### REVISED NOTICE OF PREPARATION

**PROJECT NAME:** Inglewood Transit Connector Project

**STATE CLEARINGHOUSE NO.:** 2018071034

**DUE DATE FOR PUBLIC COMMENTS:** October 12, 2020 by close of business.

**SUMMARY:** The Inglewood Transit Connector Project (proposed Project) is a proposed Automated People Mover (APM) mass-transit line connecting the City of Inglewood (City) to the greater southern California region. The proposed Project will include a revised 1.6-mile transit guideway, three stations, APM trains, and support facilities including a maintenance storage facility (MSF) and two traction power substations (TPSSs). The City, as the Lead Agency, prepared an Initial Study (Original IS), which was published in July 2018 (SCH 2018071034).

The Original IS determined that an Environmental Impact Report (EIR) would be prepared in compliance with CEQA to assess for potentially significant impacts that may result from the proposed Project. A Notice of Preparation (Original NOP) was circulated, and comments were received from the public and agencies following a 30-day comment period that ended on August 15, 2018.

As a result of the comments received, in addition to refinements and modifications to the proposed Project identified in the Original NOP and Original IS, this Revised NOP and IS are being re-circulated. Subsequent to the circulation of the Original IS, the State of California Office of Planning and Research (OPR) updated and revised the thresholds contained in the State CEQA Guidelines Appendix G. The Revised IS has been updated to address the updated Appendix G checklist that became effective on December 28, 2018.

The proposed Project includes transit improvements that would be constructed in the City along the same route and alignment as noted in the Original NOP and Original IS. The elevated guideway would be located primarily within the public right-of-way from the intersection of Market Street and Florence Avenue intersection, along Market Street to Manchester Boulevard, then to Prairie Avenue. The portions of the elevated guideway not within the public right-of-way occur at the location of Market Street/Florence Avenue Station where the elevated guideway leaves the right-of-way and enters into an existing commercial center northeast of the intersection of Market Street and Regent Street. The existing uses would be demolished.

September 10, 2020

The proposed Project begins with a pedestrian walkway that connects to the Metro Crenshaw/LAX Line across Florence Avenue in downtown Inglewood to the Market Street/Florence Avenue Station, which will be located at an existing commercial plaza. The proposed Project's elevated guideway begins at the Market Street/Florence Station, then proceeds southwest to Market Street, where it turns south onto the existing right-of-way along Market Street. The elevated guideway alignment continues on Market Street until the intersection with Manchester Boulevard, where it turns east onto Manchester Boulevard until the intersection with Prairie Avenue. At this point, the elevated guideway alignment turns south onto Prairie Avenue and continues south on Prairie Avenue until the intersection of Prairie Avenue and Hardy Street, where it terminates with the Prairie Avenue/Hardy Street Station.

The proposed Project would also include a maintenance and storage facility (MSF) that would store and maintain the trains and two traction power substations (TPSSs). The proposed MSF would be constructed adjacent to the right-of-way at the proposed MSF site, south of the corner of Hillcrest Boulevard and Manchester Boulevard, which is currently occupied by a commercial center and gas station; this site would also include one of the proposed TPSS sites. The second TPSS site would be located at the City's proposed Intermodal Transportation Facility (ITF) located on Prairie Avenue south of Arbor Vitae Street; this TPSS site would be to the east of Prairie Avenue, outside of the right-of-way within the ITF site. The existing uses would be demolished. Anticipated construction duration for the proposed Project is 4 to 5 years.

The Revised NOP and Revised IS reflect the following refinements and modifications that have been made to the proposed Project:

- Changes to proposed Project's from an approximately 1.8-mile long alignment with 5 stations to an approximately 1.6-mile long alignment with 3 stations. The revised alignment follows the same route as the original alignment from Market Street and Florence Avenue to Manchester Boulevard to Prairie Avenue terminating at the intersection of Prairie Avenue and Hardy Street.
- Refinements and modifications to the proposed stations as follows:
  - Modify the proposed Project to reduce the total number of stations from the five stations previously considered to the three stations.
  - The new locations for the three stations are located at:
    - Market Street/Florence Avenue Station: at an existing commercial plaza on the southeast corner of the intersection of Market Street and Florence Avenue between Market Street and Locust Street;
    - Prairie Avenue/Arbor Vitae Street Station: at the intersection of Prairie Avenue and Pincay Drive; and
    - Prairie Avenue/Hardy Street Station: at the intersection of Prairie Avenue and Hardy Street.
  - A pedestrian bridge linkage has been added to connect the Market Street/Florence Avenue Station with the Metro Crenshaw line on the northside of Florence Avenue.
- Removal of the Intermodal Transportation Facilities as part of the proposed Project. The City is proceeding with that project separately.
- Reduce the potential number of traction power substations from three to two. One will be co-located with the MSF facility and one will be located on the City's ITF site on Prairie Avenue.

September 10, 2020

This Revised NOP and Revised IS are being recirculated as a result of these Project refinements.

**PROJECT LOCATION:**

The proposed Project is located entirely in the central portion of the City, east of the San Diego Freeway (I-405) and north of the Glen Anderson Freeway (I-105) in Los Angeles County, California (see **Figure 1: Regional Location Map**).

The proposed Project is generally bounded by Florence Avenue to the north; Hardy Street to the south; the Los Angeles Sports and Entertainment District (LASED) to the east; and La Brea Avenue to the west (see **Figure 2: Project Vicinity Map**).

The proposed Project begins with a pedestrian walkway that connects to the Metro Crenshaw/LAX Line across Florence Avenue in downtown Inglewood to the Market Street/Florence Avenue Station, which will be located at an existing commercial plaza. The proposed Project's elevated guideway begins at the Market Street/Florence Station, then proceeds from the intersection of Market Street and Florence Avenue adjacent to the Metro Crenshaw/LAX Line in Downtown Inglewood, south through Market Street, then east onto Manchester Boulevard, turning south on Prairie Avenue until its intersection with Hardy Street.

The elevated guideway will be located within the public rights-of-way along Market Street, Manchester Boulevard, and Prairie Avenue; with the exception of the Market Street/Florence Avenue Station, which will be located on a site that currently includes existing commercial use northeast of the intersection of Market Street and Regent Street, and the proposed MSF that will be located on a site that currently has commercial uses south of the intersection of Manchester Boulevard and Hillcrest Boulevard outside of the right-of-way (see **Figure 3: Typical Automated People Mover**). Construction staging is anticipated to be contained within the footprint and easements of the proposed Project, at sites that will be demolished (for other uses including the commercial Plaza at Regent Avenue and Market Streets, the commercial office building at 150 S. Market Street, and the commercial plaza at 500 E. Manchester Boulevard).

**DUE DATE FOR PUBLIC COMMENTS:** October 12, 2020 by close of business.

Notice is hereby given that the City will prepare an EIR for the proposed Project as revised and described in this Revised NOP and the Revised IS. The EIR to be prepared by the City will evaluate the potential significant environmental effects of the proposed Project. The City is requesting comments related to the proposed Project as revised.

Due to refinements and modifications to the proposed Project following the release of the Original NOP and Original IS, this Revised NOP and Revised IS have been prepared to inform the public of the changes to the proposed Project. The City is providing this Revised NOP and accompanying Revised IS to the Governor's Office of Planning and Research (OPR), any trustee or responsible agencies identified for the Project, to adjacent cities and counties, all entities who submitted comments on the Original NOP and Original IS, and to those entities requesting such notice regarding the proposed Project.

The Draft EIR will analyze the potential adverse impacts that are anticipated to result from the proposed Project as discussed herein; identify potential mitigation measures that may be considered as reasonable and feasible; and analyze a reasonable range of alternatives to the proposed Project that could reduce or

September 10, 2020

avoid potential significant impacts that could result from the construction or operation of the proposed Project while still feasibly achieving the Project's objectives.

The City encourages all parties to provide information regarding potentially significant environmental issues, mitigation measures, and reasonable alternatives to be included in the EIR. Any agency submitting comments on this Revised NOP and Revised IS shall also indicate if that agency would be a responsible agency, or a trustee agency for the proposed Project in accordance with CEQA Guidelines Section 15082(b).

A copy of the Revised Initial Study prepared for the proposed Project is available for review at the City of Inglewood website at: <https://www.cityofinglewood.org/1016/Environmental-Documents>; and at the locations listed below:

- Inglewood City Hall, First Floor Lobby, One W. Manchester Blvd., Inglewood, CA 90301

### **PROJECT DESCRIPTION**

The proposed Project would include an automated people mover (APM) to transport riders to and from the regional Metro Rail system (Crenshaw Line) to Downtown Inglewood, the Forum, the LASED, which includes the new NFL stadium scheduled to open in the Fall of 2020, and the future Inglewood Basketball and Entertainment Center (IBEC). The proposed Project would consist of elevated dual guideways to allow for continuous APM trains to travel in each direction. The proposed Project is planned to have a ridership capacity of 11,500 passengers per hour. Additionally, the transit system presents an opportunity for integration with local economic activity, transit-oriented development, and other initiatives in the area.

The proposed Project will include support facilities to provide for maintenance, storage and system power requirements that would be located adjacent to the elevated guideway but outside the street rights-of-way. These facilities include an approximately 78,000 square feet (SF) maintenance and storage facility (MSF) to provide for maintenance activities and train storage, and two traction power substations (TPSS) facilities to provide electrical power for system operation. The location of the proposed Project's guideway, stations, and the support facilities are shown on **Figure 2**.

**ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED:** As described more fully in the Revised Initial Study, the Draft Environmental Impact Report will consider: Aesthetics, Air Quality, Biological Resources, Cultural Resources, Energy, Geology and Soils, Greenhouse Gas Emissions, Hazards and Hazardous Materials, Land Use and Planning, Noise and Vibration, Population, Employment and Housing, Transportation and Circulation, Tribal Cultural Resources, and Utilities and Service Systems impacts.

Agricultural and Forestry Resources, Hydrology and Water Quality, Mineral Resources, Public Services, Recreation, and Wildfire impacts have been determined to have less than significant impacts on the environment through the analysis in the Revised Initial Study and are not proposed for further analysis in the EIR.

**REQUESTED PERMITS/APPROVALS:** The City of Inglewood has principal responsibility for approving and carrying out the proposed Project. Approvals required for implementation of the proposed Project may include, but are not limited to, the following:

September 10, 2020

***State and Regional Agency Approval and Actions:***

- South Coast Air Quality Management District (SCAQMD)—permit to operate a generator and Dust Control Plan;
- Regional Water Quality Control Board (RWQCB)—administer regulations regarding water quality. Permits or approvals required from the WQCB may include but are not limited to: (1) General Construction Stormwater Permit; (2) Standard Urban Stormwater Mitigation Plan; and (3) Submittal of a Recycled Water Report for the use of recycled water as a dust control measure for construction; and
- California State Transportation Agency (CalSTA)—oversight and consistency with grants funding from the Transit and Intercity Rail Capital Program (TIRCP).

***City of Inglewood Approvals and Actions:***

- Certification of the Final EIR for the Inglewood Transit Connector Project;
- Updates/amendments to the City of Inglewood General Plan and municipal code. These changes relate to conforming the plans, as necessary, to reflect the physical improvements within the Inglewood Transit Connector Project and technical amendments necessary for the construction, operation and maintenance of the Inglewood Transit Connector;
- Preparation of a Project-specific Stormwater Management Plan or Standard Urban Stormwater Mitigation Plan for approval;
- County of Los Angeles (as the City's contractor) Fire Department approval;
- Grading permits, building permits, haul route approval, and other permits issued by the Department of Building and Safety for the Project and any associated Department of Public Works permits for infrastructure improvements;
- Tree removal permits;
- Noise permit for Construction and Building Hours extension;
- Tract/parcel map and zone change approvals;
- Eminent Domain approvals for acquisition of parcels outside of the City's right-of-way;
- Approvals for federal, State, or local financing plans or grants;
- Approving contracts for the design and construction of the Project; and,
- Other federal, State, or local approvals, permits, or actions that may be deemed necessary for the Project.

Other agencies, such as the County of Los Angeles and the Los Angeles County Metropolitan Transportation Authority (Metro), may have approval authority or involvement depending on the financing used to construct the proposed Project.

September 10, 2020

**COMMENTS ON THE REVISED NOTICE OF PREPARATION AND INITIAL STUDY:** The City welcomes all comments regarding the scope and content of environmental issues to be addressed in the EIR.

**All comments will be considered in the preparation of the EIR. Written comments must be submitted to this office by 5 p.m. on October 12, 2020.**

Responses should be submitted sent to Ms. Mindy Wilcox, AICP, Planning Manager, at the following email and address:

City of Inglewood  
Planning Division  
One W. Manchester Boulevard, 4th Floor  
Inglewood, CA 90301

## 1.0 EXECUTIVE SUMMARY

This document is the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) for the Inglewood Transit Connector (ITC) Project (proposed Project). This Recirculated Draft EIR has been prepared by the City of Inglewood (City or Inglewood) as the lead agency for the environmental review of this proposed Project in conformance with the California Environmental Quality Act (CEQA).

### 1.1 SCOPING AND PUBLIC OUTREACH

The City, as the Lead Agency, prepared a Notice of Preparation (Original NOP) and an Initial Study (Original IS), which were published on July 16, 2018 (SCH 2018071034), identifying the environmental topics that could have potential significant impacts from the construction and operation of the proposed Project. The Original IS determined that an Environmental Impact Report (EIR) would be prepared in compliance with the CEQA to assess potentially significant impacts that may result from the proposed Project. Comments were received from the public and agencies during a 30-day comment period for the Original NOP that ended on August 15, 2018.

As a result of the comments received and in response to refinements and modifications to the proposed Project identified in the Original NOP and Original IS, a Revised NOP and IS were revised to provide an additional opportunity for comment on the potential environmental effects of the from September 10, 2020, to October 12, 2020. Subsequent to the circulation of the Original IS, the State of California Office of Planning and Research (OPR) updated and revised the thresholds contained in the State CEQA Guidelines Appendix G. The Revised IS was updated to address the updated Appendix G checklist that became effective on December 28, 2018. See **Appendix A: Revised NOP and IS** and **Appendix B: Summary of Comments on Second Recirculated NOP**.

The Revised NOP and Revised IS reflected changing the project from an approximately 1.8-mile long alignment with 5 stations to an approximately 1.6-mile long alignment with 3 stations. The revised alignment followed the same route as the original alignment from Market Street and Florence Avenue to Manchester Boulevard to Prairie Avenue terminating at the intersection of Prairie Avenue and Hardy Street.

A Draft EIR for the proposed Project was released on December 23, 2020, for a 47-day public review and comment period, ending on February 8, 2021. A robust public outreach effort was conducted over the two-year period starting in 2018 through the close of the public comment period on the Draft EIR. This effort included over 35 community and stakeholder outreach meetings with a variety of stakeholders including local Inglewood block clubs, neighborhood watch groups and homeownership associations (HOA) such as the Renaissance HOA, Carlton Square HOA, Briarwood HOA, Regent Street HOA, and the

Hyde Park Village HOA. The City also engaged the NCAAP Inglewood Chapter, Inglewood Airport Area Chamber of Commerce, Rotary Club of Inglewood, Inglewood Unified School District, local churches, and community-based nonprofits including the Social Justice Learning Center Institute, Move LA, The Enrichment Center, and the Coalition for Clean Air.

After the close of the public comment period on the Draft EIR, the City continued to keep elected officials, community leaders and the general public informed of the status of the environmental review and approval process for the proposed Project. The outreach program has been focused on increasing project awareness and education, disseminating project information, soliciting public input, and supporting the technical and legal environmental processes. To learn more about the local community's needs for the proposed Project, the City held over 100 community and stakeholder outreach meetings over the past 3.5 years during the planning, environmental and design process. The City further revised the design of the proposed to reflect the input received.

In response to the public and stakeholder input received, since the release of the Draft EIR, the design of the proposed Project has changed. In particular, the Maintenance and Storage Facility (MSF) for the Automated Transit System (ATS) has modified to allow the Vons grocery store currently located on the proposed MSF site to remain on this site in a new building to continue to serve the community. Other modifications to the Project include the realignment of the proposed ATS alignment on Prairie Avenue to the west side of the street to allow for single column alignment and allow the street to be open to the sky, as well as the relocation of one of the proposed stations to the southwest corner of Prairie Avenue and Manchester Boulevard. Although the modifications to the proposed Project reduce, rather than increase, the Project's potential for significant environmental effects, the City has decided to prepare and circulate this Recirculated Draft EIR to analyze the effects of the proposed Project as revised.

It should also be noted that, as discussed in **Section 2.0: Introduction**, the proposed Project is statutorily exempt from CEQA compliance under Public Resources Code section 21080, subdivision (b)(12), which provides that CEQA does not apply to "[f]acility extensions not to exceed four miles in length which are required for the transfer of passengers from or to exclusive public mass transit guideway or busway public transit services." (See also State CEQA Guidelines, § 15275(b).) The Project meets this definition. Therefore, the City's preparation of the Recirculated Draft EIR is not required by CEQA. The City has nevertheless voluntarily prepared this Recirculated Draft EIR to provide a comprehensive environmental analysis of the proposed Project and to solicit public and agency input on the proposed Projects, its potentially significant environmental effects, and mitigation measures and/or alternatives to reduce or avoid any such effects. Following the completion of CEQA review, the City of Inglewood City Council will consider whether to approve the Project. Although not required to do so, if the City Council decides to approve the Project, the City Council will certify the Final EIR and adopt CEQA Findings of Fact and, if

necessary, a Statement of Overriding of Considerations for the Project. If the Project is approved, the City will also file a CEQA Notice of Determination (NOD) and a CEQA Notice of Exemption (NOE) for the Project.

## 1.2 SUMMARY OF THE PROPOSED PROJECT

### 1.2.1 Project Overview

The City proposes the Inglewood Transit Connector Project (ITC or proposed Project) to extend service from the Metro K (Crenshaw/LASX) Line to the City's activity centers. The ITC is a 1.6-mile, three station, fully elevated, electrically powered Automated Transit System (ATS system) that will connect directly to the Metro K Line Downtown Inglewood Station. The City proposes the ITC Project to address projected future congestion, improve overall mobility and levels of service, and advance its sustainability goals. Providing transit access to the City's activity centers would advance local and regional goals to increase transportation choice, significantly reduce greenhouse gas (GHG) emissions, improve air quality and human health, reduce per-capita vehicle miles traveled (VMT), reduce the growth of congestion on local and regional roads, and encourage sustainable development patterns.

In March 2021, the Board of Directors of the Los Angeles County Metropolitan Transportation Authority (Metro) approved and voted to form a Joint Powers Authority (JPA) with the City of Inglewood to help extend mass transit from the Metro K line at the Metro K Line Downtown Inglewood Station to the City's sports and entertainment areas, and to help lend its partnership and expertise to assist with the design, construction and financing, and operation and maintenance of this 1.6-mile ATS system to extend service from the K Line. Metro recognizes the increase in ridership on the K line that will be created by the proposed ITC Project and is working collaboratively with the City on all aspects of the project to extend service from the K line to the City's major employment, housing, commercial and entertainment centers.

If the City approves the proposed Project, the JPA would contract with a public private partner and select a design/build/finance/operate/maintain (DBFOM) contractor to complete the proposed Project. With the DBFOM approach, which is also being used by the Los Angeles World Airport (LAWA) for the LAX Landside Access Modernization Program (LAMP), the responsibilities for designing, building, financing, operating, and maintaining the Project are bundled together and transferred to private sector partners. In this structure, the City will enter into an agreement with a private sector party to finalize the design, build, finance, operate, and maintain the ATS system.

As currently proposed, the ATS system will have three stations including: Market Street/Florence Avenue Station, Prairie Avenue/Manchester Boulevard Station, and Prairie Avenue/Hardy Street Station. Station design capacity would be established by pedestrian demand volumes under typical peak conditions, in addition to increased demand during special events, service disruptions, and emergency evacuation

situations. Stations would provide pedestrian access to the elevated ATS from existing sidewalk and pedestrian travel areas adjacent to the station locations. Final station locations and configurations will be determined during the design and procurement process.

Existing infrastructure along the Project alignment may need to be relocated or reconfigured to accommodate new elevated transit guideway structures and stations. In addition to surface improvements, utility infrastructure under the roadway surface may need to be relocated to accommodate the guideway columns, footings, and other components.

The proposed Project is described in detail in **Section 3.0: Project Description** of this Recirculated Draft EIR.

### 1.2.2 Background

The City is undergoing a transformation into a world-class sports and entertainment destination and a major employment center within the greater Los Angeles region. First, in 2012, over \$100 million was invested in the Forum, making it one of the largest indoor concert venues and host of some of the largest entertainment acts in the country. Next, the redevelopment of approximately 298 acres at Hollywood Park includes thousands of new residential units and millions of SF of commercial and recreational uses as part of the Los Angeles Stadium and Entertainment District (LASED) project. At the centerpiece of the LASED is the new \$5 billion-dollar, 70,240-seat SoFi Stadium shared by the Los Angeles Rams and Los Angeles Chargers. SoFi Stadium will host Super Bowl LVI in Winter 2022, and the 2028 Summer Olympic Games with the possibility of hosting many more events. In August 2020, the City approved the Inglewood Basketball and Entertainment Center (IBEC), which will be home to the Los Angeles Clippers of the National Basketball Association (NBA) and includes the team's arena, headquarters, and training facilities. There are other exciting developments in the City including housing, office, retail commercial and hotel projects under construction and in the application pipeline. Additionally, the new Los Angeles Philharmonic music and cultural campus for the Youth Orchestra Los Angeles (YOLA) facility, designed by architect Frank Gehry near Inglewood City Hall opened in September 2021.

Pivotal to the City's transformation is the new 8.5-mile Metro K Line. Scheduled to begin service in 2022, the Metro K Line will enhance transit access to the City and include stations at Aviation/Century, Westchester/Veterans, Downtown Inglewood, Fairview Heights, Hyde Park, Leimert Park, MLK Jr., and Expo/Crenshaw. It will extend light-rail transit from the existing Metro E (Expo) Line station at Crenshaw/Exposition Boulevards to the Metro C (Green) Line station at Aviation/Century Boulevards and provide a transit connection to Los Angeles International Airport (LAX) via the City of Los Angeles' automated people mover. Upon completion of the Metro K Line, patrons who wish to use the Metro rail system to travel to events at the Forum, LASED including SoFi Stadium, the IBEC, or other existing and

1.0 Executive Summary

future commercial areas and residences in the City would face a “last-mile” gap of approximately 1.5 to 2 miles between the Metro K Line and the City’s new activity centers. This gap is longer than a convenient walking distance for patrons traveling to the City’s activity centers.

As Inglewood transforms into a major regional housing, employment and activity center, the number of vehicular trips associated with new jobs, retail, entertainment, and residential opportunities is anticipated to increase. Based on historic traffic counts, traffic volumes have been increasing at the rate of 1.5 percent per year, and many key intersections and highway corridors already experience congestion. According to the Southern California Association of Government’s (SCAG) *Connect SoCal - 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) Demographics and Growth Forecast*, substantial socioeconomic and demographic growth is projected in the region. The City is projected to be one of the highest growing housing and employment centers in Los Angeles County.

1.2.3 Project Location

The proposed Project is located in the central and northern portions of the City of Inglewood east of the San Diego Freeway (I-405) and north of the Glen Anderson Freeway (I-105) in Los Angeles County, California (see **Figure ES-1: Project Regional Location Map**).

The ITC will be constructed in an area generally bounded by the Metro K Line to the north; Hardy Street to the south; the NFL stadium and the Forum to the east; and La Brea Avenue to the west (see **Figure ES-2: City of Inglewood**). The Project extends from the Metro K Line Downtown Inglewood station southwest to the intersection of Market Street and Regent Street, continues south on Market Street, east on Manchester Boulevard, and south on Prairie Avenue to Hardy Street (see **Figure ES-3: Project Vicinity Map**). The ATS will be largely located within the public rights-of-way for the streets and sidewalk areas along Market Street, Manchester Boulevard, and the west side of Prairie Avenue (See **Figure ES-4: Location of Alternative Alignments in the LPA Report**). The entire Project is situated within the City of Inglewood, an incorporated city within Los Angeles County.

### 1.2.4 Project Objectives

Section 15124(b) of the State CEQA Guidelines states that the Project Description shall contain “[a] statement of the objectives sought by the proposed project.” In addition, Section 15124(b) of the State CEQA Guidelines further states, “[t]he statement of objectives should include the underlying purpose of the project.”

The City’s goals and objectives for the Inglewood Transit Connector Project are as follows:

- Provide direct and convenient connection to the Metro regional transit system for local residents and the region to access the City’s new major employment, commercial, and activity centers;
- Close the “last mile gap” to the regional transit system by providing passengers with the ability to transfer to or from destinations and the Metro K Line.
- Provide sufficient transit connection capacity between the Metro regional transit system and the City’s new major activity centers with enhanced travel time certainty and sufficient capacity to meet peak ridership demands to encourage transit as a travel mode choice;
- Maintain existing roadway capacity;
- Reduce the City’s traffic congestion and alleviate growing demand on the existing roadway network on both major arterials and residential streets for both nonevent and event days;
- Encourage intermodal transportation systems by providing convenient, reliable time-certain transit;
- Increase transit mode split, reduce vehicle trips, and reduce per-capita vehicle miles traveled to the City’s major activity centers, with corresponding improvement in air quality, public health, and reductions in greenhouse gas emissions from transportation sources in accordance with the City’s goals, the SCAG 2020-2045 RTP/SCS and State policies with respect to climate change and land use;
- Support the ongoing economic revitalization, growth opportunities for transit-oriented development (TOD) within the Downtown TOD Plan area, including commercial and residential uses, including through the creation of public parking facilities;
- Encourage redevelopment and investment within the City in areas served by the proposed Project;
- Provide safe, reliable, and convenient access to businesses in the City so that they are accessible to their workforce and customers;
- Connect the Inglewood community and citizens to jobs, education, services, and destinations within the City and within the region by providing transit within safe and accessible walking distances; and
- Support regional efforts to become more efficient, economically strong, equitable, and sustainable.

The ITC Project reflects the City’s commitment to providing adequate transportation connections to its current and proposed major housing, employment, and activity centers, and to address the critical first/last mile gap with a fixed-guideway transit connector.

### 1.2.5 Construction Commitment Program

As part of the Project, the City of Inglewood has developed a Construction Commitment Program (CCP) to pro-actively address the effects of the construction of the ATS project on the community. This program, provided in **Appendix D**, includes the following programs and plans:

- Business Community and Support Program
- Business Interruption Assistance Program
- Transit Access and Circulation Program
- Construction Staging and Traffic Control Program
- Parking Management Plan
- Air Quality Program
- Visual Resources Program
- Hazardous Materials Program
- Tree Removal and Replacement Plan

To address the effects of the construction activities on traffic conditions, the City will establish a Project Task Force for the ITC Project that will develop a Construction Staging and Traffic Control Plan that will address the following topics: review worksite traffic control plans and other traffic management plans developed by the Project contractor(s) for the Project to ensure these plans address:

- Coordination with other public infrastructure projects within the City's boundaries
- Detour routes, including analysis of impacts to pedestrian, business, bicycle, and traffic flow
- Coordination of closures and restricted access during the construction period with special attention during periods of expected heavy traffic from events scheduled at SoFi Stadium and other venues in the Los Angeles Sports and Entertainment District at Hollywood Park, the Forum, and the Inglewood Basketball and Entertainment Center.
- Coordination with the City, police, and fire services department regarding maintenance of emergency access and response times
- Monitoring and coordination of construction materials deliveries
- Notification to businesses and residents on upcoming construction activities including but not limited to the establishment of a website with project construction information, signage, and web-based media.

All haul routes and activities will need to be reviewed and approved with truck deliveries of bulk materials and hauling of soil scheduled during off-peak hours to the extent feasible and on designated routes including freeways and nonresidential streets.

Parking, staging, or queuing of Project-related vehicles, including workers' vehicles, trucks, and heavy vehicles, shall be prohibited on City streets at all times except in defined workspace areas defined in the Construction Staging and Traffic Control Program.

Construction noise reduction measures in this Program require the use of construction equipment that generates the least amount of noise, use of temporary noise barriers, and restrictions on the use of heavy equipment that create vibration near sensitive uses and buildings. Contact information for a Community Affairs Liaison will be posted throughout the construction area. This liaison shall respond to any noise complaints within 24 hours.

The air emissions reduction measures require use of the best commercially available equipment meeting the highest standard for minimizing air emissions and the use of electric powered equipment or equipment not powered by diesel engines where possible.

To ensure that any hazardous materials encountered during construction are appropriately addressed, building demolition, hazardous materials contingency, soils management, and health and safety plans will be prepared and implemented during construction.

All lighting needed to support construction activities will be required to meet defined standards to avoid impacts to adjacent uses and all stockpile area will be required to be in the least visible areas as approved by the City.

Removal of trees and other landscaping will be minimized and any trees removed will be replaced within 6 months of work being completed in affected areas.

The Construction Commitment Program also includes business and community support programs to address businesses financially affected by construction of the Project addressing:

- Advertising support for local businesses in local or regional newspapers and social media.
- Notice of plans to all affected property owners of the schedule for specific planned construction activities, changes in traffic flow, and required short-term modifications to property access.
- Notice of plans to all affected property owners if utilities would be disrupted for short periods of time and ensuring major utility shut-offs are scheduled during low-use periods of the day.
- Methods by which business owners can convey their concerns about construction activities and the effectiveness of measures during the construction period so activities can be modified to reduce adverse effect.
- Access plans that ensure that all businesses, service providers, and residents are provided with adequate access during construction. Where there is a significant limited English population, signage shall be provided in various languages (as appropriate).

### 1.0 Executive Summary

- Funding for temporary signage during construction to help businesses that are partially blocked or that have inconvenient access due to construction activity.

The City will also create a \$5 million dollar Business Assistance Fund (BAF) to provide financial assistance through grants to eligible businesses affected by construction of the Project.

### 1.2.5 Project Characteristics

The proposed Project includes the following components:

- ATS trains operating on an elevated dual-lane guideway with three stations;
- ATS guideway along Prairie Avenue to be constructed on the west side of Prairie Avenue;
- No more than three straddle bents north of Pincay Street along Prairie Avenue immediately south of the Prairie Avenue/Manchester Boulevard Station;
- Passenger walkway systems connecting the stations to the street, mezzanine areas, escalators, and elevators;
- Storage space, operations space, communications systems located within stations;
- Wayfinding signage and amenities;
- An MSF to provide regular and preventive maintenance of the ATS trains and equipment, as well as space for storage of the vehicle fleet and the operations control center, among other functions;
- Power Distribution System (PDS) substations located on the MSF and the Prairie Avenue/Hardy Street station sites to provide traction/propulsion power, auxiliary power, and housekeeping power;
- Utilities infrastructure—new, modified and/or relocated—to support the proposed Project;
- Surface public parking lots located at Market Street/Florence Avenue and Prairie Avenue/Hardy Street stations containing multimodal pick-up and drop-off areas, and at 150 S. Market Street to support Downtown Inglewood; and
- Roadway, traffic devices, and streetscape modifications and improvements to accommodate the guideway alignment and support structures.
- Land acquisitions, acquisitions of air rights, easements and encroachment rights, subdivision of parcels, and/or other reconfigurations of parcels, dedications, vacations and/or temporary closures of public rights-of-way, as necessary.

### 1.3 SUMMARY OF ENVIRONMENTAL IMPACTS

Based on the September 2020 Revised Initial Study, the City determined that preparation of an EIR was required to further evaluate potentially significant impacts of the Project related to the following environmental topics: Aesthetics, Air Quality, Biology Resources, Cultural Resources, Energy, Geology and Soils, Greenhouse Gas Emissions, Hazards and Hazardous Materials, Land Use and Planning, Noise and Vibration, Population, Employment, and Housing, Transportation, Tribal Cultural Resources, and Utilities and Service Systems.

### 1.0 Executive Summary

Impacts related to Agricultural and Forestry Resources, Hydrology and Water Quality, Mineral Resources, Public Services, Recreation, and Wildfire and the Initial Study Mandatory Findings of Significance were determined to be less than significant in the Revised Initial Study. These conclusions remain valid with respect to the revised proposed Project and these environmental topics are not evaluated further in this Recirculated Draft EIR.

**Table 1.0-4: Summary of Findings** included at the end of this section presents a summary of findings for each of the resources analyzed in this Recirculated Draft EIR for the proposed Project. A summary of impacts for each resource category is presented below. Detailed analysis is included in **Section 4.0: Environmental Impact Analysis**.

### 1.3.1 Aesthetics

#### Existing Conditions

The proposed Project is located entirely within the City, approximately 5.5 miles east of the Pacific Ocean, within a broad coastal plain surrounded by rising land to the south and north, and more-level terrain extending east. The City is a highly developed urban area containing moderately dense development along major corridors that consist of commercial, residential, and industrial uses. Street corridors in the City provide the only long-range views available in the City, including limited views of Baldwin Hills to the north and other urban areas in and surrounding the City. Overall, the views within and surrounding the City are consistent with the views of a highly developed urban area.

No designated or otherwise identified scenic views or vistas are located within or visible from the City.<sup>1</sup> The City's General Plan states that no forest resources, wildlife, fisheries, shorelines, or agricultural land are present in the City,<sup>2</sup> nor does the General Plan designate any scenic vistas within the City or its vicinity. Further, there are no designated or eligible State scenic highways within or adjacent to the Project area.<sup>3</sup> The nearest State scenic highway is Interstate 110 between mile post 25.7 and 31.9, which is located north of downtown Los Angeles and south of Interstate 210 in Pasadena. The closest portion of this scenic highway is approximately ten miles northeast of the Project boundary.

Additionally, the Project area is not near any designated wild or scenic rivers pursuant to the National Wild and Scenic Rivers System.<sup>4</sup> The nearest mountains, the Santa Monica Mountains, are more than 10

<sup>1</sup> Google Earth, 2020.

<sup>2</sup> City of Inglewood General Plan, "Conservation Element" (1997), 1.

<sup>3</sup> California Department of Transportation, California Scenic Highway Mapping System, Los Angeles County, [http://www.dot.ca.gov/hq/LandArch/16\\_livability/scenic\\_highways/](http://www.dot.ca.gov/hq/LandArch/16_livability/scenic_highways/), accessed August 2018.

<sup>4</sup> US Fish and Wildlife Service, *National Wild and Scenic Rivers System*, available at <https://www.rivers.gov/>, accessed August 31, 2018.

miles north of the Project boundary. No views of these mountains or of any other focal points or broad panoramic view corridors are available from public rights-of-way along the proposed alignment.

### **Visual Impacts**

Overall, the ATS structure, including the stations, guideway, MSF, and support facilities, would complement the existing surrounding visual environment by using transparent and neutral tones as part of its design character. The design would be in the modernist style to enhance the aesthetically pleasing quality of the structure. To prevent unsightly views and defacing of the structure, the exterior material would be anti-graffiti and anti-vandalism. The final design of the stations would also reflect its surroundings in Downtown Inglewood along Market Street and the new developments on Prairie Avenue.

Visual impacts associated with construction of the proposed Project would be less than significant with the implementation of measures from the CCP (see **Appendix D**). These CCP measures provide measures to minimize the visual impact of temporary lighting and of visually obtrusive erosion control devices and stockpile and staging areas. Construction activities at each segment and overall would be temporary in nature and visual impacts would be alleviated once the construction is completed.

The design of the ATS guideway would allow the continued expression of the buildings identified as historic resources along Market Street in Downtown Inglewood. The design of the ATS guideway would allow the continued expression of the buildings identified as historic resources. The height of the ATS guideway, the distance of the guideway from the edge of the buildings and the size and spacing of the support columns have been designed in a manner that maintains important aspects of the existing setting for the historic resources located along the proposed alignment and ensures that the overall scale, massing, composition, and design of these historic buildings would remain readily visible despite some interruption of views. The ability of the buildings to convey their historic significance would not be substantially impaired by the proposed Project as required by the CCP. Therefore, indirect impacts to identified historic resources would be less than significant.

The proposed Project would be generally consistent with the existing zoning and planning regulations governing scenic quality. The proposed Project would be designed to be complementary with the visual character defined in the City's Downtown TOD Plan and the Hollywood Park Specific Plan (HPSP) for areas located adjacent to the proposed alignment to the extent feasible and consistent with the ITC Design Standards and Guidelines (Design Guidelines). An amendment to General Plan Policy 2.3, Preservation of Historic Fabric, is proposed as part of the Project to ensure the incorporation and implemented of the ATS system into the historic fabric of the Inglewood historic core. This amendment would be consistent with the goals of the General Plan.

Additionally, light and glare impacts during construction and operation would be less than significant with the incorporation of lighting design standards in the CCP and Design Guidelines, respectively.

### **1.3.2 Air Quality**

#### **Emissions Thresholds**

During operation, the proposed Project would generate emissions from various sources including employee trips, deliveries, area sources, energy sources (natural gas), and motor vehicles. However, operation of the proposed Project would reduce emissions from motor vehicles when compared to future conditions without the proposed Project. As such, due to the reduction in motor vehicle emissions and elimination of existing sources, the proposed Project would result in net negative emissions. Moreover, during normal operation the proposed Project would not exceed the South Coast Air Quality Management District (SCAQMD) operational thresholds.

Construction of the proposed Project has the potential to temporarily emit air pollutants through the use of heavy-duty construction equipment, through vehicle trips generated from workers and haul trucks traveling to and from the proposed Project area, from demolition and various soil-handling activities, and from the use of diesel powered on-and off-road vehicles and equipment. In addition, fugitive dust emissions would be generated. With implementation of the Air Quality Program of the CCP and the mitigation measures recommended in this Recirculated Draft EIR, however, construction-related daily emissions would not exceed the SCAQMD significance threshold for any criteria pollutant.

#### **Exposure to Pollutants**

The analysis in the Recirculated Draft EIR evaluated the exposure of people to a range of specific pollutants, including carbon monoxide (CO) and Nitrogen dioxide (NO<sub>2</sub>), both of which can contribute to breathing disorders and compromised lung function. In all cases, the concentrations of these pollutants with mitigation, even when combined with existing ambient concentrations and the effects of increased activity in the vicinity from future off-site projects, are below the State and federal health-based thresholds. In addition, concentrations of small particulate matter would be less than the allowable incremental increase thresholds established by the SCAQMD.

The analysis also examined the potential for sensitive receptors (residents, workers, school children, and day-care children) in the Project vicinity to be exposed to toxic air contaminants which are known to cause health risks, including cancer. The analyses concluded that, after mitigation, exposures to contaminants that would increase cancer or non-carcinogenic risks would be below the established thresholds.

### 1.3.3 Biological Resources

The proposed Project is located within a highly developed and urbanized area and potential biological resources are limited to a few small parks. Sensitive animal and plant species and vegetation communities identified in the California Natural Diversity Database as having the potential to occur within a 0.25 mile radius of either side of the proposed Project guideway, stations, and support facility sites are largely absent. Biological resources that would be affected by development of the proposed Project are limited to trees located along the Project alignment and within the property proposed for acquisition as part of the Project. None of the trees potentially affected are native or considered to be rare, endangered, or sensitive species, but 502 trees are protected under the City of Inglewood Tree Protection Ordinance (Inglewood Municipal Code Chapter 12, Article 32), and these or others could serve as nesting habitat for migratory or other protected bird species. The removal of these trees could create impacts, especially if the trees are removed during the bird nesting season. These impacts would be mitigated to a less-than-significant level through the conduct of preconstruction surveys prior to any nesting season tree removal, protection of trees with active nest sites during construction, through obtaining necessary City permits to remove existing trees, and through protection or replacement of removed trees at a 1:1 ratio minimum as determined by the City. All trees removed to accommodate the Project will be replaced in accordance with the City's Tree Protection Ordinance. No permanent impacts to trees located along the alignment would, therefore, result from the Project.

### 1.3.4 Cultural Resources

#### *Historic Resources*

The Project area is located in a part of Inglewood known to contain historic-age buildings, which includes ten identified historical resources.<sup>5</sup> Minimum visual clearances, including the height of the guideway, the distance of the guideway from the edge of the building, and the size and spacing of the vertical supporting columns, would be incorporated into Project design as required by the Design Guidelines. The overall scale, massing, composition, and design of the historic-age buildings located along the ATS alignment will remain readily discernable despite some intermittent obscuring of physical features from some views. Thus, there will be no significant impacts to historical resources as a result of the Project.

#### *Archaeological Resources*

The cultural resource records search and field visit conducted did not result in identifying any prehistoric or historical archaeological resources within the Project study area.<sup>6</sup> Further, the built nature of the area

<sup>5</sup> Historical Resources Technical Report. Inglewood Transit Connector. October 4, 2021.

<sup>6</sup> See **Appendix K.1** of this Draft EIR.

indicates a high degree of disturbance suggesting the likelihood of encountering intact archaeological deposits near the surface of the Project area to be very low. Implementation of mitigation measures would reduce the potential impacts to archaeological resources to a less-than-significant level.

#### *Human Remains*

Implementation of mitigation measures would reduce the potential impacts to human remains to a less-than-significant level. The measures would require the contractor to hire a qualified monitor on-site to monitor any ground disturbing activities and monitors would be versed in locating and identifying human remains.

### 1.3.5 Energy Resources

Operation of the proposed Project would reduce annual VMTs under all scenarios and would therefore reduce annual petroleum consumption. Specifically, under the Adjusted Baseline scenario, the proposed Project would reduce annual fuel consumption from approximately 45.3 million gallons to 44.8 million gallons, a decrease of approximately 584,300 gallons. Under the Future (2027) Non-Event scenario, the proposed Project would reduce annual fuel consumption from approximately 47.1 million gallons to 46.5 million gallons, a decrease of approximately 622,600 gallons. Under the Future (2027) All Event scenario, the proposed Project would reduce annual fuel consumption from approximately 50.9 million gallons to 49.5 million gallons, a decrease of approximately 1.4 million gallons. Under the Future (2045) Non-Event scenario, the proposed Project would reduce annual fuel consumption from approximately 43.8 million gallons to 43.2 million gallons, a decrease of approximately 580,950 gallons. Under the Future (2045) All Event scenario, the proposed Project would reduce annual fuel consumption from approximately 47.0 million gallons to 45.6 million gallons, a decrease of approximately 1.4 million gallons.

During construction, the proposed Project would generate a demand for 165,115 kWh of electricity and up to 163.7 million gallons of petroleum each year. Electricity for operation of the proposed ATS system would be provided via two power distribution system substations (PDSs). One of the PDSs would be located on the MSF site. The second PDS substation would be located on the Prairie Avenue/Hardy Street station site. The electricity demand for the proposed Project during normal operation would be 27.1 million kWh (27.1 GWh) per year.<sup>7</sup>

Because the proposed Project would support statewide efforts to improve transportation efficiency, comply with the CALGreen building code, and comply with other State and local plans and policies, the

<sup>7</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

energy consumption from the proposed Project would not be wasteful, inefficient, or unnecessary, and would impacts would be less than significant.

### 1.3.6 Geology and Soils

The proposed Project would be constructed consistent with the requirements of the California Building Code. The Project study area is in a relatively level area with soils made up of artificial fill overlying native alluvial and older alluvial deposits, liquefaction zone area, or within areas designated as having the potential for seismically induced landslides and is not located on a geologic unit or soil that is unstable, or that would become unstable as a result of the proposed Project. The Project alignment is located in an area that contains potentially active faults, including the Townsite, Centinela Creek, Cemetery Fault, and Manchester Faults. The Townsite fault may intersect the Project alignment, stations, and near the MSF. Although the Townsite, Centinela Creek, Cemetery, and Manchester faults are not presently mapped as Alquist-Priolo Earthquake Zoning Act (APEFZ) faults, or situated within a delineated APEFZ, their location within the active Newport-Inglewood fault zone and proximity to the Project alignment suggests these faults should be considered active with the potential for fault rupture and impacts would be potentially significant. Designing the Project in conformance with the 2019 CBC,<sup>8</sup> Caltrans guidance, and applicable seismic design criteria identified in mitigation measures would reduce potential impacts to less than significant.

The Potrero Fault lies approximately one-quarter mile to the east of the project study area; however, compliance with the California Building Code would avoid the creation of seismic hazards. Construction of the proposed Project would involve substantial grading and excavation that could leave soils exposed for periods of time and susceptible to erosion. This potential impact would be reduced through the preparation of a Stormwater Pollution Prevention Plan (SWPPP), which would describe best management practices (BMPs) to ensure the proposed Project would not result in substantial erosion or loss of topsoil.

As mentioned previously, the Project alignment is known to be underlain by artificial fill atop undisturbed alluvial soils and geological formations in which Ice Age fossils have been found within several miles of the Project alignment and that are considered paleontologically sensitive. Thus, it is possible that previously unknown buried paleontological resources within the Project alignment could be impacted during construction. To reduce potential impacts to less than significant, a qualified paleontologist would be required to develop a program for monitoring of certain ground disturbing activities, and for handling of paleontological materials if discovered.

<sup>8</sup> 2019 California Building Standards Code (Cal. Code Regs., Title 24) published July 1, 2019.

### 1.3.7 Greenhouse Gas Emissions

By providing a new transit option in the City, the proposed Project will reduce VMTs and GHG emissions generated by vehicular travel. Specifically, annual MTCO<sub>2</sub>e would be reduced by 5,503 metric tons of carbon dioxide equivalent (MTCO<sub>2</sub>e) when compared to the Adjusted Baseline without proposed Project, 11,315 MTCO<sub>2</sub>e when compared to the 2027 opening year without proposed Project, and 11,455 MTCO<sub>2</sub>e when compared to the 2045 future year without proposed Project. The proposed Project would be consistent with State and local plans and policies to achieve Statewide goals for GHG reduction, including Governor's Executive Order S-3-05, the California Air Resources Board 2017 Scoping Plan, SCAG's 2020-2045 RTP/SCS, and the City's Energy and Climate Action Plan.

Construction of the Project is estimated to generate approximately 8,820 MTCO<sub>2</sub>e. Given the five-year construction period, the annual construction GHG emissions for the proposed Project would be 2,205 MTCO<sub>2</sub>e. Operational emissions were estimated for the anticipated start of operations in late 2027 and a milestone year of 2045. Due to advances in technology and regulations to reduce GHG emissions operational emissions would continue to decline by 2056, and thereafter. The normal operation of the proposed Project would generate 3,672 MTCO<sub>2</sub>e per year from the operation of the MSF, stations, and other facilities. Each PDS substation will be equipped with backup power generators which are estimated to generate 311 MTCO<sub>2</sub>e per year, bringing the total GHG emissions from operations to 3,983 MTCO<sub>2</sub>e per year.

### 1.3.8 Hazards and Hazardous Materials

Based on searches of environmental database and collection of on-site soil and soil gas samples, the proposed Project is located in an area that includes historic land uses that used or stored hazardous materials.

Operation of the Project would include the use and storage of hazardous materials typical of those used in an industrial setting and would comply with federal, State, and local regulations governing the handling of any hazardous materials, and applicable regulatory requirements to responding to accidental release of such hazardous maintenance materials. Operation of the proposed Project would not interfere or impair with the City's ability to increase public awareness or make any improvements to emergency services and warning systems. With adherence to the federal, State, and local safety requirements, the proposed Project would not conflict with the requirements of an emergency response plan or emergency evacuation plan and impacts from operation of the Project would be less than significant.

Soil sampling confirms the potential for encountering contaminants of concern that could result in adverse health effects if not handled appropriately during construction. In addition, structures within the ATS

guideway footprint that would be demolished prior to construction of the proposed Project could contain hazardous building materials that would require appropriate identification, handling, and disposal. The potential exposure of construction workers or nearby residents and workers to these existing hazards would be reduced to a less-than-significant level through compliance with existing State and federal laws and regulations, and through implementation of plans addressing the handling of any hazardous materials encountered during construction that would be required as part of the CCP prior to the start of construction.

### 1.3.9 Land Use and Planning

Analysis of the potential for the proposed Project to physically divide the existing community and conflict with applicable land use plans, policies, and regulations was conducted. The ITC guideway and support system would primarily be contained within the existing public right-of-way of Market Street, Manchester Boulevard, and Prairie Avenue with the MSF, stations, and other support facilities, including public parking, located on adjacent properties to be acquired as part of the proposed Project. The ATS guideway, stations, and associated facilities would not physically divide the community, nor disrupt existing patterns of traffic connecting different parts of the community. While the proposed Project infrastructure would be constructed over existing streets, these streets would be reconfigured to maintain the same number of lanes as currently exist.

The proposed Project includes amendments to the City's General Plan and the HPSP and the proposed adoption of the Transportation Corridor Overlay Zone to reflect the integration of the ITC Project into the area and into the City's circulation system. The proposed Project is generally consistent with the City's General Plan, the New Downtown and Fairview Heights Transit Oriented Development (TOD) Plan and Design Guidelines, and the HPSP. The proposed Project is also consistent with the goals or transportation planning in the SCAG 2020-2045 Regional Transportation Plan/Sustainable Community Plan as the Project will reduce VMT in the City and region. The proposed Project would not conflict with goals, objectives, or policies adopted for the purpose of mitigating environmental impacts.

### 1.3.10 Noise and Vibration

#### Noise

##### Operation

The ITC Project is designed to meet the City's goals and objectives related to the reducing the City's traffic congestion and alleviate growing demand on the existing roadway network by encouraging and providing the use of intermodal transportation systems. The proposed Project is intended to reduce vehicle trips and roadway noise levels. Under all operational scenarios, the roadway conditions with implementation

of the proposed Project would not exceed the threshold of significance of an increase in noise level of 3 A-weighted decibel (dBA) equivalent continuous sound (Leq) to or within the "normally unacceptable" or "clearly unacceptable" land use compatibility categories or result in an increase of 5 dBA or greater at the sensitive land use when it would exceed 65 dBA day-night average sound level (DNL) or community noise equivalent level (CNEL).

The proposed Project would either utilize large, automated monorail technologies or rubber-tire vehicles operating along a fixed guideway. Operational noise level increases during the daytime would range from no change at the majority of the identified receptors listed below to a high of 2.1 dBA Leq (Lday) at the residential uses along Spruce Ave across from the MSF. Taking into account the ambient environment, exterior noise levels during the daytime period within this area would be 70.1 dBA. Increases in daytime noise levels would not exceed the 3 dBA Leq to or within the "normally unacceptable" or "clearly unacceptable" land use compatibility categories or result in an increase of 10 dBA or greater when noise levels remain within acceptable limits. Additionally, nighttime noise level increases would range from no change at the majority of the identified receptors listed below to a high of 3.9 dBA Leq (Lnight) at the residential uses along Spruce Ave across from the MSF. Taking into account the ambient environment, exterior noise levels during the nighttime period would be 62.4 dBA. Although nighttime noise levels would increase by more than 3 dBA Leq, nighttime noise levels would not result in an exterior environment that exceeds the "normally unacceptable" or "clearly unacceptable" land use compatibility categories or result in an increase of 10 dBA or greater when noise levels remain within acceptable limits.

The MSF will be designed in accordance with the Design Guidelines which address the massing, façade, materials, colors, roof, and lighting for this facility, how the MSF will engage with the pedestrian and vehicular circulation around it, and sustainability features. Building elements would include screens to shield all exterior equipment including equipment at the rooftop and ground level, so that it is not visible from the street or accessible areas of adjacent properties. Additionally, as described previously, implementation of **PDF NOISE-1** would require stationary noise source generated from mechanical equipment in the MSF to be enclosed within a shed or barrier that would further reduce noise levels.

Noise impacts from operation of the proposed Project would be less than significant.

##### Construction

Construction noise impacts due to construction activities were determined by comparing the calculated construction-related noise levels of the proposed Project to the measured existing ambient noise levels (i.e., noise levels without construction noise from the proposed Project). Construction noise levels were calculated for each phase of construction (Phases 1 through 8) at the adjacent land uses. **PDF NOISE-1** includes implementation of a Construction Noise Control Plan which proactively addresses the potential

effects of noise during construction. The measures required by the Construction Noise Control Plan can reduce noise levels by 10 dBA or more. For example, optimal muffler systems would reduce construction noise levels by 10 dBA or more.<sup>9</sup> Temporary abatement techniques such as the use of a noise barrier can achieve a 5-dBA noise level reduction when it is tall enough to break the line-of-sight to the receiver. Modifications such as dampening of metal surfaces or the redesign of a particular piece of equipment can achieve noise reduction of up to 5 dBA.<sup>10</sup> Moving stationary equipment away from sensitive receptors will reduce noise levels at the receptor as every doubling of distance will reduce noise by 4 to 6 dBA. Thus, with implementation of **PDF NOISE-1**, construction noise will not increase ambient noise levels by more than 10 dBA. Furthermore, the Construction Noise Control Plan would include a monitoring plan during demolition and construction activities to ensure noise levels are below the specified noise limits. With implementation of **PDF NOISE-1**, construction noise levels during all phases would be less than significant.

A variety of heavy trucks will travel to and from the proposed Project during various phases of construction. As compared to adjusted baseline average daily traffic volumes along West Century Boulevard, Manchester Boulevard, South Prairie Avenue and Florence Avenue the sound power generated by the maximum anticipated number of construction trucks would not be equivalent or greater to a doubling of both the minimum and maximum ADT along these segments and therefore would not result in a 5 dBA (Leq-1hour) increase along those roadways.

## Vibration

### Operation

The condition of the rails, type of guideway construction, other proposed Project components, and the mass and stiffness of the guideway structure would have an influence on the level of ground-borne vibration. Jointed rail, worn rail, and wheel impacts at special track work can all cause substantial increases in ground-borne vibration. It is rare for ground-borne vibration to be a problem with elevated railways except when guideway supports are located within 50 feet of buildings.<sup>11</sup> For rubber-tired ATS trains, the smoothness of the roadway/guideway is the critical factor; if the surface is smooth, vibration problems are unlikely.

<sup>9</sup> FHWA, *Special Report—Measurement, Prediction, and Mitigation*, updated June 2017, [https://www.fhwa.dot.gov/Environment/noise/construction\\_noise/special\\_report/hcn04.cfm](https://www.fhwa.dot.gov/Environment/noise/construction_noise/special_report/hcn04.cfm), Accessed January 2021.

<sup>10</sup> FHWA, *Special Report—Measurement, Prediction, and Mitigation*, updated June 2017, accessed July 2019, [https://www.fhwa.dot.gov/Environment/noise/construction\\_noise/special\\_report/hcn04.cfm](https://www.fhwa.dot.gov/Environment/noise/construction_noise/special_report/hcn04.cfm).

<sup>11</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

The vibration sensitive land uses nearest to the guideway include commercial and residential uses along Market Street, Manchester Boulevard and Prairie Avenue which would be approximately 30 feet from the guideway centerline. Based on the adjusted vibration level curve, the estimated ground-borne vibration levels would be approximately 67 VdB for monorail trains (rapid transit or light rail vehicles) and 64 VdB for rubber-tired ATS trains. Consequently, the maximum vibration level of the uses along the guideway would be below the FTA recommended maximum acceptable level threshold of 72 VdB.

### Construction

Estimated vibration levels from construction activities would exceed the building damage significance threshold of 0.2 PPV inches per second (ips), and the human annoyance significance threshold of 72 PPV ips at several locations in the vicinity of the proposed Project. Implementation of **PDF NOISE-2** would require preparation of a Construction Vibration Reduction Plan to ensure minimization of construction vibration at nearby sensitive receptors from vibration created by construction activities. The Construction Vibration Reduction Plan would require continuous monitoring and collection of vibration data to verify vibration levels are below the warning level PPV. In the event the regulatory levels of PPV are triggered, construction activities would halt to visually inspect sensitive buildings for damage. **PDF NOISE-2** also requires vibration-generating equipment to be located at specified distances from adjacent noise receptors. More specifically, to limit the risk of potential structural and building damage, **PDF NOISE-2** would limit the location of pile driving and vibratory roller activity to not be within 55 feet and 30 feet of the nearest off-site sensitive receptor, respectively. **PDF NOISE-2** would limit the number of jackhammers operating simultaneously to one (1) piece operating within 45 feet of off-site sensitive receptors. Implementation of these construction management practices would limit the potential for impacts from construction vibration to result in building damage with adjusted distance of construction equipment. Impacts would be less than significant and below the significance threshold for building damage of 0.2 PPV IPS with implementation of **PDF NOISE-2**.

In addition to on-site construction activities, construction delivery/haul trucks would generate ground-borne vibration as they travel along the proposed Project's anticipated off-site truck travel routes. Based on FTA data,<sup>12</sup> the vibration generated by a typical heavy-duty truck would be approximately 63 VdB (0.00566 PPV) at a distance of 50 feet from the truck. Existing buildings along the proposed Project's anticipated off-site truck travel routes (Florence Avenue, Manchester Boulevard, Prairie Avenue, and Century Boulevard) that are situated approximately 35 feet from the truck travel pathway would be exposed to ground-borne vibration levels of approximately 0.01 PPV. This forecasted vibration level would

<sup>12</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, FTA Report No. 0123, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

be below the most stringent building damage criteria of 0.12 PPV.<sup>13</sup> Therefore, vibration impacts with respect to building damage from off-site construction truck travel on public roadways would be less than significant. In addition, vibration sensitive uses (e.g., residential, hotel uses) are located along Florence Avenue, Manchester Boulevard, Prairie Avenue, and Century Boulevard. Ground-borne vibration levels generated by proposed Project off-site construction truck travel would be below the FTA 72 VdB significance threshold,<sup>14</sup> as these uses are located more than 25 feet from the truck travel pathway. Therefore, vibration impacts with respect to human annoyance from off-site construction truck travel would be less than significant for the vibration sensitive land uses located along these roadways.

### 1.3.11 Transportation and Circulation

The assessment of transportation and circulation system impacts considers the existing traffic conditions, including existing street system, public transit service, and bicycle facilities, which may be affected by the ITC Project. The transportation analysis evaluated seventy-five (75) key roadway segments within the study area, identified fourteen (14) bus lines providing service in the study area, listed existing bicycle and pedestrian facilities, and presented transit ridership data obtained from Metro.

#### Operational Impact Analysis

The analysis summarizes the ADT, ITC ridership, and VMT estimates for the following scenarios: Adjusted Baseline Conditions Non-Event Weekdays without Project; Adjusted Baseline Conditions Non-Event Weekdays with Project; Future Opening Year (2027) Conditions with Event without Project; Future Opening Year (2027) Conditions with Event with Project; Future Horizon Year (2045) Conditions with Event without Project; and Future Horizon Year (2045) Conditions with Event with Project.

Under the Adjusted Baseline Non-Event with Project Traffic scenario, the daily traffic volumes are projected to decrease along key corridors including Prairie Avenue, Manchester Boulevard and Century Boulevards within the study area, thereby improving traffic flows compared to the Adjusted Baseline Non-Event without Project daily traffic volumes. Overall, the analyzed corridors would experience less congestion on a system-wide basis, particularly during the peak periods with implementation of the proposed Project.

<sup>13</sup> Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, FTA Report No. 0123, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

<sup>14</sup> Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, FTA Report No. 0123, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

Compared to the Future Opening Year (2027) with Event without Project scenario, the daily traffic volumes under the Future Opening Year (2027) with Event with Project scenario would decrease daily traffic volumes between approximately 1,550 to 2,160 vehicle trips per day along Prairie Avenue between Manchester Boulevard and Century Boulevard; approximately 840 to 1,210 vehicle trips per day along Manchester Boulevard between La Brea Avenue and Crenshaw Boulevard; and approximately 1,120 to 1,640 vehicle trips per day along Century Boulevard between La Brea Avenue and Crenshaw Boulevard. Additionally, the estimated non-event daily ridership under Future Opening Year (2027) conditions is 3,574 daily pedestrians. The Future Opening Year (2027) with Event conditions includes a sold-out NFL football game at the SoFi Stadium. The estimated daily ridership under Future Opening Year (2027) with Event (NFL) conditions is 29,280 daily pedestrians.

The daily traffic volumes under the Future Horizon Year (2045) with Event and Project scenario would decrease between approximately 1,710 to 2,470 vehicles per day along Prairie Avenue between Manchester Boulevard and Century Boulevard; approximately 980 to 1,410 vehicles per day along Manchester Boulevard between La Brea Avenue and Crenshaw Boulevard; and approximately 1,390 to 1,870 vehicles per day along Century Boulevard between La Brea Avenue and Crenshaw Boulevard when compared to the Future Horizon Year (2045) with Event without Project scenario. The ITC ridership analysis for the Future Horizon Year (2045) with Event with Project estimated the non-event daily ridership to be 4,462 daily pedestrians. The Future Horizon Year (2045) with NFL Game Event conditions includes a sold-out event with 70,240 attendees and 6,000 employees on a weekday at the Sofi Stadium. The daily ridership under Future Horizon Year (2045) with NFL Game Event with Project scenario is estimated at approximately 34,650 daily pedestrians.

Based on the analysis of these scenarios, implementation of the proposed Project would reduce daily traffic volumes along key roadway corridors on an average weekday basis. When an NFL game event at the Sofi Stadium is evaluated, the reduction is more substantial. When other events occur at the surrounding venues, it is anticipated the increase in ITC ridership would be more substantial. Therefore, impacts during operation related to ADT and ITC ridership would be less than significant.

CEQA Guidelines section 15064.3 establishes that VMT is generally the most appropriate measure of transportation impacts. The weekday daily VMT would be reduced by approximately 247,550 vehicle-miles (4.7%) with the implementation of the proposed Project under Future Opening Year (2027) with Event conditions in comparison to the Future Opening Year (2027) Conditions with Event without Project. The weekday VMT under the Future Horizon Year (2045) with Project with Event scenario would be reduced by approximately 316,900 vehicle-miles (5.6%) from the Future Horizon Year (2045) Conditions with Event without Project. As such, the proposed Project would result in a reduction of VMT under all

1.0 Executive Summary

scenarios and would not conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b). Therefore, impacts during operation related to VMT would be less than significant.

The proposed Project would connect the rest of the regional mass-transit system to and from major housing, employment and activity centers and adjacent uses in the City of Inglewood. The proposed Project would accommodate all users, including pedestrians, bicyclists, drivers, transit users, and those operating emergency vehicles. The proposed Project would also include pedestrian access improvements, including mezzanine level at each station to provide connectivity to elevated passenger walkways over adjacent streets. These elevated passenger walkways will be designed to improve both passenger access and comfort between the stations and the street level, in addition to providing multimodal access to adjacent bus facilities, pick-up and drop-off areas, and other adjacent resources. The proposed Project will also upgrade the existing sidewalks to ensure consistent ADA appliance along the transit corridor. These elevated passenger walkways and upgrades to existing sidewalks as part of the Project would minimize passenger-vehicle interactions. The City is proposing specific plan amendments and clarifications to the HPSP to address any potential conflict or inconsistency between the proposed Project and the HPSP related to streetscape improvements as the proposed Project would be located along approximately 0.5 miles of street frontage along Prairie Avenue within the HPSP area. Under the Design Guidelines, which identify objectives for the various project components and provides design guidance to help achieve the objectives, the streetscape in downtown Inglewood would be consistent with the street furniture items which currently exists on Market Street and the historic core and in accordance with the Downtown TOD Plan.<sup>15</sup> Accordingly, the proposed Project would not create or substantially increase safety hazards due to a design feature or incompatible uses.

**Construction**

Assuming arrival patterns consistent with anticipated shift times at construction sites of this nature, most of the manpower workforce trips would occur outside of the peak hours of adjacent street traffic. Construction activity would occur 24 hours a day, seven days a week. Heavy construction activities (those involving the use of large equipment on site) would over a 16-hour day schedule with two shifts, either a morning shift from approximately 7:00 AM to 3:00 PM and an evening shift from approx. 3:00 PM to 11:00 PM, or a morning shift from approximately 7:00 AM to 3:00 PM and a night shift from approximately 11:00 PM to 7:00 AM. The night shift would be used for material deliveries, export of soil and debris, and other light construction activities. However, certain heavy construction activities that necessitate temporary road closures could occur at nighttime to minimize traffic impacts. Construction of the ATS guideway,

<sup>15</sup> City of Inglewood. New Downtown And Fairview Heights Transit Oriented Development Plan and Design Guidelines. <http://inglewood.arroyogroup.com/wp-content/uploads/2017/01/The-New-Downtown-Fairview-Heights-TOD-Plan-Design-Guidelines-lo-res.pdf>. November 1, 2016.

1.0 Executive Summary

columns and station components that could affect Prairie Avenue and Manchester Boulevard would involve construction-related traffic occurring during the off-peak hours and night hours in order to minimize effects to daily commuter traffic and potential event traffic. Delivery of construction materials could occur during the night shift. Construction activities during the day shift would primarily consist of work that could proceed without substantial disruption to daily commuter traffic and potential event traffic along Prairie Avenue and Manchester Boulevard. Additionally, some minor activity could potentially occur during periods in between construction shifts for logistics, moving equipment, etc.

**PDF TRANS-1** through **PDF TRANS-5** would be implemented to ensure access and circulation remains adequate for all modes of travel (vehicular, passenger, bicycle, and transit) and uses along the Project alignment during construction. Implementation of **PDF TRANS-2** would ensure adequate circulation and access for all uses located along the proposed alignment of the ATS system, including providing adequate vehicular access to businesses at all times, and transportation related inconveniences would be reduced to the extent feasible.

**PDF TRANS-1** would also be implemented to ensure access to bus transit stops and bus circulation are always maintained, unless infeasible and closure is approved by the City, and coordination with Metro and any other transit service providers where the Project could affect transit services.

While access to some uses would be disrupted and detoured for short periods of time during construction, through implementation of **PDF TRANS-1** through **PDF TRANS-5**, adequate access and circulation would continue to be available at all times and construction of the Project would not conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and passenger facilities. With implementation of **PDF TRANS-1** through **PDF TRANS-5**, the proposed Project would result in less than significant transportation and circulation impacts during construction.

The proposed Project is consistent with the goals of Senate Bill 743 for reduction of GHG emissions, developing multi-modal transportation networks; and encouraging and supporting mixed use development. The ITC Project is also consistent with Goals 1, 2, 4, 5, 6, 7 and 8 identified in the 2020-2045 RTP/SCS.

The proposed Project includes a proposed amendment to the Circulation Element of the City's General Plan to reflect the integration of the proposed ATS system into the City's circulation system. With the proposed amendments, the proposed Project would be consistent with the Circulation Element. The proposed Project is consistent with the Land Use Element goals by increasing existing capacity and providing additional access to public transportation within the City and the region by adding an extension of transit facilities to connect visitors and residents with Downtown Inglewood and activity centers in the

City to the regional light rail system. As such, the proposed Project would not conflict with Inglewood General Plan policies related to transportation.

### 1.3.12 Tribal Cultural Resources

Tribal cultural resources may include sites, features, places, cultural landscapes, sacred places, or objects with cultural value to a California Native American tribe that are listed or determined to be eligible for listing in the California Register of Historic Places (CRHR) or included in a local register of historical resources, or a resource determined by the CEQA lead agency, in its discretion and supported by substantial evidence, to be significant and eligible for listing on the CRHR.

In accordance with Assembly Bill 52 ((Chapter 532, Statutes 2014), the City initiated the consultation process and distributed notification letters on July 31, 2018, to the four tribes which has requested future notification of proposed projects, including the Gabrielino–Tongva Tribe, Gabrielino Tongva Indians of California Tribal Council, Gabrielino/Tongva Nation, and the Gabrieleno/Tongva San Gabriel Band of Mission Indians. Additionally, the Gabrieleno Band of Mission Indians–Kizh Nation was identified as a relevant party. One response requesting consultation were received from the Gabrieleno Band of Mission Indians- Kizh Nation (Tribe).

As a result of consultation, the Tribe shared information including maps of the area that depict the historic and prehistoric trading routes, and suggested mitigation measures that may be considered to assist in reducing potential impacts from the proposed Project to any cultural resources that could be unearthed during ground disturbing activities.

With implementation of the mitigation measures, potentially significant impacts to tribal cultural resources, including related the unanticipated discovery of human remains, would be reduced to a level that is less than significant. These measures would work to prevent the destruction and loss of sensitive tribal cultural resources and ensure the proper disposition of human remains.

### 1.3.13 Utilities and Service Systems

#### Operation

Existing water and sewer lines are located within the footprint of the proposed Project along Market Street, Manchester Boulevard, and Prairie Avenue. Project components including the MSF and stations would connect to these existing water and sewer lines. The proposed Project stations and MSF would use approximately 71.86 afy less water than the existing uses located on the sites proposed for these facilities.

Southern California Edison (SCE) estimates that normal operation of the proposed Project would have an estimated peak power load flow of 4,127 kilowatts (kW). SCE would complete electricity upgrades and would be subject to its procedures and requirements for construction and environmental clearance.

Existing storm drains are located within the alignment along Market Street, Manchester Boulevard, and Prairie Avenue. It is anticipated that the proposed Project would not interfere with these storm drains during operation. Moreover, storm drains would be kept and maintained by the Los Angeles County Flood Control District (LACFCD) and the City.

No new gas connections to serve the proposed Project elements would be required except at the proposed MSF. Natural gas would be used at the MSF to serve the pressure wash system, and for space and water heating. It is anticipated that the MSF would connect to existing gas infrastructure along Manchester Boulevard at the discretion of the Southern California Gas Company (SoCalGas). Moreover, as described under **Section 1.3.5: Energy Resources**, the proposed Project would result in a net decrease in natural gas usage compared to the current uses.

#### Relocation or Construction of Utilities

There are several major utility lines identified within the Market Street segment of the proposed Project including water, sewer, stormwater, and electrical lines. Additionally, utility lines identified within the Manchester Boulevard segment of the alignment include water, sewer, wastewater, stormwater, and gas lines. Utility lines within the Prairie Avenue segment of the alignment include water, sewer, wastewater, stormwater, electrical, and gas lines. Based upon preliminary review, it appears that several utility lines within these segments would conflict with proposed Project columns. However, the location of utilities is based on a review of existing documentation and the exact locations have not been field verified. Additionally, several storm drains have been identified along these segments which may require relocation due to column placement. In addition, SCE has determined that the proposed Project would likely utilize the existing 16 kva circuit located within the right-of-way of Market Street to provide power for the proposed. SCE has also noted that utilization of this existing circuit would require infrastructure upgrades to accommodate the proposed Project.

Because several utility lines within these segments would conflict with proposed Project columns. Construction could require the potential relocation of utility lines to accommodate the support structure foundations or columns. However, the utility relocations would be minor

## 1.4 ALTERNATIVES

Section 15126.6(e)(2) of the State CEQA Guidelines requires an EIR to identify an environmentally superior alternative. If the environmentally superior alternative is the No Project alternative, the EIR must identify an environmentally superior alternative among the other alternatives.

As described in **Section 5.0: Alternatives** of this Recirculated Draft EIR, a range of alternatives to the proposed Project were considered, with some alternatives initially considered determined to be not feasible. A summary of the alternatives evaluated is presented below.

### 1.4.1. Alternative 1: No Project

The No Project Alternative considers conditions if the proposed Project is not built. No new transportation infrastructure would be built within the Project study area, aside from transportation projects that are currently under construction or funded for construction and operation by 2027. These projects include transit projects funded by Measure R, Measure M, and specified in SCAG's RTP/SCS. Existing infrastructure and future planned and funded projects assumed under the No Project alternative include:

- Metro K (Crenshaw/LAX) Line –Currently under construction (2021), operating start date (Fall 2022)
- Implementation of the Citywide Event Transportation Management and Operations Plan
- Street improvements being constructed as part of the Los Angeles International Airport Landside Access Modernization Program and the Inglewood Basketball and Entertainment Center (IBEC) projects.
- Existing Bus Service – Metro Rapid and Metro Local

### 1.4.2 Alternative 2: Bus Rapid Transit (BRT) System

Bus rapid transit (BRT) is a public transit system designed to provide improved capacity and reliability relative to a conventional bus system. Typically, a BRT system includes roadway lanes that are dedicated to buses, with signal priority to buses at intersections where buses may interact with other traffic, with enhanced coordinated flow. BRT systems typically include design features to optimize passenger boarding and alighting activities, as well as ticket purchases. A BRT corridor is a section of roadway or contiguous roadways served by the uniquely branded buses along routes with a minimum length of approximately 1.5 to 2 miles.

Under this alternative, the City would construct and operate a BRT system that would connect the Forum, the SoFi Stadium, the Performance Arena, the IBEC and the Hollywood Park mixed uses to the K Line Downtown Inglewood station. The proposed route of this alternative would be a loop route starting along Florence Avenue to travel east to North Prairie Avenue where it would turn south along Prairie Avenue to the Inglewood Transit Center Facility at Prairie Avenue and Arbor Vitae adjacent to the Hollywood Park

site, and then return via Prairie Avenue northbound to travel westbound along Manchester Boulevard to Market Street to traverse northbound to Florence Avenue. The BRT would be located entirely within the public right-of-way. This route is generally consistent with the route as described in the City's New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines.<sup>16</sup>

### 1.4.3 Alternative 3: Market Street Pedestrian Promenade

Under the Market Street Pedestrian Promenade Alternative, the proposed Project and all of its components would be constructed and operate. With this alternative, Market Street between Florence Avenue and Manchester Boulevard would be entirely closed to vehicular traffic. Regent and Queen streets would have barricades to prevent traffic turning onto Market Street in both directions. East-west traffic along Regent Street and Queen Street would be allowed without being able to turn on to Market Street. Traffic would be diverted to surrounding streets including La Brea Avenue and Locust Street. The establishment of this pedestrian promenade would encourage pedestrian activity by improving walkability within Downtown Inglewood.

### 1.4.4 Alternative 4: 4<sup>th</sup> Station Alternative

This alternative considers the addition of a fourth station to the ATS as proposed at Manchester Boulevard, east of the Market Street/Manchester Boulevard intersection as shown in **Figure 5.0-3: Alternative 4: 4<sup>th</sup> Station Alternative – Manchester Boulevard Station**.

The station configuration would consist of a center platform with vertical circulation to a pedestrian bridge located under the station platform level. Passengers would have the ability to access the station through a pedestrian bridge. As with the other ITC stations, this additional station would consist of a center platform configuration with the platform located at level 3 (approximately 50 feet above the existing grade). Passengers would access the platform from a mezzanine (at level 2) connected by pedestrian bridges to vertical circulation elements to provide access to the sidewalk (at level 1) on the north side of Manchester Boulevard.

### 1.4.5 Alternative 5: Prairie Avenue Single Station Alternative

The proposed Project modifies and relocates Prairie Avenue to the east to maintain the current roadway capacity. The relocation of Prairie Avenue and the need for a passenger station connection on the sidewalk/ground level affects properties located east of Prairie Avenue. This Alternative avoids affecting these properties by consolidating the two proposed stations on Prairie Avenue into a single station that would be located adjacent to the City's Intermodal Transit Facility at the City's Civic Center site. Passengers

<sup>16</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, November 1, 2016

would connect to the ground/sidewalk level within the City-owned Civic Center site. **Figure 5.0-4: Alternative 5: Prairie Avenue Single Station Alternative** illustrates this alternative.

This Alternative maintains Prairie Avenue within its existing right-of-way; however, one to two lanes would be lost, thereby reducing the capacity of the roadway. Specifically, one travel lane in each direction along Prairie Avenue between Arbor Vitae and La Palma, one lane in the southbound direction between La Palma and Pincay Drive, and one lane in each direction between Pincay Drive and Manchester Boulevard would be lost under this Alternative 5: Prairie Avenue Single Station Alternative.

#### 1.4.5 Alternative 6: Maintenance and Storage Facility Alternative

The proposed Project involves siting the MSF within the southeastern portion of the site at 500 E. Manchester Boulevard closest to the corner of Nutwood Street and Spruce Avenue that contains a Vons grocery store and gas station, with other businesses, including a private gym, bank branch and coffee shop located in the building with Vons. This siting of the MSF requires removal of the gas station currently located on the Vons site in order to provide for short-term construction staging to construct the MSF and, thereafter, to provide parking. This Alternative moves the MSF to the northwestern portion of this property closest to the south corner of Hillcrest Boulevard and Manchester Boulevard as shown in **Figure 5.0-5: Alternative 6: Maintenance and Storage Facility Alternative**. The site containing the MSF would be approximately 14,000 SF in size. This alternative would have the same elevated profile and footprint of the MSF and its supporting facilities (e.g., access, circulation, employee parking, etc.). With this alternative, the existing gas station would remain on the site.

#### 1.4.6 Environmental Superior Alternative

An EIR is required to identify the Environmentally Superior Alternative from among the range of reasonable alternatives that are evaluated. CEQA Guidelines section 15126.6(e)(2) requires that an environmentally superior alternative be designated and states that if the Environmentally Superior Alternative is the No Project alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.

Of the alternatives evaluated in this Recirculated Draft EIR, the Environmentally Superior Alternative would be Alternative 2, BRT System Alternative.

With mitigation, the Project would not result in any significant impacts and, for this reason, Alternative 2 would not avoid any significant impact that would result from the Project as proposed. Alternative 2 is considered the Environmentally Superior Alternative because it would lessen impacts to the greatest degree of the alternatives evaluated. The BRT System Alternative would, however, not meet the City's basic objectives for the proposed Project.

With the BRT System Alternative, the proposed Project would not be constructed. No demolition or construction activities would occur, except along the public right-of-way where BRT-only lanes along the route are implemented. The BRT System Alternative would avoid all significant construction related effects and impacts identified for the proposed Project.

Unlike the No Project Alternative, the BRT System Alternative would meet some of the City's objectives including providing a direct and convenient connection to the Metro regional transit system, encouraging intermodal transportation systems by providing convenient transit, and providing safe, reliable, and convenient access to businesses in the City. The BRT System Alternative would also meet the City's objectives to support the ongoing economic revitalization, growth opportunities within the Downtown TOD Plan area, and encourage redevelopment and investment within the City in areas served by the proposed Project. The BRT System Alternative would not, however, create additional public parking to support ongoing economic revitalization efforts. The proposed Project would create additional public parking facilities in three locations along the proposed Alignment. In addition, the objective to provide sufficient transit connection capacity between Metro's regional transit system and the City's new major activity centers would not be met by this BRT alternative, resulting in limited increased transit mode split, limited reduction in vehicle trips, and consequently, limited reduction in per-capita vehicle miles traveled to the City's major activity centers. The estimated daily BRT ridership with Event Conditions would be approximately 20 percent of the projected ridership for the proposed ATS, providing transit options, increasing transit mode split, reducing vehicle trips, and reducing per capita VMT to the City's major activity centers. The BRT System Alternative would also not meet the City's objectives to maintain existing roadway capacity, reduce the City's traffic congestion and alleviate growing demand on the existing roadway network on both major arterials and residential streets for both nonevent and event days.

### 1.5 AREAS OF KNOWN CONTROVERSY AND ISSUES TO BE RESOLVED

The State CEQA Guidelines<sup>17</sup> require that a Draft EIR summary identify areas of controversy known to the lead agency, including issues raised by other agencies and the public. Issues identified in comments on the Notice of Preparation (NOP), the revised NOP (see **Appendix B**), and on the 2020 Draft EIR include the following topics:

- Impacts to historical buildings along Market Street
- Land use conflicts with nearby residential uses and with the goals, policies, guidelines, and standards of the HPSP
- Construction-related air quality impacts
- Construction and operational noise impacts to nearby sensitive receptors

<sup>17</sup> California Public Resources Code, tit. 14, Div. 6, ch. 3, State CEQA Guidelines, sec. 15123.

- Impacts to students and staff at Kelso Elementary School, including potential construction and operational noise, air quality, and hazardous materials impacts
- Increases in traffic congestion in downtown Inglewood during construction
- Economic impacts to businesses along the Project alignment, including impacts caused by potentially reducing access to businesses during construction and by potentially reducing the number of available public parking spaces
- Visual compatibility with adjacent land uses
- Access for emergency vehicles
- Potential closure of the existing Vons market at the site of the proposed MSF

To the extent these topics implicate potential direct or indirect (secondary) environmental impacts of the proposed Project, those topics are addressed in **Section 4.0: Environmental Impact Analysis**.

## 1.6 PROPOSED MITIGATION MEASURES

**Table 1.0-4: Summary of Mitigation Measures** provides the mitigation program for the proposed Project that has been identified to reduce potentially significant impacts to less than significant. In addition, the proposed Project includes the CCP and the Design Guidelines to proactively address the potential effects of the construction and operation of the proposed Project on the community. The CCP and the Design Guidelines identify features and actions incorporated into the proposed Project to lessen or avoid potential impacts.

## 1.7 SIGNIFICANT AND UNAVOIDABLE ENVIRONMENTAL EFFECTS

As required by the State CEQA Guidelines Section 15126.2(b), this section identifies the significant environmental effects that cannot be avoided if the proposed Project is implemented. The State CEQA Guidelines require that an EIR "Describe any significant impacts, including those which can be mitigated but not reduced to a level of insignificance. Where there are impacts that cannot be alleviated without imposing an alternative design, their implications, and the reasons why the project is being proposed, notwithstanding their effect, should be described."<sup>18</sup> No significant impacts have been identified in the analyses in the Recirculated Draft EIR.

## 1.8 SUMMARY TABLE

**Table 1.0-4: Summary of Findings** has been organized to correspond with the environmental issues discussed in **Section 4.0**. The summary table is arranged in four columns:

1. Environmental impacts ("Impact").

---

<sup>18</sup> California Code of Regulations, tit. 14, div. 6, ch. 3, California Environmental Quality Act Guidelines, sec. 15126.2(b).

2. Level of significance without mitigation ("Significance Before Mitigation").
3. Mitigation measures ("Mitigation Measure").
4. The level of significance after implementation of mitigation measures ("Significance After Mitigation").

If an impact is determined to be significant or potentially significant, feasible mitigation measures are identified, where appropriate. More than one mitigation measure may be required to reduce the impact to a less-than-significant level. The analysis in the Recirculated Draft EIR assumes all applicable plans, policies, and regulations would be implemented, including, but not necessarily limited to, City General Plan policies, laws, and requirements or recommendations of the City of Inglewood. Applicable plans, policies, and regulations are identified and described in the Regulatory Setting of each issue area and within the relevant impact analysis. A description of the organization of the environmental analysis, as well as key assumptions regarding the approach to the analysis, is provided in **Section 4.0**.

Table 1.0-4  
Summary of Findings

Impact	Significance Before Mitigation	Project Design Features/Mitigation Measures	Significance After Mitigation
4.1 Aesthetics	LS	<p><b>PDF AES-1 Construction (CCP)</b></p> <p>Construction activities during evening and nighttime hours may require the use of temporary lighting. To minimize the impact of temporary lighting on adjacent properties, the following measures shall be implemented:</p> <ul style="list-style-type: none"> <li>Temporary lighting will be limited to the amount necessary to safely perform the required work and will be directed downwards and shielded. Care shall be taken in the placement and orientation of portable lighting fixtures to avoid directing lights toward sensitive receptors, including automobile drivers. Motorists and sensitive receptors shall not have direct views of construction light sources. Light sensitive receptors include but are not limited to residential areas and transient occupancy uses.</li> <li>Light trespass shall not exceed one foot-candle above ambient light level as measured at any adjacent residential and transient properties.</li> <li>Temporary sidewalks and any sidewalk adjacent to construction activities shall be illuminated to City Standards to protect public safety.</li> <li>To minimize the visual effects of construction the following measures shall be implemented:</li> <li>Visually obtrusive erosion control devices, such as silt fences, plastic ground cover, and straw bales should be removed as soon as the area is stabilized.</li> <li>Stockpile areas should be located in less visibly sensitive areas and pre-approved by the City. Stockpile locations, laydown, and staging areas shall be accessed by construction vehicles with minimal disruption near residential neighborhoods.</li> </ul>	LS
		<p><b>Impact AES-1a:</b> Would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings. (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project cause degradation to visual character?</p>

1.0-38

Inglewood Transit Connector Project  
November 2021

Impact	Significance Before Mitigation	Project Design Features/Mitigation Measures	Significance After Mitigation
--------	--------------------------------	---	-------------------------------

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

and landscaping for general health as a condition of final acceptance by the City. If, in the City's determination, a permanent replacement tree or landscaping does not meet the health requirements of the City, then the Contractor shall replace that tree within thirty (30) days. For any permanent trees or landscaping that must then be removed, the original warranty shall be deemed renewed commencing from when the tree or landscaping is replaced.

**PDF AES-3 Lighting (Design Guidelines)**

Station Design

- Station canopies will have indirect accent lighting.
- Lighting will clearly highlight pedestrian paths including those to stairs, escalators, and elevators.
- Accent and functional lighting will be strategically placed to minimize spillover.
- Accent and functional lighting controls will be programmable, and sensor controlled to allow for energy efficiency and various settings such as daytime, nighttime, and event lighting.

Guideway And Support Structure Design

- Where provided, guideway indirect accent lighting will complement station lighting design.
- Light fixtures will be concealed or minimally visible.
- Accent and functional lighting will be strategically placed to minimize spillover.
- Code required lighting along the guideway will be designed to minimize visibility from the ground level.

Impact	Significance Before Mitigation	Project Design Features/Mitigation Measures	Significance After Mitigation
--------	--------------------------------	---	-------------------------------

- NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable
- Street lighting will be supplemented as needed to provide a consistent light level on the sidewalk and roadway along the project alignment
- Maintenance And Storage Facility
- Where provided, functional lighting will be placed to minimize spillover
  - Building entrances will be well lit.
  - Lighting will clearly highlight pedestrian paths including those to ramps, stairs, escalators, and elevators
  - Public uses on the ground plane of the MSF Site including any covered parking areas will be well lit with particular attention paid to the comfort and safety of the public.
- Elevated Passenger Walkway
- Where provided, functional lighting will be placed to minimize spillover.
  - Overall lighting design will not interfere with roadway traffic below.
  - Accent lighting will complement station lighting design.
  - Accent and general lighting controls will be programmable and sensor controlled to allow for daytime, nighttime, and event settings.

**PDF AES-4 Tree Placement (Design Guidelines)**

- An arborist report surveying the condition and extents of all existing trees in the Project area will be provided to the developer for their use as a baseline in order to produce a final report detailing the most current conditions and proposed handling of all existing trees for the proposed Project.
- Existing flourishing trees (as identified in the arborist report) will remain, where feasible.
- An Approved Plant Palette based on the City's approved street tree list will

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

- be used as a basis for all sections of new trees.
- The quantity and species of existing trees removed by the ITC Project will be replaced in accordance with the City's current landscape guidelines.
  - Protected species in the Inglewood Municipal Code, Tree Preservation will remain.
  - City of Inglewood guidelines for tree spacing will be followed, considering species of trees and the desired canopy coverage.
  - Trees will be planted on both sides of the roadway where feasible.
  - Trees will be positioned at regular intervals relative to the guideway column supports to create a consistent rhythm.
  - On Market Street, trees will be planted at a rhythm and scale to create a continuous visual canopy over the pedestrian realm, where feasible.
  - On Manchester Boulevard, trees will be planted at a rhythm consistent with the street trees east and west of the Project, in alignment with the shape of the roadway.
  - On Prairie Avenue, trees on the east side will continue the stately rhythm from the Inglewood Cemetery north of Manchester Boulevard. Trees on the west side will be spaced to match the rhythm of the east side and the guideway support structure to the extent feasible.

**PDF AES-5 Signage (Design Guidelines)**

- Physical Non-Digital Signage incorporated into the Project will have a distinct visual graphic identity that is consistent across all physical design elements of the project
- All signage will be approved by City of Inglewood and the Authority Having Jurisdiction (AHJ).

--------	--------------------------------	---	-------------------------------

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

pollutant for which the project region is nonattainment under an applicable Federal or State ambient air quality standard.

construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity, unless it can be demonstrated to the City Planning Division with substantial evidence that such equipment is not available. To ensure that Final Tier 4 construction equipment or better shall be used during the proposed Project's construction, the City shall include this requirement in applicable bid documents, purchase orders, and contracts. The City shall also require periodic reporting and provision of written construction documents by construction contractor(s) and conduct regular inspections to the maximum extent feasible to ensure and enforce compliance.

Such equipment will be outfitted with Best Available Control Technology devices including a California Air Resources Board (CARB)-certified Level 3 Diesel Particulate Filters (DPF). Level 3 DPF are capable of achieving at least 85 percent reduction in particulate matter emissions. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by Final Tier 4 emissions standards for a similarly sized engine, as defined by the CARB's regulations. Successful contractors must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. The proposed Project representative will make available to the lead agency and Southern California Air Quality Management District (SCAQMD) a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, which will be used during construction. The inventory will include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each unit's certified tier specification, best available control technology (BACT) documentation, and CARB or SCAQMD operating permit shall be maintained on site at the time of mobilization for each applicable piece of construction equipment.

If any of the following circumstances listed below exist and the Contractor provides written documentation consistent with project contract requirements,

1.0 Executive Summary

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

the Contractor shall submit an Alternative Compliance Plan that identifies operational changes or other strategies that can reduce a comparable level of NOx emissions as Tier 4-certified engines during construction activities.

- The Contractor does not have the required type of off-road construction equipment within its current available inventory as to a particular vehicle or equipment by leasing or short-term rent, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
- The Contractor has been awarded funding by SCAQMD or another agency that would provide some or all of the cost to retrofit, repower, or purchase a piece of equipment or vehicle, but the funding has not yet been provided due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
- Contractor has ordered equipment or vehicle to be used on the construction project in compliance at least 60 days before that equipment or vehicle is needed at the Project alignment, but that equipment or vehicle has not yet arrived due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

to the City showing that the requirements of this exception provision apply.

- Construction-related diesel equipment or vehicle will be used on the Project for fewer than 20 calendar days per calendar year. The Contractor shall not consecutively use different equipment or vehicles that perform the same or a substantially similar function in an attempt to use this exception to circumvent the intent of this measure.

- Documentation of good faith efforts and due diligence regarding the previous exceptions shall include written record(s) of inquiries (i.e., phone logs) to at least three leasing/rental companies that provide construction on-road trucks and off-road equipment, documenting the availability/unavailability of the required types of truck/equipment. The City will, from time-to-time, conduct independent audit of the availability of such vehicles and equipment for lease/rent within a 120-mile radius of the Project area, which may be used in reviewing the acceptability of the Contractor's good faith efforts and due diligence.

- Equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts shall be electric or alternative-fueled (i.e., nondiesel). Pole power shall be utilized to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel-powered generators, must be operated continuously, such equipment must be Final Tier 4 construction equipment or better and located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.

- At a minimum, require that construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export with a gross vehicle weight rating of at least 14,001 pounds), or best commercially available equipment, that meet CARB's 2010 engine emissions standards at 0.01 g/hp-hour of

1.0 Executive Summary

Impact	Significance Before Mitigation	Project Design Features/Mitigation Measures	Significance After Mitigation
--------	--------------------------------	---	-------------------------------

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

particulate matter and 0.20 g/hp-hour of NOx emissions or newer, cleaner trucks, unless the Contractor provides written documentation consistent with project contract requirements the circumstances exist as described above and the Contractor submits the Plan. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards. The City shall include this requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards and make the records available for inspection.

- Require the use of electric or alternatively fueled (e.g., natural gas) sweepers with high-efficiency particulate air (HEPA) filters.

- A publicly visible sign shall be posted with the Community Affairs Liaison's contact information to contact regarding dust complaints. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.

- All roadways, driveways, sidewalks, etc., being installed as part of the Project should be completed as soon as practicable; in addition, building pads should be laid as soon as practicable after grading.

- To the extent feasible, allow construction employees to commute during off-peak hours.

- Make access available for on-site lunch trucks during construction, as feasible, to minimize off-site construction employee vehicle trips.

- Every effort shall be made to utilize grid-based electric power at any construction site, where feasible.

- Contractors shall maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and

--------	--------------------------------	---	-------------------------------

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.

- Require in all applicable bid documents, purchase orders, and contracts of the requirement to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB's policy. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify construction vendors, contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the Project area. To further ensure that drivers understand the vehicle idling requirement, post signs at the proposed Project entry gates and throughout the Project alignment, where appropriate, stating that idling longer than five minutes is not permitted.

movement of any resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

measures:

- Prior to initiating any demolition and/or construction activities, a nesting bird survey shall be conducted to determine the presence of any nesting birds within 500 feet of demolition and/or construction activities. In addition, nesting bird surveys shall be conducted at least every six (6) months until the completion of construction activities, as specified below. Nesting bird survey shall include:
  - Prior to any demolition and/or construction, and a least every six (6) months during and prior to the raptor nesting season until the completion of construction activities, January 1 to September 1, a qualified biologist shall conduct a site survey for active nests 30 days prior to any scheduled clearing, demolition, grading, or construction activities. The survey shall be conducted within all trees, manmade structures, and any other potential raptor nesting habitat.
  - Prior to any vegetation disturbance between March 1 and September 15, and a least every six (6) months until the completion of construction activities, a qualified biologist shall conduct a survey for nesting birds in all breeding/nesting habitat within the construction or demolitions areas and within 300 feet of all disturbance areas. The surveys shall be conducted within trees and structures, wherever nesting bird species may be located. Nesting bird surveys shall be conducted no earlier than 30 days prior to the initiation of ground or vegetation disturbance. If no breeding/nesting birds are observed, site preparation, demolition and construction activities may begin. If breeding activities and/or an active bird nest is located, the breeding habitat/nest site shall be fenced by the biological monitor a minimum of 300 feet (500 feet for raptors) in all directions, and this area shall not be disturbed until the nest becomes inactive, the young have fledged, the young are no longer being fed by

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

the parents, the young have left the area, and/or the young shall no longer be impacted. If the qualified biologist determines that a narrower buffer between the demolition and/or construction activities and the observed active nests is warranted, the biologist may submit a written explanation as to why (e.g., species-specific information; ambient conditions and bird's habituation to them; terrain, vegetation, and birds' lines of sight between the demolition and/or construction activities and the nest and foraging areas) to the District and, upon request, the CDFW. Based on the submitted information, the District, acting as the lead agency (and CDFW, if CDFW requests) shall determine whether to allow a narrower buffer.

- During the year prior to demolition and/or construction, a survey shall be conducted by a qualified biologist for bat habitat areas within the construction footprint of the proposed Project between March 1 and September 30 and a least every six (6) months until the completion of construction activities. The areas shall be characterized as to their potential for supporting a bat maternal colony or nursery site. The survey shall include all trees and any manmade structures, or other bat habitat areas that could be affected. If bat maternal colony or nursery sites are identified, then these areas shall be avoided by demolition and/or construction during the bat breeding season, from March 1 through September 30. Each tree or structure supporting an active maternity roost shall be inspected a week prior to disturbance to determine the presence or absence of roosting bats.

- The biologist shall submit weekly reports to the City's Parks, Recreation and Library Services Director, or designated representative, regarding the results of the nesting bird surveys.

**PDF AES-2 Tree Replacement (CCP)** LS

A Tree Removal and Replacement Plan will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and shall adhere to the following principles:

- Tree removal and replacement shall comply with the City of Inglewood Municipal Code and the Design Guidelines.
- Removal of existing healthy and flourishing trees will be avoided where feasible.
- New permanent replacement trees shall be a 36-inch box of the same species as those removed, if appropriate for the location and not in conflict with new infrastructure. Alternative locations shall be approved by the City's Public Works Department.
- New permanent replacement palm trees shall be a minimum of 20 feet in height.
- The Contractor shall permanently replace trees within six (6) months of restoration and completion of that portion of streets that may impact the tree. To the extent feasible, the Contractor shall permanently replace trees on an ongoing basis so long as doing so does not conflict with future construction.
- If construction of the project requires pruning of native tree species, the pruning shall be performed in a manner that does not cause permanent damage or adversely affect the health

4.5 Energy

LS

PDF ENERGY-1 (Design Guidelines)

LS

- **Energy Efficiency** - Where California Energy Efficiency Standards apply, the project should be more energy efficient than allowed. For energy-using equipment not governed by California Energy Efficiency Standards, best available energy efficient technologies should be used. Advanced commissioning of building systems should be conducted to ensure systems are operating as designed.
- To achieve energy use reduction, passive strategies taking advantage of the favorable local climate should be considered where feasible. The use of solar canopies as shade structures in addition to roof-mounted solar is another energy saving strategy.
- **Water Efficiency** - In order to reduce excessive water consumption, the project should identify and implement appropriate opportunities to reduce or eliminate potable water use indoors and in landscape areas.
- **Material Conservation And Resource Efficiency** - In order to reduce the environmental impact from the use of construction materials, the project should minimize the use of virgin materials. This can be accomplished by increasing the use of materials that are reused, recycled, rapidly renewable, locally sourced, and durable. In order to

**Impact E-1:** Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation.

1.0 Executive Summary

4.6 Geology

PS

LS

**MM GEO-1:** The proposed Project shall be designed to accommodate fault rupture where present in accordance with applicable Caltrans guidelines, including Memo to Designers 20-8 (Analysis of Ordinary Bridges that Cross Faults), dated January 2013; and Memo to Designers 20-10 (Fault Rupture), dated January 2013, where any portion of a structure falls within an APEFZ, or where any portion of a structure falls within approximately 100 meters (330 feet) of well-mapped active faults, or within 300 meters (1,000 feet) of an un-zoned fault (not

**Impact GEO-1:** Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo

1.0 Executive Summary

Impact	Significance Before Mitigation	Significance After Mitigation
--------	--------------------------------	-------------------------------

**Impact:** LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault. Refer to Division of Mines and Geology Special Publication 42.

in an APEFZ) that is Holocene or younger in age. Stations and elevated structures for the ATS Guideway shall be located to avoid the fault rupture hazard where present with refinement of station and ATS Guideway placement worked into final design as needed. As noted in Caltrans Memorandum to Designers (MTD) 20-8, bridge type structures, such as the ATS Guideway, must be designed for the displacement demand resulting from a static fault offset, the dynamic response due to ground shaking, and any other fault-induced hazards (e.g., creep) that may occur at the site. Caltrans MTD 20-8 provides a method for obtaining the displacements at columns and abutments at fault crossings; all the requirements must also be followed. Adequate bearing seats must be provided so the superstructure can slide at the abutment, bent, or hinge seats without falling.

**MM GEO-2:** During site investigation prior to the start of construction, the location of the anticipated trend of the Townsite Fault shall be further defined via a phased investigation process to identify and locate active fault traces in the Project area to support adjustments to the proposed Project's design.

The investigation shall include a supplemental fault investigation conducted along the trace of the Townsite fault to further refine the location of the feature and assess the activity level where it crosses the proposed ATS alignment and any stations.

The investigation shall include the following surface and subsurface methods:

- Aerial photograph analysis;
- Geophysical surveys (e.g., seismic reflection and/or seismic refraction) to refine the identified geophysical anomaly

1.0 Executive Summary

Impact	Significance Before Mitigation	Significance After Mitigation
--------	--------------------------------	-------------------------------

**Impact:** LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

associated with the Townsite fault and inform subsequent targeted fault hazard exploration as necessary;

- Targeted fault trenching based on the findings of additional geophysical studies to locate the potential Townsite fault where it crosses the proposed ITC alignment; and
- Exploratory drilling and sampling (e.g., hollow stem auger and CPT borings), as necessary, if definitive information regarding the trace of the Townsite fault cannot be adequately delineated across the proposed ITC alignment within the limits of fault trenching.

Based on the results of these investigations, column placements and facility designs would be adjusted to accommodate geologic conditions identified. Further, the facilities shall be designed in accordance with applicable Caltrans guidelines including Memo to Designers 20-8 (Analysis of Ordinary Bridges that Cross Faults) and 20-10 (Fault Rupture). Stations/structures shall be located to avoid the fault rupture hazard where present.

Columns and foundations for the guideway and stations, as well as any other ATS facilities shall be located to avoid the fault rupture hazard where present. The design fault offset where evaluating features crossing the ATS guideway alignment shall be determined as the larger of the:

- Deterministically derived average displacement.
- Probabilistically derived displacement consistent with a 5 percent in 50-years probability of exceedance.

Probabilistic procedures shall follow those outlined in Abrahamson [2008] and Petersen et al, [2011] of the *Fault*

construction personnel attended the training.

c) Direct the performance of paleontological resources monitoring by a qualified paleontological monitor (meeting the standards of the SVP, 2010). Paleontological resources monitoring shall be conducted pursuant to the monitoring and mitigation program developed under (a). Monitoring activities may be altered or ceased if determined adequate by the qualified paleontologist. Monitors shall have the authority to and shall temporarily halt or divert work away from exposed fossils or potential fossils and establish a 50-foot radius temporarily halting work around the find. Monitors shall prepare daily logs detailing the types of ground disturbing activities and soils observed, and any discoveries.

d) If fossils are encountered, determine their significance, and, if significant, supervise their collection for curation. Any fossils collected during Project-related excavations, and determined to be significant by the qualified paleontologist, shall be prepared to the point of identification and curated into an accredited repository with retrievable storage.

e) Prepare a final monitoring and mitigation report for submittal to the City in order to document the results of the paleontological monitoring. If there are significant discoveries, fossil locality information and final disposition shall be included with the final report which would be submitted to the appropriate repository and the City. The final monitoring report shall be submitted to the City within 90 days of completion of excavation and other ground disturbing activities that could affect Older Quaternary Alluvium.

Impact	Significance Before Mitigation	Project Design Features/Mitigation Measures	Significance After Mitigation
--------	--------------------------------	---	-------------------------------

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

- All equipment shall be equipped with optimal muffler systems;
- Use solar, battery powered, or hybrid equipment whenever practical;
- Locate staging areas as far away from sensitive receptors as feasible;
- Locate stationary noise sources as far away from sensitive receptors as feasible;
- Enclose stationary noise sources, such as diesel-or gasoline-powered generators, with acoustical barriers where necessary and required;
  - If stationary equipment cannot be enclosed within a shed or barrier, such equipment must be muffled and located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- Pole power shall be utilized to the maximum extent feasible in lieu of generators.
- Impact tools (i.e., jack hammers, pavement breakers, and rock drills) used for project construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust and external jackets shall be used where feasible to lower noise levels. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible. Additionally, use

- of “quiet” pile driving technology (such as auger displacement installation), where feasible in consideration of geotechnical and structural requirements and conditions shall be considered.
- Coordinate with Inglewood Unified School District administrators to avoid disruptive noise during school hours.
 

In order to ensure that construction noise levels will be below the established standards, the following shall be incorporated into the Plan:

  - A monitoring plan shall be implemented during demolition and construction activities. Warning thresholds shall be defined that are 5 dBA below the specified noise limits to allow sufficient time for the Contractor to take actions to reduce noise. A monitoring record that documents all alarms and actions taken to comply with these measures shall be provided to the City upon request.
  - In the event the warning level (dBA) is exceeded, construction activities shall be temporarily halted in the vicinity of the area where the exceedance occurs. The source of the noise exceeding the warning level shall be identified followed by actions to be implemented to reduce noise levels below the established standards. Noise measurements shall be gathered after actions are taken to verify noise levels are below the warning level before construction activities restart. The following are examples of actions that can be taken to reduce construction noise levels:

1.0 Executive Summary

Impact	Significance Before Mitigation	Project Design Features/Mitigation Measures	Significance After Mitigation
--------	--------------------------------	---	-------------------------------

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

- Halting/staggering concurrent construction activities in certain locations;
- Reducing the speed or intensity of the of heavy-duty construction equipment being operated simultaneously.
- Operate equipment at the lowest possible power levels.
- Modifying equipment, such as dampening of metal surfaces or other redesign to minimize metal-to-metal impacts.

No mitigation measures required

**Impact NOI-2:** Generation of excessive groundborne vibration or groundborne noise levels?

**PDF NOISE-2 Construction Vibration Reduction Plan (CCP)**

Prior to the issuance of any demolition or construction permit for each phase of the Project, a Construction Vibration Reduction Plan shall be prepared to minimize construction vibration at nearby sensitive receptors from vibration created by construction activities. The Plan shall be developed in coordination with a certified acoustical/vibration consultant and shall be approved by the City's Director of Public Works. The Plan shall include but not be limited to the following elements to ensure impacts from ground borne vibration are less than significant:

- A Pre-Demolition and Construction Plan that includes but is not limited to:
  - Photos of current conditions of buildings and structures that could be damaged from construction activities. This crack survey shall include photos of existing cracks and other material conditions present on or at the surveyed buildings. Images of interior conditions shall be included if possible. Photos in the report shall be labelled in detail and dated.

1.0 Executive Summary

Impact	Significance Before Mitigation	Project Design Features/Mitigation Measures	Significance After Mitigation
--------	--------------------------------	---	-------------------------------

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

- Identify representative cracks in the walls of existing buildings, if any, and install crack gauges on such walls of the buildings to measure changes in existing cracks during project activities.
- Crack gauges shall be installed on multiple representative cracks, particularly on sides of the building facing the Project.
- Determine the number and placement of vibration sensors at the affected buildings in consultation with a qualified architect. The number of units and the locations of these sensors shall take into account proposed demolition and construction activities to ensure that adequate measurements can be taken illustrating vibration levels during the course of the Project, and if/when levels exceed the established threshold.
- A line and grade pre-construction survey at the affected buildings shall be conducted.
- A Vibration Plan During Demolition and Construction that includes the following:
  - Regularly inspect and photograph crack gauges, maintaining records of these inspections to be included in postconstruction reporting. Gauges shall be inspected every two weeks, or more frequently during periods of active project actions in close proximity to crack monitors.
  - The vibration monitoring system shall measure and continuously store the peak particle velocity (PPV) in inches/second. Vibration data shall be stored on a one-second interval. The system shall also be programmed for

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

- two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA's threshold of significance for a building given its conditions, and a warning level that is 0.05 inch/second (PPV) less than the regulatory level. The system shall also provide real-time alert when the vibration levels exceed either of the two preset levels.
- In the event the warning level (PPV) is triggered, the contractor shall identify the source of vibration impacts and establish steps to reduce the vibration levels, including but not limited to halting or staggering concurrent activities and using lower vibratory techniques.
- In the event the regulatory level (PPV) is triggered, halt the construction activities in the vicinity of the trigger area and visually inspect the building for any damage. Results of the inspection must be logged. Identify the source of vibration generation and provide steps to reduce the vibration level. Vibration measurement shall be made with the new construction method to verify that the vibration level is below the warning level (PPV). Construction activities may then restart.
- In the event work occurs in the proximity of identified historic uses, the system shall be programmed for two preset velocity levels: a regulatory level that represents when PPV levels would exceed the FTA threshold of significance 0.12 inch/second for a building given its conditions, and a warning level that is 0.012 inch/second (PPV) less than the regulatory level.
- Collect vibration data from receptors and report

- vibration levels to the City Chief Building Official on a daily basis. The reports shall include annotations regarding project activities as necessary to explain changes in vibration levels.
- Post-Construction Reporting and Repairs:
  - Provide a report to the City Chief Building Official regarding crack and vibration monitoring conducted during demolition and construction. In addition to a narrative summary of the monitoring activities and their findings, this report shall include photographs illustrating the post-construction state of cracks and material conditions that were presented in the pre-construction assessment report, along with images of other relevant conditions showing the impact, or lack of impact, of project activities. The photographs shall sufficiently illustrate damage, if any, caused by the Project and/or show how the Project did not cause physical damage to the buildings. The report shall include analysis of vibration data related to project activities, as well as summarize efforts undertaken to avoid vibration impacts. Finally, a postconstruction line and grade survey shall also be included in this report.
  - Perform repairs to buildings if damage is caused by vibration or movement during the demolition and/or construction activities. Repairs may be necessary to address, for example, cracks that expanded as a result of the Project, physical damage visible in post-construction assessment, or holes or connection points that were needed for shoring or stabilization. Repairs shall be directly related to project impacts and will not apply to

- Monitoring and coordination of construction materials deliveries
- Notification to businesses and residents on upcoming construction activities including but not limited to the establishment of a website with project construction information, signage, and web-based media.

The Traffic Control Program will be updated as needed based on the following principals:

- Minimize traffic impacts on residential streets.
- Establish minimum traffic lane requirements for Manchester Boulevard, Florence Avenue, and Prairie Avenue during construction such that at least the full number of traffic lanes in the peak direction, and if feasible, one traffic lane in the off-peak direction is available, with additional capacity provided through appropriate detour routes. The directional traffic lanes may be reversible to maintain the peak directional capacity in either direction as necessitated by traffic demands. For all other streets potentially affected by construction, maintain at least one lane of traffic in each direction unless otherwise approved by the City.
- Maintain access to and from all alleys at one or both ends of the alley when possible. If an alley is obstructed such that a turnaround by any vehicle is not feasible, traffic flaggers shall be provided to control access to/from the alley.
- Maintain access for all public safety vehicles (such as police, fire, and emergency response).
- Maintain bicycle and pedestrian access within the Project

Impact NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

- area or approved detours at all times.
- Provide adequate street access to City service vehicles, including but not limited to trash pickup and street sweeping service vehicles, during planned service times.
- Sidewalk closures should be avoided to the degree feasible and are permitted only when approved by the City. Accessible detours shall be provided if sidewalk closures are necessary.
- Use traffic control officers/flaggers as appropriate to minimize the degree and duration of impacts and maintain safety.
- Establish and maintain wayfinding signage.
- Maintain vehicular and pedestrian access to all businesses and residents impacted by construction activities including roadway closures.
- Hold quarterly community outreach meetings with businesses and residents to provide updates on temporary, full, or partial street closures necessary for construction. Website will be updated 45 to 60 days prior to planned dates of any street closures.
- All closures, full or partial, are subject to City review and approval which shall consider measures to minimize the degree and duration of street and lane closures.

**PDF TRANS-3 Preliminary Haul and Overload Routes (CCP)**

- Haul routes and overload/oversized vehicle routes are subject to review and approval by the City.

be in accordance with CEQA.

Guidelines Section 15064.5(f) for historical resources and PRC Sections 21083.2(b) for unique archaeological resources. Preservation in place (i.e., avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery excavations to remove the resource along with subsequent laboratory processing and analysis. Any historic archaeological material that is not Native American in origin shall be curated at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material. If no institution accepts the archaeological material, it shall be offered to a local school or historical society in the area for educational purposes.

**MM TCR-4** and **MM TCR-5** will supplement **MM TCR-1**.

**MM TCR-2: Monitoring and Mitigation Plan.** Prepare, design, and implement a monitoring and mitigation program for the Project. The Plan shall define pre-construction coordination, construction monitoring for excavations based on the activities and depth of disturbance planned for each portion of the Project area, data recovery (including halting or diverting construction so that archaeological remains can be evaluated and recovered in a timely manner), artifact and feature treatment, procurement, and reporting. The Plan shall be prepared and approved by a qualified archaeologist prior to the issuance of the first grading permit.

1.0 Executive Summary

Impact	Significance Before Mitigation	Significance After Mitigation
Impact	Project Design Features/Mitigation Measures	Significance After Mitigation

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

**MM TCR-3: Cultural Resources Sensitivity Training.**

The qualified archaeologist and Native American Monitor shall conduct construction-worker archaeological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.) and will present the Plan as outlined in (a), for all construction personnel conducting, supervising, or associated with demolition and ground disturbance, including utility work, for the Project. In the event construction crews are phased or rotated, additional training shall be conducted for new construction personnel working on ground-disturbing activities. Construction personnel shall be informed of the types of prehistoric and historic archaeological resources that may be encountered, and of the proper procedures to be enacted in the event of an inadvertent discovery of archaeological resources or human remains. Documentation shall be retained by the qualified archaeologist demonstrating that the appropriate construction personnel attended the training.

**MM TCR-4: Archaeological and Native American Monitoring.** The qualified archaeologist will oversee archaeological and Native American monitors who shall be retained to be present and work in tandem, monitoring during construction excavations such as grading, trenching, or any other excavation activity associated with the Project and as defined in the Monitoring and Mitigation Plan. If, after advanced notice, the Native American representative declines, is unable, or does not respond to the notice, construction can proceed under supervision of the qualified archaeologist. The frequency of monitoring shall be based on the rate of excavation and grading activities, the

1.0 Executive Summary

Impact	Significance Before Mitigation	Significance After Mitigation
	Project Design Features/Mitigation Measures	not applicable

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

materials being excavated, and the depth of excavation, and if found, the quantity and type of archaeological resources encountered. Full-time monitoring may be reduced to part-time inspections, or ceased entirely, if determined adequate by the qualified archaeologist and the Native American monitor.

1. In the event of the discovery of any archaeological materials during implementation of the Project, all work shall immediately cease within 50 feet of the discovery until it can be evaluated by the qualified archaeologist. Construction shall not resume until the qualified archaeologist has made a determination on the significance of the resource(s) and provided recommendations regarding the handling of the find. If the resource is determined to be significant, the qualified archaeologist will confer with the project applicant regarding recommendation for treatment and ultimate disposition of the resource(s).
2. If it is determined that the discovered archaeological resource constitutes a historical resource or a unique archaeological resource pursuant to CEQA, avoidance and preservation in place is the preferred manner of mitigation. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement.
3. In the event that preservation in place is demonstrated to be infeasible and data recovery through excavation is the only feasible mitigation available, a Cultural Resources Treatment Plan shall be prepared and implemented by the qualified archaeologist in consultation with the project applicant, and appropriate Native American representatives (if the find is of Native American origin). The Cultural Resources Treatment Plan shall provide for the adequate recovery of the

1.0 Executive Summary

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

scientifically consequential information contained in the archaeological resource through laboratory processing and analysis of the artifacts. The Treatment Plan will further make recommendations for the ultimate curation of any archaeological materials, which shall be curated at a public, non-profit curation facility, university, or museum with a research interest in the materials, if such an institution agrees to accept them. If resources are determined to be Native American in origin, they will first be offered to the Tribe for permanent curation, repatriation, or reburial, as directed by the Tribe. If no institution or Tribe accepts the archaeological material, then the material shall be donated to a local school or historical society in the area for educational purposes.

4. If the resource is identified as a Native American, the qualified archaeologist and the City shall consult with appropriate Native American representatives, as identified through the AB 52 consultation process in determining treatment for prehistoric or Native American resources to ensure cultural values ascribed to the resource, beyond that which is scientifically important, are considered.
5. Prepare a final monitoring and mitigation report for submittal to the City, and the South Central Coastal Information Center (SCCIC), in order to document the results of the archaeological and Native American monitoring. If there are significant discoveries, artifact and feature analysis and final disposition shall be included with the final report, which will be submitted to the SCCIC and the applicant. The final monitoring report shall be submitted to the applicant within 90 days of completion of excavation and other ground disturbing activities that require monitoring.

Impact	Significance Before Mitigation	Project Design Features/Mitigation Measures	Significance After Mitigation

NOTES: LS = less than significant; PS = potentially significant; S = significant; SU = significant and unavoidable; NI = no impact; NA = not applicable

4.14 Utilities

**Impact U-1:** Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.

**PS**  
**MM UT-1:** Prior to the award of the DBFOM contract, and start of any demolition or construction activities, the City shall be responsible identifying the locations of existing utilities potentially affected by the Project. This shall include coordinating with all existing utility providers for wet and dry utilities (water, sewer, gas, electric, and telecommunications) to obtain documentation of existing utility locations. Field verification (i.e., potholing and other methods as appropriate) shall be conducted to document the locations of all utilities within 20 feet of the proposed Project's guideway and station foundations.

Based on the information from the field investigations, the DBFOM contractor shall be responsible for coordinating with the appropriate utility owners/operators to determine specific set back requirements for each utility line and the need for any stabilization for protection in place or relocation measures.

**MM UT-2:** Prior to the award of the DBFOM contract, and start of construction, the City shall contact Southern California Edison (SCE) and request an updated system Distribution Study to determine the amount of load that SCE could accommodate and required infrastructure upgrades in order to meet the proposed Project's recommended full redundancy design. Should SCE determine that additional system upgrades are required, such upgrades shall be the responsibility of the DBFOM contractor and/or the City to complete (including design and any additional environmental clearance), subject to the review and approval of SCE and the City, as applicable.

**LS**

2.0 INTRODUCTION

This document is the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) for the Inglewood Transit Connector Project (proposed Project). This Recirculated Draft EIR has been prepared by the City of Inglewood (City), acting as the Lead Agency in conformance with the California Environmental Quality Act (CEQA). The City revised the Draft EIR as circulated for review in December 2020 to address changes to the design of the Project, described below, made after circulation of the Draft EIR. The design of the Project was revised in response to comment and input from stakeholders in the community. The revised Project as described and evaluated in this Recirculated Draft EIR, avoids the significant impacts identified in the December 2020 Draft EIR. All impacts of the revised Project are less than significant with mitigation.

2.1 PURPOSE AND TYPE OF EIR

2.1.1 Statutory Authority

Under CEQA, public agencies are required to evaluate proposed development projects for their effect on the physical environment and identify any feasible measures that would avoid or lessen significant environmental effects. The EIR is an informational document used in the planning and decision-making process and is intended to provide disclosure of the environmental consequences of a project to the public and agency decision makers before action is taken to approve project permits.

The preparation of an EIR provides information to assist a lead agency in making decisions on the project but does not control the lead agency's exercise of discretion. Specifically, as noted in the State CEQA Guidelines:<sup>1</sup>

- (a) *An EIR is an informational document which will inform public agency decision-makers and the public generally of the significant environmental effect of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project. The public agency shall consider the information in the EIR along with other information which may be presented to the agency.*
- (b) *While the information in the EIR does not control the agency's ultimate discretion on the project, the agency must respond to each significant effect identified in the EIR by making findings under Section 15091 and if necessary, by making a statement of overriding consideration under Section 15093.*
- (c) *The information in an EIR may constitute substantial evidence in the record to support the agency's action on the project if its decision is later challenged in court.*

1 California Code of Regulations, tit. 14, div. 6, ch. 3, State CEQA Guidelines, sec. 15121.

The City of Inglewood is the Lead Agency for the proposed Project under CEQA<sup>2</sup> and is responsible for the preparation of this Recirculated Draft EIR.

The California State Legislature has determined that certain projects, and classes of projects, are excluded from CEQA's requirements. (See Cal. Pub. Resources Code, § 21080 et seq.). If a project fits within one of the CEQA exemptions identified by the Legislature (known as "statutory exemptions"), the Lead Agency may approve the project without conducting any CEQA review for the project. The proposed ITC Project qualifies for a statutory exemption. In particular, CEQA provides a statutory exemption for "[f]acility extensions not to exceed four miles in length which are required for the transfer of passengers from or to exclusive public mass transit guideway or busway public transit services." (Pub. Resources Code, § 21080, subd. (b)(12); see also State CEQA Guidelines, § 15275(b).) The proposed Project meets this definition.

The proposed Project will operate as a "facility extension" of the existing Metro Crenshaw/LAX light-rail line by providing light rail transit facilities, including a station (the Market Street/Florence Avenue Station) and passenger walkway that connects the existing Crenshaw/LAX line's Downtown Inglewood Station to the proposed Project's fixed guideway line. At 1.6 miles in length, the proposed Project does not "exceed four miles in length." The proposed Project is "required for the transfer of passengers" because the proposed Project is necessary to close the last-mile gap between the Crenshaw/LAX line and the City's new major housing, employment and activity centers. Finally, the proposed Project will transfer passengers "from or to exclusive public mass transit guideway" by transferring passengers both to and from the Crenshaw/LAX light-rail line's Downtown Inglewood Station to the City's new major housing, employment and activity centers. The proposed Project is therefore exempt from CEQA under that statutory exemption for facility extensions as set forth in Public Resources Code section 21080, subdivision (b)(12).

Although the proposed Project is statutorily exempt from CEQA, the City has nevertheless voluntarily elected to prepare this Recirculated Draft EIR to provide a comprehensive analysis of the proposed Project's potential environmental effects, to analyze alternatives to the proposed Project, to identify mitigation measures to avoid or substantially reduce the proposed Project's potentially significant environmental impacts, and to obtain public and agency input regarding the proposed Project and its potential impacts on the environment. Following the completion of CEQA review, the City of Inglewood City Council will consider whether to approve the Project. Although not required to do so, if the City Council decides to approve the Project, the City Council will certify the Final EIR and adopt CEQA Findings

---

<sup>2</sup> Public Resources Code, Section 21067

of Fact and a Statement of Overriding of Considerations for the Project. If the Project is approved, the City will also file a CEQA Notice of Determination (NOD) and a CEQA Notice of Exemption (NOE) for the Project.

### 2.1.2 Type of Environmental Document

As provided for in the CEQA Guidelines, Section 15161, this Recirculated Draft EIR is a project EIR.<sup>3</sup> A project EIR examines the direct and indirect environmental impacts of a specific development project. This type of EIR should focus primarily on the changes in the environment that would result from the development project and shall examine all phases of the proposed Project including construction and operation.

### 2.1.3 Purpose and Scope of the Recirculated Draft EIR

As described in the CEQA Guidelines, an EIR is a public information document that assesses potential environmental effects of a proposed project, and identifies mitigation measures and alternatives to a proposed project that could reduce or avoid substantial adverse environmental impacts. CEQA requires that State and local government agencies to consider the environmental consequences of projects over which they have discretionary authority.

The proposed Project, as defined in **Section 3.0: Project Description**, would require approval of discretionary actions as defined by CEQA and is the subject of this Recirculated Draft EIR. The EIR is used in the planning and decision-making process. The purpose of an EIR is not to advocate or recommend either approval or denial of a proposed project.

This Recirculated Draft EIR was prepared to provide information to public agencies, the general public, and decision makers regarding potential environmental impacts related to the components of the construction and operation of the proposed Project.

The objectives of CEQA include: (1) informing governmental decision makers and the public about the potentially significant environmental effects of proposed activities; (2) identifying the ways that environmental damage can be avoided or significantly reduced; (3) preventing significant, avoidable damage to the environment by requiring changes in projects through the use of alternatives or mitigation measures when the governmental agency finds the changes to be feasible; and (4) disclosing to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.<sup>4</sup>

---

<sup>3</sup> CEQA Guidelines, Section, 15161.

<sup>4</sup> CEQA Guidelines, Section 15002; Public Resources Code, sec. 21002.1.

According to CEQA and the State CEQA Guidelines, public agencies must avoid or lessen significant environmental impacts where feasible. Where impacts cannot be mitigated to less than significant levels, public agencies have an obligation to balance a project's significant impacts on the environment against other factors, including economic, social, technological, legal, and other benefits.

After circulating this Recirculated Draft EIR for public comment, the City will respond to written comments. Responses to written comments and any changes to the Draft EIR will be included in a Final EIR. The City must certify the Final EIR before approving the proposed Project. Upon certification, the Final EIR will serve as the base environmental document for the City and will be used as a basis for decisions on implementation of the proposed Project. Other agencies may also use this EIR in their review and approval processes.

This Recirculated Draft EIR was prepared in accordance with Section 15151 of the State CEQA Guidelines, which defines the standards for EIR adequacy as follows:

*An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection; but for adequacy, completeness, and good faith effort at full disclosure.*

## 2.2 SUMMARY OF PUBLIC OUTREACH

As early as 2017, the City partnered with Metro to address the City's critical mobility issues by analyzing viable transit connection options from the Metro K Line to the LASED, which includes SoFi Stadium. With the City's input, Metro conducted a study<sup>5</sup> to explore how best to extend the Metro Rail system via a high-capacity transit connection to the LASED. The Metro study analyzed (1) an interlined operability connection from the Metro K Line in a subway under Prairie Avenue, which also would jointly operate on a portion of the Metro K Line; and (2) operability options for independent services that could provide connections from the Metro Rail system at nearby Metro stations along the Metro K Line to SoFi Stadium. At the conclusion of the study, the City and Metro agreed that the interlined operability scenario is infeasible due to the cost, delay and complexity that would be created on the Metro Rail system. Consistent with Metro's recommendations, the City continued to analyze several independent operability

<sup>5</sup> Los Angeles County Metropolitan Transportation Authority, *City of Champions/Inglewood (NFL) Focused Analysis of Transit Connection (August 2017)*.

transit connections to the City's activity centers. In early 2018, the City also initiated stakeholder outreach to understand the City's need for a comprehensive long-range mobility plan, potential project goals and objectives, potential project benefits and impacts, and stakeholder concerns.

### 2.2.1 July 2018 Notice of Preparation

In July 2018, pursuant to the requirements of the California Environmental Quality Act (CEQA), the City as the Lead Agency prepared a Notice of Preparation (Original NOP) and an Initial Study (Original IS) (SCH 2018071034). The Original IS determined that an Environmental Impact Report (EIR) would be prepared in compliance with CEQA to assess for potentially significant impacts that may result from the Project. The Original NOP and IS were circulated and comments were received from the public and agencies following a 30-day comment period that ended on August 15, 2018.

A scoping meeting was held on July 26, 2018, from 6 PM to 8 PM at the Inglewood Senior Citizens Center, 111 N. Locust Street, Inglewood, CA 90301. Over 80 attendees participated at the public scoping meeting. The City also provided the opportunity for comments to be submitted at the scoping meeting.

### 2.2.2 September 2020 Revised Notice of Preparation

After circulation of the July 2018 Notice of Preparation, the City collaborated with a myriad of key stakeholders, including the City's residential, commercial, and nonprofit stakeholders, and other jurisdictions, including but not limited to the South Bay Cities Council of Governments, Caltrans, Metro, other transit agencies, the City of Los Angeles, the County of Los Angeles, Inglewood Unified School District, adjacent and nearby property owners, tenants and residents, and representatives from the LASED, IBEC, and Forum event venues, and refined the proposed Project. Based on these consultations, the City revised the Project after the Original NOP was issued and prepared; and circulated an updated IS and NOP addressing the revised Project.

As a result of the comments received and refinements and modifications to the proposed Project identified in the Original NOP and Original IS, a Revised NOP and IS were circulated for public review and comment from September 10, 2020 to October 12, 2020 (See **Appendix A**).

The Revised NOP and Revised IS reflected the following refinements and modifications made to the proposed Project:

- Changes to the proposed Project from an approximately 1.8-mile long alignment with 5 stations to an approximately 1.6-mile long alignment with 3 stations. The revised alignment follows the same route as the original alignment from Market Street and Florence Avenue to Manchester Boulevard to Prairie Avenue terminating at the intersection of Prairie Avenue and Hardy Street.

An elevated passenger walkway linkage was added to connect the Market Street/Florence Avenue Station with the Metro K Line on the northside of Florence Avenue.

In addition, the Intermodal Transit Facility (ITF) was removed from the proposed Project; the City proceeded with the ITF project separately and this facility has been completed.

The City submitted both the Original and Revised NOPs and Initial Studies to the Governor's Office of Planning and Research (OPR); applicable trustee or responsible federal, State, regional, and local agencies identified for the proposed Project, including adjacent cities and counties; the County of Los Angeles; relevant Native American tribes; and all interested parties requesting such notice to allow for comment on the IS during the 30-day comment period. The Original and Revised NOP distribution lists indicating the agencies, departments, tribes, and parties that were mailed certified copies of the Original and Revised NOPs is provided in **Appendix A.1: Revised NOP**. In addition, copies of the Original and Revised NOPs and ISs were made available for review at Inglewood City Hall and the Inglewood Public library, as well as on the City's website, to give the public the opportunity to comment during the respective 30-day comment periods.

Based on a preliminary review of the proposed Project as part of the Revised IS, the City determined that potentially significant effects could occur with respect to aesthetics; air quality; biological resources; cultural resources; energy resources; geology and soils; greenhouse gas emissions; hazards and hazardous materials; land use and planning; noise and vibration; transportation and traffic; tribal cultural resources; and utilities and service systems. These issues have been incorporated into the environmental analysis of the proposed Project contained within **Section 4.0: Environmental Impact Analysis** of this Recirculated Draft EIR.

## 2.2.2 Concerns and Issues Raised During Scoping

The CEQA Guidelines require that an EIR summary identify areas of issues raised by other agencies and the public. Issues related to the proposed Project were raised in the comments the City received in response to the Original and Revised NOP and in the comments received on the December 2020 Draft EIR. Comments were received raising issues associated with the proposed alignment of the ATS guideway and locations of the stations. Comments were also received regarding the original proposed location of the MSF on the site of Kelso Elementary School and on the new proposed location on Manchester Boulevard developed with a Vons Grocery store, which would require the closure of this store. The potential for impacts to the community, including businesses located along the proposed alignment during construction was also raised. Comments were also received on the potential for direct and indirect impacts to historic resources located along the proposed alignment in downtown Inglewood. The potential for temporary

impacts to existing transit service during construction was also identified in comments. Utility providers also commented on the potential for the Project to impact existing utilities along the proposed alignment.

## 2.2.3 Tribal Consultation

A part of the AB 52 process, the City notified tribes that may have interest in tribal cultural resources in the region. Four tribes had previously notified the City and requested future notification of, with the possibility of providing consultation on, any projects that proceed under CEQA. These tribes include the Gabrielino-Tongva Tribe, Gabrielino Tongva Indians of California Tribal Council, Gabrielino/Tongva Nation, and the Gabrieleno/Tongva San Gabriel Band of Mission Indians. Additionally, the Gabrieleno Band of Mission Indians-Kizh Nation was identified as a relevant party.

In accordance with AB 52, the City sent notification letters on July 31, 2018 notifying the four tribes identified above that the City was planning the proposed Project. Additionally, the Gabrieleno Band of Mission Indians-Kizh Nation was mailed a Notice of Preparation of this Draft EIR. Each tribe notified has 30 days from receipt of the letter to notify the City that they wish to engage in the AB 52 consultation process on the proposed Project. As of December 6, 2018, the City had received only one response requesting consultation via email from Brandy Salas, Administrative Specialist, for the Gabrieleno Band of Mission Indians-Kizh Nation (Tribe).<sup>6</sup> The Tribe indicated that if there would be any ground disturbance activity associated with the proposed Project, they would like to consult.

Consultation between the Gabrieleno Band of Mission Indians-Kizh Nation Tribe and the City, and the City's consultant team was initiated via conference call on February 6, 2019, and is described further in Chapter 4.4 and in the following appendices:

- *AB 52 Tribal Notification and Outreach Summary Memorandum*, Meridian Consultants LLC, December 6, 2018 (included as **Appendix P.1**); and
- *AB 52 Consultation Summary*, Meridian Consultants LLC, February 6, 2019 (included as **Appendix P.2**).

## 2.2.4 December 2020 Draft EIR

The City prepared and released a Draft EIR for public review in December 2020. Based on additional feedback received during the Draft EIR circulation period the City continued further collaboration with key stakeholders on the design of the Project. City also conducted additional technical analysis and due diligence on potential utility conflicts, property impacts, and potential impacts to historical resources, and refined the project to reduce the project footprint where feasible.

<sup>6</sup> See **Appendix P.1** and its attachments therein of this Draft EIR.

## 2.0 Introduction

As a result of this ongoing consultation process, the City has further refined the Project and revised the Draft EIR to evaluate these changes to the Project. The Project remains an approximately 1.6-mile long alignment with 3 stations beginning at the intersection of Market Street and Florence Avenue, continuing along Manchester Avenue and Prairie Avenue, and ending at the intersection of Prairie Avenue and Hardy Street.

The configuration of the Market Street/Florence Avenue Station has been further refined based on coordination with Metro. The connection to the Metro K Line Downtown Inglewood Station and the orientation of the Market Street/Florence Avenue Station have been revised to locate the pedestrian connection on the north side of Florence Avenue. The design of the guideway on Market Street in Downtown Inglewood has also been refined to enhance the compatibility of the Project with existing and planned development along Market Street, including historic buildings, such as the historic Fox Theater. The City has also collaborated with the property and business owners along Market Street to refine the Urban Design Guidelines and Standards to enhance harmony of the surrounding context and align with the City's efforts to help revitalize the downtown Market Street area.

The design of the guideway on Manchester Boulevard has been refined to reduce the need for columns on both sides of the street. The MSF for the system was proposed on Manchester Boulevard between E. Hillcrest Boulevard and E. Spruce Avenue on a site developed with a Vons supermarket. In response to stakeholder concerns about the removal of the local Vons market, the City collaborated with representatives of Vons to develop a refined MSF plan that would allow a new Vons supermarket to remain on this site. The City worked to address the parking, operational and facility needs identified by Vons to keep this grocery store offering high quality healthy food options in the center of the City. The current building on this site contains the Vons store and other businesses.

To address concerns raised by stakeholders, including the Inglewood Unified School District, about station locations, to improve design compatibility, to avoid potential utility conflicts, and to eliminate the need for straddle bent supports, with columns on both sides of the street to support the ATS guideway along Prairie Avenue, the City continued to refine the ITC segment along Prairie Avenue. The locations of the two stations proposed on Prairie Avenue have been updated to complement existing and planned development along Prairie Avenue. The Prairie Avenue/Hardy Station has been relocated to the west of Prairie Avenue with an elevated passenger walkway over Prairie Avenue providing access to the LASED development site. The Prairie Avenue/Pincay Drive Station is no longer planned. This station has been relocated to the west of Prairie Avenue at the intersection of Prairie Avenue and Manchester Boulevard with an elevated passenger walkway over Prairie Avenue to the Forum. The alignment of the guideway on Prairie Avenue has also been revised to reflect the changes to the location of these stations to the west side of Prairie Avenue. As these stations no longer straddle Prairie Avenue, columns supporting these

## 2.0 Introduction

stations are no longer required on both sides of Prairie Avenue, allowing greater light and air along Prairie Avenue and allowing for single columns to support the ATS guideway. The columns for the guideway and stations will now only be located on the western side of Prairie Avenue, and both the existing sidewalk and street configuration, including the number of lanes, will continue to be maintained.

### 2.2.5 Public Outreach and Community Engagement

As stated above, the City initiated a comprehensive outreach program for the proposed Project in 2018, at the outset of the environmental clearance phase. As the Draft EIR was prepared, the City continued to keep elected officials, community leaders and the general public informed of the status of the technical analysis and schedule for completion of the environmental documents. The outreach program has been focused on increasing project awareness and education, disseminating project information, garnering public input, and supporting the technical and legal environmental processes. To learn more about the local community's needs for the proposed Project, the City held over 100 community and stakeholder outreach meetings over the past 3.5 years during the planning, environmental and design process.

Stakeholders have included local Inglewood block clubs, neighborhood watch groups and homeownership associations (HOA) such as the Renaissance HOA, Carlton Square HOA, Briarwood HOA, Regent Street HOA, and the Hyde Park Village HOA. The City also engaged the NCAAP Inglewood Chapter, Inglewood Airport Area Chamber of Commerce, Rotary Club of Inglewood, Inglewood Unified School District (IUSD), local churches, and community-based nonprofits including the Social Justice Learning Center Institute, Move LA, The Enrichment Center, and the Coalition for Clean Air. The City has also worked with surrounding jurisdictions, including the City of Los Angeles and County of Los Angeles, conducted industry outreach, and worked with labor and construction trades to help develop a Project Labor Agreement and local hire program.

A complete listing of stakeholders and meetings is included in **Appendix A: Revised NOP and IS** and **Appendix B: Summary of Comments on Revised NOP** of this Recirculated Draft EIR.

Through the use of focus groups, workshops, tours, participation in community events, social media outlets, and webinars, project stakeholders have been involved in each of the major technical milestones of the project development process that has occurred to date.

### Public Engagement Process

The public engagement process included compilation of a stakeholder database, development of project related meeting materials, and collateral materials, and an interactive project website. Proactive outreach, public meetings, participation in community events and coordination meetings with public agencies were also components of the public outreach process.

### Stakeholder Database

To properly inform the public, the City compiled a list of key individuals located throughout and adjacent to the proposed Project and public agencies that have jurisdiction in the area. In addition to key individuals and/or groups identified as part of the initial due diligence, the database includes a listing of all stakeholders who have attended public meetings, participated in a key stakeholder meeting, community events or who have otherwise asked to be added to the database. It is used to notify stakeholders of public meetings, to send out the electronic Newsletter, or other updates as needed. The stakeholder database includes the following groups and individuals:

#### City Council

- Mayor James T. Butts, Jr.
- Councilman George W. Dotson, District No. 1
- Councilman Alex Padilla, District No. 2
- Councilman Eloy Morales, Jr., District No. 3
- Councilman Ralph Franklin, District No. 4

#### City Commissions

- Parking & Traffic Commission
- Parking Authority
- Park & Recreation Commission
- Planning Commission
- Senior Center Advisory Committee
- South Bay Cities Service Council
- Citizen Advisory Committee
- Community Development Committee
- Inglewood Housing Authority – RAB Committee

#### Community Based Organizations and Religious Community Institutions

- Inglewood Teen Center
- Lockhaven Community Center
- Social Justice Learning Center Institute
- The Enrichment Center
- Amassi Center
- Briarwood Community Center
- Inglewood Cultural Arts Center
- Uplift Inglewood Coalition
- Inglewood Forward
- We Can Help Foundation Inc.
- Great Beginnings for Black Babies, Inc.
- American Legion
- Women Infant Children (WIC) Inglewood Chapter
- South Bay Workforce Investment Board

- Faithful Central Bible Church
- Inglewood Ministerial Alliance
- Brotherhood Crusade
- Inglewood Community Church
- Christ Centered Ministries
- Coalition for Clean Air
- Champions for Progress
- St. John Chrysostom Church
- Van Wick Block Club Community Groups
- Holly Park Knolls Homeowners Association
- Briarwood Homeowners Association
- Carlton Square Homeowners Association
- Rotary Club of Inglewood
- Inglewood Around the Block Club
- Inglewood Cultural Arts Center
- Renaissance Homeowners Association
- St John Chrysostom Church
- Inglewood Chamber of Commerce
- LAX Coastal Chamber of Commerce
- Thomas Safran & Associates
- Hilltop Coffee + Kitchen
- Aero Collective
- Fast Signs
- Glaser Well
- Jamz Creamery
- Three Weavers Brewery
- Toragrafix
- WLM Financial
- Miracle Theater
- A Toast to Artistry
- Eye on Inglewood
- The Samiche Shoppe
- R.Hickes Realty

#### Transit Advocacy Groups

- LA County Bicycle Coalition
- Alliance for Community Transit LA
- Southern California Transit Advocates
- Cherrywood-Leimert Block Club
- Empowerment Congress West
- Move LA

**Local and Regional Agencies**

- Inglewood Unified School District
- Los Angeles County Metropolitan Transportation Agency
- Southern California Association of Governments
- South Bay Cities Council of Government
- Los Angeles World Airport
- University of California, Los Angeles
- Los Angeles/Orange Counties Building and Construction Trades Council

**Regional Stakeholders**

- A.G. Spanos, Los Angeles Chargers, President of Los Angeles Chargers
- Kevin Demoff, Los Angeles Rams, Chief Operating Officer and Executive Vice President
- Steve Ballmer, Chairman, Los Angeles Clippers
- Stadco LA, LLC, SoFi Stadium Owner
- University of California, Los Angeles
- Los Angeles/Orange Counties Building and Construction Trades Council
- Southwest Regional Council of Carpenters
- Los Angeles Cleantech (LACI)
- The Inglewood Airport Area Chamber of Commerce
- LAX Coastal Chamber of Commerce
- National Association for the Advancement of Colored People
- Ironworkers Local 433 – International Association of Bridge, Structural & Ornamental Iron Workers A.F.L – C.I.O
- Los Angeles Conservancy
- California Public Utilities Commission

**Other Public Officials<sup>7</sup>**

- U.S. Senator Dianne Feinstein
- U.S. Senator Alex Padilla
- U.S. Representative Maxine Waters
- California Assemblymember Autumn Burke
- California Assemblymember Sydney Kamlager
- California Assemblymember Tom Lackey
- California Senator Steven C. Bradford
- Secretary of the California State Transportation Agency, David S. Kim
- Executive Director of California Transportation Commission, Hilary Norton
- Director of the Department of Transportation (Caltrans), Toks Omishakin
- Director of Caltrans District 7 Director, Tony Tavares
- Los Angeles County Supervisor Janice Hahn

<sup>7</sup> Note: It is envisioned that these public officials would be contacted and briefed by the City and/or the outreach team in connection with the Inglewood Transit Connector project. At those meetings, information can also be provided on shorter-range planning efforts, which would include the TMOP.

- Los Angeles County Supervisor Hilda L. Solis
- Los Angeles City Councilmember Herb J. Wesson, Jr.
- Los Angeles Mayor Eric Garcetti
- City of El Segundo Mayor Drew Boyles
- City of Carson Mayor Cedric L. Hicks
- Casey Wasserman (Los Angeles Olympics 2028 Committee Chairperson)
- Los Angeles County Supervisor Holly Mitchell
- California Senator Maria Elena Durazo

**Project Materials and Resources**

To inform and update stakeholders about the proposed Project's progress, the outreach team developed collateral materials for distribution through various channels and means of communication. These included project related fact sheets, frequently asked questions, meeting notices, electronic newsletters/e-bulletins, and other collateral materials. In addition, a complete set of collateral pieces was developed and distributed at community meetings, stakeholder briefings, and public events, as well as electronically when requested. These collateral materials were updated throughout the proposed Project's development process and were produced in English and Spanish.

The City's project website served as the central point where stakeholders went to obtain a variety of information about the proposed Project. The website is located at:

<http://envisioninglewood.org/transportation-solutions/inglewood-transit-connector/>

The website contains maps of the proposed Project, and other collateral materials and key documentation such as the NOP, Initial Study Report, the Recirculated Draft Environmental Impact Report, planning workshops and working group presentations. The website also contains a "Contact Us" sections where people can provide their input to the study, ask questions, and add themselves to the proposed Project database to be notified of future meetings and project related updates.

**2.2.6 Post Scoping Outreach****General Public**

The City held over 100 community and stakeholder outreach meetings over the past 3.5 years during the planning, environmental review, and design process. Stakeholders have included property and landowners adjacent to the proposed Project including but not limited to business and property owners along Market Street, Stadco LA, LLC (SoFi Stadium Owner), Steve Ballmer (owner of the Forum and proposed Inglewood Basketball and Entertainment Center), the Rams and the Chargers. The City also engaged with local Inglewood block clubs, neighborhood watch groups and HOAs such as the Renaissance HOA, Carlton Square HOA, Briarwood HOA, Regent Street HOA, and the Hyde Park Village HOA. The City

also presented at local community groups and organizations including but not limited to the NCAAP Inglewood Chapter, Inglewood Airport Area Chamber of Commerce, Rotary Club of Inglewood, Inglewood Unified School District, local churches, and community-based nonprofits including the Social Justice Learning Center Institute, Move LA, The Enrichment Center, and the Coalition for Clean Air.

At the meetings, residents expressed significant interest in and support for the proposed Project. The overarching themes summarized below emerged as priority interests and needs the community would like to see addressed by the proposed Project, including but not limited to creating economic development opportunities along the corridor, specifically Downtown Inglewood; increasing transit options for local residents and visitors; connecting communities and residents to jobs and educational opportunities, services and destinations locally and regionally; reducing traffic congestion and the growing demand on the existing roadway networks on both event and nonevent days; providing a transit system that preserves existing traffic lanes along Prairie Avenue and Manchester Avenue for vehicular traffic; reducing potential impacts to local businesses during construction; ensuring stations are designed to promote safety, and be easy to access for multiple modes including pedestrians, bicyclists, and park-and-ride users. The City has embraced the stakeholder input received to date and addressed various community needs identified into the design of the proposed Project, including supporting TOD development in Downtown Inglewood, a direct transit connection to the Metro K Line, a fully elevated transit system that does not remove any existing vehicular travel lanes, a phased construction approach focused on helping local businesses, and designed state-of-the-art stations integrated into its surrounding environment. The City will continue to host public workshops, design charettes and stakeholder meetings throughout the CEQA, design, procurement, construction and project implementation process.

The City received a state funding allocation of \$8.5 million to launch a comprehensive revitalization program of Downtown Inglewood including streetscape improvements along Market Street between Florence Avenue and Hillcrest Boulevard, a façade and tenant improvement program, and revitalization of the Fox Theatre. Through these renovation efforts, the City plans to help spur private investment into Downtown Inglewood, help attract new tenants into vacant commercial spaces, and help boost the City’s local economy. In addition, the City has secured approximately \$19 million congressionally directed funding for the ITC Project from Congresswoman Maxine Waters and US Senator Alex Padilla..

**Public Agency**

In addition to the scoping meeting, the City also participated in various meetings with public agencies to allow concerns to be identified and addressed early in the development process of the proposed Project. This effort was designed to present information on the proposed Project’s concept design, to discuss relevant issues related to each agency’s jurisdiction and proactively consult with these agencies prior to formal agency consultation. Agencies involved in these meetings are list in **Table 2.0-3: Post Scoping Public Agency Outreach**.

**Table 2.0-3  
Post Scoping Public Agency Outreach**

Agency/Entity/Individual	Summer 2018	Spring 2019	Winter 2019	Summer 2020	Winter 2020	Summer 2021

In addition to the outreach conducted as part of the environmental review process the City is conducting to comply with CEQA, the City is also coordinating with the Federal Transportation Agency (FTA) and environmental review of the Project in conformance with the National Environmental Quality Act (NEPA) has also been initiated by the FTA.

**2.3 ORGANIZATION OF THIS RECIRCULATED DRAFT EIR**

This Recirculated Draft EIR is organized as follows:

**Section 1.0: Executive Summary** provides a summary of the proposed Project. This chapter includes an overview of the proposed Project description and areas of controversy, a discussion of key environmental effects, a discussion of significant and unavoidable impacts, a discussion of cumulative effects, an overview

## 2.0 Introduction

of alternatives, and a summary table that includes each environmental impact, level of impact, and all applicable mitigation measures.

**Section 2.0: Introduction** provides information on the background of the proposed Project, the environmental review process, and organization of the Recirculated Draft EIR, and describes the existing physical setting of the proposed Project and the surrounding area.

**Section 3.0: Description of the Proposed Project** presents a description of the proposed Project that addresses its location, the objectives, and the approvals being requested from the City.

**Section 4.0: Environmental Impact Analysis** contains information and analysis of the potential for the proposed Project to result in significant environmental effects for each of the following topics evaluated in this Recirculated Draft EIR:

- **Section 4.1: Aesthetics**
- **Section 4.2: Air Quality**
- **Section 4.3: Biological Resources**
- **Section 4.4: Cultural Resources**
- **Section 4.5: Energy Resources**
- **Section 4.6: Geology and Soils**
- **Section 4.7: Greenhouse Gas Emissions**
- **Section 4.8: Hazards and Hazardous Materials**
- **Section 4.9: Land Use and Planning**
- **Section 4.10: Noise and Vibration**
- **Section 4.11: Population, Employment, and Housing**
- **Section 4.12: Transportation**
- **Section 4.13: Tribal Cultural Resources**
- **Section 4.14: Utilities and Service Systems**

**Section 5.0: Alternatives** discusses alternatives to the proposed Project that have been developed and analyzed to provide additional information on ways to avoid or lessen the impacts of the proposed Project. The alternatives include the “No Project Alternative” as required by the CEQA Guidelines along with other alternatives.

**Section 6.0: Other Environmental Considerations** is divided into five subsections.

- **Section 6.1: Introduction;**
- **Section 6.2: Significant Unavoidable Impacts;**
- **Section 6.3: Significant Irreversible Environmental Changes** discusses the significant irreversible and irretrievable commitment of resources associated with the implementation of the proposed Project;
- **Section 6.4: Effects Found Not to Be Significant** discusses the potential impacts of the proposed Project that were determined not to be significant and were therefore not discussed in detail in this Recirculated Draft EIR; and
- **6.5: Growth Inducing Effects.**

## 2.0 Introduction

**Section 7.0: List of Preparers, Organizations and Persons Consulted, and Parties to Whom Sent** lists persons involved in the preparation of this Recirculated Draft EIR or who contributed information incorporated into this Recirculated Draft EIR.

**Section 8.0: List of Terms, Definitions, and Acronyms** includes specifically defined term, definitions, and acronyms used throughout this Recirculated Draft EIR.

**Section 9.0: List of References** includes the principal documents, reports, maps, and other information sources referenced in this Recirculated Draft EIR.

**Appendices** to this Recirculated Draft EIR include technical information and other materials prepared for this Recirculated Draft EIR and the City’s environmental review of the proposed Project.

## 2.4 PUBLIC REVIEW OF THE RECIRCULATED DRAFT EIR

The Recirculated Draft EIR is available for public review and comment beginning November 12, 2021 and concluding at 5 PM on December 27, 2021. The Recirculated Draft EIR is available for review at the following locations:

- City of Inglewood website at:  
<https://www.cityofinglewood.org/1016/Environmental-Documents>

During the review and comment period, written comments on the Recirculated Draft EIR may be submitted to Ms. Mindy Wilcox, AICP, Planning Manager, at the following:

By mail:

City of Inglewood  
Planning Division  
One W. Manchester Boulevard, 4th Floor  
Inglewood, CA 90301

By email: [inglewoodtransitconnector@cityofinglewood.org](mailto:inglewoodtransitconnector@cityofinglewood.org)

In accordance with CEQA Guidelines the City will be providing written responses to comments on this Recirculated Draft EIR in the Final EIR. Comments submitted on the December 2020 Draft EIR will be included in the administrative record for the Project. The City will not be providing written responses to comments submitted on the December 2020 Draft EIR in the Final EIR as permitted by Section 15088.5 (f) (1) of the CEQA Guidelines and is requesting that all parties submit new comments on this Recirculated Draft EIR.

### 3.0 PROJECT DESCRIPTION

#### 3.1 BACKGROUND

The City of Inglewood (City) is undergoing a historic transformation into a world-class sports and entertainment destination and a major employment center within the greater Los Angeles region. First, in 2012, over \$100 million was invested in the Forum, making it one of the largest indoor concert venues and host of some of the largest entertainment acts in the country. Next, the redevelopment of approximately 298 acres at Hollywood Park includes thousands of new residential units and millions of square feet (SF) of commercial and recreational uses as part of the Los Angeles Stadium and Entertainment District (LASED) project. At the centerpiece of the LASED is the new \$5 billion-dollar, 70,240-seat SoFi Stadium shared by the Los Angeles Rams and Los Angeles Chargers. SoFi Stadium will host Super Bowl LVI in Winter 2022, and the 2028 Summer Olympic Games with the possibility of hosting many more events. In August 2020, the City approved the Inglewood Basketball and Entertainment Center (IBEC), which will be home to the Los Angeles Clippers of the National Basketball Association (NBA) and includes the team's arena, headquarters, and training facilities. There are other exciting developments in the City including housing, office, retail commercial and hotel projects under construction and in the application pipeline. Additionally, the new Los Angeles Philharmonic music and cultural campus for the Youth Orchestra Los Angeles (YOLA) facility, designed by architect Frank Gehry near Inglewood City Hall opened in September 2021.

Pivotal to the City's transformation is the new 8.5-mile Los Angeles County Metropolitan Transportation Authority (Metro) K (Crenshaw/LAX) Line. Scheduled to begin service in late 2021, the Metro K Line will enhance transit access to the City and include stations at Aviation/Century, Westchester/Veterans, Downtown Inglewood, Fairview Heights, Hyde Park, Leimert Park, MLK Jr., and Expo/Crenshaw. It will extend light-rail transit from the existing Metro E (Expo) Line station at Crenshaw/Exposition Boulevards to the Metro C (Green) Line station at Aviation/Century Boulevards and provide a transit connection to Los Angeles International Airport (LAX) via the Los Angeles World Airports automated people mover project, currently under construction. Upon completion of the Metro K Line, patrons who wish to use the Metro rail system to travel to events at the Forum, LASED including SoFi Stadium, the IBEC, or other existing and future commercial areas and residences in the City would face a "last-mile" gap of approximately 1.5 to 2 miles between the Metro K Line and the City's new activity centers. This gap is longer than a convenient walking distance for patrons traveling to the City's activity centers.

In response to the anticipated increases in traffic associated with these new sports and entertainment venues, the City is updating its Mobility Plan, developing a Stadium Events Transportation Management and Operations Plan (TMOP), working with transit agencies to improve transit operations to the City given

existing limited service, creating an off-site satellite parking program with event shuttle service, installing a comprehensive intelligent transportation system, and implementing a City-wide permit parking program to protect neighborhoods. The physical capacity of the existing local and regional roadway network may still challenge the ability of residents and visitors to access the City's amenities easily in the future. Bus transit, shuttles, and other alternative modes still compete with existing traffic on the City's roadway network.

As Inglewood transforms into a major regional housing, employment and activity center, the number of vehicular trips associated with new jobs, retail, entertainment, and residential opportunities is anticipated to increase. Based on historic traffic counts, traffic volumes have been increasing at the rate of 1.5 percent per year, and many key intersections and highway corridors already experience congestion. According to the Southern California Association of Government's (SCAG) *Connect SoCal - 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)* Demographics and Growth Forecast, substantial socioeconomic and demographic growth is projected in the region. The City is projected to be one of the highest growing housing and employment centers in Los Angeles County, with growth rates of approximately 20 percent in population, 27 percent in number of households, and 36 percent in employment from 2016 to 2045.<sup>1</sup>

The City proposes the Inglewood Transit Connector Project (ITC or proposed Project) to extend service from the Metro K Line to the City's activity centers. The ITC is a 1.6-mile, three station, fully elevated, electrically powered Automated Transit System (ATS system) that will connect directly to the Metro K Line Downtown Inglewood Station. On March 29, 2021, Metro's Board of Directors approved and voted to form a Joint Powers Authority (JPA) with the City of Inglewood to help extend mass transit from the Metro K line at the Metro Downtown Inglewood Station to the City's sports and entertainment areas, and to help lend its partnership and expertise to assist with the design, construction and financing, and operation and maintenance of this 1.6-mile ATS system to extend service from the K Line. Metro recognizes the increase in ridership on the K line that will be created by the proposed ITC Project and is now working collaboratively with the City on all aspects of the project to extend service from the K line to the City's major employment, housing, commercial and entertainment centers.

Over 80 percent of the Project corridor (defined as the area within ½ mile of the proposed Project stations) is located within census tracts ranked in the top 25 percent of census tracts in California with the highest

<sup>1</sup> SCAG. 2020-2045 RTP/SCS - ConnectSoCal. *Demographics and Growth Forecast*. [https://www.connectsocial.org/Documents/Adopted/fConnectSoCal\\_Demographics-And-Growth-Forecast.pdf](https://www.connectsocial.org/Documents/Adopted/fConnectSoCal_Demographics-And-Growth-Forecast.pdf). September 1, 2020.

### 3.0 Project Description

pollution burden and socioeconomic vulnerabilities based on the CalEnviroScreen Model<sup>2</sup> The proposed Project will offer the community a new transit connection to the Metro Rail system and regional employment opportunities including those at LAX. The Project would also ensure that long-time residents, employees, and business are provided a direct connection to the Metro Rail system while also providing visitors with a seamless connection to event venues, which, in turn, would assist Inglewood's transformation into a world-class city.

The City proposes the Project to address projected future congestion, improve overall mobility and levels of service, and advance its sustainability goals. Providing transit access to the City's activity centers would advance local and regional goals to increase transportation choice, significantly reduce greenhouse gas (GHG) emissions, improve air quality and human health, reduce per-capita vehicle miles traveled (VMT), reduce the growth of congestion on local and regional roads, and encourage sustainable development patterns. The City recognizes that an efficient and effective transportation network is essential to achieving the full benefits of ongoing and widespread investment. The proposed Project is designed to support the City's growth by serving an annual ridership of 13.9 million by 2076, reducing over 2.3 billion VMT by 2076, and improving air quality throughout the South Coast Air Basin by reducing GHG emissions by approximately 768,922 metric tons of carbon dioxide equivalent (MTCO<sub>2e</sub>) over the life of the Project.

## 3.2 ITC PROJECT OVERVIEW

The proposed ATS would include an approximately 1.6-mile long, elevated, guideway located within current and to-be-acquired public right-of-way along Market Street, Manchester Boulevard, and Prairie Avenue. Three stations are proposed adjacent to the guideway on privately owned land that is proposed to be acquired as part of the Project. The elevated guideway will contain dual lanes to allow trains to travel continuously in each direction. Several trains would likely be operating at the same time, depending on ridership demand.

As part of the City's collaboration and partnership with Metro, the Project is proposed as an extension of the Metro regional rail system to the City's activity centers, closing the critical first/last mile transit gap in Inglewood, increasing passenger service along the Metro system by facilitating a seamless transfer of passengers between the ITC and the Metro K Line.

The ATS technology may be a self-propelled technology, including, rubber-tire ATS systems, monorails, large steel-wheel ATS systems, also known as automated light rail transit (ALRT) or a cable propelled ATS system. The system will be fully automated (i.e., driverless) to operate at the headways to meet the

<sup>2</sup> California Office of Environmental Health and Hazard Assessment (OEHHA), CalEnviroScreen. <https://oehha.ca.gov/calenviroscreen>.

### 3.0 Project Description

projected peak ridership needs. The vehicles are smaller than traditional heavy rail technology and can maneuver the tight curves required for the site-specific conditions. This type of technology is often times also referred to as automated guideway transit, automated people mover or simply monorail; regardless of the terminology used in the industry, it is a form of a light rail technology without an overhead catenary.

The ATS trains will operate in a pinched-loop mode on dual tracks along the alignment, wherein trains follow each other and switch back at the end-of-line stations to make the return journey on the other track. As planned, the trains can be operated in multiple different configurations, ranging from a one-car train to multiple-car length trains with a maximum train length of approximately 200 feet. Depending on the technology (self-propelled or cable propelled), ridership demands, which will be time of day and event day dependent, multiple trains of up to the maximum train length can be operated at varying headways for self-propelled systems, as close as 1.5 minutes apart, to provide the necessary peak and reserve capacity.

Cable-propelled technologies have several operational differences from self-propelled ATS systems. Because these systems have traditionally been limited to only one train at a time (per guideway lane) located between any pair of stations, the minimum operational headway is controlled by the longest trip time between stations. It is estimated that the minimum operational headway for cable propelled ATS technology would be approximately 3.9 minutes, controlled by the trip time between Market Street/Florence Avenue and Prairie Avenue/Manchester Boulevard stations. Use of larger vehicles, innovations, and other technological advancements in cable-propelled ATS technologies may allow these technologies to satisfy demands.

Scenarios for ridership demand, operating strategies and resultant capacities for self-propelled technologies are provided in **Table 3.0-3: Peak Period Ridership Headway Fleet Capacity**.

Three stations are proposed on private property proposed for acquisition as part of the Project. These stations are:

- The *Market Street/Florence Avenue* station generally located between Market Street and Locust Street providing connections to the Metro K Line and Downtown Inglewood;
- The *Prairie Avenue/Manchester Boulevard* station located on the southwest corner of the intersection of Prairie Avenue and Manchester Boulevard providing service to the Forum and the LASED at Hollywood Park including SoFi Stadium and existing and future local businesses and residences.
- The *Prairie Avenue/Hardy Street* station located on the northwest corner of the intersection of Prairie Avenue and Hardy Street providing service to the LASED at Hollywood Park, including SoFi Stadium, the IBEC, and other existing and future local businesses and residences.

### 3.0 Project Description

These station locations were chosen to be near major employment, housing, and retail centers, including the Forum, the LASED, including SoFi Stadium, and other employment, housing and retail commercial uses in the Hollywood Park Specific Plan (HPSP), the IBEC, and employment, housing and retail commercial uses in Downtown Inglewood, which the City is seeking to enhance and activate.

Existing roadways and infrastructure along the transit alignment will require reconfiguration to accommodate the new elevated transit guideway structures and stations. In addition to surface improvements, utility infrastructure located under roadways may need to be relocated to accommodate the guideway columns, footings, and other components. The roadway reconfigurations proposed along Market Street, Manchester Boulevard, and Prairie Avenue are necessary to assure that the existing roadway travel capacity is not reduced to accommodate the proposed Project.

The proposed Project includes a Maintenance and Storage Facility (MSF) to provide regular and preventive maintenance for the ATS trains, vehicle storage, and an operations control center. **Figure 3.0-3: Vicinity Map** identifies the proposed location of the MSF on the eastern half of the block bound by Manchester Boulevard, Hillcrest Boulevard, Nutwood Street and Spruce Avenue. An existing commercial building containing a Vons grocery store, a fitness center, and a bank branch, is located on the southern portion of this site. A gas station operated by Vons is located on the northeast portion of this site. Demolition of the existing commercial building and gas station are proposed as part of the Project. A new Vons replacement store is proposed on the corner of Manchester Boulevard and Hillcrest Boulevard.

The MSF will be designed in accordance with the Inglewood Transit Connector (ITC) Design Standards and Guidelines (Design Guidelines) (see *section 3.5.8*) which address the massing, façade, materials, colors, roof, and lighting for this facility, how the MSF will engage with the passenger and vehicular circulation around it, and sustainability features (see **Appendix C: ITC Design Standards and Guidelines**). The proposed Project also includes two power distribution system (PDS) substations. These PDS substations will provide the necessary power for the proposed Project including traction power, auxiliary power, and housekeeping power for the stations and related infrastructure. One of the PDS substations will be located on the MSF site, where the Southern California Edison (SCE) service connection will be provided. The second PDS substation will be located on the Prairie Avenue/Hardy Street station site.

Additional public parking would be provided as part of the Project at three locations that are proposed for acquisition for use as construction staging areas. After construction, these sites will be improved as public parking lots:

- Approximately 650 parking spaces would be provided in a surface parking lot at the Market Street/Florence Avenue Station along with pick-up and drop-off areas on Locust Avenue and Regent Street.
- Approximately 50 parking spaces would be provided in a surface parking lot at 150 S. Market Street.

### 3.0 Project Description

- Approximately 80 parking spaces and a shuttle bus pick-up and drop-off area are proposed at the Prairie Avenue/Hardy Street Station. This lot would be used for public parking, TNCs and shuttle bus pick-up and drop-off operations during events.

These parking areas will provide public parking needed in the City to support use of the ITC Project, businesses, and the City's efforts to help revitalize the historic retail areas along Market Street. The ITC Project is designed and intended to extend the transit service provided by the Metro K Line to the major event venues and existing and planned residential and commercial uses in the City, and these parking facilities are proposed to support transit use. On non-event days, the parking is designed to allow the City's residents to become transit riders and use the Metro Rail system, providing local convenient parking adjacent to the ITC and Metro K Line. On event days, the City recognizes that many visitors may still drive to the City in search of convenient parking with proximity to commercial uses and access to a direct transportation connection to the City's major event venues. To help with overall traffic congestion and improve circulation on local streets, and to help reduce visitors parking in residential areas, the City proposes to provide parking in close proximity to the ITC Project stations and downtown Market Street area. These parking areas will also provide replacement parking for public parking on streets that may be removed as part of the ITC Project.

In addition, the City is considering building a parking structure on the City's Inglewood Transit Facility (ITF) site located on the southeast corner of Prairie Avenue and Arbor Vitae Street within the HPSP area. This parking structure would provide additional public parking near event venues in the LASED and for the IBEC. The ITF site is currently improved as a surface parking lot and bus transit facility. This potential parking structure would provide up to 2,500 parking spaces in a six-level building.

While this proposed parking facility would be located within the HPSP area and is not proposed as part of the Project, it is analyzed herein as part of the potential circulation system in which the Project will operate.

### 3.3 PROJECT LOCATION

The proposed Project is located in the central and northern portions of the City, east of the San Diego Freeway (I-405) and north of the Glenn Anderson Freeway (I-105) in Los Angeles County, California, as shown in **Figure 3.0-1: Regional Location**.

The Project would be constructed in an area generally bounded by the Metro K Line to the north; Hardy Street to the south; the LASED at Hollywood Park including SoFi stadium, and the Forum to the east; and La Brea Avenue to the west, as shown in **Figure 3.0-2: Project Location Map**. The Project extends from the Metro K Line Downtown Inglewood station southwest of the intersection of Market Street and Regent Street, continues south on Market Street, east on Manchester Boulevard, and south on Prairie Avenue to Hardy Street, as shown in **Figure 3.0-3: Project Vicinity Map**.

FIGURE 3.0-3

Project Vicinity Map

251-003-20

The elevated guideway will be primarily located within the public rights-of-way for the streets and sidewalk areas along Market Street, Manchester Boulevard, and the west side Prairie Avenue with some limited encroachments on currently private property located adjacent to the public right of way for vertical circulation features, such as stairways. The three proposed stations and the portions of the guideway connecting to these stations are proposed to be located adjacent to the existing public right-of-way on private properties proposed for acquisition by the City by either voluntary agreements or through eminent domain. Additionally, the MSF site is proposed to be located on currently private property requiring a combination of a partial acquisition and an easement, as described further below.

### 3.4 PROJECT OBJECTIVES

Section 15124(b) of the State CEQA Guidelines states that the Project Description shall contain “[a] statement of the objectives sought by the proposed project.” In addition, Section 15124(b) of the State CEQA Guidelines further states, “[t]he statement of objectives should include the underlying purpose of the project.”

The City’s goals and objectives for the proposed Project are as follows:

- Provide a direct and convenient extension of the Metro regional transit system for local residents and the region to access the City’s new major housing, employment, commercial, and activity centers;
- Close the “last mile gap” to the regional transit system by providing passengers with the ability to transfer to or from destinations and the Metro K Line.
- Provide sufficient transit connection capacity between the Metro regional transit system and the City’s major activity centers with enhanced travel time certainty and sufficient capacity to meet peak ridership demands to encourage transit as a travel mode choice;
- Maintain existing roadway capacity to the extent feasible;
- Reduce the City’s traffic congestion and alleviate growing demand on the existing roadway network on both major arterials and residential streets for both nonevent and event days;
- Encourage intermodal transportation systems by providing convenient, reliable time-certain transit;
- Increase transit mode split, reduce vehicle trips, and reduce per-capita vehicle miles traveled to the City’s major activity centers, with corresponding improvements in air quality, public health, and reductions in greenhouse gas emissions from transportation sources in accordance with the City’s goals, the SCAG 2020-2045 RTP/SCS, and State policies with respect to climate change and land use.
- Support the ongoing economic revitalization and growth opportunities for transit-oriented development (TOD) within the Downtown TOD Plan area, including commercial and residential uses, including through the creation of public parking facilities;
- Encourage redevelopment and investment within the City in areas served by the proposed Project;

### 3.0 Project Description

- Provide safe, reliable, and convenient access to businesses in the City so that they are accessible to their workforce and customers;
- Connect the Inglewood community and citizens to jobs, education, services, and destinations within the City and in the region by providing transit within safe and accessible walking distances; and
- Support regional efforts to become more efficient, economically strong, equitable, and sustainable.

### 3.5 PROJECT CHARACTERISTICS

The Project Description and analysis in this EIR are based on the Conceptual Plans for the ITC Project.<sup>3</sup> The Conceptual Plans identify the proposed alignment for the ATS, which is proposed to be predominantly constructed in the public right-of-way to be acquired for the Project, with the three stations and MSF proposed on private property proposed for acquisition as part of the Project located adjacent to the public right-of-way as described further below. These Conceptual Plans will likely be refined as design of the Project progresses; however, for purposes of the analysis in this Recirculated Draft EIR, the Conceptual Plans, including, among other things, the ATS Guideway, columns, and other components of the Project, are analyzed to disclose the potential maximum impacts of the Project.

The location, layout, and size of the proposed stations, PDS substations, and MSF as illustrated in the Conceptual Plans represent the potential maximum size of these facilities for the purpose of analyzing the potential impacts of the Project. The description of the proposed changes to streets described in this section are also illustrative and identify the potential maximum extent of changes to existing streets proposed as part of the Project. Engineering and design-level details of the Project will be refined as the Project moves through the environmental review, approval, procurement, and design phases.

Components of the Project include:

- ATS trains operating on an elevated dual-lane guideway with three stations;
- ATS guideway along Prairie Avenue to be constructed on the west side of Prairie Avenue;
- No more than three straddle bents all north of Pincay Street along Prairie Avenue immediately south of the Prairie Avenue/Manchester Boulevard Station;
- Passenger walkway systems connecting the stations to the street, mezzanine areas, escalators, and elevators;
- Storage space, operations space, and communications systems located within stations;
- Wayfinding signs and communication program;

<sup>3</sup> Lea+Elliott, Inc. *Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition August 2021. (Appendix E)*

### 3.0 Project Description

- An MSF to provide regular and preventive maintenance of the ATS trains and equipment, as well as space for storage of the vehicle fleet and the operations control center, among other functions;
- PDS substations located on the MSF and the Prairie Avenue/Hardy Street station sites to provide traction/propulsion power, auxiliary power, and housekeeping power;
- Utilities infrastructure—new, modified and/or relocated—to support the proposed Project;
- Surface public parking lots located at the Market Street/Florence Avenue and Prairie Avenue/Hardy Street stations containing multimodal pick-up and drop-off areas, and at 150 S. Market Street to support Downtown Inglewood; and
- Roadway, traffic devices, and streetscape modifications and improvements to accommodate the guideway alignment and support structures.

**Table 3.0-1: ITC Project Component Locations and Sizes** provides information on the components of the proposed Project.

**Figure 3.0-4a to 3.0-4i: Proposed Project Alignment Plans and Profiles** shows the proposed alignment through the City and the locations of the three proposed stations and MSF. The alignment runs south for approximately 0.35 miles on Market Street, turning east at Manchester Boulevard for another 0.50 miles until turning south on Prairie Avenue. The alignment continues south on the west side of Prairie Avenue for approximately 0.75 miles ending north of Century Boulevard at Hardy Street. The alignment profile was developed to provide a minimum clearance of 16 feet 6 inches above all roadways. The height of the guideway is dictated by the elevations at the stations and the existing grades, which vary along the alignment. Additional alignment profile provisions have been made to preserve views of the historic Fox Theater Building on Market Street and other historic structures on Market Street.

The Market Street/Florence Avenue station is proposed on Market Street, just south of Florence Avenue, to provide a connection to and extension of the future Metro K Line Downtown Inglewood Station on Florence Avenue. The two proposed stations located along Prairie Avenue – the Prairie Avenue/Manchester Boulevard and Prairie Avenue/Hardy Street stations – would be located on the west side of Prairie Avenue to allow for the majority of the guideway to be supported by single columns to minimize the visual impact to surrounding properties and to keep the entire length of Prairie Avenue open to the sky.

The proposed Project will be a pinched-loop system, with ATS trains operating back and forth from the Market Street/Florence Avenue station to the Prairie Avenue/Hardy Street station, stopping at each station along the way and reversing at the end of the system. Trains will crossover to the adjacent guideway prior to entering the Market Street/Florence Avenue station and reverse direction when leaving the station. At the Prairie Avenue/Hardy Street station, trains will also crossover prior to entering the

station and reverse direction when leaving the station. Where possible, the dual tracks are narrowed and configured to facilitate the use of single columns to support the structure, thus minimizing the infrastructure needs.

**Table 3.0-1  
ITC Project Component Locations and Sizes (Conceptual)**

Project Component	General Location	Approximate Size
<b>Guideway</b>	<ul style="list-style-type: none"> <li>Located predominantly within the existing public right-of-way of Market Street, Manchester Boulevard, and Prairie Avenue</li> <li>The Prairie/Manchester and Prairie Hardy stations are proposed to be located on private property located west of Prairie Avenue proposed for acquisition as part of the Project.</li> </ul>	<ul style="list-style-type: none"> <li>Approximately 1.6 miles dual lane, end to end</li> <li>The guideway will vary in height from a minimum of ~35 feet to a maximum of ~60 feet measured from existing grade to top of guideway deck</li> <li>The dual-lane guideway width will vary from a minimum of ~30 feet to a maximum of ~75 feet. ### 3.5.1 Operational Characteristics

The operating system for the proposed Project consists of various integrated subsystems including the ATS train vehicles, automated train control, power distribution, guidance, propulsion, communications systems, and other equipment to create a fully functional, automated, and driverless system.

### Automated Transit System Technology

The physical requirements for the proposed Project including the turn radii required for the alignment, guideway widths, station dimensions, power distribution system substations and MSF were developed based on maximizing the types of automated transit system technologies that may be viable options for

3.0 Project Description

the Project. Factors affecting the viability of available technology options include ridership capacity, ability for the system guideway to fit within the physical limitations of the existing rights-of-way, ATS train requirements, operational flexibility, and noise during operations.

The ATS transit technology is a form of light rail technology that can be steel-wheel/steel rail, rubber tired, magnetically levitated, or cable-propelled propulsion systems. The technical requirements for large, automated monorail, rubber-tire ATS train, and automated steel-wheel/steel-rail, also known as automated light rail transit (ALRT) were reviewed against the public rights of-way and property availability to determine the technologies best applicable for the proposed Project. While rubber tired ATS trains (including monorail systems) can meet the Project’s defined physical requirements, steel wheel/steel rail and cable-propelled technologies may also be viable, provided these technologies can comply with the established Project requirements including maximum limits on noise and the ability to fit within the defined physical space available for the Project. Certain suppliers offer or are in the process of updating their steel wheel/steel rail technologies, such that they may meet these requirements. For these reasons, it is prudent to allow the market to determine the best solution in terms of the proposed technology as part of the procurement process so long as performance is demonstrated to meet the limits set

In addition, the proposed Project would include equipment to guide the movement of trains between stations, emergency lighting, communications, and wayfinding systems, a command-and-control system, a public information system, and security systems to monitor activity at station platforms, along the guideway, and at the MSF.

Operation and Ridership

The operating system components are sized based on the projected future peak demand. Ridership projections<sup>4</sup> were based on existing and future mode-share assumptions and future passenger volumes, including demand from planned and approved related projects.

Ridership

Weekday and weekend ridership demand was estimated and used to determine the peak hour demands to determine the required operations for the proposed Project. For event ridership, pre-and post-event demand for small, medium, and large events at the Forum, the SoFi Stadium at LASED, and IBEC were estimated using an event-based travel demand model. It is anticipated and assumed that riders will be distributed at various points as they travel to the Prairie Avenue/Manchester Boulevard and Prairie Avenue/Hardy Street stations from the event venues, including through walking distances to the stations

4 Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

3.0 Project Description

from venue locations, ticket purchase areas at each Station, passage through fare gates and passage through designated exits. Riders were assumed to arrive at a fairly consistent rate throughout the hour.

Table 3.0-2: Ridership Projections shows the projected ridership for the proposed Project.

**Table 3.0-2  
Ridership Projections**

Event	Projected Peak Ridership
Normal Weekday/Weekend	414 peak hour passengers
Single Large Event (NFL game)	11,450 passengers departing SoFi Stadium within one hour after the end of the event

Source: Lea & Elliott Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021. Table 4-1

The proposed Project has been designed to accommodate a projected demand of approximately 8,910 passengers per hour per direction (pphd) for NFL events.<sup>5</sup> In addition, the operations to serve the normal weekday peak-hour demand of approximately 414 pphpd.<sup>6</sup> With a 2.1 minute headway, the system capacity is approximately 11,450 pphpd (assuming operating fleet is increased by introducing a “spare train” into service).

Fleet Size and Line Capacity

Line capacity is defined as the number of people per hour per direction (pphd) that the system can carry past any particular point. The estimated fleet size considers the operating fleet, which is the number of vehicles required to provide the necessary line capacity to meet the projected demand, as well as the spare fleet, comprised of the “hot” standby and maintenance trains to ensure that the number of trains required for operations is always available.

**Operating Fleet:** The proposed Project is designed to serve the most frequent, largest event, which is an NFL game at SoFi Stadium. Given that NFL games only occur approximately 20 days per year, and that the demand for those games will typically not reach full stadium capacity, the ITC system is being proposed to provide a capacity of 11,000 pphpd. The shortfall from the 11,450 pphpd NFL game ridership projection is less than 5 percent. To meet the 11,000 pphpd capacity, a fleet of six, 4-car trains operating at 2.0 minutes headways is required.

5 Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021

6 Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021

**Spare Fleet:** For the ITC system it is assumed that one of the six-train fleet be used for hot standby or maintenance for the ITC system.

For normal weekday and weekend service, the 4-car self-propelled ATS trains may be de-coupled into smaller 1- or 2-car trains to provide service that is more optimized to the time-specific and lower projected demands. Splitting one 4-car train into two 2-car trains and operating a headway of 6.3 minutes serves a 441 pphpd ridership demand with capacity up to 1,950 pphpd for both commuter and daily service and optimizes the utilization of the fleet with respect to the lower demand. Large monorails and cable propelled trains are more difficult to de-couple so would likely operate the full generic 4-car train length for normal weekday/weekend operations.

The headways of the operating fleet to serve the projected number of passengers for self-propelled technologies are shown in **Table 3.0-3**. For purposes of defining the train, a generic vehicle dimension has been used with a maximum train length for a 4-car train of approximately 200 feet. Vehicle/car/train capacities are based on a passenger space allocation of 2.7 SF per passenger; this is consistent with the passenger space standards applied to urban transit systems.

As stated above, the headways for cable-propelled technologies are generally greater than self-propelled systems due to operational differences from self-propelled ATS systems. It is estimated that the minimum operational headway for cable propelled ATS technology would be approximately 3.9 minutes, controlled by the trip time between the Market Street/Florence Avenue and Prairie Avenue/Manchester Boulevard stations.

**Table 3.0-3  
Peak Period Ridership Headway Fleet Capacity**

Peak Period	Projected Ridership (pphpd)	Headway	Fleet	Capacity
Normal Weekday	408	6.0 minutes	2 x 2-car trains or 1 x 4-car trains	1,900
All Other Events	Maximum 6,000	2.4 minutes	5 x 4-car trains	9,500 to 9,700
NFL Event	11,000	2.0 minutes	6 x 4-car trains	11,400 to 11,600

Source: Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition August 2021. Table 5-2.

The proposed Project has the ability to provide even more additional capacity, should this be necessary in the future to accommodate changes in demand levels, event sizes, event schedules, etc. This reserve

capacity can be provided through the introduction of additional trains stored at the MSF. The stations are sized to accommodate the maximum train lengths and, for this reason, no modifications to the station configuration would be required if the reserve capacity is utilized.

### Operations

The ATS trains would typically operate daily for commuters, activity center visitors and employees 7 days per week for 18 hours per day, from 6:00 AM to 11:59 PM (midnight). The proposed Project would typically be closed with no trains operating from 12:00 AM to 5:59 AM, for 6 hours per day; during this time, maintenance activity would occur. As events at the venues along the proposed Project may occur past midnight, the ATS trains may occasionally operate for extended periods.

As event attendees travel from their event center to and from the nearest station, they would be metered and distributed at various points, including through walking distances to the stations from venue locations, ticket purchase areas at each station, passage through fare gates and passage through designated exits. As noted above, riders were assumed to arrive for events at a fairly consistent rate throughout the hour.

At the start of service, the Central Control Operator (CCO) will issue a command to initiate the required operations. The Automated Train Control (ATC) system will then automatically dispatch the necessary number of trains to the mainline from the MSF. The ATC system will be designed so that the station dwell times are adjusted until the trains are equally spaced at the required headway. To adjust the operating fleet for special event service, the CCO will issue commands to inject trains onto the mainline guideway. For removal of trains from the system, maintenance personnel will be staged at one or more stations to ensure that all passengers have deboarded the trains prior to the trains going out of service.

Total travel time from one end to the other of the proposed Project would be approximately 6.0 minutes for a self-propelled system and 7.4 minutes for a cable propelled system. **Table 3.0-4: Forecasted Northbound Station-to-Station In-Vehicle ATS Train Travel Times** shows travel times between stations. These travel times include 40 second dwells (stops) at each station. Top ATS train speed of 50 miles per hour (mph) is achievable but the actual operational speed will be limited to a maximum of 45 mph for passenger comfort.

**Table 3.0-4  
Forecasted Northbound Station-to-Station In-Vehicle ATS Train Travel Times (minutes)**

Station	Market Street/ Florence Avenue Station	Prairie Avenue/ Manchester Boulevard Station	Prairie Avenue/ Hardy Street Station
Market Street/Florence Avenue	N/A	2.9	4.6
Prairie Avenue/Manchester	2.7	N/A	1.7
Prairie Avenue/Hardy Street	4.7	2.1	N/A

Table 5- 1.

### 3.5.2 ATS System Configuration and Alignment

Along its length, the elevated guideway structure would have a minimum clearance height of approximately 16 feet 6 inches above all roadways. The conceptual design of the alignment elevation was dictated by the elevation of the grade (that varies along the alignment) and the station platform elevations (that must be situated above the mezzanine level); the alignment elevation between stations was then adjusted to ensure that the minimum roadway clearance is maintained while simultaneously lowering the guideway elevation to the extent feasible. The dual-lane guideway would include switches to allow trains to crossover to the other track to begin return trips at the end-of-line stations. Additionally, switches would be provided to allow a train to be guided from one track to another in the event of an emergency, mechanical failure, or other event and enable sectional track bypass for failure management. The exact switch configuration and whether the train switches tracks before or after entering the end of line station will be optimized through the design process depending on the selected technology.

For the length of the alignment, the proposed Project would consist of an elevated guideway with dual tracks for train travel in both directions. The train tracks will be spaced as close together as possible with tracks diverging at approaches to/from stations and at stations. The elevated guideway would be supported by single or double column/bents (depending on the train track separations and the guideway location relative to potential column placements). While the final column locations and designs will be finalized by the selected DBFOM contractor, in consultation with the City, the conceptual alignment has been optimized to minimize the number of columns and potential double column/bents to the extent feasible while still accommodating all potential ATS system types. This approach optimizes the construction costs while simultaneously reducing the visual impact of the guideway. It is expected that during final designs, by the selected DBFOM Contractor, the Project infrastructure configuration will be optimized and refined to that indicated herein but will remain within the envelopes defined in this report as they are expected to have the largest potential impact for this environmental analysis.

To minimize the overall footprint of the proposed Project, and therefore its impact on the adjacent neighborhoods, the crossovers at the end stations, Market Street/Florence Avenue station on the northern end and Prairie Avenue/Hardy Street station on the southern end, are located at the entrance to each of the stations.

The alignment of the guideway and station locations is shown in **Figures 3.0a** through **3.0-4i**.

#### **Market Street/Florence Avenue Segment**

The Market Street/Florence Avenue segment is approximately .35 miles in length. The proposed Project would connect to the Metro K Line Downtown Inglewood station at the northern end of this segment. The guideway alignment is elevated and travels from the southeast corner of Market Street/Florence Avenue southwest towards the corner of Market Street/Regent Street where it runs along the center of Market Street until it turns east on Manchester Boulevard.

The guideway would begin at the Market Street/Florence Avenue station, situated diagonally over the current location of the retail commercial center on the northeast corner of Market Street and Regent Street, between the intersections of Florence Avenue/Locust Street and Market Street/Regent Street.

Exiting the Market Street/Florence Avenue station, the guideway would continue to extend south in the center of Market Street and within the public right-of-way, as shown in **Figure 3.0-4a**.

As shown in **Figure 3.0-4b**, at the northeast corner of the Market Street and Manchester Boulevard intersection, the guideway would partially extend beyond the public right-of-way and into the private property at 150 S. Market Street.

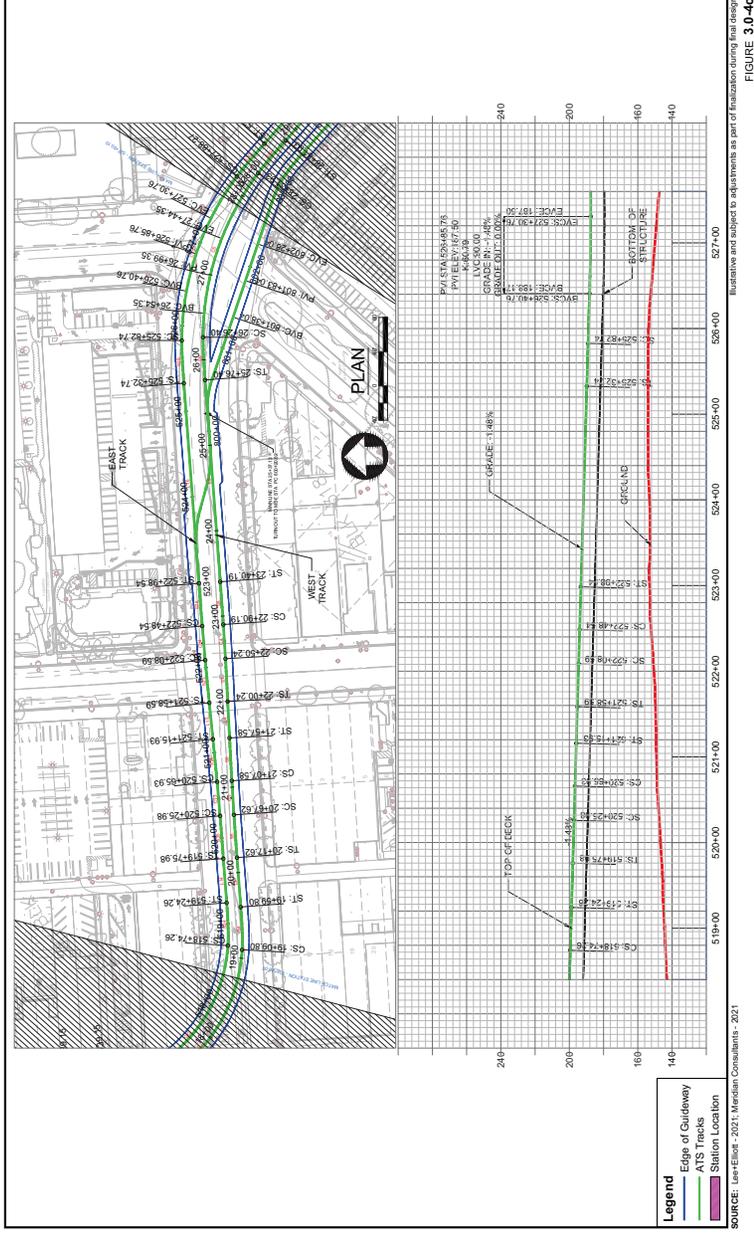

This parcel is currently occupied by a 2-story commercial building (World Hat and Boot Mart). Acquisition of this parcel is proposed as part of the Project. This parcel would accommodate the guideway and public parking that would extend to an adjacent parcel owned by the former Inglewood Redevelopment Agency.

#### **Manchester Boulevard Segment**

The Manchester Boulevard segment of the guideway is approximately .50 miles in length. This segment extends from the intersection of Market Street/Manchester Boulevard to the west, and the intersection of Prairie Avenue/Manchester Boulevard to the east as shown in **Figure 3.0-4c** through **3.04e**.

The MSF is located on this portion of the alignment to the southwest of Manchester Boulevard and will be accessed by the ATS trains from the elevated guideway (see **Figure 3.0-4d**). The MSF houses functional spaces required for the operation and maintenance.

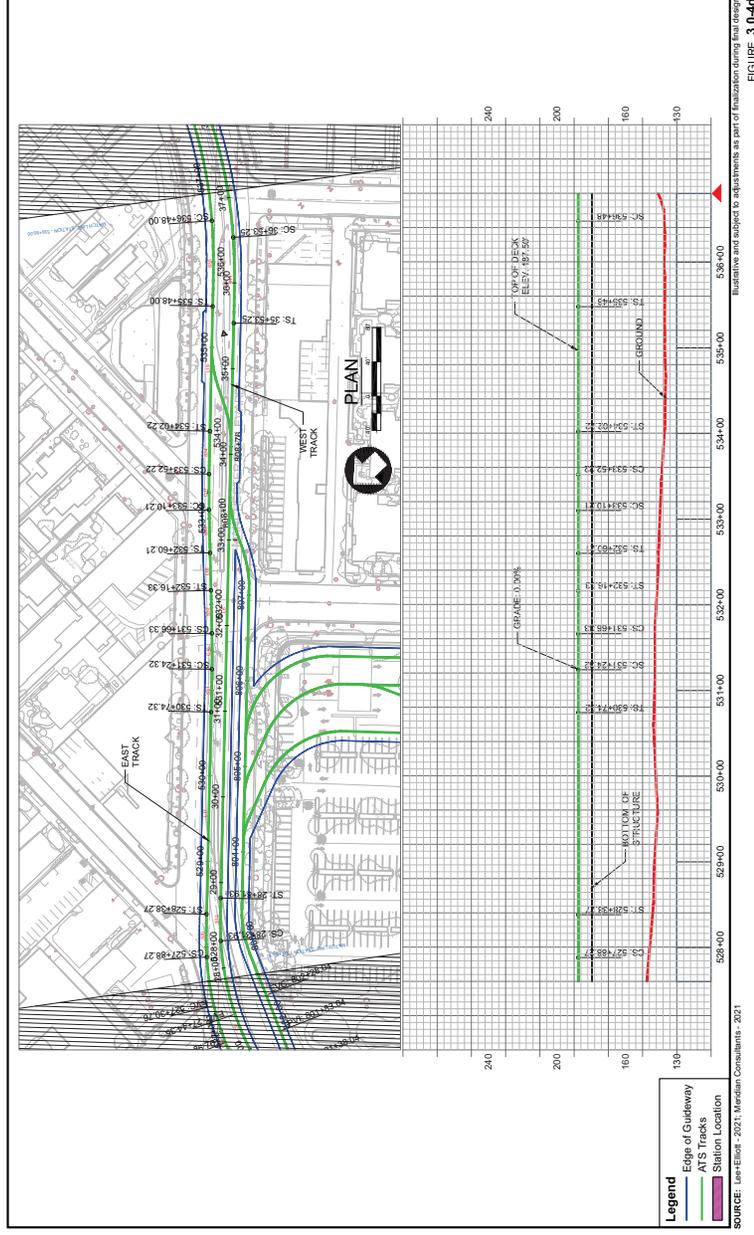

Proposed Project Alignment Plans and Profiles

The proposed MSF facility will be located on a site containing an existing retail commercial building at 500 E. Manchester Boulevard containing a Vons grocery store, a private fitness gym, and a bank branch, and a gas station operated by Vons. The MSF is proposed on the eastern portion of this site and a new replacement Vons store, which would include amenities similar to the existing store, is planned on the corner of Manchester Boulevard and Hillcrest Boulevard. The guideway would include a side (tertiary) track to access the MSF. Additional track switches would be needed to allow for the access of trains from the guideway to and from the MSF; these switches would be located on the east side of the MSF near Manchester Boulevard’s intersections with Hillcrest Boulevard and Spruce Avenue as shown in **Figure 3.0-4d**. The MSF is described further below in Section 3.5.4.

At the southwestern corner of the Manchester Boulevard and Prairie Avenue intersection, the edge of the guideway would extend beyond the existing public right-of-way and onto the vacant property at 401 Prairie Avenue where the Prairie Avenue/Manchester Boulevard Station is proposed (see **Figure 3.0-4e**). Acquisition of this property is proposed as part of the Project. The guideway would approach the Prairie Avenue/Manchester Boulevard station with dual tracks straddling the center platform station and include crossover rail switches located on the southern approach of the station. The Prairie Avenue/Manchester Boulevard station is proposed on the southwest corner of Prairie Avenue and Manchester Boulevard on private property to be acquired as part of the Project. This station would provide access to The Forum, the LASED, including SoFi Stadium and other existing and future businesses and residences. The elevated guideway extending south from the station would be located on the western side of Prairie Avenue with no more than three straddle bent columns for a switch zone located immediately south of Nutwood Street. These three straddle bents would span Prairie Avenue, and potentially require acquisition of private property from the Forum. Passengers will be able to access the ground level below the station or access the Forum site directly via an elevated passenger walkway over Prairie Avenue.

**Prairie Avenue Segment**

The Prairie Avenue segment is approximately .75 miles in length beginning at the intersection of Prairie Avenue and Manchester Boulevard and provides access to the Forum, LASED including SoFi Stadium, the IBEC and other existing and future businesses and residences. This segment extends from the intersection of Prairie Avenue/Manchester Boulevard to the intersection of Prairie Avenue/Hardy Street to the south as shown in **Figure 3.0-4f** through **3.0-4i**.

The guideway would extend south along the west side of Prairie Avenue and cross the intersections of Prairie Avenue with Nutwood Street, Kelso Street/Pincay Drive, La Palma Drive, Buckthorn Street, and Arbor Vitae Street, before ending just north of Hardy Street. Between Arbor Vitae and Hardy Street the guideway will turn west from the public right of way onto property that is proposed to be acquired a part of the Project for the Prairie Avenue/Hardy Station which will be located entirely west of the existing Prairie Avenue right-of-way.

Upon exiting the Prairie Avenue/Manchester Boulevard station and continuing south, the elevated guideway would continue along the west side of Prairie Avenue until both tracks gradually transition

### 3.0 Project Description

together immediately north of Kelso Street and continue in this configuration south to Victory Street, where the tracks diverge to enter into the Prairie Avenue/Hardy Street station, proposed on a site located west of the Prairie Avenue right of way (see **Figure 3.0-4i**). The guideway would terminate at the Prairie Avenue/Hardy Street station located on the northwest corner of the Prairie Avenue and Hardy Street.

#### Columns and Structures

As previously discussed, over the length of the alignment, the Project has been configured to minimize impacts on existing facilities, roadways and to create an alignment envelope that would minimize the need for columns and double column/straddle bent support systems to the extent possible. The final column locations will ultimately be defined by the selected contractor as part of the final design process in consultation with the City. The columns, for the most part, will be required to be located within the existing public right-of-way, either within sidewalks or parking lanes, except immediately south of the Manchester Boulevard/Prairie Avenue Station where three straddle bent columns will be located south of Nutwood Street to support a switch zone that will space across Prairie Avenue.

Generally, support columns for the guideway would be single columns ranging from 6 feet to 9 feet in diameter when centered under the supported guideway to approximately 6 feet by 12 feet oblong columns when located off-center from the guideway. Columns for straddle type bents over the roadways will range from 6 feet to 8 feet in diameter. Column foundation will likely be deep shafts with depths ranging from approximately 60 to 100 feet.

#### Market Street/Florence Avenue Segment

This segment includes one center platform station on private property (to be acquired by the City) at the southeast corner of Market Street/Florence Avenue; the station is connected to the Metro K Line Downtown Inglewood station via an easily accessible elevated passenger walkway. This elevated passenger walkway will connect passengers from the at-grade plaza at the Metro station to the mezzanine level of the proposed ATS Market Street/Florence Avenue station to avoid the need for passengers to cross Florence Avenue at-grade.

The Market Street/Florence Avenue station would be supported by columns below each guideway from the northern terminus to just north of Regent Street. Here, the dual lane tracks would separate to accommodate the station's center platform and turn-back switches. As the guideway approaches Regent Street, the dual lane tracks would converge and be supported by single columns until Manchester Boulevard. The columns would be primarily located in a reconstructed median area along Market Street between Regent Street to Manchester Boulevard. From Manchester Boulevard, the guideway turns eastward towards Prairie Avenue.

#### Manchester Boulevard Segment

As the guideway turns east onto Manchester Boulevard, the guideway would transition from single columns to a one-half straddle bent to support the turn onto Manchester Boulevard before going back to

### 3.0 Project Description

single columns in a new median located in Manchester Boulevard. As the guideway approaches the MSF it will widen and require straddle bents that will span across Manchester Boulevard. From the MSF to Prairie Avenue, a combination of single column supports and straddle bents across Manchester Boulevard will be used.

Straddle bent columns will be placed in sidewalks and/or parking lanes so as to not reduce the existing roadway capacity of Manchester Boulevard. Single column supports will be located in a median within Manchester Boulevard that will not restrict existing traffic capacity or turning movements at intersections to other City Streets.

#### Prairie Avenue Segment

No more than three straddle bent columns will support the guideway as it proceeds south onto Prairie Avenue from the Prairie Avenue/Manchester Boulevard Station just past Nutwood Street, transitioning to single column supports as the guideway converges after leaving the Manchester Boulevard/Prairie Avenue station. As the guideways converge, it will transition to single column supports located on the western side of Prairie. The guideway begins diverging south of Victory Street to the west of Prairie Avenue on its approach to the Prairie Avenue/Hardy Street station and will be supported by straddle bents in the sidewalk and west of the public right of way. There will be no straddle bents located across Prairie, south of Pincay Street.

#### Maintenance and Emergency Access

A continuous walkway would be provided along the entire length of the guideway to provide emergency egress for evacuating passengers and safe access for operations and maintenance personnel to access guideway and wayside equipment.

Maintenance walkway considerations and requirements will comply with the applicable requirements that generally include the following:

- The walkway must be continuous through crossovers/switches or other elements that may act as barriers.
- The walkway should be located at or below the vehicle floor level under both normal and worst-case vehicle suspension failure conditions. It is desirable to locate the emergency walkway not more than 12 inches below the vehicle floor level. The walkway must not be more than 40 inches below the vehicle floor level under any circumstances.
- Walkways without a railing should be at least 44-inches wide and walkways with a railing should be at least 30-inches wide.
- The walkway should provide a clear cross-sectional envelope at least 30 inches wide to a height of 6 feet-8 inches above the walkway surface.
- Emergency walkway lighting is required along the entire walkway and egress route and will normally be turned on only when passengers are required to evacuate a train or during maintenance activities.

### 3.5.3 Stations

The proposed Project includes three center platform stations located at Market Street/Florence Avenue, Prairie Avenue/Manchester Boulevard, and Prairie Avenue/Hardy Street. The Market Street/Florence Avenue station will provide connections to the Metro K Line and Downtown Inglewood. The Prairie Avenue/Manchester Boulevard station will include an elevated pedestrian walkway crossing over Prairie Avenue to provide a connection to the Forum, local businesses, and residences, and the LASED. The Prairie Avenue/Hardy Street station will provide connections to the LASED including SoFi Stadium, the commercial uses at Hollywood Park, the IBEC as well as existing and future local businesses and residences.

Each station is designed in three levels including the ground, mezzanine, and platform levels. From the ground level, each station includes vertical circulation (stairs/escalators/elevators) from grade at existing sidewalks and passenger areas adjacent to the stations to the mezzanine and platform levels of the station. The mezzanine level provides connections for passengers received from connecting elevated passenger walkways to avoid at-grade passenger roadway crossings. The Market Street/Florence Avenue station will include an elevated passenger walkway connecting to the Metro K Line Downtown Inglewood station. The Prairie Avenue/Manchester Boulevard station will include an elevated passenger walkway connecting to the Forum property, and the Prairie Avenue/Hardy Street station will include an elevated passenger walkway connecting to the LASED properties on the east side of Prairie. **Figure 3.0-5: Typical Station Design** shows the configuration that would be used for the stations; the typical design would be modified as needed to address site specific conditions, and the elevated passenger walkways will be located in consultation with affected property owners. With the exception of the elevated passenger walkway, the Prairie Avenue/Hardy Street Station will not encroach onto or over Prairie Avenue.

As noted, station design capacity would be established by passenger demand volumes under typical peak conditions, service disruptions, and emergency evacuation situations. Queuing and circulation requirements would be determined using the number of peak-hour passengers boarding and disembarking the ATS trains defined by the long-range planning horizon. Like all public elements of the Project, stations would be required to be fully accessible to passengers with disabilities. The station configurations would be refined as necessary to be compatible with the designs of the major venues the system would serve, and utility alignments.

Center platform configurations generally result in a smaller footprint and are proposed for the stations. These platforms would be located between guideways and serve as both boarding and disembarking platforms for passengers traveling in either direction.

Vertical circulation would be provided at either or both ends of station platforms, or within the length of the platform. A mezzanine level is anticipated under the station platform to connect to the street level through passenger walkways.

### Vertical Circulation at the stations

The stations will provide vertical access to the various station levels (Platform, mezzanine, and street level). The platform level where the ATS train will access the stations will be above the mezzanine and street levels. The mezzanine level will allow ATS riders to reach the street level and access passenger walkways to connect to other facilities such as the Metro K Line Downtown Inglewood Station or areas beyond the normal street level landing areas.

Vertical circulation to the platform may be at the ends or along the platform. The configurations with access at the ends of the platform are referred to as “single-ended” and “double-ended” if they provide access at one end or both ends, respectively. Several factors will determine where vertical circulation is located on the platforms, including the station orientation in relation to the adjacent facility, physical and geometric constraints, and the orientation of the station relative to adjacent facilities, such as the Metro K Line, the Forum, the SoFi Stadium at LASED, and the IBEC.

The concentration of passenger demand will also influence the size and location of vertical circulation. Vertical circulation for each station will address the concentration of passenger demands to minimize congestion and long passenger queues. To the degree feasible, the passenger demand will be evenly distributed throughout the station.

Design of the vertical circulation components will also address mobility requirements of passengers (strollers, walkers, wheelchairs, mobility concerns, and all requirements of the Americans with Disabilities Act (ADA)). From a safety point of view, adequate passenger egress capacity will be provided to ensure that the passengers alighting from the ATS trains to the platform can be dissipated through the available vertical circulation prior to the next ATS train arrival. Consideration will be given to the fact that escalators and elevators can be unavailable for use due to either unforeseen failures or preventative maintenance.

Based on analysis of passenger demands, each station platform will likely include 2 escalators in each direction for boarding and disembarking, plus another reversible escalator to assist with peak ridership events and redundancy. Additionally, 2 elevators and 6-foot-wide stairs to serve all levels will be provided. Exact requirements will be established during the design phase of the Project.

### 3.5.4 Maintenance and Storage Facility (MSF)

The MSF would be used for regular and preventive maintenance of the ATS trains and operating equipment, as well as space for storage of the vehicle fleet. As shown in **Figure 3.0-6: MSF Site Plan**, the 75,000 SF MSF is proposed on the eastern portion of the block bounded by Manchester Boulevard, Hillcrest Boulevard, Nutwood Street, and Spruce Avenue. The MSF building will be elevated to match the track elevation.

This site is currently developed with a retail commercial building containing a Vons grocery store, a private fitness gym and a gas station operated by Vons. The existing commercial building would be demolished

and a new Vons store, approximately 46,400 SF in size, would be built in a more prominent location on the corner of Manchester Boulevard and Hillcrest Boulevard. Parking for the new Vons store, consisting of approximately 205 spaces, will be provided east and south of the store on the site and will include parking under the MSF building. Parking for MSF employees and visitors, consisting of approximately 50 spaces, will be provided in a gated surface parking lot located within the site, west of the MSF building. A PDS substation is proposed on this site.

As shown in **Figure 3.0-7: MSF Plan and Section Views**, the MSF would be elevated from ground level, with double height clearance over the maintenance tracks, and a largely unenclosed ground floor. The maintenance level for ATS train cars would be located on the second floor to match the guideway track elevation. The maintenance level will contain mezzanine administrative office space. The ground level would include multiple rows of columns and support beams for structural support. The approximate dimensions of the MSF are shown on **Table 4.0-3**.

The ground floor would consist of a generally unenclosed space containing public parking for the new Vons store. A gated surface parking area containing approximately 50 parking spaces for employees and visitors to the MSF will be provided west of the MSF building. A loading dock and circulation area for large trucks, access driveways, and one of the two PDS substation (~30 feet by 100 feet) will be located on the southern portion of this site.

The central area of the MSF would consist of two train docks for light maintenance of the trains. Finally, near the northwestern side, the MSF would include two more train docks to be used for heavy vehicle maintenance. The heavy maintenance docks would be located on top of a solid platform structure to capture and contain any mechanical fluids or components during maintenance activities. The space occupying the southeastern-most side of the MSF would be used for inventory, equipment storage, mechanical/electrical shops, and employee facilities.

The mezzanine office space would be located above the inventory and storage area on the second floor. This area would house the operations control center where automated train operations are monitored and controlled. In addition, this level would include office space, conference room(s), employee locker and break room(s), restrooms, and a technician workspace.

Vehicle and passenger access to the MSF would be provided via controlled gates. Security measures for the MSF would include secured perimeter fencing, automated gates, electronic security card systems, intercoms, security cameras, and exterior lighting.

The MSF will be designed consistent with the ITC Design Standards and Guidelines (Design Guidelines) (see *section 3.5.8*), whereby massing and height will be minimized, rooftop equipment will be fully screened, color palette will be generally uniform and neutral in tone, and transparent glazing shall be provided to maximize daylight to the extent feasible. Additionally, lighting will be placed to minimize spillover to adjacent properties and building entrances and passenger paths will be clearly lit.

### 3.5.5 Power Distribution System Substations

Propulsion power which includes the power to run the train on the guideway and power for auxiliary and housekeeping needs would be provided by two Power Distribution System (PDS) substations located along the alignment. The two PDS substations would be located at the MSF and Prairie Avenue/Hardy Street station sites. The SCE service connection for the system would be provided to the PDS substation on the MSF site.

Each PDS substation is approximately 3,000 SF (approximately 30 feet by 100 feet) with 14 feet of clearance above the finished floor (see **Figure 3.0-8: Typical PDS Substation Layout**). Each PDS substation includes equipment to transform the medium- to high-voltage power feed provided from the power companies to the typically required 750-volt direct current (VDC) needed to power the vehicles and power for housekeeping and other ancillary equipment.

Based on a distribution study completed by SCE, upgrades to the existing distribution system are required to accommodate the maximum power load for the Project. These upgrades consisting of approximately 1,500 feet of new civil work/duct banks, 1,860 feet of new 1000 jacketed concentric neutral (JCN) cable, 1,700 feet of upgrading/re-cabling of the existing SCE primary cable to 1000 JCN, and two new gas switches, will be constructed as part of the Project.

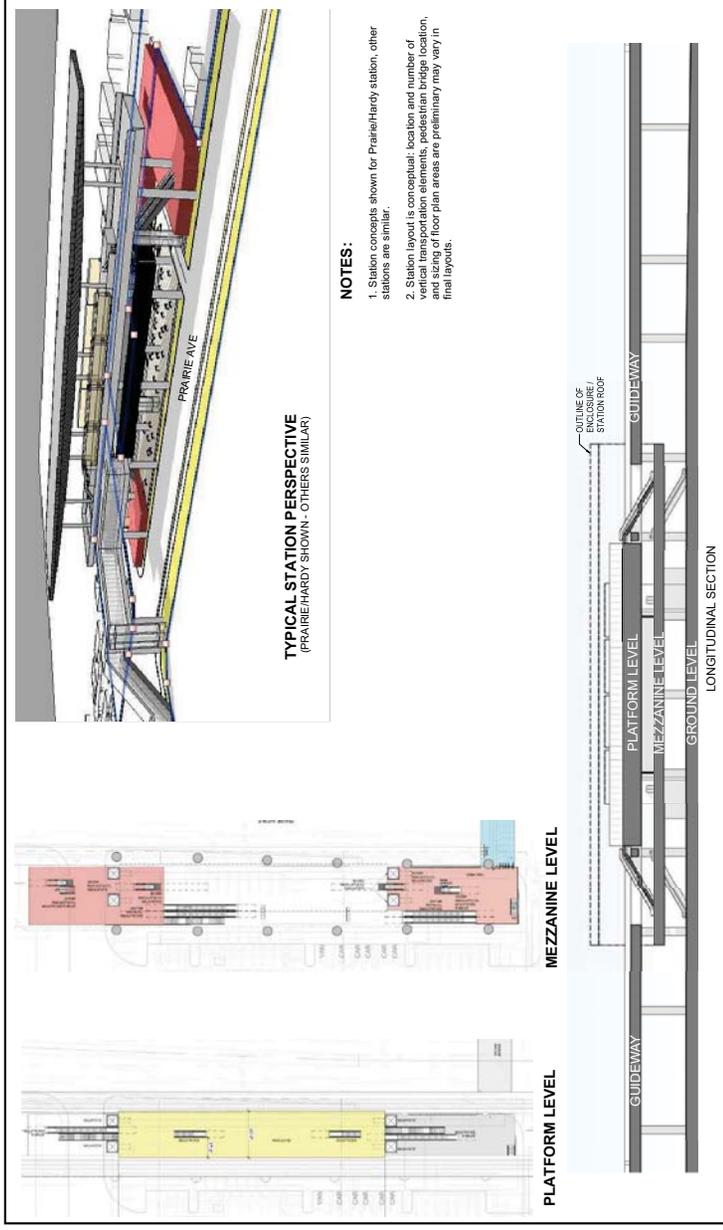

To assure the ATS trains can reach the nearest stations to offload riders in the event of loss of electrical supply, each PDS substation will be equipped with backup power generators. The backup generators would be capable of supplying power to the ATS trains for either 100 percent or 50 percent electrical capacity for a limited time to allow trains to complete their route so that riders can disembark at a station.

### 3.5.6 Roadway Improvements

To achieve the City's goal of maintaining existing roadway capacity while accommodating the components of the Project, a series of roadway improvements are proposed as described below.

#### **Restriping and Lane Modifications**

A brief description of the existing and proposed characteristics of these roadway segments including number of lanes, intersection geometry, traffic control, on-street parking, sidewalks and crosswalks, and speed limits is provided below. Roadway striping and cross-sections are included in **Figures 3.0-9 to 3.0-23: Striping Plans**, and **Figures 3.0-24 to 3.0-31: Cross-Sections**.

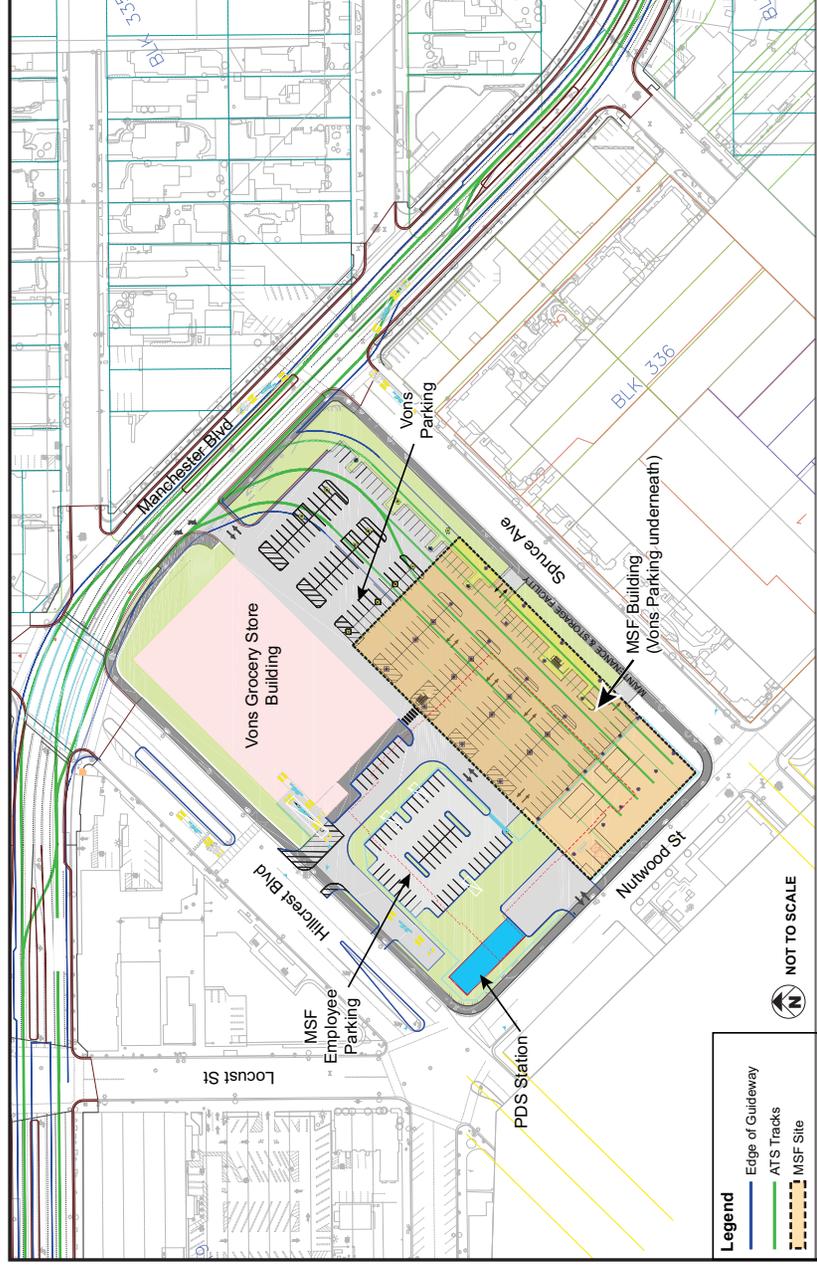

**NOTES:**

1. Station concepts shown for Prairie/Hardy station, other stations are similar.
2. Station layout is conceptual; location and number of guideways, mezzanine level, platform, and sizing of floor plan areas are preliminary and may vary in final layouts.

### Market Street between Florence Avenue and Manchester Boulevard

Market Street between Florence Avenue and Manchester Boulevard will include the same number of lanes as existing conditions (one lane in either direction). No change to roadway throughput or capacity is proposed as part of the Project. The speed limit along Market Street will remain at 25 mph, similar to existing conditions. Conceptual roadway striping plans and typical cross-sections are included in Attachment A-1.

At the intersections of Market Street/Florence Avenue and Market Street/Manchester Boulevard, lane configurations and traffic controls will mostly remain similar to existing conditions, resulting in very little to no changes to intersection capacities. At the intersections of Market Street/Regent Street and Market Street/Queen Street, there would be changes to the lane configurations, but traffic controls proposed at these intersections would not be changed. A brief description of the resulting lane configurations at the intersections along this stretch of Market Street with the ITC Project is summarized below:

- **Intersection of Market Street/Florence Avenue** – There would be no changes to the lane configurations and traffic control due to the Project at this signalized intersection, compared to existing conditions. Similar to existing conditions, the northbound approach would provide a left-turn lane and a right-turn lane. The eastbound approach would provide two through lanes and a shared through/right-turn lane, while the westbound approach would provide a left-turn lane and two through lanes.
- **Intersection of Market Street/Regent Street** – The Project would result in the removal of the northbound left-turn lane at this signalized intersection compared to existing conditions. The northbound approach would provide a shared left-/through/right-turn lane. The adjacent D3 (Market Gateway) Project (anticipated to be completed in 2022) would modify the southbound approach by removing the right-turn lane, resulting in a shared left-/through/right-turn lane. The Project would not change the southbound, eastbound, and westbound approaches. The eastbound and westbound approaches would both provide a left-turn lane and a shared through/right-turn lane. No change to traffic control (signal) at this intersection are proposed with the ITC Project compared to existing conditions.
- **Intersection of Market Street/Queen Street** – As a result of the Project, the northbound and southbound approaches would provide a shared left-/through/right-turn lane, removing the separate left-turn lanes, compared to existing conditions. The southbound approach would provide a shared left-turn/through lane and a separate right-turn lane. The Project would not change the eastbound and westbound approaches. The eastbound and westbound approaches would both provide a shared left-/through/right-turn lane. No change to traffic control (signal) at this intersection are proposed with the ITC Project compared to existing conditions.
- **Intersection of Market Street/Manchester Boulevard** - There would be no changes to the lane configurations or traffic control due to the ITC Project at this signalized intersection compared to existing conditions. The northbound and southbound approaches would provide a left-turn lane and

### 3.0 Project Description

a shared through/right-turn lane. The eastbound and westbound approaches would both provide a left-turn lane, one through lane and a shared through/right-turn lane.

#### Manchester Boulevard between West of Market Street and Prairie Avenue

Manchester Boulevard between Market Street and Prairie Avenue will include the same number of lanes as existing conditions, i.e., two lanes in either direction with turn lanes at intersections between Market Street and Hillcrest Boulevard; and two lanes / three lanes in the westbound / eastbound directions, respectively, with turn lanes at intersections between Hillcrest Boulevard and Prairie Avenue. No change to roadway capacity or traffic control is proposed as part of the Project. The speed limit along Manchester Boulevard will remain at 35 mph, similar to existing conditions.

Lane configurations at intersections will mostly remain similar to existing conditions at all locations within that stretch, resulting in no changes to intersection capacities and little to no reductions in turn-lane storage lengths would occur at any of the intersections within this stretch, as part of the ITC Project. Minor modifications to lane configurations at the intersection of Manchester Boulevard and Prairie Avenue may be required or desired based on prevailing demands at the time of construction of the Project. This could be achieved by restriping at the time of implementation of the Project. A brief description of the resulting lane configurations at the intersections along this stretch of Manchester Boulevard as a result of the ITC Project is summarized below:

- **Market Street/Manchester Boulevard** - There would be no changes to the lane configurations and traffic control (signal) due to the Project at this signalized intersection compared to existing conditions. The northbound and southbound approaches would provide a left-turn lane and a shared through/right-turn lane. The eastbound and westbound approaches would provide a left-turn lane, one through lane and a shared through/right-turn lane.
- **Intersection of Locust Street/Manchester Boulevard** - There would be no changes to the lane configurations and traffic control (signal) due to the Project at this signalized intersection compared to existing conditions. The northbound and southbound approaches would provide a shared left/through/right-turn lane. The eastbound and westbound approaches would provide a left-turn lane, one through lane and a shared through/right- turn lane.
- **Intersection of Hillcrest Boulevard/Manchester Boulevard** - There would be no changes to the lane configurations and traffic control (signal) due to the Project at this signalized intersection compared to existing conditions. The northbound and southbound approaches would provide a left turn lane, a through lane and a right-turn lane. The eastbound and westbound approaches would provide a left-turn lane, one through lane and a shared through/right-turn lane.
- **Intersection of Spruce Avenue/Manchester Boulevard** - There would be small changes to the lane configurations and traffic control (signal) due to the Project at this signalized intersection compared

### 3.0 Project Description

to existing conditions. The northbound approach would provide a shared left/through/right-turn lane similar to existing conditions. The southbound approach is a driveway and would provide a right-turn lane only. The eastbound approach would provide two through lanes and a separate right-turn lane (in the evening peak period, on- street parking restriction allows this right turn lane to function as a shared through/right- turn lane along eastbound Manchester at this intersection). The eastbound approach left- turn lane to the small driveway would be removed. The westbound approach would provide a left-turn lane, one through lane and a shared through/right-turn lane, similar to existing conditions. Due to the low volume of traffic making the left-turn from the eastbound Manchester Boulevard to the Driveway, removal of the left-turn pocket and restricting the eastbound left-turns into that driveway would have minimal effect on the circulation at this intersection.

- **Intersection of Tamarack Avenue/Manchester Boulevard** - There would be no changes to the lane configurations or traffic control (stop-sign at Tamarack Avenue northbound approach) due to the Project at this un-signalized intersection compared to existing conditions. The northbound approach would provide a shared left-/right-turn lane. The eastbound approach would provide two through lanes and a separate right-turn lane (except in the evening peak period, when on-street parking restriction allows this right turn lane to function as a shared through/right-turn lane along eastbound Manchester at this intersection). The westbound approach would provide a left-turn lane and two through lanes.
- **Intersection of Osage Avenue/Manchester Boulevard** - There would be no changes to the lane configurations and traffic control (stop-signs at Osage Avenue northbound and southbound approaches) due to the Project at this un-signalized intersection compared to existing conditions. The northbound and southbound approaches would provide a shared left-/through/right-turn lane. The westbound approach would provide a left-turn lane, one through lane and a shared through/right-turn lane. The eastbound approach would provide a left-turn lane, one through lane and a shared through/right-turn lane during the morning peak hours and off-peak hours. During the evening peak hours, with on-street parking restrictions, the eastbound approach would provide a left-turn lane, two through lanes and a shared through/right-turn lane.
- **Intersection of Prairie Avenue/Manchester Boulevard** - There would be no changes to the lane configurations and traffic control (signal) due to the Project at this signalized intersection compared to existing conditions. The northbound approach would provide a left-turn lane, two through lanes and a separate right-turn lane. The southbound approach would provide a left-turn lane, two through lanes and a shared through/right-turn lane. The eastbound approach would provide a left-turn lane, two through lanes and a shared through/right-turn lane. The westbound approach would provide a left-turn lane, two through lanes and a separate right-turn lane.

#### Prairie Avenue between Manchester Boulevard and Hardy Street

Prairie Avenue between Manchester Boulevard and Hardy Street will include the same number of lanes as existing conditions (three lanes in either direction with a central turn lane including the turn lanes at

### 3.0 Project Description

intersections). No change to roadway capacity is proposed as part of the Project. The speed limit along Prairie Avenue will remain at 40 mph, similar to existing conditions. No on- street parking will be allowed along Prairie Avenue within this stretch similar to existing conditions.

Lane configurations and traffic control at intersections will mostly remain similar to existing conditions at all locations within that stretch, resulting in no changes to intersection capacities. Additionally, no reductions in storage lengths are proposed at the intersection turn lanes as part of the ITC Project. Minor modifications to lane configurations at the Manchester Boulevard / Prairie Avenue intersection may be required or desired, based on prevailing traffic demands at the time of implementation of the Project. A brief description of the resulting lane configurations at the intersections along this stretch of Prairie Avenue due to the ITC Project is summarized below:

- **Intersection of Prairie Avenue/Manchester Boulevard** - There would be no changes to the lane configurations and traffic control (signal) due to the Project at this signalized intersection, compared to existing conditions. The northbound approach would provide a left-turn lane, two through lanes and a separate right-turn lane. The southbound approach would provide a left-turn lane, two through lanes and a shared through/right-turn lane. The eastbound approach would provide a left-turn lane, two through lanes and a shared through/right-turn lane. The westbound approach would provide a left-turn lane, two through lanes and a separate right-turn lane.
- **Intersection of Prairie Avenue/Nutwood Street** - There would be no changes to the lane configurations and traffic control (stop-sign control at the eastbound Nutwood Street approach) due to the Project at this unsignalized 'T' intersection. The northbound approach would provide a left-turn lane (central turn lane), three through lanes. The southbound approach would provide two through lanes and a shared through/right-turn lane. The eastbound approach would provide a shared left-/right-turn lane.
- **Intersection of Prairie Avenue/Kelso Street-Pincay Drive** - There would be no changes to the lane configurations and traffic control (signal) due to the Project at this signalized intersection, compared to existing conditions. The northbound approach would provide a left-turn lane, three through lanes and a separate right-turn lane. The southbound approach would provide a left-turn lane, two through lanes and a shared through/right-turn lane. The eastbound approach would provide a left-turn lane and a shared through/right- turn lane. The westbound approach would provide a left-turn lane, one through lane and a separate right-turn lane.
- **Intersection of Prairie Avenue/La Palma Drive-Stadium Driveway** - There would be no changes to the lane configurations and traffic control (stop-signs at the LA Palma Drive- Stadium Driveway approaches) due to the Project at this unsignalized intersection, compared to existing conditions. The northbound and southbound approaches would provide a left-turn lane, two through lanes and a shared through/right-turn lane. The eastbound approach would provide a shared left-/right-turn lane. The westbound approach would provide a right-turn lane.

### 3.0 Project Description

- **Intersection of Prairie Avenue/Buckthorn Street-Touchdown Drive** - There would be no changes to the lane configurations and traffic control (signal) due to the Project at this signalized intersection, compared to existing conditions. The northbound approach would provide a left-turn lane, three through lanes and a separate right-turn lane. The southbound approach would provide a left-turn lane, two through lanes and a shared through/right-turn lane. The eastbound approach would provide a left-turn lane and a shared through/right-turn lane. The westbound approach would provide a left-turn lane, one through lane and a separate right-turn lane.
- **Intersection of Prairie Avenue/Arbor Vitae Street** - There would be no changes to the lane configurations and traffic control (signal) due to the Project at this signalized intersection, compared to existing conditions. The northbound approach would provide a left-turn lane, three through lanes and a separate right-turn lane. The southbound approach would provide a left-turn lane, two through lanes and a shared through/right-turn lane. The eastbound approach would provide a left-turn lane and a shared through/right-turn lane. The westbound approach would provide a left-turn lane, one through lane and a separate right-turn lane.
- **Intersection of Prairie Avenue/Victory Street** - There would be no changes to the lane configurations and traffic control (stop sign at Victory Street westbound approach) due to the Project at this unsignalized 'T' intersection, compared to existing conditions. The northbound approach would provide two through lanes and a shared through/right-turn lane. The southbound approach would provide three through lanes. The westbound approach would provide a right-turn lane.
- **Intersection of Prairie Avenue/Hardy Street** - There would be no changes to the lane configurations and traffic control (signal) due to the Project at this signalized intersection, compared to existing conditions. The northbound approach would provide a left-turn lane, three through lanes and a separate right-turn lane. The southbound approach would provide a left-turn lane, two through lanes and a shared through/right-turn lane. The eastbound approach would provide a left-turn lane and a shared through/right-turn lane. The westbound approach would provide a left-turn lane, a shared left-turn/through lane and a separate right-turn lane.

### **Pick-Up /Drop-Off Areas and Parking Lots**

#### **Market Street Segment**

A surface parking lot with approximately 650 parking spaces at the adjacent Florence Avenue and Market Street Station site, would be provided after construction of the Project is completed. This site will be initially used for construction staging. This public parking at Florence and Market Street is proposed to accommodate anticipated public parking demands, especially on event days, for those desiring to access the event venues and mixed-use areas at the Forum, the LASED and IBEC areas. While the ITC is designed to increase transit ridership along the Metro Rail system, the City anticipates that the provision of additional public parking would support use of public transit and attract patrons to the downtown Inglewood area along Market Street. Moreover, this surface parking lot at the Station site would provide

### 3.0 Project Description

the replacement parking spaces for the reduced parking along Locust Street and Regent Street where Pick-up/Drop-off areas are proposed.

Pick-up and Drop-off areas would be provided along the west side of Locust Street south of Florence Avenue, as well as along the north-side of Regent Street between Locust Street and Market Street. A reduction in on-street parking spaces of approximately 13 spaces along Regent Street and 17 spaces along Locust Street would occur due to the Pick-up / Drop-off areas and the surface parking lot driveways proposed as part of the ITC Project. Additionally, the parking lot would provide replacement parking for 37 on-street parking spaces along Market Street that would be removed to accommodate the Project.

Conceptual roadway striping plans for the Locust Street segment between Florence Avenue and Regent Street and for the Regent Street segment between Market Street and Locust Street indicating the Pick-up/Drop-off areas and conceptual parking layout plans at the surface parking lots at the Market Street / Florence Avenue Station site are provided in **Figure 3.0-32: Market Street/Florence Avenue Station Proposed Parking Plan** and **Figure 3.0-33: 150 S. Market Street Proposed Parking Plan**.

#### Manchester Boulevard Segment

There are currently 81 on-street parking spaces along Manchester Boulevard within this segment. The proposed Project would result in reduction of approximately 48 metered on-street parking spaces. An off-street surface parking lot would be provided at the northeast corner of Market Street and Manchester Boulevard. This surface parking lot is anticipated to provide approximately 50 parking spaces, replacing 6 existing spaces, and obtaining access off of the alley east of the site.

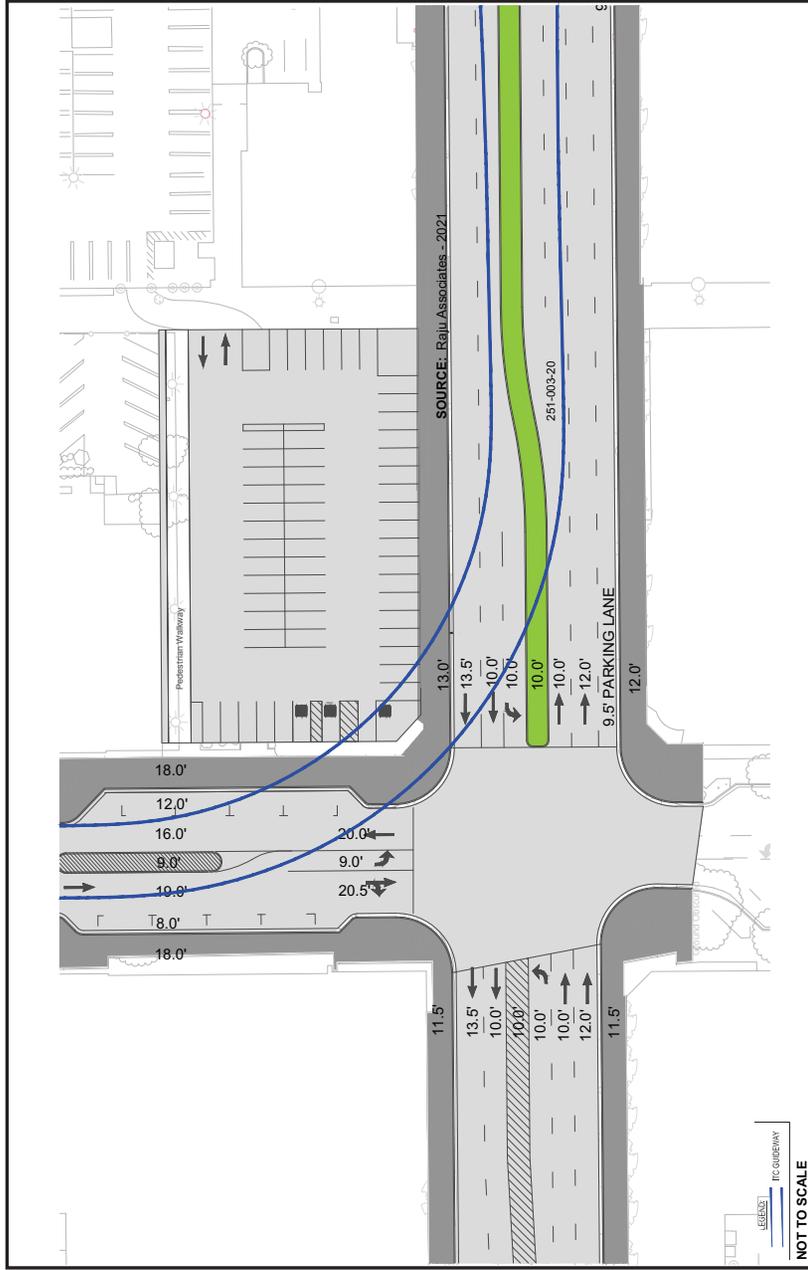

#### Prairie Avenue Segment

A surface parking lot is proposed at the Hardy Street Station located at the northwest corner of the intersection of Prairie Avenue and Hardy Street as shown in **Figure 3.0-34: Prairie Avenue/Hardy Street Station Proposed Parking Plan**. This parking lot would have approximately 80 parking spaces and a shuttle bus pick-up and drop-off area. This lot would be used for public parking, TNCs and shuttle bus pick-up and drop-off operations during events.

#### Sidewalks

Sidewalks on both sides of the street segments along the alignment will be provided by the proposed Project consistent with the requirements of the ADA. The acquisition of temporary and/or permanent easements may be required for these sidewalks. Crosswalks will be provided at intersections similar to existing conditions.

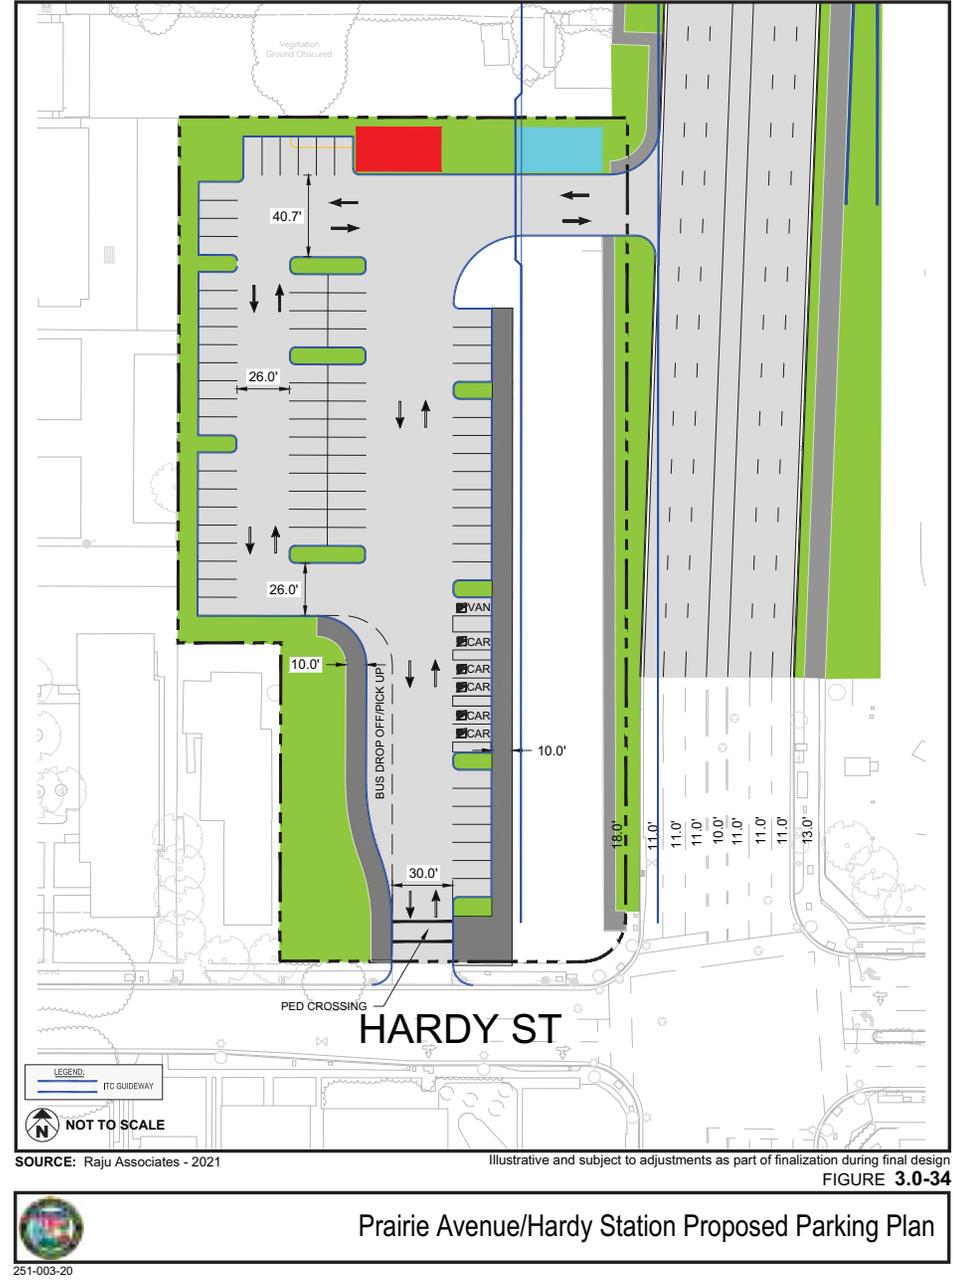

### 150 S. Market Street Proposed Parking Plan

251-003-20

251-003-20

### 3.5.7 Utility Improvements, Upgrades, and Relocations

The proposed Project would require utility systems improvements and upgrades. Based upon preliminary review, it appears that some utility relocations will be required, but these relocations would be generally minor in nature for a project of this size. The Project will not impact the existing utility substation located within the HPSP area that serves SoFi Stadium. The location of utilities is based on a review of existing documentation and non-evasive field confirmation methods. Physical utility pothole locating work will be conducted during the final design phase to supplement the pot-hole survey work completed to date. The design and construction of the elevated-guideway structures, stations, and support facilities would strive to avoid existing utility and other infrastructure to the extent possible. In addition to surface improvements, some utility infrastructure that cannot be avoided may need to be relocated to accommodate the guideway columns and foundations. Any affected utility infrastructure will be relocated and replaced as needed.

### 3.5.8 Design Guidelines

The Design Guidelines (see **Appendix C**) establish the City's comprehensive vision for the transit experience for City residents and patrons of downtown Inglewood and the surrounding entertainment and business venues. The guidelines are intended to integrate the design of new and existing facilities and to create a passenger experience that reflects the City's history and architecture, while providing design guidance for the proposed ITC Project. The Design Guidelines apply to all components of the ITC Project, including the ATS system, guideways, stations, support facilities, and parking areas. These guidelines also apply to areas of the public realm built by the ITC Project including streetscapes, station plazas, roadways, and landscape areas.

The overall purpose of the Design Guidelines is to provide a framework for enhancing the experience in and around downtown Inglewood in a way that is consistent with both the existing urban context and future development vision. These guidelines encourage the development of sustainable and user-friendly spaces with a focus on unified, distinctive architecture and urban design. They will also shape a seamless interaction between a variety of users including passengers, cyclists, transit riders, and automobile drivers with an emphasis on the public experience.

The Design Guidelines also address the comprehensive wayfinding, sign and communications program proposed as part of the Project. Signs will be designed and located to provide clear information and direction for both passengers and transit passengers along the ITC alignment and around station locations. The signage guidelines include design and performance standards for both static and dynamic signage systems. Approval of a Signage and Lighting Design Plan is required that demonstrates that lighting from all proposed signs will not adversely affect nearby uses is required.

### 3.5.9 Sustainability Features

The City has developed sustainability guidelines included in the Design Guidelines that are to be incorporated into the design, construction, and operation of Project facilities. The ITC Project will be designed and constructed to achieve a minimum of Silver Award Certification under the Envision™ Sustainable Infrastructure Rating System or equivalent. The MSF will be designed and constructed to meet a LEED Silver Certification for BD+C (Building Design and Construction) under the category of Warehouses and Distribution Centers or equivalent. Sustainable measures achieved beyond Silver certification for both Envision and LEED or equivalent are encouraged and recommended.

Standards and Guidelines are identified in the areas of site design, energy efficiency, water efficiency and conservation, material conservation and resource efficiency, and environmental quality. These measures illustrate the City's sustainability considerations including, but not limited to, the measures necessary to meet the certifications referenced above. These guidelines apply to the ATS guideway and stations, passenger walkways, parking areas, and all other components of the ITC.

The design of the individual components of the overall ITC Project will be designed to facilitate the use of other low impact forms of transportation such as walking, bicycling, carpooling, and the use of electric and alternative fuel vehicles.

To facilitate this objective, stairways and passenger pathways will be designed to be easily identified, accessible, comfortable, and visually appealing. Similarly, bike parking, carpool parking, electric vehicle charging stations and public transportation connections should be convenient and easy to locate.

The ITC Project will also incorporate landscaped outdoor spaces to reduce heat island impacts and provide stormwater detention and treatment, where possible by reducing hardscape areas and increasing landscape. Other strategies for heat island reductions identified in the Design Guidelines include the use of cool-roof materials and light-colored construction materials.

Where California Energy Efficiency Standards apply, the project will be more energy efficient than required. For energy-using equipment not governed by California Energy Efficiency Standards, best available energy efficient technologies will be used. Advanced commissioning of building systems will be conducted to ensure systems are operating as designed. To achieve energy use reduction, passive strategies taking advantage of the favorable local climate will be considered where feasible. The use of solar canopies as shade structures in addition to roof-mounted solar is another energy saving strategy that will be considered in the design of the individual components of the overall ITC Project.

### 3.0 Project Description

Water efficiency and conservation opportunities will be implemented to reduce or eliminate potable water use indoors and in landscape areas.

Material conservation and resource efficiency guidelines are included to reduce the environmental impact from the use of construction materials by minimizing use of virgin materials, increasing use of recycled materials, using rapidly renewable materials, using local materials, using durable materials, and looking for opportunities to reuse materials.

#### 3.5.10 Construction Commitment Program

As part of the Project, the City of Inglewood has developed a Construction Commitment Program to proactively address the effects of the construction of the Project on the community. This program, provided in **Appendix D**, includes the following programs and plans:

- Business Community and Support Program
- Business Interruption Assistance Program
- Transit Access and Circulation Program
- Construction Staging and Traffic Control Program
- Parking Management Plan
- Air Quality Program
- Visual Resources Program
- Hazardous Materials Program
- Tree Removal and Replacement Plan

To address the effects of the construction activities on traffic conditions, the City will establish a Project Task Force to review implementation of the CCP.

The Transit Access and Circulation Program will include coordination with Metro and any other transit service providers to ensure access to bus transit stops and bus circulation are always maintained, unless infeasible and temporary closure is approved by the City.

The Construction Staging and Traffic Control Program will be developed by members of the Project Task Force will address the following topics:

- Coordination with other public infrastructure projects within the City's boundaries
- Detour routes, including analysis of impacts to pedestrian, business, bicycle, and traffic flow

### 3.0 Project Description

- Coordination of closures and restricted access during the construction period with special attention during periods of expected heavy traffic from events scheduled at SoFi Stadium and other venues in the Los Angeles Sports and Entertainment District at Hollywood Park, the Forum, and the Inglewood Basketball and Entertainment Center.
- Coordination with the City, police, and fire services department regarding maintenance of emergency access and response times
- Monitoring and coordination of construction materials deliveries
- Notification to businesses and residents on upcoming construction activities including but not limited to the establishment of a website with project construction information, signage, and web-based media.

All haul routes and activities will need to be reviewed and approved with truck deliveries of bulk materials and hauling of soil scheduled during off-peak hours to the extent feasible and on designated routes including freeways and nonresidential streets.

Parking, staging, or queuing of Project-related vehicles, including workers' vehicles, trucks, and heavy vehicles, shall be prohibited on City streets at all times except in defined workspace areas unless otherwise approved by the City.

Construction noise reduction measures in this Program require the use of construction equipment that generates the least amount of noise (to the extent feasible), use of temporary noise barriers, and restrictions on the use of heavy equipment that create vibration near sensitive uses and buildings. Contact information for a Community Affairs Liaison will be posted throughout the construction area.

The air emissions reduction measures require use of the best commercially available equipment meeting the highest standard for minimizing air emissions as feasible and the use of electric powered equipment or equipment not powered by diesel engines where possible.

All lighting needed to support construction activities will be required to meet defined standards to avoid impacts to adjacent uses and all stockpile area will be required to be in the least visible areas as approved by the City.

#### 3.6 PROPERTY ACQUISITIONS

The proposed Project would require a number of full and partial property and air rights acquisitions and easements or leases for construction and operation of the guideway, stations, MSF, and other support facilities included in the Project as identified in **Table 3.0-5: Anticipated Project Acquisitions** and otherwise described in this Section.

3.0 Project Description

3.6.1 Guideway

At the northeast corner of the Market Street and Manchester Boulevard intersection, the guideway would partially extend beyond the public right-of-way and into the private property at 150 S. Market Street which currently is occupied by a 2-story commercial building (see **Table 3.0-5**). Additionally, an approximately 50-space surface public parking lot will be developed at this location as part of the proposed Project. This lot will be created by combining the currently private property at 150 S. Market Street with an adjacent existing public surface parking lot (which currently contains 6 parking spaces). As a result, acquisition, and demolition of the property at 150 S. Market Street is necessary to implement the proposed Project.

The guideway will also need to pass from Manchester Boulevard to access the MSF just north of the intersection of Manchester Boulevard and E. Spruce Avenue. The acquisition associated with this is more fully described below in *Section 3.6.4*.

The guideway will also need to pass from Manchester Boulevard to access the MSF just north of the intersection of Manchester Boulevard and E. Spruce Avenue. This proposed acquisition is more fully described below in *Section 3.6.4*.

Further along the alignment, the guideway will also pass through a private property at 401 S. Prairie Avenue as it transitions from the Manchester Boulevard stretch to the Prairie Avenue stretch of the alignment. The acquisition associated with this is more fully described below in *Section 3.6.2*. The proposed Project also requires moving one lane of Prairie Avenue to the east to maintain the existing roadway capacity of Prairie Avenue while accommodating the columns to support the guideway, stations, vertical circulation elements, ADA-compliant sidewalks, and landscaping. This relocation requires the acquisition of private property for public right-of-way purposes to expand Prairie Avenue by up to a maximum of 30 feet to the east of its current location, including frontage along the Forum property at 3900 W. Manchester Boulevard and frontage on the east side of Prairie Avenue in the HPSP area.

The guideway along Prairie from south of Arbor Vitae to the Prairie Avenue/Hardy Street station extends into properties west of Prairie. As a result, acquisition of these parcels is needed and demolition of some existing facilities will be necessary. Further details of these parcels are noted in *Section 3.6.2* below.

Finally, to the south of Arbor Vitae Street, the guideway will expand beyond the existing public right-of-way onto currently private property, requiring the acquisition of some or all of 6 additional private parcels. The guideway will ultimately pass-through private property at 1035 S. Prairie Ave. to terminate at the Prairie Avenue/Hardy Street Station. The property acquisition associated with these improvements are more fully described below in *Section 3.6.2*.

3.0 Project Description

Table 3.0-5  
Anticipated Project Acquisitions

APN #	Property Address	Existing Use/Primary Business	Anticipated Acquisition Type	Project Needs
4015-019-902	317 E. Florence Ave	Future Downtown Inglewood Station of K Line	Easement or partial acquisition	Market Street/Florence Avenue Station elevated passenger walkway connection
4015-019-904	319 E. Florence Ave	Future Downtown Inglewood Station of K Line	Easement or partial acquisition	Market Street/Florence Avenue Station elevated passenger walkway connection
4015-019-905	325 E. Florence Ave	Future Downtown Inglewood Station of K Line	Easement or partial acquisition	Market Street/Florence Avenue Station elevated passenger walkway connection
4015-019-906	327 E. Florence Ave	Future Downtown Inglewood Station of K Line	Easement or partial acquisition	Market Street/Florence Avenue Station elevated passenger walkway
4015-019-907	333 E. Florence Ave	Future Downtown Inglewood Station of K Line	Easement or partial acquisition	Market Street/Florence Avenue Station elevated passenger walkway
4015-027-030	310 E. Florence Ave	Restaurant - Antojitos Martin (Snack & Juice Bar)	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-031	300 E. Florence Ave	Restaurant- Fiesta Martin Bar and Grill	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-032	254 N. Market St	Small Businesses and Restaurants - House of Tacos, Water 4 U, Baja Inc. Mailbox Rentals, Amar's Wholesale Flowers, New Orleans Breakfast Take Out	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-033	250 N. Market St	O'Reilly Auto Parts	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-035	236 N. Market St	Parking Lot	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-020	234 N. Market St	Parking Lot	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-042	Address Not Available	Parking Lot	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-022	226 N. Market St	Parking Lot	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-052	Address Not Available	Parking Lot	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking

3.0 Project Description

APN #	Property Address	Existing Use/Primary Business	Anticipated Acquisition Type	Project Needs
4015-027-051	200 N. Market St	No Existing Business; Abandoned Building	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-038	240 N. Market St	Small Businesses – Silk Nails, Advance America, Ingewood Optometric Center, Ingewood Beauty Supply, Ingewood Beauty Salon	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-040	230 N. Market St	Clothing Store - DD's Discounts Store	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-041	224 N. Market St	GMD Store (general department store)	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-049	222 N. Market St	CVS Pharmacy	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4015-027-050	210 N. Market St	Westchester Dental Care, Randy's Donuts and Chinese Foot To-Go, Luxe Gold Salon, Citifund Tax Financial & Notary / Selwyn's Jewelry / Senior Corner	Full Acquisition	Market Street/Florence Avenue Station, vertical circulation, guideway, columns, construction staging, and future parking
4021-010-901	Address Not Available	Parking Lot	Full Acquisition	Construction staging and future parking
4021-010-015	150 S. Market St.	World Hit and Boot Mart / Commercial	Full acquisition	Guideway, columns, construction staging, and future parking
4021-024-015	500 E. Manchester Blvd.	Retail Commercial Center with Gas Station, Planet Fitness, and Vons grocery store (with Starbucks and US Bank branch located inside Vons)	Partial Acquisition	Maintenance and Storage Facility, guideway, power distribution system substation, construction staging, and future parking
4021-036-049 4021-036-027	401 S. Prairie Ave.	Vacant	Full Acquisition	Prairie Ave./Manchester Blvd. Station, guideway, construction staging, and future parking
4024-008-015	923 S. Prairie Avenue	Vacant Buildings/Surface Parking Lot	Easements or partial acquisition	Guideway and construction staging
4024-009-004	937 S. Prairie Avenue	Vacant/Undeveloped	Easements or partial acquisition	Guideway and construction staging
4024-009-003 4024-009-005	945 S. Prairie Avenue	Retail Commercial/Restaurant	Full acquisition, partial acquisition, or easements	Guideway and construction staging
4024-009-007	1003 S. Prairie Avenue	Office-Warehouse/Peak Performance Training Center	Full acquisition, partial acquisition, or easements	Guideway and construction staging

3.0-80

Ingewood Transit Connector Project  
November 2021

### 3.6.2 Stations

The Market Street/Florence Avenue station, along with the accompanying surface parking lot and multimodal pick-up and drop-off area, is proposed on private property located between Florence Avenue and Regent Street. As shown in **Table 3.0-5**, acquisition of 15 parcels is proposed to accommodate the Market Street/Florence Avenue Station and the accompanying parking and pick-up/drop-off areas. Passenger access points to connect the station to the Metro K Line Downtown Inglewood station would extend outside the right-of-way and land in the adjacent properties where the Downtown Inglewood Station is located. Easements or other property rights for columns, vertical circulation, and passenger access points will likely be required; additional coordination with Metro will help define the exact rights needed.

The Prairie Avenue/Manchester Boulevard station and accompanying surface parking lot is proposed on two contiguous private parcels under common ownership that are on the southwest corner of the intersection of Prairie Avenue and Manchester Boulevard. Acquisition of these parcels is proposed. An elevated passenger walkway across Prairie Avenue to provide access to the Forum would also require an easement or partial acquisition on the Forum property for this passenger walkway connection.

The Prairie Avenue/Hardy Street station and accompanying surface parking lot is proposed on two contiguous private parcels under common ownership located on the southwest corner of the intersection of Prairie Avenue and Hardy Street. Acquisition of these parcels is proposed. As shown in **Table 3.0-5** and discussed in *Section 3.6.1* above, acquisition (partial or full) of 7 additional parcels north of 1035. S. Prairie Avenue is also proposed to accommodate the guideway north of this station.

### 3.6.3 Construction Staging and Parking

As described above, the proposed Project includes providing additional public parking in certain locations along the ITC alignment. These parking areas will be used as staging areas during construction but will ultimately provide public parking needed to support use of the ITC Project and the revitalization of Downtown Inglewood, and also replace public parking on streets and one existing public parking lot that will be removed to implement the ITC Project. Additional properties identified in **Table 3.0-5** or described in *Section 3.6.5* will also be used as staging areas during construction.

Approximately 650 parking spaces would be provided in a surface parking lot at the Market Street/Florence Avenue Station. Approximately 50 public parking spaces would be provided in a surface parking lot at 150 S. Market Street. Additional surface parking would be provided at the Prairie Avenue/Hardy Street Station. Acquisition of these sites is proposed for use as construction staging areas. After construction is complete, these sites will be improved as public parking lots. While additional parking

spaces will be provided at the MSF Facility site at 500 E. Manchester Boulevard, these spaces are will be dedicated for used by Vons's customers and MSF employees and visitors.

### 3.6.4 Maintenance and Storage Facility

The MSF and adjacent surface public parking lot would occupy the eastern portion of the parcel at 500 E. Manchester Boulevard, the southern portion of which is currently developed with a retail commercial building containing a Vons grocery store and other commercial businesses. and the northeast portion of which is currently developed with a gas station. The MSF Facility will be approximately 75,000 SF in size and is proposed on the eastern half of this block to allow the Vons store currently located on the block to remain on the site in a new building. A new Vons store is proposed to be built on the northwest corner of this block on the corner of Manchester Boulevard. and Hillcrest Boulevard. Demolition of existing structures and the gas station, along with a partial acquisition of this parcel, is proposed to implement the proposed Project.

### 3.6.5 Potential Permanent and Temporary Easements and Other Property Acquisitions

In addition to the anticipated acquisitions listed in **Table 3.0-5**, additional permanent and/or temporary easements may need to be acquired on private properties located immediately adjacent to existing street right of way to accommodate the following Project improvement conditions:

- Grading repairs and adjustments due to roadway, sidewalk, and hardscape improvements.
- Access and/or staging areas to construct guideway, columns, station, and roadway improvements.
- Utility service line reconfiguration necessary from utility mainline relocation/modifications.

## 3.7 CONSTRUCTION

Construction of the proposed ATS System is planned to occur in multiple phases over approximately 46 months between January 2024 and November 2027. Construction of the new replacement Vons store would occur prior to construction of the ATS System. The analysis of the potential impacts that would result from the construction of the Project is based on the definition of the phases of construction as defined in the Inglewood Transit Connector Project Baseline Construction Phasing Narrative, June 2021 provided in **Appendix F** to this Recirculated Draft EIR. To meet the schedule objectives, multiple phases would occur concurrently. Construction of the proposed Project is contingent on Project approvals; it is anticipated that the Inglewood City Council will consider the Project for approval in late 2021/early 2022. The general sequence of construction developed for analysis in this Draft EIR represents the best available information at the time of review. The following is a summary of the planned phases of the construction of the Project.

### 3.7.1 Construction Phasing

The construction phasing as described below represents a reasonable set of assumptions for analysis of the potential impacts from construction of the Project. The construction phasing described below will likely be refined as design and implementation of the Project progresses and a contractor is selected.

Prior to Phase 1 construction activities being initiated on the MSF site, the owner/operator of the Vons supermarket currently located on this site would demolish the existing Vons gas station on the corner of Manchester Boulevard and Spruce Avenue and pave this area for use as a parking area for the new Vons store to be built on the corner of Manchester Boulevard and Hillcrest Boulevard. This construction would occur over an approximate 10-month period prior to Phase 1 of the ITC construction.

#### Phase 1

Phase 1 would include demolition of buildings and site improvements on properties acquired for construction of the project, the beginning of construction of the MSF, trenching and installation of primary power duct bank, and preparatory work on the east side of Prairie Avenue to allow for the roadway shift. Phase 1 construction would start in January 2024.

Phase 1 construction would include the following:

- Demolition of buildings and site improvements on property acquired for the project. As noted below, portions of the areas to be demolished will be used for construction staging.
- Utility locations for protection in place, possible utility relocations, and new utility installation for utilities such as electrical, water, gas, storm drains, sewer, temporary traffic signals, and streetlights.
- Removal and disposal of existing sidewalks, roadways, landscape, and medians as needed, including the installation of new or temporary pavement and asphalt for road work and sidewalks, along the east side of Prairie Avenue.
- Site preparation for installation of the PDS substations, electrical equipment, and subsystems will occur at the MSF site and Prairie Avenue/Hardy Street Station Site.
- Installation of the primary power duct bank along Prairie Avenue.
- Installation of the power duct bank for the SCE power feed from the SCE Inglewood Substation to the MSF site.

The properties where existing buildings and site improvements will be demolished include the existing retail commercial center at Market Street and Regent Street, the commercial buildings located at 500 Manchester Boulevard, the commercial building at 150 S. Market Street on the northeast corner of Manchester and Market Street, the retail commercial center at northwest corner of Prairie Avenue and

Hardy Street, the commercial building at 925 S. Prairie Avenue, and the commercial building at 1003 S. Prairie Avenue.

After demolition, the remaining asphalt flatwork areas at the commercial plaza at Market Street and Regent Street, the commercial building at 150 S. Market Street, and the retail commercial center at northwest corner of Prairie Avenue and Hardy Street, will provide space for construction staging, including but not limited to, space for equipment storage, material staging and storage, contractor jobsite trailers, and on-site parking for construction staff throughout the entire project duration.

#### Phase 2

Phase 2 would include activities to enable the construction sequence of the guideway along Prairie Avenue from Hardy Street to Manchester Boulevard, and work at the MSF site. Phase 2 construction would occur in 2024 through 2025.

Phase 2 construction would include the following:

- Removal of existing sidewalks, roadways, landscaping, and demolition of other improvements as needed along the guideway alignment. This work includes new or temporary pavement and asphalt for road work and sidewalks.
- Utility work including potential relocations, protection in place where feasible, and new utility installations including but not limited to electrical, water, gas, storm drains, sewer, temporary traffic signals, and streetlights.
- Drilling of the foundations for the MSF building.
- Construct new pavement, sidewalks, streetlights, traffic signals, and other infrastructure on Prairie Avenue, and shift the roadway east to its new alignment.
- The installation of a K-Rail system on the west side of Prairie Avenue to delineate the construction area. The K-Rail system will be installed approximately twenty-two feet into the public right-of-way from the westerly face of curb on Prairie Avenue, excluding sidewalks, from Hardy Street to Manchester Boulevard and maintained until construction in this area is completed. The area within the K-Rail system will be used for the mobilization of equipment, drilling, crane operations and concrete pump outriggers for the excavation and installation of concrete foundations, concrete piles, single and double concrete columns, beam girders and cantilevered bents for the aerial construction.
- Installation of buildings for the electrical equipment and subsystems at each of the two PDS substation sites.

**Phase 3**

Phase 3 would include foundation work for the ATS guideway, foundation work for the Market Street/Florence Avenue Station, and construction for the support structure of the MSF building. Phase 3 work will include utility relocation (if necessary), foundations, cast-in-place (CIP) columns, and setting of prefabricated buildings at the PDS substations. Phase 3 construction would occur in 2024 through 2025.

Phase 3 of construction would include the following:

- Utility work including potential relocations, protection in place where feasible, and new utility installations including but not limited to electrical, water, gas, storm drains, sewer, temporary traffic signals, and streetlights.
- Removal of existing sidewalks, roadways, landscaping, and demolition as needed. This work includes new or temporary pavement and asphalt for road work and sidewalks.
- The installation of a K-Rail system on the south side of Manchester Boulevard to delineate the construction area. The K-Rail system will be installed approximately twenty-two feet into the public right-of-way from southerly face of curb, excluding sidewalks, along Manchester Boulevard from Prairie Avenue to Market Street and maintained until construction in this area is completed. The area within the K-Rail system will be used for the mobilization of equipment, drilling, crane operations and concrete pump outriggers for the excavation and installation of concrete foundations, concrete piles, single and double concrete columns, beam girders and cantilevered bents for the aerial construction.
- Installation of buildings for the electrical equipment and subsystems at each of the two PDS substation sites.
- Construction of the support structure, columns, and cross girders for MSF building.
- The installation of two rows of K-Rail system along Market Street to delineate the construction area. The K-Rail system will be installed approximately twenty-five feet into the public right-of-way in the center of Market Street, from Manchester Boulevard to Florence Avenue. The area within the K-Rail system will be used for the mobilization of equipment, drilling, crane operations and concrete pump outriggers for the excavation and installation of concrete foundations, concrete piles, single and double concrete columns, beam girders and for supports directly under the guideway.
- Drill foundations for the ATS guideway along the west side of Prairie Avenue from Hardy Street to Manchester Boulevard, the south side of Manchester Boulevard from Prairie Avenue to Market Street, Market Street from Manchester Boulevard to Florence Avenue.
- Drill foundations for the Market Street/Florence Avenue Station.
- Drill foundations for the Prairie Ave/Manchester Boulevard Station.
- Drill foundations for the Prairie Ave/Hardy Street Station.

**Phase 4**

Phase 4 construction would include foundation work for the ATS guideway, guideway column caps along Market Street, and the MSF building deck and shell. Phase 4 activities will include utility relocation (if necessary), foundations, CIP columns, guideway column caps, and installation of equipment at the PDS substations. Phase 4 construction would occur in 2025 through 2026.

Phase 4 of construction would include the following:

- Removal of existing sidewalks, roadways, landscaping, and demolition of other improvements on Manchester as needed along the guideway alignment. This work includes new or temporary pavement and asphalt for road work and sidewalks.
- Utility work including potential relocations, protection in place where feasible, and new utility installations including but not limited to electrical, water, gas, storm drains, sewer, temporary traffic signals, and streetlights.
- Installation on of the building deck, shell, and steel roof members on the MSF building.
- Construction of the support structure, columns, and cross girders, for Market Street/Florence Avenue Station.
- Construction of the support structure, columns, and cross girders, for Prairie Ave/Hardy Street Station.
- Construction of the guideway columns and column caps along Market Street.
- Installation of electrical equipment in the PDS substation buildings.
- Reconstruct sidewalk, curb, and gutter on the west side of Prairie Avenue and south side of Manchester Boulevard.
- After construction activities on the west side of Prairie Avenue are completed, construction of the east side of Prairie Avenue would begin. A K-rail system would be installed to delineate the construction area on the east side of Prairie Avenue. The K-Rail system will be installed approximately fifteen-feet into the public right-of-way starting from the easterly face of curb, excluding sidewalk, from Hardy Street to Manchester Boulevard. If needed, a temporary easement or utility setback may be utilized to secure staging areas. The area within the K-Rail system will be used for the installation of foundations, CIP columns, single and double concrete columns, beam girders and cantilevered bents for the aerial construction.
- After construction activities on the south side of Manchester Boulevard are completed, construction of the north side of Manchester Boulevard would begin. A K-rail system would be installed to delineate the construction area on the north side of Manchester Boulevard. The area within the K-Rail system will be used for the installation of foundations, CIP columns, single and double concrete columns, beam girders and cantilevered bents for the aerial construction.
- Drill foundations for the ATS guideway along the east side of Prairie Avenue from Hardy Street to Manchester Boulevard, and the north side of Manchester Boulevard from Prairie Avenue to Market Street.

**Phase 5**

Phase 5 construction would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, guideway girder along Market Street, and MSF building interior construction. Phase 5 activities will include guideway girders, guideway straddle caps, and installation of equipment at the PDS substations. Phase 5 construction would occur in 2025 through 2026.

Phase 5 construction would include the following:

- Aerial construction of the guideway on Market Street, with precast segments and/or formwork with precast trapezoidal troughs and girders. This work would include temporary closure of Market Street during the following activities for safety measures:
  - During the formwork phase, traffic would not be allowed to pass underneath the structure.
  - Traffic would not be allowed to pass underneath precast segments while they are being moved and set.
  - During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms, temporary lane closures would be necessary.
  - The staging and holding area for the delivery of precast segments, girders, and beams will be located in the Market Street/Florence Avenue Station staging area; delivery to the construction area may require street closures.
- Construction on the interior of the MSF building.
- Aerial construction of the guideway formwork for Pincay Station with precast trapezoidal troughs and steel girders, and construction of platform, mezzanine, and vertical circulation elements.
- Aerial construction of the guideway formwork for Prairie Ave/Hardy Station with precast trapezoidal troughs and steel girders, and construction of platform, mezzanine, and vertical circulation elements.
- Aerial construction of the guideway straddle cap formwork on Manchester Boulevard. This work would include temporary closure of Manchester Boulevard during the following activities for safety measures:
  - During the formwork phase, traffic would not be allowed to pass underneath the structure.
  - During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms. Temporary lane closures would be necessary.
  - The staging and holding area for the delivery of girders and beams will be located in the MSF staging area; delivery to the construction area may require street closures.
- Aerial construction of the guideway straddle cap formwork on Prairie Avenue. This work would include temporary closure of Prairie Avenue during the following activities for safety measures:

- During the formwork phase, traffic would not be allowed to pass underneath the structure.
  - During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms. Temporary lane closures would be necessary.
  - The staging and holding area for the delivery of girders and beams will be located in the MSF staging area; delivery to the construction area may require street closures.
- Installation of electrical equipment in the PDS substation buildings.

**Phase 6**

Phase 6 construction would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, completion of Pincay Station, completion of Hardy Station, and completion of the MSF building, and the elevated passenger walkway to the Metro K Line Downtown Inglewood Station. Phase 6 construction would occur in 2025 through 2026.

Phase 6 construction would include the following:

- Aerial construction of the guideway on Manchester Boulevard, with precast segments and/or formwork with precast trapezoidal troughs and girders. This work would include temporary closure of Manchester Boulevard during the following activities for safety measures:
  - During the formwork phase, traffic would not be allowed to pass underneath the structure.
  - Traffic would not be allowed to pass underneath precast segments while they are being moved and set.
  - During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms. Temporary lane closures would be necessary.
  - The staging and holding area for the delivery of precast segments, girders, and beams will be located in the MSF staging area; delivery to the construction area may require street closures.
- Completion of the MSF including building commissioning.
- Aerial construction of the guideway on Prairie Avenue, with precast segments and/or formwork with precast trapezoidal troughs and girders. This work would include temporary closure of Prairie Avenue during the following activities for safety measures:
  - During the formwork phase, traffic would not be allowed to pass underneath the structure.
  - Traffic would not be allowed to pass underneath precast segments while they are being moved and set.
- During formwork and concrete placement of the cast-in-place trapezoidal box trough and/or the uses of precast/prestressed “I” steel girders and platforms. Temporary lane closures would be necessary.

### 3.0 Project Description

- The staging and holding area for the delivery of precast segments, girders, and beams will be located in the MSF staging area; delivery to the construction area may require street closures.
  - Completion of the electrical equipment in the PDS substation buildings.
  - Aerial construction of the guideway formwork with precast trapezoidal troughs and steel girders, and completion of platform, mezzanine, and vertical circulation elements for Pincay Station.
  - Aerial construction of the guideway formwork with precast trapezoidal troughs and steel girders, and completion of platform, mezzanine, and vertical circulation elements for the Prairie Avenue/Hardy Street Station.
  - Construction of the overhead bridge across Florence Avenue, providing a passenger access walkway from the Market Street/Florence Avenue Station to the Metro K Line Downtown Inglewood Station.

#### Phase 7

Phase 7 construction would include final site work and completion of the stations. Phase 7 would occur in 2026.

Phase 7 construction would include the following:

- Final site work and paving on Manchester Boulevard.
- Completion of the Prairie Avenue/Hardy Street Station.
- Completion of the Prairie Avenue/Manchester Boulevard Station.
- Completion of the Market Street/Florence Avenue Station.
- Final site work at the MSF site.
- Final site work at the Market Street/Florence Avenue Station.
- Construction of all surface parking lots.
- Final roadway improvements and modifications, and re-stripping of streets as required.

#### Phase 8

Phase 8 construction would occur for the guideway along the entire length of the alignment and primarily includes installation of the operating systems and testing and commissioning of the ATS trains. Phase 8 construction would occur in 2025 through 2027, with the primary construction activities occurring in 2026 and some installation of equipment starting towards the end of Phase 3 construction when sufficient aerial structure is available for the installation of the equipment.

Phase 8 construction would include the following:

- Installation of the ATS track work.
- Installation, testing, and commissioning of the operation and control systems

### 3.0 Project Description

- Installation of the station platform equipment and systems, such as platform doors, passenger information systems, and ticket vending.
- Installation, testing, and commissioning of the PDS substation and power systems.
- Testing and commissioning of the ATS trains
- Station commissioning.
- This work will involve periodic temporary lane closures as needed to allow access to the aerial construction platforms, installation of equipment, completion of platforms, stations, and electrical systems, and completing roadway improvements and modifications.

The construction phases described above consist of tasks to occur in the pre-construction, surface construction, aerial construction, and light construction sequences of construction. These associated activities and tasks are described as follows.

#### Pre-Construction

Pre-construction activities would consist of assembling/drawing design packages; commencing off-site manufacturing; commencing acquisitions; relocating, modifying, or protecting in place utility lines, as needed; identifying traffic lights and signals to be relocated during construction, including preparing temporary signals and street lighting; commencing survey requirements; conducting confirmation geotechnical investigations focusing on geological, groundwater, seismic, and environmental conditions; developing a traffic control plan and determining detours and haul routes; erecting safety devices and noise barriers; identifying staging and employee parking areas for each construction phase; and mobilizing construction equipment within designated staging areas.

#### Surface Construction

The following surface construction activities will occur:

- Inspections to define demolition activities for existing building structures, facilities and utilities including open hardscapes and landscapes impacted by surface and aerial construction.
- Demolition of existing buildings where proposed.
- Removal of underground storage tanks associated with building demolition, and remediation of contaminated soil, if necessary.
- Separation of contaminated soils, if necessary, to be disposed of as soon as they are identified.
- Demolition of sidewalks and streets. Removal of existing asphalt surfaces, concrete sidewalks, and center medians.
- Clearing and grubbing including removal of landscaping as needed.
- Construction of foundations, cast-in-place (CIP) columns, and column caps for ATS guideway.
- Relocation and installation of streetlights and traffic signals.

### 3.0 Project Description

- Construction of site improvements for the MSF, PDS substations, and adjoining infrastructure.
- Construction of temporary or final concrete sidewalks, curbs, gutters, driveways, roadway improvements, striping, traffic and passenger signage, parking meters, hardscape, and landscape.

#### **Aerial Construction**

Aerial construction activities would include:

- Construction of columns and straddle bents for ATS guideway.
- Construction of aerial ATS guideway. It is assumed that the aerial segments would be constructed as precast trapezoidal troughs and/or using precast prestressed concrete “I” girder placed on CIP concrete columns, with post-tensioning strands for the guideway.
- The aerial ATS guideway would be lifted and connected into place atop the cast-in-place pile cap columns, and the top deck would be formed and poured.
- Construction of columns, straddle bents and support structures for the above-grade stations.
- Construction of the above-grade stations. The stations consist of three levels, with ground access leading to a mezzanine level and a platform level. The station would consist of structural concrete slabs with edge girders and post-tension concrete, a roof structure, and vertical circulation.

#### **Light Construction**

Light construction activities would consist of:

- Interior and exterior finishes for the MSF building.
- Interior and exterior finishes for the stations.
- ATS systems installation and testing, such as train control systems, communication systems, and electrical and mechanical systems.
- Minor roadway improvements.

#### **Construction Hours**

Construction activity would occur 24-hours a day seven days a week with primarily heavy construction activities (those involving large equipment use on site) primarily occurring over a 16 hour/day schedule with two shifts, either a morning shift from approximately 7:00 AM to 3:00 PM and an evening shift from approx. 3:00 PM to 11:00 PM, or a morning shift from approximately 7:00 AM to 3:00 PM and a night shift from approximately 11:00 PM to 7:00 AM. The night shift would be used for material deliveries, export of soil and debris and other light construction activities. However, certain heavy construction activities that necessitate temporary road closures could occur at night-time to minimize traffic impacts.

Due to site constraints, primarily along Prairie Avenue and Manchester Boulevard, just-in-time deliveries of construction materials would be required during off-peak hours and/or night hours. Additionally,

### 3.0 Project Description

construction of the elevated guideway, columns and station components that could impact Prairie Avenue and Manchester Boulevard would be primarily constructed during the off-peak hours and night hours to minimize impacts to daily commuter traffic and potential event traffic.

Delivery of construction materials would occur during the night shift, as would most temporary lane closures. Construction activities during the day shift would primarily consist of work that could proceed without requiring lane closures or material disruption to daily commuter traffic and potential event traffic along Prairie Avenue and Manchester Boulevard. Additionally, it can be anticipated that some minor activity would occur during periods in between construction shifts for logistics, moving equipment, etc.

Pursuant to the Inglewood Municipal Code,<sup>7</sup> any construction between the hours of 8:00 PM and 7:00 AM will require the approval of a permit from the Permits and License Committee of the City.

#### **3.7.3 Construction Equipment**

##### **Off-Road On-Site Equipment**

Off-road construction equipment would include impact pile drivers, auger drill rigs, excavators, backhoes, loaders, cranes, drill rig trucks, compactors, and other heavy-duty construction equipment that is not licensed for travel on public highways. Off-road equipment is inventoried based on equipment type, model, and horsepower rating.

##### **On-Road On-Site Equipment**

On-road on-site equipment would include shuttle vans transporting construction employees to and from the site(s), on-site pick-up trucks, crew vans, water trucks, dump trucks, haul trucks, street sweepers, and other on road-road vehicles licensed to travel on public roadways.

##### **On-Road Off-Site Equipment**

On-road off-site vehicles would include personal vehicles for construction employees to come and go to work, and delivery vehicles for materials and equipment.

#### **3.7.4 Workforce Estimates**

The proposed workforce estimate is based on the phases of construction, which may overlap in any calendar year. Including all contractor staff and specialty on-site professionals, the approximate workforce would be 50 to 100 for Phase 1, 100 to 140 for Phase 2, 165 to 200 for Phase 3, 210 to 240 for Phase 4, 210 to 240 for Phase 5, 165 to 200 for Phase 6, 90 to 125 for Phase 7, and 50 to 100 for Phase 8.

---

<sup>7</sup> City, Municipal Code, Section 5-41, Construction of Building and Projects Noise Regulated.

### 3.7.5 Construction Staging Areas and Employee Contractor Parking

To the extent possible, construction laydown, staging areas, and employee contractor parking for the proposed Project would be located within the alignment for the proposed facilities. Proposed staging areas are shown in **Figure 3.0-35: Proposed Construction Staging Areas and Haul Routes**. The potential staging areas include the sites for all three stations, the MSF site, and the properties at 150 S. Market Street, 401 S. Prairie Avenue, and 1035 S. Prairie Avenue proposed for acquisition as part of the Project. Further, City-owned lots near the northeast corner of the Market Street and Manchester Boulevard, and others near the proposed Project could be used for construction employee parking.

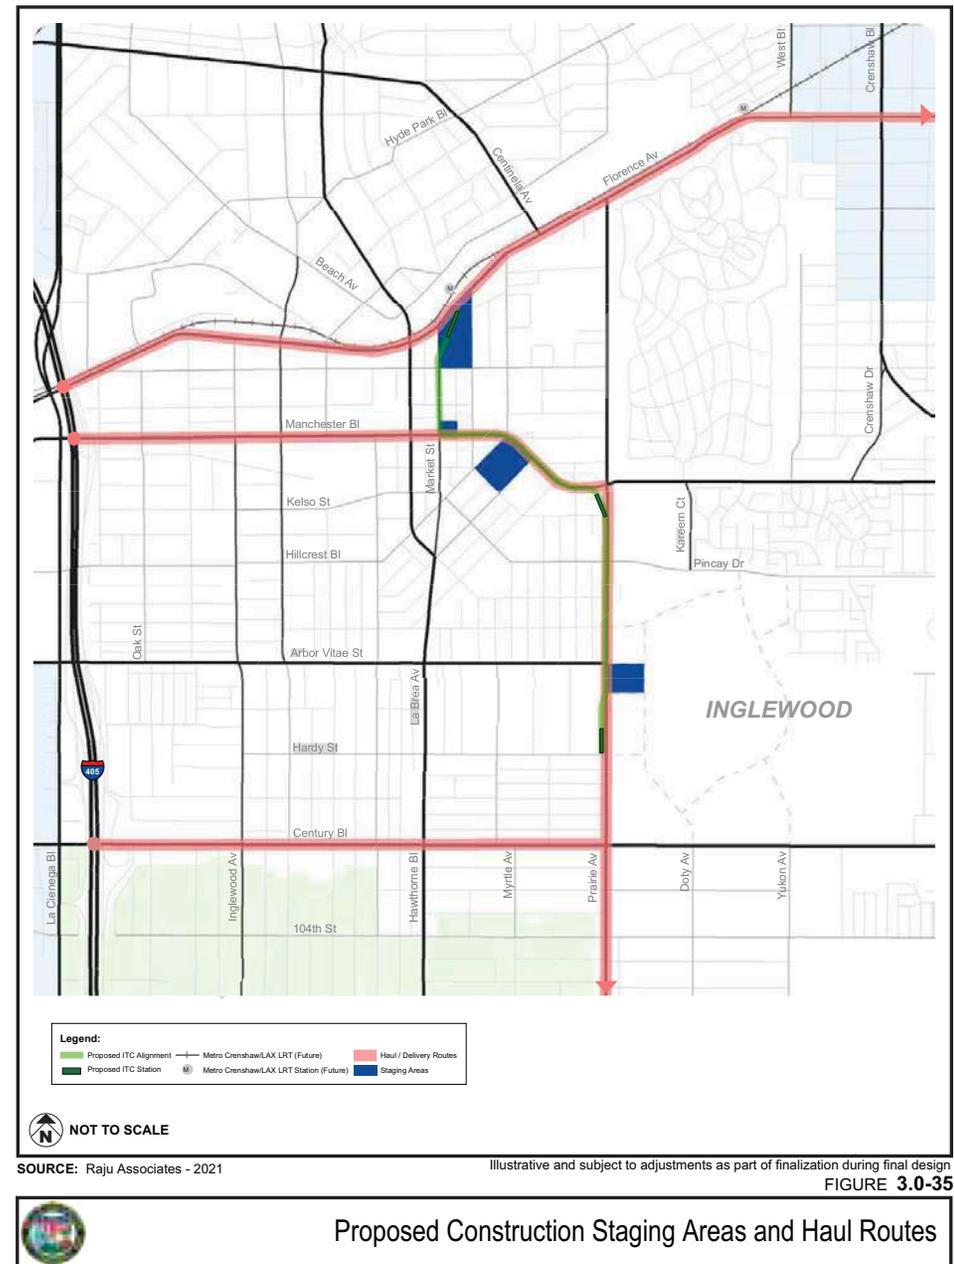

For the MSF site, a portion of the site outside the active construction footprints of the MSF and PDS substation would be used for minor construction staging, such as materials storage. Most of the site is proposed to be occupied by the reconstructed Vons supermarket and associated parking. Additionally, equipment and materials storage would also take place in the linear staging areas in the form of one lane of roadway along the length of alignment separated by K-rail.

At each construction staging area, the contractor would implement, as necessary, security and screen fencing, surveillance cameras, security personnel, and the locking and securing of equipment. Additionally, the proposed Project would incorporate various temporary construction fencing features to screen much of the construction activities along major public approaches and perimeter roadways. If necessary, contractor employees would be shuttled between construction sites and contractor employee parking areas within 1 mile of the proposed Project as needed.

### 3.7.6 Haul Routes

Designated delivery and haul routes would be established for the proposed Project consistent with the City's General Plan roadway designations and the haul routes currently used for local projects. As noted above, all haul routes would be reviewed and approved by the City as part of the Construction Commitment Program (see **Appendix D**). As shown in **Figure 3.0-35**, the primary delivery and haul routes proposed during construction of the proposed Project would utilize Florence Avenue, Manchester Boulevard, Prairie Avenue, and Century Boulevard, which have been designated by the City as appropriate for heavy truck use.<sup>8</sup> For materials delivered to and stored at designated construction staging areas, the contractor haul routes to and from the proposed Project would be generally on public streets. These routes would convey materials to and from regional routes, including the I-405 (Glen Anderson Freeway) and I-405 (San Diego Freeway).

<sup>8</sup> City of Inglewood Municipal Code, Section 3-95, Truck Routes Established. [https://www.qcode.us/codes/inglewood/view.php?topic=3-3-3\\_85&frames=0](https://www.qcode.us/codes/inglewood/view.php?topic=3-3-3_85&frames=0).

### 3.0 Project Description

It is anticipated that the haul routes closest to the respective work and staging areas of the Project alignment will be used. Excavated dirt materials may be hauled at night, where possible, due to the busier freeways and surface streets around or near the excavation site during daytime hours. An excavation plan would be prepared that defines haul routes, dust control, sweeping, and the location(s) for final disposal.

## 3.8 APPROVALS

The proposed Project includes an amendment to the City's General Plan and an amendment to Chapter 12, Planning and Zoning, of the Inglewood Municipal Code (IMC) to create an overlay zone to allow the construction and operation of the proposed Project. In addition, amendments to the City's Medical Enterprise Overlay Zone and the HPSP are proposed. The proposed Project would also include approvals related to the demolition and reconstruction of the Vons market, the reconfiguration of existing parcels through the approval of lot line adjustments, parcel maps, or tract maps and various other approvals as described below.

### 3.8.1 General Plan Amendment

The City's General Plan consists of the elements required by State law, including the Land Use, Circulation, Safety, Noise, Housing, Open Space, and Conservation Elements. The City adopted an Environmental Justice Element of the General Plan in June 2020.<sup>9</sup> The proposed Project would include amendments to the Land Use, Circulation, and Safety Elements as described below.

#### Land Use Element

The City's General Plan Land Use Element, inclusive of amendments through 2020, addresses key issues involving the use of land in the City; provides a framework of goals and objectives for decision makers as they consider the long-term commitment of land resources; and analyzes population and land use requirements into the future.<sup>10</sup>

The amendment to the General Plan Land Use Element would include changes to the text and diagrams related to the three components as described below.

First, the Goals and Objectives section would be modified to incorporate the ITC Project into the subsections addressing Circulation and the Downtown Transit Oriented District. The modified objectives address integration of the ATS system into the existing historic core area around Market Street,

---

<sup>9</sup> City of Inglewood, General Plan, Environmental Justice Element, Adopted June 2020.

<sup>10</sup> City of Inglewood, *General Plan*, "Land Use Element" (adopted 1980, amended 1986, 2009, and 2016), accessed March 2019, <https://www.cityofinglewood.org/DocumentCenter/View/132/Land-Use-Element-1980-Amended-1986-2009-2016-PDF>

### 3.0 Project Description

connecting the Downtown Inglewood Metro Rail station to the LASED including SoFi Stadium, the Forum, and the IBEC with the ITC Project, and supporting the City's goal to promote adequate public transportation within the City and the region by adding the ITC Project.

Second, a description of the proposed ITC Project would be added to the "Passenger Train Service" subsection under the "Development Factors-Transportation Network" section. The subsection provides a list of passenger train services available in the City of Inglewood.

Third, the "Downtown Transit Oriented District" subsection in the "Future Land Uses" chapter would be amended to identify the proposed Transportation Corridor Overlay Zone (TC Overlay Zone) as one of the overlay zones in Downtown Inglewood. The TC Overlay Zone would supersede all other zones and overlay zones in the Project area, including the concept plans and zoning and design guidelines outlined by the Downtown Inglewood and Fairview Heights TOD Plan.

#### Circulation Element

The amendment to the General Plan Circulation Element<sup>11</sup> would include changes to text and diagrams related to the five components described below.

First, Market Street, between Florence Avenue to the north and La Brea Avenue to the south currently has two lanes of traffic in each direction with a center turn lane. With the Project, the configuration of Market Street will be changed to have one lane of traffic in each direction between Regent Street and Manchester Boulevard with a center island. The Circulation Element currently classifies Market Street as a Minor Arterial street. Minor Arterial streets contain two lanes of traffic in each direction.; this section of Market Street will be reclassified as a Collector street; Collector streets have one lane of traffic in each direction.

Second, the Circulation Element identifies typical street sections for common right-of-way widths and sections of streets planned for widening. The second component of the proposed amendment includes defining the maximum right of way for Prairie Avenue, between Manchester Boulevard to the north and Hardy Street to the south, as 132 feet.

Third, a description of the proposed Project, including its connection to the Metro K Line, would be added to the description of light rail facilities in the City.

---

<sup>11</sup> City of Inglewood, *General Plan*, "Circulation Element" (1992), accessed March 2019, <https://www.cityofinglewood.org/DocumentCenter/View/128/Circulation-Element-1992-PDF>.

Fourth, changes to the descriptions of the street environment, parkways, medians, and on-street parking on Market Street, Manchester Boulevard, and Prairie Avenue that would be affected by the Project would be made.

Fifth, because insufficient right-of-way is available on Prairie Avenue between Manchester Boulevard and Century Boulevard to accommodate a bicycle lane, modification of the Bike Route Plan is proposed to preserve multimodal transportation options and connections for residents and employees along this section of Prairie Avenue.

### Safety Element

The Safety Element<sup>12</sup> would be amended to include descriptions of the proposed Project components including the guideway, stations MSF and PDS substations. Specifically, the proposed Project will be added to the element as a Critical Facility. The description of transportation routes would be updated to incorporate the presence of proposed Project components along its alignment.

### 3.8.2 Municipal Code Amendment

An amendment to Chapter 12, Planning and Zoning, of the IMC is proposed to create a Transportation Corridor Overlay Zone (TC Overlay Zone) that would apply to the proposed Project areas. A Zone Change and a Zoning Code Amendment are both required to establish the TC Overlay Zone. The TC Overlay Zone would modify the underlying zones to allow the development and operation of the proposed Project and all components on the properties in the underlying zones that overlap with the Project. The TC Overlay Zone would define the uses permitted in this overlay zone area and applicable supplemental development standards for the ITC facilities, and the City's design review process for the ITC Project.

The permitted uses for the TC Overlay Zone would be modeled upon, and expand on, the City's existing Transportation Corridor (T-C) Zone described in Section 12-38.5019F of the IMC, which provides the zoning framework for the Metro K Line within the City, with adjustments made to accommodate the elements necessary for an above-grade guideway, the MSF, the PDS substations, the multilevel stations, vertical circulation elements and connecting walkways and bridges, and all of the related supporting facilities and infrastructure. The proposed T-C-O Zone would allow the following as permitted uses (the TC Overlay Zone Uses):

<sup>12</sup> City of Inglewood, *General Plan*, "Circulation Element" (1992), accessed March 2019, <https://www.cityofinglewood.org/DocumentCenter/View/128/Circulation-Element-1992-PDF>.

1. The construction, operation and maintenance of any at-grade or elevated fixed guideway transportation system, including, without limitation, light rail (which may consist of an automated people mover system, automated guideway transit, monorail, and/or any other comparable system that may be steel-wheel/steel rail, rubber tired or magnetically levitated, supported on rail(s) from below, straddling, or suspended from overhead beam(s) from above), trolley, busway (including rapid transit), and/or comparable transit or transportation system, including public and private rights-of-way, easements, underground utilities, tracks, spurs, guideways, footings, support columns, support beams, and any appurtenant facilities, improvements, and equipment, including stations (which may be at-grade or elevated and comprise of one or multiple levels), maintenance facilities, storage facilities, operations control centers, related administrative and office facilities, restrooms, vertical and horizontal circulation elements (such as stairs, escalators, elevators, and passenger walkways), plazas or similar open space areas, platforms, signals, utility and storage areas, power distribution elements, electrical or traction power substations, rolling stock, and the like, that are necessary and related to the operation, maintenance and security of the transportation system.
2. Parking facilities (surface, subsurface, or structured) for transportation facilities (including such facilities' employees and users) or for use by adjacent businesses or public facilities.
3. Mobility hubs (which may be co-located with parking facilities) and multimodal pick-up and drop-off facilities.
4. In conjunction with the uses permitted in subsections (1) - (3) of this Section, property in the TC Overlay Zone may be landscaped and otherwise improved with ornamental fencing, ornamental lighting, directional and informational signage, public information and communications signage systems and all related facilities, fiber optics, emergency lighting, security systems, rest areas and seating, café or food service carts, service kiosks or structures, retail, and other similar streetscape improvements, public amenities or other uses typically found in public transit stations.
5. Station sites and maintenance or storage facility sites in the TC Overlay Zone may be jointly developed with station facilities and commercial, residential, public facility, or mixed uses.
6. As interim uses only during periods of construction, construction staging and laydown (including storage of all equipment and materials), fencing, construction-related office, and employee space (which may include restrooms and a canteen and/or food vendor area), interim parking, and ancillary temporary structures and any other temporary use approved by the Director of Public Works as reasonably related to any of the foregoing temporary or permanent uses or otherwise in the public interest.

### 3.0 Project Description

The TC Overlay Zone would also define development standards applicable to these permitted uses including the following:

- A height limit of 110 feet for station sites, 75 feet for the MSF site, and 75 feet for all other improvements, structures, and elements of the proposed Project, which include the guideway. These are height limits calculated above finished grade.
- No minimum setbacks (0' setback).
- No minimum street frontage requirements.
- Parking and public art requirements as specified in the Design Guidelines.

Additionally, development of the TC Overlay Zone Uses within the TC Overlay Zone will be subject to the Design Guidelines.

The TC Overlay Zone would specify that where the zone is overlaid on a private property, or portions thereof, any such area previously used to satisfy a minimum setback requirement in the underlying zone will still continue to be treated as a legal setback area and shall continue to be counted within any density or Floor Area Ratio calculations under the underlying zone for existing and future development purposes, regardless of whether such area is developed with the TC Overlay Zone Uses or ultimately dedicated as a public right-of-way.

The TC Overlay Zone boundaries would include the following:

- All parcels on which property rights are anticipated to be acquired to site Project infrastructure components, plus
- Along the portion of Prairie Avenue where roadway realignment is occurring, the additional width of Prairie Avenue plus an additional 30' of depth into the parcels directly east of those portions of Prairie Avenue, plus
- To the extent not covered by the above, an additional buffer of 30' around the anticipated envelope of Project infrastructure components

#### 3.8.3 Medical Enterprise Overlay Zone

The Medical Enterprise Overlay Zone applies to R-M (Residential) and C-2 (General Commercial) zoned properties located in the following Planning Areas:

- Planning Area One: Properties that are zoned R-M and located to the north of Manchester Boulevard and those C-2 zoned properties adjacent to the west side of Prairie Avenue that are located between Florence Avenue to the north and Manchester Terrace to the south.

### 3.0 Project Description

- Planning Area Two: Properties that are zoned R-M and located to the south of Manchester Boulevard and those C-2 zoned properties adjacent to the west side of Prairie Avenue that are located between Manchester Boulevard to the north and Hardy Street to the south.

The Medical Enterprise Overlay Zone currently applies to the following properties where the following Project Elements are proposed

- Prairie Avenue/Manchester Boulevard Station
- Prairie Avenue/Hardy Street Station
- Project elements proposed on the west side of Prairie not located within the public right-of-way

As part of the ITC Project, the City will amend the Medical Enterprise Overlay Zone in Chapter 12, Planning and Zoning, Article 5.1. "R-M" Residential and Medical Zone Regulations of the IMC [IMC §12-22.29] to exclude properties within the Project alignment from the Medical Enterprise Overlay Zone is proposed. The TC Overlay Zone would apply to these properties.

#### 3.8.4 Hollywood Park Specific Plan Amendment

To accommodate the ATS and to maintain the existing roadway capacity along Prairie Avenue, the ITC Project includes a relocation of an existing traffic lane on the east side of Prairie Avenue. The relocated lane would be accommodated within a variable easement for street purposes, to be acquired by the City over private property that currently comprises the existing required 30-foot setback area along the west edge of the HPSP area. While existing sidewalk widths along Prairie Avenue would be maintained, landscaping, signs and other streetscape improvements would be reduced or eliminated in certain areas following the property acquisition. To address any potential conflict or inconsistency with the HPSP, the City is proposing the following specific plan amendments and clarifications to the HPSP (which in accordance with the requirements of the Hollywood Park Development Agreement, require the concurrence of the property owner):

- The elimination of the requirement for a 30-foot setback along the western edge of the HPSP to allow zero-lot line development. Accordingly, future buildings and structures within the HPSP would be permitted to be built along the existing property line without requiring any additional setback along Prairie Avenue. Subterranean parking and certain structures, such as balconies, would be allowed to encroach within City's easement areas, to minimize the loss of the setback area on future development. Consistent with the proposed TC Overlay Zone, any area previously used to satisfy the minimum setback requirement shall continue to be counted within any density or Floor Area Ratio calculations under the Specific Plan, for existing and future development purposes, even though it may have been dedicated as a public right-of-way.

### 3.0 Project Description

- The landscape area within the 30-foot setback area on Prairie Avenue along the western edge of the HPSP area will be reduced or eliminated in certain areas, as needed to accommodate the new street easement.
- New areas where signs will be allowed will be proposed to support the replacement and relocation of existing monument and wayfinding signs currently located within the existing 30-foot setback area on Prairie Avenue along the western edge of the HPSP.
- Lastly, to support the attractiveness of the ITC Project and increase the transit mode share to the HPSP area, the City proposes to improve public safety, enhance the passenger circulation system and passenger experience to the event and activity centers at Hollywood Park by allowing for routine closures of 2 interior streets on event days to reduce passenger conflicts with vehicles within designated areas. Accordingly, to facilitate passenger only pathways on event days, the City proposes to amend the HPSP to designate Champions Way and Touchdown Drive as private streets and no longer require their public dedication (excluding subsurface, wet, dry and fiber utilities) to the City.

#### 3.8.5 500 and 510 East Manchester Boulevard

The MSF will be located on a parcel containing an existing retail commercial building at 500 E. Manchester Boulevard and 510 E. Manchester, which includes a Vons supermarket store at 500 E. Manchester Boulevard and Vons's gas station at 510 E. Manchester Boulevard. This parcel is currently designated as Historic Core (HC) and is proposed to be included as part of the TC Overlay. As part of the ITC Project, the gas station is anticipated to be demolished and a new supermarket is proposed to be constructed at the site. A City Planning Commission approval of Design Review for new supermarket store (TOD Plan §4.5 and Site Plan Review approval by the Planning and Building Department Director is required for the new grocery store (IMC § 12.39-50 et seq.). Other discretionary permits and approvals may be necessary to support the construction and operation of a new supermarket store and/or the removal of the current gas station. During construction, the City would permit the existing and new grocery store to operate with less than the amount of parking required by the City's municipal code. In addition, any current legal non-conforming uses associated with the existing grocery store, including, but not limited to, alcohol sales would be permitted to continue as legal non-conforming uses.

#### 3.8.6 Subdivision Actions, including Lot Line Adjustments, Parcel Maps, and Tract Maps

The proposed Project would require changes to the configuration and use of existing parcels owned by the City or proposed to be acquired by the City where construction of the proposed Project is proposed. Reconfiguration of existing parcels will occur as necessary either through lot line adjustments or through review and approval of a parcel or tract map.

### 3.0 Project Description

## 3.9 REQUIRED APPROVALS AND ACTIONS

The proposed Project would require a number of actions and reviews by the City, acting as Lead Agency, and other local, regional, and state agencies acting as Responsible Agencies as described below.

### 3.9.1 Lead Agency—City of Inglewood

Pursuant to Section 15051 of the State CEQA Guidelines, the City is acting as Lead Agency for the environmental review of the proposed Project. As such, it has responsibility for the approval of the Project and a number of other related actions:

- Certification of the Final EIR for the Inglewood Transit Connector Project and adoption of the Mitigation Monitoring and Reporting Plan, CEQA Findings of Fact, and, if necessary, a Statement of Overriding Considerations;
- Approval of the proposed General Plan Amendment, consisting of changes to the City General Plan Land Use Element, Circulation Element, and Safety Element;
- Approval of an amendment to Chapter 12 (Planning and Zoning) of the Inglewood Municipal Code to:
  - Add the Transportation Corridor Overlay (T-C-O) Zone; and
  - Amend the Medical Enterprise Overlay Zone to exclude properties within the Project alignment.
- Approval of amendments to the Forum Development Agreement to reflect the acquisition of frontage along Prairie (including loss of Forum parking);
- Approval of a Special Use Permit required for demolition of a gas station, Design Review for the new supermarket, and any other discretionary approval required for a new supermarket at 500 and 510 East Manchester Boulevard;
- Approval of amendments and clarifications to the Hollywood Park Specific Plan and associated Development Agreement;
- Preparation of a Project-specific Stormwater Management Plan or Standard Urban Stormwater Mitigation Plan for approval;
- Approvals of lot line adjustment(s), parcel map(s), and tract map(s) as needed;
- Approval of agreements and/or resolutions necessary to acquire the property necessary for construction and operation of the Project, in fee simple or through easements, licenses, air rights, leases, or other means of access, including through eminent domain;
- Approval of the ITC Design Guidelines;
- Approval of a contract or contracts for the design, finance, construction, and operation of the proposed Project;
- Approvals for federal, State, or local financing plans or grants.

### 3.0 Project Description

In addition to the above, ministerial approvals may be required as follows:

- Grading permits, building permits, haul route approval, and other permits issued by the Department of Building and Safety for the Project and any associated Department of Public Works permits (including encroachment permits) for infrastructure improvements;
- Tree removal permits; and
- Noise permit for Construction and Building Hours extension.
- Other federal, State, or local approvals, permits, or actions that may be deemed necessary for the Project including, but not limited to, the following:
  - California Public Utilities Commission;
  - Los Angeles County Fire Department.

#### 3.9.2 Responsible Agencies

The following State, regional, and other agencies have jurisdiction or review authority over components included in the proposed Project:

- South Coast Air Quality Management District (SCAQMD) would review permits for equipment regulated by SCAQMD;
- County of Los Angeles (as the City's contractor) Fire Department approval;
- Permits or approvals required from the Los Angeles Regional Water Quality Control Board (LARWQCB), which may include, but are not limited to: (1) General Construction Stormwater Permit; (2) Standard Urban Stormwater Mitigation Plan; (3) Industrial Stormwater General permit; and (4) Submittal of a Recycled Water Report to the LARWQCB for the use of recycled water as a dust control measure for construction;
- The Los Angeles County Sanitation District has authority for a Sewer Main Re-Alignment Permit, if applicable;
- The Los Angeles County Flood Control District has authority for a Storm Drain Realignment/Connection Permit, if applicable;
- California State Transportation Agency (CalSTA) for oversight and compliance for the Transit and Intercity Rail Capital Program (TIRCP) grant; and
- The Southern California Edison Company for any changes to the electrical distribution and service system.

## 4.0 ENVIRONMENTAL IMPACT ANALYSIS

### 4.0.1 INTRODUCTION

This Recirculated Draft EIR evaluates the physical environmental effects that would potentially occur from implementation of the proposed Project. The structure of the technical sections included in this section is discussed below, and definitions of key terms that are used throughout this Recirculated Draft EIR are provided. In addition, this section includes a description of certain possible environmental impacts that are typically considered under CEQA but are not analyzed in detail in this Recirculated Draft EIR because it was determined the proposed Project would have no impact. This section also provides a discussion of the Adjusted Baseline Environmental Setting and the identification of other past, present, or reasonably foreseeable projects that are used in the analysis of cumulative impacts throughout this chapter.

### 4.0.2 DEFINITIONS OF TERMS USED IN THE EIR

This Recirculated Draft EIR uses a number of terms that have specific meaning under CEQA. Among the most important of the terms used in the Recirculated Draft EIR are those that refer to the significance of environmental impacts. The following terms describe environmental effects of the proposed Project:

#### Significance Criteria

A set of criteria used by the lead agency (City of Inglewood) to determine at what level or threshold an impact would be considered significant. Thresholds of significance are identifiable quantitative, qualitative, or performance levels of a particular environmental effect that are supported by substantial evidence.<sup>1</sup> Thresholds of significance used in this Recirculated Draft EIR include those standards provided by the City, unless otherwise specifically defined.

- **No Impact:** No impact means that the proposed Project would result in no direct or indirect adverse changes (or impacts) to the environment, with respect to the applicable significance criterion. A project impact with a no impact determination would also not contribute to a cumulative impact. Where the proposed Project would not have an impact, the impact statement states this definitively.
- **Less-than-Significant Impact:** A project impact is considered less than significant when the physical change caused by the proposed Project would not exceed the applicable significance criterion.
- **Potentially Significant Impact:** A potentially significant impact is identified where the proposed Project may cause a substantial adverse change in the environment, depending on certain unknown conditions related to the proposed Project or the affected environment. For CEQA purposes, a potentially significant impact is treated as if it were a significant impact. A project impact is considered potentially significant if the proposed Project is anticipated to exceed identified standards of

<sup>1</sup> CEQA Guidelines section 15064.7.

significance thereby result in a substantial adverse change in the physical conditions of the environment. Significant impacts are identified by the evaluation of project-related physical change compared to specified significance criteria.

- A **Significant Impact** is defined as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance.”<sup>2</sup> In instances where potentially significant impacts are identified, the EIR must consider whether mitigation measures (as defined below) or alternatives to the proposed Project would reduce those impacts.
- **Significant and Unavoidable Impact:** A project impact is considered significant and unavoidable if it would result in a substantial adverse physical change in the environment that cannot be feasibly mitigated to a less-than-significant level.
- **Cumulative Impact:** Under CEQA, a cumulative impact refers to “two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.”<sup>3</sup> “[A] cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts.”<sup>4</sup> A project has “cumulatively considerable” environmental effects (i.e., is significant) when “the incremental effects of [the] project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.”<sup>5</sup>

### Mitigation Measures

Where a potentially significant impact or significant and unavoidable impact is identified, feasible mitigation measures that could minimize the identified significant adverse impact are required.<sup>6</sup> A mitigation measure is an action that could be taken that would avoid or reduce the magnitude of a significant impact. CEQA Guidelines section 15370 defines mitigation as:

- Avoiding the impact altogether by not taking a certain action or parts of an action;
- Minimizing impacts by limiting the degree of magnitude of the action and its implementation;
- Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment;
- Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; and
- Compensating for the impact by replacing or providing substitute resources or environments, including through permanent protection of such resources in the form of conservation easements.

<sup>2</sup> 2020 California Environmental Quality Act (CEQA) Statute and Guidelines (CEQA Guidelines) section 15382.

<sup>3</sup> CEQA Guidelines section 15355.

<sup>4</sup> CEQA Guidelines section 15130, subd. (a)(1).

<sup>5</sup> CEQA Guidelines sections 15065, subd. (a)(3), 15130, subd. (a), 15064, subd. (h)(1).

<sup>6</sup> CEQA Guidelines section 15126.4.

### 4.0.3 SECTION FORMAT

This section is divided into technical sections (e.g., **Section 4.1: Aesthetics**) that present for each environmental resource topic area the regulatory setting, the physical environmental setting, standards of significance from which impacts are measured, analytical methods, an evaluation of potential impacts to the environment, and, where required, potentially feasible mitigation measures for identified significant impacts. Each section includes an analysis of project-specific and cumulative impacts for each topic area.

The following topic areas are addressed in this section:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Energy Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Land Use and Planning
- Noise and Vibration
- Population, Employment, and Housing
- Transportation and Traffic
- Tribal Cultural Resources
- Utilities and Service Systems

The topical environmental sections each begin with a description of the proposed Project’s **regulatory setting** and the **environmental setting** (existing conditions) as it pertains to a particular topic. The environmental setting provides a point of reference for assessing the environmental impacts of the proposed Project.

- The regulatory setting presents relevant information about federal, State, regional, and/or local laws, regulations, plans or policies that pertain to the environmental resources addressed in each section.
- The environmental setting describes existing conditions at the time the NOP was circulated for the proposed Project (July 2018). An **adjusted baseline** is considered in this Recirculated Draft EIR (see discussion below in *Section 4.0.4*) to account for nearby development in the Los Angeles Sports and Entertainment District (LAESD), Hollywood Park Specific Plan (HPSP).
- Each technical environmental section includes a discussion of whether there are any inconsistencies between the proposed Project and applicable general plans, specific plans, and regional plans.

Next, each section presents **significance criteria**, which identify the standards used by the City to determine the significance of effects of the proposed Project. CEQA Guidelines state that “a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies or

recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.”<sup>7</sup>

A **methodology** and **assumptions** description in each section presents the analytical methods and key assumptions used in the evaluation of effects of the proposed Project and is followed by an **impacts** and **mitigation measures** discussion.

The impact and mitigation portion of each section includes one or more impact statements. Any Project Design Features relevant to the topic being analyzed are identified. An explanation of each impact is followed by an analysis of its significance. The impact discussion ends with a concluding statement regarding the significance of the impact. Direct, indirect, short-term, long-term, on-site, and/or off-site impacts are addressed, as appropriate, for the environmental topic area being analyzed. Depending on the significance criteria, the impact analysis may consist of a qualitative discussion, a quantitative analysis, or a combination of both. Detailed technical appendices are also provided for several technical sections, where appropriate, and can be located at the end of the document.

Mitigation measures pertinent to each individual impact, if necessary, appear after the impact discussion section. The magnitude of reduction of an impact and the potential effect of that reduction in magnitude on the significance of the impact is also disclosed. Potential **mitigation measures** for potentially significant impacts are identified as appropriate. The description of mitigation measures concludes with the **level of the significance** of the impact after application of the mitigation measure(s): either implementation of the mitigation measure(s) would reduce the impact to a less-than-significant level, or the impact would remain significant and unavoidable after implementation of all potentially feasible mitigation measures.

An example of the format of each of the is shown below.

#### **Impact 4.X-1: Impact statement (significance conclusion)**

##### **Construction and/or Operation**

In the impact statement, terminology is used to indicate the level of significance of the impact. If an impact is less than significant, then the impact statement would say that the proposed Project “could” affect a resource. If an impact is potentially significant or

<sup>7</sup> CEQA Guidelines section 15064.7, subd. (c).

significant and unavoidable, then the impact statement would say that the proposed Project “would” affect a resource.

A discussion of the proposed Project’s impact is provided in paragraph form. A statement level of significance before application of any mitigation measures is provided.

#### **Mitigation Measures**

**MM XX-X** Mitigation measure presented in bolding and numbered to match the impact number.

#### **Level of Significance After Mitigation**

This paragraph describes how the mitigation measure(s) reduces the impact and identifies the residual level of impact.

#### **Cumulative Impacts**

A cumulative impact analysis is provided for each section. As previously noted, a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts. The proposed Project’s impacts are evaluated against other related projects that are within the same geographic area that is applicable to the topic (i.e., water service area, air basin, etc.). A project has a “cumulatively considerable” environmental effect (i.e., a significant impact) when “the incremental effects of [the] project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.”

#### **4.0.4 ADJUSTED BASELINE**

The CEQA Guidelines provides that an EIR must include a description of the physical environmental conditions in the project vicinity.<sup>8</sup> It also allows for a lead agency to define existing conditions by conditions expected when the proposed Project becomes operational, when supported by substantial evidence.

#### **Development Projects**

The proposed Project is not expected to be complete and operational until 2027. At this time, the City has approved construction plans or issued building permits for, and construction has commenced on, significant portions of the LASED and HPSP located immediately east of the proposed Project and stations on Prairie Avenue.

These projects provide for substantial development that would occur since the release of the NOP and

<sup>8</sup> CEQA Guidelines section 15125, subd. (a).

prior to the start of construction and operation of the proposed Project. As such, the conditions of the existing baseline would be different from when the NOP was released.

Construction and operation of the Adjusted Baseline projects would change the physical conditions that currently exist in the vicinity of the proposed Project for most of the environmental topics addressed in this EIR. Due to the reasonable certainty that the Adjusted Baseline projects would be constructed and in operation prior to construction and operation of the proposed Project, the City has determined that assuming the Adjusted Baseline projects in the baseline provides the most accurate picture of the proposed Project's impacts and that it would be misleading to disregard the Adjusted Baseline projects in the establishing the baseline.

Accordingly, the changes associated with Adjusted Baseline projects are considered as part of the Adjusted Baseline Environmental Setting, which is the baseline against which the proposed Project's potential impacts are measured. How these changes affect the environmental setting is further described in each topical section under the heading Adjusted Baseline Environmental Setting.

The Adjusted Baseline projects are listed in **Table 4.0-1: Adjusted Baseline Projects**.

**Table 4.0-1  
Adjusted Baseline Projects**

Land Use	Adjusted Baseline Projects	Estimated Operational Date
<b>Hollywood Park Specific Plan (HPSP)</b>		
Retail	518,077 SF	September 2021
Office	466,000 SF	September 2021
Residential	314 units	May 2021
NFL Stadium	70,000 seats (2,772,304 SF)	Summer 2020 – Now Open
Perform. Venue	6,000 seats	Fall 2020
Open Space	11.89 acres	Fall 2020
Civic Use	4 acres	Fall 2020

## Roadways

A number of physical improvements are required as mitigations and/or conditions of approval of the Hollywood Park Specific Plan, are related to the City's ongoing Century Boulevard Improvement Plan or are associated with the Metro K Line project. These improvements either are under construction or are approved and funded and scheduled; the improvements would be in place under all adjusted baseline condition scenarios. The full list of improvements is described further in **Section 4.12: Transportation**.

## Transit

The Adjusted Baseline conditions transit network would differ considerably from existing conditions due to completion of Metro's K Line project prior to 2024. Ridership forecasts for a 2025 condition were used to represent the Adjusted Baseline condition.

Metro is also studying changes to its bus system through the NextGen Bus study, but future changes to bus service are not yet defined and so would be speculative to assume. Therefore, the Adjusted Baseline conditions analysis assumes the existing bus routes that serve the area would remain in operation at opening year of the proposed Project.

### 4.0.5 CUMULATIVE IMPACT METHODOLOGY

#### Cumulative Impacts

The CEQA Guidelines<sup>9</sup> require that an EIR discuss cumulative impacts of a project when a project's incremental effect is cumulatively considerable.<sup>10</sup> As defined in the CEQA Guidelines,<sup>11</sup> a cumulative impact consists of an impact that is created as a result of the combination of a project evaluated in the EIR together with other past, present, and reasonably foreseeable projects causing related impacts. CEQA Guidelines section 15130, subdivision (b) requires that the discussion of cumulative impacts shall "reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the project alone."

In each topical section of the EIR, an analysis of cumulative impacts follows the project-specific impacts and mitigation measures evaluation. An introductory discussion that identifies the cumulative impact methodology and defines the cumulative context being addressed in each respective analysis (e.g., the South Coast Air Basin, or the City) is included at the beginning of the cumulative impact analysis in each technical section. In some instances, a project-specific impact may be considered less than significant, but its contribution to a larger impact may be determined to be potentially significant when considered in combination with other cumulative development of the surrounding area or in combination with regional growth projections.

<sup>9</sup> CEQA Guidelines section 15130.

<sup>10</sup> *Ibid.*

<sup>11</sup> CEQA Guidelines Section 15355.

### Cumulative Project List

The City has identified cumulative projects focused on those projects that were proposed as of August 2020. **Figure 4.0-1: Cumulative Projects Map** identifies the locations of these cumulative projects. **Table 4.0-2: Cumulative Projects List** provides a list of all past, present, and reasonably foreseeable projects.

To understand the proposed Project’s contribution to cumulative impacts, the City, in consultation with other surrounding jurisdictions, has assembled a list of other known past, present, and reasonably foreseeable cumulative projects in the vicinity of the proposed Project. Projects on this list consist of development projects within the City or other identified surrounding jurisdictions that have a pending development application, are approved, or are under construction, and transit and related infrastructure improvement projects that have been approved or proposed and under review.

#### 4.0.6 SENSITIVE RECEPTORS

Sensitive receptors include, but are not limited to, hospitals, schools, daycare facilities, elderly housing convalescent facilities, and temporary housing (hotels and motels). These are areas where the occupants are more susceptible to the adverse effects of adverse impacts, such as increased noise and exposure to toxic chemicals, pesticides, and other pollutants. Certain population groups, such as children, elderly, and acutely and chronically ill persons (especially those with cardio-respiratory diseases), are considered more sensitive to the potential effects of air pollution than others.<sup>12</sup> As a result, certain land uses that are occupied by these population groups, such as residences, schools, playgrounds and childcare center, hospitals, rehabilitation centers, convalescent centers, and retirement homes are considered to be air quality sensitive land uses, i.e., air quality sensitive receptors. Sensitive receptors for noise include residences, schools, hospitals, libraries, and parks.

**Figure 4.0-2: Project Area Quarter Mile Buffer** identifies the area of quarter mile area used to identify the sensitive receptors. Within one quarter mile of the proposed Project including the guideway, stations, MSF, 61 sensitive receptors have been identified as shown in **Figure 4.0-3a-c: Map of Sensitive Receptors**. Sensitive receptors for noise are detailed further in **Section 4.10: Noise**.

12 South Coast Air Quality Management District, 1993. *CEQA Air Quality Handbook*. November 1993.

**Table 4.0-2  
Cumulative Projects List**

No.	Project	Address	Project Description
<b>City of Inglewood</b>			
1	Starbucks Drive-Thru Kiosk	1740 Centinela Avenue	Construct 900 SF Starbucks drive-thru kiosk
2	Commercial Building	721 N. La Brea Avenue	Demolish 1,210 SF and add 1,312 SF to an existing commercial building
3	Condominiums	329 E. Hazel Street	Development of 4-unit Condo with 10 parking spaces per SP-1229
4	Parking Lot Improvement	2616-2878 W. Imperial Highway	Renovation and adding 13,000 SF, facade and parking lot improvement of an existing shopping center
5	Condominiums	501 E. 99th Street	12 new condominiums
6	Apartments	704 N. Market Street	12 new residential apartment units
7	Senior Center	111 N. Locust Street	New Senior Center
8	Condominiums	664 E. Manchester Terrace	Four (4) new residential condominiums
9	Apartments	844 N. Centinela Avenue	Four (4) new residential apartment units
10	Apartments	125 E. Spruce Avenue	Seven (7) new apartment units with semi-subterranean parking
11	Manufacturing/Warehouse w/ Office	234 W. Hyde Park Boulevard	Construct new 140,185 SF manufacturing/warehouse building including 7,500 SF of office space
12	Parking Lot	279 W. Beach Avenue	Development of 190 parking spaces
13	Townhomes	573 1/2 E. Hyde Park Place	Construct three townhomes with 6 enclosed parking spaces
14	Senior Housing	508 S. Eucalyptus Avenue	40-unit senior affordable housing development
15	Residential Project	575 E. Hyde Park Boulevard	Three-unit two-story residential building
16	Office Project	401 W. Arbor Vitae Street	Addition of four new offices in office complex and one new bathroom, demolish existing bathroom and existing office space, and add 4 new parking spaces
17	Townhomes	333 N. Prairie Avenue	310 townhome units at the former Daniel Freeman site
18	Commercial Building	408 E. Warren Lane	New two-story 2,542 SF commercial building
19	Gas Station w/ Mini-Mart	8307 S. La Cienega Boulevard	Construct a new 3,636 SF structure (mini market and retail space) at an existing gas station operation
20	Mixed-Use Project	D3 SITE (La Brea Avenue/Florence Avenue)	243 units; 40,000 SF retail

No.	Project	Address	Project Description
21	Centinela Hospital	555 W. Hardy Street	<ol style="list-style-type: none"> <li>West Tower: Upgrades including the remodel of the main building entrance and the south elevation and seismic upgrades in compliance with SB 1953</li> <li>Electrical Upgrade: A campus-wide electrical upgrade that includes construction of a new 5,900 SF repair shop building and 4,200 SF electrical yard with three emergency generators and a 16,000 gallon underground fuel tank for 72 hour emergency power at the northeast corner of the campus on Flower Street</li> <li>Emergency Department: A new 2,400 SF addition and redesigned front entrance to the Emergency Department including new admitting, triage, and waiting areas, and expanding the capacity of the Emergency Department by eight beds (total of 52 beds)</li> <li>Loading and Delivery Areas: Other upgrades that includes the demolition of two building (totaling 6,200 SF), the partial demolition of a 4,670 SF building, addition, or rehabilitation of various buildings and relocation of the delivery and loading areas from the emergency room area to the rear of the campus</li> </ol>
22	Hollywood Park Project (note: this project is also part of the Adjusted Baseline)	1050 S. Prairie Avenue	70,240-seat sport stadium; 6,000-seat performance venue; 2,500 du residential; 890,000 SF retail; 780,000 SF office; 300-room hotel; 24.95 acres open space; 4 acres civic site
23	Apartments	417-433 Centinela Avenue	116-unit apartment
24	Residential	3660 W. 107th Street	New 3 du with 6 car garage
25	Congregate Care	614 E. Hyde Park Boulevard	18-bed congregate living facility
26	Apartments	921 N. Edgewood Street	38-unit apartment
27	Townhomes	113-133 Plymouth Street	20-unit townhome development
28	Condominiums	316 Hardy Street	5-unit condominium development
29	Self-Storage Project	705-715 N. Centinela Avenue	81,613 SF, approximately 400-unit, five-story self-storage
30	Retail	101,125,139,140,150 Market Street	40,000 SF retail and 150 parking spaces
31	Hotel Project	11111 S. Prairie Avenue	120-room hotel
32	Murphy Bowl Project (Clippers arena)	Yukon Avenue/Century Boulevard	18,500-seat venue with associated ancillary uses
33	Imperial/Crenshaw TOD	Imperial Highway/Crenshaw Boulevard	Transit oriented development plan
34	Westchester/Veterans TOD	Florence Avenue/Hindry Avenue	Transit oriented development plan

Meridian Consultants  
208-001-18

4.0-10

Inglewood Transit Connector Project  
November 2021

No.	Project	Address	Project Description
35	Downtown (Florence/La Brea) TOD (note: although proposed Project includes development of a station at this site with additional surface parking; it does not preclude development of the site as noted in the Downtown TOD)	Florence Avenue/La Brea Avenue	Transit oriented development plan
36	Fairview Heights (Florence/West) TOD	Florence Avenue/West Boulevard	Transit oriented development plan
37	Hollywood Park Phase II	1050 S. Prairie Avenue	Approximately 5,250,000 SF of office
38	Condominium Development	961 E. 68th Street	3-unit detached condominium
39	Multifamily Development	411 E. Hazel Street	18-unit multifamily building
40	Multifamily Development	222 W. Spruce Avenue	10-unit multifamily building
41	Multifamily Development	819 E. La Palma Drive	5-unit multifamily building
42	Condominium Development	417 N. Market Street	Two 6-unit condominium buildings
43	Congregate Living Facility	814 N. Market Street	Construction of a new 12 unit, 5,163 SF congregate health, residential care facility
44	Los Angeles Philharmonic Association - Youth Orchestra Program (YOLA)	101 S. La Brea Avenue	Los Angeles Philharmonic Association - Youth Orchestra Program that would serve students 6 - 18 Yrs. Expand the existing structure to a venue that is approximately 25,500 SF. The venue would serve as the home for YOLA performances, special events showcasing guest artists and LA Phil's national education programs, and some other performances. There would be 350-500 students from Monday to Saturday and around 150 on Sundays
45	Apartment Building	3920 W. 108th Street	3-unit apartment building
46	Self-Storage Facility	943-959 W. Hyde Park Boulevard	Five-story self-storage facility (159,498 SF)
47	General Plan Amendment for Rental Car Facility	8911 Aviation Boulevard	General Plan Amendment for rental car facility (173,804 SF)
48	General Plan Amendment to Incorporate Environmental Justice Element	Citywide	General Plan Amendment to incorporate Environmental Justice Element
49	Hotel	3900 W. Century Boulevard	Hotel renovation 4 units
50	Senior Housing and Pre-school	3320 W. 85th Street	65 unit senior housing and a 4,313 SF pre-school to replace existing church, pre-school (serving 70 students)
51	Multifamily	332 Stepeny Street	8-unit multifamily building with 3 affordable housing units

No.	Project	Address	Project Description
253	Data Center/Office	445 N. Douglas Street	New 314,288 SF data center to replace 223,000 SF land use (106,000 SF office and 117,000 SF warehouse industrial)
254	El Segundo Corporate Campus	710 N. Nash Street	611,545 SF office plus 13,660 SF retail on an existing vacant parcel
255	Office	1950 E. Grand Avenue	93,569 kSF office
256	Hotel	101 Continental Boulevard	167-room hotel
257	Data Center/Office	444 N. Nash Street	Demolition of 11,769 SF and construction of 75,435 SF data center. New total: 180,422 SF data center
258	Hotel	1960 E. Grand Avenue	150-room hotel
259	Residential	425-429 Indiana Street	8 residential units
260	Condominiums	616-620 W. Imperial Hwy	12 unit condominiums
261	Condominiums	301, 303, 305 W. Palm Avenue	7 unit condominiums, replacing existing 9-unit apartments
262	Mattel Grand Way Project - Phase II	455 Continental Boulevard and 1955 E. Grand Avenue	New fourteen-story 300,000 SF R&D office tower and 810-space parking structure (existing 55,000 SF office)
263	Walgreens	331 N. Pacific Coast Hwy	67 kSF retail
264	Parking Structure	525 N. Sepulveda Boulevard	1,029 space 328,532 kSF parking structure
265	Mixed-Use Commercial	141 Main Street	12,550 kSF mixed-use commercial
266	Warehouse, Office, Manufacturing	900, 950 Sepulveda Boulevard & 960, 901 - 915 Selby Street	20,819 kSF warehouse, 139,558 kSF office, 14,025 kSF manufacturing; from existing 80,165 kSF warehouse, 72,084 kSF office, 2,554 kSF manufacturing
267	Senior Assisted Living Facility	540 E. Imperial Avenue	304 senior housing residential units or 58 single and multifamily (175,000 SF); previously 22.5 kSF school
268	Indoor Ice Rink	555 N. Nash Street	17,315 kSF indoor ice rink
269	Office	116 W. El Segundo Boulevard	38 kSF office
270	In-N-Out Burger Fast-Food Restaurant with Drive-Thru	600-630 Sepulveda Boulevard	Existing Sizzler (sit-down dining) to become 3,714 kSF fast-food restaurant with drive-thru
271	Light Industrial	123 Lomita Street	10,764 kSF light industrial
272	General Office	2130 E. Maple Avenue	20,955 kSF general office
273	Research and Development	140 Sheldon Street	7,116 kSF research and development office, replacing 1,756 industrial building
274	Restaurant	2171-2191 Rosecrans Avenue	13,57 kSF restaurant
275	LA Air Force Base - Area A	SE Aviation Boulevard	Remove office 835 kSF; add 525 units condominiums
276	Fast-food Restaurant with Drive-Thru	740 Pacific Coast Highway	Existing Credit Union Bank (8,100 SF) to be replaced with 4,696 gSF fast-food restaurant with drive-thru

No.	Project	Address	Project Description
277	Hotel	707 Pacific Coast Highway	116-room hotel replacing 7.82 kSF restaurant
278	Mixed-use	2120 Rosecrans Avenue	240 kSF office; 66 kSF studio and production facilities; 7 kSF retail on existing vacant land
279	Pro Shop and Hitting-bay	400 S. Pacific Coast Highway	Three-story (71 kSF) hitting-bay and accessory use (restaurant, bar, meeting and event space) to replace existing 2,500 SF pro shop and driving range
280	Office Addition	140 Oregon Street	Additional 70 kSF office to existing office building
281	Mixed-use	401-615 N. Pacific Coast Highway	Replace existing parking lot with 263-unit apartments and 11 kSF retail/restaurant
282	Mixed-use	212 Eucalyptus Drive	Replace existing warehouse (5.35 kSF) with 13,485 kSF office and 634 SF café/food-to-go
283	Office	2221 E. Park Place	Additional 27,478 kSF office to existing office (56.6 kSF)
<b>City of Lawndale</b>			
284	Lawndale Annex	14899 Aviation Boulevard	289-unit condominium
285	Grevillea Gardens	4430 W. 153rd Street	41-unit condo and mixed use
286	Condominiums	4741 & 4743 W. 165th Street	4-unit condominium
287	Duplex Development	15133 Osage Avenue	2-unit duplex
288	Del Taco	16606 Hawthorne Boulevard	New fast food restaurant
289	Duplex Development	4212 W. 162nd Street	2-unit duplex
290	Condominiums	4720 & 4724 W. 164th Street	4-unit condominium
291	Duplex Development	4136 W. 160th Street	2-unit duplex
<b>County of Los Angeles</b>			
292	Proposed Aviation Station Project	11604 Aviation Boulevard	Lot 1: 281-unit condo/townhomes; 5 kSF retail/commercial; Lot 2: 112-unit apartment and 21.5 kSF retail/commercial
293	West Los Angeles Community College Master Plan	Overland Avenue at Freshman Drive	Approximately 291,300 SF of new building and renovation. Anticipate future student population of approximately 18,904 students and 1,248 employees by Fall 2022. Project includes second access road, parking structures, landscaping and development of athletic facilities
294	Lennox Charter High School	11044 and 11111 Freeman Avenue	560 students
295	Marina Expressway Homes	Marina Expressway Eastbound & Mindanao Way	28 single family condominiums

4.0 Environmental Impact Analysis

No.	Project	Address	Project Description
335	Civic Center	Avenue on the west. In addition to the major north-south arterial Hawthorne Boulevard, the DHSP area includes the east-west segments of Imperial Highway, 120th Street, El Segundo Boulevard, and Rosecrans Avenue	A public-private partnership opportunity that can have a mix of civic, hotel, retail and housing uses that frame a community gathering space A mid-scale mixed-use development that helps catalyze the southern portion of Hawthorne Boulevard. Medium and higher density residential development An underutilized corner that can become a new, dynamic public space. No set dates. DT Hawthorne Specific Plan design ideas suggest a local plaza for the community
336	South Bay Ford		Proposed outlet but no set date for development - existing a shuttered mall
337	St. Joseph's Plaza		
338	Hawthorne Mall Site		
339	Green Line Specific Plan Project (Dinerstein Companies Residential)	SE corner of Crenshaw Boulevard and Jack Northrop Avenue	230 du apartments and 3,700 SF of restaurant
340	Icon at Rosecrans	14135 Cerise Avenue	127 residential units (affordable housing)
341	Marriott Hotels (Courtyard and TownePlace Suites)	4427 El Segundo Boulevard	350 rooms and full-service restaurant
342	Hilton Hotel (Garden Inn)	11519 Acacia Avenue	119-room hotel
343	Residential	11845 Grevillea Avenue	Condos 13 units
344	Residential	3222 W. 139th Street	Condos 7 units
345	Residential	3670 W. Imperial Highway	96 condominium units with 2,000 SF retail space
346	Residential	3857 W. 139th Street	Condos 12 units
347	Residential	13403 Kornblum Avenue	Condos 12 units
348	Residential	14128 Kornblum Avenue	Condos 100 units
349	Residential	14412 Yukon Avenue	Condos 11 units
350	Residential	11416 Inglewood Avenue	Condos 13 units
351	Residential	14105-14137 Chadron Avenue	109 residential units (24 units affordable to moderate income households)
352	Residential	14004 Doty Avenue	22 residential units (6 units moderate income households)
353	Hotel	5151 El Segundo Boulevard	129-room hotel with minimum of 125 parking spaces
354	Costco Gas Station Expansion	14501 Hindry Avenue	Costco gas station expansion
355	Costco Gas Station	12530 Prairie Avenue	Costco gas station
356	Residential	12021 Hawthorne Way	3 single family homes
357	Mixed Use	3670 Imperial Highway	approximately 13,938 SF of commercial and 48 condominiums

## 4.1 AESTHETICS

### 4.1.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) evaluates the impacts of the proposed Inglewood Transit Connector Project (proposed Project or ITC Project) on aesthetics and visual character, obstruction of views, nighttime illumination, light and glare, and shading. The evaluation of aesthetics and visual character impacts considers the existing visual character of the area along the proposed alignment, and how implementation of the proposed Project would affect this visual character. The evaluation of view impacts considers existing viewsheds and visual resources that may be affected by the development of the Project alignment. The analysis of light and glare assesses the effects of new sources of nighttime lighting and glare from the reflection of sunlight or artificial light from any reflective surface that would be created by the Project. This section also evaluates patterns of shading that would be created by the proposed Project and the effect on uses along the proposed alignment.

Prior to the preparation of the December 2020 Draft EIR, a Recirculated Initial Study was prepared using the California Environmental Quality Act (CEQA) Environmental Checklist Form to assess potential environmental impacts associated with aesthetics. For two of these screening thresholds, the Initial Study found that the proposed Project would result in a “Less than Significant Impact,” and thus, no further analysis of these topics in an EIR was required. The following Initial Study screening criteria related to aesthetics do not require any additional analysis in this Recirculated Draft EIR:

- Impacts related to a substantial adverse effect on a scenic vista were evaluated and determined to be “Less than Significant” in the Initial Study. As discussed therein, the City of Inglewood (City)’s General Plan does not designate any scenic vistas within the City or its vicinity. Additionally, no views of regional mountain ranges, focal points, or broad panoramic view corridors are available from public rights-of-way along the proposed alignment. Therefore, impacts on scenic vistas from the proposed Project would be **less than significant**.
- Impacts related to substantial damage to scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway were evaluated and determined to be “Less than Significant” in the Initial Study. As discussed therein, the Project alignment is not located in the vicinity of a designated scenic highway. Thus, no trees or historic resources on the Project alignment are located within a State scenic highway. Additionally, no rock outcroppings are present on or near the Project alignment. Therefore, impacts on scenic resources within a State scenic highway from the proposed Project would be **less than significant**.

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the Project in response to consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. Changes to the Project relevant to the potential effects on the aesthetic and

visual character of the area include defining Project design features that address the visual characteristics of the Project as described below in *Section 4.1.7.1: Project Design Features*. Specific changes to the Project related to potential effects on the visual and aesthetic character of the areas surrounding the proposed alignment include raising the height of the ATS guideway along Market Street to preserve existing views of historic buildings, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard to avoid impacts on Kelso School, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue.

The changes to the design of the Project do not create the potential for significant impacts related to scenic vistas or scenic resources as described above. There are no designated scenic vistas within the City or its vicinity nor would the revised Project be located within a State scenic highway.

Impacts found to be less than significant are further discussed in **Section 6.0: Other Environmental Considerations**.

Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Draft EIR.

## **4.1.2 OVERVIEW**

### **4.1.2.1 Aesthetic Resources**

Aesthetic resources include a range of visual elements, including landforms, vegetation, water features, the urban design characteristics of an area, and the architecture present in an area that define how an observer experiences a place through sensory interaction. Factors considered include visual character, scenic resources, and scenic vistas. These factors, which describe the aesthetic character of a particular area are described further below.

#### ***Visual Character***

Visual character describes the unique combination of aesthetic resources, scenic elements, and landscape characteristics that contribute to the identity of a particular place. These components provide for the visual sensory interaction with a particular place by users who experience it. This interaction constitutes the basis of the overall impression a place has upon the observer. In urban settings, these characteristics largely include land use type and density, urban landscaping and design, architecture, topography, and background setting.

## ***Scenic Resources***

Scenic resources typically include natural open spaces, topographic formations, and landscapes that contribute to a high level of visual quality. They also include ridgelines, parks, trails, nature preserves, sculpture gardens, the built environment, and similar features that are critical in shaping the visual character and scenic identity of a given area and surrounding region.

## ***Scenic Vistas***

Scenic vistas are generally described in two ways: panoramic views which is visual access to a large geographic area, for which the field of view can be wide and extend into the distance; and focal views providing visual access to a particular object, scene, or feature of interest. In general, scenic vistas are the range by which scenic resources may be observed. This definition combines visual quality with information about view exposure to describe the level of interest or concern that viewers may have for the quality of a particular view or visual setting.

## **4.1.3 METHODOLOGY**

### **4.1.3.1 Visual Character**

Impacts on visual character were determined by comparing existing visual conditions at and around the proposed Project area alignment with the change in these conditions that would result from implementation of the proposed Project. The study area for the aesthetics analysis comprises the Project alignment and adjacent areas. The Project area includes the Automated Transit System (ATS) components, including the guideway, stations, and support facility sites (maintenance and storage facility [MSF] including the Vons supermarket, and power distribution system [PDS] substations ), and properties adjacent to the ATS and proposed components.

The methodology used to assess visual character impacts considers how the proposed Project would affect views of the area. This assessment focuses on views of the proposed Project along major roadways and on other public viewpoints where visual change would occur with implementation of the proposed Project. Public viewpoints of the Project area available to the general public traveling to or near the Project are located along Market Street, Manchester Boulevard, and Prairie Avenue.

Establishing the basis for the analysis also involved collecting and reviewing existing plans and guidelines in effect within or adjacent to the Project area that address design, architecture, and landscaping. These plans include the Hollywood Park Specific Plan<sup>1</sup> (HPSP) and the New Downtown and Fairview Heights

---

<sup>1</sup> City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015.

Transit-Oriented Development Plan and Design Guidelines (Downtown TOD).<sup>2</sup> These plans define the standards for development within these areas.

#### 4.1.3.2 Light and Glare

Light and glare also influences the visual character of an area. The provision of adequate and appropriate lighting and limiting glare and the potential for glare are fundamental safety requirements in the design of any large facility or structure. The analysis focuses on light spillover effects, which involve light that shines beyond the area intended for illumination that can be a source of annoyance to adjoining properties, particularly for residences where light (e.g., direct illumination) might disturb sleep or privacy. Glare—both daytime reflection of sunlight off large expanses of reflective surface (cars, buildings, or structures) and unshielded nighttime lighting (outdoor or indoor)—can also have adverse effects. Accordingly, this section also addresses the potential for the proposed Project to: (1) introduce new light sources that could adversely affect nearby light-sensitive receptors (e.g., residential uses, hotels, and natural areas); and (2) introduce new light or glare sources that could adversely affect day or nighttime views in this area.

#### 4.1.4 REGULATORY FRAMEWORK

##### 4.1.4.1 State Regulations and Directives

###### *California Department of Transportation (Caltrans) Scenic Highway Program*

The Caltrans Scenic Highway Program<sup>3</sup> protects and enhances the natural scenic beauty of California's highways and corridors through special conservation treatment. Caltrans defines a scenic highway as any freeway, highway, road, or other public right-of-way that transverses an area of exceptional scenic quality. Caltrans designates a scenic highway by evaluating how much of the natural landscape a traveler sees and the extent to which visual intrusions degrade the scenic corridor. No officially designated scenic highways are located within the City.

##### 4.1.4.2 Local Regulations and Directives

###### *City General Plan*

The City General Plan including the Land Use Element,<sup>4</sup> was adopted in August 1968 and was amended in 1980, with additional amendments, including the latest amendment in 2020. Goals, objectives, and

<sup>2</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, November 1, 2016.

<sup>3</sup> Caltrans, *Scenic Highways*, <https://dot.ca.gov/programs/design/lap-landscape-architecture-and-community-livability/lap-liv-i-scenic-highways>, accessed July 30, 2020.

<sup>4</sup> *City of Inglewood General Plan, "Land Use Element"* (adopted 1980, last amended 2020), <https://www.cityofinglewood.org/DocumentCenter/View/132/Land-Use-Element-1980-Amended-1986-2009-2016-PDF>.

policies of the City's General Plan Land Use Element applicable to this aesthetics section of the Draft EIR are outlined as follows:

#### Land Use Element

The Land Use Element sets forth Citywide policies for the general location and intensity of land uses, and includes the following goals and policies that are relevant to the proposed Project in this section:

##### *Downtown Transit Oriented District Goals and Policies (as amended September 2016)*

- Goal 1:** Downtown is a place to live, work, shop, recreate, and be entertained.
- Policy 1.1:** Mixed Use Development. Encourage a range of residential, retail, office, recreational, and institutional uses in the Historic Downtown to create a vibrant urban district and support local business.
- Policy 1.2:** Ground Floor Uses and Storefronts. Require uses that activate pedestrian activity such as retail on major streets and plaza frontages. Require that storefronts be historically-sensitive, attractive, and transparent in the Historic Downtown.
- Goal 2:** Downtown is a revitalized yet forward-looking gathering place for the community.
- Policy 2.1:** Public Gathering Places. Create public spaces in key locations in the public right-of-way and on privately-owned land. In particular, create a central plaza along Market Street between Florence Avenue and Regent Street and/or in the adjacent parcels suitable for eating, resting and people watching, but also for festivals, concerts, and events at special times.
- Policy 2.3:** Preservation of Historic Fabric. Require the preservation of buildings that have been designated as historic and encourage the reuse of other historic buildings. Maintain the sense of place in areas with historic fabric and/or meaning such as Market Street between Regent Street and Hillcrest Avenue and the Hillcrest neighborhood east of Locust Street.
- Goal 6:** Downtown expresses the unique culture of Inglewood.
- Policy 6.1:** Districts. Define the following unique districts within the Downtown TOD area, each with their own unifying character or

identity that should be preserved and enhanced: Historic Downtown, Civic Center, TechTown, Beach Avenue, Fairview West, Hillcrest and Queen Street.

**Policy 6.2:** Performing Arts. Build on assets such as the Fox Theater, Forum and Hollywood Park to establish Downtown Inglewood as part of an Inglewood entertainment and performing arts hub serving both the City and the region.

**Policy 6.3:** Visual Arts. Commission public art to provide an attractive environment for residents, employees, and visitors. Take steps to ensure a continuing role for the Inglewood art community in Downtown's visual and performing arts.

#### **Goals and Objectives (as adopted January 1980)**

- Promote Inglewood's image and identity as an independent community within the Los Angeles metropolitan area.
- Improve the visual appearance and economic condition of the existing arterial commercial development along Inglewood's major streets.

#### **Open Space Element**

The Open Space Element<sup>5</sup> sets forth Citywide policies for current and future recreation needs of the community for park land and recreation facilities. It is also a plan for the conservation or creation of open spaces to mitigate the effects of increasing urbanization of Inglewood. Since Inglewood lacks any natural resource such as a lakeshore or riverbank, the Element focuses on two basic types of open space: the traditional city park and the nonpark open space, including public plazas, landscaped boulevards, and greenbelts between buildings on private property. The following policy is relevant to the proposed Project in this section:

**Policy 1:** The City of Inglewood and its redevelopment agency, in reviewing and approving development plans, shall require the provision of landscaped plazas and gardens when possible, and the provision of landscaping within building setbacks and parking lots.

<sup>5</sup> City of Inglewood General Plan, "Open Space Element" (adopted 1973, last amended 1995), <https://www.cityofinglewood.org/DocumentCenter/View/132/Land-Use-Element-1980-Amended-1986-2009-2016-PDF>.

#### **New Downtown and Fairview Heights Transit-Oriented Development Plan and Design Guidelines**

The New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines<sup>6</sup> (Downtown TOD Plan) covers the Downtown Inglewood and Fairview Heights neighborhoods of the City and works to implement the City's vision for transforming the quality of the environment within these areas. The Downtown TOD Plan area consists of approximately 585 acres located in the center of Inglewood along the new Metro K line just east of the Florence Avenue/La Brea Avenue intersection. This TOD Plan area extends approximately one-half mile in all directions from the Metro K line Downtown Inglewood Station (Downtown Inglewood Station). The Downtown TOD Plan planning and zoning area also extends approximately one-half mile in all directions from the Downtown Inglewood Station.

The Downtown TOD Plan includes concept plans, zoning, development standards and design guidelines, and an implementation action plan for consideration by applicants submitting any proposals for new construction or rehabilitation within the Plan area, as well as for consultation by City Staff when making recommendations for project approvals. The Downtown TOD Plan addresses architectural detail, signage, public art, and civic and cultural life. Further, the Downtown TOD Plan includes street tree concepts, including recommended street tree locations and species along roadways within the Downtown and Fairview Heights neighborhoods.

Section 2.8: Street Trees and Furniture<sup>7</sup> of the Downtown TOD Plan establishes that street trees are important elements of streetscapes and placemaking and provides guidelines on the character of trees placed within key areas of Downtown Inglewood. The Downtown TOD Plan recommends that Manchester Boulevard be lined with London Plane (*Platanus x acerifolia*) trees, or a similar species. This tree's ability to withstand air pollution, drought, as well as most diseases makes it a desirable street tree that would also provide some uniformity and connectivity for Downtown Inglewood. In the case of Florence Avenue, the Downtown TOD Plan calls for London Plane trees alternated with the California fan palm (*Washingtonia filifera*). Market Street should retain its existing street trees. The smaller arterial streets near Market Street may alternate between the Brisbane box (*Lophostemon confertus*), an evergreen tree, and the ginkgo (*Ginkgo biloba*), a deciduous tree. The Downtown TOD Plan states that these smaller street trees bring down the scale of the streets and create a sense of place throughout the streets of Downtown Inglewood.

<sup>6</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, November 1, 2016.

<sup>7</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, November 1, 2016, Section 2.8: Street Trees and Furniture, p. 19.

### **Hollywood Park Specific Plan**

The HPSP<sup>8</sup> establishes development standards and design guidelines for the 238-acre Hollywood Park site at the northeast corner of the Prairie Avenue and Century Boulevard intersection and provides an overview of existing infrastructure and necessary improvements related to the site, including measures for implementation measures of the plan. The site is currently under development and with SoFi Stadium constructed and operating and ongoing development of a 6,000-seat entertainment venue, parks, and retail, office, housing, entertainment, gaming, hotel, and civic uses.

The HPSP includes guidelines and standards for improvements in the public right-of-way within the plan area, which includes approximately 0.5 miles of street frontage along South Prairie Avenue. The HPSP also provides integrated and coordinated landscape design guidelines for new development along the perimeter of the Plan area with the objective of promoting land use compatibility, particularly along South Prairie Avenue.

The HPSP includes streetscape standards and provides integrated and coordinated landscape design guidelines for new development along the perimeter of the HPSP area to integrate it with the adjoining urban fabric, achieve a diverse urban forest, and assist in developing districts of distinctive and appropriate character.<sup>9</sup> Sidewalk widths are intended to provide walking routes and parkway widths are designed to provide sufficient area for urban tree growth. The HPSP guidelines and standard for streetscape include identity elements that would differentiate Hollywood Park from nearby developments through architectural features, landscaping (such as seasonal displays of color), graphic elements (such as signs or logos), special pedestrian or automobile paving, special night lighting effects, or other similar features.

The HPSP, Section 3.2.2: Streetscape, identifies selected street trees and the desired locations for their placement on internal roadways within the HPSP area as well as along major adjacent roadways, including Prairie Avenue, Century Boulevard, and the intersection corner of those roadways.<sup>10</sup> A majority of the tree species listed in the HPSP were selected from the City's approved tree list.<sup>11</sup> Selections were based upon recommendations from local arborists to create a palette of horticulturally successful, low maintenance, and climate-appropriate tree species. Alternative selections can be proposed, subject to City approval.

---

8 City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015. <https://www.cityofinglewood.org/DocumentCenter/View/1347/Hollywood-Park-Specific-Plan>.

9 City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Section 3.2.2, Streetscape, p. 3-28.

10 City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Section 3.2.2, Streetscape, Exhibit 3-25—Landscape Street Sections Map, p. 3-28.

11 City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Section 3.2.2, Streetscape, Exhibit 3-25—Landscape Street Sections Map, p. 3-28.

The HPSP states that street trees along Prairie Avenue shall be substantial and continuous to achieve an appropriate scale for the street.<sup>12</sup> Along the portion of Prairie Avenue north of Hardy Street, large columnar evergreen trees such as Afghan pine (*Pinus eldarica*) or Canary Island pine (*Pinus canariensis*) would provide continuity with the retail development to the east and the cemetery to the north. This arrangement is intended to visually reduce the scale of the street and provide ample shade as visitors approach the HPSP site. Both Prairie Avenue south of Hardy Street and the northern side of Century Boulevard would be similarly lined with large evergreen trees such as camphor trees (*Cinnamomum camphora*) or Southern magnolia (*Magnolia grandiflora*). In addition, large canopy flowering trees and palms would mark key points near the HPSP site, including the retail corner and major entries, and maintain adequate street visibility. Selected species include Date palm (*Phoenix dactylifera*), Chanticleer Callery pear (*Pyrus calleryana*), and pink trumpet tree (*Tabebuia impetiginosa*). Palm trees at the northeastern corner of Prairie Avenue and Century Boulevard are intended to provide a thematic connection to Century Boulevard near the Los Angeles International Airport (LAX).

### **City Municipal Code**

The City Planning and Zoning Code Chapter 12, Planning and Zoning identifies zoning districts and land use classifications, land use regulations, development standards, and environmental standards. The Zoning Ordinance is intended to protect and promote the public's health, safety, and general welfare, and to implement the policies of the comprehensive General Plan.

### **Lighting and Signage**

Lighting and signage are also regulated by the Inglewood Municipal Code Chapter 12,<sup>13</sup> which defines minimum standards to safeguard life, health, property, and the public welfare by regulating and controlling the design, quality of materials, construction, size, height, location, and maintenance of all signs, sign structures, and other exterior advertising devices.

### **Tree Preservation**

The Municipal Code Tree Preservation<sup>14</sup> recognizes the importance of both native and nonnative trees within the City. Properly maintained trees increase property values, maintain the natural ecology, temper the effects of extreme temperatures, reduce runoff, prevent erosion of topsoil, and help create and maintain the identity and visual character of the City. Prior to removing or cutting a protected tree in the City, a permit must be approved by the City's Parks, Recreation, and Library Services Department.

---

12 City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Section 3.2.2, Streetscape, p. 3-29.

14 Inglewood, California, Municipal Code, Article 32, Section 12-110 (2012), Tree Preservation.

## City Design and Development Standards/Design Review Process

The City's Design and Development Standards,<sup>15</sup> supplements the Municipal Code with design standards and guidelines for development. The City has established a design review process and design standards to accomplish the following:

- To maximize freedom, creativity, and innovation in the architecture, landscape design and graphics of each individual project within the framework of constraints imposed by the community's need to control development for the health, safety, and general welfare of its citizens.
- To promote a visually attractive, safe, and well-planned community through the use of sound design techniques.
- To protect citizens from unsafe or unsightly conditions.
- To minimize potential nuisances to the uses surrounding the new development.
- To preserve and maximize the image, character, and visual quality which is making Inglewood an attractive place to live and work.

Additionally, The Municipal Code outlines the design review process required for development in the "D" Supplemental Design Review Zone.<sup>16</sup> This supplemental designation includes the TOD Mixed Use 1, TOD Mixed Use 2, and Historic Core zones.

### 4.1.5 EXISTING CONDITIONS

#### 4.1.5.1 Aesthetics and Views

##### *City of Inglewood*

The proposed Project is located entirely within the City, approximately 5.5 miles east of the Pacific Ocean, within a broad coastal plain surrounded by rising land to the south and north, and more-level terrain extending east. The City is a highly developed urban area containing moderately dense development along major corridors that consist of commercial, residential, and industrial uses. The street corridors provide the only long-range views available in the City, including limited views of Baldwin Hills to the north and other urban areas in and surrounding the City. Overall, the views within and surrounding the City are consistent with the views of a highly developed urban area.

No designated or otherwise identified scenic views or vistas are located within or visible from the City.<sup>17</sup> The City's General Plan states that no forest resources, wildlife, fisheries, shorelines, or agricultural land are present in the City,<sup>18</sup> nor does the General Plan designate any scenic vistas within the City or its vicinity.

<sup>15</sup> City of Inglewood, *Technical Background Report* (2006), Design and Development Standards, adopted January 30, 1979.

<sup>16</sup> City of Inglewood, Municipal Code Ch. 12, art. 14 (2010).

<sup>17</sup> Google Earth, 2020.

<sup>18</sup> City of Inglewood *General Plan*, "Conservation Element" (1997), 1.

Further, there are no designated or eligible State scenic highways within or adjacent to the Project area.<sup>19</sup> The nearest State scenic highway is Interstate 110 between mile post 25.7 and 31.9, which is located north of downtown Los Angeles and south of Interstate 210 in Pasadena. The closest portion of this scenic highway is approximately ten miles northeast of the Project boundary.

Additionally, the Project area is not near any designated wild or scenic rivers pursuant to the National Wild and Scenic Rivers System.<sup>20</sup> The nearest mountains, the Santa Monica Mountains, are more than 10 miles north of the Project boundary. No views of these mountains or of any other focal points or broad panoramic view corridors are available from public rights-of-way along the proposed alignment.

## Project Area

### Market Street Segment

The Market Street Segment begins at the intersection of Market Street and Florence Avenue and terminates at the intersection of Market Street and Manchester Boulevard. Aside from the shopping center and the vacant lot immediately south of Florence Avenue, this section of Market Street is composed primarily of low-rise commercial buildings and storefronts along a narrow two-lane roadway, with the exception of the former Fox Theater building, which includes structural components rising above most other nearby structures. Pedestrian sidewalks are landscaped with planters and street trees and street amenities such as benches, decorative streetlights, and decorative street posts. Landscaped medians divide the slightly curving two-lane roadway to define an intimate setting and slow traffic, with metered parking spots lining either side of the roadway to allow patrons to stop and shop at local businesses.

### Manchester Boulevard Segment

The Manchester Boulevard Segment begins at the intersection with Market Street and ends at the intersection with Prairie Avenue. Low-rise commercial buildings are located on both sides of Manchester Boulevard with storefronts making up the majority of the building facades along the roadway. Two parking lots approximately a block in length line the street adjacent to Hillcrest Boulevard on either side of the roadway, supporting two commercial shopping centers. Residential and church uses are also adjacent to Manchester Boulevard in smaller numbers, appearing as low-rise buildings along the roadway.

This segment of Manchester Boulevard includes two travel lanes in each direction with a median turn lane throughout the entire segment. Occasional concrete medians with street signs divide the lanes going in opposite directions and accommodate turn pockets. Metered parking spaces are located along the

<sup>19</sup> California Department of Transportation, California Scenic Highway Mapping System, Los Angeles County, [http://www.dot.ca.gov/hq/LandArch/16\\_livability/scenic\\_highways/](http://www.dot.ca.gov/hq/LandArch/16_livability/scenic_highways/), accessed August 2018.

<sup>20</sup> US Fish and Wildlife Service, *National Wild and Scenic Rivers System*, available at <https://www.rivers.gov/>, accessed August 31, 2018.

roadway. Sidewalks are provided on both sides of the street with palm trees, and streetlights on simple gray. Street signs are attached to the poles of the streetlights to help direct traffic with arrows and speed limits. Billboards containing large advertising displays are located on sides of the street. Limited landscaping is provided along this segment. Street benches and trash receptacles of simple design can be found at the bus stops along this segment.

#### **Prairie Avenue Segment**

The Prairie Avenue Segment begins at the intersection with Manchester Boulevard and ends at the intersection with Hardy Street. Low-rise commercial buildings, often with adjacent surface parking lots occupy the majority of the area to the west of Prairie Avenue. Located between Nutwood Street and Kelso Street is the Kelso Elementary School with single story structures that are simple in design. The playground and sports facility at the school is raised and located adjacent to Prairie Avenue. Single- and multifamily residential buildings, one- to two-stories in height, are also located along this segment of Prairie Avenue.

The Forum is located on the east side of Prairie Avenue between Manchester Boulevard and Pincay Drive. The Forum is a large circular building surrounded by an expansive surface parking lot, with vehicle entrances along Prairie Avenue. South of Pincay Drive is SoFi Stadium and a mixed-use community under development in the HPSP area. SoFi Stadium, which opened in September 2020, is located southeast of The Forum property and south of Pincay Drive. The SoFi stadium features a translucent roof which covers the stadium proper, the adjacent pedestrian plaza, and the attached performance venue. The stadium bowl contains open sides as part of its design. The majority of the HPSP site is currently under construction and consists of vacant graded areas enclosed by windscreen fences. Temporary construction lighting is visible throughout the site. Entrances to the construction site with security checkpoints are visible along the west side of Prairie Avenue.

Prairie Avenue includes three travel lane lanes in each direction, with a turn lane at the center of the roadway and additional right turn lanes in some locations Sidewalks are provided on both sides of Prairie Avenue with limited landscaping and street trees. Traffic signs are affixed on gray traffic poles and gray streetlight poles are located along the street. Multiple driveways are located along both sides of the street to allow for vehicles to enter parking lots and construction sites. A stretch of landscaped median extends from south of Arbor Vitae Street to just north of Hardy Street.

#### **4.1.5.2 Light and Glare**

The entire Project alignment is located in a highly urbanized area containing numerous light sources that generate varying degrees of light. Nighttime lighting is necessary to provide and maintain safe, secure, and attractive environments. However, these lights have the potential to produce spillover light and glare if

designed incorrectly. Light sources located close to light-sensitive receptors, such as residential units at nighttime, are most relevant for this analysis.

As described below, existing light sources in the Project area are typical of a highly developed area containing commercial and residential uses. The Project area does not contain any sources of light or glare that currently interfere with daytime or nighttime visibility. The existing levels of lighting are typical for a mix of commercial and residential uses located in an urban area, and there are no existing sources of light or glare that affect existing uses along these street segments.

#### **Market Street Segment**

Sources of existing ambient light along the Market Street Segment includes streetlights, vehicle headlights, traffic lights, and lighting from parking lots and commercial buildings. There are no existing light sensitive uses located along this segment of Market Street, such as residential dwellings and hotels/motels.

The facades of buildings along Market Street primarily include non-reflective materials that do not create glare. Existing nighttime sources of glare are primarily associated with vehicle headlights traveling throughout the area.

#### **Manchester Boulevard Segment**

Sources of nighttime illumination on Manchester Boulevard consist of light sources commonly found in developed urban areas, including streetlights, vehicle headlights, traffic lights, and lighting from adjacent buildings. This segment includes residential homes on the north side of the street between Manchester Drive and Osage Avenue which are currently exposed to these sources of light.

The facades of buildings along this segment primarily include non-reflective materials that do not contribute to glare. Existing nighttime sources of glare are primarily associated with vehicle headlights traveling on Manchester Boulevard and adjacent streets.

#### **Prairie Avenue Segment**

Nighttime lighting on Prairie Avenue consists of light sources commonly found in developed urban areas, including streetlights, vehicle headlights, traffic lights, lighting from buildings located along the street and lighting associated with billboards located along this segment of Prairie Avenue. Residential and motel uses located west of Prairie Avenue are currently exposed to these light sources.

East of Prairie Avenue, nighttime lighting associated with the surface parking lots surrounding the Forum and HPSP are also visible from the residential and motel uses west along Prairie Avenue. The parking lot lights at the Forum and HPSP are similar in intensity to the adjacent streetlights. Although located

throughout the large surface parking lots and along the perimeter, these lights are shielded and directed and result in limited light spillover onto these light-sensitive uses.

The facades of buildings along this segment primarily consist of non-reflective materials that do not contribute to glare conditions. Existing nighttime sources of glare are primarily associated with vehicle headlights traveling on Prairie Boulevard and adjacent streets.

#### 4.1.5.3 Adjusted Baseline Conditions

The Adjusted Baseline Environmental Setting as described in **Section 4.0: Environmental Impact Analysis, 4.0-5: Adjusted Baseline** is considered in this analysis. The residential, office, retail, and entertainment uses associated with the Adjusted Baseline projects would result in changes to the visual conditions east of Prairie Avenue within the HPSP area.

The Champion Park neighborhood planned between Arbor Vitae Street and Hardy Street west of Prairie Avenue would accommodate a range of housing types with a residential gateway constructed at the intersection of Arbor Vitae Street and Prairie Avenue. Street trees along this segment of Prairie Avenue would be primarily Afghan Pine (*Pinus eldarica*) planted along the sidewalks and the roadway median.<sup>21</sup>

At the intersection of Hardy Street and Prairie Avenue a primary point to the HPSP community is planned as a gateway consisting of substantial structures and signage to introduce patrons to the retail and entertainment located west of Prairie Avenue from Hardy Street to Century Boulevard. Street trees south of Hardy Street would be Camphor (*Cinnamomum camphora*) trees. Street trees on the east side of Prairie Avenue would be substantial in stature, ranging from 40 feet to 50 feet in height and create a buffer between this area and Prairie Avenue.<sup>22</sup>

All exterior lighting at the HPSP would be directed onto the driveways, walkways, and parking areas and shielded to minimize glare and light spill onto adjacent properties and streets. In addition to lighting on vertical structures, specialty lighting would be used to highlight architectural elements, landscaping, and building tenant and project signage. Security and safety lighting would also be provided as necessary in parking areas, service passages, and common areas. All lighting would be directed toward the ground wherever feasible or screened to minimize illuminating surrounding areas and minimize glare and interference with vehicular traffic. Additionally, building facades and windows would be constructed of non-reflective materials to avoid glare impacts on surrounding residential properties and streets. While

<sup>21</sup> City of Inglewood. Hollywood Park Specific Plan. Adopted July 8, 2009. Amended September 2014 and February 2015.

<sup>22</sup> City of Inglewood. Hollywood Park Specific Plan. Adopted July 8, 2009. Amended September 2014 and February 2015.

the new buildings and site improvements in the HPSP area would substantially change the visual environment east of Prairie Avenue, these changes would not conflict with nearby uses.<sup>23</sup>

#### 4.1.6 THRESHOLDS OF SIGNIFICANCE

Criteria outlined in CEQA Guidelines were used to determine the level of significance of aesthetics impacts. The Project would have a significant impact in relation to aesthetics if it would result in the following

<b>Threshold AES-1a</b>	<b>Substantially degrade the existing visual character or quality of public views of the site and its surroundings.</b>
<b>Threshold AES-1b</b>	<b>Be inconsistent with applicable zoning and planning regulations governing scenic quality.</b>
<b>Threshold AES-2</b>	<b>Create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area.</b>

#### 4.1.7 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

The project includes the ITC Design Standards and Guidelines (Design Guidelines) and Construction Commitment Program (CCP) as described in **Section 3.0: Project Description**. The CCP addresses temporary effects during construction of the Project. The Design Guidelines describe the design standards and features of the proposed Project.

##### 4.1.7.1 Project Design Features

The following measures in the Design Guidelines and CCP address the potential effects on visual character of the area along the proposed alignment, and how implementation of the proposed Project would affect this visual character:

##### PDF AES-1 Construction (CCP)

Construction activities during evening and nighttime hours may require the use of temporary lighting. To minimize the impact of temporary lighting on adjacent properties, the following measures shall be implemented:

- Temporary lighting will be limited to the amount necessary to safely perform the required work and will be directed downwards and shielded. Care shall be taken in the placement and orientation of portable lighting fixtures to avoid directing lights toward sensitive receptors, including automobile

<sup>23</sup> City of Inglewood. Final Environmental Impact Report. I. Introduction Executive Summary. <https://www.cityofinglewood.org/DocumentCenter/View/125/I-Introduction-Executive-Summary-PDF>. Accessed November 30, 2020.

drivers. Motorists and sensitive receptors shall not have direct views of construction light sources. Light sensitive receptors include but are not limited to residential areas and transient occupancy uses.

- Light trespass shall not exceed one foot-candle above ambient light level as measured at any adjacent residential and transient properties.
- Temporary sidewalks and any sidewalk adjacent to construction activities shall be illuminated to City Standards to protect public safety.
- To minimize the visual effects of construction the following measures shall be implemented:
  - Visually obtrusive erosion control devices, such as silt fences, plastic ground cover, and straw bales should be removed as soon as the area is stabilized.
  - Stockpile areas should be located in less visibly sensitive areas and pre-approved by the City. Stockpile locations, laydown, and staging areas shall be accessed by construction vehicles with minimal disruption near residential neighborhoods.

#### **PDF AES-2 Tree Replacement (CCP)**

A Tree Removal and Replacement Plan will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and shall adhere to the following principles:

- Tree removal and replacement shall comply with the City of Inglewood Municipal Code and the ITC Design Standards and Guidelines.
- Removal of existing healthy and flourishing trees will be avoided where feasible.
- New permanent replacement trees shall be a 36-inch box of the same species as those removed, if appropriate for the location and not in conflict with new infrastructure. Alternative locations shall be approved by the City's Public Works Department.
- New permanent replacement palm trees shall be a minimum of 20 feet in height.
- The Contractor shall permanently replace trees within six (6) months of restoration and completion of that portion of streets that may impact the tree. To the extent feasible, the Contractor shall permanently replace trees on an ongoing basis so long as doing so does not conflict with future construction.
- If construction of the project requires pruning of native tree species, the pruning shall be performed in a manner that does not cause permanent damage or adversely affect the health of the trees.
- The Contractor shall maintain all permanent trees and other landscaping installed by the Contractor for a period of three (3) years from the date of planting and shall warranty the trees and landscaping for one (1) year after planting. Prior to the end of the one-year warranty period, the City and the Contractor will conduct an inspection of all permanent replacement trees and landscaping for general health as a condition of final acceptance by the City. If, in the City's determination, a permanent replacement tree or landscaping does not meet the health requirements of the City, then the Contractor shall replace that tree within thirty (30) days. For any permanent trees or landscaping that

must then be removed, the original warranty shall be deemed renewed commencing from when the tree or landscaping is replaced.

#### **PDF AES-3 Lighting (Design Standards and Guidelines)**

##### Station Design

- Station canopies will have indirect accent lighting.
- Lighting will clearly highlight pedestrian paths including those to stairs, escalators, and elevators.
- Accent and functional lighting will be strategically placed to minimize spillover.
- Accent and functional lighting controls will be programmable, and sensor controlled to allow for energy efficiency and various settings such as daytime, nighttime, and event lighting.

##### Guideway And Support Structure Design

- Where provided, guideway indirect accent lighting will complement station lighting design.
- Light fixtures will be concealed or minimally visible.
- Accent and functional lighting will be strategically placed to minimize spillover.
- Code required lighting along the guideway will be designed to minimize visibility from the ground level.
- Street lighting will be supplemented as needed to provide a consistent light level on the sidewalk and roadway along the project alignment.

##### Maintenance And Storage Facility

- Where provided, functional lighting will be placed to minimize spillover.
- Building entrances will be well lit.
- Lighting will clearly highlight pedestrian paths including those to ramps, stairs, escalators, and elevators.
- Public uses on the ground plane of the MSF Site including any covered parking areas will be well lit with particular attention paid to the comfort and safety of the public.

##### Elevated Passenger Walkways

- Where provided, functional lighting will be placed to minimize spillover.
- Overall lighting design will not interfere with roadway traffic below.
- Accent lighting will complement station lighting design.
- Accent and general lighting controls will be programmable and sensor controlled to allow for daytime, nighttime, and event settings.

**PDF AES-4 Tree Placement (Design Standards and Guidelines)**

- An arborist report surveying the condition and extents of all existing trees in the Project area will be provided to the developer for their use as a baseline in order to produce a final report detailing the most current conditions and proposed handling of all existing trees for the proposed Project.
- Existing flourishing trees (as identified in the arborist report) will remain, where feasible.
- An Approved Plant Palette based on the City’s approved street tree list will be used as a basis for all sections of new trees.
- The quantity and species of existing trees removed by the ITC Project will be replaced in accordance with the City’s current landscape guidelines.
- Protected species in the Inglewood Municipal Code, Tree Preservation will remain.
- City of Inglewood guidelines for tree spacing will be followed, considering species of trees and the desired canopy coverage.
- Trees will be planted on both sides of the roadway where feasible.
- Trees will be positioned at regular intervals relative to the guideway column supports to create a consistent rhythm.
- On Market Street, trees will be planted at a rhythm and scale to create a continuous visual canopy over the pedestrian realm, where feasible.
- On Manchester Boulevard, trees will be planted at a rhythm consistent with the street trees east and west of the Project, in alignment with the shape of the roadway.
- On Prairie Avenue, trees on the east side will continue the stately rhythm from the Inglewood Cemetery north of Manchester Boulevard. Trees on the west side will be spaced to match the rhythm of the east side and the guideway support structure to the extent feasible.

**PDF AES-5 Signage (Design Standards and Guidelines)**

- Physical Non-Digital Signage incorporated into the Project will have a distinct visual graphic identity that is consistent across all physical design elements of the project.
- All signage will be approved by City of Inglewood and the Authority Having Jurisdiction (AHJ).
- Existing signage along the entire ITC alignment, which is affected, will be replaced along with its infrastructure, and will meet its originally intended design intent and function.
- Signage replaced that originated on private property will be approved by the City of Inglewood and the sign/property owner.

**PDF CUL-1 Historic Resources (Design Standards and Guidelines)**

The final Project design must consider design variables (elevation of guideway, width of guideway, distance of the guideway from the resources, and the dimensions, placement, and spacing of support columns) and resource variables (building’s height, scale, number of street-facing facades, width of primary façade, front

setback, project elements overhanging the sidewalk, and viewpoints from which the resource can best be discerned in its entirety). The final Project design shall ensure minimal impacts to the setting of historical resources, and little or no visual obstruction of the resource’s street-facing façades from the optimal viewpoints. In order to meet these performance-based standards, the following Project Design Features shall be incorporated into the final Project design:

- The guideway’s elevation and distance from the façade of the historical resource will be sufficient for the guideway to visually clear the top of the historical resources’ street-facing façade(s) when viewed from the optimal viewpoints. The final Project design is expected to achieve no visual obstruction of any of the identified historical resources from the guideway.
- At the former Fox Theatre, and for 100 feet on either side of the resource, the guideway elevation (measured from the ground plane to the underside of the guideway structure) will be a minimum of 52 feet from grade in order to achieve unobstructed views of this resource, including its monumental sign pylon.
- The dimensions, placement, and spacing of the guideway support columns will be such that the obstruction of views of the historical resources’ street-facing façade(s) when viewed from the optimal viewpoints will be minimized. For five of the identified historical resources—Holy Faith Episcopal Church, former United Bank of California (now Broadway Federal Bank), former Fox Theatre, Professional Building, and Inglewood Park Cemetery—the final Project design is expected to completely avoid visual obstructions from support columns.
- For five of the historical resources—the former Bank of Inglewood, former J.C. Penney, Bank of America, the Forum, and Lighthouse McCormick Mortuary Mortuary—views that are completely unobstructed by support columns are not necessary for the resource to convey its significance. A small portion of the resources’ primary façades will be intermittently obscured depending on the position of the viewer. However, due to the scale and/or setback of these resources, their primary façades will remain readily discernable.

**Impact AES-1 a: Would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings?**

Alterations to visual quality and character can often be perceived as subjective. To better understand the integration of the proposed Project into the existing environment, descriptions of the Design Guidelines, Construction Commitment Program (CCP), and the Transportation Corridor Overlay Zone (TC Overlay Zone) proposed as part of the Project are provided below along with photographic visual simulations of the Project.

**Construction**

The proposed Project would include the construction of the ATS system including the stations, guideways, MSF and two PDS substations. A new Vons grocery store would also be built on the MSF site prior to construction of the MSF and other project components on this site. In addition, one of the existing travel

lanes on Prairie Avenue will be shifted to the east into the existing setback area along Prairie Avenue by no more than thirty (30) feet to maintain the current roadway capacity.

During construction, exposed dirt, construction equipment, and demolition debris would be visible but temporary. Construction would occur in eight phases over approximately four years, between 2024 and 2027, with the phases likely to overlap along the segments of streets along the Project alignment to provide the most efficient construction schedule. Phasing the construction activities in this manner would reduce the duration of exposure by each segment. For detailed construction phasing timeframes and construction activities occurring during each phase, please refer to **Section 3.0**.

In order to lessen the temporary aesthetic impacts associated with construction of the Project, the CCP identifies practices to be implemented during construction. **Project Design Feature (PDF) AES-1** incorporates the visual resources program as defined in the CCP. This program addresses nighttime lighting, removing erosion control devices as soon as stabilized, and locating stockpile areas in less visibly sensitive areas. Specifically, **PDF AES-1** addresses visually obtrusive erosion control devices such as silt fences, plastic ground cover, and straw bales and removal of these elements as soon as the area is stabilized. Stockpile areas would also be located in areas with the least visibility with minimal disruption near residential neighborhoods and would be pre-approved by the City. Implementation of **PDF AES-1** would reduce unsightly views of construction activities and, for this reason, visual impacts during construction would be less than significant.

### **Operation**

After construction, the components of the proposed ATS system that would change the existing visual character along the proposed alignment would include the ATS guideway; stations including vertical circulation elements, elevated passenger walkways, parking and Pick-up/Drop-off sites; the MSF; two PDS substations proposed on the MSF site and Prairie Avenue/Hardy Street Station site; and the new Vons supermarket at the MSF site. The trains moving on the elevated ATS guideway, station structures, and associated signage would be visible from adjacent land uses and the surrounding neighborhoods. The shift of one of the existing travel lanes on Prairie Avenue by no more than thirty (30) feet into the existing setback area would also affect the existing visual character of this portion of Prairie Avenue.

The Project will ensure replacement of existing trees and will also create new landscaping. **PDF AES-2** incorporates the tree removal and replacement plan as defined in the CCP which addresses removal and replacement of trees affected by construction of the Project. **PDF AES-4** guides tree placement as called for in the Design Standards and Guidelines.

Tree removal during construction would be avoided to the extent feasible as defined in **PDF AES-2**. This Project Design Feature requires a tree removal and replacement plan to be prepared that would ensure any landscaping removed during construction is returned to its original condition where appropriate. Any

trees requiring removal would be replaced with the same species and planted in the same location as the tree being removed if feasible. If trees cannot be replaced at the same location with the same type of tree, the City's Public Works Department would designate an alternative location, type, and/or size to replace the original tree. All trees removed would also be replaced in a timely manner as long as the replacement does not conflict with any future construction activities or within six months of the completion of construction around the removal site. Lastly, post-planting maintenance of the trees would be required for a period of three years from the date of the planting and the trees and landscaping would have a warranty period of at least one year. The City would conduct an inspection of all replacement trees and landscaping for general health as a condition of final acceptance by the City. These proposed tree protection measures would ensure any tree replacement would be properly implemented and the proposed Project area maintains a high level of aesthetic quality.

**PDF AES-4** would require tree placement to follow the Design Standards and Guidelines for tree spacing and to consider the species of the trees and desired canopy coverage. Trees would be planted on both sides of the roadway as feasible. An arborist report surveying the condition and extents of all existing trees in the Project area will be provided to the developer for their use as a baseline in order to produce a final report detailing the most current conditions and proposed handling of all existing trees for the proposed Project. Existing flourishing trees (as identified in the arborist report) will remain, where feasible and an Approved Plant Palette based on the City's approved street tree list will be used as a basis for all sections of new trees. The quantity and species of existing trees removed by the ITC Project will be replaced in accordance with the City's current landscape guidelines and protected species in the Inglewood Municipal Code, Tree Preservation will remain. Trees will be placed at regular intervals relative to the ATS guideway column supports to create a consistent rhythm. These proposed tree placement measures would ensure trees are properly placed and the proposed Project area maintains a high level of aesthetic quality.

The Project will address additional sources of light. **PDF AES-3** includes the lighting design standards in the Design Standards and Guidelines. These guidelines address lighting for station design, guideway and support structures, the MSF, and elevated passenger walkways. Accent lighting at the stations would be indirect and all lighting would be strategically placed to minimize light spillover.

The Project will also include a comprehensive wayfinding and signage program. **PDF AES-5** incorporates the design standards from the Design Standards and Guidelines. This program will apply to City of Inglewood wayfinding, ITC station wayfinding, advertising, and existing signs requiring relocation. Project signs will be designed and located to provide clear information and direction for both pedestrians and transit passengers. As described in **PDF AES-5**, any existing signage along the entire ITC alignment displaced by the Project will be replaced with signs that meet the original intent and function of these signs.

To illustrate the effect of the proposed Project, visual simulations showing the Project from the public viewpoints on Florence Avenue, Market Street, Manchester Boulevard, and Prairie Avenue as identified in **Figure 4.1-1: Viewpoint Location Map** are provided below.

#### **View 1–Florence Avenue at Locust Street**

The view in **Figure 4.1-2: View 1 – Florence Avenue at Locust Street** shows the proposed ATS guideway and the Market Street/Florence Avenue station as it would be viewed looking southwest from the public right-of-way near Florence Avenue and Locust Street. The top of the station structure, the elevated passenger walkway connecting the Market Street/Florence Avenue station to the Metro K line station, support columns and portions of the guideway would be visible from this location.

#### **View 2–Market Street at Florence Avenue**

The view in **Figure 4.1-3: View 2 – Market Street at Florence Avenue** shows the proposed Project guideway as it would be viewed from the public right-of-way near Florence Avenue and Market Street. Portions of the Market Street/Florence Avenue station, associated pedestrian stairways, surface parking and guideway would be visible as the guideway enters the public right-of-way on Market Street and heads south.

Under existing conditions, the ongoing construction of a mixed-use project on the west side of Market Street north of Regent is visible, along with portions of the existing commercial center located on the west side of Market Street. Views along Florence Avenue and Market Street currently consist of low-rise commercial development, surface parking, signs, mid-rise office buildings, and the ongoing construction of the Metro K line. Continuing south along Market Street, views include existing low-rise commercial development with street parking and wide sidewalks.

#### **View 3–Manchester Boulevard at Market Street**

The view in **Figure 4.1-4: View 3 – Manchester Boulevard at Market Street** shows the proposed guideway as it would be viewed from the public right-of-way just west of Manchester Boulevard and Market Street. The guideway, straddle bent columns and single support columns centered above the proposed median would be visible looking east toward Manchester Boulevard and north toward Market Street as the alignment crosses the intersection and turns from Market Street onto Manchester Boulevard.

Existing commercial development along Manchester Boulevard on both the north and south side of the street is visible. Views along Manchester Boulevard toward Prairie Avenue currently consist of low-rise commercial and residential development, as well as street parking.

#### **View 4–Manchester Boulevard at Spruce Avenue**

The view in **Figure 4.1-5: View 4 – Manchester Boulevard at Spruce Avenue** shows the proposed elevated MSF and the support columns for the MSF and a portion of the guideway in the foreground of the view with the new Vons store visible in the background under the MSF when viewed from public right-of-way near Manchester Boulevard and Spruce Avenue looking southwest.

#### **View 5–Prairie Avenue north of Manchester Boulevard**

The view in **Figure 4.1-6: View 5 – Prairie Avenue north of Manchester Boulevard** shows the proposed guideway as seen from public right-of-way near just north of the intersection of Prairie Avenue and Manchester Boulevard. The views show the Forum on the east side of Prairie Avenue and the Prairie Avenue/Manchester Boulevard Station on the west side of Prairie Avenue. The guideway would be visible as it heads south on Prairie Avenue from the Prairie Avenue/Manchester Boulevard Station. Up to three straddle bent columns supporting a switch zone for the ATS trains immediately south of the station would also be visible from this location.

Views along Prairie Avenue include the Forum monument signage, and the ongoing construction within the HPSP entertainment district, surrounded by largely vacant land.

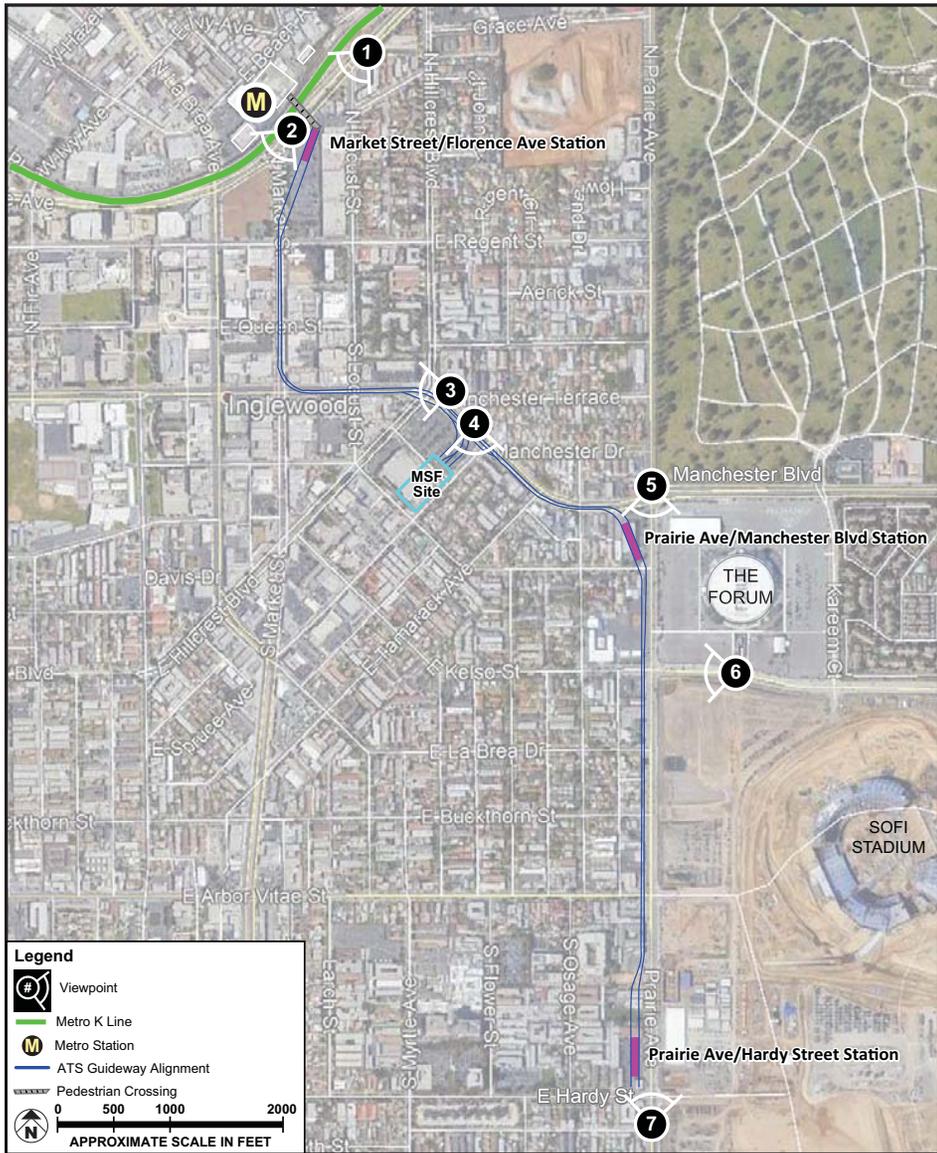

#### **View 6–Prairie Avenue at Pincay Drive**

The view in **Figure 4.1-7: View 6 – Prairie Avenue at Pincay Drive** shows guideway viewed from the public right-of-way along Pincay Drive near its intersection with Prairie Avenue looking west. The guideway extends both north and south along Prairie Avenue.

The view includes the ongoing construction in the HPSP area to the south of Pincay Drive, as well as the Forum to the north of the roadway. Future development in the HPSP area as described above in *Section 4.1.5.3: Adjusted Baseline* would also change the visual character of a portion of Prairie Avenue described in this view. All future development in the HPSP area would be required to be consistent with the design guidelines in the HPSP.

#### **View 7–Prairie Avenue at 97<sup>th</sup> Street**

The view in **Figure 4.1-8: View 7 – Prairie Avenue at 97<sup>th</sup> Street** shows the Prairie Avenue/Hardy Street station viewed from public right-of-way near Prairie Avenue and 97<sup>th</sup> Street looking north. The station would be located on the northwest corner of Prairie Avenue and Hardy Street. The proposed elevated passenger walkway across Prairie Avenue is also visible. Future development in the HPSP area as described above in *Section 4.1.5.3: Adjusted Baseline* would also change the visual character of a portion of Prairie Avenue described in this view. All future development in the HPSP area would be required to be consistent with the design guidelines in the HPSP.

Analysis of the change in visual character is described below for each segment of the proposed ATS alignment. The potential changes in visual character for individual project components are analyzed for each segment. Specifically, the potential for the components of the Project, including the guideway, stations, elevated passenger walkways and associated vertical circulation elements (i.e., elevators and stairs), the MSF and street improvements, including the shift of one of the existing travel lanes on Prairie Avenue up to thirty (30) feet into the existing setback area along Prairie Avenue, to adversely affect the existing visual character of the areas along the proposed alignment are addressed. **Table 4.1-1: ITC Project Component Locations and Sizes** describes ITC Project components and their respective location and size.

**Table 4.1-1  
ITC Project Component Locations and Sizes (Conceptual)**

Project Component	General Location	Approximate Size
<b>Guideway</b>	<ul style="list-style-type: none"> <li>Located predominantly within the existing public right-of-way of Market Street, Manchester Boulevard, and Prairie Avenue</li> <li>The Prairie Avenue/Manchester Boulevard and Prairie Avenue/Hardy Street Stations are proposed to be located on private property located west of Prairie Avenue proposed for acquisition as part of the Project.</li> </ul>	<ul style="list-style-type: none"> <li>Approximately 1.6 miles dual lane, end to end</li> <li>The guideway will vary in height from a minimum of ~35 feet to a maximum of ~60 feet measured from existing grade to top of guideway deck</li> <li>The dual-lane guideway width will vary from a minimum of ~30 feet to a maximum of ~75 feet. Maximum widths are at stations and approaches to stations.</li> </ul>
<b>Stations</b>		
<i>Market Street / Florence Avenue Station</i>	<ul style="list-style-type: none"> <li>Located on private property (to be acquired by the City) at the southeast corner of Market Street/Florence Avenue</li> </ul>	<ul style="list-style-type: none"> <li>Up to ~80 feet in height measured from existing grade to top of station canopy</li> <li>~75 feet wide (station structure and guideway only; not including vertical circulation)</li> <li>~200-foot long platform for train berthing</li> <li>~420-foot long mezzanine level for back of house and circulation</li> </ul>

<b>Elevated Passenger Walkways</b>	<ul style="list-style-type: none"> <li>Location 1: above Florence Avenue connecting the Market Street/Florence Avenue Station to the Metro Crenshaw/LAX Line Downtown Inglewood Station.</li> <li>Location 2: above Prairie Avenue from Prairie/Manchester station to the Forum site</li> <li>Location 3: above Prairie Avenue from Prairie/Hardy station to the Hollywood Park site</li> <li>Specific locations will be determined at time of design and coordinated with stakeholders</li> </ul>	<ul style="list-style-type: none"> <li>Height will be up to ~65 feet in height measured from existing grade to top of structure</li> <li>~30 feet wide maximum for passenger walkway</li> <li>~280 feet long for location 1 and ~160 feet long for locations 2 and 3</li> <li>Minimum vertical clearance of 10 feet within the walkway interior</li> </ul>
<b>Maintenance and Storage Facility (MSF)</b>	<ul style="list-style-type: none"> <li>Primarily located on private property to be acquired by the City as part of the Project with potential for portions of the MSF to be located within an easement at 500 E. Manchester Boulevard</li> </ul>	<ul style="list-style-type: none"> <li>~75,000 SF building area</li> <li>Up to ~75 feet in height measured from existing grade to top of roof</li> <li>Surface parking area under building containing 50 spaces for employees and visitors</li> </ul>
<b>Power Distribution System (PDS) Substation</b>	<ul style="list-style-type: none"> <li>Two PDS substations; one located at the MSF site and</li> </ul>	<ul style="list-style-type: none"> <li>~30 feet wide x ~100 feet long</li> <li>Up to ~20 feet clearance height measured from floor to ceiling</li> <li>If located below grade, an additional space of ~30 feet wide x ~30 feet long for vertical circulation</li> </ul>

Project Component	General Location	Approximate Size
	the second at the Prairie/Hardy Station .	<ul style="list-style-type: none"> <li>~20 feet wide x ~40 feet long additional space for auxiliary equipment such as a backup generator, if necessary</li> </ul>
	<ul style="list-style-type: none"> <li>Specific locations within each site will be determined during the design phase</li> </ul>	
<b>Roadway Improvements</b>	<ul style="list-style-type: none"> <li>Market Street, Manchester Boulevard and Prairie Avenue</li> </ul>	<ul style="list-style-type: none"> <li>New roadway striping, lane re-configurations, partial relocation, on-street parking adjustments, new sidewalks, lighting improvements, traffic signal adjustments, landscaping, and streetscape</li> </ul>
<b>Pick-Up/Drop-Off Areas, Surface Parking Lots and Staging Areas During Construction</b>	<ul style="list-style-type: none"> <li>Market Street/Florence Avenue Station site</li> <li>150 S. Market Street</li> <li>Prairie Avenue/Hardy Street Station</li> </ul>	<p>Surface level parking at each site:</p> <ul style="list-style-type: none"> <li>~650 spaces at Market Street/Florence Station</li> <li>~50 spaces at 150 S. Market Street</li> <li>~100 spaces at Prairie/Hardy Station</li> </ul> <p>Pick-Up/Drop-Off Area:</p> <ul style="list-style-type: none"> <li>Market Street/Florence Avenue Station site on Locust Street south of Florence Avenue, and Regent Street between Locust Street and Market Street</li> <li>Prairie/Hardy Street Station within the station site</li> </ul>

## **Market Street Segment**

### **Market Street/Florence Avenue Station**

The Market Street/Florence Avenue Station would be a focal point of the proposed Project, connecting the ATS system to the Metro K line Downtown Inglewood Station. The Market Street/Florence Avenue station would replace the existing commercial center at 300 E. Florence Avenue. The station would be designed in conformance with the Design Standards and Guidelines as a sleek and horizontal station design with a distinctive, modern style. The lightly colored canopy over the platform would be the dominant architectural feature, providing shade and protection from inclement weather while allowing for natural ventilation and daylight. Vertical circulation including escalators, stairs, and elevators would be included as part of the station. The elevators and associated enclosures would be constructed using transparent glass to contribute to a modern exterior design while allowing unobstructed views from all sides. For approximate station dimensions, please refer to **Table 4.1-1**.

The station exterior would be composed of exposed concrete with a light colored canopy material. The exposed exterior of the structure would be made with materials resistant to graffiti and vandalism to reduce the potential for unsightly defaced properties. The neutral tone of the station would allow it to

blend in with its surroundings. The platform and mezzanine guardrails would be as transparent as possible to enhance the integration of the station with the surrounding environment. The Design Standards and Guidelines call for the final design of this station to reflect the unique character of downtown Inglewood to further integrate the structure into the existing public realm along Market Street.

A drop-off/pick-up area on Locust Avenue and Regent Street to facilitate multiple travel modes would be located adjacent to this station along with a surface parking lot to accommodate ATS riders and consolidate parking while reducing the need to park on adjacent streets and at nearby businesses. Consistent with the Design Standards and Guidelines new landscaping and site improvements to provide shade and decorative separation of parking spaces would be provided. The proposed surface parking lot would improve the visual character of the existing surface parking lot at the same location.

### **Elevated Passenger Walkway**

An elevated passenger walkway would connect the Market Street/Florence Avenue Station with the Metro K Line Downtown Inglewood Station. This passenger connection would be elevated and span over Florence Avenue and would be visually integrated with the design of the Market Street/Florence Avenue Station and Metro K Line Downtown Inglewood Station. This walkway would be simple in design and form to deliver functionality and protect passengers from inclement weather. The exterior of the walkway, elevators and associated enclosures would be constructed with transparent material to the extent feasible to provide a contemporary and appealing aesthetic while providing as much natural daylight and unobstructed views for pedestrians. Neutral tones would be used in areas of the structure where transparent material cannot be used to further integrate the elevated passenger walkway with the surrounding structures. Visually unobstructive barriers would be integrated into the walkway design to ensure both pedestrian and roadway safety.

### **ATS Guideway**

The guideway in this segment would exit the existing commercial center site at the intersection of Market Street and Regent Street and continue south above the Market Street right of way until Manchester Boulevard where the guideway would turn east. The guideway would be supported by single columns until it reaches Manchester Boulevard. The columns would be primarily located in the existing median area along Market Street between Regent Street to Manchester Boulevard.

**PDF CUL-1** would be incorporated into the project to minimize impacts to the historic buildings along Market Street as called for in the Design Standards and Guidelines, discussed further below.

The design of the guideway would be streamlined and horizontal in expression. As required by **PDF CUL-1**, columns would be positioned in the middle of the roadway with as much space in between columns as is feasible, away from storefronts and adjacent buildings, to support the guideway structure. The drawings in Appendix D: Conceptual Project Design of the Historical Resources Technical Report (**Appendix I.2**) show the relationship of these components of the Project to individual historic resources located along the proposed alignment.

Where possible, the dual-lane guideway would be narrowed and configured to facilitate the use of single columns to support the structure to minimize the visual mass of the guideway. With the revised Project design, the amount of the guideway that would be supported by single columns has been maximized along Market Street, Manchester Boulevard, and Prairie Avenue. Specifically, shifting the guideway to the west side or Prairie Avenue allows for the guideway between the Prairie Avenue/Manchester Boulevard and Prairie Avenue/Hardy Street stations to be supported by single columns to minimize changes to existing visual character of Prairie Avenue. The conceptual guideway alignment plans and column placements are shown in **Appendix E: ITC Operating Systems**. The guideway would be constructed of exposed neutral colored concrete or similar with tapered edges to reduce perceived massing. Guideway transitions at crossovers would be smooth and rounded with all conduits, guideway equipment, walkways, drainage systems, and other utilities concealed from the ground view. Overall, the guideway would be simple, clean, respectful of the surrounding environment and complimentary to the station designs.

#### Historic Resources and Character

Five historical resources were identified on Market Street along the proposed alignment for the ATS guideway:

- Former Bank of Inglewood (100 Market Street);
- Former Fox Theater (115 Market Street);
- Former United Bank of California (158-170 Market Street);
- Former J.C. Penney (129-139 Market Street); and
- Professional Building (149-155 Market Street)

The elevation and distance of the guideway from the façade of these historical buildings on Market Street will be sufficient for the guideway to visually clear the top of the façades of these buildings when viewed from Market Street as required by **PDF CUL-1**. At the Fox Theater, and for 100 feet on either side of the Fox Theater building, the guideway elevation will be a minimum of 52 feet from grade in order to maintain unobstructed views of pylon sign and front façade of the building. The guideway will have a width of approximately 32 feet and will be supported by single round columns in the median of Market Street with

a diameter of 8 feet. The elevation and distance of the guideway from the façades of these historic buildings will be sufficient for the guideway to visually clear the top of the historical resources' street-facing façade. When viewed from the optimal viewpoints. The dimensions, placement, and spacing of the guideway support columns will also avoid or minimize obstructions of the view of the façades of these historic buildings along Market Street. The final Project design is expected to achieve no visual obstruction of any of the identified historical resources along Market Street from the guideway.

The scale, massing, and overall composition of these historic buildings would remain readily discernable to the viewer despite some interruption of views by the proposed Project and would still convey their historic significance as historic resources. As such, the project would not substantially degrade the existing visual character of these six historic resources and impacts would be less than significant.

#### Streetscape

The Design Standards and Guidelines include public realm guidelines addressing landscape and the interface of the Project with the existing streets. Under the Design Standards and Guidelines, this segment of the streetscape is designed to complement standards and guidelines outlined within the *Downtown TOD Plan*<sup>24</sup> while accommodating Project needs. Specifically, the existing streetscape design and aesthetics as described in the existing conditions would be maintained to the extent feasible while providing necessary upgrades such as ADA-compliant ramps. The sidewalks would be designed to be as wide as possible to allow for comfortable pedestrian travel. Plazas with street furniture would provide places to gather and encourage social interaction. The design of the street furniture would complement the overall design of the proposed streetscape improvements. Separation of pedestrians from the roadway using the recommended street trees per the Design Standards and Guidelines would be incorporated to maintain the character of the historic core along Market Street. Street trees and landscaping would be provided where possible to provide shade and create a walkable pedestrian pathway. Trees would be arranged to create a continuous canopy over the pedestrian realm where feasible. Trees would be planted on both sides of the roadway where feasible and would be positioned relative to the guideway columns to create a consistent visual rhythm. Street trees and new landscaping would be planted within the median below the ATS guideway along Market Street to enhance the aesthetic quality of the roadway. Street furniture and street tree concepts would be consistent with the Design Standards and Guidelines, which include consideration of the street furniture and street tree concepts set forth in the *Downtown TOD Plan*, Section 2.8, Street Trees and Furniture. These streetscape improvements would enhance the visual character of Market Street in Downtown Inglewood and assist in visually integrating the guideway into Market Street.

<sup>24</sup> City of Inglewood. New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines. Adopted November 1<sup>st</sup>, 2016. <http://inglewood.arroyogroup.com/wp-content/uploads/2017/01/The-New-Downtown-Fairview-Heights-TOD-Plan-Design-Guidelines-lo-res.pdf>.

### Shade and Shadow

New shade and shadow patterns in the Market Street segment would be created by the ATS guideway structure and the Market Street/Florence Avenue station. Uses sensitive to shading along Market Street include residential uses and outdoor spaces associated with residential or recreational uses and solar panels.

The Market Street/Florence Avenue station would be located on the southeast corner of Market Street and Florence Avenue. The station's shadow would be cast furthest during sunset on a summer evening and on a winter morning as shown in **Figure 4.1-12** and **Figure 4.1-13**. The shadow would be cast northwest over Florence Avenue on a winter morning and southeast on a winter afternoon as shown in **Figure 4.1-13** and **Figure 4.1-15**. As the surrounding land uses are commercial, no sensitive receptors are present and no shade and shadow impacts to surrounding uses are anticipated. There are no existing solar panels in this segment identified through review of aerial photographs.<sup>25</sup>

The ATS guideway within the Market Street right of way would run the entirety of the segment from south of Regent Street to Manchester Boulevard on single support columns above the roadway median. With single support columns spaced as far apart as feasible and the bottom of the guideway raised 40 feet above Market Street, the shadows created would be narrow and would not affect large areas at any point during the day. The shadow from the guideway would be west of Market Street in the morning and east of Market Street in the afternoon. This narrow shadow pattern would also move throughout the day from northwest to southeast. No areas would be shaded for long periods as shown in **Figures 4.1-9** through **4.1-15**. For these reasons, no adjacent properties will be substantially shaded for long periods of time during the day and impacts from shading will be less than significant.

### Manchester Boulevard Segment

#### ATS Guideway

The guideway in this segment would travel the entire length of Manchester Boulevard between Market Street to Prairie Avenue. As the guideway turns east onto Manchester Boulevard, the guideway would transition from single columns to one-half straddle bent to support the turn onto Manchester Boulevard before going back to single columns in a new median located in Manchester Boulevard. The guideway would widen as it approaches the MSF and require straddle bents that will span across Manchester Boulevard. From the MSF to Prairie Avenue, a combination of single column supports and straddle bents across Manchester Boulevard would be used to support the guideway.

---

<sup>25</sup> Google Earth, 2020.

The guideway would travel above the existing two-to-four-lane roadway. **PDF CUL-1** would be incorporated into the project to minimize impacts to the historic buildings along the Manchester Boulevard as called for in the Design Standards and Guidelines, discussed further below.

The design of the guideway would be streamlined and horizontal in expression. As required by **PDF CUL-1**, columns would be positioned in the middle of the roadway with as much space in between columns as is feasible, away from storefronts and adjacent buildings, to support the guideway structure. The design of the guideway would continue to be streamlined and horizontal in expression for integration into the existing built environment. Support columns would be spaced apart with as much distance in between as is feasible to reduce aesthetic impacts to travelers on the ground level and nearby land uses. Where possible, the dual lane guideway would be narrowed and configured to facilitate the use of single columns to support the structure, thus minimizing visual massing. Conceptual guideway alignment plans and column placements are detailed in **Appendix E**. The guideway would be constructed of exposed concrete or similar with tapered edges to reduce perceived massing and would use neutral colors and lightly colored canopies to minimize urban heat island effect. Transitions at crossovers would be smooth and rounded with all conduits, guideway equipment, walkways, drainage systems, and other utilities concealed from the ground view. Overall, the guideway would be simple, clean, respectful of the surrounding environment.

#### Maintenance and Storage Facility

The MSF is proposed on the southwest corner of Manchester Boulevard and Spruce Avenue on a site developed with an existing Vons grocery store. A new replacement Vons grocery will be built on the northwest corner of Manchester Boulevard and Hillcrest Boulevard. The Design Standards and Guidelines require the massing and height of the MSF to be minimized to be as unobtrusive to adjacent neighbors as possible while maintaining functionality and allowing roof access. All rooftop equipment would be fully screened to prevent unsightly views from the ground and adjacent buildings. Building exterior would be covered in a uniform and neutral color to allow proper integration of the structure with the adjacent aesthetic environment. To prevent unsightly graffiti and vandalism, and to reduce the required amount of exterior maintenance, the exterior material of the MSF would be graffiti-resistant.

The MSF would be elevated to match the guideway height. The new Vons grocery store would be located on the northwest portion of the MSF site near the intersection of Manchester Boulevard and Hillcrest Boulevard. The maintenance level for ATS train cars would match the guideway track elevation and will contain mezzanine administrative office space. The ground level would include multiple rows of columns and support beams for structural support. The ground level would consist of a generally unenclosed space containing public parking for the new Vons store. The visual character of the new surface parking lot would be similar to the existing parking lot at the proposed MSF site, with black asphalt and striped spaces

throughout the lot. The Design Standards and Guidelines would require trees and new landscaping as feasible to provide shade and decorative separation of parking spaces.

The MSF would include decorative security walls and fences along the edges of the facility to shield view of the MSF from public view as called for in the Design Standards and Guidelines. Decorative screening walls and fences would be designed to completely enclose all mechanical equipment while allowing for sufficient airflow. All solid fences or walls would be articulated with similar or complementary materials and colors to the building. Any long expanses of walls and fences would be broken up with projections or recessed elements, landscape pockets and changes in materials or textures. Landscape elements, such as vines to create a green wall or screen, would be used in combination with walls and fences to ensure the Project is visually compatible with adjacent uses.

#### Historic Resources and Character

There is one identified historical resource, the Bank of America building located at 320 Manchester Boulevard, on this segment. The scale, massing, and overall composition of this building would remain readily discernable to the viewer despite some interruption of views by three of the guideway columns. Only a small portion of the primary façade of the building would be intermittently obscured depending on the position of the viewer. As described in **PDF CUL-1**, views that are completely unobstructed by support columns are not necessary for the Bank of America building to convey its significance due to its scale and/or setback.

#### Streetscape

Under the Design Standards and Guidelines, the Manchester Boulevard segment between Market Street and Locust Street is designed to complement the standards and guidelines outlined within the *Downtown TOD Plan*,<sup>26</sup> similar to the Market Street segment. Necessary upgrades such as ADA-compliant ramps would be integrated within the Project area as applicable. The sidewalks would be designed to be as wide as possible to allow for places to sit and gather and encourage social interaction which would enhance the attractiveness of the sidewalk. Integrated landscaping along the sidewalk would enhance the attractiveness of the public realm and provide a walkable environment along Manchester Boulevard. Plazas with street furniture provide places to gather and encourage social interaction. The design of the street furniture would complement the overall design of the proposed streetscape improvements.

Separation of pedestrians from the roadway using street trees would be incorporated per the Guidelines. Trees would be planted in a pattern and frequency consistent with existing street trees east and west of the proposed Project in alignment with the shape of the roadway as required by **PDF AES-4**. Street trees

<sup>26</sup> City of Inglewood. New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines. Adopted November 1<sup>st</sup>, 2016. <http://inglewood.arroyogroup.com/wp-content/uploads/2017/01/The-New-Downtown-Fairview-Heights-TOD-Plan-Design-Guidelines-lo-res.pdf>. Accessed November 30, 2020.

and new landscaping would be planted within the median below the ATS guideway along Manchester Boulevard to enhance the aesthetic quality of the roadway. Street furniture and street trees concepts would be consistent with the Design Standards and Guidelines, which include coordinating street furniture and street trees included in the ITC Project with the concepts defined in the *Downtown TOD Plan*, Section 2.8, Street Trees and Furniture.

#### Shade and Shadow

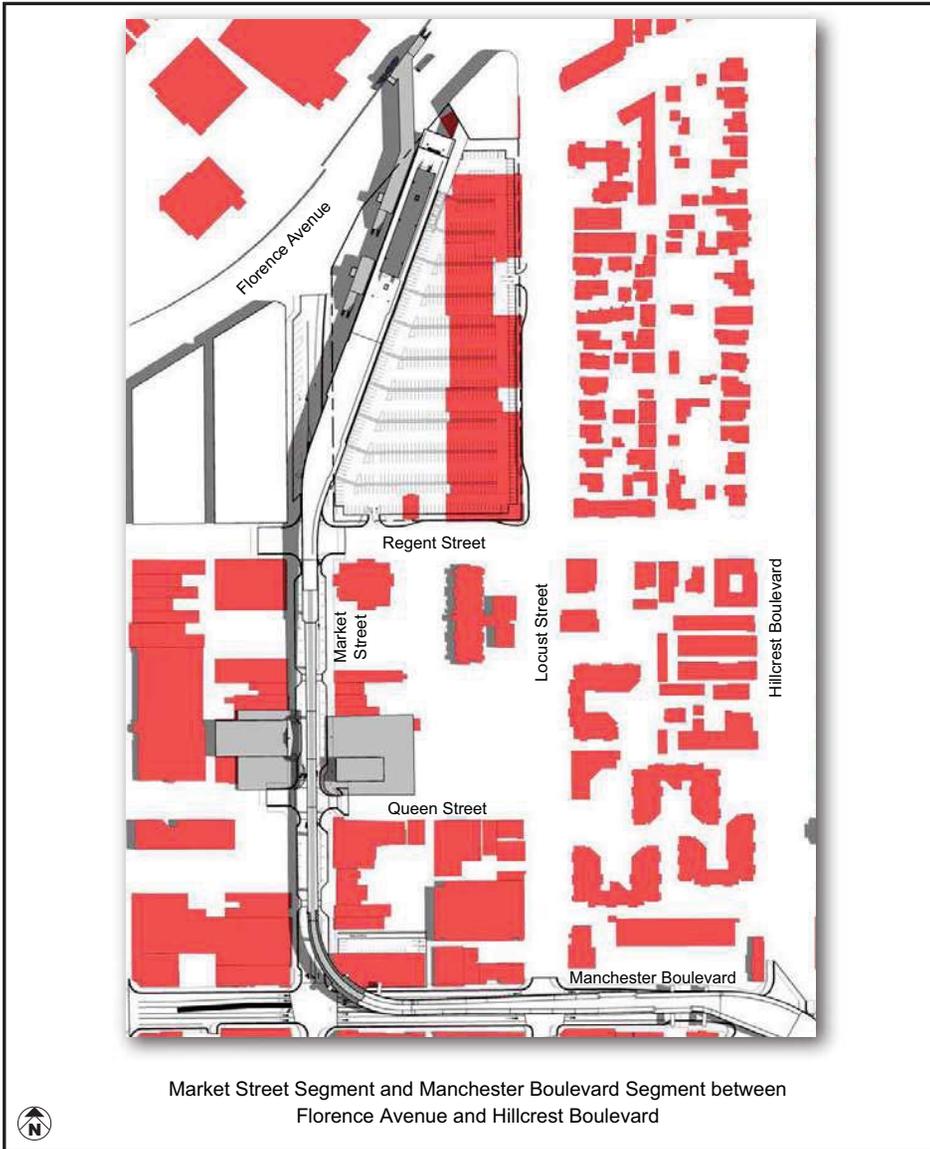

New shade and shadow patterns along the Manchester Boulevard segment would be created by the ATS guideway structures and the MSF. The PDS substation in this segment would be located at the MSF site and, given its size it would not create shadow patterns large enough to encroach on adjacent uses at any point during the year or in the day. Shade and shadow sensitive uses in this segment include the residential uses to the northeast of the segment, west of Osage Avenue. No existing solar panels in this segment that were identified through review of aerial photography.<sup>27</sup>

The MSF would be located off the public right of way on the southeast corner of Manchester Boulevard and Hillcrest Boulevard. The building's shadow would be cast furthest on a winter morning and during sunset on a winter evening. Given the dimension of the building and its distance from surrounding uses, the shadow cast by the building would be entirely contained within the MSF site. As the shade and shadow of the building would be completely contained within the site, no sensitive receptors would be present and no shade and shadow impacts to the surrounding uses is anticipated.

The guideway would be located entirely within the public right of way of Manchester Boulevard. With single support columns spaced as far apart as feasible and the bottom of the guideway raised 40 feet above Manchester Boulevard, the shadows created would be narrow and would not affect large areas at any point during the day. This narrow shadow pattern would also move throughout the day, from northwest to southeast. No areas would be shaded for long periods as shown in **Figure 4.1-16** through **Figure 4.1-19**. For these reasons, no adjacent properties will be substantially shaded for long periods of time during the day.

As the shadow of the guideway would not be extensive and no adjacent property would be shaded for a substantial portion of the day, the proposed Project would have a less than significant shade and shadow impact on the surrounding uses in this segment.

FIGURE 4.1-16

Manchester Boulevard and Prairie Avenue, June 22 at 9:00 AM

251-003-21

## Prairie Avenue Segment

### Prairie Avenue/Manchester Boulevard Station and Prairie Avenue/Hardy Street Station

The design of Prairie Avenue/Manchester Boulevard and Prairie Avenue/Hardy Street stations would be similar to the Market Street/Florence Avenue station, with a sleek, horizontal station design with a distinctive, modern style to enhance the aesthetic appearance of the structures and the identity of the proposed Project. The stations would include ground, mezzanine, and platform levels. The station exteriors would be composed of exposed concrete with a light colored canopy material. The light colored canopies would be the dominant architectural feature providing shade and protection from inclement weather while allowing for natural ventilation and daylight. Vertical circulation elements including escalators, stairs, elevators, and associated enclosures would be constructed using transparent glass to contribute to a modern exterior while allowing unobstructed views from all sides. Wherever possible, transparent screen walls and railings of the appropriate height would be integrated as part of the stations to enhance the appearance of the stations and integrate the structures with their surroundings. Where transparent materials cannot be used, a neutral color palette would be used to add to the modern style of the station. Surface materials used for the station would be resistant to graffiti and vandalism to prevent deterioration and unsightly views of the exteriors. The final design of the station would complement the new surrounding development along Prairie Avenue to visually integrate the proposed Project with the surrounding area.

### Elevated Passenger Walkways

One elevated passenger walkway would be constructed to connect the Prairie Avenue/Manchester Boulevard station with the site of the Forum and another would be constructed to connect the Prairie Avenue/Hardy Street station with the east side of Prairie Avenue adjacent to the Hollywood Park Specific Plan area located on the east side of Prairie Avenue. These passenger connections would be elevated and span over Prairie Avenue and would be designed to visually integrate with their respective ATS stations. These walkways would be simple in design and form to deliver functionality and protect passengers from inclement weather. The exterior of the walkways, elevators and associated enclosures would be constructed with transparent material to the extent feasible to provide a contemporary and appealing aesthetic while providing as much natural daylight and unobstructed views for pedestrians. Neutral tones would be used in areas of the structures where transparent material cannot be used to further integrate the elevated passenger walkways with the surrounding stations and guideway structures. Visually unobstructive barriers would be integrated into walkway design to ensure both pedestrian and roadway safety.

## ATS Guideway

The guideway in this segment would travel the length of Prairie Avenue from Manchester Boulevard to Hardy Street. Upon exiting the Prairie Avenue/Manchester Boulevard station and continuing south, the elevated guideway would continue along the west side of Prairie Avenue until both tracks gradually transition together immediately north of Kelso Street and continue in this configuration south to Victory Street, where the tracks diverge to enter into the Prairie Avenue/Hardy Street station on the northwest corner of the Prairie Avenue and Hardy Street intersection. Three Straddle bent columns would support this segment of the guideway as it proceeds south onto Prairie Avenue just past Nutwood Street. As the guideway converges, the structure would transition to single column supports located on the western side of Prairie Avenue. This portion of the guideway would diverge south of Victory Street to the west of Prairie Avenue as it approaches the Prairie Avenue/Hardy Street station and would be supported by straddle bents in the sidewalk and west of the public right of way.

The design of the guideway would continue to be streamlined and horizontal in expression to support integration into the existing environment and the anticipated new developments on the east side of Prairie Avenue. Columns would be spaced apart with as much distance in between as is feasible to reduce aesthetic impacts to travelers on the ground level and nearby land uses. Where possible, the dual lane guideway would be narrowed and configured to facilitate the use of single columns to support the structure, thus minimizing visual massing. For conceptual guideway alignment plans and column placements, please refer to **Appendix E**. The guideway would be constructed of exposed concrete or similar with tapered edges to reduce perceived massing. The guideway would use neutral colors and lightly colored canopies to minimize urban heat island effect. Transitions at crossovers would be smooth and rounded with all conduits, guideway equipment, walkways, drainage systems, and other utilities concealed from the ground view. Overall, the guideway would be simple, clean, respectful of the surrounding environment.

### Historic Resources and Character

There are two identified historical resources in this segment: the Forum located at 3900 Manchester Boulevard and the Lighthouse McCormick Mortuary located at 619 Prairie Avenue along this segment. The scale, massing, and overall composition of the Forum and the Lighthouse McCormick Mortuary would remain readily discernable to the viewer despite some interruption of views by the stations, guideway and guideway columns and would still convey their historic significance as historic resources. As such, the project would not substantially degrade the existing visual character of these two historic resources and impacts would be less than significant.

### Streetscape

The entire segment not directly adjacent to the HPSP development area would be governed by local ordinances and the Design Standards and Guidelines. The sidewalk zones would be constructed as wide as possible on both sides of the street, with planting zones between the sidewalk and the street where feasible. The sidewalks would be designed to be as wide as possible to allow for comfortable pedestrian travel. Integrated landscaping along the sidewalk would enhance the attractiveness of the public realm and provide a walkable environment along Prairie Avenue. Plazas with street furniture would provide places to gather and encourage social interaction. The design of the street furniture would complement the overall design of the proposed streetscape improvements. Street trees and landscaping would be provided where possible to provide shade and create a walkable pedestrian pathway. Street trees on the east side of Prairie Avenue would continue the existing placement of those from the Inglewood Cemetery, north of Manchester Boulevard. Street trees on the west side of Prairie Avenue would be spaced to match the placement of both the elevated guideway support columns and street trees on the east side of the roadway. The planting of street trees and integrated landscaping along the sidewalk on Prairie Avenue would enhance the attractiveness of the streets. Planting zones would also be incorporated into roadway medians where feasible to enhance the aesthetic quality of the roadway.

To accommodate the proposed ATS while maintaining the existing roadway capacity along Prairie Avenue, the ITC Project includes the proposed relocation of one existing traffic lane on the east side of Prairie Avenue within a variable easement for street purposes, to be acquired by the City over private property that currently comprises the existing 30-foot setback area along the west edge of the HPSP area. While existing sidewalk widths along Prairie would be maintained, some of the existing landscaping, signs and other streetscape improvements would be reduced or eliminated in certain locations.

Adjacent to the HPSP on the east side of Prairie Avenue, between Arbor Vitae Street and Hardy Street, the Design Standards and Guidelines define a streetscape design complementary to the streetscape design guidelines for the HPSP project.<sup>28</sup> The HPSP streetscape plan is designed to create a diverse urban forest that will integrate development in Hollywood Park with the adjoining urban fabric and assist in developing districts of distinctive and appropriate character. Tree selections on Prairie Avenue in the HPSP design guidelines consist of Afghan Pine, Camphor Tree, Southern Magnolia, and Canary Island Pine trees. Prairie Avenue adjacent to HPSP would include residential and retail gateways, with the goal of providing an appealing environment for pedestrians and vehicles traveling along Prairie Avenue. All existing

---

<sup>28</sup> Hollywood Park Lan Company, LLC. *Hollywood Park Specific Plan*. <https://www.cityofinglewood.org/DocumentCenter/View/1347/Hollywood-Park-Specific-Plan>. Adopted July 8, 2009, Amended September 23, 2014, Amended February 24, 2015.

landscaping, signs and other streetscape improvements reduced or eliminated as a result of implementation of the Project will be replaced consistent with the Design Standards and Guidelines.

### Shade and Shadow

New shade and shadow patterns in the Prairie Avenue segment would be created by the ATS guideway structures, the Manchester Boulevard/Prairie Avenue, and the Prairie Avenue/Hardy Street stations. Nearby shade and shadow sensitive uses include residential uses west of Prairie Avenue. No existing solar panels in this segment that were identified through review of aerial photographs.<sup>29</sup>

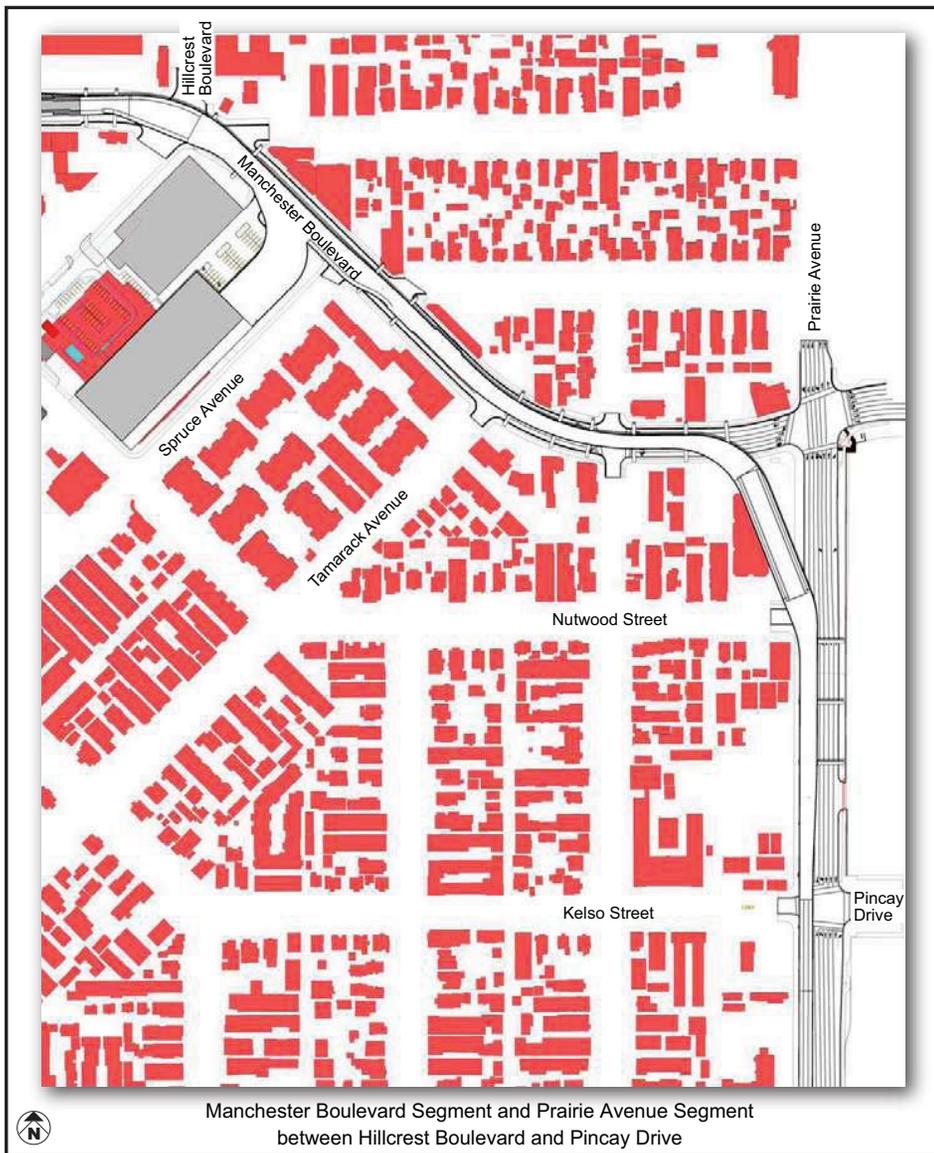

The Manchester Boulevard/Prairie Avenue and the Prairie Avenue/Hardy Street stations would both be located immediately west of Prairie Avenue. The stations would cast shadows furthest on a winter morning as shown in **Figure 4.1-20** and **Figure 4.1-27**, and during a winter evening as shown in **Figure 4.1-22** and **Figure 4.1-29**. The winter morning shadows from the stations would be almost entirely contained on the station sites and no uses sensitive to shading would be affected. Winter mid-day and afternoon shadows would not affect any adjacent uses. The shorter shadows during summer and other times of year would also not affect any adjacent uses sensitive to shading.

The guideway would run the entirety of the segment from Manchester Boulevard to Hardy Street on the west side of Prairie Avenue adjacent to the roadway. With single support columns spaced as far apart as feasible and the bottom of the guideway raised 40 feet adjacent to the west side of the roadway, the shadows created would be narrow and would not affect large areas at any point during the day. This narrow shadow pattern would also move throughout the day from northwest to southeast. No areas would be shaded for long periods as shown in **Figure 4.1-17** through **Figure 4.1-29**. For these reasons, no adjacent properties will be substantially shaded for long periods of time during the day.

Uses adjacent to the planned location of the guideway along the west side of Prairie Avenue include commercial, residential, and institutional uses, including the Kelso Elementary School and the Daycare Center. The recreational areas of these facilities are considered shade sensitive uses. Only the western edge of the Kelso School campus would be shaded during mornings from the guideway and majority of the campus would not be shaded during any portion of the day. No portion of the campus would be shaded in the afternoon. The impact of shading on the Kelso School campus, therefore, would be less than significant.

---

FIGURE 4.1-29

Prairie Avenue, La Palma Drive to Hardy Street, December 21 at 3:00 PM

251-003-21

As the shadow of the guideway would not affect any specific location for an extended time due to its size and location, the proposed Project would have a less than significant shade and shadow impact on the surrounding uses in this segment.

The addition of the components of the ITC Project including stations, elevated passenger walkways, ATS guideway along the proposed alignment along Market Street, Manchester Boulevard and Prairie Avenue and the proposed street improvements, including the shift of one of the existing travel lanes on Prairie Avenue up to thirty (30) feet into the existing setback area, the construction of the new Vons store on the corner of Manchester Boulevard and Hillcrest Boulevard, will not result in substantial adverse change of the existing visual character of the surrounding developed urban area.

**Mitigation Measures**

No mitigation is required.

**Level of Significance**

While the proposed Project, inclusive of the ATS guideway, stations, MSF, PDS substations, street improvements, and the new Vons store would result in changes to the existing visual character of the areas located along the proposed alignment of the ATS system, the Project would not result in substantial adverse changes to the existing visual character of these street corridors due to the design character of the Project as defined in the Design Standards and Guidelines and the project design features, which would result in the integration of the components of the Project into these street corridors.

Visual impacts associated with construction of the proposed Project would be less than significant with the implementation of measures from the CCP. These CCP measures would reduce the visual duration of the obtrusive erosion control devices to as short of a duration as feasible. The stockpile areas would be limited to areas less visibly sensitive as approved by the City. These measures would minimize the visual degradation impacts of the construction activities. The construction activities would also be phased to limit the exposure of one segment from continual exposure to construction activities and unpleasant views. Construction activities at each segment and overall would be temporary in nature and visual impacts would be alleviated once the construction is completed.

Overall, the ATS structure, including the stations, guideway, MSF, and support facilities, would complement the existing surrounding visual environment by using transparent and neutral tones as part of its design character. The design would be in the modernist style to enhance the aesthetically pleasing quality of the structure. To prevent unsightly views and defacing of the structure, the exterior material would be anti-graffiti and anti-vandalism. The final design of the stations would also reflect the visual character of Downtown Inglewood along Market Street and the new development occurring along Prairie Avenue.

The design of the ATS guideway would allow the continued expression of the buildings identified as historic resources. The height of the ATS guideway, the distance of the guideway from the edge of the buildings and the size and spacing of the support columns have been designed in a manner that maintains important aspects of the existing setting for the historic resources located along the proposed alignment and ensures that the overall scale, massing, composition and design of these historic buildings would remain readily visible despite some interruption of views. The ability of the buildings to convey their historic significance would not be substantially impaired by the proposed Project. Therefore, indirect impacts to identified historic resources would be less than significant.

**Impact AES-1 b: If the project is in an urbanized area, would the project be consistent with applicable zoning and planning regulations governing scenic quality?**

As previously noted, the proposed Project is located entirely within a developed urban area containing commercial, residential, and industrial uses near major corridors.

**City General Plan**

The City’s General Plan includes the Land Use Element which identifies various goals and policies that indirectly address the City’s aesthetic objectives. The Land Use Element includes the following applicable goals:

- Goal 1:** Promote Inglewood’s image and identity as an independent community within the Los Angeles metropolitan area.
- Goal 2:** Improve the visual appearance and economic condition of the existing arterial commercial development along Inglewood’s major streets.

The Downtown TOD Plan in the Land Use Element contains the following goals:

- Goal 1:** Downtown is a place to live, work, shop, recreate, and be entertained.
- Goal 2:** Downtown is a revitalized yet forward-looking gathering place for the community.
- Goal 6:** Downtown expresses the unique culture of Inglewood.

The proposed Project would be consistent with the General Plan goals and policies by improving the general visual appearance of Inglewood through the incorporation of aesthetically pleasing architectural designs in the modern style for the guideway and stations. The structures of the ATS system, including the stations, guideway, MSF, and support facilities, would utilize transparent material where feasible and appropriate and neutral tones to better integrate the system into the existing surrounding community.

Unique Inglewood Historic Core elements may be incorporated to the extent provided for in the ITC Design Standards and Guidelines to further Downtown Inglewood’s expression of a unique culture. To ensure the consistency of the ATS system with the historic fabric of downtown and the General Plan Land Use Element the proposed amendment is included as part of the Project:

The new text shown as underlined is proposed to be added to the goal below in the “Circulation” subsection of the “Goals and Objectives” section:

- Policy 2.3: *Preservation of Historic Fabric*. Require the preservation of buildings that have been designated as historic and encourage the reuse of other historic buildings. Maintain the sense of place in areas with historic fabric and/or meaning such as Market Street between Regent Street and Hillcrest Avenue and the Hillcrest neighborhood east of Locust Street, while also accommodating for the development of the Inglewood Transit Connector along Market Street between Regent Street and Manchester Boulevard.

The incorporation of the underlined language would allow for the implementation of the proposed Project to be consistent with the existing General Plan.

For detailed consistency analysis of the Land Use goals and policies please see **Table 4.1-2: Scenic Quality Consistency with General Plan Land Use Element.**

**Table 4.1-2  
Scenic Quality Consistency with General Plan Land Use Element**

Goals and Policies	Project Consistency
<b>Goals and Policies added with 2016 Amendment</b>	
<b>Goal 1:</b> Downtown is a place to live, work, shop, recreate, and be entertained.	<b>Consistent.</b> The proposed Project would strengthen Downtown Inglewood for commercial and residential uses by increasing accessibility to the downtown from local activity centers and the regional light rail network. This increased transit accessibility would promote local economic development opportunities, and enhance Downtown’s retail, recreation, and entertainment offerings and range of housing and employment options. Implementation of the proposed Project would activate and complement development in the City, and enhance social cohesion, equity, and community resilience. The streetscape improvements proposed as part of the Project will improve the pedestrian character of Market Street in Downtown.
<b>Goal 2:</b> Downtown is a revitalized yet forward-looking gathering place for the community.	<b>Consistent.</b> The proposed Project would promote economic development opportunities in Downtown Inglewood and support the development of a revitalized Downtown that serves as a gathering place for residents and visitors by increasing transit accessibility.

Goals and Policies	Project Consistency
--------------------	---------------------

**Policy 2.2:** Pedestrian Network. Enhance sidewalks, repurpose alleys and create mid-block passthroughs and internal courtyards to serve as pedestrian passageways and enjoyable public spaces.

**Consistent.** The proposed Project would maintain and enhance sidewalks around the stations and guideway which would enhance the pedestrian environment. Sidewalks would be enhanced and widened at necessary points adjacent to the support columns to meet Americans with Disabilities Act (ADA) pedestrian circulation requirements, including along Market Street. Street trees would be integrated into sidewalks and planted within the median beneath guideway support columns along Market Street and Manchester Boulevard. New enjoyable public spaces would be created such as plazas with integrated street furniture at each of the proposed stations that would be designed in accordance with the existing planning documents and the Design Standards and Guidelines.

**Policy 2.3:** Preservation of Historic Fabric. Require the preservation of buildings that have been designated as historic and encourage the reuse of other historic buildings. Maintain the sense of place in areas with historic fabric and/or meaning such as Market Street between Regent Street and Hillcrest Avenue and the Hillcrest neighborhood east of Locust Street.

**Consistent.** The proposed Project would result in less than significant impacts to historic buildings. For detailed analysis, please refer to **Section 4.4: Cultural Resources**. To properly incorporate the proposed Project into the existing historic fabric of Downtown Inglewood, the amendment to Policy 2.3 has been proposed to include the ATS system. With the incorporation of the GP amendment the proposed Project would be consistent with the GP Land Use Element.

Additionally, the Design Standards and Guidelines address the integration of the proposed Project into the historic character of the Downtown along Market Street. The guideway would have an integrated, clean design, with round columns. The underside of the guideway would be smooth, and color of the concrete would be neutral with accents achieved through lighting. The design standards and guidelines for the stations call for sleek, modern style with canopies to provide shade and allowing for natural ventilation and daylight.

**Goal 6:** Downtown expresses the unique culture of Inglewood.

**Consistent.** The Design Standards and Guidelines provide for a streetscape environment with complete streets and furnishings that help define street character. The sidewalks would be designed to be as wide as possible to facilitate the incorporation of street furniture.

Goals and Policies	Project Consistency
--------------------	---------------------

**Goals and Policies**

**General**

Promote Inglewood's image and identity as an independent community within the Los Angeles metropolitan area.

**Consistent.** The proposed Project would incorporate elements unique to Downtown Inglewood to facilitate the promotion of Inglewood's image and identity as an independent and unique community. The proposed Project would provide an integrated gateway to various entertainment activities specific to the City. In addition, the ATS system would encourage and facilitate greater access to the City's activity centers, including SoFi Stadium, Forum, IBEC and Downtown Inglewood. These activity centers contribute to the City's status and identity as an entertainment destination within the Los Angeles metropolitan area.

**Commercial**

Improve the visual appearance and economic condition of the existing arterial commercial development along Inglewood's major streets.

**Consistent.** The proposed Project would be designed in accordance with the Design Standards and Guidelines and will enhance the visual appearance of the major streets containing the ATS system by including streetscape improvements including street trees, landscaping, and street furniture. The appearance of the ATS structure would be modern with transparent materials and a natural color scheme to create an appealing appearance. The color scheme is also chosen to help better integrate the ATS structure with the adjacent environment. The ATS system would facilitate movement of greater numbers of residents and visitors along major streets in the City, thereby having the potential to activate existing commercial corridors, particularly along Market Street.

Source: City of Inglewood General Plan, "Land Use Element" (2016).  
\*Proposed GP Amendment

**Transportation Corridor Overlay Zone**

The Transportation Corridor Overlay Zone (TC Overlay Zone) would apply to the Project area and components of the ATS including stations and support facilities including the MSF and the PDS substations within the Downtown TOD Plan and HPSP areas. The TC Overlay Zone would provide allowances for encroachment into areas that may be used for the ATS system for columns, support structures, and other ATS physical components, and establish height limits to accommodate for ATS structures. The TC Overlay Zone would provide a design review process unique to the TC Overlay Zone for the construction of the ATS system. The TC Overlay zone would take precedence over the requirements of the IMC in the event of a conflict. The TC Overlay Zone is a permissive zone and would not change or restrict the current underlying zoning of any parcel.

With the implementation of the TC Overlay zone, implementation of the ATS system would be consistent with the IMC and other local regulations.

#### ***Downtown TOD Plan and Design Guidelines***

Portions of the proposed Project are located in the Historic Core area designated by the Downtown TOD Plan. While the ITC Design Standards and Guidelines address the Project and will not alter or change the standards in the Downtown TOD Plan, the Design Standards and Guidelines were created to integrate all Project elements with the Historic Core area vision set forth in the Downtown TOD Plan. Additionally, the Design Standards and Guidelines require consideration of the Downtown TOD Plan guidelines during the refinement of the design of the Project.

The Project would be designed in accordance with the Design Standards and Guidelines and would help fulfill the relevant aesthetic goals and policies of the Downtown TOD Plan, as outlined in **Table 4.1-2**. For analysis of goals and policies relevant to land use plans and planning, please refer to **Section 4.9: Land Use and Planning**. As discussed above, the Downtown TOD Plan area includes the entire Market Street segment and a portion of the Manchester Boulevard segment from Market Street to Locust Street. Accordingly, streetscape design and street trees in these areas would complement the guidelines defined within the Downtown TOD Plan. Section 4.10 of the Downtown TOD Plan details the visual design guidelines for Historic Downtown which would be integrated into the design considerations of the proposed Project.

With the incorporation of the General Plan amendment described above, the required consideration of the Downtown TOD Plan guidelines into the ITC Design Standards and Guidelines, and the complementary design and modern style of the ATS system, the proposed Project would be consistent with the Downtown TOD Plan and Guidelines.

#### ***Hollywood Park Specific Plan***

The Design Standards and Guidelines, and resulting design of the proposed Project, would not obstruct the implementation of the HPSP policies related to visual character as shown in **Table 4.1-3: ITC Design Standards and Guidelines Consistency with the Hollywood Park Specific Plan** below. The HPSP includes visual guidelines and standards for the public right-of-way within the plan area, which includes areas north of Hardy Street along Prairie Avenue. The HPSP also provides integrated and coordinated landscape design guidelines for new development in areas subject to HPSP's Plot Plan Review process along the perimeter of the Plan area with the objective of promoting visual compatibility. Similar to the Design Standards and Guidelines' approach to the portions of the Project located in the Downtown TOD Plan area, while the Design Standards and Guidelines will govern construction of the Project and therefore control over any conflicting provisions contained in HPSP, the Design Standards and Guidelines were created to integrate the Project elements with the HPSP streetscape. Additionally, the Design Standards and Guidelines require consideration of the HPSP's design guidelines where applicable during the refinement of Project plans.

The foregoing will apply to the portions of the proposed Project adjacent to the HPSP area that are covered by the HPSP's Plot Plan Review process, including the portions of the ATS guideway, the Prairie Avenue/Hardy Street station, and various support structures and columns.

The Project also includes a proposed amendment to the HPSP to address any potential conflict or inconsistency with the HPSP that may result from the shift of one lane of Prairie Avenue thirty (30) feet into the existing setback area on the east side of Prairie Avenue in the HPSP area and the associated reconfiguration of the existing sidewalk, landscape and other improvements that would be affected. For example, the amendment would eliminate the requirement for a 30-foot setback along the western edge of the HPSP to allow zero-lot line development. Accordingly, future buildings and structures within the HPSP area adjacent to Prairie Avenue would be permitted to be built along the existing property line without requiring any additional setback along Prairie Avenue. The landscape area within the 30-foot setback area on Prairie Avenue along the western edge of the HPSP area will be reduced or eliminated in certain areas, as needed to accommodate the new street easement. With this amendment and the replacement of existing streetscape features and signs that will be affected by street improvements to Prairie Avenue, no significant effects on the visual character of the HPSP area as defined by the HPSP will result from the Project.

#### ***Inglewood Municipal Code***

For the portions of the ATS systems that are not in the Downtown TOD or the Hollywood Park Specific Plan, the ITC Design Standards and Guidelines would prevail over the IMC, though IMC provisions relating to streetscapes, landscapes and signage are incorporated as part of the design process.

#### **Tree Preservation**

The IMC Tree Preservation ordinance<sup>30</sup> recognizes the importance of both native and nonnative trees within the City for the many benefits they provide. Prior to removing or cutting a protected tree in the City, a permit must be obtained with the City's Parks, Recreation, and Library Services Department. All trees removed require replacement with like-size, like-kind trees or an equal value tree or trees as determined by the City's Mater Plan or the Parks, Recreation, and Library Services Department. Compliance with the IMC Section 12-110, Tree Preservation requirements would ensure consistency and compliance of the proposed Project to the existing policies and guidelines.

Additionally, the **PDF AES-2** is consistent with the tree replacement ordinance in the IMC and also requires avoidance of tree removal to the extent feasible along with additional measures pursuant to the CCP. Any and all trees removed would be replace in kind and the same location if at all possible and in a timely manner, if the replacement of the tree would not conflict with future construction activities of the proposed Project.

---

<sup>30</sup> Inglewood, California, Municipal Code, Article 32, Section 12-110 (2012), Tree Preservation.

**Table 4.1-3  
ITC Design Standards and Guidelines Consistency with the Hollywood Park Specific Plan**

Principles and Goals	Project Consistency
<b>Design Guideline Checklist</b>	
<p>Pedestrian and vehicular circulation routes shall comply with all requirements of the Americans with Disabilities Act (ADA), and include one or more of the following design elements along all or a portion of all streets or pedestrian pathways: (1) pedestrian pathway includes a pattern, color, or paving material that is differentiated from surrounding landscaping or paved areas; (2) way-finding signage; (3) the streets and pathways are oriented such that they include verifiable lines of sight that would allow both pedestrians and vehicles to see any one or more of the following: (a) Stadium, (b) performance venue, casino, retail or residential gateway, or (c) Champion Plaza, Lake Park, Arroyo Park, or Bluff Park.</p>	<p><b>Consistent.</b> Pedestrian facilities along the guideway, and adjacent to stations adjacent to the HPSP area would be improved to comply with all ADA requirements. The passenger walkway would be made of a different paving material than those of the surrounding paved areas and way finding signage would be installed where appropriate. Passenger walkways to the east of the guideway and stations will provide lines of sight to the HPSP area and, depending on location, could include the Stadium, the performance venue and/or the retail or residential gateway.</p>
<p>The exterior entryways of buildings shall include one or more of the following: (1) a trim or border of a different color or material than other portions of the façade; (2) an integral porch; (3) an awning; (4) an articulated entryway offset from the immediately adjacent façade by not less than one foot; or (5) an arched opening.</p>	<p><b>Consistent.</b> The proposed Stations would incorporate distinguishing features, such as distinctive canopies that do not detract from the surroundings, that are generally consistent with the HPSP Design Guidelines</p>
<p>When using more than one material on a façade (except as a trim or offset portion of the façade or as an entry or window treatment), the variation in materials shall continue to all side and rear elevations that are visible from the front or corner lot line.</p>	<p><b>Consistent.</b> As defined in the ITC Design Standards and Guidelines, materials used on the stations would be neutral in tone and would include color accents only where appropriate. The façade of the stations would not be incompatible with the HPSP.</p>
<p>Each building shall include one or more of the following:</p> <ul style="list-style-type: none"> <li>- Entry or window trim/surrounds</li> <li>- Horizontal banding</li> <li>- Corner quoins</li> <li>- Balconies (supported, cantilevered or Juliet)</li> <li>- False, shuttered windows</li> <li>- Awnings</li> <li>- Change in material or color</li> </ul>	<p><b>Consistent.</b> Stations will be visibly compatible with the standards articulated in the HPSP Design Guidelines. Under the ITC Design Standards and Guidelines, stations will be identifiable, distinctive and streamlined.</p>
<p>Railings shall be constructed of wood, wrought iron, or other material, such as stucco, which is used to construct the façade or entry or window trim on the same building.</p>	<p><b>Consistent.</b> The materials chosen for station railings would be consistent with the other station materials as defined in the ITC Design Standards and Guidelines in a manner that is generally consistent with the HPSP Design Guidelines.</p>
<p>Exposed gutters and downspouts shall be colored or painted, and shall not be constructed of unpainted aluminum, copper, or zinc.</p>	<p><b>Consistent.</b> Exposed gutters along Prairie Avenue would be painted or colored as defined in the ITC Design Standards and Guidelines in a manner that is generally consistent with the HPSP Design Guidelines.</p>
<p>Stairs shall be constructed of the same material as the deck and landing.</p>	<p><b>Consistent.</b> Station stairs would be constructed of the same material as the deck and landing as defined in the ITC Design Standards and Guidelines in a manner that is generally consistent with the HPSP Design Guidelines.</p>
<p>Columns and posts shall be constructed of stone, stucco, or wood (or other material painted or molded to look like one of the allowed materials) and shall be not less than four inches in diameter if round, or four inches on each side if rectangular.</p>	<p><b>Consistent.</b> Columns and posts would be constructed of materials used elsewhere in the station as defined in the ITC Design Standards and Guidelines in a manner that is generally consistent with the HPSP Design Guidelines</p>

**PDF AES-2** also requires the Contractor to maintain any replacement trees for three years after the date of planting and provide a warranty for such trees for at least one additional year post maintenance. The contractor and the City would conduct an inspection of all replaced trees before the one-year warranty expires before the City accepts the tree. These requirements as described in **PDF AES-2** would further the goal of the City to protect and maintain City trees within its jurisdiction.

**Design Review Process**

The Public Works Director or his/her designee would, in consultation with the Planning Division Manager or his/her designee, have the authority to review each ITC system project for compliance with all applicable provisions of (i) the ITC Design Standards and Guidelines, (ii) all additional technical, aesthetic, and other specifications contained in the procurement document(s) for the applicable ITC system component(s), and (iii) all requirements of the Mitigation Monitoring and Reporting Program set forth in the ITC's Final Environmental Impact Report.

The Director of Public Works or her/his designee would in consultation with the Planning Division Manager or her/his designee have the ability to update and/or revise the ITC Design Standards and Guidelines from time to time to include, among other things, alternate technologies, new or updated ITC Design Standards and Guidelines, consistency determinations of ITC procurement document(s) and alternative mitigation measures that achieve a comparable level of mitigation and/or, clarifications of existing provisions. The Director of Public Works or her/his designee would have the final decision-making authority regarding the interpretation of the Design Guidelines should there be an appeal ability to Council. This design process is consistent with the IMC.

**Summary**

As described previously, the proposed Project would take into consideration and be consistent with visual and materials-related guidelines from plans governing adjacent areas in the Downtown TOD Plan and the HPSP areas, to the extent feasible and consistent with the Design Guidelines. An amendment to Policy 2.3 of the General Plan Land Use Element has been introduced to ensure consistency of the proposed Project with the City's General Plan. The amendment describes the incorporation and implementation of the ATS system into the historic fabric of the Inglewood historic core.

The TC Overlay Zone would also be implemented to accommodate for the ATS system and its related elements in the City. The introduction of the TC Overlay Zone would reduce the potential for the proposed Project to conflict with the IMC since the TC Overlay Zone implements the Design Guidelines and applies them to the construction of the ATS system and related components within the TC Overlay Zone. The TC Overlay Zone will not have any impacts on other, non-Project elements that fall within the TC Overlay Zone,

as those uses would continue to be governed by their existing, underlying zone and other provisions of the IMC.

With the implementation of the TC Overlay Zone and the amendment to the City's General Plan, the proposed Project would be generally consistent with existing zoning and planning regulations governing scenic quality. Therefore, impacts would be less than significant.

#### **Mitigation Measures**

No mitigation is required.

#### **Level of Significance**

The impacts associated with applicable zoning and planning regulations governing scenic quality would be less than significant.

**Impact AES-2: Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?**

#### **Construction**

Under existing conditions, the area surrounding the proposed Project has a relatively high level of ambient lighting, particularly along Florence Avenue, Manchester Boulevard, and Prairie Avenue, as those streets are well-lit, active transportation corridors. Nighttime construction activities would add to the existing ambient light levels on and in the area surrounding the proposed Project for the duration of construction.

Over the course of the construction of the proposed Project, the length of workdays would vary with the level of activity fluctuating throughout any given day. This would influence the nighttime work hours in a day which would influence the amount of lighting required at a site for a given day. The daily duration of construction lighting would also vary based on the season, with the longest duration of construction lighting occurring during winter months, when there are fewer hours of daylight, and the shortest duration of construction lighting during the summer months, when there are the most hours of daylight. Nighttime lighting sources during construction would consist mainly of floodlights that would be focused on the work area. Security lighting could also be used on construction sites but would be focused on the Project alignment. Because this lighting is intended to light the Project alignment to allow for nighttime construction and to provide security to the site, it would tend to be directed away from nearby adjacent properties, reducing the potential for spillover lighting effects.

Nighttime construction lighting would be temporary in nature. The CCP outlines measures to be taken to limit nighttime light spillage and glare to adjacent uses. Prior to the start of construction, light plans and mitigation measures would be drafted in accordance with the standards for the City issued Construction

Permit. Temporary lighting at construction sites would be limited to the amount necessary to safely perform the required work and would be directed downwards and shielded to avoid light spillage. Placement and orientation of the portable lighting fixtures would be placed in a manner to avoid directing lights toward sensitive receptors, including vehicle drivers on the roadway. The placement, shielding, and direction of the lighting would be purposeful and reduce the illumination outside of the intended area to the extent possible. The limited time duration of lighting would also limit the amount of illumination impact on nearby uses to the extent feasible.

In the event where lighting is required near the edge of the construction area, light trespass shall not exceed one foot-candle above ambient light level as measured at any adjacent residential and transient properties as outlined in the CCP. This measure would ensure lighting does not extend outside of the limits of the construction site in any significant manner. To ensure safety, temporary sidewalks, and any sidewalk adjacent to construction activities would be illuminated to City Standards to protect public safety. The illumination would be equivalent to those of street lighting and would not significantly contribute to visual impacts through significant light spillage or glare.

In addition to minimizing light spill, the CCP would ensure sensitive receptors and motorists on public streets would not have direct views of construction light sources to limit potential effects of glare. Sound barriers and temporary construction barriers that would be built in the initial phase of project construction, and, as construction progresses, newly constructed intervening structures would also incrementally block light and obscure views of construction sites from nearby residences and local streets, further restricting the potential for spillover lighting as construction progresses.

Any nighttime construction activities would require a permit from the Permits and License Committee of the City. The proposed Project would comply with any conditions identified by the City to reduce nighttime construction lighting.

With the incorporation of the CCP measures the potential impact for construction lighting and glare on surrounding land uses and sensitive receptors would be reduced to the extent feasible. Lighting and glare impacts during construction would be less than significant.

#### **Operation**

##### **Market Street Segment**

The Market Street segment contains existing ambient lighting conditions typical for a highly developed urban setting. Sources of existing light in this segment include streetlights, vehicle headlights, traffic lights, and lighting from parking lots, offices, and storefronts. As described under existing conditions, there are no existing light sensitive uses on Market Street such as residential dwelling and hotels/motels. Existing sources of daytime and nighttime glare in the area include mostly headlights of traveling cars in the area.

**PDF AES-3** includes the lighting design standards in the Design Guidelines. These guidelines address lighting for station design, guideway and support structures, the MSF, and elevated passenger walkways as described below.

#### Market Street/Florence Avenue Station

The station would be located on a site at 300 Florence Avenue currently developed with a retail commercial center. Lighting at the station would include accent lighting, lighting for security placed on pedestrian paths, and interior lighting within the station. Canopy lighting at the station would utilize indirect accent lighting to avoid glare and light illumination on adjacent properties. Additional accent lighting at the station would be less prominent than the accent lighting on the canopy and be of lesser visual impact to surrounding uses. Pedestrian friendly lighting would be functional and placed in a manner to minimize negative impacts on adjacent property. Care in the placement of the lighting would further reduce light spillage and glare to nearby uses. Additionally, all lighting facilities at the station would be programmable and sensor controlled to conserve energy and allow control for various settings such as daytime, nighttime, and event lighting. These settings would further ensure lighting at the property would be actively controlled and contained, and the level of lighting would be appropriate for the time of the day or events held at the City as required by **PDF AES-3**. The station would occupy a site already illuminated by nighttime lighting; the impact of the station lighting would be less than significant.

#### ATS Guideway

The ATS Guideway may include lighting fixtures for accent lighting. The light fixtures would be concealed or minimally visible within the guideway structure by design. Care would be taken to place lighting in a manner to limit the illumination impact on adjacent properties and lighting would not be visible from the ground level per the Design Guidelines. The limited visibility of the lighting and lighting fixture would reduce the chance of glare to passersby and adjacent uses. Illumination of the surrounding uses would also be limited by the reduced visibility of the light source. The guideway material used would be non-glare to eliminate potential for introducing glare to the surrounding uses. Because of the manner in which the lighting and the light fixtures would be designed as required by **PDF AES-3**, and the use of non-glare materials, lighting, and glare impacts of the ATS Guideway would be less than significant to surrounding uses and passersby.

#### Surface Parking Lots

Surface parking lots in the Market Street segment would be provided at the Market Street/Florence Avenue Station and at the existing site. Functional security lighting for the sites would be provided to ensure safety of the lots. Street trees surrounding the parking lot would be provided for aesthetic purposes separating the parking stalls from sidewalks which would also limit light spillage to adjacent areas outside

of the parking lots and limit glare. All parking lots are located at sites with existing light sources such as streetlights and interior lighting from buildings. As such, the security lighting at surface parking lots would not have a significant impact on surrounding uses beyond the existing light sources. The light and glare impact of surface parking lot lighting would be less than significant.

#### Streetscape

Roadway lighting would follow the requirements of the City of Inglewood per the Design Guidelines and would, therefore, be comparable to existing lighting on the roadway and not contribute to additional light spillage or glare. Pedestrian lighting in this segment would be provided on sidewalks, in elevated passenger walkways, at public places, and in all pedestrian pathways under ATS guideway to ensure safety and security for pedestrians. Along primary circulation routes, light fixtures and incident light sources would provide an average of 3-foot candles to help pedestrians better distinguish color, size, and shape of their surroundings. The streetscape lighting would not significantly contribute to existing lighting at the Project area where existing lighting as described above is consistent with the level of lighting at a highly developed urban area. Therefore, lighting and glare impacts of roadway and street lighting in this segment would be less than significant.

#### Manchester Boulevard Segment

The Manchester Boulevard segment contains existing ambient lighting characteristic typical for a highly developed urban setting. Sources of existing light in this segment includes streetlights, vehicle headlights, traffic lights, and lighting from parking lots, offices, storefronts, and interior illumination from residences.

#### ATS Guideway

Similar to the Market Street segment, the ATS guideway may include accent lighting along the guideway. Care would be taken to place accent and functional lighting in a manner to limit the illumination impact on adjacent properties and lighting would not be visible from the ground level per the Design Guidelines. The limited visibility of the lighting and lighting fixtures would reduce the chance of glare to passersby and adjacent uses. Illumination of the surrounding uses would also be limited by the reduced visibility of the light source. The guideway material would be non-glare to eliminate potential for introducing glare to the surrounding uses.

Light sensitive receptors along this segment consist of the homes located on the north side of Manchester Boulevard between Manchester Drive and Osage Avenue. In addition to the design measures mentioned previously to avoid light spillage and glare to nearby uses, the guideway along the segment with residential uses would be positioned towards the south side of the guideway. The positioning of the guideway would allow approximately 30 feet between the closest residential buildings and the edge of the guideway. The

elevated guideway would also be substantially above the height of the residential home and the lighting would not be in direct line of sight of the residents at the ground level.

Overall, because of the manner in which the lighting and the light fixture would be designed, the non-glare exterior material of the guideway as required by **PDF AES-3**, and the positioning and height of the guideway, lighting, and glare impacts of the ATS Guideway on surrounding uses and sensitive receptors would be less than significant.

#### Maintenance Storage Facility

The MSF would be built on a site currently developed with a retail commercial center. Lighting would be provided and placed in a manner to limit light spillage and glare on the residential uses across Spruce Avenue from the proposed MSF site. The building entrances to the MSF site would be lit to maintain safety and security of workers and passersby and primary walkways, steps, or ramps along the pedestrian routes would also be illuminated per **PDF AES-3** and ITC Design Standards and Guidelines. Security lighting in the parking lot would also be installed to maintain the safety of staffs and visitors.

The MSF would be separated from adjacent uses by the public right of way where existing sources of ambient light and glare includes vehicles, streetlights, and light sources from the interior of other adjacent buildings, including the new Vons store located on the northwest portion of the site. Lighting used by the MSF is would not result in any substantial increase in the level of the existing lighting by surrounding uses. Additionally, street trees would surround the MSF site for aesthetic appeal on the sidewalks and would further obstruct the lighting associated with the MSF. Therefore, lighting and glare impacts from the MSF site on surrounding uses would be less than significant.

#### Streetscape

Similar to the Market Street segment, roadway lighting would follow the requirements of the City of Inglewood per the Design Guidelines and would, therefore, be comparable to existing lighting on the roadway and not contribute to additional light spillage or glare. Pedestrian lighting in this segment would be provided similarly to the Market Street segment with the same guidelines and design features. Therefore, lighting and glare impacts of roadway and street lighting in this segment would be less than significant.

#### Prairie Avenue Segment

The Prairie Avenue segment contains existing ambient lighting characteristic typical for a highly developed urban setting. Sources of existing light in this segment includes streetlights, vehicle headlights, traffic lights, and lighting from parking lots, offices, billboards, and storefronts, security lighting at construction sites, and interior illumination from residences and hotels.

#### Manchester Boulevard/Prairie Avenue Station and Prairie Avenue/Hardy Street Station

Similar to the Market Street/Florence Avenue station, lighting at the stations would include accent lighting, lighting for security placed on pedestrian paths, and interior lighting within the station. Canopy lighting at the station utilize indirect accent lighting to avoid glare and light illumination on adjacent properties. Additional accent lighting would at the station would be less prominent than the accent lighting on the canopy and be of lesser visual impact to surrounding uses. Pedestrian friendly lighting would be functional and placed in a manner to minimize negative impacts on adjacent property. Care in the placement of the lighting would further reduce light spillage and glare to nearby uses as required by **PDF AES-3**. Additionally, all lighting facilities at the station would be programmable and sensor controlled to conserve energy and allow control for various settings such as daytime, nighttime, and event lighting. These settings would further ensure lighting at the property would be actively controlled and contained, and the level of lighting would be appropriate for the time of the day or events held at the City.

#### ATS Guideway

Similar to the other segments, the ATS guideway may include accent lighting along the guideway. Care would be taken to place lighting in a manner to limit the illumination impact on adjacent properties and lighting would not be visible from the ground level in conformance with **PDF AES-3** from the Design Guidelines. The limited visibility of the lighting and lighting fixture would reduce the chance of glare to passersby and adjacent uses. Illumination of the surrounding uses would also be limited by the reduced visibility of the light source. The guideway material would be non-glare to eliminate potential for introducing glare to the surrounding uses.

Light sensitive receptors along this segment are residential homes located on the west side of Prairie Avenue just north of Buckthorn Street, a motel just north of Arbor Vitae Street, and a motel approximately 400 feet south of Arbor Vitae Street. However, in addition to the design measures mentioned previously to avoid light spillage and glare to nearby uses, the guideway would be substantially above the height of the sensitive receptors and the lighting would not be in direct line of sight of the residents at the ground level. The positioning of the guideway would allow approximately 10 feet between the closest sensitive receptor and the edge of the guideway.

Because of the manner in which the lighting and the light fixture would be designed, the non-glare exterior material to be used, and the height of the guideway, lighting, and glare impacts of the ATS Guideway would be less than significant to surrounding uses and sensitive receptors.

### Streetscape

Roadway lighting would follow the requirements of the City of Inglewood per the Design Guidelines and would, therefore, be comparable to existing lighting on the roadway and not contribute to additional light spillage or glare. Pedestrian lighting in this segment would be provided on sidewalks, in elevated passenger walkways, at public places, and in all pedestrian pathways under ATS guideways to ensure safety and security for pedestrians. Along primary circulation routes, light fixtures and incident light sources would provide an average of 3-foot candles to help pedestrians better distinguish color, size, and shape of their surroundings. The streetscape lighting would not significantly contribute to existing lighting at the Project area where existing lighting as described above is consistent with the level of lighting at a highly developed urban area. Therefore, lighting and glare impacts of roadway and street lighting in this segment would be less than significant.

### Summary

Overall, light and glare impacts would be less than significant with the incorporation of CCP measures during construction, incorporation of **PDF AES-3**, compliance with the Design Guidelines. As discussed, the Project is proposed within a highly developed neighborhood with high levels of existing ambient lighting. Measures outlined in the CCP would limit light spillage and glare onto adjacent uses through the use of downward directed and shielded lighting and positioning the lighting in a manner that limits the illumination of light outside of the construction area. Construction lighting plans, which would comply with the CCP mitigation measures be developed prior to construction. Any light trespass outside of the construction site would be limited to one foot-candle above light level as measured at any adjacent residential and transient properties, thereby limiting the potential exposure to light spillage of any construction site adjacent uses to a less than significant level.

**PDF AES-3** and Design Guidelines would require ATS system lighting to be positioned in a manner to minimize negative impacts to adjacent properties. Lighting at the station would be programmable to allow adjustments for the best use of the lighting at any specific time of the day or event in the City. Accent lighting fixtures on the ATS guideway would be hidden by project design to the extent feasible in order to minimize light spillage and glare from lighting used at the system. As shown from the analysis discussed, surface parking lot lighting and street lighting are anticipated to be comparable to the level of lighting currently provided by the City on its roadways and sidewalks. Therefore, light and glare impact during operation to the surrounding land uses would be less than significant.

### Mitigation Measures

No Mitigation Measures Needed.

### Level of Significance

The impacts associated with light and glare would be less than significant.

#### **4.1.8 CUMULATIVE IMPACTS**

##### **4.1.8.1 Visual Character**

Overall, the components of the proposed ITC Project, including the ATS guideway, stations, and MSF and associated Project Design Features, designed in accordance with the Design Guidelines, would not adversely affect the visual character of the surrounding areas. The ITC facilities will be designed in a modern style with a neutral tone and transparent materials wherever feasible. The color scheme and transparent materials would result in an appealing appearance while integrating the components of the ATS system into its surroundings. The design of these new transportation facilities would also complement existing and future surrounding development as discussed above. The proposed Project would complement its present and future surroundings and would not contribute significant impacts on the visual character of the areas located along the proposed alignment.

The proposed Project would also have a less than significant impact on the visual character of the historical buildings located along the proposed alignment area.

The City is currently planning to build a parking structure, containing up to 2,500 spaces in six-level structure, on the City's Inglewood Transit Facility (ITF) site located on the southeast corner of Prairie Avenue and Arbor Vitae Street. This new structure would replace the existing ITF on this site, which is an improved surface parking lot. The Project includes the proposed relocation of one travel lane on Prairie Avenue east into the existing setback area along Prairie Avenue. This component of the Project would impact existing streetscape improvements on the east side of Prairie Avenue including sidewalk, landscaping, and other improvements in the HPSP area. These improvements would be replaced as part of the Prairie Avenue street improvements. Together, this new parking structure and the proposed street improvements would change the existing visual character of the eastern side of Prairie Avenue. These improvements would be designed in a manner that is compatible with the existing improvements on Prairie Avenue and existing and planned development in the HPSP area and no cumulative impact on the visual character of the HPSP area would result.

For these reasons, implementation of the Project would not contribute to any significant impact on the visual character of the areas located along the proposed alignment.

##### **4.1.8.2 Lighting and Glare**

Temporary lighting associated with construction of the proposed Project would be less than significant. This lighting would be temporary in nature and with the incorporation of requirements in the CCP would

be less than significant. Nearby construction projects such as the HPSP would also introduce construction lighting near the site. However, the increase in ambient nighttime lighting levels in these areas would only rise minimally because a significant amount of ambient lighting currently exists due to the urbanized nature of the Project area as a whole. Additionally, construction activities on Prairie Avenue for the proposed Project is anticipated to take place from the year 2024 to 2027 which would coincide with the end of the construction of the HPSP development which anticipates completion of construction by 2025. Cumulative impacts from nighttime lighting would be reduced as the HPSP development completes its construction as the proposed Project continues construction in the Prairie Avenue segment.

Operationally, cumulative lighting impacts would be less than significant as the HPSP development would reduce lighting and glare impacts from the site's previous use as determined by HPSP's EIR and the proposed Project would have a less than significant impact overall impact on lighting and glare. Both the Project and HPSP projects would utilize non-glare and non-reflective exterior materials for the proposed structures and would not contribute to glare of the surrounding area.

Therefore, no significant cumulative lighting impacts are expected and the Project's contribution would not be cumulatively significant. The Project's incremental impact associated with ambient nighttime lighting and glare effects would not be cumulatively considerable.

#### 4.1.9 CONSISTENCY WITH CITY GENERAL PLAN

As noted under **Impact AES-1b**, the proposed Project does not conflict with the City's General Plan.

## 4.2 AIR QUALITY

### 4.2.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) examines air quality emissions that would result from construction and operations associated with the proposed Inglewood Transit Connector Project (proposed Project or ITC Project).

The proposed Project would relieve traffic congestion within the Project area and the surrounding street network; improve access options and the travel experience for passengers to the City of Inglewood (City)'s major activity centers and provide a connection to the regional Los Angeles County Metropolitan Transportation Authority (Metro) rail system. The proposed Project includes an Automated Transit System (ATS) train, which would provide access to the City's major activity centers, including The Forum, the Los Angeles Sports and Entertainment District (LASED) including SoFi Stadium, and the Inglewood Basketball and Entertainment Center (IBEC) including the Intuit Dome. The ATS trains would transport passengers between the Metro rail system and the City's activity centers. Air quality emissions were analyzed using a variety of modeling techniques and are detailed within the following appendices to this Recirculated Draft EIR:

- *Air Quality and Heath Risk Assessment Technical Report for the Inglewood Transit Connector Project*, Meridian Consultants LLC, September 2021 (**Appendix G.1**)
- *Vons Replacement CalEEMod Output Sheets*, Meridian Consultants LLC, October 2021 (**Appendix G.2**)

Prior to the preparation of the December 2020 Draft EIR, a recirculated Initial Study (included as **Appendix A.2** of this Recirculated Draft EIR) was prepared to assess potential environmental impacts associated with air quality. For one of these impacts, the Initial Study found that the proposed Project would have a less than significant impact, thus, no further analysis of this topic is required in this EIR. The Initial Study concluded:

- Potential impacts related to objectionable odors affecting a substantial number of people were evaluated and determined to have a less than significant impact. Though the proposed Project may produce discernable odors during construction, these odors would decrease, dilute, and become unnoticeable. Moreover, operation of the proposed Project would not include any odor producing land uses.

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the proposed Project in response to consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. Specific changes to the proposed Project include raising the height of the ATS guideway along Market Street to preserve existing views of historic buildings, relocating

#### 4.2 Air Quality

the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue.

Additionally, the construction phasing plan has been refined. As it relates to air quality impacts, these changes include updated construction and operational details which resulted in reductions of air quality emissions compared to the December 2020 Draft EIR. Moreover, the previous significant and unavoidable impact related to construction emissions disclosed in the December 2020 Draft EIR has been reduced to a less than significant impact with mitigation incorporated.

These changes to the design of the proposed Project do not create the potential for significant impacts related to objectionable odors affecting a substantial number of people.

Other impacts found to be less than significant are further discussed in **Section 6.4: Effects Found Not to Be Significant**.

Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Recirculated Draft EIR.

#### 4.2.2 OVERVIEW OF AIR QUALITY

The proposed Project is located within the South Coast Air Basin (Basin), named so because its geographical formation is that of a basin, with the surrounding mountains trapping the air and pollutants in the valleys below. The Basin includes all of Orange County and the non-desert portions of Los Angeles, San Bernardino, and Riverside Counties. The regional climate within the Basin is considered to be semi-arid and is characterized by warm summers, mild winters, infrequent seasonal rainfall, moderate daytime onshore breezes, and moderate humidity. The air quality within the Basin is primarily influenced by a wide range of emissions sources—such as dense population centers, heavy vehicular traffic, industry, and weather.

Air pollutant emissions within the Basin are generated by stationary and mobile sources. Stationary sources can be divided into two major subcategories: point sources and area sources. Point sources occur at an identified location and are usually associated with manufacturing and industry. Examples of point sources are boilers or combustion equipment that produce electricity or generate heat. Area sources are widely distributed and produce many small emissions. Examples of area sources include residential and commercial water heaters, painting operations, lawn mowers, agricultural fields, landfills, and consumer products, such as barbecue lighter fluid and hair spray. Mobile sources are emissions from motor vehicles,

#### 4.2 Air Quality

including tailpipe and evaporative emissions, and are classified as either on-road or off-road. On-road sources may be legally operated on roadways and highways. Off-road sources include aircrafts, ships, trains, and self-propelled construction equipment. Air pollutants can also be generated by the natural environment, such as when fine dust particles are pulled off the ground surface and suspended in the air during high winds.

The United States Environmental Protection Agency (USEPA) and the California Air Resources Board (CARB) designate air basins where air pollution levels exceed the State or federal ambient air quality standards (AAQS) as “nonattainment” areas. These pollutants are referred to as “criteria air pollutants” as a result of the specific standards, or criteria, that have been adopted for them. The federal and State standards have been set at levels considered safe to protect public health, including the health of “sensitive” populations, such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings. If standards are met, the area is designated as an “attainment” area. If there is inadequate or inconclusive data to make a definitive attainment designation, an area is considered “unclassified.” Federal nonattainment areas are further designated as marginal, moderate, serious, severe, or extreme as a function of deviation from standards. Transportation conformity for nonattainment and maintenance areas is required under the federal Clean Air Act (CAA) to ensure federally supported highway and transit projects conform to the State Implementation Plan (SIP). The USEPA approved California’s SIP revisions for attainment of the 1997 8-hour ozone (O<sub>3</sub>) National AAQS for the Basin in October 2019.

Ambient air pollution can cause public health concerns and can contribute to increases in respiratory illness and death rates. Air pollution can affect the health of both adults and children. The adverse health effects associated with air pollution are diverse and include cardiovascular effects, premature mortality, respiratory effects, cancer, reproductive effects, neurological effects, and other health outcomes.<sup>1</sup>

#### 4.2.2.1 Criteria Air Pollutants

The criteria air pollutants that are most relevant to current air quality planning and regulation in the Basin include ozone (O<sub>3</sub>), carbon monoxide (CO), nitrogen dioxide (NO<sub>2</sub>), respirable particulate matter (PM<sub>10</sub>), fine particulate matter (PM<sub>2.5</sub>), sulfur dioxide (SO<sub>2</sub>), and lead (Pb). In addition, volatile organic compounds (VOC) and toxics air contaminants (TACs) are a concern in the Basin but are not classified under AAQS. The characteristics of each of these pollutants are briefly described below.

<sup>1</sup> South Coast Air Quality Management District (SCAQMD), 2016 Air Quality Management Plan, *Appendix I: Health Effects (March 2017)*, <https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/appendix-i.pdf?sfvrsn=14>. Accessed September 2021.

**Ozone (O<sub>3</sub>)**

Ozone is a highly reactive and unstable gas that is formed when reactive organic gases (ROGs), sometimes referred to as VOCs, and nitrogen oxides (NOx), byproducts of internal combustion engine exhaust, undergo slow photochemical reactions in the presence of sunlight. Ozone concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable to the formation of this pollutant.

**Carbon Monoxide (CO)**

CO is a colorless, odorless gas produced by the incomplete combustion of carbon-containing fuels, such as gasoline or wood. Carbon monoxide concentrations tend to be the highest during the winter morning, when little to no wind and surface-based inversions trap the pollutant at ground levels. Because carbon monoxide is emitted directly from internal combustion engines, unlike ozone, motor vehicles operating at slow speeds are the primary source of carbon monoxide in the Basin. The highest ambient carbon monoxide concentrations are generally found near congested transportation corridors and intersections.

**Nitrogen Dioxide (NO<sub>2</sub>)**

NO<sub>2</sub> is a reddish-brown, highly reactive gas that is formed in the ambient air through the oxidation of nitric oxide (NO), similar to O<sub>3</sub>. NO<sub>2</sub> is also a byproduct of fuel combustion. NO and NO<sub>2</sub> are collectively referred to as NOx and are major contributors to O<sub>3</sub> formation. NO<sub>2</sub> also contributes to the formation of PM<sub>10</sub>.

**Particulate Matter (PM<sub>10</sub>) and Fine Particulate Matter (PM<sub>2.5</sub>)**

Particulate Matter (PM) consists of small liquid and solid particles floating in the air, including smoke, soot, dust, salts, acids, and metals and can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. Sources of PM<sub>10</sub> emissions include dust from construction sites, landfills and agriculture, wildfires and brush/waste burning, industrial sources, and wind-blown dust from open lands.<sup>2</sup> Sources of PM<sub>2.5</sub> emissions include combustion of gasoline, oil, diesel fuel, or wood. PM<sub>10</sub> and PM<sub>2.5</sub> may be either directly emitted from sources (primary particles) or formed in the atmosphere through chemical reactions of gases (secondary particles) such as SO<sub>2</sub>, NOx, and certain organic compounds.

**Sulfur Dioxide (SO<sub>2</sub>)**

SO<sub>2</sub> is a colorless, extremely irritating gas or liquid. It enters the atmosphere as a pollutant mainly as a result of burning high sulfur-content fuel oils and coal, as well as from chemical processes occurring at

<sup>2</sup> California Air Resources Board, *Inhalable Particulate Matter and Health (PM<sub>2.5</sub> and PM<sub>10</sub>)*, <https://www.arb.ca.gov/research/aaqs/common-pollutants/pm/pm.htm>. Accessed September 2021.

chemical plants and refineries. When SO<sub>2</sub> oxidizes in the atmosphere, it forms sulfates (SO<sub>4</sub>). Collectively, these pollutants are referred to as sulfur oxides (SOx).

**Lead (Pb)**

Lead occurs in the atmosphere as particulate matter and is also considered a TAC. The combustion of leaded gasoline is the primary source of airborne lead in the Basin. The use of leaded gasoline is no longer permitted for on-road motor vehicles, so the majority of such combustion emissions are associated with off-road vehicles. However, because leaded gasoline was emitted in large amounts from vehicles when leaded gasoline was used for on-road motor vehicles, lead is present in many urban soils and can be resuspended in the air. Other sources of lead include the manufacturing and recycling of batteries, paint, ink, ceramics, ammunition, and the use of secondary lead smelters. While the South Coast Air Quality Management District (SCAQMD) CEQA Air Quality Handbook contains numerical indicators of significance for lead, project construction and operation would not include sources of lead emissions and would not exceed the numerical indicators for lead. Unleaded fuel and unleaded paints have virtually eliminated lead emissions from infrastructure projects.

**Volatile Organic Compounds (VOCs)**

VOCs include any compound of carbon, excluding CO, carbon dioxide (CO<sub>2</sub>), carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions and thus, a precursor of ozone formation. VOC emissions often result from the evaporation of solvents in architectural coatings. Reactive organic gases are any reactive compounds of carbon, excluding methane, CO, CO<sub>2</sub> carbonic acid, metallic carbides or carbonates, ammonium carbonate, and other exempt compounds. ROG emissions are generated from the exhaust of mobile sources.<sup>3</sup> Both VOCs and ROGs are precursors to ozone and the terms can be used interchangeably.<sup>4</sup>

**Toxic Air Contaminants (TACs)**

TACs refer to a diverse group of “non-criteria” air pollutants that can affect human health but have not had ambient air quality standards established for them. This is not because they are fundamentally different from the pollutants discussed previously, but because their effects tend to be local rather than regional. TACs are classified as carcinogenic and noncarcinogenic, where carcinogenic TACs can cause

<sup>3</sup> SCAQMD, Appendix A: Calculation Details for CalEEMod (October 2017), [http://www.aqmd.gov/docs/default-source/caleemod/02\\_appendix-a2016-3-2.pdf?sfvrsn=6](http://www.aqmd.gov/docs/default-source/caleemod/02_appendix-a2016-3-2.pdf?sfvrsn=6). Accessed September 2021.

<sup>4</sup> Both VOC and ROGs are precursors to ozone so they are summed in the CalEEMod report under the header ROG. For the purposes of comparing the ROG value to a VOC significance threshold, the terms can be used interchangeably.

cancer and noncarcinogenic TACs can cause acute and chronic impacts to different target organ systems (e.g., eyes, respiratory, reproductive, developmental, nervous, and cardiovascular).

CARB and the Office of Environmental Health Hazard Assessment (OEHHA) determine if a substance should be formally identified, or “listed,” as a TAC in California.<sup>5</sup> Diesel Particulate Matter (DPM), which is emitted in the exhaust from diesel engines, was listed by the State as a TAC in 1998. DPM has historically been used as a surrogate measure of exposure for all diesel exhaust emissions. DPM consists of fine particles (fine particles have a diameter less than 2.5 micrometer [ $\mu\text{m}$ ]), including a subgroup of ultrafine particles (ultrafine particles have a diameter less than 0.1  $\mu\text{m}$ ). Collectively, these particles have a large surface area, which makes them an excellent medium for absorbing organics. The visible emissions in diesel exhaust include carbon particles or “soot.” Diesel exhaust also contains a variety of harmful gases and cancer-causing substances.

#### 4.2.2.2 Health Effects of Pollutants

Elevated concentrations of certain air pollutants in the atmosphere have been recognized to cause health problems and consequential damage to the environment either directly or in reaction with other pollutants. In the United States, such pollutants have been identified and are regulated as part of the overall endeavor to prevent further deterioration and facilitate improvement in air quality. The following pollutants are regulated by the USEPA and are subject to emissions control requirements adopted by federal, State, and local regulatory agencies. These pollutants are referred to as “criteria air pollutants” as a result of the specific standards, or criteria, which have been adopted pertaining to them.

The EPA established the National Ambient Air Quality Standards (NAAQS) to “provide public health protection, including protecting the health of ‘sensitive’ populations such as asthmatics, children, and the elderly,” allowing “an adequate margin of safety.” California Ambient Air Quality Standards (CAAQS) were “established to protect the health of the most sensitive groups in our communities” and “defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without any harmful effects on people or the environment.”<sup>6</sup>

#### Ozone

According to the USEPA, ozone can cause the muscles in the airways to constrict potentially leading to wheezing and shortness of breath. Ozone can make it more difficult to breathe deeply and vigorously; cause shortness of breath and pain when taking a deep breath; cause coughing and sore or scratchy throat;

<sup>5</sup> The complete list of such substances is located at <https://ww2.arb.ca.gov/resources/documents/carb-identified-toxic-air-contaminants>.

<sup>6</sup> California Air Resources Board, California Ambient Air Quality Standards, <https://ww2.arb.ca.gov/resources/california-ambient-air-quality-standards>. Accessed September 2021.

inflammation and damage the airways; aggravate lung diseases such as asthma, emphysema, and chronic bronchitis; increase the frequency of asthma attacks; make the lungs more susceptible to infection; continue to damage the lungs even when the symptoms have disappeared; and cause chronic obstructive pulmonary disease.<sup>7</sup>

Long-term exposure to ozone is linked to aggravation of asthma and is likely to be one of many causes of asthma development. Long-term exposures to higher concentrations of ozone may also be linked to permanent lung damage, such as abnormal lung development in children.<sup>8</sup> According to CARB, inhalation of ozone causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms, and exposure to ozone can reduce the volume of air that the lungs breathe in and cause shortness of breath.<sup>9</sup>

The USEPA states that people most at risk from breathing air containing ozone include people with asthma, children, older adults, and people who are active outdoors, especially outdoor workers.<sup>10</sup> Children are at greatest risk from exposure to ozone because their lungs are still developing and they are more likely to be active outdoors when ozone levels are high, which increases their exposure.<sup>11</sup> According to CARB, studies show that children are no more or less likely to suffer harmful effects than adults; however, children and teens may be more susceptible to ozone and other pollutants because they spend nearly twice as much time outdoors and engaged in vigorous activities compared to adults.<sup>12</sup> Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults and are less likely than adults to notice their own symptoms and avoid harmful exposures. Further research may be able to better distinguish between health effects in children and adults.

#### Nitrogen Dioxide (NO<sub>2</sub>) and Nitrogen Oxides (NO<sub>x</sub>)

According to the USEPA, short-term exposures to NO<sub>2</sub> can potentially aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms. Longer exposures to elevated concentrations of NO<sub>2</sub> may contribute to the development of asthma and potentially increase susceptibility to respiratory

<sup>12</sup> California Air Resources Board, *Ozone & Health, Health Effects of Ozone*, <https://ww2.arb.ca.gov/resources/ozone-and-health>. Accessed September 2021.

infections. According to CARB, controlled human exposure studies that show that NO<sub>2</sub> exposure can intensify responses to allergens in allergic asthmatics.<sup>13</sup>

In addition, a number of epidemiological studies have demonstrated associations between NO<sub>2</sub> exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses.<sup>14</sup> Infants and children are particularly at risk from exposure to NO<sub>2</sub> because they have disproportionately higher exposure to NO<sub>2</sub> than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration while in adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease.

CARB states that much of the information on distribution in air, human exposure and dose, and health effects is specifically for NO<sub>2</sub> and there is only limited information for NO and NO<sub>x</sub>, as well as large uncertainty in relating health effects to NO or NO<sub>x</sub> exposure.<sup>15</sup>

### **Carbon Monoxide (CO)**

According to the USEPA, breathing air with a high concentration of CO reduces the amount of oxygen that can be transported in the blood stream to critical organs like the heart and brain and at very high levels, which are possible indoors or in other enclosed environments, CO can cause dizziness, confusion, unconsciousness and death.<sup>16</sup> Very high levels of CO are not likely to occur outdoors; however, when CO levels are elevated outdoors, they can be of particular concern for people with some types of heart disease since these people already have a reduced ability for getting oxygenated blood to their hearts and are especially vulnerable to the effects of CO when exercising or under increased stress. In these situations, short-term exposure to elevated CO may result in reduced oxygen to the heart accompanied by chest pain also known as angina.

According to CARB, the most common effects of CO exposure are fatigue, headaches, confusion, and dizziness due to inadequate oxygen delivery to the brain.<sup>17</sup> For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress; inadequate oxygen delivery to the heart muscle leads to chest pain and decreased exercise tolerance. Unborn babies, infants, elderly people, and people with

anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO.

### **Sulfur Dioxide (SO<sub>2</sub>)**

According to the USEPA, short-term exposures to SO<sub>2</sub> can harm the human respiratory system and make breathing difficult.<sup>18</sup> According to CARB, health effects at levels near the State one-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath and chest tightness, especially during exercise or physical activity and exposure at elevated levels of SO<sub>2</sub> (above 1 parts per million [ppm]) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality.<sup>19</sup> Children, the elderly, and those with asthma, cardiovascular disease, or chronic lung disease (such as bronchitis or emphysema) are most likely to experience the adverse effects of SO<sub>2</sub>.<sup>20,21</sup>

### **Particulate Matter (PM<sub>10</sub> and PM<sub>2.5</sub>)**

According to CARB, both PM<sub>10</sub> and PM<sub>2.5</sub> can be inhaled, with some depositing throughout the airways; PM<sub>10</sub> is more likely to deposit on the surfaces of the larger airways of the upper region of the lung, while PM<sub>2.5</sub> is more likely to travel into and deposit on the surface of the deeper parts of the lung, which can induce tissue damage, and lung inflammation.<sup>22</sup> Short-term (up to 24 hours duration) exposure to PM<sub>10</sub> has been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency department visits. The effects of long-term (months or years) exposure to PM<sub>10</sub> are less clear, although studies suggest a link between long-term PM<sub>10</sub> exposure and respiratory mortality. The International Agency for Research on Cancer published a review in 2015 that concluded that particulate matter in outdoor air pollution causes lung cancer.

Short-term exposure to PM<sub>2.5</sub> has been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days. Long-term exposure to PM<sub>2.5</sub> has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung

function growth in children.<sup>23</sup> According to CARB, populations most likely to experience adverse health effects with exposure to PM<sub>10</sub> and PM<sub>2.5</sub> include older adults with chronic heart or lung disease, children, and asthmatics. Children and infants are more susceptible to harm from inhaling pollutants such as PM<sub>10</sub> and PM<sub>2.5</sub> compared to healthy adults because they inhale more air per pound of body weight than do adults, spend more time outdoors, and have developing immune systems.

### Lead (Pb)

Lead can adversely affect the nervous system, kidney function, immune system, reproductive and developmental systems, and the cardiovascular system, and affects the oxygen carrying capacity of blood. The lead effects most commonly encountered in current populations are neurological effects in children, such as behavioral problems and reduced intelligence, anemia, and liver or kidney damage.<sup>24</sup> Excessive lead exposure in adults can cause reproductive problems in men and women, high blood pressure, kidney disease, digestive problems, nerve disorders, memory and concentration problems, and muscle and joint pain.

### Toxic Air Contaminants

Toxic Air Contaminants (TACs) are defined as those contaminants that are known or suspected to cause serious health problems, but do not have a corresponding ambient air quality standard. TACs are also defined as an air pollutant that may increase a person's risk of developing cancer and/or other serious health effects. TACs are emitted by a variety of industrial processes such as petroleum refining, electric utility and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust. TACs may exist as PM<sub>10</sub> and PM<sub>2.5</sub> or as vapors (gases). TACs include metals, other particles, gases absorbed by particles, and certain vapors from fuels and other sources. The emission of a TAC does not automatically create a health hazard. Other factors, such as the amount of the TAC, its toxicity, how it is released into the air, the weather, and the terrain, all influence whether the emission could be hazardous to human health. Emissions of TACs into the air can be damaging to human health and to the environment. Human exposure to TACs at sufficient concentrations and durations can result in cancer, poisoning, and rapid onset of sickness, such as nausea or difficulty in breathing. Other less measurable effects include immunological, neurological, reproductive, developmental, and respiratory problems. TACs deposited onto soil or into lakes and streams affect ecological systems and eventually human health through consumption of contaminated food. The carcinogenic potential of TACs is a

23 California Air Resources Board, *Inhalable Particulate Matter and Health (PM<sub>2.5</sub> and PM<sub>10</sub>)*, <https://www.arb.ca.gov/research/aaqs/common-pollutants/pm/pm.htm>. Accessed September 2021.

24 California Air Resources Board, *Lead & Health*, <https://www2.arb.ca.gov/resources/lead-and-health>. Accessed September 2021.

particular public health concern because many scientists currently believe that there is no "safe" level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of contracting cancer.<sup>25</sup>

The public's exposure to TACs is a significant public health issue in California. In the wake of publicity surrounding planned and unplanned releases of toxic chemicals into the atmosphere, the Air Toxics "Hotspots" Information and Assessment Act was enacted in September 1987 and is a State law requiring facilities to report emissions of TACs to air districts.<sup>26</sup> The program is designed to quantify the amounts of potential TACs released, the location of the release, the concentrations to which the public is exposed, and the resulting health risks. The State Air Toxics Program (AB 2588) identified over 200 TACs, including the 188 TACs identified in the CAA.<sup>27</sup>

The USEPA has assessed this expansive list and identified 21 TACs as Mobile Source Air Toxics (MSATs).<sup>28</sup> MSATs are compounds emitted from highway vehicles and nonroad equipment. Some toxic compounds are present in fuel and are emitted to the air when the fuel evaporates or passes through the engine unburned. Other toxics are emitted from the incomplete combustion of fuels or as secondary combustion products. Metal air toxics also result from engine wear or from impurities in oil or gasoline. USEPA also extracted a subset of these 21 MSAT compounds that it now labels as the nine priority MSATs: 1,3-butadiene, acetaldehyde, acrolein, benzene, diesel particulate matter (DPM)/diesel exhaust organic gases, ethylbenzene, naphthalene, and polycyclic organic matter (POM). While these nine MSATs are considered the priority transportation toxics, USEPA stresses that the lists are subject to change and may be adjusted in future rules.<sup>29</sup>

### Diesel Exhaust

According to the California Almanac of Emissions and Air Quality, the majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from the exhaust of diesel-fueled engines (i.e., DPM differs from other TACs in that it is not a single substance, but rather a complex mixture of hundreds of substances).

Diesel exhaust is composed of two phases, gas and particle, and both phases contribute to the health risk. The gas phase is composed of many of the urban TACs, such as acetaldehyde, acrolein, benzene, 1,3-

27 California Air Resources Board. AB 25188 Air Toxics "Hot Spots" Program. <https://www.arb.ca.gov/ab2588/ab2588.htm>. Accessed September 2021.

28 US Environmental Protection Agency, *Air Toxics Risk Assessment Reference Library, Volume 1 Technical Resource Manual*. April 2004.

29 US Department of Transportation Federal Highway Administration, 2016. Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents. October 18, 2016.

butadiene, formaldehyde, and polycyclic aromatic hydrocarbons. The particle phase is also composed of many different types of particles by size or composition. Fine and ultra-fine diesel particulates are of the greatest health concern and may be composed of elemental carbon with adsorbed compounds such as organic compounds, sulfate, nitrate, metals, and other trace elements. Diesel exhaust is emitted from a broad range of diesel engines; the on-road diesel engines of trucks, buses and cars and the off-road diesel engines that include locomotives, marine vessels, and heavy-duty equipment. Although DPM is emitted by diesel-fueled internal combustion engines, the composition of the emissions varies depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emission control system is present.

The most common exposure to DPM is breathing air that contains diesel exhaust. The fine and ultra-fine particles are respirable (similar to PM<sub>2.5</sub>), which means that they can avoid many of the human respiratory system defense mechanisms and enter deeply into the lungs. Exposure to DPM comes from both on-road and off-road engine exhaust that is either directly emitted from the engines or lingering in the atmosphere.

Diesel exhaust causes health effects from long-term chronic exposures. The type and severity of health effects depends upon several factors including the amount of chemical exposure and the duration of exposure. Individuals also react differently to different levels of exposure. There is limited information on exposure to only DPM, but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes chronic health effects as well as having cancer-causing potential.

Because it is part of PM<sub>2.5</sub>, DPM also contributes to the same noncancer health effects as PM<sub>2.5</sub> exposure. These effects include premature death, hospitalizations, and emergency department visits for exacerbated chronic heart and lung disease, including asthma, increased respiratory symptoms, and decreased lung function in children. Several studies suggest that exposure to DPM may also facilitate development of new allergies. Those most vulnerable to noncancer health effects are children whose lungs are still developing and the elderly who often have chronic health problems.<sup>30</sup>

### Gasoline Exhaust

Similar to diesel exhaust, gasoline is composed of two phases, gas and particle, and both phases contribute to the health risk. The gas phase is composed of the same TACs, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde, and polycyclic aromatic hydrocarbons. The particle phase is also composed of many different types of particles by size or composition. Fine and ultra-fine diesel particulates are of the greatest health concern and may be composed of elemental carbon with adsorbed compounds such as organic compounds, sulfate, nitrate, metals, and other trace elements. Gasoline exhaust is primarily

<sup>30</sup> California Air Resources Board, *Overview: Diesel Exhaust & Health*, <https://ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health>. Accessed September 2021.

emitted from light-duty passenger vehicles. The compounds in the gas and particles phases can cause health effects from short- and long-term exposures similar to those described under the TAC and particulate matter discussions above.

### Visibility Reducing Particles

Visibility-reducing particles are any particles in the atmosphere that obstruct the range of visibility by creating haze.<sup>31</sup> These particles vary in shape, size, and chemical composition, and come from a variety of natural and manmade sources including windblown metals, soil, dust, salt, and soot. Other haze-causing particles are formed in the air from gaseous pollutant (e.g., sulfates, nitrates, organic carbon particles) which are the major constituents of fine PM, such as PM<sub>2.5</sub> and PM<sub>10</sub>, and are caused from the combustion of fuel. CARB's standard for visibility reducing particles is not based on health effects, but rather on welfare effects, such as reduced visibility and damage to materials, plants, forests, and ecosystems. The health impacts associated with PM<sub>2.5</sub> and PM<sub>10</sub> are discussed above under Particulate Matter.

## 4.2.3 METHODOLOGY

### 4.2.3.1 Emissions Inventory Modeling

Development of the proposed Project would generate air pollutants from a number of individual sources during both construction and post-construction (operational) use. Intermittent, short-term construction emissions that occur from activities such as demolition, site-grading, concrete construction, and other activities are evaluated. Emissions from operation of the Project, including any reductions in emissions are also evaluated. Regulatory models used to estimate air quality and health impacts include:

- CARB's EMFAC2017<sup>32</sup> emissions inventory model. EMFAC2017 is the latest emission inventory model that calculates emission inventories and emission rates for motor vehicles operating on roads in California. This model reflects CARB's current understanding of how vehicles travel and how much they emit. EMFAC2017 can be used to show how California motor vehicle emissions have changed over time and are projected to change in the future.
- CARB OFFROAD2017 emissions inventory model. OFFROAD<sup>33</sup> is the latest emission inventory model that calculates emission inventories and emission rates for off-road equipment such as loaders, excavators, and off-road haul trucks operating in California. This model reflects CARB's current understanding of how equipment operates and how much they emit. OFFROAD can be used to show

how California off-road equipment emissions have changed over time and are projected to change in the future.

- American Meteorological Society/USEPA Regulatory Model (AERMOD). AERMOD (Version 19191) is an atmospheric dispersion model which can simulate point, area, volume, and line emissions sources and has the capability to include simple, intermediate, and complex terrain along with meteorological conditions and multiple receptor locations.<sup>34,35</sup> AERMOD is commonly executed to yield 1-hour maximum and annual average concentrations (in parts per million or ppm and micrograms per cubic meter or  $\mu\text{g}/\text{m}^3$ ) at each receptor. AERMOD is used to estimate air concentrations at nearby receptors resulting from the activities associated with an air emission source (such as construction equipment).
- The California Emissions Estimator Model (CalEEMod),<sup>36</sup> is the CARB-approved computer program model recommended by SCAQMD for use in the quantification of air quality emissions. CalEEMod was developed under the auspices of SCAQMD, with input from other California air districts. CalEEMod utilizes widely accepted models for emissions estimates combined with appropriate data that can be used if site-specific information is not available. For example, CalEEMod incorporates USEPA-developed emission factors; CARB's on-road and off-road equipment emission models, such as EMFAC and OFFROAD; and studies commissioned by other California agencies, such as the California Energy Commission and CalRecycle.

#### 4.2.3.2 Construction

The proposed Project Construction Phasing Narrative provided in **Appendix F.1: Construction Phasing Narrative** was used to estimate construction air quality emissions associated with the proposed Project.

Construction of the proposed Project would have the potential to temporarily emit criteria air pollutant emissions through the use of heavy-duty construction equipment and through vehicle trips generated from workers and haul trucks traveling to and from construction areas. In addition, fugitive dust emissions would result from demolition and various soil-handling activities. Construction emissions can vary substantially from day to day, depending on the intensity and specific type of construction activity. The maximum daily regional emissions are predicted values for the worst-case day and do not represent the emissions that would actually occur during every day of construction. The maximum daily emissions of pollutants were compared to the respective SCAQMD thresholds.

### Construction Schedule

The construction phasing as described below represents a conservative set of assumptions for analysis of the maximum potential impacts from construction of the proposed Project. It is likely that these construction phases will overlap to provide the most efficient construction schedule and be refined as design and implementation of the Project progresses once a contractor is selected for the delivery of the proposed Project. Prior to construction of the proposed Project, reconstruction of the existing Vons store proposed to be demolished to allow construction of the MSF is proposed on the corner of Manchester Boulevard and Hillcrest Boulevard.

- **Phase 1** would include demolition of buildings and site improvements on properties acquired for construction of the project, the beginning of construction of the maintenance and storage facility (MSF), trenching and installation of primary power duct bank, and preparatory work on east side of Prairie Avenue to allow for the roadway shift. Additional work in the area will occur in Phase 4 for the installation of drilled shafts and columns along Prairie Avenue for the guideway. The properties where existing buildings and site improvements will be demolished include at the existing retail commercial center at Market Street and Regent Street, the commercial buildings located at 500 Manchester Boulevard, the commercial building at 150 S. Market Street on the northeast corner of Manchester and Market Street, the retail commercial center at northwest corner of Prairie Avenue and Hardy Street, the commercial building at 401 S. Prairie Avenue, the commercial building at 945 S. Prairie Avenue, and the commercial building at 1003 S. Prairie Avenue. After demolition, the remaining asphalt flatwork areas at the commercial plaza at Market Street and Regent Street, and the commercial building at 150 S. Market Street, and the retail commercial center at northwest corner of Prairie Avenue and Hardy Street will provide suitable space for construction staging, including but not limited to, space for equipment storage, material staging and storage, contractor jobsite trailers, and on-site parking for construction staff throughout the entire project duration. Phase 1 construction would start in January 2024.
- **Phase 2** would include activities to enable the construction sequence of the guideway along Prairie Avenue from Hardy Street to Manchester Avenue, and work at the MSF site. Phase 2 construction would occur in 2024 through 2025.
- **Phase 3** would include foundation work for the Automated Transit System (ATS) guideway, foundation work for the Market Street/Florence Avenue Station, and construction for the support structure of the MSF building. Phase 3 work will include utility relocation (if necessary), foundations, cast-in-place (CIP) columns, and setting of prefabricated buildings at the two (Power Distribution System Substations [PDS]) substations. Phase 3 construction would occur in 2024 through 2025.
- **Phase 4** would include foundation work for the ATS guideway, guideway column caps along Market Street, and the MSF building deck and shell. Phase 4 activities will include utility relocation (if necessary), foundations, CIP columns, guideway column caps, and installation of equipment at the PDS substations. Phase 4 construction would occur in 2025 through 2026.

#### 4.2 Air Quality

- **Phase 5** construction would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Avenue and Manchester Avenue from Prairie Avenue to Market Street, guideway girder along Market Street, and MSF building interior construction. Phase 5 activities will include guideway girders, guideway straddle caps, and installation of equipment at the PDS substations. Phase 5 construction would occur in 2025 through 2026.
- **Phase 6** would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, completion of Prairie Avenue/Manchester Boulevard Station, completion of Prairie Avenue/Hardy Street Station, and completion of the MSF building, and the elevated passenger walkway to the Los Angeles County Metropolitan Transportation Authority (Metro) K Line Downtown Inglewood Station. Phase 6 construction would occur in 2025 through 2026.
- **Phase 7** would include final site work and completion of the stations. Phase 7 would occur in 2026.
- **Phase 8** would occur for the guideway along the entire length of the alignment and primarily includes installation of the operating systems and testing and commissioning of the ATS trains. Phase 8 construction would occur in 2025 through 2027, with the primary construction activities occurring in 2026 and some installation of equipment starting towards the end of Phase 3 construction when sufficient aerial structure is available for the installation of the equipment.

Construction activity would occur 24 hours a day, seven days a week with activities occurring over a 16-hour/day schedule with two shifts, either a morning shift from approximately 7:00 AM to 3:00 PM and an evening shift from approximately 3:00 PM to 11:00 PM, or a morning shift from approximately 7:00 AM to 3:00 PM and a night shift from approximately 11:00 PM to 7:00 AM. The night shift would be used for material deliveries, export of soil and debris and other light construction activities. Certain heavy construction activities that necessitate temporary road closures could occur at night-time to minimize traffic impacts.

Combinations of these shifts would be referred to “Morning/Evening” or “Morning/Night.” Other minimal construction work could occur during other hours at a reduced intensity. The analysis of pollutant concentrations and Health Risk Assessment (HRA) results are presented for both the Morning/Evening and Morning/Night construction scenarios.

#### **Air Emission Calculation Methodology**

Air emission sources include combustion exhaust from on-road vehicles such as construction worker vehicles, pickup/delivery trucks, and haul trucks, as well as off-road construction equipment such as backhoes, loaders, and graders. Fugitive dust emissions from vehicles from handling of soils and entrainment of dust in vehicle tires are also sources of PM<sub>10</sub> and PM<sub>2.5</sub>.

#### 4.2 Air Quality

#### **On-Road Vehicles**

Vehicular on-road emissions were computed using the CARB’s emission factor model, EMFAC2017.<sup>37</sup> Construction worker trips were modeled using the light-duty auto/truck classification. Construction worker trips are a composite of gasoline and diesel vehicles. Foreman trucks used on-site were modeled as gasoline and diesel light heavy-duty trucks. Haul trucks were modeled using the diesel combination long-haul truck classification, which is a heavy-duty truck emission factor for public vehicles. Construction worker commutes were assumed to be 12 miles per one-way trip per day. Distance traveled is conservatively assumed to be 20 miles per one-way trip per day for delivery trucks and concrete trucks.<sup>38</sup> Distance traveled is assumed to be 29 miles per one-way trip per day for asphalt removal trucks, asphalt pavement trucks, and soil spoils dump trucks.<sup>39</sup>

The total annual truck trips within each phase were assumed to be evenly distributed on any given day. The usage factor<sup>40</sup> for haul trucks is approximately 25 percent. Paved road dust, brake wear, and tire wear particulate emissions were also accounted for and included in the analysis using EMFAC2017 emission factors and methodologies. For haul trucks, exhaust particulate emissions are approximately 14 percent of the total particulate emissions.

Criteria pollutant emissions associated with on-road vehicles were calculated for each construction year (2024 to 2027) by combining the activity information with emissions factors, in grams per mile, derived using the EMFAC2017 emissions model. The EMFAC2017 emissions factors are summarized in **Appendix G.1: Air Quality and Human Health Risk Assessment** for employee vehicles, pickup trucks, delivery trucks, and haul trucks for construction years 2024 through 2027.

#### **Off-Road Equipment**

Construction of the proposed Project would require the use of heavy-duty equipment, such as excavators, loaders, forklifts, backhoes, cranes, and off-road haul trucks.

Emissions from construction activities were estimated based on the projected construction activity schedule, the number of vehicles/pieces of equipment, the types of equipment/type of fuel used, vehicle/equipment utilization rates, equipment horsepower, and the construction year. This data was based on the Inglewood Transit Connector Project: Baseline Construction Phasing Narrative by Gannett Fleming (dated October 4, 2021).

<sup>37</sup> California Emissions Estimator Model (CalEEMod), Version 2016.3.2

<sup>38</sup> The maximum distance from four supporting facilities to the proposed Project is 20 miles: CalPortland, Catalina Pacifica Concrete, Cemex-Inglewood, and Robertson’s Read Mix.

<sup>39</sup> The distance to Whittier Landfill from the proposed Project is 29 miles.

<sup>40</sup> Activity level (or usage factor) are defined as the percent of operation for a piece of equipment over a given time.

Emissions from construction activities were also estimated based on load factor (throttle setting)<sup>41</sup> and usage factor.<sup>42</sup>

For the daily emission estimates and short-term ambient concentration analysis (1-hour to 24-hour averaging periods), a usage factor of 100 percent was applied (i.e., full-time operation) to produce a conservative analysis. For the long-term ambient concentration analyses and the health risk assessment, the usage factor of less than 100 percent was applied by equipment type, as not all of the equipment can be used every hour of the day and every day of the year due to safety issues and manpower constraints.

This information was applied to criteria pollutant emissions factors, in grams per horsepower-hour, primarily derived using the OFFROAD emissions model. Off-road construction equipment emissions were computed, and the emissions factors used in this assessment are summarized, by equipment type within **Appendix G.1** for 2024 through 2027, respectively.

#### 4.2.3.3 Operation

Analysis of the proposed Project's operational emissions considers three types of sources: 1) area; 2) energy; and 3) mobile. A description of the proposed Project's various operational components is detailed in **Section 3.0: Project Description, 3.5: Project Characteristics**.

#### Area

Operation of the proposed Project would generate criteria air pollutant emissions from area sources such as operation of landscaping equipment and use of consumer products, including solvents used in nonindustrial applications which emit VOCs during their product use, such as cleaning supplies. The operational area emissions from the proposed Project were estimated using the CalEEMod<sup>43</sup> software. Area source emissions are based on architectural coatings, landscaping equipment, and consumer product usage rates provided in CalEEMod.

#### Natural Gas

Operation of the proposed Project would generate criteria air pollutant emissions from natural gas combustion. Energy source emissions are generated as a result of activities in buildings which utilize natural gas utility infrastructure. The operational energy emissions from the proposed Project were estimated using the CalEEMod<sup>44</sup> software. Energy source emissions were based on natural gas (building

41 Load factor (or throttle setting) are the engine performance demands, as a percent of maximum power; based on values within OFFROAD and typically ranging from 30 to 80 percent depending on equipment type.

42 Activity level (or usage factor) are defined as the percent of operation for a piece of equipment over a given time.

43 CalEEMod, <http://www.caleemod.com/>. Accessed September 2021.

44 CalEEMod, <http://www.caleemod.com/>. Accessed September 2021.

heating and water heaters) usage rates provided in CalEEMod. Natural gas usage factors in CalEEMod were based on the California Energy Commission California Commercial End Use Survey<sup>45</sup> (CEUS) data set, which provides energy demand by building type and climate zone. Default parameters were used when project-specific data was not available.

#### Mobile

Operation of the proposed Project would generate criteria air pollutant emissions from mobile sources from Project-generated vehicle trips traveling to and from the MSF and associated facilities, including the parking lots at the Market Street/Florence Avenue Station, at 150 S. Market Street, and at the MSF Facility site. Mobile emissions were calculated based on the data provided in the proposed Project's Transportation Study (see **Appendix O: Transportation Assessment Study**) which is further discussed in **Section 4.12: Transportation**. Under the Transportation Study, vehicle miles traveled (VMT) is the primary performance metric used to identify impacts. VMT associated with trips to and from all areas within the City were included in the Transportation Study and were utilized to calculate operational air quality emissions from mobile sources. Emissions from motor vehicles are dependent on vehicle type. Thus, the emissions were calculated using a representative motor vehicle fleet mix for the proposed Project and EMFAC2017 default fuel type.

The Adjusted Baseline Environmental Setting is described in **Section 4.0: Environmental Analysis**. Project operations are expected to commence in 2027. Regulatory models used to estimate air quality from proposed Project operations include the CARB EMFAC2017<sup>46</sup> emissions inventory model. Consistent with the Transportation Study, six operational scenarios were analyzed to evaluate the proposed Project's indirect operational emissions, as follows:

1. Adjusted Baseline,
2. Adjusted Baseline with the proposed Project,
3. Year 2027 with Event Weekday without the proposed Project,
4. Year 2027 with Event Weekday with the proposed Project,
5. Year 2045 with Event Weekday without the proposed Project, and
6. Year 2045 with Event Weekday with the proposed Project.

45 California Energy Commission, *California Commercial End Use Survey*, <https://www.energy.ca.gov/data-reports/surveys/california-commercial-end-use-survey#:~:text=The%20California%20Commercial%20End%2DUse,Commission%27s%20commercial%20sector%20forecast%20model>. Accessed September 2021.

46 California Air Resources Board, *EMFAC2017 User's Guide*, March 1, 2018, <https://www.arb.ca.gov/msei/downloads/emfac2017-volume-i-users-guide.pdf>. Accessed September 2021.

#### 4.2 Air Quality

Details of each of the above scenarios are provided in **Section 4.12** and in **Appendix O**.

The proposed Project would also produce criteria air pollutant emissions from on-site diesel-fueled emergency generators and delivery trucks. Daily maximum criteria air pollutant emissions were compared with SCAQMD thresholds for operation to determine the operational impacts of the proposed Project. Regional operational air quality impacts were assessed based on the incremental increase/decrease in emissions compared to the Adjusted Baseline. Air pollutant emissions from the existing uses to be demolished were removed from the estimated emissions for the proposed Project's operational emissions.

#### **Backup Generators**

To assure the ability to allow ATS trains to reach the nearest stations to offload riders in the event of loss of electrical supply, each PDS substation will be equipped with backup power generators. The proposed Project would include up to two stationary standby generators, one at each of the two PDS substations, with an estimated total capacity rated at approximately 4,000 kilowatts (kW) to provide emergency power primarily for ATS train operation, lighting, and other emergency systems. Emergency generator emissions were calculated based on compliance with applicable federal emissions standards and compliance with SCAQMD Rule 1470<sup>47</sup> (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) mandated emission limits and operating hour constraints. This analysis also assumed that the standby generators would operate up to two hours per day and a total of 50 hours per year for testing and maintenance (per SCAQMD Rule 1470 limit). SCAQMD requires that all internal combustion engines (ICE) greater than 50 brake horsepower (bhp) and gas turbines greater than 2,975,000 Btu per hour obtain a permit to construct prior to installation of the engines at a site.

A standby ICEs greater than 50 bhp or turbine for nonutility power generation that does not operate more than 200 hours a year and is only operated in the event of an emergency power failure or for routine testing and maintenance is considered an emergency backup generator for power generation. The SCAQMD allows for the use of backup generators thru specific permits prior to installation.<sup>48</sup>

The proposed Project would implement the following operational equipment requirements and operation protocols for operating backup generators. These would include the following:

47 SCAQMD, *Rule 1470 - Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines*.

48 SCAQMD, *Permits, Emergency Generators*. <http://www.aqmd.gov/home/permits/emergency-generators>. Accessed September 2021.

#### 4.2 Air Quality

- All backup generators would be selected from the SCAQMD certified generators list and meet applicable federal standards for diesel emissions. For after-treatment of engine exhaust air, a diesel particulate filter would be provided to meet the emission level requirements of SCAQMD;
- The proposed Project would have two standby generators, each could operate up to two hours per day and a total of 50 hours per year for testing and maintenance (per SCAQMD Rule 1470 limit) to ensure reliability in the case of a power outage; and
- The proposed Project would conduct maintenance and/or testing on the two standby generators on separate days.

As such, each standby generator would operate for 2 hours per day during 24 days per year (twice a month) for a total of not more than 50 hours per year. Each standby generator would be tested during different days; if needed for emergency operation, both generators would operate up to 2 hours each and could occur simultaneously.

#### **4.2.3.4 Health Risk Assessment**

A health risk assessment (HRA) estimates the health impacts to be expected from a project's TAC emissions. The greatest potential for TAC emissions during Project construction would be related to diesel particulate matter emissions associated with heavy-duty equipment. Although construction would be temporary, construction health impacts associated with TACs were addressed quantitatively in an HRA. Potential impacts to human health associated with TAC emissions may include increased cancer risks and increased chronic (long-term) and acute (short-term) non-cancer health hazards from inhalation of TACs. An HRA also assesses cancer burden which is the estimated increase in the occurrence of cancer cases in a population as a result of exposure to TAC emissions. The proposed Project's HRA was conducted following the methodologies in OEHHA's Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments<sup>49</sup> and SCAQMD's Risk Assessment Procedures for Rule 1401, 1401.1 and 212.<sup>50</sup> In accordance with SCAQMD guidance, modeled receptors for the HRA were placed at locations in which people are typically located for a period of time. The receptors for the HRA within one quarter of a mile of the proposed Project are as follows:

- Single and multifamily residences along the proposed Project length.
- Off-site workers within industrial and commercial areas surrounding the proposed Project area.
- Recreational facilities such as Queen Park.
- Medical facilities such as Hillcrest Medical Center and Centinela Hospital Medical Center.

49 Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*, February 2015, [http://oehha.ca.gov/air/hot\\_spots/hotspots2015.html](http://oehha.ca.gov/air/hot_spots/hotspots2015.html). Accessed September 2021.

50 *South Coast Air Quality Management District, Risk Assessment Procedures for Rule 1401, 1401.1 and 212*, September 1, 2017, <http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf?sfvrsn=12>. Accessed September 2021.

- Educational facilities such as Inglewood High School, Inglewood Junior Academy, George W Crozier Middle School, and Kelso Elementary School.
- Off-site daycare/childcare such as South Bay Child Development Center, Tender Care Child Development Center, A Bright Beginning Child Development Center, and Debbie's Child Development Center.

Sensitive receptors located within a quarter-mile of the proposed Project are shown in **Figure 4.0-3a-c: Map of Sensitive Receptors**. All receptors were set so that only ground-level concentrations were analyzed as that is where the sensitive receptors are located.

OEHHA's Guidance Manual<sup>51</sup> ensures that the greater sensitivity of children to cancer and other health risks is reflected in an HRA. For example, OEHHA recommends that risks be analyzed separately for multiple age groups, focusing especially on young children and teenagers, rather than the past practice of analyzing risks to the general population, without distinction by age. OEHHA also recommends that statistical "age sensitivity factors" be incorporated into an HRA, and that children's relatively high breathing rates be accounted for. On the other hand, the Guidance Manual revisions also include some changes that would reduce calculated health risks. For example, under the former guidance, OEHHA recommended that residential cancer risks be assessed by assuming 70 years of exposure at a residential receptor; under the Guidance Manual, this assumption is lessened to 30 years.

Terrain elevations for emission source locations were based on AERMAP (Version 11103). Hourly meteorological data from Los Angeles International Airport, located approximately four miles to the west-southwest of the proposed Project was used in the dispersion modeling analysis and HRA. Once the dispersion modeling estimated TAC concentrations at the receptors, the risk assessment applied established cancer risk estimates and acceptable reference concentrations for noncancer health effects to determine carcinogenic and non-carcinogenic human health impacts, respectively.

**Appendix G.1** provides additional methodologies and assumptions used within the HRA.

51 Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, February 2015, [http://oehha.ca.gov/air/hot\\_spots/hotspots2015.html](http://oehha.ca.gov/air/hot_spots/hotspots2015.html). Accessed September 2021.

## 4.2.4 REGULATORY FRAMEWORK

### 4.2.4.1 Federal Regulations

#### *Clean Air Act*

The USEPA is responsible for the implementation of portions of the CAA of 1970, which regulates certain stationary and mobile sources of air emissions and other requirements. The 1990 amendments to the CAA identify specific emission reduction goals for areas not meeting the NAAQS. These amendments require both a demonstration of reasonable further progress toward attainment and incorporation of additional sanctions for failure to attain or to meet interim milestones. The sections of the CAA that are most applicable to the proposed Project include Title I, Nonattainment Provisions, and Title II, Mobile Source Provisions.

Charged with handling global, international, national, and interstate air pollution issues and policies, the USEPA sets national vehicle and stationary source emission standards, oversees the approval of all State Implementation Plans,<sup>52</sup> provides research and guidance for air pollution programs, and sets national AAQS (NAAQS).<sup>53</sup> NAAQS for the six common air pollutants (ozone, PM<sub>10</sub> and PM<sub>2.5</sub>, NO<sub>2</sub>, CO, Pb, and SO<sub>2</sub>) are identified in the CAA.

The NAAQS were amended in July 1997 to include an 8-hour standard for O<sub>3</sub> and to adopt a NAAQS for PM<sub>2.5</sub>. The NAAQS were amended in September 2006 to include an established methodology for calculating PM<sub>2.5</sub> and to revoke the annual PM<sub>10</sub> threshold. More stringent area requirements now apply including implementation of Best Available Control Measures/Best Available Control Technology (BACM/BACT), a lower major source threshold (from 100 tons per year to 70 tons per year), and an update to the reasonable further progress (RFP) analysis.<sup>54</sup> Title I (Nonattainment Provisions)<sup>55</sup> requirements are implemented for the purpose of attaining NAAQS for the following criteria air pollutants: O<sub>3</sub>; NO<sub>2</sub>; CO; SO<sub>2</sub>; PM<sub>10</sub>; and lead. **Table 4.2-1: Federal and State Ambient Air Standards** shows the NAAQS currently in effect for each criteria air pollutant.

52 A State Implementation Plan is a document prepared by each state describing existing air quality conditions and measures that will be followed to attain and maintain National Ambient Air Quality Standards (NAAQS).

53 The NAAQS were established to protect public health, including that of sensitive individuals; for this reason, the standards continue to change as more medical research becomes available regarding the health effects of the criteria pollutants. The primary NAAQS defines the air quality considered necessary, with an adequate margin of safety, to protect the public health.

54 SCAQMD, "Final 2016 Air Quality Management Plan" (2017), <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15>. Accessed September 2021.

Visibility Reducing Particles <sup>o</sup>	8 Hour	Extinction coefficient of 0.23 per kilometer 10 miles or more (0.07 – 30 miles or more for Lake Tahoe) due to particles when relative humidity is less than 70%. Method: Beta Attenuation and Transmittance through Filter Tape.	Ion Chromatography	-	-	No Federal Standards
	24 Hour	25 µg/m <sup>3</sup>		-	-	
Hydrogen Sulfide	1 Hour	0.03 ppb (42 µg/m <sup>3</sup> )	Ultraviolet Fluorescence	-	-	No Federal Standards
	24 hour	0.01 ppb (26 µg/m <sup>3</sup> )		-	-	

Notes:

- a California standards for ozone, carbon monoxide (except 8-hour, Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM<sub>10</sub>, PM<sub>2.5</sub>, and visibility reducing particles), are values that are not to be exceeded. All others are not to be exceeded. CAAQS are listed in the table of Standards in section 70200 of Title 17 of the California Code of Regulations.
- b National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM<sub>10</sub>, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 micrograms per cubic meter (µg/m<sup>3</sup>) is equal to or less than one. For PM<sub>2.5</sub>, the 24-hour standard is attained when 96 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.
- c Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 millibars per mole of air. Air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
- d Any equivalent procedure which can be shown to the satisfaction of the CARB to give equivalent results at or near the level of the air quality standard may be used.
- e National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
- f National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
- g Reference method as described by the USEPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the USEPA.
- h On October 1, 2015, the national 8-hour ozone, primary and secondary standards were lowered from 0.075 to 0.070 ppm.
- i To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb.
- j On June 2, 2010, a new 1-hour SO<sub>2</sub> standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO<sub>2</sub> national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
- k On December 14, 2012, the national annual PM<sub>2.5</sub> primary standard was lowered from 15 µg/m<sup>3</sup> to 12.0 µg/m<sup>3</sup>.
- l CARB has identified lead and vinyl chloride as "toxic air contaminants" with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
- m The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m<sup>3</sup> as a quarterly average) remains in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2010 standard are approved.
- n In 1989, CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the Statewide and Lake Tahoe Air Basin standards, respectively.

Inglewood Transit Connector Project  
November 2021

#### 4.2.4.2 State Regulations

##### **California Clean Air Act**

The California CAA,<sup>56</sup> signed into law in 1988, requires all areas of the State to achieve and maintain the CAAQS by the earliest practicable date.<sup>57</sup> CARB, a part of the California EPA (CalEPA), is responsible for the coordination and administration of both State and federal air pollution control programs within California. In this capacity, CARB conducts research, sets State ambient air quality standards, compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products, and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions and the CAAQS currently in effect for each of the criteria pollutants, as well as for other pollutants recognized by the State. The CAAQS are more stringent than the NAAQS.

##### **Air Quality and Land Use Handbook**

CARB published the *Air Quality and Land Use Handbook*<sup>58</sup> on April 28, 2005, to serve as a general guide for considering health effects associated with siting sensitive receptors proximate to sources of TAC emissions. The recommendations provided therein are voluntary and do not constitute a requirement or mandate for either land use agencies or local air districts. The goal of the guidance document is to protect sensitive receptors, such as children, the elderly, acutely ill, and chronically ill persons, from exposure to TAC emissions.

Some examples of CARB's siting recommendations include the following: (1) avoid siting sensitive receptors within 500 feet of a freeway, urban road with 100,000 vehicles per day, or rural road with 50,000 vehicles per day; (2) avoid siting sensitive receptors within 1,000 feet of a distribution center (that accommodates more than 100 trucks per day, more than 50 trucks with operating transport refrigeration units per day, or where transport refrigeration unit operations exceed 300 hours per week); and (3) avoid siting sensitive receptors within 300 feet of any dry cleaning operation using perchloroethylene and within 500 feet of operations with two or more machines.

##### **California Air Resources Board (CARB)**

Mobile sources are a significant contributor to the air pollution in California. CARB has established exhaust emission standards for automobiles, which are more stringent than the federal emissions standards.

<sup>56</sup> California Air Resources Board (CARB), California Clean Air Act (1988), [https://arb.ca.gov/bluebook/bb05/HEA\[14\]16/HEA\\_\[14\]\\_16.htm](https://arb.ca.gov/bluebook/bb05/HEA[14]16/HEA_[14]_16.htm). Accessed September 2021.  
<sup>57</sup> CARB, "CAAQS" (August 10, 2017), <https://www.arb.ca.gov/research/aaqs/caaqs/caaqs.htm>. Accessed September 2021.  
<sup>58</sup> CARB, *Air Quality and Land Use Handbook: A Community Health Perspective* (April 2005), <https://www.arb.ca.gov/ch/handbook.pdf>. Accessed September 2021.

Through its Mobile Sources Program, CARB has developed programs and policies to reduce emissions from on-road heavy-duty diesel vehicles. Specifically, the On-Road Heavy-Duty Diesel Vehicle Regulation requires diesel trucks and buses that operate in the State to be upgraded to reduce emissions. By January 1, 2023, nearly all vehicles must have engines certified to 2010 model year engines or equivalent. The Innovative Clean Transit Program (ICT) sets emissions reduction standards for new public transit vehicles and requires major transit agencies to only purchase zero emission (ZE) buses after 2029. The Solid Waste Collection Vehicle Regulation requires solid waste collection vehicles and heavy diesel-fueled on-road single engine cranes to be upgraded. The Rule for On-Road Heavy-Duty Diesel-Fueled Public and Utility Fleets requires fleets to install emission control devices on vehicles or purchase vehicles that run on alternative fuels or use advanced technologies to achieve emissions requirements by specified implementation dates. CARB also establish an In-Use Off-Road Diesel-Fueled Fleets Regulation to impose limits on idling and require fleets to retrofit or replace older engines. Stationary sources can be divided into two major subcategories: point and area sources. Point sources are permitted facilities with one or more emission sources at an identified location (e.g., power plants, refineries). These facilities generally have annual emissions of 4 tons or more of either VOC, NOx, SOx, or total Particulate Matter (PM), or annual emissions of over 100 tons of CO. Facilities are required to report their criteria pollutant emissions pursuant to Rule 301 and selected air toxics to the SCAQMD on an annual basis, subject to audit, if any of these thresholds are exceeded.

Area sources consist of many small emission sources (e.g., residential water heaters, architectural coatings, consumer products and permitted sources that are smaller than the above thresholds) which are distributed across the region and are not required to individually report their emissions. There are about 400 area source categories for which emission estimates are jointly developed by CARB and the SCAQMD.

##### **Regulation to Reduce Emissions of Diesel Particulate Matter, Oxides of Nitrogen and Other Criteria Pollutants from In-Use Heavy-Duty Diesel-Fueled Vehicles**

The purpose of this regulation is to reduce emissions of diesel particulate matter (PM), NOx and other criteria pollutants from in-use diesel-fueled vehicles.<sup>59</sup> This regulation applies to any person, business, federal government agency, school district or school transportation provider that owns or operates, leases, or rents, affected vehicles that operate in California. Affected vehicles are those that operate on diesel-fuel, dual-fuel, or alternative diesel-fuel that are registered to be driven on public highways, were originally designed to be driven on public highways whether or not they are registered, yard trucks with on-road engines or yard trucks with off-road engines used for agricultural operations, both engines of two-engine

<sup>59</sup> Title 13, California Code of Regulations Division 3: Air Resources Board Chapter 1: Motor Vehicle Pollution Control Devices. § 2025. Regulation to Reduce Emissions of Diesel Particulate Matter, Oxides of Nitrogen and Other Criteria Pollutants from In-Use Heavy-Duty Diesel-Fueled Vehicles. <https://ww3.arb.ca.gov/msprog/onrdiesel/documents/tbfinalreg.pdf>. Accessed September 2021.

sweepers, school buses, and have a manufacturer's gross vehicle weight rating (GVWR) greater than 14,000 pounds (lbs.).

#### California Air Resources Board Truck and Bus Regulation

In 2008, CARB approved the Truck and Bus Regulation to reduce NO<sub>x</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions from existing diesel vehicles operating in California. The requirements were amended in December 2010 and apply to nearly all diesel fueled trucks and busses with a gross vehicle weight rating greater than 14,000 pounds. For the largest trucks in the fleet (i.e., those with a gross vehicle weight rating greater than 26,000 pounds), there are two methods to comply with the requirements. The first method is for the fleet owner to retrofit or replace engines, starting with the oldest engine model year, to meet 2010 engine standards, or better. This is phased over eight years, starting in 2015 and would be fully implemented by 2023, meaning that all trucks operating in the State subject to this option would need to meet or exceed the 2010 engine emission standards for NO<sub>x</sub> and PM by 2023. The second option, if chosen, requires fleet owners, starting in 2012, to retrofit a portion of their fleet with diesel particulate filters achieving at least 85 percent removal efficiency, so that by January 1, 2016, their entire fleet is equipped with diesel particulate filters. However, diesel particulate filters do not typically lower NO<sub>x</sub> emissions. Thus, fleet owners choosing the second method must still comply with the 2010 engine emission standards for their trucks and busses by 2020. Beginning January 1, 2020, this requirement will be enforced by the California Department of Motor Vehicles (DMV). Senate Bill 1 (SB1), the Road Repair and Accountability Act of 2017, was signed into law on April 28, 2017. SB1 authorizes the DMV to check that vehicles are compliant with or exempt from CARB's Truck and Bus Regulation. If a vehicle is not compliant with the rule, DMV will no longer register that vehicle starting January 1, 2020.

In addition to limiting exhaust from idling trucks, CARB promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower such as bulldozers, loaders, backhoes, and forklifts, as well as many other self-propelled off-road diesel vehicles. The regulation adopted by CARB on July 26, 2007, aims to reduce emissions by installation of diesel soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission-controlled models. Implementation is staggered based on fleet size (which is the total of all off-road horsepower under common ownership or control), with the largest fleets to begin compliance by January 1, 2014. Each fleet must demonstrate compliance through one of two methods. The first option is to calculate and maintain fleet average emissions targets, which encourages the retirement or repowering of older equipment and rewards the introduction of newer cleaner units into the fleet. The second option is to meet the Best Available Control Technology (BACT) requirements by turning over or installing Verified Diesel Emission Control Strategies (e.g., engine retrofits) on a certain percentage of its total fleet horsepower. The

compliance schedule requires that BACT turn overs or retrofits be fully implemented by 2023 in all equipment in large and medium fleets and across 100 percent of small fleets by 2028.

#### CARB Rule 2449, General Requirements for In-Use Off-Road Diesel-Fueled Fleets

Requires off-road diesel vehicles to limit nonessential idling to no more than 5 consecutive minutes.<sup>60</sup>

#### CARB Rule 2480 Airborne Toxic Control Measure to Limit School Bus Idling and Idling at Schools

CARB Rule 2480 requires school busses, transit busses, and commercial vehicles (gross vehicle weight greater than 10,001 pounds except for pickup trucks and zero emission vehicles) to limit nonessential idling to no more than 5 consecutive minutes when within 100 feet of a school.<sup>61</sup>

#### CARB Rule 2485, Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling

The Airborne Toxic Control Measure (ATCM) to Limit Diesel-Fueled Commercial Motor Vehicle Idling<sup>62</sup> measure includes regulations that pertain to air quality emissions. Specifically, Section 2485 states that during construction, the idling of all diesel-fueled commercial vehicles weighing more than 10,000 pounds shall be limited to 5 minutes at any location. In addition, Section 93115 in Title 17 of the California Code of Regulations (CCR)<sup>63</sup> states that operation of any stationary, diesel-fueled, compression-ignition engines shall meet specified fuel and fuel additive requirements and emission standards.

### California Building Standards Code

#### California Energy Code

California's Energy Efficiency Standards for Residential and Nonresidential Buildings<sup>64</sup> were established in 1978 in response to a legislative mandate to reduce California's energy consumption. Title 24 requires the

64 California Energy Commission, 2019 Building Energy Efficiency Standards, <https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2019-building-energy-efficiency>. Accessed September 2021.

design of building shells and components to conserve energy. The standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods.

The California Energy Commission (CEC) adopted 2019 Title 24 standards, which became effective on January 1, 2020, and are applicable to the proposed Project.<sup>65</sup> The 2019 standards will continue to improve upon prior Title 24 standards for new construction of, and additions and alterations to, residential and nonresidential buildings.<sup>66</sup>

#### California Green Building Code

The California Green Building Standards Code, which is Part 11 of the CCR, is commonly referred to as the CALGreen Code.<sup>67</sup> The most current version of the CALGreen building code went into effect in January 2020. The purpose is to establish minimum standards to safeguard the public health, safety, and general welfare through structural strength, means of egress facilities, and general stability by regulating and controlling the design, construction, quality of materials, outdoor lighting standards, use and occupancy, location, and maintenance of all building and structures within its jurisdiction.

#### 4.2.4.3 Regional Regulations

##### *South Coast Air Quality Management District*

SCAQMD shares responsibility with CARB for ensuring that all State and federal ambient air quality standards are achieved and maintained over an area of approximately 10,743 square miles. This area includes the South Coast Air Basin (Basin) and portions of the Salton Sea and Mojave Desert Air Basins (MDAB), all of Orange County, and the nondesert portions of Los Angeles, Riverside, and San Bernardino counties. It does not include the Antelope Valley or the nondesert portion of western San Bernardino County.

SCAQMD is responsible for controlling emissions primarily from stationary sources. SCAQMD maintains air quality monitoring stations throughout the Basin. SCAQMD, in coordination with the Southern California Association of Governments (SCAG), is also responsible for developing, updating, and implementing the AQMP for the Basin. An AQMP is a plan prepared and implemented by an air pollution district for a county or region designated as nonattainment of the national and/or California ambient air quality standards.

<sup>65</sup> See California Energy Commission, 2019 Building Energy Efficiency Standards for additional information.

<sup>66</sup> See California Energy Commission, 2019 Building Energy Efficiency Standards for additional information.

<sup>67</sup> California Buildings Standards Commission, California Green Building Standards Code (Cal. Code Regs., Title 24, Part 11), <http://www.bsc.ca.gov/Home/CALGreen.aspx>. Accessed September 2021.

#### South Coast Air Quality Management District Air Quality Management Plan (AQMP)

The proposed Project lies within the jurisdiction of the SCAQMD, and compliance with SCAQMD rules and guidelines is required. SCAQMD is responsible for controlling emissions primarily from stationary sources.

The SCAQMD approved a Final 2016 AQMP on March 3, 2017.<sup>68</sup> The 2016 AQMP includes transportation control measures developed by SCAG from the 2016 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), as well as the integrated strategies and measures needed to meet the NAAQS. The 2016 AQMP demonstrates attainment of the 1-hour and 8-hour ozone NAAQS as well as the latest 24-hour and annual PM<sub>2.5</sub> standards.

Under the Federal CAA, SCAQMD has adopted federal attainment plans for O<sub>3</sub> and PM<sub>10</sub>. The SCAQMD reviews projects to ensure that they would not (1) cause or contribute to any new violation of any air quality standard; (2) increase the frequency or severity of any existing violation of any air quality standard; or (3) delay the timely attainment of any air quality standard or any required interim emission reductions or other milestones of any federal attainment plan.

The SCAQMD is responsible for limiting the number of emissions that can be generated throughout the Basin by various stationary, area, and mobile sources. Specific rules and regulations have been adopted by the SCAQMD Governing Board. These rules and regulations limit the emissions that can be generated by various uses or activities and identify specific pollution reduction measures, which must be implemented in association with various uses and activities. These rules not only regulate the emissions of the federal and State criteria pollutants, but also toxic air contaminants and acutely hazardous materials. The rules are also subject to ongoing refinement by SCAQMD.

#### South Coast Air Quality Management District Rules and Regulations

Among the SCAQMD rules applicable to the proposed Project are Rule 403 (Fugitive Dust), and Rule 1113 (Architectural Coatings). Rule 403 requires the use of stringent best available control measures to minimize PM<sub>10</sub> emissions during grading and construction activities. Rule 1113 will require reductions in the VOC content of coatings, with a substantial reduction in the VOC content limit for flat coatings to 50 grams per liter (g/L) in July 2008.<sup>69</sup> Additional details regarding these rules and other potentially applicable rules are presented as follows.

<sup>68</sup> SCAQMD, *Final 2016 Air Quality Management Plan* (2016), <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>. Accessed September 2021.

<sup>69</sup> SCAQMD, Rule 1113 Architectural Coating (amended September 6, 2013), <http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-1113.pdf>. Accessed September 2021.

**Rule 201 Permit to Construct**

Rule 201 requires a permit for installation of any equipment which releases air pollutants.<sup>70</sup>

**Rule 401–Visible Emissions**

This rule states that a person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is as dark or darker in shade as that designated No. 1 on the Ringelmann Chart or of such opacity as to obscure an observer's view.<sup>71</sup>

**Rule 402 Nuisance Odors**

Rule 402 prohibits the discharge of odors that cause injury, detriment, nuisance, or annoyance to a considerable number of people.<sup>72</sup>

**Rule 403 Fugitive Dust**

Rule 403<sup>73</sup> requires fugitive dust sources to implement Best Available Control Measures for all sources and prohibits all forms of visible particulate matter from crossing any property line. This may include application of water or chemical stabilizers to disturbed soils, covering haul vehicles, restricting vehicle speeds on unpaved roads to 15 miles per hour (mph), sweeping loose dirt from paved site access roadways, cessation of construction activity when winds exceed 25 mph, and establishing a permanent ground cover on finished sites. SCAQMD Rule 403 is intended to reduce PM<sub>10</sub> emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust (see also Rule 1186).

**Rule 1113 Architectural Coatings**

Rule 1113<sup>74</sup> requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.

70 SCAQMD, "Rule 201: Permit to Construct" (amended December 3, 2004), <http://www.aqmd.gov/docs/default-source/rule-book/reg-ii/rule-201.pdf>. Accessed September 2021.

71 SCAQMD, "Rule 401: Visible Emissions", <http://www.aqmd.gov/home/rules-compliance/rules/scaqmd-rule-book>. Accessed September 2021.

72 SCAQMD, "Rule 402: Nuisance", <http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-402.pdf>. Accessed September 2021.

73 SCAQMD, "Rule 403: Fugitive Dust", <http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-403.pdf>. Accessed September 2021.

74 SCAQMD, "Rule 1113: Architectural Coatings", <http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-1113.pdf>. Accessed September 2021.

**Rule 1146.2 Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters**

Rule 1146.2<sup>75</sup> requires manufacturers, distributors, retailers, refurbishers, installers, and operators of new and existing units to reduce NOx emissions from natural gas-fired water heaters, boilers, and process heaters as defined in this rule.

**Rule 1186, PM<sub>10</sub> Emissions from Paved and Unpaved Roads, and Livestock Operations**

Rule 1186 requires control measures to reduce fugitive dust from paved and unpaved roads in addition to livestock operations.<sup>76</sup>

**Regulation XIII – New Source Review (NSR)**

The South Coast Air Quality Management District (South Coast AQMD) adopted its New Source Review (NSR) program in October 1976.<sup>77</sup> The current NSR regulation is codified by South Coast AQMD Regulation XIII–New Source Review.

NSR is a preconstruction review required under both federal and State statutes for new and modified sources located in areas that do not meet the Clean Air Act standards for healthy air (nonattainment areas). NSR applies to both individual permits and entire facilities. Any permit that has a net increase in emissions is required to apply BACT (equivalent to federal Lowest Achievable Emission Rate). Facilities with a net increase in emissions are required to offset the emission increase by use of Emission Reduction Credits (ERCs). The regulation provides for the application, eligibility, registration, use and transfer of ERCs. For low emitting facilities, the South Coast AQMD maintains an internal bank that can be used to provide the required offsets. In addition, certain facilities are subject to provisions that require public notice and modeling analysis to determine the downwind impact prior to permit issuance.

**Regulation XIV – Toxics and Other Noncriteria Air Pollutants**

Regulation XIV<sup>78</sup> sets requirements for new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants or other noncriteria air pollutants. The following is a list of rules which may apply to the proposed Project:

75 SCAQMD, "Rule 1146.2: Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters," <http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-1146.2.pdf>. Accessed September 2021.

76 SCAQMD, "Rule 1186: PM10 Emissions From Paved and Unpaved Roads, and Livestock Operations" (amended July 11, 2008), <http://www.aqmd.gov/docs/default-source/rule-book/reg-xi/rule-1186.pdf>. Accessed September 2021.

77 SCAQMD, Regulation XIII – New Source Review. October 2016. <http://www.aqmd.gov/home/permits/new-source-review>. Accessed September 2021.

78 SCAQMD, Regulation XIV – Toxics and Other Noncompliance Air Pollution. <http://www.aqmd.gov/home/rules-compliance/rules/scaqmd-rule-book/regulation-xiv>. Accessed September 2021.

**Rule 1401 – New Source Review of Toxic Air Contaminants**

This rule regulates new or modified facilities to limit cancer and noncancer health risks from facilities located within SCAQMD jurisdiction.

**Rule 1402 – Control of Toxic Air Contaminants from Existing Sources**

This rule regulates facilities that are already operating in order to limit cancer and noncancer health risks. Rule 1402 incorporates the requirements and methodology of the AB 2588 Air Toxics "Hot Spots" program.

**Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities**

This rule requires owners and operators of any demolition or renovation activity and the associated disturbance of asbestos-containing materials, any asbestos storage facility, or any active waste disposal site to implement work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials (see **Section 4.8: Hazards and Hazardous Materials**).

**Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines**

SCAQMD Rule 1470<sup>79</sup> applies to stationary compression ignition (CI) engine greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

**South Coast Air Quality Management District CEQA Air Quality Handbook**

In 1993, the SCAQMD prepared its *CEQA Air Quality Handbook* (CEQA Handbook) to assist local government agencies and consultants in preparing environmental documents for projects subject to CEQA,<sup>80</sup> the SCAQMD is in the process of developing its *Air Quality Analysis Guidance Handbook (Guidance Handbook)* to replace the CEQA Handbook. The *Guidance Handbook* describes the criteria that SCAQMD uses when reviewing and commenting on the adequacy of environmental documents. Although the *Guidance Handbook* is still being prepared, the *Guidance Handbook* provides the most up-to-date recommended thresholds of significance in order to determine if a project will have a significant adverse environmental impact. SCAQMD provides additional supplementation information including methodologies for estimating project emissions and mitigation measures that can be implemented to

79 SCAQMD, Rule 1470 - Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines

80 SCAQMD, Air Quality Analysis Guidance Handbook, <http://www.aqmd.gov/CEQA/hdbk.html>. 2010. Accessed September 2021.

avoid or reduce air quality impacts on the Guidance Handbook website. Although the Governing Board of the SCAQMD has not adopted the *Guidance Handbook* and is in the process of developing the *Guidance Handbook*, the SCAQMD does not, nor does it intend to, supersede a local jurisdiction's CEQA procedures.<sup>81</sup>

**Multiple Air Toxics Exposure Study**

To date, the most comprehensive study on air toxics in the Basin is the Multiple Air Toxics Exposure Study (MATES IV),<sup>82</sup> conducted between July 2012 and June 2013. The monitoring program measured more than 30 air pollutants including both gases and particulates. The study concluded that the average of the modeled air toxics concentrations measured at each of the monitoring stations in the Basin equates to a background cancer risk of approximately 418 in one million primarily due to diesel exhaust. Subsequent to SCAQMD's risk calculation estimates, the OEHHA updated the methods for estimating cancer risks.<sup>83</sup> The updated method utilizes higher estimates of cancer potency during early life exposures and uses different assumptions for breathing rates and length of residential exposures. However, DPM remains the largest component of air toxics estimated risk.

SCAQMD is in the process of conducting the MATES V study.<sup>84</sup> This would involve the addition of an advanced monitoring network which would include account flight-based measurements, a mobile laboratory, an optical tent, sensor networks, and community engagement.

***Southern California Association of Governments (SCAG)*****SCAG 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (2020-2045 RTP/SCS)**

SCAG is the metropolitan planning organization (MPO) for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and serves as a forum for the discussion of regional issues related to transportation, the economy, community development, and the environment. As the federally-designated MPO for the Southern California region, SCAG is mandated by the federal government to research and develop plans for transportation, hazardous waste management, and air quality. Pursuant to California

#### 4.2 Air Quality

Health and Safety Code Section 40460(b),<sup>85</sup> SCAG has the responsibility for preparing and approving the portions of the AQMP relating to regional demographic projections and integrated regional land use, housing, employment, and transportation programs, measures, and strategies. SCAG is also responsible under the CAA for determining conformity of transportation projects, plans, and programs with applicable air quality plans.

With regard to air quality planning, SCAG has prepared and adopted the 2020–2045 RTP/SCS,<sup>86</sup> which includes a SCS that addresses regional development and growth forecasts, including the development of the ITC project. The SCAG 2020–2045 RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals, with a specific goal of achieving an 8 percent reduction in passenger vehicle GHG emissions on a per capita basis by 2020, 19 percent reduction by 2035, and 21 percent reduction by 2040 compared to the 2005 level. Although the RTP/SCS is not technically an air quality plan, consistency with the RTP/SCS has air quality implications, including the reduction of VMT which reduces air quality emissions.

#### 4.2.4.4 Local Regulations

##### City

##### General Plan

California State law requires every city and county to adopt a comprehensive General Plan to guide its future development. The proposed Project is located entirely within the City. The City General Plan<sup>87</sup> includes the following elements: Land Use, Circulation, Safety, Noise, Housing, Open Space, and Conservation.

##### Land Use Element

The following goals from the Land Use Element<sup>88</sup> of the City General Plan are relevant to air pollutant emissions.

<sup>85</sup> California Health and Safety Code, Division 26. Air Resources, PART 3. Air Pollution Control Districts, Chapter 5.5. South Coast Air Quality Management District, ARTICLE 5. Plan, Section 40460(b). Accessed September 2021. [https://leginfo.ca.gov/faces/codes\\_displaySection.xhtml?sectionNum=40460.&lawCode=HSC](https://leginfo.ca.gov/faces/codes_displaySection.xhtml?sectionNum=40460.&lawCode=HSC)

<sup>86</sup> Southern California Association of Governments (SCAG), Connect SoCal: 2020-2045 Regional Transportation Plan/Sustainable Communities Strategies Draft, "Chapter 1," <https://www.connectsocial.org/Pages/Connect-SoCal-Draft-Plan.aspx>. Accessed September 2021.

<sup>87</sup> City of Inglewood, Department of Community Development and Housing, General Plan. January 1980

<sup>88</sup> City of Inglewood, Department of Community Development and Housing, 1980. Land Use Element of the Inglewood General Plan. January 1980. Amended September 14, 2016.

#### 4.2 Air Quality

**Circulation Goal:** Promote and support adequate public transportation within the City and the region.

**Circulation Goal:** Develop a safe and adequate pedestrian circulation system which is barrier free for the handicapped.

##### Conservation Element

The City's General Plan Conservation Element addresses the conservation, development, and use of natural resources.<sup>89</sup> Five specific areas of conservation and/or protection that are identified in the Conservation Element include (1) oil and gas production, (2) water production and provision for domestic use, (3) storm water runoff and wastewater, (4) hazardous waste and solid waste disposal, and (5) air pollution. The Conservation Element notes the following pollution-reducing measures:

- reducing volatile emissions from factories and refineries;
- reducing airborne particulate matter from factories and construction sites;
- reducing numbers of vehicles being driven while increasing the utilization of high occupancy vehicles and alternative transportation;
- requiring improvements to engine efficiency to decrease emissions; and
- increasing the use of clean fuel vehicles.

##### Environmental Justice Element

The following goals from the Environmental Justice Element<sup>90</sup> of the City General Plan are relevant to air pollutant emissions.

**Policy EJ-2.4:** Create land use patterns and public amenities that encourage people to walk, bicycle and use public transit.

**Policy EJ-2.9:** Work with the South Coast Air Quality Management District (SCAQMD), the Los Angeles International Airport (LAX) and other appropriate agencies to monitor and improve air quality in the City of Inglewood.

**Policy EJ-2.10:** Implement and periodically update the City's Energy and Climate Action Plan to improve air quality and reduce greenhouse gas emissions.

<sup>89</sup> City of Inglewood General Plan, "Conservation Element" (1997), General Plan. January 1980.

<sup>90</sup> City of Inglewood, Department of Community Development and Housing, 1980. Environmental Justice Element of the Inglewood General Plan. April 2020.

## Energy and Climate Action Plan

The City adopted an Energy and Climate Action Plan<sup>91</sup> (ECAP) in 2013 to guide Citywide GHG emissions reduction efforts. The ECAP established four primary compliance paths which projects may choose to adhere to, including: ministerial and exempt project status, implementation of a combination of sustainable development standards, performance-based compliance, or payment of an in-lieu fee. These measures were developed on a points-based system, which were chosen because they have been demonstrated by various studies to directly reduce GHG emissions or support changes in activities that lead to GHG emissions reductions. Each Climate-Ready Development Standard has a point value associated with it that reflects its general effectiveness at reducing GHG emissions. The standards apply to various types of projects, and a qualifier is included denoting which types of projects may implement the standard. Applicants have discretion regarding which measures that they would want their project to comply with; however, for a project to be fully compliant with the goals of the ECAP it must incorporate features meeting the standards sufficient to accrue a total of 20 points. The following two of the five strategies and their related actions included in the ECAP also have the potential for co-benefits of reducing criteria air pollutants and TACs:

- **Strategy 1: Lead by Example with Municipal Government Actions**
  - Accelerate city vehicle fleet replacement
  - Continue commute trip reduction program
  - Planning for electric vehicle infrastructure
- **Strategy 4: Improve Transportation Options and Manage Transportation Demand**
  - Make roadways more efficient
  - Improve transit
  - Improve bicycle facilities
  - Make parking more efficient
  - Reduce commute trips
  - Encourage land use intensification and diversity

<sup>91</sup> City of Inglewood, Inglewood Energy and Climate Action Plan, March 2013, <https://www.cityofinglewood.org/DocumentCenter/View/148/Inglewood-Energy-and-Climate-Action-Plan-ECAP-Adopted-2013-PDF>. Accessed September 2021.

## 4.2.5 EXISTING CONDITIONS

### 4.2.5.1 Regional Meteorology

Air quality is affected by the rate, amount, and location of pollutant emissions and the associated meteorological conditions that influence pollutant movement and dispersal. Atmospheric conditions, including wind speed, wind direction, stability, and air temperature, in combination with local surface topography (i.e., geographic features such as mountains, valleys, and Pacific Ocean), determine the effect of air pollutant emissions on local air quality.

In general, Southern California has a warm, dry Mediterranean climate; hot in the summer and mild in the winter. Temperatures are cooler near the coast and hotter near inland areas. Most of the precipitation occurs as rain during the winter months, although rain showers are common during the summer in higher-elevation desert areas. Average annual precipitation is approximately 19 inches and temperatures reach 90 degrees Fahrenheit 100 days of the year on average. August daily highs average 95 degrees while daily lows average 64 degrees Fahrenheit. January typically exhibits average daily highs of 68 degrees and average daily lows of 43 degrees Fahrenheit. The predominant wind directions are either out of the northwest or southeast. Gusts greater than 15 miles per hour occur infrequently, less than two percent of the time.

Basin climate increases the potential to create air pollution problems. Air quality within the Basin generally rates from fair to poor. Sinking or subsiding air from the Pacific High-Pressure System creates a temperature inversion (known as a subsidence inversion), which acts as a lid to vertical movement of air masses and dispersion of pollutants. The lower bound of this inversion at any given time is known as the “mixing height.” Restricted maximum mixing heights are 3,500 feet above sea level or less. Weak summertime pressure gradients suppress winds and further limit horizontal dispersion of pollutants in the mixed layer below the subsidence inversion. Poorly dispersed anthropogenic (human-made) emissions, combined with strong sunshine, lead to photochemical reactions that create ozone (O<sub>3</sub>) in this surface layer. Daytime onshore air flow (i.e., sea breeze) and nighttime offshore flow (i.e., land breeze) are quite common in Southern California. The sea breeze helps to moderate daytime temperatures and leads to air pollutants being blown out to sea at night and returning to land the following day.

### 4.2.5.2 Existing Ambient Air Quality

The proposed Project is located within the South Coast Air Basin (Basin) which covers approximately 6,745 square miles and is bounded by the Pacific Ocean to the west and south and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The Basin includes all of Orange County; the nondesert portions of Los Angeles, Riverside, and San Bernardino counties; and the San Gorgonio Pass area in Riverside County.

The Basin has some of the worst air pollution in the country. The air pollution problems are a consequence of the combination of emissions from the nation's second largest urban area, meteorological conditions unfavorable to the dispersion of those emissions, and mountainous terrain surrounding the Basin that traps pollutants as they are pushed inland with the sea breeze. Southern California also has abundant sunshine, which drives the photochemical reactions that form pollutants such as ozone (O<sub>3</sub>) and a significant portion of particulate matter with an aerodynamic diameter less than or equal to 2.5 (PM<sub>2.5</sub>).<sup>92</sup>

The City has been ranked in the 8th percentile of cities for the best overall mild weather.<sup>93</sup> Average temperatures in the vicinity range from the mid-60s to mid-70s Fahrenheit to the upper 40s to low 60s Fahrenheit. The warmest periods tend to be from June to October. Winter precipitation usually consists of low-pressure systems dependent up the size and location of the upper-level jet stream. Summer rainfall usually consists of periodic and short-term scattered thunderstorms that are formed by an extension of the North American monsoon pattern that dominates over the southwestern United States.

The SCAQMD maintains a network of monitoring stations within the Basin that monitor air quality and compliance with applicable ambient standards. The nearest air monitoring station which measures CO, NO<sub>2</sub>, SO<sub>2</sub>, and PM<sub>10</sub> is located near Los Angeles International Airport (7201 West Westchester Parkway, Southwest Coastal LA County, Station 820), four miles to the west of the proposed Project. The nearest air monitoring station which measures PM<sub>2.5</sub> is located in central Los Angeles (1630 North Main Street, Central LA, Station 087), ten miles to the northeast of the proposed Project.

### Regional Air Quality

The Basin's meteorological conditions, in combination with regional topography, are conducive to the formation and retention of ozone. Pollutant concentrations in the Basin vary with location, season, and time of day. Concentrations of ozone, for example, tend to be lower along the coast, higher in the near inland valleys, and lower in the far inland areas of the Basin and adjacent desert.<sup>94</sup> The worst air pollution conditions throughout the Basin typically occur from June through September.

### Attainment Status

California Health and Safety Code section 39607(e) requires CARB to establish and periodically review area designation criteria. **Table 4.2-2: South Coast Air Basin Attainment Status (Los Angeles County)** provides a summary of the attainment status of the Los Angeles County portion of the Basin with respect to the federal and State standards. As shown, the Basin is designated under federal or State ambient air quality standards as nonattainment for ozone, PM<sub>10</sub>, and fine particulate matter PM<sub>2.5</sub>. It is noteworthy to mention that air quality in the Basin has improved substantially over the years, primarily due to the impacts of air quality control programs at the federal, State, and local levels. The ozone and PM levels have fallen

92 SCAQMD, *Final 2016 Air Quality Management Plan* (2016), <https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>. Accessed September 2021.

93 City of Inglewood, "About the City," <https://www.cityofinglewood.org/493/About-the-City>. Accessed September 2021.

94 South Coast Air Quality Management District, 2017. *Final 2016 Air Quality Management Plan*. March 2017.

significantly compared to the worst years and are expected to continue to trend downward in the future despite increases in the economy and population in the Basin.<sup>95</sup>

**Table 4.2-2**  
**South Coast Air Basin Attainment Status (Los Angeles County)**

Pollutant	Federal Standards	California Standards
O <sub>3</sub> (1-hour standard)	N/A <sup>a</sup>	Nonattainment
O <sub>3</sub> (8-hour standard)	Nonattainment – Extreme	Nonattainment
CO	Attainment	Attainment
NO <sub>2</sub>	Attainment	Attainment
SO <sub>2</sub>	Attainment	Attainment
PM <sub>10</sub>	Attainment	Nonattainment
PM <sub>2.5</sub>	Nonattainment	Nonattainment
Lead	Nonattainment (Partial, Los Angeles County) <sup>b</sup>	Attainment
Visibility Reducing Particles	N/A	Unclassified
Sulfates	N/A	Attainment
Hydrogen Sulfide	N/A	Unclassified
Hydrogen Sulfide	N/A	N/A <sup>c</sup>

*Notes:*

N/A = not applicable

<sup>a</sup> The NAAQS for 1-hour ozone was revoked on June 15, 2005, for all areas except Early Action Compact areas.

<sup>b</sup> Partial Nonattainment designation – Los Angeles County portion of the Air Basin only for near-source monitors.

<sup>c</sup> In 1990, CARB identified vinyl chloride as a TAC and determined that it does not have an identifiable threshold. Therefore, CARB does not monitor or make status designations for this pollutant.

Source: USEPA, *The Green Book Nonattainment Areas for Criteria Air Pollutants*, <https://www.epa.gov/green-book>; CARB, *Area Designations Maps/State and National*, <http://www.arb.ca.gov/desig/adm/adm.htm>.

With respect to the State-identified criteria air pollutants (sulfates, hydrogen sulfide, visibility reducing particles, and vinyl chloride) present in **Table 4.2-2**, the proposed Project would either not use these pollutants in the day to day operations or during construction and therefore would not have emissions of those pollutants (hydrogen sulfide, vinyl chloride, and lead), or such emissions would be accounted for as part of the pollutants estimated in this analysis (visibility reducing particles are associated with particulate matter emissions, and sulfates are associated with SO<sub>2</sub>). Vinyl chloride is used in the process of making polyvinyl chloride (PVC) plastic and vinyl products and is primarily emitted from industrial processes.<sup>96</sup> Vinyl chloride would not be emitted directly during operations or during construction; therefore, there would be no project emissions of vinyl chloride. In addition, CARB determined there is not sufficient scientific evidence available to support the identification of a threshold exposure level for vinyl chloride, therefore, CARB does not monitor or make status designations for this pollutant.<sup>97</sup>

95 South Coast Air Quality Management District, 2017. *Final 2016 Air Quality Management Plan*. March 2017, p. 1-6.

96 California Air Resources Board, Vinyl Chloride & Health, <https://ww2.arb.ca.gov/resources/vinyl-chloride-and-health>. Accessed September 2021.

**Table 4.2-3: Air Quality Data Summary** summarizes the most recent three years of data (2017 through 2019) from the nearby air monitoring stations (SCAQMD Station Nos. 091 and 820). The ozone standard was not exceeded. The State annual PM<sub>10</sub> standard was exceeded in 2018 and the State 24-hour PM<sub>10</sub> standard was exceeded in 2019. The State annual PM<sub>2.5</sub> standard was exceeded in 2018 and the State 24-hour PM<sub>2.5</sub> standard was exceeded in 2019. No other exceedances were observed at the nearby air monitoring stations in 2017 through 2019.

**Table 4.2-3**  
**Air Quality Data Summary (2017–2019)**

Pollutant	Monitoring Data by Year			
	Standard	2017	2018	2019
<b>Ozone</b>				
Highest 1 Hour Average (ppm)	0.09	0.086	0.074	0.082
Days over State Standard	—	0	0	0
Highest 8 Hour Average (ppm)	0.070	0.070	0.065	0.067
Days over National Standard	—	0	0	0
Days over State Standard	—	0	0	0
<b>Nitrogen Dioxide</b>				
Highest 1 Hour Average (ppm)	0.180/0.100	0.072	0.060	0.057
Days over State Standard	—	0	0	0
Annual Average (ppm)	0.030/0.053	0.009	0.009	0.010
<b>Carbon Monoxide</b>				
Highest 1 Hour Average (ppm)	20.0	2.1	1.8	1.8
Days over State Standard	—	0	0	0
Highest 8 Hour Average (ppm)	9.0	1.6	1.5	1.3
Days over State Standard	—	0	0	0
<b>Particulate Matter (PM<sub>10</sub>)</b>				
Highest 24 Hour Average (µg/m <sup>3</sup> )	50	46	45	<b>62</b>
Days over State Standard	—	0	0	2
State Annual Average (µg/m <sup>3</sup> )	20	19.8	<b>20.5</b>	19.2
<b>Particulate Matter (PM<sub>2.5</sub>)</b>				
Highest 24 Hour Average (µg/m <sup>3</sup> )	35	27.8	30.5	<b>43.5</b>
Days over National Standard	—	0	0	1
State Annual Average (µg/m <sup>3</sup> )	12	11.9	<b>12.6</b>	10.9

Notes: Values in **bold** are in excess of at least one applicable standard.

Generally, State, and national standards are not to be exceeded more than once per year.

ppm = parts per million; µg/m<sup>3</sup> = micrograms per cubic meter.

PM<sub>10</sub> is not measured every day of the year. Number of estimated days over the standard is based on 365 days per year.

#### 4.2.5.3 Adjusted Baseline

The Air Quality analysis assumes the Adjusted Baseline Environmental Setting as described in **Section 4.0**; see **Table 4.0-1** for the details of the Adjusted Baseline. Related to air quality, the changes associated with

the Hollywood Park Specific Plan (HPSP) Adjusted Baseline projects, currently under development and anticipated to be operational prior to construction of the proposed Project, include operational air emissions associated with new uses in the HPSP area.

The HPSP projects in the Adjusted Baseline would emit air pollutants associated with vehicle trips, maintenance operations, energy consumption, etc., from all of its operational land uses. Specifically, vehicle trips associated with activities at the HPSP would take place during 2020 and would have an impact on local and regional air quality. Accordingly, the air pollutant emissions associated with this development within the HPSP area are considered as part of the Adjusted Baseline. No other changes to the existing environmental setting related to air quality would occur under the Adjusted Baseline.

#### 4.2.5.4 Existing Emissions

Implementation of the proposed Project would require the acquisition of a number of full and partial property and air rights acquisitions and easements or leases for construction and operation of the guideway, stations, MSF, and other support facilities included in the proposed Project (See **Section 3.0** for a detailed discussion of the existing land uses that would be demolished as part of the proposed Project). Presently, a variety of commercial, restaurant, and retail uses that exist where the components of the proposed Project would be constructed. These existing uses currently generate air quality emissions from building operation.

**Table 4.2-4: Existing Emissions for Existing Uses** identifies the existing emissions from the existing uses that would be removed as part of the proposed Project.

**Table 4.2-4**  
**Existing Emissions for Existing Uses (lb./day)**

Source	VOC	CO	NOx	PM <sub>10</sub>	PM <sub>2.5</sub>	SO <sub>2</sub>
Area (Consumer Products, Landscaping)	6.77	0.03	<0.01	<0.01	<0.01	<0.01
Energy (Natural Gas)	0.20	1.56	1.85	0.14	0.14	0.01
Motor Vehicles	38.9	1,327	141	55.8	23.6	3.78
<b>Total</b>	<b>45.9</b>	<b>1,329</b>	<b>143</b>	<b>55.9</b>	<b>23.7</b>	<b>3.79</b>

Source: See **Appendix G.1**.

In addition to mobile emissions for the Adjusted Baseline projects, emissions for existing uses that will be removed have been estimated. This includes mobile, area and energy emissions for existing uses that will be removed.

#### 4.2.5.5 Sensitive Receptors

Within one quarter mile of the proposed Project guideway, stations, and the MSF site, 61 sensitive receptors have been identified as shown in **Figure 4.0-2**.

Land uses such as schools, children’s daycare centers, hospitals, and convalescent homes are considered to be more sensitive than the general public to poor air quality because the population groups associated with these uses have increased susceptibility to respiratory distress. Persons engaged in strenuous work or exercise also have increased sensitivity to poor air quality. The CARB and SCAQMD have identified the following people as most likely to be affected by air pollution: children less than 14 years of age, the elderly over 65 years of age, athletes, and those with cardiovascular and chronic respiratory diseases. These groups are classified as sensitive population groups.

Residential areas are considered more sensitive to air quality conditions than commercial and industrial areas because people generally spend longer periods of time at their residences, resulting in greater exposure to ambient air quality conditions. Recreational uses are also considered sensitive, due to the greater exposure to ambient air quality conditions and because the presence of pollution detracts from the recreational experience. Off-site workers within industrial and commercial areas surrounding the proposed Project area are also considered sensitive receptors by the SCAQMD.

#### 4.2.6 THRESHOLDS OF SIGNIFICANCE

The proposed Project would have a significant impact in relation to air quality if it were to:

- Threshold AQ-1: Conflict with or obstruct implementation of the applicable air quality plan.**
- Threshold AQ-2: Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard.**
- Threshold AQ-3: Expose sensitive receptors to substantial pollutant concentrations.**

The following criteria was used to evaluate air quality impacts:

##### 4.2.6.1 SCAQMD CEQA Air Quality Handbook

Because of the SCAQMD’s regulatory role in the Basin, the significance thresholds and analysis methodologies in the SCAQMD’s *CEQA Air Quality Handbook*<sup>98</sup> are used in evaluating project impacts for construction, operations, and air toxics.<sup>99</sup>

<sup>98</sup> SCAQMD, Air Quality Analysis Guidance Handbook, <http://www.aqmd.gov/CEQA/hdbk.html>. Accessed September 2021.

<sup>99</sup> South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, March 2015, <http://www.aqmd.gov/ceqa/hdbk.html>. Accessed September 2021.

#### Daily Emissions Thresholds

SCAQMD has identified thresholds to determine the significance of regional air quality emissions for construction activities and project operation, as shown in **Table 4.2-5: Mass Daily Emissions Thresholds**.

#### Construction Emissions

In addition to the mass daily thresholds, a project would result in a significant construction air quality impact if the Project exceeds the concentration significance thresholds set forth in **Table 4.2-6: Ambient Air Quality Significance Thresholds for Criteria Pollutants**. Per SCAQMD guidance, the evaluated concentrations of CO, NO<sub>2</sub>, and SO<sub>2</sub> includes both the project contribution plus background concentrations. The total concentration is then compared to the significance thresholds. For CO, NO<sub>2</sub>, and SO<sub>2</sub>, these significance thresholds are reflective of the CAAQS and NAAQS. Background concentrations were based on existing air monitoring stations near the proposed Project and represent existing air emissions sources within the Basin. Per SCAQMD guidance, the Project contribution of PM<sub>10</sub> and PM<sub>2.5</sub> is compared to the significance thresholds without adding background concentrations.

**Table 4.2-5**  
**Mass Daily Emissions Thresholds**

Pollutant	Construction	Operation
	Significant Threshold (pounds/day)	
Volatile organic compounds (VOCs)	55	55
Nitrogen dioxide (NO <sub>x</sub> )	100	55
Carbon monoxide (CO)	550	550
Sulfur dioxide (SO <sub>x</sub> )	150	150
Respirable particulate matter (PM <sub>10</sub> )	150	150
Fine particulate matter (PM <sub>2.5</sub> )	55	55

Source: South Coast Air Quality Management District, “SCAQMD Air Quality Significance Thresholds” (last revised March 2015).

#### Operational Emissions

In addition to the mass daily thresholds above, a project would normally have a significant impact on air quality from project operations if any of the following would occur:

- Operational emissions were to exceed 10 tons per year of VOCs or any of the daily thresholds presented above in **Table 4.2-5** (as reprinted from the CEQA Air Quality Handbook);<sup>100</sup>
- Either of the following conditions would occur at an intersection or roadway within one-quarter mile of a sensitive receptor:
  - The project causes or contributes to an exceedance of the California 1-hour or 8-hour CO standards of 20 or 9.0 parts per million (ppm), respectively; or
  - The incremental increase due to the project is equal to or greater than 1.0 ppm for the California 1-hour CO standard, or 0.45 ppm for the 8-hour CO standard.

**Table 4.2-6**  
**Ambient Air Quality Significance Thresholds for Criteria Pollutants**

Pollutant	Averaging Period	Pollutant Concentration Threshold
CO	1-hour /8-hour	SCAQMD is in attainment (federal and State); project is significant if it causes or contributes to an exceedance of the attainment standards of 20 ppm (1-hour) and 9 ppm (8-hour)
NO <sub>2</sub>	1-hour	SCAQMD is in attainment (federal and state); project is significant if it causes or contributes to an exceedance of the following attainment standard 0.18 ppm (state)
	Annual	0.03 ppm (state) and 0.0534 ppm (federal)
PM <sub>10</sub>	24-hour	10.4 µg/m <sup>3</sup> (construction) and 2.5 µg/m <sup>3</sup> (operation)
	Annual	1.0 µg/m <sup>3</sup> (construction and operation)
PM <sub>2.5</sub>	24-hour	10.4 µg/m <sup>3</sup> (construction) and 2.5 µg/m <sup>3</sup> (operation)
SO <sub>2</sub>	1-hour	0.25 ppm (state) and 0.075 ppm (federal)
	24-hour	0.04 ppm (state)
Lead	30-day Average	1.5 µg/m <sup>3</sup> (state)
	Rolling 3-month Average	0.15 µg/m <sup>3</sup> (federal)

Source: South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, March 2015, <http://www.aqmd.gov/ceqa/hdbk.html>. Accessed September 2021.

### Health Risk Assessment (Toxic Air Contaminants)

Per SCAQMD, a project would result in a significant health impact if the carcinogenic or toxic air contaminants individually or cumulatively are equal to or exceed the maximum individual cancer risk of ten in one million persons or a chronic and acute hazard index of 1.0, or the cancer burden of 0.5 excess cancer cases (in areas greater than or equal to one in one million).

101 SCAQMD, Air Quality Analysis Guidance Handbook, <http://www.aqmd.gov/CEQA/hdbk.html>. Accessed September 2021.  
102 SCAQMD, Final Air Quality Management Plan (AQMP). Approved March 3, 2017. <http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp>. Accessed September 2021.

### 4.2.6.2 Consistency with Applicable Plans and Policies

The consistency analysis addresses consistency with the SCAQMD's AQMP,<sup>101</sup> the 2020-2045 SCAG RTP/SCS,<sup>102</sup> and policies included within the City's General Plan<sup>103</sup> and ECAP.<sup>104</sup>

### 4.2.7 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

**Impact AQ-1: Would the project conflict with or obstruct implementation of the applicable air quality plan?**

The proposed Project includes ITC Design Standards and Guidelines (Design Guidelines) and a Construction Commitment Program (CCP) as described in **Section 3.0: Project Description**. The CCP addresses temporary effects during construction of the proposed Project. The Guidelines describe the design features of the proposed Project.

#### 4.2.7.1 Project Design Features

The proposed Project includes the following features that address air quality emissions during construction of the ATS:

##### PDF AQ-1 Construction Air Quality Program

At a minimum, use equipment that meets the U.S. Environmental Protection Agency (USEPA)'s Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity, unless it can be demonstrated to the City Planning Division with substantial evidence that such equipment is not available. To ensure that Final Tier 4 construction equipment or better shall be used during the proposed Project's construction, the City shall include this requirement in applicable bid documents, purchase orders, and contracts. The City shall also require periodic reporting and provision of written construction documents by construction contractor(s) and conduct regular inspections to the maximum extent feasible to ensure and enforce compliance.

Such equipment will be outfitted with Best Available Control Technology devices including a California Air Resources Board (CARB)-certified Level 3 Diesel Particulate Filters (DPF). Level 3 DPF are capable of achieving at least 85 percent reduction in particulate matter emissions. Any emissions control device used

#### 4.2 Air Quality

by the contractor shall achieve emissions reductions that are no less than what could be achieved by Final Tier 4 emissions standards for a similarly sized engine, as defined by the CARB's regulations. Successful contractors must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. The proposed Project representative will make available to the lead agency and Southern California Air Quality Management District (SCAQMD) a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, which will be used during construction. The inventory will include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each unit's certified tier specification, best available control technology (BACT) documentation, and CARB or SCAQMD operating permit shall be maintained on site at the time of mobilization for each applicable piece of construction equipment.

If any of the following circumstances listed below exist and the Contractor provides written documentation consistent with project contract requirements, the Contractor shall submit an Alternative Compliance Plan that identifies operational changes or other strategies that can reduce a comparable level of NOx emissions as Tier 4-certified engines during construction activities.

- The Contractor does not have the required type of off-road construction equipment within its current available inventory as to a particular vehicle or equipment by leasing or short-term rent, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
- The Contractor has been awarded funding by SCAQMD or another agency that would provide some or all of the cost to retrofit, repower, or purchase a piece of equipment or vehicle, but the funding has not yet been provided due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
- Contractor has ordered equipment or vehicle to be used on the construction project in compliance at least 60 days before that equipment or vehicle is needed at the Project alignment, but that equipment or vehicle has not yet arrived due to circumstances beyond the Contractor's control, and the Contractor has attempted in good faith and with due diligence to lease or short-term rent the equipment or vehicle that would comply, but the equipment or vehicle is not available for lease or short-term rent within 120 miles of the Project area, and the Contractor has submitted documentation to the City showing that the requirements of this exception provision apply.
- Construction-related diesel equipment or vehicle will be used on the Project for fewer than 20 calendar days per calendar year. The Contractor shall not consecutively use different equipment or

#### 4.2 Air Quality

vehicles that perform the same or a substantially similar function in an attempt to use this exception to circumvent the intent of this measure.

- Documentation of good faith efforts and due diligence regarding the previous exceptions shall include written record(s) of inquiries (i.e., phone logs) to at least three leasing/rental companies that provide construction on-road trucks and off-road equipment, documenting the availability/unavailability of the required types of truck/equipment. The City will, from time-to-time, conduct independent audit of the availability of such vehicles and equipment for lease/rent within a 120-mile radius of the Project area, which may be used in reviewing the acceptability of the Contractor's good faith efforts and due diligence.
- Equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts shall be electric or alternative-fueled (i.e., nondiesel). Pole power shall be utilized to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel-powered generators, must be operated continuously, such equipment must be Final Tier 4 construction equipment or better and located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- At a minimum, require that construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export with a gross vehicle weight rating of at least 14,001 pounds), or best commercially available equipment, that meet CARB's 2010 engine emissions standards at 0.01 g/hp-hour of particulate matter and 0.20 g/hp-hour of NOx emissions or newer, cleaner trucks, unless the Contractor provides written documentation consistent with project contract requirements the circumstances exist as described above and the Contractor submits the Plan. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards. The City shall include this requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards and make the records available for inspection.
- Require the use of electric or alternatively fueled (e.g., natural gas) sweepers with high-efficiency particulate air (HEPA) filters.
- A publicly visible sign shall be posted with the Community Affairs Liaison's contact information to contact regarding dust complaints. The Air District's phone number shall also be visible to ensure compliance with applicable regulations.
- All roadways, driveways, sidewalks, etc., being installed as part of the Project should be completed as soon as practicable; in addition, building pads should be laid as soon as practicable after grading.
- To the extent feasible, allow construction employees to commute during off-peak hours.
- Make access available for on-site lunch trucks during construction, as feasible, to minimize off-site construction employee vehicle trips.
- Every effort shall be made to utilize grid-based electric power at any construction site, where feasible.

#### 4.2 Air Quality

- Contractors shall maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.
- Require in all applicable bid documents, purchase orders, and contracts of the requirement to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB's policy. For any idling that is expected to take longer than five minutes, the engine should be shut off. Notify construction vendors, contractors, and/or haul truck operators of these idling requirements at the time that the purchase order is issued and again when vehicles enter the Project area. To further ensure that drivers understand the vehicle idling requirement, post signs at the proposed Project entry gates and throughout the Project alignment, where appropriate, stating that idling longer than five minutes is not permitted.

The following analysis addresses consistency of the proposed Project with applicable plans and policies that regulate air quality. In particular, the analysis addresses consistency with SCAQMD's AQMP, which as discussed above, is an air quality plan that includes strategies for achieving attainment of applicable ozone, PM<sub>10</sub>, and PM<sub>2.5</sub> standards. The analysis also includes consistency with SCAG's 2020-2045 RTP/SCS which establishes strategies for achieving improvements in air quality. In addition, consistency with the air quality related policies in the City General Plan Land Use Element, Conservation, and Environmental Justices are also addressed. Finally, this analysis addresses consistency with the City's ECAP, which includes strategies to mitigate the City's impacts on air quality and climate change.

#### 2016 Air Quality Management Plan

As discussed above, SCAQMD has adopted a series of AQMPs to lead the Basin into compliance with several criteria air pollutant standards and other federal requirements, while taking into account construction and operational emissions associated with population and economic growth projections provided by SCAG's RTP/SCS.<sup>105</sup>

The current AQMP is the Final 2016 Air Quality Management Plan (2016 AQMP)<sup>106</sup> and is the regional blueprint for achieving air quality standards in the South Coast Air Basin, an area that includes Orange County and the nondesert portions of Los Angeles, Riverside and San Bernardino counties.

105 Southern California Association of Governments (SCAG), Connect SoCal: 2020-2045 Regional Transportation Plan/Sustainable Communities Strategies Draft, "Chapter 1," <https://www.connectsocial.org/Pages/Connect-SoCal-Draft-Plan.aspx>, Accessed September 2021.  
106 South Coast Air Quality Management District, Final 2016 Air Quality Management Plan, March 2017.

#### 4.2 Air Quality

The 2016 AQMP represents a thorough analysis of existing and potential regulatory control options, includes available, proven, and cost-effective strategies, and seeks to achieve multiple goals in partnership with other entities promoting reductions in greenhouse gases and toxic risk, as well as efficiencies in energy use, transportation, and goods movement. The 2016 AQMP recognizes the critical importance of working with other agencies to develop funding and incentives that encourage the accelerated transition to cleaner vehicles, and the modernization of buildings and industrial facilities to cleaner technologies in a manner that benefits not only air quality, but also local businesses and the regional economy.

SCAQMD recommends that, when determining whether a project is consistent with the relevant AQMPs, the lead agency should assess whether the project would directly obstruct implementation of the plans by impeding SCAQMD's efforts to achieve attainment with respect to any criteria air pollutant for which it is currently not in attainment of the NAAQS and CAAQS (e.g., ozone, PM<sub>10</sub>, and PM<sub>2.5</sub>) and whether it is consistent with the demographic and economic assumptions (typically land use related, such as employment and population/residential units) upon which the plan is based.<sup>107</sup> SCAQMD guidance indicates that projects whose growth is included in the projections used in the formulation of the 2016 AQMP are considered to be consistent with the plan and would not interfere with its attainment.<sup>108</sup>

#### Construction

##### Control Strategies

During construction, the proposed Project would comply with CARB's requirements to minimize short-term emissions from on-road and off-road diesel equipment, including the ATCM to limit heavy duty diesel motor vehicle idling to no more than 5 minutes at any given time, and with SCAQMD's regulations such as Rule 403<sup>109</sup> for controlling fugitive dust and Rule 1113<sup>110</sup> for controlling VOC emissions from architectural coatings. Furthermore, the proposed Project would use vehicles from vendors that comply with fleet rules to reduce on-road truck emissions under CARB's Truck and Bus regulation.<sup>111</sup> Compliance with these measures and requirements would be consistent with and meet or exceed the 2016 AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities.

Even though the proposed Project would be consistent with local and State construction regulations, and other voluntary measures designed to reduce nonattainment pollutants, regional emissions during

107 South Coast Air Quality Management District, Air Quality Analysis Handbook, pp. 12-2, 12-3, <http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook>. Accessed September 2021.

108 South Coast Air Quality Management District, 1993. CEQA Air Quality Handbook, p. 12-1. November 1993

109 SCAQMD, "Rule 403: Fugitive Dust", <http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-403.pdf>. Accessed September 2021.

110 SCAQMD, "Rule 1113: Architectural Coatings", <http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-1113.pdf>. Accessed September 2021.

111 California Air Resources Board, Truck and Bus Regulation. <https://ww2.arb.ca.gov/our-work/programs/truck-and-bus-regulation/about>. Accessed September 2021.

construction would exceed the significance threshold for NOx prior to application of mitigation. Specifically, as shown in **Table 4.2-8**, emissions during construction for 2024 (146 lbs./day), 2025 (128 lbs./day), and 2026 (118 lbs./day) would exceed the SCAQMD's mass threshold of 100 lbs./day. Other criteria pollutants are not predicted to exceed regional mass emission thresholds during construction.

#### **Growth Strategies**

The proposed Project would result in an increase in short-term employment compared to existing conditions (see **Section 4.11: Population, Employment, and Housing**). Although the proposed Project would generate construction jobs during the construction process, construction-related jobs generated would likely be filled by employees within the construction industry within the City and the greater Los Angeles County region. Construction industry jobs generally have no regular place of business, as construction workers commute to job sites throughout a given region, which may change several times a year. Moreover, these jobs would be temporary in nature. Therefore, the construction jobs generated by the proposed Project would not conflict with the long-term employment or population projections upon which the 2016 AQMP is based.

However, as the proposed Project would exceed the NOx SCAQMD threshold, construction impacts would be potentially significant.

#### **Operation**

##### **Transportation Strategies**

The 2016 AQMP includes land use and transportation strategies from the SCAG RTP/SCS that are intended to reduce VMT and resulting regional mobile source emissions. The majority of the transportation strategies are to be implemented by cities, counties, and other regional agencies such as SCAG and SCAQMD, although some can be furthered by individual development projects.

The 2016 AQMP forecasts emissions inventories up to the year 2031 "with growth" through a detailed consultation process with SCAG.<sup>112</sup> The region is projected to see a 12 percent growth in population, 16 percent growth in housing units, 23 percent growth in employment, and 8 percent growth in vehicle miles traveled between 2012 and 2031.

The proposed Project is a transit system that spans the length of approximately 1.6 miles and would be located near existing residential, office, retail, and commercial land uses which generate vehicle trips on local roadways within the City. The proposed Project would provide direct connections between the Metro K Line, and other transit providers as well as the City's major activity centers, such as The Forum, the LASED

<sup>112</sup> South Coast Air Quality Management District, *Final 2016 Air Quality Management Plan*, March 2017. P. 3-10.

and HPSP including SoFi stadium, and IBEC. Implementation of the proposed Project would provide an alternate mode of transportation within the City and reduce VMT.

As further discussed in **Section 4.12**, in 2027 the proposed Project would have a daily weekday ridership of 3,574 passengers on a non-event day, and a daily weekday ridership of 29,280 passengers on an NFL event day. Moreover in 2045 the proposed Project would have a daily weekday ridership of 4,462 passengers on a non-event day, and a daily weekday ridership of 34,650 passengers on an NFL event day.

As these increases in public transit ridership reduce potential vehicle trips and air quality emissions, VMT estimates for the six operational scenarios are derived from travel demand modeling in the Transportation Study (see **Appendix O**) and are further discussed in **Section 4.12**. The proposed Project would reduce daily and annual VMT compared to a no-Project scenario. Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce VMT accordingly when compared to the baseline scenarios without the proposed Project.

The proposed Project will help manage and support the City's projected growth by providing transit within a safe and accessible walking distance to thousands of new residents, housing units and jobs. The proposed Project's connection from the City's new housing and employment centers, and sports and entertainment venues, to the Metro K Line and larger regional and State rail system will result in significant benefits for both the City and southern California region.

#### **Growth Strategies**

As noted, the 2016 AQMP indicates that the region is projected to see a 12 percent growth in population, 16 percent growth in housing units, and 23 percent growth in employment.<sup>113</sup> According to SCAG's 2020-2045 RTP/SCS, approximately 8,389,000 jobs were available in 2016 across industries in the region and the number of jobs available will increase to 10,050,000 by 2045, an increase of approximately 0.62 percent annually in jobs.<sup>114</sup> Similarly, SCAG projects that the population in the region will increase from approximately 18,832,418 in 2016 to 22,507,188 in 2045, resulting in an increase of approximately 0.61 percent annually.

As discussed previously, implementation of the proposed Project would require the acquisition of a number of full and partial property and air rights acquisitions and easements or leases for construction and operation of the guideway, stations, MSF, and other support facilities included in the proposed Project. As such, the proposed Project would result in a reduction of jobs from existing uses. However, the

<sup>113</sup> South Coast Air Quality Management District, *Final 2016 Air Quality Management Plan*, March 2017. P. 3-10.

<sup>114</sup> SCAG. Draft 2020-2045 Connect SoCal Demographics And Growth Forecast.  
[https://www.connectsocial.org/Documents/Draft/dConnectSoCal\\_Demographics-And-Growth-Forecast.pdf](https://www.connectsocial.org/Documents/Draft/dConnectSoCal_Demographics-And-Growth-Forecast.pdf). Accessed September 2021.

reduction of jobs at existing commercial and retail uses to accommodate the proposed Project would not result in a reduction in jobs in the local job market. Other ongoing and proposed developments and construction in downtown Inglewood and the nearby area, such as the HPSP and the LASED, which are both adjacent to the proposed Project, would provide additional job and employment opportunities.

An adequate workforce exists and is projected to remain in existence, creating capacity to meet the employment needs of the proposed Project during operation. Further, with the current development of new employment opportunities in the City as well as the region, displacement of any existing workers can be absorbed. Therefore, this growth would not conflict with the 2016 AQMP.

As such, operation of the proposed Project would not conflict with the 2016 AQMP and impacts would be less than significant.

#### 2020-2045 RTP/SCS

SCAG has prepared and adopted the 2020–2045 RTP/SCS,<sup>115</sup> which includes an SCS that addresses regional development and growth forecasts. The SCAG 2020–2045 RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals, with a specific goal of achieving an 8 percent reduction in passenger vehicle GHG emissions on a per capita basis by 2020, 19 percent reduction by 2035, and 21 percent reduction by 2040 compared to the 2005 level. Although the RTP/SCS is not technically an air quality plan, consistency with the RTP/SCS has air quality implications, including the reduction of VMT which reduces air quality emissions.

Currently, the City contains roughly 8,900 housing units and 14,414 employees within one half mile of the proposed Project. By 2040, these areas are projected to increase to roughly 12,875 households, and 38,326 employees.<sup>116</sup> These increases represent a growth rate of approximately 45 percent in households and 166 percent in employment. In comparison to the SCAG region, these projections translate into the City (within a ½ mile of the proposed Project) experiencing almost twice as much growth rate in housing, and more than seven times as much growth rate in employment by 2040.

As part of its vision, the 2020-2045 RTP/SCS includes Connect SoCal;<sup>117</sup> Connect SoCal charts a path toward a more mobile, sustainable, and prosperous region by making connections between transportation

<sup>115</sup> Southern California Association of Governments (SCAG), *Connect SoCal: 2020-2045 Regional Transportation Plan/Sustainable Communities Strategies Final Plan*, <https://www.connectsocial.org/Pages/Connect-SoCal-Final-Plan.aspx>. Accessed September 2021.

<sup>116</sup> City of Inglewood, *Transit and Intercity Rail Program (TIRCP) Application for the City of Inglewood Transit Connector Project*, January 16, 2020.

<sup>117</sup> Southern California Association of Governments (SCAG), *Connect SoCal, The 2020-2045 Regional Transportation Plan/Sustainable Community Strategy of the Southern California Association of Governments*, <https://www.connectsocial.org/Pages/Connect-SoCal-Final-Plan.aspx>. Accessed September 2021.

networks, between planning strategies and between the people whose collaboration can improve the quality of life for Southern Californians. Connect SoCal builds upon and expands land use and transportation strategies established over several planning cycles to increase mobility options and achieve a more sustainable growth pattern. To augment Connect SoCal's Core Vision, Connect SoCal includes new initiatives at the intersection of land use, transportation, and technology to close the gap and reach our greenhouse gas reduction goals. As part of the planning vision, Connect SoCal looks to complete "last mile" mobility as part of its sustainability goals, Connect SoCal builds upon with regional initiatives that link the built environment and transportation system with policies, projects and programs that strengthen and enhance each other beyond what each would accomplish in isolation.<sup>118</sup>

As part of the state's mandate to reduce per-capita GHG emissions from automobiles and light trucks, Connect SoCal presents strategies and tools that are consistent with local jurisdictions' land use policies and incorporate best practices for achieving the state-mandated reductions in GHG emissions at the regional level through reduced per-capita vehicle miles traveled. These strategies identify how the SCAG region can implement Connect SoCal and achieve related GHG reductions. SCAG works to support local jurisdictions and partnerships by identifying ways to implement the SCS in a way that fits the vision and needs of each local community.

The following Connect SoCal strategies are intended to be supportive of implementing the regional SCS and are applicable to the proposed Project:

#### **Focus Growth Near Destinations & Mobility Options**

- Focus on a regional jobs/housing balance to reduce commute times and distances and expand job opportunities near transit and along center-focused main streets.
- Encourage design and transportation options that reduce the reliance on and number of solo car trips.

#### **Support Implementation of Sustainability Policies**

- Pursue funding opportunities to support local sustainable development implementation projects that reduce greenhouse gas emissions.

As noted previously, the proposed Project's is approximately 1.6 miles in length and would be located near existing residential, office, retail, and commercial land uses which generate vehicle trips on local roadways within the City. The proposed Project would provide direct connections between the Metro K Line, and other transit providers as well as the City's major activity centers, such as The Forum, the LASED and HPSP

<sup>118</sup> Southern California Association of Governments (SCAG), *Connect SoCal, The 2020-2045 Regional Transportation Plan/Sustainable Community Strategy of the Southern California Association of Governments*, p. 4 <https://www.connectsocial.org/Pages/Connect-SoCal-Final-Plan.aspx>. Accessed September 2021.

#### 4.2 Air Quality

including SoFi stadium, and IBEC. Implementation of the proposed Project would provide an alternate mode of transportation within the City and decrease VMTs.

The 2020-2045 RTP/SCS states that expanding the transit network is central to the region's plan for meeting mobility and sustainability goals while continuing to grow the regional economy.<sup>119</sup> The proposed Project provides connection to the Metro K Line and achieves the last mile/first mile goals of the 2020-2045 RTP/SCS. Further, the proposed Project is consistent with and assisting in achieving Connect SoCal strategies and incorporates best practices for achieving the state-mandated reductions in GHG emissions at the regional level through reduced per-capita VMT.

As such, the proposed Project would not conflict with the 2020–2045 RTP/SCS and impacts would be less than significant.

#### Inglewood General Plan

The City General Plan includes the following elements: Land Use, Circulation, Safety, Noise, Housing, Open Space, and Conservation.

#### Land Use Element

The following goals from the Land Use Element<sup>120</sup> of the City General Plan are relevant to air pollutant emissions.

**Circulation Goal:** Promote and support adequate public transportation within the City and the region.

**Circulation Goal:** Develop a safe and adequate pedestrian circulation system which is barrier free for the handicapped.

#### Conservation Element

The City's General Plan Conservation Element addresses the conservation, development, and use of natural resources.<sup>121</sup> Five specific areas of conservation and/or protection that are identified in the Conservation Element include (1) oil and gas production, (2) water production and provision for domestic

119 Southern California Association of Governments (SCAG), Connect SoCal, The 2020-2045 Regional Transportation Plan/Sustainable Community Strategy of the Southern California Association of Governments, Chapter 3. <https://www.connectsocial.org/Pages/Connect-SoCal-Final-Plan.aspx>, Accessed September 2021.

120 City of Inglewood, Department of Community Development and Housing, 1980. Land Use Element of the Inglewood General Plan. January 1980. Amended September 14, 2016.

121 City of Inglewood General Plan, "Conservation Element" (1997), General Plan. January 1980.

#### 4.2 Air Quality

use, (3) storm water runoff and waste water, (4) hazardous waste and solid waste disposal, and (5) air pollution.<sup>122</sup> The Conservation Element notes the following pollution-reducing measures:

- Reducing airborne particulate matter from factories and construction sites;
- Reducing numbers of vehicles being driven while increasing the utilization of high occupancy vehicles and alternative transportation;
- Requiring improvements to engine efficiency to decrease emissions; and
- Increasing the use of clean fuel vehicles.

#### Environmental Justice Element

The following goals from the Environmental Justice Element<sup>123</sup> of the City General Plan are relevant to air pollutant emissions.

**Policy EJ-2.4:** Create land use patterns and public amenities that encourage people to walk, bicycle and use public transit.

**Policy EJ-2.9:** Work with the South Coast Air Quality Management District (SCAQMD), the Los Angeles International Airport (LAX) and other appropriate agencies to monitor and improve air quality in the City of Inglewood.

**Policy EJ-2.10:** Implement and periodically update the City's Energy and Climate Action Plan to improve air quality and reduce greenhouse gas emissions.

The proposed Project would comply with CARB's requirements to minimize short-term emissions from on-road and off-road diesel equipment, including the ATCM to limit heavy duty diesel motor vehicle idling to no more than 5 minutes at any given time, and with SCAQMD's regulations such as Rule 403<sup>124</sup> for controlling fugitive dust and Rule 1113<sup>125</sup> for controlling VOC emissions from architectural coatings. Furthermore, the proposed Project would comply with fleet rules to reduce on-road truck emissions under CARBs Truck and Bus regulation.<sup>126</sup> Compliance with these measures and requirements would be

122 City of Inglewood General Plan, "Conservation Element" (1997), General Plan. January 1980.

123 City of Inglewood, Department of Community Development and Housing, 1980. Environmental Justice Element of the Inglewood General Plan. April 2020.

124 SCAQMD, "Rule 403: Fugitive Dust", <http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-403.pdf>. Accessed September 2021.

125 SCAQMD, "Rule 1113: Architectural Coatings", <http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-1113.pdf>. Accessed September 2021.

126 California Air Resources Board, Truck and Bus Regulation. <https://ww2.arb.ca.gov/our-work/programs/truck-and-bus-regulation/about>. Accessed September 2021.

consistent with and meet or exceed the AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities.

Once in operation, the proposed Project would result in a decrease in emissions for criteria pollutants (see **Impact AQ-2**). This would include reductions in 2027 for VOC of 10.8 lbs./day, CO of 378.0 lbs./day, NOx of 77.0 lbs./day, PM<sub>2.5</sub> of 28.6 lbs./day, PM<sub>10</sub> of 12.0 lbs./day and SO<sub>2</sub> of 1.63 lbs./day. As discussed previously, the proposed Project would provide direct connections between the Metro K Line, and other transit providers as well as the City's major activity centers, such as the Forum, the LASED and HPSP including SoFi stadium, and IBEC. Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce per-capita VMT.

For these reasons, the proposed Project would not conflict with Inglewood General Plan policies related to air quality and impacts would be less than significant.

#### **Inglewood Energy and Climate Action Plan**

As described above, the City's ECAP includes strategies to mitigate the City's impacts on air quality and climate change. While these strategies are primarily directed towards GHG emission reductions, the measures in the City's ECAP would also achieve co-benefits of reducing criteria air pollutants and TACs. The strategies that apply to the proposed Project include:

- **Strategy 1: Lead by Example with Municipal Government Actions**
  - Continue commute trip reduction program
- **Strategy 4: Improve Transportation Options and Manage Transportation Demand**
  - Make roadways more efficient
  - Improve transit
  - Make parking more efficient
  - Reduce commute trips

As discussed, the proposed Project would provide direct connections between regional transit provided by Metro, specifically at the Metro K Line, and other transit providers as well as the City's major activity centers, such as the Forum, the LASED and HPSP including SoFi stadium, and IBEC. Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce per-capita VMT. The proposed Project would be consistent with Strategy 1 as City would provide local transit that would connect to regional transit thereby allowing for commuters to reduce vehicle travel. The proposed Project would be consistent with Strategy 4 in that roadway improvements would provide for efficient travel along

Manchester and Boulevard and Prairie Avenue, would improve transit by connecting the Downtown area with other employment and entertainment areas of the City, and would provide efficient parking within the Downtown area nearby transit options.

The proposed Project would be consistent with the City ECAP, and impacts would be less than significant.

#### **Summary**

##### **Construction**

The proposed Project would comply with CARB's requirements to minimize short-term emissions from on-road and off-road diesel equipment, including the ATCM to limit heavy duty diesel motor vehicle idling to no more than 5 minutes at any given time, and with SCAQMD and CARB regulations. Compliance with these measures and requirements would be consistent with and meet or exceed the 2016 AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities.

Even though the proposed Project would be consistent with applicable local and State construction regulations, and other voluntary measures designed to reduce nonattainment pollutants, regional emissions during construction of the proposed Project would exceed the significance threshold for NOx, an ozone precursor. Other criteria pollutants are not predicted to exceed regional mass emission thresholds during construction. However, as the proposed Project would exceed the NOx SCAQMD threshold during construction, impacts would be potentially significant.

##### **Operation**

The proposed Project will help manage and support the City's projected growth by providing transit within a safe and accessible walking distance to thousands of new residents, housing units and jobs. The proposed Project's connection from the City's new housing and employment centers, and sports and entertainment venues, to the Metro K Line and larger regional and State rail system will result in significant air quality benefits for both the City and southern California region.

The proposed Project provides a transit connection and is consistent with the last mile/first mile goals of the 2020-2045 RTP/SCS.<sup>127</sup> The proposed Project would provide direct connections between the Metro K Line, and other transit providers as well as the City's major activity centers, such as The Forum, the LASED and HPSP, and IBEC; as such, implementation of the proposed Project would provide an alternate mode of transportation within the City and decrease vehicle ridership and thereby VMT. The proposed Project is

<sup>127</sup> Southern California Association of Governments (SCAG), *Connect SoCal*, The 2020-2045 Regional Transportation Plan/Sustainable Community Strategy of the Southern California Association of Governments, *Chapter 3*. <https://www.connectsocial.org/Pages/Connect-SoCal-Final-Plan.aspx>, Accessed September 2021.

4.2 Air Quality

consistent with and assisting in achieving Connect SoCal strategies and incorporate best practices for achieving the State-mandated reductions in GHG emissions at the regional level through reduced per-capita VMT.

Once in operation, the proposed Project would result in a decrease in emissions for criteria pollutants (see **Impact AQ-2**). This would include reductions in 2027 for VOC of 10.8 lbs./day, CO of 378.0 lbs./day, NOx of 77.0 lbs./day, PM<sub>2.5</sub> of 28.6 lbs./day, PM<sub>10</sub> of 12.0 lbs./day and SO<sub>2</sub> of 1.63 lbs./day.

For these reasons, the proposed Project would not conflict with the goals and policies of relevant regional plans or the Inglewood General Plan policies related to air quality.

**Mitigation Measures**

**MM AQ-1:** PDF AQ-1, Construction Air Quality Program, shall be implemented during construction of the ITC Project.

As described above, the proposed Project’s CCP includes **PDF AQ-1** which would reduce air quality emissions during construction of the proposed Project. **Mitigation Measure MM AQ-1** incorporates **PDF AQ-1** into the post-mitigated modeling for construction of the proposed Project.

**Level of Significance after Mitigation**

**Construction**

As shown in **Table 4.2-14**, below, regional emissions during construction of the proposed Project would not exceed the significance threshold for NOx after implementation of **MM AQ-1**

Impacts would be less than significant with mitigation.

**Operation**

As previously explained, the proposed Project is consistent with the 2016 AQMP, the 2020-2045 RTP/SCS, and the City’s General Plan and ECAP. Impacts relative to the operation of the proposed Project with these plans is less than significant.

4.2 Air Quality

**Impact AQ-2: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or State ambient air quality standard?**

The region is designated as a nonattainment area for several pollutants, including O<sub>3</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Construction and operation of the Project would result in direct and indirect impacts that could cumulatively affect air quality for nonattainment pollutants, namely PM<sub>10</sub> and PM<sub>2.5</sub>.

A cumulatively considerable increase in emissions would occur if the proposed Project’s impacts substantially contributed to air quality violations when considering other projects that may undertake construction activities at the same time. SCAQMD recommends that any construction-related emissions and operational emissions from individual development projects that exceed the project-specific mass daily emissions thresholds identified above in **Table 4.2-5** also be considered cumulatively considerable.<sup>128</sup>

**Construction**

Prior to construction of the proposed Project, reconstruction of the existing Vons store proposed for demolition to accommodate construction of the MSF is planned on the corner of Manchester Boulevard and Hillcrest Boulevard. This proposed replacement Vons store would include amenities similar to the existing store, including a pharmacy and bank branch. **Table 4.2-7: Daily Unmitigated Construction Emissions for Vons Replacement** below shows the construction emissions that would occur during development of the Vons store replacement prior to construction of the proposed Project.

**Table 4.2-7  
Daily Unmitigated Construction Emissions for Vons Replacement**

Source	VOC	CO	NOx	PM <sub>10</sub>	PM <sub>2.5</sub>	SO <sub>2</sub>
	pounds/day					
Maximum	6.51	16.35	15.22	1.30	0.78	0.04
SCAQMD Mass Daily Threshold	75	550	100	150	55	150
<b>Threshold exceeded?</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>

Refer to **Appendix G.2**.  
Notes: CO = carbon monoxide; NOx = nitrogen oxides; PM10 = particulate matter less than 10 microns; PM2.5 = particulate matter less than 2.5 microns; SOx = sulfur oxides; VOC = volatile organic compounds.

128 White Paper on Regulatory Options for Addressing Cumulative Impacts from Air Pollution Emissions, SCAQMD Board Meeting, September 5, 2003, Agenda No. 29, Appendix D, p. D-3.

As shown in **Table 4.2-7**, construction of the Vons store replacement would not exceed regional VOC, NOx, CO, SOx, PM<sub>10</sub>, and PM<sub>2.5</sub> concentration thresholds. Moreover, these emissions would be temporary and would occur prior to construction of the proposed ITC Project.

Construction of the proposed ITC Project has the potential to temporarily emit criteria air pollutant emissions through the use of heavy-duty construction equipment, and through vehicle trips generated from workers and haul trucks traveling to and from the proposed Project. In addition, fugitive dust emissions would result from demolition and various soil-handling activities. Mobile source emissions, primarily NOx and PM emissions (i.e., PM<sub>10</sub> and PM<sub>2.5</sub>), would result from the use of diesel powered on- and off-road vehicles and equipment.

#### Intermittent (short-term) Construction Emissions Analysis

Intermittent (short-term) construction emissions that occur from construction of the proposed Project were evaluated for each construction year (2024 through 2027). The air quality analysis focuses on maximum daily emissions from construction activities (mobile, area, stationary, and fugitive sources) and compares the emission estimates to thresholds of significance identified by the SCAQMD and based on the SCAQMD *Air Quality Handbook*.<sup>129</sup>

**Table 4.2-8: Daily Unmitigated Construction Emissions for Proposed Project** shows the estimated daily unmitigated emissions for construction related emissions (including combustion engine and fugitive dust emissions) for the proposed Project. The grand total construction emissions as well as the contribution from employee vehicle trips, pickup/delivery trucks, haul trucks, and off-road equipment are presented. The off-road equipment represents the largest contribution to the total construction emissions. The daily unmitigated NOx construction emissions could potentially exceed the SCAQMD thresholds of significance during 2024 through 2026.

As shown on **Table 4.2-8**, daily emissions for criteria pollutants during construction would exceed significance thresholds for NOx (100 lbs./day) in 2024 (146 lbs./day), 2025 (128 lbs./day), and 2026 (118 lbs./day) prior to the application of PDF AQ-1. As such, proposed Project construction impacts for NOx emissions would be potentially significant. Based on SCAQMD's policy, this would be a cumulatively considerable increase in emissions that could increase future exceedances of ozone, a nonattainment pollutant. For all other criteria pollutants, the construction impact would be less than significant.

#### Operation

As discussed previously, reconstruction of the existing Vons store to be removed is proposed on the corner of Manchester Boulevard and Hillcrest Boulevard. **Table 4.2-9: Operational Air Quality Emissions – Vons Replacement** below shows the operational emissions that would be generated by the Vons store replacement prior to construction of the proposed Project.

Regional air emissions from the proposed Project were assessed based on the incremental increase/decrease in emissions compared to Adjusted Baseline conditions (i.e., existing on-site or off-site Project-related emissions), consistent with SCAQMD methodology.

Operational emissions are based on the estimates for operation of the station components of the proposed Project (ATS trains, stations, and MSF). Operation emissions also include mobile emissions that would result from worker commute trips and deliveries for supplies, maintenance, and other needs.

**Table 4.2-9  
Operational Air Quality Emissions – Vons Replacement**

Source	VOC	CO	NOx	PM <sub>10</sub>	PM <sub>2.5</sub>	SO <sub>2</sub>
pounds/day						
Total Emissions <sup>a</sup>	1.04	0.24	0.26	0.02	0.02	<0.01

Refer to **Appendix G.2**.

Notes: CO = carbon monoxide; NOx = nitrogen oxides; PM10 = particulate matter less than 10 microns; PM2.5 = particulate matter less than 2.5 microns; SOx = sulfur oxides; VOC = volatile organic compounds.

<sup>a</sup> Total emissions do not include mobile emissions which are analyzed separately utilizing VMT estimates from the Transportation Study (**Appendix D**).

As discussed, the proposed Project would include operations at the MSF facility which would generate air quality emissions from both area and stationary sources. **Table 4.2-10: Operational Air Quality Emissions – Normal Conditions** identifies the operational emissions from the MSF, stations, and other stationary components of the proposed Project. As shown, all emission for criteria pollutants emissions from operation of the proposed Project under normal operating conditions would be less than the existing emissions.

**Table 4.2-10  
Operational Air Quality Emissions – Normal Conditions**

Source: See **Appendix G.1**.

**Table 4.2-11: Estimated Daily Operational Emissions/Reductions for Proposed Project Motor Vehicles** presents the daily criteria air pollutant emissions for the six operational scenarios based on VMTs with and without the proposed Project. As shown, the proposed Project daily criteria air pollutant emissions are less than the daily criteria air pollutant emissions without the proposed Project.

Impacts related to proposed Project operation would be less than significant.

**Table 4.2-11  
Estimated Daily Operational Emissions/Reductions for Proposed Project Motor Vehicles**

Scenario	VOC	CO	NOx	PM <sub>10</sub>	PM <sub>2.5</sub>	SO <sub>2</sub>
	pounds/day

Year 2027 with Event Weekday with the proposed Project vs Year 2027 with Event Weekday without the proposed Project	(10.8)	(378)	(77.0)	(28.6)	(12.0)	(1.63)
Year 2045 with Event Weekday with the proposed Project vs Year 2045 with Event Weekday without the proposed Project	(10.4)	(377)	(85.8)	(36.5)	(15.0)	(1.76)

Source: See **Appendix G.1**.

Vendor specifications were used to determine air pollutants emission factors for the standby generators. Emission factors are 5.27 g/hp-hour for NOx, 0.5 g/hp-hour for CO, 0.18 g/hp-hour for VOC, and 0.4 g/hp-hour for PM<sub>10</sub>/PM<sub>2.5</sub>. The estimated annual fuel usage assuming each generator operates for 50 hours per year (2 hours per day) is 27,440 gallons of diesel fuel.<sup>130</sup>

As shown in **Table 4.2-12: Estimated Daily Emissions for Proposed Project Backup Generators**, current estimated emissions for each of the criteria pollutants are noted. As shown, daily emissions for each of

<sup>130</sup> Vender Specifications for Standby Generator, [https://www.cat.com/en\\_US/products/new/power-systems/electric-power.html](https://www.cat.com/en_US/products/new/power-systems/electric-power.html). Accessed September 2021.

the backup generators are estimated to be 4.26 lbs./day for VOC, 11.8 lbs./day for CO, 125 lbs. day for NOx, 0.95 lbs./day for PM<sub>10</sub>, 0.95 lbs./day for PM<sub>2.5</sub> and 8.68 lbs./day for SO<sub>2</sub>.

Because the backup generators would only run for emergency conditions when the main electrical power was not available, and for regular testing, the emissions would be limited to only those periods and would not be an ongoing operational activity. Nevertheless, their emissions are included in the overall assessment of operational emissions to ensure a conservative analysis. Further, because the emissions from the operation of the proposed Project would regularly be less than the significance thresholds for NOx, and in fact would result in net negative emissions, the long-term impacts would be less than significant from the use of the backup generators.

**Table 4.2-12**  
Estimated Daily Emissions (pounds) for Proposed Project Backup Generators

Source	VOC	CO	NOx	PM <sub>10</sub>	PM <sub>2.5</sub>	SO <sub>2</sub>
(lbs. per day)						
Emergency Generator <sup>1</sup>	4.26	11.8	125	0.95	0.95	8.68

Source: See Appendix G.1.

Notes:

Values in **bold** are in excess of applicable standard.

<sup>1</sup> Emissions are for each generator operating up to 2 hours per day for either emergency power needs or testing proposes.

### Health Impacts

A description of adverse health effects from pollutants is provided above under 4.2.2.2: *Health Effects of Pollutants*. In terms of correlating the emissions of regional pollutants to health impacts, it takes a very large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels over an entire region. As shown in **Table 4.2-13** below, the proposed Project would result in a net reduction in air quality emissions. Therefore, operation of the Project will not contribute to adverse health impacts related to emissions of criteria pollutants on a regional basis. A discussion of the potential for the Project to expose sensitive receptors to a substantial increase in pollutant concentrations and the Health Risk Assessment for emissions during construction are discussed below in Impact AQ-3.

### Summary

**Table 4.2-13: Estimated Total Daily Emissions for Proposed Project** presents the daily criteria air pollutant operational emissions under normal operations including employee trips, deliveries, area sources, energy sources (natural gas), motor vehicle, while accounting for the reduction in motor vehicle as a result of the proposed Project and elimination of existing sources. Also presented are the typical daily emissions plus

O&M for the standby generators (one generator tested per day for 2 hours) associated with the proposed Project operations (e.g., 126 pounds of NOx). As shown, the typical daily emissions associated with the proposed Project operations would result in a net negative emissions. Therefore, the proposed Project operations would have a less than significant (and beneficial) impact on air quality and would not result in cumulatively considerable increases that for nonattainment pollutants ozone, PM<sub>10</sub>, and PM<sub>2.5</sub>.

### Mitigation Measures

As described above, the proposed Project's CCP includes **PDF AQ-1** which would reduce air quality emissions during construction of the proposed Project. **MM AQ-1** incorporates **PDF AQ-1** into the post-mitigated modeling for construction of the proposed Project. **PDF-AQ 1** describes a number of specific actions to reduce construction NOx emissions from on-road vehicles and off-road equipment used in construction activities.

**MM AQ-1:** PDF AQ-1, Construction Air Quality Program, shall be implemented during construction of the ITC Project.

#### Level of Significance after Mitigation

##### Construction

**MM AQ-1** incorporates **PDF AQ-1** from the proposed Project's CCP and was included in the post-mitigation modeling for construction of the proposed Project. Specifically, **PDF AQ-1** would require the use of equipment that meets the USEPA's Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 hp or greater, for all phases of construction activity, or the use of equipment that would achieve equivalent emissions reductions. Additionally, **PDF AQ-1** would require construction vendors, contractors, and/or haul truck operators to commit to using 2010 model year, or equivalent, trucks. **PDF AQ-1** would also require the use of electric or alternatively fueled (e.g., natural gas) sweepers with HEPA filters. Compliance with these mitigation measures would result in substantial reductions in emissions of VOC, NOx PM<sub>10</sub>, and PM<sub>2.5</sub> compared to fleet-wide average emissions for heavy-duty construction equipment and trucks in the southern California region.

**Table 4.2-14: Daily Mitigated Construction Emissions for Proposed Project** shows the estimated daily mitigated emissions for construction related emissions (including combustion engine and fugitive dust emissions) for the proposed Project including **MM AQ-1**.

The total construction emissions including the contribution from employee vehicle trips, pickup/delivery trucks, haul trucks, and off-road equipment are presented. The daily mitigated construction emissions would not exceed the SCAQMD thresholds of significance. The mitigation measures represent a reduction of approximately 3926 percent of the NOx emissions, approximately 3620 percent of the PM<sub>10</sub> emissions, and approximately 4831 percent of the PM<sub>2.5</sub> emissions. As such, construction of the proposed Project would not result a cumulatively considerable increase in emissions. Impacts would be less than significant with mitigation.

##### Operation

Operational emissions are based on the estimates for both stationary/area and energy sources for operation of the station components of the proposed Project (ATS trains, stations, and MSF) and mobile sources from worker commute trips and deliveries for supplies, maintenance, and other needs).

As shown in **Table 4.2-13**, the typical daily emissions associated with the proposed Project operations would result in a net negative emissions. Moreover, daily emissions under normal operations would be below the SCAQMD operational thresholds for all emissions.

**Table 4.2-14**  
**Daily Mitigated Construction Emissions for Proposed Project**

Construction Year	VOC	CO	NOx	PM <sub>10</sub>	PM <sub>2.5</sub>	SO <sub>2</sub>

Note: Values in **bold** are in excess of applicable standard.  
Source: See **Appendix G.1**.

As shown in **Table 4.2-13**, the daily emissions for a backup generator would exceed the NOx SCAQMD threshold. Backup generators would only run for emergency conditions when the main electrical power was not available, and for regular testing. As such, the emissions would be limited to only those periods and would not be an ongoing operational activity. Moreover, the overall reductions in emissions from operation of the Project would more than offset emissions from operation of the generators. Therefore, the proposed Project operations would have a less than significant (and beneficial) impact on air quality and would not result in cumulatively considerable increases that for nonattainment pollutants ozone, PM<sub>10</sub>, and PM<sub>2.5</sub>. Pursuant to SCAQMD guidance, the proposed Project's operations would not result in a cumulatively considerable number of emissions of any nonattainment pollutant.

Impacts related to proposed Project operation would be less than significant.

**Impact AQ-3: Would the project expose sensitive receptors to substantial pollutant concentrations?**

#### Construction

##### *Air Dispersion Analysis*

A dispersion modeling analysis was conducted to assess related impacts to air concentrations of CO, NO<sub>2</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, and SO<sub>2</sub> for nearby receptors within one quarter mile of the proposed Project. These receptors are designed to represent off-site locations where a person has access and can be situated for an hour or longer at a time (which is different from the HRA receptors discussed below, which are designed to represent specific residences, schools, daycares, off-site worker locations).

The ambient air quality standards analysis results are presented for both the Morning/Evening and Morning/Night construction scenarios identified in the Construction Phasing Narrative (see **Appendix F.1**). Concentrations were compared to SCAQMD's significance thresholds and California/federal ambient air quality standards as identified in **Table 4.2-6**.

##### Morning/Evening Construction Activities

Estimated emissions for the various criteria pollutants for the Morning/Evening scenario are shown in **Table 4.2-15: Estimated Unmitigated Concentration Impacts from Construction Activities for Morning/Evening Scenario**.

##### NO<sub>x</sub>

For the nearby receptors during construction for the Morning/Evening scenario, the incremental 1-hour NO<sub>2</sub> impacts to a receptor, including background concentrations, would be a maximum of 0.16 ppm, which is below the State threshold of 0.18 ppm. The maximum construction incremental annual NO<sub>2</sub> impacts to a nearby receptor, including background concentrations, would be 0.01 ppm, which is below the thresholds of 0.03 ppm (State) and below the threshold of 0.0534 ppm (federal). However, the maximum incremental 98<sup>th</sup> percentile 1-hour NO<sub>2</sub> impacts to a sensitive receptor, including background concentrations, would be 0.12 ppm, which is above the federal threshold of 0.10 ppm. As such, impacts would be potentially significant for the 1-hour NO<sub>2</sub> federal threshold of 0.10 ppm without mitigation.

##### Particulate Matter

As shown in **Table 4.2-15**, for the nearby receptors during construction, the maximum incremental 24-hour and annual PM<sub>10</sub> impacts to a sensitive receptor would be 2.79 µg/m<sup>3</sup> and 0.11 µg/m<sup>3</sup>, respectively; impacts would be below the 24-hour PM<sub>10</sub> threshold of 10.4 µg/m<sup>3</sup> and below the annual PM<sub>10</sub> threshold of 1.0 µg/m<sup>3</sup>. The construction maximum incremental 24-hour PM<sub>2.5</sub> impacts to a sensitive receptor would

be 2.42 µg/m<sup>3</sup>, which would be below the 24-hour PM<sub>2.5</sub> threshold of 10.4 µg/m<sup>3</sup>. Therefore, unmitigated construction activities would result in a less than significant air quality impact of PM<sub>10</sub> and PM<sub>2.5</sub> on nearby receptors due to construction activities.

##### CO and SO<sub>2</sub>

Concentrations of CO and SO<sub>2</sub> during the Morning/Evening scenario would not exceed significance thresholds on nearby receptors as shown in **Table 4.2-15**. Impacts of CO and SO<sub>2</sub> would be less than significant.

##### Morning/Night Construction Activities

As shown in **Table 4.2-16: Estimated Unmitigated Concentration Impacts from Construction Activities for Morning/Night Scenario**, estimated emissions for the various criteria pollutants for the Morning/Night scenario.

##### NO<sub>x</sub>

For the nearby receptors during construction for the Morning/Night scenario, the maximum construction incremental annual NO<sub>2</sub> impacts including background concentrations would be 0.01 ppm, which is below the thresholds of 0.03 ppm (State) and 0.0534 ppm (federal). However, the maximum construction incremental 1-hour NO<sub>2</sub> impacts to a receptor, including background concentrations, would be 0.20 ppm, which is above the State threshold of 0.18 ppm. Additionally, the maximum incremental 98<sup>th</sup> percentile 1-hour NO<sub>2</sub> impacts to nearby receptor, including background concentrations, would be 0.14 ppm, which is above the federal threshold of 0.10 ppm. As such, impacts would be potentially significant for the 1-hour NO<sub>2</sub> State threshold of 0.18 ppm and the 1-hour NO<sub>2</sub> federal threshold of 0.10 ppm without mitigation.

##### Particulate Matter

As shown in **Table 4.2-16**, for the nearby receptors, the construction maximum incremental 24-hour and annual PM<sub>10</sub> impacts to a receptor would be 3.75 µg/m<sup>3</sup> and 0.10 µg/m<sup>3</sup>, respectively. Impacts would be below the 24-hour PM<sub>10</sub> threshold of 10.4 µg/m<sup>3</sup> and below the annual PM<sub>10</sub> threshold of 1.0 µg/m<sup>3</sup>. The construction maximum incremental 24-hour PM<sub>2.5</sub> impacts would be 3.30 µg/m<sup>3</sup>, which would be below the 24-hour PM<sub>2.5</sub> threshold of 10.4 µg/m<sup>3</sup>. Therefore, unmitigated construction activities would result in a less than significant air quality impact of PM<sub>10</sub> and PM<sub>2.5</sub> on nearby receptors due to construction activities.

##### CO and SO<sub>2</sub>

Concentrations of CO and SO<sub>2</sub> during the Morning/Night scenario would not exceed significance thresholds on nearby receptors as shown in **Table 4.2-16**. Impacts of CO and SO<sub>2</sub> would be less than significant.

**Table 4.2-15**

**Health Risk Assessment**

An HRA was conducted for the proposed Project to address the potential for human health impacts associated with construction of the proposed Project. The SCAQMD thresholds of significance applied to assess project-level health impacts are the exposure of persons to substantial levels of air toxics resulting in (a) a cancer risk level greater than 10 per one million persons; or (b) a noncancerous risk (chronic or acute) hazard index greater than 1; or (c) a cancer burden of greater than 0.5 excess cancer cases.<sup>131</sup> For this threshold, sensitive receptors include residential uses, schools, daycare centers, nursing homes, medical centers, and off-site workers.

**Lifetime Cancer Risk**

The proposed Project would constitute a new emission source of DPM due to its construction activities. Studies have demonstrated that DPM from diesel-fueled engines is a human carcinogen and that chronic (long-term) inhalation exposure to DPM poses a chronic health impact. Health effects from carcinogenic air toxics are usually described in terms of individual cancer risk. Individual cancer risk is the likelihood that a person exposed to air toxic concentrations over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology and a 30-year exposure duration. The maximally exposed individual (MEI) represents the worst-case risk estimate, based on a theoretical person being exposed for a period of 30 years at the highest concentration. This is a highly conservative assumption since most people do not remain in place all day and on average residents change residences every 11 to 12 years and do not stay in the same place of work for 25 years. In addition, this assumes that individuals are experiencing outdoor concentrations for the entire exposure period (even when indoors). A school child exposure duration is between ages 2 and 16 years old, which again, is conservative because the elementary, middle, and high school are not often located at the same location. This theoretical 30-year exposure duration also does not apply to temporary exposure during construction of the project, which will have a duration of approximately 46 months.

If incremental individual cancer risk from the proposed Project would exceed the SCAQMD regulatory threshold of an incremental increase of 10 in one million, then an estimated determination of population level risks is required (a cancer burden analysis). For the cancer burden analysis, the proposed Project risks from construction and operation impacts are evaluated for a 70-year residential scenario.<sup>132</sup>

<sup>131</sup> South Coast Air Quality Management District, 2017. Risk Assessment Procedures for Rule 1401, 1401.1, and 212, Version 8.1, September 1, 2017.

<sup>132</sup> South Coast Air Quality Management District, 2017. Risk Assessment Procedures for Rule 1401, 1401.1, and 212, Version 8.1, September 1, 2017.

**Noncarcinogenic Health Risk (Chronic and Acute)**

The HRA also evaluates the risk of potential noncarcinogenic negative health outcomes related to TACs exposure from airborne emissions during the construction of the proposed Project. For construction, the potential TAC emission sources are heavy-duty equipment used during demolition, grading and excavation, and building construction activities. The HRA followed the procedures and methods provided in the Guidance Manual for Preparation of Health Risk Assessments issued by the OEHHA in 2015<sup>133</sup> as well as the methods in the SCAQMD's Risk Assessment Procedures<sup>134</sup> used in conjunction with the associated SCAQMD Permit Application Package "N."<sup>135</sup> Noncancer effects of chronic (i.e., long-term) and acute (i.e., short-term) TAC exposure were evaluated using the Hazard Index (HI) approach consistent with the OEHHA and SCAQMD guidance.

A chronic health impact equal to or greater than 1.0 represents a significant chronic health hazard. A chronic health effect could include irritation to eyes, throat, lungs, or neurological damage. The proposed Project related TACs with known or suspected chronic health effects emitted during construction could include DPM, acetaldehyde, benzene, 1,3-butadiene, formaldehyde, and nickel.<sup>136</sup> An acute health impact equal to or greater than 1.0 represents a significant acute health hazard. An acute health effect could include irritation to eyes, throat, or lungs, sensory irritation, or coughing, chest pain or vomiting.

**Morning/Evening Construction Activities**

**Table 4.2-17: Estimated Unmitigated Health Impacts from Construction Activities for Morning/Evening Scenario** provides the proposed Project's unmitigated health impacts from construction activities for existing residences, schools, daycares, and off-site workers, and proposed residences. A large majority of the health impacts are due to off-road construction equipment operating within the proposed Project construction areas with a minimal contribution from off-site construction truck travel along nearby roadways.

As shown in **Table 4.2-17**, the maximum cancer risk from unmitigated proposed Project construction emissions for existing residential receptors would be 21.9 per one million persons. Moreover, the maximum cancer risk from unmitigated proposed Project construction emissions for proposed residential receptors would be 18.1 per one million persons. Thus, the cancer risk for residential receptors due to

<sup>133</sup> Office of Environmental Health Assessment, Air Toxic Hotspots Program, Risk Assessment Guidelines – Guidance Manual for Preparation of Health Risk Assessment, February 2015.

<sup>136</sup> Office of Environmental Health Hazard Assessment. Determination of Noncancer Chronic Reference Exposure Levels. February 2000.

construction activities would be potentially above the SCAQMD threshold of 10 per one million persons and would be potentially significant for residential receptors due to construction activities. The cancer burden due to construction activities would be 0.03<sup>137</sup> and below the SCAQMD threshold of 0.5 excess cancer cases and would therefore be less than significant for all residential receptors due to construction activities.

**Table 4.2-17**  
**Estimated Unmitigated Health Impacts from Construction Activities**  
**for Morning/Evening Scenario**  
**(Approximately 7:00 AM to 3:00 PM and 3:00 PM to 11:00 PM)**

Criteria	Cancer Risk	Chronic/Acute Impact
<b>Existing Residence</b>	<b>21.9</b>	0.01

<b>Proposed Residence</b>	<b>18.1</b>	0.01
Significance Threshold	10	1.0
Potentially Significant (Yes or No)?	Yes	No

Note: Values in **bold** are in excess of applicable standard.  
 Source: See **Appendix G.1**.

The unmitigated chronic health impact would be 0.01, based on a proposed Project-related maximum annual diesel concentration of 0.07  $\mu\text{g}/\text{m}^3$  (per dispersion modeling analysis) or 0.07  $\mu\text{g}/\text{m}^3/5.0 \mu\text{g}/\text{m}^3$ , which is 0.01. The chronic health impact due to construction activities would be below the project-level threshold of 1 and would therefore be less than significant for all residential receptors due to construction activities.

As shown in **Table 4.2-17**, the maximum cancer risk from unmitigated proposed Project construction emissions for a school/daycare receptor would be 1.05 per one million persons. Thus, the cancer risk for school/daycare receptors due to construction activities would be below the SCAQMD threshold of 10 per

<sup>137</sup> Cancer burden is the total cancer risk for all receptors divided by the estimated population within the modeling domain.

one million persons and would be less than significant for all off-site school/daycare receptors due to construction activities.

The maximum unmitigated chronic health impact for an off-site school/daycare receptor would be 0.01. Thus, the chronic health impact due to construction activities for all off-site school/daycare receptors would be below the project-level threshold of 1 and the chronic health impact would be less than significant for all off-site school/daycare receptors due to construction activities.

As shown in **Table 4.2-17**, the maximum cancer risk from unmitigated proposed Project construction emissions for an off-site worker receptor (such as office buildings, retail centers, hotels, hospitals) would be 0.43 per one million persons. Thus, the cancer risk for an off-site worker receptor due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be less than significant for all off-site worker receptors due to construction activities.

The maximum unmitigated chronic health impact for an off-site worker receptor would be 0.02. Thus, the chronic health impact due to construction activities for all off-site worker receptors would be below the project-level threshold of 1 and the chronic health impact would be less than significant for all off-site worker receptors due to construction activities.

#### **Morning/Night Construction Activities**

**Table 4.2-18: Estimated Unmitigated Health Impacts from Construction Activities for Morning/Night Scenario** provides the proposed Project's unmitigated health impacts from construction activities for existing residences, schools, daycares, and off-site workers, and proposed residences. A large majority of the health impacts are due to off-road construction equipment operating within the proposed Project construction areas with a minimal contribution from off-site construction truck travel along nearby roadways.

As shown in **Table 4.2-18**, the maximum cancer risk from unmitigated proposed Project construction emissions for a residential receptor would be 24.7 per one million persons. Moreover, the maximum cancer risk from unmitigated proposed Project construction emissions for proposed residential receptors would be 27.8 per one million persons. Thus, the cancer risk for residential receptors due to construction activities would be potentially above the SCAQMD threshold of 10 per one million persons and would be potentially significant for residential receptors due to construction activities. The cancer burden due to construction activities would be 0.02<sup>138</sup> and below the SCAQMD threshold of 0.5 excess cancer cases and would therefore be less than significant for all residential receptors due to construction activities.

<sup>138</sup> Cancer burden is the total cancer risk for all receptors divided by the estimated population within the modeling domain.

The unmitigated chronic health impact would be 0.01, based on a proposed Project-related maximum annual diesel concentration of 0.08  $\mu\text{g}/\text{m}^3$  (per dispersion modeling analysis) or 0.08  $\mu\text{g}/\text{m}^3/5.0 \mu\text{g}/\text{m}^3$ , which is 0.01. The chronic health impact due to construction activities would be below the project-level threshold of 1 and would therefore be less than significant for all residential receptors due to construction activities.

**Table 4.2-18**  
**Estimated Unmitigated Health Impacts from Construction Activities for Morning/Night Scenario**  
**(Approximately 7:00 AM to 3:00 PM and 11:00 PM to 7:00 AM)**

Criteria	Cancer Risk	Chronic/Acute Impact
<b>Existing Residence</b>	<b>24.7</b>	0.01
Significance Threshold	10	1.0
Potentially Significant (Yes or No)?	Yes	No
<b>Off-site School/Daycare</b>	1.62	0.01
Significance Threshold	10	1.0
Potentially Significant (Yes or No)?	No	No
<b>Off-site Worker</b>	0.28	0.01
Significance Threshold	10	1.0
Potentially Significant (Yes or No)?	No	No
<b>Proposed Residence</b>	<b>27.8</b>	0.02
Significance Threshold	10	1.0
Potentially Significant (Yes or No)?	Yes	No

Note: Values in **bold** are in excess of applicable standard.  
Source: See **Appendix G1: Air Quality and Human Health Risk Assessment**.

As shown in **Table 4.2-18**, the maximum cancer risk from unmitigated proposed Project construction emissions for a school/daycare receptor would be 1.62 per one million persons. Thus, the cancer risk for school/daycare receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be less than significant for all off-site school/daycare receptors due to construction activities.

The maximum unmitigated chronic health impact for an off-site school/daycare receptors would be 0.01. Thus, the chronic health impact due to construction activities for all off-site school/daycare receptors would be below the project-level threshold of 1 and the chronic health impact would be less than significant for all off-site school/daycare receptors due to construction activities.

As shown in **Table 4.2-18**, the maximum cancer risk from unmitigated proposed Project construction emissions for an off-site worker receptor (such as office buildings, retail centers, hotels, hospitals) would

be 0.28 per one million persons. Thus, the cancer risk for off-site worker receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be less than significant health impacts for all off-site worker receptors due to construction activities.

The maximum unmitigated chronic health impact modeled to occur at an off-site worker receptor would be 0.01. Thus, the chronic health impact due to construction activities at all off-site worker receptors would be below the project-level threshold of 1 and would be less than significant for all off-site worker receptors due to construction activities.

### Summary

As a result of emissions from TACs for both the Morning/Evening and Morning/Night scenarios, the proposed Project, without mitigation could result in an incremental cancer risk that exceeds applicable standards, the impacts related to such exposures are potentially significant.

The proposed Project, without mitigation, would result in noncarcinogenic health risk that would be below the significance threshold of a chronic health impact of 1.0 for the maximum impacted resident, worker, school (child), and early childhood education (child) receptors and, this, this impact would be less than significant.

### Operation

As discussed in **Impact AQ-2**, the typical daily emissions associated with the proposed Project operations would result in net negative emissions. As a result, the proposed Project would not expose sensitive receptors to substantial pollutant concentrations. Impacts from operation would be less than significant.

### Mitigation Measures

#### Construction Mitigation

As described above, the proposed Project's CCP includes **PDF AQ-1** which would reduce air quality emissions during construction of the proposed Project. **Mitigation Measure MM AQ-1** incorporates **PDF AQ-1** into the post-mitigated modeling for construction of the proposed Project.

#### Operation Mitigation

As there are no significant impacts resulting from operation of the proposed Project, no mitigation required.

**Level of Significance after Mitigation**

**Air Dispersion Analysis**

**Morning/Evening Scenario**

As noted above, during the Morning/Evening scenario the unmitigated maximum incremental 98<sup>th</sup> percentile 1-hour NO<sub>2</sub> impacts to a sensitive receptor, including background concentrations, would be 0.12 ppm, which is above the federal threshold of 0.10 ppm. As shown in **Table 4.2-19: Estimated Mitigated Concentration Impacts from Construction Activities for Morning/Evening Scenario**, for the air quality receptors during construction, the maximum incremental 98<sup>th</sup> percentile 1-hour NO<sub>2</sub> impacts to a sensitive receptor, including background concentrations, would be 0.09 ppm, which is below the federal threshold of 0.10 ppm. The maximum construction incremental annual NO<sub>2</sub> impacts including background concentrations would be 0.01 ppm, which is below the thresholds of 0.03 ppm (state) and below the threshold of 0.0534 ppm (federal). Therefore, mitigated construction activities would not exceed the 1-hour and annual NO<sub>2</sub> thresholds.

Impacts would be less than significant with incorporation of mitigation for NO<sub>2</sub> on nearby receptors during construction activities for the Morning/Evening Scenario.

**Morning/Night Scenario**

As noted above, during the Morning/Night scenario the unmitigated construction incremental 1-hour NO<sub>2</sub> impacts to a sensitive receptor, including background concentrations, would be 0.20 ppm, which is above the State threshold of 0.18 ppm. Moreover, unmitigated maximum incremental 98<sup>th</sup> percentile 1-hour NO<sub>2</sub> impacts to a sensitive receptor, including background concentrations, would be 0.14 ppm, which is above the federal threshold of 0.10 ppm. As shown in **Table 4.2-20: Estimated Mitigated Concentration Impacts from Construction Activities for Morning/Night Scenario**, for the air quality receptors, the maximum incremental 1-hour NO<sub>2</sub> impacts to a sensitive receptor, including background concentrations, would be 0.14 ppm, which is below the State threshold of 0.18 ppm. Moreover, maximum incremental 98<sup>th</sup> percentile 1-hour NO<sub>2</sub> impacts to a sensitive receptor, including background concentrations, would be 0.099 ppm, which is below the federal threshold of 0.10 ppm. The maximum construction incremental annual NO<sub>2</sub> impacts to a sensitive receptor, including background concentrations, would be 0.01 ppm, which is below the thresholds of 0.03 ppm (State) and 0.0534 ppm (federal).

Impacts would be less than significant with incorporation of mitigation for NO<sub>2</sub> on nearby receptors during construction activities for the Morning/Night Scenario.

 Total concentrations reflect rounding of values (Project Increment plus background concentration). Per SCAQMD guidance, PM<sub>10</sub> and PM<sub>2.5</sub> impacts do not include background concentrations.  
 \*This value was rounded up from 0.099 and would be below the threshold of 0.10.

**Health Risk Assessment**

**Morning/Evening Scenario**

As noted above, during the Morning/Evening scenario the maximum cancer risk from the unmitigated construction emissions from the proposed Project for existing residential receptors would be 21.9 per one million persons. The maximum cancer risk from unmitigated construction emissions from the proposed Project for proposed residential receptors would be 18.1 per one million persons. **Table 4.2-21: Estimated Mitigated Health Impacts from Construction Activities for Morning/Evening Scenario** provides the mitigated proposed Project health impacts from construction activities for existing residences, schools, daycares, and off-site workers, and proposed residences. A large majority of the health impacts are due to off-road construction equipment operating within the proposed Project construction areas with a minimal contribution from off-site construction truck travel along nearby roadways.

**Table 4.2-21**  
**Estimated Mitigated Health Impacts from Construction Activities for Morning/Evening Scenario**  
**(Approximately 7:00 AM to 3:00 PM and 3:00 PM to 11:00 PM)**

Criteria	Cancer Risk	Chronic/Acute
<b>Existing Off-site Residence</b>	7.21	<0.01
Significance Threshold	10	1.0
Threshold Exceeded?	No	No
<b>Off-site School/Daycare</b>	0.34	<0.01
Significance Threshold	10	1.0
Threshold Exceeded?	No	No
<b>Off-site Worker</b>	0.14	0.01
Significance Threshold	10	1.0
Threshold Exceeded?	No	No
<b>Proposed Residence</b>	5.94	<0.01
Significance Threshold	10	1.0
Threshold Exceeded?	No	No

Notes: Values in bold are in excess of applicable standard.  
 Source: See Appendix G.1.

**Residential Receptors**

As shown in **Table 4.2-21**, the maximum cancer risk from mitigated construction emissions from the proposed Project for existing residential receptors would be 7.21 per one million persons. The maximum cancer risk from mitigated construction emissions from the proposed Project for residential receptors would be 5.94 per one million persons. Thus, the cancer risk for residential receptors due to construction activities would be less than significant for all residential receptors due to construction activities. The

cancer burden due to construction activities would be 0.01<sup>139</sup> and below the SCAQMD threshold of 0.5 excess cancer cases.

The mitigated chronic health impact would be less than 0.01, based on a proposed Project-related maximum annual diesel concentration of 0.02 µg/m<sup>3</sup> (per dispersion modeling analysis) or 0.02 µg/m<sup>3</sup>/5.0 µg/m<sup>3</sup>, which is 0.01. The chronic health impact due to construction activities would be below the project-level threshold of 1.

Impacts for chronic health issues would be less than significant for all residential receptors due to construction activities.

#### School/Daycare Receptors

As shown in **Table 4.2-21**, the maximum cancer risk from mitigated proposed construction emissions for a school/daycare receptor would be 0.34 per one million persons.<sup>140</sup> Thus, the cancer risk for school/daycare receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be less than significant health impacts for all school/daycare receptors due to construction activities. The maximum mitigated chronic health impact for a school/daycare receptor would be less than 0.01. The chronic health impact due to construction activities for all school/daycare receptors would be below the project-level threshold of 1.

The chronic health impact would be less than significant for all school/daycare receptors during construction activities.

#### Off-site Worker Receptor

As shown in **Table 4.2-21**, the maximum cancer risk from mitigated proposed Project construction emissions for an off-site worker receptor would be 0.14 per one million persons. Thus, the cancer risk for off-site worker receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons.

Impacts would be less than significant health impacts for all off-site worker receptors during construction activities.

The maximum mitigated chronic health impact modeled to occur at an off-site worker receptor would be 0.01. Thus, the chronic health impact due to construction activities at all off-site worker receptors would be below the project-level threshold of 1.

<sup>139</sup> Cancer burden is the total cancer risk for all receptors divided by the estimated population within the modeling domain.

<sup>140</sup> Primarily due to construction activities during year 2 (2025) and 3 (2026) within Phases 1 through 8.

Impacts for chronic health issues would be less than significant for all off-site worker receptors during construction activities.

#### Morning/Night Scenario

As noted above, the maximum cancer risk from unmitigated construction emissions from the proposed Project for existing residential receptors would be 24.7 per one million persons. The maximum cancer risk from unmitigated construction emissions from the proposed Project for proposed residential receptors would be 27.8 per one million persons. **Table 4.2-22: Estimated Mitigated Health Impacts from Construction Activities for Morning/Night Scenario** provides the mitigated proposed Project health impacts from construction activities for existing residences, schools, daycares, and off-site workers, and proposed residences. A large majority of the health impacts are due to off-road construction equipment operating within the proposed Project construction areas with a minimal contribution from off-site construction truck travel along nearby roadways.

**Table 4.2-22**  
**Estimated Mitigated Health Impacts from Construction Activities for Morning/Night Scenario**  
**(Approximately 7:00 AM to 3:00 PM and 11:00 PM to 7:00 AM)**

Criteria	Cancer Risk	Chronic/Acute Impact
<b>Existing Off-site Residence</b>	8.18	<0.01
Significance Threshold	10	1.0
Threshold Exceeded?	No	No
<b>Off-site School/Daycare</b>	0.52	<0.01
Significance Threshold	10	1.0
Threshold Exceeded?	No	No
<b>Off-site Worker</b>	0.09	<0.01

<b>Off-site Worker</b>	9.17	0.01
Significance Threshold	10	1.0
Threshold Exceeded?	No	No

*Note: Values in bold are in excess of applicable standard.*

Source: **Appendix G.1.**

#### Residential Receptors

As shown in **Table 4.2-22**, the maximum cancer risk from mitigated construction emissions from the proposed Project for existing residential receptors would be 8.18 per one million persons. The maximum cancer risk from mitigated construction emissions from the proposed Project for proposed residential

receptors would be 9.17 per one million persons. Thus, the cancer risk for residential receptors due to construction activities would be less than significant for all residential receptors due to construction activities. The cancer burden due to construction activities would be 0.01<sup>141</sup> and below the SCAQMD threshold of 0.5 excess cancer cases.

The mitigated chronic health impact would be 0.01, based on a proposed Project-related maximum annual diesel concentration of 0.02  $\mu\text{g}/\text{m}^3$  (per dispersion modeling analysis) or 0.02  $\mu\text{g}/\text{m}^3/5.0 \mu\text{g}/\text{m}^3$ , which is 0.01. The chronic health impact due to construction activities would be below the project-level threshold of 1.

Impacts for chronic health issues would be less than significant for all residential receptors during construction activities.

#### School/Daycare Receptors

As shown in **Table 4.2-22**, the maximum cancer risk from mitigated proposed Project construction emissions for a school/daycare receptor would be 0.52 per one million persons.<sup>142</sup> Thus, the cancer risk for school/daycare receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons.

The maximum mitigated chronic health impact for all school/daycare receptors would be less than 0.01. Thus, the chronic health impact due to construction activities for all school/daycare receptors would be below the project-level threshold of 1.

The chronic health impact would be less than significant for all school/daycare receptors during construction activities.

#### Off-site Worker Receptor

As shown in **Table 4.2-22**, the maximum cancer risk from mitigated proposed Project construction emissions for an off-site worker receptor would be 0.09 per one million persons. Thus, the cancer risk for off-site worker receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons.

The maximum mitigated chronic health impact modeled to occur at an off-site worker receptor would be less than 0.01. Thus, the chronic health impact due to construction activities at all off-site worker receptors would be below the project-level threshold of 1.

<sup>141</sup> Cancer burden is the total cancer risk for all receptors divided by the estimated population within the modeling domain.

<sup>142</sup> Primarily due to construction activities during year 2 (2025) and 3 (2026) within Phases 1 through 8.

Impacts would be less than significant for all off-site worker receptors during construction activities.

#### **Summary**

The SCAQMD thresholds of significance applied to assess project-level health impacts are the exposure of persons to substantial levels of air toxics resulting in (a) a cancer risk level greater than 10 per one million persons or (b) a noncancerous risk (chronic or acute) hazard index greater than 1 or (c) a cancer burden of greater than 0.5 excess cancer cases.<sup>143</sup>

Localized impacts from criteria pollutants would be a less than significant with incorporation of mitigation measures designed to reduce NO<sub>2</sub> on nearby receptors during construction activities for the Morning/Evening and Morning/Night Scenarios during construction.

The proposed Project would result in carcinogenic health risk that would be below the significance threshold for the maximum impacted resident, worker, school (child), and early childhood education (child) receptors and, this, this impact would be less than significant with the implementation of mitigation.

Emissions of TACs would result in acute and chronic noncarcinogenic health risks below applicable standards, the impacts related to such exposures are less than significant. Therefore, the impacts related to exposing air quality sensitive receptors to substantial pollutant emissions would be less than significant with the implementation of mitigation.

#### **4.2.8 CUMULATIVE IMPACTS**

The following cumulative impact analysis is based on the recommendations provided by SCAQMD in the *Potential Control Strategies to Address Cumulative Impacts from Air Pollution White Paper*.<sup>144</sup> SCAQMD's guidance for assessing a project's cumulative impacts recommends the use of two alternative methodologies: (1) that project-specific air quality impacts be used to determine the project's potential cumulative impacts to regional air quality; or (2) that a project's consistency with the AQMPs are used to determine its potential cumulative impacts. Under SCAQMD's guidance, "[p]rojects that exceed the project-specific significance thresholds are considered by SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively

<sup>143</sup> South Coast Air Quality Management District, 2017. Risk Assessment Procedures for Rule 1401, 1401.1, and 212, Version 8.1, September 1, 2017.

<sup>144</sup> SCAQMD, White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution, August 2003. <http://www.aqmd.gov/docs/default-source/Agendas/Environmental-Justice/cumulative-impacts-working-group/cumulative-impacts-white-paper.pdf>. Accessed September 2021.

significant.” Consistent with this guidance, the potential for the proposed Project to result in cumulative impacts from regional emissions is assessed based on SCAQMD thresholds.

According to the SCAQMD, individual development projects that exceed the SCAQMD-recommended daily thresholds for project-specific impacts would cause a cumulatively considerable increase in emissions for those pollutants for which the Basin is in nonattainment.

#### 4.2.8.1 Construction

The SCAQMD CEQA *Air Quality Handbook*<sup>145</sup> states: “[f]rom an air quality perspective, the impact of a project is determined by examining the types and levels of emissions generated by the project and its impact on factors that affect air quality. As such, projects should be evaluated in terms of air pollution thresholds established by the District.” According to the SCAQMD, if an individual project results in air emissions of criteria pollutants that exceed the SCAQMD’s recommended daily thresholds for project-specific impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants.

During construction, the proposed Project’s unmitigated daily criteria pollutant emissions would not exceed SCAQMD thresholds, with the exception of NO<sub>x</sub>. Implementation of **MM AQ-1** would reduce potential construction-related proposed Project’s daily emissions. Construction-related daily emissions would not exceed the SCAQMD’s regional significance threshold for NO<sub>x</sub> with mitigation. As such, impacts from the proposed Project would be less than significant with mitigation and would not result in a cumulatively considerable increase of NO<sub>x</sub> during the construction period.

Unmitigated construction activities would potentially exceed the 1-hour NO<sub>2</sub> State threshold and the 1-hour NO<sub>2</sub> federal threshold at nearby receptors. However, implementation of **MM AQ-1** would reduce potential construction-related daily emissions for the proposed Project below the 1-hour NO<sub>2</sub> State threshold and the 1-hour NO<sub>2</sub> federal threshold. As such, the construction related activities would be less than significant with mitigation. All other pollutant emissions during construction would fall below the thresholds and cumulative impacts would be less than significant.

The maximum cancer risk from unmitigated proposed Project construction emissions for existing and proposed residential receptors would be potentially above the SCAQMD threshold of 10 per one million persons. However, implementation of **MM AQ-1** would reduce potential construction-related emissions for the proposed Project below the 10 per one million persons threshold. Thus, the cancer risk for existing

<sup>145</sup> SCAQMD, Air Quality Analysis Guidance Handbook, <http://www.aqmd.gov/CEQA/hdbk.html>. Accessed September 2021

and proposed residential receptors due to construction activities would be less than significant with mitigation for all residential receptors due to construction activities.

Based on SCAQMD methodology, the proposed Project construction emissions would represent a considerable contribution to a cumulative impact, resulting in a potentially significant and unavoidable cumulative impact.

#### 4.2.8.2 Operation

Modeling of daily criteria air pollutant emissions for the six operational scenarios includes consideration of VMT with and without the proposed Project. The 2027 and 2045 scenarios include the development of the related projects identified in **Section 4.0, 4.0.6: Cumulative Assumptions**. In addition, the Transportation Study (see **Appendix O**) the SCAG 2020-2045 RTP/SCS<sup>146</sup> Socio-economic data (SED) for base year (2016) and Future baseline (2045) constrained conditions were utilized as the basis for developing the socio-economic data for use with the Inglewood Travel Demand Forecast (TDF) model. Updates to the socioeconomic data include those associated with known related projects from various cities and adjacent jurisdictions. Opening year (2027) SED database was used for the Inglewood TDF developed using interpolation of the 2016 and 2045 databases from SCAG 2020-2045 RTP/SCS data updated for related projects. Therefore, the 2027 and 2045 scenarios account for the growth associated with related project and future growth as provided by SCAG.

With the proposed Project, emissions would result in decreases for all criteria pollutants (VOC, CO, NO<sub>x</sub>, PM<sub>10</sub>, PM<sub>2.5</sub> and SO<sub>2</sub>) compared to existing conditions, as well as the 2027 and 2045 scenarios without the proposed Project. Thus, operations would not have a significant cumulative regional air quality impact due to criteria pollutant emissions. In fact, emissions would be reduced from existing and future 2027 and 2045 No Project scenarios. As such, cumulative impacts from Project operations would be beneficial.

#### 4.2.9 CONSISTENCY WITH CITY GENERAL PLAN

As discussed previously under **Impact AQ-1**, the proposed Project would provide direct connections between the Metro K Line, and other transit providers as well as the City’s major activity centers, such as The Forum, the LASED and HPSP including SoFi stadium, and IBEC. Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce per-capita VMT. For these reasons, the proposed Project would not conflict with Inglewood General Plan policies related to air quality.

<sup>146</sup> Southern California Association of Governments (SCAG), Connect SoCal: 2020-2045 Regional Transportation Plan/Sustainable Communities Strategies Draft, “Chapter 1,” <https://www.connectsocial.org/Pages/Connect-SoCal-Draft-Plan.aspx>. Accessed September 2021.

## 4.3 BIOLOGICAL RESOURCES

### 4.3.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) evaluates the impacts of the proposed Inglewood Transit Connector Project (proposed Project) on nesting or migratory birds/raptors and trees afforded protection pursuant to Federal, State of California (State), and local statutes and regulations. The existing biological resource conditions in the area of the proposed Project are described, along with the methodology and the regulatory framework that guided the evaluation of biological resources. Potential impacts to biological resources that would result from the proposed Project are identified, along with any measures to mitigate significant effects of the proposed Project. The following information is incorporated into this section:

- *Preliminary Tree Survey of ATS Alignment*, Meridian Consultants LLC, June 11, 2018 (**Appendix H.1**);
- *Preliminary Tree Survey of Potential Support Facility Sites*, Meridian Consultants LLC, September 20, 2018 (**Appendix H.2**);
- *Preliminary and Supplemental Tree Inventory*, Pax Environmental, Incorporated, September 10, 2021 (**Appendix H.3**); and
- *CNDBR Survey*, Meridian Consultants LLC, September 10, 2021 (**Appendix H.4**)

The existing biological resources within the footprint of the proposed Project and immediate surrounding area have been evaluated based on existing published information and database research. The existing resources have been identified, along with the methodology and the regulatory framework that guided the evaluation thereof. Direct and/or indirect impacts to biological resources that would result from the demolition and clearing of existing vegetation, and construction and operation of the proposed Project were identified and evaluated as part of the Revised Initial Study prepared prior to the preparation of the December 2020 Draft EIR, and it was determined that the proposed Project would result in a “Less than Significant Impact.” Additionally, for three of these thresholds, the Initial Study found that the proposed Project would have “No Impact.”

The following impacts were determined to be less than significant:

- A substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (CDFW) or U.S. Fish and Wildlife Service (USFWS).
- A substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS.

- A substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the proposed Project in response to consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. Specific changes to the proposed Project include raising the height of the ATS guideway along Market Street to preserve existing views of historic buildings, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue. These changes include updated construction and operational details which resulted in similar impacts to biological resources compared to the December 2020 Draft EIR.

The changes to the design of the proposed Project do not create the potential for significant impacts related to the impacts above. The revised proposed Project would result in additional property acquisitions that would require demolition prior to construction of the proposed Project. Additionally, the revised proposed Project would include a Vons store replacement which would be developed prior to construction of the proposed Project. These changes would not affect the potential level of significance for the impacts discussed above.

Impacts found to be less than significant are further discussed in **Section 6.0: Other Environmental Considerations**.

Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Recirculated Draft EIR.

### 4.3.2 METHODOLOGY

The methodology used to evaluate impacts to biological resources entails a review of the appropriate biological resources databases to determine which threatened or endangered plant or animal species have the potential to occur within the 7.5-minute quadrangles in which the proposed Project, including the guideway and stations, and support facility sites are located. The visual surveys were conducted to determine whether biological resources, including sensitive ecological areas, wetlands, wildlife migratory corridors, and/or habitat conservation areas, occur within 0.25 mile radius of the proposed guideway, stations, and other support facility sites to support these sensitive species. If the proposed Project could

potentially impact biological resources that exist within this area, there would be a potential for adverse impacts.

An intensive tree survey was completed to identify and categorize the existing street trees and landscaping that may be impacted (see **Appendix H.1**). This tree inventory covered the entire guideway alignment and locations of stations, including the public rights-of-way along the proposed Project with an approximately 50-foot buffer, as well as sites for potential support facilities. As the proposed Project has been refined, some of these potential locations have been eliminated from further consideration and were not analyzed in this section. Additionally, as the 50-foot buffer area included in the *Tree Inventory* provided a considerably conservative analysis for potential impacts of the proposed Project on biological resources, this section only addresses trees identified in the report that have been reasonably inferred to be within or near the footprint for the proposed guideway, stations, and support facilities.

The *Tree Inventory* collected information on all trees meeting the specifications for protected tree status as described by the City of Inglewood Tree Preservation Ordinance.<sup>1</sup> Data collection included a determination of species, geographic positioning system (GPS) coordinates, tree diameter at breast height (DBH) at 54.5 inches above the ground, and a description of tree health (poor, fair, or good as determined in the field). The information included in this tree inventory was reported in accordance with accepted scientific and technical standards that are consistent with the requirements of the USFWS and the CDFW. Based on the results of this inventory and the proposed improvements, loss of biological resources and their resulting impacts were identified. Construction of the guideway and stations would include equipment staging areas that may reach 22 feet from the guideway. As such, this analysis conservatively assumed that all existing trees within 25 feet of the proposed guideway and stations, and the MSF and PDS substation sites could be removed during construction. Additionally, potential measures to mitigate significant impacts have been identified for the proposed Project, as necessary.

### 4.3.3 REGULATORY FRAMEWORK

A review of the various federal, State, regional, and local government regulatory requirements was conducted to identify regulations that provide protections of biological resources. This section summarizes the various regulatory requirements that are relevant to the proposed Project.

<sup>1</sup> Inglewood Municipal Code Chapter 12, Article 32, Tree Preservation.

### 4.3.3.1 Federal Regulations

#### ***Federal Endangered Species Act***

The Federal Endangered Species Act<sup>2</sup> (FESA) of 1973, as amended, was promulgated to protect, and conserve any species of plant or animal that is endangered or threatened with extinction and the habitats in which these species are found.

Section 4(a) of the FESA<sup>3</sup> requires that critical habitat be designated by the USFWS “to the maximum extent prudent and determinable, at the time a species is determined to be endangered or threatened.” Critical habitat is formally designated by USFWS to provide guidance for planners/managers and biologists with an indication of where suitable habitat may occur and where high priority of preservation for a particular species should be given. “Take” of endangered species is prohibited under Section 9<sup>4</sup> of the FESA. Take, as defined under FESA, means to “harass, harm, pursue, hunt, wound, kill, trap, capture, collect, or attempt to engage in any such conduct.” Section 7 of the FESA requires federal agencies to consult with the USFWS on proposed federal actions that may affect any endangered, threatened or proposed (for listing) species or critical habitat that may support the species.

Section 10<sup>5</sup> of the FESA provides the regulatory mechanism that allows the incidental take of a listed species by private interests and nonfederal government agencies during lawful activities. Habitat conservation plans (HCPs) for the impacted species must be developed in support of incidental take permits for nonfederal projects to minimize impacts to the species and develop viable mitigation measures to offset the unavoidable impacts.

#### ***Migratory Bird Treaty Act***

The Migratory Bird Treaty Act<sup>6</sup> (MBTA) of 1918 is the domestic law that affirms or implements the United States’ commitment to four international conventions with Canada, Japan, Mexico, and Russia for the protection of shared migratory bird resources. The MBTA governs the taking, killing, possession, transportation, and importation of migratory birds, their eggs, parts, and nests, and prohibits the take, possession, import, export, transport, sale, purchase, barter, or offering of these activities, except under a valid permit or as permitted in the implementing regulations.

<sup>2</sup> United State Code (USC), Title 16, Sections 1531-1544, Endangered Species Act.

<sup>3</sup> USC Title 16, Section 1533. [ESA Section 4] Determination of endangered species and threatened species.

<sup>4</sup> USC Title 16, Section 1538. [ESA Section 9] Prohibited acts.

<sup>5</sup> USC Title 16, Section 1539. [ESA Section 10] Exceptions.

<sup>6</sup> U.S. Fish and Wildlife Service (USFWS), Migratory Bird Treaty Act of 1918 (16 U.S.C. 703-712; Ch. 128; July 3, 1918; 40 Stat. 755) as amended by: Chapter 634; June 20, 1936; 49 Stat. 1556; P.L. 86-732; September 8, 1960; 74 Stat. 866; P.L. 90-578; October 17, 1968; 82 Stat. 1118; P.L. 91-135; December 5, 1969; 83 Stat. 282; P.L. 93-300; June 1, 1974; 88 Stat. 190; P.L. 95-616; November 8, 1978; 92 Stat. 3111; P.L. 99-645; November 10, 1986; 100 Stat. 3590 and P.L. 105-312; October 30, 1998; 112 Stat. 2956

As with the FESA, the MBTA also authorizes the Secretary of the Interior to issue permits for take. The procedures for securing such permits are found in Title 50 of the Code of Federal Regulations, together with a list of the migratory birds covered by the act. This law is generally protective of migratory birds but does not specify the type of protection required. USFWS administers permits to take migratory birds in accordance with the regulations promulgated by the MBTA. Nesting raptors, such as red-tailed hawks and burrowing owls, are protected under the MBTA. In common practice, USFWS places restrictions on disturbances allowed near active raptor nests.

#### 4.3.3.2 State Regulations

##### **California Endangered Species Act (CESA)**

In addition to federal laws, the State implements the California Endangered Species Act,<sup>7</sup> (CESA) which is enforced by CDFW. The CESA program maintains a separate listing of species beyond the FESA, although the provisions of each act are similar.

State-listed threatened and endangered species are protected under provisions of the CESA. Activities that may result in “take” of individuals (defined in CESA as; “hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill”) are regulated by CDFW. Habitat degradation or modification is not included in the definition of “take” under CESA. Nonetheless, CDFW has interpreted “take” to include the destruction of nesting, denning, or foraging habitat necessary to maintain a viable breeding population of protected species.

The State of California considers an endangered species as one whose prospects of survival and reproduction are in immediate jeopardy. A threatened species is considered as one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the absence of special protection or management. A rare species is one that is considered present in such small numbers throughout its range that it may become endangered if its present environment worsens. State threatened and endangered species are fully protected against take, as defined above.

The CDFW has also produced a species of special concern list to serve as a species watch list. Species on this list are either of limited distribution or their habitats have been reduced substantially, such that a threat to their populations may be imminent. Species of special concern may receive special attention during environmental review, but they do not have formal statutory protection. At the federal level, USFWS also uses the label species of concern, as an informal term that refers to species which might be in need of concentrated conservation actions. As the Species of Concern designated by USFWS do not

<sup>7</sup> California, Fish and Game Code, Section 2050 et. seq. California Endangered Species Act.

receive formal legal protection, the use of the term does not necessarily ensure that the species will be proposed for listing as a threatened or endangered species.

##### **California Native Plant Protection Act**

The California Naïve Plant protection Act<sup>8</sup> (NPPA) was enacted in 1977 and allows the Fish and Game Commission to designate plants as rare or endangered. There are 64 species, subspecies, and varieties of plants that are protected as rare under the NPPA. The NPPA prohibits take of endangered or rare native plants, but includes some exceptions for agricultural and nursery operations; emergencies; and after properly notifying CDFW for vegetation removal from canals, roads, and other sites, changes in land use, and in certain other situations (see Fish and Game Code section 1900 et seq. for more information).

##### **California Fish and Game Code**

###### **Section 3500-3516 – Birds**

California Fish and Game Code Sections 3503, 3503.5, 3511, and 3513<sup>9</sup> are applicable to natural resource management. Section 3503 of the Code makes it unlawful to destroy any birds’ nest or any birds’ eggs that are protected under the MBTA. Further, any birds in the orders Falconiformes or Strigiformes (Birds of Prey, such as hawks, eagles, and owls) are protected under Section 3503.5 of the Fish and Game Code which makes it unlawful to take, possess, or destroy their nest or eggs.

A consultation with CDFW may be required prior to the removal of any bird of prey nest that may occur on a project site. Section 3511 of the Fish and Game Code lists fully protected bird species, where the CDFW is unable to authorize the issuance of permits or licenses to take these species. Pertinent species that are State fully protected by the State include golden eagle (*Aquila chrysaetos*) and white-tailed kite (*Elanus leucurus*).

Section 3513 of the Fish and Game Code makes it unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA.

<sup>8</sup> California Department of Fish and Wildlife, Native Plant Protection Act (NPPA), accessed September 2021, <https://www.wildlife.ca.gov/Conservation/Plants/Laws>.

<sup>9</sup> California Department of Fish and Wildlife, Fish and Game Code (FGC), Division 4. Birds and Mammals, [3000 - 4904] (Division 4 enacted by Stats. 1957, Ch. 456), Part 2. Birds [3500 - 3864] ( Part 2 enacted by Stats. 1957, Ch. 456)

### California Fish and Game Code Sections 1900–1913 – Rare and Endangered Plants

California Fish and Game Code Sections 1900–1913<sup>10</sup> were developed to preserve, protect, and enhance Rare and Endangered plants in the State. The act requires all State agencies to use their authority to carry out programs to conserve Endangered and Rare native plants. Provisions of the Native Plant Protection Act prohibit the taking of listed plants from the wild and require notification of the CDFW at least ten days in advance of any change in land use which would adversely impact listed plants. This allows the CDFW to salvage listed plant species that would otherwise be destroyed.

### California Native Plant Society Rare and Endangered Plant Species

The California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants is a widely-recognized resource that directly guides rare plant protection, conservation planning, and land acquisition and management in California. CNPS published the first edition of its Inventory of Rare and Endangered Plants in 1974, with the Inventory currently in its 8th edition.<sup>11</sup>

The CNPS Inventory of Rare and Endangered Plants ranks plants and threats as follows:

#### California Rare Plant Rank

- 1A – Plants Presumed Extirpated in California and either Rare or Extinct Elsewhere
- 1B – Plants Rare, Threatened, or Endangered in California and Elsewhere
- 2A – Plants Presumed Extirpated in California, But More Common Elsewhere
- 2B – Plants Rare, Threatened, or Endangered in California, But More Common Elsewhere
- 3 – Plants about Which More Information is Needed - A Review List
- 4 – Plants of Limited Distribution - A Watch List

#### Threat Ranks

- .1 – Seriously threatened in California (over 80 percent of occurrences threatened/high degree and immediacy of threat)
- .2 – Moderately threatened in California (20-80 percent occurrences threatened/moderate degree and immediacy of threat)
- .3 – Not very threatened in California (less than 20 percent of occurrences threatened/low degree and

<sup>10</sup> California Fish and Game Code, Fish and Game Code (FGC), Division 2, Department of Fish and Wildlife, (700-1940), Chapter 10, Sections 1900-1913, Native Plant protection.

<sup>11</sup> California Native Plant Society (CNPS), Inventory of Rare and Endangered Plants (V. 6) 2001, Note - the Inventory switched to being online (V. 7, developed and maintained by Larry Levine), and is currently in its 8th edition. <https://www.cnps.org/rare-plants/cnps-inventory-of-rare-plants>, accessed September 2021.

### California Environmental Quality Act

Section 15380 of the CEQA Guidelines<sup>12</sup> independently defines “endangered” and “rare” species separately from the definitions of the CESA.<sup>13</sup> Under CEQA, “endangered” species of plants or animals are defined as those whose survival and reproduction in the wild are in immediate jeopardy, while “rare” species are defined as those who are in such low numbers that they could become endangered if their environment worsens.

#### Special-Status Species

Special-status species are those animal and plant species that, in the judgment of the resource agencies, trustee agencies, and certain nongovernmental organizations, warrant special consideration in the CEQA process. This includes the following:

- Officially designated “threatened,” “endangered,” or “candidate” species federally listed by the USFWS and protected under the Federal Endangered Species Act.
- Officially designated “rare,” “threatened,” “endangered,” or “candidate” species listed by the CDFW and protected under the California Endangered Species Act. CDFW also maintains a list of “Fully Protected” species as well as “California Species of Special Concern” that are also generally treated as special-status species under CEQA.
- Species considered rare, threatened, or endangered under the conditions of Section 15380 of the CEQA Guidelines, such as plant species identified on lists 1A, 1B, and 2 in the CNPS Inventory of Rare and Endangered Vascular Plants of California, which may include species not found on either State or federal endangered species list.
- Other species considered sensitive, such as birds protected under the MBTA, which includes most native birds. A species may also be designated as special concern at the local level.

#### 4.3.3.3 Local Plans and Regulations

##### General Plan

##### Conservation Element

The Conservation Element of the City’s General Plan was adopted in October 1997 and addresses the conservation, development, and use of natural resource including water, soils, lakes, and mineral deposits.<sup>14</sup> The Conservation Element notes that resources which are typically addressed in conservation

<sup>12</sup> California Code of Regulations, Title 14, Division 6, Chapter 3, Article 20, § 15380.

<sup>13</sup> California, Fish and Game Code, Section 2050 et. seq. California Endangered Species Act.

<sup>14</sup> City of Inglewood *General Plan*, “Conservation Element” (1997).

elements, including biological resources such as forests, wildlife, fisheries, shorelines, and agricultural land, are not found in Inglewood.

#### Land Use Element

The Land Use Element of the City's General Plan describes tree masses as an important component of the physical environment of the City.<sup>15</sup> The Land Use Element states that trees are not merely aesthetic elements of the urban setting, but also provide beneficial effects such as noise attenuation, amelioration of air pollution and dust, and temperature control. As such, landowners are encouraged to plant trees to realize these benefits. The following policy from the Land Use Element is applicable to the proposed Project:

**Policy 3.2: Green Boulevards**

Create Green Boulevards that protect cyclists, infiltrate stormwater and use vegetation to create a sense of place on Florence Avenue, La Brea Avenue, Manchester Boulevard and Prairie Avenue.

#### ***New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines***

The New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines<sup>16</sup> (Downtown TOD Plan) provides guidelines and standards for design, including landscaping, within the Downtown Inglewood and Fairview Heights neighborhoods of the City and works to implement the City's vision for transforming the quality of the environment within these areas. The Downtown TOD Plan area consists of approximately 585 acres located in the center of Inglewood along the Metro K Line just east of the Florence Avenue/La Brea Avenue intersection. This Downtown planning and zoning area extends approximately one-half mile in all directions from the Metro K Line Downtown Inglewood station. The Fairview Heights TOD Plan area consists of approximately 328 acres located near the intersection of Florence Avenue and West Boulevard. This Fairview Heights planning and zoning area also extends approximately one-half mile in all directions from the Metro Station.

The Downtown TOD Plan includes concept plans, zoning, development standards and design guidelines, and an implementation action plan for consideration by applicants submitting any proposals for new construction or rehabilitation within the Plan area, as well as for consultation by City Staff when making recommendations for project approvals. The Downtown TOD Plan addresses architectural detail, signage, public art, and civic and cultural life. Further, the Downtown TOD Plan includes street tree concepts,

<sup>15</sup> City of Inglewood *General Plan*, "Land Use Element" (adopted 1980, amended 1986, 2009, and 2016).

<sup>16</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*.

including recommended street tree locations and species along roadways within the Downtown and Fairview Heights neighborhoods.

Section 2.8: Street Trees and Furniture<sup>17</sup> of the Downtown TOD Plan establishes that street trees are important elements of streetscapes and placemaking and provides guidelines on the character of trees placed within key areas of Downtown Inglewood. The Downtown TOD Plan recommends that Manchester Boulevard be lined with London Plane (*Platanus x acerifolia*) trees, or a similar species. This tree's ability to withstand air pollution, drought, as well as most diseases makes it a desirable street tree that would also provide some uniformity and connectivity for Downtown Inglewood. In the case of Florence Avenue, the Downtown TOD Plan calls for London Plane trees alternated with the California fan palm (*Washingtonia filifera*). Market Street should retain its existing street trees. The smaller arterial streets near Market Street may alternate between the Brisbane box (*Lophostemon confertus*), an evergreen tree, and the ginkgo (*Ginkgo biloba*), a deciduous tree. The Downtown TOD Plan states that these smaller street trees bring down the scale of the streets and create a sense of place throughout the streets of Downtown Inglewood.

#### ***Hollywood Park Specific Plan***

The Hollywood Park Specific Plan (HPSP)<sup>18</sup> establishes development standards and design guidelines for the 238-acre Hollywood Park site at the northeast corner of the Prairie Avenue and Century Boulevard intersection and provides an overview of existing infrastructure and necessary improvements related to the Hollywood Park site, including measures for implementation measures of the HPSP. Portions of the area within the HPSP site have either been developed (SoFi Stadium) or are under development.

The HPSP provides guidelines and standards for improvements in the public right-of-way within the Specific Plan area, which includes approximately 0.5 miles of street frontage along Prairie Avenue. The HPSP includes streetscape standards and provides integrated and coordinated landscape design guidelines for new development along the perimeter of the HPSP area to integrate it with the adjoining urban fabric, achieve a diverse urban forest, and assist in developing districts of distinctive and appropriate character.<sup>19</sup> Sidewalk widths are intended to provide walking routes and parkway widths are designed to provide sufficient area for urban tree growth. The HPSP guidelines and standard for streetscape include identity elements that will differentiate Hollywood Park from nearby developments through architectural features, landscaping (such as seasonal displays of color), graphic elements (such as

<sup>17</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, , Section 2.8: Street Trees and Furniture, p. 19.

<sup>18</sup> City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015.

<sup>19</sup> City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Section 3.2.2, Streetscape, p. 3-28.

signs or logos), special passenger or automobile paving, special night lighting effects, or other similar features.

The HPSP, Section 3.2.2: Streetscape, identifies selected street trees and the desired locations for their placement on internal roadways within the HPSP area as well as along major adjacent roadways, including Prairie Avenue, Century Boulevard, and the intersection corner of those roadways.<sup>20</sup> A majority of the tree species listed in the HPSP were selected from the City of Inglewood's approved tree list.<sup>21</sup> Selections were based upon recommendations from local arborists to create a palette of horticulturally successful, low maintenance, and climate-appropriate tree species. Alternative selections can be proposed, subject to City approval.

The HPSP states that street trees along Prairie Avenue shall be substantial and continuous to achieve an appropriate scale for the street.<sup>22</sup> Along the portion of Prairie Avenue north of Hardy Street, large columnar evergreen trees such as Afghan pine (*Pinus eldarica*) or Canary Island pine (*Pinus canariensis*) will provide continuity with the retail development to the east and the cemetery to the north. This arrangement is intended to visually reduce the scale of the street and provide ample shade as visitors approach the HPSP site. Both Prairie Avenue south of Hardy Street and the northern side of Century Boulevard will be similarly lined with large evergreen trees such as camphor trees (*Cinnamomum camphora*) or Southern magnolia (*Magnolia grandiflora*). In addition, large canopy flowering trees and palms will mark key points near the HPSP site, including the retail corner and major entries, and maintain adequate street visibility. Selected species include Date palm (*Phoenix dactylifera*), Chanticleer Callery pear (*Pyrus calleryana*), and pink trumpet tree (*Tabebuia impetiginosa*). Palm trees at the northeastern corner of Prairie Avenue and Century Boulevard are intended to provide a thematic connection to Century Boulevard near the Los Angeles International Airport (LAX).

### City of Inglewood Municipal Code

The City of Inglewood Municipal Code (IMC), Tree Preservation.<sup>23</sup> recognizes the importance of both native and nonnative trees within the City for the many benefits they provide. Properly maintained trees increase property values, maintain the natural ecology, temper the effects of extreme temperatures, reduce runoff, prevent erosion of topsoil, and help create and maintain the identity and visual character of the City.

<sup>20</sup> City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Section 3.2.2, Streetscape, Exhibit 3-25—Landscape Street Sections Map, p. 3-28.

<sup>21</sup> City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Section 3.2.2, Streetscape, Exhibit 3-25—Landscape Street Sections Map, p. 3-28.

<sup>22</sup> City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Section 3.2.2, Streetscape, p. 3-29.

<sup>23</sup> Inglewood, California, Municipal Code, Article 32, Section 12-110 (2012), Tree Preservation.

Prior to removing or cutting a protected tree in the City, a permit must be obtained with the City's Parks, Recreation, and Library Services Department. Protected trees are specified by IMC include:<sup>24</sup>

- (A) Trees having a minimum trunk diameter of eight inches measured fifty-four inches above the ground. When measuring a multitrunk tree, the diameters of the largest three trunks shall be added together.
- (B) Street trees or other required trees such as those required as a condition of approval, Use Permit, or other zoning requirement, regardless of size.
- (C) All memorial trees dedicated by an entity recognized by the City, and all specimen trees that define a neighborhood or community.
- (D) Trees of the following species that have reached a minimum of four inches diameter trunk size:
  - Big Leaf Maple (*Acer macrophyllum*)
  - California Buckeye (*Aesculus californica*)
  - Madrone Arbutus (*menziesii*)
  - Western Dogwood (*Cornus nuttallii*)
  - California Sycamore (*Platanus racemose*)
  - Coast Live Oak (*Quercus agrifolia*)
  - Canyon Live Oak (*Quercus chrysolepis*)
  - Blue Oak (*Quercus douglassii*)
  - Oregon White Oak (*Quercus garryana*)
  - California Black Oak (*Quercus kelloggii*)
  - Valley Oak (*Quercus lobata*)
  - Interior Live Oak (*Quercus wislizenii*)
  - California Bay (*Umbellularia californica*)

- (E) A tree or trees of any size planted as a replacement for a protected tree.

Pursuant to the provisions of City Ordinance 12-06 5-8-12,<sup>25</sup> no person shall remove, destroy, perform cutting of branches over one inch in diameter, or disfigure or cause to be removed, destroyed, or disfigured any protected tree without having first obtained a permit to do so. Moreover, an application for a Protected tree Removal or Cutting Permit shall be filed for removal of the protected trees along with the inspection fee as specified in the City's Master Fee Schedule.<sup>26</sup> All protected trees shall require a permit for removal, relocation, cutting or reshaping. All removed or disfigured trees shall also require replacement with like-size, like-kind trees or an equal value tree or trees as determined by the Parks, Recreation and Library Services Department.<sup>27</sup> If a replacement tree is unavailable in like size or kind, the value of the original protected tree shall be determined using the latest edition of *Guide for Plant*

<sup>24</sup> Inglewood, California, Municipal Code, Section 12-113, Protected Trees.

<sup>25</sup> Inglewood, California, Municipal Code, Chapter 12, Article 32, Section 12-117 (2012).

<sup>26</sup> City of Inglewood, "Master Fee Schedule," September 2016.

<sup>27</sup> Inglewood, California, Municipal Code, Chapter 12, Article 32, Section 12-117 (2012).

*Appraisal* by the International Society of Arboriculture.<sup>28</sup> The valuation is used to determine the number and size of replacement trees required. The replacement trees must be located on site wherever possible.<sup>29</sup> Where there is not sufficient room on site for the replacement trees in the judgment of the City's Parks, Recreation and Library Services Department, another site may be designated that is mutually agreeable.<sup>30</sup>

### **Inglewood and Lennox Greening Plan**

The Social Justice Learning Institute and TreePeople joined forces in 2009 to improve the environmental and health conditions in the City of Inglewood and the adjacent unincorporated community of Lennox in developing the Inglewood and Lennox Greening Plan (Greening Plan).<sup>31</sup> The Greening Plan was completed via a grant provided by the State Strategic Growth Council Urban Greening and Sustainable Communities Planning Grant Program, under the authority of the Safe Drinking Water, Water Quality and Supply, Flood Control, River and Coastal Protection Bond Act of 2006 (Proposition 84).<sup>32</sup>

The Greening Plan is meant to serve as a master document to guide and coordinate greening efforts within Inglewood and Lennox. Priority actions include increasing tree canopy cover, building community gardens and implementing practices to capture and conserve rainwater on select sites identified in the Plan. Strategies have also been developed that will increase opportunities for active living and enhanced community health. In the Greening Plan, the term "greening" encompasses a comprehensive suite of objectives, activities, and strategies outlined throughout the plan.

### **4.3.4 EXISTING CONDITIONS**

The proposed Project is located in the central and northern portions of the City of Inglewood, east of the San Diego Freeway (I-405) and north of the Glen Anderson Freeway (I-105) in Los Angeles County, California. The proposed Project would begin along Market Street near the Metro K Line and proceed south through downtown Inglewood, east on Manchester Boulevard, and south on Prairie Avenue until its intersection with Hardy Street.

As shown in **Section 3.0: Project Description, Figure 3.0-3: Project Vicinity Map**, the proposed Project would be located along the public rights-of-way within the City and upon several developed properties adjacent to the proposed Project which would accommodate the guideway, stations, and support facilities. The alignment of the guideway and locations of stations, and support facility sites (MSF and PDS

<sup>28</sup> International Society of Arboriculture, *Guide for Plan Appraisal, 10th Edition*, 2018.

<sup>32</sup> California Code of Regulations, Division 43. The Safe Drinking Water, Water Quality and Supply, Flood Control, River and Coastal Protection Bond Act of 2006.

substations) consist of developed or disturbed areas adjacent to active roadways. Disturbed land are areas that have been previously disturbed by grading, vehicle use, and/or vegetation clearing and maintenance while urban/developed land are areas that consist of buildings, roadways, and other built infrastructure.

### **4.3.4.1 Database Review**

#### **California Natural Diversity Database**

The California Natural Diversity Database (CNDDDB)<sup>33</sup> is an inventory of the status and locations of rare plants and animals in California maintained by CDFW. CNDDDB staff collaborate with partners to maintain current lists of rare species, as well as to maintain an ever-growing database of GIS-mapped locations for these species.

As part of the environmental review for the Initial Study of the proposed Project completed in 2018, a review of the CNDDDB found that the only plant species consist of ornamental landscaping and street trees as well as weeds and ruderal vegetation. A subsequent review of the CNDDDB<sup>34</sup> was completed in September 2021 for the nine quadrangles (the Inglewood Quadrangle in which the prospect is located and the surrounding eight quadrangles including Beverly Hills, Hollywood, Los Angeles, Venice, South Gate, Redondo Beach, Torrance, and Long Beach) that encompass the proposed Project.<sup>35</sup> The review indicated that 193 species were identified for the nine quadrangles; this includes 29 species located within the Inglewood quadrant. Of these, five species were previously identified within approximately one mile of the proposed Project. These consisted of two wildlife species, crotch bumble bee (*Bombus crotchii*) and pocketed free-tailed bat (*Nyctinomops femorosaccus*), and three plant species, southern tarplant (*Centromadia parryi ssp. australis*), spreading navarretia (*Navarretia fossalis*), and prostrate vernal pool navarretia (*Navarretia prostrata*). Spreading navarretia and prostrate vernal pool navarretia are presumed extirpated from the area. The other species are presumed extant, but only occur in specific habitats that are not located within the footprint of the proposed Project.<sup>36</sup>

The CNDDDB does not list any recently recorded observations of sensitive plant or animal species or sensitive habitats protected by State or federal law. However, it should be noted that a lack of records in CNDDDB should not be construed to mean that no rare plants or animals occur in a given area.

<sup>33</sup> California Department of Fish and Wildlife (CDFW), California Natural Diversity Database, accessed September 2021, <https://www.wildlife.ca.gov/Data/CNDDDB>.

<sup>34</sup> CDFW, California Natural Diversity Database, "Maps and Data," accessed September 2021, <https://www.wildlife.ca.gov/Data/CNDDDB>.

<sup>35</sup> See **Appendix H.4: CNDDDB Survey** to this Recirculated Draft EIR.

<sup>36</sup> CDFW, California Natural Diversity Database, "Maps and Data," accessed September 2021, <https://www.wildlife.ca.gov/Data/CNDDDB>.

### eBird Database

The eBird<sup>37</sup> is the world's largest biodiversity-related citizen science project, with more than 100 million bird sightings contributed each year by eBirders around the world. eBirders are a collaborative enterprise with hundreds of partner organizations, thousands of regional experts, and hundreds of thousands of users, and is managed by the Cornell Lab of Ornithology.

A review of the eBird database was completed in September 2021.<sup>38</sup> Common bird species noted in the eBird database historically observed within the area near the proposed Project include Brewer's Blackbird (*Euphagus cyanocephalus*), Black-bellied Plover (*Pluvialis squatarola*), Tricolored Blackbird (*Agelaius tricolor*), Canada Goose (*Branta canadensis*), Northern Rough-winged Swallow (*Stelgidopteryx serripennis*), American Coot (*Fulica americana*), Western Bluebird (*Sialia mexicana*), Lincoln's Sparrow (*Melospiza lincolni*), Brown-headed Cowbird (*Molothrus ater*), Cliff Swallow (*Petrochelidon pyrrhonota*), Bushtit (*Psaltriparus minimus*), white-crowned sparrow (*Zonotrichia leucophrys*), house finch (*Carpodacus mexicanus*), and the common house sparrow (*Passer domesticus*).<sup>39</sup> None of these species are sensitive or protected by State or federal law with the exception of the Tricolored Blackbird (*Agelaius tricolor*) which is listed as a threatened species under CESA.<sup>40</sup>

While the proposed Project does not include native habitat areas that are used for wildlife movement or migration corridors, various roadways and proposed support facility sites include and are lined with street trees and other landscaping that could harbor native birds or raptors and their nests.

#### 4.3.4.2 Biological Setting

This section identifies areas within 0.25-mile radius of either side of the proposed Project guideway, stations, and support facility sites for the MSF and PDS substations that may be considered to have biological resources. The proposed Project is located within a highly developed and urbanized area and potential biological resources are limited to a few small parks. These parks are primarily landscaped areas and wildlife species utilizing the parks are mostly those adapted to living in an urban environment.

Sensitive animal and plant species and vegetation communities identified by the CNDDDB as having the potential to occur within 0.25-mile radius of either side of the proposed Project's guideway, stations, and support facility sites are largely absent. Due to their mobility, some sensitive bird species may utilize

37 Cornell Lab of Ornithology, *eBird*, accessed September 2021, <https://ebird.org/about>.

38 Cornell Lab of Ornithology, *eBird*, "Hotspot Map," accessed September 2021, <https://ebird.org/home>.

39 Cornell Lab of Ornithology, *eBird*, "Hotspot Map," accessed September 2021, <https://ebird.org/home>.

40 California Endangered Species Act (CESA), Listing of Species Under the California Endangered Species Act, <https://fgc.ca.gov/CESA#tcbb2015>, accessed September 2021.

existing mature trees during migration but would not be supported as residents within this urbanized setting.

With the exception of the small pond located within the Inglewood Park Cemetery, there are no wetland areas within 0.25-mile radius of either side of the guideway, stations, support facility sites. Vegetation around this pond is nonnative, landscaped vegetation, but waterfowl were observed utilizing the small amount of open water there. No wildlife corridors exist within this area to support movement of wildlife species other than birds.

There are no Habitat Conservation Plans (HCPs) for this area. Further, there are no Significant Ecological Areas (SEAs) as designated by Los Angeles County Department of Regional Planning located within 0.25-mile radius of either side of the guideway, stations, support facility sites.<sup>41</sup>

Visual surveys were conducted in May 2018. The surveys consisted of visual observation and photographic documentation of all parks and open space areas along the guideway, stations, and support facility sites. During the surveys, mature trees existing in roadway medians directly within the footprint of the proposed Project were also observed.

#### 4.3.4.3 Trees and Landscaping

The Tree Inventory was conducted by Pax Environmental on November 15, 16, 18, 19, and December 6, 2018, and an additional survey was conducted in August 2021 based on the changes to the alignment boundary. The Tree inventory covers the entire footprint of the proposed Project, including the public rights-of-way along the length of the guideway, locations of stations and the support facilities (MSF and PDS substation sites) with an approximately 50-foot buffer. This inventory involved an intensive effort to identify and categorize the existing street trees and landscaping within the proposed Project and identified trees determined to qualify as protected according to the provisions of the City's Tree Preservation Ordinance. The 50-foot buffer area included in the Tree Inventory (refer to **Appendix H.3**) provided a conservative analysis potential impacts to biological resources. See **Figure 4.3-1: Potential Tree Impacts – Market Street/Florence Avenue Station(a)** through **Figure 4.3-18: Potential Tree Impacts – Prairie Avenue(f)** (see end of this section) which shows the existing tree locations along the guideway and within the acquisition sites. A breakdown of these trees by Project component is provided below.

#### Guideway

The proposed Automated Transit System (ATS) guideway would be approximately 1.6-miles long and would have a minimum clearance height of approximately 16 feet 6 inches above all roadways. The

41 Los Angeles County Department of Regional Planning, Significant Ecological Areas Program, GIS Web Application, accessed September 2021, [http://rpgis.isd.lacounty.gov/Html5Viewer/index.html?viewer=GISNET\\_Public.GIS-NET\\_Public](http://rpgis.isd.lacounty.gov/Html5Viewer/index.html?viewer=GISNET_Public.GIS-NET_Public).

elevated guideway will be primarily located within the public rights-of-way for the streets and sidewalk areas along Market Street, Manchester Boulevard, and Prairie Avenue with some encroachments on private property located adjacent to the public right of way for stations and vertical circulation features, such as stairways and escalators. All protected trees identified along the guideway consist of nonnative tree species which are commonly used in ornamental landscaping. Protected tree species within these areas predominantly consist of Mexican fan palm, little-leaved fig, narrow-leaved eucalyptus, Jacaranda, Canary Island pine, and Queen palm. See below for more detail.

**Market Street**

Figure 4.3-2 through Figure 4.3-5 identify the existing trees along Market Street from Florence Avenue to Manchester Boulevard. **Table 4.3-1: Summary of Protected Trees Along Market Street** summarizes the types of trees located along and within the vicinity of the Market Street segment.

**Table 4.3-1  
Summary of Protected Trees Along Market Street**

Source: Tree Inventory, Pax Environmental, Inc., September 10, 2021. Included as Appendix H.3 of this Recirculated Draft EIR.  
 \* Unidentified tree species not included in the Tree Inventory but may qualify as protected.

As shown in Table 4.3-2, a total of 152 protected trees were identified for the Manchester Boulevard segment. All 152 trees are located within the Downtown TOD Plan and qualify as protected by meeting the minimum trunk diameter size requirements of the IMC.<sup>43</sup>

**Prairie Avenue**

Figure 4.3-12 through Figure 4.3-18 identify the existing trees along Prairie Avenue from Manchester Boulevard to Hardy Street. **Table 4.3-3: Summary of Protected Trees Along Prairie Avenue** summarizes the types of trees located along and within the vicinity of the Prairie Avenue segment.

**Summary of Protected Trees Along Prairie Avenue**

Common Name	Scientific Name	Quantity
Callery Pear	<i>Pyrus calleryana</i>	2
Carrotwood	<i>Cupaniopsis anacardioides</i>	4
Chinese elm	<i>Ulmus parvifolia</i>	3
Crape-Myrtle	<i>Lagerstroemia speciosa</i>	2
Evergreen ash	<i>Fraxinus uhdei</i>	1
Fern pine	<i>Podocarpus gracilior</i>	2
Giant yucca	<i>Yucca gigantea</i>	2
Liquidambar	<i>Liquidambar styraciflua</i>	1
Little-leaved Fig	<i>Ficus microcarpa</i>	12
Magnolia	<i>Magnolia grandiflora</i>	2
Mexican Ash	<i>Fraxinus berlandieriana</i>	18
Mexican fan palm	<i>Washingtonia robusta</i>	10
Naked Coral Tree	<i>Erythemacoralodendron</i>	1
Queen palm	<i>Syagrus romanzoffiana</i>	13
Red Gum	<i>Eucalyptus camaldulensis</i>	1
<b>Total</b>		<b>74</b>

Source: Tree Inventory, Pax Environmental, Inc., September 10, 2021. Included as Appendix H.3 of this Recirculated Draft EIR.

As shown in **Table 4.3-3**, a total of 74 protected trees were identified along Prairie Avenue. These trees are not located within a City plan but remain within the jurisdiction of the IMC and qualify as protected by meeting the minimum trunk diameter size requirements of the IMC.<sup>44</sup>

The guideway and stations would be developed within areas included in the Downtown TOD Plan and adjacent to the western portion of the HPSP area. The remainder of the guideway would be subject to the requirements of the IMC. While the Downtown TOD Plan and HPSP contain provisions regarding the removal of trees or protected trees beyond the requirements of the IMC, they do contain unique provisions and recommendations for the location of tree placement and types of tree species to be used.

<sup>44</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

### Stations and MSF

The proposed Project would require a number of full and/or partial property and air rights acquisitions and easements or leases for construction and continued operation of the guideway, stations, MSF, and other support facilities.

### Market Street/Florence Avenue Station

The Market Street/Florence Avenue station site is located along a portion of Market Street and Florence Avenue generally located between Market Street and Locust Street.

**Figure 4.3-1** through **Figure 4.3-3** identify the existing trees associated the Market Street/Florence Avenue station site. **Table 4.3-4: Summary of Protected Trees Within the Market Street/Florence Avenue Station Site** summarizes the types of trees associated with the Market Street/Florence Avenue station site.

**Table 4.3-4**  
**Summary of Protected Trees Within Market Street/Florence Avenue Station Site**

Common Name	Scientific Name	Quantity
Brazilian pepper	<i>Schinus terebinthifolius</i>	23
California fan palm	<i>Washingtonia filifera</i>	2
Callery pear	<i>pyrus taiwanensis</i>	2
Canary Island pine	<i>Pinus canariensis</i>	2
Coral tree	<i>Erythrina caffra</i>	10
Date Palm	<i>Phoenix dactylifera</i>	14
European hackberry	<i>Celtis australis</i>	1
Little-leaved Fig	<i>Ficus microcarpa</i>	17
Mexican fan palm	<i>Washingtonia robusta</i>	7
<b>Total</b>		<b>78</b>

Source: Tree Inventory, Pax Environmental, Inc., September 10, 2021. Included as Appendix H.3 of this Recirculated Draft EIR.

As shown in **Table 4.3-4**, a total of 78 protected trees are associated with the Market Street/Florence Avenue station site. Of these, 58 are located within the site and are considered private property. The remaining 20 trees are public street trees located throughout the perimeter of the site along Florence Avenue, Locust Street, and Regent Street. All protected trees identified within this area and adjoining parcels consist of nonnative, ornamental tree species which are commonly used in ornamental landscaping. Protected tree species within this site predominantly consist of Little-leaved Fig, Brazilian

pepper, and Coral tree. As no protected tree *species* were identified, the 78 trees identified as protected qualified as such by meeting the minimum trunk diameter size requirements of the IMC Section 12-113.<sup>45</sup> This site would be developed within an area included in the Downtown TOD Plan. While the Downtown TOD Plan does not contain provisions regarding the removal of trees or protected trees beyond the requirements of the IMC, it does contain unique provisions and recommendations for the location of tree placement and types of tree species to be used.

#### Prairie Avenue/Manchester Boulevard Station

The Prairie Avenue/Manchester Boulevard station site is proposed on the southwest corner of the Prairie Avenue and Manchester Boulevard intersection.

Figure 4.3-12 identifies the existing trees associated the Prairie Avenue/Manchester Boulevard station site. However, as indicated in Figure 4.3-12, the trees identified within the Prairie Avenue/Manchester Boulevard station site have been removed since the 2018 *Tree Inventory* was conducted. The supplemental 2021 *Tree Inventory* identified two additional trees located adjacent to the site along Nutwood Street. These trees are identified at Mexican Ash (*Ulmus parvifolia*) and qualify as protected by meeting the minimum trunk diameter size requirements of the IMC.<sup>46</sup>

#### Prairie Avenue/Hardy Street Station

The Prairie Avenue/Hardy Street station site is located west of Prairie Avenue on the northwest corner of the Prairie Avenue and Hardy Street intersection.

Figure 4.3-17 and Figure 4.3-18 identify the existing trees associated with the Prairie Avenue/Hardy Street station site. Table 4.3-5: Summary of Protected Trees Within the Prairie Avenue/Hardy Street Station Site summarizes the types of trees associated with the Prairie Avenue/Hardy Street station site. As shown in Table 4.3-7, a total of 32 protected trees are associated with the Prairie Avenue/Hardy Street station site. All 32 trees located within the site are considered private property. All protected trees identified within this area and adjoining parcels consist of nonnative, ornamental tree species which are commonly used in ornamental landscaping.<sup>47</sup> These trees are not located within a City plan but remain within the jurisdiction of the IMC and qualify as protected by meeting the minimum trunk diameter size requirements of the IMC.<sup>48</sup>

<sup>45</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

<sup>46</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

#### Maintenance and Storage Facility (MSF)

The MSF is proposed on a site developed with an existing retail commercial building. The MSF building is proposed on the southern half of this site and the new replacement Vons store on the eastern half of the site.

Figure 4.3-7 through Figure 4.3-9 identify the existing trees associated the MSF/Vons site. Table 4.3-6: Summary of Protected Trees Within the MSF/Vons Site summarizes the types of trees associated with the MSF site. As shown in Table 4.3-6, a total of 119 protected trees are associated with the MSF/Vons site. Of these, 116 are located within the site and are considered private property. The remaining 3 trees are public street trees located along Nutwood Street. All protected trees identified within the MSF/Vons site consist of nonnative, ornamental tree species which are commonly used in ornamental landscaping. Protected tree species within this site predominantly consist of Mexican fan palm, River red gum, and Chinese elm. As no protected tree *species* were identified, the 119 trees identified as protected qualified as such by meeting the minimum trunk diameter size of 1.5 inches pursuant of the IMC Section 12-113.<sup>49</sup> The entirety of the MSF and new replacement Vons store would be developed within an area included in the Downtown TOD Plan. While the Downtown TOD Plan does not contain provisions regarding the removal of trees or protected trees beyond the requirements of the IMC, it does contain unique provisions and recommendations for the location of tree placement and types of tree species to be used.

<sup>49</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

**Table 4.3-6**  
**Summary of Protected Trees Within the MSF/Vons Site**

Common Name	Scientific Name	Quantity
Chinese elm	<i>Ulmus parvifolia</i>	10
Liquidambar	<i>Liquidambar styraciflua</i>	8
Little-leaved Fig	<i>Ficus microcarpa</i>	3
Mexican fan palm	<i>Washingtonia robusta</i>	66
River Red Gum	<i>Eucalyptus camaldulensis</i>	32
<b>Total</b>		<b>119</b>

Source: Tree Inventory, Pax Environmental, Inc., December 10, 2018. Included as Appendix H.3 of this Recirculated Draft EIR.

### Power Distribution System Substations

The proposed Project would include two power distribution system (PDS) substations. These PDS substations will provide the necessary power for the proposed Project including traction power, auxiliary power, and housekeeping power for the stations and related infrastructure. One of the PDS substations will be located on the MSF site and the second PDS substation will be located on the Prairie Avenue/Hardy Street station site. As discussed above, the MSF site which includes the first PDS substation would be developed within an area included in the Downtown TOD Plan and would be subject to the tree requirements for this plan. The second PDS substation would be located within the Prairie Avenue/Hardy Street station site which is not located within a City plan but is subject to the provisions of the IMC.

#### 4.3.4.4 Wildlife

##### Birds

Common bird species historically observed near the proposed Project as noted in the CNDDB<sup>50</sup> and eBird<sup>51</sup> database include Brewer's Blackbird (*Euphagus cyanocephalus*), Black-bellied Plover (*Pluvialis squatarola*), Tricolored Blackbird (*Agelaius tricolor*), Canada Goose (*Branta canadensis*), Northern Rough-winged Swallow (*Stelgidopteryx serripennis*), American Coot (*Fulica americana*), Western Bluebird (*Sialia mexicana*), Lincoln's Sparrow (*Melospiza lincolni*), Brown-headed Cowbird (*Molothrus ater*), Cliff Swallow (*Petrochelidon pyrrhonota*), Bushtit (*Psaltriparus minimus*), white-crowned sparrow (*Zonotrichia leucophrys*), house finch (*Carpodacus mexicanus*), and the common house sparrow (*Passer domesticus*).<sup>52</sup> None of these species are sensitive or protected by State or federal law with the exception

50 CDFW, California Natural Diversity Database, "Maps and Data," accessed September 2021, <https://www.wildlife.ca.gov/Data/CNDDDB>.

51 Cornell Lab of Ornithology, *eBird*, "Hotspot Map," accessed September 2021, <https://ebird.org/home>.

52 Cornell Lab of Ornithology, *eBird*, "Hotspot Map," accessed September 2021, <https://ebird.org/home>.

of the Tricolored Blackbird (*Agelaius tricolor*), which is listed as a threatened species under CESA.<sup>53</sup> The Tricolored Blackbird (*Agelaius tricolor*) primarily nests in grasslands and freshwater wetlands and is not likely to nest in street trees.<sup>54</sup>

Given the nature that birds will nest in a variety of trees and other locations, the possibility exists that these species listed above, as well as others, may be present and nest in existing trees within the footprint of the proposed Project.

### Other Wildlife Species

Wildlife species identified during the most recent review of the CNDDB crotch bumble bee (*Bombus crotchii*) and pocketed free-tailed bat (*Nyctinomops femorosaccus*). However, observation of neither species has been recently recorded on site; observation of the pocketed free-tailed bat was last recorded in 1994 and the crotch bumble bee in 1953.<sup>55</sup>

Additionally, the CDFW describes the habitat used by the pocketed free-tailed bat as including rock crevices in cliffs in pinyon-juniper woodlands, desert scrub, desert succulent shrub, desert riparian, desert wash, alkali desert scrub, Joshua tree, and palm oasis.<sup>56</sup> Habitat used by the crotch bumble bee consists of shrubland and grassland.<sup>57</sup> None of these habitats occur within or are adjacent to the proposed Project.

Wildlife in the area predominantly consists of domesticated animals and pets, though wild animals that are capable of living in close proximity to man, such as birds, skunks, and squirrels, are found in the area.

#### 4.3.5 ADJUSTED BASELINE

As discussed previously, the street trees along Prairie Avenue have since been removed for the development of the HPSP. The HPSP area would be fully developed per the design guidelines of the HPSP, prior to the construction of the proposed Project.<sup>58</sup> The HPSP calls for large columnar evergreen trees such as Afghan pine (*Pinus eldarica*) or Canary Island pine (*Pinus canariensis*) along Prairie Avenue north of Hardy Street. This arrangement will visually reduce the scale of the street and will provide ample shade

58 City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Chapter 3, Design Guidelines.

as visitors approach the Hollywood Park entries. In addition, large-canopy flowering trees and palms will mark major entry points and maintain adequate street visibility.

Landscaping along Prairie Avenue would also include a setback area which would serve as a primary welcoming edge of Hollywood Park. The Prairie Avenue setback will feature drought-tolerant plantings which will add a lush Mediterranean character to the spaces. Specifically, plant materials within the formal entrances will include hedges, colorful flowering groundcovers, and various flowering trees. Taller evergreen hedges and shrubs will be used to create strong entry drives and to screen undesirable views.

#### 4.3.6 THRESHOLDS OF SIGNIFICANCE

Criteria outlined in the CEQA Guidelines were used to determine the level of significance of biological resource impacts. Appendix G of the State CEQA Guidelines indicates that a project would have a significant impact in relation to biological resources if it were to:

**Threshold BIO-1:** Interfere substantially with the movement of any resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

**Threshold BIO-2:** Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

#### 4.3.7 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

The proposed Project includes ITC Design Standards and Guidelines (Design Guidelines) and a Construction Commitment Program (CCP) as described in **Section 3.0: Project Description**. The CCP addresses temporary effects during construction of the Project. The Design Guidelines describe the design features of the proposed Project.

##### 4.3.7.1 Project Design Features

The proposed Project includes the following features that address impacts to trees during development of the proposed Project:

###### PDF AES-2 Tree Replacement

A Tree Removal and Replacement Plan will be developed by members of the Project Task Force, subject to review and acceptance by the City and/or the JPA, and shall adhere to the following principles:

- Tree removal and replacement shall comply with the City of Inglewood Municipal Code and the Design Guidelines.

- Removal of existing healthy and flourishing trees will be avoided where feasible.
- New permanent replacement trees shall be a 36-inch box of the same species as those removed, if appropriate for the location and not in conflict with new infrastructure. Alternative locations shall be approved by the City's Public Works Department.
- New permanent replacement palm trees shall be a minimum of 20 feet in height.
- The Contractor shall permanently replace trees within six (6) months of restoration and completion of that portion of streets that may impact the tree. To the extent feasible, the Contractor shall permanently replace trees on an ongoing basis so long as doing so does not conflict with future construction.
- If construction of the project requires pruning of native tree species, the pruning shall be performed in a manner that does not cause permanent damage or adversely affect the health of the trees.
- The Contractor shall maintain all permanent trees and other landscaping installed by the Contractor for a period of three (3) years from the date of planting and shall warranty the trees and landscaping for one (1) year after planting. Prior to the end of the one-year warranty period, the City and the Contractor will conduct an inspection of all permanent replacement trees and landscaping for general health as a condition of final acceptance by the City. If, in the City's determination, a permanent replacement tree or landscaping does not meet the health requirements of the City, then the Contractor shall replace that tree within thirty (30) days. For any permanent trees or landscaping that must then be removed, the original warranty shall be deemed renewed commencing from when the tree or landscaping is replaced.

###### PDF AES-4 Tree Placement

- An arborist report surveying the condition and extents of all existing trees in the Project area will be provided to the developer for their use as a baseline in order to produce a final report detailing the most current conditions and proposed handling of all existing trees for the proposed Project.
- Existing flourishing trees (as identified in the arborist report) will remain, where feasible.
- An Approved Plant Palette based on the City's approved street tree list will be used as a basis for all sections of new trees.
- The quantity and species of existing trees removed by the ITC Project will be replaced in accordance with the City's current landscape guidelines.
- Protected species in the Inglewood Municipal Code, Tree Preservation will remain.
- City of Inglewood guidelines for tree spacing will be followed, considering species of trees and the desired canopy coverage.
- Trees will be planted on both sides of the roadway where feasible.

#### 4.3 Biological Resources

- Trees will be positioned at regular intervals relative to the guideway column supports to create a consistent rhythm.
- On Market Street, trees will be planted at a rhythm and scale to create a continuous visual canopy over the pedestrian realm, where feasible.
- On Manchester Boulevard, trees will be planted at a rhythm consistent with the street trees east and west of the Project, in alignment with the shape of the roadway.
- On Prairie Avenue, trees on the east side will continue the stately rhythm from the Inglewood Cemetery north of Manchester Boulevard. Trees on the west side will be spaced to match the rhythm of the east side and the guideway support structure to the extent feasible.

The environmental impact analysis presented below is based on determinations made in the Initial Study for impacts considered to be potentially significant.

**Impact BIO-1: Would the project interfere substantially with the movement of any resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?**

Sensitive animal and plant species and vegetation communities identified by the CNDDDB as having the potential to occur within 0.25 mile radius of either side of the proposed Project, including the guideway stations, and MSF sites are largely absent. Due to their mobility, some sensitive bird species may utilize existing mature trees during migration but would not be supported as residents within this urbanized setting. With the exception of the small pond located within the Inglewood Park Cemetery, there are no wetland areas within 0.25 mile radius of either side of the proposed Project, including the guideway, stations, and MSF sites. Vegetation around this pond is nonnative, landscaped vegetation, but waterfowl were observed utilizing the small amount of open water there. No wildlife corridors exist within this area to support movement of wildlife species other than birds.

#### 4.3 Biological Resources

##### Construction

Common bird species historically observed in the area of the proposed Project as noted in the CNDDDB and eBird database include Brewer's Blackbird (*Euphagus cyanocephalus*), Black-bellied Plover (*Pluvialis squatarola*), Tricolored Blackbird (*Agelaius tricolor*), Canada Goose (*Branta canadensis*), Northern Rough-winged Swallow (*Stelgidopteryx serripennis*), American Coot (*Fulica americana*), Western Bluebird (*Sialia mexicana*), Lincoln's Sparrow (*Melospiza lincolni*), Brown-headed Cowbird (*Molothrus ater*), Cliff Swallow (*Petrochelidon pyrrhonota*), Bushtit (*Psaltriparus minimus*), white-crowned sparrow (*Zonotrichia leucophrys*), house finch (*Carpodacus mexicanus*), and the common house sparrow (*Passer domesticus*).<sup>59</sup> None of these species are sensitive or protected by State or federal law with the exception of the Tricolored Blackbird (*Agelaius tricolor*) which is listed as a threatened species under CESA.<sup>60</sup>

The review of the CNDDDB notes that the pocketed free-tailed bat (*Nyctinomops femorosaccus*) and crotch bumble bee (*Bombus crotchii*) have been observed within a one-mile area of the proposed Project, including the guideway and stations, and support facility sites. However, observations of neither species have been recently recorded in the area; the last recorded observation of the pocketed free-tailed bat was in 1994 and the crotch bumble bee in 1953.<sup>61</sup> Additionally, the CDFW describes the habitat used by the pocketed free-tailed bat as including rock crevices in cliffs in pinyon-juniper woodlands, desert scrub, desert succulent shrub, desert riparian, desert wash, alkali desert scrub, Joshua tree, and palm oasis.<sup>62</sup> Habitat used by the crotch bumble bee consists of shrubland and grassland.<sup>63</sup> Given that these species occur in specific habitats that do not occur within or near the proposed Project, including the guideway and stations, and support facility sites, as the area is completely developed and paved with no natural plant communities, the pocketed free-tailed bat or crotch bumble bee are not anticipated to be encountered within the proposed Project, including the guideway and stations, and support facility sites during demolition and clearing of existing vegetation, and construction.

The removal of trees will require that the proposed Project meet the requirements of the City's Municipal Code relative to tree preservation. In accordance with the IMC, the proposed Project will be required to plant replacement trees for every protected tree that would be removed within the areas subject to IMC provisions, after having obtained a permit to do so from the City.<sup>64</sup> Replacement trees are required to be

<sup>59</sup> Cornell Lab of Ornithology, *eBird*, "Hotspot Map," accessed September 2021, <https://ebird.org/home>.

<sup>60</sup> California Endangered Species Act (CESA), Listing of Species Under the California Endangered Species Act, <https://figc.ca.gov/CESA#tcbb2015>, accessed September 2021.

<sup>61</sup> CDFW, California Natural Diversity Database, "Maps and Data," accessed September 2021, <https://www.wildlife.ca.gov/Data/CNDDDB>.

<sup>62</sup> CDFW, California Interagency Wildlife Task Group, *California Wildlife Habitat Relationships System*, "Pocketed Free-Tailed Bat," accessed September 2021, <https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=2353>.

<sup>63</sup> International Union for Conservation of Nature, "Crotch bumble bee," accessed September 2021, <https://www.iucnredlist.org/species/44937582/46440211>.

<sup>64</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

replaced at a 1:1 ratio minimum and with a tree of like-size and species or an equal value tree (or trees) as determined by the City. To comply with the requirements of the Tree Preservation Ordinance, an application for a Protected Tree Removal or Cutting Permit must be filed for removal of the protected trees along with the inspection fee as specified in the City's Master Fee Schedule.<sup>65</sup> The application must be filed and approved prior to any tree removal, relocation or cutting, per City Ordinance.<sup>66</sup>

Several common bird species were historically observed in the area as noted in the CNDDDB and eBird database. As discussed previously, a total of approximately 502 trees have been recorded along the ATS. Given the nature that birds will nest in a variety of trees and other locations, the possibility exists that trees located within the ATS may provide habitat for wildlife.

Demolition and clearing of existing vegetation, and construction of the guideway and supporting facilities would result in removal and/or trimming of trees and other ornamental vegetation along the ATS. As such, removal and/or trimming of trees along the ATS could result in impacts to migratory or nesting birds, or raptors protected under the MBTA,<sup>67</sup> CESA,<sup>68</sup> and/or California Fish and Game Code.<sup>69</sup>

Impacts to biological resources from demolition and clearing of existing vegetation, and construction of the proposed Project are potentially significant because tree and vegetation trimming or removal could interfere with the movement of resident or migratory wildlife species that could occur within the area.

#### Summary of Construction Impacts

The loss of trees along the proposed Project, including the guideway and stations, and support facility sites could reduce nesting opportunities for birds. While preservation of the existing trees will be prioritized, in the case where trimming and tree removal is unavoidable, loss of these trees could be considered a potentially significant impact that could affect wildlife movement.

<sup>67</sup> U.S. Fish and Wildlife Service (USFWS), Migratory Bird Treaty Act of 1918 (16 U.S.C. 703-712; Ch. 128; July 3, 1918; 40 Stat. 755) as amended by: Chapter 634; June 20, 1936; 49 Stat. 1556; P.L. 86-732; September 8, 1960; 74 Stat. 866; P.L. 90-578; October 17, 1968; 82 Stat. 1118; P.L. 91-135; December 5, 1969; 83 Stat. 282; P.L. 93-300; June 1, 1974; 88 Stat. 190; P.L. 95-616; November 8, 1978; 92 Stat. 3111; P.L. 99-645; November 10, 1986; 100 Stat. 3590 and P.L. 105-312; October 30, 1998; 112 Stat. 2956

<sup>68</sup> California, Fish and Game Code, Section 2050 et. seq. California Endangered Species Act.

<sup>69</sup> California Department of Fish and Wildlife, Fish and Game Code (FGC), Division 4. Birds and Mammals, [3000 - 4904] ( Division 4 enacted by Stats. 1957, Ch. 456), Part 2. Birds [3500 - 3864] ( Part 2 enacted by Stats. 1957, Ch. 456)

Operation of the proposed Project, including ATS trains using the guideway and stations, would be within an urbanized area of the City. Operation of the guideway and stations would not create a significant change in habitat value or nesting sites. The guideway and stations would involve the construction of new buildings and structures, some of which would have windows that could pose obstacles to migratory birds. However, compared to the existing commercial uses to be removed, the guideway and stations would not include an increased number of windows which may impede migratory birds within the vicinity. During operation of the guideway and stations, it is possible that migratory or nesting birds would build nests within the structure or near the area. However, operation of the guideway and stations would not substantially interfere with these nests once built as the majority of the Project components would remain stationary with exception of the ATS train cars.

The Design Guidelines, contained in **Appendix C**, include sustainability guidelines included that define a list of green measures to be incorporated into the design, construction, and operations of the ITC facilities. Exterior lighting associated with these structures would be consistent with the Design Guidelines for the proposed Project. The Design Guidelines would serve to provide for well designed, energy efficient site lighting that contributes to a safe and inviting atmosphere without casting light into the night sky or adjacent properties. This would be accomplished through measures such as light shielding, automatic controls, and architectural compatibility in design, among others. These measures would have the additional effect of minimizing the potential for lighting of the guideway and stations to attract or disorient nocturnal migrating birds.

The guideway and stations would not diminish the chances for long-term survival of bird species or their habitats. Throughout operation vegetation maintenance and abatement would be performed as needed for City street trees and landscaping on the station and MSF sites. No additional tree and/or ornamental vegetation removals are planned and, as such, no significant impacts to nesting birds/raptors would occur from the operation of the guideway and stations.

#### Support Facilities

#### **Maintenance and Storage Facility**

Operation of the MSF would be within an existing retail plaza which is located within an urbanized area of the City. As mentioned previously, a replacement Vons store would be developed on the MSF site prior to construction of the proposed Project. The replacement Vons store would be reduced in size compared to the existing Vons store. Operation of the MSF site would not create a significant change in habitat value or nesting sites. The MSF site would include the construction of an approximately 75,000 square-foot building which would have windows that could pose obstacles to migratory birds. However, compared to the existing commercial uses, the MSF would not include an increased number of windows which may

#### 4.3 Biological Resources

impede migratory birds in the vicinity. During operation of the MSF site, it is possible that migratory or nesting birds would build nests within the structure or near the area. However, operation of the MSF site would not substantially interfere with these nests once built as the majority of the Project components would remain stationary with exception of the ATS train cars.

Exterior lighting associated with this site would be consistent with the lighting already in place in this area and any new or remodeled lighting would be consistent with the Design Guidelines for the proposed Project. The Design Guidelines would serve to provide for well designed, energy efficient site lighting that contributes to a safe and inviting atmosphere without casting light into the night sky or adjacent properties. This would be accomplished through measures such as light shielding, automatic controls, and architectural compatibility in design, among others. These measures would have the additional effect of minimizing the potential for lighting of the MSF site to attract or disorient nocturnal migrating birds.

The MSF site would not diminish the chances for long-term survival of bird species or their habitats. Throughout operation vegetation maintenance and abatement would be performed as needed for City street trees and the proposed Project's landscaping. No additional tree and/or ornamental vegetation removals are planned and, as such, no significant impacts to nesting birds/raptors would occur from the operation of the MSF site.

#### Power Distribution System Substations

As discussed previously, the PDS substations would be located within the MSF site and the Prairie Avenue/Hardy Street station site which are analyzed above. The PDS substations would involve the construction of new buildings and structures, some of which would have windows that could pose obstacles to migratory birds. However, as there are no native or nonnative vegetated corridors in the proximity of the proposed Project, the potential impact of these structures on migratory birds is anticipated to be minimal. During operation of the PDS substations, it is possible that migratory or nesting birds would build nests within or near the area. However, operation of the PDS substations would not substantially interfere with these nests once built as the majority of the Project components would remain stationary with exception of the ATS train cars.

Exterior lighting associated with these sites would be consistent with the lighting already in place in this area and any new or remodeled lighting would be consistent with the Design Guidelines for the proposed Project. The Design Guidelines would serve to provide for well designed, energy efficient site lighting that contributes to a safe and inviting atmosphere without casting light into the night sky or adjacent properties. This would be accomplished through measures such as light shielding, automatic controls, and architectural compatibility in design, among others. These measures would have the additional effect of

#### 4.3 Biological Resources

minimizing the potential for lighting of the PDS substations to attract or disorient nocturnal migrating birds.

The PDS substations would not diminish the chances for long-term survival of bird species or their habitats. Throughout operation vegetation maintenance and abatement would be performed as needed for City street trees and proposed Project's landscaping. No additional tree and/or ornamental vegetation removals are planned and, as such, no significant impacts to nesting birds/raptors would occur from the operation of the PDS substations.

#### Summary of Operational Impacts

As described, the 0.25-mile radius area surrounding the proposed Project, including the guideway and stations, and support facility sites, is heavily urbanized. Due to lack of suitable habitat, no listed sensitive species are anticipated to occur. Further, there are no sensitive ecological areas, wetlands, or wildlife migratory corridors within the 0.25-mile radius area of the proposed Project.

Operation of the proposed Project would not result in significant impacts to such biological resources with respect to interfering with the movement of any resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impeding the use of native wildlife nursery sites.

#### *Mitigation Measures*

The following Mitigation Measures (MMs) have been identified to mitigate the impacts of the Project to less than significant.

#### Construction

**MM BIO-1: Conservation of Faunal Resources: Nesting Birds/Raptors.** The City shall require demolition and construction contractors to implement the following measures:

- Prior to initiating any demolition and/or construction activities, a nesting bird survey shall be conducted to determine the presence of any nesting birds within 500 feet of demolition and/or construction activities. In addition, nesting bird surveys shall be conducted at least every six (6) months until the completion of construction activities, as specified below.

Nesting bird survey shall include:

- Prior to any demolition and/or construction, and at least every six (6) months during and prior to the raptor nesting season until the completion of construction activities,

January 1 to September 1, a qualified biologist shall conduct a site survey for active nests 30 days prior to any scheduled clearing, demolition, grading, or construction activities. The survey shall be conducted within all trees, manmade structures, and any other potential raptor nesting habitat.

- Prior to any vegetation disturbance between March 1 and September 15, and at least every six (6) months until the completion of construction activities, a qualified biologist shall conduct a survey for nesting birds in all breeding/nesting habitat within the construction or demolitions areas and within 300 feet of all disturbance areas and submit the results of these surveys to the City. The surveys shall be conducted within trees and structures, wherever nesting bird species may be located. Nesting bird surveys shall be conducted no earlier than 30 days prior to the initiation of ground or vegetation disturbance. If no breeding/nesting birds are observed, site preparation, demolition and construction activities may begin. If breeding activities and/or an active bird nest is located, the breeding habitat/nest site shall be fenced by the biological monitor a minimum of 300 feet (500 feet for raptors) in all directions, and this area shall not be disturbed until the nest becomes inactive, the young have fledged, the young are no longer being fed by the parents, the young have left the area, and/or the young shall no longer be impacted. If the qualified biologist determines that a narrower buffer between the demolition and/or construction activities and the observed active nests is warranted, the biologist may submit a written explanation as to why (e.g., species-specific information; ambient conditions and bird's habituation to them; terrain, vegetation, and birds' lines of sight between the demolition and/or construction activities and the nest and foraging areas) to the City and, upon request, the CDFW. Based on the submitted information, the City, acting as the lead agency (and CDFW, if CDFW requests) shall determine whether to allow a narrower buffer.

#### Operation

No mitigation is required for biological resources during operation of the proposed Project.

#### Level of Significance after Mitigation

#### Construction

With implementation of **MM BIO-1**, significant impacts to nesting birds/raptors would be reduced to a level that is less than significant. These measures would prevent substantial interference with the movement of resident or migratory wildlife species through protecting nesting birds/raptors.

#### Operation

Impacts to biological resources would be less than significant.

#### **Impact BIO-2: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?**

As detailed under existing conditions, approximately 502 trees exist along the proposed Project, including the guideway and stations, and support facility sites. Loss of these trees would be considered a significant impact if removal and replacement of these trees does not comply with the City's tree preservation ordinance. To comply with the requirements of the Tree Preservation Ordinance, an application for a Protected Tree Removal or Cutting Permit is required to be filed for removal of the protected trees along with the inspection fee as specified in the City's Master Fee Schedule.<sup>70</sup> This application is required to be filed and approved prior to any tree removal, relocation or cutting, per City Ordinance.<sup>71</sup>

#### Construction

This section discusses the potential impacts to trees that may be impacted as a result of the proposed Project. As previously noted, construction of the guideway and stations would include equipment staging areas that may reach 22 feet from the guideway. As such, this analysis conservatively assumed that all existing trees within 25 feet of the proposed guideway and stations, and the MSF and PDS substation sites could be removed during construction. The locations of trees with respect to the proposed Project are shown in **Figure 4.3-1: Potential Tree Impacts – Market Street/Florence Avenue Station(a)** through **Figure 4.3-18: Potential Tree Impacts – Prairie Avenue(f)** and are available at the end of this section.

#### Guideway

##### **Market Street**

As discussed previously, a total of approximately 45 trees exist along Market Street. All of these trees are located within the Downtown TOD Plan and qualify as protected by meeting the minimum trunk diameter size requirements of the IMC.<sup>72</sup> The proposed guideway along Market Street in relation to the existing trees is shown in **Figure 4.3-2, Figure 4.3-4, and Figure 4.3-5**. As shown, 35 trees are located within the path of the guideway or within the 25-foot construction equipment staging zone. As such, these trees may be removed during construction.

In accordance with the City's Tree Preservation Ordinance, replacement trees will be planted for every protected tree that would be removed within areas after a permit is approved for tree removal.<sup>73</sup> Replacement trees will be replaced at a 1:1 ratio minimum with a tree of like-size and species or an equal value tree (or trees) as determined by the City. Due to compliance with the requirements of the Tree

<sup>70</sup> City of Inglewood, Master Fee Schedule, September 2016.

<sup>71</sup> City of Inglewood, Ordinance 12-06 5-8-12 and Ordinance 13-04 11-5-13.

<sup>72</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

<sup>73</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

#### 4.3 Biological Resources

Preservation Ordinance, an application for a Protected Tree Removal or Cutting Permit shall be filed for removal of the protected trees along with the inspection fee as specified in the City's Master Fee Schedule.<sup>74</sup> This application will be filed and approved prior to any tree removal, relocation or cutting, per City Ordinance.<sup>75</sup>

In addition to being subject to the IMC, the trees along Market Street would be developed within the Downtown TOD Plan area, as shown in **Figure 3.0-2**. While the Downtown TOD Plan does not contain provisions regarding the removal of trees or protected trees beyond the requirements of the IMC, it contains unique provisions and recommendations for the location of tree placement and types of tree species.

In particular, the Downtown TOD Plan calls for Market Street to retain its existing street trees, and the smaller arterial streets including Regent Street and Locust Street may alternate between the Brisbane box (*Lophostemon confertus*), an evergreen tree, and the ginkgo (*Ginkgo biloba*), a deciduous tree.

As the proposed Project will comply with the City's Tree Preservation ordinance, **PDF AES-2**, and **PDF AES-4**, impacts will be less than significant.

##### **Manchester Boulevard**

As discussed previously, a total of approximately 152 trees exist along Manchester Boulevard. All of these trees are located within the Downtown TOD Plan and qualify as protected by meeting the minimum trunk diameter size requirements of the IMC.<sup>76</sup> The proposed guideway along Manchester Boulevard in relation to the existing trees is shown in **Figure 4.3-5 through Figure 4.3-7, and Figure 4.3-9 through Figure 4.3-12**. As shown, 64 trees are located within the path of the guideway or within the 25-foot construction equipment staging zone. As such, these trees may be removed during construction.

In accordance with the IMC, the proposed Project shall plant replacement trees for every protected tree that would be removed within areas subject to IMC provisions, after having obtained a permit to do so.<sup>77</sup> Replacement trees shall be replaced at a 1:1 ratio minimum and shall be like-size and species or an equal value tree (or trees) as determined by the City. Due to compliance with the requirements of the Tree Preservation Ordinance, an application for a Protected Tree Removal or Cutting Permit shall be filed for removal of the protected trees along with the inspection fee as specified in the City's Master Fee Schedule.<sup>78</sup> The application shall be filed and approved prior to any tree removal, relocation or cutting,

<sup>74</sup> City of Inglewood, Master Fee Schedule, September 2016.

<sup>75</sup> City of Inglewood, Ordinance 12-06 5-8-12 and Ordinance 13-04 11-5-13.

<sup>76</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

<sup>77</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

<sup>78</sup> City of Inglewood, Master Fee Schedule, September 2016.

#### 4.3 Biological Resources

per City Ordinance.<sup>79</sup> In addition to being subject to the IMC, the trees along Manchester Boulevard would be developed within the Downtown TOD Plan area, as shown in **Figure 3.0-2**. While the Downtown TOD Plan does not contain provisions regarding the removal of trees or protected trees beyond the requirements of the IMC, it contains unique provisions and recommendations for the location of tree placement and types of tree species.

In particular, the Downtown TOD Plan identifies Manchester Boulevard as a Green Boulevard which would have green dividers that separate bike lanes from traffic lanes. The Downtown TOD Plan states that Green Boulevards should be lined with London Plane trees, or a similar species.

As the proposed Project will comply with the City's Tree Preservation ordinance, **PDF AES-2**, and **PDF AES-4**, impacts will be less than significant.

##### **Prairie Avenue**

As discussed previously, a total of approximately 74 trees have been recorded along Prairie Avenue and qualify as protected by meeting the minimum trunk diameter size requirements of the IMC.<sup>80</sup> The proposed guideway along Prairie Avenue in relation to the existing trees is shown in **Figures 4.3-12 through 4.3-18**. As shown, 28 trees are located within the path of the guideway or within the 25-foot construction equipment staging zone. As such, these trees may be removed during construction.

In accordance with the City's Tree Preservation Ordinance, replacement trees will be planted for every protected tree that would be removed within areas after a permit is approved for tree removal.<sup>81</sup> Replacement trees will be replaced at a 1:1 ratio minimum with a tree of like-size and species or an equal value tree (or trees) as determined by the City. Due to compliance with the requirements of the Tree Preservation Ordinance, an application for a Protected Tree Removal or Cutting Permit shall be filed for removal of the protected trees along with the inspection fee as specified in the City's Master Fee Schedule.<sup>82</sup> This application will be filed and approved prior to any tree removal, relocation or cutting, per City Ordinance.<sup>83</sup>

The HPSP area is located adjacent to the approximately 0.5-mile portion of the Prairie Avenue segment of the guideway. The east side of Prairie Avenue is subject to the HPSP while the west side is subject to the IMC. The guideway and support columns would be located on the west side of Prairie Avenue and would not directly impact the setback of the HPSP area along Prairie Avenue. The relocation of the travel lanes

<sup>79</sup> City of Inglewood, Ordinance 12-06 5-8-12 and Ordinance 13-04 11-5-13.

<sup>80</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

<sup>81</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

<sup>82</sup> City of Inglewood, Master Fee Schedule, September 2016.

<sup>83</sup> City of Inglewood, Ordinance 12-06 5-8-12 and Ordinance 13-04 11-5-13.

for Prairie Avenue into the setback area would impact existing landscaping, installed in accordance with the design guidelines in the HPSP.<sup>84</sup> The HPSP calls for large columnar evergreen trees such as Afghan pine (*Pinus eldarica*) or Canary Island pine (*Pinus canariensis*) along Prairie Avenue north of Hardy Street. This arrangement will visually reduce the scale of the street and will provide ample shade as visitors approach the Hollywood Park entries. In addition, large-canopy flowering trees and palms will mark major entry points and maintain adequate street visibility.

Landscaping along Prairie Avenue would also include a setback area which would serve as a primary welcoming edge of Hollywood Park. The Prairie Avenue setback will feature drought-tolerant plantings which will add a lush Mediterranean character to the spaces. Specifically, plant materials within the formal entrances will include hedges, colorful flowering groundcovers, and various flowering trees. Taller evergreen hedges and shrubs will be used to create strong entry drives and to screen undesirable views.

As the proposed Project will comply with the City's Tree Preservation ordinance, **PDF AES-2**, and **PDF AES-4**, impacts will be less than significant.

### Stations

#### **Market Street/Florence Avenue Station**

As discussed previously, a total of approximately 78 trees are associated with the Market Street/Florence Avenue station site. Of these, 58 are located within the site and are considered private property. The remaining 20 trees are public street trees located throughout the perimeter of the site along Florence Avenue, Locust Street, and Regent Street. These trees are located within the Downtown TOD Plan and qualify as protected by meeting the minimum trunk diameter size requirements of the IMC.<sup>85</sup> The proposed Market Street/Florence Avenue station in relation to the existing trees is shown in **Figure 4.3-1** through **Figure 4.3-3**. The area within the site boundaries of the Market Street/Florence Avenue station site would be demolished during construction. As such, these trees may be removed during construction.

In accordance with the City's Tree Preservation Ordinance, replacement trees will be planted for every protected tree that would be removed within areas after a permit is approved for tree removal.<sup>86</sup> Replacement trees will be replaced at a 1:1 ratio minimum with a tree of like-size and species or an equal value tree (or trees) as determined by the City. Due to compliance with the requirements of the Tree Preservation Ordinance, an application for a Protected Tree Removal or Cutting Permit shall be filed for removal of the protected trees along with the inspection fee as specified in the City's Master Fee

<sup>84</sup> City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Chapter 3, Design Guidelines.

<sup>85</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

<sup>86</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

Schedule.<sup>87</sup> This application will be filed and approved prior to any tree removal, relocation or cutting, per City Ordinance.<sup>88</sup>

In addition to being subject to the IMC, the trees within the Market Street/Florence Avenue station site would be developed within the Downtown TOD Plan area, as shown in **Figure 3.0-2**. While the Downtown TOD Plan does not contain provisions regarding the removal of trees or protected trees beyond the requirements of the IMC, it contains unique provisions and recommendations for the location of tree placement and types of tree species.<sup>89</sup> In particular, the Downtown TOD Plan calls for Market Street to retain its existing street trees, and the smaller arterial streets including Regent Street and Locust Street may alternate between the Brisbane box (*Lophostemon confertus*), an evergreen tree, and the ginkgo (*Ginkgo biloba*), a deciduous tree.

As the Project will comply with the City's Tree Preservation ordinance, **PDF AES-2**, and **PDF AES-4**, impacts will be less than significant.

#### **Prairie Avenue/Manchester Boulevard Station**

As discussed previously, the trees identified within the Prairie Avenue/Manchester Boulevard station site have been removed since the 2018 *Tree Inventory* was conducted. The supplemental 2021 *Tree Inventory* identified two additional trees located adjacent to the site along Nutwood Street. These trees qualify as protected by meeting the minimum trunk diameter size requirements of the IMC.<sup>90</sup> The proposed Prairie Avenue/Manchester Boulevard station in relation to the existing trees is shown in **Figure 4.3-12**. The area within the site boundaries of the Prairie Avenue/Manchester Boulevard station site would be disturbed during construction. As such, these trees may be removed during construction.

In accordance with the City's Tree Preservation Ordinance, replacement trees will be planted for every protected tree that would be removed within areas after a permit is approved for tree removal.<sup>91</sup> Replacement trees will be replaced at a 1:1 ratio minimum with a tree of like-size and species or an equal value tree (or trees) as determined by the City. Due to compliance with the requirements of the Tree Preservation Ordinance, an application for a Protected Tree Removal or Cutting Permit shall be filed for removal of the protected trees along with the inspection fee as specified in the City's Master Fee

<sup>87</sup> City of Inglewood, Master Fee Schedule, September 2016.

<sup>88</sup> City of Inglewood, Ordinance 12-06 5-8-12 and Ordinance 13-04 11-5-13.

<sup>89</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, November 1, 2016.

<sup>90</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

<sup>91</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

Schedule.<sup>92</sup> This application will be filed and approved prior to any tree removal, relocation or cutting, per City Ordinance.<sup>93</sup>

As the proposed Project will comply with the City's Tree Preservation ordinance, **PDF AES-2**, and **PDF AES-4**, impacts will be less than significant.

#### **Prairie Avenue/Hardy Street Station**

As discussed previously, a total of approximately 32 private trees are associated with the Prairie Avenue/Hardy Street station site. These trees qualify as protected by meeting the minimum trunk diameter size requirements of the IMC.<sup>94</sup> The proposed Prairie Avenue/Hardy Street station in relation to the existing trees is shown in **Figure 4.3-17** and **Figure 4.3-18**. The area within the site boundaries of the Prairie Avenue/Hardy Street station site would be demolished during construction. As such, these trees may be removed during construction.

In accordance with the City's Tree Preservation Ordinance, replacement trees will be planted for every protected tree that would be removed within areas after a permit is approved for tree removal.<sup>95</sup> Replacement trees will be replaced at a 1:1 ratio minimum with a tree of like-size and species or an equal value tree (or trees) as determined by the City. Due to compliance with the requirements of the Tree Preservation Ordinance, an application for a Protected Tree Removal or Cutting Permit shall be filed for removal of the protected trees along with the inspection fee as specified in the City's Master Fee Schedule.<sup>96</sup> This application will be filed and approved prior to any tree removal, relocation or cutting, per City Ordinance.<sup>97</sup>

The HPSP area is located adjacent to the Prairie Avenue/Hardy Street station site. The east side of Prairie Avenue is subject to the HPSP while the west side is subject to the IMC. The Prairie Avenue/Hardy Street station would not be situated within the setback of the HPSP area along Prairie Avenue. Moreover, the street trees along the east side of Prairie Avenue have since been removed for the development of the HPSP area. The HPSP area would be fully developed prior to the construction of the proposed Project. Specifically, Prairie Avenue would be developed per the design guidelines of the HPSP.<sup>98</sup> The HPSP calls for large columnar evergreen trees such as Afghan pine (*Pinus eldarica*) or Canary Island pine (*Pinus canariensis*) along Prairie Avenue north of Hardy Street. This arrangement will visually reduce the scale of

<sup>92</sup> City of Inglewood, Master Fee Schedule, September 2016.

<sup>93</sup> City of Inglewood, Ordinance 12-06 5-8-12 and Ordinance 13-04 11-5-13.

<sup>94</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

<sup>95</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

<sup>96</sup> City of Inglewood, Master Fee Schedule, September 2016.

<sup>97</sup> City of Inglewood, Ordinance 12-06 5-8-12 and Ordinance 13-04 11-5-13.

<sup>98</sup> City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Chapter 3, Design Guidelines.

the street and will provide ample shade as visitors approach the Hollywood Park entries. In addition, large-canopy flowering trees and palms will mark major entry points and maintain adequate street visibility.

Landscaping along Prairie Avenue would also include a setback area which would serve as a primary welcoming edge of Hollywood Park. The Prairie Avenue setback will feature drought-tolerant plantings which will add a lush Mediterranean character to the spaces. Specifically, plant materials within the formal entrances will include hedges, colorful flowering groundcovers, and various flowering trees. Taller evergreen hedges and shrubs will be used to create strong entry drives and to screen undesirable views.

As the proposed Project will comply with the City's Tree Preservation ordinance, **PDF AES-2**, and **PDF AES-4**, impacts will be less than significant.

#### **Support Facilities**

##### **Maintenance and Storage Facility**

As discussed previously, a total of approximately 119 trees are located on the MSF site and the adjacent site for the new Vons replacement store. Of these, 116 are located within the site and are considered private property. The remaining 3 trees are public street trees located along Nutwood Street. These trees qualify as protected by meeting the minimum trunk diameter size requirements of the IMC.<sup>99</sup> The proposed MSF site in relation to the existing trees is shown in Figure 4.3-7 through Figure 4.3-9. All uses within the MSF site would be demolished prior to construction. As such, these trees may be removed during construction.

The MSF site is located within an area bound by the Downtown TOD Plan which supersedes the provisions within the IMC. While the Downtown TOD Plan does not contain provisions regarding the removal of trees or protected trees beyond the requirements of the IMC, it does contain unique provisions and recommendations for the location of tree placement and types of tree species.

In particular, the Downtown TOD Plan recommends that Manchester Boulevard be lined with London Plane trees, or a similar species.

As the proposed Project will comply with the City's Tree Preservation ordinance, **PDF AES-2**, and **PDF AES-4**, impacts will be less than significant.

<sup>99</sup> City of Inglewood, IMC Section 12-113, Protected Trees.

### PDS Substations

The proposed Project would include two PDS substations located at the MSF site and the Prairie Avenue/Hardy Street station site which are analyzed above.

As discussed previously, the MSF site is located within an area bound by the Downtown TOD Plan which supersedes the provisions within the IMC. While the Downtown TOD Plan does not contain provisions regarding the removal of trees or protected trees beyond the requirements of the IMC, it does contain unique provisions and recommendations for the location of tree placement and types of tree species.

In particular, the Downtown TOD Plan recommends that Manchester Boulevard be lined with London Plane trees, or a similar species.

The HPSP area is located adjacent to the Prairie Avenue/Hardy Street station site. The east side of Prairie Avenue is subject to the HPSP while the west side is subject to the IMC. The Prairie Avenue/Hardy Street station would not be situated within the setback of the HPSP area along Prairie Avenue. The HPSP area would be fully developed prior to the construction of the proposed Project. Specifically, Prairie Avenue would be developed per the design guidelines of the HPSP.<sup>100</sup>

As the proposed Project will comply with the City's Tree Preservation ordinance, **PDF AES-2**, and **PDF AES-4**, impacts will be less than significant.

### Summary of Construction Impacts

As discussed above, the proposed Project will comply with the City's Tree Preservation ordinance, **PDF AES-2**, and **PDF AES-4**. Impacts from the removal of trees to construct the proposed Project will be less than significant.

### Operation

#### Guideway and Stations

Operation of the proposed Project, including the guideway and the three proposed stations, support facility sites, including trains using the guideway and stations, would be within an urbanized area of the City. The operation of the guideway and stations would introduce different land uses within the public rights-of-way and adjacent properties co-located with the proposed Project. The guideway and stations would introduce new ornamental landscaping, as well as new lighting associated with the guideway, stations, and passenger access areas. The new ornamental trees and landscaping could be illuminated by

<sup>100</sup> City of Inglewood, *Hollywood Park Specific Plan*, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015., Chapter 3, Design Guidelines.

nighttime lighting and would be located in highly urbanized, active locations. Because the proposed Project is located in a highly urbanized area with existing light, noise, and activity, increased lighting, noise, and activity associated with the guideway and stations would not significantly affect the activities of birds within the area. Additionally, birds that occur within the existing area are highly adapted to living within urbanized areas; the guideway and stations would be consistent with the urbanized developments in the vicinity.

As previously noted, the City of Inglewood Tree Preservation Ordinance governs the removal or modification of protected trees within the City.<sup>101</sup> The proposed Project would follow the applicable program (Downtown TOD, HPSP, and IMC as applicable) for the area the guideway and stations it is under. Operation of the guideway and stations would require landscaping maintenance activities; however, no additional tree and/or ornamental vegetation removals are planned. As such, no significant impacts regarding conflict with local policies or ordinances protecting biological resources would occur from the operation of the guideway and stations.

### Support Facilities

#### Maintenance and Storage Facility

Operation of the MSF site would be within an urbanized area of the City. As mentioned previously, a replacement Vons store would be developed on the MSF site prior to construction of the proposed Project. The operation of the MSF site would introduce different land uses within the public rights-of-way and adjacent properties along Manchester Boulevard. The MSF site would introduce new ornamental landscaping, as well as new lighting associated with passenger access areas and support facilities. The new ornamental trees and landscaping could be illuminated by nighttime lighting and would be located in highly urbanized, active locations. Because the proposed Project is located in a highly urbanized area, increased lighting, noise, and activity associated with MSF site would not significantly affect the activities of birds within the area. Additionally, birds that occur within the existing area are highly adapted to living within urbanized areas; the MSF would be consistent with the urbanized developments in the vicinity.

As discussed previously, the City of Inglewood Tree Preservation Ordinance governs the removal or modification of protected trees within the City.<sup>102</sup> Operation of the MSF site would require landscaping maintenance activities similar to existing uses; however, no additional tree and/or ornamental vegetation removals are planned. As such, no significant impacts regarding conflict with local policies or ordinances protecting biological resources would occur from the operation of the MSF site.

<sup>101</sup> City of Inglewood Tree Preservation Ordinance (IMC Section Chapter 12, Article 32).

<sup>102</sup> City of Inglewood Tree Preservation Ordinance (IMC Section Chapter 12, Article 32).

**PDS Substations**

The proposed Project would include two PDS substations located at the MSF site and the Prairie Avenue/Hardy Street station site which are analyzed above.

As discussed previously, these sites could introduce new ornamental landscaping, as well as new lighting associated with p access areas and support facilities. The new ornamental trees and landscaping could be illuminated by nighttime lighting and would be located in highly urbanized, active locations. Because the proposed Project is located in a highly urbanized area, increased lighting, noise, and activity associated with these sites would not significantly affect the activities of birds within the area. Additionally, birds that occur within the existing area are highly adapted to living within urbanized areas; these sites would be consistent with the urbanized developments in the vicinity.

As previously noted, the City of Inglewood Tree Preservation Ordinance governs the removal or modification of protected trees within the City.<sup>103</sup> Operation of these sites would require landscaping maintenance activities similar to existing uses; however, no additional tree and/or ornamental vegetation removals are planned. As such, no significant impacts regarding conflict with local policies or ordinances protecting biological resources would occur from the operation of these sites.

**Summary of Operational Impacts**

Operation of the proposed Project including the guideway and stations, support facility sites, would not conflict with any existing policies or ordinances protecting biological resources including the City's Tree Preservation Ordinance, or the provisions identified in either the Downtown TOD or HPSP. Impacts would be less than significant.

**Mitigation Measures****Construction**

No mitigation is required due to conflicts existing policies or ordinances protecting biological resources.

**Operation**

No mitigation is required due to conflicts existing policies or ordinances protecting biological resources.

<sup>103</sup> City of Inglewood Tree Preservation Ordinance (IMC Section Chapter 12, Article 32).

**Level of Significance after Mitigation****Construction**

Impacts due to conflicts existing policies or ordinances protecting biological resources would be less than significant.

**Operation**

Impacts due to conflicts existing policies or ordinances protecting biological resources would be less than significant.

**4.3.8 CUMULATIVE IMPACTS**

Cumulative development projects in the vicinity of the proposed Project, described in **Section 4.0: Environmental Impact Analysis, 4.0.6: Cumulative Assumptions**, would result in potentially significant impacts to biological resources.

The City of Inglewood is located within a highly developed and urbanized area and potential biological resources are limited to a few small parks and the Inglewood Park Cemetery. These parks are primarily landscaped areas and wildlife species utilizing the parks are mostly those adapted to living in an urban environment. The geographic scope of analysis for cumulative impacts related to biological resources varies for each resource. Regarding the movement of wildlife species, which are limited to common species found in urban environments as identified above, it is considered to be the vicinity surrounding the proposed Project.

The proposed Project is located entirely in a disturbed and/or developed area and supports limited biological resources, with the exception of trees and ornamental shrubs that may provide nesting habitat for birds, including trees that are protected in accordance with the local municipal code. The geographic scope of analysis for cumulative impacts related to protected trees is the City. While migratory birds may occur within the proposed Project, including the guideway and stations, support facility sites, the quality of the habitat is low due to the absence of native habitat and open space, the level of disturbance (existing levels of urban activity and lighting from adjacent uses), and a lack of suitable habitat in the vicinity. As such, migratory bird habitat within the footprint of the proposed Project and vicinity is limited to mainly nonnative ornamental trees.

It is likely that the common, urbanized species, including migratory species, would continue to use the vegetation that exists within the urbanized areas that surround the proposed Project. Therefore, the loss of trees from demolition and construction of the proposed Project would not result in a substantial or significant decline of bird nesting habitat in the region. Implementation of mitigation measures would

#### 4.3 Biological Resources

ensure that bird nests are avoided during the demolition or construction phases of the proposed Project. Compliance with the IMC would require that replacement trees and landscaping that would ensure that the urban habitat for birds is maintained.

The proposed Project, in conjunction with cumulative development within the vicinity of the proposed Project, demolition, construction or operational activities would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

Therefore, the Project's potential to contribute to a significant cumulative impact related to biological resources would not be cumulatively considerable.

#### 4.3.9 CONSISTENCY WITH CITY OF INGLEWOOD GENERAL PLAN

The proposed Project will comply with the City's Tree Preservation ordinance, **PDF AES-2**, and **PDF AES-4**.

The Conservation Element of the City's General Plan was adopted in October 1997 and addresses the conservation, development, and use of natural resource including water, soils, lakes, and mineral deposits.<sup>104</sup> The Conservation Element notes that resources which are typically addressed in conservation elements, including biological resources such as forests, wildlife, fisheries, shorelines, and agricultural land, are not found in Inglewood.

The Land Use Element of the City's General Plan describes tree masses as an important component the physical environment of the City.<sup>105</sup> The Land Use Element states that trees are not merely aesthetic elements of the urban setting, but also provide beneficial effects such as noise attenuation, amelioration of air pollution and dust, and temperature control. As such, landowners are encouraged to plant trees to realize these benefits. The General Plan does not address biological resources any further.

The proposed Project would comply with the requirements of the IMC Tree Preservation Ordinance, **PDF AES-2**, and **PDF AES-4**. Implementation of incorporated features and actions of the CCP would address the removal of trees and the requirements for the replacement of the loss of protected trees at a 1:1 ratio per City requirements. As such, the proposed Project would help ensure the maintenance of a robust urban forest in the City and would not conflict with any goal, objective, or policy of the City's General Plan related to biological resources.

<sup>104</sup> City of Inglewood *General Plan*, "Conservation Element" (1997).

<sup>105</sup> City of Inglewood *General Plan*, "Land Use Element" (adopted 1980, amended 1986, 2009, and 2016).

## 4.4 CULTURAL RESOURCES

### 4.4.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) evaluates the potential for the proposed Inglewood Transit Connector Project (proposed Project or ITC Project) to impact cultural resources within the proposed Project area.

Cultural resources include places, objects, and settlements that reflect group or individual religious, archaeological, architectural, or paleontological activities. Such resources provide information on scientific progress, environmental adaptations, group ideology, or other human advancements. Information from the following studies of the Project area is incorporated into this section:

- *Cultural Resource Investigation*, Roberta Thomas, M.A., RPA, and Gena Granger, M.A., RPA, PaleoWest Archaeology (PaleoWest), December 4, 2018 (**Appendix I.1**);
- *Historic Resources Technical Report*, Paul Travis, AICP, and Kari Fowler, Historic Resources Group (HRG), October 4, 2021 (**Appendix I.2**); and
- *Historic Preservation Memo*, Teresa Grimes, October 7, 2021 (**Appendix I.3**).

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the Project in response consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. The *Historic Resources Technical Report* (see **Appendix I.2**) was peer reviewed in a *Historic Preservation Memo* (see **Appendix I.3**) and updated in response to comments received addressing historic buildings. Changes to the Project relevant to the potential effects of the Project on historic buildings include defining Project features addressing the physical design of the Project as described below in *Section 4.4.6.1: Project Design Features*. Specific changes to the proposed Project include raising the height of the ATS guideway along Market Street to preserve existing views of historic buildings in downtown Inglewood, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Manchester Boulevard and Prairie Avenue, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue. These changes to the Project reduced the impacts of the Project on historic resources. In addition, the information and analysis in the historic resources report was updated and expanded and a peer review of this report was performed. The updated historic resources report determined the revised Project will not result in any significant impacts to historic resources.

See **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Recirculated Draft EIR.

### 4.4.2 METHODOLOGY

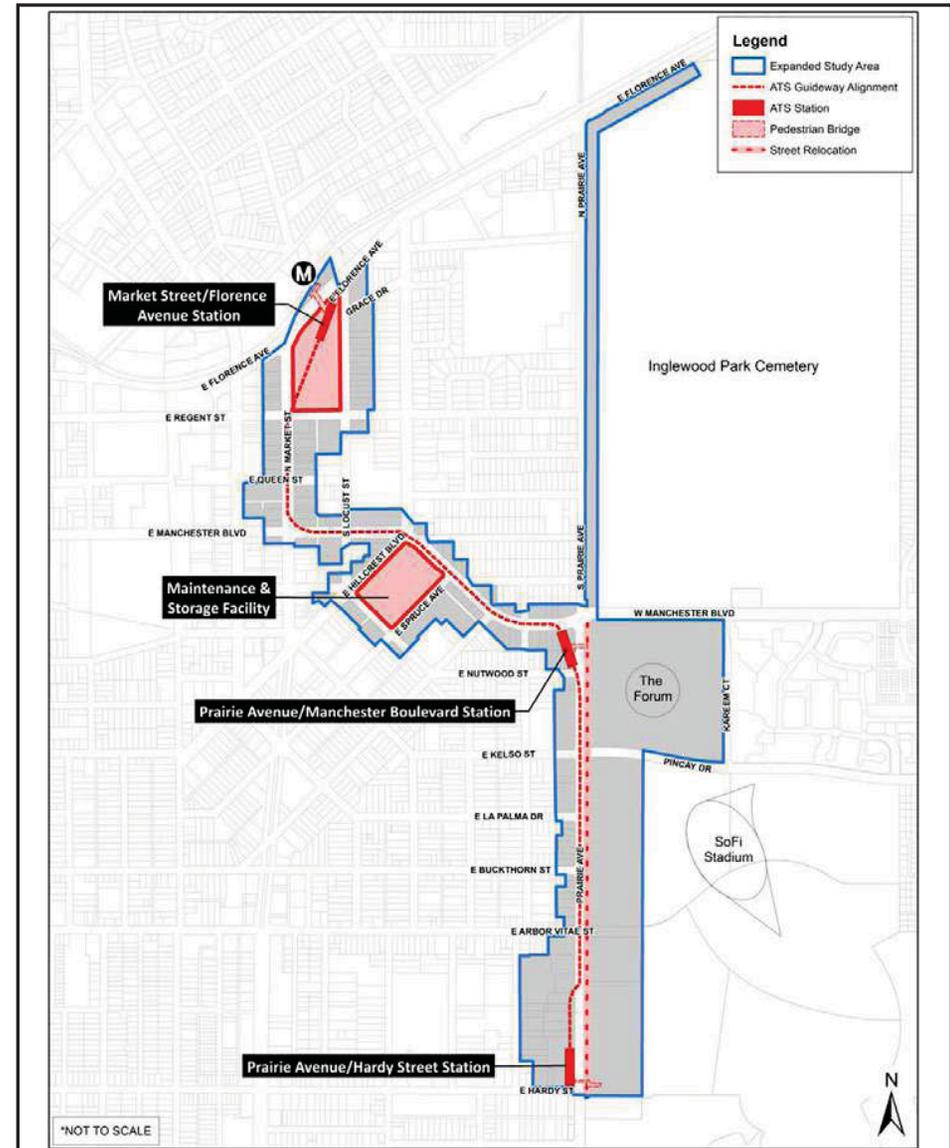

#### 4.4.2.1 Historic Architectural Resources

The analysis of impacts to historic architectural resources is based on the *Historic Preservation Memo (Appendix I.3)* and *Historic Resources Technical Report (Appendix I.2)* prepared by qualified personnel who meet or exceed the Secretary of the Interior's Professional Qualification Standards in history and architectural history.

**Figure 4.4-1: Historic Resource Study Area** identifies the Project Area and Expanded Study Area defined for purposes of the historic resource investigation. The Project Area includes all areas and parcels where new construction will occur. This includes the public rights-of-way along Market Street, Manchester Boulevard, and Prairie Avenue where the elevated ATS guideway will be constructed; the block bounded by Market Street, Florence Avenue, Locust Street, and Regent Street where the Market Street/Florence Avenue station would be constructed; parcels north of Florence Avenue where a pedestrian bridge from the Market Street/Florence Avenue station to the existing Metro K Line Downtown Inglewood station will land; the block bounded by Manchester Boulevard, Hillcrest Boulevard, Nutwood Street, and Spruce Avenue where the MSF and a PDS substation will be built; the parcel at the corner of southwest corner of Manchester Boulevard and Prairie Avenue where a station will be located; parcels at the northwest corner of Prairie Avenue and Hardy Street where a station and a PDS substation will be located; and parcels east of Prairie Avenue between Manchester and Hardy where the travel lanes will be relocated to the east.

The Expanded Study Area encompasses what is expected to be the maximum extent within which Project impacts will occur. The Expanded Study Area includes all parcels fronting the alignment right-of-way on both sides. In addition, where there will be substantial new construction outside of the alignment right-of-way, parcels immediately adjacent to or across from the new construction have been included in the Expanded Study Area. This includes parcels adjacent to or across from the block where the Market Street/Florence Avenue, Prairie Avenue/Manchester Boulevard, and Prairie Avenue/Hardy Street stations would be constructed; parcels adjacent to or across from the MSF site; and sites where the pedestrian bridges will land.

Where historical resources exist within the Project Area or Expanded Study Area, evaluation of the potential for the Project to result in an adverse change in the significance of identified historic resources was completed. Review of previous studies and reference materials on June 4, 2018, and February 21, 2019, were conducted to evaluate the eligibility of properties for listing in the National Register and the California Register. This investigation used primary and secondary sources related to the history and development of the City with an emphasis on the early 20th-century, central business district that comprises much of the Project footprint and Expanded Study Area.

SOURCE: Historic Resources Group, September 2021

FIGURE 4.4-1

251-004-21

## Historic Resource Study Area

Documents that were consulted included previous historical resources surveys and assessments; previous environmental reviews; the City's historical building permits; Los Angeles County Tax Assessor records; Sanborn Fire Insurance maps; historical photographs and aerial images; historical newspapers and other periodicals; local histories and historic context statements; and the California State Historic Resources Inventory, Los Angeles County.

The California State Historic Resources Inventory for Los Angeles County, records housed at the California Historic Resources Information System (CHRIS) South Central Coastal Information Center (SCCIC), was consulted to identify any previous evaluations of potential historic resources on, or immediately adjacent to, the Project alignment.

Detailed field surveys of the Project Area and Expanded Study Area were conducted on June 4, 2018, February 21, 2019, and August 1, 2021. These field surveys were supplemented by property-specific and contextual research to identify additional properties that may be considered historical resources under CEQA.

#### 4.4.2.2 Archaeological Resources

A *Cultural Resource Investigation* (see **Appendix I.1**) was performed for the area for the proposed Project consisting of both desktop-level review and a field investigation. This investigation effort included the Project footprint and a half-mile radius beyond the footprint. The objective of this investigation was to identify prehistoric or historical cultural and archaeological resources that have been previously recorded within the study area during prior cultural resource investigations and through field investigation.

As part of the *Cultural Resource Investigation*, literature, and records searches were conducted at the SCCIC housed at California State University, Fullerton on June 20, 2018. The objective of this records search was to identify prehistoric or historical cultural resources that have been previously recorded within the study area during prior cultural resource investigations. The research component of the investigation was also used to describe the development history of the City and its surrounding area. Additional sources consulted during the literature review and records search included published local histories, previous environmental review documents for the City and region, the National Register of Historic Places, the Office of Historic Preservation Archaeological Determinations of Eligibility, and the Office of Historic Preservation Directory of Properties in the Historic Property Data File.

The *Cultural Resource Investigation* also included a windshield/reconnaissance field survey conducted by a qualified PaleoWest archaeologist on July 20, 2018. The purpose of the survey was to observe and note the conditions of the area, including the extent of the hardscape, the overall degree of ground disturbance, and the character and nature of the area. This included a survey along the length of the ATS alignment to

identify any areas of open ground surface and any areas likely to contain or exhibit archaeologically or historically sensitive cultural resources. Identified areas were inspected to ensure that if any visible, potentially significant archaeological resources were discovered that they were documented. The area of the proposed Project was recorded with digital photographs and a photo log was maintained to include, at a minimum, photo number, date, orientation, photo description, and comments.

As part of the *Cultural Resource Investigation*, the Native American Heritage Commission (NAHC) was contacted on June 15, 2018, for a review of the Sacred Lands File (SLF) in addition to five Native American individuals and/or tribal groups to elicit information regarding cultural resource issues related to the proposed Project. Detailed information describing the City's formal tribal consultation process and the proposed Project's potential impacts to tribal cultural resources are discussed in **Section 4.13: Tribal Cultural Resources** of this Recirculated Draft EIR.

#### 4.4.3 REGULATORY FRAMEWORK

Cultural historic resources are regulated at the Federal, State, and local levels of government. Federal laws establish broad frameworks for cultural historic resource identification and protection, while State and local jurisdictions actively identify, document, and protect resources within their boundaries. The National Historic Preservation Act of 1966,<sup>1</sup> the California Register, the California Public Resources Code (Sections 5020-5029.5,<sup>2</sup> 5079-5079.65,<sup>3</sup> and 5097.9-5097.998),<sup>4</sup> and the California Environmental Quality Act (CEQA) are the primary federal and State laws regulating the preservation of cultural historic resources of national and State significance.

##### 4.4.3.1 Federal Regulations

###### *National Historic Preservation Act*

The National Historic Preservation Act of 1966 (NHPA) authorized formation of the National Register and coordinates public and private efforts to identify, evaluate, and protect the nation's historic and archaeological resources. The National Register includes districts, sites, buildings, structures, and objects that are significant in American history, architecture, archaeology, engineering, and culture.<sup>5</sup>

Section 106 (Protection of Historic Properties) of the NHPA requires federal agencies to consider the effects of their undertakings on historic properties. A Section 106 review refers to the federal review process designed to ensure that historic properties are considered during federal project planning and

<sup>1</sup> US Code, Title 54, Section 300101 et seq., National Historic Preservation Act of 1966, Sections 106 and 110.

<sup>2</sup> California Public Resources Code (PRC), Sections 5020-5029.5, Historic Resources.

<sup>3</sup> California PRC, Sections, 5079-5079.65. Parks and Monuments.

<sup>4</sup> California PRC, Sections 5097.9-5097.998, Native American Historical, Cultural, and Sacred Sites.

<sup>5</sup> US Code, Title 54, Section 300101 et seq., National Historic Preservation Act of 1966, Sections 106 and 110.

implementation. The Advisory Council on Historic Preservation, an independent federal agency, administers the review process, with assistance from State Historic Preservation Offices (SHPOs). If any impacts are identified, the agency undergoing the project must identify the appropriate SHPO to consult with during the process.<sup>6</sup>

### **National Register of Historic Places**

The National Register of Historic Places (NRHP)<sup>7</sup> is the official list of the Nation's historic places worthy of preservation. Authorized by the National Historic Preservation Act of 1966, the National Park Service's (NPS) National Register of Historic Places is part of a national program to coordinate and support public and private efforts to identify, evaluate, and protect America's historic and archeological resources.

Section 106 of the NHPA requires federal agencies to consider the effects of an undertaking on historic properties, which are defined as cultural resources included in or eligible for listing in the National Register. Determination of National Register eligibility for cultural resources is made according to the following criteria:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and

- a. that are associated with events that have made a significant contribution to the broad patterns of our history; or
- b. that are associated with the lives of persons significant in our past; or
- c. that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- d. that have yielded, or may be likely to yield, information important in prehistory or history.<sup>8</sup>

If cultural resources do not meet the above criteria, they are not historic properties and are not further considered in the Section 106 process. In addition to having significance, resources must have integrity for the period of significance. The period of significance is the date or span of time within which significant events transpired or significant individuals made their important contributions.

<sup>6</sup> US Code, Title 54, Section 300101 et seq., National Historic Preservation Act of 1966, Section 106  
<sup>7</sup> U.S. Department of the Interior, National Park Service (NPS), *Nation Register of Historic Places*.  
<https://www.nps.gov/subjects/nationalregister/what-is-the-national-register.htm>  
<sup>8</sup> US Code, Title 54, Section 300101 et seq., National Historic Preservation Act of 1966, Section 106

### **Historic Districts**

The NPS defines a historic district as “a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical development.”<sup>9</sup> A historic district derives its significance as a single unified entity. According to the NPS:

*A district can comprise both features that lack individual distinction and individually distinctive features that serve as focal points. It may even be considered eligible if all of the components lack individual distinction, provided that the grouping achieves significance as a whole within its historic context. In either case, the majority of the components that add to the district's historic character, even if they are individually undistinguished, must possess integrity, as must the district as a whole.*

Some examples of districts include business districts, college campuses, large estates, farms, industrial complexes, residential areas, and rural villages.<sup>10</sup> Properties that have been found to contribute to the historic significance of a district are referred to as district contributors. Properties located within the district boundaries that do not contribute to its significance are identified as non-contributors.

### **Secretary of the Interior's Standards**

The Secretary of the Interior's Standards for the Treatment of Historic Properties (Standards) are intended to promote responsible preservation practices that help protect irreplaceable cultural resources.<sup>11</sup> They cannot be used to make essential decisions about which features of the historic building should be saved and which should be changed. Choosing the appropriate treatment Standard, or approach, requires careful decision making and depends on a number of considerations, including level of historical significance, physical condition, proposed use, and code or regulatory requirements. Once the Standard is selected—whether it is preservation, rehabilitation, restoration, or reconstruction—the Standards provide philosophical consistency when treatment work is undertaken.

Rehabilitation, the most common treatment approach, is the process of making possible a compatible use for a property through repair, alterations, and additions while preserving those portions or features which convey its historical, cultural, or architectural values. The Standards for Rehabilitation are as follows:

<sup>9</sup> National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation. Washington D.C.: National Park Service, U.S. Department of Interior, 1995, 5.  
<sup>10</sup> National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation. Washington D.C.: National Park Service, U.S. Department of Interior, 1995, 5.  
<sup>11</sup> U.S. Department of the Interior, National Park Services, *Technical Preservation Services*, The Secretary of The Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring & Reconstructing Historic Buildings, 2017, accessed June 2018 at <https://www.nps.gov/tps/standards/treatment-guidelines-2017.pdf>.

1. A property shall be used for its historic purpose or be placed in a new use that requires minimal change to the defining characteristics of the building and its site and environment.
2. The historic character of a property shall be retained and preserved. The removal of historic materials or alteration of features and spaces that characterize a property shall be avoided.
3. Each property shall be recognized as a physical record of its time, place, and use. Changes that create a false sense of historical development, such as adding conjectural features or architectural elements from other buildings, shall not be undertaken.
4. Most properties change over time; those changes that have acquired historic significance in their own right shall be retained and preserved.
5. Distinctive features, finishes, and construction techniques or examples of craftsmanship that characterize a property shall be preserved.
6. Deteriorated historic features shall be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature shall match the old in design, color, texture, and other visual qualities and, where possible, materials. Replacement of missing features shall be substantiated by documentary, physical, or pictorial evidence.
7. Chemical or physical treatments, such as sandblasting, that cause damage to historic materials shall not be used. The surface cleaning of structures, if appropriate, shall be undertaken using the gentlest means possible.
8. Significant archeological resources affected by a project shall be protected and preserved. If such resources must be disturbed, mitigation measures shall be undertaken.
9. New additions, exterior alterations, or related new construction shall not destroy historic materials that characterize the property. The new work shall be differentiated from the old and shall be compatible with the massing, size, scale, and architectural features to protect the historic integrity of the property and its environment.
10. New additions and adjacent or related new construction shall be undertaken in such a manner that if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

#### 4.4.3.2 State Regulations

##### *Office of Historic Preservation*

The California Office of Historic Preservation (OHP) administers federally and State-mandated historic preservation programs to further the identification, evaluation, registration, and protection of California's irreplaceable resources.<sup>12</sup> As an office of the California Department of Parks and Recreation, the OHP implements the policies of the NHPA on a Statewide level. OHP works to preserve California's heritage

<sup>12</sup> State of California, Office of Historic Preservation. <https://ohp.parks.ca.gov/>.

resources by ensuring that projects and programs carried out or sponsored by federal, State, and local agencies comply with federal and State historic preservation laws.

##### *California Register of Historical Resources*

The State Historical Resources Commission has designed the California Register of Historic Places (California Register) for use by State and local agencies, private groups, and citizens to identify, evaluate, register, and protect California's historical resources. The California Register is the authoritative guide to the State's significant historical and archeological resources.<sup>13</sup>

The California Register program encourages public recognition and protection of resources of architectural, historical, archeological, and cultural significance, identifies historical resources for State and local planning purposes, determines eligibility for State historic preservation grant funding and affords certain protections under the California Environmental Quality Act.

The California Register is the authoritative guide to the State's significant archaeological and historical resources. It closely follows the eligibility criteria of the National Register but deals with State and local-level resources. The California Register serves to identify, evaluate, register, and protect California's historical resources. For purposes of CEQA, a historical resource is any building, site, structure, object, or historic district listed in or eligible for listing in the California Register.<sup>14</sup> A resource is considered eligible for listing in the California Register if it meets any of the following criteria:

- a. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- b. Is associated with the lives of persons important in our past.
- c. Embodies the distinctive characteristics of type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
- d. Has yielded, or may be likely to yield, information important in prehistory or history [PRC Section 5024.1(c)].

Historical resources meeting one or more of the criteria listed above are eligible for listing in the California Register. In addition to significance, resources must have integrity for a period of significance—the date or span of time within which significant events transpired or significant individuals made important contributions. Important archaeological resources are required to be at least 50 years old to be considered. “Integrity is the authenticity of a historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance.” Simply put, resources must

<sup>13</sup> State of California, Office of Historic Preservation, *California Register of Historic Places*, [https://ohp.parks.ca.gov/?page\\_id=21238](https://ohp.parks.ca.gov/?page_id=21238).

<sup>14</sup> California PRC, *Division 13. Environmental Quality*, Section 21084.1.

“retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance.”

CEQA also requires the lead agency to consider whether there is a significant effect on unique archaeological resources that are not eligible for listing in the California Register. As defined in CEQA, a unique archaeological resource is:

*an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:*

1. *Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.*
2. *Has a special and particular quality such as being the oldest of its type or the best available example of its type.*
3. *Is directly associated with a scientifically recognized important prehistoric or historic event or person.<sup>15</sup>*

If an archaeological resource is found eligible for listing in the California Register, then it is considered under CEQA to be a historic resource that needs to be protected. This may also apply to unique archaeological resources. If a historic resource may be impacted by activity, under CEQA, avoidance and preservation in place is the preferred alternative. If that is not possible, then a data recovery plan would need to be created and enacted to lessen impacts to the environment to a less-than-significant-level. If the archaeological resource is not eligible for listing in the California Register, and it is not a unique archaeological resource, then no further action is required to protect or mitigate possible impacts to it.

### **California Health and Safety Code**

The discovery of human remains is regulated per California Health and Safety Code,<sup>16</sup> which addresses dead bodies and requires the County Coroner to be notified in the event of the discovery of human remains. If the human remains discovered are determined to be Native American in origin, the Coroner will contact the Native American Heritage Commission (NAHC) within 24 hours.

<sup>15</sup> California PRC, *Division 13. Environmental Quality*, Section 21083.2.

<sup>16</sup> California, *Health and Safety Code* sec. 7050.5, “Dead Bodies.”

### **California Public Resources Code Sections 5020-5029.5 – Historical Resources**

The California Public Resources Code<sup>17</sup> addresses the protection of archaeological, paleontological, and historical sites. In addition, cultural and paleontological resources are recognized as a nonrenewable resource and, therefore, receive protection under the statute as follows:

- *California Public Resources Code* Sections 5020-5029.5 established the Historical Landmarks Advisory Committee as the State Historical Resources Commission (SHRC). The SHRC oversees the administration of the California Register of Historical Resources and is responsible for the designation of State Historical Landmarks and Historical Points of Interest.
- Defines the functions and duties of the OHP. OHP is responsible for the administration of federally and State mandated historic preservation programs in California and the California Heritage Fund.
- Provides protection to Native American historical and cultural resources and sacred sites and identifies the powers and duties of NAHC. These sections also require notification of discoveries of Native American human remains, descendants and provide for treatment and disposition of human remains and associated grave goods.

### **California Environmental Quality Act**

The State CEQA Guidelines<sup>18</sup> require that environmental protection be given significant consideration in the decision-making process. Historical resources are included under environmental protection. Thus, any project or action which constitutes a substantial adverse change in the significance of a historical resource also has a significant effect on the environment and shall comply with the State CEQA Guidelines.

CEQA clarifies which cultural resources are significant, as well as which project impacts are considered to be significantly adverse. A “substantial adverse change” means “demolition, destruction, relocation, or alteration such that the significance of a historical resource would be impaired.”

CEQA defines a historical resource as a resource listed in, or determined eligible for listing, in the California Register of Historical Resources. All properties on the California Register are to be considered historic resources under CEQA. However, because a property does not appear on the California Register does not mean it is not significant and therefore exempt from CEQA consideration. All resources determined eligible for the California Register are also to be considered under CEQA.

<sup>17</sup> California PRC, Sections 5020-5029.5, *Historic Resources*.  
[https://leginfo.ca.gov/faces/codes\\_displayText.xhtml?lawCode=PRC&division=5.&title=&part=&chapter=1.&article=2](https://leginfo.ca.gov/faces/codes_displayText.xhtml?lawCode=PRC&division=5.&title=&part=&chapter=1.&article=2).

<sup>18</sup> State CEQA Guidelines, Section 15064.5. *Determining the Significance of Impacts to Archaeological and Historical Resources*.

The courts have interpreted CEQA to create three categories of historical resources:

- Mandatory historical resources are resources “listed in, or determined to be eligible for listing in, the California Register of Historical Resources.”
- Presumptive historical resources are resources “included in a local register of historical resources, as defined in subdivision (k) of Section 5020.1 or deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1” of the Public Resources Code, unless the preponderance of the evidence demonstrates that the resource is not historically or culturally significant.
- Discretionary historical resources are those resources that are not listed but determined to be eligible under the criteria for the California Register of Historical Resources.<sup>19</sup>

To simplify the first three definitions provided in the CEQA statute, a historical resource is a resource that is:

- Listed in the California Register of Historical Resources;
- Determined eligible for the California Register by the State Historical Resources Commission; or
- Included in a local register of historical resources.

The CEQA Guidelines provide two additional definitions of historical resources, which may be simplified in the following manner. A historical resource is a resource that is:

- Identified as significant in a historical resource survey meeting the requirements of Public Resources Code 5024.1(g);
- Determined by a Lead Agency to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California. Generally, this category includes resources that meet the criteria for listing on the California Register (Pub. Res. Code SS5024.1, Title 14 CCR, Section 4852).

The fact that a resource is not listed in, or determined eligible for listing in, the California Register, not included in a local register of historical resources, or not deemed significant pursuant to criteria set forth in subdivision (g) of Section 5024.1, does not preclude a lead agency from determining that the resource may be an “historical resource” for purposes of CEQA.

Properties formally determined eligible for listing in the National Register of Historic Places are automatically listed in the California Register. Properties designated by local municipalities can also be

<sup>19</sup> League for the Protection of Oakland’s Architectural and Historic Resources vs. City of Oakland, 52 Cal. App. 4th 896, 906-7 (1997).

considered historical resources. A review of properties that are potentially affected by a project for historic eligibility is also required under CEQA.

### **City of Inglewood General Plan**

The City’s General Plan Land Use Element presents a long-range plan for the distribution and future use of land within the City. The Land Use Element analyzes population, existing and future land use requirements, and proposed implementation techniques. It provides a framework upon which the development of public and privately owned land can be based.<sup>20</sup>

### **Land Use Element**

The City’s Land Use Element<sup>21</sup> was adopted in 1980 and subsequently amended in 1986, 2009, 2016, and 2020. Applicable goals to the Cultural Resources section were added in 2016 to the Land Use Element with the adoption of the New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines described below.

### **New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines**

The New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines<sup>22</sup> (Downtown TOD Plan) covers the Downtown Inglewood and Fairview Heights neighborhoods of the City and works to implement the City’s vision for transforming the quality of the environment within these areas. The Downtown TOD Plan area consists of approximately 585 acres located in the center of Inglewood along the Metro K line just east of the Florence Avenue/La Brea Avenue intersection. This Downtown planning and zoning area extends approximately one-half mile in all directions from the Metro Downtown Inglewood Station.

The Downtown TOD Plan planning goals were incorporated into the Land Use Element with its 2016 update. Relevant goals and policies in the Downtown TOD are listed as follows:

**Goal 1:** Downtown is a place to live, work, shop, recreate, and be entertained.

**Policy 1.2:** Ground Floor Uses and Storefronts. Require uses that activate pedestrian activity such as retail on major streets and plaza frontages. Require that

<sup>20</sup> City of Inglewood, *General Plan- Related Documents*, <https://www.cityofinglewood.org/209/General-Plan>. Accessed June 12, 2020.

<sup>21</sup> City of Inglewood, *Land Use Element*. <https://www.cityofinglewood.org/DocumentCenter/View/132/Land-Use-Element-1980-Amended-1986-2009-2016-PDF>. Accessed July 22, 2020.

<sup>22</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, November 1, 2016.

storefronts be historically-sensitive, attractive, and transparent in the Historic Downtown.

**Goal 2:** Downtown is a revitalized yet forward-looking gathering place for the community.

**Policy 2.3:** Preservation of Historic Fabric. Require the preservation of buildings that have been designated as historic and encourage the reuse of other historic buildings. Maintain the sense of place in areas with historic fabric and/or meaning such as Market Street between Regent Street and Hillcrest Avenue and the Hillcrest neighborhood east of Locust Street.

**Goal 6:** Downtown expresses the unique culture of Inglewood.

**Policy 6.1:** Districts. Define the following unique districts within the Downtown TOD area, each with their own unifying character or identity that should be preserved and enhanced: Historic Downtown, Civic Center, TechTown, Beach Avenue, Fairview West, Hillcrest and Queen Street.

Additionally, the Downtown TOD states that the Historic Downtown is the heart of Downtown Inglewood, characterizing it as pedestrian-oriented and human scaled neighborhood. The element further states that Downtown Inglewood is intended to function as a regional destination and gathering space for all in the City that links residents with the community's past, present, and future. The district should include public space, restaurants, entertainment, residential uses, hotel, and office uses.

### **City of Inglewood Municipal Code**

The City of Inglewood's General Plan does not identify any goals or policies related specifically to cultural or historical resources. Permitted uses in the Historic Core Zone are those identified in the Downtown TOD.<sup>23</sup>

## **4.4.4 EXISTING CONDITIONS**

### **4.4.4.1 Regional Ethnographic Setting**

#### **Pre-History**

In the pre-historical period, the fertile coastal plain between present-day Los Angeles and Long Beach was enriched by the periodic flooding of the Los Angeles River over millennia. It was home to the Tongva people, also referred as the Gabrieleño, Fernandño, or Nicoleño, the names given to the region's

<sup>23</sup> City of Inglewood, Municipal Code, Section 12-31.46 (Ord. 17-01 11-01-16).

indigenous people by California's Spanish missionaries. The Tongva occupied the area now encompassed by the Los Angeles basin, San Fernando Valley, San Gabriel Valley, San Bernardino Valley, and the local California coastline. The South Bay region was home to a number of small Tongva (Gabrieleño) villages, with notable settlements at Suangna near the present-day city of Carson, near Point Fermin in San Pedro, and near Malaga Cove in Palos Verdes.<sup>24</sup>

### **Spanish Colonial and Mexican Periods**

In 1542, Spanish explorer Juan Rodriguez Cabrillo led the first European expedition to explore what is now the west coast of North America. Explorers with Cabrillo's expedition encountered native people on land and sea voyages, making what is thought to be the first known contact with Alta California's indigenous tribes, including the Tongva of the Suangna area.<sup>25</sup> While Cabrillo claimed California for the Spanish Crown at this time, Spanish settlement would not reach this territory for another two hundred years.

On July 14, 1769, Don Gaspar de Portolá, governor and military leader of Baja California, led the first expedition to colonize Alta California. Accompanied by Franciscan friars Junípero Serra and Juan Crespi, Portolá took a group of 64 men northward from San Diego toward Monterey. On August 2, the expedition camped along the east bank of the Los Angeles River just south of where it is joined by the Arroyo Seco. Fr. Crespi named the spot "El Pueblo de Nuestra Señora la Reina de los Ángeles del Río Porciúncula (translating as "town of Our Lady the Queen of Angels of the River Porciúncula"). As the expedition crossed the river and continued to the south and west approximately one mile, they encountered the Tongva village of *Yang-na*, believed to be near the current site of *El Pueblo de Los Angeles*.

On September 8, 1771, Spanish colonists established Mission San Gabriel, the fourth of an eventual 21 Spanish missions in California, and the first in this area. Much of the area's native population would be recruited to work the San Gabriel Mission lands. Seven years later, in 1778, Governor Felipe de Neve received approval for the creation of a civil pueblo along the *Río la Porciúncula*. Persuaded by Crespi's earlier descriptions of a well-watered valley with good soils for growing crops and an ample native population to work the land, the Spanish colonial government ordered Governor Neve to establish a settlement at this location and name the new pueblo *La Reina de los Angeles* ("Queen of the Angels").

In 1821, Mexico won its independence from Spain and Alta California became a territory of the new Mexican Republic, marking an end to Spanish colonial rule in the region. The political and social control of the military and religious leadership began to shift toward the secular and private sector, and to native-born Californios. The new Mexican government sought to diminish the influence of Spain in the region, as the Spanish missions largely remained loyal to the Roman Catholic Church in Spain. At the same time,

<sup>24</sup> Sam Gnerre, "The Suangna Native American Village in Carson," South Bay Daily Breeze, January 17, 2015.

<sup>25</sup> Sam Gnerre, "The Suangna Native American Village in Carson," South Bay Daily Breeze, January 17, 2015.

there was a need for more grazing lands to increase commerce in the hide and tallow trade. Thus, beginning in 1834, the Mexican government began to secularize the missions, confiscating mission lands to be distributed in large land grants called “ranchos.” Pío Pico, the last governor of Alta California, subdivided the former mission lands into large tracts, granting them to various prominent “Californios.”

### American Period

United States troops began occupying Alta California in 1846, at the advent of the Mexican-American War, and soon gained possession of Los Angeles itself. However, Alta California would not officially come under American rule until February 2, 1848, with the signing of the Treaty of Guadalupe Hidalgo, which ceded the California territory to the United States and ended the war. Importantly, the treaty also provided that the existing land grants would be honored.

#### 4.4.4.2 History of Inglewood

The origin of today’s City of Inglewood dates back to the mid-1800s and a dispute between two prominent California families: the Ávilas and the Machados. José Manuel Orchado Machado was a Spanish soldier and mule tender who was sent west of Los Angeles in 1781 to graze his livestock. He found the area around the Centinela Springs to be excellent grazing lands and settled there with a group of ranchers.<sup>26</sup> In 1834, Machado’s son Ygnacio built the Centinela Adobe.<sup>27</sup> During this same period, Francisco Ávila and his family had established grazing lands near the Centinela. As the claims of the two families clashed, they took their dispute to the local council in 1837, which gave official title of the area around Centinela Springs to the Machado family as the 2,219-acre Rancho Aguaje de la Centinela. The Ávila family was granted the much larger Rancho Sausal Redondo. At 22,458 acres, this land encompassed much of what is now the South Bay region of Los Angeles County. In 1845, Bruno Ygnacio Ávila arranged a trade with the Machados: a small tract in the Pueblo de Los Angeles for Rancho Aguaje de la Centinela. The grant for Rancho Sausal Redondo was officially patented to Antonio Ygnacio Ávila in 1855; Rancho Aguaje de la Centinela was officially granted to Bruno Ávila in 1872.

Ultimately the Ávila family would lose both of the ranchos. Bruno Ávila lost Rancho Aguaje de la Centinela through foreclosure in 1857; the property was subsequently acquired by Scotsman Sir Robert Burnett in 1860. In 1868, the heirs of Antonio Ávila were forced to sell Rancho Sausal Redondo to pay probate costs, and Burnett acquired it. By 1872, Burnett combined the total area of some 25,000 acres into the Centinela Ranch, thus reuniting the extent of the original land grant. This ranch included what would ultimately

<sup>26</sup> The site of Centinela Springs is today’s Edward Vincent Junior Park, just northeast of the Project Area.

<sup>27</sup> The Centinela Adobe is located in the Los Angeles community of Westchester and is the oldest building in the area. Considered the “birthplace of Inglewood,” it is operated as a house museum by the Historical Society of Centinela Valley.

become the coastal communities of Playa del Rey, El Segundo, Manhattan Beach, Hermosa Beach, and Redondo Beach; as well as the inland communities of Westchester, Inglewood, Hawthorne, and Lawndale.

In 1873, Burnett returned to his native Scotland, leasing the combined rancho lands to Canadian attorney Daniel Freeman and his wife, Catherine, with an agreement that they could eventually purchase the property outright.<sup>28</sup> The Freeman family moved to the ranch, which Burnett had been using to graze sheep and cattle. Daniel Freeman continued to graze the stock, while also planting more than 10,000 fruit and nut trees. Following a drought that led to the death of some 22,000 of his sheep, Freeman turned to dry farming, eventually producing a million barrels of barley annually. Ultimately Freeman would amass a fortune farming barley, olives, citrus fruits, and almonds. He named his ranch “Inglewood,” after his birthplace in Ontario.

Following Catherine’s death, Daniel Freeman began to pursue the commercial development of his expansive holdings. He first established the Centinela Land Company, which proved unsuccessful. Then in 1887, as the California Central Railway laid tracks to Redondo Beach, Freeman sold some 11,000 acres of his ranch to the Centinela-Inglewood Land Company, which would subdivide the extent into small parcels for the settlement of the new town of Inglewood. The parcels sold quickly and attracted crowds traveling in from far and wide to make land purchases.

In 1888, Freeman began work on a large mansion for himself and his family, with bricks provided by his own newly-established Continuous Brick Kiln Company of Inglewood, and lumber from the recently-acquired local planning mill.<sup>29</sup> In 1889, he built the Land Company office next to the train depot, moving it to the grounds of his estate in 1895 where it served as his office until his death in 1918.<sup>30</sup> Ultimately, all 25,000 acres of the Centinela Ranch would be subdivided and developed, with the only remaining portion of the ranch being the one-acre site on which the Centinela Adobe is situated.

<sup>28</sup> The Freeman family officially acquired this land from Burnett in 1885.

<sup>29</sup> Gladys Waddingham, *The History of Inglewood (Inglewood, CA: Historical Society of Centinela Valley, 1994)*, 8.

<sup>30</sup> Gladys Waddingham, *The History of Inglewood (Inglewood, CA: Historical Society of Centinela Valley, 1994)*, 11. Daniel Freeman is considered the founder of the City of Inglewood. Among his various pursuits, he is said to have been the first farmer to engage extensively in wheat cultivation in Southern California. Upon discovering a deposit of brick clay on his property, he established the Continuous Brick Kiln Company of Inglewood in 1888, manufacturing the building materials for many of the business blocks on Spring Street and Broadway in downtown Los Angeles, including his own building, the Freeman Block at 6th and Spring streets. He was the first president of the California Club of Los Angeles, president of the Los Angeles Chamber of Commerce in 1893-1894, and director of the Southern California Railway Co. Freeman lived in the Centinela Adobe before erecting his own residence in beginning in 1891, which was demolished 1972 to make way for the Daniel Freeman Memorial Hospital (now closed). In 1975, the Land Company office was moved from his estate to the grounds of the Centinela Adobe, where it now stands.

### ***Inglewood Townsite***

The townsite of Inglewood was platted by the Centinela-Inglewood Land Company in 1888, by which time the town already had a population of 300.<sup>31</sup> The plan divided the town into northern and southern sections on either side of the newly completed Inglewood Division of the California Central Railroad line, a subsidiary of the Atchison Topeka & Santa Fe Railway, which ran along Florence Boulevard as it made its way from Los Angeles to Redondo Beach. The major north-south street leading into Inglewood was Grevillea Avenue. Development during this period was sparse, and most buildings were of impermanent wood-frame construction. The first few business buildings clustered on narrow uniform lots along Grevillea Avenue and Commercial Street (now La Brea Avenue) between Regent and Queen streets.

By 1892, the town of Inglewood was home to several small businesses, including a grocery, post office, a barber, a restaurant, and a large two-story hotel on Queen Street between Commercial and Market.<sup>32</sup> At this time, Inglewood also had a post office, a railroad depot, and a large grain storage building situated along the Redondo Branch of the AT&SF railroad, as well as a handful of single-family residences. Market Street was predominantly residential during this period, before the opening of a streetcar line along its length in 1904, which would lead to its gradual transition to a commercial corridor.

By 1907, downtown Inglewood had several dozen dwellings. Commercial establishments included a drug store, general merchandise store, grocery, meat market, tailor, print shop, and various lodging buildings and offices. Institutional properties included a public school and a Presbyterian church. Industrial uses were clustered along the rail lines and included a greenhouse, planning mill, lumber yard, cement storage, gain mills and storage, and several warehouses.<sup>33</sup> The City of Inglewood was officially incorporated on February 14, 1908.

Also, by this time, Inglewood was home to an expansive cemetery. In 1905, a group of local businessmen formed the Inglewood Park Cemetery Association, acquiring a large plot of land just east of what would become downtown Inglewood. A total of 32 internments took place in the cemetery's first year of operation, with funerals often arriving by rail from Los Angeles in a private funeral car.<sup>34</sup> In 1907, the cemetery erected the Romanesque-style Grace Chapel, a three-quarters replica of a church in Edinburgh, Scotland. Within a decade, the cemetery would erect the Neoclassical-style Inglewood Mausoleum, the first community mausoleum in the State of California.<sup>35</sup> Many of the South Bay region's earliest settlers

<sup>34</sup> Portions of the original railroad waiting station have been incorporated into the main entrance.

<sup>35</sup> The Inglewood Mausoleum was erected over the course of three years, from 1913 to 1915.

have been laid to rest at Inglewood Park Cemetery, including a number of Civil War veterans.<sup>36</sup> Other notable residents include former Los Angeles Mayor Tom Bradley, Chet Baker, Ray Charles, Ella Fitzgerald, Etta James, boxer Sugar Ray Robinson, and architect Paul Williams.<sup>37</sup>

By 1912, Inglewood's commercial core was beginning to take shape along Commercial Street between Los Angeles Street/Inglewood Avenue (now Florence Avenue) and Queen Street. Deep, narrow lots were being developed with various commercial uses, from restaurants and boarding houses to plumbers and hardware stores. Market Street remained primarily residential during this period, with a few commercial buildings, including a jeweler, a milliner, a confectioner, an undertaker, a bank, and a Methodist church.<sup>38</sup>

By 1920, the South Bay's local economy was booming due to the region's fertile agricultural lands, productive oil fields, and emerging aviation industry. The City of Inglewood was growing exponentially, as hundreds of new homes were being built. At the same time, the city's commercial development was coalescing into a downtown business district. Commercial Street between Regent and Queen streets was now solidly commercial, boasting many of the business enterprises needed by any growing town, from banks and automobile showrooms to furniture stores and a movie theater. South of Queen, Commercial Street was still largely undeveloped but for a few single-family residences and an apartment house. At this point, Market Street was more sparsely developed overall and displayed a combination of commercial and residential uses.<sup>39</sup>

The commercial structures erected in downtown Inglewood at this time were typical of those being built in downtowns throughout Southern California. These were what have since been termed "taxpayer blocks," speculative investments to generate tax benefit until more valuable development could be carried out. Early examples were multiunit two-story buildings, frequently with retail units on the ground floor and offices or apartments above. These buildings were typically unreinforced brick in construction, with applied ornament of cast stone or terra cotta at the entrance or along the parapet. Depending on the size of the building, it may contain one or more retail storefronts, with flexible interiors to accommodate the ever-changing needs of individual tenants. While many of these buildings were vernacular in design, in Southern California they were often overlaid with details of the Spanish Colonial Revival style, including tile roofs or parapet edges, arched doors and window openings, and decorative wall tile and cast-stone

<sup>39</sup> Sanborn Fire Insurance Maps, Inglewood CA, 1923.

detailing. With the advent of the personal automobile, a single-story version of the form became popular, with surface parking behind.<sup>40</sup>

Inglewood also had a number of churches by this time, including the First Methodist Episcopal Church, St. John's Catholic Church, Church of the Brethren, and Christian Church.<sup>41</sup> The only church that survives from this period is Holy Faith Episcopal Church, located at the southeast corner of Locust Street and Grace Avenue.<sup>42</sup> The church was first established in 1911, with services held in the Inglewood Masonic Hall. In 1912, Grace Freeman Howland<sup>43</sup> and her husband Charles donated the funds to erect a religious complex consisting of a church, a rectory (the dwelling to the south), and parish hall (now a school at the rear). They hired a young architect, Philip Frohman, to design what would be hailed as "the most perfect example of true Gothic architecture in the West." Frohman would go on to become nationally renowned, particularly for his work on the National Cathedral in Washington, D.C. The church was officially consecrated on November 8, 1914, and dedicated to Catherine Freeman and Mathilda Howland, the mothers of Grace and Charles. The church lost its original bell tower in the 1933 Long Beach Earthquake, but soon thereafter gained the Stations of the Cross, imported from Italy; the pulpit, lectern, and choir stalls from England; and the reredos carved and imported from Bavaria. The stained-glass windows were crafted by Judson Studios in Highland Park.<sup>44</sup>

On the evening of June 21, 1920, the Los Angeles Basin was rattled by an estimated 5.0 earthquake centered near Inglewood. While tremors were felt as far away as Ventura and Riverside, almost all of the damage took place in Inglewood, and specifically to the unreinforced brick buildings along Commercial Street (now La Brea Avenue), where exterior walls fell into the street and plate glass windows shattered.<sup>45</sup> The Inglewood Hotel was also badly damaged and subsequently demolished. The City recovered quickly however, and the population grew from 3,286 according to the 1920 census to double of that number in two years.<sup>46</sup>

The 1920s was a boom period for the City, both in terms of population and development. While Commercial Street continued to be the primary artery of the downtown business district, many more

46 Gladys Waddingham, *The History of Inglewood (Inglewood, CA: Historical Society of Centinela Valley, 1994)*, 26.

businesses were being established on Market Street and its cross-streets during this period. At least seven new buildings were constructed in the 100 block of North Market Street alone. The local financial institution the People's Federal Building & Loan Association was established at this time, first in a unit of the building at 314 S. Market Street, before constructed their own building at the northeast corner of Market Street and Pimiento Street (now Manchester Boulevard) in 1927.<sup>47</sup> That same year, the Bank of Inglewood erected a two-story mixed-use building at the northeast corner of Market and Queen streets, at a cost of \$140,000. Designed by local architect William L. Campbell in the Mediterranean Revival style, the reinforced concrete building was touted as the "first steel frame business block in this city" and as "practically fire and earthquake proof."<sup>48</sup>

On May 18, 1927, some 15,000 locals came out to celebrate the "Festival of Light," which marked the opening of a new ornamental lighting system installed along Market Street. In addition to providing much needed illumination, the standards also supported the trolley wires of the Los Angeles Railway, allowing for the removal of the wooden poles from the middle of the street and the sidewalk.<sup>49</sup> In 1928, a two-story mixed-use structure called the Professional Building was constructed at Market Street and Manchester Boulevard's northwest corner. The building was designed in the Spanish Colonial Revival style with Churrigueresque details.<sup>50</sup> Also constructed in downtown Inglewood during this period were a new City Hall building (1923, demolished), the Granada Theater (1923, demolished), an S.H. Kress Variety Store (1927), and a United Artists Theater (1931, demolished), as well as a number of auto-related businesses such as gas stations and repair garages.

Toward the end of the 1930s, Inglewood's economic base began to expand outside the downtown core. In 1937, the City of Los Angeles purchased the Mines Field just southwest of the City to serve as its municipal airport, bringing many new jobs to the region. In 1938, the Hollywood Park, an "ultra-modern" thoroughbred racetrack, opened on 314 acres just southeast of downtown, effectively making Inglewood a destination for the first time.<sup>51</sup> In addition to attracting the typical racing fan, Hollywood Park brought in celebrated personalities associated with the entertainment industry from studio executives Jack Warner, Walt Disney, and Samuel Goldwyn to A-list actors like Al Jolson and Bing Crosby, of whom were also investors in the operation.

47 The former People's Federal Building & Loan Association building is located at 150 S. Market Street. It is currently occupied by the World Hat & Boot Mart.

### **Wartime and Postwar Growth**

As the likelihood of war increased in the early 1940s, a number of aviation-related and other wartime manufacturing facilities set up shop around the Los Angeles Airport. North American Aviation, Inc., and the Northrup Company both established airplane manufacturing plants in the vicinity. Due to the emergence of these new facilities, this area would not only be important to the defense industry during World War II, but in the postwar years would evolve into a center of the nation's aerospace industry.

The presence of wartime and postwar manufacturing jobs added to the local population and financially supported a growing middle class throughout the South Bay region, including in Inglewood. In 1938, the City had a population of 26,000; by 1956, that number had grown to 64,000.<sup>52</sup> Housing construction responded to the increased demand, and commercial development followed, leading to a pattern of postwar decentralization. By the mid-1950s, the City had three retail business areas – in North Inglewood, Morningside Park, and Crenshaw – in addition to the downtown.

Despite this overall growth, new development in downtown Inglewood was limited during this period. In 1941 a J.C. Penney department store opened on Market Street between Queen Street and Manchester Boulevard. Originally constructed as a one-story building, in 1954 it was expanded with a second story and remodeled in its exiting Mid-Century Modern style, with a deep front canopy and glazed terra cotta tile columns.<sup>53</sup>

The Fox Theater opened on March 31, 1949, on Market Street between Regent and Queen streets. Erected on the site of the Granada Theater, which burned down in 1945, it was the last theater constructed by the Fox West Coast Theater chain. Designed by theater architect S. Charles Lee in the Late Modern style, it was the first theater in Inglewood to have air conditioning. Other features included automatic lobby doors, CinemaScope widescreen projections, assistance for the hearing impaired, and a soundproof “crying room.” The Fox Inglewood was often used for Fox Pictures’ premiers and sneak previews.<sup>54</sup>

During this same period, two noteworthy institutions opened near downtown Inglewood. In 1948, Bank of America erected a 22,000-SF branch at the southwest corner of Manchester Boulevard and Locust Street.<sup>55</sup> That same year, funeral director John Flanagan opened Hardin & Flanagan Colonial Chapel &

<sup>52</sup> Bricker, 15.

The former Fox Theater is located at 115 N. Market Street.

<sup>55</sup> The Bank of America building is located at 320-330 E. Manchester Boulevard.

Mortuary on Prairie Avenue at La Palma Drive, across the street from Hollywood Park. Flanagan built a number of mortuaries around the Los Angeles area using the same American Colonial Revival design.

In 1959, the business was purchased by the McCormick family and renamed McCormick Mortuary.<sup>56</sup> The following year, the building was expanded with a two-story north wing, adding a new lobby with offices above. Today, the business is operated as Lighthouse McCormick Mortuary.<sup>57</sup> The other area for new development during the postwar period was La Brea Avenue, a wide auto corridor which previously served as the western border of downtown Inglewood.<sup>58</sup>

Despite these examples of new construction in and around downtown during this period, the primacy of the City's downtown as a commercial district was substantially diminished by increased competition from outlying commercial areas. The removal of the Market Street trolley line in 1957 added further stress to already struggling businesses. The City responded by adding municipally owned off-street parking lots located throughout the district to draw car-dependent shoppers. The Chamber of Commerce and Downtown Inglewood Retail Merchants Association coordinated to organize various promotional activities, as well as physical improvements like tree planting in the center strip and along sidewalks, which were in place by the early 1960s.<sup>59</sup> However, these effects of these efforts were soon eclipsed by the continued loss of customers to new shopping malls in communities throughout Los Angeles. Inglewood considered, but ultimately rejected, plans to build a mall of its own on a large parcel at Prairie Avenue and Manchester Boulevard, a proposal largely defeated by the Market Street merchants. The site would instead become the home of the Forum.<sup>60</sup>

By the late 1960s, downtown Inglewood needed reinvention. To this end, the City contemplated a wholesale redevelopment scheme for the Market Street corridor that would expand and remodel existing stores, construct two high-rise office and apartment towers, introduce a landscaped arcade, and build a four-square block parking deck above shops to quadruple parking capacity.<sup>61</sup> However, this plan would go unrealized. The United Bank of California at the southeast corner of Market and Regent streets would be the first new structure to be added to the Market Street corridor in nearly two decades, replacing several early 20th-century commercial buildings.<sup>62</sup> Constructed in 1967 in the Late Modern style, it was joined nine years later by a stand-alone drive-thru automated teller building situated across Regent Street from

<sup>56</sup> The McCormick family operated various locations throughout the South Bay, including Westchester, Hawthorne, Redondo Beach, Manhattan Beach, Gardena, and Whittier.

<sup>57</sup> The Lighthouse McCormick Mortuary is located at 619-635 S. Prairie Avenue.

<sup>58</sup> Also built during this period was a Sears department store at Manchester and Hillcrest boulevards. Opened in 1947, this was an early indicator that the future of retail in Inglewood would not be downtown. Sears was demolished in 1993 and replaced by a Vons supermarket.

<sup>59</sup> “Downtown Center of Many Activities,” Los Angeles Times, March 18, 1962.

<sup>60</sup> “The Changing Face of South Bay: Downtowns,” Los Angeles Times, January 4, 1987.

<sup>61</sup> “\$11 Million Center Assured in Inglewood,” Los Angeles Times, March 31, 1968.

<sup>62</sup> The former United Bank of California is located at 158-170 N. Market Street.

the bank. Both buildings are believed to have been designed by Los Angeles modernist architect Richard Dorman.<sup>63</sup>

### **Beyond Downtown**

In the late 1960s, nationally prominent businessman Jack Kent Cooke selected the site of a former golf course at the southeast corner of Prairie Avenue and Manchester Boulevard to erect a new venue for his three professional sports franchises – the Los Angeles Lakers NBA basketball team, the Los Angeles Kings NHL hockey team, and the short-lived Los Angeles Wolves professional soccer team. The Forum, a multipurpose indoor arena, was designed by the prominent Los Angeles architectural firm Charles Luckman & Associates and completed in 1967.<sup>64</sup> Designed in the New Formalist architectural style, it was intended as a modern and highly-stylized version of the Coliseum of ancient Rome. Nicknamed “the Fabulous Forum,” it would host tennis matches, boxing matches, ice shows, rodeos, the circus, award shows, and political events. In 1972, the Forum was the site of the Lakers’ first NBA championship since moving to Los Angeles; five additional titles would follow in the 1980s. From the mid-1970s through the 1990s, the Forum would serve as the premier large-scale concert venue for the Los Angeles area and would be influential in the birth of “arena rock.” During the 1984 Olympics, the Forum was the venue for men’s and women’s basketball.<sup>65</sup>

By the early 1970s, Market Street had been neglected as shoppers abandoned the downtown business center for suburban malls, and key tenants like J.C. Penney closed their doors. In an effort to reinvigorate the core of the City, from 1971 to 1976 Inglewood spent about \$50 million in local, County, and federal funds to erect a new civic center complex along La Brea Avenue, just one block west of downtown. This new complex combined City Hall, a courthouse, library, fire and police facilities, public health complex, and a major new parking garage onto a single super-block, surrounded by expanses of lawn and public art. As hoped, this new construction sparked a flurry of new commercial development in the larger In-Town Redevelopment Area<sup>66</sup>—bounded by Florence, Locust, Manchester, and Fir—the vast majority of which was office space and not retail. Several residential projects were built at this time as well, most notably the 200-unit Inglewood Meadows housing complex on Locust Street, just east of downtown.<sup>67</sup>

While these projects brought large numbers of people into the vicinity of Market Street, their presence did not raise the corridor’s fortunes, and the vitality of the downtown business district continued to wain

<sup>63</sup> Although an original building permit for the 1967 bank building is not available from the City of Inglewood, the permit for the similarly-styled drive-thru automated teller building lists Richard Dorman as its architect.

<sup>64</sup> The Forum is located at 3900 W. Manchester Boulevard.

<sup>65</sup> “Forum,” National Register of Historic Places Form. Prepared by Historic Resources Group, April 29, 2014.

<sup>66</sup> The In-Town Redevelopment Area was one of six redevelopment project areas adopted by the Inglewood Redevelopment Agency between 1970 and 1973.

<sup>67</sup> Dean Murphy and Michele L. Norris, “Government Money Becomes Urban Lifeblood: Innovation and Optimism Thrive on Public Funds in Inglewood, San Pedro,” Los Angeles Times, January 4, 1987.

into the 1980s. In October 1986, Market Street merchants brought downtown business activity to a halt as they closed their shops and picketed in a City-owned parking lot in a final effort to save it from redevelopment. The parking lot at La Brea Avenue and Queen Street provided 80 metered parking spaces which local shopkeepers saw as critical to continued viability of the downtown business district, which was already suffering from a parking shortage. Ultimately, however, the protests were unsuccessful, and the parking lot was soon replaced by a five-story office building.<sup>68</sup> Yet another sign of downtown’s economic decline, the Fox Theater, then owned by the Mann theater chain, closed its doors in 1988.

Since the late-1970s, at least four City-sponsored revitalization programs have focused on improving Market Street’s commercial viability, introducing street landscaping and furniture as well as façade improvements to the existing buildings. Efforts have included a façade improvement program designed by architectural firm Kahn, Kappe, Lotery, Boccato (1979); a \$250,000 façade improvement program, including signs and awnings (1984); a California Main Street Community Project (1990s); and the Market Street Renaissance program (2000). However, despite these efforts, Market Street has largely remained an underutilized asset.

### **Present Day Inglewood**

In 1994, Hollywood Park underwent a \$100 million expansion into Hollywood Park Casino, which extended the facility’s economic viability. However, in May of 2013, it was announced that the Hollywood Park racetrack would be closing at the end of the fall racing season. In 2015, the Inglewood City Council approved a plan to build an 70,000-seat football stadium on the site in anticipation of the St. Louis Rams moving back to Los Angeles.

The Forum remained the home of the Lakers and Kings until 1999, when both teams relocated to the newly constructed Staples Center in downtown Los Angeles. Beginning in 2012, the Forum underwent a \$50 million renovation, reopening in 2014. Later that year, the Forum was listed in the National Register. The venue is inextricably tied to the identity of the City, which adopted the moniker “City of Champions.” The Forum is slated to host the gymnastics events for the 2028 Summer Olympics.

Over the past decade, the City of Inglewood has been acquiring select parcels throughout the City for redevelopment, including along Market Street. Various planning studies have been conducted to develop standards for transit-oriented development, mixed-use development, and parking, with the goal of revitalizing downtown Inglewood. Local advocacy organization the Inglewood Historic Preservation Alliance (IHPA, formerly the Inglewood Historic Site Preservation Committee) continues to work toward the protection of the City’s historic structures and places of interest, including the Fox Theater, which was

<sup>68</sup> “Merchants Protest Proposal to Build on Parking Lot,” Los Angeles Times, October 16, 1986.

successfully listed in the National Register in 2013.<sup>69</sup> Currently, the City is utilizing The New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines, adopted November 1, 2016, as the controlling document for future development activity along Market Street and downtown Inglewood.

On January 12, 2016, the National Football League (NFL) voted to move the St. Louis Rams back to Los Angeles, with the San Diego Chargers to follow. In October 2016, the last part of the former racetrack, the Casino, was demolished, and a new Hollywood Park Casino was opened next door. Construction of the new SoFi Stadium was completed in July 2020 and is the new home of the NFL Los Angeles Rams and Los Angeles Chargers. The SoFi Stadium is slated to host Super Bowl LVI in 2022, the College Football National Championship in 2023, and the opening and closing ceremonies and soccer events for the 2028 Summer Olympics. Construction at the adjacent Hollywood Park Specific Plan development area is ongoing. In September 2020, the City of Inglewood approved the Inglewood Basketball and Entertainment Center (IBEC).

#### 4.4.4.3 Historic Setting

The proposed Project is located entirely within the City and would connect downtown Inglewood near the Metro K Line to the City's major activity centers, including the Forum, the Los Angeles Stadium and Entertainment District (LASED) at Hollywood Park and the Inglewood Basketball and Entertainment Center (IBEC).

Beginning on Market Street and Locust Street, land uses bordering the proposed ATS system include a commercial shopping center with surface parking, single-family and multi-family residences, and vacant land. These land uses transition to one- and two-story mixed-use commercial development further south on Market Street, including the former Fox Theater, with little to no front or side setbacks. Shifting east on Manchester Boulevard, the ATS system would similarly be bordered by one- and two-story mixed-use commercial/office development with little to no front or side setbacks. Proceeding further east on Manchester Boulevard, adjacent buildings include a strip mall and commercial shopping center with surface parking. Continued one- and two-story commercial and mixed-use development, surface parking, and limited areas of single- and multifamily uses round out the remainder of Manchester Boulevard. Surrounding the proposed MSF site along Manchester Boulevard are one-story commercial development to the northwest, five-story office, and one-story educational uses to the southwest, and two-story multifamily uses to the southeast.

<sup>69</sup> Anne Check La Rose, "Inglewood Fox Theatre: Bringing Back the Inglewood Fox Theatre," *Los Angeles Historic Theatre Foundation*, <http://www.lahtf.org/inglewoodfox/> (accessed February 2019).

At the intersection of Manchester Boulevard and Prairie Avenue, the Inglewood Park Cemetery is located to the northeast. Turning south on Prairie Avenue until Century Boulevard, the ATS system would primarily be bordered by one- and two-story mixed-use commercial, office, and multifamily development to the west, with substantial portions of single-family residences and surface parking intermixed. Kelso Elementary School and the Lighthouse McCormick Mortuary building are also located along the western side of Prairie Avenue. To the east of Prairie Avenue are major commercial and recreation venues such as the Forum, which is surrounded by surface parking, and the SoFi stadium, entertainment, retail, and residential uses under construction as part of the LASED at Hollywood Park.

#### 4.4.4.4 Cultural and Historical Resources

##### *Archaeological Resources*

The cultural resource records search and field visit conducted in support of the *Cultural Resource Investigation* (see **Appendix I.1**) did not result in identifying any prehistoric or historical archaeological resources within the Project study area.<sup>70</sup> The *Cultural Resource Investigation* states that the highly developed status of the Project area limits ground visibility and the ability to assess surface conditions for cultural resources. Further, the built nature of the area indicates a high degree of disturbance suggesting the likelihood of encountering intact archaeological deposits near the surface of the Project area to be very low.

##### *Historical Resources*

##### **Listed Historic Resources**

There are two properties along the proposed Project alignment that are listed in the National Register and are, therefore, automatically listed in the California Register. Accordingly, these properties are considered historic resources as defined by CEQA. These resources consist of the following:

**3900 W. Manchester Boulevard (The Forum).** This property, located at the southeastern corner of Manchester Boulevard and Prairie Avenue, contains the Forum, a multipurpose indoor arena, surrounded by an expansive surface parking lot. It was built by nationally prominent businessman Jack Kent Cooke as a venue for his three professional sports franchises, the Los Angeles Lakers NBA basketball team, the Los Angeles Kings NHL hockey team, and the short-lived Los Angeles Wolves professional soccer team. Completed in 1967, it was designed by prominent Los Angeles architectural firm Charles Luckman & Associates in the New Formalist style. From 2012 to 2014, it underwent an extensive historic renovation.

<sup>70</sup> See **Appendix I.1** of this Recirculated Draft EIR.

The Forum was listed in the National Register on September 24, 2014, under Criterion C as an excellent example of a 1960s New Formalist-style arena building.

**115 N. Market Street (former Fox Theater).** This property, located on the western side of Market Street between Regent and Queen streets, contains a 12,090-SF-neighborhood movie theater building. Originally constructed in 1949 for Fox West Coast Theaters, it was designed by prolific theater architect S. Charles Lee in the Late Modern style. The building is currently unoccupied and its storefront windows and doors are boarded up. The Fox Theater was listed in the National Register on January 14, 2013.

#### Previous Historic Resources Study

An investigation to inform the preparation of the “Inglewood Downtown District, Main Street Project Area, Historic Design Guidelines” prepared for the City of Inglewood in May 2000 included an effort to identify historic resources. The 2000 Historic Design Guidelines document included an investigation of historic resources located in the Inglewood Downtown District/Main Street project area, which was bounded by La Brea Avenue to the west, Locust Street to the east, Florence Avenue to the north, and Hillcrest Boulevard to the south. The upper portion of the Downtown District/Main Street area includes the Market Street portion of the Project Area and Expanded Study Area.

The 2000 Historic Design Guidelines investigation does not meet the requirements in Public Resources Code 5024.1(g) for historic resource surveys. This investigation did not include an intensive-level historic resources survey. Instead, preparation of the Historic Design Guidelines was limited to a reconnaissance-level survey only; properties were not fully evaluated or documented on inventory forms. These preliminary evaluations were summarized and entered into a database. Several properties were identified as eligible for local listing only, but the City of Inglewood does not have a local landmark designation program with codified eligibility standards and criteria for local listing. For these reasons, as well as the fact that it is now over 20 years old, the 2000 Historic Design Guidelines investigation is not considered an authoritative or definitive source for this report and is utilized only for research and informational purposes. There are ten properties adjacent to the Project alignment identified in the 2000 investigation as potentially eligible for listing in the National Register or California Register. Each of these properties was re-examined and re-evaluated for its eligibility for listing in the National Register or California Register.

#### Properties Evaluated as Eligible for Historic Listing

During field surveys, eight properties were re-evaluated and were determined to appear eligible for listing in the National Register and/or California Register and, for this reason, are considered historical resources for the purposes of CEQA.

**260 N. Locust Street (Holy Faith Episcopal Church).** This property, located at the southeast corner of Locust Street and Grace Avenue, contains the Holy Faith Episcopal Church complex. The congregation was first established in 1911, with services held in the Inglewood Masonic Hall. In 1912, funds were donated to erect a complex consisting of a church, a rectory (the dwelling to the south), and parish hall (now a school at the rear). The complex of buildings designed by architect Philip Frohman would go on to become nationally renowned, particularly for his work on the National Cathedral in Washington, D.C. The church building was officially consecrated on November 8th, 1914. It lost its original bell tower in the 1933 Long Beach Earthquake, but continued to be improved throughout the 1930s, with the Stations of the Cross, imported from Italy; the pulpit, lectern, and choir stalls from England; and the reredos carved and imported from Bavaria. The stained-glass windows were crafted by Judson Studios in Highland Park. Due to its growing congregation, in the late 1950s architect Philip Frohman returned to design an addition to the church building. The church was extended to the west and an interior balcony added, doubling its capacity from 200 to 400. The newly expanded church building was dedicated in 1959. The parish hall, which now serves as a school, has been expanded multiple times from the 1950s to the 1980s, now extending nearly the full width of the lot. The rectory appears largely intact, with some windows replaced. In 2000, the property was assigned a status code of 4S1 (may become eligible for the National Register when it becomes old enough).

This property was re-evaluated and appears substantially intact, including the main church building, the rectory, and the school. Character-defining features of the church building include its double-cruciform plan; gabled roofs with capped parapets and decorative crosses; copper steeple; stucco exterior walls with cast-stone stepped buttresses; base with cast-stone molding; pointed-arch openings with decorative cast-stone surrounds; leaded stained-glass windows; cast-stone Gothic tracery and quoining; wood plank doors with exposed iron hardware; metal scuppers and downspouts; and decorative wrought-iron wall sconces. The church expansion was designed by the original architect to respect and complement the original church—with features such as wood entry doors and stained-glass windows retained and incorporated into the expanded design—and thus is considered to have acquired significance in its own right. Similarly, additions to the school building are compatible with yet differentiated from the original extent, which remains evident.

Because this is a religious property, in order to be eligible for listing in the National Register it must meet Criterion Consideration A. Criterion Consideration A states that a religious property must “[derive] primary significance from architectural or artistic distinction or historical importance. Indeed, the Holy Faith Episcopal Church complex was found eligible for both of these reasons, thus meeting the Criterion Consideration.

#### 4.4 Cultural Resources

According to National Park Service guidance on Criterion Consideration A as applied to eligibility under National Register Criterion A, a religious property can meet this criterion if it is significant under a historical theme not related to religion, such as patterns of settlement. Because the complex originated with the main church building constructed in 1914, the property meets Criterion Consideration A and appears eligible under National Register Criterion A as an excellent, intact example of early institutional development in Inglewood.

According to NPS guidance on Criterion Consideration A as applied to eligibility under National Register Criterion C, a religious property can meet this criterion for its architectural or artistic values.<sup>71</sup> This property represents the work of nationally-renowned architect Philip Frohman, who would become best known for his work on the National Cathedral in Washington, D.C. As noted above, Frohman was not only responsible for the church's original design but also for its mid-20th century expansion. In addition to its architecture, the church incorporated the work of various artisans, including the Stations of the Cross, imported from Italy; the pulpit, lectern, and choir stalls from England; and the reredos carved and imported from Bavaria. The stained-glass windows were crafted by the world-renowned Judson Studios in the Los Angeles neighborhood of Highland Park. Thus, the property meets Criterion Consideration A and appears eligible under National Register Criterion C as an outstanding example of Late Gothic Revival architecture, and as representing the work of master designers and artisans, including a nationally significant architect.

This property appears substantially intact, including the main church building, the rectory, and the school. The church expansion was designed by the original architect to respect and complement the original church and thus is considered to have acquired significance in its own right. Similarly, additions to the school building are compatible with yet differentiated from the original extent, which remains evident. As such, the property as a whole retains sufficient integrity to convey its significance. Therefore, the Holy Faith Episcopal Church complex meets Criterion Consideration A for Religious Properties and thus appears eligible for listing in the National Register.

**158-170 N. Market Street (former United Bank of California).** This property, located at the southeast corner of Market and Regent streets, contains a 9,000 SF branch bank building and rear surface parking lot. Originally constructed in 1967 for United Bank of California, it was designed by noted Los Angeles architect Richard Dorman in the Late Modern style. Richard Dorman was a prolific modernist architect and designer who worked throughout the Los Angeles region from the 1950s through the 1970s. Over the course of his career, he designed dozens of high-end residences, as well as various commercial and institutional buildings such as offices, churches, and banks. In 1976, the bank added a similarly designed drive-thru automated teller building across Regent Street to the north, also designed by Dorman. The

<sup>71</sup> National Register Bulletin 15, 26.

#### 4.4 Cultural Resources

building is currently occupied by Broadway Federal Bank. In 2000, the property was assigned a status code of 6Z (appears ineligible for the National Register).

This property was re-evaluated and found to be substantially unaltered since its original construction. Character-defining features include its cruciform roof plan; projecting trapezoidal volumes; battered walls; heavy wood beams; smooth exterior surfaces of brick and stucco; and large expanses of tinted glass. Alterations, such as contemporary signage, and the addition of an in-wall ATM with an access ramp and projecting canopy, are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. At the time of its previous evaluation, the bank building was well below the 50-year age threshold used in standard preservation practice for evaluating eligibility for historic designation.<sup>72</sup> Additionally, since the 2000 survey there has been substantial new scholarship on the built environment of the mid-20th century, with new historic contexts developed to provide guidance for evaluating such properties. In light of this new scholarship, this property appears to be significant as a 1960s Late Modern-style bank building in Inglewood, representing the work of a noted architect. It remains highly intact and thus retains sufficient integrity to convey its significance as a good example of its architectural style. Therefore, the property appears eligible for listing in the California Register under Criterion 3 for its architectural merit. As such, it is considered a historical resource for the purposes of CEQA.

**100 N. Market Street/307 E. Queen Street (former Bank of Inglewood).** This property, located at the northeast corner of Market and Queen streets, contains a two-story, 9,258 SF mixed-use commercial building constructed in 1927. The building was originally constructed for the Bank of Inglewood at a cost of \$140,000. Designed by local architect William L. Campbell in the Mediterranean Revival style, the reinforced concrete building was the first steel frame business block in the city. The building was sold to Bank of America National Trust & Savings Association in 1936; in 1950 it became Southwest Bank. It now serves as a retail space occupied by Vajra Books & Gifts. In 2000, the property was assigned a status code of 3S (appears eligible for the National Register as an individual property through survey evaluation) under Criterion C as an excellent example of a 1920s Mediterranean Revival-style bank building in Inglewood.

This property was re-evaluated and found to be substantially unaltered since its original construction. The building retains the majority of its original exterior features, including its form and massing, roof material, exterior wall cladding, fenestration patterns, elaborated arched main entrance and ground-story windows, upper-story windows, and various decorative elements. Alterations—such as replaced front doors and the addition of tile cladding on the ground story—are minor in relation to the building's overall appearance, and do not substantially diminish its integrity. The building remains highly intact and continues to display the characteristic features of a Mediterranean Revival bank building from the 1920s. Thus, this building retains sufficient integrity to convey its significance as a good example of its architectural style, and

<sup>72</sup> According to National Park Service guidance, 50 years is a general estimate of time needed to develop sufficient historical perspective to evaluate historic significance.

therefore appears eligible for listing in the National Register and the California Register. As such, this property is considered a historical resource herein for the purposes of CEQA.

**129-139 S. Market Street (former J.C. Penney).** This property, located on the west side of Market Street between Queen Street and Manchester Boulevard, contains a two-story, 62,583 SF commercial retail building which originally housed a J.C. Penney department store. The building was initially constructed as one story in 1941. In 1954, it was expanded with a second story and remodeled in the Mid-Century Modern style. The Inglewood Marketplace currently occupies the building. In 2000, the property was assigned a status code of 5S1 (eligible for local listing) under Criterion C as a good example of a 1950s Mid-Century Modern-style department store building.

This property was re-evaluated and found to be substantially unaltered since its 1950s remodel. The building retains the majority of its exterior features from this period, including its form and massing, exterior wall cladding, angled storefronts, recessed entry with terrazzo flooring, entry doors, canopy, upper-story ribbon windows, and applied decoration. Alterations—such as contemporary signage and the distinctive paint job—are minor in relation to the building’s overall appearance, and do not substantially diminish its integrity. The building remains highly intact and continues to display the characteristic features of a Mid-Century Modern department store building from the 1950s. Thus, this building retains sufficient integrity to convey its significance as a good example of its architectural style, and therefore appears eligible for listing in the California Register. As such, this property is considered a historical resource for the purposes of CEQA.

**149-155 S. Market Street/231-239 E. Manchester Boulevard (Professional Building).** This property, located at the northwest corner of Market Street and Manchester Boulevard, contains a two-story, 6,000-square-foot (SF) mixed-use commercial building. Constructed in 1928 as the Professional Building, it was designed in the Spanish Colonial Revival style with cast-stone Churrigueresque details. In 2000, the property was assigned a status code of 4S7 (may become eligible for the National Register when integrity is restored).

This property was re-evaluated and despite alterations on the ground story, the upper story appears substantially unaltered since its original construction. The building retains the majority of its original exterior features, including its red clay tile shed roofs with exposed rafter tails; smooth stucco exterior cladding; wood tripartite upper-story windows; decorative cast-stone details at the roofline; and a canopy with decorative wrought-iron supports at the secondary entrance. Alterations, including replacement of ground-story storefronts and entry doors, somewhat diminish the building’s integrity. Overall, however, the building remains largely intact and continues to display the characteristic features of a Spanish Colonial Revival commercial building from the 1920s. Thus, it retains sufficient integrity to convey its significance as a good example of its architectural style, and therefore appears eligible for listing in the California

Register under Criterion 3 for its architectural merit. As such, this property is considered a historical resource for the purposes of CEQA.

**320-330 E. Manchester Boulevard (Bank of America).** This property, located at the southwest corner of Manchester Boulevard and Locust Street, contains a 21,976-SF bank building and a rear surface parking lot. Originally constructed in 1948, the building was erected for Bank of America and designed in the Late Moderne style. Bank of America continues as its current tenant. The smaller adjacent building at 320 E. Manchester Boulevard was originally constructed in 1920 and remodeled as part of the Bank of America in 1954. In 2000, the property was assigned a status code of 3S (appears eligible for the National Register as an individual property through survey evaluation) under Criterion C as a good example of a 1940s PWA Moderne-style bank building in Inglewood.

This property was re-evaluated and found to be substantially unaltered since its original construction. The building retains the majority of its original exterior features, including its form and massing, exterior wall cladding, fenestration patterns, and decorative elements. The framing of the windows and doors may have been updated. However, the replacement material appears to be in keeping with what would have been in place historically, such that this change does not substantially diminish the building’s integrity. Other changes—including lighting, signage, and the addition (and subsequent removal) of an in-wall ATM—are minor in relation to the building’s overall appearance. The building remains largely intact and continues to display the characteristic features of a PWA Moderne bank building from the 1940s. Thus, this building retains sufficient integrity to convey its significance as a good example of its architectural style, and therefore appears eligible for listing in the California Register. As such, this property is considered a historical resource for the purposes of CEQA.

**720 E. Florence Avenue (Inglewood Park Cemetery).** This property, located at the northeast corner of Manchester Boulevard and Prairie Avenue, contains a large cemetery. In 1905, a group of local businessmen formed the Inglewood Park Cemetery Association and acquired a large plot of land just east of what would become downtown Inglewood. In 1907, the cemetery erected the Romanesque-style Grace Chapel, a three-quarters replica of a church in Edinburgh, Scotland. In these early days, funerals often arriving by rail from Los Angeles in a private funeral car; portions of the original railroad waiting station have been incorporated into the main entrance. The Neoclassical-style Inglewood Mausoleum was completed in 1915 and was the first community mausoleum in the State of California. The Mausoleum of the Golden West was built over several decades from the 1930s to the 1960s and features stained-glass representations of early California by Judson Studios. Various notable persons have been laid to rest at Inglewood Park Cemetery, including some of the South Bay region’s earliest settlers, a number of Civil War veterans, and famous figures such as former Los Angeles Mayor Tom Bradley, Chet Baker, Ray Charles, Ella Fitzgerald, Etta James, boxer Sugar Ray Robinson, and architect Paul Williams. At the time of this report, both Grace Chapel and the Inglewood Mausoleum were undergoing renovation.

#### 4.4 Cultural Resources

This property was re-evaluated and while it has evolved over time, it remains substantially intact. The property appears to retain the majority of its original features, such as its overall form and configuration, landscape design, and main entrance, as well as multiple excellent examples of cemetery architecture, including Grace Chapel, Inglewood Mausoleum, and Mausoleum of the Golden West. Alterations, such as the addition of more recent buildings, do not substantially diminish the integrity of the property overall.

The property as a whole retains sufficient integrity to convey its significance as an excellent and rare early 20th-century cemetery in Inglewood. Additionally, Grace Chapel, Inglewood Mausoleum, and Mausoleum of the Golden West appear to be excellent examples of their architectural style. Therefore, the property appears eligible the California Register under Criterion 1 as early institutional development in Inglewood, and Criterion 3 and for the quality of its architectural and landscape design.

Because this is a cemetery property, in order to be eligible for listing in the National Register it must meet Criterion Consideration D. Criterion Consideration D states that a cemetery property must “[derive] its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, from association with historic events.”<sup>73</sup>

National Park Service guidance on the application of Criterion Consideration D explains that a cemetery property can meet this criterion and be eligible under National Register Criterion A on the basis of age if it has “achieved historic significance for [its] relative great age in a particular geographic or cultural context.”<sup>74</sup> As described in the Historical Resources Technical Report, Inglewood Park Cemetery was originally established in 1905, three years prior to the City of Inglewood’s incorporation in 1908. Grace Chapel, built in 1907, is one of the oldest, if not the oldest, remaining religious buildings in Inglewood. As noted above, the Inglewood Mausoleum was the first community mausoleum in the State of California when it was erected in 1915. For these reasons, the property meets Criterion Consideration D and appears eligible under National Register Criterion A as an excellent example of early institutional development in Inglewood.

According to NPS guidance, a cemetery property can also meet Criterion Consideration D and be eligible under National Register Criterion A as the burial place of persons of transcendent importance, defined as persons “of great eminence in their fields of endeavor or [who] had a great impact upon the history of their community, State, or nation.”<sup>75</sup> Inglewood Park Cemetery contains the graves of numerous notable persons, including some of the South Bay region’s earliest settlers, and a number of Civil War veterans. Additionally, the cemetery serves as the final resting place for a number of the region’s most prominent African American residents, including singers Ray Charles, Ella Fitzgerald, and Etta James; boxer Sugar Ray Robinson; architect Paul R. Williams; and former Los Angeles Mayor Tom Bradley. For these reasons, the

<sup>73</sup> *National Register Bulletin* 15, 25.

<sup>74</sup> *National Register Bulletin* 15, 35.

<sup>75</sup> *National Register Bulletin* 15, 34.

#### 4.4 Cultural Resources

property meets Criterion Consideration D and appears eligible under National Register Criterion A as the burial place of persons of transcendent importance.

Per NPS guidance, a cemetery property can meet Criterion Consideration D and be eligible under National Register Criterion C on the basis of distinctive design values, including “aesthetic or technological achievement in the fields of city planning, architecture, landscape architecture, engineering, mortuary art, and sculpture.”<sup>76</sup> As noted above, the cemetery contains several excellent examples of architecture styles, most notably the Romanesque-style Grace Chapel and the Neoclassical-style Inglewood Mausoleum. Additionally, the Mausoleum of the Golden West features scenes of early California rendered in stained-glass by the world-renowned Judson Studios in Highland Park. For these reasons, the property meets Criterion Consideration D and appears eligible under National Register Criterion C for the quality of its architecture and design.

Although this property has evolved over time, it remains substantially intact. The property appears to retain the majority of its original features, and the addition of more recent buildings do not substantially diminish the integrity of the property overall. Thus, the property as a whole retains sufficient integrity to convey its significance. Therefore, the Inglewood Park Cemetery meets Criterion Consideration D for Cemetery Properties and thus appears eligible for listing in the National Register in addition to being eligible for the California Register. As such, this property is considered a historical resource for the purposes of CEQA.

**619-635 S. Prairie Avenue (Lighthouse McCormick Mortuary).** This property, located at the northwest corner of Prairie Avenue and La Palma Drive, contains a two-story, 9,352-SF chapel and mortuary building. Designed in the American Colonial Revival style, the building was initially constructed in 1948 as the Hardin & Flanagan Colonial Chapel & Mortuary. In 1959, the business was acquired by the McCormick family and renamed McCormick Mortuary. Around 1960, the building was expanded with a new two-story wing to the north. It is currently operated as Lighthouse McCormick Mortuary.

This property was re-evaluated and found to be substantially unaltered since its 1960s expansion. The building retains the majority of its exterior features from this period, including its form and massing; hipped and gable roofs with boxed eaves; decorative cornice with return; two-story porticos with slender full-height columns; stucco and wood clapboard exterior cladding; fluted pilasters; divided-light double-hung wood windows with louvred wood shutters; wood paneled doors; round and rounded-arch openings; elaborated entrances including fanlights, sidelights, and decorative wood surrounds; and hanging lanterns. Alterations, such as replacement of an original window with a vinyl slider, are minor in relation to the building’s overall appearance, and do not substantially diminish its integrity. The mortuary’s expansion was designed to respect and complement that of the original chapel and office and is considered to have

<sup>76</sup> *National Register Bulletin* 15, 35.

acquired significance in its own right. The building remains highly intact and continues to display the characteristic features of a mid-20th century American Colonial Revival mortuary building. It retains sufficient integrity to convey its significance as an excellent example of its architectural style, and therefore appears eligible for listing in the California Register under Criterion 3 for its architectural merit. As such, this property is considered a historical resource for the purposes of CEQA.

#### Properties Evaluated as Eligible for Historic Listing

Six (6) properties that had been previously identified as potentially eligible for historic listing in the 2000 Historic Design Guidelines investigation were re-evaluated and were found to appear ineligible for historic listing due to substantial alteration. Each of these properties has been evaluated for its eligibility for listing in the California Register below.

**124-126 N. Market Street.** This property, located on the east side of Market Street between Regent and Queen streets, contains a two-story, 2,750-SF mixed-use commercial building constructed in 1920. In 2000, the property was assigned a status code of 5S1 (eligible for local listing); no reason for significance was provided.

The property was re-evaluated and found to have been substantially altered over time. The original retail storefronts have been replaced with floor-to-ceiling aluminum storefronts, thereby completely altering the ground story on the building's only publicly visible façade. On the upper story, original fenestration has been replaced with metal sliders. The building does not display the characteristic features of a particular architectural style and is not known to be the work of a master; it does not appear to be a notable example of its building type from a particular period; and it has no known important historic associations that would qualify it for historic listing or designation. Therefore, the building does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource for the purposes of CEQA.

**125 S. Market Street.** This property, located on the west side of Market Street between Queen Street and Manchester Boulevard, contains a one-story commercial building constructed in 1938. The building is currently occupied by Basket Beauty Supply. In 2000, the property was assigned a status code of 5S1 (eligible for local listing) under Criterion C as an intact example of a mid-century remodeled façade.

The property was re-evaluated and found to have been substantially altered over time, including alterations since its previous evaluation. The 2000 survey referred to this building as "among the more visually interesting" mid-century façade remodels along Market Street, noting a "metal pylon sign [that] juts above the building's parapet at a sufficient height and angle to be seen by the pedestrian" and "framed [display] cases that cantilever beyond their built-in bases." None of these features remain extant. Alterations include the replacement of the exterior wall cladding on both stories, the replacement of all retail storefronts and entry doors, the addition of applied decorative features above the canopy, added

light fixtures, and contemporary signage. Taken together, these alterations have completely transformed the building's only publicly visible façade, such that it no longer displays any elements of its original 1930s design, nor does it represent a comprehensive mid-century façade remodel. Thus, this building does not retain sufficient integrity to convey its significance as a good example of its architectural style, and therefore does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

**132 S. Market Street.** This property, located on the east side of Market Street between Queen Street and Manchester Boulevard, contains a two-story mixed-use commercial building constructed in 1925. The building is currently occupied by Smoove Fashion World. In 2000, the property was assigned a status code of 5S1 (eligible for local listing) but no reason for significance was provided.

The property was re-evaluated and found to have been substantially altered over time. The building's original retail storefront has been replaced with a floor-to-ceiling aluminum storefront, and brick veneer wall cladding and an awning have been added, thereby completely altering the building's ground story. On the upper story, original fenestration has been replaced with metal or vinyl sliders. Some original decorative features remain on the upper story. Overall, the building does not display the characteristic features of a particular architectural style and is not known to be the work of a master; it does not appear to be a notable example of its building type from a particular period; and it has no known important historic associations that would qualify it for historic listing or designation. Therefore, the building does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

**150 S. Market Street (former People's Federal Building & Loan Association Building).** This property, located at the northeast corner of Market Street and Manchester Boulevard, contains a two-story, mixed-use commercial building originally constructed in 1927 as the People's Federal Building & Loan Association. It was remodeled in the Late Modern style, likely sometime in the 1960s, and is currently occupied by World Hat & Boot Mart. The 2000 historic resources investigation for the "Inglewood Downtown District, Main Street Project Area, Historic Design Guidelines," assigned the property a status code of 5S1 (eligible for local listing) under Criterion C as a good example of a 1960s Late Modern-style commercial building. As noted above, the 2000 historic resources investigation was limited to a reconnaissance-level survey only and did not include an intensive-level historic resources survey. The 2000 Historic Design Guidelines effort identified 150 S. Market Street as eligible for local listing only, but the City of Inglewood did not then, and does not currently, have a local landmark designation program with codified eligibility standards and criteria for local listing.

A more detailed investigation of the building indicates 150 S. Market Street is not an eligible historic resource. The building was originally constructed in 1927 and later acquired its Late Modern-style appearance in the mid-1960s. Visible elements of the underlying original 1920s building include its overall

form and massing, pedestrian orientation set at the sidewalk, clipped corner entrance, and the overall fenestration pattern including primary and secondary door openings and upper-story window openings. In the 1960s, additional design elements were applied to the primary facades of the building. These include stucco and stone panel cladding; metal-framed doors, windows, and storefronts, a flat, curved canopy over the ground story; and stylized piers on the upper story which support a flat, curved canopy suspended above the roofline. No architect was identified with this remodel. The end result is a 1920s-era building in mass and form with 1960s-era design elements applied to its facades. As such, 150 S. Market Street is not a fully realized and cohesive example of Late Modern architecture from the 1960s.

Re-evaluation of 150 S. Market Street determined the building is not a significant example of Late Modern architecture and is, therefore, not eligible for listing in the National Register under criterion C or the California Register under Criterion 3. It is not listed in a local register of historical resources and is not identified as significant in a historical resources survey which meets state criteria. Based upon this re-evaluation, the former People's Federal Building & Loan Association at 150 S. Market Street is not a historical resource for purposes of CEQA.

**302 E. Manchester Boulevard/200-204 S. Market Street (Cox Menswear).** This property, located at the southeast corner of Manchester Boulevard and Market Street, contains a two-story commercial retail building. Originally constructed in 1941, the building was designed in the Streamline Moderne style and was historically occupied by Scotty's Men's Shop. The building's current tenant is Cox Menswear. In 2000, the property was assigned a status code of 3S (appears eligible for the National Register as an individual property through survey evaluation) under Criterion C as a good example of the Streamline Moderne style in Inglewood.

The property was re-evaluated and found to have been substantially altered over time. On the ground story, the existing stone veneer and projecting aluminum-frame display windows appear to be the result of a mid-century remodel, replacing all of the original retail storefronts and wall cladding along both street-facing façades. On the upper story, original fenestration has been replaced with vinyl sliders. Also, the neon sign that originally adorned the corner tower has been removed. Due to these alterations, the building no longer displays the characteristic features of the Streamline Modern style, nor does it represent a comprehensive or wholesale stylistic remodel from a particular historic period. Thus, this building does not retain sufficient integrity to convey its significance as a good example of its architectural style, and therefore does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource for the purposes of CEQA.

**333 E. Nutwood Street.** This property, located at the northwest corner of Locust and Nutwood streets, contains a one-story commercial office building constructed in 1940. The building is currently occupied by Anphon Medical Center. In 2000, the property was assigned a status code of 5S1 (eligible for local listing); no reason for significance was provided.

The property was re-evaluated and found to have been substantially altered over time. The building's exterior wall cladding has been replaced with rough-textured stucco, and exaggerated stucco-clad window surrounds have been added throughout. These changes are incompatible with the building's American Colonial Revival style, and thereby substantially alter the building's overall appearance. The building is no longer a good example of its architectural style and is not known to be the work of a master; it does not appear to be a notable example of its building type from a particular period; and it has no known important historic associations that would qualify it for historic listing or designation. Therefore, the building does not appear eligible for listing in the National Register or the California Register. As such, it is not considered a historical resource herein for the purposes of CEQA.

#### Potential Historic District

No historic districts have been identified within the Project area and/or Expanded Study Area. The extent of Market Street within the Project area and Expanded Study Area appears significant as a historic district for its association with early- and mid-20th century commercial development in the City of Inglewood. This extent comprises a significant concentration of historically related properties from a specific historic period, and thus is an identifiable entity that is distinguishable from the surrounding area. However, due to substantial changes to individual properties over time, this extent does not convey a visual sense of the overall historic environment.

A total of 42 parcels were examined and researched in detail, including parcels along both sides of Market Street, between Florence Avenue on the north and Manchester Boulevard on the south, and including all four corner parcels at the intersection of Market and Manchester. While downtown Inglewood originated in the 1920s, the period of significance for a potential historic district was extended through the 1960s to include postwar development and façade improvements that remain evident in the downtown area today.<sup>77</sup>

Of the 42 parcels that were examined, twelve were evaluated as potential district contributors (DC) if a historic district was identified,<sup>78</sup> while the remaining 30 parcels were evaluated as non-contributors (NC). Most of the non-contributing parcels were evaluated due to extensive alterations over time. Some parcels contain more recent infill development, while others are vacant lots or parking lots. With 12 of 42 parcels evaluated as potential district contributors, this results in a contribution rate of just 29 percent, which is below the requirement for an eligible historic district.<sup>79</sup> Due to this low ratio of district contributors, it was

<sup>77</sup> Of the six properties evaluated as individually eligible, three are postwar resources.

<sup>78</sup> Six of these twelve were also evaluated as individually eligible for historic listing and comprise the six identified CEQA resources discussed in the DEIR for this project.

<sup>79</sup> For a geographical area to be considered eligible for listing as a historic district, standard preservation practice requires that the majority of properties be contributors to the district.

4.4 Cultural Resources

determined that this extent of Market Street does not retain sufficient integrity to convey its historic significance, and therefore does not meet the criteria to qualify as a historic district.

The full extent of the Market Street corridor in downtown Inglewood, extending an additional two-and-a-half blocks south of the Project Area and Expanded Study Area to Hillcrest Boulevard, was also evaluated to determine if this larger area retained sufficient integrity to qualify as a potential historic district. As with the smaller area described above, this larger segment of the Market Street corridor is considered potentially significant for its association with early- and mid-20th century commercial development in the City of Inglewood as it includes a significant concentration of historically related properties from a specific historic period. However, due to substantial changes to individual properties over time this corridor no longer conveys a visual sense of the overall historic environment. A reconnaissance-level review of these southern blocks found a somewhat higher concentration of buildings with sufficient integrity to qualify as district contributors, but not enough to offset the lower concentration in the northern blocks. Of the 64 parcels that examined along the full extent of the Market Street corridor, 23 were evaluated as potential district contributors (DC) if a historic district was identified, while the remaining 41 parcels were evaluated as non-contributors (NC). This results in a contribution rate of just 36 percent, still well below what would typically be required for an eligible historic district. Due to this low ratio of district contributors, it was determined that this larger segment of Market Street does not retain sufficient integrity to convey its historic significance, and therefore does not meet the criteria to qualify as a historic district. While Market Street largely retains its overall scale, massing and pedestrian orientation, incremental changes over time have substantially compromised the cohesion of the area as a whole. As such, Market Street does not retain the ability to convey a sense of time and place from its historic period. Despite its historic significance, Market Street in downtown Inglewood does not retain sufficient integrity to convey its significance and does thus not meet the criteria to qualify as a historic district. This determination confirms a previous evaluation of the Market Street corridor completed in a 2000 historic resources investigation prepared to support the preparation of design guidelines. The reconnaissance-level survey completed in 2000 reviewed 112 buildings and did not identify a historic district. For these reasons, Market Street does not constitute historic district and is not a historical resource under CEQA.

Summary of Historical Resources

In summary, ten (10) historical resources have been identified in the Project Area and/or Expanded Study Area as shown in **Table 4.4-1: Summary List of Historical Resources** and **Figure 4.4-2: Map of Historic Resources** below. Of these, two (2) are listed in the National Register and the California Register, and eight (8) were evaluated as appearing eligible for listing in the California Register and/or National Register. All of these properties are considered as historical resources for the purposes of CEQA and the potential for the Project to impact properties is evaluated below.

4.4 Cultural Resources

Table 4.4-1  
Summary List of Historical Resources

Address	APN	Date	Name	Description	Current Evaluation
260 N Locust Street	4015026039	1914	Holy Faith Episcopal Church	Religious complex (Church, rectory, and School)	Appears Eligible for listing in NR and CR
158-170 N. Market Street	4021007012	1967	Former United Bank of California (now Broadway Federal Bank)	Branch bank, rear parking lot	Appears eligible for listing in CR
115 N Market Street	4021008006	1949	Former Fox Theater	Neighborhood movie theater	Listed in NR and CR
100 N. Market St/307 E. Queen Street	4021007024	1927	Former Bank of Inglewood (now Vajra Books & Gifts)	Two-story mixed-use commercial building	Appears eligible for listing in NR and CR
129-139 S Market Street	4021009031	1941, addition and remodel 1954	Former J.C. Penney (now Inglewood Marketplace)	Two-story retail commercial building	Appears eligible for listing in CR
149-155 S Market St/231-239 E Manchester Boulevard	4021009017	1928	Professional Building	Two-story mixed-use commercial building	Appears eligible for listing in CR
320-330 E Manchester Boulevard	4021013018	1948	Bank of America	Branch bank, rear parking lot	Appears eligible for listing in CR
720 E Florence Avenue	4012031930	1905	Inglewood Park Cemetery	Cemetery	Appears eligible for listing in NR and CR
3900 W Manchester Boulevard	4025001002	1967	The Forum	Multipurpose indoor arena, surrounding parking lot	Listed in NR and CR
619-635 S Prairie Avenue	4021038027	1948, addition c. 1960	Lighthouse McCormick Mortuary (former Hardin & Flanagan Colonial Chapel and Mortuary)	Two-story chapel and mortuary building	Appears eligible for listing in CR

Source: Historic Resources Technical Report, HRG, O 2021 (refer to Appendix I.2).

### 4.4.5 THRESHOLDS OF SIGNIFICANCE

The project would have a significant impact in relation to cultural resources if it were to:

- Threshold CUL-1:** Cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5.
- Threshold CUL-2:** Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?
- Threshold CUL-3:** Disturb any human remains, including those interred outside of formal cemeteries

The CEQA Guidelines, Section 15064.5 (b) states that “a project that may cause a substantial adverse change in the significance of a historical resource is a project that may have a significant effect on the environment.” A “substantial adverse change in the significance of a historical resource” means the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired. The CEQA Guidelines go on to state that:

*The significance of a historical resource is materially impaired when a project...[d]emolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources...local register of historical resources... or its identification in a historical resources survey.<sup>80</sup>*

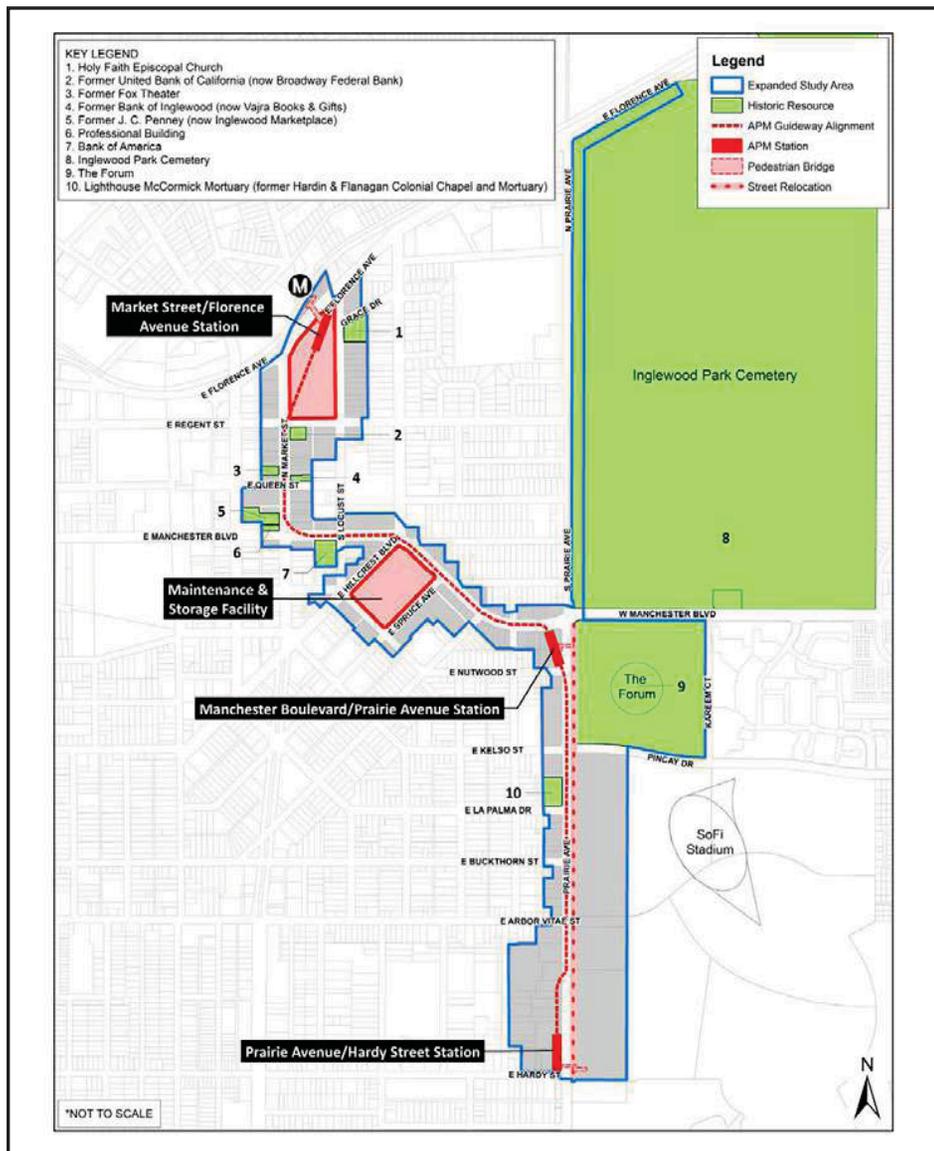

The significance of a historical resource may be materially impaired through both direct and indirect project impacts. Thus, the *Historic Resources Technical Report* (see **Appendix I.2**) analyzed the potential for the proposed Project to impact a historical resource either directly or indirectly.

### 4.4.6 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

#### 4.4.6.1 Project Design Features

The Project includes the following feature, identified in the ITC Design Standards and Guidelines (Design Guidelines), that address the potential effects of the Project on historic resources located along the proposed alignment:

<sup>80</sup> CEQA Guidelines, Section 15064.5(b).

SOURCE: Historic Resources Group, September 2021

FIGURE 4.4-2

251-004-21

## Map of Historic Resources

**PDF CUL-1 Historic Resources (Design Standards and Guidelines)**

The final Project design must consider design variables (elevation of guideway, width of guideway, distance of the guideway from the resources, and the dimensions, placement, and spacing of support columns) and resource variables (building's height, scale, number of street-facing facades, width of primary façade, front setback, project elements overhanging the sidewalk, and viewpoints from which the resource can best be discerned in its entirety). The final Project design shall ensure minimal impacts to the setting of historical resources, and little or no visual obstruction of the resource's street-facing façades from the optimal viewpoints. In order to meet these performance-based standards, the following Project Design Features shall be incorporated into the final Project design:

- The guideway's elevation and distance from the façade of the historical resource will be sufficient for the guideway to visually clear the top of the historical resources' street-facing façade(s) when viewed from the optimal viewpoints. The final Project design is expected to achieve no visual obstruction of any of the identified historical resources from the guideway.
- At the former Fox Theater, and for 100 feet on either side of the resource, the guideway elevation (measured from the ground plane to the underside of the guideway structure) will be a minimum of 52 feet from grade in order to achieve unobstructed views of this resource, including its monumental sign pylon.
- The dimensions, placement, and spacing of the guideway support columns will be such that the obstruction of views of the historical resources' street-facing façade(s) when viewed from the optimal viewpoints will be minimized. For five of the identified historical resources—Holy Faith Episcopal Church, former United Bank of California (now Broadway Federal Bank), former Fox Theater, Professional Building, and Inglewood Park Cemetery—the final Project design is expected to completely avoid visual obstructions from support columns.
- For five of the historical resources—the former Bank of Inglewood, former J.C. Penney, Bank of America, the Forum, and Lighthouse McCormick Mortuary Mortuary—views that are completely unobstructed by support columns are not necessary for the resource to convey its significance. A small portion of the resources' primary façades will be intermittently obscured depending on the position of the viewer. However, due to the scale and/or setback of these resources, their primary façades will remain readily discernable.

**Impact CUL-1: Would the project cause a substantial adverse change in the significance of a historical resource as defined in Section 15064.5?****Impacts**

The *Historic Resources Technical Report* identified a total of ten historical built-environment resources within the proposed Project area,<sup>81</sup> as identified in **Table 4.4-1** and **Figure 4.4-2**. Two of these are listed in the National Register and the California Register, and eight have been re-evaluated as appearing eligible for listing in the National Register and/or California Register. All of these properties are considered as historical resources as defined in CEQA Guidelines Section 15064.5.

**Direct Impacts**

A direct adverse environmental impact would involve an immediate physical change in the built characteristics of a resource or its immediate surroundings that convey its historical significance. While the proposed ATS guideway and stations would largely be constructed within the public right-of-way, several properties along the ATS alignment would be affected through the development of the ATS guideway and stations on adjacent properties.

The proposed ATS guideway would result in direct physical impacts on the following resource:

- 3900 W. Manchester Boulevard (The Forum), AIN 4025-001-002.

The Forum property is located within the Project Area on the east side of Prairie Avenue. The ATS guideway and Prairie Avenue/Manchester Boulevard station are proposed on the west side of Prairie Avenue. The elevated ATS guideway will be primarily supported by columns located on the west side of Prairie Avenue within the public right-of-way. A few straddle bent columns may be necessary along this section of the alignment near the corner of Manchester Boulevard and Prairie Avenue immediately south of the Prairie Avenue/Manchester Boulevard station to support a switch zone for this station. Traffic lanes on Prairie Avenue would also be relocated to the east to accommodate the ATS columns on the west side of the street and maintain a sufficient sidewalk width. The relocation of the lane along Prairie Avenue will result in an encroachment into the Forum property along its western boundary. Straddle bent support columns may land on the east side of the ATS guideway in what is now the Forum parking lot. An elevated passenger walkway will be constructed from the Prairie Avenue/Manchester Boulevard Station, with vertical circulation elements (stairs, escalators, elevators) landing on the east side of Prairie in the current Forum parking lot.

<sup>81</sup> *Historic Resources Technical Report*. Inglewood Transit Connector. October 4, 2021.

#### 4.4 Cultural Resources

The Project will not physically alter the Forum building itself. The building will remain in its original location and will retain all of its significant character-defining features. The Project will alter a portion of the Forum's surface parking lot, which is defined in the National Register nomination for the Forum as one of the Forum's character-defining features. The Project will encroach into the Forum parking lot along its western edge between Manchester Boulevard and Pincay Drive no more than 30 feet to accommodate the relocation of one of the traffic lanes on Prairie Avenue. This encroachment will alter the original dimensions of the property. Because this encroachment will only affect the westernmost 30 feet of the large parking lot around the Forum building, the parking lot will retain its overall character as an expansive, on-grade, asphalt-paved parking area surrounding the Forum building on all sides.

The stairway and elevator components from the elevated passenger walkway from the Prairie Avenue/Manchester Boulevard station will land on what is currently the Forum property. These elements would be constructed within the public right-of-way of the newly relocated sidewalk on the east side of Prairie Avenue. These features would be situated along the property's western edge and there will remain a substantial physical distance of over 300 feet between these new features and the Forum building itself. The Project, therefore, will not alter the relationship between the Forum building and its immediate surroundings in any meaningful way.

The view for motorists of the Forum building from Prairie Avenue looking east and pedestrian views from the west sidewalk will be intermittently obstructed by the straddle-bent support columns supporting the ATS guideway and the stairs and elevators from the elevated passenger walkway. However, pedestrian views from the new sidewalk on the east side of Prairie Avenue will remain largely unobstructed with only minimal impairment. Views of the Forum building looking south from Manchester Boulevard and north from Pincay Drive will also remain unobstructed. Overall, the new construction will not block or obscure important views of the Forum building, as there will remain multiple vantage points from which the building can be observed without obstruction. The Forum property will retain its essential character as a large circular building set at the center of a sprawling, generally open site with largely unobstructed views from all sides. Important features of the Forum's setting are limited mainly to the property itself, the most important of which is the expansive surface parking area surrounding the building on all sides. Although the Project will encroach on the Forum property along the eastern edge of the parking lot, the important aspects of the Forum's historical setting will remain intact.

Because the Project will not physically alter the Forum building; will not block or obscure important views of the Forum building; and will only alter a small portion of the Forum parking lot; the revised Project will not result in a substantial adverse change in the significance of the historical resource. After construction of the Project, the Forum will continue to convey its historic significance as a 1960s New Formalist-style

#### 4.4 Cultural Resources

arena in Inglewood. Therefore, direct, and indirect impacts to the Forum as a result of the revised Project would be less than significant.

#### Indirect Impacts

An indirect impact is distinguished in this evaluation as a physical change which is not immediately related to the Project, but which is caused indirectly by the Project. An indirect adverse environmental impact would involve a substantial alteration in how a resource is viewed and experienced by pedestrians and motorists through obscuring, interfering, or blocking the view of a resource from the public right-of-way. An example would be new construction that diminishes the ability of a historical resource to convey its significance by blocking or obscuring character-defining features after the project has been completed. These indirect impacts may materially impair and adversely affect the significance of a historical resource if the historical resource can no longer convey its historical significance and justify its inclusion in the California Register, local register, or historical resource survey. Built-environmental historical resources identified along the proposed Project's footprint, including those adjacent the proposed ATS guideway alignment and stations, have been determined to convey their historical significance through physical characteristics such as design, construction, and/or form.

The Project could potentially result in indirect impacts on the following seven resources as discussed below:

- 158-170 N. Market Street (former United Bank of California)
- 115 N. Market Street (former Fox Theater)
- 100 N. Market St/307 E Queen Street (former Bank of Inglewood)
- 129-139 S. Market Street (former J.C. Penney)
- 149-155 S. Market Street/231-239 E Manchester Boulevard (Professional Building)
- 320-330 E. Manchester Boulevard (Bank of America)
- 619-635 S. Prairie Avenue (Lighthouse McCormick Mortuary)

The ATS guideway and stations would follow Market Street, Manchester Boulevard, and Prairie Avenue and pass directly in front of these resources. The ATS guideway and support structure would not physically alter these buildings in any way and the buildings would remain in their original locations, retaining all their significant character-defining features and materials. The proposed Project would erect substantial new physical structure features in the form of the ATS guideway and support structures within proximity to these buildings along Market Street and Manchester Boulevard. However, the guideway structure and the support columns would only obscure a limited portion of the facades for five of the six historical

resources, depending on the position of the viewer. Additionally, the ATS guideway would be elevated above the roadway and sidewalks, and often substantially higher than the historic structures. For these reasons, the proposed Project would have a less than significant indirect impact on the former United Bank of California building, the former Fox Theater building, the former Bank of Inglewood building, the former J.C. Penney building, the Professional Building, the Bank of America building, and the Lighthouse McCormick Mortuary. Impacts to each of these resources is described below.

158-170 N. Market Street (former United Bank of California)

The former United Bank of California building is located on the east side of Market Street, immediately adjacent to the proposed location of the ATS guideway.<sup>82</sup>

The Project will not physically alter the former United Bank of California building in any manner. The building will remain in its original location and will retain all of its significant character-defining features. However, the Project will erect a substantial new physical structure in front of and within close proximity of the building along Market Street, altering its setting and potentially interfering with the visual and spatial relationships between the building and its immediate surroundings. Because the United Bank of California building is set back slightly from the property line, important setting features are limited to the building parcel and the configuration of the street and sidewalk fronting the building's east-facing façade. New construction has the potential to encroach upon and reduce the generally open area of public street and sidewalk that partly defines the building's setting. The Project also has the potential to limit the ability of the building to convey its historic significance by substantially obscuring its primary façade when viewed from the west side of Market Street which is an important vantage point from which to understand the building's overall scale, massing composition, and design. The building's secondary façade along Regent Street will not be obscured by the Project.

The ATS guideway will be elevated above the roadway and sidewalks, passing directly in front of the United Bank of California building. As shown in the updated conceptual Project plans, the edge of the guideway will be approximately 38 feet from the building's façade and approximately 24 feet from the projecting canopy. The bottom of the guideway will be elevated a minimum of 40 feet above the roadway. Additionally, the guideway will be carried by single columns positioned in the center of Market Street, one of which will be located in front of or immediately adjacent to the United Bank of California. The support columns will be a round shape approximately 8 feet in diameter and spaced a minimum of 120 feet apart on center. Moreover, **PDF CUL-1** has been incorporated into the Project that requires the elevation and distance of the guideway from the façade of the historical resource to be sufficient for the guideway to visually clear the top of the historic resources' street facing façade. **PDF CUL-1** also requires the

<sup>82</sup> The drive-thru automated teller building across the street is not considered part of the bank building.

dimensions, placement, and spacing of the guideway support columns be optimized to minimize the obstruction of views of the street facing facades of historical buildings.

These elements will allow for a substantial distance between the ATS guideway and the United Bank of California building, maintaining a substantial portion of the existing open sidewalk and street area that partly defines the building's setting. The United Bank of California building measures approximately 23 feet in height and the guideway will clear the top of the building by approximately 17 feet. Because the guideway will be a substantial distance away from the façade of the United Bank of California building's and positioned a substantial distance higher than the building, it will not obscure important physical features of the primary façade when viewed from the west side of Market Street.

Because two columns will sit in front of or immediately adjacent to the United Bank of California building, a portion of the building's primary façade will be intermittently obscured depending on the position of the viewer. However, due to the dimensions and spacing of the columns, only a very limited portion of the United Bank of California building's primary façade will be obstructed when viewed from the west side of Market Street. The north façade facing Regent Street will remain unobstructed. Those portions of the building's façade that will be obscured will be minor in comparison to the overall size of the building, the majority of which will remain visible. Because the ATS guideway would be located approximately 17 feet above the top of the United Bank of California building and the center support columns carrying the guideway will only obscure a small portion of the building's primary façade, the Project will not obscure its primary façade such that its physical form and architectural style cannot be discerned. Ultimately, the building's overall scale, massing, composition, and design will remain readily discernable despite some intermittent obscuring of physical features from some views.

The Project will alter the historic setting of the United Bank of California building by placing new construction along Market Street. However, this alteration to setting will not substantially interfere with the visual and spatial relationships between the building and its immediate surroundings. **PDF CUL-1** requires the height of the guideway, the distance of the guideway from the edge of the building, and the size and spacing of the vertical supporting columns to be designed in a manner that maintains important aspects of the existing setting of this resource and ensures that the overall scale, massing, composition, and design of the building will remain readily discernable. For architecturally significant historical resources like the United Bank of California building, the most important aspects of integrity are design, workmanship, and materials. Although integrity of setting will be altered along Market Street, all of the other aspects of integrity including location, design, materials, workmanship, feeling and association will remain and, for these reasons, the historical resource will retain overall integrity. The United Bank of California building will continue to convey its historic significance after implementation of the Project and as such, the impact of the Project to the historic resource will be less than significant.

115 N. Market Street (former Fox Theater)

The former Fox Theater building is located on the west side of Market Street, immediately adjacent to where the new ATS guideway will be located in the center of Market Street.

The Project will not physically alter the Fox Theater building in any way. The building will remain in its original location and will retain all of its significant character-defining features. The Project will, however, erect a substantial new physical structure in front of, and within close proximity to, the Fox Theater, altering its setting and potentially interfering with the visual and spatial relationships between the buildings and their immediate surroundings. Because the Fox Theater building is built to the property line, important features of the building are limited to the scale of the surrounding development and configuration of the street and sidewalk fronting the building's west and south façades. New construction has the potential to encroach upon and reduce the generally open area of public street and sidewalk that defines the building's setting. New construction also has the potential to limit the building's ability to convey its historic significance by substantially obscuring its primary east-facing façade when viewed from the west side of Market Street, an important vantage point from which to understand the building's overall scale, massing, composition, and design.

The former Fox Theater building conveys its historical significance through its only public façade on Market Street, an important vantage point from which to observe the building's primary façade. The ATS guideway will be elevated above the roadway and sidewalks, passing directly in front of the Fox Theater building. The main volume of the Fox Theater building measures approximately 38 feet tall, with its vertical sign pylon, an important feature of the front facade, rising to a height of approximately 70 feet.

As shown in the conceptual Project plans, the horizontal distance from the edge of the guideway to the marquee will be approximately 17 feet; the horizontal distance from the edge of the guideway to the building façade would be approximately 28 feet, based on a maximum guideway width of 42 feet. The guideway along the frontage of the building would be supported by single columns positioned in the center of Market Street, with no columns located directly in front of, or immediately adjacent to, the Fox Theater building.

In order to allow continued views of the sign pylon, the height of the guideway will be raised so that the bottom is a minimum of 53 feet from grade above the roadway. This minimum elevation will be maintained for approximately 100 feet to the north and south of the Fox Theater. This would allow for a greater distance between the ATS guideway and the Fox Theater building, maintaining much of the existing open sidewalk and street that define the building's setting. The height of the guideway in front of the Fox Theater building, the stipulation that no support columns will be located in front of or adjacent to the Fox Theater and the horizontal separation between the Fox Theater and the guideway would ensure that the

Project would not obscure important physical features of the primary façade, including the vertical sign pylon, when viewed from the east side of Market Street.

The Project will alter the historic setting of the Fox Theater building by placing new construction along Market Street. However, this alteration to the setting will not substantially interfere with the visual and spatial relationships between the building and its immediate surroundings. **PDF CUL-1** requires minimum visual clearances; including the height of the guideway, the distance of the guideway from the edge of the building, and the size and spacing of the vertical supporting columns, to be incorporated into project design. The Project will be designed in a manner that maintains important aspects of the resource's existing setting and ensures that its overall scale, massing, composition, and design will remain readily discernable. For architecturally significant historical resources like the Fox Theater building, the most important aspects of integrity are design, workmanship, and materials. Although integrity of setting will be altered along Market Street, all of the other aspects of integrity, including location, design, materials, workmanship, feeling and association will remain, and therefore the historical resource will retain integrity overall. The Fox Theater building will continue to convey its historic significance as a 1940s Late Moderne-style movie theater building after implementation of the Project and as such, indirect impacts to the Fox Theater building would be less than significant.

100 N. Market St/307 E Queen Street (former Bank of Inglewood)

The former Bank of Inglewood building is located on the west side of Market Street, immediately adjacent to where the new ATS guideway will be located.

The Project will not physically alter the former Bank of Inglewood building in any manner. The building will remain in its original location and will retain all of its significant character-defining features. The Project will, however, erect a substantial new physical structure in front of and within close proximity of the buildings along Market Street, altering their setting and potentially interfering with the visual and spatial relationships between the buildings and their immediate surroundings. Because the Bank of Inglewood building is built to the property line, important setting features are limited to the scale of the surrounding development and configuration of the street and sidewalk fronting the building's west and south façades. New construction has the potential to encroach upon and reduce the generally open area of public street and sidewalk that defines the building's setting. New construction also has the potential to limit the building's ability to convey its historic significance by substantially obscuring its primary façade when viewed from the west side of Market Street, which is an important vantage point from which to understand the building's overall scale, massing composition, and design. The building's façade along Queen Street will not be obscured by the Project.

#### 4.4 Cultural Resources

The ATS guideway will be elevated above the roadway and sidewalks, passing directly in front of the Bank of Inglewood building. The edge of the guideway will be approximately 29 feet from the façade of the Bank of Inglewood building (assuming a maximum guideway width of 42 feet). Additionally, the guideway will be supported by single columns positioned in the center of Market Street, one of which will likely be located in front of or immediately adjacent to the Bank of Inglewood building. The support columns will be round in shape, approximately 8 feet in diameter, and spaced a minimum of 120 feet apart on center. This will allow for a substantial distance between the ATS guideway and the Bank of Inglewood building, maintaining much of the existing open sidewalk and street that define the setting of the building. The Bank of Inglewood building measures approximately 33 feet in height; thus, the guideway will be higher than the building by approximately 7 feet. Because the guideway will be a substantial distance away from the Bank of Inglewood building's façade, and positioned a substantial distance higher than the building, it will not obscure important physical features of the primary façade when viewed from the west side of Market Street.

With a single column located adjacent to the Bank of Inglewood building, a portion of the building's primary façade will be intermittently obscured depending on the position of the viewer. However, due to the dimensions and spacing of the columns, only a very limited portion of the Bank of Inglewood building's primary façade will be obstructed when viewed from the west side of Market Street. The larger south façade facing Queen Street will remain unobstructed. Additionally, columns will be placed so that the important corner view of the building, which takes in the entirety of both publicly visible façades, will be maintained. Those portions of the building's façade that will be obscured will be minor in comparison to the overall size of the building, the majority of which will remain visible. Because the ATS guideway would be located at least 7 feet higher than the Bank of Inglewood building and the center support columns carrying the guideway will only obscure a small portion of the building's primary façade, the Project will not obscure its primary facade such that its physical form and architectural style cannot be discerned. Moreover, **PDF CUL-1** requires the guideway's elevation and distance from the façade of the historical resource to be sufficient for the guideway to visually clear the top of the historic resources' street facing façade. **PDF CUL-1** also requires the dimensions, placement, and spacing of the guideway support columns will be such that the obstruction of views of historical resources' street facing facades will be minimized. Ultimately, the building's overall scale, massing, composition, and design will remain readily discernable despite some intermittent obscuring of physical features from some views.

The Project will alter the historic setting of the Bank of Inglewood building by placing new construction along Market Street. However, this alteration to setting will not substantially interfere with the visual and spatial relationships between the building and its immediate surroundings. **PDF CUL-1** requires the height of the guideway, the distance of the guideway from the edge of the building, and the size and spacing of the vertical supporting columns to be designed in a manner that maintains important aspects of the

#### 4.4 Cultural Resources

existing setting of the building, which will ensure that the overall scale, massing, composition, and design of this building will remain readily discernable.

For architecturally significant historical resources like the Bank of Inglewood building, the most important aspects of integrity are design, workmanship, and materials. Although integrity of setting will be altered along Market Street, all of the other aspects of integrity including location, design, materials, workmanship, feeling and association will remain, and therefore the historical resource will retain integrity overall. Thus, the Bank of Inglewood building will continue to convey its historic significance after implementation of the revised Project and as such, the indirect impact of the Project to this historic resource would be less than significant.

#### 129-139 S. Market Street (former J.C. Penney)

The former J.C. Penney building is located on the west side of Market Street adjacent to where the new ATS guideway will be located. The former J.C. Penney building conveys its historical significance through its only public façade on Market Street, an important vantage point from which to observe the building's primary façade and main entry.

The Project will not physically alter the former J.C. Penney building in any way. The building will remain in its original location and will retain all of its significant character-defining features. However, the Project will erect a substantial new physical structure in front of and within close proximity of the buildings along Market Street, altering their setting and potentially interfering with the visual and spatial relationships between the buildings and their immediate surroundings. Because the J.C. Penney building is built to the property line, important setting features are limited to the scale of the surrounding development and configuration of the street and sidewalk fronting the building's east façade. New construction has the potential to encroach upon and reduce the generally open area of public street and sidewalk that defines the building's setting. New construction also has the potential to limit the building's ability to convey its historic significance by substantially obscuring its primary façade when viewed from the east side of Market Street—an important vantage point from which to understand the building's overall scale, massing composition, and design.

The ATS guideway will be elevated above the roadway and sidewalks, passing directly in front of the J.C. Penney building. The edge of the guideway will be approximately 21 feet to the building's projecting canopy and approximately 28 feet to the building façade at its closest point, after which the guideway pulls further away from the building as it turns the corner onto Manchester Boulevard. The bottom of the guideway will be approximately of 40 feet above the roadway. Additionally, the guideway will be carried by single columns positioned in the center of Market Street, one of which will be located in front of or immediately adjacent to the J.C. Penney building. The support columns will be round in shape,

#### 4.4 Cultural Resources

approximately 8 feet in diameter, and spaced a minimum of 120 feet apart when measured from the center of the column.

This will allow for distance between the ATS guideway and the J.C. Penney building, maintaining a substantial portion of the existing open sidewalk and street that define the building's setting. The J.C. Penney building measures approximately 30 feet in height so the guideway will clear the top of the building by approximately 10 feet. Because the guideway will be a substantial distance away from the J.C. Penney building façade, and positioned a substantial distance higher than the building, it will not obscure important physical features of the primary façade when viewed from the east side of Market Street. Additionally, **PDF CUL-1**, incorporated into the Project, requires the guideway's elevation and distance from the façade of the historical resource to be sufficient for the guideway to visually clear the top of the historic resources' street facing façade. **PDF CUL-1** also requires the dimensions, placement, and spacing of the guideway support columns will be such that the obstruction of views of historical resources' street facing facades will be minimized.

With a single column located in front of or adjacent to the J.C. Penney building, a portion of the building's primary façade will be intermittently obscured depending on the position of the viewer. However, due to the dimensions and spacing of the columns, only a very limited portion of the J.C. Penney building's primary façade will be obstructed when viewed from the east side of Market Street. The portion of the building's façade that will be obscured will be minor in comparison to the overall size of the building, the majority of which will remain visible. Because the ATS guideway would be located approximately 10 feet higher than the J.C. Penney building and the support columns carrying the guideway will only obscure a small portion of the building's primary façade, the Project will not obscure its primary facade such that its physical form and architectural style cannot be discerned. Ultimately, the building's overall scale, massing, composition, and design will remain readily discernable despite some intermittent obscuring of physical features from some views.

The Project will alter the historic setting of the J.C. Penney building by placing new construction along Market Street. However, this alteration to setting will not substantially interfere with the visual and spatial relationships between the building and its immediate surroundings. **PDF CUL-1** requires that the height of the guideway, the distance of the guideway from the edge of the building, and the size and spacing of the vertical supporting columns, have been designed in a manner that maintains important aspects of the resource's existing setting and ensures that its overall scale, massing, composition, and design will remain readily discernable.

For architecturally significant historical resources like the J.C. Penney building, the most important aspects of integrity are design, workmanship, and materials. Although integrity of setting will be altered along Market Street, all of the other aspects of integrity, including location, design, materials, workmanship,

#### 4.4 Cultural Resources

feeling and association, will remain, and therefore the historical resource will retain integrity overall. Thus, the J.C. Penney building will continue to convey its historic significance as a 1950s Mid-Century Modern-style department store building after implementation of the Project and the impact of the Project to this historic resource will be less than significant.

#### 149-155 S. Market Street/231-239 E Manchester Boulevard (Professional Building)

The Professional Building is located on the west side of Market Street, immediately adjacent to where the new ATS guideway will be located. The Professional Building conveys its historical significance through its two publicly visible facades, on Market Street (primary) and Manchester Boulevard (secondary).

The Project will not physically alter the Professional Building in any way. The building will remain in its original location and will retain all of its significant character-defining features. However, the Project will erect a substantial new physical structure in front of and within close proximity of the building along Market Street, altering its setting and potentially interfering with the visual and spatial relationships between the building and its immediate surroundings. Because the Professional Building is built to the property line, important setting features are limited to the building parcel and the configuration of the street and sidewalk fronting the building's east- and south-facing façades. New construction has the potential to encroach upon and reduce the generally open area of public street and sidewalk that partly defines the building's setting. New construction also has the potential to limit the building's ability to convey its historic significance by substantially obscuring its primary façade when viewed from the east side of Market Street—an important vantage point from which to understand the building's overall scale, massing composition, and design. The building's secondary façade along Manchester Boulevard will not be obscured by the Project.

The ATS guideway will be elevated above the roadway and sidewalks, passing directly in front of the Professional Building. The edge of the guideway will be approximately 47 feet from the building's façade at its closest point, after which the guideway pulls further away as it turns the corner onto Manchester Boulevard. The bottom of the guideway will be elevated approximately 40 feet above the roadway. Additionally, as the guideway makes its turn at Market Street and Manchester Boulevard, the columns will be placed on the opposite (east) side of the Market Street and on Manchester Boulevard. Because no columns will sit in front of or immediately adjacent to the Professional Building, the building's primary facade will not be obscured when viewed from the east side of Market Street. The south façade facing Manchester will also remain unobstructed.

This allows for a substantial distance between the ATS guideway and the Professional Building, maintaining more of the existing open sidewalk and street area that partly defines the building's setting. The Professional Building measures approximately 32 feet in height; thus, the guideway will clear the top of

#### 4.4 Cultural Resources

the building by approximately eight feet. Because the guideway will be a substantial distance away from the Professional Building's façade, and positioned a substantial distance higher than the building, it will not obscure important physical features of the primary façade when viewed from the east side of Market Street. Ultimately, the building's overall scale, massing, composition, and design will remain readily discernable. Moreover, **PDF CUL-1** has been incorporated into the Project that requires the guideway's elevation and distance from the façade of the historical resource to be sufficient for the guideway to visually clear the top of the historic resources' street facing façade. **PDF CUL-1** also requires the dimensions, placement, and spacing of the guideway support columns will be such that the obstruction of views of historical resources' street facing facades will be minimized.

The Project will alter the historic setting of the Professional Building by placing new construction along Market Street. However, this alteration to setting will not substantially interfere with the visual and spatial relationships between the building and its immediate surroundings. **PDF CUL-1** requires the height of the guideway, the distance of the guideway from the edge of the building, and the size and spacing of the vertical support columns, to be designed in a manner that maintains important aspects of the resource's existing setting and ensures that its overall scale, massing, composition, and design will remain readily discernable. Although integrity of setting will be altered along Market Street, all of the other aspects of integrity, including location, design, materials, workmanship, feeling and association, will remain, and therefore the historical resource will retain integrity overall. For these reasons, the Professional Building will continue to convey its historic significance as a 1920s Spanish Colonial Revival-style commercial building after implementation of the Project and as such, the indirect impact of the Project to the historic resource would be less than significant.

#### 320-330 E. Manchester Boulevard (Bank of America)

The Bank of America building is located on the south side of Manchester Boulevard, adjacent to where the new ATS guideway will be located. The Bank of America building conveys its historical significance through its two publicly visible facades, on the south side of Manchester Boulevard (primary), and Locust Street (secondary).

The revised Project will not physically alter the Bank of America building in any manner. The building will remain in its original location and will retain all of its significant character-defining features. However, the revised Project will erect a substantial new physical structure in front of this resource, altering its setting and potentially interfering with the visual and spatial relationships between the building and its immediate surroundings. The setting of a historical resource includes features within its boundaries as well as its immediate surroundings. Because the Bank of America building is built to the property line, important setting features are limited to the scale of the surrounding development and configuration of the street and sidewalk fronting the building's north and east façades. New construction has the potential to

#### 4.4 Cultural Resources

encroach upon and reduce the generally open area of public street and sidewalk that defines the building's setting. New construction also has the potential to limit the building's ability to convey its historic significance by substantially obscuring its primary façade when viewed from the north side of Manchester which is a critical vantage point from which to understand the building's overall scale, massing, composition, and design.

The ATS guideway will be elevated above the roadway and sidewalks, passing directly in front of the Bank of America building. The edge of the guideway will be approximately 30 feet from the façade of the Bank of America building (assuming a maximum guideway width of 42 feet). The bottom of the ATS guideway would be elevated a minimum of 40 feet above the roadway.

The guideway along Manchester Boulevard would be supported by single columns in a new center median. Each column will be approximately 8 feet in diameter and spaced a minimum of 120 feet apart on center. As a result, the support columns will be located away from the Bank of America building façade with substantial space between columns, maintaining much of the existing open sidewalk and street that define the building's setting. The Bank of America building measures approximately 28 feet in height; the guideway will clear the top of the building by approximately 12 feet. Because the guideway will be a substantial distance away from the Bank of America building's façade, and positioned a substantial distance higher than the building, it will not obscure important physical features of the primary façade when viewed from directly across the street on the north side of Manchester.

With single columns located within the center of Manchester Boulevard in the vicinity of the Bank of America building, portions of the building's primary facade will be intermittently obscured depending on the position of the viewer. However, due to the planned dimensions and spacing of the columns, only very limited portions of the Bank of America building's primary façade will be obstructed when viewed from the north side of Manchester Boulevard. Those portions of the building's façade that will be obscured will be minor in comparison to the façade's total size, the majority of which will remain unobstructed. Because the ATS guideway would be located approximately 12 feet above the top of the Bank of America Building and the center support columns carrying the guideway will only obscure small portions of the building's primary façade, the Project will not obscure its primary facade such that its physical form and architectural style cannot be discerned. The building's overall scale, massing, composition, and design will remain readily discernable despite some intermittent obscuring of some views. The revised Project will alter the historic setting of the Bank of America building by placing new construction along Manchester Boulevard. However, this alteration to the setting will not substantially interfere with the visual and spatial relationships between the building and its immediate surroundings. **PDF CUL-1**, incorporated into the Project, requires the guideway's elevation and distance from the façade of the historical resource to be sufficient for the guideway to visually clear the top of the historic resources' street facing façade. **PDF CUL-**

#### 4.4 Cultural Resources

1 also requires the dimensions, placement, and spacing of the guideway support columns will be such that the obstruction of views of historical resources' street facing facades will be minimized. **PDF CUL-1** ensures that the Bank of America building's overall scale, massing, composition, and design will remain readily discernable.

For architecturally significant historical resources like the Bank of America building, the most important aspects of integrity are design, workmanship, and materials. Although integrity of setting will be altered along Manchester Boulevard, all of the other aspects of integrity, including location, design, materials, workmanship, feeling and association, will remain, and therefore the historical resource will retain integrity overall. The Bank of America building will continue to convey its historic significance after implementation of the revised Project and as such, the indirect impact of the revised Project to the historical resource would be less than significant.

#### 619-635 S. Prairie Avenue (Lighthouse McCormick Mortuary)

The Lighthouse McCormick Mortuary property is located on the west side of Prairie Avenue, adjacent to where the new ATS guideway will be located. The Lighthouse McCormick Mortuary building conveys its historical significance through its main public façade on Prairie Avenue, an important view from which to observe the building's primary east-facing façade and main entry.

The Project will not physically alter the Lighthouse McCormick Mortuary property. The building will remain in its original location and will retain all of its significant character-defining features. However, the Project will erect a substantial new physical structure in front of the mortuary property, altering its setting and potentially interfering with the visual and spatial relationships between the building and its immediate surroundings to the east. The Lighthouse McCormick Mortuary property is set back from the property line behind a front lawn. Important setting features are limited to the property itself and the configuration of the street and sidewalk fronting the building's east-facing façade. New construction has the potential to encroach upon and reduce the generally open area of public street and sidewalk that partly defines the building's setting. New construction also has the potential to limit the building's ability to convey its historic significance by substantially obscuring its primary façade when viewed from Prairie Avenue. The building's secondary façade along La Palma Drive will not be obscured by the revised Project.

The ATS guideway will be elevated above the roadway and sidewalks, passing directly in front of the Lighthouse McCormick Mortuary property. The bottom of the guideway will be elevated approximately 40 feet above the roadway, meaning the ATS guideway will clear the top of the mortuary building by approximately 10 feet. Additionally, the guideway will be carried by three support columns positioned on the Prairie Avenue sidewalk in front of the mortuary building.

#### 4.4 Cultural Resources

The Project will alter the immediate surroundings of the Lighthouse McCormick Mortuary by encroaching on the existing open sidewalk and street area that partly defines the building's setting. ATS support columns will also partially obscure the mortuary building's primary façade from some vantage points on the east side of Prairie Avenue. Because three columns will sit in front of the Lighthouse McCormick Mortuary property, a portion of the building's primary façade will be intermittently obscured depending on the position of the viewer. However, due to the dimensions and spacing of the columns, only a very limited portion of the Lighthouse McCormick Mortuary property's primary façade will be obstructed when viewed from the west side of Prairie Avenue. More importantly, the mortuary's primary façade is set back from the sidewalk behind a front lawn, physically separating between the mortuary building and the new construction. Due to this separation, the mortuary building's primary façade will not be obscured from vantage points on the east side of Prairie Avenue. The south façade facing La Palma Drive will remain unobstructed. Those portions of the building's façade that will be obscured will be minor in comparison to the overall size of the building, the majority of which will remain visible.

Because the ATS guideway would be located approximately 10 feet higher than the Lighthouse McCormick Mortuary property and the center support columns carrying the guideway will only obscure a small portion of the building's primary façade, the Project will not obscure its primary facade such that its physical form and architectural style cannot be discerned. In addition, **PDF CUL-1** has been incorporated into the Project which requires the guideway's elevation and distance from the façade of the historical resource to be sufficient for the guideway to visually clear the top of the historic resources' street facing façade. **PDF CUL-1** also requires the dimensions, placement, and spacing of the guideway support columns will be such that the obstruction of views of historical resources' street facing facades will be minimized. The building's overall scale, massing, composition, and design will remain readily discernable despite some intermittent obscuring of physical features from some views.

The Project will alter the historic setting of the Lighthouse McCormick Mortuary property by placing new construction along Prairie Avenue including the placement of three support columns within the Prairie Avenue sidewalk in front of the Mortuary building. This alteration to setting will not substantially interfere with the visual and spatial relationships between the building and its immediate surroundings. **PDF CUL-1** requires the height of the guideway, the distance of the guideway from the edge of the building, and the size and spacing of the vertical supporting columns, to be designed in a manner that maintains important aspects of the resource's existing setting and ensures that it's overall scale, massing, composition, and design will remain readily discernable.

For architecturally significant historical resources like the Lighthouse McCormick Mortuary property, the most important aspects of integrity are design, workmanship, and materials. Although integrity of setting will be altered along Market Street, all of the other aspects of integrity, including location, design,

4.4 Cultural Resources

materials, workmanship, feeling and association, will remain, and therefore the historical resource will retain integrity overall. The Lighthouse McCormick Mortuary property will continue to convey its historic significance after implementation of the Project and the indirect impact of the Project to the historic resource will be less than significant for this reason.

**Summary of Impacts**

The Project will result in both direct and indirect impacts to historical resources under CEQA. Of the ten (10) historical resources identified in the Project Area and/or Expanded Study Area, the Project will have a less than significant impact on eight (8) resources, and no impact on two (2) resources. There will be no significant impacts to historical resources as a result of the Project as summarized below in **Table 4.4-2: Historical Resources Impact Summary**.

**Table 4.4-2  
Historical Resources Impact Summary**

Address	APN	Name	No Impact	Less Than Significant Impact	Significant Impact
260 N Locust St	4015026039	Holy Faith Episcopal Church	✓		
158-170 N Market St	4021007012	Broadway Federal Bank (former United Bank of California)		✓

Source: *Historic Resources Technical Report*, HRG, October 2021 (refer to **Appendix I.2**).

<sup>83</sup> The parcel situated within the Expanded Study Area (APN 4012031930) has no address and contains only a small portion of the Inglewood Park Cemetery property. The vast majority of the cemetery occupies the adjacent parcel at 720 E Florence Avenue (APN 4012031027).

4.4 Cultural Resources

**Impact CUL-2: Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?**

**Impacts**

Section 15064.5 of the CEQA Guidelines generally defines a historic or archeological resource as a resource that is (1) listed in, or determined to be eligible for listing in the California Register of Historical Resources (California Register); (2) included in a local register of historical resources (pursuant to Section 5020.1(k) of the PRC); or (3) identified as significant in an historical resources survey (meeting the criteria in Section 5024.1(g) of the PRC) in addition to maintaining a sufficient level of physical integrity.

Further, CEQA considers unique archaeological resources including archaeological artifact, object, or site which can clearly demonstrate the following criteria: (1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information; (2) Has a special and particular quality such as being the oldest of its type or the best available example of its type; or (3) Is directly associated with a scientifically recognized important prehistoric or historic event or person.<sup>84</sup> Unique archaeological resources include material evidence of past human life and culture of previous ages.

A literature review and records search were conducted at the South Central Coastal Information Center housed at California State University, Fullerton on June 20, 2018.<sup>85</sup> The records search included the proposed Project footprint and an area of a half-mile surrounding the Project area. The records search indicated there are no prehistoric or historical archaeological resources recorded within a half-mile radius of the area. In addition to the records search, a reconnaissance survey of the proposed Project area was conducted on July 20, 2018, also resulting in negative findings of prehistoric or historic archaeological resources identified. However, ground visibility surrounding the proposed Project footprint is very poor due to a high level of urbanization and development and any resources buried below ground would be difficult to observe.

During construction, the proposed Project would require excavation, grading, drilling, and other related construction activities that involve extensive ground disturbance that could expose undiscovered archaeological artifacts. As much of the area has experienced prior development, the potential for such discoveries is considered low. Deeper ground disturbing activities, such as drilling for columns, would involve techniques that would not provide for successful recovery of any artifacts as they would be

<sup>84</sup> California PRC, Sections 21083.2, Archeological Resources.

<sup>85</sup> *Cultural Resource Investigation*, Roberta Thomas, M.A., RPA, and Gena Granger, M.A., RPA, PaleoWest Archaeology (PaleoWest), December 12, 2018.

destroyed during drilling. Therefore, there is a potential significant impact for unearthing or destroying previously unknown archaeological resources during construction.

Operation of the proposed Project would not involve ground disturbing activities and, therefore, would not have the opportunity to unearth previously unknown archaeological resources. Operation of the proposed Project would have no impact on archaeological resources at or around the proposed Project area.

#### **Mitigation Measures**

**MM TCR-1 to MM TCR-4** from **Section 4.13**.

#### **Level of Significance after Mitigation**

The impacts associated with causing a substantial adverse change in the significance of an archaeological resource would be reduced to a less-than-significant-level with the implementation of **MM TCR-1 to MM TCR-4**. The measures would require the contractor to hire a qualified archaeologist meeting Secretary of the Interior's Professional Qualifications Standards for archaeology (US Department of the Interior, 2008) to carry out all mitigation related to cultural resources, including on-site monitoring of any ground disturbing activities. The monitor would be versed in locating and identifying archeological artifacts. This would increase the likelihood for locating archeological resources unearthed on-site and properly identifying its significance. Proper treatment of the artifacts immediately after discovery would be determined by the qualified archaeologist to minimize adverse change in the significance of the archeological resource discovered.

Prior to construction all construction personnel associated with demolition and ground disturbance activities would also be required to receive Cultural Resources Sensitivity Training, which would include training in identifying characteristics of archeological resource finds. Minimizing the possibility to cause substantial adverse change to significant archeological resources due to construction activities. In the event of the discovery of any archaeological materials during implementation of the Project, all work shall immediately cease within 50 feet of the discovery until it can be evaluated by the qualified archaeologist. Construction shall not resume until the qualified archaeologist has made a determination on the significance of the resource(s) and provided recommendations regarding the handling of the find. If the resource is determined to be significant, the qualified archaeologist will confer with the project applicant regarding recommendation for treatment and ultimate disposition of the resource(s). This process would ensure proper treatment and processing of the archeological resources found. Therefore, potential impacts associated with causing a substantial adverse change in the significance of an archaeological resource would be reduced to a less-than-significant-level.

**Impact CUL-3: Disturb any human remains, including those interred outside of formal cemeteries.**

#### **Impacts**

A significant adverse effect would occur if ground disturbing activities associated with the proposed Project were to disturb previously interred human remains. Construction of the proposed Project would require extensive construction of foundations and columns, as well as other ground-disturbing activities. Required construction activities have the potential for unearthing and destroying unknown human remains underground which were not observed during the field survey. Thus, the potential to disturb human remains exists and this potential impact would be significant.

Discovery of Native American human remains is further discussed in **Section 4.13**.

#### **Mitigation Measures**

**MM TCR-1, MM TCR-3 and MM TCR-5** from **Section 4.13**.

#### **Level of Significance after Mitigation**

The impacts associated with disturbing any undiscovered human remains would be reduced to a less-than-significant-level with the implementation of **MM TCR-1, MM TCR-3, and MM TCR-5**. The measures would require the contractor to hire a qualified monitor on-site to monitor any ground disturbing activities. The monitors would be versed in locating and identifying human remains. Prior to construction all construction personnel associated with demolition and ground disturbance activities would also be required to receive Cultural Resources Sensitivity Training, which would include training in identifying human remains. In the event human remains is found, work would immediately cease within 150 feet of the discovery and the County coroner would be contacted in accordance with PRC Section 5097.98 and Health and Safety Code Section 7050.5. The City, tribal cultural resources monitor, and archaeological monitor would also be notified. Proper treatment and processing of the human remains would be carried out in compliance with PRC Section 5097.98, Health and Safety Code Section 7050.5, **MM TCR-1, MM TCR-3, and MM TCR-5**. Therefore, potential impacts to disturbing human remains would be reduced to a less-than-significant-level.

#### **4.4.7 CUMULATIVE IMPACTS**

The cumulative context for historic resources can be defined by a number of factors depending on the conditions and the presence or absence of known historic resources in the area. No historic district has been identified within the Project Area or Expanded Study Area and, for this reason, there is no potential for cumulative impacts to historical resources as a result of the proposed Project.

For the proposed Project, the cumulative context for historical resources considers impacts to significant historical resources in Inglewood. The majority of the cumulative projects identified in **Section 4.0** involve commercial and residential developments, many of which are smaller in scale, while the HPSP accounts for a large portion of the cumulative development. The HPSP EIR was certified in 2009 and concluded that the HPSP project would result in a less-than-significant impact to historic resources. Given the long history of Inglewood and large number of historic-age buildings and structures throughout the City it is possible that historical resources may be significantly impacted as a result of at least one of the identified cumulative projects that constitute the cumulative context. Therefore, the cumulative impact on historic architectural resources is considered potentially significant. Because the Project would not be constructed within a Historic District and would result in less than significant impacts to historical resources, the Project's incremental contribution to the potential significant cumulative impact on cultural resources would not be cumulatively considerable.

#### 4.4.8 CONSISTENCY WITH CITY OF INGLEWOOD GENERAL PLAN

##### Land Use Element

The City's Land Use Element<sup>86</sup> was adopted in 1980 and subsequently amended in 1986, 2009, 2015, 2016, and 2020. Applicable goals to the Cultural Resources section were added in 2016 to the Land Use Element with the adoption of the New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines described below.

##### ***New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines***

The New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines<sup>87</sup> (Downtown TOD Plan) covers the Downtown Inglewood and Fairview Heights neighborhoods of the City and works to implement the City's vision for transforming the quality of the environment within these areas. The Downtown TOD Plan area consists of approximately 585 acres located in the center of Inglewood along the Metro K line just east of the Florence Avenue/La Brea Avenue intersection. This Downtown planning and zoning area extends approximately one-half mile in all directions from the Metro Downtown Inglewood Station.

The Downtown TOD Plan planning effort were incorporated into the Land Use Element with its 2016 update. Relevant goals and policies in the Downtown TOD are listed as follows:

<sup>86</sup> City of Inglewood. *Land Use Element*. <https://www.cityofinglewood.org/DocumentCenter/View/132/Land-Use-Element-1980-Amended-1986-2009-2016-PDF>. Accessed July 22, 2020.

<sup>87</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, November 1, 2016.

<b>Goal 1:</b>	Downtown is a place to live, work, shop, recreate, and be entertained.
<b>Policy 1.2:</b>	Ground Floor Uses and Storefronts. Require uses that activate pedestrian activity such as retail on major streets and plaza frontages. Require that storefronts be historically sensitive, attractive, and transparent in the Historic Downtown.
<b>Goal 2:</b>	Downtown is a revitalized yet forward-looking gathering place for the community.
<b>Policy 2.3:</b>	Preservation of Historic Fabric. Require the preservation of buildings that have been designated as historic and encourage the reuse of other historic buildings. Maintain the sense of place in areas with historic fabric and/or meaning such as Market Street between Regent Street and Hillcrest Avenue and the Hillcrest neighborhood east of Locust Street.
<b>Goal 6:</b>	Downtown expresses the unique culture of Inglewood.
<b>Policy 6.1:</b>	Districts. Define the following unique districts within the Downtown TOD area, each with their own unifying character or identity that should be preserved and enhanced: Historic Downtown, Civic Center, TechTown, Beach Avenue, Fairview West, Hillcrest and Queen Street.

The proposed Project is consistent with the Policy 1.2 and Policy 6.1 within the Downtown TOD Plan in the Land Use Element. The design of the proposed ATS system has taken into consideration storefronts and retail on major streets within the project footprint to limit its direct and indirect impact to surrounding historic resources. Resources impacted by the proposed Project would be mitigated to the extent feasible and impacts to publicly visible facades would be minimized as allowed for by proposed Project design.

The proposed Project would be consistent with Policy 2.3 within the Downtown TOD Plan through the implementation of an amendment proposed by the Project, by adding the underlined language to the end of Policy 2.3's text:

- Policy 2.3: *Preservation of Historic Fabric*. Require the preservation of buildings that have been designated as historic and encourage the reuse of other historic buildings. Maintain the sense of place in areas with historic fabric and/or meaning such as Market Street between Regent Street and Hillcrest Avenue and the Hillcrest neighborhood east of Locust Street, while also accommodating for the development of the Inglewood Transit Connector along Market Street between Regent Street and Manchester Boulevard.

The amendment would allow the policy to take into account the historical significance of Inglewood Downtown while accommodating for the implementation of the ATS system. Historical resources would remain recognized as an important part of the Inglewood Downtown and any impacts to historical resources would be mitigated to the extent feasible. The proposed Project would be consistent with Policy 2.3 with the proposed amendment.

## 4.5 ENERGY RESOURCES

### 4.5.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) evaluates potential impacts associated with the proposed Inglewood Transit Connector Project (proposed Project) as it relates to energy resources, focusing on the following three resources: electricity, natural gas, and transportation-related energy (petroleum-based fuels). This section contains: (1) a summary of the federal, State, and local regulations related to energy demand and conservation; (2) a description of the energy consumption from the proposed Project, as well as a description of the Adjusted Baseline Environmental Setting; and (3) an analysis of the potential impacts related to energy demand associated with the implementation of the proposed Project.

Appendix F: Energy Conservation of the State California Environmental Quality Act (CEQA) Guidelines identifies the suggested requirements to be considered in an EIR relative to the potential energy impacts of a proposed Project, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy.

Furthermore, this section addresses the infrastructure capacity and demand associated with the energy consumption of the proposed Project, energy conservation and sustainability measures that may be included in the proposed Project. The proposed Project includes ITC Design Standards and Guidelines (Design Guidelines) and a Construction Commitment Program (CCP) provided in **Appendix C** and **Appendix D** to this Recirculated Draft EIR. These features align with Inglewood's commitment to sustainability Citywide, as outlined in the City's Energy and Climate Action Plan and Energy Efficiency Climate Action Plan. These sustainability features serve as a mechanism to promote the City's commitment to reduce its environmental footprint and promote energy efficient design requirements, water conservation, and water quality improvement projects, natural resource protection efforts, waste reduction and recycling, and numerous air quality emissions reduction policies and programs.

For construction impacts, the City would include in bid documents for the proposed Project language specifying that the Project's contractors shall use Tier 4 construction equipment or equivalent on the proposed Project (see **PDF AQ-1** in the CCP). For operational impacts, the proposed Project would comply with the requirements of California Green Building Standards Code (CALGreen), the Design Guidelines and be consistent with the City Energy Efficiency Climate Action Plan policies and programs related to sustainability, energy efficiency, and reduction in greenhouse gas (GHG) emissions. The City has committed to taking an active role in promoting energy conservation and environmentally-friendly initiatives to improve the environment and realize the co-benefits, which include energy independence, cost savings

for energy not used, water saved, improved air quality, and public health benefits from improved air quality.

Energy calculations for this analysis were conducted for existing uses, and proposed Project construction and operation. These calculations are detailed within the following appendices to this Recirculated Draft EIR:

- *Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition*, Lea + Elliott, August 2021 (**Appendix E**)
- *Existing Conditions Energy Calculations*, Meridian Consultants LLC, September 2021 (**Appendix J.1**)
- *Electricity Calculations for Project Construction*, Meridian Consultants LLC, September 2021 (**Appendix J.2**)
- *Vehicle Fuel Calculations for Project Construction*, Meridian Consultants LLC, September 2021 (**Appendix J.3**)
- *Project Operational Energy Calculations*, Meridian Consultants LLC, September 2021 (**Appendix J.4**)
- *Operational Vehicle Fuel Calculations*, Meridian Consultants LLC, September 2021 (**Appendix J.5**)
- *Project Operational Vehicle Fuel Calculations*, Meridian Consultants LLC, September 2021 (**Appendix J.7**)
- *Vons Store Replacement Energy Calculations*, Meridian Consultants LLC, October 2021 (**Appendix J.8**)

Air quality and GHG emissions associated with energy production—that is, production of electricity and the combustion of fuels—are discussed in the impact analyses in **Sections 4.2: Air Quality** and **4.7: Greenhouse Gas Emissions**. Potential conflicts between the proposed Project and existing utility infrastructure that would result in environmental impacts are discussed in **Section 4.14: Utilities and Service Systems**.

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the proposed Project in response to consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. Specific changes to the proposed Project include raising the height of the ATS guideway along Market Street to preserve existing views of historic buildings, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue. In addition, the two power distribution system (PDS) substations are now proposed to be located on the MSF and Prairie Avenue/Hardy Street station sites. As it relates to energy impacts, these changes include updated construction and operational details which resulted in reductions of energy resource consumption compared to the December 2020 Draft EIR.

Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Recirculated Draft EIR.

#### 4.5.2 METHODOLOGY

This analysis compares energy consumption associated with the proposed Project to those under the Adjusted Baseline conditions as defined in **Section 4.0: Environmental Impact Analysis, 4.0.5: Adjusted Baseline**. Energy demand for the proposed Project has been estimated based on generation factors for use type or on specifications for similar facilities at other locations and as estimated by the system design engineers in the Operating Systems Conceptual Report.<sup>1</sup>

Specific assumptions and data sources needed to quantify energy consumption during both construction and operation are presented in **Section 3.0: Project Description**. The methods and scenarios used for the energy calculations are the same as those used for the air quality emissions calculations, as discussed in **Section 4.2**.

##### 4.5.2.1 Construction

Annual energy use includes mobile sources and energy usage associated with the existing on-site structures that would be removed and replaced with construction of the proposed Project. The proposed Project would require a number of full and partial property acquisitions and easements or leases for construction and operation of the guideway, stations, maintenance, and storage facility (MSF), and other support facilities included in the proposed Project. (See **Section 3.0** for a detailed discussion of the existing land uses that would be demolished as part of the proposed Project).

Construction energy consumption would result from transportation fuels (e.g., diesel and gasoline) used for haul trucks, heavy-duty construction equipment, construction workers traveling to and from the proposed Project, electricity consumed to power the construction trailers (lights, electronic equipment, and heating and cooling), and exterior uses such as lights, conveyance of water for dust control, and any electrically-driven construction equipment.

Construction activities could vary substantially from day to day, depending on the specific type of construction activity and the number of workers and vendors that would travel to the proposed Project. This analysis considered these factors and provided the estimated maximum construction energy consumption for the purposes of evaluating the associated impacts on energy resources. The anticipated construction program is discussed in **Section 3.0, 3.7: Construction**. Further details are provided in **Appendix F: ITC Construction Scenarios**.

<sup>1</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

Construction fuel use was forecasted by assuming a conservative estimate of construction activities and applying mobile source emission factors. Construction activities are expected to commence in early 2024 and be completed in 2027.

Construction electricity use was estimated for a temporary construction office, for construction equipment that would use electricity as an alternative to diesel fuel, and for water usage from dust control activities. The CalEEMod emissions model, described further in **Sections 4.2**, was used to estimate the proposed Project's emissions of criteria air pollutants, and was also used to estimate electricity, natural gas, and water use. The same model used for air quality analyses was also used for the purpose of estimating energy use.

The construction office was assumed to be two 2,500 SF trailers and was modeled using the CalEEMod land use category for "General Office." Electricity demand by construction equipment was estimated using default horsepower (hp) and load factors from CalEEMod and hours of operation per day.<sup>2</sup> The total horsepower-hours (hp-h) were then converted to kilowatt-hours (kWh) using a standard conversion factor.

Natural gas would not be consumed in large quantity during construction of the proposed Project because construction offices would not be heated with natural gas, and construction equipment and vehicles would be primarily powered by either diesel, gasoline, or electricity.

Transportation fuels would be consumed for transportation of construction workers and materials to and from the proposed Project, and operation of construction equipment throughout the construction phases. Fuel consumption from on-site heavy-duty construction equipment was calculated based on the equipment mix estimated in the **Appendix F**. The total hp was then multiplied by fuel usage estimates per hp-h from the CARB off-road vehicle (OFFROAD) model.<sup>3</sup>

Fuel consumption from construction on-road worker, vendor, and delivery/haul trucks was calculated using the trip rates and distances consistent with the air quality emissions modeling worksheets and CalEEMod construction output files (see **Section 4.2**). Total vehicle miles travelled (VMT) for these on-road vehicles were then calculated for each type of construction-related trip and divided by the corresponding County-specific miles per gallon factor using the CARB EMFAC2017 model. The model was used to calculate fuel consumed based on the total annual VMT for each vehicle type. A combination of CalEEMod assumed trip lengths and client-provided specific trip lengths were used for worker commutes, vendor and concrete trucks, and haul truck trips (see **Appendix F**). Consistent with CalEEMod, construction worker trips were assumed to include a mix of light duty gasoline automobiles and light duty gasoline trucks.

<sup>2</sup> South Coast Air Quality Management District, 2017. CalEEMod® Users Guide Appendix D: Default Data Tables. October 2017.

<sup>3</sup> California Air Resources Board, 2017. Off-Road Diesel Emission Factor Update for NO<sub>x</sub> and PM. 2017.

Construction vendor trucks were assumed to be a mix of medium-heavy duty and heavy duty diesel trucks and concrete and haul trucks were assumed to be heavy-duty diesel trucks.

The energy usage required for construction of the proposed Project was estimated based on the number and type of construction equipment that would be used during construction by assuming a conservative estimate of construction activities (i.e., maximum daily equipment usage levels) (see **Appendix F**). Energy for construction-worker commuting trips was estimated based on the predicted number of workers for the various phases of construction, and the estimated VMT based on the conservative values in the CalEEMod and EMFAC2017 models. The assessment also includes a discussion of the proposed Project's compliance with relevant energy-related regulatory requirements and incorporation of design features discussed in **4.7**, which would minimize the amount of energy usage during construction. These measures are also discussed in **Section 3.0**.

The estimated fuel economy for heavy-duty construction equipment was based on fuel consumption factors from the CARB OFFROAD emissions model, which is a State-approved model for estimating emissions from off-road heavy-duty equipment. The estimated fuel economy for haul trucks, vendor trucks, concrete trucks, and worker commute vehicles was based on fuel consumption factors from the CARB EMFAC 2017 emissions model, which is a State-approved model for estimating emissions from on-road vehicles and trucks.

#### 4.5.2.2 Operation

Operational energy impacts were assessed based on the increase in energy demand compared to existing conditions described. Operation of the proposed Project would include implementation of a number of sustainability measures as noted in **Section 3.0**, 3.5.9.

Operational energy associated with the existing uses to be demolished were subtracted from the total operations of the proposed Project to calculate the net energy consumed. Within the CalEEMod software, building electricity and natural gas usage rates were adjusted to account for prior Title 24 Building Energy Efficiency Standards for the existing uses.<sup>4</sup> As stated previously, the net change in operational energy demand was based on the difference between the existing baseline condition energy demand and the energy demand of the proposed Project at full buildout. The following discusses only the methodology for the new operations at the proposed Project's MSF, power distribution system (PDS) substations, stations, and train operations as detailed in the Operating Systems Conceptual Report.<sup>5</sup>

<sup>4</sup> California Air Resources Board, 2016. *CalEEMod\* Users Guide*, Appendix E, Section 5. September 2016. Factors for the prior Title 24 standard are extrapolated based on the technical source documentation.

<sup>5</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

The proposed Project operational natural gas demand would be generated mainly by building heating/cooling of the MSF and stations. The proposed Project estimated natural gas demand was analyzed relative to Southern California Gas Company (SoCalGas) existing and planned energy supplies in 2027 (i.e., the proposed Project buildout year)<sup>6</sup> to determine whether the utility would be able to meet the proposed Project energy demands. Furthermore, natural gas demand generated by the existing uses to be demolished were calculated using demand factors provided in CalEEMod and subtracted from the proposed Project natural gas demand to obtain the net annual natural gas demand.

Mobile source fuel consumption for the proposed Project during operation would include event-day trips related to commute trips by employees and suppliers.

### 4.5.3 REGULATORY FRAMEWORK

#### 4.5.3.1 Federal Regulations and Directives

##### *Energy Policy and Conservation Acts*

The Federal Energy Policy and Conservation Act of 1975,<sup>7</sup> the Federal Energy Policy Act of 2005,<sup>8</sup> and the Energy Independence and Security Act of 2007<sup>9</sup> require the US Department of Energy (USDOE) to set electrical efficiency standards of various appliances, fixtures, and equipment.

The Energy Independence and Security Act of 2007 includes standards for an increased Corporate Average Fuel Economy standard of 35 miles per gallon (mpg) for the combined fleet of cars and light trucks by the 2020 model year, in addition to provisions for Renewable Fuel Standard, Appliance and Lighting Efficiency Standards, and Building Energy Efficiency. The Act includes standards for general service lighting that will require lightbulbs to consume 60 percent less energy by 2020. This standard is leading to the phasing out of incandescent lightbulbs to be replaced by more efficient lighting. Additional provisions of the Act address energy savings in government and public institutions; promote research for alternative energy, carbon capture, and international energy programs; and create green jobs.

##### *Corporate Average Fuel Economy Standards*

Established by the US Congress in 1975, the Corporate Average Fuel Economy (CAFE) standards<sup>10</sup> reduce energy consumption by increasing the fuel economy of cars and light trucks. The National Highway Traffic Safety Administration (NHTSA) and United States Environmental Protection Agency (USEPA) jointly

<sup>6</sup> California Gas and Electric Utilities, 2020. *2020 California Gas Report, 2020*. While the estimated life of the proposed Project would be 30 years, comparison to the year of 2027 provides a conservative analysis as supply projections for electricity and natural gas increase in future years.

<sup>7</sup> Energy and Policy Conservation Act (EPCA) (Pub. Law 94-163, 89 Stat. 871, enacted December 22, 1975).

<sup>8</sup> 42 USC §13201 et seq. (2005).

<sup>9</sup> Public Law 110-140 (2007).

<sup>10</sup> For more information on the CAFE standards, refer to <https://www.nhtsa.gov/laws-regulations/corporate-average-fuel-economy>.

administer CAFE standards. The US Congress has specified that CAFE standards must be set at the “maximum feasible level” with consideration given to: (1) technological feasibility; (2) economic practicality; (3) effect of other standards on fuel economy; and (4) need for the nation to conserve energy.

Fuel efficiency standards for medium- and heavy-duty trucks have been jointly developed by USEPA and NHTSA. The Phase 1 heavy-duty truck standards apply to combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles for model years 2014 through 2018, and result in a reduction in fuel consumption from 6 to 23 percent over the 2010 baseline, depending on the vehicle type. USEPA and NHTSA have also adopted the Phase 2 heavy-duty truck standards, which cover model years 2021 through 2027 and require the phase-in of a 5 to 25 percent reduction in fuel consumption over the 2017 baseline depending on the compliance year and vehicle type.<sup>11</sup>

#### ***US Department of Transportation, US Department of Energy, and US Environmental Protection Agency Influence on Transportation Energy***

On the federal level, the US Department of Transportation (USDOT), USDOE, and USEPA are three agencies with substantial influence over energy policies related to transportation fuels consumption. Generally, federal agencies influence transportation energy consumption through establishment and enforcement of fuel economy standards for automobiles and light trucks, through funding of energy-related research and development projects, and through funding for transportation infrastructure projects.

#### **4.5.3.2 State Regulations and Directives**

##### ***California Public Utilities Commission***

The California Public Utilities Commission (CPUC) has authority to set electric rates, regulate natural gas utility service, protect consumers, promote energy efficiency, and ensure electric system reliability. The CPUC has established rules for the planning and construction of new transmission facilities, distribution facilities, and substations. Utility companies are required to obtain permits to construct certain power line facilities or substations. The CPUC also has jurisdiction over the siting of natural gas transmission lines.

The CPUC regulates distributed energy generation policies and programs for both customers and utilities. This includes incentive programs (e.g., California Solar Initiative) and net energy metering policies. Net energy metering allows customers to receive a financial credit for power generated by their on-site system and fed back to the utility. The CPUC is involved with utilities through a variety of energy procurement programs, including the Renewable Portfolio Standard program.

<sup>11</sup> US Environmental Protection Agency, 2016. Federal Register/Vol. 81, No. 206/Tuesday, Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2. October 25, 2016.

In 2008, the CPUC adopted the Long-Term Energy Efficiency Strategic Plan, which is a road map to achieving maximum energy savings in California through 2020.<sup>12</sup> Consistent with California's energy policy and electricity “loading order,” the Energy Efficiency Strategic Plan indicates that energy efficiency is the highest priority resource in meeting California's energy needs. The CPUC also adopted energy goals that require all new residential construction in California to be zero net energy by 2020. The zero net energy goal means new buildings must use a combination of improved efficiency and distributed renewable energy generation to meet 100 percent of their annual energy need. In addition to the zero net energy goals for residential buildings by 2020, the CPUC has adopted goals that all new commercial construction in California will be zero net energy by 2030 and 50 percent of existing commercial buildings will be retrofitted to zero net energy by 2030.

#### ***California Energy Commission***

The California Energy Commission (CEC) is primary energy policy and planning agency in California. Created by the California Legislature in 1974, the CEC has five major responsibilities: (1) forecasting future energy needs and keeping historical energy data; (2) licensing thermal power plants 50 MW or larger; (3) promoting energy efficiency through appliance and building standards; (4) developing energy technologies and supporting renewable energy; and (5) planning for and directing State response to energy emergencies.

#### ***Senate Bill 1389***

Senate Bill (SB) 1389 requires the CEC to prepare a biennial integrated energy policy report that assesses major energy trends and issues facing the electricity, natural gas, and transportation fuel sectors in California, and provides policy recommendations to conserve resources; protect the environment; ensure reliable, secure, and diverse energy supplies; enhance the State economy; and protect public health and safety.<sup>13</sup>

The 2019 Integrated Energy Policy Report<sup>14</sup> provides the results of the CEC assessments of a variety of energy topics in California, including electricity sector trends, building decarbonization and energy efficiency, zero-emission vehicles, energy equity, climate change adaptation, electricity reliability in Southern California, natural gas assessment, and electricity, natural gas, and transportation energy demand forecasts.

<sup>12</sup> CPUC, *Long Term Energy Efficiency Strategic Plan*. 2008

<sup>13</sup> SB 1389, (PRC sections 25300–25323)

<sup>14</sup> *Final 2019 Integrated Energy Policy Report*, Adopted February 20, 2020, <https://www.energy.ca.gov/data-reports/reports/integrated-energy-policy-report/2019-integrated-energy-policy-report>. Accessed September 28, 2021.

### **California Green Building Standards Code**

Adopted in 2010, and updated periodically, CALGreen is found in Part 11, Title 24 of the California Code of Regulations (CCR).<sup>15</sup> The purpose of CALGreen is to cause a reduction in GHG emissions; promote environmentally responsible, cost effective, healthier places to live and work; and reduce energy and water consumption. CALGreen identifies mandatory building measures and voluntary measures that may be incorporated into the design of buildings. CALGreen establishes voluntary and mandatory standards pertaining to the planning and design of sustainable site development, energy efficiency, water conservation, material conservation, and interior air quality.

The 2019 CALGreen Code took effect January 1, 2020. CALGreen requires every new building constructed in California to reduce water consumption by 20 percent, divert 65 percent of construction waste from landfills, and install low-pollutant-emitting materials. It also requires separate water meters for nonresidential buildings' indoor and outdoor water use, with a requirement for moisture-sensing irrigation systems for larger landscape projects and mandatory inspections of energy systems (e.g., heat furnace, air conditioner, and mechanical equipment) for nonresidential buildings larger than 10,000 SF to ensure that all are working at their maximum capacity and according to their design efficiencies.

### **Senate Bill 350, Clean Energy and Pollution Reduction Act of 2015**

SB 350, the Clean Energy and Pollution Reduction Act of 2015, requires that the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources be increased from 33 percent to 50 percent by December 31, 2030; thereby doubling energy efficiency within the State.<sup>16</sup> SB 350 makes revisions to the California Renewable Portfolio Standards (RPS) Program and to certain other requirements on public utilities and publicly owned electric utilities. SB 350 also requires local, publicly owned electric utilities to establish annual targets for energy efficiency savings and demand reduction consistent with a Statewide goal established by the California Public Utilities Commission and provides incentives for electrification of rail facilities. Local utilities would be required to develop more detailed strategies and incentives for use of renewable energy sources, resulting in an increased demand for renewable energy generation.

SB 350 emphasizes the important role of electric vehicles in California's overall scheme to combat climate change, declaring that "[d]eveloping electric vehicles should assist in grid management, integrating generation from eligible renewable energy resources, and reducing fuel costs for vehicle drivers." The bill (1) promotes the development of additional electric vehicle charging infrastructure to encourage greater

<sup>15</sup> California Green Building Standards Code (CCR, Title 24, Part 11 - CALGreen)

<sup>16</sup> SB 350, Clean Energy and Pollution Reduction Act.

use of electric cars; and (2) requires electrical utilities to include expansion of electrical vehicle charging facilities as part of their strategies and incentives for reducing overall energy consumption.

### **Assembly Bill 32**

In 2006, Governor Schwarzenegger signed Assembly Bill (AB) 32, the California Global Warming Solutions Act of 2006,<sup>17</sup> which focused on reducing GHG emissions in California to 1990 levels by 2020. CARB has the primary responsibility for reducing the GHG emissions in California; however, AB 32 also tasked the CEC and CPUC with providing information, analysis, and recommendations to CARB regarding strategies to reduce GHG emissions in the energy sector.

### **Senate Bill 32**

Enacted in 2016, SB 32 codifies the 2030 emissions reduction goal by requiring CARB to ensure that Statewide GHG emissions are reduced to 40 percent below 1990 levels by 2030. The reduction of GHG emissions is a priority for development projects throughout the State and is achieved through a combination of policies, planning, direct regulations, market approaches, incentives, and voluntary efforts. Generally speaking, the focus of GHG emission reductions is on energy production and motor vehicles.

### **AB 1007**

AB 1007<sup>18</sup> required the CEC to prepare a State plan (State Alternative Fuels Plan) to increase the use of alternative fuels in California. The Commission prepared the State Alternative Fuels Plan in partnership with CARB and in consultation with other State, federal, and local agencies. The final State Alternative Fuels Plan,<sup>19</sup> published in December 2007, attempts to achieve an 80 percent reduction in GHG emissions associated with personal transportation, even as California's population increases.

### **SB 1368, Performance Standard for Baseload Power Generation**

SB 1368 (Chapter 598, Statutes of 2006), Performance Standard for Baseload Power Generation,<sup>20</sup> required the CPUC to establish a GHG emissions performance standard for "baseload" generation from investor-owned utilities of 1,100 pounds of carbon dioxide per megawatt hour (MWh). The CEC established a similar standard for local publicly owned utilities. All electricity provided to California, including imported electricity, must be generated from plants that meet or exceed this standard.

<sup>17</sup> Assembly Bill (AB) 32, the California Global Warming Solutions Act of 2006 (codified in the California Health and Safety Code (HSC), Division 25.5.

<sup>18</sup> AB 1007, Pavley, Chapter 371, Statutes of 2005.

<sup>19</sup> State Alternative Fuels Plan.

<sup>20</sup> SB 1368 - Emission Performance Standards, Perata, Chapter 598, Statutes of 2006.

### **SB X1-2, Renewable Portfolio Standard**

California law (SB X1-2, Statutes of 2011) requires retail suppliers of electricity to source at least 33 percent of annual retail sales from eligible renewable energy sources by 2020.<sup>21</sup>

### **Executive Order S-03-05**

Executive Order S-03-05 mandates that California emit 80 percent fewer GHGs in 2050 than it emitted in 1990.<sup>22</sup> Energy efficiency and reduced VMT would play important roles in achieving this goal.

### **Executive Orders S-14-08 and S-21-09**

Since 2006, California has had a mandate to increase the use of renewable generation to 20 percent of retail electricity sales by 2010. In November 2008, Governor Schwarzenegger signed Executive Order S-14-08, which raises California's renewable energy goals to 33 percent by 2020.<sup>23</sup> This enhanced target is intended to help California meet Statewide GHG emission reduction targets. This has been reiterated by California Executive Order S21-09 which charged CARB to establish a regulation consistent with this 33 percent target by 2020.<sup>24</sup> This represented an increase in RPSs over SB 1078<sup>25</sup> and SB 107.<sup>26</sup> State RPSs have since been expanded with SB 350.

### **Low Carbon Fuel Standard**

The Low Carbon Fuel Standard (LCFS), established in 2007 through Executive Order S-1-07 and administered by CARB, requires producers of petroleum-based fuels to reduce the carbon intensity of their products, starting with 0.25 percent in 2011 and culminating in a 10-percent total reduction in 2020.<sup>27</sup> Petroleum importers, refiners, and wholesalers can either develop their own low carbon fuel products, or buy LCFS credits from other companies that develop and sell low carbon alternative fuels, such as biofuels, electricity, natural gas, and hydrogen.

### **Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling**

In 2004, CARB adopted an Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling to reduce public exposure to diesel particulate matter emissions.<sup>28</sup> The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are

<sup>21</sup> SB X1-2, Statutes of 2011.

<sup>22</sup> California Executive Order S-03-05, June 2005.

<sup>24</sup> California Executive Order S-21-09, September 2009.

<sup>25</sup> SB 1078, Chapter 516, Statutes of 2002.

<sup>26</sup> SB 107, Chapter 325, Statutes of 2015.

<sup>27</sup> California Executive Order S-01-07, January 2007.

<sup>28</sup> CARB, *Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling*, Title 13 CCR section 2485.2004.

licensed to operate on highways, regardless of where they are registered. This measure prohibits diesel fueled commercial vehicles from idling for more than 5 minutes at any given location. While the goal of this measure is primarily to reduce public health impacts from diesel emissions, compliance with the regulation also results in energy savings in the form of reduced fuel consumption from unnecessary idling.

### **Airborne Toxic Control Measure for Stationary Compression Ignition (CI) Engines**

In 2004, CARB adopted an Airborne Toxic Control Measure to reduce public exposure to diesel particulate matter emissions and criteria pollutant emissions from stationary diesel-fueled compression ignition (CI) engines.<sup>29</sup> The measure applies to any person who owns or operates a stationary CI engine in California with a rated brake horsepower greater than 50, or anyone who either sells, offers for sale, leases, or purchases a stationary CI engine. This measure outlines fuel and fuel additive requirements; emission standards; recordkeeping, reporting and monitoring requirements; and compliance schedules for CI engines.

### **Regulation to Reduce Emissions of Diesel Particulate Matter, Nitrogen Oxides, and Other Criteria Air Pollutants, from In-Use Heavy-Duty Diesel-Fueled Vehicles**

In addition to limiting exhaust from idling trucks, in 2008, CARB approved the Truck and Bus regulation to reduce NO<sub>x</sub>, PM10, and PM2.5 emissions from existing diesel vehicles operating in California (13 CCR section 2025). The phased regulation aims to reduce emissions by requiring installation of diesel soot filters and encouraging the retirement, replacement, or retrofit of older engines with newer emission-controlled models. The phasing of this regulation has full implementation by 2023.

### **California Environmental Quality Act**

Under CEQA,<sup>30</sup> EIRs are required to include a discussion of the potential significant energy impacts of projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy. If the analysis of a project shows that the project may result in significant environmental effects due to wasteful, inefficient, or unnecessary use of energy, or wasteful use of energy resources, then the EIR must identify mitigation measures to address that energy use. This analysis should include the project energy use for all project phases and components, including transportation-related energy, during construction and operation. In addition to building code compliance, other relevant considerations may include, among others, the project size, location, orientation, equipment use and any renewable energy features that could be incorporated into the project.<sup>31</sup> CEQA Guidelines, Appendix F, provides a list of energy-related topics that should be analyzed in the EIR.

<sup>29</sup> CARB, *Airborne Toxic Control*, Title 17 CCR section 93115, 2004.

<sup>30</sup> CEQA, PRC section 21100(b)(3).

<sup>31</sup> CEQA Guidelines section 15126.2(b).

### 4.5.3.3 Regional Regulations and Directives

#### *Southern California Association of Governments*

The SCAG 2020–2045 Regional Transportation Plan/Sustainable Communities Strategies (RTP/SCS)<sup>32</sup> is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals, with a specific goal of achieving an 8 percent reduction in passenger vehicle GHG emissions on a per capita basis by 2020, 19 percent reduction by 2035, and 21 percent reduction by 2040 compared to the 2005 level. Although the RTP/SCS is not technically an energy efficiency plan, consistency with the RTP/SCS has energy implications, including the reduction of VMT which reduces GHG emissions and has the co-benefit of reducing fossil fuel consumption from travel to and from a project.

### 4.5.3.4 Local Regulations and Directives

#### *Inglewood General Plan*

The City General Plan does not contain any policies, regulations, or directives that specifically address energy resources.

There are no goals and policies in the General Plan that directly address energy demand and conservation. However, the following goals from the Land Use Element of the City General Plan are relevant to transportation-related energy demand and conservation.<sup>33</sup>

**Circulation Goal:** Promote and support adequate public transportation within the City and the region.

**Circulation Goal:** Develop a safe and adequate pedestrian circulation system which is barrier free for the handicapped.

#### *Inglewood Energy and Climate Action Plan*

The City adopted an Energy and Climate Action Plan<sup>34</sup> (ECAP) in 2013 to guide Citywide GHG emissions reduction efforts. The ECAP established four primary compliance paths which projects may choose to adhere to, including: ministerial and exempt project status, implementation of a combination of sustainable development standards, performance-based compliance, or payment of an in-lieu fee. These measures were developed on a points-based system, which were chosen because they have been

<sup>32</sup> Southern California Association of Governments (SCAG), *Connect SoCal: 2020-2045 Regional Transportation Plan/Sustainable Communities Strategies Adopted Final*, "Chapter 1," <https://scag.ca.gov/connect-social> Accessed September 28, 2021.

<sup>33</sup> City of Inglewood, Department of Community Development and Housing, 1980. *Land Use Element of the Inglewood General Plan*. January 1980. Amended September 14, 2016.

<sup>34</sup> City of Inglewood, *Inglewood Energy and Climate Action Plan*, March 2013, <https://www.cityofinglewood.org/DocumentCenter/View/148/Inglewood-Energy-and-Climate-Action-Plan-ECAP-Adopted-2013-PDF>, Accessed September 28, 2021.

demonstrated by various studies to directly reduce GHG emissions or support changes in activities that lead to GHG emissions reductions. Each Climate-Ready Development Standard has a point value associated with it that reflects its general effectiveness at reducing GHG emissions. The standards apply to various types of projects, and a qualifier is included denoting which types of projects may implement the standard. Applicants have discretion regarding which measures that they would want their project to comply with; however, for a project to be fully compliant with the goals of the ECAP it must incorporate features meeting the standards sufficient to accrue a total of 20 points. The ECAP contains the following:

- **Emissions Inventory:** Expands the City's 1990, 2005, and 2007 greenhouse gas inventory to include an inventory of 2010 emissions. The ECAP also includes a year 2010 inventory of electricity and natural gas consumed.
- **Emissions Reduction Target/Goal:** Establishes a 2020 emissions reduction target of 15 percent below 2005 levels and a 2035 emission reduction goal of 32.5 percent below 2005 levels.
- **Emission Reduction Strategies:** The ECAP contains energy and greenhouse gas emissions reduction strategies. Particular attention is provided to budget-neutral measures that will reduce the community-wide energy consumption and greenhouse gas emissions in order to meet the statewide emissions targets identified in the ARB's Scoping Plan and Executive Order S-03-05.
- **Implementation Program:** Identifies the timeline for implementing each strategy, relative cost, and any additional analysis and/or legislative action needed.
- **Streamlined CEQA Review:** The ECAP serves as a tiering document for the streamlined review of project-level greenhouse gas emissions under CEQA for projects proposed within the City's jurisdiction.

#### *Inglewood Energy Efficiency Climate Action Plan*

The City developed an Energy Efficiency Climate Action Plan<sup>35</sup> (EECAP) in December 2015 that evaluates both energy and GHG emissions. In addition, the Inglewood EECAP is a roadmap for achieving community-wide energy and GHG emissions reductions that encourages the City to grow more sustainably. The EECAP includes the following: an energy and GHG emissions inventory, reduction target/goal, reduction and efficiency strategies, and an implementation program. The EECAP sets forth six general goals for community GHG reduction: (1) increase energy efficiency in existing residential units, (2) increase energy efficiency in new residential development, (3) increase energy efficiency in existing commercial units, (4) increase energy efficiency in new commercial development, (5) increase energy efficiency through water efficiency, and (6) decrease energy demand through reducing urban heat island effect. Additionally, the EECAP sets forth four general goals for municipal GHG reduction: (1) participate in education, outreach,

<sup>35</sup> City of Inglewood, *Energy Efficiency Climate Action Plan*, December 2015, [https://www.southbaycities.org/sites/default/files/EECAP\\_Inglewood\\_Final\\_20151218.pdf](https://www.southbaycities.org/sites/default/files/EECAP_Inglewood_Final_20151218.pdf). Accessed September 28, 2021.

and planning for energy efficiency, (2) increase energy efficiency in municipal buildings, (3) increase the energy efficiency in city infrastructure, (4) reduce energy consumption in the long term.

### Other Local Conservation Initiatives

The Southern California Edison Company (SCE) and SoCalGas provide several programs for energy customers in Inglewood to conserve energy. Programs include Consumer Rebate Programs, a Refrigerator Turn-In and Recycling Program, Green Power Program, Outdoor Area Lighting Program, Solar Power Incentives, Power Quality Consulting Programs, and Electric Vehicle Programs. Programs include Commercial Lighting Efficiency Offer (CLEO), Heating, Ventilation and Air Conditioning (HVAC) Rebate Program, Customer Generation Rebate, Technical Assistance Program, Premium Efficiency Motors (PEM) Program, Chiller Efficiency Program, Energy Load Monitoring (ELM) Program, and Financing Programs. Programs for nonresidential customers include rebates on energy efficient HVAC systems and refrigeration equipment, customer generation rebates, energy-load monitoring, energy-efficiency financing, and solar power initiatives.

## 4.5.4 EXISTING CONDITIONS

### 4.5.4.1 Electricity

Electrical power within the City is supplied by SCE, which serves approximately 15 million people in a 50,000-square-mile service area.<sup>36</sup> The SCE service area used approximately 64,564,000 MWh of electricity in 2019.<sup>37</sup> SCE produces and obtains electricity from various generating sources that utilize coal, nuclear, natural gas, hydroelectric, and renewable resources to generate power.

In 2012, the latest year of publicly available data, the City consumed a total of approximately 434,308 MWh of electricity, an approximately 16 percent reduction from 2005.<sup>38</sup> Based on building type, single- and multifamily residential units consumed the most electricity at approximately 164,000 MWh, followed by industrial at 62,000 MWh, and commercial at approximately 24,000 MWh.<sup>39</sup> This compares with the total amount of built space for each building type, with multifamily residential units constituting the greatest square footage, followed by single-family residential, commercial, other, industrial, condominium

- 39 City of Inglewood, *Energy Efficiency Climate Action Plan*, December 2015, [http://www.southbaycities.org/sites/default/files/EECAP\\_Inglewood\\_Final\\_20151218.pdf](http://www.southbaycities.org/sites/default/files/EECAP_Inglewood_Final_20151218.pdf). Accessed September 28, 2021.

residential, institutional, and mixed building types. The SCE estimates that electricity consumption within its planning area will be approximately 122,500 GWh annually by 2027.<sup>40</sup>

In Downtown Inglewood's residential neighborhoods, existing electrical facilities consist of an overhead electrical system, including poles carrying low voltage conduits along with telecommunication and cable TV facilities. In most of the commercial and industrial areas in the Inglewood Downtown area, the existing electrical networks are underground within all the streets.<sup>41</sup>

### 4.5.4.2 Natural Gas

SoCalGas is the natural gas purveyor within the City. The SoCalGas service area reaches 21.8 million consumers through 5.9 million meters in more than 500 communities, covering an area of approximately 24,000 square miles throughout Central and Southern California.<sup>42</sup>

In 2012, the latest year of publicly available data, the City consumed a total of approximately 1,900 MMcf per year.<sup>43</sup> Based on building type, single- and multifamily residential units consumed the most natural gas at approximately 1,363 MMcf in 2012, a 4.2 percent reduction from 2005. Commercial and industrial uses consumed approximately 536 MMcf in 2012, a 16.8 percent reduction from 2005.<sup>44</sup> This compares with the total amount of built space for each building type, with multifamily residential units constituting the greatest square footage, followed by single-family residential, commercial, other, industrial, condominium residential, institutional, and mixed building types.

The SoCalGas planning area had an available natural gas capacity of 3,175 million cubic feet (MMcf) in 2020.<sup>45</sup> Natural gas capacity within SoCalGas' planning area is anticipated to be approximately 3,435 MMcf per day (or 1,253,775 million MMcf per year) in 2027, which is the opening year of the proposed Project.<sup>46</sup>

SoCalGas projects total gas demand to decline at an annual rate of 1 percent from 2020 to 2035.<sup>47</sup> The decline in demand is due to modest economic growth, and CPUC-mandated energy efficiency (EE) standards and programs and SB 350 goals. Other factors that contribute to the downward trend are tighter

standards created by revised Title 24 Codes and Standards, renewable electricity goals, a decline in core commercial and industrial demand, and conservation savings linked to Advanced Metering Infrastructure (AMI). By comparison, the 2018 California Gas Report projected an annual decline in demand of 0.74 percent over the forecast horizon.

#### 4.5.4.3 Petroleum-Based Fuel (Transportation Energy)

Crude oil is a mixture of hydrocarbons that exists as a liquid in underground geologic formations and remains a liquid when brought to the surface.<sup>48</sup> Petroleum products are produced from the processing of crude oil and other liquids and include transportation-related fuels such as gasoline and diesel. Petroleum is a worldwide commodity. According to the US Energy Information Administration (EIA), California consumed approximately 681,893,000 barrels (28,639,506,000 gallons, or 42 gallons per barrel) in 2019, the most recent year of publicly available data.<sup>49</sup> The EIA forecasts the national supply and demand in its Annual Energy Outlook 2021.<sup>50</sup> The EIA forecasts a national oil supply of 19.9 million barrels per day (mb/d) in 2027, which is the opening year for the proposed Project.<sup>51</sup> This equates to approximately 7,264 million barrels per year (mb/y) or 305,067 million gallons per year (mg/y).<sup>52</sup>

Recent data shows that the transportation sector accounts for a majority of California's petroleum consumption.<sup>53</sup> In 2019, the most recent year of publicly available data, California consumed approximately 565,056,000 barrels (23,732,352,000 gallons, or 42 gallons per barrel) of petroleum for transportation.<sup>54</sup>

Over the last several decades, California has implemented several policies, rules, and regulations to improve vehicle efficiency, increase the development and use of alternative fuels, reduce air pollutants and GHGs emissions from the transportation sector, and reduce vehicle travel. Incentive programs, such as the CEC's Alternative and Renewable Fuel and Vehicle Technology Program (ARFVTP), are helping the

State to reduce its dependency on gasoline. The CEC predicts that the demand for gasoline will continue to decline over the upcoming years, and there will be an increase in the use of alternative fuels.<sup>55</sup>

#### 4.5.4.4 Existing Energy Use Within the Project Footprint

The proposed Project is located within a developed area which utilizes energy supply for a variety of land uses. There are several existing developments which contribute to existing electricity demand that would be demolished as part of the proposed Project.

The proposed Project would require a number of full and partial property acquisitions and easements or leases for construction and operation of the guideway, stations, MSF, and other support facilities included in the proposed Project. These existing uses currently generate electricity and natural gas demand for building operation. **Table 4.5-1: Annual Energy Demand of Existing Uses within the Proposed Project Footprint** lists the existing energy demand for the existing uses that would be demolished as part of the proposed Project.

**Table 4.5-1**

<b>Natural Gas Total</b>				<b>6,902,525</b>	<b>kBTU/yr</b>

Source: Refer to Appendix J.1 for detailed calculations.

Notes: kWh/yr = kilowatt-hours per year; kBTU/yr = thousand British Thermal Units per year.

Electricity and natural gas for the existing uses is total yearly operational usage.

As shown, the existing uses currently consume approximately 6,489,214kWh of electricity per year. Moreover, the existing uses currently consume 6,902,525thousand British thermal units (kBTU) (or 6.7 MMcf)<sup>56</sup> of natural gas per year.

4.5.5 ADJUSTED BASELINE

This section assumes the Adjusted Baseline Environmental Setting as described in Section 4.0, 4.0.5: Adjusted Baseline. Specifically, operation of land uses included in the Hollywood Park Specific Plan (HPSP) would result in the consumption of energy resources such as electricity, natural gas, and transportation

56 The conversion of kBTU to cubic feet uses the factor of 1 cf to 1.037 kBTU.

4.5 Energy Resources

fuels. Similar to the proposed Project, the HPSP would utilize SCE and SoCalGas for electricity and natural gas supplies and infrastructure. As such, SCE and SoCalGas would be responsible for providing adequate electricity and natural gas supplies for the HPSP project. Moreover, the HPSP would increase the number of vehicles traveling to and from the HPSP site, thus increase the consumption of transportation related fuels. Table 4.5-2: Adjusted Baseline Annual Energy Demand shows the Adjusted Baseline energy demand for electricity and natural gas.

Table 4.5-2  
Adjusted Baseline Annual Energy Demand

Land Use	Square Footage	Annual Energy Demand	Units
<b>Electricity</b>			
General Office	466,000 SF	6,519,340	kWh/yr
Apartments	314,000 SF	1,248,240	kWh/yr
Retail	518,080 SF	5,926,840	kWh/yr
Water Conveyance	—	2,813,125	kWh/yr
<b>Electricity Total</b>		<b>16,507,545</b>	<b>kWh/yr</b>
<b>Natural Gas</b>			
General Office	466,000 SF	4,259,240	kBTU/yr
Apartments	314,000 SF	3,588,220	kBTU/yr
Retail	518,080 SF	1,036,160	kBTU/yr
<b>Natural Gas Total</b>		<b>8,883,620</b>	<b>kBTU/yr</b>

Source: Refer to Appendix J.1 for detailed calculations.

Notes: kWh/yr = kilowatt-hours per year; kBTU/yr = thousand British Thermal Units per year.

Electricity and natural gas for the existing uses is total yearly operational usage.

As shown, the Adjusted Baseline conditions would consume approximately 16,507,545 kWh of electricity per year and 8,883,620 kBTU (or 8.6 MMcf)<sup>57</sup> of natural gas per year. Vehicle fuel usage for the Adjusted Baseline is discussed further under Impact E-1.

57 The conversion of kBTU to cubic feet uses the factor of 1 cf to 1.037 kBTU.

#### 4.5.6 THRESHOLDS OF SIGNIFICANCE

Criteria outlined in Appendix G of the CEQA Guidelines were used to determine the level of significance of energy impacts. A project would have a significant impact in relation to energy if it were to:

**Threshold E-1:** Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation.

**Threshold E-2:** Conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

#### 4.5.7 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

**Impact E-1:** Would the project result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources during project construction or operation?

The proposed Project includes Design Guidelines and a Construction Commitment Program (CCP) as described in **Section 3.0**. The CCP addresses temporary effects during construction of the Project. The Design Guidelines describe the design features of the proposed Project.

##### 4.5.7.1 Project Design Features

The proposed Project includes the following features that address the energy related consumption during construction and operation of the ATS:

###### PDF EN-1

- **Energy Efficiency** - Where California Energy Efficiency Standards apply, the project should be more energy efficient than allowed. For energy-using equipment not governed by California Energy Efficiency Standards, best available energy efficient technologies should be used. Advanced commissioning of building systems should be conducted to ensure systems are operating as designed.

To achieve energy use reduction, passive strategies taking advantage of the favorable local climate should be considered where feasible. The use of solar canopies as shade structures in addition to roof-mounted solar is another energy saving strategy.

- **Water Efficiency** - In order to reduce excessive water consumption, the project should identify and implement appropriate opportunities to reduce or eliminate potable water use indoors and in landscape areas.

- **Material Conservation And Resource Efficiency** - In order to reduce the environmental impact from the use of construction materials, the project should minimize the use of virgin materials. This can be accomplished by increasing the use of materials that are reused, recycled, rapidly renewable, locally sourced, and durable. In order to determine the best approach to reducing the overall environmental impact from use of materials, a life cycle assessment (LCA) could be used.
- **Environmental Quality** - In order to protect and enhance the health and comfort of occupants, the project should provide a high quality, sustainable indoor environment that is designed to maximize natural daylighting and views of the outdoors where feasible. Indoor spaces should use high efficiency air filtration and should create a comfortable indoor acoustical environment. Materials and systems should be selected that will provide for a healthy indoor environment.

Implementation of the proposed Project will require the consumption of energy resources during both construction and operation.

For construction impacts, the City would include in bid documents for the proposed Project language specifying that the contractors shall use Tier 4 construction equipment or equivalent (see **PDF AQ-1** in the CCP). For operational impacts, the proposed Project would comply with the requirements of CALGreen<sup>58</sup> and be consistent with the City Energy Efficiency Climate Action Plan<sup>59</sup> involving policies and programs related to sustainability, energy efficiency, and reduction in GHG emissions. In addition, the Design Guidelines, contained in **Appendix C**, include sustainability guidelines that provide green measures to be incorporated into the design and operations of the ITC facilities. The proposed Project will be designed and constructed to achieve Silver Award Certification under the Envision™ Sustainable Infrastructure Rating System or equivalent.

###### Construction

Prior to construction of the proposed Project, reconstruction of the existing Vons store, which is proposed for demolition to accommodate the construction of the MSF, is proposed on the corner of Manchester Boulevard and Hillcrest Boulevard. This proposed replacement Vons store would include amenities similar to the existing store, including a pharmacy and bank branch. **Table 4.5-3: Energy Use During Vons Replacement Construction** below shows the transportation related fuel associated with construction of the Vons store replacement. It is assumed electricity would be provided by diesel fueled generators during building construction. As shown in **Table 4.5-3**, the construction of the Vons store replacement would consume a total of 19,436 gallons of petroleum. Consumption of energy resources for construction of the Vons store replacement would be temporary and would occur prior to construction of the proposed Project.

<sup>58</sup> California Green Building Standards Code (CCR, Title 24, Part 11 - CALGreen).

<sup>59</sup> City of Inglewood, Energy Efficiency Climate Action Plan, December 2015.

**Table 4.5-3**  
**Energy Use During Vons Replacement Construction**

Fuel Type	Gallons
Diesel	16,471
Gasoline	2,965
<b>Total</b>	<b>19,436</b>

Source: Refer to **Appendix J.1** for detailed calculations

During construction of the proposed Project, energy would be consumed in the form of electricity for powering the construction trailers (lights, electronic equipment, and heating and cooling) and exterior uses, such as lights, water conveyance for dust control, and other construction activities. Construction would also consume energy in the form of petroleum-based fuels associated with on and off-road construction equipment and vehicles, construction workers' travel to and from the proposed Project, and delivery and haul truck trips (e.g., hauling of demolition material to off-site reuse and disposal facilities). As discussed below, construction activities, including the construction of new buildings and facilities, typically do not involve the consumption of natural gas.

#### **Electrical Demand**

During construction, electricity would be consumed to power lighting, heating, and cooling in the construction trailers, outdoor lighting of the proposed Project, electric equipment, and supply and convey water for dust control. SCE would supply electricity and would be obtained from the existing electrical lines that connect to the proposed PDS substations. As shown in **Table 4.5-4: Total Electricity Use During Proposed Project Construction**, a total of approximately 165,115 kWh of electricity is estimated to be consumed during construction of the proposed Project.

**Table 4.5-4**  
**Total Electricity Use During Proposed Project Construction**

Fuel Type	Quantity
<b>Electricity</b>	
Water Conveyance	95,165 kWh
Construction Trailers	69,950 kWh
<b>Total</b>	<b>165,115 kWh</b>

Source: Refer to **Appendix J.1** for detailed calculations.

For comparison, the average annual electricity consumption for a U.S. residence is 10,972 kWh.<sup>60</sup> Although there is a temporary increase in electricity consumption during construction, the electrical consumption would be within the supply and infrastructure capabilities of SCE which estimates electricity consumption within its planning area will be approximately 120,000 GWh annually by 2024, which is the first year of construction.<sup>61</sup>

The electricity demand at any given time would vary throughout the construction period based on the construction activities being performed and would cease upon completion of construction. Electricity use from construction would be short-term, limited to working hours, used for necessary construction-related activities, and represent a small fraction of the proposed Project's operational electricity. Furthermore, the electricity used for off-road light construction equipment would reduce the amount of harmful construction-related air pollutant and GHG emissions because they would not rely on more traditional construction-related energy in the form of diesel fuel which generates emissions. As such, the proposed Project would not result in inefficient, or unnecessary consumption of electricity resources during construction.

Electrical energy demands during construction would be less than significant.

#### **Natural Gas**

Construction activities do not typically involve the consumption of natural gas, as construction equipment and staging rely heavily on electricity and transportation fuels. Accordingly, natural gas would likely not be needed to support construction activities; thus, there would be little to no demand generated by construction. As such, the proposed Project's would not result in inefficient, or unnecessary consumption of natural gas energy resources during construction.

Natural gas energy demands during construction would be less than significant.

#### **Transportation Fuel**

Construction of the proposed Project would result in the irretrievable commitment of construction materials (e.g., steel products, cement, glass). While construction would result in the irretrievable commitment of nonrenewable energy resources, primarily in the form of fossil fuels (including fuel oil), natural gas, and gasoline for automobiles and construction equipment, the consumption of fossil fuels would occur on a temporary basis during the construction period.

<sup>60</sup> U.S. EIA, *Frequently Asked Questions*, "How much electricity does an American home use?" <https://www.eia.gov/tools/faqs/faq.php?id=97&t=3>. Accessed September 28, 2021.

<sup>61</sup> CEC, Demand Analysis Office, *California Energy Demand 2018-2030 Revised Forecast* <https://efiling.energy.ca.gov/getdocument.aspx?tn=223244>. , Accessed September 28, 2021.

4.5 Energy Resources

As shown in **Table 4.5-5: Total Vehicle Fuel Use During Proposed Project Construction**, the Project would consume a total of 163,734,871 gallons of petroleum during the morning/evening shift construction scenario, and 151,002,831 gallons of petroleum during the morning/night shift construction scenario. The EIA forecasts a national oil supply of 20.18 million barrels (mb) per day in 2024, which is the first year of construction.<sup>62</sup> This equates to approximately 7,366 mb per year or 309,360 million gallons (mg) per year. Although construction would result in the consumption of petroleum-based fuels, it would be within the EIA supply forecast and would be temporary in nature.

As discussed previously, the proposed Project includes a CCP which addresses temporary effects during construction of the proposed Project. The CCP includes **PDF AQ-1** which would require more fuel-efficient construction equipment. Additionally, construction of the proposed Project would employ fuel-efficient equipment consistent with State and federal regulations, such as fuel efficiency regulations in accordance with the CARB Pavley Phase II standards,<sup>63</sup> the anti-idling regulation in accordance with section 2485 in Title 13 of the CCR,<sup>64</sup> and fuel requirements for stationary equipment in accordance with section 93115 (concerning Airborne Toxic Control Measures) in Title 17 of the CCR.<sup>65</sup> Use of construction equipment that is compliant with these regulations would result the use of more fuel-efficient engines and associated fuel savings.

**Table 4.5-5  
Total Vehicle Fuel Use During Proposed Project Construction**

Source	Petroleum Consumption (Gallons)	
	Morning/Evening Shift	Morning/Night Shift
Off-Road Construction Equipment	2,082,283	2,108,818
On-Road Construction Equipment	161,419,382	148,312,451
Worker Vehicles	233,206	233,206
Delivery Vehicles <sup>a</sup>	0	348,356
<b>Maximum Total</b>	<b>163,734,871</b>	<b>151,002,831</b>

Source: Refer to **Appendix J.1** for detailed calculations.

<sup>a</sup> Delivery of construction materials would occur during the night shift.

Accessed September 28, 2021.

4.5 Energy Resources

The proposed Project would divert mixed construction and demolition debris to City-certified construction and demolition waste processors using City-certified waste haulers, consistent with State targets of 75 percent waste diversion by 2020. In addition, select building materials or products for permanent installation would be selected from sources within southern California area. The proposed Project would divert mixed construction and demolition debris to City-certified construction and demolition waste processors using City-certified waste haulers, which would reduce truck trips to landfills, and increase the amount of waste recovered (e.g., recycled, reused, etc.) at material recovery facilities, thereby further reducing transportation fuel consumption.<sup>66</sup>

Construction would utilize energy only for necessary on-site and off-site transportation-related activities, construction worker travel to and from the proposed Project, and to transport construction materials and demolition debris. Idling restrictions and the use of cleaner, energy-efficient equipment would result in less fuel combustion and energy consumption and thus minimize construction-related energy use. As such, the proposed Project would not result in inefficient, or unnecessary consumption of vehicle fuels during construction.

Transportation fuel demands during construction would be less than significant.

**Operation**

As discussed previously, reconstruction of the existing Vons store to be removed is proposed on the corner of Manchester Boulevard and Hillcrest Boulevard. **Table 4.5-6: Energy Use from Vons Replacement Operation** below shows the energy use associated with operation of the Vons replacement store.

**Table 4.5-6  
Energy Use from Vons Replacement Operation**

Source	Quantity
Electricity (kWh/yr)	1,742,391
Natural Gas (kBTU/yr)	953,520

Source: Refer to **Appendix J.1** for detailed calculations

66 Energy savings result from the avoidance of needing to mine and process virgin materials and then transport those materials to the project. As shown on MSS2 California Aggregates Map ([https://www.conservation.ca.gov/cgs/Documents/Publications/Map-Sheets/MS\\_052\\_California\\_Aggregates\\_Map\\_201807.pdf](https://www.conservation.ca.gov/cgs/Documents/Publications/Map-Sheets/MS_052_California_Aggregates_Map_201807.pdf)) Aggregate production areas in the Los Angeles areas include Irwindale and areas further away in Upland and Temescal Canyon areas in Orange County. Irwindale is a lesser producer of virgin aggregate as most of the mines have been depleted to their permitted limits. According to LA County ([https://dpw.lacounty.gov/epd/cd/cd\\_attachments/Recycling\\_Facilities.pdf](https://dpw.lacounty.gov/epd/cd/cd_attachments/Recycling_Facilities.pdf)) there are recycling facilities much closer that supply recycled aggregate and other construction materials to the region.

As shown in **Table 4.5-6**, the operation of the Vons store replacement would generate a demand of 1,742,391 kWh of electricity per year and 953,520 kBtu of natural gas per year.

**Electrical Demand**

Propulsion power (i.e., the power to run the train on a guideway) would be provided via two PDS substations located along the guideway alignment. Each PDS substation includes equipment to transform the medium- to high-voltage power feed provided from the power companies to the required 750-volt direct current (VDC) needed to power the vehicles and other ancillary equipment. The proposed Project’s operating components would utilize electrical energy for the operation of the related support features, such as the ATS trains, stations, and MSF via electricity from the two PDSs. For normal operations, the required load flow for power of the proposed Project would be divided between the two PDSs. One of the PDSs would be located on the MSF site. The second PDS would be located on the Prairie Avenue/Hardy Street station site. This includes operation of all interior and exterior lighting features included for the proposed Project. Power requirements for each PDS are provided in **Table 4.5-7: Proposed Project Normal Operation Load Flow**.

**Table 4.5-7  
Proposed Project Normal Operation Load Flow**

PDS Site	Peak Power (KW)	RMS Power (KW)	Average Power (KW)	RMS Current (A)
MSF	2,008	834	755	1,067
Prairie Avenue/Hardy Street station	2,119	777	639	996

Source: Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021. Table 9-2.  
Notes:  
KW – kilowatt  
RMS – The substation load calculation output provides both per second and root mean squared (RMS) KVA loads for each substation.

As shown, the proposed MSF PDS is estimated to have a peak power load flow of 2,008 kW, and the Prairie Avenue/Hardy Street station PDS is estimated to have a peak power load flow of 2,119 kW for a total of 4,127 kW.<sup>67</sup> The ATS trains would operate for 18 hours per day which would generate a total electricity demand of 74,286 kWh per day or 27,114,390 kWh (27.1 GWh) per year.<sup>68</sup>

In the event the MSF PDS is unable to operate, the Prairie Avenue/Hardy Street station PDS is estimated

67 Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.  
68 Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

to have a peak power load of 4,152 kW which would generate a total electricity demand of 74,736 kWh per day or 27,278,640 kWh (27.3 GWh) per year. Similarly, in the event the Prairie Avenue/Hardy Street station PDS is unable to operate, the MSF PDS is estimated to have a peak power load of 4,353 kW which would generate a total electricity demand of 78,354 kWh per day or 28,599,210 kWh (28.6 GWh) per year.

The electrical demand from the existing land uses to be removed to implement the Project is 6,489,214 kWh per year. As noted previously, the Vons store replacement would use 1,742,391 kWh of electricity per year. As shown in **Table 4.5-8: Annual Electricity Use from Proposed Project Operation**, the electricity demand for the proposed Project during normal operation would result in a net increase of 22,367,567 kWh (22.4 GWh) per year. In the event the MSF PDS is unable to operate, the electricity demand would result in a net increase of 22,531,817 kWh (22.5 GWh) per year. In the event the Prairie Avenue/Hardy Street station PDS is unable to operate, the electricity demand would result in a net increase of 23,852,387 kWh (23.9 GWh) per year. Should any of the uses that would be removed to implement the Project relocate within the City, the net increase in energy shown in **Table 4.5-8** would be reduced but in no event would the amount of electricity required exceed the total shown for the ATS system.

**Table 4.5-8  
Annual Electricity Use from Proposed Project Operation**

Operation Scenario	Annual Electricity Usage (kWh/yr)		
	ATS System <sup>a</sup>	Existing <sup>b</sup>	Net Increase
Normal Operation	27,114,390	4,746,823	22,367,567
Prairie Avenue/Hardy Street station PDS Only	27,278,640	4,746,823	22,531,817
MSF PDS Only	28,599,210	4,746,823	23,852,387

Notes: kWh/yr = kilowatt-hours per year.  
<sup>a</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.  
<sup>b</sup> Existing data accounts for operation of the Vons store replacement.

As further discussed in **Section 4.14: Utilities and Service Systems**, SCE completed a high-level Distribution Study to determine the amount of load that SCE could accommodate and required infrastructure upgrades in order to meet the proposed Project’s recommended full redundancy design.<sup>69</sup>

SCE’s analysis assumed the use of the existing single (nonredundant) 16 kva circuit currently available along Market Street as it may be the most likely used circuit for the proposed Project.

69 Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

The results of SCE's analysis found that:<sup>70</sup>

- The maximum load that can be accommodated at the present time is 10 MVA.
- To accommodate the 10 MVA load with full redundancy, the following upgrades would be required:
  - 1,500 feet of new civil work/duct banks,
  - 1,860 feet of new 1000 JCN cable,
  - 1,700 feet of upgrading/re-cabling the existing SCE primary cable to 1000 JCN, and
  - Two new gas switches.

SCE would complete the aforementioned upgrades and would be subject to its procedures and requirements for construction and environmental clearance. The proposed Project would need to be reevaluated by SCE prior to coming online as the details are finalized as described in **MM UT-2 in Section 4.14**.

As further discussed below, the proposed Project would be designed in a manner that is consistent with relevant energy requirements, such as Title 24 and CALGreen, which are designed to encourage development that results in the efficient use of energy resources.

As such, the proposed Project would not result in inefficient, or unnecessary consumption of electricity during operation and electricity demands during operation would be less than significant.

#### Natural Gas

No new gas connections to serve the proposed Project elements would be required except at the proposed MSF. Natural gas would be used at the MSF to serve the pressure wash system, and for space and water heating. **Table 4.5-9: Annual Natural Gas Use During Proposed Project Operation** shows the operational natural gas estimates for the operation of the MSF and stations, as well as the net total of natural gas after taking into account the existing uses to be demolished.

As shown in **Table 4.5-9**, the MSF and stations would use approximately 2,340,800 kBTU (or 2.3 MMcf)<sup>71</sup> of natural gas per year. The natural gas demand from the existing land uses to be removed is 6,902,525 KBTU per year. The Vons store replacement would use 953,520 KBTU of natural gas per year. Therefore, the proposed Project would result in a net decrease of 3,608,205 kBTU of natural gas per year.

<sup>70</sup> Lea+Elliott, Inc. Inglewood Transit Connector EIR Operating Systems Conceptual Planning EIR Project Definition - August 2021.

<sup>71</sup> The conversion of kBTU to cubic feet uses the factor of 1 cf to 1.037 kBTU.

Further, the proposed Project would be within the service capacity of SoCalGas which is anticipated to have an available capacity of approximately 3,435 MMcf of natural gas per day (or 1,253,775 million MMcf per year) in 2027, which is the opening year of the proposed Project<sup>72</sup> As discussed, the proposed Project would be designed in a manner that is consistent with building efficiency requirements including Title 24 and CALGreen. Increased building efficiency would help alleviate natural gas demand. Further, the proposed Project would incorporate a number of sustainability features as discussed in the Design Guidelines (**Appendix C**). Specifically, the proposed Project will be designed and constructed to achieve Silver Award Certification under the Envision™ Sustainable Infrastructure Rating System or equivalent. As such, the proposed Project would not result in inefficient, or unnecessary consumption of natural gas during operation.

**Table 4.5-9  
Annual Natural Gas Use During Proposed Project Operation**

Source	Units	Quantity
Stations	kBTU/yr	576,840
MSF	kBTU/yr	1,763,960
<b>Project Total</b>	kBTU/yr	<b>2,340,800</b>
<i>Existing Natural Gas<sup>a</sup></i>	kBTU/yr	5,949,005
<b>Net Natural Gas Total</b>	kBTU/yr	<b>(3,608,205)</b>

Notes: kBTU/yr = thousand British Thermal Units per year.

Source: See **Appendix J.1.1** for MSF operational natural gas usage.

<sup>a</sup> Existing data accounts for operation of the Vons store replacement.

Natural gas demands during operation would be less than significant.

#### Transportation Fuel

The proposed Project spans approximately 1.6 miles and would be located near existing land uses which generate vehicle trips on local roadways within the vicinity of the Project. The proposed Project would provide direct connections between the Los Angeles County Metropolitan Transportation Authority (Metro) K Line, and other transit providers as well as the City's major activity centers, such as the Forum, the Los Angeles Sports and Entertainment District (LASED) and the Inglewood Basketball and Entertainment Center. Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce per-capita VMT. **Table 4.5-10: Annual VMT With and Without Proposed Project** presents the annual VMTs for the Adjusted Baseline, Future (2027), and Future (2045) scenarios.

<sup>72</sup> California Gas and Electric Utilities, *2020 California Gas Report*, [https://www.socalgas.com/sites/default/files/2020-10/2020\\_California\\_Gas\\_Report\\_Joint\\_Utility\\_Biennial\\_Comprehensive\\_Filing.pdf](https://www.socalgas.com/sites/default/files/2020-10/2020_California_Gas_Report_Joint_Utility_Biennial_Comprehensive_Filing.pdf). Accessed September 28, 2021.

As shown in **Table 4.5-10**, implementation of the proposed Project would reduce annual VMTs under all scenarios. Specifically, under the Adjusted Baseline scenario, the proposed Project would reduce annual VMTs from 998,811,151 to 985,939,091, a decrease of 12,872,060. Under the Future (2027) Non-Event scenario, the proposed Project would reduce annual VMTs from 1,245,731,160 to 1,229,255,081, a decrease of 16,476,079. Under the Future (2027) All Event scenario, the proposed Project would reduce annual VMTs from 1,346,432,106 to 1,310,204,482, a decrease of 36,227,624. Under the Future (2045) Non-Event scenario, the proposed Project would reduce annual VMTs from 1,369,204,193 to 1,351,035,367, a decrease of 18,168,826. Under the Future (2045) All Event scenario, the proposed Project would reduce annual VMTs from 1,469,905,139 to 1,426,761,804, a decrease of 43,143,335.

**Table 4.5-10  
Annual VMT With and Without Proposed Project**

Scenario	Annual VMT		
	Without ITC	With ITC	Reduction
Adjusted Baseline	998,811,151	985,939,091	12,872,060
Future (2027) Non-Event	1,245,731,160	1,229,255,081	16,476,079
Future (2027) All Events	1,346,432,106	1,310,204,482	36,227,624
Future (2045) Non-Event	1,369,204,193	1,351,035,367	18,168,826
Future (2045) All Events	1,469,905,139	1,426,761,804	43,143,335

See **Section 4.12:Transportation** to this Recirculated Draft EIR for further discussion.

Petroleum usage from vehicle travel was calculated based on the projected annual VMTs provided previously. **Table 4.5-11: Annual Vehicle Fuel Use With and Without Proposed Project** below presents the annual petroleum consumption for the Adjusted Baseline, Future (2027), and Future (2045) scenarios.

As shown, implementation of the proposed Project would reduce annual petroleum-based fuel under all scenarios. Specifically, under the Adjusted Baseline scenario, the proposed Project would reduce annual fuel consumption from 45,338,712 gallons to 44,754,415 gallons, a decrease of 584,297 gallons. Under the Future (2027) Non-Event scenario, the proposed Project would reduce annual fuel consumption from 47,071,377 gallons to 46,448,809 gallons, a decrease of 622,567 gallons. Under the Future (2027) All Event scenario, the proposed Project would reduce annual fuel consumption from 50,876,477 gallons to 49,507,575 gallons, a decrease of 1,368,902. Under the Future (2045) Non-Event scenario, the proposed Project would reduce annual fuel consumption from 43,780,331 gallons to 43,199,383 gallons, a decrease of 580,949 gallons. Under the Future (2045) All Event scenario, the proposed Project would reduce annual fuel consumption from 47,000,246 gallons to 45,620,737 gallons, a decrease of 1,379,509 gallons.

**Table 4.5-11  
Annual Vehicle Fuel Use With and Without Proposed Project**

Scenario	Annual Fuel Consumption (gal)		
	Without ITC	With ITC	Reduction
Adjusted Baseline	45,338,712	44,754,415	584,297
Future (2027) Non-Event	47,071,377	46,448,809	622,567
Future (2027) All Events	50,876,477	49,507,575	1,368,902
Future (2045) Non-Event	43,780,331	43,199,383	580,949
Future (2045) All Events	47,000,246	45,620,737	1,379,509

Source: See **Appendix J.1** for fuel calculations.

Vehicles used for project-related vehicle trips would also comply as applicable with Pavley and Low Carbon Fuel Standards<sup>73</sup> which are designed to reduce vehicle GHG emissions, but would also result in fuel savings, in addition to compliance with CAFE standards. The proposed Project would support Statewide efforts to improve transportation energy efficiency and reduce transportation energy consumption with respect to private automobiles for the reasons discussed below. As discussed in detail in **Section 4.9: Land Use and Planning**, the proposed Project design and characteristics would be consistent with and would not conflict with the goals of the SCAG 2020-2045 RTP/SCS.<sup>74</sup> The 2020-2045 RTP/SCS provides a framework for member agencies to fund and implement regional transportation infrastructure improvements that benefit the region as a whole, including transit projects such as the one analyzed herein.

Additionally, the proposed Project would include up to two stationary standby generators with an estimated total capacity rated at approximately 4,000 kW to provide emergency power primarily for lighting and other emergency building systems. Emergency generators would utilize diesel fuel to operate during an emergency and for testing and maintenance. The generators would be required to comply with applicable federal emissions standards and Southern California Air Quality Management District (SCAQMD) Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) which mandate emission limits and operating hour constraints. Specifically, each standby generator would operate for 2 hours per day during 25 days per year for a total of 50 hours per year. For emergency operation both generators would operate up to 2 hours each and could occur simultaneously. SCAQMD requires that all internal combustion engines (ICE) greater than 50 brake horsepower (bhp) and gas turbines greater than 2,975,000 Btu per hour obtain a permit to construct prior

74 Southern California Association of Governments, *Connect SoCal – 2020 – 2045 RTP/SCS*, <https://www.connectsocial.org/Pages/What-Is-Connect-SoCal.aspx>. Accessed September 28, 2021.

#### 4.5 Energy Resources

to installation of the engines. The estimated annual fuel usage assuming each generator operates of 50 hours per year (2 hours per day) is 27,440 gallons of diesel fuel.<sup>75</sup>

The proposed Project would not result in inefficient, or unnecessary consumption of vehicle fuels during operation. Accordingly, vehicle fuel demands during operation would be less than significant.

#### Summary

Operation of the proposed Project would comply with all applicable building codes, including the 2019 Title 24 building energy efficiency standards,<sup>76</sup> CAFE fuel economy standards,<sup>77</sup> consistency with the SCAG 2020-2045 RTP/SCS,<sup>78</sup> compliance with the County's Low Impact Development (LID) Development Standards Manual,<sup>79</sup> compliance with the City's Low Impact Development Requirements for New Development and Redevelopment, the City's Green Street Policy,<sup>80</sup> the City's Water Conservation and Water Supply Shortage Program,<sup>81</sup> the Sustainability Guidelines included in the Design Guidelines, as described above, as well as mitigation measures included in this Recirculated Draft EIR, which would ensure that natural resources are used efficiently and conserved to the maximum extent possible.

The City has developed a set of broad sustainability strategies included as part of the Design Guidelines to be incorporated into the design, construction, and operations of each proposed Project component. These guidelines align with Inglewood's commitment to sustainability City-wide, as outlined in the City's Energy and Climate Action Plan and Energy Efficiency Climate Action Plan. These sustainability guidelines serve as a mechanism to promote the City's commitment to reduce its environmental footprint and promote energy efficient design requirements, water conservation and water quality improvement projects, natural resource protection efforts, waste reduction and recycling, and numerous air quality emissions reduction policies and programs.

For operational impacts, the proposed Project would comply with the requirements of California Green Building Standards Code (CALGreen) and be consistent with the City of Inglewood Energy Efficiency Climate Action Plan involving policies and programs related to sustainability, energy efficiency, and

#### 4.5 Energy Resources

reduction in GHG emissions. The City has committed to taking an active role in promoting energy conservation and environmentally-friendly initiatives to improve the environment and realize the benefits, which include energy independence, cost savings for energy not used, water saved, improved air quality, and public health benefits from improved air quality.

The City has an ongoing commitment to increasing energy efficiency and implementing energy conservation measures to reduce wasteful, inefficient, and unnecessary consumption. The proposed Project would incorporate a number of sustainability features as listed in **Section 3.0, 3.5.9**. The City has committed to implementing, if feasible, various sustainability measures for different proposed Project elements that meet or exceed CALGreen requirements, including energy and water conservation measures, for each of the follow proposed Project components: the guideway, stations, and the MSF. The sustainability strategies relate to planning and design; energy efficiency and renewable energy; water efficiency and conservation; materials conservation and resource efficiency; and environmental quality.

Further, it is expected that over time new technologies or systems will emerge, or will become more cost-effective or user-friendly, which will further reduce the reliance upon nonrenewable natural resources. For example, future implementation of the Clean Fuel Standard and the Renewable Portfolio Standard are expected to decrease the use of nonrenewable fossil fuels.

As stated in **Section 3.0**, the goals of the proposed Project include building new efficient transportation facilities that conserve energy, water, and other resources; and reducing traffic congestion and VMT. The components of the proposed Project would be required to meet the energy efficiency and conservation requirements of the California Green Building Standards Code<sup>82</sup> and the City Energy Efficiency Climate Action Plan.<sup>83</sup> Specifically, the proposed Project would incorporate the sustainability features included in the Design Guidelines, as described above.

Operation of the proposed Project would minimize the consumption of transportation fuels. Therefore, as proposed operation of the proposed Project would not result in the wasteful, inefficient, or unnecessary consumption of electricity, natural gas, and transportation fuels, the proposed Project would not result in unjustified consumption of natural resources and impacts would be less than significant.

82 California Green Building Standards Code (CCR, Title 24, Part 11 - CALGreen)

83 City of Inglewood, *Energy Efficiency Climate Action Plan*, December 2015, [http://www.southbaycities.org/sites/default/files/EECAP\\_Inglewood\\_Final\\_20151218.pdf](http://www.southbaycities.org/sites/default/files/EECAP_Inglewood_Final_20151218.pdf). Accessed September 28, 2021.

**Mitigation Measures****Construction**

No mitigation is required.

**Operation**

No mitigation is required.

**Level of Significance after Mitigation****Construction**

Impacts related to energy use from implementation of the proposed Project would be less than significant.

**Operation**

Impacts related to energy use from implementation of the proposed Project would be less than significant.

**Impact E-2: Would the project conflict with or obstruct a State or local plan for renewable energy or energy efficiency?**

The proposed Project would comply with applicable regulatory requirements for the design of new buildings, including the provisions set forth in the CALGreen Code and California's Building Energy Efficiency Standards, which have been incorporated into the County Green Building Code. Based on the below, the proposed Project would be consistent with adopted energy conservation plans and impacts would be less than significant.

**The Inglewood Energy and Climate Action Plan (ECAP)**

The ECAP<sup>84</sup> includes a business-as-usual (BAU) forecast that estimates future emissions in 2020 and 2035 from six sectors: Transportation, Residential Energy, Commercial/Municipal Energy, Industrial Energy, Solid Waste, and Water. The BAU forecast assumes a future under regulatory conditions as they existed in 2010, and it does not include the effects of updates to Title 24,<sup>85</sup> the Renewables Portfolio Standard,<sup>86</sup> and the Pavley Clean Car Standards<sup>87</sup> on future GHG emissions. Under the BAU forecast, total GHG emissions in Inglewood are expected to increase approximately 14 percent from 2010 (594,273 MTCO<sub>2e</sub>) to 2035 (678,283 MTCO<sub>2e</sub>). On a per service population basis, the increase is shown to be 4.5 percent, from 4.22

<sup>84</sup> City of Inglewood, *Energy Efficiency Climate Action Plan*, December 2015, [http://www.southbaycities.org/sites/default/files/EECAP\\_Inglewood\\_Final\\_20151218.pdf](http://www.southbaycities.org/sites/default/files/EECAP_Inglewood_Final_20151218.pdf). Accessed September 28, 2021.

<sup>85</sup> California Green Building Standards Code (CCR, Title 24, Part 11 - CALGreen).

<sup>86</sup> SB 1078, *Renewable Energy: California Renewables Portfolio Standard Program*.

<sup>87</sup> AB 1493, *Clean Car Standards – Pavley, California Air Resources Board, Low-Emissions Vehicle Greenhouse Gas Program*, <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program/lev-program/low-emission-vehicle-greenhouse-gas>. Accessed September 28, 2021.

MTCO<sub>2e</sub>/SP in 2010 to 4.41 MTCO<sub>2e</sub>/SP in 2035. The GHG emissions reductions realized by State and local measures would be a direct result of energy efficiency upgrades aimed at increasing building energy performance, promoting renewable energy, and increasing vehicle fuel economy.

ECAP<sup>88</sup> implementation is expected to reduce emissions by 18.8 percent below 2005 levels by 2020, enabling the City to meet its 2005 target. However, the City would, need to reduce emissions by an additional 111,702 MT CO<sub>2e</sub> per year by 2035 to meet its 2035 target. The ECAP identifies a number of strategies aimed at reducing emissions through increased energy efficiency, renewable energy generation, improved transit options, and reduced consumption and waste. The ECAP includes energy reductions from the following implementing strategies and actions:

**Strategy 4: Improve Transportation Options and Manage Transportation Demand**

- Make roadways more efficient
- Improve transit
- Improve bicycle facilities
- Make parking more efficient
- Reduce commute trips
- Encourage land use intensification and diversity

ECAP implementation is expected to reduce emissions by 18.8 percent below 2005 levels by 2020, enabling the City to meet its 2005 target. However, the City would, need to reduce emissions by an additional 111,702 MT CO<sub>2e</sub> per year by 2035 to meet its 2035 target. The ECAP identifies a number of strategies aimed at reducing emissions through increased energy efficiency, renewable energy generation, improved transit options, and reduced consumption and waste.

The proposed Project would provide direct connections between the Metro K Line, and other transit providers as well as the City's major activity centers, such as the Forum, the LASED, HPSP and the IBEC. Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce per-capita VMT.

The proposed Project would be consistent with the City ECAP.

Impacts would be less than significant.

<sup>88</sup> City of Inglewood, *Energy Efficiency Climate Action Plan*, December 2015, [http://www.southbaycities.org/sites/default/files/EECAP\\_Inglewood\\_Final\\_20151218.pdf](http://www.southbaycities.org/sites/default/files/EECAP_Inglewood_Final_20151218.pdf). Accessed September 28, 2021.

### CALGreen Code and Title 24

The proposed Project would be designed in a manner that is consistent with relevant energy conservation plans designed to encourage development that results in the efficient use of energy resources. The proposed Project would incorporate the sustainability features as contained in the Design Guidelines, as described above. Specifically, the proposed Project will be designed and constructed to achieve Silver Award Certification under the Envision™ Sustainable Infrastructure Rating System or equivalent.

Electricity would be required for water conveyance to the proposed Project. As such, reducing water consumption would reduce electricity demand for water conveyance. Water demand indoors and outdoors would be reduced through numerous measures that meet or exceed CalGreen requirements.<sup>89</sup> Recycled water would be used for landscape irrigation, toilet flushing, or car or train washing, water would be filtered and reused as wash and rinse water for train cars in the MSF. Once initial plants are established, xeriscape landscape would be implemented to utilize no-water irrigation, and drought-tolerant plants would be watered via drip irrigation. Low flow faucets and low flow flush fixtures would be implemented throughout the proposed Project design, and the best available water efficiency technologies would be used for cooling towers. Drainage systems designs would manage and capture any stormwater runoff to the maximum extent feasible through, in order of priority, infiltration, evapotranspiration, capture and use, and treatment with a high removal efficiency biofiltration/ biotreatment system.

As such, the proposed Project would comply with CALGreen and Title 24 requirements<sup>90</sup> to reduce energy consumption by implementing energy efficient building designs, reducing indoor and outdoor water demand, and installing energy-efficient appliances and equipment.

### SCAG 2020-2045 RTP/SCS

The proposed Project would be consistent with the 2020-2045 RTP/SCS.<sup>91</sup> The SCAG RTP/SCS is designed to support development of compact communities in existing urban areas with more mixed-use and infill development, and reuse developed land that is also accessible to transit and/or served by high quality transit. The 2020-2045 RTP/SCS builds on the foundation of the 2016-2040 RTP/SCS by adapting its goals to a changing region, mainly focusing on leveraging new transportation technologies for more efficient travel, improving mobility and accessibility, and increasing the movement of people and diversification of choice within the transportation system.

Overall, the Project would be consistent with the goals and policies of the SCAG 2020-2045 RTP/SCS because it supports reductions in VMT to and from the proposed Project. Although the 2020-2045 RTP/SCS

<sup>89</sup> California Green Building Standards Code (CCR, Title 24, Part 11 - CALGreen)

<sup>90</sup> California Green Building Standards Code (CCR, Title 24, Part 11 - CALGreen)

<sup>91</sup> Southern California Association of Governments, *Connect SoCal – 2020 – 2045 RTP/SCS*, <https://www.connectsocial.org/Pages/What-Is-Connect-SoCal.aspx>. Accessed September 28, 2021.

is not an energy efficiency plan, consistency with the 2020-2045 RTP/SCS has energy implications, including the reduction of VMT from the plan which reduces GHG emissions and reduces fossil fuel consumption from travel to and from the implementation of the proposed Project.

Impacts would be less than significant.

### Summary

The proposed Project would incorporate a number of sustainability features as listed in **Section 3.0, 3.5.9**. The City has committed to implementing various sustainability measures for different proposed Project elements that meet or exceed CALGreen requirements, including energy and water conservation measures, for each of the follow proposed Project components: the guideway, stations, and the MSF. As such, it would be consistent with applicable plans, policies and regulations adopted for the purpose of promoting renewable energy and overall energy efficiency.

Impacts would be less than significant.

### Mitigation Measures

#### Construction

No mitigation is required.

#### Operation

No mitigation is required.

### Level of Significance after Mitigation

#### Construction

Implementation of the proposed Project would be consistent with the applicable plans; impacts would be less than significant.

#### Operation

Implementation of the proposed Project would be consistent with the applicable plans; impacts would be less than significant.

### 4.5.8 CUMULATIVE IMPACTS

Implementation of the proposed Project, including the related projects identified in **Section 4.0, 4.0.6: Cumulative Assumptions** would further increase demands for energy and may require the construction or relocation of related supply facilities. Each project will require site specific assessment to determine any impacts to existing energy or conservation.

### Electricity

As discussed previously, electricity within the City is supplied by SCE. The geographic scope for cumulative electricity impacts is SCE's electricity service area. There are approximately 304 related projects that would be within the same service area as the proposed Project. Development of the proposed Project and related projects could cumulatively increase demands on the existing electricity supply. However, each project will require a site-specific assessment to determine any impacts to existing and forecasted electricity supply. Specifically, all related projects would be required to assess construction and operational electricity usage and coordinate with SCE prior to project approval. Further, like the proposed Project, other related projects would be required to incorporate energy conservation features in order to comply with applicable mandatory regulations including CALGreen and State energy standards in Title 24, and incorporate mitigation measures, as necessary. Therefore, cumulative impacts related to electrical infrastructure would be less than significant.

### Natural Gas

As discussed previously, SoCalGas is the natural gas purveyor within the City. The geographic scope for cumulative natural gas impacts is SoCalGas' service area. There are approximately 395 related projects that would be within the same service area as the proposed Project. Development of the proposed Project and related projects could cumulatively increase demands on the existing natural gas supply. However, each project will require a site-specific assessment to determine any impacts to existing and forecasted natural gas supply. Specifically, all related projects would be required to assess construction and operational natural gas usage and coordinate with SoCalGas prior to project approval. Further, like the proposed Project, other related projects would be required to incorporate energy conservation features in order to comply with applicable mandatory regulations including CALGreen and State energy standards in Title 24, and incorporate mitigation measures, as necessary. Therefore, cumulative impacts related to natural gas infrastructure would be less than significant.

### Transportation Fuel

The geographic scope for cumulative transportation fuel impacts is the SCAG region. Buildout of the proposed Project and other transit and transit-oriented-development projects in the SCAG region would be expected to decrease overall VMT, as a result of the use of the ATS trains by people, rather than using vehicles for travel to the area. The effect on transportation fuel demand by other cumulative projects would be reduced by future improvements to vehicle fuel economy pursuant to Federal and State regulations. By 2025, vehicles are required to achieve 54.5 mpg (based on USEPA measurements), which is a 54 percent increase from the 35.5 mpg standard in the 2012–2016 standards. Cumulative development projects would need to demonstrate consistency with these goals and incorporate any mitigation measures required under CEQA, which would also ensure cumulative development projects contribute to

transportation energy efficiency. Therefore, cumulative impacts related to transportation fuels would be less than significant.

### 4.5.9 CONSISTENCY WITH CITY OF INGELWOOD GENERAL PLAN

The City's General Plan does not contain any policies, regulations, or directives that specifically address energy resources. However, the following circulation goals from the Land Use Element of the City General Plan are relevant to transportation-related energy demand and conservation.<sup>92</sup>

**Circulation Goal:** Promote and support adequate public transportation within the City and the region.

**Circulation Goal:** Develop a safe and adequate pedestrian circulation system which is barrier free for the handicapped.

The proposed Project would promote and support adequate public transportation within the City and the region. The proposed Project is a public transit project by design, connecting future riders to the Metro K Line and solving the problem of the last mile connection to various activity centers throughout the City. The proposed Project would decrease overall VMT as a result of the ridership in lieu of automobile use to and from the City activity centers. Decrease in VMT would result in more efficient energy use and a reduction in vehicle fuel usage and GHG emissions.

The proposed Project would develop a safe and adequate pedestrian circulation system which is barrier free for the handicapped. For example, all station mezzanine levels would provide connectivity to elevated passenger walkways for traveling over existing roadways. The elevated passenger walkways would be designed to improve both pedestrian access and comfort between the stations and the City in addition to providing multimodal access to adjacent bus facilities, pick-up and drop-off areas, and other adjacent resources. The proposed Project would also upgrade existing sidewalks to ensure consistent Americans with Disabilities Act appliance along the transit corridor. As such, the proposed Project would be consistent with the City General Plan goals relevant to transportation-related energy demand and conservation as discussed under **Impact E-2**.

<sup>92</sup> City of Inglewood, Department of Community Development and Housing, 1980. *Land Use Element of the Inglewood General Plan, January 1980*. Amended September 14, 2016.

## 4.6 GEOLOGY AND SOILS

### 4.6.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) evaluates the impacts of the proposed Inglewood Transit Connector Project (proposed Project or ITC Project) related to seismicity and paleontological resources.<sup>1</sup> Information from the following reports is incorporated into this section:

- *Fault Rupture Hazard Evaluation in Support of Draft EIR (Fault Rupture Hazard Evaluation)*, Geosyntec Consultants, September 27, 2019 (**Appendix K.1: Fault Rupture Study**);
- *Development of Seismic Design Criteria in Support of Draft EIR (Seismic Design Criteria)*, Geosyntec Consultants, June 26, 2019 (**Appendix K.2: Seismic Design Criteria**); and
- *Inglewood Transit Connector, Technical Memorandum, Geology and Soils*, Geosyntec Consultants, June 25, 2018 (**Appendix K.3: Technical Memorandum, Geology and Soils**).

Prior to the preparation of the December 2020 Draft EIR, a Revised Initial Study (included in **Appendix A.2**), was prepared using the California Environmental Quality Act (CEQA) Environmental Checklist to assess potential environmental impacts associated with geology and soils. Four screening thresholds were found to result in “Less than Significant Impacts,” and two thresholds would result in “No Impact.” Thus, these topics are not analyzed further in this Recirculated Draft EIR:

- Impacts related to the exposure of people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction, were evaluated, and determined to be less than significant. The location of the proposed Project is not within an area known to be susceptible to liquefaction.<sup>2</sup>
- Impacts related to the exposure of people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving landslides, were evaluated, and determined to have no impact. The location of the proposed Project is not within a designated earthquake-induced landslide zone known to the California Geological Survey (CGS). Further, the lack of general elevation difference in the area would limit the risk of seismically induced landslides occurring, nor does the proposed Project substantially alter the existing topography of the area.<sup>3</sup>
- Impacts related to substantial soil erosion or the loss of topsoil were evaluated and determined to be less than significant. The proposed Project shall be subject to a Storm Water Pollution Prevention Plan

<sup>1</sup> Paleontological Resources Assessment Report, Inglewood Basketball and Entertainment Center, City of Inglewood, California, ESA, May 2019.

<sup>2</sup> Inglewood Transit Connector, *Technical Memorandum, Geology and Soils*, Geosyntec Consultants, June 25, 2018. See **Appendix K.3**.

<sup>3</sup> Inglewood Transit Connector, *Technical Memorandum, Geology and Soils*, Geosyntec Consultants, June 25, 2018. See **Appendix K.3**.

(SWPPP) in accordance with the National Pollutant Discharge Elimination System (NPDES). Compliance with construction-related best management practices (BMPs), as detailed in the SWPPP, would control, and minimize erosion and siltation.<sup>4</sup>

- Impacts related to location on a geologic unit or soil that is unstable, or that would become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse were evaluated and determined to be less than significant. United States Geological Survey (USGS) groundwater data note that groundwater is at least 85 feet below ground surface. Dewatering, an activity that contributes to subsidence and ground collapse, would not be necessary for the proposed Project. The proposed Project design and construction would be required to adhere to all applicable building codes and standards ensuring that impacts related to geological failure—including lateral spreading, off-site landslides, liquefaction, or collapse would be less than significant.<sup>5</sup>
- Impacts related to location on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property were evaluated and determined to be less than significant. The proposed Project’s design and construction would incorporate construction practices to maintain the integrity of building and support structures and would comply with all applicable building codes and standards.<sup>6</sup>
- No impacts would result from soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater. The proposed Project would connect to the City’s existing sewer system and would not require the use of septic tanks or alternative wastewater disposal systems.<sup>7</sup>

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the Project in response consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. Specific changes to the proposed Project include raising the height of the ATS guideway along Market Street to preserve existing views of historic buildings, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue. As it relates to impacts to geology and soils, impacts would remain less than significant with mitigation similar to the December 2020 Draft EIR.

<sup>4</sup> Inglewood Transit Connector, *Technical Memorandum, Geology and Soils*, Geosyntec Consultants, June 25, 2018. See **Appendix K.3**.

<sup>5</sup> Inglewood Transit Connector, *Technical Memorandum, Geology and Soils*, Geosyntec Consultants, June 25, 2018. See **Appendix K.3**.

<sup>6</sup> Inglewood Transit Connector, *Technical Memorandum, Geology and Soils*, Geosyntec Consultants, June 25, 2018. See **Appendix K.3**.

<sup>7</sup> Inglewood Transit Connector, *Technical Memorandum, Geology and Soils*, Geosyntec Consultants, June 25, 2018. See **Appendix K.3**.

These changes to the design of the Project do not create the potential for significant impacts related to liquefaction, seismically induced landslides, erosion and/or loss of topsoil. These changes also do not create the potential for significant impacts related to geologic failure including lateral spreading, off-site landslides, or collapse, as described above. The revised Project would not be located on expansive soils, nor would it require alternative wastewater disposal systems.

Impacts found to be less than significant are further discussed in **Section 6.0: Other Environmental Considerations**.

#### 4.6.2 METHODOLOGY

The evaluation of potentially significant impacts related to seismicity as a result of the proposed Project is based on a review of existing conditions and a review of geotechnical reports prepared for the proposed Project. To ascertain the existing conditions, published USGS geological maps were reviewed, and geologic and geotechnical records were obtained from publicly available online resources, including municipalities and agencies with jurisdiction near the Project area including Los Angeles County Department of Public Works, LA Metro, Caltrans, and City of Inglewood (City) Building and Safety Division. Various database searches were performed using USGS and CGS to compile available documents and incorporate relevant information into this assessment. No site reconnaissance, geologic mapping, subsurface, or site-specific investigations were performed.

The evaluation of the potential for paleontological resources to be located within the Project alignment and impacts to these resources is based on a paleontological report prepared for a project in the vicinity of the proposed Project area.<sup>8</sup>

Existing seismic conditions and paleontological resources near the Project are described, and the regulatory framework that guides the evaluation of the proposed Project are provided. Direct and/or indirect Project impacts that would result from Project implementation are then identified, along with any measures to mitigate potentially significant impacts, as necessary.

#### 4.6.3 REGULATORY FRAMEWORK

Federal, State, and local laws, regulations, and policies pertaining to geology and soils provide the regulatory framework for addressing aspects of seismic and geotechnical conditions that would be affected by development of the proposed Project. The following is a summary of key applicable regulations related to potential seismic and geotechnical conditions.

<sup>8</sup> DEIR Appendix I: Paleontological Resources Report, *Inglewood Basketball and Entertainment Center Project*, December 2019, [http://ibecproject.com/I\\_PaleontologicalResourcesReport.pdf](http://ibecproject.com/I_PaleontologicalResourcesReport.pdf).

#### 4.6.3.1 Federal Regulations

##### ***Earthquake Hazards Reduction Act***

The U.S. Congress passed the Earthquake Hazards Reduction Act in 1977<sup>9</sup> to reduce the risks to life and property from future earthquakes in the United States through the establishment and maintenance of an effective earthquake hazards reduction program.

To accomplish this goal, the act established the National Earthquake Hazards Reduction Program (NEHRP);<sup>10</sup> this program was substantially amended in November 1990 by the NEHRPA,<sup>11</sup> which refined the description of agency responsibilities, program goals, and objectives. Focusing on research, building code standards, technical guidance, and education, NEHRP is a collaborative effort among the Federal Emergency Management Agency (FEMA), the National Institute of Standards and Technology (NIST), the National Science Foundation (NSF), and the USGS.

#### 4.6.3.2 State Regulations

##### ***Alquist-Priolo Earthquake Fault Zoning Act***

The purpose of the Alquist-Priolo Earthquake Fault Zoning Act is to identify hazards associated with surface fault ruptures and to prevent the construction of buildings on active faults.<sup>12</sup> Alquist-Priolo earthquake fault zones (APEFZ) are regulatory zones surrounding the surface traces of active faults in California. Wherever an active fault exists, if it has the potential for surface rupture, a structure for human occupancy cannot be placed over the fault and must be a minimum distance from the fault, generally fifty feet. Earthquake fault zones were conceived in the Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo Act). The intent of the Alquist-Priolo Act is to reduce property and life losses from surface fault rupture.

The State Geologist is required to establish and map zones around the surface traces of active faults, which are then distributed to county and city agencies to be incorporated into their land use planning and construction policies. Proposed development needs to be proven through geologic investigation to not be located across active faults before a city or county can permit the implementation of projects. If an active fault is found, development for human occupancy is prohibited within a 50-foot setback, or a distance demonstrated to be appropriate by the geologic investigation, from the identified fault.

<sup>9</sup> National Earthquake Hazards Reduction Program Reauthorization Act of 2004, Public Law 95-124, 42 U.S.C. 7701 et. seq., as amended by Public Laws 101-614, 105-47, 106-503, and 108-360.

<sup>10</sup> Earthquake Hazards Reduction Act of 1977, As Amended by Section 5. Earthquake Hazards Reduction Program [New Section 103 in Public Law 108-360]

<sup>11</sup> Earthquake Hazards Reduction Program Reauthorization Act of 1990 (P.L. 101-614)

<sup>12</sup> California State Alquist-Priolo Earthquake Fault Zoning Act of 1972. California Public Resources Code, sec. 2621.5.

### **Seismic Hazards Mapping Act**

The Seismic Hazards Mapping Act is a State law that requires delineated maps to be created by the California State Geologist to reflect where potential ground shaking, liquefaction, or earthquake-induced landslides may occur.<sup>13</sup> The purpose of the Seismic Hazards Mapping Act is to protect the public from the effects of nonsurface fault rupture earthquake hazards, inducing strong ground shaking, liquefaction, seismically induced landslides, or other ground failure caused by earthquakes. City, County, and State agencies are required to use seismic hazard maps in their land use decision making. Projects within seismic hazard zones are required to have site-specific geotechnical investigations and incorporate appropriate mitigation measures identified as a result. The State has published guidelines for evaluating and mitigating seismic hazards.<sup>14</sup>

### **California Building Code, California Code of Regulations**

The 2019 California Building Code (CBC) was published July 1, 2019, with an effective date of January 1, 2020. It is administered by the California Building Standards Commission (CBSC).<sup>15</sup> The CBC governs all development within the State of California, as amended and adopted by each local jurisdiction. These regulations include provisions for site work, demolition, and construction, which include excavation and grading, as well as provisions for foundations, retaining walls, and expansive and compressible soils. The CBC provides guidelines for building design to protect occupants from seismic hazards.

### **California Department of Transportation (Caltrans)**

The California Department of Transportation (Caltrans) Division of Engineering Services (DES) is the lead project delivery organization for the design, construction, and oversight of bridge and other transportation structures. DES is a comprehensive, multidisciplinary engineering organization committed to providing quality products and services in a timely manner. DES has prepared numerous guidance documents for use in the design and construction of bridges and structures to address geologic conditions. These guidance documents include the two Memorandums (Memos) to Designers, described below, applicable to the design of the proposed Project. These memos define the factors to be addressed in fault investigations completed as part of the structural design process.

<sup>13</sup> California Public Resources Code, sec. 2690–2699.6 Seismic Hazards Mapping Act.

<sup>14</sup> California Division of Mines and Geology Special Publication 117, 1997; revised and readopted in 2008 by the California Geologic Survey.

<sup>15</sup> 2019 California Building Standards Code (Cal. Code Regs., Title 24) published July 1, 2019.

### **Caltrans Memo to Designers 20-8 (Analysis of Ordinary Bridges that Cross Faults)**

Caltrans Memo to Designers 20-8 (Analysis of Ordinary Bridges that Cross Faults) dated January 2013, provides specific guidance for the design of bridges that cross active earthquake faults.<sup>16</sup>

Memo to Designers (MTD) 20-8 states that although a few exceptions exist, the fault rupture hazard is only required for Holocene faults<sup>17</sup> identified by the California Geologic Survey in APEFZ maps.

The memo states that when a bridge or similar structure crosses a fault that falls within a mapped APEFZ, the design is to take into account the displacement demand resulting from a fault offset, dynamic response due to ground shaking, and any other fault-induced hazards, such as creep, which may occur. MTD 20-8 defines a method for determining the potential displacement at columns and abutments at fault crossings to support designing structures to respond to these conditions.

### **Caltrans Memo to Designers 20-10 (Fault Rupture)**

Caltrans Memo to Designers 20-10 (Fault Rupture),<sup>18</sup> dated January 2013, provides guidance for the design of bridge type structures to address the potential fault rupture where any portion of a structure falls within an APEFZ, where any portion of a structure falls within 330 feet of well-mapped active faults, or within 1,000 feet of a fault not located in an APEFZ may require further study.<sup>19</sup>

This memo identifies changes to design required for bridges and similar structures when crossing a fault to address potential fault rupture effects. MTD 20-10 supplements the defined method described in MTD 20-08 above for determining the potential displacement at columns and abutments at fault crossings and designing the structures so to slide at the abutment, bent, or hinge seats points without failing.

### **Public Resources Code Section 5097.5 and Section 30244**

Paleontological resources are limited, nonrenewable resources of scientific, cultural, and educational value that are afforded protection under state laws and regulations. The following section summarizes the applicable federal and state laws and regulations, as well as professional standards provided by the Society of Vertebrate Paleontology (SVP).

PRC Section 5097.5 and Section 30244 include state requirements for paleontological resource management. These statutes prohibit the removal of any paleontological site or feature from public lands without permission of the jurisdictional agency, define the removal of paleontological sites or features as

<sup>16</sup> Caltrans LRFD, Memo to Designers 20-8, Analysis of Ordinary Bridges that Cross Faults, January 2018.

<sup>17</sup> Holocene faults are less than 10,000 years old.

<sup>18</sup> Caltrans LRFD, Memo to Designers 20-10, Fault rupture, January 2013.

<sup>19</sup> In such instances, the memo states that if further study of the fault rupture is needed, then procedures as outlined in CGS Note 49 shall be followed. <https://www.conservation.ca.gov/cgs/Documents/Publications/CGS-Notes/CGS-Note-49.pdf>.

a misdemeanor, and require reasonable mitigation of adverse impacts to paleontological resources from developments on public (State, county, city, district) lands.

#### 4.6.3.3 Local Regulations

##### **City of Inglewood General Plan Safety Element**

The General Plan Safety Element<sup>20</sup> is designed to ensure that the citizens of Inglewood can be protected from unreasonable risks caused by natural and manmade disasters. The City's goals are to minimize the dangers associated with natural and manmade hazards by implementing standards, regulations and laws that would reduce loss of life, injuries and property damage resulting from disasters, and to provide for the continuity of government operations and civilian life during and after a major disaster.

It is a general policy of the City to provide appropriate services and support to combat any disasters, and to protect the citizenry from significant adverse impacts arising from any disasters. Policies of the City's General Plan "Safety Element"<sup>21</sup> applicable to geology, soils, and seismicity include the following:

**Policy 1 Provide measures to reduce seismic impact.**

- Ensure that all potentially hazardous buildings are reinforced or demolished.
- Restrict new structures for human occupancy from being constructed across active faults.
- Require geological and soils engineering investigations in high risk fault areas.
- Use the latest State-approved edition of the Uniform Building Code and other applicable seismic design information.
- Periodically review subdivision requirements and other codes to improve requirements for safety and seismic safety as new information becomes available.
- Study the need for a seismic overlay zone to restrict certain types of development.
- Require a soils report for new buildings, as well as obtaining or utilizing, when available, geologic drillings or studies, local ground subsidence and elevation studies, geologic-seismic studies, strong motion monitoring, gathering, compiling, and interpreting local and regional geologic seismic data as it becomes available.
- Maintain the tagging system used to identify buildings damaged in an earthquake.
- Ensure that the Centinela Adobe historic site and any historical sites identified in the future be seismically reinforced.

<sup>20</sup> City of Inglewood General Plan, "Safety Element" (1995).

<sup>21</sup> City of Inglewood General Plan, "Safety Element" (1995).

##### **City of Inglewood Municipal Code**

###### **Municipal Code Chapter 11, Article 2 Building Code.**

The Inglewood Municipal Code<sup>22</sup> has incorporated the most up to date California Building Code in Chapter 11, Sections 11-2 to 11-5. These include ordinances referencing applicable standards and documentation requirements found in the California Building Code that address seismic safety and include the California Building Code, 2019 Edition, Volumes 1 and 2, based on the International Building Code, 2018 Edition, including the Appendix Chapters B, H, I, J and L, "Uniform Housing Code, 1997 Edition," and the "Uniform Code for the Abatement of Dangerous Buildings, 1997 Edition.

###### **Municipal Code Chapter 11, Article 13 Earthquake Hazard Reduction in Existing Buildings**

This section of the City's Municipal Code Chapter 11, Sections 11-130 to 11-138<sup>23</sup> promotes public safety and welfare by reducing the risk of death or injury that may result from the effects of earthquakes on unreinforced masonry-bearing-wall buildings constructed prior to 1934, or any unreinforced masonry building located in the City. The municipal code sets forth the minimum standards for structural seismic resistance established primarily to reduce the risk of life loss or injury and provides systematic procedures and standards or identification and classification of unreinforced masonry-bearing-wall buildings based on their present use. Priorities, time periods and standards are also established under which these buildings are required to be structurally analyzed and anchored. Where the analysis finds deficiencies, this code requires the building to be strengthened or demolished. In addition, qualified historical buildings are required to comply with the State Historical Building Code.<sup>24</sup>

#### 4.6.4 EXISTING CONDITIONS

##### 4.6.4.1 Regional Geology

The proposed Project is located within the central portion of the Los Angeles Basin, south of the Santa Monica Mountains, near the intersection of the Peninsular Ranges and Transverse Ranges geomorphic provinces of southern California. The Peninsular Ranges province is characterized by a series of northwest trending mountains and valleys separated by faults associated with, and subparallel to, the San Andreas Fault system. These rocks were intruded by Cretaceous-age (65 million years ago [mya]) granitic basement rocks, also known as the Peninsular Ranges Batholith. The Transverse Ranges are characterized by east-west trending structural features such as the Santa Monica Mountains and the Santa Monica and

<sup>22</sup> City of Inglewood, *Municipal Code*, "Chapter 11, Article 2 Building Code, Sections 11-2 through 11-5. California Building Code. Established and Additions, Deletions and Amendments."

<sup>23</sup> City of Inglewood, *Municipal Code*, "Chapter 11, Article 13 Earthquake Hazard Reduction in Existing Buildings, Sections 11-130 to 11-138."

<sup>24</sup> California Administrative Code, State Historical Building Code per Part 8, Title 4.

Hollywood faults. The Santa Monica and Hollywood faults are considered the boundary between these two physiographic provinces (the Peninsular Range province and Transverse Range province).

The Los Angeles Basin is a northwest-trending alluviated lowland plain filled with thick deposits of relatively unconsolidated marine and nonmarine sediments bounded by the Santa Monica Mountains to the north; the Elysian, Repetto and Puente Hills to the east; the Santa Ana Mountains and San Joaquin Hills to the south and southeast; and the Pacific Ocean to the west. The relatively flat surface of the Los Angeles Basin slopes gently south and is interrupted by locally trending northwest alignment of low hills and mesas to the south and west that extend from Newport Beach northwest to Beverly Hills, and the Palos Verdes Peninsula at the southwest extremity.

The Los Angeles Basin began forming during the Late Miocene (approximately 7.2 mya) as a result of subsidence following compressional stresses between the right-oblique Whittier and Palos Verdes fault zones, and the left-oblique Santa Monica fault system. Sedimentary deposits within the Los Angeles Basin are estimated to range in thickness from approximately 32,000 feet to 35,000 feet within the general vicinity of the proposed Project.

#### **Subsurface Conditions**

Previous geotechnical investigations within the vicinity of the proposed Project were reviewed. These explorations along with published geologic maps indicate that recent Pleistocene-age alluvium forms the surficial cover within the vicinity, often with thin localized layers of artificial fill associated with previous development activities. The anticipated geologic materials in the Project area are described in the following sections.

#### **Artificial Fill**

Artificial fill was encountered during previous investigations within the vicinity of the proposed Project extending up to 2 feet below ground surface (bgs) and generally consisted of brown to dark brown sandy silt, characterized as slightly moist and soft to medium stiff. Potential fill underlying the Project alignment is likely the result of grading or construction activities associated with previous development and may vary in composition and thickness.

#### **Alluvial Fan Deposits**

Geologic maps of the area describe relatively small portions of the area as underlain by late Pleistocene-age alluvial fan sediments of granitic sand. These alluvial fan deposits (Qae) typically consist of unconsolidated to weakly consolidated sands, silts, clays, and/or mixtures thereof (sandy silts, silty sands,

etc.). These materials are generally derived from material shed off the nearby Santa Monica Mountains. The thickness of the alluvial fan deposits is likely variable in the Project alignment.

#### **Older Alluvium**

Most of the Project area is underlain by relatively older late Pleistocene-age alluvium (Qoa). The older alluvial deposits consist of sediments that were mainly shed from the Santa Monica Mountains to the north. Composition of the older alluvial deposits primarily consists of slightly consolidated deposits of silts, clays, sands, and sandy gravel, and/or mixtures thereof (e.g., sandy silts and silty sands). Similar to the alluvial fan deposits, thickness of the older alluvium materials is likely to vary in the Project alignment but would extend to depths below the anticipated development associated with the proposed Project.

#### **4.6.4.2 Seismic Setting**

The tectonic setting of the Los Angeles Basin area is dominated by right-lateral strike-slip faults with a general northwest by southeast trend as a result of the interaction between the Pacific and North American lithospheric plates. Numerous faults in southern California include “active,” “potentially active,” and “inactive” faults. Division of these major groups are based on criteria by CGS for the Alquist-Priolo Earthquake Fault Zoning Program. By definition, an “active” fault is one that has had displacement within Holocene time (last 11,000 years). A “potentially active” fault has demonstrated displacement of Quaternary-age deposits (last 1.6 million years). “Inactive” faults have not exhibited displacement in the last 1.6 million years.<sup>25</sup>

Faults of tectonic significance mapped in the Los Angeles region and the historical earthquake epicenters in the region include the Santa Monica fault zone (SMFZ) to the north and northwest; the Newport-Inglewood fault zone (NIFZ) to the east and west; and the Cabrillo, Redondo Canyon, and Palos Verdes faults offshore to the west and southwest. Faults considered active and their respective distances from the Project and maximum moment magnitudes are presented in **Table 4.6-1: Significant Seismic Sources Near the Project**.

<sup>25</sup> Faults are currently categorized as Holocene-active, age-undetermined, and pre-Holocene according to Earthquake Fault Zones, California Geological Survey’s Special Publication 42, Section 5, rev. 2018.

**Table 4.6-1**  
**Significant Seismic Sources Near the Project**

Fault or Fault Segment	Fault Type <sup>1</sup>	Approximate Slip Rate (mm/yr) <sup>2</sup>	Dip Direction <sup>3</sup>	Approximate Fault Length (km) <sup>4</sup>	Approximate Closest Distance to Project (km) <sup>5</sup>	Approximate Maximum Magnitude (Mw) <sup>6</sup>

2 - Approximate Slip Rate millimeters per year (mm/yr) obtained from CGS (2003) and USGS (2008)

3 - N = North; S = South; V = Vertical; NE = Northeast, E = East

4 - Fault Length obtained from CGS (2003) and USGS (2008)

5 - Distances from Project noted are the closest distances to the surface trace or inferred projection of the fault as measured from the CDMG (1998), CGS (2003), or USGS (2008)

6 - Maximum Earthquake values reported at maximum moment magnitude by the CGS (2003) and USGS (2008)

#### 4.6.4.3 Faults

Both active and potentially active faults are located in the Project area, as shown in **Figure 4.6-1: Faults within the Project Area.**

##### Active Faults

The faults closest to the Project area that are considered "active" include the following:

##### Newport Inglewood Fault Zone

The Los Angeles Basin section of the NIFZ is the closest major active fault zone to the Project, with the Inglewood and Potrero fault segments located respectively at their nearest points, approximately 0.45 miles (0.75 km) east and 0.15 miles (0.25 km) west of the Project alignment. The NIFZ is composed of

a series of discontinuous northwest trending en echelon faults extending from Ballona Gap southeast to the area offshore of Newport Beach.<sup>26</sup> This zone is reflected at the surface by a line of geomorphically young anticlinal hills and mesas formed by the folding and faulting of a thick sequence of Pleistocene-age sediments and Tertiary-age sedimentary rocks. Historical seismic activity (between 1977 and 1985) shows mostly strike-slip faulting with some reverse faulting along the northern segment (north of Dominguez Hills), and normal faulting along the southern segment (south of Dominguez Hills to Newport Beach).

##### Inglewood Fault

The Inglewood Fault, one local component of the Newport-Inglewood Fault Zone, is well exposed in the Baldwin Hills, where it has been mapped by the USGS.<sup>27</sup> North of Centinela Creek, which is northwest of the Project, the fault offsets geologic units of Pleistocene age and is marked by a westerly-facing scarp which dies out to the south with only a small break in slope extending south of Centinela Creek.<sup>28</sup>

There is diverse opinion as to whether the fault extends south of Centinela Creek along its established trend, or whether it is offset by the Centinela Creek Fault and becomes the Townsite Fault, which trends through portions of the Project alignment, towards the southeast and across Sofi Stadium.<sup>29</sup>

##### Potrero Fault

The Potrero Fault, a major local component of the Newport-Inglewood Fault Zone, traverses east of the Project in a northwest-southeast direction. It is well defined in the subsurface by oil well data from the Potrero oil field where it consists of a zone 100 to 200 feet wide.<sup>30</sup> It is known to cut Pleistocene aquifers in the Centinela Creek area where historically it was responsible for the existence of the Centinela Spring. At its intersection with the Centinela Fault, the Potrero Fault is either offset or bent so that its northern extension is displaced to the east. Along the east side of the Sofi Stadium, the fault is marked at the surface by an impressive westward-facing scarp about 50 feet high. Near its southern end, both topographic and subsurface evidence of its position disappear. The fault bends to the east and extends toward the southeast of the City.

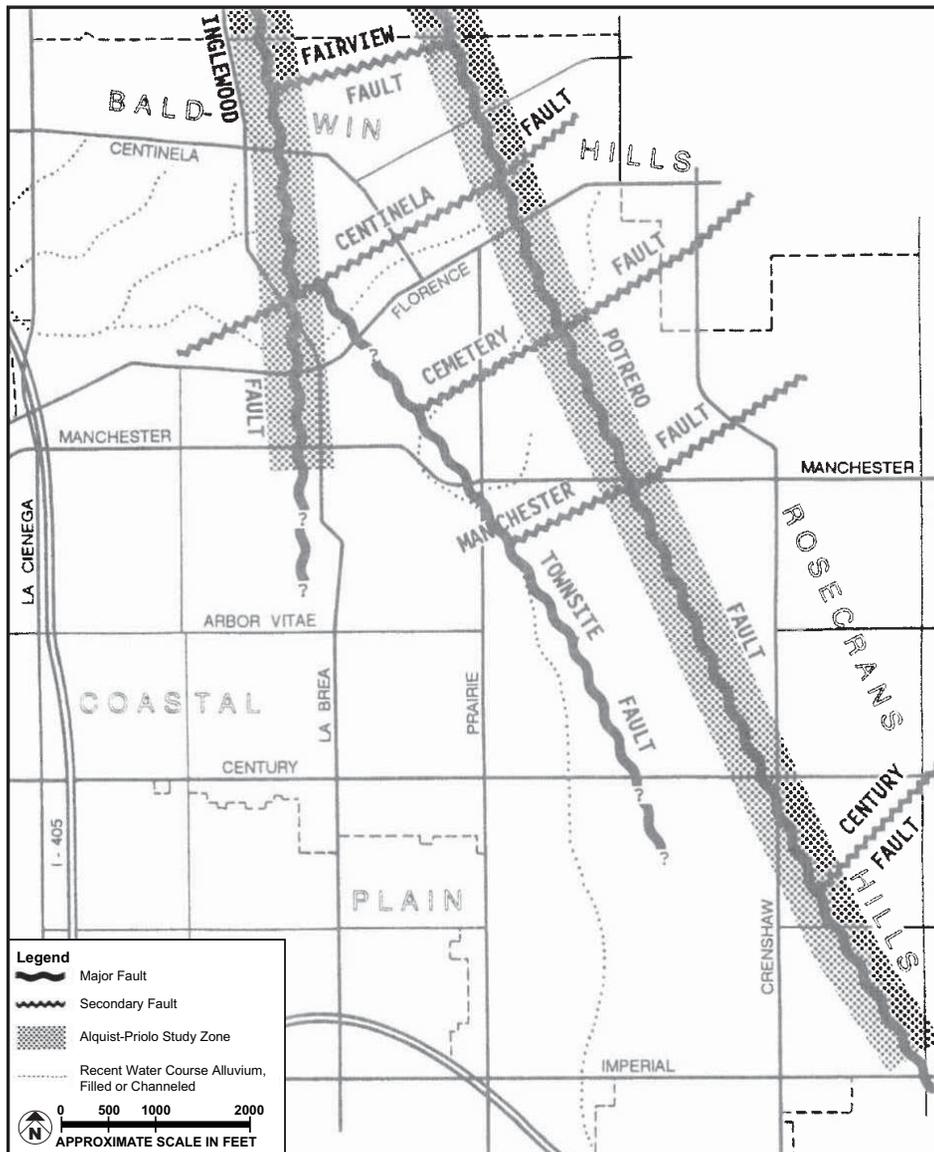

26 En echelon faults are parallel or subparallel, closely spaced, overlapping, or step-like faults that are oblique to the overall structural trend.

FIGURE 4.6-1

Faults within the Project Area

251-003-20

**Santa Monica Fault Zone**

The SMFZ is considered a continuous zone comprised of five fault segments including the Malibu Coast, Santa Monica, Hollywood, and Raymond faults, with a total length of approximately 150 miles. The SMFZ exhibits both reverse and left-lateral components of slip and is located approximately 7 miles (12 km) northwest of the Project alignment at its nearest points. The SMFZ extends 25 miles from the western edge of Beverly Hills across West Los Angeles and Santa Monica to Pacific Palisades, where it trends offshore and parallels the Malibu coast near Point Dume. The SMFZ extends eastward as the Hollywood fault along the base of the Santa Monica Mountains from the West Beverly Hills Lineament in the West Hollywood-Beverly Hills area, to the Los Feliz area of Los Angeles. The active Hollywood fault trends east-west along the southern boundary of the Santa Monica Mountains, located approximately 8.5 miles (13.5 km) north of the proposed Project.

**San Andreas Fault Zone**

The San Andreas strike-slip fault is located approximately 40 miles (65 km) to the northeast, along the northern edge of the San Gabriel Mountains at their contact with the Mojave Desert. The approximately 700-mile-long San Andreas Fault is a network of faults that collectively accommodates the majority of relative north-south motion between the North American and Pacific tectonic plates. The most recent movement on the fault is estimated to be Latest Quaternary (less than 15,000 years before present) with a slip rate of 30 millimeters per year (mm/yr) and a 100-135-year recurrence rate.

**Elsinore Fault Zone**

The Whittier section of the right-lateral Elsinore fault zone is approximately 17 miles (27 km) to the east of the Project. The most recent movement in the fault zone is estimated to be within late Quaternary (less than 15,000 years before present) with a slip rate of 2.5 mm/yr.

**Blind Thrust Faults**

Blind thrust fault zones are considered active features that do not rupture at the ground surface. Although these features present risk by generating intense seismic shaking, their respective distances to the proposed Project are not included in Table 4.6-1 due to the uncertainty in their vertical surface projection. Known blind thrust faults within the Project vicinity along with their respective slip rates and maximum moment magnitudes are described below.

**Elysian Park Thrust**

The Elysian Park Thrust, previously defined as the Elysian Park Fold and Thrust Belt, is a blind thrust fault that overlies the Los Angeles and Santa Fe Springs segments of the Puente Hills Thrust. The eastern edge of the Elysian Park Thrust is defined by the northwest-trending Whittier fault zone. The closest edge of the

vertical surface projection of the Elysian Park Thrust is approximately 6 miles (10 km) northeast of the proposed Project. Like other blind thrust faults in the Los Angeles area, the Elysian Park Thrust is not exposed at the surface and does not present a potential surface rupture hazard; however, should be considered an active feature capable of generating future earthquakes. An average slip rate of 1.3 mm/yr and a maximum moment magnitude (M, defined as a measurement of the size of an earthquake in terms of energy released) of 6.4 were estimated for the Elysian Park Thrust.

#### **Compton-Los Alamitos Thrust**

The Compton-Los Alamitos Thrust is an inferred blind thrust fault located within the south-central portion of the Los Angeles Basin. The closest edge of the vertical surface projection of the buried thrust fault is located approximately 8 miles (13 km) southwest of the Project alignment. Like other blind thrust faults in the Los Angeles Area, the Compton-Los Alamitos Thrust is not exposed at the surface and does not present a potential surface rupture hazard; however, should be considered an active feature capable of generating future earthquakes. An average slip rate of 1.5 mm/yr and a maximum moment magnitude M 6.8 were estimated for the Compton-Los Alamitos Thrust.

#### **Puente Hills Blind Thrust**

The Puente Hills Blind Thrust fault (PHBT) system extends eastward from downtown Los Angeles to Brea in northern Orange County. The PHBT is comprised of three north-dipping segments overlain by folds expressed at the surface as the Coyote Hills, Santa Fe Springs Anticline, and the Montebello Hills. The PHBT exhibits an estimated average slip rate of 0.7 mm/year. Postulated earthquake scenarios for the PHBT include a single segment rupture of a magnitude M 6.6, and a multiple segment rupture producing an earthquake of M 7.1. The PHBT is not exposed at the ground surface and does not present a potential for surface fault rupture. However, based on deformation of late Quaternary age sediments above this fault system and the occurrence of the Whittier Narrows earthquake, the PHBT is considered an active fault capable of generating future earthquakes beneath the Los Angeles Basin.

#### **Potentially Active Faults**

Faults considered “potentially active” located close to the Project alignment include the following:

#### **Overland Fault**

The Overland fault located approximately 1.3 miles (2 km) southwest of the Project alignment is considered potentially active. The Overland fault trends northwest between the Charnock fault and the Newport-Inglewood fault zone, extending from the northwest flank of the Baldwin Hills to Santa Monica Boulevard in the vicinity of Overland Avenue. However, there is no evidence that the fault has offset late Pleistocene or Holocene age alluvial deposits and is considered potentially active by the State Geologist.

#### **Charnock Fault**

The potentially active Charnock fault is located approximately 3.8 miles (6 km) southwest of the Project alignment. The Charnock fault trends northwest-southeast subparallel to the Newport-Inglewood fault zone and the Overland fault. No recent evidence suggests the fault has offset late Pleistocene or Holocene age alluvial deposits and is considered potentially active by the State Geologist.

#### **Townsite Fault**

The Townsite fault extends from its intersection with the Centinela Fault in the Centinela Creek, towards the southeast—likely across the Sofi Stadium—to Century Boulevard. Nearby improvements weave around the Townsite fault. The Townsite fault does not lie within the boundaries of an “Earthquake Fault Zone” as defined by the State of California in the Alquist-Priolo Earthquake Zoning Act. However, its location within the active NIFZ suggests it should be considered active with the potential for surface fault rupture.

#### **Transverse Faults**

Five generally east-west trending faults intersect the major general north-south trending faults (Inglewood, Townsite, and Potrero): Fairview, Centinela, Manchester Boulevard, Inglewood Park Cemetery, and Century Faults. Little geologic data have been published on these faults. They have been mapped on the basis of topographic expression and some studies. As shown in **Figure 4.6-1**, the Centinela Creek fault, Inglewood Park Cemetery fault, and Manchester Boulevard fault are perpendicular to the Townsite fault and in close proximity to the Project.

#### **Surface Fault Rupture**

Surface rupture or displacement occurs as a fault breaks the ground surface during a seismic event. Generally, this hazard is anticipated to occur along pre-existing faults. There has been no history of any major surface rupture on any of these fault zones.<sup>31</sup>

Fault rupture hazard is evaluated to assess the exposure of people or structures to substantial adverse effects, including the risk of loss, injury, or death. The potential for fault surface rupture is generally considered to be significant along “active” faults and to a lesser degree along “potentially active” faults.

The proposed Project does not lie within the boundaries of an Earthquake Fault Zone as defined previously. The closest Alquist-Priolo Zone to the proposed Project has been established for two portions of the Newport-Inglewood fault zone located approximately 280-feet west of the alignment along North Market

<sup>31</sup> City of Inglewood *Technical Background Report*, August 2006.

Street (Inglewood fault), and approximately 2,750-feet east of the alignment from the intersection of West Manchester Boulevard and Prairie Avenue (Potrero fault).

#### 4.6.4.4 Ground Shaking

Most of Southern California is characterized by seismic activity and is subject to some level of ground shaking as a result of movement along the major active (and potentially active) fault zones that are located in the region. Additionally, as a result of the existing faults within the City and the region, the Project area is seismically active. Ground shaking is a major cause of structural damage from earthquakes. The amount of motion expected at a building or structure site can vary from none to forceful depending upon the distance to the fault, the magnitude of the earthquake, and the local geology. Greater movement can be expected at sites located on poorly consolidated material such as alluvium located near the source of the earthquake epicenter or in response to an earthquake of great magnitude.

The City is underlain by two different types of alluvium soils, undifferentiated late Pleistocene alluvium (Qoa) that is composed of well consolidated and cemented gravel, sand, silt, and clay; and late Holocene alluvium (Qya2) that is composed of unconsolidated and uncemented gravel, sand, silt, and clay. Both of these soil types generally provide poor resistance to ground shaking.<sup>32</sup>

The Project alignment is situated within a seismically active region and would likely experience moderate to severe ground shaking in response to a large-magnitude earthquake occurring on a local or more distant active fault during the expected lifespan of the Project. The potential for significant seismically induced ground shaking in response to an earthquake occurring along a nearby active fault is relatively high within the vicinity of the proposed Project.

#### 4.6.4.5 Paleontological Resources

The geologic units present in the Project area are older quaternary alluvium (Qoa), deposited from erosion of the surrounding highlands. Qoa are considered to have a high paleontological sensitivity. They are old enough to preserve fossil resources (i.e., over 5,000 years, as per the SVP) and have a rich fossil history in Los Angeles and throughout southern California. A wide variety of Ice Age fossils are known from these sediments across the Los Angeles Basin including multiple specimens belonging to ten taxa known from within two to four miles of the proposed Project vicinity.<sup>33</sup>

Additionally, according to the Natural History Museum of Los Angeles County, the closest locality known from Qoa sediments is approximately 2.0 miles west of the Project, where a fossil mammoth

<sup>32</sup> City of Inglewood *General Plan*, "Safety Element" (1995).

<sup>33</sup> Paleontological Resources Assessment Report, Inglewood Basketball and Entertainment Center, City of Inglewood, California, ESA, May 2019

(*Mammuthus*) was recovered 40 feet bgs. North of that locality, specimens of mammoth, rodent (*Rodentia*), and a speckled sanddab (*Citharichthys stigmaeus*) were collected from 14 feet bgs. Near the intersection of Airport Boulevard and Manchester Boulevard, fossil specimens of horse (*Equus*), mammoth, bison (*Bison*), and rabbit (*Lepus*) were collected from 13 – 16 feet bgs. Farther west, near the Los Angeles International Airport, a fossil elephant (*Proboscidea*) was collected from 25 feet bgs.<sup>34</sup>

#### 4.6.4.6 Adjusted Baseline

This section assumes the Adjusted Baseline Environmental Setting as described in **Section 4.0: Environmental Impact Analysis, 4.0.4: Adjusted Baseline**. Related to seismicity and paleontological resources, the changes associated with the Adjusted Baseline projects include excavation and construction activities within the HPSP area.

There is no evidence that development in the HPSP would affect the baseline for analysis of geology and soils. No new impacts to geology and soils have been discovered or documented during construction of the Adjusted Baseline projects that would provide additional information on the presence or sensitivity of geology and soils impacts in the area.

#### 4.6.5 THRESHOLDS OF SIGNIFICANCE

Criteria outlined in CEQA Guidelines were used to determine the level of impacts to geology and soils. As discussed in *Section 4.6.1*, six screening thresholds related to geology and soils of Appendix G of CEQA Guidelines were eliminated from further analysis in this EIR. The below three were identified in the Initial Study as having a potentially significant impact in relation to geology and soils if the Project were to:

- Threshold GEO-1:** Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault. Refer to Division of Mines and Geology Special Publication 42.
- Threshold GEO-2:** Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking.
- Threshold GEO-3:** Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

<sup>34</sup> Paleontological Resources Assessment Report, Inglewood Basketball and Entertainment Center, City of Inglewood, California, ESA, May 2019

#### 4.6.6 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

**Impact GEO-1:** Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map, issued by the State Geologist for the area or based on other substantial evidence of a known fault?

The State of California, under the guidelines of the Alquist-Priolo Earthquake Fault Zoning Act, classifies faults as active, potentially active, and not active. The Alquist-Priolo Earthquake Fault Zoning Act requires that geologic investigations be prepared for development sites within Earthquake Fault Zones (APEFZ) to demonstrate that the sites are not threatened by surface rupture from future faulting. In addition, if an active fault is found, all structures for human occupancy must be set back a minimum of 50 feet, or a distance demonstrated to be appropriate by the geologic investigation, from the fault.

The Project area does not lie within the boundaries of an APEFZ. The nearest APEFZs to the Project are two segments of the Newport-Inglewood fault zone located approximately 280 feet west of the alignment along Market Street (the Inglewood Fault), and approximately 2,750-feet east of the Project from the intersection of Manchester Boulevard and Prairie Avenue (the Potrero Fault). Furthermore, previous fault investigations completed west of Market Street did not reveal evidence of faulting or surface rupture (see **Appendix K.1**). Therefore, impacts resulting from the Inglewood and Potrero faults would be less than significant.

The Project, however, is close to several potentially active faults, including the Townsite Fault, Centinela Creek Fault, Inglewood Park Cemetery Fault, and Manchester Fault. The Townsite Fault, in particular, may traverse the Project alignment. As described previously in *Section 4.6.4.3* and shown in **Figure 4.6-2: Location of Active Faults and the Project**, the Townsite Fault may intersect the Project alignment at various points.

- A segment of the guideway within the parking lot near the Market Street/Florence Avenue Station appears to cross the Townsite Fault, and
- A segment of the guideway on Manchester Boulevard, near the proposed Maintenance and Storage Facility (MSF) may cross the Townsite Fault.

Also as noted in **Figure 4.6-2**:

- The Manchester Fault may intersect the guideway on Prairie Avenue near Pincay Drive, perpendicular to the Townsite Fault,

- The Market Street/Florence Avenue station is approximately 830 feet south of the Centinela Creek Fault, and
- Segments of the guideway on Market Street and Manchester Boulevard are as close as approximately 525 feet southwest of the Inglewood Park Cemetery Fault.

Although the Townsite, Centinela Creek, Inglewood Park Cemetery, and Manchester faults are not APEFZ faults, their locations near the Inglewood Fault and Potrero Fault, which are active and local components of the Newport-Inglewood Fault Zone, suggest that these faults should be considered active with the potential for fault rupture.<sup>35</sup> As a result of the proposed improvements potentially overlying the Townsite Fault, fault rupture impacts would be potentially significant.

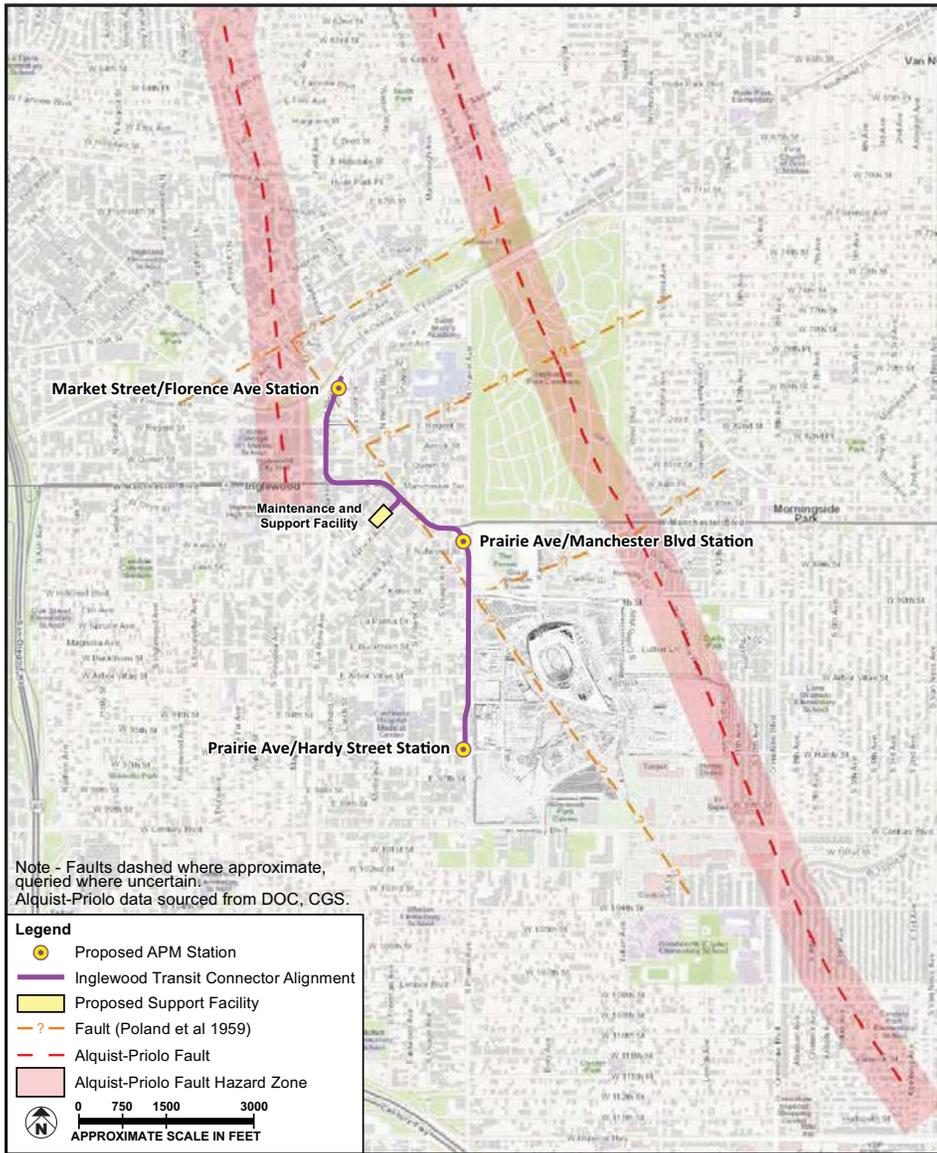

Prior to the start of construction, the anticipated trend of the Townsite fault would be further investigated to identify and locate active fault traces in the Project area and to allow for adjustments to the placement of proposed structures. Additionally, the design of the structures would comply with the provisions of the California Building Code, which would address the potential effects of fault ruptures. Elevated structures that may cross a fault segment, including the guideway and elevated passenger walkways would be designed in conformance with Caltrans MTD 20-8 and 20-10 as discussed above in *Section 4.6.3.2*. Consistent with Caltrans MTD 20-8 and 20-10, columns and abutments, as well as other structural components will be located to avoid or minimize fault rupture zones or designed to take into account potential displacement from a fault offset, dynamic response due to ground shaking, and any other fault-induced hazards, such as creep. Designing the Project in conformance with the latest CBC<sup>36</sup>, Caltrans guidance, and applicable seismic design criteria as would be required by **Mitigation Measures (MM) GEO-1** through **MM GEO-3** would reduce potential impacts to less than significant.

#### Summary

The City contains both active and potentially active faults, which may traverse the Project alignment. The Project does not lie within the boundaries of APEFZ as defined by the State of California in the Alquist-Priolo Earthquake Zoning Act. However, the Project alignment is proximate to a number of potentially active faults, including the Townsite fault, Centinela Creek Fault, Inglewood Park Cemetery Fault, and Manchester Fault.

FIGURE 4.6-2

Location of Active Faults and the Project

251-003-20

Although these faults are not mapped as APEFZ faults, or situated within a delineated APEFZ, their locations within the active Newport-Inglewood fault zone suggests that they be considered active with the potential for fault rupture. In particular, the Townsite Fault may intersect the Project alignment and cause surface rupture. Therefore, impacts would be potentially significant. Further investigation of the anticipated trend of the Townsite fault, placement of structures away from faults, and designing the Project in conformance with the latest CBC,<sup>37</sup> Caltrans guidance, and applicable seismic design criteria as would be required by MM GEO-1 through MM GEO-3 would reduce potential fault rupture impacts to less than significant.

4.6.6.1 Mitigation Measures

The following Mitigation Measures (MMs) are identified to reduce potential impacts related to fault rupture and seismic shaking to less than significant:

**MM GEO-1: Project Design.** The proposed Project shall be designed to accommodate fault rupture where present in accordance with applicable Caltrans guidelines, including MTD 20-8, *Analysis of Ordinary Bridges that Cross Faults*, dated January 2013; and MTD 20-10, *Fault Rupture*, dated January 2013, where any portion of a structure falls within an APEFZ, or where any portion of a structure falls within approximately 100 meters (330 feet) of well-mapped active faults, or within 300 meters (1,000 feet) of an un-zoned fault (not in an APEFZ) that is Holocene or younger in age.

Stations and elevated structures for the Automated Transit System (ATS) guideway shall be located to avoid the fault rupture hazard where present with refinement of station and ATS guideway placement worked into final design as needed. Bridge type structures, such as the ATS guideway, shall be designed to take into account potential displacement from a fault offset, dynamic response due to ground shaking, and any other fault-induced hazards (e.g., creep) that may occur. The design shall be in accordance with the Caltrans MTD 20-8, which defines a method for determining the potential displacement at columns and abutments at fault crossings and designing the structure so it can slide without falling.

**MM GEO-2:** Prior to the start of construction, the location of the anticipated trend of the Townsite Fault shall be further defined via a phased investigation process to identify and locate active fault traces in the Project area to support adjustments to the Project’s final design as needed.

The phased investigation shall be prepared by registered professionals (i.e., California Professional Civil Engineer, Professional Engineering Geologist with experience in fault evaluations) and include a fault investigation conducted along the trace of the Townsite

37 2019 California Building Standards Code (Cal. Code Regs., Title 24) published July 1, 2019.

Fault to refine its location and assess its activity level where it crosses the ATS guideway and stations.

The following methods shall be included in the investigation:

- Aerial photograph analysis;
- Geophysical surveys (e.g., seismic reflection and/or seismic refraction) to refine the location of the Townsite fault and inform subsequent targeted fault hazard exploration as necessary;
- Targeted fault trenching based on the findings of additional geophysical studies to locate the potential Townsite Fault where it crosses the proposed ATS alignment; and
- Exploratory drilling and sampling (e.g., hollow stem auger and CPT [cone penetration test] borings), as necessary, if the trace of the Townsite fault cannot be adequately delineated across the proposed ATS alignment through the means of fault trenching.

Based on the results of these investigations, column placements and facility designs shall be adjusted to accommodate geologic conditions identified. Further, the facilities shall be designed in accordance with applicable Caltrans guidelines including MTD 20-8, *Analysis of Ordinary Bridges that Cross Faults*, and MTD 20-10, *Fault Rupture*. Stations/structures shall be located to avoid the fault rupture hazard where present.

Columns and foundations for the guideway and stations, as well as any other ATS facilities shall be located to avoid the fault rupture hazard where present.

Probabilistic procedures shall follow those outlined in the *Fault Rupture Hazard Evaluation (Appendix K.1)*. If further study of the fault rupture is conducted, then procedures as outlined in CGS Note 49<sup>38</sup> shall be followed.

**MM GEO-3:** The proposed ATS system facilities shall be designed in accordance with applicable Caltrans guidelines including Memo to Designers 20-8 (Analysis of Ordinary Bridges that Cross Faults) and 20-10 (Fault Rupture). The response spectra provided in the *Development of Seismic Design Criteria in Support of Draft EIR - Seismic Design Criteria (Appendix K.2)* shall be considered applicable for both aerial guideway and ancillary structures within each segment of the alignment under the guideway and each station.

Probabilistic procedures also shall follow those outlined Caltrans Memo to Designers 20-10 -Fault Rupture, dated January 2013.

38 California Geological Survey, Note 49: Guidelines for Evaluating the Hazard of Surface Fault Rupture, <https://www.conservation.ca.gov/cgs/Documents/Publications/CGS-Notes/CGS-Note-49.pdf>.

#### 4.6.6.2 Level of Significance After Mitigation

Implementation of **MM-GEO-1** would prevent impacts by locating structural improvements to avoid faults where feasible and designing the guideway, columns, and elevated passenger walkways to account for the effects that may result from fault displacement. With implementation of **MM GEO-2**, the trend of the Townsite Fault would be determined through an investigation prior to final design of the Project with the findings dictating the placement of structural improvements to ensure impacts related to fault rupture would be minimized or avoided. Implementation of **MM GEO-3** would ensure that the design of the proposed improvements adhere to specific seismic and structural design criteria. As such, significant impacts and hazards regarding fault rupture and seismic ground shaking would be reduced to a level that is less than significant.

**Impact GEO-2: Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?**

Ground shaking is a major cause of structural damage from earthquakes. The amount of motion expected at a building or structure can vary from none to forceful depending upon the distance to the fault, the magnitude of the earthquake, and the local geology. Greater movement can be expected at sites located on poorly consolidated material such as alluvium located near the source of the earthquake epicenter or in response to an earthquake of great magnitude.

The proposed Project is situated in a seismically active region and will likely experience moderate to severe ground shaking in response to a large-magnitude earthquake occurring on a local or more distant active fault during the expected lifespan of the Project. The potential for significant seismically induced ground shaking in response to an earthquake occurring along a nearby active fault, such as the Newport-Inglewood fault zone, or a regional fault, such as the San Andreas fault zone, is relatively high within the vicinity of the proposed Project.

The Project is located within a surface geologic unit designated as “older alluvium (Qoa),” which is described as stiff to hard clay and medium dense to very dense sand, silty sand, clayey sand, and silt. This soil type generally provides poor resistance to ground shaking. Due to the proximity of the Project to nearby faults and the geologic unit, the possibility for extreme seismic shaking within the Project area is potentially significant.

*The Development of Seismic Design Criteria in Support of Draft EIR - Seismic Design Criteria (Appendix K.2)* show the distribution of the mean of the time-averaged shear wave velocity within the upper 30 meters (Vs30\_mean) in the soils in the areas surrounding the ITC are generally considered to be “very dense soil

and soft rock,” which is consistent with generally poor resistance to groundshaking as described previously. The various components of the proposed Project would be susceptible to the effect of ground shaking from seismic activity.

#### ***Aerial Guideways, Elevated Passenger Walkways, and Stations***

Other public agencies, including Caltrans and Metro, have determined that when structures such as those proposed for the guideway and stations are designed, the designs should meet the requirements for “bridges and aerial guideways, the design shall not result in less seismic performance capability than that required by Caltrans.” As such, ground motions developed for the proposed Project in accordance with the maximum design event (MDE) level should be compared to the Caltrans design spectrum<sup>39</sup> and the more critical design load should govern.

#### ***Ancillary Surface Facilities***

Portions of the proposed Project, including the PDS substations, would be subject to review by City building officials. Ground motions developed for the Project in accordance with the MDE level should be compared to the 2019 CBC,<sup>40</sup> and the more critical design load should govern. In the case where commercial/residential structures are unrelated to or not connected to the Project or support buildings directly, the use of 2019 CBC<sup>41</sup> design response spectra may be an appropriate basis for design at the discretion of the design engineer. Again, agencies responsible for the construction and operation of transportation facilities such as Caltrans and Metro have determined that to reduce the effects of extreme seismic shaking, ancillary surface facilities, such as the planned PDS substations, may be subject to both the code forces normally applied to surface buildings as well as those being applied to the transit guideways and above ground structures. Whichever code applies the most critical set of requirements shall apply.<sup>42</sup>

#### ***Summary***

The proposed Project is located within a surface geologic unit designated as “older alluvium (Qoa)” and would be susceptible to the effect of ground shaking from seismic activity. Ground shaking impact resulting in loss, injury, and death would be potentially significant. Furthermore, all Project improvements would be susceptible to structural damage from extreme ground shaking events, and the interruption to service or backup power could occur, resulting in a potentially significant impact for loss, injury, or death.

40 2019 California Building Standards Code (Cal. Code Regs., Title 24, Part 2, Volumes I and II) published July 1, 2019.

40 2019 California Building Standards Code (Cal. Code Regs., Title 24, Part 2, Volumes I and II) published July 1, 2019.

41 2019 California Building Standards Code (Cal. Code Regs., Title 24, Part 2, Volumes I and II) published July 1, 2019.

42 2019 California Building Standards Code (Cal. Code Regs., Title 24) published July 1, 2019.

#### **4.6.6.3 Mitigation Measures**

**MM GEO-1** through **MM GEO-3** shall be implemented to reduce potentially significant impacts related to seismic ground shaking to less than significant.

#### **4.6.6.4 Level of Significance After Mitigation**

Implementation of **MM GEO-1** through **MM GEO-3** would reduce seismic related impacts to less than significant.

**Impact GEO-3: Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?**

A direct effect on a unique paleontological resource would result in the direct damage or destruction of such a resource. Indirect impacts are not specifically caused by a development project but may be a reasonably foreseeable result of such a project. Typical indirect impacts to paleontological resources include the destruction or loss of surface fossils from increased erosion or the non-scientific or unauthorized surface collection or subsurface excavation of a fossil or paleontological site.

The Project area is underlain by artificial fill materials, as shallow as two feet bgs before alluvial soils are encountered. The subsurface sediments in the Project area are identified as Qoa and are assigned high paleontological sensitivity,<sup>43</sup> as there is a proven record throughout Los Angeles of containing scientifically significant fossils in this formation. Although no known resources were identified within the Project vicinity from the Natural History Museum, this does not preclude the possibility that previously unknown buried paleontological resources could be impacted during Project construction. Excavation during construction could encounter Qoa determined to have a high sensitivity for fossils, and the proposed Project would have the potential to directly and/or indirectly destroy a previously unknown unique paleontological resource.

Implementation of **MM GEO-4** would require that prior to the City’s approval of grading permits, a paleontologist meeting the SVP Standards be retained to prepare, design, and implement a paleontology monitoring and mitigation program for the Project consistent with SVP Guidelines. This monitoring and mitigation program would include education and sensitivity training for construction workers, guidelines for on-site paleontological monitors to issue stop-work orders if fossils are found, procedures for paleontological resource evaluation in the event of discovery, and final reporting procedure guidelines for

43 Paleontological Resources Assessment Report, Inglewood Basketball and Entertainment Center, City of Inglewood, California, ESA, May 2019.

submission to the City. With implementation of **MM GEO-4**, potentially significant impacts related to paleontological resources would be reduced to less than significant.

#### 4.6.6.5 Mitigation Measures

The following mitigation measure will reduce potentially significant impacts to paleontological resources to less than significant:

**MM GEO-4:** A qualified paleontologist meeting the SVP standards shall be retained by the project applicant and approved by the City prior to the approval of grading permits. The qualified paleontologist shall:

- a) Prepare, design, and implement a monitoring and mitigation program for the Project consistent with Society of Vertebrate Paleontology Guidelines. The Plan shall define pre-construction coordination, construction monitoring for excavations based on the activities and depth of disturbance planned for each portion of the Project area, data recovery (including halting or diverting construction so that fossil remains can be salvaged in a timely manner), fossil treatment, procurement, and reporting. The Plan monitoring and mitigation program shall be prepared and approved by the City prior to the issuance of the first grading permit. If the qualified paleontologist determines that the Project-related grading and excavation activity would not affect Older Quaternary Alluvium, then no further mitigation is required.
- b) Conduct construction worker paleontological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.) and would present the Plan as outlined in (a). In the event construction crews are phased or rotated, additional training shall be conducted for new construction personnel working on ground-disturbing activities. The training session shall provide instruction on the recognition of the types of paleontological resources that could be encountered within the Project area and the procedures to be followed if they are found. Documentation shall be retained by the qualified paleontologist demonstrating that the appropriate construction personnel attended the training.
- c) Direct the performance of paleontological resources monitoring by a qualified paleontological monitor (meeting the standards of the SVP, 2010). Paleontological resources monitoring shall be conducted pursuant to the monitoring and mitigation program developed under (a), above. Monitoring activities may be altered or ceased if determined adequate by the qualified paleontologist. Monitors shall have the authority to and shall temporarily halt or divert work away from exposed fossils or potential fossils and establish a 50-foot radius temporarily halting work around the find. Monitors shall prepare daily logs detailing the types of ground disturbing activities and soils observed, and any discoveries.

- d) If fossils are encountered, determine their significance, and, if significant, supervise their collection for curation. Any fossils collected during Project-related excavations, and determined to be significant by the qualified paleontologist, shall be prepared to the point of identification and curated into an accredited repository with retrievable storage.
- e) Prepare a final monitoring and mitigation report for submittal to the City in order to document the results of the paleontological monitoring. If there are significant discoveries, fossil locality information and final disposition shall be included with the final report which would be submitted to the appropriate repository and the City. The final monitoring report shall be submitted to the City within 90 days of completion of excavation and other ground disturbing activities that could affect Older Quaternary Alluvium.

#### 4.6.6.6 Level of Significance after Mitigation

Implementation of **MM GEO-4** would ensure that paleontological resources would be identified before they are damaged or destroyed and are properly evaluated and treated to reduce potentially significant impacts to less than significant.

#### 4.6.7 CUMULATIVE IMPACTS

Geotechnical impacts related to developments in the City would involve hazards related to site-specific soil conditions, erosion, and ground-shaking during earthquakes. These impacts would be site-specific and would not be common to (nor shared with, in an additive sense) the impacts on other sites. Cumulative development in the area would increase the overall population for exposure to seismic hazards by increasing the number of people potentially exposed. However, with adherence to **MM GEO-1** through **MM GEO-3**, applicable State, and federal regulations, building codes and sound engineering practices, geologic hazards could be reduced to less-than-significant levels. Furthermore, development of each of the related projects and the proposed Project would be subject to existing building codes, uniform site development and construction review standards that are designed to protect public safety. Therefore, cumulative geotechnical impacts would not be cumulatively considerable.

Impacts to paleontological resources related to future development in the region could involve the demolition or destruction of significant paleontological resources. The proposed Project could contribute to this impact if paleontological resources are located beneath the Project area and are damaged or destroyed during the excavation process. In such an event, the proposed Project contribution to the significant cumulative impact would be cumulatively considerable, and impacts would be potentially significant. Implementation of **MM GEO-4** would lessen the Project's contribution to the loss of paleontological resources by requiring that work stop of such resources are discovered, until the resources can be evaluated, collected, properly treated, and curated with accredited repository with retrievable storage. With implementation of this mitigation measure, the Project's contribution to the cumulative loss of paleontological resources would be less than cumulatively considerable.

4.6.8 CONSISTENCY WITH CITY OF INGLEWOOD GENERAL PLAN

4.6.8.1 Safety Element

Table 4.6-2: Project Consistency with General Plan Safety Element below lists the policy and measures from the City's General Plan Safety Element applicable to the proposed Project:

Table 4.6-2  
Project Consistency with General Plan Safety Element

Policies and Measures	Plan Consistency
<p><b>Policy 1:</b> Provide Measures to reduce seismic impacts.</p>	<p><b>Consistent with Mitigation.</b></p> <p>The proposed Project is located in a seismically active area. As such, the Project including the guideway, stations, MSF, and elevated passenger walkways, and other support facilities would be subject to seismic shaking. The replacement Vons store, which would be developed prior to proposed Project construction, would also be subject to seismic shaking.</p> <p>The Recirculated Draft EIR identified Mitigation Measures <b>MM GEO-1</b>, <b>MM GEO-2</b>, and <b>MM GEO-3</b> to avoid fault rupture from seismic activity and to reduce the effects of seismic shaking on built structures.</p> <p>Implementation of <b>MM GEO-1</b> would dictate the location of the ATS system where it crosses the known active and potentially active faults to prevent failure from fault rupture and would be consistent with Caltrans Memo to Designers 20-8 and 20-10. With implementation of <b>MM GEO-2</b>, the trend of the Townsite Fault would be specified through an investigation prior to Project construction; findings would dictate the placement of proposed structural improvements to ensure that impacts related to fault rupture would be minimized or avoided. Implementation of <b>MM GEO-3</b> would ensure that the design of the proposed improvements adhere to conservative specific seismic design criteria.</p> <p>The Project's compliance with the latest CBC and Caltrans advisory design measures would reduce potential impacts related to seismic ground shaking to a less-than-significant-level. In addition, the proposed Project would be consistent with Caltrans requirements pertaining to aerial guideways, bridges, and ancillary surface facilities.</p> <p>Further compliance with the requirements of the 2019 CBC, City municipal code, and Caltrans for structural safety would reduce hazards from strong seismic ground shaking to a less-than-significant-level.</p>
<p>Restrict new structures for human occupancy from being constructed across active faults.</p>	<p><b>Consistent with Mitigation.</b></p> <p>The proposed Project may cross potentially active faults (Townsite Fault). To assure compliance with this policy the Recirculated Draft EIR identified mitigation measure: <b>MM GEO-2</b>.</p>

Policies and Measures	Plan Consistency
<p>Require geological and soils engineering investigations in high risk fault areas.</p>	<p>This measure is directed towards the City and would not apply to the proposed Project, as it is a transportation project with no residential component. Implementation of <b>MM GEO-2</b> would dictate the location of structural improvements that cross the fault segments to prevent failure from potential fault rupture and would be consistent with Caltrans Memo to Designers 20-8 and 20-10.</p> <p>Implementation of <b>MM GEO-1</b>, the trend of the Townsite fault would be specified through an investigation prior to Project construction; findings would dictate placement of structural improvements to ensure that impacts related to fault rupture would be minimized or avoided.</p>
<p>Use the latest State-approved edition of the Uniform Building Code and other applicable seismic design information</p>	<p><b>Consistent with Mitigation.</b></p> <p>The proposed Project crosses potentially active faults (Townsite Fault). To assure compliance with this policy the Recirculated Draft EIR identified mitigation measure: <b>MM GEO-2</b>.</p> <p>Implementation of <b>MM GEO-2</b> would require the performance a geotechnical investigation prior to Project construction to evaluate localized geological and soils conditions, such as the approximate trend of the Townsite Fault.</p>
<p>Require a soils report for new buildings, as well as obtaining or utilizing, when available, geologic drillings or studies, local ground subsidence and elevation studies, geologic-seismic studies, strong motion monitoring, gathering, compiling, and interpreting local and regional geologic seismic data as it becomes available.</p>	<p><b>Consistent.</b></p> <p>The Project's compliance with 2019 CBC and Caltrans advisory design measures would reduce potential impacts related to seismic ground shaking to a less-than-significant-level. In addition, the proposed Project would be consistent with Caltrans requirements pertaining to aerial guideways, bridges, and ancillary surface facilities.</p> <p>Because the Project alignment is in a seismically active region, some risk related to seismic ground shaking would remain, even with compliance with all applicable regulatory standards and design guidelines.</p> <p>The proposed Project would comply with the requirements of the Municipal Code Chapter 11, Article 2 Building Code, which has adopted the has incorporated the most up to date California Building Code.</p>
<p>Require a soils report for new buildings, as well as obtaining or utilizing, when available, geologic drillings or studies, local ground subsidence and elevation studies, geologic-seismic studies, strong motion monitoring, gathering, compiling, and interpreting local and regional geologic seismic data as it becomes available.</p>	<p><b>Consistent.</b></p> <p>The proposed Project would be subject to review the design by the City and subject to the requirements of the Municipal Code Chapter 11, Article 2 Building Code, which has adopted the has incorporated the most up to date California Building Code.</p>

## 4.7 GREENHOUSE GAS EMISSIONS

### 4.7.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) evaluates the significance of the greenhouse gas (GHG) emissions that would be generated by the proposed Inglewood Transit Connector Project (proposed Project).

The section contains: (1) a description of the local setting to establish baseline conditions; (2) a summary of the relationship between GHG emissions and global climate change; (3) an overview of applicable plans, policies, and regulations related to GHG emissions; (4) an assessment of current GHG emissions at the City, State, national, and global levels; (5) a quantitative analysis of future GHG emissions associated with construction and operation of the proposed Project; and (6) an analysis of the consistency of the proposed Project with applicable regulations, plans, and policies to reduce GHGs as set forth by the State of California, South Coast Air Quality Management District (SCAQMD), Southern California Association of Governments (SCAG) and the City of Inglewood (City).

The proposed Project's GHG emissions are considered within the context of the City's planning for the reduction of GHG emissions. The sustainable design features of the proposed Project that would reduce GHG emissions are compared to measures identified in the *Inglewood Energy and Climate Action Plan* to determine the consistency of the proposed Project with the City's plans to reduce GHG emissions.

A quantified estimate of GHG emissions is provided for both construction and operations of the proposed Project. GHG emissions were analyzed using a variety of modeling techniques and are detailed within:

- *Air Quality and Heath Risk Assessment Technical Report for the Inglewood Transit Connector Project*, Meridian Consultants LLC, September 2021 (**Appendix G.1**)
- *Vons Replacement CalEEMod Output Sheets*, Meridian Consultants LLC, October 2021 (**Appendix G.2**)

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the proposed Project in response to consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. Specific changes to the proposed Project include raising the height of the Automated Transit System (ATS) guideway along Market Street to preserve existing views of historic buildings, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard, redesign of the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue. Additionally, the construction phasing plan has been refined. As it

relates to GHG impacts, these changes resulted in reductions of GHG emissions compared to the December 2020 Draft EIR.

Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Recirculated Draft EIR.

### 4.7.2 OVERVIEW OF GREENHOUSE GAS EMISSIONS

#### 4.7.2.1 Global Context

Global climate change refers to changes in average climatic conditions on Earth as a whole, including changes in temperature, wind patterns, precipitation, and storms. Historical records indicate that global climate changes have occurred in the past due to natural phenomena; however, current data increasingly indicate that the current global conditions differ from past climate changes in rate and magnitude. Global climate change attributable to anthropogenic (human) GHG emissions is currently one of the most important and widely debated scientific, economic, and political issues in the United States and the world. The extent to which increased concentrations of GHGs have caused or will cause climate change and the appropriate actions to limit and/or respond to climate change are the subject of significant and rapidly evolving regulatory efforts at the federal and State levels of government.

GHGs are global pollutants that have long atmospheric lifetimes (1 year to several thousand years). GHGs persist in the atmosphere for a long enough time to be dispersed around the globe. Although the exact lifetime of any particular GHG molecule depends on multiple variables and cannot be pinpointed, more CO<sub>2</sub> is currently emitted into the atmosphere than is avoided or sequestered. CO<sub>2</sub> sinks, or reservoirs, include vegetation and the ocean, which absorb CO<sub>2</sub> through photosynthesis and dissolution, respectively. These are two of the most common processes of CO<sub>2</sub> sequestration. Of the total annual human-caused CO<sub>2</sub> emissions, approximately 54 percent is sequestered within a year through ocean uptake, northern hemisphere forest regrowth, and other terrestrial sinks; the remaining 46 percent of human-caused CO<sub>2</sub> emissions are stored in the atmosphere.

Similarly, the effects of GHGs are borne globally (sea-level rise, hurricanes, droughts, etc.), as opposed to the localized air quality effects of criteria air pollutants and toxic air contaminants (TACs). The quantity of GHGs that it takes to ultimately result in climate change is not precisely known, but that quantity is enormous. No single project would be expected to measurably contribute to a noticeable incremental change in the global average temperature, or to global, local, or microclimates. However, it is the combined GHG contributions per project that create an impact.

Not all GHGs possess the same capacity to induce atmospheric warming; as a result, the warming contribution of a GHG is commonly quantified in the common unit of carbon dioxide equivalent (CO<sub>2</sub>e)

over a 100-year period, by applying the appropriate global warming potential (GWP) value. GHGs with lower emissions rates than carbon dioxide (CO<sub>2</sub>) may still contribute to climate change because they are more effective at absorbing outgoing infrared radiation than carbon dioxide.<sup>1</sup> By using the applicable GWP for each GHG, project-related emissions can be tabulated in the common unit of metric tons per year carbon dioxide equivalent (MTCO<sub>2</sub>e/year). GWP ratios are provided by the Intergovernmental Panel on Climate Change (IPCC). Historically, GHG emission inventories were calculated using the GWPs from the IPCC's Second Assessment Report (SAR), published in 1996. The IPCC has since updated the GWP values based on the latest science in its Fourth Assessment Report (AR4)<sup>2</sup> and Fifth Assessment Report (AR5),<sup>3</sup> published in 2007 and 2014, respectively. California Air Resources Board (CARB) uses the AR4 GWPs in the Statewide GHG emissions inventory,<sup>4</sup> in the current Climate Change Scoping Plan,<sup>5</sup> and in the current version of the California Emissions Estimator Model (CalEEMod)<sup>6</sup> that is used to calculate CO<sub>2</sub>e values for construction as well as operations for existing and proposed Project build-out conditions.

Methane (CH<sub>4</sub>) and nitrous oxide (N<sub>2</sub>O) are generally much lower than those of carbon dioxide (CO<sub>2</sub>) and are associated with anaerobic microbial activity resulting from agricultural practices, flooded soils, and landfills. Methane and nitrous oxide have approximately 23 and 296 times the GWP of carbon dioxide, respectively.

#### 4.7.2.2 Effects of Global Climate Change

The scientific community's understanding of the fundamental processes responsible for global climate change has improved over the past decade, and its predictive capabilities are advancing. However, there remain scientific uncertainties in, for example, predictions of local effects of climate change, occurrence, frequency, and magnitude of extreme weather events, effects of aerosols, changes in clouds, shifts in the intensity and distribution of precipitation, and changes in oceanic circulation. Due to the complexity of and inability to accurately model Earth's climate system, the uncertainty surrounding climate change may

- 1 The measure of carbon dioxide equivalent (CO<sub>2</sub>e) is used to account for the different potentials of GHGs to absorb infrared radiation. This potential, known as the global warming potential (GWP) of a GHG, is dependent on the lifetime, or persistence, of the gas molecule in the atmosphere.

Available: [www.arb.ca.gov/cc/scopingplan/scoping\\_plan\\_2017.pdf](http://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf). Accessed August 4, 2020.
- 6 California Emissions Model (CalEEMod®), <http://www.aqmd.gov/caleemod/home>. Accessed September 21, 2021.

never be completely eliminated. Nonetheless, the IPCC's Fifth AR5<sup>7</sup> states that is extremely likely that the dominant cause of the observed warming since the mid-20th century is the anthropogenic increase in GHG concentrations.<sup>8</sup> A report from the National Academy of Sciences concluded that 97 to 98 percent of the climate researchers most actively publishing in the field support the tenets of the IPCC in that climate change is very likely caused by human (i.e., anthropogenic) activity.<sup>9</sup>

The AR4<sup>10</sup> found that the potential impacts in California due to global climate change include: loss in snow pack; sea-level rise; more extreme heat days per year; more high ozone days; more extreme forest fires; more severe droughts punctuated by extreme precipitation events; increased erosion of California's coastlines and sea water intrusion into the Sacramento and San Joaquin Deltas and associated levee systems; and increased pest infestation.<sup>11</sup> The Fourth Assessment's findings are consistent with climate change studies published by the California Natural Resources Agency (CNRA) since 2009, starting with the California Climate Adaptation Strategy 10 as a response to the Governor's Executive Order S-13-2008.<sup>12</sup> In 2014, the CNRA rebranded the first update of the 2009 adaptation strategy as the Safeguarding California Plan.<sup>13</sup> The 2018 update to Safeguarding California Plan identifies hundreds of ongoing actions and next steps State agencies are taking to safeguard Californians from climate impacts within a framework of 81 policy principles and recommendations.<sup>14</sup>

#### Temperature Increase

The primary effect of adding GHGs to the atmosphere has been a rise in the average global temperature. The impact of human activities on global temperature is readily apparent in the observational record. Since 1895, the contiguous US has observed an average temperature increase of 1.5 degrees Fahrenheit (°F) per

century. The last 5-year period (2014–2018) is the warmest on record for the contiguous US,<sup>15</sup> while the 20 warmest years have occurred over the past 22-year period.<sup>16</sup> The AR4<sup>17</sup> indicates that average temperatures in California could rise 5.6°F to 8.8°F by the end of the century, depending on the global trajectory of GHG emissions. According to the Cal-Adapt website, the portion of the State in which the Project area is located could result in an average increase in temperature of approximately 4.2° to 6.9°F by 2070–2090, compared to the baseline period of 1961–1990.<sup>18</sup>

With climate change, extreme heat conditions and heat waves are predicted to impact larger areas, last longer, and have higher temperatures. Heat waves, defined as three or more days with temperatures above 90°F, are projected to occur more frequently by the end of the century. Extreme heat days and heat waves can negatively impact human health. Heat-related illness includes a spectrum of illnesses ranging from heat cramps to severe heat exhaustion and life-threatening heat stroke.<sup>19</sup>

### Wildfires

The hotter and dryer conditions expected with climate change will make forests more susceptible to extreme wildfires. One study found that, if GHG emissions continue to rise, the frequency of extreme wildfires burning over approximately 25,000 acres would increase by nearly 50 percent, and the average area burned Statewide each year would increase by 77 percent, by the year 2100. In the areas that have the highest fire risk, wildfire insurance is estimated to see costs rise by 18 percent by 2055 and the fraction of property insured would decrease.<sup>20</sup>

### Air Quality

Higher temperatures, conducive to air pollution formation, could worsen air quality in California and make it more difficult for the State to achieve air quality standards. Climate change may increase the concentration of ground-level ozone in particular, which can cause breathing problems, aggravate lung diseases such as asthma, emphysema, chronic bronchitis, and cause chronic obstructive pulmonary

disease (COPD) but the magnitude of the effect, and therefore, its indirect effects, are uncertain. Emissions from wildfires can lead to excessive levels of particulate matter, ozone, and volatile organic compounds.<sup>21</sup> Additionally, severe heat accompanied by drier conditions and poor air quality could increase the number of heat-related deaths, illnesses, and asthma attacks throughout the State.<sup>22</sup>

### Precipitation and Water Supply

There is a high degree of uncertainty with respect to the overall impact of global climate change on future water supplies in California. Studies indicate considerable variability in predicting precise impacts of climate change on California hydrology and water resources. Increasing uncertainty in the timing and intensity of precipitation will challenge the operational flexibility of California’s water management systems. Warmer, wetter winters would increase the amount of runoff available for groundwater recharge; however, this additional runoff would occur at a time when some basins are either being recharged at their maximum capacity or are already full. Conversely, reductions in spring runoff and higher evapotranspiration because of higher temperatures could reduce the amount of water available for recharge.<sup>23</sup>

### Hydrology and Sea-Level Rise

Climate changes could potentially affect: the amount of snowfall, rainfall, and snowpack; the intensity and frequency of storms; flood hydrographs (flash floods, rain or snow events, coincidental high tide, and high runoff events); sea-level rise and coastal flooding; coastal erosion; and the potential for saltwater intrusion. Sea-level rise can be a product of global warming through two main processes: expansion of sea water as the oceans warm and melting of ice over land. A rise in sea levels could result in coastal flooding and erosion and could jeopardize California’s water supply. Sea level could rise as much as 2 feet along most of the U.S. coastline. Increased storm intensity and frequency could affect the ability of flood-control facilities, including levees to handle storm events.<sup>24</sup>

## Agriculture

California has a massive agricultural industry that represents 11.3 percent of total US agricultural revenue. Higher carbon dioxide levels can stimulate plant production and increase plant water-use efficiency. However, a changing climate presents significant risks to agriculture due to “potential changes to water quality and availability; changing precipitation patterns; extreme weather events including drought, severe storms, and floods; heat stress; decreased chill hours; shifts in pollinator lifecycles; increased risks from weeds, pest and disease; and disruptions to the transportation and energy infrastructure supporting agricultural production.”<sup>25</sup>

## Ecosystems and Wildlife

Increases in global temperatures and the potential resulting changes in weather patterns could have ecological effects on a global and local scale. Increased concentrations of GHGs are likely to accelerate the rate of climate change. Scientists expect that the average global surface temperature could rise by 2–11.5°F (1.1–6.4°C) by 2100, with significant regional variation.<sup>26</sup> Soil moisture is likely to decline in many regions, and intense rainstorms are likely to become more frequent. With climate change, ecosystems and wildlife will be challenged by the spread of invasive species, barriers to species migration or movement in response to changing climatic conditions, direct impacts to species health, and mismatches in timing between seasonal life-cycle events such as species migration and food availability.<sup>27</sup>

### 4.7.2.3 Climate Change Effects for California

In 2016, the CNRA released Safeguarding California: Implementation Action Plans<sup>28</sup> in accordance with Executive Order B-30-15,<sup>29</sup> identifying a lead agency to lead adaptation efforts in each sector. In accordance with the 2009 California Climate Adaptation Strategy,<sup>30</sup> the California Energy Commission (CEC) was directed to develop a website on climate change scenarios and impacts that would be beneficial for local decision makers. The information provided on the Cal-Adapt website<sup>31</sup> represents a projection of

potential future climate scenarios comprised of local average values for temperature, sea-level rise, snowpack, and other data representative of a variety of models and scenarios, including potential social and economic factors.

Climate change could affect environmental conditions in California in a variety of ways. One effect of climate change is rising sea levels. Sea levels along the California coast rose approximately 7 inches during the last century, and they are predicted to rise an additional 7 to 22 inches by 2100, depending on the future levels of GHG emissions. The effects of a rise in sea level could include increased coastal flooding, saltwater intrusion (especially a concern in the low-lying Sacramento–San Joaquin Delta, where pumps delivering potable water to Southern California could be threatened), and disruption of wetlands.

As the State’s climate changes over time, the range of various plant and wildlife species could shift or be reduced, depending on the favored temperature and moisture regimes of each species. In the worst cases, some species would become extinct or be extirpated from the State if suitable conditions are no longer available. Additional concerns associated with climate change include a reduction in the snowpack, leading to less overall water storage in the mountains (the largest “reservoir” in the State), and increased risk of wildfires caused by changes in rainfall patterns and plant communities. Changes in the climate can also impact California’s weather patterns and rainfall, causing droughts in certain areas and flooding in others.

### 4.7.2.4 Sources of Greenhouse Gas Emissions

GHGs are the result of both natural and anthropogenic activities. With respect to anthropogenic activities, motor vehicle travel, air travel, consumption of fossil fuels for power generation, industrial processes, heating and cooling, landfills, agriculture, and wildfire are the primary sources of GHG emissions. Additionally, land use decisions can affect the generation of GHG emissions from multiple sectors, resulting in direct or indirect GHG emissions. For example, electricity consumed in the lighting and heating of buildings is an indirect source of GHG emissions because it requires electricity from power plants, which emits GHGs directly into the atmosphere. Conversely, tailpipe emissions from the use of vehicles generate direct GHG emissions.

GHGs are a group of emissions that include CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, HFCs, PFCs, SF<sub>6</sub>, and nitrogen trifluoride (NF<sub>3</sub>). Carbon dioxide is the most abundant GHG. As stated above, other GHGs are less abundant, but have higher global warming potential than CO<sub>2</sub>. Thus, emissions of other GHGs are frequently expressed in the equivalent mass of CO<sub>2</sub>; denoted as CO<sub>2</sub>e. A general description of GHGs discussed is provided in **Table 4.7-1: Description of Identified Greenhouse Gases**.

**Table 4.7-1**  
Description of Identified Greenhouse Gases

GHG	General Description
Carbon Dioxide (CO <sub>2</sub> )	An odorless, colorless GHG that has both natural and anthropogenic sources. Natural sources include the following: decomposition of dead organic matter; respiration of bacteria plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic (human caused) sources of CO <sub>2</sub> are burning coal, oil, natural gas, and wood.
Methane (CH <sub>4</sub> )	A flammable gas and is the main component of natural gas. When one molecule of CH <sub>4</sub> is burned in the presence of oxygen, one molecule of CO <sub>2</sub> and two molecules of water are released. A natural source of CH <sub>4</sub> is the anaerobic decay of organic matter. Geological deposits, known as natural gas fields, also contain CH <sub>4</sub> , which is extracted for fuel. Other sources are from landfills, fermentation of manure, and cattle.
Nitrous Oxide (N <sub>2</sub> O)	A colorless GHG. High concentrations can cause dizziness, euphoria, and sometimes slight hallucinations. N <sub>2</sub> O is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used in rocket engines, race cars, and as an aerosol spray propellant.
Hydrofluorocarbons (HFCs)	Chlorofluorocarbons (CFCs) are gases formed synthetically by replacing all hydrogen atoms in CH <sub>4</sub> or ethane (C <sub>2</sub> H <sub>6</sub> ) with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble, and chemically unreactive in the troposphere (the level of air at Earth's surface). CFCs were first synthesized in 1928 for use as refrigerants, aerosol propellants, and cleaning solvents. Because they destroy stratospheric ozone, the production of CFCs was stopped as required by the Montreal Protocol in 1987. HFCs are synthetic man-made chemicals that are used as substitute for CFCs as refrigerants. HFCs deplete stratospheric ozone, but to a much lesser extent than CFCs.
Perfluorinated Chemicals (PFCs)	PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere. High-energy ultraviolet rays about 60 kilometers above Earth's surface are able to destroy the compounds. PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane and hexafluoroethane. The two main sources of PFCs are primary aluminum production and semi-conductor manufacturing.
Sulfur Hexafluoride (SF <sub>6</sub> )	An inorganic, odorless, colorless, nontoxic, and nonflammable gas. SF <sub>6</sub> is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semi-conductor manufacturing, and as a tracer gas for leak detection.
Nitrogen Trifluoride (NF <sub>3</sub> )	An inorganic, nontoxic, odorless, nonflammable gas. NF <sub>3</sub> is used in the manufacture of semiconductors, as an oxidizer of high energy fuels, for the preparation of tetrafluoro hydrazine, as an etchant gas in the electronic industry, and as a fluorine source in high power chemical lasers.

<sup>a</sup> GHGs identified in this table are ones identified in the Kyoto protocol and other synthetic gases recently added to the IPCC's Fifth Assessment Report.

## 4.7.3 METHODOLOGY

### 4.7.3.1 Methodologies for Evaluating Significance

GHG impacts are exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective.<sup>32</sup>

It is the accumulation of GHGs in the atmosphere that may result in global climate change. Climate change impacts are cumulative in nature, and thus no typical single project would result in emission of such a magnitude that it, in and of itself, would be significant on a project basis. A typical single project's GHG emission will be small relative to the total global or even Statewide GHG emissions. Thus, the analysis of significance of potential impacts from GHG emissions related to a single project is already representative of long-term impacts on a cumulative basis.

As such, the assessment of significance is based on a determination of whether the GHG emissions from the proposed Project represent a cumulatively considerable contribution to global climate change. The analysis of the Project's GHG emissions consists of a quantitative analysis of the GHG emissions generated by the proposed Project and a qualitative analysis of the proposed Project's consistency with adopted GHG-related legislation, plans, and policies. This approach is in accordance with CEQA Guidelines Section 15064.4(a), 31F which affirms the discretion of a lead agency to determine, in the context of a particular project, whether to use quantitative and/or qualitative methodologies to determine the significance of a project's impacts.

#### 4.7.3.1 Emissions Inventory Modeling

Project development would generate GHG emissions from a number of individual sources during both construction and post-construction (operational) use of the proposed Project. Intermittent, short-term construction emissions that occur from activities such as demolition, site-grading, construction, paving, and architectural coatings were evaluated. Regulatory models used to estimate GHG impacts include:

- CARB's EMFAC<sup>33</sup> emissions inventory model. EMFAC is the latest emission inventory model that calculates emission inventories and emission rates for motor vehicles operating on roads in California. This model reflects CARB's current understanding of how vehicles travel and how much they emit. EMFAC can be used to show how California motor vehicle emissions have changed over time and are projected to change in the future.

<sup>32</sup> California Air Pollution Control Officers Association, *CEQA & Climate Change: Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act*, January 2008, p. 35, Accessed August 2020 at: <http://www.capcoa.org/wp-content/uploads/2012/03/CAPCOA-White-Paper.pdf>. Accessed September 21, 2021.

<sup>33</sup> California Air Resources Board, *EMFAC2017 User's Guide*, March 1, 2018, Accessed July 23, 2020 at: <https://ww3.arb.ca.gov/msei/downloads/emfac2017-volume-i-users-guide.pdf> and <https://www.arb.ca.gov/emfac/2017/>. Accessed September 21, 2021.

#### 4.7 Greenhouse Gas Emissions

- The California Emissions Estimator Model (CalEEMod),<sup>34</sup> is the CARB-approved computer program model recommended by SCAQMD for use in the quantification of air quality and GHG emissions. CalEEMod was developed by SCAQMD, with input from other California air districts. CalEEMod utilizes widely accepted models for emissions estimates combined with appropriate data that can be used if site-specific information is not available. For example, CalEEMod incorporates USEPA-developed emission factors; CARB's on-road and off-road equipment emission models, such as EMFAC and OFFROAD; and studies commissioned by other California agencies, such as the California Energy Commission and CalRecycle.

#### 4.7.3.2 Construction

The proposed Project Construction Scenarios are provided in **Appendix F: ITC Construction Scenarios** and were used to estimate construction GHG associated with the proposed Project.

Construction of the proposed Project would have the potential to temporarily emit GHG emissions through the use of heavy-duty construction equipment and through vehicle trips generated from workers and haul trucks traveling to and from the proposed Project carrying demolition debris, building material and soils.

#### Construction Schedule

The construction phasing as described below represents a conservative set of assumptions for analysis of the maximum potential impacts from construction of the proposed Project. This approach conservatively assumes all construction occurs at the earliest feasible date.

Prior to Phase 1 construction activities being initiated on the MSF site, the owner/operator of the Vons supermarket currently located on this site would demolish the existing Vons gas station on the corner of Manchester Boulevard and Spruce Avenue and pave this area for use as a parking area for the new Vons store to be built on the corner of Manchester Boulevard and Hillcrest Boulevard. This construction would occur over an approximate 10-month period prior to Phase 1 of the ITC construction.

- **Phase 1** would include demolition of buildings and site improvements on properties acquired for construction of the project, the beginning of construction of the MSF, trenching and installation of primary power duct bank, and preparatory work on east side of Prairie Avenue to allow for the roadway shift. Additional work in the area will occur in Phase 4 for the installation of drilled shafts and columns along Prairie Avenue for the guideway. The properties where existing buildings and site improvements will be demolished include at the existing retail commercial center at Market Street and Regent Street, the commercial buildings located at 500 Manchester Boulevard, the commercial building at 150 S. Market Street on the northeast corner of Manchester Boulevard and Market Street, the retail commercial center at northwest corner of Prairie Avenue and Hardy Street, the commercial building at 401 S. Prairie Ave, the commercial building at 945 S. Prairie Avenue, and the commercial

<sup>34</sup> California Emissions Model (CalEEMod®), <http://www.aqmd.gov/caleemod/home>. Accessed September 21, 2021.

#### 4.7 Greenhouse Gas Emissions

building at 1003 S. Prairie Avenue. After demolition, the remaining asphalt flatwork areas at the commercial plaza at Market Street and Regent Street, and the commercial building at 150 S. Market Street, and the retail commercial center at northwest corner of Prairie Avenue and Hardy Street will provide suitable space for construction staging, including but not limited to, space for equipment storage, material staging and storage, contractor jobsite trailers, and on-site parking for construction staff throughout the entire project duration. Phase 1 construction would start in January 2024.

- **Phase 2** would include activities to enable the construction sequence of the guideway along Prairie Avenue from Hardy Street to Manchester Boulevard, and work at the MSF site. Phase 2 construction would occur in 2024 through 2025.
- **Phase 3** would include foundation work for the ATS guideway, foundation work for the Market Street/Florence Avenue Station, and construction for the support structure of the MSF building. Phase 3 work will include utility relocation (if necessary), foundations, cast-in-place (CIP) columns, and setting of prefabricated buildings at the two Power Distribution System (PDS) substations. Phase 3 construction would occur in 2024 through 2025.
- **Phase 4** would include foundation work for the ATS guideway, guideway column caps along Market Street, and the MSF building deck and shell. Phase 4 activities will include utility relocation (if necessary), foundations, CIP columns, guideway column caps, and installation of equipment at the PDS substations. Phase 4 construction would occur in 2025 through 2026.
- **Phase 5** construction would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, guideway girder along Market Street, and MSF building interior construction. Phase 5 activities will include guideway girders, guideway straddle caps, and installation of equipment at the PDS substations. Phase 5 construction would occur in 2025 through 2026.
- **Phase 6** would include aerial work for the ATS guideway along Prairie Avenue from Hardy Street to Manchester Boulevard and Manchester Boulevard from Prairie Avenue to Market Street, completion of Prairie Avenue/Manchester Boulevard Station, completion of Prairie Avenue/Hardy Street Station, and completion of the MSF building, and the elevated passenger walkway to the Los Angeles County Metropolitan Transportation Authority (Metro) K Line Downtown Inglewood Station. Phase 6 construction would occur in 2025 through 2026.
- **Phase 7** would include final site work and completion of the stations. Phase 7 would occur in 2026.
- **Phase 8** would occur for the guideway along the entire length of the alignment and primarily includes installation of the operating systems and testing and commissioning of the ATS trains. Phase 8 construction would occur in 2025 through 2027, with the primary construction activities occurring in 2026 and some installation of equipment starting towards the end of Phase 3 construction when sufficient aerial structure is available for the installation of the equipment.

Construction activity would occur 24-hours a day seven days a week with primarily heavy construction activities (those involving large equipment use on site) occurring over a 16 hour/day schedule with two shifts: either a morning shift from approximately 7:00 AM to 3:00 PM and an evening shift from

approximately 3:00 PM to 11:00 PM; or a morning shift from approximately 7:00 AM to 3:00 PM and a night shift from approximately 11:00 PM to 7:00 AM. The night shift would be used for material deliveries, export of soil and debris and other light construction activities.

Combinations of these shifts would be referred to “Morning/Evening” or “Morning/Night.” Other minimal construction work could occur during other hours at a reduced intensity. Delivery of construction materials would occur during the night shift, as would most lane closures.

#### 4.7.3.3 Operation

Analysis of the proposed Project’s operational emissions considers five types of sources: 1) area; 2) energy; 3) solid waste; 4) water and wastewater; and 5) mobile. A description of the proposed Project’s various operational components is detailed in **Section 3.0: Project Description**, 3.5: *Project Characteristics*.

##### Area

The operational area emissions from the proposed Project were estimated using the CalEEMod<sup>35</sup> software. Area source emissions associated with normal operations for the proposed Project include on-site activities and upkeep including landscaping equipment. The emissions were estimated using CalEEMod, based on the size of the proposed Project stationary uses (MSF and stations), and the GHG emission factors for fuel combustion.

##### Energy

The operational energy emissions from the proposed Project were estimated using the CalEEMod<sup>36</sup> software and Southern California Edison’s (SCE) average CO<sub>2</sub>e intensity factors. Energy source emissions are generated as a result of activities associated with the MSF and stations which would utilize electricity and natural gas utility infrastructure. Moreover, electricity will be used for propulsion of the ATS system. Propulsion power (i.e., the power to run the ATS train on a guideway and operate the stations) is provided via two PDS substations located along the guideway.

##### Solid Waste

The operational emissions from solid waste associated with the proposed Project’s MSF and stations were estimated using the CalEEMod<sup>37</sup> software. Solid waste generation and associated emissions are calculated based on building square-footage, using default data found in CalEEMod for the proposed land uses.

<sup>35</sup> CalEEMod, <http://www.caleemod.com/>. Accessed September 21, 2021.

<sup>36</sup> CalEEMod, <http://www.caleemod.com/>. Accessed September 21, 2021.

<sup>37</sup> CalEEMod, <http://www.caleemod.com/>. Accessed September 21, 2021.

#### Water and Wastewater

The operational emissions from water consumption and wastewater generation associated with the proposed Project were estimated using the CalEEMod<sup>38</sup> software. California’s water conveyance system is energy intensive, with electricity used to pump and treat water. The Project would result in indirect GHG emissions due to water consumption and wastewater generation. Water consumption and wastewater generation, and their associated emissions, are calculated based on building square-footage, using default CalEEMod data.

##### Mobile

Operation of the proposed Project would generate GHG emissions from mobile sources from Project-generated vehicle trips traveling to and from the MSF and other facilities. Mobile emissions were calculated based on the data provided in the proposed Project’s Transportation Assessment (see **Appendix O: Transportation Assessment**) which is further discussed in **Section 4.12: Transportation**. Under the Transportation Assessment, vehicle miles traveled (VMT) was chosen as the primary performance metric used to identify impacts. VMT associated with trips to and from all areas within the City were included in the Transportation Assessment and were utilized to calculate operational GHG emissions from mobile sources. Emissions from motor vehicles are dependent on vehicle type. Thus, the emissions were calculated using a representative motor vehicle fleet mix for the proposed Project and EMFAC2017 default fuel type. Note that mobile emission estimates did not account for the recently issued Executive Order N-79-20 which sets forth a state goal that 100 percent of in-state sales of new passenger cars and trucks will be zero-emission by 2035, among other goals.

The Adjusted Baseline Environmental Setting is described in **Section 4.0: Environmental Analysis**. Project operations are expected to commence in 2027. Consistent with the Transportation Assessment, six operational scenarios were analyzed to evaluate the proposed Project’s indirect operational emissions, as follows:

<sup>38</sup> CalEEMod, <http://www.caleemod.com/>. Accessed September 21, 2021.

#### 4.7 Greenhouse Gas Emissions

1. Adjusted Baseline without proposed Project,
2. Adjusted Baseline with the proposed Project,
3. Year 2027 with Event Weekday without the proposed Project,
4. Year 2027 with Event Weekday with the proposed Project,
5. Year 2045 with Event Weekday without the proposed Project, and
6. Year 2045 with Event Weekday with the proposed Project.

Details of each of the above scenarios are provided in **Section 4.12** and in **Appendix O**.

#### **Backup Generators**

To assure the ability to allow ATS trains to reach the nearest stations to offload riders in the event of loss of electrical supply, each PDS substation will be equipped with backup power generators. The proposed Project would include up to two stationary standby generators, on at each of the PDS substations, with an estimated total capacity rated at approximately 4,000 kilowatts (kW) to provide emergency power primarily for ATS train operation, lighting, and other emergency systems. Emergency generator emissions were calculated based on compliance with applicable federal emissions standards and compliance with SCAQMD Rule 1470<sup>39</sup> (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) mandated emission limits and operating hour constraints.

A standby internal combustion engine (ICE) greater than 50 brake horsepower (bhp) or gas turbine for nonutility power generation that does not operate more than 200 hours a year and is only operated in the event of an emergency power failure or for routine testing and maintenance is considered an emergency backup generator for power generation. The SCAQMD allows for the use of backup generators thru specific permits prior to installation.<sup>40</sup>

The proposed Project would implement the following operational equipment requirements and operation protocols for operating backup generators. These would include the following:

- All backup generators would be selected from the SCAQMD certified generators list and meet applicable federal standards for diesel emissions. For after-treatment of engine exhaust air, a diesel particulate filter would be provided to meet the emission level requirements of SCAQMD;

<sup>39</sup> SCAQMD, *Rule 1470 - Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines*.

<sup>40</sup> SCAQMD, *Permits, Emergency Generators*. <http://www.aqmd.gov/home/permits/emergency-generators>. Accessed September 21, 2021.

#### 4.7 Greenhouse Gas Emissions

- The proposed Project would have two standby generators, each could operate up to two hours per day and a total of 50 hours per year for testing and maintenance (per SCAQMD Rule 1470 limit) to ensure reliability in the case of a power outage; and
- The proposed Project would conduct maintenance and/or testing on the two standby generators on separate days.

As such, each standby generators would operate for 2 hours per day during 24 days per year (twice a month) for a total of not more than 50 hours per year. Each standby generator would be tested during different days; if needed for emergency operation, both generators would operate up to 2 hours each and could occur simultaneously.

#### **4.7.4 REGULATORY FRAMEWORK**

##### **4.7.4.1 International and Federal**

##### ***International Governmental Panel on Climate Change (IPCC)***

In 1988, the United Nations and the World Meteorological Organization established the IPCC to assess “the scientific, technical and socioeconomic information relevant to understanding the scientific basis of risk of human-induced climate change, its potential impacts, and options for adaption and mitigation.” The initial task for the IPCC was to prepare a comprehensive review and recommendations with respect to the state of knowledge of the science of climate change; the social and economic impact of climate change, and possible response strategies and elements for inclusion in a possible future international convention on climate. Since its inception, the IPCC has delivered five comprehensive scientific reports about climate change, with the latest (the Fifth Assessment Report) released in four parts between September 2013 and November 2014.<sup>41</sup>

##### ***Federal Clean Air Act***

The US Supreme Court ruled in *Massachusetts v. Environmental Protection Agency*<sup>42</sup> that CO<sub>2</sub> and other GHGs are pollutants under the federal Clean Air Act (CAA), which the US Environmental Protection Agency (USEPA) must regulate if it determines they pose an endangerment to public health or welfare.<sup>43</sup> The Court did not mandate that the USEPA enact regulations to reduce GHG emissions. Instead, the Court found that

<sup>41</sup> Intergovernmental Panel on Climate Change (IPCC), *Climate Change 2014-Mitigation of Climate Change, Working Group III Contribution to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change*, 2014, p. 439.

<sup>42</sup> *Massachusetts v. Environmental Protection Agency*, 127 S.Ct. 1438 (2007).

<sup>43</sup> Perry W. Payne and Sara Rosenbaum, “Massachusetts et al. v Environmental Protection Agency: Implications for Public Health Policy and Practice,” *Public Health Reports 122 No. 6 (2007): 817–819*, <https://doi.org/10.1177/0033354907112200614>. Accessed September 21, 2021.

the USEPA could avoid taking action if it found that GHGs do not contribute to climate change or if it offered a “reasonable explanation” for not determining that GHGs contribute to climate change.

On April 17, 2009, the USEPA issued a proposed finding that GHGs contribute to air pollution that may endanger public health or welfare. On April 24, 2009, the proposed rule was published in the Federal Register under Docket ID No. EPA-HQ-OAR-2009-0171.<sup>44</sup> The USEPA Stated that high atmospheric levels of GHGs “are the unambiguous result of human emissions and are very likely the cause of the observed increase in average temperatures and other climatic changes.” The USEPA further found that “atmospheric concentrations of greenhouse gases endanger public health and welfare within the meaning of Section 202 of the Clean Air Act.” The final rule was effective on January 14, 2010.<sup>45</sup> While these findings alone did not impose any requirements on industry or other entities, this action was a prerequisite to regulatory actions by the EPA, including, but not limited to, GHG emissions standards for light-duty vehicles.

In response, the USEPA promulgated a regulation to require reporting of all GHG emissions from all sectors of the economy. The final rule applies to fossil fuel suppliers and industrial gas suppliers, direct greenhouse gas emitters and manufacturers of heavy-duty and off-road vehicles and engines. The rule does not require control of greenhouse gases; rather, it requires only that sources above certain threshold levels monitor and report emissions.<sup>46</sup>

### USEPA Actions

USEPA has taken the following actions to regulate, monitor, and potentially reduce GHG emissions.

#### Mandatory Greenhouse Gas Reporting Rule

On September 22, 2009, the USEPA issued a rule for mandatory reporting of GHGs from large GHG emissions sources in the United States.<sup>47</sup> In general, this national reporting requirement provides USEPA with accurate and timely GHG emissions data from facilities that emit 25,000 metric tons (MT) or more of CO<sub>2</sub> per year and allows the operators of these facilities to track their own emissions, compare them to similar facilities, and aid in identifying cost-effective opportunities to reduce emissions in the future. An

<sup>44</sup> Federal Register, *Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act*, <https://www.federalregister.gov/documents/2009/12/15/E9-29537/endangerment-and-cause-or-contribute-findings-for-greenhouse-gases-under-section-202a-of-the-clean>. Accessed September 21, 2021.

<sup>45</sup> United States Environmental Protection Agency (USEPA), *Endangerment and Cause or Contribute Findings for Greenhouse Gases under the Section 202(a) of the Clean Air Act*, <https://www.epa.gov/climate-change/endangerment-and-cause-or-contribute-findings-greenhouse-gases-under-section-202a>. Accessed September 21, 2021.

<sup>46</sup> Federal Register, *Mandatory Reporting of Greenhouse Gases*, <https://www.gpo.gov/tdsys/pkg/FR-2009-10-30/pdf/E9-23315.pdf>. Accessed September 21, 2021.

<sup>47</sup> United States Environmental Protection Agency, *Greenhouse Gas Reporting Program (GHGRP)*, <https://www.epa.gov/ghgreporting/additional-information-2009-proposed-rule>. Accessed September 21, 2021.

estimated 85 percent of the total US GHG emissions from approximately 10,000 facilities are covered by this rule.

#### Endangerment and Cause or Contribute Findings for Greenhouse Gases under the CAA

On December 7, 2009, USEPA adopted its Proposed Endangerment and Cause or Contribute Findings for Greenhouse Gases under Section 202(a) of the Compliance Certification Application (Endangerment Finding).<sup>48</sup> These include:

- Endangerment Finding: The Administrator finds that the current and projected concentrations of the six key well-mixed GHGs—carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxide (N<sub>2</sub>O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF<sub>6</sub>)—in the atmosphere threaten the public health and welfare of current and future generations.
- Cause or Contribute Finding: The Administrator finds that the combined emissions of these well-mixed GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution, which threatens public health and welfare.

These findings do not themselves impose any requirements on industry or other entities. However, this action is a prerequisite to finalizing the proposed USEPA GHG standards for light-duty vehicles. These standards were jointly proposed by USEPA and the Department of Transportation National Highway Traffic Safety Administration (NHTSA), and the final rule became effective January 14, 2010. In collaboration with the NHTSA, USEPA finalized emission standards for light-duty vehicles (2012–2016 model years) in May 2010 and for heavy-duty vehicles (2014–2018 model years) in August 2011. Furthermore, the agencies finalized standards to extend the light-duty vehicle GHG National Program for model years 2017–2025. The standards are estimated to cut GHG emissions from cars and light trucks in half by 2025, reducing emissions by 6 billion metric tons over the life of the program—more than the total amount of CO<sub>2</sub> emitted by the United States in 2010.

#### Greenhouse Gases and Fuel Efficiency Standards

##### Passenger Cars and Light-Duty Trucks

In October 2012, the USEPA and NHTSA finalized the second phase of a coordinated National Program to establish GHG standards and Corporate Average Fuel Economy (CAFE) standards for new model years 2017 through 2021 passenger cars, light-duty trucks, and medium-duty passenger vehicles, and issued

<sup>48</sup> United States Environmental Protection Agency, *Endangerment and Cause or Contribute Findings for Greenhouse Gases under the Section 202(a) of the Clean Air Act*, <https://www.epa.gov/climate-change/endangerment-and-cause-or-contribute-findings-greenhouse-gases-under-section-202a>. Accessed September 21, 2021.

#### 4.7 Greenhouse Gas Emissions

standards for model year 2022 through 2025 following direction from the Obama Administration.<sup>49</sup> The agencies developed the second phase of the coordinated National Program for GHG emissions and fuel efficiency standards following the successful adoption of the first phase for model year 2012-2016 light-duty vehicles in April 2010. Under the second phase standards, CO<sub>2</sub> emission limits would decrease from 250 grams per mile (g/mi) in model year 2016 to 163 g/mi in model year 2025 for a combined fleet of cars and light trucks, equivalent to 54.5 mpg if this level were achieved solely through fuel efficiency improvements. If all of the necessary emission reductions were made from fuel economy improvements, then the standards would correspond to a combined fuel economy of 40.3-41 mpg in 2021 for the first phase of NHTSA rulemaking action and 48.7-49.7 mpg in 2025 for the second phase. In March 2020, the Trump Administration issued the *Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks* (SAFE Vehicles Rule), setting fuel economy and carbon dioxide standards that increase 1.5 percent in stringency each year from model years 2021 through 2026.<sup>50</sup>

#### Medium- and Heavy-Duty Engines and Vehicles

In October 2016, the USEPA and NHTSA announced a comprehensive Phase 2 Heavy-Duty (HD) National Program to reduce GHG emissions and to improve fuel efficiency for medium- and heavy-duty vehicles through model year 2027, with interim standards for model years 2021 and 2024.<sup>51</sup> The agencies developed the second phase of the HD National Program following the early success of and broad support for the first phase National Program for model years 2014-2018 new medium and heavy-duty vehicles in August 2011, which set to reduce GHG emissions by 270 million metric tons and oil consumption by 530 million barrels over the life of the affected vehicles. On October 17, 2017, USEPA announced it would revisit these standards; however, no changes to the 2016 standards have been made as of October 2020.

#### Federal Energy Policy and Conservation Acts

The Federal Energy Policy and Conservation Act of 1975, the Federal Energy Policy Act of 2005, and the Energy Independence and Security Act of 2007 require the U.S. Department of Energy (DOE) to set electrical efficiency standards for various appliances, fixtures, and equipment. Specifically, the Energy Independence and Security Act of 2007 includes standards for an increased CAFE standard of 35 miles per gallon (mpg) for the combined fleet of cars and light trucks by the 2020 model year, in addition to the

49 U.S. Environmental Protection Agency (USEPA), *Regulations for Emissions from Vehicles and Engines*, “Final Rule for Model Year 2017 and Later Light-Duty Vehicle Greenhouse Gas Emissions and Corporate Average Fuel Economy Standards,” October 15, 2012, <https://www.gpo.gov/fdsys/pkg/FR-2012-10-15/pdf/2012-21972.pdf>. Accessed September 21, 2021.

#### 4.7 Greenhouse Gas Emissions

following provisions: Renewable Fuel Standard (RFS) (Section 202), Appliance and Lighting Efficiency Standards (Sections 301–325) and Building Energy Efficiency (Sections 411–441). The Act includes standards for general service lighting that will require lightbulbs to consume 60 percent less energy by 2020. This standard is leading to the phasing out of incandescent lightbulbs to be replaced by more efficient lighting. Additional provisions of the Act address energy savings in government and public institutions, promote research for alternative energy, carbon capture, and international energy programs, and create green jobs.

#### Energy Independence and Security Act

The Energy Independence and Security Act of 2007 (EISA) facilitates the reduction of national GHG emissions by requiring the following:

- Increasing the supply of alternative fuel sources by setting a mandatory RFS that requires fuel producers to use at least 36 billion gallons of biofuel in 2022;
- Prescribing or revising standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances;
- Requiring approximately 25 percent greater efficiency for light bulbs by phasing out incandescent light bulbs between 2012 and 2014; requiring approximately 200 percent greater efficiency for light bulbs, or similar energy savings, by 2020; and
- While superseded by USEPA and NHTSA actions described above, (i) establishing miles per gallon targets for cars and light trucks and (ii) directing the NHTSA to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for trucks.

Additional provisions of EISA address energy savings in government and public institutions, promote research for alternative energy, additional research in carbon capture, international energy programs, and the creation of “green jobs.”<sup>52</sup>

52 A green job, as defined by the United States Department of Labor, is a job in business that produces goods or provides services that benefit the environment or conserve natural resources

#### 4.7.4.2 State Regulations and Directives

##### Executive Orders

###### Executive Order S-03-05

Executive Order S-3-05, signed by Governor Arnold Schwarzenegger and issued in June 2005, proclaimed that California is vulnerable to the impacts of climate change.<sup>53</sup> It declared that increased temperatures could reduce the Sierra snowpack, further exacerbate California's air quality problems, and potentially cause a rise in sea levels. To combat those concerns, the Executive Order established the following total GHG emission targets:

- By 2010, reduce GHG emissions to 2000 levels;
- By 2020, reduce GHG emissions to 1990 levels; and
- By 2050, reduce GHG emissions to 80 percent below 1990 levels.

Executive Order S-3-05 also created the California Climate Action Team (CAT), an initiative of the Office of the Governor comprised of members from 14 State agencies, in order to coordinate climate policy and meeting agency targets at the State level. CAT has identified strategies that integrate transportation and land-use decisions, termed "smart land use." Such strategies generally encourage jobs/housing proximity, promote transit-oriented development (TOD), and encourage high-density residential/commercial development along transit corridors. These strategies develop more efficient land-use patterns within each jurisdiction or region to match population increases, workforce, and socioeconomic needs for the full spectrum of the population. "Intelligent transportation systems" is the application of advanced technology systems and management strategies to improve operational efficiency of transportation systems and the movement of people, goods, and service.<sup>54</sup>

###### Executive Order S-01-07

Executive Order S-1-07, the Low Carbon Fuel Standard (issued on January 18, 2007), requires a reduction of at least 10 percent in the carbon intensity of California's transportation fuels by 2020.<sup>55</sup> Regulatory proceedings and implementation of the Low Carbon Fuel Standard have been directed to CARB. CARB has identified the Low Carbon Fuel Standard as a discrete early action item in the adopted Climate Change Scoping Plan (discussed below). CARB expects the Low Carbon Fuel Standard to achieve the minimum 10 percent reduction goal; however, many of the early action items outlined in the Climate Change Scoping

<sup>53</sup> California Office of the Governor, California Executive Order S-3-05, June 1, 2005.

<sup>54</sup> California Environmental Protection Agency, *Climate Action Team Report to Governor Schwarzenegger and the Legislature* (March 2006), 58, <http://s3-us-west-2.amazonaws.com/uclidc-nuxeo-ref-media/0bdec21c-ca2b-4f4d-9e11-35935ac4cf5f>, Accessed September 21, 2021.

<sup>55</sup> Office of the Governor, *Executive Order S-01-07*, (January 18, 2007), <https://climateactionnetwork.ca/wp-content/uploads/2011/06/eos0107.pdf>. Accessed September 21, 2021.

Plan work in tandem with one another. Other specific emission reduction measures included are the Million Solar Roofs Program<sup>56</sup> and Assembly Bill (AB) 1493 (Pavley I), Vehicle Emissions: Greenhouse Gases, which establishes motor vehicle GHG emissions standards.<sup>57</sup> To avoid the potential for double-counting emission reductions associated with AB 1493, the Climate Change Scoping Plan has modified the aggregate reduction expected from the Low Carbon Fuel Standard to 9.1 percent. CARB released a draft version of the Low Carbon Fuel Standard in October 2008. The final regulation was approved by the Office of Administrative Law and filed with the Secretary of State on January 12, 2010; the Low Carbon Fuel Standard became effective on the same day.

###### Executive Order B-30-15

Executive Order B-30-15, signed by Governor Edmund Gerald "Jerry" Brown and issued on April 29, 2015, established a new Statewide policy goal to reduce GHG emissions to 40 percent below their 1990 levels by 2030. Furthering advancing the targets of AB 32, reducing GHG emissions by 40 percent below 1990 levels in 2030, and by 80 percent below 1990 levels by 2050 (consistent with Executive Order S-3-05), aligns with scientifically established levels needed to limit global warming to less than 2 degrees Celsius.<sup>58</sup>

###### Executive Order N-79-20

On September 23, 2020, Governor Gavin Newsom issued Executive Order N-79-20 which relates to issues surrounding GHG emissions generated from vehicular transportation and fossil fuel production in California. This Executive Order builds on previous orders issued by former Governor Jerry Brown in 2012 and 2018, which set state goals, respectively of 1.5 million zero-emission vehicles by 2025 and 5 million zero-emission vehicles by 2030. Executive Order N-79-20 sets the following goals in addition to current state goals:

- 100 percent of in-state sales of new passenger cars and trucks will be zero-emission by 2035;
- 100 percent of medium- and heavy-duty vehicles in the State will be zero-emission by 2045 for all operations where feasible and by 2035 for drayage trucks; and
- 100 percent zero-emission off-road vehicles and equipment by 2035 where feasible.<sup>59</sup>

<sup>56</sup> US Department of Energy, "Laying the Foundation for Solar America: The Million Solar Roofs Initiative" (October 2016), <https://www.nrel.gov/docs/fy07osti/40483.pdf>. Accessed September 21, 2021.

<sup>57</sup> The standards enacted in Pavley I are the first GHG standards in the nation for passenger vehicles and took effect for model years starting in 2009 to 2016. Pavley I could potentially result in 27.7 million metric tons CO<sub>2</sub>e reduction in 2020. Pavley II will cover model years 2017 to 2025 and potentially result in an additional reduction of 4.1 million metric tons CO<sub>2</sub>e.

<sup>59</sup> California Office of the Governor, *Executive Order N-79-20*, Available: <https://www.gov.ca.gov/wp-content/uploads/2020/09/9.23.20-EO-N-79-20-Climate.pdf>. Accessed September 21, 2021.

### **Assembly Bill 32, California Global Warming Solutions Act of 2006**

AB 32, the Global Warming Solutions Act of 2006, required a sharp reduction of GHG emissions to 1990 levels by 2020. To achieve these goals, AB 32 mandated that CARB establish a quantified emissions cap and institute a schedule to meet the cap; implement regulations to reduce Statewide GHG emissions from stationary sources consistent with the California Climate Action Team strategies; and develop tracking, reporting, and enforcement mechanisms to ensure that reductions are achieved. To reach the reduction targets, AB 32 required CARB to adopt—in an open, public process—rules and regulations that achieve the maximum technologically feasible and cost-effective GHG reductions.

### **Assembly Bill 197 and Senate Bill 32: Statewide Reductions in GHG Emissions**

On September 8, 2016, Governor Brown signed AB 197, which requires CARB to approve a Statewide GHG emissions limit equivalent to the Statewide GHG emission level in 1990 to be achieved by 2030. AB 197 requires the CARB to prepare and approve a scoping plan for achieving the maximum technologically feasible and cost-effective reductions in GHG emissions. The bill became effective on January 1, 2017.

On September 8, 2016, Governor Brown also signed Senate Bill (SB) 32, which extends AB 32 another 10 years to 2030 and updates the State's objectives. SB 32 calls for Statewide reductions in GHG emissions to 40 percent below 1990 levels by 2030. The bill became effective on January 1, 2017.<sup>60</sup>

### **Assembly Bill 1493 – Pavley**

Enacted on July 22, 2002, the California's Greenhouse Gas Vehicle Emission Standards under Assembly Bill 1493 of 2002<sup>61</sup> required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light-duty trucks. Regulations adopted by CARB apply to 2009 through 2016 vehicles. CARB estimated that the regulation would reduce GHG emissions from the light-duty and passenger vehicle fleet by an estimated 18 percent in 2020 and by 27 percent in 2030. In 2011, the U.S. Department of Transportation, USEPA, and State of California announced a single timeframe for proposing fuel and economy standards, thereby aligning the Pavley standards with the federal standards for passenger cars and light-duty trucks.<sup>62</sup> Emission estimates included in this analysis account for the Pavley standards.

<sup>60</sup> California Legislative Information, *Senate Bill No. 32*, [https://leginfo.ca.gov/faces/billNavClient.xhtml?bill\\_id=2015201605B32](https://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=2015201605B32). Accessed September 22, 2021.

Accessed September 22, 2021.

### **Senate Bill 375, Sustainable Communities and Climate Protection Act**

SB 375, signed into law in September 2008, aligns regional transportation planning efforts, regional GHG reduction targets, and land use and housing allocations.<sup>63</sup> The act requires metropolitan planning organizations (MPOs) to adopt a Sustainable Communities Strategy (SCS) or Alternative Planning Strategy (APS) that prescribes land use allocation in that MPO's Regional Transportation Plan (RTP). CARB, in consultation with MPOs, provided regional reduction targets for GHGs for the years 2020 and 2035.

### **Senate Bill X1-2: 2020 Renewable Portfolio Standard**

On April 12, 2011, California Governor Jerry Brown signed SB X1-2.<sup>64</sup> This bill supersedes the 33 percent by RPS created by Executive Order S-14-08, previously signed by Governor Schwarzenegger. The RPS required that all retail suppliers of electricity in California serve 33 percent of their load with renewable energy by 2020. A number of significant changes are made in SB X1-2. It extends application of the RPS to all electric retailers in the State, including municipal and public utilities, and community choice aggregators.

SB X1-2 creates a three-stage compliance period for electricity providers to meet renewable energy goals: 20 percent of retail sales must be renewable energy products by 2013, 25 percent of retail sales must be renewable energy products by 2016, and 33 percent of retail sales must be renewable energy products by 2020. The 33 percent level must be maintained in the years that follow. This three-stage compliance period requires the RPS to be met increasingly with renewable energy that is supplied to the California grid and is located within or directly proximate to California. SB X1-2 mandates that renewables from this category make up:

- At least 50 percent for the 2011–2013 compliance period;
- At least 65 percent for the 2014–2016 compliance period; and
- At least 75 percent for 2016 and beyond.

SB X1-2 sets rules for the use of Renewable Energy Credits (RECs) as follows:

- Establishes a cap of no more than 25 percent unbundled RECs going toward the RPS between 2011 and 2013, 15 percent from 2014 to 2016, and 10 percent thereafter;
- Does not allow for the grandfathering of tradable REC contracts executed before 2010, unless the contract was (or is) approved by the California Public Utilities Commission (CPUC);

<sup>63</sup> California Legislative Information, *Senate Bill No. 375*, [https://leginfo.ca.gov/faces/billNavClient.xhtml?bill\\_id=2007200805B375](https://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=2007200805B375). Accessed September 22, 2021.

<sup>64</sup> California Energy Commission, *Renewable Portfolio Standard*, <http://www.energy.ca.gov/portfolio>. Accessed September 22, 2021.

- Allows banking of RECs for 3 years only; and
- Allows energy service providers, community choice aggregators, and investor-owned utilities with 60,000 or fewer customers to use 100 percent RECs to meet the RPS.

SB X1-2 also eliminates the Market Price Referent, which was a benchmark to assess the above-market costs of RPS contracts based on the long-term ownership, operating, and fixed-price fuel costs for a new 500-megawatt (mW) natural-gas-fired, combined-cycle gas turbine.

### **Senate Bill 350: Clean Energy and Pollution Reduction Act**

SB 350, the Clean Energy and Pollution Reduction Act of 2015, was signed on October 7 of that year.<sup>65</sup> SB 350 implements some of the goals of Executive Order B-30-15 described above. The objectives of SB 350 are: (1) to increase the procurement of our electricity from renewable sources from 33 percent to 50 percent; and (2) to double the energy efficiency savings in electricity and natural gas final end uses of retail customers through energy efficiency and conservation.<sup>66</sup>

### **Senate Bill 1078 and Senate Bill 107**

Established in 2002 under SB 1078, the California Renewables Portfolio Standards (RPS) were accelerated in 2006 under SB 107, which required that, by 2010, at least 20 percent of electricity retail sales come from renewable sources. In April 2016, the CEC updated the RPS pursuant to SB 350, intended to set the new target 50 percent renewables by 2030.<sup>67</sup>

### **Senate Bill 97**

SB 97, signed in August 2007, acknowledged that climate change is an environmental issue requiring analysis under CEQA. This bill directed the Governor's Office of Planning and Research (OPR) to prepare, develop, and transmit to the CNRA guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions, as required by CEQA, no later than July 1, 2009. SB 97 required the CNRA to certify or adopt those guidelines by January 1, 2010. On December 30, 2009, the Natural Resources Agency adopted amendments to the CEQA Guidelines. The CEQA Guidelines amendments provide guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in draft CEQA documents. The amendments became effective March 18, 2010.

<sup>65</sup> California Legislative Information, *Senate Bill No. 350*, [https://leginfo.ca.gov/faces/billNavClient.xhtml?bill\\_id=201520160SB350](https://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=201520160SB350). Accessed September 22, 2021.

<sup>66</sup> Senate Bill 350 (2015–2016 Reg. Session) Stats 2015, ch. 547.

<sup>67</sup> California Energy Commission, *Enforcement Procedures for the Renewables Portfolio Standards for Local Publicly Owned Electric Utilities: Amended Regulations*, <http://www.energy.ca.gov/2016publications/CEC-300-2016-002/CEC-300-2016-002-CMF.pdf>. Accessed September 22, 2021.

### **CEQA Guidelines**

CEQA Guidelines section 15064.4 addresses the significance of GHG emissions, directing that a lead agency shall make a “good-faith effort” to “describe, calculate or estimate” GHG emissions in CEQA environmental documents.<sup>68</sup> Section 15064.4 further states that the analysis of GHG impacts should include consideration of (1) the extent to which the project may increase or reduce GHG emissions, (2) whether the project GHG emissions would exceed a threshold of significance that the lead agency determines applies to the project, and (3) the extent to which the project would comply with “regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions.”

The CEQA Guidelines focus on the effects of GHG emissions as cumulative impacts, and direct that they should be analyzed in the context of CEQA's requirements for cumulative impact analysis.<sup>69</sup> CEQA Guidelines section 15064.4 states that “the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change. A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national, or global emissions. The agency's analysis should consider a timeframe that is appropriate for the project. The agency's analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes.” The CEQA Guidelines also establish that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program (including plans or regulations for the reduction of GHG emissions) that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located (CEQA Guidelines section 15064(h)(3)).

The CEQA Guidelines do not require or recommend a specific analytical methodology or provide quantitative criteria for determining the significance of GHG emissions, nor do they set a numerical threshold of significance for GHG emissions. Guideline 15064.7(c) clarifies that in adopting or using thresholds of significance, a lead agency may appropriately consider thresholds developed by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence.

#### 4.7 Greenhouse Gas Emissions

When GHG emissions are found to be significant, CEQA Guidelines section 15126.4(c) includes the following direction on measures to mitigate GHG emissions:

Consistent with section 15126.4(a), lead agencies shall consider feasible means, supported by substantial evidence and subject to monitoring or reporting, of mitigating the significant effects of greenhouse gas emissions. Measures to mitigate the significant effects of greenhouse gas emissions may include, among others:

1. Measures in an existing plan or mitigation program for the reduction of emissions that are required as part of the lead agency's decision;
2. Reductions in emissions resulting from a project through implementation of project features, project design, or other measures;
3. Off-site measures, including offsets that are not otherwise required, to mitigate a project's emissions;
4. Measures that sequester greenhouse gases; and
5. In the case of the adoption of a plan, such as a general plan, long range development plan, or plans for the reduction of greenhouse gas emissions, mitigation may include the identification of specific measures that may be implemented on a project-by project basis. Mitigation may also include the incorporation of specific measures or policies found in an adopted ordinance or regulation that reduces the cumulative effect of emissions.

In late 2018, the CNRA finalized amendments to the CEQA Guidelines, including changes to CEQA Guidelines section 15064.4, which addresses the analysis of GHG emissions. The amendments were approved by the Office of Administrative Law and filed with the Secretary of State. The amendments became effective on December 28, 2018. The revision of CEQA Guidelines section 15064.4 clarified several points, including the following:

- Lead agencies must analyze the GHG emissions of proposed projects.
- The focus of the lead agency's analysis should be on the project's effect on climate change, rather than simply focusing on the quantity of emissions and how that quantity of emissions compares to statewide or global emissions.
- The impacts analysis of GHG emissions is global in nature and thus should be considered in a broader context. A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national, or global emissions.
- Lead agencies should consider a timeframe for the analysis that is appropriate for the project.
- A lead agency's analysis must reasonably reflect evolving scientific knowledge and state regulatory schemes.

#### 4.7 Greenhouse Gas Emissions

- Lead agencies may rely on plans prepared pursuant to section 15183.5 (Plans for the Reduction of Greenhouse Gases) in evaluating a project's greenhouse gas emissions.
- In determining the significance of a project's impacts, the lead agency may consider a project's consistency with the state's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is consistent with those plans, goals, or strategies.
- The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change. The lead agency must support its selection of a model or methodology with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use.

#### **Senate Bill 862 (Transit and Intercity Rail Capital Program)**

The Transit and Intercity Rail Capital Program (TIRCP) was created by SB 862 (Chapter 36, Statutes of 2014) and modified by Senate Bill 9 (Chapter 710, Statutes of 2015) to provide grants from the Greenhouse Gas Reduction Fund to fund transformative capital improvements that will modernize California's intercity, commuter, and urban rail systems, and bus and ferry transit systems to reduce emissions of greenhouse gases by reducing congestion and vehicle miles traveled throughout California. The goal of the TIRCP is to provide monies to fund transformative capital improvements that modernize California's intercity rail, bus, ferry, and rail transit systems to achieve the following objectives:

- Reduction in greenhouse gas emissions;
- Expand and improve rail service to increase ridership;
- Integrate the rail service of the State's various rail operations, including integration with the high-speed rail system; and
- Improve safety

#### **Climate Change Scoping Plan**

CARB approved a Climate Change Scoping Plan (Scoping Plan) on December 11, 2008, as required by AB 32. The Scoping Plan proposed a "comprehensive set of actions designed to reduce overall carbon GHG emissions in California, improve our environment, reduce our dependence on oil, diversify our energy sources, save energy, create new jobs, and enhance public health."<sup>70</sup> The Scoping Plan had a range of GHG reduction actions, including direct regulations; alternative compliance mechanisms; monetary and

<sup>70</sup> CARB, *Climate Change Scoping Plan: A Framework for Change*, [https://www.arb.ca.gov/cc/scopingplan/document/adopted\\_scoping\\_plan.pdf](https://www.arb.ca.gov/cc/scopingplan/document/adopted_scoping_plan.pdf). Accessed September 22, 2021.

#### 4.7 Greenhouse Gas Emissions

nonmonetary incentives; voluntary actions; market-based mechanisms, such as a cap-and-trade system; and an AB 32 implementation regulation to fund the program.

The Scoping Plan called for a “coordinated set of strategies” to address all major categories of GHG emissions.<sup>71</sup> Transportation emissions were to be addressed through a combination of higher standards for vehicle fuel economy, implementation of the Low Carbon Fuel Standard,<sup>72</sup> and greater consideration to reducing trip length and generation through land use planning and transit-oriented development. Buildings, land use, and industrial operations were encouraged and, sometimes, required to implement energy efficiency practices. Utility energy supplies will change to include more renewable energy sources through implementation of the Renewables Portfolio Standard. This will be complemented with emphasis on local generation, including rooftop photovoltaics and solar hot water installations. Additionally, the Scoping Plan emphasized opportunities for households and businesses to save energy and money through increasing energy efficiency. It indicated that substantial savings of electricity and natural gas would be accomplished through improving energy efficiency.

CARB updated the Scoping Plan in May 2014 (2014 Scoping Plan). The 2014 Scoping Plan<sup>73</sup> adjusted the 1990 GHG emissions levels to 431 million metric tons of carbon dioxide equivalents (MMTCO<sub>2</sub>e); the updated 2020 GHG emissions forecast is 509 MMTCO<sub>2</sub>e, which credited for certain GHG emission reduction measures already in place (e.g., the RPS). The 2014 Scoping Plan also recommended a 40 percent reduction in GHG emissions from 1990 levels by 2030, and a 60 percent reduction in GHG emissions from 1990 levels by 2040.

The 2017 Scoping Plan,<sup>74</sup> approved on December 14, 2017, builds on previous programs, and takes aim at the 2030 target established by the SB 32, which is further discussed below. The 2017 Scoping Plan outlines options to meet California’s aggressive goals to reduce GHGs by 40 percent below 1990 levels by 2030. In addition, the plan incorporates the State’s updated RPS requiring utilities to procure 50 percent of their electricity from renewable energy sources by 2030. It also raises the State’s Low Carbon Fuel Standard<sup>75</sup> and aims to reduce emissions of methane and hydrofluorocarbons by 40 percent from 2013 levels by 2030 and emissions of black carbon by 50 percent from 2013 levels.

<sup>71</sup> CARB, *Climate Change Scoping Plan*, p. ES-7.

<sup>72</sup> Office of the Governor, Executive Order S-01-07, (January 18, 2007), <https://www.arb.ca.gov/fuels/lcfs/eos0107.pdf>. Accessed September 22, 2021.

<sup>73</sup> CARB, *First Update to the Climate Change Scoping Plan: Building on the Framework (May 2014)*.

<sup>74</sup> CARB, *California’s 2017 Climate Change Scoping Plan*, [https://www.arb.ca.gov/cc/scopingplan/scoping\\_plan\\_2017.pdf](https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf). Accessed September 22, 2021.

<sup>75</sup> Office of the Governor, Executive Order S-01-07, (January 18, 2007), <https://www.arb.ca.gov/fuels/lcfs/eos0107.pdf>. Accessed September 22, 2021.

#### 4.7 Greenhouse Gas Emissions

The 2017 Scoping Plan<sup>76</sup> advises that absent conformity with a qualified GHG reduction plan, projects should incorporate all feasible GHG reduction measures and that achieving “no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development.”

#### Cap-and-Trade Program

AB 32 established the goal of reducing GHG emissions Statewide to 1990 levels by 2020. To help achieve this goal, CARB adopted a regulation to establish a cap-and-trade program that places a “cap” on the aggregate GHG emissions from entities responsible for roughly 85 percent of the State’s GHG emissions. As part of the cap-and-trade program, CARB conducts quarterly auctions where it sells emission allowances. Revenues from the sale of these allowances fund projects that support the goals of AB 32, including transit and rail investments.

On October 20, 2011, CARB’s board adopted the final cap-and-trade regulation; the program began on January 1, 2012. The scope of GHG emission sources subject to cap-and-trade in the first compliance period (2013–2014) included all electricity generated and imported into California, and large industrial facilities emitting more than 25,000 metric tons of carbon dioxide equivalents (MTCO<sub>2</sub>e) per year (e.g., oil refineries and cement manufacturers). The scope of GHG emission sources subjected to cap-and-trade during the second compliance period (2015–2017) expands to include distributors of transportation fuels (including gasoline and diesel), natural gas, and other fuels.

#### California Advanced Clean Cars/Zero Emission Vehicle Program

In 2012, CARB approved the Advanced Clean Cars (ACC) program, a new emissions-control program for vehicle model years 2017–2025. The program combines the control of smog, soot, and GHGs with requirements for greater number of zero-emission vehicles. By 2025, when the rules will be fully implemented, automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog forming emissions.<sup>77</sup>

#### California Energy Commission

##### California Building Energy Efficiency Standards (Title 24, Part 6)

California’s Energy Efficiency Standards for Residential and Nonresidential Buildings, found in Title 24, Part 6 of the California Code of Regulations (CCR) and commonly referred to as “Title 24,” were established in

<sup>76</sup> California Air Resources Board, 2017. *California’s 2017 Climate Change Scoping Plan*. pp. 100-101. Available: [www.arb.ca.gov/cc/scopingplan/scoping\\_plan\\_2017.pdf](https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf). Accessed September 22, 2021.

<sup>77</sup> CARB, *The Advanced Clean Cars Program*, (January 18, 2017), <https://www.arb.ca.gov/msprog/acc/acc.htm>. Accessed September 22, 2021.

1978 in response to a legislative mandate to reduce California’s energy consumption. Title 24 requires the design of building shells and components to conserve energy. The standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods.<sup>78</sup>

An update to Title 24 was adopted by the CEC on April 23, 2008. The 2008 Title 24 standards applied to building permits for which an application was submitted on or after January 1, 2010. The CEC adopted the changes made in 2008 to the Building Energy Efficiency Standards to respond to the mandates of AB 32 and to pursue California energy policy that energy efficiency is the resource of first choice for meeting California’s energy needs. The CEC adopted the Title 24 standards as well as the 2019 Title 24 standards, which became effective on January 1, 2020, and are applicable to the proposed Project.<sup>79</sup>

#### California Green Building Standards (Title 24, Part 11)

The California Green Building Standards Code, which is Part 11 of the CCR, is commonly referred to as the CALGreen Code.<sup>80</sup> The 2008 edition, the first edition of the CALGreen Code, contained only voluntary standards. The 2010 CALGreen Code contains mandatory requirements for State-regulated buildings and structures throughout California beginning on January 1, 2011. The 2010 CALGreen Code contains requirements for construction site selection, stormwater control during construction, construction waste reduction, indoor water use reduction, material selection, natural resource conservation, site irrigation conservation, and more. The 2010 CALGreen Code provides for design options, allowing the designer to determine how best to achieve compliance for a given site or building condition. The 2010 CALGreen Code also requires building commissioning, which is a process for verification that all building systems, such as heating and cooling equipment and lighting systems, are functioning at their maximum efficiency.

The most current version of the CALGreen building code went into effect in January 2020. The purpose is to establish minimum standards to safeguard the public health, safety, and general welfare through structural strength, means of egress facilities, and general stability by regulating and controlling the design, construction, quality of materials, outdoor lighting standards, use and occupancy, location, and maintenance of all building and structures within its jurisdiction.

#### California Appliance Efficiency Regulations (Title 20, Sections 1601 through 1608)

The 2016 Appliance Efficiency Regulations, adopted by the CEC, include standards for new appliances, equipment, and lighting sold or offered for sale in California. These standards include minimum levels of

<sup>78</sup> California Energy Commission, *2019 Building Energy Efficiency Standards*, <https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2019-building-energy-efficiency>. Accessed September 22, 2021.

<sup>79</sup> See California Energy Commission, *2019 Building Energy Efficiency Standards* for additional information.

operating efficiency and other cost-effective measures to promote the use of energy- and water-efficient appliances.<sup>81</sup>

#### 4.7.4.3 Regional

##### *Southern California Association of Governments*

##### **SCAG 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy**

SCAG is the MPO for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties and serves as a forum for the discussion of regional issues related to transportation, the economy, community development, and the environment. As the federally designated MPO for the Southern California region, SCAG is mandated by the federal government to research and develop plans for transportation, hazardous waste management, and air quality. Pursuant to California Health and Safety Code Section 40460(b),<sup>82</sup> SCAG has the responsibility for preparing and approving the portions of the AQMP relating to regional demographic projections and integrated regional land use, housing, employment, and transportation programs, measures, and strategies. SCAG is also responsible under the CAA for determining conformity of transportation projects, plans, and programs with applicable air quality plans.

With regard to GHG emissions, SCAG has prepared and adopted the 2020–2045 RTP/SCS,<sup>83</sup> which includes a Sustainable Communities Strategy that addresses regional development and growth forecasts. The SCAG 2020–2045 RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals, with a specific goal of achieving an 8 percent reduction in passenger vehicle GHG emissions on a per capita basis by 2020, 19 percent reduction by 2035, and 21 percent reduction by 2040 compared to the 2005 level.

##### *South Coast Air Quality Management District*

##### **Policy on Global Warming and Stratospheric Ozone Depletion and General Guidance**

In October 2008, the SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds. SCAQMD proposed the use of a percent emission reduction target to determine significance for commercial/residential projects that emit greater than 3,000 MT of GHG per year. On December 5,

<sup>81</sup> California Energy Commission, *2016 Appliance Efficiency Regulations*, <http://www.energy.ca.gov/2017publications/CEC-400-2017-002/CEC-400-2017-002.pdf>. Accessed September 22, 2021.

<sup>82</sup> California Health and Safety Code, *Division 26. Air Resources, PART 3. Air Pollution Control Districts, Chapter 5.5. South Coast Air Quality Management District, ARTICLE 5. Plan, Section 40460(b)*, [https://leginfo.ca.gov/faces/codes\\_displaySection.xhtml?sectionNum=40460.&lawCode=HSC](https://leginfo.ca.gov/faces/codes_displaySection.xhtml?sectionNum=40460.&lawCode=HSC). Accessed September 22, 2021.

<sup>83</sup> Southern California Association of Governments (SCAG), *Connect SoCal: 2020-2045 Regional Transportation Plan/Sustainable Communities Strategies Draft, "Chapter 1,"* <https://www.connectsocial.org/Pages/Connect-SoCal-Draft-Plan.aspx>, Accessed September 22, 2021.

2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold for stationary source/industrial projects where SCAQMD is the Lead Agency.<sup>84</sup>

However, SCAQMD has yet to adopt a GHG significance threshold for land use development projects (e.g., residential/commercial projects). While it formed a GHG Significance Threshold Working Group to evaluate potential GHG significance thresholds, it failed to reach consensus; as a result, the SCAQMD has never adopted a formal threshold of significance.

SCAQMD adopted a “Policy on Global Warming and Stratospheric Ozone Depletion” on April 6, 1990.<sup>85</sup> The policy commits the SCAQMD to consider global impacts in rulemaking and in drafting revisions to the Air Quality Management Plan (AQMP). In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy to include the following directives:

- Phase out the use and corresponding emissions of chlorofluorocarbons, methyl chloroform (1,1,1-trichloroethane or TCA), carbon tetrachloride, and halons by December 1995;
- Phase out the large quantity use and corresponding emissions of hydrochlorofluorocarbons by the year 2000;
- Develop recycling regulations for hydrochlorofluorocarbons (e.g., SCAQMD Rules 1411 and 1415);
- Develop an emissions inventory and control strategy for methyl bromide; and
- Support the adoption of a California GHG emission reduction goal.

#### **California Air Pollution Control Officers Association (CAPCOA) Guidance**

CAPCOA published a white paper to provide a common platform of information and tools to address climate change in CEQA analyses, including the evaluation of mitigation of GHG emissions from proposed Projects and identifying significance thresholds options. The white paper addresses issues inherent in establishing CEQA thresholds, evaluates tools, catalogues mitigation measures, and provides air districts and lead agencies with options for incorporating climate change into their programs.<sup>86</sup>

Accessed September 22, 2021.

#### **General Plan**

The Inglewood General Plan includes the following elements: Land Use, Circulation, Safety, Noise, Housing, Open Space, Conservation, and Environmental Justice.

#### **Land Use Element**

The following goal from the Land Use Element<sup>87</sup> of the City General Plan are relevant to air pollutant emissions.

**Circulation Goal:** Promote and support adequate public transportation within the City and the region.

**Circulation Goal:** Develop a safe and adequate pedestrian circulation system which is barrier free for the handicapped.

#### **Conservation Element**

The City's General Plan Conservation Element addresses the conservation, development, and use of natural resources.<sup>88</sup> Five specific areas of conservation and/or protection that are identified in the Conservation Element include (1) oil and gas production, (2) water production and provision for domestic use, (3) storm water runoff and wastewater, (4) hazardous waste and solid waste disposal, and (5) air pollution. The Conservation Element notes the following pollution-reducing measures:

- Reducing volatile emissions from factories and refineries;
- Reducing airborne particulate matter from factories and construction sites;
- Reducing numbers of vehicles being driven while increasing the utilization of high occupancy vehicles and alternative transportation;
- Requiring improvements to engine efficiency to decrease emissions; and
- Increasing the use of clean fuel vehicles.

#### **Inglewood Energy and Climate Action Plan**

The City adopted an Energy and Climate Action Plan<sup>89</sup> (ECAP) in 2013 to guide Citywide GHG emissions reduction efforts. The ECAP established four primary compliance paths which projects may choose to adhere to, including: ministerial and exempt project status, implementation of a combination of sustainable development standards, performance-based compliance, or payment of an in-lieu fee. These

#### 4.7 Greenhouse Gas Emissions

measures were developed on a points-based system, which were chosen because they have been demonstrated by various studies to directly reduce GHG emissions or support changes in activities that lead to GHG emissions reductions. Each Climate-Ready Development Standard has a point value associated with it that reflects its general effectiveness at reducing GHG emissions. The standards apply to various types of projects, and a qualifier is included denoting which types of projects may implement the standard. Applicants have discretion regarding which measures that they would want their project to comply with; however, for a project to be fully compliant with the goals of the ECAP it must incorporate features meeting the standards sufficient to accrue a total of 20 points.

The ECAP quantifies GHG reductions from the following five implementing strategies and actions:

- Strategy 1: Lead by Example with Municipal Government Actions
  - Continue Building and Facility Energy Upgrades to reduce energy use
  - Replace all City-owned street, park, and traffic lights with light-emitting diode (LED) lights
  - Accelerate city vehicle fleet replacement
  - Continue commute trip reduction program
  - Planning for electric vehicle infrastructure
- Strategy 2: Increase Energy Efficiency
  - Make commercial buildings more efficient
  - Increase the energy efficiency of residential buildings
  - Increase the energy efficiency of street and traffic lights
- Strategy 3: Support Renewable Energy Generation
  - Remove barriers to renewable energy generation
  - Make renewable energy generation more affordable
  - Educate potential customers
- Strategy 4: Improve Transportation Options and Manage Transportation Demand
  - Make roadways more efficient
  - Improve transit
  - Improve bicycle facilities
  - Make parking more efficient
  - Reduce commute trips
  - Encourage land use intensification and diversity
- Strategy 5: Reduce Consumption and Waste
  - Use less water
  - Produce less waste
  - Promote local food production

#### 4.7 Greenhouse Gas Emissions

##### **City Green Building Code**

In December 2019, the Inglewood City Council approved Ordinance No. 20-05, which amended Chapter 11-2 of the Municipal Code.<sup>90</sup> As such, the City's Green Building Code adopted by reference the 2019 CALGreen<sup>91</sup> and associated standards.

##### **Envision Inglewood**

The City, through Envision Inglewood,<sup>92</sup> is developing a comprehensive transportation infrastructure plan and multimodal improvement program to connect the City's activity centers directly to the regional Metro Rail and Bus System, implement state-of-the-art transportation technologies and traffic demand management strategies to improve both daily and event commutes, and overall traffic management, reduce vehicular trips and enhance pedestrian, bike, and other transit amenities designed to improve air quality, and reduce overall greenhouse gas emissions, and support the economic revitalization already underway while simultaneously developing neighborhood protection programs.

As noted in the City's plan,<sup>93</sup> Inglewood is committed to providing world class transportation connections to its new State-of-the-art sports and entertainment centers and is working diligently to define and propose a last-mile fixed guideway transit connector. Mobility and direct transit access to the City's new activity centers are critical top priorities, especially given local and regional goals to increase transportation choices, reduce greenhouse gas emissions, improve air quality and human health, and encourage sustainable development patterns.

##### **Transit and Intercity Rail Capital Program**

The City applied for and received a Transit and Intercity Rail Capital Improvement Program (TIRCP) grant<sup>94</sup> from the California State Transportation Agency (CALSTA). The application required that the City demonstrate the effectiveness to reduce GHG emissions using the TIRCP Benefits Calculator.<sup>95</sup> The CARB developed the TIRCP Benefits Calculator Tool to estimate the GHG emissions and selected co-benefits of eligible grant applications. The Benefits Calculator Tool estimates GHG emissions using methods described in CARB's Co-Benefit Assessment Methodologies and utilizes motor vehicle emission factors (in grams per mile) to estimate GHG emissions (reported as carbon dioxide or CO<sub>2</sub> in metric tons). The emission factors

4.7 Greenhouse Gas Emissions

are based on the CARB’s EMFAC2017<sup>96</sup> emissions inventory model. Emission factors are based on information associated with the Los Angeles County and the City within the South Coast Air Basin.

The goal of the TIRCP is to provide monies to fund transformative capital improvements that modernize California’s intercity rail, bus, ferry, and rail transit systems to achieve the following objectives:

- Reduction in greenhouse gas emissions;
- Expand and improve rail service to increase ridership;
- Integrate the rail service of the State’s various rail operations, including integration with the high-speed rail system; and
- Improve safety.

4.7.5 EXISTING CONDITIONS

4.7.5.1 Existing Greenhouse Gas Emissions

In 2019, the United States emitted about 6,558 million metric tons of CO<sub>2</sub>. Emissions decreased from 2018 to 2019 by 1.7 percent (after accounting for sequestration from the land sector). This decrease was driven largely by a decrease in emissions from fossil fuel combustion resulting from a decrease in total energy use in 2019 compared to 2018 and a continued shift from coal to natural gas and renewables in the electric power sector. Additionally, 2019 emissions were 13 percent below 2005 levels.<sup>97</sup>

State Emissions

California is the second largest contributor of GHGs in the United States and the 16th largest in the world.<sup>98</sup> In 2019, California produced 418.2 million metric tons of carbon dioxide equivalents (MMTCo<sub>2</sub>e), including imported electricity, and excluding combustion of international fuels and carbon sinks or storage. The major source of GHGs in California is transportation, contributing to 40 percent of the State’s total GHG emissions. The Statewide inventory of GHGs by sector is shown in **Table 4.7-2: California GHG Inventory 2011-2019**.

Local Emissions

City Greenhouse Gas Emissions Inventory

The South Bay Cities Council of Governments (SBCCOG) received funding from SCE’s 2013-2014 Local Government Partnership Strategic Plan Pilots Program<sup>99</sup> to assist local governments within the South Bay sub-region to prepare inventories of local GHG emissions and develop GHG reduction programs and policies. As a member of the SBCCOG, the City collaborated with the SBCCOG to develop inventories of community-wide GHG emissions for the years 2005 and 2007.<sup>100</sup> Additionally, the City developed a community-wide inventory for 2010 as reported in the 2013 Inglewood ECAP.<sup>101</sup>

The ECAP includes a business-as-usual (BAU) forecast that estimates future emissions in 2020 and 2035 from six sectors: Transportation, Residential Energy, Commercial/Municipal Energy, Industrial Energy, Solid Waste, and Water. The BAU forecast assumes GHG emissions that would occur in the future under regulatory conditions as they existed in 2010; the BAU forecast does not include the effects of updates to

4.7 Greenhouse Gas Emissions

Title 24,<sup>102</sup> the Renewables Portfolio Standard,<sup>103</sup> and the Pavley Clean Car Standards<sup>104</sup> on future GHG emissions.

The City's GHG inventories and forecasts are summarized in **Table 4.7-3: City of Inglewood Community GHG Emissions by Sector**. Under the ECAP's BAU forecast,<sup>105</sup> Inglewood's total GHG emissions are expected to increase approximately 14 percent from 2010 (594,273 MTCO<sub>2</sub>e) to 2035 (678,283 MTCO<sub>2</sub>e). On a per-service population (SP) basis, the increase is shown to be just 4.5 percent, from 4.22 MTCO<sub>2</sub>e/SP in 2010 to 4.41 MTCO<sub>2</sub>e/SP in 2035.

**Table 4.7-3  
City of Inglewood Community GHG Emissions by Sector  
(MTCO<sub>2</sub>e)**

Sector	2005	2007	2010	2020	2035
Transportation	320,245	311,853	322,042	327,998	337,552

4.7 Greenhouse Gas Emissions

Clean Cars legislation,<sup>106</sup> the Low Carbon Fuel Standard,<sup>107</sup> the Renewables Portfolio Standard,<sup>108</sup> and Title 24<sup>109</sup> upgrades are expected to reduce community emissions by 121,139 MTCO<sub>2</sub>e per year by 2020, and 160,002 MTCO<sub>2</sub>e by year 2035.

Local measures in the CAP are expected to reduce community emissions an additional 9,803 MTCO<sub>2</sub>e per year by 2020, and 10,994 MTCO<sub>2</sub>e per year-by-year 2035.

The City's Community-wide emissions were categorized in six sectors:

- **Transportation** includes emissions from vehicles traveling (wholly or partially) within the City, and emissions from operating off-road vehicles and equipment (e.g., lawn and garden equipment, construction equipment, industrial equipment, and light commercial equipment).
- **Residential Energy** includes emissions from electricity and natural gas consumption in residential buildings.
- **Commercial/Municipal Energy** includes emissions from electricity and the on-site combustion of natural gas and fuel use in nonresidential buildings and city facilities (including outdoor lighting).
- **Industrial Energy** includes emissions from electricity and the on-site combustion of natural gas and fuel use in industrial buildings and facilities.
- **Solid Waste** includes emissions from solid waste that is generated in the community and sent to landfills.
- **Water** includes emissions from the electricity used to source, treat, and deliver imported water in the community that is not accounted for in the community utility data.

As shown, the transportation sector was the largest contributor to the most recent inventory (2010) at over 54 percent of the total. Residential Energy consumption is the second-largest contributor to emissions at 20.6 percent of the total, followed by Commercial/Municipal Energy (16 percent), Industrial Energy (4.4 percent), Solid Waste (2.8 percent), and Water (2 percent).

**Existing Uses**

The proposed Project would require a number of full and partial property acquisitions and easements or leases for construction and operation of the he proposed Project. Existing operations at the current uses

that will be removed as part of the proposed Project generate GHG emissions from energy (electricity and natural gas), on-road motor vehicles (mobile), solid waste, water and wastewater, and area sources.

**Table 4.7-4: Existing Uses Greenhouse Gas Emissions** identifies the existing emissions from the existing uses within the area of the proposed Project that will be converted. As shown, the existing uses currently generate 67,372 MTCO<sub>2</sub>e per year.

**Table 4.7-4  
Existing Uses Greenhouse Gas Emissions (Metric Tons per Year)**

Source	MTCO <sub>2</sub> e
Area (Consumer Products, Landscaping)	<1
Energy (Natural Gas)	371
Energy (Electrical)	1,882
Solid Waste	563
Water and Wastewater	241
Motor Vehicles	64,316
<b>Total</b>	<b>67,372</b>

Source: RCH Group, 2021, **Appendix G.1.**

Notes:

MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent emissions

Area sources, water, waste, and energy (Natural Gas and electrical) values based on CalEEMod calculations. Motor vehicle values based EMFAC calculations.

#### 4.7.5.2 Adjusted Baseline

The Air Quality and Transportation analyses, including the analysis of VMT, assume the Adjusted Baseline Environmental Setting as described in **Section 4.0: Environmental Analysis**; see **Table 4.0-1** for the details of the Adjusted Baseline. Analysis of GHG emissions is cumulative in nature because global climate change effects are caused by cumulative global emissions. Although the Hollywood Park Specific Plan (HPSP) project will be constructed and in operation prior to opening of the proposed Project, its potential impact on global emissions would not affect the impact analysis regarding GHG emissions from the proposed Project. No other changes to the existing environmental setting related to GHG emissions would occur under the Adjusted Baseline.

#### 4.7.6 THRESHOLDS OF SIGNIFICANCE

Criteria outlined in CEQA Guidelines were used to determine the level of significance of greenhouse gas emissions impacts. The Project would have a significant impact in relation to greenhouse gas emissions if it were to:

**Threshold GHG-1** Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.

**Threshold GHG-2** Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Pursuant to CEQA Guidelines Section 15064.4,<sup>110</sup> the methods suitable for analysis of GHG emissions are:

1. Use a model or methodology to quantify greenhouse gas emissions resulting from a project. The Lead Agency has discretion to select the model it considers most appropriate provided it supports its decision with substantial evidence. The Lead Agency should explain the limitation of the particular model or methodology selected for use.
2. Rely on a qualitative analysis or performance-based standards.

Assessing the significance of a project’s contribution to cumulative global climate change involves: (1) developing pertinent inventories of GHG emissions, and (2) considering project consistency with applicable emission reduction strategies and goals, such as those set forth in the ECAP.

For the purposes of this impact discussion, the proposed Project would generate GHG emissions that may have a significant impact on the environment if the proposed Project’s GHG emissions would exceed a net-zero threshold.

#### 4.7.7 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

**Impact GHG-1:** Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

The proposed Project is a new electrically powered ATS system that will expand the regional Metro Rail system’s transit access by providing three new stations with direct connectivity to one of the highest growing housing and employment centers in LA County, new regionally serving sports and entertainment venues in the City, new plan areas with adopted land use policies/zoning promoting greater housing density and transit-oriented developments, and new planned bicycle/pedestrian infrastructure connections.

The following analysis of the impact on climate change focuses on the proposed Project’s contribution to cumulatively significant GHG emissions.

<sup>110</sup> California Code of Regulations Title 14, Section 15064.4. Determining the Significance of Impacts from Greenhouse Gas Emissions.

### Construction

Prior to construction of the proposed Project, reconstruction of the existing Vons store to be removed is proposed on the corner of Manchester Boulevard and Hillcrest Boulevard. This proposed replacement Vons store would include amenities similar to the existing store, including a pharmacy and bank branch.

**Table 4.7-5: Vons Replacement Construction Greenhouse Gas Emissions** below shows the construction emissions that would occur during development of the Vons store prior to construction of the proposed Project. As shown in **Table 4.7-5**, the total estimated construction GHG emissions for the replacement Vons store is 257 metric tons of CO<sub>2</sub>e. Amortized over 30 years, construction related GHG emissions would be approximately 9 metric tons of CO<sub>2</sub>e per year.

Source	MTCO <sub>2</sub> e
Total Construction Emissions	257
<b>Total 30-Year Amortized Construction Emissions per Year</b>	<b>9</b>

Source: **Appendix G.2**  
MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent emissions

The modeling for the proposed Project construction includes **PDF AQ-1** from the Construction Commitment Program (CCP). **PDF AQ-1** would require the use equipment that meets the USEPA's Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 hp or greater, for all phases of construction activity. Additionally, **PDF AQ-1** would require smaller pieces of equipment to be electric or alternative-fueled (i.e., non-diesel) to the maximum extent feasible and would require construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks. Finally, **PDF AQ-1** would require the use of electric or alternatively fueled (e.g., natural gas) sweepers with HEPA filters.

Construction of the proposed Project would result in GHG emissions of CO<sub>2</sub> and smaller amounts of CH<sub>4</sub> and N<sub>2</sub>O from construction equipment and mobile sources such as haul trucks and worker vehicles (see **Section 4.2: Air Quality** for construction emissions). Construction emissions were calculated for each year of construction activity using CalEEMod and applying emission factors from EMFAC2017 to calculate mobile source emissions. Construction emissions were forecasted based on an expectation that construction of the proposed Project would occur in several overlapping phases over an approximately four-year period, from 2024 through 2027. This is a conservative approach that assumes all construction occurs at the earliest feasible date.

GHG emissions from construction were amortized over the 30-year lifetime of the proposed Project.

The total estimated construction GHG emissions for the proposed Project are 8,820 metric tons of CO<sub>2</sub>e.<sup>111</sup> Given the four-year construction period, the annual construction GHG emissions for the proposed Project are 2,205 metric tons of CO<sub>2</sub>e. Amortized over 30 years, construction related GHG emissions would be approximately 294 metric tons of CO<sub>2</sub>e per year. The results are presented in **Table 4.7-6: Estimated Construction Greenhouse Gas Emissions for the Proposed Project**.

**Table 4.7-6  
Estimated Construction Greenhouse Gas Emissions for the Proposed Project (Metric Tons per Year)**

Construction Year	MTCO <sub>2</sub> e
2024	2,799
2025	3,044
2026	2,481
2027	496

Construction (30-Year Annual Amortized Rate)	9
<b>Total Emissions</b>	<b>806</b>

Source: **Appendix G.2**  
MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent emissions

<sup>111</sup> Fuel usage is estimated using the output for CO<sub>2</sub> and a 10.15 kg-CO<sub>2</sub>/gallon conversion factor, as cited in the U.S. Energy Information Administration Voluntary Reporting of Greenhouse Gases Program, [https://www.eia.gov/environment/pdfpages/0608s\(2009\)index.php](https://www.eia.gov/environment/pdfpages/0608s(2009)index.php). Accessed September 23, 2021.

As shown in **Table 4.7-7**, the total estimated construction GHG emissions for the replacement Vons store is 806 metric tons of CO<sub>2</sub>e.

The operational life of the proposed Project is assumed to be 30 years. Operational emissions were estimated for the anticipated start of operations in late 2027 and a milestone year of 2045.<sup>112</sup> It is assumed that due to advances in technology and regulations to reduce GHG emissions, that operational emissions would continue to decline by 2045, and thereafter. CalEEMod and EMFAC 2017 were used to estimate GHG emissions from area, energy, solid waste, water and wastewater, and mobile sources.

The normal operation of the proposed Project would generate GHG emissions from the operation of the MSF, stations, and other facilities. **Table 4.7-8: Estimated Annual GHG Emissions for Proposed Project Components** presents the annual GHG emissions to operate these facilities. As shown, emissions from normal operations would be 3,378 MTCO<sub>2</sub>e per year.

**Table 4.7-8  
Estimated Annual GHG Emissions for Proposed Project Components**

Source	Annual GHG MTCO <sub>2</sub> e

Solid Waste	49
Water and Wastewater	130
<b>Total Project (Typical Operations)</b>	<b>3,378</b>
Backup Generators	311
<b>Total Project (Typical Operations + Backup Generators)</b>	<b>3,689</b>

Source: RCH Group, 2021, Appendix G1.  
MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent emissions  
<sup>a</sup> Based on CalEEMod for MSF plus ATS usage of 9,192,000kWh along with an SCE emission factor of 535 pounds per MWh.

As discussed previously, each PDS substation will be equipped with backup power generators. The proposed Project would include up to two stationary standby generators, one at each of the PDS substations, with an estimated total capacity rated at approximately 4,000 kilowatts (kW) to provide emergency power primarily for ATS train operation, lighting, and other emergency systems. As shown in **Table 4.7-8**, GHG emissions for the backup generators are estimated to be 311 MTCO<sub>2</sub>e per year, bringing total operations to 3,689 MTCO<sub>2</sub>e per year. The backup generators would only run for emergency

112 For purposes of analysis, modeling emissions begin the first full year after completion of construction. For the proposed Project, this would be year 2028.

conditions when the main electrical power is not available, and for regular testing. The emissions would be limited to only those periods and would not be an ongoing operational activity.

**Vehicle GHG Emissions**

The proposed Project has been designed to reduce VMT for local and regional travel by shifting demand from the general public from autos to public transit. As discussed, **Section 3.0: Project Description** this includes connection to regional rail and light rail transit and other means. Mobility, connectivity, and VMT reduction benefits of the proposed Project include:

- The proposed Project would provide direct connections for passengers throughout the region to the City’s housing and employment centers, and new sports and entertainment venues;
- The proposed Project would help manage and support the City’s projected growth by providing transit within a safe and accessible walking distance to thousands of new residents, housing units and jobs, including the new residents, housing units, and jobs at the Los Angeles Stadium and Entertainment District (LASED) property in Hollywood Park;
- The proposed Project will provide a direct connection to the regional Metro Rail system and would close the “last mile” gap of approximately 1.5 to 2 miles from Metro’s Downtown Inglewood station to the City’s major activity centers; and
- The proposed Project would be located within close proximity to bus lines serving the area and would provide new opportunities to increase bus service ridership.

See **Section 4.12** for further discussion of transit opportunities within the proposed Project vicinity.

Mobile GHG emissions from fleetwide shifts from auto use to public transit were calculated based on EMFAC2017 data and Project-specific VMT data which is presented in **Section 4.12** and is provided in **Appendix O**.

**Table 4.7-9: Daily and Annual VMT for the Six Operational Scenarios** presents the daily and annual VMT for the Adjusted Baseline and the operational scenarios for 2027 and 2045 with and without the proposed Project. As shown, the proposed Project daily and annual VMT are less than the daily and annual VMT in each “Operational” scenario than without the proposed Project. For the Adjusted Baseline, the reduction for VMT with and without the proposed Project is 40,367 VMT daily and 12,872,060 VMT annually. For the 2027 opening year, the reduction in VMT with and without the proposed Project is 247,540 VMT daily and 36,227,624 VMT annually. For the 2045 future year, the reduction for VMT with and without the proposed Project is 316,881 VMT daily and 43,143,335 VMT annually.

**Table 4.7-9**  
Daily and Annual VMT for the Six Operational Scenarios

Scenario	Daily VMT	Annual VMT
Adjusted Baseline without proposed Project	3,132,256	998,811,151
Adjusted Baseline with proposed Project	3,091,889	985,939,091
Year 2027 with Event Weekday without proposed Project	5,275,088	1,346,432,106
Year 2027 with Event Weekday with proposed Project	5,027,548	1,310,204,482
Year 2045 with Event Weekday without proposed Project	5,662,297	1,469,905,139
Year 2045 with Event Weekday with proposed Project	5,345,416	1,426,761,804

Year 2027 with Event Weekday with proposed Project	409,227
Year 2045 with Event Weekday without proposed Project	390,262
Year 2045 with Event Weekday with proposed Project	378,807
<b>Incremental Change</b>	<b>MTCO<sub>2</sub>e</b>
Adjusted Baseline with proposed Project vs Adjusted Baseline	-5,503
Year 2027 with Event Weekday with proposed Project vs Year 2026 with Event Weekday without proposed Project	-11,315
Year 2045 with Event Weekday with proposed Project vs Year 2045 with Event Weekday without proposed Project	-11,455

Source: RCH Group, 2021, Appendix G1.

Numbers may not add up due to rounding

MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent emissions

Note: For purposes of analysis, modeling emissions begin the first full year of completion of construction. For the proposed Project, this would be year 2028.

As shown, annual MTCO<sub>2</sub>e would be reduced by 5,503 MTCO<sub>2</sub>e when compared to the Adjusted Baseline without proposed Project, 11,315 MTCO<sub>2</sub>e when compared to the 2027 opening year without proposed Project, and 11,455 MTCO<sub>2</sub>e when compared to the 2045 future year without proposed Project.

#### Combined Source Proposed Project GHG Emissions

**Table 4.7-11: Estimated Annual GHG Emission Reductions for Proposed Project** presents the GHG emissions under normal operations including the directly emissions from employee trips, deliveries, area

sources, energy sources (natural gas), while accounting for the reduction in motor vehicle as a result of the demolition of existing development.

**Table 4.7-11**  
Estimated Annual GHG Emissions for Proposed Project

Notes:

a – See Table 4.7-10

b – see Table 4.7-3

c – see Table 4.7-7

MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent emissions

The GHG emissions account for the normal operations of the proposed Project and also provide consideration for use of the backup generators and construction emissions amortized over a 30-year period. The total annual GHG emissions of the normal operations of the proposed Project would be 3,672 MTCO<sub>2</sub>e.

When the reduction in 2027 vehicle emissions of -11,315 MTCO<sub>2</sub>e and the existing uses to be removed of -67,372 MTCO<sub>2</sub>e is considered, the result of the proposed Project is a net reduction of 73,898 MTCO<sub>2</sub>e annually. When the reduction in 2045 vehicle emissions of -11,455 MTCO<sub>2</sub>e and the existing uses to be removed of -67,372 MTCO<sub>2</sub>e is considered, the result of the proposed Project is a net reduction of 74,038 MTCO<sub>2</sub>e annually.

Finally, the City will publish annual performance reviews to demonstrate progress toward the benefits enabled by the TIRCP program, as defined by the CalSTA Call for Project Guidelines. The annual

performance review will include tracking metrics and will be conducted by the City. This will include annual reports for GHG reductions measured by MTCO<sub>2</sub>e and decrease in criteria pollutants.

As such, the proposed Project would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment, and impacts would be less than significant.

### Mitigation Measures

#### Construction

Mitigation measures that have been identified for air quality **Impact AQ-1 (PDF AQ-1)** have been accounted for in the estimate of construction-related GHG emissions.

#### Operation

No mitigation is required.

#### Level of Significance after Mitigation

The proposed Project will generate a net GHG emission reduction of 73,898 MTCO<sub>2</sub>e annually by 2027, and 74,038 MTCO<sub>2</sub>e annually by 2045.<sup>113</sup> These net reductions in GHG emissions are consistent with the net-zero significance thresholds established in this analysis. As a result, operational GHG emissions would not be cumulatively considerable, and impacts would be considered beneficial.

**Impact GHG-2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?**

A significant impact would occur if the proposed Project would conflict with applicable regulations, plans and policies that were adopted to reduce GHG emissions that contribute to global climate change. For the proposed Project, this analysis considers the proposed Project's consistency with the following applicable plans, policies, and regulations to reduce GHG emissions:

- The 2017 Climate Change Scoping Plan Update, CARB's plan for achieving a 40 percent reduction on GHG emissions from 1990 levels by 2030, Statewide, as mandated by SB 32;
- SCAG's 2020-2045 RTP/SCS, the regional plan for achieving sustainable land use patterns that reduce passenger vehicle GHG emissions, as mandated by SB 375;
- The City General Plan; and
- The City's ECAP.

<sup>113</sup> CEQA Guideline, Section 15064.3(b), *Determining Significant Impacts of Transportation Projects*.

### CARB 2017 Scoping Plan Update

As directed by Executive Order B-30-15, CARB's 2017 Scoping Plan Update<sup>114</sup> describes how the State plans to achieve the 2030 GHG emission reduction goal for California of 40 percent below 1990 levels by 2030, as mandated by SB 32. The 2017 Scoping Plan Update strategy for meeting the 2030 GHG target incorporates the full range of legislative actions and State-developed plans that have relevance to the year 2030, including the LCFS, SB 350, the 2016 Mobile Source Strategy, the Sustainable Freight Action Plan, SB 1383, and the Cap-and-Trade Program (AB 398).

The proposed Project would be consistent with key State plans and regulatory requirements referenced in the 2017 Scoping Plan Update designed to reduce Statewide emissions. According to the 2017 Scoping Plan Update, reductions needed to achieve the 2030 target are expected to be achieved by increasing the RPS to 50 percent of the State's electricity by 2030, greatly increasing the fuel economy of vehicles and the number of zero-emission or hybrid vehicles, reducing the rate of growth in VMT, supporting high-speed rail and other alternative transportation options, and increasing the use of high-efficiency appliances, water heaters, and HVAC systems. The proposed Project would provide direct connections between regional transit provided by Metro, specifically at the Metro K Line, and other transit providers as well as the City's major activity centers, such as the Forum, the LASED and HPSP including SoFi stadium, and IBEC. Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce per-capita VMT. For these reasons, the proposed Project would not conflict with CARB's 2017 Scoping Plan Update.

### Executive Order S-3-05

Executive Order No. S3-05 established a long-term goal of reducing California's GHG emissions to 80 percent below the 1990 level by the year 2050. The proposed Project GHG emissions would result in a net decrease of over 60,000 MTCO<sub>2</sub>e of GHG annually starting in 2027.

Even though the State has not provided a clear regulatory and technological roadmap to achieve the 2050 goal, it has demonstrated the potential pace at which emission reductions can be achieved through new regulations, technology deployments, and market developments. In developing the 2017 Scoping Plan Update, CARB, CEC, CPUC, and the California Independent System Operator (CAISO) commissioned a study to evaluate the feasibility and cost of meeting the 2030 target along the way to reaching the State goal of reducing GHG emissions to 80 percent below 1990 levels by 2050. With input from the agencies, the California State Agencies' PATHWAYS Project explores scenarios for meeting the State long-term GHG emissions targets, encompassing the entirety of California economy with detailed representations of the

<sup>114</sup> CARB, California's 2017 Climate Change Scoping Plan, [https://www.arb.ca.gov/cc/scopingplan/scoping\\_plan\\_2017.pdf](https://www.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf). Accessed September 23, 2021.

buildings, industry, transportation, and electricity sectors.<sup>115</sup> While acknowledging the inherent uncertainty associated with its modeling assumptions, the PATHWAYS study emphasizes the need for significant action and continued policy development by the State to support low-carbon technologies and markets for energy efficiency, building electrification, renewable electricity, zero emission vehicles, and renewable liquid fuels. The study underscores the need for a periodic review of State policies and programs for reducing GHG emissions, as was anticipated by AB 32 in its directive to update the Scoping Plan at least every 5 years.

Statewide efforts are underway to facilitate the achievement of the EO S-3-05 goals. As discussed herein, the proposed Project GHG would provide net benefits in GHG reductions. Given the net reduction GHG emissions that would result from the proposed Project, it would not conflict with the ability of the State to achieve the 2050 horizon-year goal of EO S-3-05.

#### SCAG 2020-2045 RTP/SCS

A detailed consistency analysis for proposed Project with the 2020-2045 RTP/SCS is provided in **Section 4.9: Land Use and Planning**. The 2020-2045 SCAG RTP/SCS<sup>116</sup> is the primary planning document for regional transportation infrastructure in the greater Los Angeles area. With a horizon year of 2045, this long-range plan, required by the federal government, is updated by SCAG every four years as demographic, economic, and policy circumstances change.

Although demographic growth in the six-county SCAG region is slowing, the overall regional population is expected to exceed 22.5 million by 2045 - an increase of nearly 4 million people from the 2016 baseline. According to SCAG, population, housing, and employment growth are expected to be particularly strong in the cities of Los Angeles, Culver City, unincorporated areas of Los Angeles County, portions of the South Bay Cities, and Inglewood. The SCAG region is projected to experience a household growth rate of approximately 24 percent, and an employment growth rate of 23 percent. Currently, the City contains roughly 8,900 housing units and 14,414 employees within a ½ mile of the proposed Project's three stations. By 2040, these areas are projected to increase to roughly 12,875 households, and 38,326 employees. These increases represent a growth rate of approximately 45 percent in households and 166 percent in employment. In comparison to the SCAG region, these projections translate into the City (within

<sup>115</sup> Energy + Environmental Economics (E3), 2015. Summary of the California State Agencies' PATHWAYS Project: Long-term Greenhouse Gas Reduction Scenarios. Available: [https://www.ethree.com/public\\_proceedings/summary-california-state-agencies-pathways-project-long-term-greenhouse-gas-reduction-scenarios/](https://www.ethree.com/public_proceedings/summary-california-state-agencies-pathways-project-long-term-greenhouse-gas-reduction-scenarios/). Accessed September 23, 2021.

<sup>116</sup> Southern California Association of Governments (SCAG), *Connect SoCal: 2020-2045 Regional Transportation Plan/Sustainable Communities Strategies Draft*, "Chapter 1," <https://www.connectsocial.org/Pages/Connect-SoCal-Draft-Plan.aspx>. Accessed September 23, 2021.

a ½ mile of the proposed Project's three stations) experiencing almost twice as much growth rate in housing, and more than seven times as much growth rate in employment by 2040.<sup>117</sup>

As discussed in **Section 4.2** of this Recirculated Draft EIR, the SCAQMD AQMPs includes land use and transportation strategies from the SCAG 2020-2045 RTP/SCS<sup>118</sup> that are intended to reduce VMT and resulting regional mobile source emissions. The applicable land use strategies include planning for growth around livable corridors; providing more options for short trips/neighborhood mobility areas; supporting electric vehicles and expanding vehicle charging stations; supporting local sustainability planning.

The proposed Project spans the length of approximately 1.6 miles and would be located near existing restaurant, retail, and commercial land uses which generate vehicle trips on local roadways within the area of the proposed Project. The proposed Project would provide direct connections between regional transit provided by Metro, specifically at the Metro K Line, and other transit providers as well as the City's major activity centers, such as the Forum, the LASED and HPSP including SoFi stadium, and IBEC. Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce per-capita VMT. A reduction in VMTs would result in reduced GHG emissions from mobile sources.

The proposed Project would be consistent with a number of SCAG's goals including the following: 1) improving mobility, accessibility, reliability, and travel safety for people and goods; 2) increasing person and goods movement and travel choices within the transportation system; 3) reducing GHG emissions and improving air quality; and 4) encouraging development of diverse housing types in areas that are supported by multiple transportation options. In addition, the proposed Project is a prime example of one of SCAG's primary strategies which is to link future growth with more transportation choices, specifically around high-quality transit areas (i.e., the ½ mile surrounding rail transit stops or bus stops/corridors that have peak headways of 15 minutes or less), such as the proposed Project's stations.

As part of its vision, the 2020-2045 RTP/SCS includes Connect SoCal;<sup>119</sup> Connect SoCal charts a path toward a more mobile, sustainable, and prosperous region by making connections between transportation networks, between planning strategies and between the people whose collaboration can improve the quality of life for Southern Californians. Connect SoCal builds upon and expands land use and transportation strategies established over several planning cycles to increase mobility options and achieve

<sup>117</sup> City of Inglewood, *Transit, and Intercity Rail Program (TIRCP) Application for the City of Inglewood Transit Connector Project*, January 16, 2020.

<sup>118</sup> Southern California Association of Governments (SCAG), *Connect SoCal: 2020-2045 Regional Transportation Plan/Sustainable Communities Strategies Draft*, "Chapter 1," <https://www.connectsocial.org/Pages/Connect-SoCal-Draft-Plan.aspx>. Accessed September 23, 2021.

<sup>119</sup> Southern California Association of Governments (SCAG), *Connect SoCal, The 2020-2045 Regional Transportation Plan/Sustainable Community Strategy of the Southern California Association of Governments*, <https://www.connectsocial.org/Pages/Connect-SoCal-Final-Plan.aspx>. Accessed September 23, 2021.

#### 4.7 Greenhouse Gas Emissions

a more sustainable growth pattern. To augment the Core Vision of the plan, Connect SoCal includes new initiatives at the intersection of land use, transportation, and technology to close the gap and reach our greenhouse gas reduction goals. As part of the planning vision, Connect SoCal looks to complete “last mile” mobility as part of its sustainability goals. Connect SoCal builds upon with regional initiatives that link the built environment and transportation system with policies, projects and programs that strengthen and enhance each other beyond what each would accomplish in isolation.<sup>120</sup>

As part of the State’s mandate to reduce per-capita GHG emissions from automobiles and light trucks, Connect SoCal presents strategies and tools that are consistent with local jurisdictions’ land use policies and incorporate best practices for achieving the State-mandated reductions in GHG emissions at the regional level through reduced per-capita VMT. These strategies identify how the SCAG region can implement Connect SoCal and achieve related GHG reductions. SCAG works to support local jurisdictions and partnerships by identifying ways to implement SCS in a way that fits the vision and needs of each local community.

The following Connect SoCal strategies are intended to be supportive of implementing the regional Sustainable Communities Strategy and are applicable to the proposed Project:

##### **Focus Growth Near Destinations & Mobility Options**

- Focus on a regional jobs/housing balance to reduce commute times and distances and expand job opportunities near transit and along center-focused main streets.
- Encourage design and transportation options that reduce the reliance on and number of solo car trips.

##### **Support Implementation of Sustainability Policies**

- Pursue funding opportunities to support local sustainable development implementation projects that reduce greenhouse gas emissions.

The proposed Project’s is approximately 1.6 miles in length and would be located near existing residential, office, retail, and commercial land uses which generate vehicle trips on local roadways within the City. The proposed Project would provide direct connections between regional transit provided by Metro, specifically at the Metro K Line, and other transit providers as well as the City’s major activity centers, such as The Forum, the LASED and HPSP. Implementation of the proposed Project would provide an alternate mode of transportation within the City and decrease vehicle ridership and thereby VMTs.

The 2020-2045 RTP/SCS states that expanding the transit network is central to the region’s plan for

<sup>120</sup> Southern California Association of Governments (SCAG), *Connect SoCal, The 2020-2045 Regional Transportation Plan/Sustainable Community Strategy of the Southern California Association of Governments*, p. 4 <https://www.connectsocial.org/Pages/Connect-SoCal-Final-Plan.aspx>. Accessed September 23, 2021.

#### 4.7 Greenhouse Gas Emissions

meeting mobility and sustainability goals while continuing to grow the regional economy.<sup>121</sup> The proposed Project connects transit and achieves the last mile/first mile goals of the 2020-2045 RTP/SCS. Further, the proposed Project is consistent with and assists in achieving Connect SoCal strategies and incorporates best practices for achieving the State-mandated reductions in GHG emissions at the regional level through reduced per-capita VMT.

For these reasons, the proposed Project would not conflict with SCAG’s 2020-2045 RTP/SCS.

##### **City ECAP**

ECAP<sup>122</sup> implementation is expected to reduce emissions by 18.8 percent below 2005 levels by 2020, enabling the City to meet its 2005 target. However, the City would need to reduce emissions by an additional 111,702 MTCO<sub>2</sub>e per year by 2035 to meet its 2035 emissions reduction goal. The ECAP includes the following strategies and actions that are applicable to the proposed Project:

- Strategy 1: Lead by Example with Municipal Government Actions
  - Continue Building and Facility Energy Upgrades to reduce energy use
  - Replace all City-owned street, park, and traffic lights with light-emitting diode (LED) lights
  - Accelerate city vehicle fleet replacement
  - Continue commute trip reduction program
  - Planning for electric vehicle infrastructure
- Strategy 3: Support Renewable Energy Generation
  - Remove barriers to renewable energy generation
  - Make renewable energy generation more affordable
  - Educate potential customers
- Strategy 4: Improve Transportation Options and Manage Transportation Demand
  - Make roadways more efficient
  - Improve transit
  - Improve bicycle facilities
  - Make parking more efficient
  - Reduce commute trips
  - Encourage land use intensification and diversity

<sup>121</sup> Southern California Association of Governments (SCAG), *Connect SoCal, The 2020-2045 Regional Transportation Plan/Sustainable Community Strategy of the Southern California Association of Governments*, Chapter 3. <https://www.connectsocial.org/Pages/Connect-SoCal-Final-Plan.aspx>, Accessed September 23, 2021.

<sup>122</sup> City of Inglewood, *Inglewood Energy and Climate Action Plan*, March 2013, <https://www.cityofinglewood.org/DocumentCenter/View/148/Inglewood-Energy-and-Climate-Action-Plan-ECAP-Adopted-2013-PDF>. Accessed September 23, 2021.

#### 4.7 Greenhouse Gas Emissions

As discussed previously, the proposed Project would provide direct connections between regional transit provided by Metro, specifically at the Metro K Line, and other transit providers as well as the City's major activity centers, such as the Forum, the LASED and HPSP including SoFi stadium and IBEC. Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce per-capita VMT. The proposed Project would be consistent with the City's ECAP.

The proposed Project's connection from the City's new housing and employment centers, and sports and entertainment venues, to the Metro K Line and larger regional and State rail system will result in significant benefits for both the City and southern California region, including significant reductions in VMT and GHG emissions.

As a transit connector project, the proposed Project will generate a significant amount of ridership from throughout the region with nearly half of the trips originating from Metro's regional light-rail transit system including the Metro K Line and its connection to South Los Angeles, the Metro Green Line and its connections to the South Bay region and Norwalk, the Expo Line and its connections to Santa Monica, Union Station (connection to California High-Speed Rail), East Los Angeles, Pasadena, and the San Gabriel and San Fernando Valleys. The proposed Project will attract passengers throughout the region by providing a direct transit connection to the City's housing and employment centers, and new sports and entertainment venues.

In addition to rail integration, the proposed Project provides opportunities to increase bus service ridership. Rail and bus integration are symbiotic – bus service is enhanced by urban transit and vice versa. The proposed Project will be located within close proximity to twenty-two municipal bus lines serving the area, including eighteen bus lines operated by Metro, one line operated by Santa Monica Big Blue, one operated by Culver City Bus, one operated by Los Angeles County, and other operated by the Los Angeles Department of Transportation (LADOT).

The ECAP also reflects a commitment to increasing energy efficiency and implementing energy conservation measures to reduce wasteful, inefficient, and unnecessary consumption. The proposed Project would incorporate a number of sustainability features as listed in **Appendix C: ITC Design Standards and Guidelines**. The City has committed to implementing, if feasible, various sustainability measures for different proposed Project elements that meet or exceed CALGreen requirements, including energy and water conservation measures.

As a result, the benefits of completing the proposed Project will generate significant GHG emission reductions. Without the proposed Project, these VMT reductions and air quality improvements would not be realized.

#### 4.7 Greenhouse Gas Emissions

##### City General Plan

The City General Plan<sup>123</sup> includes the following elements: Land Use, Circulation, Safety, Noise, Housing, Open Space, and Conservation.

##### Land Use Element

The following goal from the Land Use Element<sup>124</sup> of the City General Plan are relevant to GHG emissions.

**Circulation Goal:** Promote and support adequate public transportation within the City and the region.

**Circulation Goal:** Develop a safe and adequate pedestrian circulation system which is barrier free for the handicapped.

##### Conservation Element

The City's General Plan Conservation Element addresses the conservation, development, and use of natural resources.<sup>125</sup> Five specific areas of conservation and/or protection that are identified in the Conservation Element include (1) oil and gas production, (2) water production and provision for domestic use, (3) storm water runoff and waste water, (4) hazardous waste and solid waste disposal, and (5) air pollution.<sup>126</sup> The Conservation Element notes the following pollution-reducing measures, which would also reduce GHGs:

- Reducing numbers of vehicles being driven while increasing the utilization of high occupancy vehicles and alternative transportation;
- Requiring improvements to engine efficiency to decrease emissions; and
- Increasing the use of clean fuel vehicles.

As discussed previously, the proposed Project would comply with **PDF AQ-1** from the proposed Project's CCP. **PDF AQ-1** would require the use equipment that meets the USEPA's Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 hp or greater, for all phases of construction activity. Additionally, **PDF AQ-1** would require smaller pieces of equipment to be electric or alternative-fueled (i.e., non-diesel) to the maximum extent feasible and would require construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks. Finally, **PDF AQ-1** would require the use of electric or alternatively fueled (e.g., natural gas) sweepers with HEPA filters. Furthermore, the proposed Project would comply with fleet rules to reduce on-road truck emissions under

123 City of Inglewood, *Department of Community Development and Housing*, General Plan. January 1980

124 City of Inglewood, *Department of Community Development and Housing*, 1980. Land Use Element of the Inglewood General Plan. January 1980. Amended September 14, 2016.

125 City of Inglewood General Plan, "Conservation Element" (1997), General Plan. January 1980.

126 City of Inglewood General Plan, "Conservation Element" (1997), General Plan. January 1980.

CARBs Truck and Bus regulation.<sup>127</sup> Compliance with these measures and requirements would be consistent with the goals and policies of the Conservation Element.

Once in operation, the proposed Project would result in a decrease in GHG emissions pollutants (see **Impact GHG-1**). As shown on **Table 4.7-3**, the GHG emissions would result in net reductions under normal operations.

As discussed previously, the proposed Project would provide direct connections between regional transit provided by Metro, specifically at the Metro K Line, and other transit providers as well as the City's major activity centers, such as the Forum, the LASED and HPSP. Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce per-capita VMT.

For these reasons, the proposed Project would not conflict with Inglewood General Plan policies related to GHG emissions.

**Summary**

The proposed Project would be consistent with and implement the goals, policies, and regulations to reduce GHG emissions of the following:

- The 2017 Climate Change Scoping Plan Update, CARB's plan for achieving a 40 percent reduction on GHG emissions from 1990 levels by 2030, Statewide, as mandated by SB 32;
- SCAG's 2020-2045 RTP/SCS, the regional plan for achieving sustainable land use patterns that reduce passenger vehicle GHG emissions, as mandated by SB 375;
- The City General Plan; and
- The City's ECAP.

Impacts would be less than significant.

**Mitigation Measures**

No mitigation is required.

**Level of Significance after Mitigation**

As discussed, the proposed Project would be consistent with and implement the goals, policies, and regulations of the applicable plans to reduce GHG emissions.<sup>128</sup>

Impacts would be less than significant.

<sup>128</sup> CEQA Guidelines, Section 15064.3(b), *Determining Significant Impacts of Transportation Projects*.  
<sup>128</sup> CEQA Guidelines, Section 15064.3(b), *Determining Significant Impacts of Transportation Projects*.

**4.7.8 CUMULATIVE IMPACTS**

As discussed previously in *Section 4.7.3* above, GHG impacts are exclusively cumulative impacts, hence an evaluation of cumulative GHG impacts is already provided above and no further analysis is necessary.

**4.7.9 CONSISTENCY WITH CITY OF INGLEWOOD GENERAL PLAN**

As discussed above under **Impact GHG-2**, the proposed Project would provide direct connections between regional transit provided by Metro, specifically at the Metro K line, and other transit providers as well as the City's major activity centers, such as the Forum, the LASED and HPSP. Implementation of the proposed Project would increase transit mode split, reduce vehicle trips, and reduce per-capita VMT. For these reasons, the proposed Project would not conflict with Inglewood General Plan policies related to GHG emissions.

## 4.8 HAZARDS AND HAZARDOUS MATERIALS

### 4.8.1 INTRODUCTION

This section of the Recirculated Draft EIR describes and evaluates potential impacts related to hazards and hazardous materials that could result from construction and operation of the proposed Project. Since circulation of the December 2020 Draft EIR, the footprint of the proposed ATS system has been modified to address stakeholder comments and to enhance the compatibility and visual character of the proposed Project with the existing and planned developments surrounding the proposed ATS system. The section contains: (1) a description of the existing land uses within the modified footprint of the proposed Project and surrounding areas as they pertain to hazardous materials use, as well as a description of the Adjusted Baseline Environmental Setting; (2) a summary of the federal, State, and local regulations related to hazards or hazardous materials; and (3) an analysis of the potential impacts related to hazards and hazardous materials associated with the implementation of the proposed Project, as well as identification of potentially feasible measures that could mitigate significant impacts.

After circulation of the December 2020 Draft EIR for public review, the City revised the design of the proposed Project in response to consultation with key stakeholders in the community and comments received on the December 2020 Draft EIR. Specific changes to the proposed Project include raising the height of the ATS guideway along Market Street to preserve existing views of historic buildings, relocating the Prairie Avenue/Pincay Drive Station to the southwest corner of Prairie Avenue and Manchester Boulevard, redesigning the proposed MSF to allow this facility to be located on the proposed site with a new Vons store, and realignment of the guideway and stations on Prairie Avenue to the west side of Prairie Avenue. These changes include updated construction and operational details which resulted in similar impacts to hazards and hazardous materials compared to the December 2020 Draft EIR.

In response to comments from the Inglewood Unified School District (IUSD) on the December 2020 Draft EIR, this section addresses potential hazards at IUSD schools, including incorporating the findings of a rail safety study prepared for Kelso Elementary School referenced below.

Information from the following hazard investigations conducted for the proposed Project were used in part to prepare this section:

- *Hazardous Material Assessment*, Geosyntec Consultants, July 3, 2018 (**Appendix L.1**),
- *Hazards and Hazardous Materials*, Geosyntec Consultants, July 3, 2018 (**Appendix L.2**),
- *Inglewood Transit Connector EDR Radius Map Report*, EDR, September 15, 2021 (**Appendix L.3**), and
- *Railroad Safety Study*, Inglewood Transit Connector Project, Meridian Consultants LLC, March 2021 (**Appendix L.4**)

Prior to the December 2020 Draft EIR, a Revised Initial Study (included in **Appendix A.2** of this Recirculated Draft EIR) was prepared using the California Environmental Quality Act (CEQA) Guidelines Environmental Checklist Form to assess potential environmental impacts associated with hazards and hazardous materials. Seven screening criteria were evaluated, and four were found to result in “no impact” or “less than significant impacts.” The proposed Project, as modified, does not change the findings of the Revised Initial Study as follow:

- The routine transport, use, or disposal of hazardous materials associated with the proposed Project, as modified would continue to result in “Less than Significant Impacts.” As discussed in the Revised Initial Study, construction and operation of the proposed Project would comply with existing federal, State, and local regulations, and routine precautions would be undertaken to reduce the potential for accidental releases of hazardous materials or substances. As such, the proposed Project, as modified from the Revised Initial Study would not create a significant hazard to the public or environment through the routine transport, use, or disposal of hazardous materials and substances. Therefore, this issue is not addressed further in this section.
- Potential impacts related to being located within an airport land use plan or within two miles of a public airport, public use airport, or private airstrip, resulting in a safety hazard for people residing or working in the area were evaluated and determined to have “No Impact.” Los Angeles International Airport (LAX) is located more than 2 miles southwest and Hawthorne Municipal Airport is located approximately 2.75 miles southeast of the proposed Project area, as modified since the Revised Initial Study. The proposed Project would not construct any buildings or structures to a height that would interfere with or obstruct any airport operations. Therefore, this issue is not addressed further in this section.<sup>1</sup>
- Potential impacts related to the exposure of people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fire were evaluated and determined to have “No Impact.” The City is developed and urbanized and is without an urban/wildland interface. The footprint of the proposed Project alignment, as modified is not within a Moderate, High, or Very High Fire Hazard Severity Zone as designated by the California Department of Forestry and Fire Protection (CAL FIRE). Therefore, this issue is not addressed further in this section.<sup>2</sup>

The remaining three of seven screening criteria are addressed below in *Section 4.8.5: Thresholds of Significance*.

Impacts determined to be less than significant are discussed further in **Section 6.0: Other Environmental Considerations**. Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Recirculated Draft EIR.

<sup>1</sup> *Hazardous Material Assessment Technical Memorandum*, Geosyntec Consultants, July 3, 2018.

<sup>2</sup> *Hazardous Material Assessment Technical Memorandum*, Geosyntec Consultants, July 3, 2018.

## 4.8.2 METHODOLOGY

Hazardous materials generally refers to hazardous substances, hazardous waste, and other materials that exhibit corrosive, poisonous, flammable, and/or reactive properties and have the potential to harm human health and/or the environment. Hazardous materials are used in products (e.g., household cleaners, industrial solvents, paint, pesticides, etc.) and in the manufacturing of products (e.g., electronics, newspapers, plastic products, etc.). Hazardous materials can include petroleum products, natural gas, synthetic gas, acutely toxic chemicals, and other toxic chemicals that are used in agriculture, commercial and industrial uses, retail businesses, hospitals, and households. Accidental releases of hazardous materials can result from a variety of incidents, including highway incidents, warehouse fires, train derailments, shipping accidents, and industrial incidents.

The term “hazardous materials” as used in this section includes all materials defined in the California Health and Safety Code as follows:

*A material that, because of its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. ‘Hazardous materials’ include, but are not limited to, hazardous substances, hazardous waste, and any material that a handler or the unified program agency has a reasonable basis for believing that it would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment.*

The term includes chemicals regulated by the United States Department of Transportation (USDOT), the United States Environmental Protection Agency (USEPA), the California Department of Toxic Substances Control (DTSC), the California Governor’s Office of Emergency Services, and other agencies as hazardous materials, wastes, or substances.

Analysis in this section is focused on the use or management of hazardous or potentially hazardous materials resulting from construction and operational activities envisioned under the proposed Project. The severity of potential hazards to people, property, and the environment associated with the heightened interaction with hazardous materials associated with implementation of the proposed Project is also analyzed. Analysis in this section is based on various existing databases and historical data, including California Hazardous Material Incident Report System (CHMIRS), HAZNET, HIST CORTESE, and Los Angeles County Industrial Waste and Underground Storage Tank Sites. Contaminated site locations extracted from these databases are then delineated on the proposed Project guideway, stations, and MSF locations, and impacts are assessed according to the potential activities that would take place on specific sites.

Additionally, this section addresses short-term construction impacts resulting from demolition of underground storage tanks (USTs) and other existing (typically older) structures, work in the vicinity of historical oil well and pipeline activity, work in areas with previously documented soil contamination, and other subsurface construction activities, as well as operational impacts associated with the type of uses proposed and the materials that the operation of these uses would entail. In determining the level of significance, the analysis recognizes that all components of the proposed Project would be required to comply with relevant federal and State laws and regulations that are designed to ensure the safety of routine transport, use, management, or disposal of hazardous materials.

## 4.8.3 REGULATORY FRAMEWORK

The following presents the federal, State, and local regulatory framework, laws, ordinances, and regulations governing the proposed Project as related to hazards and hazardous materials (HHM).

### 4.8.3.1 Federal

#### *Occupational Safety and Health Act*

The Occupational Safety and Health Act (OSHA) is intended to create a safe workplace.<sup>3</sup> OSHA establishes procedures and standards for the safe handling and storage of hazardous chemicals. In addition, a safety data sheet (SDS) containing specified information must be provided to customers, making them aware of chemical hazards to which they may be exposed. OSHA also establishes standards regarding the safe exposure limits for chemicals to which construction workers may be exposed. Safety and Health Regulation for Construction<sup>4</sup> contains Compliance Guidelines for construction activities, which include occupational health and environmental controls to protect worker health and safety. These Guidelines articulate the required health and safety plan(s) to be developed and implemented during construction, including associated training, protective equipment, evacuation plans, chains of command, and emergency response procedures.

#### *Emergency Planning and Community Right-to-Know*

The Emergency Planning and Community Right-to-Know Act (EPCRA)<sup>5</sup> requires facilities that store or use hazardous chemicals to submit a specified plan with copies of SDSs to the State Emergency Response Center (SERC) and the local emergency planning center (LEPC). Additionally, facilities must submit an annual inventory list with details on the amount, location, and storage method of regulated chemicals present at the facility.<sup>6</sup>

<sup>3</sup> 29 USC Section 651 et seq. (1970), 29 CFR Section 1910 et seq. (1999).

<sup>4</sup> 29 CFR Section 1926.65 Appendix C – Compliance Guidelines (1993).

<sup>5</sup> 42 USC Section 116 et seq. (2010), 40 CFR Section 350 et seq. (2011).

<sup>6</sup> 40 CFR Section 370.20 et seq. (2002).

### **Toxic Substances Control Act**

The Toxic Substances Control Act (TSCA) enables USEPA to track industrial chemicals produced or imported into the United States.<sup>7</sup> USEPA screens the chemicals and can require testing to determine if any pose an environmental or human-health hazard. Any chemical that poses an unreasonable risk then can be regulated or banned from manufacturing or importation. Congress enacted major amendments to TSCA in 2016 via the Lautenberg Act,<sup>8</sup> which strengthened USEPA's authority to regulate chemicals.

### **Clean Air Act**

Section 112 of the Clean Air Act requires USEPA to set air toxics standards for regulating the emissions of hazardous air pollutants.<sup>9</sup> The 1990 federal Clean Air Act Amendments establish a program designed to prevent the release of highly hazardous chemicals.<sup>10</sup>

### **Resource Conservation and Recovery Act**

The Resource Conservation and Recovery Act (RCRA)<sup>11</sup> establishes design, construction, and operational standards to prevent chemical releases from USTs. RCRA, Subtitle I regulates USTs containing hazardous substances or petroleum. USEPA sets standards governing tank construction based on whether the tank is new or whether an existing tank is upgraded. USEPA also imposes operation and maintenance procedures for UST owners and operators and establishes reporting requirements from regulated tanks that release substances into the environment.

RCRA Subtitle C<sup>12</sup> is intended to proactively manage hazardous waste and to minimize and avoid hazardous waste contamination. RCRA Subtitle C addresses hazardous waste from cradle-to-grave, regulating the generation, transport, storage, treatment, and disposal of hazardous waste by "large-quantity generators" (1,000 kilograms/month or more). RCRA, Subtitle I, the Hazardous and Solid Waste Amendments (HSWA) of 1984, expanded and clarified RCRA Subtitle C. USEPA administers RCRA Subtitle C pursuant to regulations found at 40 CFR Section 260 et seq. and has delegated RCRA Subtitle C implementation and enforcement within California to the State. Under RCRA regulations, hazardous wastes must be tracked from the time of generation to the point of disposal. At a minimum, each generator of hazardous waste must register and obtain a hazardous waste activity identification number. If hazardous wastes are stored for more than 90 days or treated or disposed at a facility, any treatment, storage, or

<sup>7</sup> 15 USC Section 2601 et seq. (1976), 40 CFR Section 700 et seq. (2012).

<sup>8</sup> H.R. 2576 — 116th Congress, "Federal Government Advertising Equity Accountability Act," (2016).

<sup>9</sup> Clean Air Act Title I, Section 112, USC 7412 "Hazardous Air Pollutants."

<sup>10</sup> EPA, "The Clean Air Act – Highlights of the 1990 Amendments," United States Environmental Protection Agency, accessed June 22, 2020, <https://www.epa.gov/clean-air-act-overview/clean-air-act-highlights-1990-amendments>.

<sup>11</sup> 42 USC Section 6991 et seq., (1976), 40 CFR Section 280 et seq., (2014).

<sup>12</sup> 42 USC Section 6901 et seq.

disposal unit must be permitted under RCRA. Additionally, all hazardous waste transporters are required to be permitted and must have an identification number.

### **Hazardous Materials Transportation Act**

The Hazardous Materials Transportation Act regulates transport of hazardous materials on water, rail, highways, airplanes, and pipelines.<sup>13</sup> The US Department of Transportation (DOT) administers the Act.<sup>14</sup> Title 49 of the CFR specifies additional requirements and regulations with respect to the transport of hazardous materials. Title 49 of the CFR requires that every employee who transports hazardous materials receive training to recognize and identify hazardous materials and become familiar with hazardous materials requirements. Drivers are also required to be trained in function and commodity specific requirements. In addition, vehicles transporting certain types or quantities of hazardous materials must display placards (warning) signs. Transporters of hazardous wastes must be permitted and have an identification number.

#### **4.8.3.2 State**

##### **Department of Toxic Substances Control**

At the State level, authority for the Statewide administration and enforcement of RCRA is enforced through CalEPA's DTSC. While the DTSC has primary State responsibility in regulating the generation, storage, and disposal of hazardous materials, DTSC may further delegate enforcement authority to local jurisdictions. In addition, the DTSC is responsible and/or provides oversight for contamination cleanup, and administers Statewide hazardous waste reduction programs.<sup>15</sup> DTSC operates programs to accomplish the following: (1) deal with the aftermath of improper hazardous waste management by overseeing site cleanups; (2) prevent releases of hazardous waste by ensuring that those who generate, handle, transport, store, and dispose of wastes do so properly; and (3) evaluate soil, water, and air samples taken at sites.

##### **Division of Occupational Safety and Health**

The California OSHA (Cal-OSHA) program is administered and enforced by the Division of Occupational Safety and Health (DOSH). The Cal-OSHA program is similar to the Federal OSHA program in that both programs contain rules and procedures related to exposure to hazardous materials during demolition and construction activities. In addition, Cal-OSHA requires employers to implement a comprehensive, written

<sup>13</sup> 49 USC Section 1801 et seq., (1975).

<sup>14</sup> 49 CFR Section 100 et seq., (2016).

<sup>15</sup> 22 CCR Division 4.5, "Environmental Health Standards for the Management of Hazardous Waste," 2020, [https://govt.westlaw.com/calregs/Index?transitionType=Default&contextData=\(sc.Default\)](https://govt.westlaw.com/calregs/Index?transitionType=Default&contextData=(sc.Default)).

Injury and Illness Prevention Program (IIPP). An IIPP is an employee safety program for potential workplace hazards, including those associated with hazardous materials.<sup>16</sup>

### **California Highway Patrol and Department of Transportation**

The California Highway Patrol and California Department of Transportation (Caltrans) are the enforcement agencies responsible for hazardous materials transportation regulations. Hazardous materials and waste transporters are responsible for complying with all applicable packaging, labeling, and shipping regulations.<sup>17</sup> The provisions of this section apply to the highway transportation of hazardous materials and hazardous waste and include restrictions on labeling/placards, transportation routes, and other measures to ensure safe transport of regulated materials.

### **Hazardous Waste Control Act**

The Hazardous Waste Control Act was passed in 1972 and established the California Hazardous Waste Control Program within the Department of Health Services. California's hazardous waste regulatory effort became the model for the federal RCRA. California's program, however, was broader and more comprehensive than the federal system, regulating wastes and activities not covered by the federal program. California's Hazardous Waste Control Law<sup>18</sup> was followed by emergency regulations in 1973 that clarified and defined the hazardous waste program, as follows:

- Included definitions of what was a waste and what was hazardous as well as what was necessary for appropriate handling, processing, and disposal of hazardous and extremely hazardous waste in a manner that would protect the public, livestock, and wildlife from hazards to health and safety.
- The early regulations also established a tracking system for the handling and transportation of hazardous waste from the point of waste generation to the point of ultimate disposition, as well as a system of fees to cover the costs of operating the hazardous waste management program.
- Advancing the newly developing awareness of hazardous waste management issues, the program established a technical reference center, for public and private use, dealing with all aspects of hazardous waste management.

### **California Government Code Section 65962.5**

The Hazardous Waste and Substance Sites (Cortese) List is a planning document used by the State, local agencies, and developers to comply with the CEQA requirements in providing information about the location of hazardous materials release sites.<sup>19</sup> Government Code Section 65962.5 requires the California

<sup>16</sup> California Code of Regulations, Title 8 Section 3203, "Injury and Illness Prevention Program," 2020, <https://www.dir.ca.gov/title8/3203.html>.

<sup>17</sup> California Vehicle Code Division 13, Chapter 5, Article 1, Section 31303–31309

<sup>18</sup> Hazardous Waste Control Law, California Health and Safety Code sections 25100 et seq

<sup>19</sup> <https://calepa.ca.gov/sitecleanup/corteselist/>.

Environmental Protection Agency (CalEPA) to develop at least annually an updated Cortese List. The Department of Toxic Substances Control is responsible for a portion of the information contained in the Cortese List. Other State and local government agencies are required to provide additional hazardous material release information for the Cortese List.<sup>20</sup>

CEQA<sup>21</sup> requires the lead agency to consult the lists compiled pursuant to Government Code Section 65962.5 to determine whether a project and any project alternatives are identified on any of the following lists:

- **EPA NPL:** USEPA's National Priorities List (NPL) includes all sites under USEPA's Superfund program, which was established to fund cleanup of contaminated sites that pose risk to human health and the environment.
- **EPA CERCLIS and Archived Sites:** USEPA's Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) includes a list of 15,000 sites nationally identified as hazardous sites. This would also involve a review for archived sites that have been removed from CERCLIS due to No Further Remedial Action Planned (NFRAP) status.
- **EPA RCRIS (RCRA Info):** The Resource Conservation and Recovery Act Information System (RCRIS or RCRA Info) is a national inventory system about hazardous waste handlers. Generators, transporters, handlers, and disposers of hazardous waste are required to provide information for this database.
- **DTSC Cortese List:** DTSC maintains the Cortese list as a planning document for use by the State and local agencies to comply with the CEQA requirements in providing information about the location of hazardous materials release sites. This list includes the Site Mitigation and Brownfields Reuse Program Database (CalSites).
- **DTSC HazNet:** DTSC uses this database to track hazardous waste shipments.
- **SWRCB LUSTIS:** Through the Leaking Underground Storage Tank Information System (LUSTIS), the State Water Resources Control Board (SWRCB) maintains an inventory of USTs and leaking USTs, which tracks unauthorized releases.

The required lists of hazardous material release sites are commonly referred to as the "Cortese List," named after Dominic L. Cortese, the California State Assemblyman who authored the legislation. Because the statute was enacted more than 20 years ago, some of the provisions refer to agency activities that are no longer being implemented and, in some cases, the information required in the Cortese List does not exist. Those requesting a copy of the Cortese Lists are now referred directly to the appropriate information resources contained on internet websites hosted by the boards or departments referenced in the statute, including DTSC's online EnviroStor database and the SWRCB's online GeoTracker database.

<sup>20</sup> California Government Code Section 65962.5

<sup>21</sup> California Public Resources Code Section 21092.6.

Sites that are no longer considered “active” because the SWRCB, a regional board, or the County has determined that no further action is required because actions were taken to adequately remediate the release, or because the release was minor, presents no environmental risk, and no remedial action is necessary, are listed as “closed” and deleted from the list.<sup>22</sup>

#### **Hazardous Materials Business Plan**

Any business that handles, stores, or disposes of a hazardous substance at a given threshold quantity must prepare a hazardous materials business plan (HMBP). HMBPs are intended to minimize hazards to human health and the environment from fires, explosions, or an unplanned release of hazardous substances into air, soil, or surface water. The HMBP must be carried out immediately whenever a fire, explosion, or unplanned chemical release occurs. An HMBP includes three sections: (1) an inventory of hazardous materials, including a site map, which details their location; (2) an emergency response plan; and (3) an employee-training program. HMBPs serve as an aid to employers and employees in managing emergencies at a given facility. They also help better prepare emergency response personnel for handling a wide range of emergencies that might occur at the facility. Effective March 15, 2021, HMBPs are required to be submitted via the California Environmental Reporting System (CERS). The plans must be resubmitted, reviewed, revised, or amended as necessary every three years. The HMBP must also be amended within 30 days whenever there are changes in the amount or location of stored hazardous chemicals on a site. The Los Angeles County Fire Department, Hazardous Materials Division conducts routine inspections at businesses required to submit business plans. The purpose of these inspections is to (1) ensure compliance with existing laws and regulations concerning HMBP requirements, (2) identify existing safety hazards that could cause or contribute to an accidental spill or release, and (3) suggest preventative measures designed to minimize the risk of a spill or release of hazardous materials.<sup>23</sup>

#### **Risk Management Plan**

Any owner or operator of a stationary source (non-transportation) with more than a threshold quantity of a regulated substance is required to prepare a risk management plan. The State statutes and regulations combine federal- and State-program requirements for the prevention of accidental releases of listed substances into the atmosphere: the CalARP program. CalARP requires that a risk management plan include a hazard assessment program, an accidental release prevention program, and an emergency response plan. The risk management plan must be revised every 5 years or as necessary. Typical facilities or businesses that are required to prepare risk management plans include: ammonia refrigeration

<sup>22</sup> California Environmental Protection Agency, Cortese List: Section 65962.5(c), accessed March 2019, available at <https://calepa.ca.gov/sitecleanup/cortese/section-65962-5c/>.

<sup>23</sup> California Health and Safety Code Sections 25500–25520.

facilities, water treatment and wastewater treatment plants that handle chlorine gas, and facilities that store flammable chemicals such as methane and propane.<sup>24</sup>

#### **Titles 14, 22, 23, and 27 of the California Code of Regulations (CCR)**

Title 14 requires that gas storage fields be closely monitored by facility operators to ensure their safe operation and to establish that no damage to health, property, or natural resources occurs.<sup>25</sup> Titles 22 and 23 of the CCR address hazardous materials and wastes. Title 22 defines, categorizes, and lists hazardous materials and wastes including universal wastes.<sup>26</sup> Title 23 addresses public health and safety issues related to hazardous materials and wastes, and specifies disposal options.<sup>27</sup> Title 27 of the CCR addresses landfill closure standards and landfill-related public health and safety issues.<sup>28</sup>

#### **Unified Hazardous Waste and Hazardous Materials Management Regulatory Program**

In 1996, CalEPA adopted the Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program). The Unified Program consolidates and coordinates the six State programs that regulate business and industry use, storage, handling, and disposal of hazardous materials and wastes. The Los Angeles County Fire Department is the Certified Unified Program Agency (CUPA) responsible for administering providing the regulatory oversight for federal, State, and local laws and regulations related to hazardous materials use and disposal within the City. The CUPA protects the public health and the environment from accidental releases and improper handling, storage, transportation, and disposal of hazardous materials and wastes through coordinated efforts of inspections, emergency response, enforcement, and site mitigation oversight. In addition, the Los Angeles County Fire Department Health and Hazardous Materials Division (HHMD) implements the following programs that are relevant to the proposed Project:<sup>29</sup>

- Hazardous Materials Release Response Plans and Inventory Program
- Hazardous Waste Generator Program
- California Accidental Release Prevention (CalARP) Program
- Aboveground Storage Tank Program
- Underground Storage Tank Program

<sup>24</sup> California Health and Safety Code Sections 25531–25543.3.

<sup>25</sup> California Code of Regulations, Title 14, “Natural Resources.”

<sup>26</sup> California Code of Regulations, Title 22, “Social Security.”

<sup>27</sup> California Code of Regulations, Title 23, “Waters.”

<sup>28</sup> California Code of Regulations, Title 27, “Environmental Protection.”

<sup>29</sup> California Senate Bill 1082.

### **California Human Health Screening Levels**

The California Human Health Screening Levels (CHHSLs or “Chisels”)<sup>30</sup> are concentrations of 54 hazardous chemicals in soil or soil gas that CalEPA considers to be below thresholds of concern for risks to human health. The CHHSLs were developed by the Office of Environmental Health Hazard Assessment on behalf of CalEPA. The CHHSLs were developed using standard exposure assumptions and chemical toxicity values published by the EPA and CalEPA. The CHHSLs can be used to screen sites for potential human health concerns where releases of hazardous chemicals to soils have occurred. Under most circumstances, the presence of a chemical in soil, soil gas, or indoor air at concentrations below the corresponding CHHSL can be assumed to not pose a significant health risk to people who may live or work at the site. There are separate CHHSLs for residential and commercial/industrial sites.

### **Senate Bill 1889, Accidental Release Prevention Law/CalARP**

Senate Bill (SB) 1889 required California to implement a new federally mandated program governing the accidental airborne release of chemicals promulgated under Section 112 of the Clean Air Act. Effective January 1, 1997, CalARP replaced the previous California Risk Management and Prevention Program and incorporated the mandatory federal requirements. CalARP addresses facilities that contain specified hazardous materials, known as “regulated substances,” which if involved in an accidental release could result in adverse off-site consequences. CalARP defines regulated substances as chemicals that pose a threat to public health and safety or the environment because they are highly toxic, flammable, or explosive.<sup>31</sup>

### **California Emergency Services Act**

The California Emergency Services Act<sup>32</sup> was adopted to establish the State’s roles and responsibilities during human-made or natural emergencies that result in conditions of disaster and/or extreme peril to life, property, or the resources of the State. This act is intended to protect health and safety by preserving the lives and property of the people of the State.

### **California Code of Regulations, Title 5, Section 14010(d) (Schools and Rail Safety)**

CCR Title 5, Section 14010(d) contains minimum standards for construction of school facilities including consideration of railroad safety when selecting new school sites. CCR Title 5, Section 14010(d) contains standards for school site selection, as it relates to railroad track easements. Specifically, Section 14010(d) provides that if a proposed site is within 1,500 feet of a railroad track easement, a safety study shall be undertaken by a professional trained in assessing cargo manifests, frequency, speed, and schedule of

<sup>30</sup> Health and Safety Code Section 57008.

<sup>31</sup> Health and Safety Code Sections 25531 – 25534.3.

<sup>32</sup> California Public Resources Code Section 8550 – 8669.7.

railroad traffic, grade, curves, type and condition of track need for sound or safety barriers, need for pedestrian and vehicle safeguards at railroad crossings, presence of high-pressure gas lines near the tracks that could rupture in the event of a derailment, preparation of an evacuation plan. It further provides that if required, reasonable mitigation measures must be identified.<sup>33</sup> While these standards only apply to the review and approval of sites for new schools, as discussed above, a rail safety study was prepared for Kelso Elementary School in response to a request from IUSD.

### **State Fire Regulations**

State fire regulations include those concerning building standards (as also set forth in the California Building Code), fire protection and notification systems, fire protection devices such as extinguishers and smoke alarms, high-rise building and childcare facility standards, and fire suppression training. The State fire marshal enforces these regulations and building standards in all State-owned buildings, State-occupied buildings, and State institutions throughout California.<sup>34</sup>

### **California Fire Code (Chapter 33, Fire Safety During Construction and Demolition)**

The California Fire Code, Chapter 33 related to fire safety during construction and demolition prescribes safeguards to provide reasonable safety to life and property from fire during such operations. Specific safeguards related to oil-fired heaters, gas heaters, refueling, smoking, waste disposal, welding, electrical, flammable, and combustible odors, water supply for fire protection, fire extinguishers, etc. Implementation of these safeguards are designed to reduce the potential of fire-related hazards during construction and demolition activities.<sup>35</sup>

### **State Water Resources Control Board**

The SWRCB operates under the authority of CalEPA, with a mission to preserve, enhance, and restore the quality of California’s water resources and drinking water for the protection of the environment, public health, and all beneficial uses, and to ensure proper water resource allocation and efficient use, for the benefit of present and future generations. There are nine regional water quality control boards (RWQCBs) that develop and enforce water quality objectives and implementation plans that will best protect the beneficial uses of the State’s waters. The RWQCBs develop “basin plans” for their hydrologic areas, govern requirements/issue waste discharge permits, take enforcement action against violators, and monitor water quality. The RWQCBs have the authority to require the remediation of sites where groundwater quality may be degraded by hazardous materials or substances releases from USTs or other sources. The proposed Project is within the jurisdiction of the Los Angeles RWQCB (Region 4). The Los Angeles RWQCB

<sup>33</sup> California Code of Regulations, Title 5, “School Facilities Construction,” Section 14010(d).

<sup>34</sup> California Health and Safety Code Section 13000 et seq.

<sup>35</sup> California Fire Code 2019.

#### 4.8 Hazards and Hazardous Materials

issued Order No. R4-2007-0019 which provides General Waste Discharge Requirements (WDRs) relative to the groundwater remediation at petroleum hydrocarbon fuel and/or volatile organic compound (VOC) impacted sites. The Order identifies a list of materials that can be used for in-situ remediation zone treatment purposes.<sup>36</sup>

The State Water Board adopted a Low-Threat Underground Storage Tank Case Closure Policy.<sup>37</sup> The Policy applies to petroleum UST sites subject to Chapter 6.7 of the Health and Safety Code. The Policy establishes both general and media-specific criteria.

Both Regional Water Boards and local agencies have been directed to review all cases in the petroleum UST Cleanup Program using the framework provided in the Policy. This review shall be accomplished within existing budgets and be performed no later than 365 days from the effective date of this Policy. These case reviews shall, at a minimum, include the following for each UST case:

1. Determination of whether or not each UST case meets the criteria in the Policy or is otherwise appropriate for closure based on a site-specific analysis.
2. If the case does not satisfy the criteria in this Policy or does not present a low-risk based upon a site-specific analysis, impediments to closure shall be identified.
3. Each case review shall be made publicly available on the State Water Board's GeoTracker web site

If both the general and applicable media-specific criteria are satisfied, then the leaking UST case is generally considered to present a low threat to human health, safety, and the environment. The Policy recognizes, however, that even if all of the specified criteria in the Policy are met, there may be unique attributes of the case or site-specific conditions that increase the risk associated with the residual petroleum constituents. In these cases, the regulatory agency overseeing corrective action at the site must identify the conditions that make case closure under the Policy inappropriate.

#### **Asbestos-Containing Materials and Lead-Based Paint**

Several regulations and guidelines pertain to abatement of and protection from exposure to asbestos-containing materials (ACM) and lead-based paint (LBP), including Construction Safety Orders 1529 (pertaining to ACM) and Section 1532.1 (pertaining to LBP) from CCR, Title 8, and Part 61, Subpart M, of the Code of Federal Regulations (pertaining to ACM). California Health and Safety Code Section 39650 et seq. provides further regulations on airborne toxic control measures. In California, ACM and LBP abatement must be performed and monitored by contractors with appropriate certification from the

<sup>36</sup> LARWQCB Basin Plan, March 13, 2020, [https://www.waterboards.ca.gov/losangeles/water\\_issues/programs/basin\\_plan/](https://www.waterboards.ca.gov/losangeles/water_issues/programs/basin_plan/).

#### 4.8 Hazards and Hazardous Materials

California Department of Health Services. Asbestos is also regulated as a hazardous air pollutant under the Clean Air Act and a potential worker safety hazard under the authority of Cal/OSHA. Requirements for limiting asbestos emissions from building demolition and renovation are specified in SCAQMD Rule 1403 (Asbestos Emissions from Demolition/Renovation Activities); see below. California Government Code Sections 1529 and 1532.1 provide for exposure limits, exposure monitoring, respiratory protection and good working practice by workers exposed to lead and ACMs.

#### **Other Hazardous Materials**

The removal of hazardous materials, such as PCBs, mercury-containing light ballast, and mold, must be completed in accordance with applicable regulations pursuant to 40 CFR 761 (PCBs), 40 CFR 273 (mercury-containing light ballast), and 29 CFR 1926 (molds) by workers with the hazardous waste operations and emergency response (HAZWOPER) training, as outlined in 29 CFR 1910.120 and 8 CCR 5192.

#### **4.8.3.3 Regional and Local**

##### **South Coast Air Quality Management District**

Remediation of contamination has the potential to expose workers to hazardous emissions. The South Coast Air Quality Management District (SCAQMD) regulates emissions from soil remediation activities through Rule 1166, Volatile Organic Compound Emissions from Decontamination of Soil. This rule requires development and approval of a mitigation plan, monitoring of VOC concentrations, and implementation of the mitigation plan if VOC-contaminated soil is detected.<sup>38</sup>

SCAQMD Rule 1403 specifies work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of ACM. The rule's requirements for demolition and renovation activities include asbestos surveying, notification, ACM removal procedures and time schedules, ACM handling and cleanup procedures, and storage, disposal, and landfilling requirements for asbestos-containing waste materials (ACWM).<sup>39</sup>

##### **Regional Water Quality Control Board**

USTs are regulated under Subtitle I of RCRA and its implementing regulations, which establish construction standards for new UST installations, as well as standards for upgrading existing USTs and associated piping. After 1998, all nonconforming tanks were required to be either upgraded or closed.

<sup>38</sup> Rule 1166 – Volatile Organic Compound Emissions from Decontamination of Soil, AQMD, 2001, <http://www.aqmd.gov/docs/default-source/rule-book/reg-xi/rule-1166.pdf>.

<sup>39</sup> Rule 1403 – Asbestos Emissions from Demolition/Renovations Activities, AQMD, 2007, <http://www.aqmd.gov/docs/default-source/rule-book/reg-xiv/rule-1403.pdf>.

#### 4.8 Hazards and Hazardous Materials

The storage of hazardous materials in USTs is regulated by CalEPA's SWRCB, which has delegated authority to each of the nine RWQCBs and, typically on the local level, to the local fire department. The State's UST Program regulations include, among others, permitting USTs, installation of leak detection systems and/or monitoring of USTs for leakage, UST closure requirements, release reporting/corrective action, and enforcement. The State's Site Cleanup Program (SCP)<sup>40</sup> regulates and oversees the investigation and cleanup of unauthorized discharges of pollutants and pollution-impaired sites not overseen by the UST Program.<sup>41</sup> The primary goal of the SCP is to direct and provide oversight of site investigation and cleanup activities that will result in restoration and/or protection of water quality, human health, and the environment.

#### **Los Angeles County Fire Department**

At the local level, the County of Los Angeles Fire Department (LACoFD) monitors the storage of hazardous materials in the City for compliance with local requirements. Specifically, businesses and facilities which store more than threshold quantities of hazardous materials are required to file an Accidental Risk Prevention Program with the LACoFD. This program includes information such as emergency contacts, phone numbers, facility information, chemical inventory, and hazardous materials handling and storage locations. The LACoFD also has delegated authority to administer and enforce Federal and State laws and local ordinances for USTs. Plans for the construction/installation, modification, upgrade, and removal of USTs are reviewed by LACoFD Inspectors.<sup>42</sup>

The LACoFD administers and enforces federal and State laws and local ordinances for USTs in the City of Inglewood. Plans for the construction/installation, modification, upgrade, and removal of USTs are reviewed by LACoFD Inspectors.

#### **City of Inglewood General Plan**

The City's General Plan, Safety Element outlines the following relevant measures as means to minimize the dangerous aspects of hazardous materials:<sup>43</sup>

- Enforcement of the State law that requires businesses involved with hazardous materials to disclose the quantities of hazardous materials, their locations, their disposal, and a management plan designed to decrease risks to the public.
- Private businesses and government agencies must continue to update and prepare the proper emergency responses in the event of a spill or explosion.

<sup>40</sup> 42 USC Section 6901 et seq.

<sup>41</sup> 42 USC Section 6901 et seq.

<sup>42</sup> California Health and Safety Code, Chapter 6.95.

<sup>43</sup> *City of Inglewood* General Plan, "Safety Element" (1995).

#### 4.8 Hazards and Hazardous Materials

- The City must have continuous coordination among its staff to ensure that hazardous material operations are located in zones and facilities that are appropriate and safe for such use.
- The City must ensure that these uses are located safe distances from residences, schools, hospitals, large assemblages of people, etc.
- The City must inform the public of the potential perils that accompany hazardous material sites. Public awareness as acquired through public education programs will enable the citizenry to learn to protect themselves by observing and implementing safety procedures during a spill or explosion.

The City's General Plan, Safety Element identifies evacuation routes that assume worst-case displacement and surface rupture from a seismic event. Within the City, Florence Avenue, La Brea Avenue, Crenshaw Boulevard, and Imperial Highway are identified as designated evacuation routes. In addition, the Safety Element of the General Plan identifies emergency corridors that can be most readily opened immediately following a seismic event. These include Inglewood Avenue, La Brea Avenue/Hawthorne Boulevard, Prairie Avenue, Crenshaw Boulevard, La Cienega Boulevard, Van Ness Avenue, West Boulevard, Florence Avenue, Manchester Boulevard, Century Boulevard, Imperial Highway, and Centinela Avenue.

#### **City of Inglewood Multi-Hazard Mitigation Plan and Emergency Operation Plan**

The City of Inglewood Multi-Hazard Mitigation Plan (MHMP) was developed to reduce or eliminate long-term risk to human life and property from both natural and man-made hazards.<sup>44</sup> The plan includes a list of mitigation measures to be implemented in order to meet identified goals and objectives related to emergency readiness and hazard reduction. In addition, the City prepared an Emergency Response Plan to comply with the California Standardized Emergency Management System and the Federal Emergency Management Agency (FEMA) National Incident Management System. The plan includes information on the Emergency Operations Organization, the roles, and responsibilities of each City division, and includes operational checklists to guide response actions. The City's Multi-Hazard Mitigation plan was adopted on August 18, 2009, with a 5-year planning horizon. The City is currently undergoing the development of a revised and updated plan.

The City's Office of Emergency Services (OES) acts in coordination with all City departments to maximize the City's potential to prevent, prepare for, respond to, and recover from both natural and man-made emergencies and disasters. The 2010 MHMP generally provides a means to prepare and maintain systems, supplies and other logistical items to support emergency/disaster response and recovery among City departments. According to the MHMP, "all future development/redevelopment projects will be

<sup>44</sup> *City of Inglewood*, Multi-Hazard Mitigation Plan, March 23, 2010.

4.8 Hazards and Hazardous Materials

constructed to current design standards and building codes and are not expected contribute to community vulnerability from natural or technological hazards.”<sup>45</sup> The overall goals of the plan are to:

- Minimize the loss of life and property from natural hazard events
- Protect public health and safety
- Increase public awareness of risk from natural hazards
- Enhance emergency services including warning systems

**City of Inglewood Municipal Code**

The Inglewood Municipal Code adopts the Los Angeles County Fire Code as the Fire Code of the City.<sup>46</sup> Additionally, the Municipal Code designates the LACoFD as the administering agency for the hazardous material inventory and emergency response program within the City, including the provisions of the California Hazardous Materials Release Response Plans and Inventory Law and other hazardous materials related regulations.<sup>47</sup> These sections of the Municipal Code set forth requirements to ensure fire safety of new and reconstructed buildings within Inglewood.

**4.8.4 EXISTING CONDITIONS**

**Sensitive Receptors**

The proposed Project alignment is located along North Market Street, West Manchester Boulevard, and South Prairie Avenue, which are zoned for transit oriented development, including commercial and residential development, and mixed use. Surrounding uses are mainly commercial, although there are some sensitive land uses, including residences, schools, and childcare facilities. Schools and daycare facilities within one-quarter mile (1,320 feet) of the proposed alignment of the ATS system are identified below:

**Table 4.8-1  
School and Daycare Facilities Near the Project**

Name	Address	Distance (ft.)	Direction
A Bright Beginning Child Development Center	712 Manchester Blvd	25	South

**Properties Listed on Government Databases**

A review of local, State, and federal government-maintained databases for properties within one mile of the proposed Project alignment that release and/or have released hazardous materials was conducted by Environmental Database Resources, Inc. (EDR). The EDR report did not include listings of areas of the proposed Project within the existing public right-of-way. However, properties listed that are within the proposed Project alignment—i.e., those that would require full or partial acquisition and/or an easement (see **Table 3.0-5: Anticipated Project Acquisitions**)—are as follows:

**Table 4.8-2  
Properties Within Proposed Project Alignment Listed on  
Government Databases for Hazardous Materials**

Addresses	Government Databases <sup>1</sup>

**Underground Storage Tanks**

Soils and groundwater in the City have the potential to be contaminated due to historical spills and leaking USTs. A UST is defined by law as "any one or combination of tanks, including pipes connected thereto, that is used for the storage of hazardous substances and that is substantially or totally beneath the surface of the ground" (certain exceptions apply).<sup>48</sup> There are nine known Leaking Underground Storage Tanks

48 California State Water Resources Control Board, Division of Water Quality, "Underground Storage Tank Program," accessed March 2019, available at <https://www.waterboards.ca.gov/ust/>.

#### 4.8 Hazards and Hazardous Materials

(LUSTs) within 500 feet of the proposed Project identified by the State Water Resources Control Board.<sup>49</sup> These locations are listed as follows and are arranged by proximity to each guideway segment:

##### Market Street Segment

- **317 E. Florence Avenue** (Los Angeles County Metropolitan Transportation Authority [Metro]); RWQCB Case Number R-60173 involved potential contamination of gasoline in soil; remediation completed, and case closed as of January 13, 2017; and
- **230 N. La Brea Avenue** (Fujita Corporation); RWQCB Case Number R-37884 involved potential contamination of gasoline; case closed as of September 10, 2003.

##### Manchester Boulevard Segment

- **501 E. Manchester Boulevard** (Simon's Mini Market); RWQCB Case Number I-13094 involved potential contamination of gasoline in drinking water aquifer; remediation completed, and case closed as of November 1, 2006;
- **501 E. Manchester Boulevard** (Simon's Mini Market); Los Angeles County Department of Public Works case number 009805-013094; remediation completed, and case closed as of January 9, 2014;
- **500 E. Manchester Boulevard** (former Sears Auto Center); RWQCB Case Number I-09429 involved potential contamination of gasoline in soil; remediation completed, and case closed as of July 19, 1996;
- **3900 W. Manchester Boulevard** (the Forum); RWQCB Case Number R-09447 involved potential contamination of gasoline in soil; remediation completed, and case closed as of February 23, 1998;
- **3900 W. Manchester Boulevard** (the Forum); RWQCB Case Number R-09447A involved potential contamination of gasoline, methyl tertiary-butyl ether (MTBE)/tert-Butyl alcohol (TBA)/other fuel oxygenates, and tetrachloroethylene (PCE) in drinking water aquifer; remediation completed, and case closed as of July 15, 2013; and
- **145 E. Manchester Boulevard** (UNOCAL #1923); RWQCB Case Number I-09888; leaking tank closed and case closed as of October 7, 1993.

##### Prairie Avenue Segment

- **600 S. Prairie Avenue** (former Airport Park Hotel); RWQCB Case Number R-63615 involved potential contamination of gasoline in soil; remediation completed, and case closed as of April 10, 2018.

<sup>49</sup> California State Water Resources Control Board, GeoTracker, accessed September 2021, available at <https://geotracker.waterboards.ca.gov/>.

#### 4.8 Hazards and Hazardous Materials

All identified LUST cases have been remediated and closed at the time of this analysis. Per the California DTSC, there are no other contaminated, State agency-monitored properties in the vicinity of the proposed Project.<sup>50</sup>

Further, the SWRQCB identifies a number of registered USTs within 500 feet of the proposed Project guideway segments, listed as follows:<sup>51</sup>

##### Market Street Segment

- **317 E. Florence Avenue** (Metro), LACoFD facility ID not available; and
- **111 N. Locust Street** (Senior Center Site), LACoFD facility ID not available.

##### Manchester Boulevard Segment

- **145 E. Manchester Boulevard** (Wowsj Mart), LACoFD facility ID LACoFA0017377;
- **338 E. Manchester Street** (Retail Boutique), LACoFD facility ID not available;
- **450 E. Manchester Boulevard** (Bruno's Burgers), Statewide Environmental Evaluation and Planning System (SWEEPS) UST S106923602;
- **501 E. Manchester Boulevard** (G&M Oil Co #193), LACoFD facility ID LACoFA001738; and
- **510 E. Manchester Boulevard** (Vons Fuel Center #2502), LACoFD facility ID LACoFA0033888.

##### Prairie Avenue Segment

- **601 S. Prairie Avenue** (Miles Mini Mart), LACoFD facility ID LACoFA0021214;
- **600 S. Prairie Avenue** (Pincay 60-Acre Property [Hollywood Park property]), LACoFD facility ID not available; and
- **1050 S. Prairie Avenue** (Hollywood Park Racetrack), LACoFD facility ID LACoFA0021198.

Three of these registered USTs are located within the footprint of the proposed Project: The Metro K Line at 317 E. Florence Avenue, Vons Fuel Center at 510 E. Manchester Boulevard, and the Hollywood Park (LASED) property at 600 S. Prairie Avenue.

The Vons Fuel Center #2502 at 510 E. Manchester Boulevard (facility ID LACoFA0033888) is proposed for removal as part of the proposed Project. The portion of the Vons property containing the gas station is proposed for use as a surface parking area for the new Vons replacement store. As part of the demolition process for the proposed Project, this UST facility would be closed and removed from the site. The site

<sup>50</sup> California Department of Toxic Substances Control, EnviroStor, accessed March 2019, available at <https://www.envirostor.dtsc.ca.gov/public/>.

<sup>51</sup> California State Water Resources Control Board, GeoTracker, accessed September 2021, available at <https://geotracker.waterboards.ca.gov/>.

would be remediated for any contamination in accordance with the appropriate regulatory requirements pursuant to UST closure and any additional regulatory requirements; closure requirements and approval would be sought from the jurisdiction having authority included the LARWQCB.

### Historical Oil and Gas Extraction Activities

The City is located within the southern portion of a large oil field that includes Baldwin Hills to the northwest of the Project. The oil deposits in this oil field have been explored and actively extracted for nearly a century.<sup>52</sup> Records indicate a substantial number of abandoned, plugged, or idle oil and gas and dry hole wells in the City.<sup>53,54</sup> The Potrero Oil Field traverses much of the northern and eastern portions of the City, including portions of the proposed Project including the Market Street Segment and Manchester Boulevard Segment of the guideway.<sup>55</sup> Contaminants frequently associated with oil and gas activities include crude oil, refined petroleum products, drilling mud, metals, PCBs, pesticides and volatile organic compound (VOCs) impacts in soil and soil vapor. Potential sources for these contaminants include oil wells, well cellars, pumps, pipes, sumps, storage tanks, separators, transformers, and application of petroleum products/crude oil (likely containing PCBs and pesticides) for dust/weed control. As commonly found near oil and gas fields, the subsurface conditions in the vicinity of the proposed Project may also include naturally occurring methane and hydrogen sulfide gas.<sup>56</sup>

While the City is entirely urbanized and largely precluded from future oil exploration and drilling, a number of historical oil and gas exploration and drilling activities have occurred in the vicinity of the proposed Project. These locations are listed as follows, according to their unique American Petroleum Institute (API) well number and Project guideway segment:

#### Manchester Boulevard Segment

- **API 0403713694**; oil and gas well located within the Potrero Oil Field on the southeastern side of Spruce Avenue, approximately 90 southeast of the proposed MSF site across Spruce Avenue and 150 feet southwest of the Spruce Avenue and Manchester Boulevard intersection; plugged and abandoned

52 City of Inglewood, General Plan Update Technical Background Report, August 2006.

53 Dry hole wells are oil, water, or gas wells which are determined not to be commercially profitable.

54 California Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR), Well Statewide Tracking and Reporting System (WellSTAR) database, interactive map, accessed March 2019, available at <https://maps.conservation.ca.gov/doggr/wellfinder/#openModal/-118.94276/37.10257/6>.

55 California Department of Conservation, DOGGR, WellSTAR, interactive map, accessed March 2019, available at <https://maps.conservation.ca.gov/doggr/wellfinder/#openModal/-118.94276/37.10257/6>.

56 *Hazardous Material Assessment*, Geosyntec Consultants, July 3, 2018.

to the satisfaction of the California Department of Natural Resources, Division of Oil and Gas (now DOGGR) as of March 5, 1930.<sup>57,58</sup>

#### Prairie Avenue Segment

- **API 0403705654**; dry hole well located on the southern side of Nutwood Street, approximately 150 feet west of Prairie Avenue; plugged and abandoned to the satisfaction of the California Department of Natural Resources, Division of Oil and Gas (now DOGGR) as of March 19, 1930.<sup>59,60</sup>

No previously identified oil and gas or dry hole wells are located within the footprint of the proposed Project guideway, stations, or parcels that would be used for support facilities.

#### Aged Buildings

In urbanized areas such as those in the vicinity of the proposed Project, risk from hazards and hazardous materials are associated with historical land uses involving the use of hazardous materials for building construction (lead and asbestos) or for operation for uses such as auto repair shops, medical offices, dry cleaners, and photo processing centers. Many of the existing buildings in the area were constructed from the 1920s through the 1980s. Based on their age, these older buildings may contain asbestos, LBPs and potentially toxic finishes, molds, and/or PCBs that could be released during demolition or renovation activities. Typical hazardous materials of concern for existing older structures include the following:

- **Asbestos** is a mineral fiber that is carcinogenic and harmful to respiratory health and is considered both a hazardous air pollutant and a human health hazard. Because of its fiber strength and heat resistance, it was widely used prior to the 1980s in California in a variety of building construction materials for insulation, fire-retardation, and friction and heat-resistant products, such as ducting insulation, wallboard, shingles, ceiling tiles, floor tiles, insulation, plaster, and floor backing. Thus, buildings constructed prior to 1980 could contain ACM. The risk to human health is from inhalation of airborne asbestos, which commonly occurs when ACM are disturbed during activities such as demolition and renovation. Due to the age of the buildings within the area, it is likely that ACM are present.
- **Lead** is a recognized harmful environmental pollutant exposed through air, drinking water, food, soils, paint, and dust. Lead was widely used in paint, gasoline, water pipes, and many other products prior to 1977 when the U.S. Consumer Product Safety Commission banned the use of lead-based paint.

57 California Department of Conservation, DOGGR, WellSTAR, Well Details for API # 03713694, accessed March 2019, available at <https://secure.conservation.ca.gov/WellSearch/Details?api=03713694#main-content>.

58 California Department of Natural Resources, Division of Oil and Gas (now DOGGR), WellSTAR, Well Record for API #03713694, accessed March 2019, available at [https://secure.conservation.ca.gov/WellRecord/037/03713694/03713694\\_2018-02-27\\_DATA.pdf](https://secure.conservation.ca.gov/WellRecord/037/03713694/03713694_2018-02-27_DATA.pdf).

59 California Department of Conservation, DOGGR, WellSTAR, Well Details for API # 03705654, accessed March 2019, available at <https://secure.conservation.ca.gov/WellSearch/Details?api=03705654>.

60 California Department of Natural Resources, Division of Oil and Gas (now DOGGR), WellSTAR, Well Record for API # 03705654, accessed March 2019, available at [https://secure.conservation.ca.gov/WellRecord/037/03705654/03705654\\_2018-02-09\\_DATA.pdf](https://secure.conservation.ca.gov/WellRecord/037/03705654/03705654_2018-02-09_DATA.pdf).

Common methods of paint removal, such as sanding, scraping, and burning, create dust and the potential for lead to be absorbed into the body and pose a potential health risk. Since many of the structures located within the area were built prior to the federal regulations banning the use of LBPs, it is likely to exist in structures constructed prior to 1977.

- **Polychlorinated Biphenyls (PCBs)** are synthetic chemicals that were manufactured for use in various industrial and commercial applications—including oil in electrical and hydraulic equipment, and plasticizers in paints, plastics, and rubber products—because of their nonflammability, chemical stability, high boiling point, and electrical insulation properties. When released into the environment, PCBs persist for many years, accumulate and concentrate in organisms. The USEPA has classified PCBs as probable human carcinogens. In 1979, USEPA banned the use of PCBs in new electrical equipment and began a program to phase out PCB-containing equipment. Thus, older industrial areas in the vicinity of the proposed Project could contain PCBs.

#### 4.8.5 ADJUSTED BASELINE

This section assumes the Adjusted Baseline Environmental Setting as described in **Section 4.0: Environmental Impact Analysis, 4.0.5: Adjusted Baseline**. Related to hazards and hazardous materials, the changes associated with the Adjusted Baseline projects include excavation and construction activities within the HPSP area and the establishment of new uses.

For the purposes of the hazards and hazardous materials analysis, the Adjusted Baseline includes projects that will be constructed immediately northeast of the intersection of West Century Boulevard and South Prairie Avenue which are expected to include the use, storage, and disposal of hazardous materials. Construction of these improvements will not likely have any direct effect on the hazards and hazardous materials associated with the proposed Project, as the improvements being constructed would be expected to have only site-specific hazard issues.

As described in the SMP for the HPSP project and the Adjusted Baseline projects, following completion of construction, none of the sites for related projects included in the Adjusted Baseline will contain contaminants of potential concern that are above the criteria set in the SMP. Remediation has or will occur during grading and site preparation activities. The regulatory oversight required for these types of remediation activities would be required prior to completion of construction and would require that no potential for off-site migration could adversely affect the proposed Project. Also, the Adjusted Baseline projects will not be associated with substantive routine emissions of hazardous materials or wastes and any incidents such as accidental and upset conditions would likely be isolated and localized events. Therefore, while the number of hazardous materials being transported, stored, handled, and disposed of with these new land uses will increase, they would not substantively alter the environmental setting a beyond that existing under current existing conditions.

#### 4.8.6 THRESHOLDS OF SIGNIFICANCE

Criteria outlined in the CEQA Guidelines were used to determine Project impacts related to hazards and hazardous materials. As discussed in *Section 4.8.1*, three screening criteria related to hazards and hazardous materials of Appendix G of the CEQA Guidelines were not carried through for further analysis in this EIR. The Project would result in a significant impact if it would:

- Threshold HAZ-1: Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.**
- Threshold HAZ-2: Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.**
- Threshold HAZ-3: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.**

#### 4.8.7 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

The project includes ITC Design Guidelines (Design Guidelines) and Construction Commitment Program (CCP) as described in **Section 3.0: Project Description**. The CCP addresses temporary effects during construction of the Project. The Design Guidelines describe the design features of the proposed Project.

##### 4.8.7.1 Project Design Features

The Project includes the following features that limit potential exposure of hazards and hazardous materials during construction and operation of the proposed Project alignment and that manages the Project's construction activities that can interfere with emergency access:

##### PDF HAZ-1 Hazardous Materials Program

The following practices will be followed during construction to address the potential for encountering hazardous materials during construction of the Project.

- **Building Demolition Plan** – Prior to any demolition occurring, conduct an evaluation of all buildings built prior to 1980 to be demolished to identify the presence of asbestos containing materials (ACMs) and lead-based paint (LBP). Remediation shall be implemented in accordance with the recommendations of these evaluations to ensure that no ACMs or LBP remain present and to ensure ACMs and LBP are removed to levels established for public safety.
- **Hazardous Materials Contingency Plan** – Prior to construction, prepare a plan addressing the potential for discovery of unidentified underground storage tanks (USTs), hazardous materials, petroleum

#### 4.8 Hazards and Hazardous Materials

hydrocarbons, or hazardous or solid wastes encountered during construction. This Plan shall address UST decommissioning, field screening and materials testing methods, contaminant management requirements, and health and safety requirements to ensure no exposure to hazards or hazardous materials occurs on site and to ensure any materials encountered during construction are removed to levels established for public safety.

- **Soil Management Plan** – After final construction plans are prepared showing the lateral and vertical extent of soil excavation during construction are prepared, prepare a Soil Management Plan to establish soil reuse criteria, define a sampling plan for stockpiled materials, describe the disposition of materials that do not satisfy the reuse criteria, and specify guidelines for imported materials.
- **Health and Safety Plan** – Prior to construction, prepare a Health and Safety Plan to address the potential for exposure to any constituents of concern that may be encountered during construction.

#### PDF TRANS-2 Construction Staging & Traffic Control Program

A Construction Staging and Traffic Control Program will be developed by members of the Project Task Force (as defined in the Construction Commitment Program), subject to review and acceptance by the City and/or the JPA, and will address the following topics:

- Coordination with other public infrastructure projects within the City's boundaries.
- Detour routes, including analysis of impacts to pedestrian, business, bicycle, and traffic flow.
- Coordination of closures and restricted access during the construction period with special attention during periods of expected heavy traffic from events scheduled at SoFi Stadium and other venues in the Los Angeles Sports and Entertainment District at Hollywood Park, the Forum, and the Inglewood Basketball and Entertainment Center.
- Coordination with the City, police, and fire services department regarding maintenance of emergency access and response times.
- Monitoring and coordination of construction materials deliveries.
- Notification to businesses and residents on upcoming construction activities including but not limited to the establishment of a website with project construction information, signage, and web-based media.

The Traffic Control Program will be updated as needed based on the following principals:

- Minimize traffic impacts on residential streets.
- Establish minimum traffic lane requirements for Manchester Boulevard, Florence Avenue, and Prairie Avenue during construction such that at least the full number of traffic lanes in the peak direction, and if feasible, one traffic lane in the off-peak direction is available, with additional capacity provided through appropriate detour routes. The directional traffic lanes may be reversible to maintain the peak directional capacity in either direction as necessitated by traffic demands. For all other streets

#### 4.8 Hazards and Hazardous Materials

potentially affected by construction, maintain at least one lane of traffic in each direction unless otherwise approved by the City.

- Maintain access to and from all alleys at one or both ends of the alley when possible. If an alley is obstructed such that a turnaround by any vehicle is not feasible, traffic flaggers shall be provided to control access to/from the alley.
- Maintain access for all public safety vehicles (such as police, fire, and emergency response).
- Maintain bicycle and pedestrian access within the Project area or approved detours at all times.
- Provide adequate street access to City service vehicles, including but not limited to trash pickup and street sweeping service vehicles, during planned service times.
- Sidewalk closures should be avoided to the degree feasible and are permitted only when approved by the City. Accessible detours shall be provided if sidewalk closures are necessary.
- Use traffic control officers/flaggers as appropriate to minimize the degree and duration of impacts and maintain safety.
- Establish and maintain wayfinding signage.
- Maintain vehicular and pedestrian access to all businesses and residents impacted by construction activities including roadway closures.
- Hold quarterly community outreach meetings with businesses and residents to provide updates on temporary, full, or partial street closures necessary for construction. Website will be updated 45 to 60 days prior to planned dates of any street closures.
- All closures, full or partial, are subject to City review and approval which shall consider measures to minimize the degree and duration of street and lane closures.

#### PDF TRANS-3 Preliminary Haul and Overload Routes

- Haul routes and overload/oversized vehicle routes are subject to review and approval by the City.
- To the extent possible, truck deliveries and hauling of bulk materials such as aggregate, bulk cement, dirt, etc. to the Project area, and hauling of material from the Project area, shall be scheduled during off-peak hours to avoid the peak commuter traffic periods on designated haul routes.
- Truck deliveries and hauling of dirt, aggregate, bulk cement, and all other materials and equipment, shall be on designated routes only (freeways and nonresidential streets).

#### PDF TRANS-4 Pedestrian Access Program

A Pedestrian Access Program will be developed by members of the Project Task Force (as defined in the Construction Commitment Program), subject to review and acceptance by the City and/or the JPA, and will adhere to the following principles:

#### 4.8 Hazards and Hazardous Materials

- Pedestrian access to buildings shall be maintained at all times.
- Maintain all crosswalks to the extent feasible. Whenever a crosswalk is removed from service, establish, and maintain temporary accessible replacement crosswalks as close as practicable to the original crosswalk locations unless the City determines that a replacement crosswalk is not necessary to maintain an adequate level of service. Replacement crosswalks shall be identified and controlled by wayfinding signs approved by the City.
- Establish and maintain pedestrian wayfinding signage.
- Maintain sidewalk access for pedestrians, including providing temporary sidewalks if existing sidewalks are disrupted during construction. Any sidewalk closures are subject to review and approval by the City.
- Sidewalks that are being maintained in a temporary condition shall meet all applicable safety standards, including but not limited to the requirements of the Federal Americans with Disabilities Act and similar California laws for sidewalks being maintained in a temporary condition.
- Protect pedestrians from construction-related debris, dust, and noise; such protection may include the use of dedicated pedestrian barriers.
- Coordinate with the Inglewood Unified School District and the City to provide crossing guards at locations requested by IUSD or the City when crosswalks or sidewalks are closed. Identify temporary alternate routes to school, working closely with IUSD and the City, and disseminate this information to schools and stakeholders affected by construction.

#### PDF AQ-1 Construction Air Quality Program

At a minimum, use equipment that meets the U.S. Environmental Protection Agency (USEPA)'s Final Tier 4 emissions standards for off-road diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity, unless it can be demonstrated to the City Planning Division with substantial evidence that such equipment is not available. To ensure that Final Tier 4 construction equipment or better shall be used during the proposed Project's construction, the City shall include this requirement in applicable bid documents, purchase orders, and contracts. The City shall also require periodic reporting and provision of written construction documents by construction contractor(s) and conduct regular inspections to the maximum extent feasible to ensure and enforce compliance.

Such equipment will be outfitted with Best Available Control Technology devices including a California Air Resources Board (CARB)-certified Level 3 Diesel Particulate Filters (DPF). Level 3 DPF are capable of achieving at least 85 percent reduction in particulate matter emissions. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by Final Tier 4 emissions standards for a similarly sized engine, as defined by the CARB's regulations. Successful contractors must demonstrate the ability to supply the compliant construction equipment for use prior to any ground disturbing and construction activities. The proposed Project representative will make available to the lead agency and Southern California Air Quality Management District (SCAQMD) a comprehensive

#### 4.8 Hazards and Hazardous Materials

inventory of all off-road construction equipment, equal to or greater than 50 horsepower that will be used during construction. The inventory will include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each unit's certified tier specification, best available control technology (BACT) documentation, and CARB or SCAQMD operating permit shall be maintained on site at the time of mobilization for each applicable piece of construction equipment.

If any of the following circumstances listed below exist and the Contractor provides written documentation consistent with project contract requirements, the Contractor shall submit an Alternative Compliance Plan that identifies operational changes or other strategies that can reduce a comparable level of NOx emissions as Tier 4-certified engines during construction activities.

- Equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts shall be electric or alternative-fueled (i.e., nondiesel). Pole power shall be utilized to the maximum extent feasible in lieu of generators. If stationary construction equipment, such as diesel-powered generators, must be operated continuously, such equipment must be Final Tier 4 construction equipment or better and located at least 100 feet from air quality sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
- At a minimum, require that construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export with a gross vehicle weight rating of at least 14,001 pounds), or best commercially available equipment that meet CARB's 2010 engine emissions standards at 0.01 g/hp-hour of particulate matter and 0.20 g/hp-hour of NOx emissions or newer, cleaner trucks.
- Require the use of electric or alternatively fueled (e.g., natural gas) sweepers with high-efficiency particulate air (HEPA) filters.
- All roadways, driveways, sidewalks, etc., being installed as part of the Project should be completed as soon as practicable; in addition, building pads should be laid as soon as practicable after grading.
- To the extent feasible, allow construction employees to commute during off-peak hours.
- Make access available for on-site lunch trucks during construction, as feasible, to minimize off-site construction employee vehicle trips.
- Every effort shall be made to utilize grid-based electric power at any construction site, where feasible.
- Contractors shall maintain and operate construction equipment to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.
- Require in all applicable bid documents, purchase orders, and contracts of the requirement to notify all construction vendors, contractors, and/or haul truck operators that vehicle and construction equipment idling time will be limited to no longer than five minutes, consistent with the CARB's policy.

**Impact HAZ-1: Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?**

#### Construction

Construction of the proposed Project would entail demolition, excavation, and grading activities which would disturb the existing physical landscape. As described in *Section 4.8.4: Existing Conditions*, areas near the proposed Project have been identified to contain former and current commercial operations and historic oil and gas exploration and production activities. Additionally, construction activities would involve the use of materials—including fuels, paints, oils, transmission fluids, solvents, and other acidic and alkaline solutions—that require special handling, transport, and disposal. These materials would be transported to and from the proposed Project for use during construction activities. The improper handling and transport of the materials could result in the accidental release of hazardous materials, thereby potentially exposing the public or the environment to hazardous materials.

#### Transportation of Construction Materials

As discussed in *Section 4.8.3.1*, the transport of hazardous materials is regulated by USDOT and Caltrans.<sup>61</sup> The transport regulations ensure safe transport of the regulated materials by addressing how hazardous materials are labeled, identifying approved transport routes, and including provisions that restrict containment during highway transportation of hazardous materials and wastes. Furthermore, the City has established “Designated Truck Routes.”<sup>62</sup> As shown in **Figure 4.12-4: Construction Haul/Delivery Routes and Staging Areas**, the primary delivery routes for the proposed Project include Florence Avenue, Manchester Boulevard, Prairie Avenue, and Century Boulevard. The Project would implement **PDF TRANS-3**, which requires construction vehicles to use designated truck routes during off-peak hours. Therefore, compliance with existing regulations and implementation of project features would reduce potential impacts related to the transportation of hazards and hazardous materials to less than significant.

#### Construction Materials

Common construction materials such as fuels, paints, cleaners, solvents, and welding materials would be used during construction. In general, aside from refueling needs for heavy equipment, the hazardous materials typically used on a construction site would be brought onto the site by the construction contractor, packaged in consumer quantities, and used in accordance with manufacturer recommendations. The overall quantities of these materials on the construction site at any one time would not result in large bulk amounts that, if spilled, could cause significant soil or groundwater contamination.

<sup>61</sup> Inglewood Municipal Code. Chapter 3 – Motor vehicles and traffic, Article 3 – Truck Route regulations.

<sup>62</sup> Inglewood Municipal Code. Chapter 3 – Motor vehicles and traffic, Article 3 – Truck Route regulations.

If a spill of hazardous materials on the construction sites were to occur, the spilled materials would be localized because of the relatively small quantities involved and it would be cleaned up in a timely manner in accordance with best management practices (BMPs) as specified in the contaminated soil contingency plan (**PDF HAZ-1**). Additionally, as the proposed Project would disturb more than an acre of land, it would be required to implement requirements of the NPDES General Construction Permit, including BMPs implemented as part of a Stormwater Pollution Prevention Plan (SWPPP). The BMPs would address the safe handling of hazardous materials. In the unlikely event of an inadvertent spill, response measures would contain the hazardous materials. The use of construction BMPs would minimize the potential adverse effects from accidental release of hazardous materials or wastes. These BMPs could include, but are not necessarily limited to, the following:

- Establishment of a dedicated area for fuel storage and refueling activities that includes secondary containment protection measures and spill control supplies;
- Requirements to follow manufacturer’s recommendations on use, storage and disposal of chemical products used in construction;
- Avoidance of overtopping construction equipment fuel gas tanks;
- Proper containment and removal of grease and oils during routine maintenance of construction equipment; or
- Proper disposal of discarded containers of fuels and other chemicals.

As described above, refueling activities of heavy equipment would be conducted in a dedicated and controlled area. Secondary containment and protective barriers would also be implemented to minimize potential hazards that might occur. Given the required protective measures (i.e., BMPs) and the quantities of hazardous materials typical for construction, as well as implementation of **PDF HAZ-1**, the potential of exposure of hazardous materials to construction workers, the public, or contamination to soil and/or groundwater would be reduced to acceptable standards, and potential impacts related to construction materials would be less than significant.

#### Pre-1980 Structures and Improvements

Construction of the proposed Project would involve the demolition of existing buildings at the commercial center at the northeast corner of Market Street and Regent Avenue, 150 S. Market Street, the retail commercial buildings at 500 E. Manchester Boulevard and 923 and 1035 S. Prairie Avenue. Due to their age, some of these buildings may have the potential to release hazardous materials, such as ACMs, LBP, and other potentially hazardous building materials, including PCBs, mercury, or chlorofluorocarbons found in fluorescent lighting and electrical switches. The release of these hazardous materials into the

environment may expose construction workers and members of the public in the vicinity of the demolition activities to hazardous materials.

Preparation and implementation of the Building Demolition Plan as described in **PDF HAZ-1** would include an evaluation of all buildings to be demolished prior to demolition activities. The Building Demolition Plan would gauge the likelihood and levels of possible ACMs, LBP, PCBs, and other hazardous materials that could be encountered and would identify the approach to remove and dispose of the materials in compliance with applicable rules and regulations, including SCAQMD Rule 1403<sup>63</sup> and Cal/OSHA regulations regarding LBP, ACMs, PCBs, mercury, or chlorofluorocarbons, as listed above in *Section 4.8.3: Regulatory Framework*.

SCAQMD Rule 1403 specifies work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of ACM.<sup>64</sup> The rule's requirements for demolition and renovation activities include asbestos surveying, notification, ACM removal procedures and time schedules, ACM handling and cleanup procedures, and storage, disposal, and landfilling requirements for ACWM. Under the Lead Renovation, Repair, and Painting Rule, contractors who renovate or partially demolish pre-1978 residential buildings must be lead-safe certified by USEPA and use lead-safe practices. Lead abatement activities are regulated by the USEPA; lead abatement companies are governed by the USEPA and the USEPA requires individuals and firms that conduct lead-based paint activities, including abatement, to be licensed.

Implementation of the Building Demolition Plan (**PDF HAZ-1**) and compliance with relevant federal, state, and local regulations and requirements for identified hazardous materials would reduce potentially significant impacts related to exposing hazards to the public or the environment.

#### **Underground Tanks and Soil Hazards**

Construction of the proposed Project would involve excavation, loading, and transportation of soils and USTs that may contain hazardous materials. As shown in **Table 4.8-2** and further discussed below, the proposed improvements would be developed on properties listed on Government databases for hazardous materials.

#### **Market Street/Florence Avenue Station**

This proposed station would be located on the even number addresses of 200—270 N. Market Street and 300—330 E. Florence Avenue. The property is currently developed with a strip mall and surface parking.

<sup>63</sup> Rule 1403 – Asbestos Emissions from Demolition/Renovations Activities, AQMD, 2007, <http://www.aqmd.gov/docs/default-source/rule-book/reg-xiv/rule-1403.pdf>.

<sup>64</sup> Rule 1403 – Asbestos Emissions from Demolition/Renovations Activities, AQMD, 2007, <http://www.aqmd.gov/docs/default-source/rule-book/reg-xiv/rule-1403.pdf>.

Current and historic uses at the property have required permits for the use of various chemicals, including petroleum hydrocarbons, dry-cleaning solvents to alkaline and acidic solutions, other inorganic solid waste, pharmaceutical waste, ignitable waste, chromium, mercury, selenium, m-cresol, nicotine, 2-propanone, acetone, cyclohexane, lindane, selenium sulfide, and other organic chemicals. **PDF HAZ-1** requires preparation of a Soil Management Plan, which will determine whether there are recognized environmental conditions on the property caused by the current and historic uses of hazardous materials at the property and if there is possible presence of contaminated soil. If required, the Soil Management Plan will require implementation of a Contaminated Soil Contingency Plan that will include procedures for segregation, sampling, and chemical analysis of the soil. Contaminated soil will be profiled for disposal and will be transported to an appropriate waste or recycling facility licensed to accept and treat the type of waste indicated by the profiling process. Compliance with the Soil Management Plan, Contaminated Soil Contingency Plan, and Health and Safety Plan (**PDF HAZ-1**) will ensure that potential exposure of hazardous materials to construction worker and the public are limited and that their removal is consistent with existing regulations enforced by the Cal-OSHA, DTSC, RWQCB, SCAQMD, and LACoFD.

Additionally, the landing leg of the proposed elevated passenger walkway for the Market Street/Florence Avenue station, on the north side of Florence Avenue would be developed on property with the addresses of 317 and 333 E. Florence Avenue. Both addresses are associated with USTs, including two LUST cases (RWQCB Case Number R-60173 and RWQCB Case Number R-37884) that have been closed. According to the SWRQCB, the 317 E. Florence address, which is the Metro K Line Downtown Inglewood Station, also operate one UST. Although this UST is unlikely to be within the footprint of the development area of the proposed elevated passenger walkway, the Soil Management Plan and Hazardous Materials Contingency Plan (**PDF HAZ-1**) will determine this possibility and include recommendations for its safe removal and/or relocation, if needed and in accordance with applicable regulations and guidelines to ensure that potential exposure of hazards to the construction workers, the public, and environment is limited.

#### **Maintenance and Storage Facility**

The proposed MSF would be constructed on property associated with the 500 and 510 E. Manchester Boulevard addresses. The property is currently developed with a grocery store, gas station, and surface parking. The property contains at least one UST (facility ID LACoFA0033888) related to operations of the gas station; it is also associated with a previous LUST (RWQCB Case Number I-09429), which was closed by RWQCB on July 19, 1996. All USTs on this property would be decommissioned and removed as part of the proposed Project and would be addressed in the Hazardous Materials Contingency Plan and Health and Safety Plan (**PDF HAZ-1**). Closure of the gas station and removal of the USTs, related piping, and/or dispensers would be subject to the requirements of LACoFD and RWQCB. Any potential contamination would be remediated in accordance with the appropriate regulatory requirements, including conditions directed on the Closure Permit as well as meet the requirements of California Health and Safety Code

#### 4.8 Hazards and Hazardous Materials

Section 25298, Underground Storage of Hazardous Substances, California Code of Regulations Title 23, Sections 2670 through 2672, Underground Storage Tank Closure Requirements, and the Los Angeles County Department of Public Works, Environmental Programs Division, Underground Storage Tank Program: Closure.<sup>65</sup> Therefore, construction of the proposed MSF would not result in an accidental release of hazardous materials into the environment.

##### **Prairie Avenue Guideway and Roadway Improvements**

Towards the Prairie Avenue/Hardy Street Station—on the west side of Prairie Avenue—the proposed guideway would be constructed on and over private property, including 923 S. Prairie Avenue, which is followed by a CalEPA database for the storage of chemicals, related to the operation of a T-Mobile cell tower. No violations have been identified on this property. Nevertheless, the Soil Management Plan (**PDF HAZ-1**) will identify potential concerns, including the potential removal of the cell phone tower and chemicals, if required, as a part of the proposed Project.

The proposed expansion of the Prairie Avenue right-of-way, between Manchester Boulevard and Hardy Street would encroach onto 3900 W. Manchester Boulevard and 600 S. Prairie Avenue, which are listed on government databases for USTs containing gasoline, MTBE, and other fuels. With recent developments in this area (i.e., the Forum and SoFi Stadium and Entertainment District), any potential hazards identified have likely been removed and/or remediated. The Soil Management Plan and Health and Safety Plan (**PDF HAZ-1**) will determine the extent of hazardous soils, if any, and ensure that any potential exposure of the hazards from soil disturbance to construction workers, the public, and environment would be limited.

##### **Prairie Avenue/Hardy Street Station**

The property proposed for the Prairie Avenue/Hardy Street Station is currently developed with a strip mall and surface parking. Addresses associated with this property include the odd numbers of 1035—1051 S. Prairie Avenue. One of the addresses is associated with dry cleaning solvents. Implementation of **PDF HAZ-1**, which requires preparation of the Soil Management Plan, Contaminated Soil Contingency Plan, if warranted, and Health and Safety Plan will determine the extent of potential hazardous soils and their remediation/removal if necessary. Compliance with **PDF HAZ-1** will ensure that soil disturbance would be compliant with government regulations and reduce the potential exposure of hazards to construction workers, the public, and environment.

##### **Properties Adjacent to the Proposed Inglewood Transit Connector Project**

As listed in **Table 4.8-3**, numerous properties adjacent and near the proposed Project alignment have been identified on Government databases for hazardous materials. Depending on the current and historic uses

<sup>65</sup> Los Angeles County Department of Public Works, Environmental Programs Division, *Underground Storage Tank Program: Closure*, accessed June 30, 2020, <https://pw.lacounty.gov/epd/UST/closure.cfm>.

#### 4.8 Hazards and Hazardous Materials

of the hazardous materials and operations at these properties, environmental conditions at these properties may exist and affect the soils that would be disturbed by Project implementation. The Soil Management Plan and Health and Safety Plan that would be prepared under **PDF HAZ-1** for each phase of the proposed Project will consider the adjoining properties' potentially hazardous soil conditions. If required, a contaminated soil contingency plan will be implemented to ensure the safe handling and removal of hazardous soils and to limit environmental exposure to construction workers and the public.

##### **Summary of Impacts**

Construction of the proposed Project would not result in the accidental or inadvertent release of hazardous materials into the environment. The proposed Project includes the CCP, which is implemented as a project design feature (**PDF HAZ-1**) that requires the preparation and implementation of Building Demolition Plans, Hazardous Materials Contingency Plans, Soil Management Plans, and Health and Safety Plans that will outline hazards and hazardous materials within the Project area and identify how they are to be handled, removed, remediated, transported, and/or disposed of in a safe manner that would comply with applicable regulations, guidelines, and BMPs. Accordingly, potential exposure of hazards and hazardous materials to construction workers, the public, and the environment would be reduced to acceptable standards, and reasonably foreseeable upsets and accident conditions involving hazards and hazardous materials during construction would be less than significant.

##### **Operation**

Operation of the proposed Project would require the storage and handling of various types of regulated chemicals that are considered hazardous:

- **Cleaning and Building Maintenance Supplies.** Maintenance of each of the three stations and the MSF would require use and storage of janitorial cleaning supplies, paints and thinners, and pesticides for landscaping.
- **Train and Vehicle Fleet Maintenance Supplies.** The MSF would use and store chemicals for the purpose of maintaining Automated Transit System (ATS) trains and vehicle fleet. These may include fuel, solvents, oil, lubricants, transmission fluid, coolants, and absorbents.
- **Power Distribution System (PDS) Substations and Backup Power Generators.** The MSF and Prairie Avenue/Hardy Street Station would each operate a PDS substation and power generator. Various chemicals would be used and stored, including but not limited to dielectric fluid, transformer oil, insulating oils, sulfuric acid, and sulfur hexafluoride in order to insulate and cool electrical conductors and operate the PDS substations. Diesel fuel would also be stored for the operation of the power generators.

The use and storage of these chemicals have the potential to be released into the environment if they are not properly handled and stored in accordance with the manufacturers' instructions and applicable

#### 4.8 Hazards and Hazardous Materials

federal, State, and local regulations, including those set forth by the federal- and Cal-OSHA, DTSC, as well as a facility-specific Hazardous Materials Business Plan (HMBP) that would be prepared for the proposed Inglewood Transit Connector project, administered by the LACoFD. The HMBP would address hazards related to the operations of the proposed Project, such as fires, explosions, or an unplanned release of hazardous substances into air, soil, or surface water.

The HMBPs would inventory the hazardous materials used and stored at each of the three stations and MSF and include an emergency response plan, including spill response measures to ensure that in the event that a release occurs, protocols would be implemented to contain and control the release in a manner that is protective of human health and the environment. The LACoFD would be required to review plans and ensure that hazardous substances used for the proposed Project are properly stored and the accident response plan is in place. The LACoFD would be responsible for inspecting and monitoring the use and storage of the hazardous materials. Material safety data sheets would be obtained from chemical manufacturers and made available to employees. Chemical containers would be required to be properly labeled. The proposed Project would be required to develop and maintain a written hazard communication program and develop and implement programs to train employees about hazardous materials.

Project operations may require the transportation of hazardous materials to and from stations and the MSF. The transport of these materials is regulated by the USDOT and Caltrans, which together determine driver-training requirements, load labeling procedures, and container specifications designed to minimize the risk of accidental release.

Compliance with federal, State, and local laws and regulations relating to transport, storage, disposal, and handling of hazardous materials during Project operations would reduce the potential for accidental release or upset of hazards and hazardous materials in the environment reduce potential health risks. Therefore, operational impacts are less than significant.

#### Summary of Impacts

Operation of the proposed Project would require the use and storage of various types of hazardous materials at the proposed stations and MSF site. If not handled and stored in accordance with the manufacturers' instructions and applicable federal, State, and local regulations, the use and storage of the hazardous materials would have the potential to be released into the environment. The proposed Project would comply with federal- and Cal-OSHA, DTSC, the project's HMBP, administered by the LACoFD, as well as USDOT and Caltrans transportation requirements for hazardous materials. Accordingly, risks related to the use and storage of hazardous materials would be reduced to acceptable standards, and operational impacts would be less than significant.

#### 4.8 Hazards and Hazardous Materials

#### Mitigation Measures

##### Construction

No mitigation is required.

##### Operation

No mitigation is required.

#### Level of Significance after Mitigation

Impacts would be less than significant.

**Impact HAZ-2: Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?**

Section 4.8.4 lists schools and childcare facilities within one-quarter mile (1,320 feet) of the proposed Project alignment.

#### Construction

As discussed in **Impact HAZ-1**, construction of the proposed Project would involve the use, handling, transport, and disposal of hazardous materials that if improperly handled could result in an accidental release and potential exposure of hazards to the public, including schools adjacent to the proposed ATS system and along designated truck routes.

#### Handling of Construction Materials

Hazardous materials used at construction sites include fuels, paints, oils, transmission fluids, solvents, acidic and alkaline solutions, and welding materials. The materials would be brought onto the site by the construction contractor, packaged in consumer quantities, and used in accordance with manufacturer recommendations. The quantities of the materials at any one time would not result in large bulk amounts that, if spilled, would cause significant contamination or exposure to the public and schools. An accidental spill would be localized and contained due to the relatively small quantities involved and cleaned up in a timely manner, required by existing regulations, including OSHA. Removal procedures would be detailed in the contaminated soil contingency plan that is required for all construction activities and incorporated in the proposed Project as **PDF HAZ-1, Hazardous Materials Program**. Construction best management practices, included in the proposed Project's Stormwater Pollution Prevention Plan, would limit pollutants entering to the stormwater as well as exposure of potential hazards and hazardous materials to the public, including schools. Given the required protective measures, limited quantities of hazardous materials used

at any one time at the construction site, and implementation of PDF HAZ-1, potential impacts related to the exposure of hazardous materials at nearby schools would be less than significant.

#### **Transportation of Construction Materials**

Construction materials would be transported along designated truck routes approved by the City (**PDF TRANS-3**). The routes would be along freeways and major thoroughfares, including Florence Avenue, Manchester Boulevard, Prairie Avenue, and Century Boulevard and would avoid residential streets. There are, however, existing schools along these routes. The transportation of hazardous materials is regulated by the Hazardous Materials Transportation Act, which is administered by the USDOT and Caltrans.<sup>66</sup> All truck drivers carrying hazardous materials to and from the construction sites—including materials for construction of the proposed ATS system and demolished existing building materials, underground improvements, and any contaminated soils—are required to have a commercial driver license with a hazardous materials (HazMat) endorsement; the HazMat endorsement allows truck drivers to transport hazardous material legally. Truck drivers would be trained for safety and to become familiar with hazardous materials requirements and complying with applicable packaging, labeling, and shipping regulations.<sup>67</sup> **PDF TRANS-3** also requires truck deliveries and the hauling of bulk construction-related materials to and from the Project area to be scheduled during off-peak hours. The morning peak hour would coincide with morning drop-off activities at schools. Accordingly, potential impacts related to the transportation of hazardous materials and school operations would be further limited with **PDF TRANS-3**. **PDF TRANS-4** would further minimize pedestrian exposure to hazardous materials by maintaining safe routes to schools. **PDF TRANS-4** requires the maintenance of safe and accessible sidewalks and crosswalks during construction and installation of wayfinding signs to ensure adequate levels of service of City-maintained pedestrian facilities. It also requires dedicated pedestrian barriers to protect pedestrians from construction-related debris, dust, and noise, and the use of crossing guards to address pedestrian safety and potential hazards related to construction activities. Therefore, compliance with existing regulations and the implementation of **PDF TRANS-3** and **PDF TRANS-4** would reduce potential impacts related to the transportation of construction and hazardous materials near schools to less than significant.

#### **Construction Emissions**

**Air Emissions.** Project construction would generate potentially hazardous air emissions. Air quality impacts are analyzed in **Section 4.2: Air Quality**. Specifically, a Health Risk Assessment was conducted to determine if Toxic Air Contaminants (TAC) from Project construction would significantly contribute to cancer risk at sensitive receptors within one-quarter mile, including schools and daycare centers. As discussed under **Impact AQ-3**, the HRA found that the proposed Project's construction-related emissions

<sup>66</sup> 49 USC Section 1801 et seq., (1975).

<sup>67</sup> California Vehicle Code Division 13, Chapter 5, Article 1, Section 31303–31309

with mitigation (i.e., **PDF AQ-1**) would reduce health risks caused by off-road construction equipment to acceptable standards, and impacts are less than significant. Implementation of **PDF AQ-1** would mitigate regional air quality impacts and health risks at the sensitive receptors, including schools, to less than significant. **PDF AQ-1** requires construction equipment to meet Tier 4 emissions standards. Tier 4 compliant engines significantly reduce emissions of particulate matter (PM) and oxides of nitrogen (NOx) to near zero levels.<sup>68</sup> Construction equipment must also be outfitted with the best available control technology, including Level 3 diesel particulate filters, which further reduces particulate matter emissions by at least 85 percent. **PDF AQ-1** requires construction equipment and vehicles to be nondiesel and/or at a minimum meet CARB's 2010 engine emissions standards (0.01 g/hp-hour of particulate matter and 0.20 g/hp-hour of NOx emissions). Sweepers must have high-efficiency particulate air (HEPA) filters installed. To the extent feasible, equipment will be pole powered in lieu of generators. Additionally, if stationary equipment cannot be enclosed within acoustical barriers, the equipment must be muffled and, whenever possible, located at least 100 feet from sensitive land uses, including schools. Stationary construction equipment, such as diesel- that must be operated continuously must be placed at least 100 feet from air quality sensitive land uses, such as schools and daycare facilities, whenever possible. As demonstrated in **Tables 4.2-21** and **4.2-22**, the combined use of mitigating project features of **PDF AQ-1** reduces potentially significant health risks and impacts caused by construction emissions to less-than-significant levels.

**Noise and Vibration.** Construction activities would generate noise and vibration that could affect schools proximate to the proposed ATS system and along truck routes. Noise and vibration impacts are analyzed in **Section 4.10: Noise and Vibration**. **Impact NOI-1** includes noise modeling and impact analysis conducted at sensitive receptors near the proposed ATS system. Kelso Elementary School and a daycare facility, which are closest to the Project, are identified as receptors. The modeling conducted showed that construction noise levels at both sites would not exceed established thresholds, and impacts would be less than significant. Construction traffic noise was also assessed. As discussed in **Impact NOI-1**, delivery of construction materials would occur mainly during the night shift; therefore, construction traffic noise would have no impact on school operations.

Potential vibration impacts on buildings and human annoyance is discussed in **Impact NOI-2**. As documented in **Table 4.10-25**, heavy construction equipment would not damage school buildings, which would create a hazardous condition. However, due to the close proximity of the construction area, as shown in **Table 4.10-26** (listed as Site 3), pile driving activities could create vibration levels considered to be an annoyance at Kelso Elementary School. **PDF NOISE-1**, Construction Noise Control Plan, and **PDF NOISE-2**, Construction Vibration Reduction Plan, would require coordination with Inglewood Unified

<sup>68</sup> US EPA. Regulations for Emissions from Heavy Equipment with Compression-Ignition (Diesel) Engines. Site Accessed 2021, September 29. <https://www.epa.gov/regulations-emissions-vehicles-and-engines/regulations-emissions-heavy-equipment-compression>

#### 4.8 Hazards and Hazardous Materials

School District administrators to minimize disruptive noise and vibration effects, and limit the location of pile driving to 310 feet of off-site vibration sensitive receptors, such as Kelso Elementary School. Compliance with **PDF NOISE-1** and **PDF NOISE-2** would reduce potential health hazards related to short-term construction noise and vibration effects at nearby schools to acceptable standards; impacts would be less than significant.

#### **Summary of Construction Impacts**

With compliance with applicable local, State, and federal regulations governing the transport, handling, and disposal of hazardous materials and the implementation of the proposed Project's CCP, Project construction impacts related to the handling of hazardous materials and release of emissions at schools located within one-quarter mile of the proposed Project would be less than significant.

#### **Operation**

##### **Hazardous Materials**

As discussed in **Impact HAZ-1**, the operation and maintenance of the proposed ATS guideway, stations, MSF, PDS substations, and emergency generators would require the storage and handling of chemicals that have the potential to be released into the environment.

- The stations would include use of materials typical to a commercial setting such as cleaning solutions, solvents, pesticides for landscaping, and painting supplies. Compliance with federal, State, and local laws and regulations relating to transport, storage, disposal, and handling of hazardous materials would minimize any potential for accidental release or upset of hazardous materials during station operation. Additionally, the proposed Project would comply with planning and emergency response regulations pertaining to the presence of such materials during operation.
- Operations of the MSF and Prairie Avenue/Hardy Street Station would be subject to the requirements of programs administered by the LACoFD for storage of all hazardous materials on site, including diesel fuel for the emergency generators, which would be required to adhere to a facility-specific HMBP.
- The MSF would require the use of equipment, tools, and materials for maintenance activities; these may also require the use of various materials and substances that would be considered hazardous. The PDS substations at the MSF and Prairie Avenue/Hardy Street Station would use and store bulk quantities of hazardous materials—such as fuel, solvents, oil, transmission fluid, paints, and other chemicals—that would have the potential to be released into the environment if not properly handled and stored. The proposed Project would comply with existing regulations governing the storage and handling of such chemicals, and applicable regulations to responding to accidental release of such chemicals.

#### 4.8 Hazards and Hazardous Materials

Therefore, the potential exposure of hazardous materials to the environment and sensitive receptors, including nearby schools, would be reduced to acceptable standards, and impacts would be less than significant.

##### **Hazardous Emissions**

Air emissions that would be generated by operation of the proposed ATS System are analyzed in **Section 4.2**. In general, the proposed Project would have an overall beneficial effect on regional and local air quality. The Project would result in a significant reduction in vehicle emissions. Coupled with the removal of several existing land uses that generate emissions, the proposed Project would result in net negative emissions. Furthermore, the ATS trains and guideway would be powered by electricity, which would not generate emissions associated with fuel combustion. Therefore, Project operations would not result in the generation of hazardous air emissions that would impact schools.

##### **Rail Safety Hazards**

Title 5 California Code of Regulations Section 14010(d) requires the preparation of a Rail Safety Study (RSS) when a proposed new school site is within 1,500 feet of an existing railroad track easement. Although not applicable to the proposed Project, at the request of the IUSD, the City prepared an RSS for the potential derailment of the proposed 1.6-mile elevated ATS trains. For analytical purposes, the RSS uses Kelso Elementary School as the primary site as it is nearest to the proposed Project alignment; potential impacts to other schools would be less as they are farther away.

A quantitative probability (annual frequency) of a derailment accident was determined for the ATS trains using the portion of the ITC Guideway within 1,500 feet of Kelso Elementary School. The determination of the likelihood of derailment is based on a comparison of the ATS train travel characteristics with the characteristics of similar systems in the Federal Railroad Association (FRA) railroad accident statistics.

The probabilities of a train accident and a train derailment are computed considering the following findings:

- The trains would operate on a single main line track.
- The trains will run on an elevated guideway, which eliminates potential conflicts with pedestrian and vehicular traffic that could affect students traveling to and from schools.
- The frequency of ATS trains and speed (maximum up to 50 mph) are similar to other transit lines operated by Metro in the region.
- The ATS trains would be strictly used for transporting passengers; there will not be any other cargo.
- The ATS trains would not transport hazardous materials, such as fuel, as it would be electrically powered.

#### 4.8 Hazards and Hazardous Materials

Accordingly, the probability of an accident for each train mile in one direction is 1.44E-04 (or 0.000144) or 2.88E-04 (or 0.000288) in both directions, which is extremely low. The annual probability of the occurrence of a train derailment within 1,500 feet of Kelso Elementary School and during school operating hours (7 AM to 4 PM) was determined to be roughly zero (0.00E+0.0). Therefore, potential risk related to derailment of the proposed ATS trains is less than significant. (Additional discussion on safety and security programs for fixed guideway transit systems is provided below in the Operations discussion of **Impact HAZ-3**.)

#### Summary of Operational Impacts

**Hazardous Materials.** The proposed Project would comply with federal, State, and local laws and regulations relating to the transport, storage, disposal, and handling of hazardous materials during Project construction and operation. The use and storage of hazardous materials would comply with a project-specific HMBP, which would be administered by LACoFD. Therefore, potential impacts cause by hazardous materials at schools within one-quarter mile would be less than significant.

**Hazardous Emissions.** The Project would generate construction emissions; however, the emissions would not significantly contribute to health risks or acute impacts at nearby schools. Furthermore, mitigation measures required to reduce the Project's regional air quality impacts would also reduce localized air quality impacts, including at school sites. With the reduction of vehicle trips in the Project vicinity, removal of commercial uses for development of the proposed stations, and the operation of the proposed electric powered ATS, the proposed Project would result in an overall beneficial reduction of toxic emissions within a quarter mile of the proposed Project, including at school sites. Therefore, impacts related to hazardous emissions is less than significant.

**Rail Safety Operations.** An RSS was prepared for Kelso Elementary School, as it is the closest school to the proposed guideway. The RSS determined that the likelihood of a train accident in one direction is 1.44E-04 (or 0.000144) or 2.88E-04 (or 0.000288) in both directions. The annual probability of a derailment for the ATS railcars is roughly zero (0.00E+0.0) during school hours.

#### Mitigation Measures

##### Construction

No mitigation is required.

##### Operation

No mitigation is required.

#### 4.8 Hazards and Hazardous Materials

#### Level of Significance after Mitigation

Impacts would be less than significant.

#### Impact HAZ-3: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

As described in *Section 4.8.3.3*, the proposed Project would be constructed in accordance with current design standards and building codes, which is consistent with the MHMP. Implementation of these standards and codes would minimize the loss of life and property from natural hazard events and protect public health and safety. The proposed Project would not interfere or impair with the City's ability to increase public awareness or make any improvements to emergency services and warning systems.

#### Construction

The proposed Project is located largely within public rights-of-way. For this reason, construction activities may cause the temporary closure of travel lanes, roadways segments, and sidewalks along the elevated guideway and stations within the street rights-of-way.

The City of Inglewood Public Works Department, Transportation Division operates and maintains the following:

- ITS traffic management center and intersection monitoring cameras
- Traffic signals and stop signs
- Intersection design and roadway alignments
- Public parking structures and lots
- Parking meters
- Parking permit districts
- Crosswalks and roadway striping
- Street lighting
- Street and traffic signs
- Street closures and barricades

The City Department of Public Works Engineering Division is responsible for issuing permits related to street closures for construction activities including Encroachment and Excavation Permits. An encroachment or excavation permit is required for all construction work within or related to the use of any public street right-of way.

### Temporary Closures of Roadways and Sidewalks

Construction of the proposed stations, parking lots, and MSF would mainly occur within the properties affected. Perimeter improvements at these facilities, such as new driveways and sidewalk improvements, may require the temporary closure of lanes and sidewalks adjacent to the improvement area. Construction of the proposed ATS guideway and Prairie Avenue roadway shift would predominantly occur within the rights-of-way and as discussed in *Section 3.7: Construction*, would result in temporary street and/or lane closures. The closure of streets would be confined to the construction phase of the proposed Project and as required by **PDF TRANS-2**, Construction Staging and Traffic Control Program, would typically occur during off-peak hours. Closures would be temporary in nature and would not last the entirety of the Project construction phase. However, the phased construction duration of the proposed Project would be approximately four years, which could adversely affect the existing emergency access routes and services.

Specifically, the proposed Project could restrict access to streets that are designated as evacuation routes in the Safety Element of the City's General Plan, including Florence Avenue, Prairie Avenue and Manchester Boulevard. Street closures would interfere with emergency response or evacuation plans involving the use of these streets, even though the closures would be conducted in accordance with the City's permitting process. Adjacent collector/local streets on either side of Florence Avenue, Prairie Avenue and Manchester Boulevard could be used during street or lane closures.

The CCP will require all potential street and/or lane closures during construction to be reviewed and approved by the City and shall include measures to minimize the degree and duration of the closures.

The Construction Staging and Traffic Control Plan would include detour routes and would require coordination with the City, police, and fire services department regarding maintenance of emergency access and response times.

Preparation and implementation of the Construction Staging and Traffic Control Plan would ensure that adequate access or appropriate detour routes are provided along Florence Avenue, Prairie Avenue, and Market Street. Impacts would be less than significant.

### Operation

The proposed Project would not interfere or impair with the City's ability to increase public awareness or make any improvements to emergency services and warning systems during operations.

### ATS Guideway

The proposed Project would operate in conformance with established safety requirements. The American Society of Civil Engineers (ASCE) Standard 21, Part 1 – Automated People Mover Standards<sup>69</sup> which addresses safety and performance requirements that apply to proposed Project. ASCE published a safety and security standard that included requirements that address federal and State regulations for independent safety oversight agencies. Safety and security programs should also adhere to ASCE 21, Part 4 (ASCE 21.4-08) – Automated People Mover Standards—Part 4: Security Emergency Preparedness System Verification and Demonstration Operations, Maintenance, and Training Operational Monitoring.<sup>70</sup>

Safety oversight of fixed guideway transit systems is required at the State government level under the Federal Transit Administration, Part 659, Rail Fixed Guideway Systems – State Safety Oversight requirements when there is a similar transit system operating within the State.<sup>71</sup> The proposed Project's safety and security programs would be subject to the requirements the of CPUC and State Safety Oversight of Fixed Guideway Transit Systems. In addition, the operation of the proposed Project would be required to adhere to all State and local safety requirements including those of the City's fire and police departments. With adherence to the federal, State, and local safety requirements, the proposed Project would not conflict with the requirements of an emergency response plan or emergency evacuation plan.

### Roadway Reconfiguration and Restriping

Roadway configuration and striping for the proposed Project are shown in **Figures 3.0-10 to 3.0-24: Striping Plans**, and **Figures 3.0-25 to 3.0-32: Cross-sections**. Proposed improvements would be designed consistent with standards established in the City's Circulation Element.<sup>72</sup> The City's Department of Public Works, Transportation Division would review and approve the final roadway configuration and restriping improvements.<sup>73</sup> Therefore, operation of the reconfigured and restriped roadways would not interfere with adopted emergency response plan or emergency evacuation and this impact is less than significant.

**Mitigation Measures**

**Construction**

No mitigation is required.

**Operation**

No mitigation is required.

**Level of Significance after Mitigation**

**Construction**

Impacts would be less than significant.

**Operation**

Impacts would be less than significant.

**4.8.8 CUMULATIVE IMPACTS**

Hazardous materials and hazard impacts are generally localized to specific sites and do not combine with one another in a way to create a greater or more severe hazard. Because of the relative infrequencies and the variances in timing, the geographic scope for cumulative hazards and hazardous materials impacts varies based on the hazard and the significance threshold being analyzed. Impacts relative to hazardous materials usually depend on the nature and extent of the hazardous materials release, and existing and future soil and groundwater conditions. Hazardous materials incidents tend to be limited to a smaller more localized area surrounding the immediate location and extent of a release and could only be cumulative if two or more hazardous material releases overlapped spatially and contemporaneously.

The timeframe during which the proposed Project could contribute to cumulative hazards and hazardous materials effects includes the construction and operations phases. Similar to the geographic limitations discussed previously, it should be noted that impacts relative to hazardous materials are generally time-specific. Hazardous material events could only be cumulative if two or more hazardous material releases occurred at overlapping times.

As discussed in **Section 3.0: Project Description**, the City is considering building a parking structure on the City’s Inglewood Transit Facility (ITF) site located on the southeast corner of Prairie Avenue and Arbor Vitae Street. This parking structure would provide additional public parking near event venues in the LASED and for the IBEC. The ITF site is currently improved as a surface parking lot and bus transit facility. This potential parking structure would provide up to 2,500 parking spaces in a six-level building. Although this proposed

parking facility is not proposed as part of the Project, it is considered a related project for the purposes of assessing potential cumulative impacts.

The 2009 EIR for the Hollywood Park Specific Plan (HPSP) project evaluated the impacts of developing the City’s four-acre ITF site with respect to potential hazardous materials and risk of upset. As described in the 2009 EIR, the City’s ITF has undergone numerous site assessment evaluations over the past two decades; those which are relevant to the proposed Project are shown in **Table 4.8-4: ITF Site-Specific Investigations**. A summary of the investigative history associated with the City’s Civic Center site is provided below.

**Table 4.8-4  
ITF Site-Specific Investigations**

Investigation	Prepared By	Date
Phase I Environmental Site Assessment and Limited Compliance Assessment	ENVIRON International Corporation	April 11, 2005
Soil Management Plan	Erlar & Kalinowski, Inc.	July 3, 2007
Technical Report and Work Plan	Erlar & Kalinowski, Inc.	April 24, 2008
Field Portable X-Ray Fluorescence Spectrometry for In-Situ Screening of Arsenic in Soil	Erlar & Kalinowski, Inc.	February 26, 2015

Source: City of Inglewood, Final Environmental Impact Report for the Hollywood Park Redevelopment Project, June 3, 2009.

A Soil Management Plan (SMP) summarizing prior screening-level subsurface investigations was prepared in July 2007 and submitted and approved by the RWQCB, to address localized areas found to contain or suspected to contain chemicals of potential concern (COPCs) on the Hollywood Park property including the City’s Civic Center site where the proposed Project may locate a PDS substation either above or below grade. The SMP includes soil and soil gas COPCs criteria and soil management and construction risk management protocols to be implemented during planned redevelopment of the property, including soil reuse and waste disposal classification protocols.

Soil sampling revealed arsenic in shallow soil at the ITF site. All shallow arsenic-contaminated soil has been removed from the City’s Civic Center site as of the summer of 2020. The remaining soil on the site is below the Property-specific Soil Criteria (PSC) requirement and removal is deemed complete; no further action is recommended. The RWQCB required no further action, and the site was developed by the City with as a surface parking lot and bus transfer facility.

The proposed Project in conjunction with other cumulative projects would include the use, storage, and disposal of varying quantities of hazardous materials. The proposed Project does not include any substantive emissions of hazardous materials that would be associated with industrial land uses (e.g., manufacturing, chemical processing, handling of bulk quantities of hazardous materials or wastes). Just as

*4.8 Hazards and Hazardous Materials*

with the proposed Project, all commercial uses/businesses would be required to submit business information and hazardous materials inventory forms to the LACoFD and/or appropriate jurisdiction having responsibility, such as the California Environmental Reporting System. All hazardous materials are required to be stored and handled according to the manufacturer's instructions and local, State, and federal regulations. With adherence to existing regulatory requirements, releases from routine transport, use, or disposal of hazardous materials would be minimized, and in the unlikely event of a release, would be localized in extent.

As discussed previously, adherence to the regulatory requirements would ensure that incidents at the proposed Project and other cumulative projects are infrequent, and thus unlikely to occur simultaneously in a way that could result in the public or environment being exposed to multiple releases of hazardous materials. For the aforementioned reasons, the proposed Project, in conjunction with other cumulative projects, would not create a significant cumulative hazard impact to the public or the environment through the routine transport, use, or disposal of hazardous materials.

A cumulative impact related to transport, use, or disposal of hazardous materials could occur if there were hazards releases in the vicinity and at the same time as a release associated with the construction or operation of the proposed Project. For the purposes of this analysis, the geographic scope considered for analysis of this criterion is a 1-mile-radius area from the proposed Project. A 1-mile radius is reasonable in light of the relatively small amounts and types of hazardous materials that would be associated with construction and operation of the proposed Project.

The proposed Project in conjunction with other cumulative projects would include the use, storage, and disposal of varying quantities of hazardous materials. The proposed Project does not include any substantive emissions of hazardous materials such as might be associated with industrial land uses (e.g., manufacturing, chemical processing, handling of bulk quantities of hazardous materials or wastes). Just as with the proposed Project, all commercial uses/businesses would be required to submit business information and hazardous materials inventory forms contained in a Hazardous Materials Management Plan and Hazardous Materials Business Plan. The LACoFD, as the CUPA, and other CUPA agencies for the cumulative projects outside of LACoFD's jurisdiction, requires all new commercial and other users to follow applicable regulations and guidelines regarding storage and handling of hazardous waste. All hazardous materials are required to be stored and handled according to manufacturer's directions and local, State, and federal regulations. With adherence to existing regulatory requirements, releases from routine transport, use or disposal of hazardous materials would be minimized, and in the unlikely event of a release, would likely be localized in extent.

*4.8 Hazards and Hazardous Materials*

As noted above, adherence to the regulatory requirements would ensure that incidents at the proposed Project and other cumulative projects within a 1-mile radius are infrequent, and thus unlikely to occur simultaneously in a way that could result in the public or environment being exposed to multiple releases of hazardous materials. For the reasons described above, the proposed Project, in conjunction with other cumulative projects, would not create a cumulatively significant hazard impact to the public or the environment through the routine transport, use, or disposal of hazardous materials. Therefore, this cumulative impact would be less than significant.

Construction and operation of the proposed Project, like the other largely residential and commercial cumulative projects identified in **Section 4.0, 4.0.6: Cumulative Assumptions**, would include the use of relatively small quantities of hazardous materials and generation of small amounts of hazardous wastes. The proposed Project and other cumulative projects would not require the transport, storage, use, or disposal any unusually large, toxic, or explosive quantities of hazardous materials or hazardous wastes. The proposed Project and other cumulative residential and commercial projects, would use, store, handle, and dispose of relatively limited quantities of hazardous materials, such as cleaning fluids, lubricants, paints, and fuels. Similarly, these types of projects generate small quantities of hazardous wastes, including small leftover amounts of hazardous materials previously discussed, paint cans, medical wastes, and the like.

The proposed Project and cumulative projects and their associated businesses would be required to adhere to the comprehensive set of existing federal, State, and local regulatory requirements, including the HMBP programs administered by the LACoFD. These programs require all users of hazardous materials to implement employee training, safe storage, and appropriate handling requirements to ensure that upset and accident conditions are minimized. In the unlikely event that an accidental release was to occur, these programs require spill response measures to ensure that incidents are quickly contained and, therefore, would not travel off site in a way that could cumulatively combine to affect large numbers of people or affect substantial parts of the environment.

The proposed Project and cumulative projects would be required to operate in conformance with established safety requirements during operation to ensure compliance with City emergency service and warning systems. The proposed Project and cumulative projects would operate in conformance with ASCE standards and Federal Transportation Administration requirements. The proposed Project's and cumulative projects' safety and security programs would be subject to the requirements of CPUC and State Safety Oversight of Fixed Guideway Transit Systems. In addition, operation of the proposed Project and cumulative projects would be required to adhere to all State and local safety requirements including those of the City's fire and police departments. With adherence to the federal, State, and local safety

#### 4.8 Hazards and Hazardous Materials

requirements, the proposed Project, in conjunction with other cumulative projects, would not conflict the requirements of an emergency response plan or emergency evacuation plan.

For the reasons described above, the proposed Project, in conjunction with other cumulative projects, would not create a cumulatively considerable hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Therefore, cumulative impacts would not be significant.

#### 4.8.9 CONSISTENCY WITH CITY OF INGLEWOOD GENERAL PLAN

There are no specific policies within the General Plan that apply to the proposed Project regarding hazards or hazardous materials. The City's General Plan Safety Element outlines measures related to potential hazardous materials incidents. As discussed above, compliance with federal, State, and local laws and regulations relating to transport, storage, disposal, and sale of hazardous materials would minimize any potential for accidental release or upset of hazardous materials.

There are no specific policies within the General Plan that apply to the proposed Project regarding emergency response and emergency evacuation plans. The City's General Plan Safety Element outlines measures related to disasters that require emergency evacuation plans. As discussed above, compliance with federal, State, and local laws and regulations relating to emergency response and emergency evacuation plans would ensure consistency with the General Plan Safety Element.

## 4.9 LAND USE AND PLANNING

### 4.9.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) provides an analysis of the potential land use impacts of the proposed Inglewood Transit Connector Project (proposed Project). In response to comments received on the December 2020 Draft EIR, the design of the Maintenance and Storage Facility (MSF) for the Automated Transit System (ATS) system was modified to allow the Vons grocery store currently located on the proposed MSF site to remain on this site in a new building to continue to serve the community. Other modifications to the Project since release of the December 2020 Draft EIR include the realignment of the proposed ATS alignment on Prairie Avenue to the west side of the street to allow for single column alignment and allow the street to be open to the sky, as well as the relocation of one of the proposed stations to the southwest corner of Prairie Avenue and Manchester Boulevard to address stakeholder concerns, including Inglewood Unified School District. As a result of these modifications to the design of the Project and other comments on the December 2020 Draft EIR, changes and additions to the proposed approval and actions required to implement the Project were identified as described in Section 3.8 in Section 3.0, Project Description.

This section analyzes the potential for the Project as currently proposed, to physically divide the existing community and conflict with applicable land use plans, policies, and regulations. This section describes existing land use conditions, general plan designations, and zoning as necessary to evaluate the potential land use impacts of the Project as currently proposed.

Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Draft EIR.

### 4.9.2 METHODOLOGY

The significance of potential impacts of the proposed Project is determined based on the thresholds of significance described below in *Section 4.9.5: Thresholds of Significance*. The evaluation of land use impacts identifies applicable land use plans and policies and assesses whether the proposed Project is inconsistent with those plans and policies. The study area for the land use impact analysis is the City of Inglewood (City), with a focus on land uses located in proximity to the proposed Project. The analysis of whether the proposed Project would physically divide an existing community considers whether the existing land uses near the proposed Project and the ATS components, including the guideway, stations, and support facilities would create a barrier that would divide the community. The Project is also analyzed for consistency with existing policies, regulations, and programs adopted for the purpose of avoiding or mitigating an environmental effect. If an established program goal and/or policy is relevant to another

environmental resource and has been analyzed in another section, readers are referred to the appropriate environmental resource section for the discussion.

### 4.9.3 REGULATORY FRAMEWORK

#### 4.9.3.1 State Plans and Regulations

##### **Senate Bill 535**

Senate Bill 535 was signed into law on September 30, 2012. This bill directs 25 percent of the proceeds from the Greenhouse Gas Reduction Fund to projects that provide a benefit to disadvantaged communities. As part of the legislation, CalEPA was assigned the responsibility of identifying communities that are considered disadvantaged throughout California. A list of disadvantaged communities was released by CalEPA in April 2017. The proposed Project is within or adjacent to disadvantaged communities as defined in Senate Bill 535 and identified by CalEPA.<sup>1</sup>

##### **Assembly Bill 1550**

Assembly Bill 1550 was signed into law on September 14, 2016. This bill builds on Senate Bill 535 by requiring the Greenhouse Gas Reduction Fund investment plan to allocate (1) a minimum of 25 percent of the available funds to projects located within, and benefiting individuals living in, disadvantaged communities, (2) an additional minimum of 5 percent of the available funds to projects that benefit low-income households or to projects located within, and benefiting individuals living in, low-income communities located anywhere in the State, and (3) an additional minimum of 5 percent of the available funds either to projects that benefit low-income households that are outside of, but within a ½ mile of, disadvantaged communities, or to projects located within the boundaries of, and benefiting individuals living in, low-income communities that are outside of, but within a ½ mile of, disadvantaged communities. The proposed Project is within or adjacent to disadvantaged communities as defined in Assembly Bill 1550.<sup>2</sup>

#### 4.9.3.2 Regional Plans and Regulations

##### **SCAG 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy**

The Southern California Association of Governments (SCAG) 2020-2045 Regional Transportation Plan/Communities Strategy (RTP/SCS) was adopted in September 2020. The RTP/SCS is a long-range visioning plan that serves as an important planning document for the region that balances future mobility

<sup>1</sup> OEHA. *SB 535 Disadvantaged Communities*. <https://oehha.ca.gov/calenviroscreen/sb535>. Accessed September 15, 2020.

<sup>2</sup> California Air Resources Board. *Priority Population Investments*. <https://ww3.arb.ca.gov/cc/capandtrade/auctionproceeds/communityinvestments.htm>. Accessed September 15, 2020.

and housing needs with economic, environmental, and public health goals. The plan charts a course for closely integrating land use and transportation so that the region can grow smartly and sustainably. The RTP/SCS includes land use policies to guide the region's development, including economic development and land use near transit.

The proposed Project is included in the Project List under the 2020-2045 RTP/SCS program (RTP ID S1200T100)<sup>3</sup> in support of the RTP Framework.

Applicable goals from the 2020-2045 RTP/SCS include:

- Goal 2:** Improve mobility, accessibility, reliability, and travel safety for people and goods
- Goal 3:** Enhance the preservation, security, and resilience of the regional transportation system
- Goal 4:** Increase person and goods movement and travel choices within the transportation system
- Goal 5:** Reduce greenhouse gas emissions and improve air quality
- Goal 6:** Support healthy and equitable communities
- Goal 7:** Adapt to a changing climate and support an integrated regional development pattern and transportation network
- Goal 8:** Leverage new transportation technologies and data-driven solutions that result in more efficient travel

#### 4.9.3.3 Local Plans and Regulations

##### **Los Angeles County Airport Land Use Commission Airport Land Use Plan**

The Los Angeles County Airport Land Use Commission adopted the Los Angeles County Airport Land Use Plan in 1991 (revised 2004) in order to comply with State law and coordinate planning efforts surrounding public-use airports in the County.<sup>4</sup> The purpose of the Commission is to protect the public health, safety, and welfare through ensuring compatibility of land uses near public-use airports and minimizing the public's exposure to excessive noise and safety hazards within areas around public-use airports. Los Angeles International Airport (LAX) is located approximately 2 miles southwest of the proposed Project.<sup>5</sup>

<sup>3</sup> SCAG. *ConnectSoCal. Adopted Final Connect SoCal. Transportation System Project List*. [https://www.connectsoocal.org/Documents/Adopted/fConnectSoCal\\_Project-List.pdf](https://www.connectsoocal.org/Documents/Adopted/fConnectSoCal_Project-List.pdf). Accessed September 15, 2020.

<sup>4</sup> Los Angeles County Airport Land Use Commission, *Los Angeles County Airport Land Use Plan*, adopted 1991 and revised 2004.

<sup>5</sup> Google Maps, 2017. Available at [maps.google.com](https://maps.google.com).

4.9 Land Use and Planning

As shown in Figure 4.9-1: Los Angeles International Airport – Airport Influence Area, a portion of the proposed ATS alignment on Manchester Boulevard and Prairie Avenue is located within the airport influence area<sup>6</sup> and the 65 decibel (dB) community noise equivalent level (CNEL) noise contour for Los Angeles International Airport.

**City of Inglewood General Plan**

California State law requires every city and county to adopt a comprehensive General Plan to guide its future development. The proposed Project is located entirely within the City. The City’s General Plan includes the following elements: Land Use, Circulation, Safety, Noise, Housing, Open Space, Conservation, and Environmental Justice Elements.<sup>7, 8</sup>

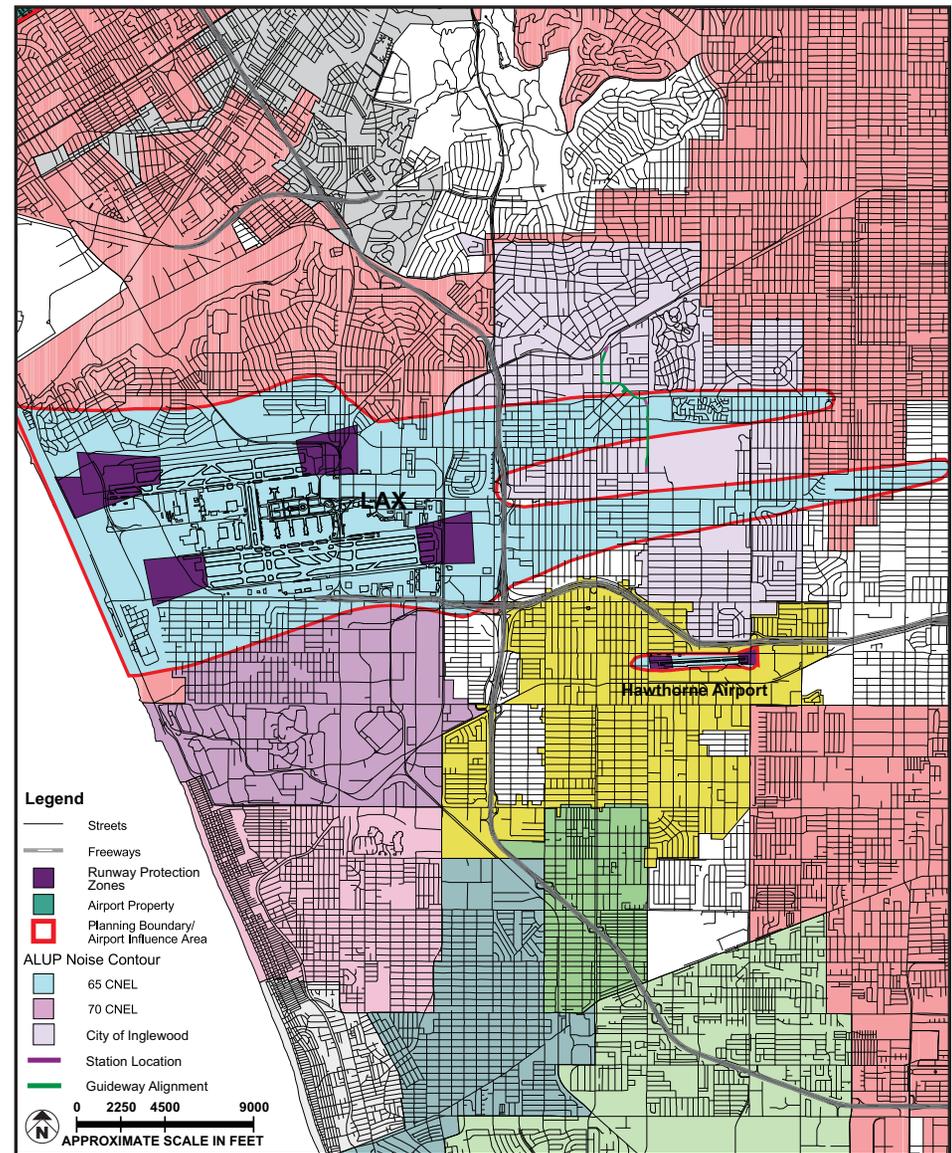

**Land Use Element**

The Land Use Element<sup>9</sup> was adopted in 1980 and subsequently amended in 1986, 2009, and 2016. The Land Use Element presents a long-range plan for the general distribution and intensity of public and private land uses within the City. The goals applicable to the proposed Project are identified below:

**Goals—General**

- Provide for the orderly development and redevelopment of the City while preserving a measure of diversity among its parts. Allocate land in the City to satisfy the multiple needs of residents but recognize that land is a scarce resource to be conserved rather than wasted.
- Help promote sound economic development and increase employment opportunities for the City’s residents by responding to changing economic conditions.
- Maximize the use and conservation of existing housing stock and neighborhoods and also facilitate development of new housing to meet community needs.
- Promote Inglewood’s image and identity as an independent community within the Los Angeles metropolitan area.

6 An airport influence area is the area which current or future airport-related noise, over flight, safety, and/or airspace protection factors may significantly affect land uses or necessitate restrictions on those uses.  
 7 City of Inglewood *General Plan*, (1980).  
 8 City of Inglewood *General Plan*, “Environmental Justice Element” (April 2020).  
 9 City of Inglewood *General Plan*, “Land Use Element” (1980).

SOURCE: Google Earth - 2021; Meridian Consultants LLC - 2021

FIGURE 4.9-1

Los Angeles International Airport – Airport Influence Area

4.9 Land Use and Planning

**Goals—Commercial**

- Create and maintain a healthy economic condition within the present business community and assist new business to locate within the city.
- Protect local businessmen and encourage the importance of maintaining a strong commercial district in the downtown.
- Improve the visual appearance and economic condition of the existing arterial commercial development along Inglewood’s major streets.
- Promote the development of commercial/recreational uses which would complement those which already are located in Inglewood.

**Goals—Industrial**

- Increase the industrial employment opportunities for the City’s residents.

**Goals — Circulation**

- Ensure that proposed new uses can be accommodated by adequate and safe streets.
- Promote and support adequate public transportation within the City and the region.
- Develop modified traffic systems that would discourage through traffic from utilizing neighborhood streets.
- Develop a safe and adequate pedestrian circulation system which is barrier-free for the handicapped.

**Goals — Community Facilities**

- Maintain the present high level of police and fire services to the extent it is fiscally prudent.
- Expand opportunities for cultural and social growth for the City’s residents.

As part of the Land Use Element, the City adopted the Downtown Transit Oriented District goals and policies in September 2016.<sup>10</sup> Analysis of goals and policies related to historic resources is provided in **Section 4.4: Cultural Resources**. Policies and goals applicable to this section include:

**Downtown Transit Oriented District Goals and Policies (as amended September 2016)**

**Goal 1:** Downtown is a place to live, work, shop, recreate, and be entertained.

**Policy 1.1:** Mixed Use Development. Encourage a range of residential, retail, office, recreational, and institutional uses in the Historic Downtown to create a vibrant urban district and support local business.

<sup>10</sup> City of Inglewood *General Plan, “Land Use Element”* (1980).

4.9 Land Use and Planning

**Policy 1.2:** Ground Floor Uses and Storefronts. Require uses that activate pedestrian activity such as retail on major streets and plaza frontages. Require that storefronts be historically-sensitive, attractive, and transparent in the Historic Downtown.

**Goal 2:** Downtown is a revitalized yet forward-looking gathering place for the community.

**Policy 2.1:** Public Gathering Places. Create public spaces in key locations in the public right-of-way and on privately-owned land. In particular, create a central plaza along Market Street between Florence Avenue and Regent Street and/or in the adjacent parcels suitable for eating, resting and people watching, but also for festivals, concerts, and events at special times.

**Policy 2.2:** Pedestrian Network. Enhance sidewalks, repurpose alleys and create mid-block passthroughs and internal courtyards to serve as pedestrian passageways and enjoyable public spaces.

**Policy 2.3:** Preservation of Historic Fabric. Require the preservation of buildings that have been designated as historic and encourage the reuse of other historic buildings. Maintain the sense of place in areas with historic fabric and/or meaning such as Market Street between Regent Street and Hillcrest Avenue and the Hillcrest neighborhood east of Locust Street.

**Goal 3:** Downtown provides a unique mix of accessibility options including light rail, pedestrians, bicycles, autos, buses, and advanced technology local transit.

**Policy 3.1:** Complete Streets. Accommodate all modes of transportation on streets, with particular attention to transit vehicles and pedestrians, but also design streets to serve as open spaces in the urban environment, places where people gather, communicators of the locality’s culture, vision and values, and generators of development on adjacent parcels.

**Policy 3.2:** Green Boulevards. Create Green Boulevards that protect cyclists, infiltrate stormwater, and use vegetation to create a sense of place on Florence Avenue, La Brea Avenue, Manchester Boulevard and Prairie Avenue.

4.9 Land Use and Planning

4.9 Land Use and Planning

**Policy 3.3:** Pedestrian Promenades. Emphasize Market Street and Queen Street as pedestrian promenades that may be closed to automobiles for special events or as conditions require.

daylighted stream through TechTown reflecting topography and flow of water to the treatment plant.

**Policy 3.4:** Pedestrian Connections to Metro Rail. Establish high-quality at-grade and/or bridge connections from the Downtown Inglewood Metro station across Florence Avenue to the south. Make every effort to facilitate a direct pedestrian connection from the station to Beach Avenue to the north.

**Goal 6:** Downtown expresses the unique culture of Inglewood.

**Policy 6.1:** Districts. Define the following unique districts within the Downtown TOD area, each with their own unifying character or identity that should be preserved and enhanced: Historic Downtown, Civic Center, TechTown, Beach Avenue, Fairview West, Hillcrest and Queen Street.

**Policy 3.5:** Local Transit Connections to Metro Rail. Provide quality local transit connections from major destinations such as the NFL Stadium and Forum to Downtown and the Downtown Inglewood Metro station using existing or emerging technologies.

**Circulation Element**

The Circulation Element, adopted in December 1995, serves as a guide for future circulation and transportation developments. The program addresses the adequacy of street access, traffic capacity for current and future land use needs, truck routes, and bicycle routes. For consistency analysis of the proposed Project and the Circulation Element see **Section 4.12: Transportation**.

**Policy 3.6:** Parking District. Establish a parking district with shared parking consolidated in garages, and manage pricing

**Conservation Element**

The Conservation Element, adopted in October 1997, contains goals, guidelines, and policies for the conservation, development, and utilization of natural resources found within the jurisdiction of the City of Inglewood. Resources addressed in the Element include water, soils, natural gas, and oil. For a consistency analysis of the proposed Project and the Conservation Element see **Sections 4.2: Air Quality, 4.3: Biological Resources, and 4.14: Utilities and Service Systems**.

**Goal 4:** Downtown is a major economic engine providing jobs, sales tax, and other revenues.

**Policy 4.1:** Major Sites Development. Develop major sites and create new destinations at the north and south ends of Market Street, immediately north of the Metro station, and on and around the City Yard that create jobs, generate revenues for the city through sales and bed tax and provide new opportunities for residents.

**Housing Element**

The City's current Housing Element<sup>11</sup> was adopted on January 28, 2014. The current version of the Housing Element covers the 5<sup>th</sup> Cycle Regional Housing Needs Allocation (RHNA) projections from 2013-2021. The Housing Element establishes policies to create or preserve quality residential neighborhoods while identifying current and future housing needs and establishes policies and programs to address housing deficiencies. The City is currently updating the Housing Element to reflect the SCAG 6<sup>th</sup> Cycle Regional Housing Needs Assessment allocation for the October 2021 to October 2029 planning period for the City of Inglewood.<sup>12</sup> Adoption of the updated Housing Element is anticipated by March 2022. See **Section 4.11: Population, Employment, and Housing** for consistency analysis of the proposed Project and the Housing Element.

**Policy 4.3:** Equitable Development. Implement policies such as a local hire notification requirement for large employers, Business Improvement District youth guide program and others so that the benefits of growth accrue to the current population of Inglewood. Encourage educational uses wherever possible to improve the job-readiness of the local population.

**Goal 5:** Downtown is a model for economic development.

**Policy 5.1:** Stormwater Management. Collect, clean and infiltrate stormwater runoff on streetscapes, parking lots and roofs wherever possible. Create a

<sup>11</sup> City of Inglewood *General Plan, "Housing Element"* (2014).  
<sup>12</sup> California Government Code Section 65583 (c)(1)(A).

**Noise Element**

The Noise Element, adopted in September 1987,<sup>13</sup> contains a comprehensive program regarding noise control in the planning process, including goals and policies that would guide the local planners in achieving and maintaining compatible land uses with environmental noise levels. Noise sensitive uses include residential, schools, hospitals, libraries, and parks. A consistency analysis was conducted for the Noise Element and discussed in **Section 4.10: Noise and Vibration**.

**Open Space Element**

The Open Space Element adopted in December 1995 addresses the current and future recreation needs of the community for park land and recreational facilities and plans for the conservation or creation of open spaces to mitigate the effects of increasing urbanization of Inglewood. See Revised Initial Study for the no impact finding under Section 2.14: Public Services, Threshold (a) iv, Parks. The proposed Project would not have impacts on parks and would not directly generate population growth, which would require more recreational facilities.

**Safety Element**

The General Plan Safety Element adopted in July 1995<sup>14</sup> and amended in 2020, contains goals, objectives, and policies that protect the welfare and safety of the citizens of Inglewood and their properties, and the community as a whole, from risks associated with a variety of natural and man-made disasters. These disasters include, but are not limited to, earthquakes, flooding, fires, and airplane crashes. See **Section 4.6: Geology and Soils** for the consistency analysis of the proposed Project with the Safety Element.

**Environmental Justice Element**

The Environmental Justice Element, adopted on June 30, 2020, provides guidelines to minimize pollution and its effects on the community, and ensure that all residents have a say in decisions that may affect their quality of life. The State of California defines Environmental Justice as “the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies.”<sup>15</sup> The goals and policies that apply to the proposed Project are presented below:

<sup>13</sup> City of Inglewood *General Plan*, “Noise Element” (1987).  
<sup>14</sup> City of Inglewood *General Plan*, “Safety Element” (1995).  
<sup>15</sup> *California Government Code §65040.12. e.*

**Goal 1:** Residents and stakeholders who are aware of, and effectively participate in, decisions that affect their environment and quality of life.

**Policy:** Participation and Collaboration

**EJ-1.11:** Conduct broad outreach on public hearings that affect the environment in languages used by the community.

**EJ-1.12:** Inform the public on decisions that affect their environment using multiple communication methods, including traditional and online forms of communication.

**EJ-1.13:** Provide written notices and other announcements regarding key land use and development issues in English and Spanish where feasible. For all other materials, note that verbal translation assistance is available.

**EJ-1.14:** Offer interpretation services at key meetings and workshops on issues affecting the environment.

**EJ-1.15:** Consider offering childcare at key meetings and workshops on environmental issues affecting entire neighborhoods and the City as a whole.

**EJ-1.16:** Consider varying the time and date of key meetings and workshops, or holding multiple meetings and workshops, in order to ensure broad participation.

**EJ-1.17:** Seek feedback on public decisions through traditional and online forms of communication, such as website, email, mobile phone apps, online forums, and podcasts.

**EJ-1.18:** Partner with community-based organizations that have relationships, trust, and cultural competency with target communities to outreach on local initiatives and issues.

**Goal 2:** The community’s exposure to pollution in the environment is minimized through sound planning and public decision making.

**Policy:** General Environmental Health

**EJ-2.1:** Incorporate compliance with State and federal environmental regulations in project approvals.

**4.9 Land Use and Planning**

- EJ-2.2:** Work with other agencies to minimize exposure to air pollution and other hazards in the environment.
- EJ-2.3:** Ensure compliance with rules regarding remediation of contaminated sites prior to occupancy of new development.
- EJ-2.4:** Create land use patterns and public amenities that encourage people to walk, bicycle and use public transit.
- EJ-2.8:** Encourage new development to reduce vehicle miles traveled to reduce pollutant emissions.
- EJ-2.12:** Place adequate conditions on large construction projects to ensure they do not create noise, dust, or other impacts on the community to the extent feasible.
- EJ-2.13:** Continue to reduce pollution entering the storm drain system through the incorporation of best management practices.

**Goal 3:** A community that promotes physical activity and opportunities for active living.

**Policy:** Access and Connectivity

- EJ-3.4:** Require the provision of on-site bicycle facilities in new large-scale development projects.
- EJ-3.5:** Partner with transit agencies to ensure that parks and recreational facilities are accessible to low-income and minority populations.
- EJ-3.7:** Encourage new specific plans and development projects be designed to promote pedestrian movement through direct, safe, and pleasant routes that connect destinations inside and outside the plan or project area.

**Goal 4:** Healthy, affordable, and culturally appropriate food is readily available to all members of the community.

**Policy:** Affordable and Nutritious Food

- EJ-4.4:** Maximize multimodal access to fresh food by encouraging grocery stores, healthy corner stores, and outdoor markets at key

**4.9 Land Use and Planning**

transit nodes and within new transit-oriented development projects.

**Goal 6:** Adequate and equitably distributed public facilities are available in the community.

- EJ-6.1:** Ensure the City provides equitable public improvements and community amenities to all areas of the City.
- EJ-6.2:** Prioritize the City's capital improvement program to address the needs of disadvantaged communities.
- EJ-6.3:** Plan for the future public improvement and service needs of underserved communities.
- EJ-6.6:** Provide ongoing infrastructure maintenance in existing residential neighborhoods through the capital improvement program.
- EJ-6.8:** Ensure that new public facilities are well designed, energy efficient and compatible with adjacent land uses.
- EJ-6.10:** Coordinate with the Inglewood Unified School District, transit agencies and other public agencies to provide adequate public facilities, improvements, and programs to the City of Inglewood.

***New Downtown Inglewood and Fairview Heights Transit Oriented Development Plan and Design Guidelines***

The Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines (TOD Plan) address Downtown Inglewood and the Fairview Heights neighborhoods and implements the City's vision for transforming the quality of the environment within these areas.<sup>16</sup> The Downtown TOD Plan area consists of approximately 585 acres located in the center of Inglewood along the Metro K line just east of the Florence Avenue/La Brea Avenue intersection. The Downtown TOD Plan area extends approximately one-half mile in all directions from the Metro K Line Downtown Inglewood Station. The Fairview Heights TOD Plan area consists of approximately 328 acres located near the intersection of Florence Avenue and West Boulevard. This Fairview Heights TOD Plan area also extends approximately one-half mile in all directions from the Downtown Inglewood Metro K Line Station.

<sup>16</sup> City of Inglewood, *New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines*, November 1, 2016.

#### 4.9 Land Use and Planning

The TOD Plan includes goals and policies which were incorporated into the Land Use Element goals and policies in 2016 under the Downtown Transit Oriented District Goals and Policies section. The TOD Plan further includes concept plans, zoning, development standards, design guidelines, and an implementation action plan for consideration by applicants submitting any proposals for new construction or rehabilitation within the TOD Plan area, submitting project plans for design review, as well as for consultation by City Staff when making recommendations for project approvals. The TOD Plan also addresses architectural detail, signage, public art, and civic and cultural life.

The proposed Project is located within the Historic Downtown and Hillcrest Districts as defined in this plan. The Historic Downtown District is pedestrian-oriented and human-scaled. Under the plan, the Historic Downtown District would function as a regional destination and gathering space for all in the City of Inglewood that links residents with the community's past, present, and future. This district would include public space, restaurants, entertainment, residential uses and limited hotel and office uses. The goal for the Hillcrest District is to retain the District's present character and continue to be home to churches, neighborhood retail uses, as well as residences.

#### **Hollywood Park Specific Plan**

The Hollywood Park Specific Plan (HPSP) establishes development standards and design guidelines for the 298-acre Hollywood Park site at the northeast corner of the Prairie Avenue and Century Boulevard intersection and provides an overview of existing infrastructure and necessary improvements related to the site, including measures for implementation of the HPSP. The site is currently under development. SoFi Stadium was completed in August 2020 and development of a 6,000-seat entertainment venue, parks, and retail, office, housing, entertainment, gaming, hotel, and civic uses are also allowed by the HPSP.<sup>17</sup>

The HPSP includes guidelines and standards for improvements in and fronting the public right-of-way within the Plan area, which includes approximately 0.5 miles of street frontage along Prairie Avenue where the proposed Project will be located. The HPSP provides integrated and coordinated landscape design guidelines for new development along the perimeter of the Plan area with the objective of promoting land use compatibility, particularly along Prairie Avenue. The HPSP includes streetscape standards in order to integrate Hollywood Park with the adjoining urban fabric, achieve a diverse urban forest, and assist in developing districts of distinctive and appropriate character.<sup>18</sup> Sidewalk widths provide comfortable walking routes and parkway widths are designed to provide sufficient area for urban tree growth. The streetscape will also include identity elements that will differentiate Hollywood Park

<sup>17</sup> City of Inglewood, Hollywood Park Specific Plan, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015.

<sup>18</sup> City of Inglewood, Hollywood Park Specific Plan, adopted July 8, 2009, amended September 23, 2014, and further amended February 24, 2015.

#### 4.9 Land Use and Planning

from nearby developments, including unique architectural features, special landscape (such as seasonal displays of color), graphic elements (such as signs or logos), special pedestrian or automobile paving, special night lighting effects, or other similar features.

The HPSP area has an existing General Plan designation that permits an overall floor area ratio of 2:1 averaged over the entire 298-acre site. The General Plan designation is vested by a Development Agreement approved by the City in February 2015. The analysis in this EIR assumes 5.25 million square feet (SF) of future commercial development, consistent with the vested General Plan provisions, will be completed in the cumulative development scenario.

#### **The Forum Development Agreement**

In 2013, the City of Inglewood entered into a Development Agreement with the Forum Landowner and authorized a \$100 million renovation plan, which included new and increased total seats, a new Forum Club, and a larger concession area. As part of the Development Agreement, the City acknowledged, among other things, that 3,530 parking spaces located on the Forum Property, and the current configuration (including the layout, landscaping, size of spaces, and drive aisles) is legally non-conforming, and the improvements contemplated by the Forum project approvals did not constitute a change to such legally non-conforming status.

#### **City of Inglewood Planning and Zoning Ordinance**

The City of Inglewood Planning and Zoning Code (Chapter 12 of the Inglewood Municipal Code (IMC) is the primary land use regulation in the City.<sup>19</sup> The purpose of the Zoning Code is to protect and promote the public's health, safety, and general welfare, and to implement the policies of the comprehensive General Plan. The Zoning Ordinance describes the zoning districts and land use classifications, land use regulations, environmental standards, and developments standards relating to issues such as intensity, setbacks, height, and parking.

#### **4.9.4 EXISTING CONDITIONS**

##### **4.9.4.1 Existing Land Uses**

The City of Inglewood was historically developed as a low-density single-family community and is transitioning to include higher density development with the implementation of land use plans such as the New Downtown and Fairview Heights TOD Plan and the HPSP. These plans allow and encourage mixed-use development focusing on walkability, density, and TOD.

<sup>19</sup> City of IMC, Chapter 12.

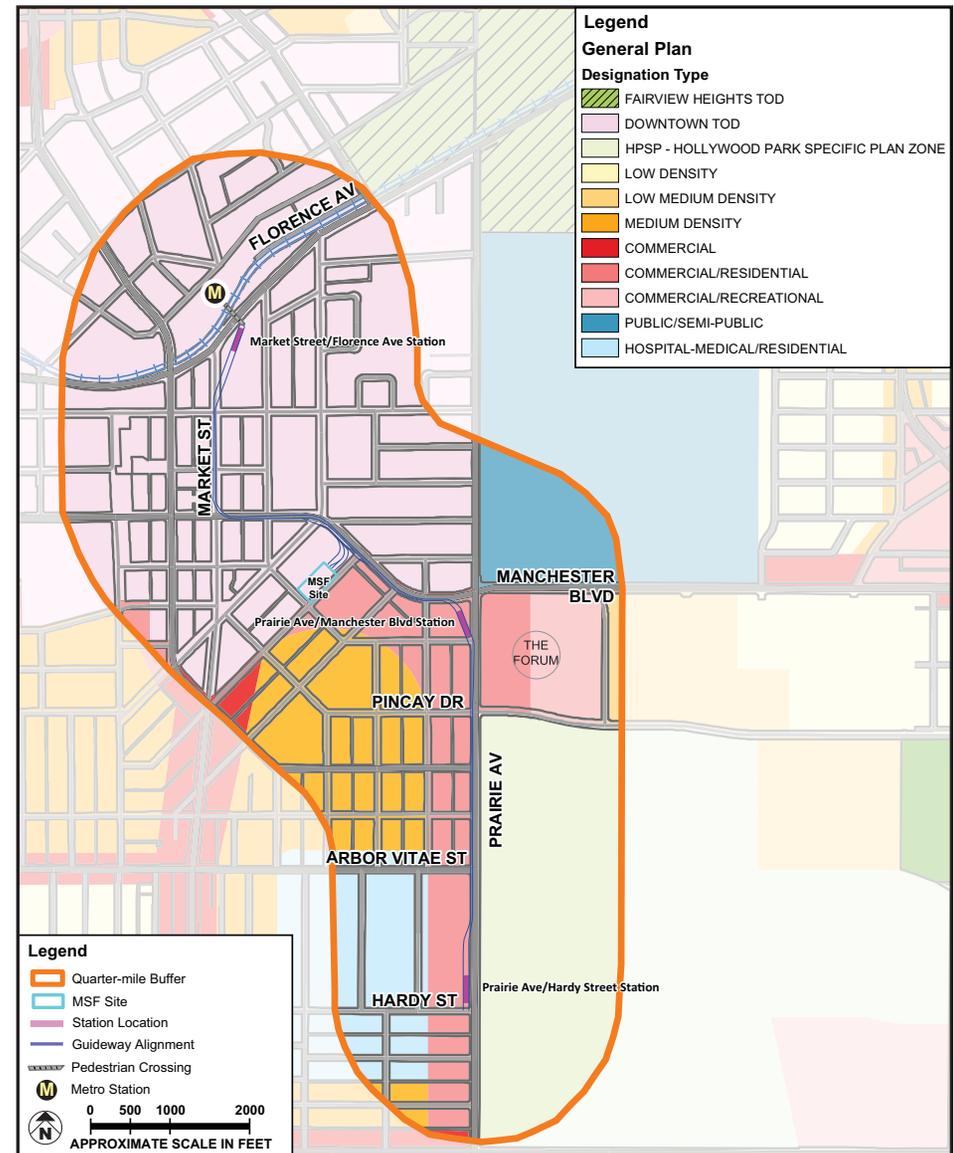

4.9 Land Use and Planning

As of 2016, land uses in the City were comprised of residential (46.7 percent), right-of-way (23.5 percent), public/semi-public (20.3 percent), commercial (6.1 percent) and industrial (3.7 percent) uses.<sup>20</sup> Existing zoning allows 60 percent of residentially zoned land to be developed into two-family or multifamily units. Today, there are more multifamily dwelling units than single-family units in the City.

Commercial uses are typically located along major arterials in the City of Inglewood. The two major components of commercial land uses include retail service and automobile sales and service, representing 63 percent and 20 percent, respectively, of all commercial uses. The City is experiencing a growth of light industrial oriented uses focused on shipping in and out of LAX. Zoning for light industrial represents 75 percent of land zoned for industrial uses while the remaining 25 percent is zoned for heavy industrial uses. Land uses included within the City's public/semi-public areas include parks, schools, government buildings and facilities, churches, the Inglewood Cemetery, and hospitals. The City's right-of-way area includes 180 miles, or 1,337 acres, of streets and alleys. The City is primarily developed. A majority of the vacant land in the City is designated for industrial land uses with minimal vacant land designated for residential and commercial uses.<sup>21</sup>

Further descriptions of existing land uses along the proposed Project for the guideway is provided below. The proposed Project is described in three segments: the Market Street Segment, the Manchester Boulevard Segment, and the Prairie Avenue Segment. Descriptions for each segment are then broken down into descriptions of General Plan designations, followed by a description of the existing zoning, and ending with a description of existing physical uses on site (such as retail, schools, churches). Two figures are included to show the land use designations under the General Plan and IMC in the Project footprint. The figures include the following: **Figure 4.9-2: General Plan Land Use Designations**, and **Figure 4.9-3: Zoning Map**.

FIGURE 4.9-3

208-001-18

### Market Street Segment

The Market Street Segment extends from the intersection of Market Street and Florence Avenue to the intersection of Market Street and Manchester Boulevard. As shown in **Figure 4.9-2**, the entire Market Street Segment is designated Downtown TOD in the General Plan Land Use Map. The Downtown TOD designation is a component of the New Downtown Inglewood and Fairview Heights TOD Plan,<sup>22</sup> which as discussed previously, was approved in 2016. The plan defines the allowable uses within each area.

As shown in **Figure 4.9-3**, the Market Street Segment is almost entirely designated Historic Core (HC)<sup>23</sup> on both sides of the roadway, with only two parcels directly south of Florence Avenue being outside of the HC zone and designated as TOD Mixed Use 1 (TOD MU-1). The HC zone is intended to provide for a mix of land uses, including commercial services such as retail, restaurants, and offices and civic uses, including public and quasi-public facilities. Residential uses are also allowed in the HC zone. The land use patterns and sizes of the developments in this zone are intended to be consistent with the existing historic urban fabric. The HC zone permits a maximum height of five stories or 68 feet, no minimum lot size, and public street setback of zero feet. An exception to this condition is given to portions of parcels directly adjacent to Market Street, which are limited in height to three stories or 45 feet within 20 feet of Market Street.

The objective of the TOD MU-1 zone is to provide larger-scale transit-oriented development at a higher density. A variety of uses are allowed in the TOD MU-1 zone and the mixing of uses is encouraged. Allowable uses in the TOD MU-1 zone include ground-level retail, services, public-serving offices, and upper-level residential, office, hotel, or institutional functions. Plazas and shared parking structures are also encouraged. The TOD MU-1 zone is further divided into three separate districts: North Station, North Market Place, and South Market Place. The parcels adjacent to the proposed Project are located in the North Market Place district, with a height limit of up to eight stories or 104 feet, minimum lot size 80,000 SF, and public street setback of zero feet.

Zoning east of Locust Street and north of Regent Street, adjacent to the Market Street/Florence Avenue Station is TOD MU-1 on the north end and Residential Multifamily (R-3) to the south. In the event of a conflict between the Downtown TOD plan and the IMC designated zoning, the Downtown TOD Plan would

22 City of Inglewood. *The New Downtown Inglewood & Inglewood TOD Plans*. <http://inglewood.arroyogroup.com/wp-content/uploads/2017/01/The-New-Downtown-Fairview-Heights-TOD-Plan-Design-Guidelines-lo-res.pdf>, accessed July 2020.

23 City of Inglewood. *New Downtown Inglewood and Fairview Heights TOD Plan*. <http://inglewood.arroyogroup.com/wp-content/uploads/2017/01/The-New-Downtown-Fairview-Heights-TOD-Plan-Design-Guidelines-lo-res.pdf>. Accessed September 17, 2020.

#### 4.9 Land Use and Planning

override the requirements within the IMC designated zoning requirements.<sup>24</sup> However, in the event that the Downtown TOD Plan does not address a regulatory requirement, the IMC prevails.

At the north end of the segment is a commercial shopping center that includes 15 parcels and contains restaurants, an auto parts shop, retail stores, pharmacy, cosmetic services, and a dental office. Existing uses adjacent to Locust Street consist of single-family and multifamily residential homes to the east, adjacent to the shopping plaza. North of Florence Avenue on the other side of the Metro K Line are additional retail commercial uses including a grocery store, pharmacy, and cosmetic services. A senior housing project, bank, and beauty salons are located south of Regent Street and the shopping plaza. The existing land use west of the plaza is a vacant lot which is currently being developed with a commercial/residential mixed-use project.

Commercial uses border the street on both sides of Market Street from south of Regent Street up to the intersection with Manchester Boulevard. Uses on the west side of Market Street, from north to south consist of a beauty salon, a vacant lot planned for mixed-use development, restaurants, the former Fox Theater building, a repair shop, public employment services, retail stores, and an office building. On the east side of Market Street, the existing land uses from Regent Street to Manchester Avenue include a bank, a vacant lot planned for mixed-use development, art gallery, restaurants, retail stores, and a commercial office.

#### **Manchester Boulevard Segment**

The Manchester Boulevard Segment extends from the intersection of Market Street and Manchester Boulevard to the intersection of Manchester Boulevard and Prairie Avenue. A majority of the Manchester Boulevard Segment is designated Downtown TOD on the General Plan Land Use Map as shown in **Figure 4.9-2**. The area southeast of Manchester Boulevard and Spruce Avenue is designated Commercial/Residential.

As shown in **Figure 4.9-3**, the majority of the Manchester Boulevard Segment is zoned HC on either side of the street from the intersection with Market Street to the intersection with Hillcrest Boulevard. Starting on the south side of Manchester Boulevard, the HC zone extends past Hillcrest Boulevard all the way to Spruce Avenue, including the proposed MSF site. On the north side of Manchester Boulevard zoning is General Commercial (C-2). The height limit for the C-2 zone is 6 stories or 75 feet, with no setback requirements.

<sup>24</sup> Inglewood Municipal Code 12-16.8.

#### 4.9 Land Use and Planning

The area located south of Manchester Boulevard from Spruce Avenue to Prairie Avenue is zoned C-2. Under the IMC, the C-2 zone allows for a variety of commercial uses (e.g., retail and service businesses) and does not allow for new residential uses. The height limit for the C-2 zone is six-stories or 75 feet, with no setback requirements except those contained in the City's General Design Guidelines (1979).

Land uses on Manchester Boulevard consist of primarily commercial uses. Land uses on the north side of Manchester Boulevard from west to east include retail stores, a dentist office, and a restaurant. Near Manchester and Hillcrest Boulevards is a gas station medical clinic, advertising agency, a retail store, and an institutional (religious) facility. Near Manchester Drive and Osage Avenue is an insurance office, an institutional (religious) facility, and multifamily housing. An auto shop and a restaurant are located on Manchester Boulevard at Prairie Avenue. A cemetery is located across Prairie Avenue to the north.

On the south side of Manchester Boulevard, traveling from west to east to Hillcrest Boulevard uses include retail stores, a pharmacy, and restaurants. Between Hillcrest Boulevard and Spruce Avenue is a shopping center that includes a grocery store with a gas station. Other uses located within the grocery store shopping center include a bank branch, coffee shop, and gym. East of Spruce Avenue, the south side of the roadway is lined with retail shops, a day care facility, and a real estate office. Moving past Osage Avenue towards Prairie Avenue is a tire shop, non-profit organization, dry cleaner, dentist office, daycare facility, commercial buildings, and a vacant lot.

#### **Prairie Avenue Segment**

The Prairie Avenue Segment extends from the intersection of Prairie Avenue and Manchester Boulevard to the northwest corner of the Prairie Avenue and Hardy Street intersection. The entire area west of Prairie Avenue is designated Commercial/Residential by the General Plan (see **Figure 4.9-2**). East of Prairie Avenue, The Forum is designated Commercial/Recreational and Commercial/Residential. South of the Forum, the HPSP is designated Major Mixed-Use which continues until Century Boulevard. The Major Mixed Use designation permits an overall floor area ratio of 2:1 averaged over the entire 298-acre Hollywood Park site.

As shown in **Figure 4.9-3**, the area west of Prairie Avenue is zoned C-2 for the entirety of the segment. Land uses on the west side of Prairie Avenue from the north to Kelso Avenue, include a vacant lot, daycare facility and Kelso Elementary School. South of Kelso Avenue is a restaurant and a funeral home before the land use transitions into residential uses. On either side of Buckthorn Street are retail stores and continuing south between Buckthorn and Arbor Vitae Streets is an institutional (religious) facility and a motel. South of Arbor Vitae Street is a restaurant, convenience store, a vacant building, more restaurants, beauty salons, and a repair shop in a commercial center.

#### 4.9 Land Use and Planning

The area east of Prairie Avenue is zoned Commercial Recreation (C-R) north of Pincay Drive and HPSP south of Pincay Drive. The C-R zone allows for a variety of commercial entertainment uses including, among others, animal exhibitions, athletic events, social events, and conventions. The height limit for the C-R zone is 150 feet in height from natural grade with a 30 feet setback from the property line. The setback area can be used to accommodate landscaping or landscaped parking/subterranean parking. The HPSP is a Mixed-Use specific plan that includes SoFi Stadium and allows development of a mix of uses, including retail, office, commercial and residential uses. Starting on the north end of Prairie Avenue, the Inglewood Park Cemetery is located on the northeast corner of Prairie Avenue and Manchester Boulevard. The Inglewood Park Cemetery is located on 200 acres of land with park-like vegetation throughout the site. South of Manchester Boulevard is the Forum, a historic commercial recreational venue built in 1967. South of Pincay Drive is the recently completed SoFi Stadium with additional development ongoing south of the stadium. The HPSP area, including SoFi Stadium, includes 298 acres east of Prairie Avenue extending to Century Boulevard.

The City's Medical Enterprise Overlay Zone overlays the Residential and Medical (R-M) and C-2 Zones along Prairie Avenue between Manchester Boulevard and Hardy Street. This overlay allows for development of hospitals, medical offices, real estate, and insurance offices, dental offices, and ancillary uses, along with some entertainment and personal care uses and shopping centers only on properties zoned C-2.

#### 4.9.5 ADJUSTED BASELINE CONDITIONS

This section assumes the Adjusted Baseline Environmental Setting as described in **Section 4.0: Environmental Impact Analysis, 4.0-5: Adjusted Baseline**. Related to land use, the changes associated with the Adjusted Baseline affect the vacant land immediately east of the proposed Project across Prairie Avenue, which would be developed with retail, restaurant, commercial, and residential uses, and other entertainment and open space uses in the HPSP area. No other changes to the existing environmental setting related to land use and planning would occur under the Adjusted Baseline Environmental Setting.

#### 4.9.6 THRESHOLDS OF SIGNIFICANCE

A significant land use impact would occur if the proposed Project would result in the following:

#### 4.9 Land Use and Planning

**Threshold LU-1**      **Physically divide an established community.**

**Threshold LU-2**      **Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.**

The first threshold applies to projects that would create physical barriers which would create divisions to existing connections between parts of a community. Physical divisions in a community could be created if connectivity between areas of the existing community is substantially affected. Physical division can also occur if the connectivity between areas of an existing community is reduced to the extent that one portion of a community would be physically separated from the rest of the community.

The second threshold addresses consistency with applicable land use plans and focuses on potential conflicts between the proposed Project and existing land use plan, policies, and regulations adopted to avoid or mitigate environmental effects. Determinations of significance are not based on inconsistency alone, but on instances where inconsistencies with plans, policies, and regulations would also result in physical impacts on the environment.

A project is considered to be consistent with a general plan and related planning documents if, considering all its aspects, it would further the objectives and policies of the plan or not obstruct their attainment. If a project is determined to be inconsistent with specific individual objectives or policies but is largely consistent with the land use or the other goals and policies of that plan and would not preclude the attainment of the primary intent of the land use plan, the proposed Project would not be considered inconsistent with the plan.

Inconsistency with a land use or planning policy is not necessarily considered to be an impact under CEQA; only those inconsistencies that result in physical effects on the environment are considered a significant impact to the environment as defined by CEQA. The proposed Project is considered to be consistent with the goals of regional and local plans if it meets the general intent of the plans and would not preclude the attainment of the primary intent of the land use plan or policy. Policies that do not result in physical impacts represent factors that the Lead Agency and Responsible Agencies would consider in their planning reviews of the proposed Project.

Thresholds and analysis relevant to land use compatibility, including consistency with applicable plans, in terms of views, air quality, noise, and surface transportation are addressed in **Sections 4.1: Aesthetics, 4.2: Air Quality, 4.10: Noise, and 4.12: Transportation**, respectively.

## 4.9.7 IMPACT ANALYSIS FOR THE PROPOSED PROJECT

### 4.9.7.1 Project Characteristics

The proposed Project is an approximately 1.6-miles long, elevated ATS system with associated support facilities, primarily located within the public right-of-way along Market Street, Manchester Boulevard, and Prairie Avenue, with limited encroachments currently outside of the public right-of-way onto private property to be acquired as part of the Project. Three stations would be located along the proposed Project alignment as follows:

- Market Street/Florence Avenue station (at the site of the existing retail commercial center) generally proposed between Florence Avenue and Regent Street providing connections to the Metro K Line and downtown Inglewood;
- Manchester Boulevard/Prairie Avenue station proposed on the southwest corner of Manchester Boulevard and Prairie Avenue providing a connection to the Forum, and Los Angeles Stadium & Entertainment District (LASED) at Hollywood Park, and
- Prairie Avenue/Hardy Street station proposed on the northwest corner of Prairie Avenue and Hardy Street providing connections to the LASED at Hollywood Park, including SoFi Stadium, and the Inglewood Basketball & Entertainment Center (IBEC).

Each station is configured with center station platforms to minimize the total footprint of the station and guideways while providing ease of passenger wayfinding.

The ATS guideways would consist of dual lanes, with each lane approximately 14 feet wide, and widths varying from 30 feet to 75 feet to accommodate stations and turn-back switches. The guideway is supported by columns ranging in size from approximately 6 feet by 9 feet to 6 feet by 12 feet in diameter depending on the locations, spacing and guideway configuration.

Existing roadways and infrastructure along the guideway would require some reconfiguration to accommodate new elevated transit guideway structures and stations. In addition to surface improvements, utility infrastructure under the roadway surface may need to be relocated to accommodate the guideway columns, footings, and other components. The roadway reconfigurations along Market Street, Manchester Boulevard, and Prairie Avenue are necessary to ensure that the existing number of travel lanes is maintained.

The proposed Project includes a MSF, to provide regular and preventive maintenance for the ATS trains (i.e., rolling stock and equipment), vehicle storage, and an operations control center. **Figure 4.9-4: Map of Property Acquisitions and Easements** identifies the location of the proposed MSF. The MSF building would be approximately 75,000 SF and elevated from ground level to match the guideway elevation. The

ground floor would consist of a generally unenclosed space containing approximately 250 public parking spaces for the new Vons store. A gated surface parking area containing approximately 50 parking spaces for employees and visitors to the MSF will be provided west of the MSF building.

Support facilities would include two power distribution system (PDS) substations. These substations would be the service connection point and would provide the necessary power for the proposed Project including traction power, auxiliary power and housekeeping power for the stations and infrastructure. One of the PDS substations would be co-located with the MSF and another would be located at Prairie Avenue/Hardy Street Station.

Additional public parking would be provided as part of the Project at three locations:

- Approximately 650 parking spaces would be provided in a surface parking lot at the Market Street/Florence Avenue Station along with pickup and drop off areas on Locust Avenue and Regent Street.
- Approximately 50 parking spaces would be provided in a surface parking lot at 150 S. Market Street.
- Approximately 80 parking spaces would be provided in a surface parking lot at the Prairie Avenue/Hardy Street Station along with pickup and drop off areas within the lot.

### Property and Easement Acquisitions

The proposed Project is located in a highly developed urban setting containing existing residential, commercial, education, and transportation facilities. While the majority of the proposed Project would be located within the public street right of way, components of the guideway system are proposed on adjacent property which would require acquisition of property or easements. In addition, the Market Street/Florence Avenue station, MSF, the Manchester Boulevard/Prairie Avenue station, and the Prairie Avenue/Hardy Street station would require acquisitions of properties. Property and easement acquisitions are discussed below.

### Market Street Segment

The northern most station of the proposed Project is the Market Street/Florence Avenue station which would be located at 310 E. Florence Avenue, southeast of Market Street and Florence Avenue. The station would replace an existing retail commercial center containing restaurants, auto part store, cosmetology school, convenience store, and drug store. An elevated passenger walkway would connect the Market Street/Florence Avenue station with the Metro K line Downtown Inglewood Station north of Florence Boulevard.

*4.9 Land Use and Planning*

As the guideway continues south on Market Street, existing commercial buildings and vacant lots would line both sides of the guideway.

**Manchester Boulevard Segment**

The guideway turns east onto Manchester Boulevard which would require the guideway to extend into the adjacent property occupied by a two-story commercial building at 150 S. Market Street, located on the northeast corner of the Market Street and Manchester Boulevard intersection. The existing commercial building would be replaced by the guideway and a surface parking lot providing approximately 50 public parking spaces as part of the proposed Project.

As the guideway continues east, retail, commercial, and restaurant uses continue on both sides of Manchester Boulevard until the intersection with Manchester Drive, where churches and residential homes line the north side of Manchester Boulevard. An additional property acquisition would be required in this segment to accommodate the MSF, which would be located south of the street between Hillcrest Boulevard and Spruce Avenue, at 500 E. Manchester Boulevard on the eastern portion of this site. This site is developed with Vons grocery store building (which includes a separate gym) and gas station. A new Vons replacement store would be developed on the northwest portion of this site. Other uses located within the grocery store include a bank branch and coffee shop which are anticipated to be included in the new Vons replacement store. A PDS substation would also be located on this property.

**Prairie Avenue Segment**

The Prairie Avenue Segment extends from the intersection of Prairie Avenue and Manchester Boulevard to just northwest of the intersection of Prairie Avenue and Hardy Street. As the guideway turns south, the Manchester Boulevard/Prairie Avenue station would be located on a vacant commercial site located on the southwest corner of Manchester Boulevard and Prairie Avenue at 401 Prairie Avenue that would be acquired as part of the Project.

As the guideway continues south, uses include a commercial office building and educational facilities west of Prairie Avenue, including a daycare center and Kelso Elementary School. Existing land use south of Kelso Street and west of the Prairie Avenue is a mix of commercial buildings and retail commercial centers, hotels, and residential buildings. East of Prairie Avenue are the Forum, SoFi Stadium, and other new development in the HPSP area.

This Prairie Avenue/Hardy Street station is proposed at the southern end of this segment on the northwest corner of Prairie Avenue and Hardy Street on property proposed to be acquired as part of the Project. This site is currently developed with a retail commercial center. Acquisition of 6 additional parcels located immediately north of the proposed station site is necessary to accommodate the switch zone north of the

*4.9 Land Use and Planning*

station. These parcels include 2 vacant parcels, 2 containing vacant commercial buildings and 2 containing occupied commercial buildings.

**Table 4.9-1: Anticipated Property Acquisitions And Easements** and **Figure 4.9-4** identifies parcels that would be acquired in fee (full or partial) or on which easements would be acquired to implement the proposed Project. These real property rights would be acquired by either the City of the Joint Powers Authority (JPA) to be formed by Metro and the City to implement the Project.

A detailed list of existing parcels on and adjacent to the proposed Project is provided in **Appendix M: Existing Land Use Setting for Parcels Adjacent to the ATS System**.

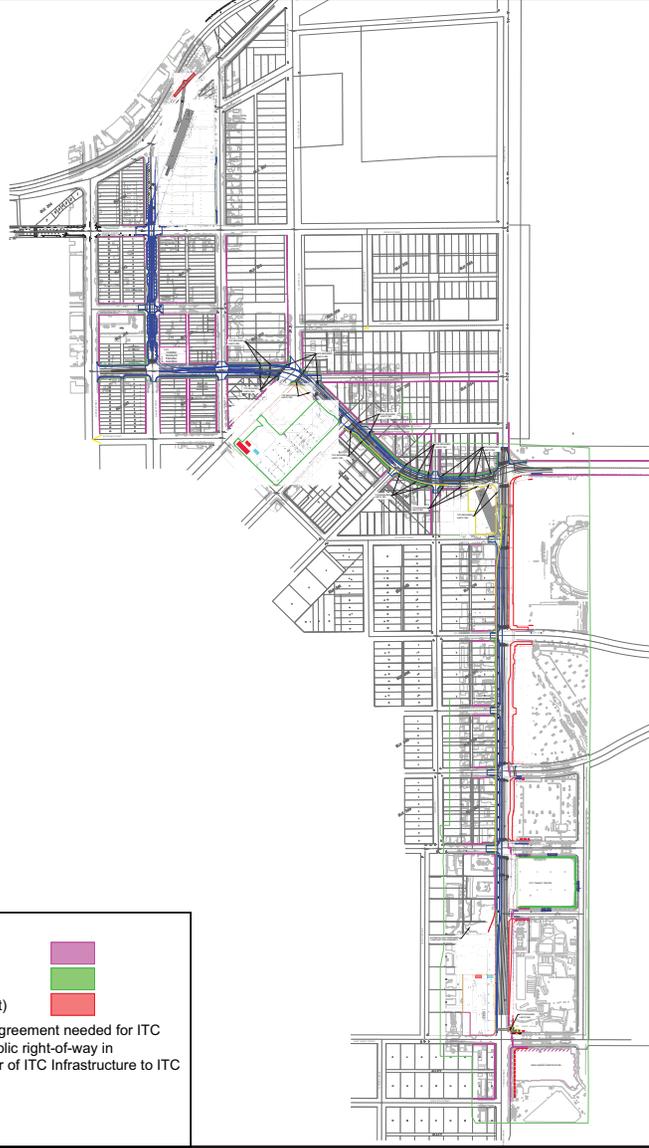

251-003-20

4.9-31

Ingewood Transit Connector Project  
November 2021

### ***ITC Design Standards and Guidelines***

The ITC Design Standards and Guidelines (Design Guidelines) (see **Appendix C**) identify the objectives for the various project components and provides design guidance to help achieve the objectives. The Design Guidelines include instructions on the project component dimensions, characteristics, and construction methods to better integrate the proposed Project with existing resources and nearby communities.

#### **Guideline Objectives**

##### ***ATS Guideway***

The guideway would have a significant presence on the streets where it is located, connecting the major entertainment centers with each station. The guideway would be simple and streamlined and will be a unifying feature between stations. The guideway architecture will create a sense of movement that connects the stations.

##### ***Stations***

The stations would be the architectural focal points within the design of the proposed Project. Stations will be identifiable, distinctive, and streamlined. The massing of the stations will be sleek and modern. The station canopies will be distinctive, yet designed in a manner not to detract from the surrounding environment.

##### ***Maintenance and Storage Facility***

The MSF will be easily accessible by employees who serve and maintain ATS trains. It will be simple and modern in style and rectilinear in form with complimentary lighting, finishes, landscaping and color palette. Screens will be provided to shield all exterior equipment including equipment at the rooftop and ground level, so that it is not visible from the street or accessible areas of adjacent properties. Sufficient area for landscape will be provided in order to integrate the facility site perimeter with the urban environment. The building exterior would be covered in a uniformed and neutral color, with accent colors, where appropriate, to allow proper integration of the structure with the environment existing visual character of the area. Additionally, the Design Guidelines would require trees and new landscaping as feasible to provide shade and decorative separation of parking spaces. Passenger walkways surrounding the site would comply with local standards and guidelines with street trees planted around the site for aesthetic appeal and to separate the MSF building from surrounding uses.

##### ***Streetscape***

Roadway and street related designs would establish a framework and overall vision for the streetscape. Building upon proposed development within the Inglewood downtown and areas adjacent to the ATS, the

streetscape improvements associated with the proposed Project would add additional pedestrian facilities, active transportation, and aesthetics.

The public right-of-way includes the roadway, the bicycle network, and the sidewalk area. The goals for the roadways, streetscape, and pedestrian connections are to create an attractive and functional environment for the users and seek to create well defined edges between the pedestrian and the vehicle realm, to use a hierarchy of spaces that help define the use of the public realm, and to improve the passenger experience through clarity of circulation and wayfinding.

##### ***Pedestrian Network and Streetscape***

The pedestrian network would connect buildings, streets, parking areas, and the Project stations to create an environment that supports all modes of transportation. Sidewalks are a fundamentally important component of the area's pedestrian circulation network. Sidewalks provide pedestrian access to virtually every activity and provide critical connections between other modes of travel (automobile, public transit, bicycles, etc.) to land uses in the area. The pedestrian zone would be of adequate width to accommodate pedestrians, including those with disabilities while providing pedestrian connections to the ATS stations.

Under the Design Guidelines, streetscape in downtown Inglewood would be consistent with the street furnishings which currently exists on Market Street and the historic core and in accordance with the Downtown TOD Plan.<sup>25</sup> Existing furnishings on Market Street includes waste baskets, light posts, sidewalk posts, and street chairs spread across the downtown area on sidewalk areas. Street furnishings and street trees would be consistent with the Design Guidelines, which provide trees planted on Market Street will be planted at a rhythm and scale to create a continuous visual canopy over the pedestrian realm, where feasible.

For the streetscape adjacent to HPSP on Prairie Avenue, the Design Guidelines require trees on the west side of Prairie Avenue to be spaced to match the spacing on the east side of Prairie Avenue and the guideway support structure to the extent feasible. The HPSP streetscape plan is designed to achieve a diverse urban forest, to integrate Hollywood Park with the adjoining urban fabric and to assist in developing districts of distinctive and appropriate character. Street trees selected for Prairie Avenue are based on recommendations from local arborists to create a palette of horticulturally successful, low maintenance and climate-appropriate tree species.<sup>26</sup> Tree selections on Prairie Avenue under the design guidelines of the HPSP are Afghan Pine, Camphor Tree, Southern Magnolia, and Canary Island Pine trees.

<sup>25</sup> City of Inglewood. Inglewood Municipal Code. Section 12-38.50. T-C Zone. Permitted Uses. [https://qcode.us/codes/inglewood/view.php?topic=12-17\\_2-12\\_38\\_50&frames=on](https://qcode.us/codes/inglewood/view.php?topic=12-17_2-12_38_50&frames=on).

<sup>26</sup> City of Inglewood. Inglewood Municipal Code. Section 12-38.50. T-C Zone. Permitted Uses. [https://qcode.us/codes/inglewood/view.php?topic=12-17\\_2-12\\_38\\_50&frames=on](https://qcode.us/codes/inglewood/view.php?topic=12-17_2-12_38_50&frames=on).

Prairie Avenue adjacent to HPSP would also accommodate residential and retail gateways to the development and HPSP identifying elements with the goal of accommodating and providing architectural features, landscaping, graphic elements, special pedestrian or automobile paving, special night lighting effects or other similar features that complement the HPSP development.

Overall, the streetscape design would build upon proposed development within downtown Inglewood and adjacent to the ATS. The goals for the roadways, streetscape, and pedestrian connections in the Design Guidelines include creating a cohesive, attractive, and functional environment for the users and seeking to create well defined edges between the pedestrian and the vehicle realm. A hierarchy of spaces would also be created to define the pedestrian space and improve passenger circulation and wayfinding experience.

#### **Parking**

The proposed Project includes parking lots at three locations: The Market Street/Florence Avenue Station, 150 S. Market Street, and the Prairie Avenue/Hardy Street Station. The Market Street/Florence Avenue Station site would include pick up and drop off areas on Locust Avenue and Regent Street and a surface parking lots containing approximately 650 public parking spaces. The surface parking lot at 150 S. Market Street would contain approximately 50 public parking spaces, and the surface parking lot at the Prairie Avenue/Hardy Street Station would contain approximately 80 public parking spaces. Planting zones will be provided to separate parking stalls from sidewalks with trees that would be planted at a minimum ratio of one tree per 10 parking spaces, not including the trees along the street edge of the parking lot.

In addition, the City is considering building a parking structure on the City's Inglewood Transit Facility (ITF) site located on the southeast corner of Prairie Avenue and Arbor Vitae Street within the HPSP area. This parking structure would provide additional public parking near event venues in the LASED and for the IBEC. The ITF site is currently improved as a surface parking lot and bus transit facility. This planned parking structure would provide up to 2,500 parking spaces in a six-level building. While this proposed parking facility would be located within the HPSP area and is not proposed as part of the Project, it is analyzed as part of the potential circulation system in which the Project will operate.

#### **Construction Commitment Program**

The Construction Commitment Program (CCP) (**Appendix D**) identifies construction practices that would be implemented during construction of the proposed Project to address potential impacts associated with construction activities. These include measures to avoid or reduce adverse impacts of the proposed Project to environmental resources and the surrounding communities. Construction measures included in this Program address:

- Business and community support plans, including a business assistance fund
- Construction staging and traffic control requirements
- Maintaining access to parking, businesses, residences, and pedestrian facilities
- Noise and vibration measures
- Air quality measures
- Other vital measures during construction

#### **General Plan Amendment**

The proposed Project includes proposed amendments to the General Plan Land Use, Circulation, and Safety Elements as described below to reflect the addition of this transit system to the City's circulation system. No changes are proposed to the other elements of the General Plan including the Housing, Conservation, Noise, Open Space, and Environmental Justice Elements.

#### **Land Use Element**

The amendment to the General Plan Land Use Element would change the text and diagrams related to the three components as described below.

First, the Goals and Objectives section would be modified to incorporate the ITC Project into the subsections addressing Circulation and the Downtown Transit Oriented District. The modified objectives address integration of the ATS system into the existing area around Market Street, connecting the Downtown Inglewood Metro Rail station to the LASED including SoFi Stadium, the Forum, and the IBEC with the ITC Project, and supporting the City's goal to promote adequate public transportation within the City and the region by adding the ITC Project.

Second, a description of the proposed ITC Project would be added to the "Passenger Train Service" subsection under the "Development Factors-Transportation Network" section. The subsection provides a list of passenger train services available in the City of Inglewood.

Third, the "Downtown Transit Oriented District" subsection in the "Future Land Uses" chapter would be amended to identify the proposed Transportation Corridor Overlay Zone (TC Overlay Zone) as one of the overlay zones in Downtown Inglewood. The TC Overlay Zone would take precedence over or supersede, as necessary, all other zones, including overlay zones, in the Project area, including the concept plans and zoning and design guidelines outlined by the Downtown TOD Plan.

#### **Circulation Element**

The amendment to the General Plan Circulation Element would include changes to text and diagrams related to the four components described below.

First, Market Street, between Florence Avenue to the north and La Brea Avenue to the south, would be revised from its current configuration to have one lane of traffic in each direction between Regent Street and Manchester Boulevard with a center island; currently this section of Market Street has two lanes in each direction with a center turn lane. The Circulation Element currently classifies Market Street as a Minor Arterial street. Minor Arterial streets contain two lanes of traffic in each direction. This section of Market Street would be reclassified as a Collector street; Collector streets have one lane of traffic in each direction.

The Circulation Element identifies typical street sections for common right-of-way widths and sections of streets planned for widening. The second component of the proposed amendment includes defining the maximum right of way for Prairie Avenue, between Manchester Boulevard to the north and Hardy Street to the south, as 132 feet.

Third, a description of the proposed Project, including its connection to the Metro K Line, would be added to the description of light rail facilities in the City.

Fourth, changes to the descriptions of the street environment, parkways, medians, and on-street parking on Market Street, Manchester Boulevard, and Prairie Avenue that would be affected by the Project would be made.

#### Safety Element

The Safety Element would be amended to include descriptions of the proposed Project components including the guideway, stations, MSF and PDS substations. Specifically, the proposed Project would be added to the element as a Critical Facility. The description of transportation routes would be updated to incorporate the presence of proposed Project components along its alignment.

#### Transportation Corridor Overlay Zone

An amendment to Chapter 12, Planning and Zoning, of the IMC is proposed to add a Transportation Corridor Overlay Zone (TC Overlay Zone) that would apply to the proposed Project areas. The intent of the TC Overlay Zone is to define specific uses and development standards applicable to the proposed Project as the standards in the underlying zones are not applicable to an elevated guideway, stations, or various other components of the proposed Project infrastructure. The TC Overlay Zone standards would supersede or take precedence over the standards of the zones underlying the TC Overlay Zone footprint, but only with respect to the proposed Project elements; the standards of the underlying zones would continue to govern existing and future development of non-Project elements.

The TC Overlay Zone defines the uses permitted in this overlay zone area along with supplemental development standards and design guidelines. The boundaries of the proposed TC Overlay Zone are

shown in **Figure 4.9-5: Transportation Corridor Overlay Zone**. The TC Overlay Zone area includes the guideway, stations, and all related support facilities.

The permitted uses for the TC Overlay Zone would be modeled upon, and expand upon, those contained in the City's existing Transportation Corridor (T-C) Zone described in Section 12-38.50<sup>27</sup> of the IMC, which provides the zoning framework for the Metro K Line within the City, with adjustments made to accommodate the elements necessary for the ITC Project including, without limitation, an above-grade guideway, the MSF, the multilevel stations, vertical circulation elements, and connecting walkways and bridges, and all of the related supporting facilities and infrastructure. The proposed TC Overlay Zone would allow the following as permitted uses (the TC Overlay Zone Uses):

- The construction, operation and maintenance of any at-grade or elevated fixed guideway transportation system, including, without limitation, light rail (which may consist of an automated people mover system, automated guideway transit, monorail, and/or any other comparable system that may be steel-wheel/steel rail, rubber tired or magnetically levitated, supported on rail(s) from below, straddling, or suspended from overhead beam(s) from above), trolley, busway (including rapid transit), and/or comparable transit or transportation system, including public and private rights-of-way, easements, underground utilities, tracks, spurs, guideways, footings, support columns, support beams, and any appurtenant facilities, improvements, and equipment, including stations (which may be at-grade or elevated and comprised of one or multiple levels), maintenance facilities, storage facilities, operations control centers, related administrative and office facilities, restrooms, vertical and horizontal circulation elements (such as stairs, escalators, elevators, and passenger bridges and walkways), plazas or similar open space areas, platforms, signals, utility and storage areas, power distribution elements, electrical or traction power.
- Substations, rolling stock, and the like, which are necessary and related to the operation, maintenance, and security of the transportation system.
- Parking facilities (surface, subsurface, or structured) for transportation facilities (including such facilities' employees and users) or for use by adjacent or nearby businesses or public facilities.
- Mobility hubs (which may be co-located with parking facilities) and multimodal pick-up and drop-off facilities.
- In conjunction with the uses permitted above, property in the TC Overlay Zone may be landscaped and otherwise improved with ornamental fencing, ornamental lighting, directional and informational signage, public information and communications signage systems and all related facilities, fiber optics, emergency lighting, security systems, rest areas and seating, café or food service carts, service kiosks or structures, retail, and other similar streetscape improvements, public amenities or other uses typically found in public transit stations.

<sup>27</sup> City of Inglewood. Inglewood Municipal Code. Section 12-38.50. T-C Zone. Permitted Uses. [https://qcode.us/codes/inglewood/view.php?topic=12-17\\_2-12\\_38\\_50&frames=on](https://qcode.us/codes/inglewood/view.php?topic=12-17_2-12_38_50&frames=on).

- Station sites and maintenance or storage facility sites in the TC Overlay Zone may be jointly developed with station facilities and commercial, residential, public facility, or mixed uses.
- As interim uses only during periods of construction, construction staging and laydown (including storage of all equipment and materials), fencing, construction-related office, and employee space (which may include restrooms and a canteen and/or food vendor area), interim parking, and ancillary temporary structures and any other temporary uses approved by the Director of Public Works as reasonably related to any of the foregoing temporary or permanent uses or otherwise in the public interest.

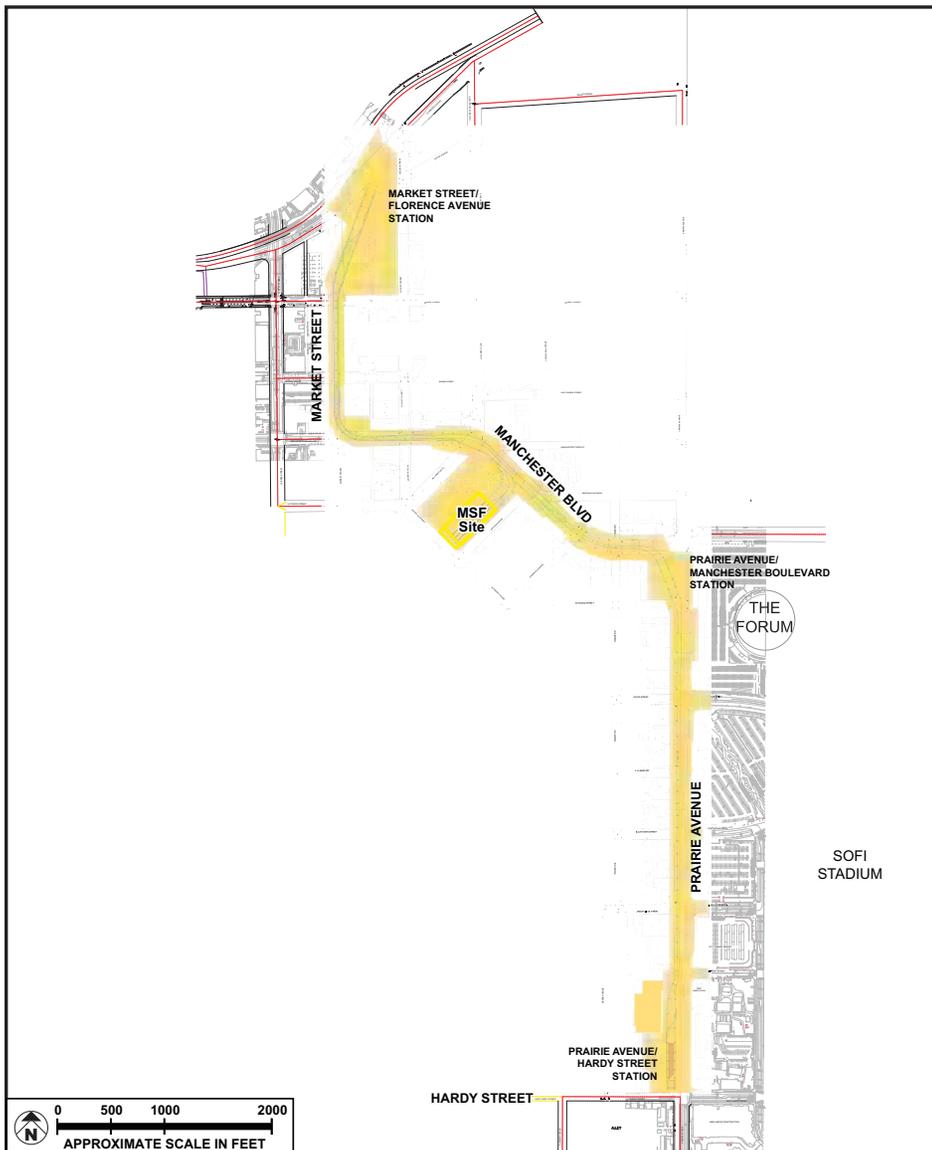

Development of the TC Overlay Zone Uses within the TC Overlay Zone will be subject to the Inglewood Transit Connector Standards and Design Guidelines (Design Guidelines). The Design Guidelines provide design guidance for each component of the Project (e.g., guideway, stations, parking lots) and define the City's review and permitting process for the development of the TC Overlay Zone Uses in the TC Overlay Zone area. With respect to such uses only, the Design Guidelines will supersede the standards in the Inglewood Municipal Code, the Downtown Inglewood and Fairview Heights Transit Oriented Development Plan, and the Hollywood Park Specific Plan, as well as any other design, plan review, or permit process described in any of the foregoing documents (including the Site Plan Review process in Article 18.1 in Chapter 12). Compliance with the review process as specified in the Design Guidelines will be required prior to the issuance of building permit(s) for development of the TC Overlay Zone Uses, and the review will require consistency with the assumptions in this EIR.

The Design Guidelines will include standards for design, features and design elements for buildings, structures, transit system elements, streetscapes, landscaping, lighting, parking, and sustainability.

The TC Overlay Zone would also define development standards applicable to these permitted uses including the following:

- A height limit of 110 feet for station sites, 75 feet for the MSF site, and 75 feet for all other improvements, structures, and elements of the proposed Project, which include the guideway. These are height limits calculated above finished grade.
- No minimum setbacks (0' setback).
- No minimum street frontage requirements.
- Parking and public art requirements as specified in Design Guidelines.

The TC Overlay Zone would specify that any area within the zone, previously used to satisfy a minimum setback requirement in the underlying zone, will still continue to be treated as a legal setback area and shall continue to be counted for purposes of any permitted density or floor area calculations under the underlying zone for existing and future development purposes.

SOURCE: Meridian Consultants LLC - 2021

FIGURE 4.9-5

Transportation Corridor Overlay Zone

The TC Overlay Zone boundaries would be coterminous with the proposed Project footprint and would also extend up to 50 feet from the edge of the guideway and outside edge of the stations along the entire alignment of the guideway.

### **Medical Enterprise Overlay Zone**

As part of the Project, the City would amend the Medical Enterprise Overlay Zone in Chapter 12, Planning and Zoning, Article 5.1. "R-M" Residential and Medical Zone Regulations of the IMC [IMC §12-22.29] to exclude properties within the Project Site from the Medical Enterprise Overlay Zone. The TC Overlay Zone would apply to these properties.

The Medical Enterprise Overlay Zone applies to R-M (Residential) and C-2 (General Commercial) zoned properties located in Planning Area One and Planning Area Two. Planning Area One includes properties that are zoned R-M and located to the north of Manchester Boulevard and those C-2 zoned properties adjacent to the west side of Prairie Avenue that are located between Florence Avenue to the north and Manchester Terrace to the south. Planning Area Two includes properties that are zoned R-M and located to the south of Manchester Boulevard and those C-2 zoned properties adjacent to the west side of Prairie Avenue that are located between Manchester Boulevard to the north and Hardy Street to the south.

Currently, the Medical Enterprise Overlay Zone applies to the proposed sites for the Prairie Avenue/Manchester Boulevard and Prairie Avenue/Hardy Street stations and associated components of the Project on the west side of Prairie Avenue not located within the public right-of-way.

### **Hollywood Park Specific Plan Amendment**

To accommodate the ATS while maintaining the existing roadway capacity along Prairie Avenue, the ITC Project includes the proposed relocation of one existing traffic lane on the east side of Prairie Avenue. The relocated lane would be accommodated within a variable easement for street purposes, to be acquired by the City over private property that currently comprises the existing required 30-foot setback area along the west edge of the HPSP area. While existing sidewalk widths along Prairie would be maintained, landscaping, signs and other streetscape improvements would need to be reduced or eliminated in certain areas following the property acquisition. To address any potential conflict or inconsistency with the HPSP, the City is proposing the following specific plan amendments and clarifications to the HPSP:

- The elimination of the requirement for a 30-foot setback area along the western edge of the HPSP area (30-foot Setback Area) to allow zero-lot line development. Accordingly, future buildings and structures within the western edge of the HPSP area would be permitted to be built along the existing property line without requiring any additional setback along Prairie Avenue. Subterranean parking

and certain structures, such as balconies, would be allowed to encroach within the City's easement areas, to minimize the loss of the setback area for future development purposes. Consistent with the proposed TC Overlay Zone, any area previously used to satisfy the minimum setback requirement shall continue to be counted within any density or Floor Area Ratio calculations under the Specific Plan, for existing and future development purposes, even though it may have been dedicated as a public right-of-way.

- The landscape area within the 30-foot Setback Area will be reduced or eliminated in certain areas, as needed to accommodate the new street easement.
- New areas where signs will be allowed will be proposed to support the replacement and relocation of existing monument and wayfinding signs currently located within the existing 30-foot Setback Area.
- To support the attractiveness of the ITC Project and increase the transit mode share to the HPSP area, the City proposes to improve public safety, enhance the pedestrian circulation system and pedestrian experience to the event and activity centers at Hollywood Park by allowing for routine closures of 2 interior streets on event days to reduce pedestrian conflicts with vehicles within designated areas. Accordingly, to facilitate pedestrian-only pathways on event days, the City proposes to amend the Specific Plan to designate Champions Way and Touchdown Drive as private streets and no longer require their public dedication (excluding subsurface, wet, dry and fiber utilities) to the City.

Other amendments will be considered together with the HPSP owner, as necessary, for implementation of the Project and coordination with existing and future HPSP development.

### **The Forum**

To accommodate the ATS while maintaining the existing roadway capacity along Prairie Avenue, the ITC Project includes the proposed relocation of one existing traffic lane on the east side of Prairie Avenue. The relocated lane would be accommodated within a maximum 30-foot variable easement along the Forum property for street purposes. The Project will also include a pedestrian connection from the proposed Prairie Avenue/ Manchester Boulevard Station, which may also eliminate some parking at the Forum site. The City would acquire a 30-foot easement over the Forum private property and could potentially eliminate some parking spaces on the Forum site along the Prairie Avenue edge of the property to accommodate the Project. The City would continue to acknowledge that the parking for the Forum would be legally non-conforming with implementation of the ITC Project, and the Forum Development Agreement would be updated accordingly. Finally, the existing marquee sign for the Forum located in Prairie Avenue may be adjusted as necessary to accommodate the proposed lane relocation and ITC infrastructure while maintaining the prominence and visibility of this existing sign.

### **Vons Grocery Store Relocation**

To accommodate the MSF while maintaining a Vons supermarket at or near its current location, the ITC Project includes the phased relocation of the current Vons supermarket to a new location on the same parcel and the removal of the current gas station located at the site. The City would acquire a portion of the existing site while also accommodating supermarket parking under the elevated MSF building. A City Planning Commission approval of a Special Use Permit is required for demolition of the gas station [IMC §12-63(a)], Planning Commission approval of Design Review is required for the new supermarket store [TOD Plan §4.5], and approval of a Site Plan Review by the Planning and Building Department Director is required for the new supermarket store [IMC §12.39-50 et seq.]. Other discretionary permits and approvals may be necessary to support the construction and operation of a new supermarket store and/or the removal of the current gas station. During construction, the City would permit the existing and new grocery store to operate with less than the amount of parking required by the City's municipal code. In addition, any current legal non-conforming uses associated with the existing grocery store, including, but not limited to, alcohol sales would be permitted to continue as legal non-conforming uses.

#### **Impact LU-1: Would the project physically divide an established community?**

Physical divisions in a community could be created if connectivity between areas of the existing community is substantially affected. Physical division can also occur if the connectivity between areas of an existing community is reduced to the extent that one portion of a community would be physically separated from the rest of the community.

#### **Construction**

Construction of the proposed Project could divide the existing community by reducing vehicular, bicycle, and pedestrian access within the Project area due to lane closures and impacts on the circulation system. However, implementation of the CCP (**Appendix D**) would ensure that access to project adjacent sites would be available to the public with minor inconveniences. The Construction Staging and Traffic Control Program required by the CCP would prioritize maintaining a minimum of one travel lane in each direction on streets affected by construction activities. In the event that a complete road closure would be required, a detour route would be reviewed and approved by the City and public notice will be provided regarding the closure and the detour route. The detour route will allow for continued access to areas affected by project construction.

To minimize impacts on surrounding communities, construction staging would largely take place on parcels outside the existing right of way, limiting impacts on circulation. Staging would also comply with any City issued permits and be reviewed by the City prior to its implementation.

Although construction activities during Phases 5 and 6 would occasionally pose physical barriers to connections on Market Street or Manchester Boulevard, the physical barriers would be temporary and measures within the CCP would be provided to minimize transportation impacts that may arise from temporary street closures.

The CCP includes the measures described below to minimize traffic interruptions during construction. Implementation of the Construction Staging and Traffic Control Program will maintain pedestrian and vehicular access throughout construction of the Project. Other measures included in the CCP, including the Business and Community Support Program and Business Interruption Assistance Program, will also minimize the effects of the construction of the Project on the community. While construction of the Project will result in temporary disruptions, construction of the Project will not create a physical division of the community that will result in a significant land use impact

The requirements set forth in the CCP, including the Transit Access and Circulation Program (CCP, Section 5.0), the Construction Staging & Traffic Control Program (CCP, Section 6.0), and the Business and Community Support Program (CCP, Section 2.0) and Business Interruption Assistance Program (CCP, Section 3.0) (see **Appendix D**) would continue to allow access within the Project area, including access to businesses at all times, and transportation related inconveniences would be reduced to the extent feasible and provide additional support for businesses. Efforts would be made to keep all traffic lanes open for peak directional travel. If all lanes cannot remain open, one lane would be kept open for peak direction and supplemented by detour options. Advanced notice of road closures and detours would be provided to the City and the community.

Measures to minimize transportation impacts are not limited to private vehicles. Bus stop relocation and bicycle/pedestrian detours facilitates access by other modes of transportation and ensures continued operation and connectivity to nearby communities. Multimodal access to local businesses would be maintained throughout construction.

While access to some neighborhoods would be disrupted and detoured for short periods of time during construction, through implementation of the CCP access would continue to be available to neighborhoods for both residents and emergency response. In addition, the funding assistance provided as part of the CCP's Business Interruption Assistance Program would avoid indirect impacts on existing businesses from construction of the ITC Project. For these reasons, the proposed Project would not physically divide the existing community during construction and this impact is less than significant.

Additional construction impact analysis including aesthetics, air quality, noise and vibration, and traffic, can be found in **Sections 4.1, 4.2, 4.10, and 4.12.**

### Operation

The proposed Project will extend service from the Metro K line to the major event venues and existing and planned residential and commercial uses in the City, facilitating regional transit connectivity across the greater Los Angeles region. Both the guideway and the stations will be elevated and the guideway will be primarily located within public right-of-way for the length of the proposed Project. Existing uses adjacent to the proposed Project include commercial, single, and multifamily residential, and entertainment uses.

As discussed below, the proposed Project guideway and stations would be elevated to minimize access impacts to adjacent land uses and ground transportation. The ATS guideway and support columns will change the physical characteristics of the streets it is located on, including affecting the views of buildings along these streets. These streets are existing transportation facilities that are a feature of the community, and the additional ATS infrastructure does not reduce capacity of these streets and does not block access to existing structures or residential or commercial uses along the alignment. Stations would be designed to provide easy access for pedestrians to and from the station and adjacent streets. The proposed support facilities for the ATS system, such as the MSF, would not be constructed on existing transportation facilities and would be contained within designated parcels without physically dividing the community. Therefore, operation of the proposed Project will have a less than significant impact on access and will not introduce features on these streets that will physically divide the community.

### Market Street Segment

The Market Street/Florence Avenue station footprint would be entirely contained within the 9-acre site and will not contribute to physically dividing the surrounding community.

The elevated guideway would travel south from this station on Market Street until the intersection with Manchester Boulevard. Since the guideway will be elevated and located with a minimum clearance of 16 feet 6 inches from the street and located within the existing street the columns for the guideway and other associated components of the system would not introduce physical features that will form a physical barrier. While the ATS guideway and support columns would change the physical characteristics of this segment of Market Street and would affect the views of buildings along the street, the Project will not introduce features that would physically divide the community.

As identified in *Section 4.9.4: Existing Conditions*, adjacent to this segment are commercial retail, office, restaurant, parking, and mixed-use residential uses, as well as vacant lots. The guideway will be elevated and supported by columns. The number of support columns will be minimized by providing the maximum allowable spacing between each column. Aside from the property to be acquired at the corner of Market Street and Manchester Boulevard, which is described further in *Manchester Boulevard Segment* below,

the guideway is not expected to intrude into any existing land uses or impact the existing traffic flow or pedestrian movement below the guideway footprint. No physical division of the community would occur.

An elevated passenger walkway will connect the Market Street/Florence Avenue station with the Metro K line through the Downtown Inglewood station across Florence Avenue to the north. Because the passenger walkway will be elevated, it will not interfere with access to existing neighborhoods and would not physically divide an existing community.

### Manchester Boulevard Segment

The Manchester Boulevard segment begins at the intersection of Market Street and Manchester Boulevard and continues east until the intersection of Manchester Boulevard and Prairie Avenue. The Manchester Boulevard roadway is bordered by commercial retail, office, churches, mixed-use and residential uses on both sides of the street. As the guideway turns east on Manchester Boulevard, the guideway will extend into the property located at 150 S. Market Street. This property contains a two-story commercial building that will be acquired and demolished to allow construction of the guideway.

Similar to the Market Street segment, the guideway will be constructed primarily within the current Manchester Boulevard right-of-way. The number of support columns for the guideway will be minimized by providing the maximum allowable spacing between each column and the guideway would not pose a physical barrier except for the occasional columns support for the guideway. The columns will be spaced out to the maximum extent feasible to minimize visual and land use impacts for nearby right of way and properties.

The MSF will be constructed within the Manchester Boulevard segment, located southwest of Manchester Boulevard between Hillcrest Boulevard and Spruce Avenue, at an existing commercial center containing a Vons grocery store. This commercial center would be acquired and the existing buildings demolished to accommodate both the MSF on the eastern portion of the site and a new Vons grocery store will be reconstructed on the northwest portion of the site. The MSF building would be elevated to match the track elevation. One PDS substation will be co-located on the MSF site. Since the MSF site will be entirely contained within the existing commercial center site, the structure will not physically divide the existing community or impede access to local businesses, amenities, and residential uses. Existing traffic circulation will continue to operate around the MSF site without physical obstructions.

Neither the elevated guideway nor the MSF site will physically divide the community by limiting local access or obstructing traffic. The guideway and support columns will be located above the roadway within the proposed median and will not introduce physical features that will form a physical barrier. While the ATS guideway and support columns would change the physical characteristics of this segment of

Manchester Boulevard, including affecting the views of buildings along the street, the Project will not introduce features that will physically divide the community.

#### **Prairie Avenue Segment**

The Prairie Avenue segment begins at the intersection of Manchester Boulevard and Prairie Avenue and continues south on the west side of Prairie Avenue until the termination of the guideway at the intersection of Hardy Street and Prairie Avenue. As the guideway turns south from Manchester Boulevard, the guideway will partially extend beyond the public right-of-way to pass through the property at 401 S. Prairie Avenue to accommodate the Prairie Avenue/Manchester Boulevard station. An acquisition of this parcel would be necessary to accommodate the station and associated support columns. This segment of the guideway would be bordered by commercial and multifamily residential uses on the west and a mix of uses on the east, including the Forum and entertainment, retail, and residential uses under development within the HPSP area.

The Prairie Avenue segment will be constructed primarily within the western edge of the Prairie Avenue right-of-way and will be adjacent to established communities to the west and entertainment centers and developing communities to the east. Acquisition of a maximum 30-foot easement will be required to reconfigure Prairie Avenue to the east and accommodate columns, sidewalk, and existing number of travel lanes. Similar to other segments, the guideway, located on the west side of Prairie Avenue, will be elevated, at least 4 feet from adjacent buildings, and spaced out to the extent practical to limit the number of columns. Existing traffic flow below the guideway structure will be maintained.

There are two stations proposed on this segment of the ATS; the Prairie Avenue/Manchester Boulevard Station and the Prairie Avenue/Hardy Street Station. The Prairie Avenue/Manchester Boulevard Station is proposed on a vacant parcel located on the southwest corner of Prairie Avenue and Manchester Boulevard and the Prairie Avenue/Hardy Street Station is proposed on the northwest corner of Prairie Avenue and Hardy Street on a site currently developed with a retail commercial center. Acquisition of these parcels is proposed as part of the Project.

To accommodate the ATS and to maintain the existing roadway capacity along Prairie Avenue, the ITC Project includes a relocation of an existing traffic lane on the east side of Prairie Avenue. The City will acquire a 30-foot easement along the west edge of the Forum property and the current 30-foot setback area in Hollywood Park Specific Plan area for street purposes. Existing sidewalk widths along Prairie would be maintained, landscaping and signage would be replaced within the existing HPSP setback area, and the intent of the development standards and future development potential would be unchanged by the ITC Project.

The elevated stations and guideway would not obstruct existing traffic flow, would not block access to existing residential, commercial and all other facilities or create a physical division of the existing community, and the Design Guidelines will help minimize visual impacts to the surrounding community.

Additionally, the residential neighborhoods located west of the Prairie Avenue commercial entertainment facilities located east of Prairie Avenue are currently separated by Prairie Avenue. While the ATS guideway and associated support columns would change the physical characteristics of this segment of Prairie Avenue and Prairie Avenue will be shifted to the east as discussed above to maintain the existing roadway capacity, the addition of the ATS system and widening of Prairie Avenue by shifting one travel lane to the east will not result in Prairie Avenue further dividing the community. Access to existing commercial and residential uses on both sides of the guideway would remain due to the elevated nature of the guideway and the implementation of the Design Guidelines. Therefore, the Prairie Avenue Segment of the proposed Project will have a less than significant impact to local access and physical division of the community.

#### **Mitigation Measures**

Impact is less than significant. No mitigation measures required.

#### **Level of Significance after Mitigation**

Impact is less than significant. No mitigation measures required.

**Impact LU-2: Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?**

#### **Impacts**

This analysis addresses both the construction and operation of the proposed Project. The discussion evaluates whether implementation of the proposed Project would conflict with an applicable land use plan, policy, or regulation to such an extent that it would constitute a significant, adverse environmental impact.

The criterion for determining significance with respect to land use plans considers conflicts with plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect. This criterion recognizes that an inconsistency with an individual plan, policy, or regulation does not necessarily equate to a significant physical impact on the environment.

**SCAG 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy**

The overarching goals of the 2020–2045 SCAG RTP/SCS address four core categories: economy, mobility, environment, and healthy/complete communities. The RTP/SCS includes goals to improve mobility and access for local communities in the region with reliable and safe transportation options. The RTP/SCS also encourages a diverse portfolio of transportation options that would increase people and goods movement within the region using new transportation technologies and data driven solutions that result in more efficient travel. Beyond transportation, the RTP/SCS also seeks to reduce greenhouse gas emissions and improve air quality within the region while supporting more healthy and equitable communities.

The proposed Project would further the objectives of the plan by increasing local and regional transportation options while minimizing greenhouse gas emissions locally and in the region. The proposed Project would be a reliable transportation system that would improve the security and resilience of the regional transportation system by increasing local transportation service capacity and options for transportation in the region. The increase in transportation service capacity would promote regional economic prosperity and competitiveness while serving major regional activity centers including downtown Inglewood, SoFi Stadium, the Forum and the Inglewood Basketball and Entertainment Center (IBEC).

The proposed Project would decrease local VMT and improve local air quality (See **Section 4.2**) in the City of Inglewood. As the proposed Project is located within and adjacent to disadvantaged and underserved communities, the health benefits and reliable, low-cost transit service would create a more equitable community with increased access and reliable transportation options. Lastly, the proposed Project would increase transportation options for diverse housing types in the area, including single and multifamily residential uses in the City of Inglewood.

**Table 4.9-2: SCAG 2020–2045 RTP/SCS Analysis** provides a consistency analysis of the proposed Project as compared to applicable goals and policies contained in various chapters of the SCAG 2020-2045 RTP/SCS. The analysis contained in **Table 4.9-2** demonstrates the proposed Project would generally be consistent with the advisory and voluntary RTP/SCS Goals and Policies. Therefore, implementation of the proposed Project would not result in significant land use impacts due to inconsistency with the RTP/SCS. Accordingly, impacts would be less than significant. For consistency with SCAG growth forecast for population, employment, and housing please refer to **Section 4.11**.

**Table 4.9-2  
SCAG 2020–2045 RTP/SCS Analysis**

2020 RTP/SCS Goals, Policies, and Strategies	Project Consistency
<b>Goal 1:</b> Encourage regional economic prosperity and global competitiveness.	<b>Consistent.</b> Implementation of the proposed Project would have local and regional economic benefits by improving access to the City's major activity centers including downtown Inglewood, SoFi Stadium, Forum and IBEC, increasing regional connectivity, and incentivizing economic activity across the region along the transit route.
<b>Goal 2:</b> Improve mobility, accessibility, reliability, and travel safety for people and goods.	<b>Consistent.</b> The proposed Project would develop a fully elevated guideway connecting the Metro K Line, downtown Inglewood, and the City's major activity centers. The proposed Project would maximize the movement of passengers and travelers on both event and non-event days at SoFi Stadium, Forum and IBEC, by integrating pedestrian, roadway, and transit improvements into an efficient transportation network. Further, the proposed Project would provide convenient, reliable, and time-certain transit service for residents and visitors. As such, the proposed Project would improve mobility, accessibility, reliability, and travel safety for the region.
<b>Goal 3:</b> Enhance the preservation, security, and resilience of the regional transportation system.	<b>Consistent.</b> The proposed Project would develop a fully elevated dual lane guideway with supporting maintenance facilities integrated into the City of Inglewood's transportation system and linking with the regional light rail system. Regular maintenance would be provided to support the continuing operation of the system, enhancing the security and resilience of this new component of the regional transportation system.
<b>Goal 4:</b> Increase person and goods movement and travel choices within the transportation system.	<b>Consistent.</b> The proposed Project would expand the range of travel choices available in the City of Inglewood by adding a transit system that links downtown Inglewood and activity centers in the City with the regional light rail network.
<b>Goal 5:</b> Reduce greenhouse gas emissions and improve air quality.	<b>Consistent.</b> The proposed Project would reduce reliance on automobiles and other light duty vehicles in the City of Inglewood by providing an alternative mode of travel within the City that links to the regional light rail network. The proposed Project also includes streetscape improvements that would facilitate pedestrian and bicycle travel by reducing vehicles and congestion on the existing roadway system and increasing transit, pedestrian, and bicycle use which would reduce greenhouse gas emissions and improve air quality.
<b>Goal 6:</b> Support healthy and equitable communities.	<b>Consistent.</b> The proposed Project would reduce traffic congestion and overall VMT, increasing use of transit, bicycle, and pedestrian travel, which would improve local and regional air quality and public health in the City of Inglewood. The addition of the proposed Project in the City of Inglewood that links to the regional light rail

2020 RTP/SCS Goals, Policies, and Strategies	Project Consistency
	network would provide a reliable, low-cost transportation option to SB 535 disadvantaged communities.
<b>Goal 7:</b> Adapt to a changing climate and support an integrated regional development pattern and transportation network.	<b>Consistent.</b> The proposed Project would include a range of both mandatory and feasible sustainability measures, reduce congestion, and reduce overall vehicle miles traveled (See <b>Section 3.0, Table 3.0-5</b> ). The proposed Project would link downtown Inglewood and activity centers in the City to the Metro K Line light rail line, which would support an integrated development pattern and transportation network.
<b>Goal 8:</b> Leverage new transportation technologies and data-driven solutions that result in more efficient travel.	<b>Consistent.</b> The proposed Project would integrate a new transportation technology into the City's transportation system. By linking downtown Inglewood and activity centers in the City to the regional light rail network, the proposed Project would result in more efficient travel.
<b>Goal 9:</b> Encourage development of diverse housing types in areas that are supported by multiple transportation options	<b>Consistent.</b> Implementation of the proposed Project would expand the range of transportation options available in the City of Inglewood by providing a transit system within the City that links to the regional light rail network, which would facilitate the development of a diverse range of housing in the City.

Source: SCAG. 2020-2045 RTP/SCS ConnectSoCal. September 3, 2020. <https://www.connectsocial.org/Documents/Adopted/ConnectSoCal-Plan.pdf>. Accessed October 6, 2021.

#### Los Angeles County Airport Land Use Commission Airport Land Use Plan

Portions of the guideway, stations, and support facilities, including the MSF, the Prairie Avenue/Manchester Boulevard Station, and the Prairie Avenue/Hardy Street Station, are located within the LAX Planning Boundary/Airport Influence Area. Based on review by the Los Angeles County Airport Land Use Commission staff, review of the proposed Project by the Airport Land Use Commission is not required.

As shown in **Figure 4.9-1**, the proposed Project is also not located within the Runway Protection Zone (RPZ)<sup>28</sup> and is not subject to land use restrictions in the RPZ, including the restrictions on residential and public assembly uses. A portion of the proposed ATS alignment along Manchester Boulevard and Prairie Avenue is located within the 65 dB CNEL noise contour for the airport. As a transit facility, the proposed ATS would be a compatible use in the 65 dB CNEL contour as the ATS is not a noise sensitive use.

28 Los Angeles World Airports. *Los Angeles Plan Amendment Study Report*. March 2012.

#### City of Inglewood General Plan

##### Land Use Element

The General Plan policies focus largely on orderly infill development, promotion of transit oriented development, facilitation of mixed uses, provision of housing for all income level households, improvement of aesthetics, provision of public services, safety from seismic effects, use of alternative energy sources, and prevention of land use consistency conflicts. In order to ensure the proposed Project is consistent with the Land Use Element of the General Plan, the following changes to the Land Use Element are proposed:

- The new text shown as underlined is proposed to be added to the goal below in the "Circulation" subsection of the "Goals and Objectives" section:
  - Promote and support adequate public transportation within the city and the region, including through the development and operation of the Inglewood Transit Connector and its appurtenant infrastructure, stations, maintenance and storage facility, substations, and related improvements.
  - The new text shown as underlined is proposed to be added to the "Downtown Transit Oriented District" subsection of the "Goals and Objectives" section for the following policies and the text shown as strikethrough will be deleted:
    - Policy 2.3: *Preservation of Historic Fabric*. Require the preservation of buildings that have been designated as historic and encourage the reuse of other historic buildings. Maintain the sense of place in areas with historic fabric and/or meaning such as Market Street between Regent Street and Hillcrest Avenue and the Hillcrest neighborhood east of Locust Street, while also accommodating for the development of the Inglewood Transit Connector along Market Street between Regent Street and Manchester Boulevard.
    - Policy 3.5: *Local Transit Connections to Metro Rail*. Provide quality local transit connections from major destinations such as the NFL Stadium and Forum to downtown and the Downtown Inglewood Metro station through development and operation of the Inglewood Transit Connector using existing or emerging technologies.
    - Policy 3.6: *Parking District*. Establish a parking district with shared parking consolidated in garages or surface lots and manage pricing.
- The new text shown as underlined is proposed to be added and the text shown as strikethrough would be deleted under the "Passenger Train Service" subsection in the "Development Factors – Transportation Network" section:
  - Passenger Train Service

Inglewood is currently connected to the Los Angeles Metro Rail system by Crenshaw Station on the Metro C Line. This station is located in the 105 freeway at Crenshaw Boulevard.

The Metro K Line, scheduled to open in 2021~~19~~, will add three new stations to the City of Inglewood: Fairview Heights (Florence/West), Downtown Inglewood (Florence/La Brea), and Westchester/Veterans (Florence/Hindry).

The Inglewood Transit Connector, anticipated to open in 2027, would further enhance connectivity by adding an extension from the Metro K Line that would connect the transit line's

Market Street Station (located at Florence/Market) to the entertainment, housing, and employment centers located at or near The Forum, the NFL Stadium, Hollywood Park and the future Inglewood Basketball and Entertainment Center.

2. The new text shown as underlined is proposed to be added and the text shown as strikethrough would be deleted in the “Downtown Transit Oriented District” subsection in “Future Land Uses”:

G. Downtown Transit Oriented District [*Intervening text intentionally omitted*]

The Downtown Transit Oriented District consists principally of the half-mile radius around the Downtown Inglewood Metro Station located near Florence Avenue and Market Street but also can incorporate the areas adjacent to the Inglewood Transit Connector. The Transit Oriented District should contain a variety of mutually complementary uses, including residential, office, retail, government and light industrial/creative office, all in a pedestrian-friendly environment that facilitates transit usage. Concept plans, zoning and design guidelines for this District are given by the TOD Plan for the area or, with respect to those areas containing the Inglewood Transit Connector, the zoning provisions and design guidelines of the Transportation Corridor Overlay Zone. It is divided into seven sub-districts: Historic Downtown, Civic Center, TechTown, Beach Avenue, Fairview West, Hillcrest and Queen Street.

The proposed amendments are consistent with the intent of these existing goals and policies for the Downtown Transit Oriented District and the City’s circulation system. Specifically, the proposed Project would implement Policy 3.5 by providing a local connection to the Metro Rail system from Downtown Inglewood and activity centers in the City including SoFi Stadium, Forum, and IBEC. The additional surface parking lots providing public parking included as components of the proposed Project are consistent with the intent of Policy 3.6 for parking in the Downtown Transit Oriented District.

The proposed changes are consistent with the Land Use Element goals for promoting and providing adequate public transit to the local community. The proposed Project would add reliable public transit to Inglewood communities that do not have access to existing transit services. The Design Guidelines would ensure the proposed Project is integrated into the historic fabric for the segment of the guideway that would travel through the City’s historic core along Market Street.

The proposed TOC Overlay Zone and Design Guidelines are complementary to, and consistent with the existing policies for the Downtown Transit Oriented District to create a pedestrian-friendly environment that facilitates transit usage.

Overall, the proposed Project furthers the goals of the Land Use Element by providing additional transit options and facilitating transit-oriented development within the City of Inglewood. As the proposed Project would connect passengers between downtown Inglewood and the City’s activity centers, it would result in additional transit options for both residents and visitors and create transit-oriented development areas near the transit line.

The proposed Project also supports other General Plan policies as well which are not directly related to transit. The proposed Project would support infill development and increase the use of alternative methods of circulation centered around the Metro system, pedestrian network, and bicycle facilities. The increase in visitors and pedestrian activity that would be associated with the proposed Project in downtown and around the other stations, coupled with proposed streetscape improvements, would advance economic development through increased patronage at local businesses and help encourage mixed-use land development patterns conducive to pedestrian activity.

As shown in **Table 4.9-3: Project Consistency with General Plan Land Use Element**, the proposed Project would support and would be generally consistent with the Land Use Element. Operation of the proposed Project would not conflict with any of the applicable goals, objectives, and policies included in the City’s General Plan Land Use Element and, thus, would not result in a significant impact.

**Table 4.9-3  
Project Consistency with General Plan Land Use Element**

Goals and Policies	Project Consistency
<b>Goals and Policies added with 2016 Amendment</b>	
<b>Goal 1:</b> Downtown is a place to live, work, shop, recreate, and be entertained.	<b>Consistent.</b> The proposed Project would strengthen Downtown Inglewood for commercial and residential uses by increasing accessibility to the downtown area from local activity centers and the regional light rail network. This increased transit accessibility would promote local economic development opportunities, and enhance downtown’s retail, recreation, and entertainment offerings and range of housing and employment options. Implementation of the proposed Project would activate and complement development in the City, and enhance social cohesion, equity, and community resilience.
<b>Policy 1.1:</b> Mixed Use Development. Encourage a range of residential, retail, office, recreational, and institutional uses in the Historic Downtown to create a vibrant urban district and support local business.	<b>Consistent.</b> The proposed Project would increase transit accessibility in the City’s Historic Downtown, which would support and encourage the development of a range of residential, retail, office, recreational, and institutional uses. By connecting downtown with local activity centers and the regional light rail network, the proposed Project would result in an increase in visitors and pedestrian activity in the downtown neighborhood that would support the development of a vibrant urban district and support local businesses.
<b>Goal 2:</b> Downtown is a revitalized yet forward-looking gathering place for the community.	<b>Consistent.</b> The proposed Project would promote economic development opportunities in downtown Inglewood and support the development of a revitalized downtown that serves as a gathering place for residents and visitors by increasing transit accessibility.
<b>Policy 2.2:</b> Pedestrian Network. Enhance sidewalks, repurpose alleys and create mid-block passthroughs and	<b>Consistent.</b> The proposed Project would maintain and enhance sidewalks around the stations and guideway which would enhance the pedestrian environment.

4.9 Land Use and Planning

Goals and Policies	Project Consistency
internal courtyards to serve as pedestrian passageways and enjoyable public spaces.	Sidewalks would be enhanced and widened at necessary points adjacent to the support columns to meet Americans with Disabilities Act (ADA) pedestrian circulation requirements, including along Market Street. New enjoyable public spaces would be created at each of the proposed stations that would be designed in accordance with the Design Guidelines.
<b>Policy 2.3:</b> Preservation of Historic Fabric. Require the preservation of buildings that have been designated as historic and encourage the reuse of other historic buildings. Maintain the sense of place in areas with historic fabric and/or meaning such as Market Street between Regent Street and Hillcrest Avenue and the Hillcrest neighborhood east of Locust Street.	<b>Consistent.</b> The proposed Project would not result in significant impacts to historic buildings. For detailed analysis, please refer to <b>Section 4.4 Cultural Resources</b> . To properly incorporate the proposed Project into the existing historic fabric of downtown Inglewood, the amendment to Policy 2.3 has been proposed to include the ATS system. With the incorporation of the GP amendment the proposed Project would be consistent with the GP Land Use Element.  The guideway would have an integrated, clean design, with round columns spaced as far apart as feasible. The underside of the guideway would be smooth, and color of the concrete would be neutral with accents achieved through lighting with tapered edges to reduce visual massing. Street trees and new landscaping would be planted within the median below Market Street. Improved landscaping and widened sidewalks would enhance the public realm for pedestrians to gather and circulate along Market Street.
<b>Goal 3:</b> Downtown provides a unique mix of accessibility options including light rail, pedestrians, bicycles, autos, buses, and advanced technology local transit.	<b>Consistent.</b> The proposed Project would expand the range of accessibility options in downtown consistent with this goal by connecting downtown to the regional light rail network and enhance pedestrian and bicycle transit through streetscape improvements.
<b>Policy 3.1:</b> Complete Streets. Accommodate all modes of transportation on streets, with particular attention to transit vehicles and pedestrians, but also design streets to serve as open spaces in the urban environment, places where people gather, communicators of the locality's culture, vision and values, and generators of development on adjacent parcels.	<b>Consistent.</b> The guideway would be fully elevated above the existing street network, adding an additional mode of transportation without affecting the existing street network. Streetscape improvements would maintain and improve pedestrian access around the stations. The Design Guidelines address the design character of the stations and the integration of the stations with the pedestrian, bicycle, and vehicular character of the street network.
<b>Policy 3.4:</b> Pedestrian Connections to Metro Rail. Establish high-quality at-grade and/or bridge connections from the Downtown Inglewood Metro station across Florence Avenue to the south. Make every effort to facilitate a direct pedestrian connection from the station to Beach Avenue to the north.	<b>Consistent.</b> The proposed Project would provide a pedestrian connection from the Market Street/Florence Avenue Station to the Metro K Line by means of an elevated passenger walkway spanning Florence Avenue. The elevated passenger walkway would extend north from the mezzanine level of the Market Street/Florence Avenue Station, cross Florence Avenue, and land on the pedestrian sidewalk on the north side of Florence Avenue. Additionally, the Market Street/Florence Avenue Station would include ground level pedestrian connections to encourage pedestrian circulation in the vicinity of the proposed Project.
<b>Policy 3.5:</b> Local Transit Connections to Metro Rail. Provide quality local transit connections from major	<b>Consistent.</b> The primary intent of the proposed Project is to provide a public transportation connection between

4.9 Land Use and Planning

Goals and Policies	Project Consistency
destinations such as the NFL Stadium and Forum to Downtown and the Downtown Inglewood Metro station using existing or emerging technologies.	the Metro K line and major activity centers in the City, including the Forum, Los Angeles Sports and Entertainment District, and future Inglewood Basketball and Entertainment Center. The ATS trains would be a driverless, self-propelled electric train using existing technologies to make the transit connection.
<b>Policy 3.6:</b> Parking District. Establish a parking district with shared parking consolidated in garages and manage pricing.	<b>Consistent.</b> Parking facilities would be provided as part of the proposed Project to supplement existing parking in downtown and offset any existing street-side parking that may be impacted by the implementation of the proposed Project.
<b>Goal 4:</b> Downtown is a major economic engine providing jobs, sales tax, and other revenues.	<b>Consistent.</b> The proposed Project would increase the number of visitors to downtown Inglewood. This increase would generate additional business patronage and economic growth in downtown, contributing to more jobs, sales tax revenue, and other revenues in the City.
<b>Policy 4.1:</b> Major Sites Development. Develop major sites and create new destinations at the north and south ends of Market Street, immediately north of the Metro station, and on and around the City Yard that create jobs, generate revenues for the city through sales and bed tax and provide new opportunities for residents.	<b>Consistent.</b> The guideway would begin at the Market Street/Florence Avenue Station, located near the Market Street/Florence Avenue intersection. The placement of a station in this vicinity would serve to create a public transportation destination for visitors or residents traveling to one of the City's activity centers or to downtown. This increase in transit accessibility and activity in downtown would support the development of major site at the north and south ends of Market Street.
<b>Goals and Policies (as adopted January 1980)</b>	
<b>General</b>	
Provide for the orderly development and redevelopment of the City while preserving a measure of diversity among its parts. Allocate land in the City to satisfy the multiple needs of residents but recognize that land is a scarce resource to be conserved rather than wasted.	<b>Consistent.</b> The proposed Project involves the development of an elevated guideway built entirely above grade and largely within the public rights-of-way, with support constructed on appropriate sites adjacent to the guideway. The MSF would consist of an elevated building on an approximately 4- to 6-acre site with sufficient space for maintenance facilities, administration facilities, storage, shipping/receiving areas, and staff parking. The guideway, stations, and support facilities are intended to meet the transportation needs of the City while ensuring that the development of new, major activity centers can be accommodated by the local and regional transportation network in an orderly fashion. Additionally, the proposed Project would encourage complementary transit-oriented, mixed-use development near stations conducive to the anticipated increase in pedestrian activity, including within the Downtown TOD Plan area.
Help promote sound economic development and increase employment opportunities for the City's residents by responding to changing economic conditions.	<b>Consistent.</b> The proposed Project would support economic activity in downtown Inglewood by improving connectivity to activity centers in the region and locally, thereby increasing employment opportunities for the City's residents. Additionally, the proposed Project would create jobs in the maintenance and operation of the ATS trains at the MSF.

4.9 Land Use and Planning

Goals and Policies	Project Consistency
Maximize the use and conservation of existing housing stock and neighborhoods and also facilitate development of new housing to meet community needs.	<b>Consistent.</b> The proposed Project would provide an additional transportation option between downtown Inglewood and the City's activity centers for visitors and residents. The proposed Project would enhance the use and viability of existing housing as well as encourage new mixed-use, transit-oriented development, including residential uses.
Promote Inglewood's image and identity as an independent community within the Los Angeles metropolitan area.	<b>Consistent.</b> The proposed Project would encourage and facilitate greater access to the City's activity centers, including SoFi Stadium, Forum, IBEC and downtown Inglewood. These activity centers contribute to the City's status and identity as an entertainment destination within the Los Angeles metropolitan area.
<b>Commercial</b>	
Create and maintain a healthy economic condition with the present business community and assist new business to locate within the City.	<b>Consistent.</b> The proposed Project's introduction of increased visitors through increased connectivity to the region would likely have the effect of encouraging business patronage, employment, and economic growth in the City.
Protect local businessmen and encourage the importance of maintaining a strong commercial district in the downtown.	<b>Consistent.</b> As mentioned previously, the proposed Project's introduction of increased visitors and pedestrian traffic in the downtown neighborhood would likely have the effect of encouraging business patronage, employment, and economic growth in the area.
Improve the visual appearance and economic condition of the existing arterial commercial development along Inglewood's major streets.	<b>Consistent.</b> The proposed Project would enhance the appearance of major streets adjacent to the ATS system facilities including sidewalks and roadway medians. The appearance of the ATS structure would be modern with transparent and neutral toned color scheme to create an appealing appearance. The color scheme is also chosen to help better integrate the ATS structure with the adjacent environment. The ATS system would facilitate movement of greater numbers of residents and visitors along major streets in the City, thereby having the potential to activate existing commercial corridors, particularly along Market Street.
Promote the development of commercial/recreational uses which would complement those which are already located in Inglewood.	<b>Consistent.</b> As mentioned previously, the proposed Project's introduction of increased visitors and pedestrian traffic in the downtown neighborhood would likely have the effect of encouraging business patronage, employment, and recreational development in the area. Connectivity to existing recreational uses such as the Forum and SoFi stadium would complement commercial recreational uses already located in Inglewood.
<b>Industrial</b>	
Increase the industrial employment opportunities for the City's residents.	<b>Consistent.</b> The proposed Project would include an MSF which would provide for regular and preventive maintenance of the ATS train rolling stock and operating equipment, as well as space for storage of the vehicle fleet. Additionally, the MSF would house the operations control center where automated train operations would be monitored and controlled. The proposed Project is

4.9 Land Use and Planning

Goals and Policies	Project Consistency
	anticipated to generate approximately 150 full time employment opportunities in the light industrial sector.
<b>Circulation</b>	
Ensure that proposed new uses can be accommodated by adequate and safe streets.	<b>Consistent.</b> During construction of the proposed Project, right-of-way closures or diversions may occur along the length of the guideway and near the MSF and City's ITF sites. However, such closures would be temporary and would adhere to a traffic construction management plan as approved by the City of Inglewood Transportation Division. Upon implementation of the proposed Project, the existing number of travel lanes in the area would be maintained and area roadways would continue to accommodate a range of transportation options.
Promote and support adequate public transportation within the City and the region.	<b>Consistent.</b> The proposed Project would increase existing capacity and provide additional access to public transportation within the City and the region by adding a transit system to connect visitors and residents with downtown Inglewood and activity centers in the City and to regional light rail system.
Develop modified traffic systems that would discourage through traffic from utilizing neighborhood streets.	<b>Consistent.</b> Implementation of the proposed Project would increase transit choices and reduce vehicle trips in the City.
Develop a safe and adequate pedestrian circulation system which is barrier-free for the handicapped.	<b>Consistent.</b> The proposed Project would include pedestrian access at the ground level surrounding the stations along the proposed Project. Access to the stations would be accomplished through ADA-compliant pedestrian amenities such as escalators, elevators, stairs, signage, walkways, and mezzanine areas. Streetscape improvements along the guideway would ensure that sidewalks/walkways would be ADA-compliant surrounding stations, support columns, and other facilities.
<b>Community Facilities</b>	
Maintain the present high level of police and fire services to the extent it is fiscally prudent.	<b>Consistent.</b> The proposed Project would divert some attendees of the City's activity centers who would otherwise travel by private vehicle, resulting in reduced traffic and congestion. The reduction in surface vehicle traffic could potentially reduce the amount of police and fire services required in the area. However, passengers of the ATS system would require additional police and fire services. The City would work with the local police and fire services to ensure that a high quality of existing police and fire services would be maintained.
Expand opportunities for cultural and social growth for the City's residents.	<b>Consistent.</b> The proposed Project would encourage economic development in downtown Inglewood and transit-oriented development in the vicinity of the proposed Project while connecting neighborhoods with the City's activity centers. These efforts would serve to expand opportunities for cultural and social growth amongst the City's residents.
Source: City of Inglewood General Plan, "Land Use Element" (2016). *Proposed GP Amendment	

**Environmental Justice Element**

The Environmental Justice Element focuses on issues of equity when planning for future growth and development in the City, highlighting two environmental justice factors- pollution burden and population characteristics. Environmental Justice is a prominent issue in the City as residents in the City primarily reside in SB 535 disadvantaged communities and the City of Inglewood consistently ranks among the top 25 percent in California with the highest pollution burden and socioeconomic vulnerabilities.<sup>29</sup>

The proposed Project would further the goals and objectives stated within the Element by providing reliable transit service and improving mobility of the local City residents while reducing the number of vehicles on the existing roadway. These reductions in vehicle miles traveled would contribute to a reduction in air quality impacts in the local neighborhoods and the region, providing an improvement to local air quality and public health (see **Section 4.2**). Noise impacts on the roadways would not increase during the operation of the proposed Project and the overall noise impact would be less than significant during operation which would ensure the quality of life of the nearby communities (see **Section 4.10**). The City has involved and would continue to involve the community during the proposed Project’s planning and environmental review process and has provided and would continue to provide information to the public through public outreach efforts, notifications online and publications in newspapers and mailing notices. For outreach effort information conducted during the planning period by the proposed Project, please refer to **Section 2.0: Introduction** and associated appendices (**Appendix A: Revised NOP and IS** and **Appendix B: Summary of Comments on Revised NOP**). Furthermore, over 100 public meetings have been held with community members including local businesses and property owners. The City would continue outreach efforts during the construction period to inform communities and businesses of the latest project construction updates, to coordinate mitigation measures to local businesses for parking and access, and to provide additional signage, advertisements, and support throughout the construction duration.<sup>30</sup> These outreach efforts increase the participation of nearby disadvantaged neighborhoods and makes project information available to the public.

In addition, the proposed MSF has been sited and designed to maintain the existing Vons Store on Manchester Boulevard, consistent with the goals and policies in the Element to provide access to affordable and nutritious food.

As shown in **Table 4.9-4: Project Consistency with Environmental Justice Element**, the proposed Project would support and be consistent with the Environmental Justice Element.

<sup>29</sup> City of Inglewood. *Environmental Justice Element*. April 2020. <https://www.cityofinglewood.org/DocumentCenter/View/14211/Environmental-Justice-Element>.  
<sup>30</sup> ITC Construction Commitment Program.

**Table 4.9-4  
Project Consistency with Environmental Justice Element**

**Goals and Policies**  
**Participation and Collaboration**

**Goal 1:** Residents and stakeholders who are aware of, and effectively participate in, decisions that affect their environment and quality of life. **Consistent.** The City circulated the Initial Study (Original IS) and issued a Notice of Preparation (Original NOP) on July 16, 2018. Publication of project notices were also published in Los Angeles Times (July 18, 2018), La Opinion (July 18, 2018), and Inglewood News (July 19, 2018) newspaper circulations. A public scoping meeting for the proposed Project was held on July 26, 2018. Notification of revised project scope were circulated via a Revised NOP and Revised IS on September 10, 2020. Notice was provided by publication in newspaper circulations for the Revised NOP including Los Angeles Times on September 16, 2020, Inglewood Today on September 24, 2020, and the Spanish- language newspaper La Opinion on September 15, 2020, as well. Comments were collected from both rounds of NOP/IS publications and the scoping meeting and considered in the formulation and assessment for the proposed Project. The City provided notice of the availability (NOA) of the Draft Environmental Impact Report on December 23, 2020. This notice stated that comments would be accepted on the DEIR through February 8, 2021. The NOA was published in the Los Angeles Times on December 23, 2020, and was also published in the Spanish- language newspaper La Opinion on December 17, 2020. The City would continue to ensure residents and stakeholders are aware of, and can effectively participate in, decisions concerning the proposed Project and its environmental effects.

**Policy EJ-1.11:** Conduct broad outreach on public hearings that affect the environment in languages used by the community. **Consistent.** The City hosted an open house style public scoping meeting for the proposed Project on July 26, 2018. Both Spanish translators and sign language interpreters were present to assist with interpretation. The Original IS and Original NOP were circulated on July 16, 2018, and three newspaper publications were published on July 18/19, 2018. Additionally, a Revised NOP and IS with updated project information were published on September 10, 2020. Publications notices were published in the newspaper circulations for the Revised NOP including Los Angeles Times on September 16, 2020, Inglewood Today on September 24, 2020, and the Spanish- language newspaper La Opinion on September 15, 2020, as well. Comments from the public, organizations, and agencies were collected and considered for Project analysis. The City provided notice of the availability (NOA) of the Draft Environmental Impact Report on December 23, 2020. This notice stated that comments would be accepted on the DEIR through February 8, 2021. The NOA was published in the Los Angeles Times on December 23, 2020, and was also

4.9 Land Use and Planning

Goals and Policies

published in the Spanish- language newspaper La Opinion on December 17, 2020. The City also held a virtual public meeting on January 13, 2021, to provide information on the project and allow for public comments on the Draft EIR. Outreach efforts continued after and in between the scoping periods and reaching over 100 community and stakeholder outreach meetings prior to the publication of this DEIR. Outreach efforts will continue to be held after the publication of the Recirculated DEIR with additional newspaper publications and public hearings being held.

**Policy EJ-1.12:** Inform the public on decisions that affect their environment using multiple communication methods, including traditional and online forms of communication.

**Consistent.** Three newspaper notices publications were published on July 18/19, 2018. Circulation of Original NOP by mail was distributed on July 16, 2018. The Original IS and Original NOP were also posted on City of Inglewood’s Envisioning Inglewood website and CEQAnet. Additionally, a Revised NOP and IS with updated project information were published on September 10, 2020. Publications notices were published in the newspaper circulations for the Revised NOP including Los Angeles Times on September 16, 2020, Inglewood Today on September 24, 2020, and the Spanish- language newspaper La Opinion on September 15, 2020, as well. The City provided notice of the availability (NOA) of the Draft Environmental Impact Report on December 23, 2020. This notice stated that comments would be accepted on the DEIR through February 8, 2021. The NOA was published in the Los Angeles Times on December 23, 2020, and was also published in the Spanish- language newspaper La Opinion on December 17, 2020. The City would continue to use multiple communication methods, including traditional and online forms of communications, for the proposed Project during the Project review, the approval process, and during the construction duration.

**Policy EJ-1.13:** Provide written notices and other announcements regarding key land use and development issues in English and Spanish where feasible. For all other materials, note that verbal translation assistance is available.

**Consistent.** Newspaper notices were published in both Spanish and English in three newspapers—Los Angeles Times, La Opinion, and Inglewood Times. The City would continue to follow these notice procedures for the proposed Project.

**Policy EJ-1.14:** Offer interpretation services at key meetings and workshops on issues affecting the environment.

**Consistent.** Project public scoping meeting hosted on July 26, 2018, included Spanish translators and sign language interpreters for the meeting. Spanish translators and sign language interpreters will also be present at future meetings hosted for the Project.

**Policy EJ-1.15:** Consider offering childcare at key meetings and workshops on environmental issues affecting entire neighborhoods and the City as a whole.

**Consistent.** The scoping meeting was a focused technical meeting; childcare was considered for this meeting but determined not to be warranted. Childcare would be considered for future general meetings on the Project.

**Policy EJ-1.16:** Consider varying the time and date of key meetings and workshops, or holding multiple meetings and workshops, in order to ensure broad participation.

**Consistent.** Over 100 meetings with community stakeholders, including business owners and property owners, and agencies has been conducted over the span of over two years. The number of meetings and varying

4.9 Land Use and Planning

Goals and Policies

time, date, and places ensured broad participation by the public. The City would continue to consider varying times, dates, and places for Project meetings and workshops for all future meetings.

**Policy EJ-1.17:** Seek feedback on public decisions through traditional and online forms of communication, such as website, email, mobile phone apps, online forums, and podcasts.

**Consistent.** Public comment periods were held from July 16, 2018, to August 15, 2018, and from September 10, 2020, to October 12, 2020, for the Original and Revised NOPs. Public comments were accepted on the Draft EIR from December 23, 2020, to February 8, 2021. Comments and feedback on the proposed Project were accepted both through an online form and mail. Both the Original NOP and the Revised NOP for the proposed Project was published through the Envision Inglewood website and distributed through emails and on the ground mailing. The City would continue to seek feedback on the proposed Project through traditional and online forms of communication.

**Policy EJ-1.18:** Partner with community-based organizations that have relationships, trust, and cultural competency with target communities to outreach on local initiatives and issues.

**Consistent.** The City has and would continue to coordinate with community-based organizations to conduct outreach on the proposed Project (See Section 2.0).

General Environmental Health

**Goal 2:** The community’s exposure to pollution in the environment is minimized through sound planning and public decision making.

**Consistent.** The proposed Project would reduce overall vehicle miles traveled, reduce congestion, and improve local air quality.

**Policy EJ-2.1:** Incorporate compliance with State and federal environmental regulations in project approvals.

**Consistent.** The proposed Project would comply with all State and federal environmental regulations for project approval.

**Policy EJ-2.2:** Work with other agencies to minimize exposure to air pollution and other hazards in the environment.

**Consistent.** The proposed Project would reduce overall vehicle miles traveled, reduce congestion, and improve air quality in the local community. The City has planned the proposed Project in cooperation with local and regional agencies.

**Policy EJ-2.3:** Ensure compliance with rules regarding remediation of contaminated sites prior to occupancy of new development.

**Consistent.** The proposed Project would provide remediation to sites with contamination prior to construction of the proposed Project’s components. This includes the removal of existing UST at the MSF site and potentially contaminated soil due to prior use. Refer to Section 4.8: Hazards for more information.

**Policy EJ-2.4:** Create land use patterns and public amenities that encourage people to walk, bicycle and use public transit.

**Consistent.** The proposed Project would add to local transportation options and promote land use patterns that encourage people to walk, bicycle, and use public transit. Pedestrian facilities near stations and along the guideway would be widened and improved to incorporate ADA components and bicycle parking would be provided at transit stations.

**Policy EJ-2.8:** Encourage new development to reduce vehicle miles traveled to reduce pollutant emissions.

**Consistent.** The proposed Project would provide an additional public transit option to the local area and reduce overall vehicle miles traveled, reduce congestion, and improve local air quality.

4.9 Land Use and Planning

**Goals and Policies**

**Policy EJ-2.12:** Place adequate conditions on large construction projects to ensure they do not create noise, dust, or other impacts on the community to the extent feasible.

**Consistent.** The proposed Project would include a Construction Commitment Program and implement mitigation measures to minimize the impacts of construction on the community to the extent feasible. Refer to **Sections 4.2** and **4.10** for more information.

**Access and Connectivity**

**Goal 3:** A community that promotes physical activity and opportunities for active living.

**Consistent.** The proposed Project would promote active living by reducing vehicle volumes and congestion on the City's street system and enhancing the pedestrian and bicycle infrastructure in the City.

**Policy EJ-3.4:** Require the provision of on-site bicycle facilities in new large-scale development projects.

**Consistent.** The proposed Project would construct on-site bicycle facilities at stations to facilitate an active lifestyle around the City.

**Policy EJ-3.5:** Partner with transit agencies to ensure that parks and recreational facilities are accessible to low-income and minority populations.

**Consistent.** The proposed Project would provide an additional transit option for residents to access park and recreation facilities in the City.

**Policy EJ-3.7:** Encourage new specific plans and development projects be designed to promote pedestrian movement through direct, safe, and pleasant routes that connect destinations inside and outside the plan or project area.

**Consistent.** Pedestrian facilities including sidewalks, elevated passenger walkways, and access around stations would be improved to accommodate for ADA requirements and widened to accommodate for support column widths. A elevated passenger walkway would connect the Market Street/Florence Avenue Station with the Metro K Line downtown Inglewood station to facilitate direct and safe pedestrian travel.

**Affordable and Nutritious Food**

**Goal 4:** Healthy, affordable, and culturally appropriate food is readily available to all members of the community.

**Consistent.** Currently all Inglewood residents are within 1-mile of a grocery store, and approximately ninety-two percent (92.1%) of all residents are within 1/8-mile of a grocery store. The proposed MSF has been sited and designed to allow a new replacement Vons store to be developed on the site of the existing Vons store and co-located with the MSF. All Inglewood residents will remain within 1-mile of a grocery store.

**Policy EJ-4.4:** Maximize multimodal access to fresh food by encouraging grocery stores, healthy corner stores, and outdoor markets at key transit nodes and within new transit-oriented development projects.

**Consistent.** The proposed Project would provide additional mode of transportation providing local access to grocery stores and fresh food through the ATS system. Roadway adjacent facilities such as passenger walkways would also be improved to encourage local multimodal access. The proposed Project would facilitate the development of a new Vons replacement store on the MSF Site to replace the existing store to maintain access for the community to a grocery store at this location.

**Public Facilities**

**Goal 6:** Adequate and equitably distributed public facilities are available in the community.

**Consistent.** The proposed Project would provide transit service linking the southern area of the City with downtown and the regional light rail network. The proposed Project would increase local transit options, providing additional reliable and low-cost transportation facilities connecting communities across the City and to regional activity centers on the Metro K line.

4.9 Land Use and Planning

**Goals and Policies**

**Policy EJ-6.1:** Ensure the City provides equitable public improvements and community amenities to all areas of the City.

**Consistent.** The proposed Project would provide a reliable and low-cost transit option for the southern area of the City from the Metro K line, thereby increasing local transit options. Pedestrian facilities along the guideway and stations would be widened and improved to accommodate for ADA compliance and column widths. In addition, bike racks would be provided for community use and promote active transportation.

**Policy EJ-6.2:** Prioritize the City's capital improvement program to address the needs of disadvantaged communities.

**Consistent.** The proposed Project is entirely within or adjacent to SB 535 disadvantaged communities, located in the center of downtown Inglewood and provides transit service to the southern area of the City. The proposed Project would increase local transit options, providing an additional reliable and low-cost transportation facility connecting underserved communities across the City and to regional activity centers on the Metro K line.

**Policy EJ-6.3:** Plan for the future public improvement and service needs of underserved communities.

**Consistent.** As discussed in **Section 4.11**, both employment and population in Inglewood are anticipated to increase overtime. In addition, over 90 percent of the City's residents work outside of the City in the greater Los Angeles region. The proposed Project would reduce congestion and increase transportation capacity, while providing a reliable and low-cost transportation option to disadvantaged communities. As previously discussed, the proposed Project would be located entirely within an SB 535 disadvantaged community.

**Policy EJ-6.6:** Provide ongoing infrastructure maintenance in existing residential neighborhoods through the capital improvement program.

**Consistent.** The proposed Project would construct the MSF to allow for the continued maintenance of the ATS trains. Long term maintenance and operation of the system is anticipated for the proposed Project.

**Policy EJ-6.8:** Ensure that new public facilities are well designed, energy efficient and compatible with adjacent land uses.

**Consistent.** The proposed Project includes a range of both mandatory and additional feasible sustainability measures including energy efficiency measures, and measures to reduce congestion and overall vehicle miles traveled (See **Section 3.0, Table 3.0-5**). As discussed in **Section 4.1**, the proposed Project would include designs that would complement adjacent land uses and fit into the larger fabric of the community.

**Policy EJ-6.10:** Coordinate with the Inglewood Unified School District, transit agencies and other public agencies to provide adequate public facilities, improvements, and programs to the City of Inglewood.

**Consistent.** The NOP and Revised NOP were distributed to the Inglewood Unified School District and various public agencies including Metro and Caltrans. The proposed Project has taken the School District's concerns into account regarding Kelso Elementary School and would continue to work with the School District to minimize any potential project impacts to the school.

Source: City of Inglewood General Plan, "Environmental Justice Element" (2020).

**City of Inglewood Planning and Zoning Code**

The City of Inglewood Planning and Zoning Code implements the goals and policies of the comprehensive General Plan. To be consistent with the established zoning code, a proposed Project needs to be consistent with applicable standards.

The proposed Project includes the proposed adoption of a TC Overlay Zone to define appropriate standards for the development and operation of the proposed Project. A description of the TC Overlay Zone is analyzed below for its consistency to the General Plan and its effect on the proposed Project.

**New Downtown and Fairview Heights Transit Oriented Development Plan and Design Guidelines**

The New Downtown and Fairview Heights TOD Plan and Design Guidelines apply to new construction or rehabilitation within the areas of Fairview Heights and Downtown Inglewood. The New Downtown and Fairview Heights TOD Plan and Design Guidelines address the Downtown TOD area and Fairview Heights TOD areas separately. The Downtown TOD area consists of approximately 585 acres located in the center of Inglewood along the new Metro K line just east of the Florence Avenue/La Brea Avenue intersection. This planning and zoning area extends approximately ½ mile in all directions from the Metro K Line Downtown Inglewood Station.

The New Downtown and Fairview Heights TOD Plan details the vision for the downtown area of the City as a place to live, work, shop and be entertained with a unique mix of accessibility options. The Plan also promotes sustainable development. The proposed Project supports this vision through the implementation of the transit system and the upgrading of pedestrian facilities, while connecting downtown to major commercial entertainment centers including the Forum and HPSP. The TC Overlay Zone, which is designed to implement the proposed Project, would also complement anticipated mixed-use development adjacent to the proposed Project to help revitalize downtown Inglewood. Transit development is considered a sustainable development through its reduction in VMT and air pollutants while offering reliable transit service to the public. In general, the proposed Project supports the visions of the New Downtown and Fairview Heights TOD Plan.

An analysis of the New Downtown and Fairview Heights TOD Plan vision and design concept elements is provided in **Table 4.9-5: Project Consistency with New Downtown and Fairview Heights TOD Plan and Design Guidelines**. The analysis within this section and the table shows that the proposed Project would support and be generally consistent with the New Downtown and Fairview Heights TOD Plan and Design Guidelines. Thus, the proposed Project would result in a less than significant impact related to potential conflicts with the New Downtown and Fairview Heights TOD Plan and Design Guidelines.

**Table 4.9-5  
Project Consistency with New Downtown and Fairview Heights TOD Plan and Design Guidelines**

Vision and Design Concept Elements	
Vision	
Downtown is a place to live, work, shop and be entertained.	<b>Consistent.</b> The proposed Project would strengthen downtown Inglewood neighborhoods by providing a direct connection between downtown Inglewood and major activity centers, promoting local economic development opportunities, and enhancing future transit-oriented development opportunities. These efforts would have the effect of enhancing downtown's retail, recreation, and entertainment offerings and range of housing and employment options. Implementation of the proposed Project would activate and complement development in the City, and enhance social cohesion, equity, and community resilience.
Downtown is a revitalized yet forward-looking gathering place for the community.	<b>Consistent.</b> The proposed Project would help promote economic development in downtown Inglewood and enhance future transit-oriented land use patterns. These opportunities would be a culmination of local planning efforts to achieve a denser built environment connected by modern modes of public transportation. Connections to downtown from regional activity centers would encourage visitors and residents to gather in Downtown gathering spaces. Combined, these efforts would serve to promote downtown Inglewood as a destination location within the neighborhood and broader community.
Downtown provides a unique mix of accessibility options including light rail, pedestrians, bicycles, autos, buses, and advanced technology local transit.	<b>Consistent.</b> Implementation of the proposed Project would provide a convenient, reliable, and efficient public transportation option and help diversify the transit options in the downtown Inglewood neighborhood. The proposed Project would serve to increase accessibility to and through the area and help to complete the first/last mile connection from the regional Metro rail system to the City's major activity centers. Pedestrian access and sidewalks in and around the guideway would be enhanced and widened to support columns and meet ADA pedestrian circulation requirements. The updated pedestrian sidewalks would increase accessibility options around downtown.
Downtown is a major economic engine providing jobs, sales tax, and other revenues.	<b>Consistent.</b> As discussed previously, the proposed Project would increase the number of visitors to and through downtown Inglewood. This increase in activity would generate additional business patronage and economic growth in the downtown neighborhood, contributing to more jobs, sales tax revenue, and other revenues in the City.
Downtown is a model for sustainable development.	<b>Consistent.</b> The proposed Project would reduce roadway congestion. The proposed Project's associated streetscape improvements would improve pedestrian access in the proposed Project. The removal of vehicles and congestion on the existing roadway and the increase of transit and pedestrian roadway use would improve air

**Vision and Design Concept Elements**

	quality in the region and reduce greenhouse gas emissions
Downtown expresses the unique culture of Inglewood.	<b>Consistent.</b> The proposed Project design would reflect the unique character of downtown Inglewood through holistic and integrated design components that integrates the stations within the local setting. For more information, please refer to <b>Section 4.1</b> .

**Design Concept Elements**

<b>Area 1:</b> Creation of a new North Market Place destination which includes Inglewood Plaza- the City's new gathering place, closure of Market Street north of Regent Street as part of the Plaza, provision of pedestrian oriented retail around the plaza, new residential developments, several public parking structures, and a bridge/escalator connection across Florence Boulevard.	<b>Consistent.</b> Pedestrian facilities along the guideway and surrounding stations would be improved to incorporate ADA components and widened to accommodate for support columns. In addition, a passenger walkway would be incorporated to connect the Market Street/Florence Avenue Station with the Metro K line across Florence Boulevard, with pedestrian entrance/exit on both sides of Florence Boulevard.
<b>Area 3:</b> Restoration of the Fox Theater in conjunction with revitalization of the Fox Theater block.	<b>Consistent.</b> The proposed Project would connect the local community with the greater Los Angeles region and bring in visitors to downtown and the Fox Theater block. No support columns would be located in front of or adjacent to the Fox Theater and the guideway would have extended clearance to accommodate the vertical pylon sign to promote compatibility of the proposed Project with the historic context of the Fox Theater. The inflow of visitors would economically benefit local businesses, helping revitalize downtown. An increase in transportation option and transportation capacity would connect downtown to the south part of the City as well, likely increasing traffic flow to and from downtown Inglewood and south Inglewood.
<b>Area 12:</b> Linkage between the Metro Station, Downtown, the Forum, Hollywood Park, and the NFL Stadium via a combination of existing and advanced technology local transit systems/people movers.	<b>Consistent.</b> The proposed Project would connect the Metro K line with downtown Inglewood, the Forum, Hollywood Park, and the NFL Stadium using existing technology. The System would provide a reliable and low-cost method of connecting riders from the region to the City.

Source: City of Inglewood. The New Downtown Fairview Heights TOD Plan Design Guidelines. November 2016. <http://inglewood.arrayogroup.com/wp-content/uploads/2017/01/The-New-Downtown-Fairview-Heights-TOD-Plan-Design-Guidelines-lo-res.pdf>.

A study of the potential effects of the ITC Project on the economic viability of downtown Inglewood was prepared by the City.<sup>31</sup> This study reviewed the current economic conditions of downtown Inglewood and analyzed the potential impact of the ITC on downtown Inglewood.

Analysis of market data found that the current market and economic performance of downtown Inglewood is modest compared to other high performing downtowns in the region. Retail vacancies in downtown Inglewood have remained above average retail vacancies in the City and the county for the

31 Analysis of potential impacts on economic viability of Downtown Inglewood as a result of the proposed Inglewood Transit Connector, September 16, 2021, HR&A Advisors, Inc.

last 10 years. In that period, downtown retail vacancies have ranged between 7 and 14 percent, while retail vacancies in the City and the county hovered around 5 percent. A similar trend is observed in retail rents, where average lease rates in downtown Inglewood are 17 and 38 percent lower than those Citywide and countywide, respectively.

Some of the key physical characteristics of high performing downtowns and retail districts identified in this study include good access using multiple modes of transportation, unobstructed visibility of storefronts for drivers and pedestrians, safe and well-lit areas during all hours, and a high-quality public realm (i.e., public improvements including streets, sidewalks, and landscaping).

Prior to the pandemic, visitation to downtown was approximately 4,500 visitors per day, with most of these visits related to daytime employment and occurring during the weekday. Currently, 45 percent of downtown visitors come from within a 10-minute drive. With a projected average daily ITC ridership of approximately 8,400 people, there will be additional visitors to downtown. If 10 to 20 percent of these riders visit downtown Inglewood, this would represent an increase of approximately 840 to 1,670 visitors per day. This would represent an increase of up to 37 percent above the 4,500 daily visitors.

The additional public parking proposed at the Market Street/Florence Avenue Station, consisting of 650 spaces, may also help increase the number of visitors to downtown on a daily basis. By providing an easy to use transit connection to other parts of Inglewood where event venues and new development is planned, such as the Hollywood Park Specific Plan area, visitors to downtown during the evening and at nighttime, when current activity in downtown is lowest would also increase.

The increase in visitors that will be generated by the ITC Project are expected to represent a wider cross section of the region, which would potentially diversify downtown's current visitor base. In addition, the greater share of this new visitor market segment will be during evenings and weekends, further introducing opportunities for existing and new businesses to expand their hours of activity throughout the week and at different times of the day.

The improvements to the public realm proposed as part of the Project, such as landscaping and lighting, has the potential to increase small business performance, increasing sales and reducing vacancies. The proposed streetscape and public realm improvements will also assist in integrating the ITC improvements into downtown Inglewood in a manner that supports the City's current revitalization efforts.

The conclusion of this economic study is that the ITC Project will not negatively impact the factors, including access and parking, visibility and safety, and quality of the public realm that will contribute to the economic viability of downtown Inglewood. This study also included a review of elevated transit systems with similar design features implemented in U.S. cities, which found no evidence that the introduction of these systems alone may lead to economic decline in downtowns. There is a potential for

temporary effects on economic conditions in downtown during the approximate 46-month construction period for the Project. As noted under Impact LU-1, the Construction Commitment Program includes a Business and Community Support Program and a Business Interruption Assistance Program to assist all businesses financially affected by construction activities. This Program includes the following components:

- Advertising support for local businesses in local or regional newspapers and social media.
- Notice of plans to all affected property owners of the schedule for specific planned construction activities, changes in traffic flow, and required short-term modifications to property access.
- Notice of plans to all affected property owners if utilities would be disrupted for short periods of time and ensuring major utility shut-offs are scheduled during low-use periods of the day.
- Methods by which business owners can convey their concerns about construction activities and the effectiveness of measures during the construction period so activities can be modified to reduce adverse effects.
- Access plans that ensure that all businesses, service providers, and residents are provided with adequate access during construction. Where there is a significant limited English population, signage shall be provided in various languages (as appropriate).
- Funding for temporary signage during construction to help businesses that are partially blocked or that have inconvenient access due to construction activity.

Implementation of the Business and Community Support Program will minimize the potential for temporary effects on local businesses during construction. Additionally, as part of the Construction Commitment Program, the City is committed to providing financial assistance to small local businesses to help offset to the extent possible, business revenue losses or increased expenses that are directly attributable to disruptions during the construction of the ITC within the ITC Project area. The City will create a \$5 million dollar Business Assistance Fund to provide financial assistance through grants to eligible businesses for eligible expenses as established by the Business Assistance Fund Program Administrator.

For these reasons, it is not expected that the Project will result in business closures or vacancies. If any commercial property vacancies occur along the proposed alignment, these vacancies are expected to be short term and would not result in changes to the character of the community that would result in physical impacts to the environment that would be significant.

The economic analysis concludes that implementation of the ITC Project presents opportunities to improve the existing economic conditions in downtown Inglewood, consistent with City's current plans and goals for downtown Inglewood.

#### **Transportation Corridor Overlay Zone**

The Transportation Corridor Overlay Zone implements the goals and policies of the General Plan related to the addition of the proposed Project to the City's circulation system. Development of the proposed Project within the TC Overlay Zone would provide the downtown with a unique mix of accessibility options including light rail, pedestrians, buses, and advanced technology local transit. The TC Overlay Zone would also allow transit and pedestrian connection to the Metro Rail. Aerial development of transit conserves limited land within the urban environment which furthers additional goals for conservative use of land within the City.

The TC Overlay Zone allows for pedestrian improvements and ADA compliance upgrades which the proposed Project would implement. Upgraded pedestrian facilities would add to the existing pedestrian network and provide additional public spaces. Lastly, the transit connections provided by the TC Overlay Zone would promote local entertainment and commercial centers, boosting local economy and local businesses.

The TC Overlay Zone would implement goals and policies of the existing General Plan and is consistent with the General Plan for this reason. No significant land use impacts would result from the adoption of the Transportation Corridor Overlay Zone.

#### **Medical Enterprise Overlay Zone Amendment**

The proposed amendment to the Medical Overlay Zone would exclude the proposed sites for the Prairie Avenue/Manchester Boulevard and Prairie Avenue/Hardy Street stations and associated components of the Project on the west side of Prairie Avenue not located within the public right-of-way.

This amendment would be limited to these properties. The Medical Enterprise Overlay Zone would continue to apply to all other properties in the Overlay Zone and this overlay would continue to effectively implement the City's General Plan. For this reason, this amendment would not result in any significant land use impacts.

#### **Hollywood Park Specific Plan Amendment**

The HPSP area is located northeast of Prairie Avenue and Century Boulevard with Pincay Drive to the north. The purpose of the HPSP is to define the land use framework for the redevelopment of the 298-acre Hollywood Park site with a mix of parks, stadium, retail, office, housing, entertainment, gaming, hotel, and civic uses. The HPSP:

4.9 Land Use and Planning

- Determines the appropriate location and intensity of development, mix of land uses and building heights to be constructed in the Specific Plan area;
- Guides the character of the land planning to ensure that high-quality, place making improvements are made to create a safe and inviting, pedestrian-oriented, regional retail destination not currently available in the area;
- Establishes public and private sector implementation measures and responsibilities that adequately address both local and regional impacts; and
- Defines the future locations and dimensions of streets, rights-of-ways, or other access ways.

To accommodate the ATS while maintaining the existing roadway capacity along Prairie Avenue, the ITC Project includes the proposed relocation of one existing traffic lane on the east side of Prairie Avenue. The relocated lane would be accommodated within a maximum thirty (30) foot variable easement for street purposes, to be acquired by the City over private property that currently comprises the existing required maximum 30-foot setback area along the west edge of the HPSP area. While existing sidewalk widths along Prairie Avenue would be maintained, landscaping, signs and other streetscape improvements would need to be reduced or eliminated in certain areas, following the property acquisition.

As described above, an amendment to the HPSP is proposed to address any potential conflict or inconsistency with the HPSP that may result from the shift of one lane of Prairie Avenue a maximum of thirty (30) feet into the existing setback area on the east side of Prairie Avenue in the HPSP area and the associated reconfiguration of the existing sidewalk, landscape and other improvements that would be affected. For example, the amendment would eliminate the requirement for a 30-foot setback along the western edge of the HPSP to allow zero-lot line development. Accordingly, future buildings and structures within the HPSP area adjacent to Prairie Avenue would be permitted to be built along the existing setback property line without requiring any additional setback along Prairie Avenue. Subterranean parking and certain structures, such as balconies, would be allowed to encroach within City’s easement areas, to minimize the loss of the setback area on future development. Consistent with the proposed TC Overlay Zone, any area previously used to satisfy the minimum setback requirement shall continue to be counted within any density or Floor Area Ratio (FAR) calculations under the Specific Plan for existing and future development purposes, even though it may have been dedicated as a public right-of-way. Additionally, the proposed amendment would allow for the routine closures of 2 interior streets, Champions Way and Touchdown Drive, on event days to reduce pedestrian conflicts with vehicles within designated areas.

The proposed Project would be implemented through the TC Overlay Zone while supporting the HPSP development through the enhancement of local multimodal transportation including the upgrade of pedestrian facilities and providing transit. The proposed Project would connect the development with the

4.9 Land Use and Planning

region, connecting residents and visitors to the regional retail, entertainment, and sports venues within the HPSP area. In terms of development, the TC Overlay Zone would complement development allowed by the underlying zone classification with any facilities associated with the ATS system including the gateway, stations, MSF, PDS, vertical circulation elements, walkways, bridges.

A consistency analysis is presented in **Table 4.9-6: Project Consistency with Hollywood Park Specific Plan**, which shows that, the Project would support and be generally consistent with the HPSP.<sup>32</sup> In addition, the proposed amendment to the HPSP would also be consistent with the goals and principles of the HPSP by accommodating the ITC Project, including the shift of one travel lane into the existing HPSP area setback along Prairie Avenue without affecting existing and future development permitted by the HPSP. The construction and operation of the proposed Project would not conflict with any of the applicable principles and goals included in the HPSP or obstruct implementation of the HPSP. The analysis in this section and within **Table 4.9-6** shows the proposed Project would no conflict with, or obstruct implementation of, the HPSP.

**Table 4.9-6  
Project Consistency with Hollywood Park Specific Plan**

Principles and Goals	Project Consistency
<b>Transportation</b>	
Provide pedestrian connections from Hollywood Park to major transit corridors on Century Boulevard and Prairie Avenue.	<b>Consistent.</b> The proposed Project includes a pedestrian connection from the Prairie Avenue/Hardy Street Station over Prairie Avenue to Hollywood Park. The existing sidewalk on the east side of Prairie Avenue and associated streetscape improvements that would be affected by the shift of one travel lane east by a maximum of thirty (30) feet into the existing setback area will be replaced to maintain the pedestrian circulation system on Prairie Avenue. The change to associated standards included in the proposed amendment to the HPSP would maintain the pedestrian circulation network along Prairie Avenue.
Reduce reliance on the private automobile by enhancing opportunities for transit ridership, walking and biking.	<b>Consistent.</b> The proposed Project would reduce congestion on the existing roadway system by reducing overall vehicle miles traveled and providing an increase in local transit options. By providing a connection to the Metro K line, the ITC Project would enhance opportunities for alternative transportation and reduce reliance on the private automobile. The Project would also support the full amount of development approved in the General Plan for Hollywood Park. The proposed modifications to Prairie Avenue, including shifting one travel lane to the east and modifying the existing

32 City of Inglewood. *Hollywood Park Specific Plan* (2009, amended 2014, amended 2015). <https://www.cityofinglewood.org/DocumentCenter/View/1347/Hollywood-Park-Specific-Plan>.

Principles and Goals	Project Consistency
	streetscape improvements on the west side of Prairie Avenue, and the associated amendment to standards in the HPSP to accommodate these improvements would include pedestrian and bicycle facilities. The proposed HPSP amendment would allow for the routine closures of 2 interior streets, Champions Way and Touchdown Drive, on event days to reduce pedestrian conflicts with vehicles within designated areas, which would enhance pedestrian circulation to and from the Project.
Reduce traffic compared to other developments by providing a mix of commercial, entertainment, restaurant, residential and park uses in proximity to each other and to existing transit routes.	<b>Consistent.</b> The proposed Project would provide an additional transit option near the commercial, entertainment, restaurants, residential and park uses allowed by the HPSP. The Prairie Avenue/Hardy Street station includes a direct pedestrian connection to the HPSP area, which will reduce traffic and reduce overall vehicle miles traveled compared to other developments. The Project would also support the full amount of development approved in the General Plan for Hollywood Park.
Development Standards	
<b>§ 2.6 and § 6.2.5 - Minimum Building Setbacks:</b> The required minimum setbacks for the HPSP are shown in Exhibit 6-5—Minimum Building Setbacks. The intent of the setback requirements is to reinforce and protect the character of the public streets and to create a pedestrian-scaled street scene. Also, the setbacks provide a landscape buffer from the surrounding development.	<b>Consistent.</b> The proposed Project would amend the HPSP to eliminate the requirement for a 30-foot setback along the western edge of the HPSP along Prairie Avenue to allow zero-lot line development. Accordingly, future buildings and structures within the HPSP would be permitted to be built along the existing property line without requiring any additional setback along Prairie Avenue. Subterranean parking and certain structures, such as balconies, would be allowed to encroach within City’s easement areas, to minimize the loss of the setback area on future development.
<b>§ 2.15 and § 6.2.14 – Signage:</b> The purpose of the HPSP signage requirements is to allow signage to create an identity for the HPSP area. Exceptions to the HPSP signage requirements are established for development within the Sports and Entertainment Zone. For example, outside of the Sports and Entertainment Zone, the size of mural graphics within the HPSP may not exceed 75% of the building face or wall, or 1,000 SF per mural, whichever is less. This requirement does not apply within the Sports and Entertainment Zone.	<b>Consistent.</b> The proposed Project would amend the HPSP to clarify that signage within the TC Overlay Zone on property that is also located within the HPSP boundaries must adhere to the signage requirements set forth in section 2.15 of the HPSP and that the exceptions for the Sports and Entertainment Zone recognized in the HPSP do not apply within the TC Overlay Zone.
Streetscapes	
<b>§ 3.3.2 – Streetscapes:</b> Street trees and parkways in Hollywood Park are designed to achieve a diverse urban forest, to integrate Hollywood Park with the adjoining urban fabric and to assist in developing districts of distinctive and appropriate character.	<b>Consistent.</b> The proposed Project would amend the HPSP to clarify that property within the TC Overlay Zone that overlaps with the HPSP boundaries must adhere, to the maximum extent feasible, to the streetscape requirements set forth in the HPSP, including the standards set forth in the following exhibits to the HPSP: Exhibit 3-30 (Prairie Avenue), Exhibit 3-52 (Prairie Avenue Landscape Setback), and Exhibit 3-53 (Prairie Avenue/Century Boulevard Setback).

Principles and Goals	Project Consistency
Design Guideline Checklist	
– Pedestrian and vehicular circulation routes shall comply with all requirements of the Americans with Disabilities Act (ADA), and include one or more of the following design elements along all or a portion of all streets or pedestrian pathways: (1) pedestrian pathway includes a pattern, color, or paving material that is differentiated from surrounding landscaping or paved areas; (2) way-finding signage; (3) the streets and pathways are oriented such that they include verifiable lines of sight that would allow both pedestrians and vehicles to see any one or more of the following: (a) Stadium, (b) performance venue, casino, retail or residential gateway, or (c) Champion Plaza, Lake Park, Arroyo Park, or Bluff Park.	<b>Consistent.</b> Pedestrian facilities along the guideway, and adjacent to stations adjacent to the HPSP area would be improved to comply with all ADA requirements. The elevated passenger walkway would be made of a different paving material than those of the surrounding paved areas and way finding signage would be installed where appropriate. Elevated passenger walkways to the east of the guideway and stations will provide lines of sight to the HPSP area and, depending on location, could include the Stadium, the performance venue and/or the retail or residential gateway.
– The exterior entryways of buildings shall include one or more of the following: (1) a trim or border of a different color or material than other portions of the façade; (2) an integral porch; (3) an awning; (4) an articulated entryway offset from the immediately adjacent façade by not less than one foot; or (5) an arched opening.	<b>Consistent.</b> The proposed Stations would incorporate distinguishing features, such as distinctive canopies that do not detract from the surroundings, that are generally consistent with the HPSP Design Guidelines
– When using more than one material on a façade (except as a trim or offset portion of the façade or as an entry or window treatment), the variation in materials shall continue to all side and rear elevations that are visible from the front or corner lot line.	<b>Consistent.</b> As defined in the Design Guidelines, materials used on the stations would be neutral in tone and would include color accents only where appropriate. The façade of the stations would not be incompatible with the HPSP.
Each building shall include one or more of the following: – Entry or window trim/surrounds – Horizontal banding – Corner quoins – Balconies (supported, cantilevered or Juliet) – False, shuttered windows – Awnings – Change in material or color	<b>Consistent.</b> Stations will be visibly compatible with the standards articulated in the HPSP Design Guidelines. Under the Design Guidelines, stations will be identifiable, distinctive and streamlined.
Railings shall be constructed of wood, wrought iron, or other material, such as stucco, which is used to construct the façade or entry or window trim on the same building.	<b>Consistent.</b> The materials chosen for station railings would be consistent with the other station materials as defined in the Design Guidelines in a manner that is generally consistent with the HPSP Design Guidelines.
Exposed gutters and downspouts shall be colored or painted, and shall not be constructed of unpainted aluminum, copper, or zinc.	<b>Consistent.</b> Exposed gutters along Prairie Avenue would be painted or colored as defined in the Design Guidelines in a manner that is generally consistent with the HPSP Design Guidelines.
Stairs shall be constructed of the same material as the deck and landing.	<b>Consistent.</b> Station stairs would be constructed of the same material as the deck and landing as defined in the Design Guidelines in a manner that is generally consistent with the HPSP Design Guidelines.

4.9 Land Use and Planning

Principles and Goals	Project Consistency
Columns and posts shall be constructed of stone, stucco, or wood (or other material painted or molded to look like one of the allowed materials) and shall be not less than four inches in diameter if round, or four inches on each side if rectangular.	<b>Consistent.</b> Columns and posts would be constructed of materials used elsewhere in the station as defined in the Design Guidelines in a manner that is generally consistent with the HPSP Design Guidelines.
<b>Sustainability</b>	
<b>Goal 1:</b> Create a more sustainable community	<b>Consistent.</b> The proposed Project would reduce vehicle miles traveled and traffic congestion on the street network, which will improve both local and regional air quality. Additionally, the Design Guidelines outlines sustainability measures including energy efficiency, addressing heat island effect, use of recycled water and rainwater, and recycling of demolished materials in a manner that is generally consistent with the HPSP Design Guidelines.
<b>Goal 2:</b> Respect the site.	<b>Consistent.</b> Under the Design Guidelines, landscape designs will prioritize the use of drought-resistant plants, which would be consistent with the landscape areas and plants provided by the HPSP. The proposed amendment to the HPSP includes minor revisions to development standards along Prairie Avenue to accommodate the street improvements included in the Project in a manner that is compatible with the planned conditions within the HPSP area.
<b>Goal 3:</b> Save water and reduce local water impacts.	<b>Consistent.</b> The Water Efficiency and Conservation Objective of the Design Guidelines is consistent with the HPSP Sustainability Goals.
<b>Goal 4:</b> Reduce, reuse, recycle.	<b>Consistent.</b> The Material Conservation and Resource Efficiency Objective of the Design Guidelines is consistent with the HPSP Sustainability Goals.
<b>Goal 5:</b> Make concrete with sustainable materials.	<b>Consistent.</b> The Material Conservation and Resource Efficiency Objective of the Design Guidelines is consistent with the HPSP Sustainability Goals.
<b>Goal 6:</b> Design to save wood and labor.	<b>Consistent.</b> The proposed Project would use an integrated design approach that brings together all, applicable, major design disciplines including architecture, planning, structural, landscape, mechanical, electrical, and plumbing engineers and other specialists to collaborate on the most effective way to meet programmatic goals with lowest lifecycle environmental impacts in a manner that is generally consistent with the HPSP Sustainability Goals.
<b>Goal 7:</b> Support sustainable forests.	<b>Consistent.</b> The proposed Project would use an integrated design approach that brings together all, applicable, major design disciplines including architecture, planning, structural, landscape, mechanical, electrical and plumbing engineers and other specialists to collaborate on the most effective way to meet programmatic goals with lowest lifecycle environmental impacts in a manner that is generally consistent with the HPSP Sustainability Goals.

4.9 Land Use and Planning

Principles and Goals	Project Consistency
<b>Goal 8:</b> Make a sustainable roof.	<b>Consistent.</b> The Design Guidelines provide that to achieve energy use reduction, passive strategies taking advantage of the favorable local climate should be considered where feasible. The MSF and PDS substation roof surfaces will be light in color to reduce the urban heat island effect. These features of the Project are generally consistent with the HPSP Sustainability Goals.
<b>Goal 9:</b> Save energy through passive design.	<b>Consistent.</b> Designs with passive reductions to energy use would be preferred for the proposed Project, which generally consistent with the HPSP Sustainability Goals.
<b>Goal 10:</b> Save water and energy in plumbing systems.	<b>Consistent.</b> The Water Efficiency and Conservation Objective and the Energy Objective of the Design Guidelines are The proposed Project would utilize rainwater or gray-water for toilet flushing as feasible. Low flow fixtures including low flow faucets would be used to reduce water and energy consumption within the plumbing system. These features of the Project are generally consistent with the HPSP Sustainability Goals.
<b>Goal 11:</b> Save energy in lighting.	<b>Consistent.</b> The Energy Efficiency Objective of the Design Guidelines, the purpose of which is to achieve energy efficiency and maximize the use of renewable energy in the Project above and beyond minimum code requirements is generally consistent with the HPSP Sustainability Goals.
<b>Goal 12:</b> Save energy in equipment use.	<b>Consistent.</b> Sustainability measures to reduce energy use of equipment would be incorporated into the proposed Project. Measures include using Tier 4 construction equipment (See <b>Section 4.5: Energy</b> ). Further, the Energy Efficiency Objective of the Design Guidelines would achieve energy efficiency and maximize the use of renewable energy in the Project above and beyond minimum code requirements. e These features of the Project are generally consistent with the HPSP Sustainability Goals.
<b>Goal 13:</b> Create healthy indoor environments	<b>Consistent.</b> The Design Guidelines include measures to provide maximum natural daylighting and access to views of the outdoors. Further, under the Design Guidelines, indoor spaces should use high efficiency air filtration and should create a comfortable indoor acoustical environment and materials and systems should be selected that will provide for a healthy indoor environment. These features and guidelines of the Project are generally consistent with the HPSP Sustainability Goals.
<b>Goal 14:</b> Replace fossil fuel use with alternatives.	<b>Consistent.</b> Sustainability measures to reduce energy use of equipment would be incorporated into the proposed Project. Measures include using Tier 4 construction equipment (See <b>Section 4.5: Energy</b> ). Further, the Energy Efficiency Objective of the Design Guidelines would achieve energy efficiency and maximize the use of renewable energy in the Project above and beyond minimum code requirements. These features of the

Principles and Goals	Project Consistency
	Project are generally consistent with the HPSP Sustainability Goals.
<b>Goal 15:</b> Support market for recycled materials.	<b>Consistent.</b> The Material Conservation and Resource Efficiency Objective of the Design Guidelines is generally consistent with the HPSP Sustainability Goals.
<b>Goal 16:</b> Use creativity and innovation to build sustainable environments.	<b>Consistent.</b> The proposed Project uses existing technology to provide transit service and remove vehicles off of the existing roadway network. The guideway would be elevated to allow existing roadway capacity to remain while improvements to sidewalks would promote alternative transportation and an active lifestyle in the local community. The Project would be generally consistent with this HPSP goal and facilitate the ability of development in the HPSP area to meet this goal.

Source: City of Inglewood. Hollywood Park Specific Plan. (July 2009, amended 2014, amended 2015). <https://www.cityofinglewood.org/DocumentCenter/View/1347/Hollywood-Park-Specific-Plan>. Accessed October 5, 2021.

**The Forum Development Agreement**

The proposed relocation of one existing traffic lane on the east side of Prairie Avenue would be accommodated within a 30-foot street easement to be acquired along the western edge of the Forum Property. The proposed street improvements would eliminate approximately 250-300 of the existing parking spaces in the Forum Parking lot located along Prairie Avenue.

The amount of parking required for a use is a land use regulatory matter and the direct impact of a proposed project on existing parking is not considered an impact under the California Environmental Quality Act. Effects on parking is considered a social impact under CEQA and not an environmental impact unless the effect on parking would result in specific significant secondary effects on the physical environment. The small amount of parking spaces that may be eliminated as a result of the ITC Project would not result in secondary impacts on the environment, as the amount of parking remaining on the Forum site would be adequate to meet parking demands of events held at the Forum, especially given the increased transit ridership from the ITC Project anticipated for events at the Forum. The Project may also include an amendment to the Forum Development Agreement to confirm that as a regulatory matter the amount of parking left post-acquisition will be sufficient and the Forum can continue to operate without an additional parking supply.

**Summary of Impacts**

A project is considered to be consistent with a general plan and related planning documents if, considering all its aspects, it will further the objectives and policies of the plan or not obstruct their attainment. As discussed above, the proposed Project would be consistent with applicable plans, policies, and

regulations, and would further the goals and objectives of the existing plans and policies and would not obstruct the attainment of the existing policies, plans, and programs. As demonstrated in this section, the proposed Project (including the proposed General Plan Amendment, TC Overlay Zone, Hollywood Specific Park Amendment, property acquisitions and easements) would further the objectives and policies of applicable regional and local plans or will not obstruct the attainment of the goals of these plans, and therefore, the proposed Project’s impacts would be less than significant.

**Mitigation Measures**

Impact is less than significant. No mitigation measures required.

**Level of Significance after Mitigation**

Impact is less than significant. No mitigation measures required.

**4.9.7 CUMULATIVE IMPACTS**

A cumulative impact analysis for land use evaluates whether impacts of a project and related projects, when taken as a whole, would have significant environmental impacts under the two land use thresholds. The geographic scope of this cumulative impact analysis is the community, City, and the region. If the related projects identified in **Section 4.0, 4.0.6: Cumulative Assumptions** in combination with the proposed Project would result in a cumulatively significant impact, then the significance of the proposed Project’s incremental contribution to that cumulatively significant impact must be determined. The City is currently planning to build a parking structure, containing up to 2,500 spaces in six-level structure, on the City’s ITF site located on the southeast corner of Prairie Avenue and Arbor Vitae Street. This parking structure would provide additional public parking near event venues in the LASED in the HPSP area and for the IBEC. The ITF site is currently improved as a surface parking lot and bus transit facility. This parking structure would facilitate flexibility during events at the venues in the area. During non-event times, this parking would be available as a park-and-ride facility to connect to the Metro rail system via the ITC Project. Developing this parking structure on the site of the existing ITF would provide additional public parking to support the existing and planned land uses.

As analyzed above within this section, the proposed Project would not create a physical division in the community. Potential future related projects, including the parking structure planned on the ITF site, would not create physical divisions in the community, in the City, or in the region. Therefore, the proposed Project, in combination with related projects, would not cause a significant cumulative impact related to the physical division of an established community.

#### 4.9 Land Use and Planning

The related projects would be required to be consistent with all applicable planning documents. The proposed Project, with the proposed amendments to the General Plan, IMC, and HPSP would also be consistent with existing policies, plans, and programs. Therefore, the proposed Project, in combination with related projects, would not cause a cumulatively significant impact related to inconsistencies with existing policies, plans, and programs.

#### 4.9.8 CONSISTENCY WITH CITY OF INGLEWOOD GENERAL PLAN

As discussed in the analysis provided above, the proposed Project is consistent with the City of Inglewood General Plan with the proposed regulatory changes included in the Project. For General Plan consistency analysis regarding specific topic areas, please refer to the chapters addressing those topic areas. No additional analysis is required.

## 4.10 NOISE AND VIBRATION

### 4.10.1 INTRODUCTION

This section of the Recirculated Draft Environmental Impact Report (Recirculated Draft EIR) addresses construction and operational noise and vibration impacts associated with the proposed Project as modified and refined since the December 2020 Draft EIR. This section evaluates the potential for temporary impacts associated with operation of construction equipment and associated activities, as well as the potential for long-term impacts from operation of the proposed ATS system and changes in traffic volumes on streets in the area that would result from the Project.

Since release of the December 2020 Draft EIR, the City has modified the design of the Project along the proposed alignment as a result of consultation with key stakeholders in the community, as described in **Section 1.0: Introduction**. In addition, the Project Construction Commitment Program (CCP) has been refined to further control noise generated during construction. The construction noise reduction measures within the CCP have been incorporated in the analysis below.

Prior to the preparation of the December 2020 Draft EIR, a Revised Initial Study was prepared using the CEQA Environmental Checklist Form to assess potential environmental impacts associated with noise. For one of the screening thresholds, the Initial Study found that the proposed Project would result in “No Impact” and thus, no further analysis of this topic in an EIR was required. The following Initial Study screening criteria related to noise do not require any additional analysis in this Recirculated Draft EIR:

- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Similar to the December 2020 Draft EIR, the changes to the design of the Project do not create the potential for significant impacts related to location as the general area of the proposed Project would remain by the Metro K Line to the north; Hardy Street to the south; the Los Angeles Stadium and Entertainment District (LASED) at Hollywood Park including SoFi stadium, and the Forum to the east; and La Brea Avenue to the west. The nearest public use airport to the proposed Project is LAX. There are no private airstrips located in the vicinity of the proposed Project.

Impacts found to be less than significant are further discussed in **Section 6.3: Effects Found Not to be Significant**.

The data, assumptions, and modeling outputs used in the analyses of this Recirculated Draft EIR are provided below. Additional existing ambient noise measurements (**Appendix N**) were not taken for

preparation of this Recirculated Draft EIR as the data continues to reflect existing conditions for purposes this analysis.

- Ambient Noise Measurements - **Appendix N.1:**
  - Long-Term (24-hour) Ambient Noise Measurements – **Appendix N.1-1**
  - Short-Term (1-hour) Ambient Noise Measurements (Daytime) – **Appendix N.1-2**
  - Short-Term (15-minute) Ambient Noise Measurements (Nighttime) – **Appendix N.1-3**
- Roadway Noise Levels – **Appendix N.2:**
  - Adjusted Baseline Conditions During Typical Non-Event Weekdays Without ITC Project Count Conversions – **Appendix N.2-1**
  - Adjusted Baseline Conditions During Typical Non-Event Weekdays With ITC Project Count Conversions – **Appendix N.2-2**
  - Opening Year (2027) Conditions With NFL Event Without ITC Project Count Conversions – **Appendix N.2-3**
  - Opening Year (2027) Conditions With NFL Event With ITC Project Count Conversions – **Appendix N.2-4**
  - Future Horizon Year (2045) Conditions With NFL Event Without ITC Project Count Conversions – **Appendix N.2-5**
  - Future Horizon Year (2045) Conditions With NFL Event With ITC Project Count Conversions – **Appendix N.2-6**
  - Roadway Noise Level Tables – **Appendix N.2-7**

  - Construction Sound Power Level Worksheets – **Appendix N.4-1**
  - Construction Noise (Phase 1) Worksheets – **Appendix N.4-2**
  - Construction Noise (Phase 2) Worksheets – **Appendix N.4-3**
  - Construction Noise (Phase 3) Worksheets – **Appendix N.4-4**
  - Construction Noise (Phase 4) Worksheets – **Appendix N.4-5**
  - Construction Noise (Phase 5) Worksheets – **Appendix N.4-6**
  - Construction Noise (Phase 6) Worksheets – **Appendix N.4-7**
  - Construction Noise (Phase 7) Worksheets – **Appendix N.4-8**
  - Construction Noise (Phase 8) Worksheets – **Appendix N.4-9**
- Construction Vibration Worksheets – **Appendix N.5**

- Operational Noise Worksheets – **Appendix N.6:**
  - Maintenance and Storage Facility (MSF) Stationary Source Worksheets – **Appendix N.6-1**
  - Guideway Worksheets – **Appendix N.6-2**

Please see **Section 8.0** for a glossary of terms, definitions, and acronyms used in this Recirculated Draft EIR.

## 4.10.2 OVERVIEW OF NOISE AND VIBRATION

### 4.10.2.1 Noise Descriptors

Noise levels are measured using a variety of scientific metrics. As a result of extensive research into the characteristics of noise and human response, standard noise descriptors have been developed for noise exposure analyses. All noise levels provided in this analysis are for outdoor conditions, unless otherwise stated specifically to be interior noise levels.

**A-Weighted Sound Pressure Level (dBA):** The decibel (dB) is a unit used to describe sound pressure level. When expressed in dBA, the sound has been filtered to reduce the effect of very low and very high frequency sounds, much as the human ear filters sound frequencies. Without this filtering, calculated and measured sound levels would include events that the human ear cannot hear (e.g., dog whistles and low-frequency sounds, such as the groaning sounds emanating from large buildings with changes in temperature and wind). With A-weighting, calculations and sound-monitoring equipment approximate the sensitivity of the human ear to sounds of different frequencies.

**Maximum Noise Level (Lmax):** Lmax is the maximum or peak sound level during a noise event. The metric accounts only for the instantaneous peak intensity of the sound, and not for the duration of the event. As a vehicle passes by an observer, the sound level increases to a maximum level and then decreases. Some sound level meters measure and record the maximum or Lmax level.

**Sound Exposure Level (SEL):** SEL, expressed in dBA, is a time-integrated measure, expressed in decibels, of the sound energy of a single noise event at a reference duration of 1 second. The sound level is integrated over the period that the level exceeds a threshold. Therefore, SEL accounts for both the maximum sound level and the duration of the sound. The standardization of discrete noise events into a 1-second duration allows calculation of the cumulative noise exposure of a series of noise events that occur over a period of time.

**Equivalent Continuous Noise Level (Leq):** Leq is the sound level, expressed in dBA, of a steady sound that has the same A-weighted sound energy as the time-varying sound over the averaging period. Unlike SEL, Leq is the average sound level for a specified time period (e.g., 24 hours, 8 hours, 1 hour). Leq is calculated

by integrating the sound energy from all noise events over a given time period and applying a factor for the number of events. Leq can be expressed for any time interval; for example, the Leq representing an averaged level over an 8-hour period would be expressed as Leq(8).

**Community Noise Equivalent Level (CNEL):** CNEL, expressed in dBA, is the standard metric used in California to represent cumulative noise exposure. The metric provides a single-number description of the sound energy to which a person or community is exposed over a period of 24 hours similar to day-night average sound level (DNL). CNEL includes penalties applied to noise events occurring after 7:00 PM and before 7:00 AM, when noise is considered more intrusive. The penalized time period is further subdivided into an evening period (7:00 PM through 10:00 PM) with an addition of 5 dBA to measured noise levels and a nighttime period (10:00 PM to 7:00 AM) with an addition of 10 dB to measured noise levels. The evening weighting is the only difference between CNEL and DNL.

#### 4.10.2.2 Groundborne Noise

Groundborne noise refers to noise generated by groundborne vibration. More specifically, groundborne noise is the low-frequency rumbling noise emanating from the motion of building room surfaces due to the vibration of floors and walls; it is perceptible only inside buildings.<sup>1</sup> The relationship between groundborne vibration (discussed in *Section 4.10.2.3*, directly below) and groundborne noise depends on the frequency content of the vibration and the acoustical absorption characteristics of the receiving room. For typical buildings, groundborne vibration that causes low frequency noise (i.e., the vibration spectrum peak is less than 30 Hz) results in a groundborne noise levels that is approximately 50 decibels lower than the velocity level. For groundborne vibration that causes mid-frequency noise (i.e., the vibration spectrum peak is between 30 and 60 Hz), the groundborne noise level will be approximately 35 dB lower than the velocity level. For groundborne vibration that causes high-frequency noise (i.e., the vibration spectrum peak is greater than 60 Hz), the groundborne noise level will be approximately 20 dB lower than the velocity level.<sup>2</sup> Therefore, for typical buildings, the groundborne noise decibel level is lower than the groundborne vibration velocity level at low frequencies.

#### 4.10.2.3 Groundborne Vibration

Ground-borne vibration is the perceptible movement of building floors, rattling windows, and doors, shaking of items on shelves or walls, and rumbling sounds. The root mean square (RMS) amplitude of a motion over a 1-second period is commonly used to predict human response to vibration. The motion due to ground-borne vibration is described in vibration velocity levels, measured in decibels referenced to 1

<sup>1</sup> Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, p. 112, September 2018, accessed September 2021, [https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123\\_0.pdf](https://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf)

<sup>3</sup> City of Inglewood, IMC, Chapter 5 Offenses, Miscellaneous, "Article 2. Noise Regulations," Section 5-26. Noise Level Measurement Criteria.

microinch per second and expressed as vibration decibels (VdB). Ground-borne vibration is not a common environmental problem unlike roadway noise or transit noise. The vibration source levels for various types of construction equipment would be based on data provided in Table 7-4 of the Federal Transit Administration (FTA) *Transit Noise and Vibration Impact Assessment Manual*.

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods employed. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. While ground vibrations from construction activities do not often reach the levels that can damage structures, fragile buildings must receive special consideration.

#### 4.10.2.4 Effects of Noise on Humans

Human response to sound is highly individualized. Annoyance is the most common issue associated with community noise levels. Many factors influence the response to noise including the character of the noise, the variability of the sound level, the presence of tones or impulses, and the time of day of the occurrence. Additionally, non-acoustical factors, such as individual opinion of the noise source, the ability to adapt to the noise, the attitude towards the source and those associated with it, and the predictability of the noise, all influence the response to noise. These factors result in the reaction to noise being highly subjective, with the perceived effect of a particular noise varying widely among individuals in a community. The effects of noise can be grouped into three general categories:

- Subjective effects of annoyance, nuisance, dissatisfaction;
- Interference with activities such as speech, sleep, and learning; and
- Physiological effects such as starting hearing loss.

Noise-induced hearing loss usually takes years to develop. Hearing loss is one of the most obvious and easily quantifiable effects of excessive exposure to noise. While the loss may be temporary at first, it can become permanent after continued exposure. When combined with hearing loss associated with aging, the amount of hearing loss directly due to the environment is difficult to quantify. Although the major cause of noise induced hearing loss is occupational, nonoccupational sources may also be a factor.

Noise can mask important sounds and disrupt communication between individuals in a variety of settings. This process can cause anything from a slight irritation to a serious safety hazard, depending on the circumstance. Noise can disrupt face-to-face communication and telephone communication, and the enjoyment of music and television in the home. Interference with communication has proved to be one of the most important components of noise-related annoyance.

Noise-induced sleep interference is one of the critical components of community annoyance. Sound level, frequency distribution, duration, repetition, and variability can make it difficult to fall asleep and may cause momentary shifts in the natural sleep pattern or level of sleep. It can produce short-term effects, with the possibility of more serious effects on health if it continues over long periods.

Annoyance can be defined as the expression of negative feelings resulting from interference with activities, as well as the disruption of one's peace of mind and the enjoyment of one's environment. The consequences of noise-induced annoyance are privately held dissatisfaction, publicly expressed complaints to authorities, and potential adverse health effects, as discussed previously.

Some common sounds on the dBA scale, relative to ordinary conversation, are provided in **Table 4.10-1: Common Sounds on the A-Weighted Decibel Scale**. As shown, the relative perceived loudness of sound doubles for each increase of 10 dBA, although a 10 dBA change corresponds to a factor of 10 in relative sound energy. Generally, sounds with differences of 3 dBA or less are not perceived to be noticeably different by most listeners.

**Table 4.10-1**  
**Common Sounds on the A-Weighted Decibel Scale**

Sound	Sound Level (dBA)	Subjective Evaluations
Near Jet Engine	140	
Threshold of Pain	130	Deafening
Rock music, with amplifier	120	
Thunder, snowmobile (operator)	110	
Boiler shop, power mower	100	Very Loud
Orchestral crescendo at 25 feet, noisy kitchen	90	
Busy street	80	Loud
Interior of department store	70	
Ordinary conversation, 3 feet away	60	Moderate
Quiet automobiles at low speed	50	
Average office	40	Faint
City residence	30	
Quiet country residence	20	
Rustle of leaves	10	Very Faint
Threshold of hearing	0	

Source: U.S. Department of Housing and Urban Development, *Aircraft Noise Impact – Planning Guidelines for Local Agencies*, 1972

Note:

<sup>1</sup> Continuous exposure above 85 dB is likely to degrade the hearing of most people (hearing protection recommended).

<sup>2</sup> Range of Speech: 50 – 70 dB

## 4.10.3 METHODOLOGY

### 4.10.3.1 Noise Measurements

Noise measurements were collected pursuant to Section 5-26 of the Inglewood Municipal Code (IMC),<sup>3</sup> which states that sound level meters (SLMs) shall meet the American National Standard Institute's (ANSI) standard S1.4-1971<sup>4</sup> for Type 1 sound level meters, or by using an instrument with associated recording and analyzing equipment that would provide equivalent data. The SLMs were field calibrated before the measurements and have annual calibration records traceable to the National Institute of Standards and Technology.<sup>5</sup>

A Type 1 (precision) Larson Davis Model 831 SLM<sup>6</sup> was used to conduct the noise monitoring survey. This meter meets all requirements of ANSI S1.4-1983 and ANSI 1.43-1997 Type 1 standards,<sup>7</sup> as well as International Electrotechnical Commission (IEC)<sup>8</sup> and IEC 60804 Type 1, Group X standards.<sup>9</sup> The SLM was located approximately 5 feet above-ground and covered with a Larson Davis windscreen. The SLM was field calibrated with an external calibrator prior to operation.

Noise measurements were taken to establish ambient noise conditions for three time periods. Locations and data measurements are discussed in *Section 4.10.5.2* and shown in **Figure 4.10-5**. 24-hour ambient noise measurements were collected between November 14, 2018, to November 16, 2018, (refer to **Appendix N-1.1**). Short-term (1-hour) ambient noise measurements were collected between November 26, 2018, to January 23, 2019, during the morning peak hours (7:00 AM to 10:00 AM) and evening peak hours (4:00 PM – 7:00 PM) (refer to **Appendix N-1.2**). Short-term (15-minute) ambient noise measurements were collected between August 3, 2020, to August 5, 2020, during the nighttime period after 8:00 PM (refer to **Appendix N-1.3**). It is important to note, short-term ambient noise measurements were collected during the “Safer at Home” order that went into effect in March 2020 due to the COVID-19 pandemic. For quality assurance, gathered nighttime noise measurements were compared to the results of the existing average daily traffic volumes that occurred prior to “Safer at Home”. As shown in data sets provided later in this section, nighttime noise measurements taken along the study intersections were

<sup>3</sup> City of Inglewood, IMC, Chapter 5 Offenses, Miscellaneous, “Article 2. Noise Regulations,” Section 5-26. Noise Level Measurement Criteria.
