalks are disrupted during construction. Any sidewalk closures are subject to review and approval by the City.
- Sidewalks that are being maintained in a temporary condition shall meet all applicable safety standards, including but not limited to the requirements of the Federal Americans with Disabilities Act and similar California laws. ~~for sidewalks being maintained in a temporary condition.~~
- Protect pedestrians from construction-related debris, dust and noise; such protection may include the use of dedicated pedestrian barriers.
- Coordinate with the Inglewood Unified School District (IUSD) and the City to provide crossing guards at locations requested by IUSD or the City when crosswalks or sidewalks are closed. Identify temporary/alternative routes to schools, working closely with IUSD and the City and disseminate this information to schools and stakeholders affected by construction.

#### 7.0 PARKING MANAGEMENT PLAN

A Parking Management Plan will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and shall adhere to the following principles:

- Parking, staging, or queuing of Project-related vehicles, including workers' personal or project-assigned vehicles, trucks, and heavy vehicles, shall be prohibited on City streets at all times, outside of a permitted workspace unless otherwise approved by the City. If the use of residential permit parking spots is necessary for construction, provide for equivalent overnight replacement parking for removed residential permit parking spots at the nearest possible location to the location where parking has been removed.
- Replace loss of metered parking spaces by making available an equivalent number of parking spaces in an off-street parking facility located near the lost parking. The parking spaces shall be provided for public use at a rate no greater than the metered parking rate.
- Provide public notice of the availability of the alternative parking spaces through outreach to businesses and residents with signage.

#### 8.0 AIR QUALITY PROGRAM

- At a minimum, use equipment that meets the U.S. Environmental Protection Agency (USEPA)'s Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity, unless it can be demonstrated to the City Planning Division with substantial evidence that such equipment is not available. To ensure that Final Tier 4 construction equipment or better shall be used during the proposed Project's construction, the

INGLEWOOD TRANSIT CONNECTOR PROJECT  
CONSTRUCTION COMMITMENT PROGRAM

City shall include this requirement in applicable bid documents, purchase orders, and contracts. The City shall also require periodic reporting and provision of written construction documents by construction contractor(s) and conduct regular inspections to the maximum extent feasible to ensure and enforce compliance.

- Such equipment will be outfitted with Best Available Control Technology devices including a California Air Resources Board (CARB)-certified Level 3 Diesel Particulate Filters (DPF). Level 3 DPF are capable of achieving at least 85 percent reduction in particulate matter emissions. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by Final Tier 4 emissions standards for a similarly sized engine, as defined by the CARB's regulations. Successful contractors must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. The proposed Project representative will make available to the lead agency and Southern California Air Quality Management District (SCAQMD) a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used during construction. The inventory will include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each unit's certified tier specification, best available control technology (BACT) documentation, and CARB or SCAQMD operating permit shall be maintained on site at the time of mobilization for each applicable piece of construction equipment.
- If any of the following circumstances listed below exist and the Contractor provides written documentation consistent with project contract requirements, the Contractor shall submit an Alternative Compliance Plan that identifies operational changes or other strategies that can reduce a comparable level of NOx emissions as Tier 4-certified engines during construction activities:
  - The Contractor does not have the required type of off-road construction equipment within its current available inventory as to a particular vehicle or equipment by leasing or short-term rent, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
  - The Contractor has been awarded funding by SCAQMD or another agency that would provide some or all of the cost to retrofit, repower, or purchase a piece of equipment or vehicle, but the funding has not yet been provided due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
  - The Contractor has ordered equipment or vehicle to be used on the construction project in compliance at least 60 days before that equipment or vehicle is needed at the Project alignment, but that equipment or vehicle has not yet arrived due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.

INGLEWOOD TRANSIT CONNECTOR PROJECT  
CONSTRUCTION COMMITMENT PROGRAM

- Construction-related diesel equipment or vehicle will be used on the Project for fewer than 20 calendar days per calendar year. The Contractor shall not consecutively use different equipment or vehicles that perform the same or a substantially similar function in an attempt to use this exception to circumvent the intent of this measure.
- Documentation of good faith efforts and due diligence regarding the previous exceptions shall include written record(s) of inquiries (i.e., phone logs) to at least three leasing/rental companies that provide construction on-road trucks and off-road equipment, documenting the availability/unavailability of the required types of truck/equipment. The City will, from time-to-time, conduct independent audit of the availability of such vehicles and equipment for lease/rent within a 120-mile radius of the Project area, which may be used in reviewing the acceptability of the Contractor's good faith efforts and due diligence.
- Equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts shall be electric or alternative-fueled (i.e., nondiesel). Pole power shall be utilized to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel-powered generators, must be operated continuously, such equipment must be Final Tier 4 construction equipment or better and located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- At a minimum, require that construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export with a gross vehicle weight rating of at least 14,001 pounds), or best commercially available equipment, that meet CARB's 2010 engine emissions standards at 0.01 g/hp-hour of particulate matter and 0.20 g/hp-hour of NOx emissions or newer, cleaner trucks, unless the Contractor provides written documentation consistent with project contract requirements the circumstances exist as described above and the Contractor submits the Plan. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards. The City shall include this requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards and make the records available for inspection.
- Require the use of electric or alternatively fueled (e.g., natural gas) sweepers with high-efficiency particulate air (HEPA) filters.
- A publicly visible sign shall be posted with the Community Affairs Liaison's contact information to contact regarding dust complaints. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.
- Dust shall be controlled per local ordinances. The Contractor shall be responsible for excessive dust or construction debris that results in impacts to adjacent residences or private vehicles, including taking responsibility for clean-up and addressing complaints brought to the project.
- All trucks carrying fill materials, debris, or similar materials shall secure and cover loads to prevent dust or debris while travelling on public right of ways.
- All trucks removing materials from the site will be loaded within the site perimeter and will be required to cover loads as deemed necessary for dust control.
- Material stockpiles and construction area surfaces shall be covered and/or watered as needed to

prevent dust at designated construction areas.

- All roadways, driveways, sidewalks, etc., being installed as part of the Project should be completed as soon as practicable; in addition, building pads should be laid as soon as practicable after grading.
- To the extent feasible, allow construction employees to commute during off-peak hours.
- Make access available for on-site lunch trucks during construction, as feasible, to minimize off-site construction employee vehicle trips.
- Every effort shall be made to utilize grid-based electric power at any construction site, where feasible.
- Contractors shall maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.
- Require in all applicable bid documents, purchase orders, and contracts of the requirement to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB's policy. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify construction vendors, contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the Project area. To further ensure that drivers understand the vehicle idling requirement, post signs at the proposed Project entry gates and throughout the Project alignment, where appropriate, stating that idling longer than five minutes is not permitted.

### 9.0 VISUAL RESOURCES PROGRAM

Construction activities during evening and nighttime hours may require the use of temporary lighting. To minimize the impact of temporary lighting on adjacent properties, the following measures shall be implemented:

- Temporary lighting will be limited to the amount necessary to safely perform the required work and will be directed downwards and shielded. Care shall be taken in the placement and orientation of portable lighting fixtures to avoid directing lights toward sensitive receptors, including automobile drivers. Motorists and sensitive receptors shall not have direct views of construction light sources. Light sensitive receptors include but are not limited to residential areas and transient occupancy uses.
- Light trespass shall not exceed one foot-candle above ambient light level as measured at any adjacent residential and transient properties.
- Construction night lighting shall be shielded to prevent a direct view of the light sources from residential properties with a property boundary that is within 150 feet of the construction site.
- Temporary sidewalks and any sidewalk adjacent to construction activities shall be illuminated to City Standards to protect public safety.

To minimize the visual effects of construction the following measures shall be implemented:

- Visually obtrusive erosion control devices, such as silt fences, plastic ground cover, and straw bales should be removed as soon as the area is stabilized.
- Stockpile areas should be located in less visibly sensitive areas and pre-approved by the City. Stockpile locations, laydown, and staging areas shall be accessed by construction vehicles with minimal disruption near residential neighborhoods.
- When not in use or being staged, heavy equipment shall be located as far as practicable from residential areas, businesses and pedestrian pathways.

### 10.0 HAZARDOUS MATERIALS PROGRAM

The following practices will be followed during construction to address the potential for encountering hazardous materials during construction of the Project.

- **Building Demolition Plan** – Prior to any demolition occurring, conduct an evaluation of all buildings built prior to 1980 to be demolished to identify the presence of asbestos containing materials (ACMs) and lead-based paint (LBP). Remediation shall be implemented in accordance with the recommendations of these evaluations to ensure that no ACMs or LBP remain present and to ensure ACMs and LBP are removed to levels established for public safety.
- **Hazardous Materials Contingency Plan** – Prior to construction, prepare a plan addressing the potential for discovery of unidentified underground storage tanks (USTs), hazardous materials, petroleum hydrocarbons, or hazardous or solid wastes encountered during construction. This Plan shall address UST decommissioning, field screening and materials testing methods, contaminant management requirements, and health and safety requirements to ensure no exposure to hazards or hazardous materials occurs on site and to ensure any materials encountered during construction are removed to levels established for public safety.
- **Soil Management Plan** – After final construction plans are prepared showing the lateral and vertical extent of soil excavation during construction are prepared, prepare a Soil Management Plan to establish soil reuse criteria, define a sampling plan for stockpiled materials, describe the disposition of materials that do not satisfy the reuse criteria, and specify guidelines for imported materials.
- **Health and Safety Plan** – Prior to construction, prepare a Health and Safety Plan to address the potential for exposure to the constituents of concern identified in the limited Phase II ESA.
- Utility Relocation Work – All Project utility relocations in the vicinity of Kelso Elementary School shall be designed and constructed to remain within the public right-of-way and not impact school property. Relocations shall be located further away from the school as feasible and designed and constructed to current standards to assure that they create no unacceptable hazards to the school. During Project construction, any open trenches and construction equipment shall be marked and barricaded such that they are not accessible by the students or create any potential hazard to school operations. Project utility relocations or cut overs that may require disruption to school normal utility services shall be scheduled to occur outside of normal school hours with advanced notification to the School District.
- .

## 11.0 NOISE AND VIBRATION CONTROL PROGRAM

### 11.1 Construction Noise Control Plan

A Construction Noise Control Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works prior to construction. The Plan shall include measures demonstrating that construction noise levels will be below the Federal Transit Administration's (FTA's) General Assessment Construction Noise Criteria. The following construction noise reduction measures shall be incorporated into the plan:

- Install temporary noise barriers that reduce sound at receptors;
- For any idling that is expected to take longer than five minutes, the engine shall be shut off;
- All equipment shall be equipped with optimal muffler systems;
- Use solar, battery powered, or hybrid equipment whenever practical;
- Locate staging areas as far away from sensitive receptors as feasible;
- Locate stationary noise sources as far away from sensitive receptors as feasible;
- Enclose stationary noise sources, such as diesel- or gasoline-powered generators, with acoustical barriers where necessary and required;
  - If stationary equipment cannot be enclosed within a shed or barrier, such equipment must be muffled and located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- Pole power shall be utilized to the maximum extent feasible in lieu of generators.
- Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible. Additionally, use of "quiet" pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions shall be considered.
- Staging of construction material deliveries behind fencing to minimize noise emitting from idling vehicles.
- On site-signage reminding workers to minimize noise generation.
- When not in use or being staged, heavy equipment shall be located as far as practicable from sensitive receptors.
- For project foundations, consider the use of drilled piles or sonic pile drivers or vibratory pile drivers instead of traditional impact pile drivers, as permitted by geological conditions.
- Sequence noisy activities to occur during the same general time period during daytime hours to the extent practical.
- Select quieter demolition methods where appropriate and feasible such that demolition activities can

remain within the project specified noise levels.

- Unless deemed infeasible for a particular construction activity, the Contractor shall utilize rubber tire earth moving equipment in lieu of track mounted earth moving equipment.
- Construction material deliveries shall take place within designated construction staging areas as far from residential sites as practical to minimize noise impacts.
- Provide signage at active construction sites and staging areas reminding workers, equipment operators and delivery vehicles to minimize noise levels to the extent possible.
- Rumble strips or signage shall be provided at roadway access points into contractor laydown and staging areas to slow construction vehicles and limit vehicle noise.
- Coordinate with Inglewood Unified School District administrators to avoid disruptive noise during school hours including scheduling heavy equipment such as cranes, haul trucks, concrete trucks, concrete pumps, pneumatic equipment, earth moving vehicles or similar to operate outside of school hours. The City shall require that the Project's construction noise during school hours would be limited to 5 dBA Leq 1-hour above the measured ambient noise levels at Kelso School property line as identified in the RDEIR. Activities that would exceed this threshold shall be scheduled to occur outside of normal school hours or mitigated with specific mitigation measures such as temporary sound walls, sound blankets, or other sound-attenuating devices. The City shall monitor the Project's construction noise levels during school hours to assure compliance. As requested by the District, monthly noise monitoring reports on noise levels during school hours at Kelso School will be provided to the District.

In order to ensure that construction noise levels will be below the established standards, the following shall be incorporated into the Plan:

- A monitoring plan shall be implemented during demolition and construction activities. Warning thresholds shall be defined that are 5 dBA below the specified noise limits to allow sufficient time for the Contractor to take actions to reduce noise. A monitoring record that documents all alarms and actions taken to comply with these measures shall be provided to the City upon request.
- In the event the warning level (dBA) is exceeded, construction activities shall be temporarily halted in the vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the established standards. Noise measurements shall be gathered after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels:
  - Halting/staggering concurrent construction activities in certain locations;
  - Reducing the speed or intensity of the of heavy-duty construction equipment being operated simultaneously.
  - Operate equipment at the lowest possible power levels.
  - Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.

### 11.2 Construction Vibration Reduction Plan

INGLEWOOD TRANSIT CONNECTOR PROJECT  
CONSTRUCTION COMMITMENT PROGRAM

Prior to the issuance of any demolition or construction permit for each phase of the Project, a Construction Vibration Reduction Plan shall be prepared to minimize construction vibration at nearby sensitive receptors from vibration created by construction activities. The Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works. The Plan shall include but not be limited to the following elements to ensure impacts from ground borne vibration are less than significant:

- A Pre-Demolition and Construction Plan that includes but is not limited to:
  - Photos of current conditions of buildings and structures that could be damaged from construction activities. This crack survey shall include photos of existing cracks and other material conditions present on or at the surveyed buildings. Images of interior conditions shall be included if possible. Photos in the report shall be labelled in detail and dated.
  - Identify representative cracks in the walls of existing buildings, if any, and install crack gauges on such walls of the buildings to measure changes in existing cracks during project activities.
  - Crack gauges shall be installed on multiple representative cracks, particularly on sides of the building facing the Project.
  - Determine the number and placement of vibration sensors at the affected buildings in consultation with a qualified architect. The number of units and the locations of these sensors shall take into account proposed demolition and construction activities to ensure that adequate measurements can be taken illustrating vibration levels during the course of the Project, and if/when levels exceed the established threshold.
  - A line and grade pre-construction survey at the affected buildings shall be conducted.
- A Vibration Plan During Demolition and Construction that includes the following:
  - Regularly inspect and photograph crack gauges, maintaining records of these inspections to be included in postconstruction reporting. Gauges shall be inspected every two weeks, or more frequently during periods of active project actions in close proximity to crack monitors.
  - The vibration monitoring system shall measure and continuously store the peak particle velocity (PPV) in inches/second. Vibration data shall be stored on a one-second interval. The system shall also be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA's threshold of significance for a building given its conditions, and a warning level that is 0.05 inch/second (PPV) less than the regulatory level. The system shall also provide real-time alert when the vibration levels exceed either of the two preset levels.
  - In the event the warning level (PPV) is triggered, the contractor shall identify the source of vibration impacts and establish steps to reduce the vibration levels, including but not limited to halting or staggering concurrent activities and using lower vibratory techniques.
  - In the event the regulatory level (PPV) is triggered, halt the construction activities in the vicinity of the trigger area and visually inspect the building for any damage. Results of the inspection must be logged. Identify the source of vibration generation and provide steps to reduce the vibration level. Vibration measurement shall be made with the new construction method to verify that the vibration level is below the warning level (PPV). Construction

INGLEWOOD TRANSIT CONNECTOR PROJECT  
CONSTRUCTION COMMITMENT PROGRAM

activities may then restart.

- In the event work occurs in the proximity of identified historic uses, the system shall be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA threshold of significance 0.12 inch/second for a building given its conditions, and a warning level that is 0.012 inch/second (PPV) less than the regulatory level.
  - Collect vibration data from receptors and report vibration levels to the [Joint Powers Authority and/or the City Chief Building Official](#) on a daily basis. The reports shall include annotations regarding project activities as necessary to explain changes in vibration levels.
- Post-Construction Reporting and Repairs:
    - Provide a report to the [Joint Powers Authority and/or City Chief Building Official](#) regarding crack and vibration monitoring conducted during demolition and construction. In addition to a narrative summary of the monitoring activities and their findings, this report shall include photographs illustrating the post-construction state of cracks and material conditions that were presented in the pre-construction assessment report, along with images of other relevant conditions showing the impact, or lack of impact, of project activities. The photographs shall sufficiently illustrate damage, if any, caused by the Project and/or show how the Project did not cause physical damage to the buildings. The report shall include analysis of vibration data related to project activities, as well as summarize efforts undertaken to avoid vibration impacts. Finally, a postconstruction line and grade survey shall also be included in this report.
    - Perform repairs to buildings if damage is caused by vibration or movement during the demolition and/or construction activities. Repairs may be necessary to address, for example, cracks that expanded as a result of the Project, physical damage visible in post-construction assessment, or holes or connection points that were needed for shoring or stabilization. Repairs shall be directly related to project impacts and will not apply to general rehabilitation or restoration activities of the buildings.
  - To minimize the risk of potential structural and building damage:
    - Limit the location of pile driving and vibratory roller activity to not be within 55 feet and 30 feet of the nearest off-site sensitive receptor, respectively.
    - Limit the number of jackhammers operating simultaneously to one (1) piece operating within 45 feet of off-site sensitive receptors.
    - In the event impact pile driving is required, equipment shall only be used from the hours of 7:00 AM to 7:00 PM. If feasible, pile driving should use alternative technology such as vibration or hydraulic insertion.
  - To minimize the risk of related to human annoyance:
    - Limit the location of pile driving to 310 feet of off-site vibration sensitive receptors.
    - Limit the location of vibratory roller to 150 feet of off-site vibration sensitive receptors.
    - Limit the location of large bulldozer to 85 feet of off-site vibration sensitive receptors.

*INGLEWOOD TRANSIT CONNECTOR PROJECT  
CONSTRUCTION COMMITMENT PROGRAM*

- Limit the location of caisson drilling to 85 feet of off-site vibration sensitive receptors.
- Limit the location of loaded trucks to 75 feet of off-site vibration sensitive receptors.
- Limit the location of jackhammers to 45 feet of off-site vibration sensitive receptors.
- Limit the location of small bulldozer to 25 feet of off-site vibration sensitive receptors.

**12.0 TREE REMOVAL AND REPLACEMENT PLAN**

A Tree Removal and Replacement Plan will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and shall adhere to the following principles:

- Tree removal and replacement shall comply with the City of Inglewood Municipal Code and the ITC Design Standards and Guidelines.
- Removal of existing healthy and flourishing trees will be avoided where feasible.
- New permanent replacement trees shall be a 36-inch box of the same species as those removed, if appropriate for the location and not in conflict with new infrastructure. Alternative locations shall be approved by the City's Public Works Department.
- New permanent replacement palm trees shall be a minimum of 20 feet in height.
- The Contractor shall permanently replace trees within 12 (12) months of restoration and completion of that portion of streets that may impact the tree. To the extent feasible, the Contractor shall permanently replace trees on an ongoing basis so long as doing so does not conflict with future construction.
- If construction of the project requires pruning of native tree species, the pruning shall be performed in a manner that does not cause permanent damage or adversely affect the health of the trees.

The Contractor shall maintain all permanent trees and other landscaping installed by the Contractor for a period of three (3) years from the date of planting and shall warranty the trees and landscaping for one (1) year after planting. Prior to the end of the one-year warranty period, the City and the Contractor will conduct an inspection of all permanent replacement trees and landscaping for general health as a condition of final acceptance by the City. If, in the City's determination, a permanent replacement tree or landscaping does not meet the health requirements of the City, then the Contractor shall replace that tree within thirty (30) days. For any permanent trees or landscaping that must then be removed, the original warranty shall be deemed renewed commencing from when the tree or landscaping is replaced.

1.0 Introduction .....	1.0-1
2.0 Revisions and Additions to the Final EIR.....	2.0-1
3.0 Additions to the Construction Commitment Program.....	3.0-1

## Appendices

- A** Mitigation Monitoring and Reporting Program
- D** Construction Commitment Program

## 1.0 INTRODUCTION

---

This Errata addresses minor revisions and additions to the Final EIR for the proposed Inglewood Transit Connector (ITC) Project (proposed Project) related to the responses to the comments from the Inglewood Unified School District (IUSD) on the Draft EIR. Specifically, minor revisions were made to the response to Comment 3-2 from the IUSD. The revision to this response clarifies the noise monitoring protocol during construction to be implemented to avoid noise impacts to Kelso School. Corresponding revisions were also made to the response to Mitigation Monitoring and Reporting Program (MMRP) in Section 4.0 of the Final EIR and the Construction Commitment Program (CCP) in Appendix D of the Final EIR.

The revisions and additions to the Final EIR, MMRP, and CCP included in this EIR Errata would not result in any new or substantially more significant impacts and are indicative of the City of Inglewood's (City's) commitment to implementing measures to avoid or lessen potential impacts to the greatest extent feasible.

## 2.0 REVISIONS AND ADDITIONS TO THE FINAL EIR

---

The following revision has been made to Response to Comment 3-2 on page 3.0-11 of the Final EIR:

In order to ensure that acceptable noise levels are maintained at Kelso School ~~during the school day~~, real time noise monitoring will be conducted at Kelso School during the school day. A noise monitor will be located at the southeast corner of Kelso School on Prairie Avenue. This noise monitor will update the 1-hour Leq noise level every minute during the school day. Any time the ~~Leq~~ 1-hour Leq noise level increases by 3 dBA over the ambient noise level during the school day, an alert message will be sent to the construction manager(s) and contact(s) for the contractor(s) working in the vicinity of the school to allow for adjustments to be made to the work in progress to avoid noise levels reaching or exceeding an increase of 5 dBA 1-hour Leq over ambient noise levels. A contact will also be provided to the Inglewood Unified School District and administration at Kelso School to ~~discuss~~ resolve any District or Kelso School concerns with construction activities and their resulting noise levels ~~at any time~~ during the school day.

The following addition has been made to Project Design Feature (PDF) HAZ-1 in the Mitigation Monitoring Program on Page 4.0-41 of the Final EIR:

### **PDF HAZ-1 Hazardous Materials Program**

The following practices will be followed during construction to address the potential for encountering hazardous materials during construction of the Project.

- Building Demolition Plan – Prior to any demolition occurring, conduct an evaluation of all buildings built prior to 1980 to be demolished to identify the presence of asbestos containing materials (ACMs) and lead-based paint (LBP). Remediation shall be implemented in accordance with the recommendations of these evaluations to ensure that no ACMs or LBP remain present and to ensure ACMs and LBP are removed to levels established for public safety.
- Hazardous Materials Contingency Plan – Prior to construction, prepare a plan addressing the potential for discovery of unidentified underground storage tanks (USTs), hazardous materials, petroleum hydrocarbons, or hazardous or solid wastes encountered during construction. This Plan shall address UST decommissioning, field screening and materials testing methods, contaminant management requirements, and health and safety requirements to ensure no exposure to hazards or hazardous materials occurs on site and to ensure any materials encountered during construction are removed to levels established for public safety.
- Soil Management Plan – After final construction plans are prepared showing the lateral and vertical extent of soil excavation during construction are prepared, prepare a Soil Management Plan to establish soil reuse criteria, define a sampling plan for stockpiled materials, describe the disposition of materials that do not satisfy the reuse criteria, and specify guidelines for imported materials.

- Health and Safety Plan – Prior to construction, prepare a Health and Safety Plan to address the potential for exposure to any constituents of concern that may be encountered during construction.
- Utility Relocation Work – All Project utility relocations in the vicinity of Kelso Elementary School shall be designed and constructed to remain within the public right-of-way and not impact school property. Relocations shall be located further away from the school as feasible and designed and constructed to current standards to assure that they create no unacceptable hazards to the school. During Project construction, any open trenches and construction equipment shall be marked and barricaded such that they are not accessible by the students or create any potential hazard to school operations. Project utility relocations or cut overs that may require disruption to normal school utility services shall be scheduled to occur outside of normal school hours with advanced notification to the School District.

The following addition has been made to Project Design Feature (PDF) NOISE-1 on Page 4.0-43 of the Final EIR:

**PDF-NOISE-1 Construction Noise Control Plan (CCP)**

A Construction Noise Control Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City’s Director of Public Works prior to construction. The Plan shall include measures demonstrating that construction noise levels will be below FTA’s General Assessment Construction Noise Criteria. The following construction noise reduction measures shall be incorporated into the Plan:

- Install temporary noise barriers that reduce sound at receptors;
- For any idling that is expected to take longer than five minutes, the engine shall be shut off;
- All equipment shall be equipped with optimal muffler systems;
- Use solar, battery powered, or hybrid equipment whenever practical;
- Locate staging areas as far away from sensitive receptors as feasible;
- Locate stationary noise sources as far away from sensitive receptors as feasible;
- Enclose stationary noise sources, such as diesel-or gasoline-powered generators, with acoustical barriers where necessary and required;
  - If stationary equipment cannot be enclosed within a shed or barrier, such equipment must be muffled and located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- Pole power shall be utilized to the maximum extent feasible in lieu of generators.

- Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible. Additionally, use of “quiet” pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions shall be considered.
- Staging of construction material deliveries behind fencing to minimize noise emitting from idling vehicles.
- On site-signage reminding workers to minimize noise generation.
- When not in use or being staged, heavy equipment shall be located as far as practicable from sensitive receptors.
- For project foundations, consider the use of drilled piles or sonic pile drivers or vibratory pile drivers instead of traditional impact pile drivers, as permitted by geological conditions.
- Sequence noisy activities to occur during the same general time period during daytime hours to the extent practical.
- Select quieter demolition methods where appropriate and feasible such that demolition activities can remain within the project specified noise levels.
- Unless deemed infeasible for a particular construction activity, the Contractor shall utilize rubber tire earth moving equipment in lieu of track mounted earth moving equipment.
- Construction material deliveries shall take place within designated construction staging areas as far from residential sites as practical to minimize noise impacts.
- Provide signage at active construction sites and staging areas reminding workers, equipment operators and delivery vehicles to minimize noise levels to the extent possible.
- Rumble strips or signage shall be provided at roadway access points into contractor laydown and staging areas to slow construction vehicles and limit vehicle noise.
- Coordinate with the Inglewood Unified School District administrators to avoid disruptive noise during school hours, including scheduling heavy equipment such as cranes, haul trucks, concrete trucks, concrete pumps, pneumatic equipment, earth moving vehicles or similar to operate outside of school hours. The City shall require that the Project's construction noise during school hours would be limited to 5 dBA Leq 1-hour above the measured ambient noise levels at Kelso School property line as identified in the RDEIR. Activities that would exceed this threshold shall be scheduled to occur outside of normal school hours or mitigated with specific mitigation measures such as temporary sound walls, sound blankets, or other sound-attenuating devices. The City shall monitor the Project's construction noise levels during school hours to assure compliance. As requested by the District, monthly noise monitoring reports on noise levels during school hours at Kelso School will be provided to the District.

In order to ensure that construction noise levels will be below the established standards, the following shall be incorporated into the Plan:

- A monitoring plan shall be implemented during demolition and construction activities. Warning thresholds shall be defined that are 5 dBA below the specified noise limits to allow sufficient time for the Contractor to take actions to reduce noise. A monitoring record that documents all alarms and actions taken to comply with these measures shall be provided to the City upon request.
- In the event the warning level (dBA) is exceeded, construction activities shall be temporarily halted in the vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the established standards. Noise measurements shall be gathered after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels:
  - Halting/staggering concurrent construction activities in certain locations;
  - Reducing the speed or intensity of the heavy-duty construction equipment being operated simultaneously;
  - Operating equipment at the lowest possible power levels;
  - Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.
  - In order to ensure that acceptable noise levels are maintained at Kelso School, real time noise monitoring will be conducted at Kelso School during the school day. A noise monitor will be located at the southeast corner of Kelso School on Prairie Avenue. This noise monitor will update the 1-hour Leq noise level every minute during the school day. Any time the 1-hour Leq noise level increases by 3 dBA over the ambient noise level during the school day, an alert message will be sent to the construction manager(s) and contact(s) for the contractor(s) working in the vicinity of the school to allow for adjustments to be made to the work in progress to avoid noise levels reaching or exceeding an increase of 5 dBA 1-hour Leq over ambient noise levels. A contact will also be provided to the Inglewood Unified School District and administration at Kelso School to resolve any District or Kelso School concerns with construction activities and their resulting noise levels during the school day.

## 3.0 ADDITION TO THE CONSTRUCTION COMMITMENT PROGRAM

---

Provided below is an addition to the Construction Commitment Program (CCP). Changes are identified below by the corresponding CCP section and subsection, if applicable, and the page number. Additions are double underlined and deletions are shown in ~~strikethrough~~ format. It should also be noted that in response to comments received on the Recirculated Draft EIR and community and stakeholder outreach, modifications to the Construction Commitment Program (CCP), provided in Appendix D of the Final EIR were made. These changes are summarized in the relevant responses to comments, as applicable.

The following revision has been made to the Noise and Vibration Control Program on pages 11 through 13 of the CCP, included as Appendix D of the Final EIR:

### 11.0 NOISE AND VIBRATION CONTROL PROGRAM

#### 11.1 Construction Noise Control Plan

A Construction Noise Control Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works prior to construction. The Plan shall include measures demonstrating that construction noise levels will be below the Federal Transit Administration's (FTA's) General Assessment Construction Noise Criteria. The following construction noise reduction measures shall be incorporated into the plan:

- Install temporary noise barriers that reduce sound at receptors;
- For any idling that is expected to take longer than five minutes, the engine shall be shut off;
- All equipment shall be equipped with optimal muffler systems;
- Use solar, battery powered, or hybrid equipment whenever practical;
- Locate staging areas as far away from sensitive receptors as feasible;
- Locate stationary noise sources as far away from sensitive receptors as feasible;
- Enclose stationary noise sources, such as diesel- or gasoline-powered generators, with acoustical barriers where necessary and required;
  - If stationary equipment cannot be enclosed within a shed or barrier, such equipment must be muffled and located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- Pole power shall be utilized to the maximum extent feasible in lieu of generators.
- Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is

unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible. Additionally, use of “quiet” pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions shall be considered.

- Staging of construction material deliveries behind fencing to minimize noise emitting from idling vehicles.
- On site-signage reminding workers to minimize noise generation.
- When not in use or being staged, heavy equipment shall be located as far as practicable from sensitive receptors.
- For project foundations, consider the use of drilled piles or sonic pile drivers or vibratory pile drivers instead of traditional impact pile drivers, as permitted by geological conditions.
- Sequence noisy activities to occur during the same general time period during daytime hours to the extent practical.
- Select quieter demolition methods where appropriate and feasible such that demolition activities can remain within the project specified noise levels.
- Unless deemed infeasible for a particular construction activity, the Contractor shall utilize rubber tire earth moving equipment in lieu of track mounted earth moving equipment.
- Construction material deliveries shall take place within designated construction staging areas as far from residential sites as practical to minimize noise impacts.
- Provide signage at active construction sites and staging areas reminding workers, equipment operators and delivery vehicles to minimize noise levels to the extent possible.
- Rumble strips or signage shall be provided at roadway access points into contractor laydown and staging areas to slow construction vehicles and limit vehicle noise.
- Coordinate with Inglewood Unified School District administrators to avoid disruptive noise during school hours including scheduling heavy equipment such as cranes, haul trucks, concrete trucks, concrete pumps, pneumatic equipment, earth moving vehicles or similar to operate outside of school hours. The City shall require that the Project’s construction noise during school hours would be limited to 5 dBA Leq 1-hour above the measured ambient noise levels at Kelso School property line as identified in the RDEIR. Activities that would exceed this threshold shall be scheduled to occur outside of normal school hours or mitigated with specific mitigation measures such as temporary sound walls, sound blankets, or other sound-attenuating devices. The City shall monitor the Project’s construction noise levels during school hours to assure compliance. As requested by the District, monthly noise monitoring reports on noise levels during school hours at Kelso School will be provided to the District.

In order to ensure that construction noise levels will be below the established standards, the following shall be incorporated into the Plan:

- A monitoring plan shall be implemented during demolition and construction activities. Warning thresholds shall be defined that are 5 dBA below the specified noise limits to allow sufficient time for the Contractor to take actions to reduce noise. A monitoring record that documents all alarms and actions taken to comply with these measures shall be provided to the City upon request.
- In the event the warning level (dBA) is exceeded, construction activities shall be temporarily halted in the vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the established standards. Noise measurements shall be gathered after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels:
  - Halting/staggering concurrent construction activities in certain locations;
  - Reducing the speed or intensity of the of heavy-duty construction equipment being operated simultaneously.
  - Operate equipment at the lowest possible power levels.
  - Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.

In order to ensure that acceptable noise levels are maintained at Kelso School, real-time noise monitoring will be conducted at Kelso School during the school day. A noise monitor will be located at the southeast corner of Kelso School on Prairie Avenue. This noise monitor will update the 1-hour Leq noise level every minute during the school day. Any time the 1-hour Leq noise level increases by 3 dBA over the ambient noise level during the school day, an alert message will be sent to the construction manager(s) and contact(s) for the contractor(s) working in the vicinity of the school to allow for adjustments to be made to the work-in-progress to avoid noise levels reaching or exceeding an increase of 5 dBA 1-hour Leq over ambient noise levels. A contact will also be provided to the Inglewood Unified School District and administration at Kelso School to resolve any District or Kelso School concerns with construction activities and their resulting noise levels during the school day.

**APPENDIX A**

**Mitigation Monitoring and Reporting Program**

## 4.0 MITIGATION MONITORING AND REPORTING PROGRAM

---

### 4.1 INTRODUCTION

Public Resources Code section 21081.6 and section 15097 of the California Environmental Quality Act (CEQA) Guidelines require public agencies to establish monitoring or reporting programs for projects approved by a public agency whenever approval involves the adoption of either a mitigated negative declaration or specified environmental findings related to environmental impact reports.

This is the Mitigation Monitoring and Reporting Program (MMRP) for the Inglewood Transit Connector (ITC, or Project). The intent of the MMRP is to ensure the successful implementation of the mitigation measures identified in the Final Environmental Impact Report (Final EIR) for the Project.

### 4.2 MITIGATION MEASURES

The mitigation measures from the Final EIR are assigned the same title as in the Final EIR. The MMRP describes the actions to be taken to implement each mitigation measure, the timing of these actions, the entities responsible for implementing and monitoring the actions, and, where appropriate, the entities responsible for ensuring that reporting responsibilities are carried out. The mitigation measures identify the Project as the “Proposed Project”; this same terminology is used here in order to ensure that the measures in this MMRP are consistent with those identified in the Final EIR.

In some instances, mitigation measures require a monitor or community liaison to be retained or designated. In those instances, the person or entity designated to perform this task shall be identified to the City, and the City will review that person or entity’s qualifications to confirm that the designated party has the requisite expertise or qualifications.

The MMRP also includes a table identifying “Project Design Features” (PDFs). This information is included for convenience and comprehensiveness. These PDFs are not “mitigation measures” as defined by CEQA. PDFs consist of elements or features that have been incorporated into the Project that may reduce the environmental effects of the Project. These PDFs are included in a separate table in order to ensure that these features are implemented.

### 4.3 MMRP COMPONENTS

The components of the attached tables, which contain applicable mitigation measures and project design features, are addressed briefly, below:

- **Impact:** This column summarizes the impact stated in the Draft EIR, as revised in the Final EIR.

- **Mitigation Measure:** All mitigation measures identified in the Draft EIR, as revised in the Final EIR, are presented and titled accordingly.
- **Implementing Party:** The column entitled “Implementing Party” identifies the entity that will undertake the required action. The Implementing Party is most often the Contractor/Operator, who will be responsible for the design, construction or operation of each site, phase, or component of the Project. The Contractor/Operator responsible for undertaking a required action may include the owner or operator of the Project component, as appropriate. In some instances, the required action will or should be undertaken by another party. This column therefore provides clarity regarding the entity that is primarily responsible for carrying out the action.
- **Monitoring Party:** This column identifies the specific party responsible for monitoring. The City of Inglewood (the City) is primarily responsible for monitoring that mitigation measures are successfully implemented. Within the City, the Public Works Department would have responsibility for monitoring some aspect of the overall project. The City of Inglewood proposed the formation of a joint powers authority (JPA) with the Los Angeles County Metropolitan Transportation Authority (Metro) to implement and operate the ITC Project. In March 2021, Metro’s Board approved and voted to form the JPA. Upon formation, the JPA would assume responsibility for oversight of the Project. Therefore, although the JPA does not yet exist, it has been added as a Monitoring Party where the JPA would have that role once the JPA is constituted. Other entities, such as the DBFOM Contractor, or other agencies, such as the Los Angeles Regional Water Quality Control Board, may also be responsible for monitoring the implementation of mitigation measures.

The department within the City who is identified as a monitoring party includes the: (1) the Public Works Department, which helps to plan, design, inspect, and administer contracts for capital infrastructure construction and facility improvements projects (Engineering Division); manage the City’s municipal solid waste services (Environmental Services Division); and assures that City transportation improvements and systems are functional and safe (Transportation & Traffic Division).

- **Timing:** Implementation of the action must occur prior to or during some part of project approval, project design or construction, or during ongoing project operations. The timing for each measure is identified in this column.
- **Notes:** Certain measures identify reporting responsibility. In those instances, the MMRP identifies the party that must prepare a report so that the monitoring party can confirm that the required action(s) have been implemented. This column also notes where the mitigation measure will be enforced in part by another agency or provides additional information that provide clarity concerning how the measure will be carried out.
- **Acronyms:** The MMRP uses various acronyms to refer to various City Departments or other agencies or entities. In some instances, the full name of the department or agency is used. The following agency or department acronyms are used throughout the MMRP:

<b>Name of Department or Agency</b>	<b>Acronym</b>
<b><i>City of Inglewood, Public Works Department</i></b>	
Engineering Division	DPW-Engineering Division
Environmental Services Division	DPW-Environmental Services Division
Transportation & Traffic Division	DPW-Transportation & Traffic Division
<b><i>South Coast Air Quality Management District</i></b>	<b><i>SCAQMD</i></b>
<b><i>State of California, Department of Transportation</i></b>	<b><i>Caltrans</i></b>
<b>Other acronyms:</b>	
ATS	Automated Transit System
CCP	Construction Commitment Plan
JPA	Joint Powers Authority
PDF	Project Design Feature

Impact	Mitigation Measures	Implementing Party	Monitoring Party	Timing	Notes
<b>4.2 Air Quality</b>					
<b>Impact AQ-1:</b> Conflict with or obstruct implementation of the applicable air quality plan.	<b>MM AQ-1: PDF AQ-1</b> shall be implemented during construction, as described in Project Design Features table below.	Contractor/ Operator	JPA/DPW	See <b>PDF AQ-1</b> in Project Design Features table below.	See <b>PDF AQ-1</b> in Project Design Features table below.
<hr/>					
<b>Impact AQ-2:</b> Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard.					
<hr/>					
<b>Impact AQ-3:</b> Expose sensitive receptors to substantial pollutant concentrations.					
<hr/>					
<b>4.3 Biology Resources</b>					
<b>Impact BIO-1:</b> Interfere substantially with the movement of any resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.	<p><b>BIO-1 Conservation of Faunal Resources: Nesting Birds/Raptors:</b> The City shall require demolition and construction contractors to implement the following measures:</p> <ul style="list-style-type: none"> <li>• Prior to initiating any demolition and/or construction activities, a nesting bird survey shall be conducted to determine the presence of any nesting birds within 500 feet of demolition and/or construction activities. In addition, nesting bird surveys shall be conducted at least every six (6) months until the completion of construction activities, as specified below.</li> </ul> <p>Nesting bird survey shall include:</p>	Contractor/ Operator	JPA/DPW	Prior to tree removal activities that would occur between January 1 through September 1 for raptors and March 1 to September 15 for nesting birds, preconstruction surveys would be conducted by a qualified biologist no earlier than 30 days prior to the commencement of	Measure applies for tree removal activities occurring between January 1 through September 1 for raptors and March 1 to September 15 for nesting birds. Biologist retained by Contractor/Operator subject to review and approval by City to confirm that biologist is qualified to perform survey.

Impact	Mitigation Measures	Implementing Party	Monitoring Party	Timing	Notes
	<ul style="list-style-type: none"> <li data-bbox="617 266 1066 716">– Prior to any demolition and/or construction, and a least every six (6) months during and prior to the raptor nesting season until the completion of construction activities, January 1 to September 1, a qualified biologist shall conduct a site survey for active nests no more than 30 days prior to any scheduled clearing, demolition, grading, or construction activities. The survey shall be conducted within all trees, manmade structures, and any other potential raptor nesting habitat.</li> <li data-bbox="617 732 1066 1403">– Prior to any vegetation disturbance between March 1 and September 15, and a least every six (6) months until the completion of construction activities, a qualified biologist shall conduct a survey for nesting birds in all breeding/nesting habitat within the construction or demolitions areas and within 300 feet of all disturbance areas. The surveys shall be conducted within trees and structures, wherever nesting bird species may be located. Nesting bird surveys shall be conducted no earlier than 30 days prior to the initiation of ground or vegetation disturbance. If no breeding/nesting birds are observed, site preparation, demolition and construction activities may begin. If breeding activities and/or an active bird nest</li> </ul>			<p data-bbox="1415 266 1640 716">construction activities. If active nests are found during preconstruction surveys, the qualified biologist shall utilize the appropriate buffer (300 feet for nesting birds and 500 feet for raptors) to avoid the nest and the City shall be notified.</p> <p data-bbox="1415 724 1640 911">The requirement to establish a buffer applies if active nests or raptors are found during construction.</p>	<p data-bbox="1667 266 1904 586">Biologist to prepare report of pre-construction survey, and to submit report to ECDD-Planning Division. Biologist shall notify ECDD-Planning Division if active nests are found.</p>

Impact	Mitigation Measures	Implementing Party	Monitoring Party	Timing	Notes
	<p>is located, the breeding habitat/nest site shall be fenced by the biological monitor a minimum of 300 feet (500 feet for raptors) in all directions, and this area shall not be disturbed until the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, and/or the young shall no longer be impacted. If the qualified biologist determines that a narrower buffer between the demolition and/or construction activities and the observed active nests is warranted, the biologist may submit a written explanation as to why (e.g., species-specific information; ambient conditions and bird’s habituation to them; terrain, vegetation, and birds’ lines of sight between the demolition and/or construction activities and the nest and foraging areas) to the City and, upon request, the CDFW. Based on the submitted information, the City, acting as the lead agency (and CDFW, if CDFW requests) shall determine whether to allow a narrower buffer.</p> <ul style="list-style-type: none"> <li data-bbox="617 1214 1066 1404">– During the year prior to demolition and/or construction, a survey shall be conducted by a qualified biologist for bat habitat areas within the construction footprint of the proposed Project between March 1</li> </ul>				

Impact	Mitigation Measures	Implementing Party	Monitoring Party	Timing	Notes
	<p>and September 30 and at least every six (6) months until the completion of construction activities. The areas shall be characterized as to their potential for supporting a bat maternal colony or nursery site. The survey shall include all trees and any manmade structures, or other bat habitat areas that could be affected. If bat maternal colony or nursery sites are identified, then these areas shall be avoided by demolition and/or construction during the bat breeding season, from March 1 through September 30. Each tree or structure supporting an active maternity roost shall be inspected a week prior to disturbance to determine the presence or absence of roosting bats.</p> <ul style="list-style-type: none"> <li>The biologist shall submit weekly reports to the City's Parks, Recreation and Library Services Director, or designated representative, regarding the results of the nesting bird surveys.</li> </ul>				

**4.4 Cultural Resources**

formal cemeteries.		TCR-5.	MM TCR-5.		

**4.6 Geology**

**Impact GEO-1:** Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault. Refer to Division of Mines and Geology Special Publication 42.

**MM GEO-1:** The proposed Project shall be designed to accommodate fault rupture where present in accordance with applicable Caltrans guidelines, including Memo to Designers 20-8 (Analysis of Ordinary Bridges that Cross Faults), dated January 2013; and Memo to Designers 20-10 (Fault Rupture), dated January 2013, where any portion of a structure falls within an APEFZ, or where any portion of a structure falls within approximately 100 meters (330 feet) of well-mapped active faults, or within 300 meters (1,000 feet) of an un-zoned fault (not in an APEFZ) that is Holocene or younger in age.

Stations and elevated structures for the ATS Guideway shall be located to avoid or accommodate the fault rupture hazard where present with refinement of station and ATS Guideway placement worked into final design as needed based on project specific geologic surveys, recommendations and criteria. As noted in Caltrans Memorandum to Designers (MTD) 20-8, bridge type structures, such as the ATS Guideway, must be designed for the displacement demand resulting from a static fault offset, the dynamic response due to ground shaking, and any other fault-induced hazards (e.g., creep) that may occur at the site. Caltrans MTD 20-8 provides a method for obtaining the displacements at columns and abutments at fault crossings; all the

Contractor/  
Operator

JPA/DPW

ATS system facilities designed in accordance with applicable Caltrans guidelines shall be shown on building plans for the ATS, prior to the issuance of building permits for the ATS.

Impact	Mitigation Measures	Implementing Party	Monitoring Party	Timing	Notes
	<p>requirements must also be followed. Adequate bearing seats must be provided so the superstructure can slide at the abutment, bent, or hinge seats without falling.</p>				
	<p><b>MM GEO-2:</b> During site investigation prior to the start of construction, the location of the anticipated trend of the Townsite Fault shall be further defined via a phased investigation process to identify and locate active fault traces in the Project area to support adjustments to the proposed Project’s design.</p> <p>The investigation shall include a supplemental fault investigation conducted along the trace of the Townsite fault to further refine the location of the feature and assess the activity level where it crosses the proposed ATS alignment and any stations.</p> <p>The investigation shall include the following surface and subsurface methods:</p> <ul style="list-style-type: none"> <li>• Aerial photograph analysis;</li> <li>• Geophysical surveys (e.g., seismic reflection and/or seismic refraction) to refine the identified geophysical anomaly associated with the Townsite fault and inform subsequent targeted fault hazard exploration as necessary;</li> <li>• Targeted fault trenching based on the findings of additional geophysical studies to locate the potential Townsite fault where it crosses the proposed ITC alignment; and</li> <li>• Exploratory drilling and sampling (e.g.,</li> </ul>	Contractor/ Operator	JPA/DPW	<p>A supplemental fault investigation will be prepared prior to the issuance of any permit by the City for ground-disturbing activity for each site or phase of the Project, as applicable.</p> <p>ATS system facilities designed in accordance with applicable Caltrans guidelines shall be shown on building plans for the ATS, prior to the issuance of building permits for the ATS.</p>	Necessary column placements and ATS facility design would be adjusted on an as-needed basis based on supplemental fault investigation results.

Impact	Mitigation Measures	Implementing Party	Monitoring Party	Timing	Notes
	<p>hollow stem auger and CPT borings), as necessary, if definitive information regarding the trace of the Townsite fault cannot be adequately delineated across the proposed ITC alignment within the limits of fault trenching.</p> <p>Based on the results of these investigations, column placements and facility designs would be adjusted to accommodate geologic conditions identified. Further, the facilities shall be designed in accordance with applicable Caltrans guidelines including Memo to Designers 20-8 (Analysis of Ordinary Bridges that Cross Faults) and 20-10 (Fault Rupture). Stations/structures shall be located to avoid the fault rupture hazard where present.</p> <p>Columns and foundations for the guideway and stations, as well as any other ATS facilities shall be located to avoid the fault rupture hazard where present. The design fault offset where evaluating features crossing the ATS guideway alignment shall be determined as the larger of the:</p> <ul style="list-style-type: none"> <li>• Deterministically derived average displacement.</li> <li>• Probabilistically derived displacement consistent with a 5 percent in 50-years probability of exceedance.</li> </ul> <p>Probabilistic procedures shall follow those outlined in Abrahamson [2008] and Petersen et al., [2011] of the <i>Fault Rupture Hazard Evaluation (Appendix K.1)</i>. These procedures allow for evaluation of offset based on the</p>				

Impact	Mitigation Measures	Implementing Party	Monitoring Party	Timing	Notes
	<p>results of field investigation. If further study of the fault rupture is conducted, then procedures as outlined in CGS Note 49<sup>1</sup> shall be followed.</p>				
	<p><b>MM GEO-3:</b> The proposed ATS system facilities shall be designed in accordance with applicable Caltrans guidelines including Memo to Designers 20-8 (Analysis of Ordinary Bridges that Cross Faults) and 20-10 (Fault Rupture). The response spectra provided in <i>the Development of Seismic Design Criteria in Support of Draft EIR - Seismic Design Criteria (Appendix K.2)</i> shall be considered applicable for both aerial guideway and ancillary structures within each segment of the alignment under the guideway and each station.</p> <p>Probabilistic procedures also shall follow those outlined Caltrans memo to Designers 20-10 -Fault Rupture, dated January 2013.</p>	Contractor/ Operator	JPA/DPW	ATS system facilities designed in accordance with applicable Caltrans guidelines shall be shown on building plans for the ATS, prior to the issuance of building permits for the ATS	
<p><b>Impact GEO-3:</b> Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?</p>	<p><b>MM GEO-4:</b> A qualified paleontologist meeting the Society of Vertebrate Paleontology (SVP) Standards (SVP, 2010) shall be retained by the Contractor/Operator and approved by the City prior to the approval of grading permits. <b>4.2 Air Quality</b>				
<p><b>PDF AQ-1 Construction Air Quality Program (CCP)</b></p> <p>At a minimum, use equipment that meets the U.S. Environmental Protection Agency (USEPA)’s Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity, unless it can be demonstrated to the City Planning Division with substantial evidence that such equipment is not available. To ensure that Final Tier 4 construction equipment or better shall be used during the proposed Project’s construction, the City shall include this requirement in applicable bid documents, purchase orders, and contracts. The City shall also require periodic reporting and provision of written construction documents by construction contractor(s) and conduct regular inspections to the maximum extent feasible to ensure and enforce compliance.</p>	Contractor/ Operator	JPA/DPW	Construction equipment requirements for equipment operating at the Project Site, as well as the construction protocols shall be included in applicable bid documents prior to seeking bids for construction. A comprehensive inventory of all off-road construction equipment for activities being permitted shall be made available to SCAQMD prior to issuance of any permits for construction activities by the City of	

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>Such equipment will be outfitted with Best Available Control Technology devices including a California Air Resources Board (CARB)-certified Level 3 Diesel Particulate Filters (DPF). Level 3 DPF are capable of achieving at least 85 percent reduction in particulate matter emissions. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by Final Tier 4 emissions standards for a similarly sized engine, as defined by the CARB’s regulations. Successful contractors must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. The proposed Project representative will make available to the lead agency and Southern California Air Quality Management District (SCAQMD) a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, which will be used during construction. The inventory will include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each unit’s certified tier specification, best available control technology (BACT) documentation, and CARB or SCAQMD operating permit shall be maintained on site at the time of mobilization for each applicable piece of construction equipment.</p> <p>If any of the following circumstances listed below exist and the Contractor provides written documentation consistent with project contract requirements, the Contractor shall submit an Alternative Compliance Plan that identifies operational changes or other strategies that can reduce a comparable level of NOx emissions as Tier 4-certified engines during construction activities.</p> <ul style="list-style-type: none"> <li>The Contractor does not have the required type of off-road construction equipment within its current available inventory as to a particular vehicle or equipment by leasing or short-term rent, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle, but the equipment or vehicle is not</li> </ul>			<p>Inglewood for each site or phase, as applicable.</p> <p>Construction equipment features for equipment operating at the Project Site, as well as the construction protocols shall be implemented during any ground disturbing activities and construction activities on an on-going basis. Periodic reporting and provision of written construction documents by the Contractor and compliance inspections by the City would be required on an ongoing basis during construction.</p>	

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.</p> <ul style="list-style-type: none"> <li>• The Contractor has been awarded funding by SCAQMD or another agency that would provide some or all of the cost to retrofit, repower, or purchase a piece of equipment or vehicle, but the funding has not yet been provided due to circumstances beyond the Contractor’s control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.</li> <li>• Contractor has ordered equipment or vehicle to be used on the construction project in compliance at least 60 days before that equipment or vehicle is needed at the Project alignment, but that equipment or vehicle has not yet arrived due to circumstances beyond the Contractor’s control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.</li> <li>• Construction-related diesel equipment or vehicle will be used on the Project for fewer than 20 calendar days per calendar year. The Contractor shall not consecutively use different equipment or vehicles that perform the same or a substantially similar function in an attempt to use this exception to circumvent the intent of this measure.</li> </ul>				

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<ul style="list-style-type: none"> <li>Documentation of good faith efforts and due diligence regarding the previous exceptions shall include written record(s) of inquiries (i.e., phone logs) to at least three leasing/rental companies that provide construction on-road trucks and off-road equipment, documenting the availability/unavailability of the required types of truck/equipment. The City will, from time-to-time, conduct independent audit of the availability of such vehicles and equipment for lease/rent within a 120-mile radius of the Project area, which may be used in reviewing the acceptability of the Contractor’s good faith efforts and due diligence.</li> <li>Equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts shall be electric or alternative-fueled (i.e., nondiesel). Pole power shall be utilized to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel-powered generators, must be operated continuously, such equipment must be Final Tier 4 construction equipment or better and located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.</li> <li>At a minimum, require that construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export with a gross vehicle weight rating of at least 14,001 pounds), or best commercially available equipment, that meet CARB’s 2010 engine emissions standards at 0.01 g/hp-hour of particulate matter and 0.20 g/hp-hour of NOx emissions or newer, cleaner trucks, unless the Contractor provides written documentation consistent with project contract requirements the circumstances exist as described above and the Contractor submits the Plan. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these</li> </ul>				

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>emission standards. The City shall include this requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards and make the records available for inspection.</p> <ul style="list-style-type: none"> <li>• Require the use of electric or alternatively fueled (e.g., natural gas) sweepers with high-efficiency particulate air (HEPA) filters.</li> <li>• A publicly visible sign shall be posted with the Community Affairs Liaison’s contact information to contact regarding dust complaints. The Air District’s phone number shall also be visible to ensure compliance with applicable regulations.</li> <li>• Dust shall be controlled per local ordinances. The Contractor shall be responsible for excessive dust or construction debris that results in impacts to adjacent residences or private vehicles, including taking responsibility for clean-up and addressing complaints brought to the project.</li> <li>• All trucks carrying fill materials, debris, or similar materials shall secure and cover loads to prevent dust or debris while travelling on public right of ways.</li> <li>• All trucks removing materials from the site will be loaded within the site perimeter and will be required to cover loads as deemed necessary for dust control .</li> <li>• Material stockpiles and construction area surfaces shall be covered and/or watered as needed to prevent dust at designated construction areas.</li> <li>• All roadways, driveways, sidewalks, etc., being installed as part of the Project should be completed as soon as practicable; in addition, building pads should be laid as soon as practicable after grading.</li> <li>• To the extent feasible, allow construction employees to</li> </ul>				

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>commute during off-peak hours.</p> <ul style="list-style-type: none"> <li>• Make access available for on-site lunch trucks during construction, as feasible, to minimize off-site construction employee vehicle trips.</li> <li>• Every effort shall be made to utilize grid-based electric power at any construction site, where feasible.</li> <li>• Contractors shall maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer’s specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer’s specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.</li> <li>• Require in all applicable bid documents, purchase orders, and contracts of the requirement to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB’s policy. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify construction vendors, contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the Project area. To further ensure that drivers understand the vehicle idling requirement, post signs at the proposed Project entry gates and throughout the Project alignment, where appropriate, stating that idling longer than five minutes is not permitted.</li> </ul>				
<b>4.4 Cultural Resources</b>				
<b>PDF CUL-1 Historic Resources (Design Guidelines)</b>	Contractor/	JPA/ DPW- Engineering	Guideway and support column design, elevation, and distance	

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>The final Project design must consider design variables (elevation of guideway, width of guideway, distance of the guideway from the resources, and the dimensions, placement, and spacing of support columns) and resource variables (building’s height, scale, number of street-facing facades, width of primary façade, front setback, project elements overhanging the sidewalk, and viewpoints from which the resource can best be discerned in its entirety). The final Project design shall ensure minimal impacts to the setting of historical resources, and little or no visual obstruction of the resource’s street-facing façades from the optimal viewpoints. In order to meet these performance-based standards, the following Project Design Features shall be incorporated into the final Project design:</p> <ul style="list-style-type: none"> <li>• The guideway’s elevation and distance from the façade of the historical resource will be sufficient for the guideway to visually clear the top of the historical resources’ street-facing façade(s) when viewed from the optimal viewpoints. The final Project design is expected to achieve no visual obstruction of any of the identified historical resources from the guideway.</li> <li>• At the former Fox Theatre, and for 100 feet on either side of the resource, the guideway elevation (measured from the ground plane to the underside of the guideway structure) will be a minimum of 52 feet from grade in order to achieve unobstructed views of this resource, including its monumental sign pylon.</li> <li>• The dimensions, placement, and spacing of the guideway support columns will be such that the obstruction of views of the historical resources’ street-facing façade(s) when viewed from the optimal viewpoints will be minimized. For five of the identified historical resources—Holy Faith Episcopal Church, former United Bank of California (now Broadway Federal Bank), former Fox Theatre, Professional Building, and Inglewood Park Cemetery—the final Project design is</li> </ul>	Operator	Division	from known resources shall be shown on building plans for the ATS, prior to the issuance of building permits for the ATS.	

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>expected to completely avoid visual obstructions from support columns.</p> <ul style="list-style-type: none"> <li>For five of the historical resources—the former Bank of Inglewood, former J.C. Penney, Bank of America, the Forum, and Lighthouse McCormick Mortuary Mortuary—views that are completely unobstructed by support columns are not necessary for the resource to convey its significance. A small portion of the resources’ primary façades will be intermittently obscured depending on the position of the viewer. However, due to the scale and/or setback of these resources, their primary façades will remain readily discernable.</li> </ul>				

**4.5 Energy**

<p><b>PDF ENERGY-1 (Design Guidelines)</b></p> <ul style="list-style-type: none"> <li><u>Energy Efficiency</u> - Where California Energy Efficiency Standards apply, the project should be more energy efficient than allowed. For energy-using equipment not governed by California Energy Efficiency Standards, best available energy efficient technologies should be used. Advanced commissioning of building systems should be conducted to ensure systems are operating as designed.</li> <li>To achieve energy use reduction, passive strategies taking advantage of the favorable local climate should be considered where feasible. The use of solar canopies as shade structures in addition to roof-mounted solar is another energy saving strategy.</li> <li><u>Water Efficiency</u> - In order to reduce excessive water consumption, the project should identify and implement appropriate opportunities to reduce or eliminate potable water use indoors and in landscape areas.</li> <li><u>Material Conservation And Resource Efficiency</u> - In order to reduce the environmental impact from the use of</li> </ul>	<p>Contractor/ Operator</p>	<p>JPA/ DPW- Engineering Division</p>	<p>Energy efficient design features shall be shown on building plans for the ATS, prior to the issuance of building permits for the ATS.</p>	
--	---------------------------------	---	--	--

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>construction materials, the project should minimize the use of virgin materials. This can be accomplished by increasing the use of materials that are reused, recycled, rapidly renewable, locally sourced, and durable. In order to determine the best approach to reducing the overall environmental impact from use of materials, a life cycle assessment (LCA) could be used.</p> <ul style="list-style-type: none"> <li>• <u>Environmental Quality</u> - In order to protect and enhance the health and comfort of occupants, the project should provide a high quality, sustainable indoor environment that is designed to maximize natural daylighting and views of the outdoors where feasible. Indoor spaces should use high efficiency air filtration and should create a comfortable indoor acoustical environment. Materials and systems should be selected that will provide for a healthy indoor environment.</li> </ul>				

**4.8 Hazards and Hazardous Materials**

<p><b>PDF HAZ-1 Hazardous Materials Program (CCP)</b></p> <p>The following practices will be followed during construction to address the potential for encountering hazardous materials during construction of the Project.</p> <ul style="list-style-type: none"> <li>• <u>Building Demolition Plan</u> – Prior to any demolition occurring, conduct an evaluation of all buildings built prior to 1980 to be demolished to identify the presence of asbestos containing materials (ACMs) and lead-based paint (LBP). Remediation shall be implemented in accordance with the recommendations of these evaluations to ensure that no ACMs or LBP remain present and to ensure ACMs and LBP are removed to levels established for public safety.</li> <li>• <u>Hazardous Materials Contingency Plan</u> – Prior to construction, prepare a plan addressing the potential for discovery of unidentified underground storage tanks (USTs),</li> </ul>	<p>Contractor/ Operator</p>	<p>JPA/DPW</p>	<p>A Building Demolition Plan, Hazardous Materials Contingency Plan, Soil Management Plan, and Health and Safety Plan shall be prepared and submitted prior to issuance of any permits by the City of Inglewood for ground disturbing activities for each site or phase of the Project, as applicable.</p> <p>Implementation of the plans shall be on-going for the duration of construction.</p> <p>If unidentified or suspected</p>	<p>ECDD-Building Safety to confirm that Contractor/Operator has submitted SMP, and that appropriate regulatory agency has approved it</p>
---	---------------------------------	----------------	---	---

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>hazardous materials, petroleum hydrocarbons, or hazardous or solid wastes encountered during construction. This Plan shall address UST decommissioning, field screening and materials testing methods, contaminant management requirements, and health and safety requirements to ensure no exposure to hazards or hazardous materials occurs on site and to ensure any materials encountered during construction are removed to levels established for public safety.</p> <ul style="list-style-type: none"> <li>• <u>Soil Management Plan</u> – After final construction plans are prepared showing the lateral and vertical extent of soil excavation during construction are prepared, prepare a Soil Management Plan to establish soil reuse criteria, define a sampling plan for stockpiled materials, describe the disposition of materials that do not satisfy the reuse criteria, and specify guidelines for imported materials.</li> <li>• <u>Health and Safety Plan</u> – Prior to construction, prepare a Health and Safety Plan to address the potential for exposure to the constituents of concern identified in the limited Phase II ESA.</li> <li>• <u>Utility Relocation Work</u> – All Project utility relocations in the vicinity of Kelso Elementary School shall be designed and constructed to remain within the public right-of-way and not impact school property. Relocations shall be located further away from the school as feasible and designed and constructed to current standards to assure that they create no unacceptable hazards to the school. During Project construction, any open trenches and construction equipment shall be marked and barricaded such that they are not accessible by the students or create any potential hazard to school operations. Project utility relocations or cut overs that may require disruption to normal school utility services shall be scheduled to occur outside of normal school hours with advanced notification to the School District.</li> </ul>			<p>contaminated soils or groundwater is encountered, any further ground disturbing activities shall be conducted according to a site- specific health and safety plan and the City shall be notified of this contamination.</p> <p>If contaminated soils or groundwater is encountered, ground disturbing activities shall not recommence until remediation is completed and a “no further action” letter is obtained or direction is otherwise given from the appropriate regulatory agency that construction can recommence.</p>	

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<b>4.10 Noise</b>				
<p><b>PDF-NOISE-1 Construction Noise Control Plan (CCP)</b></p> <p>A Construction Noise Control Plan shall be developed in coordination with an acoustical/vibration consultant approved by the City and approved by the City’s Director of Public Works prior to construction. The Plan shall include measures demonstrating that construction noise levels will be below Federal Transit Administration (FTA)’s General Assessment Construction Noise Criteria. The following construction noise reduction measures shall be incorporated into the plan:</p> <ul style="list-style-type: none"> <li>– Install temporary noise barriers that reduce sound at receptors;</li> <li>– For any idling that is expected to take longer than five minutes, the engine shall be shut off;</li> <li>– All equipment shall be equipped with optimal muffler systems;</li> <li>– Use solar, battery powered, or hybrid equipment whenever practical;</li> <li>– Locate staging areas as far away from sensitive receptors as feasible;</li> <li>– Locate stationary noise sources as far away from sensitive receptors as feasible;</li> <li>– Enclose stationary noise sources, such as diesel-or gasoline-powered generators, with acoustical barriers where necessary and required;</li> <li>– If stationary equipment cannot be enclosed within a shed or barrier, such equipment must be muffled and located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.</li> </ul>	<p>Contractor/ Operator, Community Affairs Liaison</p>	<p>JPA/DPW- Engineering Division</p>	<p>A Construction Noise Control Plan shall be prepared or updated and approved prior to the issuance of any permits for construction activities by the City for each site or phase of the Project, as applicable. The approved Construction Noise Control Plan shall be implemented for the duration of Project construction.</p>	<p>Acoustical consultant retained by Contractor/Operator subject to review and approval by DPW-Engineering Division to confirm that designee has requisite expertise. The City will designate a Community Affairs Liaison to be responsible for responding within 24 hours to any local complaint or question about construction activities. A website will be established with project construction information and contact information for the Community Affairs Liaison. A toll-free phone line (available 24 hours a day) and website will be made a part of all construction notices and shall be</p>

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<ul style="list-style-type: none"> <li>– Pole power shall be utilized to the maximum extent feasible in lieu of generators.</li> <li>– Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible. Additionally, use of “quiet” pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions shall be considered.</li> <li>– Staging of construction material deliveries behind fencing to minimize noise emitting from idling vehicles.</li> <li>– On site-signage reminding workers to minimize noise generation.</li> <li>– When not in use or being staged, heavy equipment shall be located as far as practicable from sensitive receptors.</li> <li>– For project foundations, consider the use of drilled piles or sonic pile drivers or vibratory pile drivers instead of traditional impact pile drivers, as permitted by geological conditions.</li> <li>– Sequence noisy activities to occur during the same general time period during daytime hours to the extent practical.</li> <li>– Select quieter demolition methods where appropriate and feasible such that demolition activities can remain within the project specified noise levels.</li> </ul>				<p>posted in prominent public facing locations around the Project area and in adjacent public spaces.</p>

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<ul style="list-style-type: none"> <li>– Unless deemed infeasible for a particular construction activity, the Contractor shall utilize rubber tire earth moving equipment in lieu of track mounted earth moving equipment.</li> <li>– Construction material deliveries shall take place within designated construction staging areas as far from residential sites as practical to minimize noise impacts.</li> <li>– Provide signage at active construction sites and staging areas reminding workers, equipment operators and delivery vehicles to minimize noise levels to the extent possible.</li> <li>– Rumble strips or signage shall be provided at roadway access points into contractor laydown and staging areas to slow construction vehicles and limit vehicle noise.</li> <li>– Coordinate with Inglewood Unified School District administrators to avoid disruptive noise during school hours, including scheduling heavy equipment such as cranes, haul trucks, concrete trucks, concrete pumps, pneumatic equipment, earth moving vehicles or similar to operate outside of school hours. The City shall require that the Project's construction noise during school hours would be limited to 5 dBA Leq 1-hour above the measured ambient noise levels at Kelso School property line as identified in the RDEIR. Activities that would exceed this threshold shall be scheduled to occur outside of normal school hours or mitigated with specific mitigation measures such as temporary sound walls, sound blankets, or other sound-attenuating devices. The City shall monitor the Project's construction noise levels during school hours to assure compliance. As requested by the District, monthly noise monitoring reports on noise levels during school hours at Kelso School will be provided to the District.</li> </ul>				

In order to ensure that construction noise levels will be below the

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>established standards, the following shall be incorporated into the Plan:</p> <ul style="list-style-type: none"> <li>– A monitoring plan shall be implemented during demolition and construction activities. Warning thresholds shall be defined that are 5 dBA below the specified noise limits to allow sufficient time for the Contractor to take actions to reduce noise. A monitoring record that documents all alarms and actions taken to comply with these measures shall be provided to the City upon request.</li> <li>– In the event the warning level (dBA) is exceeded, construction activities shall be temporarily halted in the vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the established standards. Noise measurements shall be gathered after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels: <ul style="list-style-type: none"> <li>– Halting/staggering concurrent construction activities in certain locations;</li> <li>– Reducing the speed or intensity of the of heavy-duty construction equipment being operated simultaneously.</li> <li>– Operate equipment at the lowest possible power levels.</li> <li>– Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.</li> </ul> </li> </ul> <p>In order to ensure that acceptable noise levels are maintained at Kelso School, real time noise monitoring will be conducted at Kelso School during the school day. A noise monitor will be located at the southeast corner of Kelso</p>				

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>School on Prairie Avenue. This noise monitor will update the 1-hour Leq noise level every minute during the school day. Any time the 1-hour Leq noise level increases by 3 dBA over the ambient noise level during the school day, an alert message will be sent to the construction manager(s) and contact(s) for the contractor(s) working in the vicinity of the school to allow for adjustments to be made to the work in progress to avoid noise levels reaching or exceeding an increase of 5 dBA 1-hour Leq over ambient noise levels. A contact will also be provided to the Inglewood Unified School District and administration at Kelso School to resolve any District or Kelso School concerns with construction activities and their resulting noise levels during the school day.</p>				
<p><b>PDF NOISE-2 Construction Vibration Reduction Plan (CCP)</b></p> <p>Prior to the issuance of any demolition or construction permit for each phase of the Project, a Construction Vibration Reduction Plan shall be prepared to minimize construction vibration at nearby sensitive receptors from vibration created by construction activities. The Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City’s Director of Public Works. The Plan shall include but not be limited to the following elements to ensure impacts from ground borne vibration are less than significant:</p> <ul style="list-style-type: none"> <li>• A Pre-Demolition and Construction Plan that includes but is not limited to: <ul style="list-style-type: none"> <li>– Photos of current conditions of buildings and structures that could be damaged from construction activities. This crack survey shall include photos of existing cracks and other material conditions present on or at the surveyed buildings. Images of interior conditions shall be included if possible. Photos in the report shall be labelled in detail and dated.</li> </ul> </li> </ul>	<p>Contractor/ Operator</p>	<p>JPA/DPW- Engineering Division</p>	<p>A Construction Vibration Reduction Plan shall be prepared or updated and approved prior to the issuance of any permits for construction activities by the City for each site or phase of the Project, as applicable. The approved Construction Vibration Reduction Plan shall be implemented for the duration of Project construction.</p>	<p>The City will designate a Community Affairs Liaison to be responsible for responding within 24 hours to any local complaint or question about construction activities. A website will be established with project construction information and contact information for the Community Affairs Liaison. A toll-free phone line (available 24 hours a day) and website</p>

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<ul style="list-style-type: none"> <li>– Identify representative cracks in the walls of existing buildings, if any, and install crack gauges on such walls of the buildings to measure changes in existing cracks during project activities.</li> <li>– Crack gauges shall be installed on multiple representative cracks, particularly on sides of the building facing the Project.</li> <li>– Determine the number and placement of vibration sensors at the affected buildings in consultation with a qualified architect. The number of units and the locations of these sensors shall take into account proposed demolition and construction activities to ensure that adequate measurements can be taken illustrating vibration levels during the course of the Project, and if/when levels exceed the established threshold.</li> <li>– A line and grade pre-construction survey at the affected buildings shall be conducted.</li> <li>• A Vibration Plan During Demolition and Construction that includes the following:               <ul style="list-style-type: none"> <li>– Regularly inspect and photograph crack gauges, maintaining records of these inspections to be included in postconstruction reporting. Gauges shall be inspected every two weeks, or more frequently during periods of active project actions in close proximity to crack monitors.</li> <li>– The vibration monitoring system shall measure and continuously store the peak particle velocity (PPV) in inches/second. Vibration data shall be stored on a one-second interval. The system shall also be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA's threshold of significance for a building given its</li> </ul> </li> </ul>				<p>will be made a part of all construction notices and shall be posted in prominent public facing locations around the Project area and in adjacent public spaces.</p>

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>conditions, and a warning level that is 0.05 inch/second (PPV) less than the regulatory level. The system shall also provide real-time alert when the vibration levels exceed either of the two preset levels.</p> <ul style="list-style-type: none"> <li>– In the event the warning level (PPV) is triggered, the contractor shall identify the source of vibration impacts and establish steps to reduce the vibration levels, including but not limited to halting or staggering concurrent activities and using lower vibratory techniques.</li> <li>– In the event the regulatory level (PPV) is triggered, halt the construction activities in the vicinity of the trigger area and visually inspect the building for any damage. Results of the inspection must be logged. Identify the source of vibration generation and provide steps to reduce the vibration level. Vibration measurement shall be made with the new construction method to verify that the vibration level is below the warning level (PPV). Construction activities may then restart.</li> <li>– In the event work occurs in the proximity of identified historic uses, the system shall be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA threshold of significance 0.12 inch/second for a building given its conditions, and a warning level that is 0.012 inch/second (PPV) less than the regulatory level.</li> <li>– Collect vibration data from receptors and report vibration levels to the Joint Powers Authority and/or the City on a daily basis. The reports shall include annotations regarding project activities as necessary to explain changes in vibration levels.</li> </ul> <ul style="list-style-type: none"> <li>• Post-Construction Reporting and Repairs: <ul style="list-style-type: none"> <li>– Provide a report to the Joint Powers Authority and/or</li> </ul> </li> </ul>				

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<p>the City regarding crack and vibration monitoring conducted during demolition and construction. In addition to a narrative summary of the monitoring activities and their findings, this report shall include photographs illustrating the post-construction state of cracks and material conditions that were presented in the pre-construction assessment report, along with images of other relevant conditions showing the impact, or lack of impact, of project activities. The photographs shall sufficiently illustrate damage, if any, caused by the Project and/or show how the Project did not cause physical damage to the buildings. The report shall include analysis of vibration data related to project activities, as well as summarize efforts undertaken to avoid vibration impacts. Finally, a postconstruction line and grade survey shall also be included in this report.</p> <ul style="list-style-type: none"> <li>– Perform repairs to buildings if damage is caused by vibration or movement during the demolition and/or construction activities. Repairs may be necessary to address, for example, cracks that expanded as a result of the Project, physical damage visible in post-construction assessment, or holes or connection points that were needed for shoring or stabilization. Repairs shall be directly related to project impacts and will not apply to general rehabilitation or restoration activities of the buildings.</li> <li>• To minimize the risk of potential structural and building damage: <ul style="list-style-type: none"> <li>– Limit the location of pile driving and vibratory roller activity to not be within 55 feet and 30 feet of the nearest off-site sensitive receptor, respectively.</li> <li>– Limit the number of jackhammers operating simultaneously to one (1) piece operating within 45 feet of off-site sensitive receptors.</li> </ul> </li> </ul>				

Project Design Features	Implementing Party	Monitoring Party	Timing	Notes
<ul style="list-style-type: none"> <li>– In the event impact pile driving is required, equipment shall only be used from the hours of 7:00 AM to 7:00 PM. If feasible, pile driving should use alternative technology such as vibration or hydraulic insertion.</li> <li>• To minimize the risk of related to human annoyance:               <ul style="list-style-type: none"> <li>– Limit the location of pile driving to 310 feet of off-site vibration sensitive receptors.</li> <li>– Limit the location of vibratory roller to 150 feet of off-site vibration sensitive receptors.</li> <li>– Limit the location of large bulldozer to 85 feet of off-site vibration sensitive receptors.</li> <li>– Limit the location of caisson drilling to 85 feet of off-site vibration sensitive receptors.</li> <li>– Limit the location of loaded trucks to 75 feet of off-site vibration sensitive receptors.</li> <li>– Limit the location of jackhammers to 45 feet of off-site vibration sensitive receptors.</li> <li>– Limit the location of small bulldozer to 25 feet of off-site vibration sensitive receptors.</li> </ul> </li> </ul>				
<p><b>PDF NOISE-3      Operational (CCP)</b></p> <p>The exterior noise level generated by the ATS train, inclusive of all contributing noise sources, shall not exceed the levels specified in Section 2.2.1, Exterior Airborne Noise, ASCE 21-05 (American Society of Civil Engineers, Automated People Mover Standards - Part 2 Section 2.2.1, Exterior Airborne Noise, ASCE 21-05.).29F</p> <p>The design of any barriers along the guideway designed to reduce noise shall be subject to the limits noted in <b>Table 4.10-9</b>.</p>	Operator	JPA/DPW-Engineering Division

## INGLEWOOD TRANSIT CONNECTOR PROJECT CONSTRUCTION COMMITMENT PROGRAM

---

### 1.0 INTRODUCTION

The Inglewood Transit Connector (ITC) Project includes this Construction Commitment Program to proactively address the potential effects of the construction of the Project on the community. This Program addresses:

- Business and community support plans
- Construction staging and traffic control requirements
- Maintaining access to parking, businesses, residences, and pedestrian facilities
- Noise and vibration measures
- Air quality measures
- Other vital measures during construction
- Tree removal and replacement

A Project Task Force will be established for the ITC Project. The Project Task Force will include representation from the following entities:

- City of Inglewood (City)
- The ITC Joint Powers Authority (JPA) – that will be responsible for the oversight of the DBFOM Contractor during the design, construction and subsequent operations and maintenance of the ITC Project.

The DBFOM Contractor (responsible for the design, build/construct, finance, operations, and maintenance of the ITC Project)

### 2.0 BUSINESS AND COMMUNITY SUPPORT PROGRAM

The Project Task Force will be responsible for developing a Business and Community Support Program for the purpose of assisting those businesses financially affected by the construction that addresses the following:

- Advertising support for local businesses in local or regional newspapers and social media.
- Notice of plans to all affected property owners of the schedule for specific planned construction activities, changes in traffic flow, and required short-term modifications to property access.
- Notice of plans to all affected property owners if utilities would be disrupted for short periods of time and ensuring major utility shut-offs are scheduled during low-use periods of the day.

- Methods by which business owners can convey their concerns about construction activities and the effectiveness of measures during the construction period so activities can be modified to reduce adverse effects.
- Access plans that ensure that all businesses, service providers, and residents are provided with adequate access during construction. Where there is a significant limited English population, signage shall be provided in various languages (as appropriate).
- Funding for temporary signage during construction to help businesses that are partially blocked or that have inconvenient access due to construction activity.

### **3.0 BUSINESS ASSISTANCE FUND PROGRAM**

The City is committed to providing financial assistance to small “mom and pop” businesses to help offset to the extent possible, business revenue losses or increased expenses that are directly attributable to disruptions during the ITC construction activities within the ITC Project area. The City will create a \$5 million dollar Business Assistance Fund (BAF) to provide financial assistance through grants to eligible businesses for eligible expenses as established by the BAF Program Administrator. Similar to the LA Metro BIF model, businesses may file multiple requests for financial assistance through the BIF; but in no event will the amount paid exceed the lesser total amount of \$50,000, or 60% of annual business revenue losses per business. The financial assistance is expected to cover eligible fixed operating expenses such as utilities, insurance, rent or mortgage (excluding the principal amount portion of the mortgage payment), fixed payroll, and certain other documented business-related expenses as determined by the BAF Program Administrator. The City will develop Administrative Guidelines to establish program eligibility requirements targeted to businesses that are directly impacted by the ITC Project construction, are located within the eligible geographic area in proximity to the ITC Project, and that meet the definition of small “mom and pop” businesses. Anticipated requirements to participate in the program, include:

- Businesses must be in continuous operation for at least two years within the eligible geographic area.
- Businesses must provide financial records (e.g., gross receipts, payroll taxes, bank statements or other financial information as requested) to demonstrate the business revenue losses or increased expenses are directly attributable to the ITC construction activities during the period of disruption.
- Businesses must be financially solvent and have a good faith plan and commitment to remain in business within the eligible geographical area; and
- Businesses must be in good standing with all local, state and federal taxing and licensing authorities.

### **4.0 COMMUNITY AFFAIRS LIAISON**

The Community Affairs Liaison shall be responsible for responding within 24 hours to any local complaint or question about construction activities. A website will be established with project construction information and contact information for the Community Affairs Liaison. A toll-free phone line (available 24 hours a day) and website will be made a part of all construction notices and shall be posted in prominent public facing locations around the Project area and in adjacent public spaces.

The Community Affairs Liaison shall receive all public complaints, investigate the cause of the complaint and develop/implement feasible measures to address and resolve the cause of the complaint.

## 5.0 TRANSIT ACCESS AND CIRCULATION PROGRAM

The Project Task Force will be responsible for the following:

- Ensuring that access to bus transit stops and bus circulation are always maintained, unless infeasible and closure is approved by the City.
- Coordinating with Metro and any other transit service providers to:
  - Relocate bus stop(s) if necessary, during construction with appropriate wayfinding signage and information dissemination, with all temporarily relocated bus stops located as close as feasible to the original bus stop location.
  - Reroute transit bus lines if necessary, during construction with appropriate wayfinding signage and information dissemination.

## 6.0 CONSTRUCTION STAGING & TRAFFIC CONTROL PROGRAM

The Construction Staging and Traffic Control Program will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and will address the following topics:

- Coordination with other public infrastructure projects within the City's boundaries
- Detour routes, including analysis of impacts to pedestrian, business, bicycle, transit and traffic flow
- Coordination of closures and restricted access during the construction period with special attention during periods of expected heavy traffic from events scheduled at SoFi Stadium and other venues in the Los Angeles Sports and Entertainment District at Hollywood Park, the Forum, and the Inglewood Basketball and Entertainment Center.
- Coordination with the City, police, and fire services department regarding maintenance of emergency access and response times
- Monitoring and coordination of construction materials deliveries
- Notification to businesses and residents on upcoming construction activities including but not limited to the establishment of a website with project construction information, signage, and web-based media.

The Traffic Control Program will be developed based on the following principles:

- Minimize traffic impacts on residential streets.
- Establish minimum traffic lane requirements for Manchester Boulevard, Florence Avenue, and Prairie Avenue during construction such that at least the full number of traffic lanes in the peak direction, and if feasible, one traffic lane in the off-peak direction is available, with additional capacity provided through appropriate detour routes. The directional traffic lanes may be reversible to maintain the peak directional capacity in either direction as necessitated by traffic demands. For all other streets potentially affected by construction, maintain at least one lane of traffic in each direction unless otherwise approved by the City.

- Maintain access to and from all alleys at one or both ends of the alley when possible. If an alley is obstructed such that a turnaround by any vehicle is not feasible, traffic flaggers shall be provided to control access to/from the alley.
- Maintain access for all public safety vehicles (such as police, fire, and emergency response).
- Maintain bicycle and pedestrian access within the Project area or approved detours at all times.
- Provide adequate street access to City service vehicles, including but not limited to trash pickup and street sweeping service vehicles, during planned service times.
- Sidewalk closures should be avoided to the degree feasible and are permitted only when approved by the City. Accessible detours shall be provided if sidewalk closures are necessary.
- Use traffic control officers/flaggers as appropriate to minimize the degree and duration of impacts and maintain safety.
- Establish and maintain wayfinding signage.
- Maintain vehicular and pedestrian access to all businesses and residents impacted by construction activities including roadway closures.
- Hold quarterly community outreach meetings with businesses and residents to provide updates on temporary, full, or partial street closures necessary for construction. Website will be updated 45 to 60 days prior to planned dates of any street closures.
- All closures, full or partial, are subject to City review and approval which shall consider measures to minimize the degree and duration of street and lane closures.
- Entry and exit to the Market Street/Florence Avenue construction site shall be limited to right turns to/from Florence Avenue for large trucks, construction equipment, and material deliveries. An entrance off Locust Street between Florence Avenue and Regent Street will also be required to serve the contractor's offices and staging area. If required for phasing, the Locust Street entrance may also be used for large trucks, construction equipment, and material deliveries as approved by the City.

### **6.1 Preliminary Haul And Overload Routes**

- Haul routes and overload/oversized vehicle routes are subject to review and approval by the City.
- To the extent possible, truck deliveries and hauling of bulk materials such as aggregate, bulk cement, dirt, etc. to the Project area, and hauling of material from the Project area, shall be scheduled during off-peak hours to avoid the peak commuter traffic periods on designated haul routes.
- Truck deliveries and hauling of dirt, aggregate, bulk cement, and all other materials and equipment, shall be on designated routes only (freeways and nonresidential streets)

### **6.2 Pedestrian Access Program**

A Pedestrian Access Program will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and will adhere to the following principles:

- Pedestrian access to buildings shall be maintained at all times.

- Maintain all crosswalks to the extent feasible. Whenever a crosswalk is removed from service, establish and maintain temporary accessible replacement crosswalks as close as practicable to the original crosswalk locations unless the City determines that a replacement crosswalk is not necessary to maintain an adequate level of service. Replacement crosswalks shall be identified and controlled by wayfinding signs approved by the City.
- Establish and maintain pedestrian wayfinding signage.
- Maintain sidewalk access for pedestrians, including providing temporary sidewalks if existing sidewalks are disrupted during construction. Any sidewalk closures are subject to review and approval by the City.
- Sidewalks that are being maintained in a temporary condition shall meet all applicable safety standards, including but not limited to the requirements of the Federal Americans with Disabilities Act and similar California laws.
- Protect pedestrians from construction-related debris, dust and noise; such protection may include the use of dedicated pedestrian barriers.
- Coordinate with the Inglewood Unified School District (IUSD) and the City to provide crossing guards at locations requested by IUSD or the City when crosswalks or sidewalks are closed. Identify temporary alternative routes to schools, working closely with IUSD and the City and disseminate this information to schools and stakeholders affected by construction.

## **7.0 PARKING MANAGEMENT PLAN**

A Parking Management Plan will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and shall adhere to the following principles:

- Parking, staging, or queuing of Project-related vehicles, including workers' personal or project-assigned vehicles, trucks, and heavy vehicles, shall be prohibited on City streets at all times, outside of a permitted workspace unless otherwise approved by the City. If the use of residential permit parking spots is necessary for construction, provide for equivalent overnight replacement parking for removed residential permit parking spots at the nearest possible location to the location where parking has been removed.
- Replace loss of metered parking spaces by making available an equivalent number of parking spaces in an off-street parking facility located near the lost parking. The parking spaces shall be provided for public use at a rate no greater than the metered parking rate.
- Provide public notice of the availability of the alternative parking spaces through outreach to businesses and residents with signage.

## **8.0 AIR QUALITY PROGRAM**

- At a minimum, use equipment that meets the U.S. Environmental Protection Agency (USEPA)'s Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity, unless it can be demonstrated to the City Planning Division with substantial evidence that such equipment is not available. To ensure that Final Tier 4 construction equipment or better shall be used during the proposed Project's construction, the

City shall include this requirement in applicable bid documents, purchase orders, and contracts. The City shall also require periodic reporting and provision of written construction documents by construction contractor(s) and conduct regular inspections to the maximum extent feasible to ensure and enforce compliance.

- Such equipment will be outfitted with Best Available Control Technology devices including a California Air Resources Board (CARB)-certified Level 3 Diesel Particulate Filters (DPF). Level 3 DPF are capable of achieving at least 85 percent reduction in particulate matter emissions. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by Final Tier 4 emissions standards for a similarly sized engine, as defined by the CARB's regulations. Successful contractors must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. The proposed Project representative will make available to the lead agency and Southern California Air Quality Management District (SCAQMD) a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used during construction. The inventory will include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each unit's certified tier specification, best available control technology (BACT) documentation, and CARB or SCAQMD operating permit shall be maintained on site at the time of mobilization for each applicable piece of construction equipment.
- If any of the following circumstances listed below exist and the Contractor provides written documentation consistent with project contract requirements, the Contractor shall submit an Alternative Compliance Plan that identifies operational changes or other strategies that can reduce a comparable level of NOx emissions as Tier 4-certified engines during construction activities:
  - The Contractor does not have the required type of off-road construction equipment within its current available inventory as to a particular vehicle or equipment by leasing or short-term rent, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
  - The Contractor has been awarded funding by SCAQMD or another agency that would provide some or all of the cost to retrofit, repower, or purchase a piece of equipment or vehicle, but the funding has not yet been provided due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
  - The Contractor has ordered equipment or vehicle to be used on the construction project in compliance at least 60 days before that equipment or vehicle is needed at the Project alignment, but that equipment or vehicle has not yet arrived due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.

- Construction-related diesel equipment or vehicle will be used on the Project for fewer than 20 calendar days per calendar year. The Contractor shall not consecutively use different equipment or vehicles that perform the same or a substantially similar function in an attempt to use this exception to circumvent the intent of this measure.
- Documentation of good faith efforts and due diligence regarding the previous exceptions shall include written record(s) of inquiries (i.e., phone logs) to at least three leasing/rental companies that provide construction on-road trucks and off-road equipment, documenting the availability/unavailability of the required types of truck/equipment. The City will, from time-to-time, conduct independent audit of the availability of such vehicles and equipment for lease/rent within a 120-mile radius of the Project area, which may be used in reviewing the acceptability of the Contractor's good faith efforts and due diligence.
- Equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts shall be electric or alternative-fueled (i.e., nondiesel). Pole power shall be utilized to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel-powered generators, must be operated continuously, such equipment must be Final Tier 4 construction equipment or better and located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- At a minimum, require that construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export with a gross vehicle weight rating of at least 14,001 pounds), or best commercially available equipment, that meet CARB's 2010 engine emissions standards at 0.01 g/hp-hour of particulate matter and 0.20 g/hp-hour of NOx emissions or newer, cleaner trucks, unless the Contractor provides written documentation consistent with project contract requirements the circumstances exist as described above and the Contractor submits the Plan. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards. The City shall include this requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards and make the records available for inspection.
- Require the use of electric or alternatively fueled (e.g., natural gas) sweepers with high-efficiency particulate air (HEPA) filters.
- A publicly visible sign shall be posted with the Community Affairs Liaison's contact information to contact regarding dust complaints. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.
- Dust shall be controlled per local ordinances. The Contractor shall be responsible for excessive dust or construction debris that results in impacts to adjacent residences or private vehicles, including taking responsibility for clean-up and addressing complaints brought to the project.
- All trucks carrying fill materials, debris, or similar materials shall secure and cover loads to prevent dust or debris while travelling on public right of ways.
- All trucks removing materials from the site will be loaded within the site perimeter and will be required to cover loads as deemed necessary for dust control.

- Material stockpiles and construction area surfaces shall be covered and/or watered as needed to prevent dust at designated construction areas.
- All roadways, driveways, sidewalks, etc., being installed as part of the Project should be completed as soon as practicable; in addition, building pads should be laid as soon as practicable after grading.
- To the extent feasible, allow construction employees to commute during off-peak hours.
- Make access available for on-site lunch trucks during construction, as feasible, to minimize off-site construction employee vehicle trips.
- Every effort shall be made to utilize grid-based electric power at any construction site, where feasible.
- Contractors shall maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.
- Require in all applicable bid documents, purchase orders, and contracts of the requirement to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB's policy. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify construction vendors, contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the Project area. To further ensure that drivers understand the vehicle idling requirement, post signs at the proposed Project entry gates and throughout the Project alignment, where appropriate, stating that idling longer than five minutes is not permitted.

## **9.0 VISUAL RESOURCES PROGRAM**

Construction activities during evening and nighttime hours may require the use of temporary lighting. To minimize the impact of temporary lighting on adjacent properties, the following measures shall be implemented:

- Temporary lighting will be limited to the amount necessary to safely perform the required work and will be directed downwards and shielded. Care shall be taken in the placement and orientation of portable lighting fixtures to avoid directing lights toward sensitive receptors, including automobile drivers. Motorists and sensitive receptors shall not have direct views of construction light sources. Light sensitive receptors include but are not limited to residential areas and transient occupancy uses.
- Light trespass shall not exceed one foot-candle above ambient light level as measured at any adjacent residential and transient properties.
- Construction night lighting shall be shielded to prevent a direct view of the light sources from residential properties with a property boundary that is within 150 feet of the construction site.
- Temporary sidewalks and any sidewalk adjacent to construction activities shall be illuminated to City Standards to protect public safety.

To minimize the visual effects of construction the following measures shall be implemented:

- Visually obtrusive erosion control devices, such as silt fences, plastic ground cover, and straw bales should be removed as soon as the area is stabilized.
- Stockpile areas should be located in less visibly sensitive areas and pre-approved by the City. Stockpile locations, laydown, and staging areas shall be accessed by construction vehicles with minimal disruption near residential neighborhoods.
- When not in use or being staged, heavy equipment shall be located as far as practicable from residential areas, businesses and pedestrian pathways.

## 10.0 HAZARDOUS MATERIALS PROGRAM

The following practices will be followed during construction to address the potential for encountering hazardous materials during construction of the Project.

- **Building Demolition Plan** – Prior to any demolition occurring, conduct an evaluation of all buildings built prior to 1980 to be demolished to identify the presence of asbestos containing materials (ACMs) and lead-based paint (LBP). Remediation shall be implemented in accordance with the recommendations of these evaluations to ensure that no ACMs or LBP remain present and to ensure ACMs and LBP are removed to levels established for public safety.
- **Hazardous Materials Contingency Plan** – Prior to construction, prepare a plan addressing the potential for discovery of unidentified underground storage tanks (USTs), hazardous materials, petroleum hydrocarbons, or hazardous or solid wastes encountered during construction. This Plan shall address UST decommissioning, field screening and materials testing methods, contaminant management requirements, and health and safety requirements to ensure no exposure to hazards or hazardous materials occurs on site and to ensure any materials encountered during construction are removed to levels established for public safety.
- **Soil Management Plan** – After final construction plans are prepared showing the lateral and vertical extent of soil excavation during construction are prepared, prepare a Soil Management Plan to establish soil reuse criteria, define a sampling plan for stockpiled materials, describe the disposition of materials that do not satisfy the reuse criteria, and specify guidelines for imported materials.
- **Health and Safety Plan** – Prior to construction, prepare a Health and Safety Plan to address the potential for exposure to the constituents of concern identified in the limited Phase II ESA.
- **Utility Relocation Work** – All Project utility relocations in the vicinity of Kelso Elementary School shall be designed and constructed to remain within the public right-of-way and not impact school property. Relocations shall be located further away from the school as feasible and designed and constructed to current standards to assure that they create no unacceptable hazards to the school. During Project construction, any open trenches and construction equipment shall be marked and barricaded such that they are not accessible by the students or create any potential hazard to school operations. Project utility relocations or cut overs that may require disruption to normal school utility services shall be scheduled to occur outside of normal school hours with advanced notification to the School District.

## 11.0 NOISE AND VIBRATION CONTROL PROGRAM

### 11.1 Construction Noise Control Plan

A Construction Noise Control Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works prior to construction. The Plan shall include measures demonstrating that construction noise levels will be below the Federal Transit Administration's (FTA's) General Assessment Construction Noise Criteria. The following construction noise reduction measures shall be incorporated into the plan:

- Install temporary noise barriers that reduce sound at receptors;
- For any idling that is expected to take longer than five minutes, the engine shall be shut off;
- All equipment shall be equipped with optimal muffler systems;
- Use solar, battery powered, or hybrid equipment whenever practical;
- Locate staging areas as far away from sensitive receptors as feasible;
- Locate stationary noise sources as far away from sensitive receptors as feasible;
- Enclose stationary noise sources, such as diesel-or gasoline-powered generators, with acoustical barriers where necessary and required;
  - If stationary equipment cannot be enclosed within a shed or barrier, such equipment must be muffled and located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- Pole power shall be utilized to the maximum extent feasible in lieu of generators.
- Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible. Additionally, use of "quiet" pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions shall be considered.
- Staging of construction material deliveries behind fencing to minimize noise emitting from idling vehicles.
- On site-signage reminding workers to minimize noise generation.
- When not in use or being staged, heavy equipment shall be located as far as practicable from sensitive receptors.
- For project foundations, consider the use of drilled piles or sonic pile drivers or vibratory pile drivers instead of traditional impact pile drivers, as permitted by geological conditions.
- Sequence noisy activities to occur during the same general time period during daytime hours to the extent practical.

- Select quieter demolition methods where appropriate and feasible such that demolition activities can remain within the project specified noise levels.
- Unless deemed infeasible for a particular construction activity, the Contractor shall utilize rubber tire earth moving equipment in lieu of track mounted earth moving equipment.
- Construction material deliveries shall take place within designated construction staging areas as far from residential sites as practical to minimize noise impacts.
- Provide signage at active construction sites and staging areas reminding workers, equipment operators and delivery vehicles to minimize noise levels to the extent possible.
- Rumble strips or signage shall be provided at roadway access points into contractor laydown and staging areas to slow construction vehicles and limit vehicle noise.
- Coordinate with Inglewood Unified School District administrators to avoid disruptive noise during school hours including scheduling heavy equipment such as cranes, haul trucks, concrete trucks, concrete pumps, pneumatic equipment, earth moving vehicles or similar to operate outside of school hours. The City shall require that the Project's construction noise during school hours would be limited to 5 dBA Leq 1-hour above the measured ambient noise levels at Kelso School property line as identified in the RDEIR. Activities that would exceed this threshold shall be scheduled to occur outside of normal school hours or mitigated with specific mitigation measures such as temporary sound walls, sound blankets, or other sound-attenuating devices. The City shall monitor the Project's construction noise levels during school hours to assure compliance. As requested by the District, monthly noise monitoring reports on noise levels during school hours at Kelso School will be provided to the District.

In order to ensure that construction noise levels will be below the established standards, the following shall be incorporated into the Plan:

- A monitoring plan shall be implemented during demolition and construction activities. Warning thresholds shall be defined that are 5 dBA below the specified noise limits to allow sufficient time for the Contractor to take actions to reduce noise. A monitoring record that documents all alarms and actions taken to comply with these measures shall be provided to the City upon request.
- In the event the warning level (dBA) is exceeded, construction activities shall be temporarily halted in the vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the established standards. Noise measurements shall be gathered after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels:
  - Halting/staggering concurrent construction activities in certain locations;
  - Reducing the speed or intensity of the of heavy-duty construction equipment being operated simultaneously.
  - Operate equipment at the lowest possible power levels.
  - Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.

In order to ensure that acceptable noise levels are maintained at Kelso School, real time noise monitoring will be conducted at Kelso School during the school day. A noise monitor will be located at the southeast corner of Kelso School on Prairie Avenue. This noise monitor will update the 1-hour Leq noise level every minute during the school day. Any time the 1-hour Leq noise level increases by 3 dBA over the ambient noise level during the school day, an alert message will be sent to the construction manager(s) and contact(s) for the contractor(s) working in the vicinity of the school to allow for adjustments to be made to the work in progress to avoid noise levels reaching or exceeding an increase of 5 dBA 1-hour Leq over ambient noise levels. A contact will also be provided to the Inglewood Unified School District and administration at Kelso School to resolve any District or Kelso School concerns with construction activities and their resulting noise levels during the school day.

## 11.2 Construction Vibration Reduction Plan

Prior to the issuance of any demolition or construction permit for each phase of the Project, a Construction Vibration Reduction Plan shall be prepared to minimize construction vibration at nearby sensitive receptors from vibration created by construction activities. The Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works. The Plan shall include but not be limited to the following elements to ensure impacts from ground borne vibration are less than significant:

- A Pre-Demolition and Construction Plan that includes but is not limited to:
  - Photos of current conditions of buildings and structures that could be damaged from construction activities. This crack survey shall include photos of existing cracks and other material conditions present on or at the surveyed buildings. Images of interior conditions shall be included if possible. Photos in the report shall be labelled in detail and dated.
  - Identify representative cracks in the walls of existing buildings, if any, and install crack gauges on such walls of the buildings to measure changes in existing cracks during project activities.
  - Crack gauges shall be installed on multiple representative cracks, particularly on sides of the building facing the Project.
  - Determine the number and placement of vibration sensors at the affected buildings in consultation with a qualified architect. The number of units and the locations of these sensors shall take into account proposed demolition and construction activities to ensure that adequate measurements can be taken illustrating vibration levels during the course of the Project, and if/when levels exceed the established threshold.
  - A line and grade pre-construction survey at the affected buildings shall be conducted.
- A Vibration Plan During Demolition and Construction that includes the following:
  - Regularly inspect and photograph crack gauges, maintaining records of these inspections to be included in postconstruction reporting. Gauges shall be inspected every two weeks, or more frequently during periods of active project actions in close proximity to crack monitors.

- The vibration monitoring system shall measure and continuously store the peak particle velocity (PPV) in inches/second. Vibration data shall be stored on a one-second interval. The system shall also be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA's threshold of significance for a building given its conditions, and a warning level that is 0.05 inch/second (PPV) less than the regulatory level. The system shall also provide real-time alert when the vibration levels exceed either of the two preset levels.
- In the event the warning level (PPV) is triggered, the contractor shall identify the source of vibration impacts and establish steps to reduce the vibration levels, including but not limited to halting or staggering concurrent activities and using lower vibratory techniques.
- In the event the regulatory level (PPV) is triggered, halt the construction activities in the vicinity of the trigger area and visually inspect the building for any damage. Results of the inspection must be logged. Identify the source of vibration generation and provide steps to reduce the vibration level. Vibration measurement shall be made with the new construction method to verify that the vibration level is below the warning level (PPV). Construction activities may then restart.
- In the event work occurs in the proximity of identified historic uses, the system shall be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA threshold of significance 0.12 inch/second for a building given its conditions, and a warning level that is 0.012 inch/second (PPV) less than the regulatory level.
- Collect vibration data from receptors and report vibration levels to the Joint Powers Authority and/or the City on a daily basis. The reports shall include annotations regarding project activities as necessary to explain changes in vibration levels.
- Post-Construction Reporting and Repairs:
  - Provide a report to the Joint Powers Authority and/or City regarding crack and vibration monitoring conducted during demolition and construction. In addition to a narrative summary of the monitoring activities and their findings, this report shall include photographs illustrating the post-construction state of cracks and material conditions that were presented in the pre-construction assessment report, along with images of other relevant conditions showing the impact, or lack of impact, of project activities. The photographs shall sufficiently illustrate damage, if any, caused by the Project and/or show how the Project did not cause physical damage to the buildings. The report shall include analysis of vibration data related to project activities, as well as summarize efforts undertaken to avoid vibration impacts. Finally, a postconstruction line and grade survey shall also be included in this report.
  - Perform repairs to buildings if damage is caused by vibration or movement during the demolition and/or construction activities. Repairs may be necessary to address, for example, cracks that expanded as a result of the Project, physical damage visible in post-construction assessment, or holes or connection points that were needed for shoring or stabilization. Repairs shall be directly related to project impacts and will not apply to general rehabilitation or restoration activities of the buildings.

- To minimize the risk of potential structural and building damage:
  - Limit the location of pile driving and vibratory roller activity to not be within 55 feet and 30 feet of the nearest off-site sensitive receptor, respectively.
  - Limit the number of jackhammers operating simultaneously to one (1) piece operating within 45 feet of off-site sensitive receptors.
  - In the event impact pile driving is required, equipment shall only be used from the hours of 7:00 AM to 7:00 PM. If feasible, pile driving should use alternative technology such as vibration or hydraulic insertion.
- To minimize the risk of related to human annoyance:
  - Limit the location of pile driving to 310 feet of off-site vibration sensitive receptors.
  - Limit the location of vibratory roller to 150 feet of off-site vibration sensitive receptors.
  - Limit the location of large bulldozer to 85 feet of off-site vibration sensitive receptors.
  - Limit the location of caisson drilling to 85 feet of off-site vibration sensitive receptors.
  - Limit the location of loaded trucks to 75 feet of off-site vibration sensitive receptors.
  - Limit the location of jackhammers to 45 feet of off-site vibration sensitive receptors.
  - Limit the location of small bulldozer to 25 feet of off-site vibration sensitive receptors.

## **12.0 TREE REMOVAL AND REPLACEMENT PLAN**

A Tree Removal and Replacement Plan will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and shall adhere to the following principles:

- Tree removal and replacement shall comply with the City of Inglewood Municipal Code and the ITC Design Standards and Guidelines.
- Removal of existing healthy and flourishing trees will be avoided where feasible.
- New permanent replacement trees shall be a 36-inch box of the same species as those removed, if appropriate for the location and not in conflict with new infrastructure. Alternative locations shall be approved by the City's Public Works Department.
- New permanent replacement palm trees shall be a minimum of 20 feet in height.
- The Contractor shall permanently replace trees within 12 (12) months of restoration and completion of that portion of streets that may impact the tree. To the extent feasible, the Contractor shall permanently replace trees on an ongoing basis so long as doing so does not conflict with future construction.
- If construction of the project requires pruning of native tree species, the pruning shall be performed in a manner that does not cause permanent damage or adversely affect the health of the trees.

The Contractor shall maintain all permanent trees and other landscaping installed by the Contractor for a period of three (3) years from the date of planting and shall warranty the trees and landscaping for one (1) year after planting. Prior to the end of the one-year warranty period, the City and the Contractor will conduct an inspection of all permanent replacement trees and landscaping for general health as a condition of final acceptance by the City. If, in the City's determination, a permanent replacement tree or landscaping does not meet the health requirements of the City, then the Contractor shall replace that tree within thirty (30) days. For any permanent trees or landscaping that must then be removed, the original warranty shall be deemed renewed commencing from when the tree or landscaping is replaced.

---

Project Title: Inglewood Transit Connector Project

Project Applicant: City of Inglewood

Project Location (include county): City of Inglewood, County of Los Angeles, California

Project Description:

The Inglewood Transit Connector Project (ITC Project) is a 1.6-mile, three-station, fully elevated, electrically powered light-rail transit system, including, among other things, an Automated Transit System (ATS) mass-transit line, proposed by the City to close the last-mile gap and connect passengers between the Metro K Line Downtown Inglewood to major event and activity centers, including the Forum, the Los Angeles Sports and Entertainment District (which includes SoFi Stadium) and the Inglewood

This is to advise that the City of Inglewood has approved the above (Lead Agency or Responsible Agency)

described project on 04/12/22 and has made the following determinations regarding the above described project.

- 1. The project will not have a significant effect on the environment.
2. An Environmental Impact Report was prepared for this project pursuant to the provisions of CEQA.
3. Mitigation measures were made a condition of the approval of the project.
4. A mitigation reporting or monitoring plan was adopted for this project.
5. A statement of Overriding Considerations was adopted for this project.
6. Findings were made pursuant to the provisions of CEQA.

This is to certify that the final EIR with comments and responses and record of project approval, or the negative Declaration, is available to the General Public at:

City's website at https://www.cityofinglewood.org/1016/Environmental-Documents

Signature (Public Agency): Mindy Wilcox Title: Planning Manager

Date: 4-13-22 Date Received for filing at OPR:

## Findings of Fact

# **CEQA FINDINGS OF FACT FOR THE INGLEWOOD TRANSIT CONNECTOR**

---

In determining to approve the Inglewood Transit Connector project (“Project”), the City of Inglewood (“City”) City Council makes and adopts the following findings of fact and decisions regarding mitigation measures and alternatives based on substantial evidence in the whole record of this proceeding and under the California Environmental Quality Act (“CEQA”) (Pub. Resources Code, § 21000 et seq.), particularly Public Resources Code sections 21081 and 21081.5, the State Guidelines for Implementation of CEQA (“CEQA Guidelines”) (California Code of Regulations, tit. 14, § 15000 et seq.), particularly sections 15091 through 15093, and City of Inglewood Municipal Code, Chapter 12, Article 28.

This document is organized as follows:

**Section I** provides a description of the Project, the environmental review process for the Project, the approval actions to be taken, and the location of records;

**Section II** identifies the impacts found not to be significant that do not require mitigation;

**Section III** identifies potentially significant impacts that can be avoided or reduced to less-than- significant levels through mitigation and describes the disposition of the mitigation measures;

**Section IV** evaluates the different Project alternatives and the economic, legal, social, technological, and other considerations that support approval of the Project and the rejection of the alternatives, or elements thereof, analyzed.

The Mitigation Monitoring and Reporting Program (“MMRP”) for the mitigation measures that have been proposed for adoption are adopted with these findings. The MMRP is required by CEQA section 21081.6, subdivision (a)(1), and CEQA Guidelines sections 15091, subdivision (d), and 15097. The MMRP provides a table setting forth each mitigation measure listed in the Final Environmental Impact Report for the Project (“Final EIR”) that is required to reduce or avoid a significant adverse impact. The MMRP also includes the Project Design Features incorporated into the Project and identified in the EIR to avoid or lessen impacts of the Project. Exhibit C also specifies the agency responsible for implementation of each measure. All of the City’s specific obligations are also described. The full text of each mitigation measure summarized or cited in these findings is set forth in the MMRP.

Under CEQA, the City Council has discretion to revise or reject proposed mitigation measures. These findings reflect the mitigation measures as set forth in the EIR. If and to the extent the City Council directs

City staff to revise the mitigation measures listed in these findings or in the MMRP, City staff will revise these documents as necessary to reflect the City Council's direction.

These findings are based upon substantial evidence in the entire record before the City Council. In these findings the references to certain pages or sections of the Recirculated Draft or Final EIR, which together constitute the EIR, are for ease of reference and are not intended to provide an exhaustive list of the evidence relied upon for these findings. A full explanation of the substantial evidence supporting these findings can be found in the EIR, and these findings hereby incorporate by reference the discussion and analyses in those documents supporting the EIR's determinations regarding the Project's impacts and mitigation measures designed to address those impacts. References to the Recirculated Draft EIR or to the EIR are intended as a general reference to information that may be found in either or both the Recirculated Draft EIR or Final EIR.

## **I. APPROVAL OF PROJECT**

### **A. Description of the Project**

The Project is an Automated Transit System (ATS), which would include an approximately 1.6-mile-long, elevated, guideway located within current and to-be-acquired public right-of-way along Market Street, Manchester Boulevard, and Prairie Avenue. Three stations are proposed adjacent to the guideway on privately owned land that is proposed to be acquired as part of the Project. The elevated guideway will contain dual lanes to allow trains to travel continuously in each direction. Several trains would likely be operating at the same time, depending on ridership demand.

As part of the City's collaboration and partnership with the Los Angeles County Metropolitan Transportation Authority (Metro), the Project is an extension of the Metro regional rail system to the City's activity centers, closing the critical first/last mile transit gap in Inglewood, increasing passenger service along the Metro system by facilitating a seamless transfer of passengers between the ITC and the Metro K Line.

The ATS technology may be a self-propelled technology, including rubber-tire ATS systems, monorails, large steel-wheel ATS systems, also known as automated light rail transit (ALRT), or a cable-propelled ATS system. The system will be fully automated (i.e., driverless) to operate at the headways to meet the projected peak ridership needs.

The ATS trains will operate in a pinched-loop mode on dual tracks along the alignment, wherein trains follow each other and switch back at the end-of-line stations to make the return journey on the other track. As planned, the trains can be operated in multiple different configurations, ranging from a one-car

train to multiple-car length trains with a maximum train length of approximately 200 feet. Depending on the technology (self-propelled or cable propelled), ridership demands, which will be time of day and event day dependent, multiple trains of up to the maximum train length can be operated at varying headways for self-propelled systems, as close as 1.5 minutes apart, to provide the necessary peak and reserve capacity.

The Project includes three stations::

- a) The *Market Street/Florence Avenue* station generally located between Market Street and Locust Street providing connections to the Metro K Line and Downtown Inglewood;
- b) The *Prairie Avenue/Manchester Boulevard* station located on the southwest corner of the intersection of Prairie Avenue and Manchester Boulevard providing service to the Forum, Hollywood Park including SoFi Stadium, and existing and future local businesses and residences.
- c) The *Prairie Avenue/Hardy Street* station located on the northwest corner of the intersection of Prairie Avenue and Hardy Street providing service to the Hollywood Park, including SoFi Stadium, the Inglewood Basketball and Entertainment Center including Intuit Dome, and other existing and future local businesses and residences.

These station locations were chosen to be near major employment, housing, and retail centers, including the Forum, SoFi Stadium, and other employment, housing, and retail commercial uses in the Hollywood Park Specific Plan (HPSP), the IBEC, and Downtown Inglewood, which the City is seeking to enhance and activate.

Existing roadways and infrastructure along the transit alignment will require reconfiguration to accommodate the new elevated transit guideway structures and stations. In addition to surface improvements, utility infrastructure located under roadways may need to be relocated to accommodate the guideway columns, footings, and other components. The roadway reconfigurations proposed along Market Street, Manchester Boulevard, and Prairie Avenue are necessary to assure that the existing roadway travel capacity is not reduced to accommodate the Project.

The Project includes a Maintenance and Storage Facility (MSF) to provide regular and preventive maintenance for the ATS trains, vehicle storage, and an operations control center located on the eastern half of the block bound by Manchester Boulevard, Hillcrest Boulevard, Nutwood Street and Spruce Avenue. An existing commercial building containing a Vons grocery store, a fitness center, and a bank branch, is located on the southern portion of this site. A gas station operated by Vons is located on the northeast portion of this site. Demolition of the existing commercial building and gas station is proposed

as part of the Project. A new Vons replacement store is proposed on the corner of Manchester Boulevard and Hillcrest Boulevard.

The MSF will be designed in accordance with the ITC Design Standards and Guidelines (Design Guidelines), which address the massing, façade, materials, colors, roof, and lighting for this facility, how the MSF will engage with the passenger and vehicular circulation around it, and sustainability features. The Project also includes two power distribution system (PDS) substations. These PDS substations will provide the necessary power for the Project, including traction power, auxiliary power, and housekeeping power for the stations and related infrastructure. One of the PDS substations will be located on the MSF site, where the Southern California Edison (SCE) service connection will be provided. The second PDS substation will be located on the Prairie Avenue/Hardy Street or Prairie Avenue/Manchester Boulevard station site.

Additional public parking will be provided as part of the Project at three locations that will be used as construction staging areas. After construction, these sites will be improved as public parking lots:

- Approximately 650 parking spaces will be provided in a surface parking lot at the Market Street/Florence Avenue Station along with pick-up and drop-off areas on Locust Avenue and Regent Street.
- Approximately 50 parking spaces would be provided in a surface parking lot at 150 S. Market Street.
- Approximately 80 parking spaces and a shuttle bus pick-up and drop-off area are would be provided at the Prairie Avenue/Hardy Street Station. This lot would be used for public parking, TNCs and shuttle bus pick-up and drop-off operations during events.

These parking areas will provide public parking needed in the City to support use of the Project, businesses, and the City's efforts to help revitalize the historic retail areas along Market Street. The Project is designed and intended to extend the transit service provided by the Metro K Line to the major event venues and existing and planned residential and commercial uses in the City, and these parking facilities are proposed to support transit use. On non-event days, the parking is designed to allow the City's residents to become transit riders and use the Metro Rail system, providing local convenient parking adjacent to the ITC and Metro K Line. On event days, the City recognizes that many visitors may still drive to the City in search of convenient parking with proximity to commercial uses and access to a direct transportation connection to the City's major event venues. To help with overall traffic congestion and improve circulation on local streets, and to help reduce visitors parking in residential areas, the Project includes parking in close proximity to the Project stations and downtown Market Street area. These parking areas will also provide replacement parking for public parking on streets that may be removed as part of the Project.

## B. Project Objectives

Section 15124, subdivision (b) of the CEQA Guidelines states that the Project Description shall contain “[a] statement of the objectives sought by the Project.” In addition, Section 15124, subdivision (b) of the CEQA Guidelines further states, “[t]he statement of objectives should include the underlying purpose of the project.”

The City’s goals and objectives for the Project are as follows:

- Provide a direct and convenient extension of the Metro regional transit system for local residents and the region to access the City’s new major housing, employment, commercial, and activity centers;
- Close the “last mile gap” to the regional transit system by providing passengers with the ability to transfer to or from destinations and the Metro K Line.
- Provide sufficient transit connection capacity between the Metro regional transit system and the City’s major activity centers with enhanced travel time certainty and sufficient capacity to meet peak ridership demands to encourage transit as a travel mode choice;
- Maintain existing roadway capacity to the extent feasible;
- Reduce the City’s traffic congestion and alleviate growing demand on the existing roadway network on both major arterials and residential streets for both nonevent and event days;
- Encourage intermodal transportation systems by providing convenient, reliable time-certain transit;
- Increase transit mode split, reduce vehicle trips, and reduce per-capita vehicle miles traveled to the City’s major activity centers, with corresponding improvements in air quality, public health, and reductions in greenhouse gas emissions from transportation sources in accordance with the City’s goals, the SCAG 2020-2045 RTP/SCS, and State policies with respect to climate change and land use.
- Support the ongoing economic revitalization and growth opportunities for transit-oriented development (TOD) within the Downtown TOD Plan area, including commercial and residential uses, including through the creation of public parking facilities;
- Encourage redevelopment and investment within the City in areas served by the Project;
- Provide safe, reliable, and convenient access to businesses in the City so that they are accessible to their workforce and customers;
- Connect the Inglewood community and citizens to jobs, education, services, and destinations within the City and in the region by providing transit within safe and accessible walking distances; and
- Support regional efforts to become more efficient, economically strong, equitable, and sustainable.

## C. Environmental Review

### 1. Preparation of the Final EIR

The EIR for the Inglewood Transit Connector (SCH No. 2018071034) was prepared, noticed, published, circulated, reviewed, and completed in full compliance with CEQA, the CEQA Guidelines (, and the City of Inglewood Municipal Code, as follows:

- a) In 2017, the City partnered with Metro to address the City’s critical mobility issues by analyzing viable transit connection options from the Metro K Line to the LASED, which includes SoFi Stadium. With the City’s input, Metro conducted a study<sup>1</sup> to explore how best to extend the Metro Rail system via a high-capacity transit connection to the LASED.
- b) In early 2018, the City also initiated stakeholder outreach to understand the City’s need for a comprehensive long-range mobility plan, potential project goals and objectives, potential project benefits and impacts, and stakeholder concerns.
- c) In July 2018, pursuant to the requirements of CEQA, the City as the Lead Agency prepared a Notice of Preparation (Original NOP) and an Initial Study (Original IS) (SCH 2018071034).
- d) The Original NOP and IS were circulated and comments were received from the public and agencies following a 30-day comment period that ended on August 15, 2018.
- e) A scoping meeting was held on July 26, 2018, from 6 PM to 8 PM at the Inglewood Senior Citizens Center, 111 N. Locust Street, Inglewood, CA 90301. The City provided the opportunity for comments to be submitted at the scoping meeting.
- f) As a result of the comments received and refinements and modifications to the Project identified in the Original NOP and Original IS after circulation of the July 2018 Notice of Preparation, a Revised NOP and IS were circulated for public review and comment from September 10, 2020 to October 12, 2020. The City submitted both the Original and Revised NOPs and Initial Studies to the Governor’s Office of Planning and Research (OPR); applicable trustee or responsible federal, State, regional, and local agencies identified for the Project, including adjacent cities and counties; the County of Los Angeles; relevant Native American tribes; and all interested parties requesting such notice to allow for comment on the IS during the 30-day comment period. In addition, copies of the Original and Revised NOPs and ISs were made available for review at Inglewood City Hall and the Inglewood Public library, as well as on the City’s website, to give the public the opportunity to comment during the respective 30-day comment periods.
- g) The City prepared and released a Draft EIR for public review in December 2020. Based on additional feedback received during the Draft EIR circulation period the City continued further collaboration with key stakeholders on the design of the Project. City also conducted additional technical analysis and

---

1 Los Angeles County Metropolitan Transportation Authority, *City of Champions/Inglewood (NFL) Focused Analysis of Transit Connection* (August 2017).

due diligence on potential utility conflicts, property impacts, and potential impacts to historical resources, and refined the project to reduce the project footprint where feasible.

- h) As a result of this ongoing consultation process, the City further refined the Project and revised the Draft EIR to evaluate these changes to the Project. The City prepared and released a Recirculated Draft EIR for public review in November 2021. The Revised Project as evaluated in the RDEIR remains an approximately 1.6-mile long alignment with 3 stations beginning at the intersection of Market Street and Florence Avenue, continuing along Manchester Avenue and Prairie Avenue, and ending at the intersection of Prairie Avenue and Hardy Street.
- i) A Notice of Completion (NOC) and copies of the Draft EIR were filed with SCH on November 12, 2021. An official 45-day public review period for the Draft EIR was established by SCH, ending on December 27, 2021. A Notice of Availability (NOA) for the Draft EIR was published on November 11, 2021 and sent to appropriate public agencies, including SCH and Los Angeles County Clerk, and all entities who requested to be notified about the Project and/or EIR. The Recirculated Draft EIR was also published on the City's website.
- j) On January 25, 2022, the City held a hearing at which it determined that the Project is exempt from CEQA pursuant to CEQA section 21080, subdivision (b)(12) and CEQA Guidelines section 15275, subdivision (b) as a "[f]acility [extension] not to exceed four miles in length which [is] required for the transfer of passengers from or to exclusive public mass transit guideway or busway public transit services."
- k) On **February XX**, 2022, the City released the Final EIR for the Project. The Final EIR included (i) comments on the Recirculated Draft EIR submitted during the comment period, (ii) responses to those comments, (iii) staff-initiated revisions to the text of the Recirculated Draft EIR, together with an explanation of why those changes were made, and (iv) a draft of the MMRP. The City sent notice to those submitting comments and to other interested agencies and individuals that the Final EIR had been released, stating that the Final EIR had been posted and was available for review on the City's web site, and that the Final EIR included responses to comments received on the Recirculated Draft EIR.
- l) On March 3, 2022, following a public hearing, the City Planning Commission adopted a resolution recommending that the City Council certify the Final EIR, adopt these findings, and approve the MMRP.
- m) The City made documents available to the public in a readily accessible electronic format, including the Recirculated Draft EIR, all documents submitted to or relied on in the preparation of the Recirculated Draft EIR, comments and the Final EIR, as required by Public Resources Code section 21168.6.8(g). Documents were posted in a timely manner on the City's Economic and Community Development Department EIR web page at <https://www.cityofinglewood.org/1016/Environmental-Documents> and [www.inglewoodtransitconnector.com](http://www.inglewoodtransitconnector.com).

## 2. Recirculation

Under section 15088.5 of the CEQA Guidelines, recirculation of an EIR is required when “significant new information” is added to the EIR after public notice is given of the availability of the Draft EIR for public review but prior to certification of the Final EIR. The term “information” can include changes in the project or environmental setting, as well as additional data or other information. New information added to an EIR is not “significant” unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project’s proponents have declined to implement. “Significant new information” requiring recirculation includes, for example, a disclosure showing that:

- 1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
- 2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
- 3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project’s proponents decline to adopt it.
- 4) The DEIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

(CEQA Guidelines, § 15088.5, subd. (a).)

Recirculation is not required where the new information added in the Final EIR merely clarifies or amplifies or makes insignificant modifications in an adequate Draft EIR. The above standard is “not intend[ed] to promote endless rounds of revision and recirculation of EIR’s.” (*Laurel Heights Improvement Assn. v. Regents of University of California* (1993) 6 Cal.4th 1112, 1132 (*Laurel Heights*).) “Recirculation was intended to be an exception, rather than the general rule.” (*Ibid.*)

The City recognizes that minor changes have been made to the Project and additional evidence has been developed after publication of the Recirculated Draft EIR. The refinements to the project are described in Chapter 2 of the Final EIR. As described in the Final EIR, these refinements would result either in no changes to the impact conclusions or in a reduction in the severity of the impact presented in the Recirculated Draft EIR. In addition, minor refinements that have occurred after the publication of the Final EIR will not result in new or substantially more severe significant impacts.

Finally, the Final EIR includes supplemental data and information that was developed after publication of the Recirculated Draft EIR to further support the information presented in the Recirculated Draft EIR. None of this supplemental information affects the conclusions or results in substantive changes to the information presented in the Recirculated Draft EIR or to the significance of impacts as disclosed in the Recirculated Draft EIR.

CEQA case law emphasizes that “[t]he CEQA reporting process is not designed to freeze the ultimate proposal in the precise mold of the initial project; indeed, new and unforeseen insights may emerge during investigation, evoking revision of the original proposal.” (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 736–737 (*Kings County*); see also *River Valley Preservation Project v. Metropolitan Transit Development Bd.* (1995) 37 Cal.App.4th 154, 168, fn. 11.) “CEQA compels an interactive process of assessment of environmental impacts and responsive project modification which must be genuine. It must be open to the public, premised upon a full and meaningful disclosure of the scope, purposes, and effect of a consistently described project, with flexibility to respond to unforeseen insights that emerge from the process.’ [Citation.] In short, a project must be open for public discussion and subject to agency modification during the CEQA process.” (*Concerned Citizens of Costa Mesa, Inc. v. 33rd Dist. Agricultural Assn.* (1986) 42 Cal.3d 929, 936.)

Similarly, additional studies included in a Final EIR that result in minor modifications or additions to analysis concerning significant impacts disclosed in a Draft EIR does not constitute “significant new information” requiring recirculation of an EIR. (See *Mount Shasta Bioregional Ecology Center v. County of Siskiyou* (2012) 210 Cal.App.4th 184, 221 [incorporation of technical studies in a Final EIR disclosing additional locations affected by a significant noise impact identified in the Draft EIR did not require recirculation].) Here, the changes made to the Project and the additional evidence relied on in the Final EIR are the kind of information and revisions that the case law recognizes as legitimate and proper and does not trigger the need to recirculate the Recirculated Draft EIR.

The City Council finds that none of the changes and revisions in the Final EIR substantially affect the analyses or conclusions presented in the Recirculated Draft EIR, and do not constitute significant new information; therefore, recirculation of the Recirculated Draft EIR for additional public comments is not required.

## **D. Approval Actions**

Implementation of the Project may require, but may not be limited to, the following actions by the City of Inglewood:

- Certification of the Final EIR for the Inglewood Transit Connector Project and adoption of the Mitigation Monitoring and Reporting Plan, CEQA Findings of Fact, and, if necessary, a Statement of Overriding Considerations;
- Approval of the proposed General Plan Amendment, consisting of changes to the City General Plan Land Use Element, Circulation Element, and Safety Element;
- Approval of an amendment to Chapter 12 (Planning and Zoning) of the Inglewood Municipal Code to:
  - Add the Transportation Corridor Overlay (TCO) Zone; and
  - Amend the Medical Enterprise Overlay Zone to exclude land uses associated with the Project.
- Approval of amendments to the Forum Development Agreement to reflect the acquisition of frontage along Prairie (including loss of Forum parking);
- Approval of a Special Use Permit required for demolition of a gas station, Design Review for the new supermarket, and any other discretionary approval required for a new supermarket at 500 and 510 East Manchester Boulevard;
- Approval of amendments and clarifications to the Hollywood Park Specific Plan and associated Development Agreement;
- Preparation of a Project-specific Stormwater Management Plan or Standard Urban Stormwater Mitigation Plan for approval;
- Approvals of lot line adjustment(s), parcel map(s), and tract map(s) as needed;
- Approval of agreements and/or resolutions necessary to acquire the property necessary for construction and operation of the Project, in fee simple or through easements, licenses, air rights, leases, or other means of access, including through eminent domain;
- Approval of the ITC Design Standards and Guidelines;
- Approval of a contract or contracts for the design, finance, construction, and operation of the Project;
- Approvals for federal, State, or local financing plans or grants.

In addition to the above, ministerial approvals may be required as follows:

- Grading permits, building permits, haul route approval, and other permits issued by the Department of Building and Safety for the Project and any associated Department of Public Works permits (including encroachment permits) for infrastructure improvements;
- Tree removal permits; and
- Noise permit for Construction and Building Hours extension.

- Other federal, State, or local approvals, permits, or actions that may be deemed necessary for the Project including, but not limited to, the following:
  - California Public Utilities Commission;
  - Los Angeles County Fire Department.

## **E. Contents and Location of Record**

The record upon which all findings and determinations related to the Project consists of those items listed in Public Resources Code section 21167.6 subdivision (e), which are incorporated by reference and made part of the record supporting these findings:

- The City of Inglewood General Plan and all Elements thereto, as amended from time to time through the date of approval of the Project;
- City of Inglewood Municipal Code;
- The NOP and all other public notices issued by the City in conjunction with the Project;
- The EIR and all documents referenced in or relied upon by the EIR;
- The MMRP for the Project;
- All findings and resolutions adopted by the City in connection with the Project, and all documents cited or referred to therein;
- All information including written evidence and testimony provided by City staff and consultants to the City Council relating to the EIR, the Project, and the alternatives set forth in the EIR or these CEQA findings;
- All records of decision, staff reports, memoranda, maps, exhibits, letters, synopses of meetings, and other documents approved, reviewed, relied upon, or prepared by any City commissions, boards, officials, consultants, or staff relating to the Project;
- All information provided by the public, including written correspondence received by City staff during the public comment period of the Recirculated Draft EIR.
- All testimony presented to the Planning Commission or City Council;
- All information presented at workshops or hearings held by the City for the Project.

The documents constituting the record of proceedings are available for review by responsible agencies and interested members of the public during normal business hours at the City of Inglewood Economic and Community Development Department, One West Manchester Boulevard, Fourth Floor, Inglewood, CA 90301. The custodian of these documents is the Economic and Community Development Director. The City Council has relied on all of the documents listed above in reaching its decision on the Project, even if not every document was formally presented to the Council. Without exception, any documents set forth

above not found in the Project files fall into one of two categories. In the first category, many of the documents reflect prior planning or legislative decisions of which the City Council was familiar with when approving the Project. (See *Dominey v. Dept. of Personnel Administration* (1988) 205 Cal.App.3d 729, 738, fn. 6; *City of Santa Cruz v. Local Agency Formation Com.* (1978) 76 Cal.App.3d 381, 391–392.) In the second category, documents that influenced the expert advice provided to City staff or consultants, who then provided advice to the City Council as final decision makers, form part of the underlying factual basis for the City Council’s decisions relating to approval of the Project and properly constitute part of the administrative record. (See CEQA, § 21167.6, subd. (e)(10); *Stanislaus Audubon Society, Inc. v. County of Stanislaus* (1995) 33 Cal.App.4th 144, 153, 155; *Browning-Ferris Industries v. City Council* (1986) 181 Cal.App.3d 852, 866.) The City Council notes, however, that the record of proceedings does not include internal “working draft” documents that have not been shared with the public; rather, such documents reflect the practical reality that a given document often undergoes multiple drafts before it is released to the public, relied upon by the City, or presented to decisionmakers. Just as the first draft of a legal brief or of a judicial opinion is not relevant to a document in its final, filed form, the internal working draft of City staff or consultants is not relevant to the City Council’s decision. Such documents are therefore not part of the record of proceedings.

The public hearing transcript, a copy of all letters regarding the Draft EIR received during the public review period, the administrative record, and background documentation for the Final EIR, as well as additional materials concerning approval of the Project and adoption of these findings are contained in the Project files. Project files are available by contacting Mindy Wilcox, Planning Manager, at the Inglewood City Hall, Economic & Community Development Department Planning Division, One West Manchester Boulevard, Fourth Floor, Inglewood, California 90301. The City may also be contacted by e-mail at [inglewoodtransitconnector@cityofinglewood.org](mailto:inglewoodtransitconnector@cityofinglewood.org). All files have been available to the City Council and the public for review in considering these findings and whether to approve the Project.

## **F. Findings Required Under CEQA**

### **1. Findings**

CEQA requires that the lead agency adopt mitigation measures or alternatives, where feasible, to substantially lessen or avoid significant environment impacts that would otherwise occur. Mitigation measures or alternatives are not required, however, where such changes are infeasible or where the responsibility for implementing the mitigation measure or alternative resides with another agency. (Pub. Resources Code, § 21081, subd. (a)(2); CEQA Guidelines, § 15091, subds. (a), (b).)

Public Resources Code section 21061.1 defines “feasible” to mean “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors.” CEQA Guidelines section 15364 includes another factor: “legal” considerations. (See also *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 565–566 (*Goleta II*).)

The concept of “feasibility” also encompasses the question of whether a particular alternative or mitigation measure promotes the underlying goals and objectives of a project. (*City of Del Mar v. City of San Diego* (1982) 133 Cal.App.3d 410, 417.) “[F]easibility” under CEQA encompasses ‘desirability’ to the extent that desirability is based on a reasonable balancing of the relevant economic, environmental, social, and technological factors.” (*Ibid.*; see also *Sequoyah Hills Homeowners Assn. v. City of Oakland* (1993) 23 Cal.App.4th 704, 715; see also *California Native Plant Society v. City of Santa Cruz* (2009) 177 Cal.App.4th 957, 1001 [after weighing “economic, environmental, social, and technological factors” an agency may conclude that a mitigation measure or alternative is “impracticable or undesirable from a policy standpoint” and reject it as “infeasible” on that ground].)

With respect to a project for which significant impacts are not avoided or substantially lessened, a public agency, after adopting proper findings, may nevertheless approve the project if the agency first adopts a statement of overriding considerations setting forth the specific reasons why the agency found that the project’s “benefits” rendered “acceptable” its “unavoidable adverse environmental effects.” (CEQA Guidelines, §§ 15093, 15043, subd. (b); see also Pub. Resources Code, § 21081, subd. (b).)

In seeking to effectuate the substantive policy of CEQA to substantially lessen or avoid significant environmental effects to the extent feasible, an agency, in adopting findings, need not necessarily address the feasibility of both mitigation measures and environmentally superior alternatives when contemplating approval of a Project with significant impacts. Where a significant impact can be mitigated to an “acceptable” level solely by the adoption of feasible mitigation measures, the agency, in drafting its findings, has no obligation to consider the feasibility of any environmentally superior alternative that could also substantially lessen or avoid that same impact — even if the alternative would render the impact less severe than would the Project as mitigated. (*Laurel Hills Homeowners Association v. City Council* (1978) 83 Cal.App.3d 515, 521; see also *Kings County, supra*, 221 Cal.App.3d at pp. 730-731; and *Laurel Heights Improvement Association v. Regents of the University of California* (1988) 47 Cal.3d 376, 400–403.)

In these findings, the City first addresses the extent to which each significant environmental effect can be substantially lessened or avoided through the adoption of feasible mitigation measures. Only after

determining that, even with the adoption of all feasible mitigation measures, an effect is significant and unavoidable does the City address the extent to which alternatives described in the EIR are (i) environmentally superior with respect to that effect and (ii) “feasible” within the meaning of CEQA.

In cases in which a project’s significant effects cannot be mitigated or avoided, an agency, after adopting proper findings, may nevertheless approve the project if it first adopts a statement of overriding considerations setting forth the specific reasons why the agency found that the “benefits of the project outweigh the significant effects on the environment.” (Pub. Resources Code, § 21081, subd. (b); see also CEQA Guidelines, §§ 15093, 15043, subd. (b).) In the statement of overriding considerations found at the end of these findings, the City identifies the specific economic, legal, social, and other considerations that, in its judgment, outweigh the significant environmental effects that the Project will cause.

The California Supreme Court has stated that “[t]he wisdom of approving . . . any development project, a delicate task which requires a balancing of interests, is necessarily left to the sound discretion of the local officials and their constituents who are responsible for such decisions. The law as we interpret and apply it simply requires that those decisions be informed, and therefore balanced.” (*Goleta II, supra*, 52 Cal.3d at p. 576.)

The City Council’s findings in support of its approval of the Project are set forth below for each of the significant environmental effects of and alternatives to the Project identified in the EIR pursuant to section 21080 of CEQA and section 15091 of the CEQA Guidelines. These findings provide the written analysis and conclusions of the City Council regarding the environmental impacts of the Project and the mitigation measures included as part of the EIR and adopted by the City Council as part of the Project. To avoid duplication and redundancy, and because the City Council agrees with, and hereby adopts, the conclusions in the EIR, these findings will not repeat the analysis and conclusions in the EIR, but instead incorporates them by reference in these findings and relies upon them as substantial evidence supporting these findings.

In making these findings, the City Council has considered the opinions of staff and experts, other agencies, and members of the public. The City Council finds that the determination of significance thresholds is a judgment decision within the discretion of the City Council; the significance thresholds used in the EIR are supported by substantial evidence in the record, including the expert opinion of the EIR preparers and City staff; and the significance thresholds used in the EIR provide reasonable and appropriate means of assessing the significance of the adverse environmental effects of the Project. Thus, although, as a legal matter, the City Council is not bound by the significance determinations in the EIR (see Pub. Resources Code, § 21082.2, subd. (e)), the City Council finds them persuasive and hereby adopts them as its own.

As set forth below, the City Council adopts and incorporates all of the mitigation measures set forth in the EIR and the attached MMRP to substantially lessen or avoid the potentially significant and significant impacts of the Project.

## ***2. Findings About Significant Environmental Impacts and Mitigation Measures***

The following sections of these findings – Sections II, III and IV – set forth the City’s findings about the EIR’s determinations regarding significant environmental impacts and the mitigation measures proposed to address them. These findings provide the written analysis and conclusions of the City regarding the environmental impacts of the Project and the mitigation measures included as part of the EIR and adopted by the City as part of the Project. To avoid duplication and redundancy, and because the City agrees with, and hereby adopts, the conclusions in the EIR, these findings will not repeat the analysis and conclusions in the EIR, but instead incorporates them by reference in these findings and relies upon them as substantial evidence supporting these findings.

These findings do not attempt to describe the full analysis of each environmental impact contained in the EIR. Instead, a full explanation of these environmental findings and conclusions can be found in the EIR, and these findings hereby incorporate by reference the discussion and analysis in the EIR supporting the EIR’s determination regarding the Project’s impacts and mitigation measures designed to address those impacts. In making these findings, the City Council ratifies, adopts, and incorporates in these findings, the determinations and conclusions of the EIR relating to environmental impacts and mitigation measures, except to the extent any such determinations and conclusions are specifically and expressly modified by these findings.

As set forth below, the City Council adopts and incorporates all of the mitigation measures within its authority and jurisdiction as lead agency, as set forth in the EIR and presented in the MMRP, in order to substantially lessen or avoid the potentially significant and significant impacts of the Project. The MMRP will remain available for public review during the compliance period. In adopting mitigation measures from the EIR, the City Council intends to adopt each of the mitigation measures proposed in the EIR for the Project for adoption by the City. The City Council also intends that the MMRP should include each and every mitigation measure included in the EIR, including those assigned to responsible agencies. Accordingly, in the event a mitigation measure recommended in the EIR has inadvertently been omitted in these findings or the MMRP, any such mitigation measure is hereby adopted and/or incorporated in the findings below by reference.

In addition, mitigation measures are listed in different locations in these findings, in the MMRP, and in the EIR. The City has made every effort to ensure that the text of each mitigation measure is consistent wherever that text appears. To the extent the text differs for the same mitigation measure from one location to another, such differences are inadvertent. In those instances, the text of the mitigation measure as it appears in the MMRP shall control, unless in context it is clear that the text in the MMRP does not reflect the City's determination with respect to the mitigation measure to be adopted; in such instances, the most stringent version of the mitigation measure shall apply, regardless of whether that most stringent version appears in the findings, in the MMRP, or in the EIR.

The impact numbers and mitigation measure numbers used in these findings reflect the information contained in the EIR. In Sections II, III and IV below, the same statutory findings are made for a category of environmental impacts and mitigation measures. Rather than repeat the identical finding several times to address each and every significant effect and mitigation measure, the initial finding obviates the need for such repetition because in no instance is the City Council rejecting the conclusions of the EIR or the mitigation measures recommended in the EIR for the Project.

## **II. IMPACTS FOUND TO HAVE NO IMPACT OR BE LESS THAN SIGNIFICANT AND THUS REQUIRING NO MITIGATION**

Under CEQA, no mitigation measures are required for impacts that are less than significant (Pub. Resources Code, section §; CEQA Guidelines, §§ 15126.4, subd. (a)(3), 15091). Based on substantial evidence in the entire record of this proceeding, the City Council finds that implementation of the Project will not result in any significant impacts in the following areas and that these impact areas, therefore, do not require mitigation. As stated above, these findings do not repeat the analysis and conclusions in the EIR, but instead incorporates them by reference in these findings and rely upon them as substantial evidence supporting these findings.

### **A. Aesthetics**

Impact AES-1a: Construction and operation of the Project could substantially degrade the existing visual character or quality of public views of the site and its surroundings or could conflict with the City's zoning and regulations governing scenic quality. (Refer to pages 4.1-19 through 4.1-68 of the Recirculated Draft EIR.)

Impact AES-1b: Construction and operation of the Project could be inconsistent with applicable zoning and planning regulations governing scenic quality. (Refer to pages 4.1-68 through 4.1-75 of the Recirculated Draft EIR.)

Impact AES-2: Construction and operation of the Project could create a new source of substantial light or glare, which could adversely affect day or nighttime views in the area. (Refer to pages 4.1-76 through 4.1-82 of the Recirculated Draft EIR.)

## **B. Biological Resources**

Impact BIO-2: Construction and operation of the Project could conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. (Refer to pages 4.3-52 through 4.9-62 of the Recirculated Draft EIR.)

## **C. Cultural Resources**

Impact CUL-1: Construction and operation of the Project could cause a substantial adverse change in the significance of a historic resource pursuant to Section 15064.5. (Refer to pages 4.4-45 through 4.4-60 of the Recirculated Draft EIR.)

## **D. Energy Resources**

Impact E-1: Construction and operation of the Project could result in wasteful, inefficient, or unnecessary consumption of energy resources. (Refer to pages 4.5-21 through 4.5-35 of the Recirculated Draft EIR.)

Impact E-2: Construction and operation of the Project could conflict with or obstruct a State or local plan for renewable energy or energy efficiency. (Refer to pages 4.5-35 through 4.5-38 of the Recirculated Draft EIR.)

## **E. Greenhouse Gas Emissions**

Impact GHG-1: Construction and operation of the Project could generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment. (Refer to pages 4.7-42 through 4.7-49 of the Recirculated Draft EIR.)

Impact GHG-2: Construction and operation of the Project could conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases. (Refer to pages 4.7-49 through 4.7-57 of the Recirculated Draft EIR.)

## **F. Hazards and Hazardous Materials**

- Impact HAZ-1: Construction and operation of the Project could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. (Refer to pages 4.8-31 through 4.8-38 of the Recirculated Draft EIR.)
- Impact HAZ-2: Construction and operation of the Project could emit hazardous emissions or involve the handling of hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. (Refer to pages 4.8-38 through 4.8-43 of the Recirculated Draft EIR.)
- Impact HAZ-3: Construction and operation of the Project could impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan? (Refer to pages 4.8-44 through 4.8-47 of the Recirculated Draft EIR.)

## **G. Land Use and Planning**

- Impact LU-1: Construction and operation of the Project could physically divide an established community. (Refer to pages 4.8-49 through 4.9-47 of the Recirculated Draft EIR.)
- Impact LU-2: Construction and operation of the Project could cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. (Refer to pages 4.9-47 through 4.9-77 of the Recirculated Draft EIR.)

## **H. Noise**

- Impact NOI-1: Construction and operation of the Project could result in a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or

applicable standards of other agencies. (Refer to pages 4.10-65 through 4.10-109 of the Recirculated Draft EIR.)

Impact NOI-2: Construction and operation of the Project could result in exposure of persons to or generate excessive groundborne vibration or groundborne noise levels. (Refer to pages 4.10-109 through 4.10-116 of the Recirculated Draft EIR.)

## **I. Population, Employment, and Housing**

Impact POP-1: Construction of the Project could induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure). (Refer to pages 4.11-15 through 4.11-23 of the Recirculated Draft EIR.)

## **J. Transportation**

Impact T-1: Construction and operation of the Project could conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities. (Refer to pages 4.12-36 through 4.11-52 of the Recirculated Draft EIR.)

Impact T-2: Construction and operation of the Project could conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b). (Refer to pages 4.12-52 through 4.11-66 of the Recirculated Draft EIR.)

Impact T-3: Construction and operation of the Project could substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)? (Refer to pages 4.12-66 through 4.11-67 of the Recirculated Draft EIR.)

Impact T-4: Construction and operation of the Project could conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities. (Refer to pages 4.12-68 through 4.11-69 of the Recirculated Draft EIR.)

### III. SIGNIFICANT OR POTENTIALLY SIGNIFICANT IMPACTS MITIGATED TO A LESS THAN SIGNIFICANT LEVEL

The following significant and potentially significant environmental impacts of the Project, including cumulative impacts, are being mitigated to a less than significant level and are set out below. Pursuant to section 21081, subdivision (a)(1) of CEQA and section 15091, subdivision (a)(1) of the CEQA Guidelines, as to each such impact, the City Council, based on the evidence in the record before it, finds that changes or alterations incorporated into the Project by means of conditions or otherwise mitigate, avoid, or substantially lessen to a level of insignificance these significant or potentially significant environmental impacts of the Project. The basis for the finding for each identified impact is set forth below.

#### A. Air Quality

**Impact AQ-1:** Construction of the Project could conflict with or obstruct implementation of the applicable air quality plan as the Project would exceed the NOx SCAQMD threshold during construction. (Refer to pages 4.2-47 through 4.2-60 of the Recirculated Draft EIR.)

**MM AQ-1:** PDF AQ-1, Construction Air Quality Program, shall be implemented during construction of the ITC Project.

**Basis for Finding:** Mitigation Measure MM AQ-1 requires the implementation of PDF AQ-1 from the Project's Construction Commitment Program (CCP) to reduce air quality emissions during construction. PDF AQ-1 requires the Project to use equipment that meets the U.S. Environmental Protection Agency (USEPA)'s Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity. With implementation of PDF AQ-1, this impact would be **less than significant**.

**Finding:** Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effect as identified in the Recirculated Draft EIR. Impacts will be less than significant.

**Impact AQ-2:** Construction of the Project could result in a cumulatively considerable net increase of NOx emissions. (Refer to pages 4.2-61 through 4.2-70 of the Recirculated Draft EIR.)

**MM AQ-1:** PDF AQ-1, Construction Air Quality Program, shall be implemented during construction of the ITC Project.

**Basis for Finding:** Mitigation Measure MM AQ-1 requires the implementation of PDF AQ-1 from the Project's CCP to reduce air quality emissions during construction. PDF AQ-1 requires the Project to use equipment that meets the U.S. Environmental Protection Agency (USEPA)'s Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity. With implementation of PDF AQ-1, this impact would be **less than significant**.

**Finding:** Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effect as identified in the Recirculated Draft EIR. Impacts will be less than significant.

**Impact AQ-3:** The Project could expose sensitive receptors to substantial pollutant concentrations during construction. (Refer to pages 4.2-70 through 4.2-87 of the Recirculated Draft EIR.)

**MM AQ-1:** PDF AQ-1, Construction Air Quality Program, shall be implemented during construction of the ITC Project.

**Basis for Finding:** Mitigation Measure MM AQ-1 requires the implementation of PDF AQ-1 from the Project's CCP to reduce air quality emissions during construction. PDF AQ-1 requires the Project to use equipment that meets the U.S. Environmental Protection Agency (USEPA)'s Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity. With implementation of PDF AQ-1, this impact would be **less than significant**.

**Finding:** Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effect as identified in the Recirculated Draft EIR. Impacts will be less than significant.

## B. Biological Resources

**Impact BIO-1:** Construction and operation of the Project could interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites. (Refer to pages 4.3-45 through 4.3-50 of the Draft EIR.)

**MM BIO-1: Conservation of Faunal Resources: Nesting Birds/Raptors.** The City shall require demolition and construction contractors to implement the following measures:

- Prior to initiating any demolition and/or construction activities, a nesting bird survey shall be conducted to determine the presence of any nesting birds within 500 feet of demolition and/or construction activities. In addition, nesting bird surveys shall be conducted at least every six (6) months until the completion of construction activities, as specified below.
- Nesting bird survey shall include:
- Prior to any demolition and/or construction, and at least every six (6) months during and prior to the raptor nesting season until the completion of construction activities, January 1 to September 1, a qualified biologist shall conduct a site survey for active nests 30 days prior to any scheduled clearing, demolition, grading, or construction activities. The survey shall be conducted within all trees, manmade structures, and any other potential raptor nesting habitat.
- Prior to any vegetation disturbance between March 1 and September 15, and at least every six (6) months until the completion of construction activities, a qualified biologist shall conduct a survey for nesting birds in all breeding/nesting habitat within the construction or demolitions areas and within 300 feet of all disturbance areas and submit the results of these surveys to the City. The surveys shall be conducted within trees and structures, wherever nesting bird species may be located. Nesting bird surveys shall be conducted no earlier than 30 days prior to the initiation of ground or vegetation disturbance. If no breeding/nesting birds are observed, site preparation, demolition and construction activities may begin. If breeding activities and/or an active bird nest is located, the breeding habitat/nest site shall be fenced by the biological monitor a minimum of 300 feet (500 feet for raptors) in all directions, and this area shall not be disturbed until the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, and/or the young shall no longer

be impacted. If the qualified biologist determines that a narrower buffer between the demolition and/or construction activities and the observed active nests is warranted, the biologist may submit a written explanation as to why (e.g., species-specific information; ambient conditions and bird's habituation to them; terrain, vegetation, and birds' lines of sight between the demolition and/or construction activities and the nest and foraging areas) to the City and, upon request, the CDFW. Based on the submitted information, the City, acting as the lead agency (and CDFW, if CDFW requests) shall determine whether to allow a narrower buffer.

**Basis for Finding:** With the implementation of MM BIO-1, construction of the Project would no longer have the potential to disturb active nests for nesting birds and raptors. Active nests would be identified, and suitable buffers would be established to ensure that construction activities do not disturb nesting birds. Mitigation measures would thus ensure that the Project would not cause a substantial reduction in local population size or reduce reproductive success to birds and raptors. Thus, this impact would be considered **less than significant**.

**Finding:** Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effect as identified in the Recirculated Draft EIR. Impacts would be reduced to less than significant.

### **C. Cultural Resources**

**Impact CUL-2:** Construction and operation of the Project could cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5. (Refer to pages 4.4-61 through 4.4-62 of the Recirculated Draft EIR.)

**MM TCR-1:** Retention of a Tribal Cultural Resources Monitor/Consultant.

Prior to the commencement of any ground disturbing activity at the Project alignment, the Project contractor, in consultation with the City, shall retain a qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (US Department of the Interior, 2008) to carry out all mitigation related to cultural resources. In addition, a Native American Monitor shall be designated by the Gabrieleno Band of Mission Indians-Kizh Nation – the tribe that consulted on this project pursuant to Assembly Bill AB 52 (the "Tribe" or the "Consulting Tribe"). If no Native American Monitor is designated within a reasonable period of time (not to exceed 30 days), the activity can commence without the designated Monitor. A copy of the executed contract(s) with the qualified archaeologist and Native American Monitor shall be submitted to the City of Inglewood Planning and Building Department prior to the

issuance of any permit necessary to commence a ground-disturbing activity. The Native American Monitor will only be present on-site during the construction phases that involve ground-disturbing activities. Ground disturbing activities are defined by the Tribe as activities that may include, but are not limited to, pavement removal, potholing or auguring, grubbing, tree removals, boring, grading, excavation, drilling, and trenching, within the Project area. The Native American Monitor will complete daily monitoring logs that will provide descriptions of the day's activities, including construction activities, locations, soil, and any cultural materials identified. The on-site monitoring shall end when all ground-disturbing activities on the Project alignment are completed, or when the Native American Representatives and Native American Monitor have indicated that all upcoming ground-disturbing activities at the Project alignment have little to no potential for impacting Tribal Cultural Resources. Upon discovery of any Tribal Cultural Resources, construction activities shall cease in the immediate vicinity of the find (not less than the surrounding 50 feet) until the find can be assessed. All Tribal Cultural Resources unearthed by project activities shall be evaluated by the qualified archaeologist and the Native American Monitor. If the resources are Native American in origin, the Consulting Tribe will retain it/them in the form and/or manner the Tribe deems appropriate, for educational, cultural and/or historic purposes.

If human remains and/or grave goods are discovered or recognized at the Project alignment, all ground disturbance shall immediately cease, and the county coroner shall be notified per Public Resources Code Section 5097.98, and Health & Safety Code Section 7050.5. Human remains and grave/burial goods shall be treated alike per California Public Resources Code section 5097.98(d)(1) and (2). Work may continue on other parts of the Project alignment while evaluation and, if necessary, mitigation takes place (CEQA Guidelines Section 15064.5[f]). If a non-Native American resource is determined by the qualified archaeologist to constitute a "historical resource" or "unique archaeological resource," time allotment and funding sufficient to allow for implementation of avoidance measures, or appropriate mitigation, must be available. The treatment plan established for the resources shall be in accordance with CEQA Guidelines Section 15064.5(f) for historical resources and Public Resources Code Sections 21083.2(b) for unique archaeological resources. Preservation in place (i.e., avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery excavations to remove the resource along with subsequent laboratory processing and analysis. Any historic archaeological material that is not Native American in origin shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local

school or historical society in the area for educational purposes. **MM TCR-2** through **MM TCR-5** will supplement **MM TCR-1**.

**MM TCR-2: Monitoring and Mitigation Program.**

Prepare, design, and implement an Archaeological Monitoring and Mitigation Program for the Project. The Monitoring and Mitigation Program shall define pre-construction coordination, construction monitoring for excavations based on the activities and depth of disturbance planned for each portion of the Project area, data recovery (including halting or diverting construction so that archaeological remains can be evaluated and recovered in a timely manner), artifact and feature treatment, procurement, and reporting. The Monitoring and Mitigation Program shall be prepared and approved by a qualified archaeologist prior to the issuance of the first grading permit.

**MM TCR-3: Cultural Resources Sensitivity Training.**

The qualified archaeologist and Native American Monitor shall conduct construction-worker archaeological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.) and will present the Archaeological Monitoring and Mitigation Program as outlined in **MM TCR-2**, for all construction personnel conducting, supervising, or associated with demolition and ground disturbance, including utility work, for the Project. In the event construction crews are phased or rotated, additional training shall be conducted for new construction personnel working on ground-disturbing activities. Construction personnel shall be informed of the types of prehistoric and historic archaeological resources that may be encountered, and of the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains. Documentation shall be retained by the qualified archaeologist demonstrating that the appropriate construction personnel attended the training.

**MM TCR-4: Archaeological and Native American Monitoring**

The qualified archaeologist will oversee archaeological and Native American monitors who shall be retained to be present and work in tandem, monitoring during construction excavations such as grading, trenching, or any other excavation activity associated with the Project and as defined in the Monitoring and Mitigation Program. If, after advanced notice of potential ground-disturbing activities, the Native American representative declines, is unable, or does not respond to the notice, construction can proceed under supervision of the qualified archaeologist. The frequency of monitoring shall be based on the rate of excavation and grading activities, the materials being excavated, and the depth of excavation, and if found, the quantity and type of archaeological resources encountered. Full-time monitoring may be reduced to part-time inspections, or ceased

entirely, if determined adequate by the qualified archaeologist and the Native American Monitor.

In the event of the discovery of any archaeological materials during implementation of the Project, all work shall immediately cease within 50 feet of the discovery until it can be evaluated by the qualified archaeologist. Construction shall not resume until the qualified archaeologist has made a determination on the significance of the resource(s) and provided recommendations regarding the handling of the find. If the resource is determined to be significant, the qualified archaeologist will confer with the City and contractor regarding recommendation for treatment and ultimate disposition of the resource(s).

If it is determined that the discovered archaeological resource constitutes a historical resource or a unique archaeological resource pursuant to CEQA, avoidance and preservation in place is the preferred manner of mitigation. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement.

In the event that preservation in place is demonstrated to be infeasible and data recovery through excavation is the only feasible mitigation available, a Cultural Resources Treatment Plan shall be prepared and implemented by the qualified archaeologist in consultation with the City and contractor, and appropriate Native American representatives (if the find is of Native American origin). The Cultural Resources Treatment Plan shall provide for the adequate recovery of the scientifically consequential information contained in the archaeological resource through laboratory processing and analysis of the artifacts. The Cultural Resources Treatment Plan will further make recommendations for the ultimate curation of any archaeological materials, which shall be curated at a public, non-profit curation facility, university, or museum with a research interest in the materials, if such an institution agrees to accept them. If resources are determined to be Native American in origin, they will first be offered to the Tribe for permanent curation, repatriation, or reburial, as directed by the Tribe. If no institution or Tribe accepts the archaeological material, then the material shall be donated to a local school or historical society in the area for educational purposes.

If the resource is identified as a Native American, the qualified archaeologist and the City shall consult with appropriate Native American representatives, as identified through the AB 52 consultation process in determining treatment for prehistoric or Native American resources to ensure cultural values ascribed to the resource, beyond that which is scientifically important, are considered.

Prepare a final monitoring and mitigation report for submittal to the City, and the South Central Coastal Information Center (SCCIC), in order to document the results of the archaeological and Native American monitoring. If there are significant discoveries, artifact and feature analysis and final disposition shall be included with the final report, which will be submitted to the SCCIC and the City. The final monitoring report shall be submitted to the City within 90 days of completion of excavation and other ground disturbing activities that require monitoring.

**Basis for Finding:** With implementation of mitigation measures MM TCR-1 through MM TCR-4, construction of the Project would no longer have the potential to cause a substantial adverse change in the significance of an archaeological resource. With implementation of MM TCR-1, the City shall retain a qualified archaeologist meeting the Secretary of the Interior’s Professional Qualifications Standards for archaeology to carry out all mitigation related to cultural resources. In addition, a Native American Monitor shall be designated by the Gabrieleno Band of Mission Indians-Kizh Nation. With implementation of Mitigation Measure MM TCR-2, the City shall prepare, design, and implement an Archaeological Monitoring and Mitigation Program for the Project. With implementation of Mitigation Measure MM TCR-3, the qualified archaeologist and Native American Monitor shall conduct construction-worker archaeological resources sensitivity training and will present the Archaeological Monitoring and Mitigation Program for all construction personnel for the Project. With implementation of Mitigation Measure MM TCR-4, the qualified archaeologist will oversee the archaeological and Native American monitors who shall be retained to be present and work in tandem, monitoring during construction excavations as defined in the Monitoring and Mitigation Program. With implementation of Mitigation Measures MM TCR-1, MM TCR-2, MM TCR-3, and MM TCR-4, this impact would be **less than significant**.

**Finding:** Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effect as identified in the Recirculated Draft EIR. Impacts would be reduced to less than significant.

**Impact CUL-3:**                   **Construction and operation of the Project could disturb any human remains, including those interred outside of formal cemeteries. (Refer to page 4.4-63 of the Recirculated Draft EIR.)**

**MM TCR-1:**           **Retention of a Tribal Cultural Resources Monitor/Consultant.**

Prior to the commencement of any ground disturbing activity at the Project alignment, the Project contractor, in consultation with the City, shall retain a qualified archaeologist meeting the Secretary of the Interior’s Professional Qualifications Standards for archaeology (US Department of the Interior, 2008) to carry out all mitigation related to

cultural resources. In addition, a Native American Monitor shall be designated by the Gabrieleno Band of Mission Indians-Kizh Nation – the tribe that consulted on this project pursuant to Assembly Bill AB 52 (the “Tribe” or the “Consulting Tribe”). If no Native American Monitor is designated within a reasonable period of time (not to exceed 30 days), the activity can commence without the designated Monitor. A copy of the executed contract(s) with the qualified archaeologist and Native American Monitor shall be submitted to the City of Inglewood Planning and Building Department prior to the issuance of any permit necessary to commence a ground-disturbing activity. The Native American Monitor will only be present on-site during the construction phases that involve ground-disturbing activities. Ground disturbing activities are defined by the Tribe as activities that may include, but are not limited to, pavement removal, potholing or auguring, grubbing, tree removals, boring, grading, excavation, drilling, and trenching, within the Project area. The Native American Monitor will complete daily monitoring logs that will provide descriptions of the day’s activities, including construction activities, locations, soil, and any cultural materials identified. The on-site monitoring shall end when all ground-disturbing activities on the Project alignment are completed, or when the Native American Representatives and Native American Monitor have indicated that all upcoming ground- disturbing activities at the Project alignment have little to no potential for impacting Tribal Cultural Resources. Upon discovery of any Tribal Cultural Resources, construction activities shall cease in the immediate vicinity of the find (not less than the surrounding 50 feet) until the find can be assessed. All Tribal Cultural Resources unearthed by project activities shall be evaluated by the qualified archaeologist and the Native American Monitor. If the resources are Native American in origin, the Consulting Tribe will retain it/them in the form and/or manner the Tribe deems appropriate, for educational, cultural and/or historic purposes.

If human remains and/or grave goods are discovered or recognized at the Project alignment, all ground disturbance shall immediately cease, and the county coroner shall be notified per Public Resources Code Section 5097.98, and Health & Safety Code Section 7050.5. Human remains and grave/burial goods shall be treated alike per California Public Resources Code section 5097.98(d)(1) and (2). Work may continue on other parts of the Project alignment while evaluation and, if necessary, mitigation takes place (CEQA Guidelines Section 15064.5[f]). If a non-Native American resource is determined by the qualified archaeologist to constitute a “historical resource” or “unique archaeological resource,” time allotment and funding sufficient to allow for implementation of avoidance measures, or appropriate mitigation, must be available. The treatment plan established for the resources shall be in accordance with CEQA Guidelines Section 15064.5(f) for historical resources and Public Resources Code Sections 21083.2(b) for unique archaeological resources. Preservation in place (i.e., avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include

implementation of archaeological data recovery excavations to remove the resource along with subsequent laboratory processing and analysis. Any historic archaeological material that is not Native American in origin shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes. **MM TCR-2** through **MM TCR-5** will supplement **MM TCR-1**.

**MM TCR-3: Cultural Resources Sensitivity Training.**

The qualified archaeologist and Native American Monitor shall conduct construction-worker archaeological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.) and will present the Archaeological Monitoring and Mitigation Program as outlined in **MM TCR-2**, for all construction personnel conducting, supervising, or associated with demolition and ground disturbance, including utility work, for the Project. In the event construction crews are phased or rotated, additional training shall be conducted for new construction personnel working on ground-disturbing activities. Construction personnel shall be informed of the types of prehistoric and historic archaeological resources that may be encountered, and of the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains. Documentation shall be retained by the qualified archaeologist demonstrating that the appropriate construction personnel attended the training.

**MM TCR-5: Inadvertent Discoveries Related to Human Remains.**

In the event of the unanticipated discovery of human remains during excavation or other ground disturbance related to the Project, all work shall immediately cease within 150 feet of the discovery and the County Coroner shall be contacted in accordance with PRC Section 5097.98<sup>2</sup> and Health and Safety Code Section 7050.5.<sup>3</sup> Additionally, the contractor shall notify the City, and the tribal cultural resources monitor and archaeological monitor.

The City, as the Project sponsor, and the contractor shall ensure that the immediate vicinity where the discovery occurred is not disturbed by further activity, is adequately protected according to generally accepted cultural and tribal standards or practices, and

---

<sup>2</sup> NAGPRA, Title 43. Public Lands: Interior, Subtitle A. Office of the Secretary of the Interior, Part 10. Native American Graves Protection and Repatriation Regulations, § 5097.98 – Notification of discovery of Native American human remains, descendants; disposition of human remains and associated grave goods.

<sup>3</sup> [California / Health and Safety Code - HSC / CHAPTER 2. General Provisions \[7050.5. - 7055.\] / Section 7050.5.](#)

that further ground-disturbing activities take into account the possibility of multiple burials.

No further excavation or disturbance of the discovery or any nearby area reasonably suspected to overlie adjacent remains (as determined by the qualified archaeologist and/or tribal cultural resources monitor) shall occur until the coroner has made the necessary findings as to origin and disposition pursuant to PRC Section 5097.98. If such a discovery occurs, a temporary construction exclusion zone shall be established surrounding the area of the discovery so that the area would be protected (as determined by the qualified archaeologist and/or cultural resources monitor), and consultation and treatment could occur as prescribed by law. As required by law, the coroner would determine within two working days of being notified if the remains are subject to his or her authority.

If the coroner recognizes the human remains to be those of a Native American or has reason to believe that they are those of a Native American, he or she shall contact, by telephone within 24 hours, the NAHC. In accordance with Health and Safety Code Section 7050.5, subdivision (c), and PRC Section 5097.98 (as amended by AB 2641), the NAHC would make an MLD determination.

If the Tribe is designated MLD, the following standards shall apply and the following requirements and treatment measures shall be implemented.

1. To the Tribe, the term “human remains” encompasses more than human bones. In ancient as well as historic times, Tribal Traditions included, but were not limited to, the burial of funerary objects with the deceased, and the ceremonial burning of human remains. These remains are to be treated in the same manner as bone fragments that remain intact. Associated funerary objects are objects that, as part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later; other items made exclusively for burial purposes or to contain human remains can also be considered as associated funerary objects.
2. Prior to the continuation of ground disturbing activities, the landowner shall arrange a designated site location within the footprint of the project for the respectful reburial of the human remains and/or ceremonial objects. In the case where discovered human remains cannot be fully documented and recovered on the same day, the remains shall be covered with muslin cloth and a steel plate that can be moved by heavy equipment placed over the excavation opening to protect the remains. If this type of steel plate is not available, a 24-hour guard

should be posted outside of working hours. As stated by the Tribe as part of the Project's AB 52 consultation:

*The Tribe will make every effort to recommend diverting the project and keeping the remains in situ and protected. If the project cannot be diverted, it may be determined that burials will be removed. The Tribe will work closely with the qualified archaeologist to ensure that the excavation is treated carefully, ethically, and respectfully.*

3. If data recovery is approved by the Tribe, documentation shall be taken which includes at a minimum detailed descriptive notes and sketches. The Tribe shall approve additional types of documentation for data recovery purposes. Cremations must either be removed in bulk or by means as necessary to ensure completely recovery of all material. If the discovery of human remains includes four or more burials, the location is considered a cemetery and a separate treatment plan shall be created. Once complete, a final report of all activities is to be submitted to the Tribe and the NAHC. Scientific study or the utilization of any invasive diagnostics on human remains of Native American origin.
4. Each occurrence of human remains and associated funerary objects will be stored using opaque cloth bags. All human remains, funerary objects, sacred objects and objects of cultural patrimony will be removed to a secure container on site if feasible. These items shall be retained and reburied within six months of recovery if feasible. The site of reburial/repatriation shall be on the Project area, but at a location agreed upon between the Tribe and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered.

If the Tribe is not designated MLD, each occurrence of human remains and associated funerary objects shall be stored using opaque cloth bags. All human remains, funerary objects, sacred objects, and objects of cultural patrimony shall be preserved in place where feasible and to consult with the tribal cultural resources monitor and/or the MLD about appropriate treatment if removal is required. If remains are removed, they shall be removed to a secure container on site, if possible, with consultation with of the qualified archaeologist and/or tribal cultural resources monitor. These items shall be retained and reburied within six months of recovery or as directed by the qualified archaeologist and/or tribal cultural resources monitor. The site of reburial/repatriation shall be within the Project footprint, or at a location agreed upon between the MLD and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered.

**Basis for Finding:** With implementation of Mitigation Measure MM TCR-1, MM TCR-3, and MM TCR-5, construction of the Project would no longer have the potential to cause a substantial adverse change in the significance of an archaeological resource. With implementation of MM TCR-1, the City shall retain a qualified archaeologist meeting the Secretary of the Interior’s Professional Qualifications Standards for archaeology to carry out all mitigation related to cultural resources. In addition, a Native American Monitor shall be designated by the Gabrieleno Band of Mission Indians-Kizh Nation. With implementation of Mitigation Measure MM TCR-3, the qualified archaeologist and Native American Monitor shall conduct construction-worker archaeological resources sensitivity training and will present the Archaeological Monitoring and Mitigation Program for all construction personnel for the Project. With implementation of Mitigation Measure MM TCR-5, the City and contractor shall ensure the cessation of all construction work in the event of the unanticipated discovery of human remains during excavation related to the Project. With implementation of Mitigation Measures MM TCR-1, MM TCR-3, and MM TCR-5, this impact would be **less than significant**.

**Finding:** Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effect as identified in the Recirculated Draft EIR. Impacts would be reduced to less than significant.

## **D. Geology and Soils**

**Impact GEO-1:**            **The Project could directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault?**

**MM GEO-1:**    **Project Design.** The Project shall be designed to accommodate fault rupture where present in accordance with applicable Caltrans guidelines, including MTD 20-8, *Analysis of Ordinary Bridges that Cross Faults*, dated January 2013; and MTD 20-10, *Fault Rupture*, dated January 2013, where any portion of a structure falls within an APEFZ, or where any portion of a structure falls within approximately 100 meters (330 feet) of well-mapped active faults, or within 300 meters (1,000 feet) of an un-zoned fault (not in an APEFZ) that is Holocene or younger in age.

Stations and elevated structures for the ATS guideway shall be located to avoid or accommodate the fault rupture hazard where present with refinement of station and ATS guideway placement worked into final design as needed based on project specific geologic surveys, recommendations and criteria. Bridge type structures, such as the ATS guideway, shall be designed to take into account potential displacement from a fault

offset, dynamic response due to ground shaking, and any other fault-induced hazards (e.g., creep) that may occur. The design shall be in accordance with the Caltrans MTD 20-8, which defines a method for determining the potential displacement at columns and abutments at fault crossings and designing the structure so it can slide without falling.

**MM GEO-2:** Prior to the start of construction, the location of the anticipated trend of the Townsite Fault shall be further defined via a phased investigation process to identify and locate active fault traces in the Project area to support adjustments to the Project's final design as needed.

The phased investigation shall be prepared by registered professionals (i.e., California Professional Civil Engineer, Professional Engineering Geologist with experience in fault evaluations) and include a fault investigation conducted along the trace of the Townsite Fault to refine its location and assess its activity level where it crosses the ATS guideway and stations.

The following methods shall be included in the investigation:

- Aerial photograph analysis;
- Geophysical surveys (e.g., seismic reflection and/or seismic refraction) to refine the location of the Townsite fault and inform subsequent targeted fault hazard exploration as necessary;
- Targeted fault trenching based on the findings of additional geophysical studies to locate the potential Townsite Fault where it crosses the proposed ATS alignment; and
- Exploratory drilling and sampling (e.g., hollow stem auger and CPT [cone penetration test] borings), as necessary, if the trace of the Townsite fault cannot be adequately delineated across the proposed ATS alignment through the means of fault trenching.

Based on the results of these investigations, column placements and facility designs shall be adjusted to accommodate geologic conditions identified. Further, the facilities shall be designed in accordance with applicable Caltrans guidelines including MTD 20-8, Analysis of Ordinary *Bridges* that Cross Faults, and MTD 20-10, Fault Rupture. Stations/structures shall be located to avoid the fault rupture hazard where present.

Columns and foundations for the guideway and stations, as well as any other ATS facilities shall be located to avoid the fault rupture hazard where present.

Probabilistic procedures shall follow those outlined in the *Fault Rupture Hazard Evaluation (Appendix K.1)*. If further study of the fault rupture is conducted, then procedures as outlined in CGS Note 49<sup>4</sup> shall be followed.

**MM GEO-3:** The proposed ATS system facilities shall be designed in accordance with applicable Caltrans guidelines including Memo to Designers 20-8 (Analysis of Ordinary Bridges that Cross Faults) and 20-10 (Fault Rupture). The response spectra provided in the *Development of Seismic Design Criteria in Support of Draft EIR - Seismic Design Criteria (Appendix K.2)* shall be considered applicable for both aerial guideway and ancillary structures within each segment of the alignment under the guideway and each station.

Probabilistic procedures also shall follow those outlined Caltrans Memo to Designers 20-10 -Fault Rupture, dated January 2013.

**Basis for Finding:** With implementation of Mitigation Measure MM GEO-1, the Project will be designed to accommodate fault rupture where present in accordance with applicable Caltrans guidelines. Moreover, stations and elevated structures for the ATS guideway shall be designed in locations avoiding or accomodating fault rupture hazards where present. With implementation of Mitigation Measure MM GEO-2, a phased investigation to further define the trend of the Townsite Fault will be conducted to support adjustments to the Project’s final design. With implementation of Mitigation Measure MM GEO-3, the ATS facilities will be designed in accordance with applicable Caltrans guidelines and seismic design criteria. With implementation of Mitigation Measures MM GEO-1, MM GEO-2, and MM GEO-3, this impact would be **less than significant**.

**Finding:** Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effect as identified in the Recirculated Draft EIR. Impacts would be reduced to less than significant.

**Impact GEO-2:** **The Project could directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?**

**MM GEO-1: Project Design.** The Project shall be designed to accommodate fault rupture where present in accordance with applicable Caltrans guidelines, including MTD 20-8, *Analysis of Ordinary Bridges that Cross Faults*, dated January 2013; and MTD 20-10, *Fault Rupture*, dated January 2013, where any portion of a structure falls within an APEFZ, or where any portion of a structure falls within approximately 100 meters (330 feet) of well-mapped

---

4 California Geological Survey, Note 49: Guidelines for Evaluating the Hazard of Surface Fault Rupture, <https://www.conservation.ca.gov/cgs/Documents/Publications/CGS-Notes/CGS-Note-49.pdf>.

active faults, or within 300 meters (1,000 feet) of an un-zoned fault (not in an APEFZ) that is Holocene or younger in age.

Stations and elevated structures for the ATS guideway shall be located to avoid or accommodate the fault rupture hazard where present with refinement of station and ATS guideway placement worked into final design as needed based on project specific geologic surveys, recommendations and criteria. Bridge type structures, such as the ATS guideway, shall be designed to take into account potential displacement from a fault offset, dynamic response due to ground shaking, and any other fault-induced hazards (e.g., creep) that may occur. The design shall be in accordance with the Caltrans MTD 20-8, which defines a method for determining the potential displacement at columns and abutments at fault crossings and designing the structure so it can slide without falling.

**MM GEO-2:** Prior to the start of construction, the location of the anticipated trend of the Townsite Fault shall be further defined via a phased investigation process to identify and locate active fault traces in the Project area to support adjustments to the Project's final design as needed.

The phased investigation shall be prepared by registered professionals (i.e., California Professional Civil Engineer, Professional Engineering Geologist with experience in fault evaluations) and include a fault investigation conducted along the trace of the Townsite Fault to refine its location and assess its activity level where it crosses the ATS guideway and stations.

The following methods shall be included in the investigation:

- Aerial photograph analysis;
- Geophysical surveys (e.g., seismic reflection and/or seismic refraction) to refine the location of the Townsite fault and inform subsequent targeted fault hazard exploration as necessary;
- Targeted fault trenching based on the findings of additional geophysical studies to locate the potential Townsite Fault where it crosses the proposed ATS alignment; and
- Exploratory drilling and sampling (e.g., hollow stem auger and CPT [cone penetration test] borings), as necessary, if the trace of the Townsite fault cannot be adequately delineated across the proposed ATS alignment through the means of fault trenching.

Based on the results of these investigations, column placements and facility designs shall be adjusted to accommodate geologic conditions identified. Further, the facilities shall be designed in accordance with applicable Caltrans guidelines including MTD 20-8, Analysis of Ordinary *Bridges* that Cross Faults, and MTD 20-10, Fault Rupture. Stations/structures shall be located to avoid the fault rupture hazard where present.

Columns and foundations for the guideway and stations, as well as any other ATS facilities shall be located to avoid the fault rupture hazard where present.

Probabilistic procedures shall follow those outlined in the *Fault Rupture Hazard Evaluation (Appendix K.1)*. If further study of the fault rupture is conducted, then procedures as outlined in CGS Note 49<sup>5</sup> shall be followed.

**MM GEO-3:** The proposed ATS system facilities shall be designed in accordance with applicable Caltrans guidelines including Memo to Designers 20-8 (Analysis of Ordinary Bridges that Cross Faults) and 20-10 (Fault Rupture). The response spectra provided in the *Development of Seismic Design Criteria in Support of Draft EIR - Seismic Design Criteria (Appendix K.2)* shall be considered applicable for both aerial guideway and ancillary structures within each segment of the alignment under the guideway and each station.

Probabilistic procedures also shall follow those outlined Caltrans Memo to Designers 20-10 -Fault Rupture, dated January 2013.

**Basis for Finding:** With implementation of Mitigation Measure MM GEO-1, the Project will be designed Projectto accommodate fault rupture where present in accordance with applicable Caltrans guidelines. Moreover, stations and elevated structures for the ATS guideway shall be designed in locations avoiding or accommodating fault rupture hazards where present. With implementation of Mitigation Measure MM GEO-2, a phased investigation to further define the trend of the Townsite Fault will be conducted to support adjustments to the Project’s final design. With implementation of Mitigation Measure MM GEO-3, the City the ATS facilities will be designed in accordance with applicable Caltrans guidelines and seismic design criteria. With implementation of Mitigation Measures MM GEO-1, MM GEO-2, and MM GEO-3, this impact would be **less than significant**.

**Finding:** Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effect as identified in the Recirculated Draft EIR. Impacts would be reduced to less than significant.

**Impact GEO-3:**           **The Project could directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?**

**MM GEO-4:** A qualified paleontologist meeting the SVP standards shall be retained by the project applicant and approved by the City prior to the approval of grading permits. The qualified paleontologist shall:

---

5 California Geological Survey, Note 49: Guidelines for Evaluating the Hazard of Surface Fault Rupture, <https://www.conservation.ca.gov/cgs/Documents/Publications/CGS-Notes/CGS-Note-49.pdf>.

- a) Prepare, design, and implement a monitoring and mitigation program for the Project consistent with Society of Vertebrate Paleontology Guidelines. The Plan shall define pre-construction coordination, construction monitoring for excavations based on the activities and depth of disturbance planned for each portion of the Project area, data recovery (including halting or diverting construction so that fossil remains can be salvaged in a timely manner), fossil treatment, procurement, and reporting. The Plan monitoring and mitigation program shall be prepared and approved by the City prior to the issuance of the first grading permit. If the qualified paleontologist determines that the Project-related grading and excavation activity would not affect Older Quaternary Alluvium, then no further mitigation is required.
- b) Conduct construction worker paleontological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.) and would present the Plan as outlined in (a). In the event construction crews are phased or rotated, additional training shall be conducted for new construction personnel working on ground-disturbing activities. The training session shall provide instruction on the recognition of the types of paleontological resources that could be encountered within the Project area and the procedures to be followed if they are found. Documentation shall be retained by the qualified paleontologist demonstrating that the appropriate construction personnel attended the training.
- c) Direct the performance of paleontological resources monitoring by a qualified paleontological monitor (meeting the standards of the SVP, 2010). Paleontological resources monitoring shall be conducted pursuant to the monitoring and mitigation program developed under (a), above. Monitoring activities may be altered or ceased if determined adequate by the qualified paleontologist. Monitors shall have the authority to and shall temporarily halt or divert work away from exposed fossils or potential fossils and establish a 50-foot radius temporarily halting work around the find. Monitors shall prepare daily logs detailing the types of ground disturbing activities and soils observed, and any discoveries.
- d) If fossils are encountered, determine their significance, and, if significant, supervise their collection for curation. Any fossils collected during Project-related excavations, and determined to be significant by the qualified paleontologist, shall be prepared to the point of identification and curated into an accredited repository with retrievable storage.
- e) Prepare a final monitoring and mitigation report for submittal to the City in order to document the results of the paleontological monitoring. If there are significant discoveries, fossil locality information and final disposition shall be included with the final report which would be submitted to the appropriate repository and the City. The final monitoring report shall be submitted to the City within 90 days of completion of excavation and other ground disturbing activities that could affect Older Quaternary Alluvium.

**Basis for Finding:** With implementation of Mitigation Measure MM GEO-4, the a paleontologist meeting the SVP Standards to prepare, design, and implement a paleontology monitoring and mitigation program for the Project consistent with SVP Guidelines will be retained. Moreover, this monitoring and mitigation program shall include education and sensitivity training for construction workers, guidelines for on-site paleontological monitors to issue stop-work orders if fossils are found, procedures for paleontological resource evaluation in the event of discovery, and final reporting procedure guidelines for submission to the City. With implementation of Mitigation Measure MM GEO-4, this impact would be **less than significant**.

**Finding:** Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effect as identified in the Recirculated Draft EIR. Impacts would be reduced to less than significant.

## **E. Tribal Cultural Resources**

**Impact TCR-1: Construction and operation of the Project could cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code § 21074 as either a site, feature, place, or cultural landscape that is geographically defined in terms of size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:**

- i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k); or**
- ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code § 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code § 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe. (Refer to pages 4.13-22 through 4.13-31 of the Recirculated Draft EIR.)**

**MM TCR-1: Retention of a Tribal Cultural Resources Monitor/Consultant.**

Prior to the commencement of any ground disturbing activity at the Project alignment, the Project contractor, in consultation with the City, shall retain a qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for

archaeology (US Department of the Interior, 2008) to carry out all mitigation related to cultural resources. In addition, a Native American Monitor shall be designated by the Gabrieleno Band of Mission Indians-Kizh Nation – the tribe that consulted on this project pursuant to Assembly Bill AB 52 (the “Tribe” or the “Consulting Tribe”). If no Native American Monitor is designated within a reasonable period of time (not to exceed 30 days), the activity can commence without the designated Monitor. A copy of the executed contract(s) with the qualified archaeologist and Native American Monitor shall be submitted to the City of Inglewood Planning and Building Department prior to the issuance of any permit necessary to commence a ground-disturbing activity. The Native American Monitor will only be present on-site during the construction phases that involve ground-disturbing activities. Ground disturbing activities are defined by the Tribe as activities that may include, but are not limited to, pavement removal, potholing or auguring, grubbing, tree removals, boring, grading, excavation, drilling, and trenching, within the Project area. The Native American Monitor will complete daily monitoring logs that will provide descriptions of the day’s activities, including construction activities, locations, soil, and any cultural materials identified. The on-site monitoring shall end when all ground-disturbing activities on the Project alignment are completed, or when the Native American Representatives and Native American Monitor have indicated that all upcoming ground- disturbing activities at the Project alignment have little to no potential for impacting Tribal Cultural Resources. Upon discovery of any Tribal Cultural Resources, construction activities shall cease in the immediate vicinity of the find (not less than the surrounding 50 feet) until the find can be assessed. All Tribal Cultural Resources unearthed by project activities shall be evaluated by the qualified archaeologist and the Native American Monitor. If the resources are Native American in origin, the Consulting Tribe will retain it/them in the form and/or manner the Tribe deems appropriate, for educational, cultural and/or historic purposes.

If human remains and/or grave goods are discovered or recognized at the Project alignment, all ground disturbance shall immediately cease, and the county coroner shall be notified per Public Resources Code Section 5097.98, and Health & Safety Code Section 7050.5. Human remains and grave/burial goods shall be treated alike per Public Resources Code section 5097.98, subdivision (d)(1) and (2). Work may continue on other parts of the Project alignment while evaluation and, if necessary, mitigation takes place (CEQA Guidelines Section 15064.5[f]). If a non-Native American resource is determined by the qualified archaeologist to constitute a “historical resource” or “unique archaeological resource,” time allotment and funding sufficient to allow for implementation of avoidance measures, or appropriate mitigation, must be available. The treatment plan established for the resources shall be in accordance with CEQA Guidelines section 15064.5, subdivision (f) for historical resources and Public Resources Code section 21083.2, subdivision (b) for unique archaeological resources. Preservation

in place (i.e., avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery excavations to remove the resource along with subsequent laboratory processing and analysis. Any historic archaeological material that is not Native American in origin shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes. **MM TCR-2** through **MM TCR-5** will supplement **MM TCR-1**.

**MM TCR-2: Monitoring and Mitigation Program.**

Prepare, design, and implement an Archaeological Monitoring and Mitigation Program for the Project. The Monitoring and Mitigation Program shall define pre-construction coordination, construction monitoring for excavations based on the activities and depth of disturbance planned for each portion of the Project area, data recovery (including halting or diverting construction so that archaeological remains can be evaluated and recovered in a timely manner), artifact and feature treatment, procurement, and reporting. The Monitoring and Mitigation Program shall be prepared and approved by a qualified archaeologist prior to the issuance of the first grading permit.

**MM TCR-3: Cultural Resources Sensitivity Training.**

The qualified archaeologist and Native American Monitor shall conduct construction-worker archaeological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.) and will present the Archaeological Monitoring and Mitigation Program as outlined in **MM TCR-2**, for all construction personnel conducting, supervising, or associated with demolition and ground disturbance, including utility work, for the Project. In the event construction crews are phased or rotated, additional training shall be conducted for new construction personnel working on ground-disturbing activities. Construction personnel shall be informed of the types of prehistoric and historic archaeological resources that may be encountered, and of the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains. Documentation shall be retained by the qualified archaeologist demonstrating that the appropriate construction personnel attended the training.

**MM TCR-4: Archaeological and Native American Monitoring**

The qualified archaeologist will oversee archaeological and Native American monitors who shall be retained to be present and work in tandem, monitoring during construction

excavations such as grading, trenching, or any other excavation activity associated with the Project and as defined in the Monitoring and Mitigation Program. If, after advanced notice of potential ground-disturbing activities, the Native American representative declines, is unable, or does not respond to the notice, construction can proceed under supervision of the qualified archaeologist. The frequency of monitoring shall be based on the rate of excavation and grading activities, the materials being excavated, and the depth of excavation, and if found, the quantity and type of archaeological resources encountered. Full-time monitoring may be reduced to part-time inspections, or ceased entirely, if determined adequate by the qualified archaeologist and the Native American Monitor.

In the event of the discovery of any archaeological materials during implementation of the Project, all work shall immediately cease within 50 feet of the discovery until it can be evaluated by the qualified archaeologist. Construction shall not resume until the qualified archaeologist has made a determination on the significance of the resource(s) and provided recommendations regarding the handling of the find. If the resource is determined to be significant, the qualified archaeologist will confer with the City and contractor regarding recommendation for treatment and ultimate disposition of the resource(s).

If it is determined that the discovered archaeological resource constitutes a historical resource or a unique archaeological resource pursuant to CEQA, avoidance and preservation in place is the preferred manner of mitigation. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement.

In the event that preservation in place is demonstrated to be infeasible and data recovery through excavation is the only feasible mitigation available, a Cultural Resources Treatment Plan shall be prepared and implemented by the qualified archaeologist in consultation with the City and contractor, and appropriate Native American representatives (if the find is of Native American origin). The Cultural Resources Treatment Plan shall provide for the adequate recovery of the scientifically consequential information contained in the archaeological resource through laboratory processing and analysis of the artifacts. The Cultural Resources Treatment Plan will further make recommendations for the ultimate curation of any archaeological materials, which shall be curated at a public, non-profit curation facility, university, or museum with a research interest in the materials, if such an institution agrees to accept them. If resources are determined to be Native American in origin, they will first be offered to the Tribe for permanent curation, repatriation, or reburial, as directed by the Tribe. If no institution or Tribe accepts the archaeological material, then the material shall be donated to a local school or historical society in the area for educational purposes.

If the resource is identified as a Native American, the qualified archaeologist and the City shall consult with appropriate Native American representatives, as identified through the AB 52 consultation process in determining treatment for prehistoric or Native American resources to ensure cultural values ascribed to the resource, beyond that which is scientifically important, are considered.

Prepare a final monitoring and mitigation report for submittal to the City, and the SCCIC, in order to document the results of the archaeological and Native American monitoring. If there are significant discoveries, artifact and feature analysis and final disposition shall be included with the final report, which will be submitted to the SCCIC and the City. The final monitoring report shall be submitted to the City within 90 days of completion of excavation and other ground disturbing activities that require monitoring.

**MM TCR-5: Inadvertent Discoveries Related to Human Remains.**

In the event of the unanticipated discovery of human remains during excavation or other ground disturbance related to the Project, all work shall immediately cease within 150 feet of the discovery and the County Coroner shall be contacted in accordance with Public Resources Code section 5097.98<sup>6</sup> and Health and Safety Code section 7050.5.<sup>7</sup> Additionally, the contractor shall notify the City, and the tribal cultural resources monitor and archaeological monitor.

The City, as the Project sponsor, and the contractor shall ensure that the immediate vicinity where the discovery occurred is not disturbed by further activity, is adequately protected according to generally accepted cultural and tribal standards or practices, and that further ground-disturbing activities take into account the possibility of multiple burials.

No further excavation or disturbance of the discovery or any nearby area reasonably suspected to overlie adjacent remains (as determined by the qualified archaeologist and/or tribal cultural resources monitor) shall occur until the coroner has made the necessary findings as to origin and disposition pursuant to Public Resources Code section 5097.98. If such a discovery occurs, a temporary construction exclusion zone shall be established surrounding the area of the discovery so that the area would be protected (as determined by the qualified archaeologist and/or cultural resources monitor), and consultation and treatment could occur as prescribed by law. As required by law, the

---

<sup>6</sup> NAGPRA, Title 43. Public Lands: Interior, Subtitle A. Office of the Secretary of the Interior, Part 10. Native American Graves Protection and Reparation Regulations, § 5097.98 – Notification of discovery of Native American human remains, descendants; disposition of human remains and associated grave goods.

<sup>7</sup> [California / Health and Safety Code - HSC / CHAPTER 2. General Provisions \[7050.5. - 7055.\] / Section 7050.5.](#)

coroner would determine within two working days of being notified if the remains are subject to his or her authority.

If the coroner recognizes the human remains to be those of a Native American or has reason to believe that they are those of a Native American, he or she shall contact, by telephone within 24 hours, the NAHC. In accordance with Health and Safety Code section 7050.5, subdivision (c), and Public Resources Code section 5097.98 (as amended by AB 2641), the NAHC would make an MLD determination.

If the Tribe is designated MLD, the following standards shall apply and the following requirements and treatment measures shall be implemented.

1. To the Tribe, the term “human remains” encompasses more than human bones. In ancient as well as historic times, Tribal Traditions included, but were not limited to, the burial of funerary objects with the deceased, and the ceremonial burning of human remains. These remains are to be treated in the same manner as bone fragments that remain intact. Associated funerary objects are objects that, as part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later; other items made exclusively for burial purposes or to contain human remains can also be considered as associated funerary objects.
2. Prior to the continuation of ground disturbing activities, the landowner shall arrange a designated site location within the footprint of the project for the respectful reburial of the human remains and/or ceremonial objects. In the case where discovered human remains cannot be fully documented and recovered on the same day, the remains shall be covered with muslin cloth and a steel plate that can be moved by heavy equipment placed over the excavation opening to protect the remains. If this type of steel plate is not available, a 24-hour guard should be posted outside of working hours. As stated by the Tribe as part of the Project’s AB 52 consultation:

*The Tribe will make every effort to recommend diverting the project and keeping the remains in situ and protected. If the project cannot be diverted, it may be determined that burials will be removed. The Tribe will work closely with the qualified archaeologist to ensure that the excavation is treated carefully, ethically, and respectfully.*

3. If data recovery is approved by the Tribe, documentation shall be taken which includes at a minimum detailed descriptive notes and sketches. The Tribe shall approve additional types of documentation for data recovery purposes. Cremations must either be removed in bulk or by means as necessary to ensure

completely recovery of all material. If the discovery of human remains includes four or more burials, the location is considered a cemetery and a separate treatment plan shall be created. Once complete, a final report of all activities is to be submitted to the Tribe and the NAHC. Scientific study or the utilization of any invasive diagnostics on human remains of Native American origin.

4. Each occurrence of human remains and associated funerary objects will be stored using opaque cloth bags. All human remains, funerary objects, sacred objects and objects of cultural patrimony will be removed to a secure container on site if feasible. These items shall be retained and reburied within six months of recovery if feasible. The site of reburial/repatriation shall be on the Project area, but at a location agreed upon between the Tribe and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered.

If the Tribe is not designated MLD, each occurrence of human remains and associated funerary objects shall be stored using opaque cloth bags. All human remains, funerary objects, sacred objects, and objects of cultural patrimony shall be preserved in place where feasible and to consult with the tribal cultural resources monitor and/or the MLD about appropriate treatment if removal is required. If remains are removed, they shall be removed to a secure container on site, if possible, with consultation with of the qualified archaeologist and/or tribal cultural resources monitor. These items shall be retained and reburied within six months of recovery or as directed by the qualified archaeologist and/or tribal cultural resources monitor. The site of reburial/repatriation shall be within the Project footprint, or at a location agreed upon between the MLD and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered.

**Basis for Finding:** With implementation of Mitigation Measure MM TCR-1 through MM TCR-5, construction of the Project would no longer have the potential to cause a substantial adverse change in the significance of a tribal cultural resource. With implementation of MM TCR-1, the a qualified archaeologist meeting the Secretary of the Interior’s Professional Qualifications Standards for archaeology to carry out all mitigation related to cultural resources shall be retained. In addition, a Native American Monitor shall be designated by the Gabrieleno Band of Mission Indians-Kizh Nation. With implementation of Mitigation Measure MM TCR-2, the an Archaeological Monitoring and Mitigation Program for the Project will be prepared. With implementation of Mitigation Measure MM TCR-3, the qualified archaeologist and Native American Monitor shall conduct construction-worker archaeological resources sensitivity training and will present the Archaeological Monitoring and Mitigation Program for all construction personnel for the Project. With implementation of Mitigation Measure MM TCR-4, the

qualified archaeologist will oversee the archaeological and Native American monitors who shall be retained to be present and work in tandem, monitoring during construction excavations as defined in the Monitoring and Mitigation Program. With implementation of Mitigation Measure MM TCR-5, the City and contractor shall ensure the cessation of all construction work in the event of the unanticipated discovery of human remains during excavation related to the Project. With implementation of Mitigation Measures MM TCR-1, MM TCR-2, MM TCR-3, MM TCR-4 and MM TCR-5, this impact would be **less than significant**.

**Finding:** Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effect as identified in the Recirculated Draft EIR. Impacts would be reduced to less than significant.

## **F. Utilities and Service Systems**

**Impact U-1:** **Construction and operation of the Project could require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects. (Refer to pages 4.14-47 through 4.14-56 of the Recirculated Draft EIR.)**

**MM UT-1:** Prior to the award of the DBFOM contract, and start of any demolition or construction activities, the City or DBFOM shall be responsible for identifying the locations of existing utilities potentially affected by the Project. This shall include coordinating with all existing utility providers for wet and dry utilities (water, sewer, gas, electric, and telecommunications) to obtain documentation of existing utility locations. Field verification (i.e., potholing and other methods as appropriate) shall be conducted to document the locations of all utilities within 20 feet of the Project's guideway and station foundations.

Based on the information from the field investigations, the DBFOM contractor shall be responsible for confirming the location of existing utilities and coordinating with the appropriate utility owners/operators to determine specific set back requirements for each utility line and the need for any stabilization for protection in place or relocation measures.

**MM UT-2:** Prior to the award of the DBFOM contract, and start of construction, the City shall contact Southern California Edison (SCE) and request an updated system Distribution Study to determine the amount of load that SCE could accommodate and required infrastructure upgrades in order to meet the Project's recommended full redundancy design. Should

SCE determine that additional system upgrades are required, such upgrades shall be the responsibility of the DBFOM contractor and/or the City to complete (including design and any additional environmental clearance), subject to the review and approval of SCE and the City, as applicable.

**Basis for Finding:** With implementation of Mitigation Measure MM U-1, the City or DBFOM contractor shall be responsible for identifying the locations of existing utilities potentially affected by the Project. Moreover, the DBFOM contractor shall be responsible for confirming the location of existing utilities and coordinating with the appropriate utility owners/operators to determine specific set back requirements for each utility line and the need for any stabilization for protection in place or relocation measures. With implementation of Mitigation Measure MM U-2, the City shall contact SCE and request an updated system Distribution Study to determine the amount of load that SCE could accommodate and required infrastructure upgrades in order to meet the Project’s recommended full redundancy design. With implementation of Mitigation Measures MM U-1 and MM U-2, this impact would be **less than significant**.

**Finding:** Changes or alterations have been required in, or incorporated into, the Project which avoid or substantially lessen the significant environmental effect as identified in the Recirculated Draft EIR. Impacts would be reduced to less than significant.

#### **IV. EVALUATION OF PROJECT ALTERNATIVES**

The Recirculated Draft EIR identified and analyzed in detail six alternatives to the Project. These alternatives were selected for detailed analysis because, among other things, they were identified as “potentially feasible.” (CEQA Guidelines, § 15126.6, subd. (a).) Alternatives that are identified as not “potentially feasible” may be eliminated from detailed analysis in the EIR.

The City Council now adopts findings concerning the feasibility of these alternatives. In adopting these findings, the City Council has considered the Project alternatives presented and analyzed in the EIR and presented during the comment period and public hearing process. The City Council finds, based on specific economic, legal, social, technological, or other considerations, that these alternatives are infeasible. Based on the impacts identified in the Recirculated DEIR and other reasons summarized below, and as supported by substantial evidence in the record, the City Council finds that approval and implementation of the Project as proposed is the most desirable, feasible, and appropriate action and hereby rejects the other alternatives and other combinations and/or variations of alternatives as infeasible based on consideration of the relevant factors set forth in CEQA Guidelines section 15126.6, subdivision (f). (See also CEQA Guidelines, §, subd. (a)(3).)

## **A. Summary of Alternatives Considered**

CEQA mandates that an EIR evaluate a reasonable range of alternatives to the Project or the Project location that generally reduce or avoid potentially significant impacts of the Project. CEQA requires that every EIR also evaluate a “No Project” alternative. Alternatives provide a basis of comparison to the Project in terms of their significant impacts and their ability to meet project objectives. This comparative analysis is used to consider reasonable, potentially feasible options for minimizing environmental consequences of the Project. Here, the Recirculated Draft EIR identified and analyzed in detail six alternatives to the Project. These alternatives were selected for detailed analysis because, among other things, they were identified as “potentially feasible.” (CEQA Guidelines, § 15126.6, subd. (a).) The six alternatives to the Project analyzed in the Recirculated Draft EIR are the (1) No Project; (2) Bus Rapid Transit (BRT) System; (3) Market Street Pedestrian Promenade; (4) 4th Station Alternative; (5) Prairie Avenue Single Station Alternative; and (6) Maintenance and Storage Facility (MSF) Site Alternative.

The City Council rejects the Alternatives set forth in the Recirculated Draft EIR and summarized below because the City Council finds that there is substantial evidence, including evidence of economic, legal, social, technological, and other considerations described in this Section in addition to those described in Section F below under CEQA Guidelines section 15091, subdivision (a)(3), that make infeasible such Alternatives. In making these determinations, the City Council is aware that CEQA defines “feasibility” to mean “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.” (CEQA Guidelines, § 15364.) The Council is also aware that under CEQA case law the concept of “feasibility” encompasses (i) the question of whether a particular alternative promotes the underlying goals and objectives of a project. and (ii) the question of whether an alternative is “desirable” from a policy standpoint to the extent that desirability is based on a reasonable balancing of the relevant economic, environmental, social, legal, and technological factors.

### ***Alternative 1: No Project***

#### **Description**

Under CEQA, the No Project Alternative must consider the effects of not approving the project under consideration. The No Project Alternative describes the environmental conditions that exist at the time that the environmental analysis commences, as well as what would reasonably be expected to occur in the foreseeable future if the project were not approved. (CEQA Guidelines, § 15126.6, subdivision (e)(2).)

The No Project Alternative considers conditions if the Project is not built. No new transportation infrastructure would be built within the Project study area, aside from transportation projects that are

currently under construction or funded for construction and operation by 2027. These projects include transit projects funded by Measure R, Measure M, and specified in the Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). Existing infrastructure and future planned and funded projects assumed under the No Project alternative include:

- Metro K Line –Currently under construction (2021), operating start date (Fall 2022)
- Implementation of the Citywide Event Transportation Management and Operations Plan
- Street improvements being constructed as part of the Los Angeles International Airport Landside Access Modernization Program and the Inglewood Basketball and Entertainment Center (IBEC) projects.
- Existing Bus Service – Metro Rapid and Metro Local

Existing public transit and private transportation operators would continue to provide service. Public transit operators would likely increase service in response to the projected growth in the number of visitors and residents that would occur as result of new and proposed major activity centers being developed in the City in the Downtown and Hollywood Park areas.

The LASED at Hollywood Park includes SoFi Stadium and additional development allowed by the Hollywood Park Specific Plan. Higher density mixed-use development is also planned in the vicinity of the Metro Downtown Inglewood station near Florence Avenue and Market Street being developed within the Crenshaw/Imperial TOD Plan Area. These projects and improvements would reasonably be expected to occur in the foreseeable future if the Project were not approved based on current plans.

Throughout 2020, the City of Inglewood developed a Citywide Transportation Management and Operations Plan (TMOP) focused on addressing future traffic demands that may result from events at the stadium. The Inglewood TMOP establishes a plan that provides public information, reduces unwarranted traffic through adjacent neighborhoods, and promotes the use of alternative modes of transportation as described below.

### ***City of Inglewood Event Park and Ride Shuttle Program and Intermodal Transit Facility at Hollywood Park***

To address the limited pre-sold on-site parking available at SoFi Stadium, the City has established a remote parking and shuttle program, known as the I Park & Go Program, which considers comprehensive access, circulation, and traffic management for residents, visitors, and businesses on NFL game days and during large special events.

Given the growing event-day demand of the City's I Park & Go Program, the City would not only continue the use at the ITF Lot but also utilize the vacant lot at the southwest corner of Prairie Avenue and Manchester Boulevard given the limited capacity for increased shuttles at the City's ITF Lot.

### ***Event Transit Service***

The City has established a partnership and received support from Metro, Big Blue Bus (Santa Monica), GTrans (Gardena), and Torrance Transit to expand transit service. Under the No Project alternative, the City would work cooperatively with Metro and other municipal bus operators to increase and enhance transit service to City of Inglewood destinations through more frequent headways, additional route options, and other improvements by 2021, if possible. The TMOP addresses both Pre-Event and Post-Event conditions associated with SoFi Stadium at Hollywood Park. The Pre-Event scenario includes bus routes along Pincay Drive, Kareem Court, and Century Boulevard. The Post-Event scenario includes bus routes along Prairie Avenue, Manchester Avenue, Crenshaw Boulevard, Pincay Drive, Kareem Court, and Century Boulevard

### **Relationship to Project Objectives**

The No Project Alternative would not meet any of the City's objectives for the Project, except that it would maintain existing roadway capacity.

### **Comparative Impacts**

**Table 5.0-1** at the beginning of Chapter 5.0, Alternatives, of the Recirculated Draft EIR, provides an impact-by-impact comparison of the significant impacts of the Project and Alternative 1. Because no new development would occur, the effects of the No Project Alternative would be a continuation of the existing conditions. Because the Project would not be constructed or operated, none of the impacts identified for the Project would occur under the No Project alternative.

### **Basis for Finding**

While the No Project Alternative would avoid impacts associated with the Project, this alternative would not further any of the Project's objectives or provide any of the benefits contemplated by the Project. Under the No Project Alternative, VMT within the City would continue to increase due to operation of the Forum, the SoFi Stadium, the Performance Arena, the IBEC and the Hollywood Park mixed uses. An increase in VMT would worsen traffic conditions and result in an increase of air quality and greenhouse gas emissions. All of the reasons provide sufficient independent grounds for rejecting this alternative.

## Finding

Specific economic, legal, social, technological, or other considerations, make Alternative 1 infeasible.

## ***Alternative 2: Bus Rapid Transit (BRT) System***

### **Description**

Bus rapid transit (BRT) is a public transit system designed to provide improved capacity and reliability relative to a conventional bus system. Typically, a BRT system includes roadway lanes that are dedicated to buses, with signal priority to buses at intersections where buses may interact with other traffic, with enhanced coordinated flow. BRT systems typically include design features to optimize passenger boarding and alighting activities, as well as ticket purchases. A BRT corridor is a section of roadway or contiguous roadways served by the uniquely-branded buses along routes with a minimum length of approximately 1.5 to 2 miles.

Under this alternative, the City would construct and operate a BRT system that would connect the Forum, the SoFi Stadium, the Performance Arena, the IBEC, and the Hollywood Park mixed uses to the Metro K Line Downtown Inglewood station. The proposed route of this alternative would be a loop route starting along Florence Avenue to travel east to North Prairie Avenue where it would turn south along Prairie Avenue to the Inglewood Transit Center Facility at Prairie Avenue and Arbor Vitae adjacent to the Hollywood Park site, and then return via Prairie Avenue northbound to travel westbound along Manchester Boulevard to Market Street to traverse northbound to Florence Avenue. The BRT would be located entirely within the public right-of-way. This route is generally consistent with the route as described in the City's New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines.<sup>8</sup>

Along the alignment, one eastbound travel lane along Florence Avenue between Market Street and Prairie Avenue; one southbound travel lane along Prairie Avenue between Florence Avenue and Manchester Boulevard; two lanes (one lane in each direction) along Prairie Avenue between Manchester Boulevard and the Inglewood Transit Center Facility; one westbound travel lane along Manchester Boulevard between Prairie Avenue and Market Street; and one northbound lane along Market Street between Manchester Boulevard and Florence Avenue would all be converted (from the existing mixed flow traffic lanes) to provide the Bus-only lane to accommodate the BRT alternative thereby reducing roadway lane capacities for mixed-flow traffic.

---

<sup>8</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, November 1, 2016

BRT systems typically include the following features:

- Dedicated lanes and alignment:
  - Separate lanes to avoid congested roadways.
  - Dedicated bus-only lanes for faster travel and to ensure that buses are not delayed by mixed traffic congestion. Separate rights of way may be used. Transit malls or “bus streets” may also be created in city centers.
- Off-board fare collection
  - Fare prepayment at the station, instead of on board the bus, eliminates the delay caused by passengers paying on board.
- Intersection treatment
  - Prohibit turns for mixed-flow traffic across the bus lane to reduce delays to the buses, in most cases. Transit Bus priority will often be provided at signalized intersections (using Transit Priority System (TPS) modules at all upgraded signal controllers at intersections along the alignment) to coordinate them to reduce delays by extending the green phase or reducing the red phase in the required direction compared to the normal sequence. Potential additional communication equipment to transmit and receive signals between the intersections and the City’s Transportation Management Center may also be provided, as part of this alternative. Equipment to track the locations of the buses and closed-circuit television cameras may also be required / provided at the intersections along the alignment to provide the required monitoring.
- Platform-level boarding
  - Station platforms/stops would be convenient for quick and easy boarding, making them fully accessible for wheelchairs and baby strollers, with minimal delays.

Passenger loading areas would include stops at the following locations:

- Market Street/Florence Avenue in close proximity to the Metro K Line Downtown Inglewood Station. This BRT stop would provide connections to and from the regional light rail system;
- The Forum on Prairie Avenue;
- The City’s Intermodal Transit Facility at Hollywood Park providing access to the SoFi Stadium, Hollywood Park Development Site, and IBEC.

High-capacity bus vehicles such as articulated buses may be used; these may have multiple doors for fast entry and exit. To reduce greenhouse gas emissions, vehicles may be electric or alternative fuel technology.

Under the BRT alternative, the Project would not be built and none of the transit infrastructure, street provisions and activities would occur.

## Relationship to Project Objectives

The BRT System Alternative would meet some, but not all of the City's objectives for the Project, but not as well as the Project. The objectives to provide a direct and convenient connection to the Metro regional transit system, encourage intermodal transportation systems by providing convenient, safe, and reliable transit and convenient access to businesses in the City would be partially met by this alternative. Although the objective related to providing sufficient transit connection capacity between Metro's regional transit system and the City's new major activity centers would not be met, this alternative would still result in limited increased transit mode split, limited reduction in vehicle trips, and consequently, limited reduction in per-capita vehicle miles traveled to the City's major activity centers. The BRT System Alternative would also partially meet the City's objectives to support the ongoing economic revitalization within the Downtown TOD Plan area and encourage redevelopment and investment within the City in areas served by the Project, but not to the same degree as the Project.

This alternative would partially meet the City's objective to support regional efforts to become more efficient, economically strong, equitable, and sustainable. Though the BRT System Alternative would provide limited operational benefits by reducing traffic volumes along key roadway corridors, it would also reduce the roadway capacities along Florence Avenue, Prairie Avenue, Manchester Boulevard, and Market Street, consequently increasing traffic congestion throughout the City. As such, this alternative would not meet the City's objectives to maintain existing roadway capacity or reduce the City's traffic congestion and alleviate growing demand on the existing roadway networks on both major arterials and residential streets for both nonevent and event days.

## Comparative Impacts

**Table 5.0-1** at the beginning of Chapter 5.0, Alternatives, of the Recirculated Draft EIR, provides an impact-by-impact comparison of the significant impacts of the Project and Alternative 2.

### 1. Aesthetics

The Project would not result in significant impacts to the aesthetic character of the community during construction or operation with implementation of the project design features in the ITC CCP and ITC Design Guidelines.

With Alternative 2, the proposed ATS guideway would not be built and existing visual characteristics along Market Street, Manchester Boulevard, and Prairie Avenue would generally be maintained. As such, there would generally be little to no impact to the aesthetic character of the community because the BRT would be contained within the existing roadway system. For this reason, no potentially significant impact to the

visual character of the area would occur with Alternative 2. The Project would change the visual characteristics of the areas located along the proposed alignment but would not result in significant impacts. While Alternative 2 would result in fewer changes to the visual character of the area than the Project, neither this alternative nor the Project would result in significant aesthetic impacts.

## **2. Air Quality**

The BRT System would require some modifications to existing streets in order to create dedicated transit lanes and stops but this construction would be less than the demolition and construction activities associated with the Project. This alternative would not conflict with implementation of the applicable air quality plans and unmitigated construction emissions would be substantially reduced compared to the Project.

Though this Alternative would reduce VMTs, it would only be able to provide approximately 20 percent of the ridership capacity compared to the Project. Moreover, Alternative 2 would reduce average daily traffic (ADT) volumes along key roadway corridors and VMTs on an average weekday basis to a lesser degree than the Project. Specifically, typical weekday nonevent and daily VMT in the City would be reduced by an amount equivalent to 20 percent to 25 percent of those of the Project. Moreover, under Alternative 2 the existing uses that would be removed by the Project would remain operational and would not be replaced by the Project components which generate less air pollutant emissions than the existing uses. As such, Alternative 2 would increase operational air quality impacts in comparison to the Project.

## **3. Biological Resources**

Approximately 502 trees are present along the Project alignment which may require removal during construction of the Project. The BRT System Alternative would only involve minor modifications to existing streets along the public right-of-way where BRT-only lanes along the route are implemented and BRT stops are constructed. Alternative 2 would not, therefore, require the same amount of potential tree removals as the Project. Similar to the Project, operation of Alternative 2 would not diminish the chances for long-term survival of bird species or their habitats and no additional tree and/or ornamental vegetation removals would occur. As such, Alternative 2 would result in similar operational impacts compared to the Project.

## **4. Cultural Resources**

The Project would not result in significant impacts to historic resources on Market Street or the other segments. Alternative 2, which would involve minor modifications of existing streets, construction of bus stops, and the operation of a Bus Rapid Transit system, would also not result in significant impacts to

cultural resources. For this reason, neither this alternative nor the Project would result in significant impacts to cultural resources.

## **5. Energy Resources**

With Alternative 2, the Project would not be built. No demolition or construction activities, which would consume energy resources would occur, except along the public right-of-way where BRT-only lanes and bus stops along the route would be located. As such, Alternative 2 would reduce construction impacts to energy resources. Operation of the Project would consume a maximum net increase of 23.85 million kWh of electricity per year. Alternative 2 would reduce operational electricity impacts. However, the Project would result in a net decrease of 3.61 million kBtu of natural gas per year. Alternative 2 would not require demolition of existing land uses and would reduce traffic along key roadway corridors and VMT on an average weekday basis to a lesser degree than the Project. For this reason, Alternative 2 would increase impacts related to natural gas and petroleum-based fuel consumption. The Project would be consistent with the ECAP and General Plan, which set goals to reduce emissions through increased energy efficiency, renewable energy generation, improved transit options, and reduced consumption and waste. Alternative 2 would address the goals and policies within these plans by improving transit options but to a lesser degree than the Project.

## **6. Geology and Soils**

Under Alternative 2, impacts related to geology and soil conditions, including paleontological resources, would be less compared to the Project. The Project is proposed in an area subject to groundshaking from earthquake events that may occur on faults in the region. Potentially active faults cross the alignment for the Project. Measures are identified to mitigate potential impacts associated with these conditions to less than significant. Because Alternative 2 would occur in the location as the Project, the geological and soils conditions that would be encountered in construction of Alternative 2 would be the similar as with the Project, but because substantially less construction would be required, potential risks associated with ground-shaking would be reduced as compared to the Project. During operations, potential risks from seismic events would be reduced with an at-grade system as no aerial structures would be built. Because there would be substantially less construction with an at-grade BRT system, the potential for accidental discovery of paleontological resources would decrease.

## **7. Greenhouse Gas Emissions**

Under Alternative 2, the Project would not be built. No demolition or construction activities which would produce GHG emissions would occur, except along the public right-of-way where BRT-only lanes and bus stops along the route would be located. As such, Alternative 2 would reduce construction GHG impacts

compared to the Project.

Though this alternative would reduce VMT, it would only be able to provide approximately 20 percent of the ridership capacity of the Project. Alternative 2 would reduce traffic along key roadway corridors and VMT on an average weekday basis to a lesser degree than the Project. Specifically, typical weekday nonevent and daily VMT in the City would be reduced by an amount equivalent to 20 percent to 25 percent of that of the Project. Additionally, dedicated bus lanes would take away roadway carrying capacity for private vehicles and increase local traffic congestion. As such, Alternative 2 would not decrease operational GHG emissions to the same degree as the Project.

Similar to the Project, Alternative 2 would be consistent with the CARB 2017 Scoping Plan Update, SCAG 2020-2045 RTP/SCS, the ECAP, and General Plan, which set goals to reduce GHG emissions by improving transit infrastructure. However, Alternative 2 would improve transit infrastructure at a lesser degree compared to the Project and would not result in more energy efficient uses being developed in place of the less energy efficient existing uses.

## **8. Hazards and Hazardous Materials**

With the BRT Transit system alternative, the Project would not be built. No construction of the guideway and stations in conjunction with the MSF and PDS substations would occur. Construction of the Project would include the demolition of existing buildings that may contain ACM and LBP. Construction activities may also encounter underground storage tanks and soil that may be contaminated. The ITC CCP requires the preparation of plans defining protocols and actions to address this potential and avoid significant impacts. Alternative 2 would not involve the demolition of existing buildings, which may have the potential to release hazardous materials, such as asbestos containing materials (ACMs), lead-based paint (LBP), and other potentially hazardous building materials. Additionally, Alternative 2 would generate a lower amount of construction emissions, which may release toxic air contaminants (TACs) at schools within one-quarter mile. Transportation of hazardous materials during construction of the Project would also not likely occur with this alternative. The potential for accidental release of hazardous materials in the environment would be significantly lessened when compared to the Project.

Operation of the Project would include the use and storage of hazardous materials during operation typical of those used in an industrial setting. Compliance with federal, State, and local laws and regulations relating to transport, storage, disposal, and handling of hazardous materials would minimize any potential for accidental release or upset of hazardous materials during station operation. Under Alternative 2, operation of a BRT system would include the use and storage of similar materials. As such, operational impacts under Alternative 2 would be similar to those of the Project.

## **9. Land Use and Planning**

Alternative 2 would not include the construction of the ATS system or any of the associated supporting facilities. The Project would remove traffic from existing roadways without diminishing the existing traffic capacity or the number of lanes. With the BRT system alternative, an existing lane of travel would be dedicated for use by buses along the route, which would reduce the lane capacity for other vehicles and increase local traffic congestion for passenger vehicles in the community. This increase in congestion on roadways under Alternative 2 would have an indirect effect on the character of the community.

Alternative 2 would be generally consistent with all existing goals, plans, and policies as it would maintain the majority of the infrastructure in the surrounding communities, allowing the goals and objectives of the existing plans to be carried out generally. Notwithstanding, in certain locations there could be conflicts with the design of existing roadways, roadway capacity, and the City's circulation element and amendments to City documents may be needed to avoid these conflicts. Land use impacts would be similar with this alternative and the Project.

## **10. Noise and Vibration**

Under Alternative 2, the Project would not be built. No demolition or construction activities which would produce noise or groundborne vibration impacts would occur, except along the public right-of-way where BRT-only lanes and bus stops are located. As such, construction noise and vibration impacts would be reduced. Though this alternative would reduce VMT, it would only be able to provide approximately 20 percent of the ridership capacity compared to the Project. Alternative 2 would reduce traffic volumes along key roadway corridors and VMT on an average weekday basis to a lesser degree than the Project. Specifically, typical weekday nonevent and daily VMT in the City would be reduced by an amount equivalent to 20 percent to 25 percent of those of the Project. With the Project, operation of the ATS trains would result in noise levels increases from a low of 0.1 dBA to a high of 1.8 dBA, and operation of the MSF would result in noise increases ranging from no increase to a high of 3.9 dBA. Under Alternative 2, the ATS would not be built or operate, and these noise increases would not occur. However, increased bus traffic on these roadways would increase the local noise levels and, as such, noise and vibration impacts associated with operation of Alternative 2 would be similar to the Project.

## **11. Population, Employment, and Housing**

The Project would have no direct impact on housing as the Project does not include the construction or demolition of any housing units. The Project would impact existing employment opportunities in the City as commercial uses that would be displaced by the Project are estimated to be approximately 464 jobs.

However, the Project would result in a net increase of approximately 11,052<sup>9</sup> FTE jobs, as estimated by the Job Co-Benefits calculation (see **Section 4.11 Population, Employment, and Housing**). The number of jobs that will be supported by the Project in the region is within the projected regional trends in the SCAG 2020-2045 RTP/SCS data and the jobs that will benefit from the Project will not directly translate into additional population growth in the region. As such, the Project would have a less than significant impact on inducing employment and population growth.

Alternative 2 would maintain the existing population and housing trends within the City and the region while having a minor impact on employment by hiring personnel for the BRT System construction and operation. As such, Alternative 2 would not significantly impact population or employment growth in the City or the region. As such, Alternative 2 would have similar impacts on population and housing conditions, although the beneficial effects of this alternative would be substantially reduced as compared to the Project.

## **12. Transportation**

Under Alternative 2, the City would construct and operate a BRT system that would connect the LASED, including the Performance Arena, other mixed uses in the Hollywood Park Specific Plan area, SoFi Stadium, the Forum, and the IBEC to the K Line Downtown Inglewood station. Under this alternative, the Project would not be built. No demolition or construction activities would occur, except along the public right-of-way where BRT-only lanes and bus stops along the route would be located. As such, Alternative 2 would reduce impacts associated with the construction of transportation facilities.

One to two roadway lanes would be lost to mixed traffic flow along the BRT alternative route depending upon location. With a maximum potential headway of approximately 3 minutes at peak times, Alternative 2 would only be able to provide approximately 20 percent of the capacity compared to the Project. The plan amendments included in the Project would not occur. The area would continue to be used by the existing commercial, recreational, and other uses.

Alternative 2 would provide operational benefits by reducing traffic volumes along key roadway corridors and VMT on an average weekday basis to a lesser degree than the Project. Specifically, typical weekday nonevent and daily VMT in the City would be reduced by an amount equivalent to 20 percent to 25 percent of those of the Project. The estimated daily BRT ridership with Event Conditions would be approximately 20 percent of the projected Project ridership. Sufficient transit connection capacity between the Metro's regional transit system and the City's new major activity centers and entertainment venues would not be provided by this alternative. Additionally, this alternative would reduce the roadway capacities along

---

9 11,516 minus 464 in numbers of jobs displaced.

Florence Avenue, Prairie Avenue, Manchester Boulevard, and Market Street, consequently increasing traffic congestion areawide. In comparison, the Project would not reduce roadway capacities compared to existing conditions and would improve congestion and traffic flows areawide. As such, Alternative 2 would obtain limited operational benefits while substantially worsening traffic flows and congestion. Transportation impacts of Alternative 2 would be increased as compared to the Project.

### **13. Tribal Cultural Resources**

The Project would have a less than significant impact on Tribal Cultural Resources (TCRs). No TCRs were identified in the records around the Project site and no sensitive resources were identified. Nonetheless, the Project would include construction which would have the potential to unearth subsurface resources not previously identified. Given the level of urban development in Inglewood, the likelihood of unearthing TCRs is low but it is still a possibility. Alternative 2 would eliminate the need to construct the ATS and this potential impact to TCRs would be avoided. TCR impacts for Alternative 2 would be reduced as compared to the Project.

### **14. Utilities and Service Systems**

Under Alternative 2, the Project would not be built. No demolition or construction activities would occur, except along the public right-of-way where BRT-only lanes and bus stops along the route are located. As such, no utility lines would need to be removed or relocated along Market Street, Manchester Boulevard, or Prairie Avenue, which would reduce construction impacts.

Once operational, the Project and Alternative 2 would not require further utility upgrades or relocation of utility infrastructure, except for potential electric charging infrastructure. However, as discussed previously, operation of the Project would consume a maximum net increase of 23.85 million kWh of electricity per year. Alternative 2 would reduce operational electricity demands in comparison to the Project. However, operation of the Project would result in a net decrease of 3.61 million kBtu of natural gas per year, and a net decrease of 71.86 acre feet per year of water per year. Alternative 2 would not result in similar reductions in utility demands.

### **Basis for Finding**

Alternative 2 would avoid or lessen some of the impacts associated with the Project. However, it would also reduce the roadway capacities along Florence Avenue, Prairie Avenue, Manchester Boulevard, and Market Street, consequently increasing traffic congestion throughout the City. Moreover, this Alternative would not reduce VMT's to the same capacity as the Project. All of these reasons provide sufficient independent grounds for rejecting this alternative.

## **Finding**

Specific economic, legal, social, technological, or other considerations, make Alternative 2 infeasible.

### ***Alternative 3: Market Street Pedestrian Promenade***

#### **Description**

Under the Market Street Pedestrian Promenade Alternative, the Project and all of its components would be constructed and would operate. With this alternative, Market Street between Florence Avenue and Manchester Boulevard would be entirely closed to vehicular traffic. Regent and Queen streets would have barricades to prevent traffic from turning onto Market Street in both directions. East-west traffic along Regent Street and Queen Street would be allowed without being able to turn onto Market Street. Traffic would be diverted to surrounding streets including La Brea Avenue and Locust Street. The establishment of this pedestrian promenade would encourage pedestrian activity by improving walkability within Downtown Inglewood.

#### **Relationship to Project Objectives**

The Market Street Pedestrian Promenade Alternative would meet most of the City's objectives for the Project since the Project would still be built, and reductions to daily traffic volumes along key roadway corridors and reductions to VMTs on an average weekday basis with event would occur similar in magnitude to those associated with the Project. However, Alternative 3 would not meet the City's objective to maintain existing roadway capacity along Market Street.

#### **Comparative Impacts**

**Table 5.0-1** at the beginning of Chapter 5.0, Alternatives, of the Recirculated Draft EIR, provides an impact-by-impact comparison of the significant impacts of the Project and Alternative 3.

##### **1. Aesthetics**

With this alternative, the Project and all of its components would be constructed and operate, but Market Street between Florence Avenue and Manchester Boulevard would be closed to vehicular traffic. Alternative 3 would require the placement of barricades to prevent vehicle access. These barricades would need to be designed in a manner which would not degrade the existing visual character of Downtown. As the ATS system as would be constructed with this alternative, the aesthetic impacts of the Project would be similar to the Project.

##### **2. Air Quality**

Construction under Alternative 3 would be similar to the Project. During construction, the Project would not exceed the significance threshold for any criteria pollutant after mitigation, and impacts would be less than significant. Therefore, similar to the Project, Alternative 3 would not conflict with implementation of the applicable air quality plans and would not exceed thresholds established by the SCAQMD for criteria air pollutants.

Operational impacts associated with Alternative 3 would be similar to the Project as the Pedestrian Promenade would not generate additional air quality emissions. Moreover, reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis with event would occur similar in magnitude to those associated with the Project. As such, Alternative 3 would result in similar operational impacts compared to the Project.

### **3. Biological Resources**

Approximately 502 trees along the Project alignment may require removal during construction of the Project. The addition of a Pedestrian Promenade would not require tree removals and would likely include the planting of additional trees. As such, impacts to biological resources during construction would be reduced compared to the Project. Alternative 3 would not diminish the chances for long-term survival of bird species or their habitats and no additional tree and/or ornamental vegetation removals would be required. As such, Alternative 3 would result in similar operational impacts compared to the Project.

### **4. Cultural Resources**

Closing a portion of Market Street in downtown Inglewood to vehicle use, which would occur with Alternative 3, would not result in a significant impacts to historic resources located on Market Street. Conversion of this portion of Market Street to a pedestrian mall would not result in any additional direct or indirect impacts to historic or other cultural resource impacts compared to the Project, nor would it substantially reduce the cultural resources impacts of the Project. Neither this alternative nor the Project would result in significant impacts to cultural resources.

### **5. Energy Resources**

Energy demand from construction activities under Alternative 3 would be similar to the Project, as the ATS system would be built as proposed. The additional construction required to create the pedestrian mall would only increase these impacts incrementally. Reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis would occur similar in magnitude to those associated with the Project. As such, Alternative 3 would result in similar operational impacts compared to the Project.

## **6. Geology and Soils**

Under Alternative 3, the Project would be built but would include a pedestrian promenade on Market Street between Florence Avenue and Manchester Boulevard. Impacts related to geology and soils conditions, including paleontological resources, would be similar to those identified for the Project. Geology and soils conditions that would be encountered in construction of Alternative 3 would be the same as with the Project. The Potrero Fault lies approximately one-quarter mile to the east of the project study area; however, compliance with the California Building Code would avoid the creation of seismic hazards. Ground-disturbing activity and the potential for accidental discovery of paleontological resources would continue to be potentially significant with Alternative 3. Alternative 3 would implement similar measures as the Project to mitigate the potential impacts on paleontological resources to less than significant.

## **7. Greenhouse Gas Emissions**

Construction under Alternative 3 would be similar to the Project and would result in a similar level of GHG emissions. Reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis would occur similar in magnitude to those associated with the Project. Therefore, similar to the Project, Alternative 3 would be consistent with the CARB 2017 Scoping Plan Update, SCAG's 2020-2045 RTP/SCS, the ECAP, and General Plan, which set goals to reduce GHG emissions by increasing energy efficiency and improving transit infrastructure. Operational GHG impacts would be similar to the Project.

## **8. Hazards and Hazardous Materials**

Under Alternative 3, the Project would be built but would include the pedestrian promenade. Construction under Alternative 3 would be similar to the Project. Construction of the guideway and stations in conjunction with the MSF and PDS substations would involve the demolition of existing buildings, which may have the potential to release hazardous materials, such as ACMs, LBP, and other potentially hazardous building materials. The additional construction activities required to create the pedestrian promenade would be minor. Similar to the Project, construction activities under Alternative 3 would likely cause the temporary closure of travel lanes, roadway segments, and sidewalks along the elevated guideway and stations within the street rights-of-way.

Under Alternative 3, operation of the ATS would include the use and storage of hazardous materials typical of those used in an industrial setting, similar to the Project. Alternative 3 would not interfere with or impair the City's ability to increase public awareness or make any improvements to emergency services and warning systems during operation. Converting this portion of Market Street to a pedestrian

promenade would not involve the use of handling of any hazardous materials. With adherence to the federal, State, and local safety requirements, Alternative 3 would not conflict with the requirements of an emergency response plan or emergency evacuation plan, similar to the Project. As such, operational impacts under Alternative 3 would be similar to the Project.

## **9. Land Use and Planning**

Alternative 3 would modify existing traffic patterns and connections within the community. Vehicular connections would be reduced as Market Street between Florence Avenue and Manchester Boulevard would be closed. Vehicular traffic would need to be rerouted around the closed pedestrian promenade which may increase local traffic volume for adjacent streets. The connection between different parts of the community would not be diminished in a substantial manner as the street segment that would be closed only includes three blocks. Alternative 3 would not, therefore, divide the community physically, but may contribute to additional ground level traffic surrounding the closure.

Alternative 3 would be generally consistent with all existing goals, plans, and policies, as it would maintain the majority of the infrastructure in the surrounding community, allowing the goals and objectives of the existing plans to be carried out generally. Additionally, closure of Market Street would enable the activation and programming of Market Street, which could include open air markets, creative retail and concession spaces, recreational and open space areas, locations for public art, and locations for public gathering. This Alternative could achieve City's objective for economic development of Market Street. Conflicts with the design of existing roadways, roadway capacity, and the City's circulation element may exist and appropriate design and amendments for City documents would be needed to avoid conflicts with existing plans and policies. The land use impacts of this alternative and the Project would be similar and less than significant.

## **10. Noise and Vibration**

Construction under Alternative 3 would be similar to the Project. It is anticipated that the development of a Pedestrian Promenade along Market Street would not result in substantial noise or vibration impacts, as it would eliminate vehicle travel along Market Street between Florence Avenue and Manchester Boulevard, which would reduce roadway noise. Moreover, reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis with event would occur similar in magnitude to those associated with the Project. The operational impacts of the Project would be less than significant. As such, operational noise and vibration impacts would be reduced in comparison to the Project.

## **11. Population, Employment, and Housing**

The Project would have no direct impact on housing as the Project does not include the construction or demolition of housing units. The Project would impact existing employment opportunities in the City as commercial uses that would be displaced by the Project are estimated to be approximately 464 jobs. However, the Project would result in a net increase of approximately 11,052<sup>10</sup> FTE jobs through the Greenhouse Gas Reduction Funds, as estimated by the Job Co-Benefits calculation (see **Section 4.11 Population, Employment, and Housing**). The number of jobs that will be supported by the Project in the region is within the projected regional trends in the SCAG 2020-2045 RTP/SCS data and the jobs that will benefit from the Project will not directly translate into additional population growth in the region. As such the Project would have a less than significant impact on inducing employment and population growth.

Converting a portion of Market Street to a pedestrian mall would not result in any additional direct or indirect impacts to population, employment, and housing. Alternative 3 would maintain the existing population, employment, and housing trends within the City and the region. As such, Alternative 3 would not directly or indirectly substantially induce population in the City or the region. Employment support and would be similar to the Project under Alternative 3.

## 12. Transportation

Construction under Alternative 3 would be similar to the Project. The Project and all of its components would be constructed and operational. Market Street between Florence Avenue and Manchester Boulevard would be reconfigured to eliminate vehicular traffic north and south on Market Street. Cross traffic would be allowed on Regent Street and Queen Street without any turns to/from Market Street. The closure of Market Street would divert traffic to the surrounding streets including La Brea Avenue and Locust Street. Since the current traffic along Market Street is very low, this diversion of Market Street traffic can be accommodated along adjacent parallel streets. The operation of the ATS would be the same as planned for the Project.

Similar to the Project, Alternative 3 would result in operational benefits. Reductions to daily traffic volumes along key roadway corridors and reductions to VMTs on an average weekday basis would occur similar in magnitude to those associated with the Project. Additionally, this alternative is estimated to result in transit ridership similar to the Project. Finally, Alternative 3 would provide similar operational benefits as those of the Project relative to reduction in traffic congestion and improvement of traffic flows along key roadway facilities areawide.

---

<sup>10</sup> 11,516 minus 464 in numbers of jobs displaced.

### **13. Tribal Cultural Resources**

The Project would have a less than significant impact on Tribal Cultural Resources (TCRs), No TCRs were identified in the records around the Project site and no sensitive resources were identified. Nonetheless, the Project would include construction which would have the potential to unearth subsurface resources not previously identified. Given the level of urban development in Inglewood, the likelihood of unearthing TCRs is low but it is still a possibility. Converting a portion of Market Street to a pedestrian promenade would not result in any additional impacts.

### **14. Utilities and Service Systems**

Construction and operation under Alternative 3 would be similar to the Project. Closing a portion of Market Street to vehicle traffic would only involve minor above ground street improvements. For this reason, impacts related to the construction or relocation of water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities would be similar compared to the Project.

#### **Basis for Finding**

Alternative 3 would not reduce operational impacts and would result in similar overall impacts compared to the Project. Moreover, this Alternative would result in reductions to daily traffic volumes along key roadway corridors and reductions to VMTs on an average weekday basis with event in magnitude to those associated with the Project. However, Alternative 3 would not meet the City's objective to maintain existing roadway capacity along Market Street, as it directly involves entirely closing off a portion of roadway to vehicular traffic. The Project, on the other hand, would satisfy this objective as it involves no change to roadway capacity. (See DEIR, p. 4.12-35.) This provides sufficient independent grounds for rejecting this alternative.

#### **Finding**

Specific economic, legal, social, technological, or other considerations, make Alternative 3 infeasible.

### ***Alternative 4: 4th Station Alternatives***

#### **Description**

This alternative considers the addition of a fourth station to the ATS as proposed at Manchester Boulevard, east of the Market Street/Manchester Boulevard intersection.

The station configuration would consist of a center platform with vertical circulation to an elevated passenger walkway located under the station platform level. Passengers would have access to the station

through an elevated passenger walkway. As with the other ITC stations, this additional station would consist of a center platform configuration with the platform located at level 3 (approximately 50 feet above the existing grade). Passengers would access the platform from a mezzanine (at level 2) connected by elevated passenger walkways to vertical circulation elements to provide access to the sidewalk (at level 1) on the north side of Manchester Boulevard. Providing this additional station in Downtown would:

1. Support ongoing economic revitalization in Downtown Inglewood;
2. Provide a direct connection from Downtown Inglewood to the regional rail system, the Forum, the LASED, including SoFi Stadium, and the IBEC; and
3. Enhance the connection of Inglewood and residents to jobs, education, services, and destinations within the City and within the region; and support regional efforts to become more efficient, economically strong, equitable, and sustainable.

### **Relationship to Project Objectives**

The 4<sup>th</sup> Station Alternative would meet all of the City's objectives for the Project since the Project would still be built and reductions to daily traffic volumes along key roadway corridors and reductions to VMTs on an average weekday basis with event would occur similar in magnitude to those associated with the Project.

### **Comparative Impacts**

**Table 5.0-1** at the beginning of Chapter 5.0, Alternatives, of the Recirculated Draft EIR, provides an impact-by-impact comparison of the significant impacts of the Project and Alternative 4.

#### **1. Aesthetics**

Under the 4<sup>th</sup> station alternative, impacts to visual character under aesthetics would be similar to the Project. The Project would not result in significant impacts to the aesthetic character of the community during construction or operation with implementation of the project design features in the CCP and Design Guidelines. The addition of a 4<sup>th</sup> station east of the intersection of Market Street and Manchester Boulevard would not result in any additional visual impacts as this station would be integrated into the design of the ATS consistent with the Design Guidelines.

#### **2. Air Quality**

Under Alternative 4, the Project would be built but would include an additional station along Manchester Boulevard. During construction, the Project would not exceed the significance threshold for any criteria pollutant after mitigation, and impacts would be less than significant. The construction of a 4<sup>th</sup> station

would require additional construction activities including operation of off-road heavy-duty equipment and on-road trucks for hauling which would increase air quality emissions. Though Alternative 4 would implement similar mitigation measures as the Project, it would increase construction impacts.

Operation of the ATS with a 4<sup>th</sup> station would not result in any additional operational air quality emissions. Operational air quality impacts would be similar with this alternative and the Project.

### **3. Biological Resources**

Approximately 502 trees are located along the proposed ATS alignment that may require removal during construction of the Project. The 4<sup>th</sup> station would be located along the guideway within the public right-of-way along Manchester Boulevard. With Alternative 4, no additional properties would need to be acquired and no additional demolition of buildings or site improvements would be required. Alternative 4 would not require an increase in tree removals or disturbance of nesting raptors or migratory birds. For this reason, impacts to biological resources during construction would be similar compared to the Project. Moreover, operation of Alternative 4 would not diminish the chances for long-term survival of bird species or their habitats and no additional tree and/or ornamental vegetation removals would be planned. As such, Alternative 4 would result in similar operational impacts compared to the Project.

### **4. Cultural Resources**

Alternative 4 would have impacts on cultural resources similar to the Project. Alternative 4 would construct the ATS guideway on the same alignment with the same dimensions as the Project. The additional station would not result in any additional impacts because the additional station and this segment of the guideway would be constructed above the nearby historic resource, the Bank of America building at 320 Manchester Boulevard. The Bank of America building would retain its ability to convey its historical significance without additional indirect impact to the view of its primary façade. As such impacts to cultural resources would be similar for Alternative 4 and the Project.

### **5. Energy Resources**

Under Alternative 4, the Project would be built but would include an additional station along Manchester Boulevard. Construction of a 4<sup>th</sup> station would result in an incremental increase in energy resource consumption for electricity and petroleum-based fuels for construction of this station. However, this increase would be minimal and temporary, similar to the Project. Nonetheless construction impacts to energy resources would increase incrementally compared to the Project.

Operation of a 4<sup>th</sup> station would increase consumption of energy resources including electricity and natural gas. This alternative would result in reductions to daily traffic volumes along key roadway corridors

and VMT on an average weekday basis would occur similar in magnitude to those estimated for the Project, although the addition of a 4th station could incrementally increase ridership. As such, this alternative would result in a reduction of petroleum-based fuel consumption from vehicle travel similar or to a slightly greater degree than the Project. The addition of one station would not increase energy resource consumption to a level of significance.

## **6. Geology and Soils**

Under Alternative 4, the Project would be built but would include an additional station along Manchester Boulevard. Impacts related to geology and soils conditions, including paleontological resources, and potential conflict with an emergency evacuation plan, would be similar to those described for the Project. Geology and soils conditions that would be encountered in construction of Alternative 4 would be the same as with the Project. The Potrero Fault lies approximately one-quarter mile to the east of the project study area; however, compliance with the California Building Code would avoid the creation of seismic hazards. Ground-disturbing activity and the potential for accidental discovery of paleontological resources would continue to be potentially significant under Alternative 4. Alternative 4 would implement similar measures as the Project to mitigate the potential impacts on paleontological resources to less than significant.

## **7. Greenhouse Gas Emissions**

Under Alternative 4, the Project would be built but would include an additional station along Manchester Boulevard. Construction of a 4th station would require additional construction activities including operation of off-road heavy-duty equipment and on-road trucks for hauling which would increase GHG emissions. However, similar to the Project, these emissions would be temporary in nature and cease once the Project is complete. Nonetheless, construction related GHG emissions would increase under Alternative 4.

Operation of a 4th station would incrementally increase operational GHG emissions. However, this alternative would result in reductions to daily traffic volumes along key roadway corridors and VMT on an average weekday basis would occur similar in magnitude to those estimated for the Project. As such, this alternative would result in a net negative GHG emissions associated with vehicle travel. The addition of one station would not increase operational GHG emissions to a level of significance. Moreover, similar to the Project, Alternative 4 would be consistent with the CARB 2017 Scoping Plan Update, SCAG 2020-2045 RTP/SCS, the ECAP, and General Plan, which set goals to reduce GHG emissions by increasing energy efficiency and improving transit infrastructure. Nonetheless, operational GHG emissions would increase incrementally with Alternative 4.

## **8. Hazards and Hazardous Materials**

Under Alternative 4, the Project would be built but would include an additional station along Manchester Boulevard. Although construction of an additional station would increase construction activities compared to the Project, construction impacts under Alternative 4 would be similar to those of Project. Construction of the guideway and four stations in conjunction with the MSF and PDS substations would still involve the demolition of existing buildings, which may have the potential to release hazardous materials, such as ACMs, LBP, and other potentially hazardous building materials. Furthermore, excavations of potentially contaminated soils may occur during construction of Alternative 4 as a result of prior uses on some of the sites, similar to the Project.

Under Alternative 4, operation would include the use and storage of hazardous materials typical of those used in an industrial setting, similar to the Project. Alternative 4 would not interfere with or impair the City's ability to increase public awareness or make any improvements to emergency services and warning systems during operation. With adherence to the federal, State, and local safety requirements, Alternative 4 would not conflict with the requirements of an emergency response plan or emergency evacuation plan, similar to the Project. As such, operational impacts under Alternative 4 would be similar when compared to the Project.

## **9. Land Use and Planning**

Alternative 4 would build an ATS similar to the Project with a 4<sup>th</sup> station located on Manchester Boulevard. The Project would not physically divide the community with its elevated guideways and maintenance of existing roadway capacity and roadway connections. Alternative 4 would have an alignment and elevated guideways similar to the Project. As such, Alternative 4 would also maintain the existing roadway capacity and roadway connections. Alternative 4 could activate foot traffic and interest on Market Street and help reinvigorate the Downtown business area. Alternative 4 will have a similar impact on physically dividing the community as the Project.

Alternative 4 would be generally consistent with the existing plans, policies and guidelines in the City and the greater region. Alternative 4 would require the same amendments to the Land Use Element, Circulation Element, Safety Element, Environmental Justice Element, and the Inglewood Municipal Code as the Project to incorporate the ATS into the language of the existing plans, policies, and guidelines within the City. As such, land use impacts of Alternative 4 would be similar to the Project with neither this alternative nor the Project resulting in significant land use impacts.

## **10. Noise and Vibration**

Under Alternative 4, the Project would be built but would include an additional station along Manchester Boulevard. Construction of a 4<sup>th</sup> station would require additional construction activities including operation of off-road heavy-duty equipment and on-road trucks for hauling which could increase construction noise and vibration levels. Though Alternative 4 would implement similar mitigation measures as the Project, it would increase construction noise and vibration impacts.

Alternative 4 would result in reductions to daily traffic volumes along key roadway corridors and VMT on an average weekday basis would occur similar or slightly increased in magnitude to those estimated for the Project. As such, this alternative would result in similar or slightly increased roadway noise levels as the Project. The addition of one station would not increase operational noise or vibration levels to a level of significance.

## **11. Population, Employment, and Housing**

The Project would have no direct impact on housing as the Project does not include the construction or demolition of any housing units. The Project would impact existing employment opportunities in the City as commercial uses that would be displaced by the Project are estimated to be approximately 464 jobs. However, the Project would result in a net increase of for approximately 11,052<sup>11</sup>FTE jobs as estimated by the Job Co-Benefits calculation (see **Section 4.11 Population, Employment, and Housing** of the Recirculated Draft EIR). The number of jobs that will be supported by the Project in the region is within the projected regional trends in the SCAG 2020-2045 RTP/SCS data and the jobs that will benefit from the Project will not directly translate into additional population growth in the region. As such the Project would have a less than significant impact on inducing employment and population growth.

Alternative 4 would have a similar effect on the population and employment trend as the ATS would be constructed and the same displacement of jobs and hiring of ATS personnel would occur. As such, Alternative 4 would have similar population, employment, and housing impacts as the Project.

## **12. Transportation**

Under Alternative 4, the Project would be built but would include an additional station along Manchester Boulevard. Construction of a 4<sup>th</sup> station would require additional construction activities including operation of off-road heavy-duty equipment and on-road trucks for hauling which could increase transportation effects and disruptions.

The weekday daily VMT would be reduced in the Future Opening Year (2027) with Event conditions similar to the VMT reductions estimated for the Project. The estimated daily ITC ridership during Future Opening

---

11 11,516 minus 464 in numbers of jobs displaced.

Year (2027) with NFL Event conditions are estimated to be approximately 29,300 passengers similar to the Project. The weekday daily VMT would be reduced in the Future Horizon Year (2045) with Event conditions similar to the VMT reductions estimated for the Project. The estimated daily ITC ridership during Future Horizon Year (2045) with an NFL Event conditions are estimated to be approximately 34,650 passengers, similar to the Project. Additionally, daily traffic volumes would decrease along key travel corridors such as Prairie Avenue, Manchester Boulevard and Century Boulevard, thereby reducing congestion and improving travel conditions on a system-wide basis.

Similar to the Project, Alternative 4 would result in operational benefits. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur similar in magnitude to those estimated for the Project. This alternative is estimated to result in ITC ridership similar to the Project. Improved traffic flows and reduction in congestion along key travel corridors, similar to those associated with the Project would occur with Alternative 4.

### **13. Tribal Cultural Resources**

The Project would have a less than significant impact on Tribal Cultural Resources (TCRs). No TCRs were identified in the records around the Project site and no sensitive resources were identified. Nonetheless, the Project as proposed would include construction which would have the potential to unearth subsurface resources not previously identified. Given the level of urban development in Inglewood, the likelihood of unearthing TCRs is low but it is still a possibility. The 4<sup>th</sup> station alternative would have a similar impact to TCRs as the Project since extensive construction and excavation of soil would be required to construct the ATS structure and the 4<sup>th</sup> station. Similar impacts to the TCRs would result from the Project and Alternative 4.

### **14. Utilities and Service Systems**

The 4<sup>th</sup> station would be located along the guideway within the public right-of-way along Manchester Boulevard. Under Alternative 4, no additional properties would need to be acquired and no additional demolition of buildings and site improvements would be required. As such impacts related to the construction or relocation of water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities would be similar to the Project.

### **Basis for Finding**

Alternative 4 would meet all of the City's objectives for the Project and would reduce VMTs in a similar magnitude to the Project, but would provide little benefit to ridership. The area of the additional stop under this Alternative is already sufficiently serviced by existing public bus stops. Moreover, Alternative 4

would result in increased construction and operational impacts compared to the Project. Alternative 4 would also be substantially more expensive than the Project. This provides sufficient independent grounds for rejecting this alternative.

## **Finding**

Specific economic, legal, social, technological, or other considerations, make Alternative 4 infeasible.

## ***Alternative 5: Prairie Avenue Single Station Alternative***

### **Description**

The Project modifies and relocates Prairie Avenue to the east to maintain the current roadway capacity. The relocation of Prairie Avenue and the need for a passenger station connection on the sidewalk/ground level affects properties located east of Prairie Avenue. This Alternative avoids affecting these properties by consolidating the two proposed stations on Prairie Avenue into a single station that would be located adjacent to the City's Intermodal Transit Facility at the City's Civic Center site. Passengers would connect to the ground/sidewalk level within the City-owned Civic Center site.

This Alternative maintains Prairie Avenue within its existing right-of-way; however, one to two lanes would be lost, thereby reducing the capacity of the roadway. Specifically, one travel lane in each direction along Prairie Avenue between Arbor Vitae and La Palma, one lane in the southbound direction between La Palma and Pincay Drive, and one lane in each direction between Pincay Drive and Manchester Boulevard would be lost under this Alternative 5: Prairie Avenue Single Station Alternative.

### **Relationship to Project Objectives**

Alternative 5 would meet, or partially meet, most of the City's objectives for the Project. Alternative 5 would reduce the City's traffic congestion and alleviate growing demand on the existing roadway network, although to a slightly lesser degree than the Project. Specifically, the Prairie Avenue Single Station Alternative would result in a reduction in capacities along Prairie Avenue, and traffic flow and congestion on a system-wide basis would be increased compared to those estimated for the Project. However, several of the City's objectives would be met to the same extent as under the Project. For example, by eliminating one of the stations, Alternative 5 would not meet the objective of encouraging intermodal transportation systems by providing convenient, reliable time-certain transit to the same degree as would the Project. Eliminating a station would also not meet the objective of providing convenient access to businesses, and to connect the City by providing transit within safe and accessible walking distances to the same degree as would the Project.

## **Comparative Impacts**

**Table 5.0-1** at the beginning of Chapter 5.0, Alternatives, of the Recirculated Draft EIR, provides an impact-by-impact comparison of the significant impacts of the Project and Alternative 5.

### **1. Aesthetics**

Under Alternative 5, the Project would not result in significant impacts to the aesthetic character of the community during construction or operation with implementation of the project design features in the ITC CCP and Design Guidelines. Similarly, Alternative 5 would travel down the same alignment with the same proposed and elevated guideway across the frontage of the buildings on Market Street. No additional impacts on the visual character of downtown would result from the consolidation and relocation of the single station along Prairie Avenue.

### **2. Air Quality**

Under Alternative 5, the Project would be built but the two proposed stations along Prairie Avenue would be consolidated into a single station that would be located adjacent to the City's Civic Center site. The construction of a single station along Prairie Avenue instead of two stations would result in less construction activities compared to the Project. Similar to the Project, Alternative 5 would not conflict with implementation of the applicable air quality plans or exceed thresholds established by the SCAQMD for criteria air pollutants. Moreover, Alternative 5 would implement similar mitigation measures as the Project and would reduce construction air quality emissions.

Operation of a single station along Prairie Avenue instead of two stations would slightly decrease operational air quality emissions. However, under Alternative 5, mobile operational benefits would be less than those associated with the Project. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur, but approximately 15 percent less in magnitude than those associated with the Project. As such, operational air quality emissions associated mobile sources would increase compared to the Project.

### **3. Biological Resources**

Approximately 502 trees which may require removal during construction of the Project exist along the Project alignment. With Alternative 5, no additional properties would need to be acquired and no additional demolition of buildings or site improvements would be required. The guideway would still be constructed along the same segment of Prairie Avenue compared to the Project. As such, Alternative 5 would not require an increase or decrease in tree removals or disturbance of nesting raptors or migratory birds. As such, impacts to biological resources during construction would be similar compared to the

Project. Similar to the Project, operation of Alternative 5 would not diminish the chances for long-term survival of bird species or their habitats and no additional tree and/or ornamental vegetation removals would be planned. As such, Alternative 5 would result in similar operational impacts compared to the Project.

#### **4. Cultural Resources**

Alternative 5 would have a less than significant impact on cultural resources, similar to the Project. The consolidated and relocated station on Prairie Avenue would have no impact and would not be located near any identified historical resources. As such, impacts to cultural resources would be similar for Alternative 5 and the Project.

#### **5. Energy Resources**

Under Alternative 5, the Project would be built but the two proposed stations along Prairie Avenue would be consolidated into a single station that would be located adjacent to the City's Civic Center site. Construction of a single station in place of two stations would result in an incremental decrease of energy resource consumption for electricity and petroleum-based fuels associated with operation of the station.

Operation of a single station along Prairie Avenue instead of two stations would also slightly decrease operational energy resource consumption. However, under Alternative 5, mobile operational benefits would be less than those associated with the Project. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur, but approximately 15 percent less in magnitude than those associated with the Project. As such, Alternative 5 would result in an increase in petroleum-based fuel consumption compared to the Project.

#### **6. Geology and Soils**

Under Alternative 5, the Project would be built but the two proposed stations along Prairie Avenue would be consolidated into a single station that would be located adjacent to the City's Civic Center site. Impacts related to geology and soils conditions, including paleontological resources, and potential to conflict with an emergency evacuation plan, would be similar to those described for the Project. Geology and soils conditions that would be encountered in construction of Alternative 5 would be the same as with the Project. The Potrero Fault lies approximately one-quarter mile to the east of the project study area; however, compliance with the California Building Code would avoid the creation of seismic hazards. Ground-disturbing activity and the potential for accidental discovery of paleontological resources would continue to be potentially significant under Alternative 5 and would require the same mitigation measures as identified for the Project in order to reduce the impact to less than significant.

## **7. Greenhouse Gas Emissions**

The construction of a single station along Prairie Avenue instead of two stations would result in a reduction in the level of construction activities compared to the Project. As such Alternative 5 would reduce construction related GHG emissions.

Operation of a single station along Prairie Avenue instead of two stations would also slightly decrease GHG emissions resulting from operation of the stations. However, under Alternative 5, mobile operational benefits would be less than those associated with the Project. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur, but approximately 15 percent less in magnitude than those associated with the Project. However, similar to the Project, Alternative 5 would be consistent with the CARB 2017 Scoping Plan Update, SCAG 2020-2045 RTP/SCS, the ECAP, and General Plan, which set goals to reduce GHG emissions by increasing energy efficiency and improving transit infrastructure. Nonetheless, operational GHG emissions associated mobile sources would increase compared to the Project.

## **8. Hazards and Hazardous Materials**

While construction of a single station along Prairie Avenue instead of two stations would result in a reduction in the level of construction activities compared to the Project, construction impacts under Alternative 5 would be similar to those of the Project. Construction of the guideway and stations in conjunction with the MSF and PDS substations would still involve the demolition of existing buildings, which may have the potential to release hazardous materials, such as ACMs, LBP, and other potentially hazardous building materials. Furthermore, excavations of potentially contaminated soils may occur during construction of Alternative 5 as a result of prior uses on some of the sites, similar to the Project. Similar to the Project, construction activities under Alternative 5 would likely cause the temporary closure of travel lanes, roadway segments, and sidewalks along the elevated guideway and stations within the street rights-of-way.

Under Alternative 5, operation would include the use and storage of hazardous materials typical of those used in an industrial setting, similar to the Project. Alternative 5 would not interfere with or impair the City's ability to increase public awareness or make any improvements to emergency services and warning systems during operation. With adherence to the federal, State, and local safety requirements, Alternative 5 would not conflict with the requirements of an emergency response plan or emergency evacuation plan, similar to the Project. As such, operational impacts under Alternative 4 would be similar when compared to the Project.

## 9. Land Use and Planning

Alternative 5 would involve building and operating an ATS system similar to the Project while consolidating the two proposed stations on Prairie Avenue to one single station adjacent to the Civic Center Site on Prairie Avenue. The Project would not physically divide the community with its elevated guideways and maintenance of existing roadway capacity and roadway connections. Alternative 5 would have a similar alignment and elevated guideways similar to the Project. As such, Alternative 5 would also maintain the existing roadway capacity and roadway connections. Alternative 5 would have a similar impact on physically dividing the community as the Project.

Alternative 5 would be generally consistent with the existing plans, policies and guidelines in the City and the greater region. Alternative 5 would include the same amendments to the Land Use Element, Circulation Element, Safety Element, Environmental Justice Element, and the Inglewood Municipal Code as the Project to incorporate the ATS into the language of the existing plans, policies, and guidelines within the City. As such, the policy consistency impacts of Alternative 5 would be similar to the Project.

## 10. Noise and Vibration

The construction of a single station along Prairie Avenue instead of two stations would result in a reduction in the level of construction activities compared to the Project. For this reason, Alternative 5 would reduce construction related noise and vibration levels.

Operation of a single station along Prairie Avenue instead of two stations would also slightly decrease operational noise and vibration levels. However, under Alternative 5, mobile operational benefits would be less than those associated with the Project. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur, but approximately 15 percent less in magnitude than those associated with the Project. As such, operational noise and vibration impacts associated mobile sources would increase compared to the Project.

## 11. Population, Employment, and Housing

The Project would have no direct impact on housing as the Project does not include the construction or demolition of any housing units. The Project would impact existing employment opportunities in the City as commercial uses that would be displaced by the Project are estimated to be approximately 464 jobs. However, the Project would result in a net increase of for approximately 11,052<sup>12</sup>FTE jobs through the Greenhouse Gas Reduction Funds, as estimated by the Job Co-Benefits calculation (see **Section 4.11 Population, Employment, and Housing**). The number of jobs that will be supported by the Project in the

---

12 11,516 minus 464 in numbers of jobs displaced.

region is within the projected regional trends in the SCAG 2020-2045 RTP/SCS data and the jobs that will benefit from the Project will not directly translate into additional population growth in the region. As such the Project would have a less than significant impact on inducing employment and population growth.

Alternative 5 would have a similar effect on the population and employment trend as the ATS would be constructed as planned. Alternative 5 would have a similar impact to the population, employment, and housing resource as compared to the Project.

## **12. Transportation**

Under Alternative 5, the Project would be built but the two proposed stations along Prairie Avenue would be consolidated into a single station that would be located adjacent to the City's Civic Center site. The Project modifies and relocates Prairie Avenue to the east to maintain the current roadway capacity. This relocation in conjunction with the need for a passenger station connection to the sidewalk/ground level affects properties located east of Prairie Avenue. Alternative 5 avoids affecting these properties by consolidating the two proposed stations along Prairie Avenue into a single station that would be located adjacent to the Intermodal Transit Facility at the City's Civic Center site. This alternative maintains Prairie Avenue within its existing right-of-way; however, one to two lanes would be lost reducing the capacity of the roadway. Specifically, one travel lane in each direction along the Prairie Avenue roadway between Arbor Vitae and La Palma, one lane in the southbound direction between La Palma and Pincay Drive, and one lane in each direction between Pincay Drive and Manchester Boulevard would be lost under Alternative 5.

Under Alternative 5, operational benefits would be less than those associated with the Project. Reductions to daily traffic volumes along key roadway corridors and VMTs on an average weekday basis would occur, but approximately 15 percent less in magnitude than those associated with the Project. Alternative 5 is estimated to result in transit ridership equivalent to approximately 75 percent of the transit ridership associated with the Project. However, due to a reduction in capacities along Prairie Avenue, traffic flow and congestion in the surrounding area would be worse under Alternative 5 compared to the Project.

## **13. Tribal Cultural Resources**

The Project would have a less than significant impact on Tribal Cultural Resources (TCRs), No TCRS were identified in the records around the Project site and no sensitive resources were identified. Nonetheless, the Project as proposed would include construction which would have the potential to unearth subsurface resources not previously identified. Given the level of urban development in Inglewood, the likelihood of

unearthing TCRs is low but it is still a possibility. Alternative 5 would result in similar potential impacts to TCRs as the Project since excavation of soil would be required to construct the ATS system along the proposed alignment, including a single station on Prairie Avenue. Similar impacts to the TCRs are anticipated for the Project and Alternative 5.

#### **14. Utilities and Service Systems**

The proposed Prairie station under Alternative 5 would be located within the City's Civic Center site. The guideway would still be constructed along the same segment of Prairie Avenue compared to the Project. As such, impacts related to the construction or relocation of water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities would be similar compared to the Project.

#### **Basis for Finding**

Alternative 5 would result in similar impacts compared to the Project. Alternative 5 would reduce the City's traffic congestion and alleviate growing demand on the existing roadway network, although to a slightly lesser degree than the Project. Moreover, Alternative 5 would not meet the objective of encouraging intermodal transportation systems by providing convenient, reliable time-certain transit to the same degree as would the Project. Eliminating a station would also not meet the objective of providing convenient access to businesses, and to connect the City by providing transit within safe and accessible walking distances to the same degree as would the Project. Alternative 5 would also not meet the goal of maintaining roadway capacity because it will reduce eliminate one to two lanes on Prairie Avenue. This provides sufficient independent grounds for rejecting this alternative.

#### **Finding**

Specific economic, legal, social, technological, or other considerations, make Alternative 5 infeasible.

### ***Alternative 6: Maintenance and Storage Facility (MSF) Site Alternative***

#### **Description**

The Project involves siting the MSF within the southeastern portion of the site at 500 E. Manchester Boulevard closest to the corner of Nutwood Street and Spruce Avenue that contains a Vons grocery store and gas station, with other businesses, including a private gym, bank branch and coffee shop located in the building with Vons. This siting of the MSF requires removal of the gas station currently located on the Vons site in order to provide for short-term construction staging to construct the MSF and, thereafter, to provide parking.

This Alternative moves the MSF to the northwestern portion of this property closest to the south corner of Hillcrest Boulevard and Manchester Boulevard. The site containing the MSF would be approximately 14,000 square feet in size.

This alternative would have the same elevated profile and footprint of the MSF and its supporting facilities (e.g., access, circulation, employee parking, etc.). With this alternative, the existing gas station would remain on the site. Under this Alternative, the building containing the grocery store and other businesses would be demolished. With the Project, a replacement Vons store would be built on the corner of Manchester Boulevard and Hillcrest Boulevard. With this alternative a replacement Vons store would not be built on this site.

### **Relationship to Project Objectives**

Alternative 6 would meet most of the City's objectives since the Project would still be built and reductions to daily traffic volumes along key roadway corridors and reductions to VMTs on an average weekday basis with event would occur similar in magnitude to those associated with the Project. Alternative 6, however, would not meet the objective to encourage redevelopment and investment within the City in areas served by the Project to the same degree as would the Project because Alternative 6 would not include replacement of the existing Vons grocery store on the MSF site.

### **Comparative Impacts**

**Table 5.0-1** at the beginning of Chapter 5.0, Alternatives, of the Recirculated Draft EIR, provides an impact-by-impact comparison of the significant impacts of the Project and Alternative 6.

#### **1. Aesthetics**

The Project would not result in significant impacts to the aesthetic character of the community during construction or operation with implementation of the project design features in the ITC CCP and Design Guidelines. Similarly, Alternative 6 would travel down the same alignment with the same proposed and elevated guideway across the frontage of the buildings on Market Street. No additional impacts on the visual character of downtown would result from moving the MSF to the northwestern portion of the Vons site closest to the south corner of Hillcrest Boulevard and Manchester Boulevard.

## **2. Air Quality**

Construction under Alternative 6 would be similar to the Project. During construction, the Project would not exceed the significance threshold for any criteria pollutant after mitigation, and impacts would be less than significant. Similar to the Project, Alternative 6 would not conflict with implementation of the applicable air quality plans and would not exceed thresholds established by the SCAQMD for criteria air pollutants.

Operational impacts associated with Alternative 6 would be similar to the Project as the ATS would be built as proposed. Moreover, reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis with event would occur similar in magnitude to those associated with the Project. As such, Alternative 6 would result in similar operational impacts compared to the Project.

## **3. Biological Resources**

Approximately 502 trees which may require removal during construction of the Project exist along the Project alignment. With Alternative 6, no additional properties would need to be acquired and no additional demolition of buildings or site improvements would be required. As such, impacts to biological resources during construction would be similar compared to the Project. Similar to the Project, operation of Alternative 6 would not diminish the chances for long-term survival of bird species or their habitats and no additional tree and/or ornamental vegetation removals would be planned. As such, Alternative 6 would result in similar operational impacts compared to the Project.

## **4. Cultural Resources**

Alternative 6 would have a less than significant impact on cultural resources, similar to the Project. The relocated MSF on the northwest portion of its site would have no impact on cultural resources and would not be located near any identified historical resources. For this reason, impacts to cultural resources would be similar for Alternative 6 and the Project.

## **5. Energy Resources**

Energy demand from construction activities under Alternative 6 would be similar to the Project as the ATS would be built as proposed. Reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis would occur similar in magnitude to those associated with the Project. As such, Alternative 6 would result in similar operational impacts compared to the Project.

## **6. Geology and Soils**

Impacts related to geology and soils conditions, including paleontological resources, would be similar to those identified for the Project. Geology and soils conditions that would be encountered in construction of Alternative 6 would be the same as with the Project. The Potrero Fault lies approximately one-quarter mile to the east of the project study area; however, compliance with the California Building Code would avoid the creation of seismic hazards. Ground-disturbing activity and the potential for accidental discovery of paleontological resources would continue to be potentially significant with Alternative 6. Alternative 6 would implement similar measures as the Project to mitigate the potential impacts on paleontological resources to less than significant.

## **7. Greenhouse Gas Emissions**

Construction under Alternative 6 would be similar to the Project and would result in a similar level of GHG emissions. Reductions to daily traffic volumes along key roadway corridors and reductions to VMT on an average weekday basis would occur similar in magnitude to those associated with the Project. Therefore, similar to the Project, Alternative 6 would be consistent with the CARB 2017 Scoping Plan Update, the SCAG 2020-2045 RTP/SCS, the ECAP, and General Plan, which set goals to reduce GHG emissions by increasing energy efficiency and improving transit infrastructure. Operational GHG impacts would be similar to the Project.

## **8. Hazards and Hazardous Materials**

Under Alternative 6, the MSF would be relocated to the northwestern portion of the Vons site. Construction under Alternative 6 would be similar to the Project. Construction of the guideway and stations in conjunction with the MSF and PDS substations would involve the demolition of the existing building, which may have the potential to release hazardous materials, such as ACMs, LBP, and other potentially hazardous building materials. Similar to the Project, construction activities under Alternative 6 would likely cause the temporary closure of travel lanes, roadway segments, and sidewalks along the elevated guideway and stations within the street rights-of-way. Construction of Alternative 6, however, would not involve demolition of the existing gas station at the MSF site, thereby resulting in a slightly reduced potential for the potential release of hazardous materials.

Under Alternative 6, operation of the ATS would include the use and storage of hazardous materials typical of those used in an industrial setting, similar to the Project. Alternative 6 would not interfere with or impair the City's ability to increase public awareness or make any improvements to emergency services and warning systems during operation. With adherence to the federal, State, and local safety requirements, Alternative 6 would not conflict with the requirements of an emergency response plan or

emergency evacuation plan, similar to the Project. As such, operational impacts under Alternative 3 would be similar to the Project.

## **9. Land Use and Planning**

Alternative 6 would include the construction and operation of an ATS system similar to the Project while moving the MSF along Hillcrest Boulevard between Manchester Boulevard and Nutwood Street. With this alternative the existing gas station on this property would be retained, but the existing commercial building containing the grocery store and other businesses would be demolished. Under the Project a replacement Vons store would be constructed on the corner of Manchester Boulevard and Hillcrest Boulevard. Under Alternative 6, however, a replacement grocery store would not be provided on this site. Nevertheless, the community is served by other grocery stores and the loss of this store is not considered a significant land use impact for this reason.

The Project would not create a physical division of the existing community as the ATS guideway and stations would be elevated and the existing configuration of travel lanes on Market Street, Manchester Boulevard and Prairie Avenue would be maintained.

Alternative 6 would be generally consistent with the existing regional and local land use plans and policies. Alternative 6 would require the same amendments to the Land Use Element, Circulation Element, Safety Element, Environmental Justice Element, and the Inglewood Municipal Code as the Project to incorporate the ATS system into these plans and regulations.

## **10. Noise and Vibration**

Construction under Alternative 6 would be similar to the Project and would result in similar noise levels. Moreover, Alternative 6 would implement similar mitigation measures as the Project to reduce construction noise and vibration impacts to less than significant. Alternative 6 would result in reductions to daily traffic volumes along key roadway corridors and VMT on an average weekday basis would occur similar in magnitude to those estimated for the Project. As such, this alternative would result in similar roadway noise levels as the Project. Neither this alternative or the Project would result in significant noise and vibration impacts.

## **11. Population, Employment, and Housing**

The Project would have no direct impact on housing as the Project does not include the construction or demolition of housing units. The Project would impact existing employment opportunities in the City as commercial uses that would be displaced by the Project are estimated to be approximately 464 jobs.

However, the Project would result in a net increase of approximately 11,052<sup>13</sup> FTE jobs through the Greenhouse Gas Reduction Funds, as estimated by the Job Co-Benefits calculation (see **Section 4.11 Population, Employment, and Housing**). The number of jobs that will be supported by the Project in the region is within the projected regional trends in the SCAG 2020-2045 RTP/SCS data and the jobs that will benefit from the Project will not directly translate into additional population growth in the region. As such the Project would have a less than significant impact on inducing employment and population growth.

Alternative 6 would result in the demolition of the existing Vons grocery store and other businesses on site (with the exception of the existing gas station). It is possible that these businesses might choose not to relocate, which would result in corresponding job losses. Overall, alternative 6 would maintain the existing population, employment, and housing trends within the City and the region. As such, Alternative 6 would not directly or indirectly substantially induce population in the City or the region. Employment support and would be similar to the Project under Alternative 6.

## **12. Transportation**

Construction under Alternative 6 would be similar to the Project. The Project and all of its components would be constructed and operate. The operation of the ATS would be the same as planned for the Project.

Similar to the Project, Alternative 6 would result in operational benefits. Reductions to daily traffic volumes along key roadway corridors and reductions to VMTs on an average weekday basis would occur similar in magnitude to those associated with the Project. Additionally, this alternative is estimated to result in transit ridership similar to the Project. Finally, Alternative 6 would provide similar operational benefits as those of the Project relative to reduction in traffic congestion and improvement of traffic flows along key roadway facilities areawide.

## **13. Tribal Cultural Resources**

The Project would have a less than significant impact on Tribal Cultural Resources (TCRs), No TCRs were identified in the records around the Project site and no sensitive resources were identified. Nonetheless, the Project as proposed would include construction which would have the potential to unearth subsurface resources not previously identified. Given the level of urban development in Inglewood, the likelihood of unearthing TCRs is low but it is still a possibility. Relocating the MSF to the northwestern portion of the Vons site would not result in any additional impacts.

---

13 11,516 minus 464 in numbers of jobs displaced.

## **14. Utilities and Service Systems**

Construction and operation under Alternative 6 would be similar to the Project. For this reason, impacts related to the construction or relocation of water, wastewater treatment, storm water drainage, electric power, natural gas, or telecommunications facilities would be similar compared to the Project.

### **Basis for Finding**

Alternative 6 would result in similar impacts compared to the Project. Alternative 6 would result in reductions to daily traffic volumes along key roadway corridors in a similar magnitude to those associated with the Project. However, Alternative 6 would not meet the objective to encourage redevelopment and investment within the City to the same degree as would the Project because Alternative 6 would not include replacement of the existing Vons grocery store on the MSF site. This provides sufficient independent grounds for rejecting this alternative.

### **Finding**

Specific economic, legal, social, technological, or other considerations, make Alternative 6 infeasible.

### **Conclusion**

The Project meets all the City's goals and objectives to deliver a world-class transportation system and provide a direct connection between downtown Inglewood and the major activity centers to the Metro Regional rail system. Compared to other alternatives reviewed and rejected, the ITC presents the opportunity for integration with local economic activity, current and future transit-oriented development, and support for the revitalization of the downtown/commercial district of Inglewood. The Project is anticipated to generate a high transit ridership, will meet the City's operational demands during events and non-event days and represents one of the most cost-effective transit solutions compared to other alternatives, avoids significant construction impacts to the adjacent commercial uses, and avoids acquisition of residential property along the alignment. Other alternatives considered are fundamentally inconsistent with City goals. The Fairview Heights Alternative connecting Florence Avenue onto Prairie Avenue would potentially impact the Inglewood Cemetery and does not generate economic development opportunities within the City. The Alternative on Arbor Vitae Street, whose right-of-way ranges from 100 feet to 66 feet, would potentially require acquisition of existing small businesses and possible residential neighborhood displacement. The Century Boulevard Alternative had many major utility conflicts and would have major design challenges as the transition from an elevated segment to a level sufficient under the I-405 may not be feasible due to the short distance

available and the real estate constraint between Century Boulevard and the LAX LAMP Manchester Square development.

An Interlined Operability Scenario was also initially studied by LA Metro and the City of Inglewood and was determined to be infeasible due to the cost and complexity of this type of system and extension of the Metro K Line. Underground APM options were preliminarily reviewed and rejected due to the significantly higher costs and conflicts with the major underground utilities along Prairie Avenue. Transitioning from an underground to an elevated option along Prairie would cut off major roadways at the transition - a fatal flaw to traffic circulation and capacity. An at-grade transit system along Market Street was initially considered but determined to be infeasible because it would result in significant traffic impacts, would not have the capacity to meet peak ridership demands, and would be more costly to build and/or operate than the proposed Project. The BRT option would be located entirely within the public right-of-way, would include bus-only lanes that would reduce roadway lane capacities for mixed-flow traffic, and would not provide the level of service of capacity desired for event days.

The Market Street Promenade Alternative would not meet goal of maintaining roadway capacity, could potentially hurt local businesses, and is generally deemed premature until temporary closures of Market Street are activated for occasional events, such as farmer's markets, block parties, and art walks. The 4th Station Alternative is rejected because it is too expensive, increases construction related impacts along Manchester Boulevard and would have negative impacts on adjacent sidewalks without providing a substantial increase in transit ridership. While a Prairie Avenue Single Station Alternative meets some City objectives, it would not provide the highest levels of service and acceptable walk distances to the various event venues. Lastly, the MSF site alternative is rejected because the City has identified a more suitable location for the MSF and is collaborating with the Vons to replace the new supermarket at its current location.

Based on the technical evaluation and public stakeholder input, the Project provides a convenient, reliable, time-certain transit connectivity to the City's major employment, housing, and activity centers from the regional Metro Rail system, achieving new economic and air quality benefits to the City of Inglewood and the Southern California region.

# Notice of Exemption

# Notice of Exemption

To: Office of Planning and Research  
P.O. Box 3044, Room 113  
Sacramento, CA 95812-3044

From: (Public Agency): City of Inglewood  
One West Manchester Boulevard  
Inglewood CA 90301

County Clerk

County of: Los Angeles  
12400 Imperial Hwy.  
Norwalk CA 90650

(Address)

Project Title: Inglewood Transit Connector (ITC) Project

Project Applicant: City of Inglewood

Project Location - Specific: The ITC Project is proposed on Market St., Manchester Blvd. and Prairie Avenue

Project Location - City: Inglewood Project Location - County: Los Angeles

Description of Nature, Purpose and Beneficiaries of Project: The ITC Project is a 1.6-mile, three station, fully elevated electrically powered Automated Transit System (ATC) proposed to close the last-mile gap between the LA Metros K Line light rail system to major new housing, employment and activity centers in the City, including the Forum, the Los Angeles Sports and Entertainment District, which includes SoFi Stadium and the Inglewood Basketball and Entertainment Center. The ITC Project also includes a maintenance and storage facility for the ATS trains, two power distribution substations to provide power to the ATS system and surface public parking facilities at the Market St./Florence Ave. Station, the maintenance and storage facility and at 150 Market St.

Name of Public Agency Approving Project: City of Inglewood

Name of Person or Agency Carrying Out Project: City of Inglewood

Exempt Status: (check one):

- Ministerial (Sec. 21080(b)(1); 15268);
- Declared Emergency (Sec. 21080(b)(3); 15269(a));
- Emergency Project (Sec. 21080(b)(4); 15269(b)(c));
- Categorical Exemption. State type and section number: \_\_\_\_\_
- Statutory Exemptions. State code number: Pub. Resources Code, § 21080, subd. (b)(12), CEQA Guidelines § 15275(b)

Reasons why project is exempt: The ITC Project is a "facility extension" of the LA Metro K Line light rail line is less than 4 miles in length at 1.6 miles and the project will close the existing last mile gap between the Metro K Line and new housing, employment and activity centers in the City of Inglewood and is required for the transfer of passengers to and from the Metro K Line and these housing, employment centers in the City.
