The Draft EIR’s Project Description includes: (i) the precise location and boundaries of the Project (see Section II.2, Project Location and Surrounding Uses of the Draft EIR, including Figure II-1, Regional and Site Location Map and Figure II-2, Aerial Photograph of Project Site and Vicinity); (ii) a statement of project objectives (See Section II.6, Project Objectives of the Draft EIR); (iii) a general description of the project’s technical, economic, and environmental characteristics (see Draft EIR Section II.3, Project Background; Section II.4, Existing Project Site Conditions; Section II.5, Land Use and Zoning Designations; Section II.7, Description of the Project, including Table II-1, Figure II-5, Figure II-6, Figure II-7, Figure II-16, Figure II-8, Level 1 Plan, Figure II-9, Figure II-10, Figure II-11, Figure II-12, Figure II-13, Figure II-14, Figure II-15, Figure II-16, Figure II-17, Figure II-18, Table II-4, Project and Project with the East Site Hotel Option Gross and LAMC Floor Area Square Footages by Building, Figure II-25, Figure II-26, Figure II-27, Figure II-28, Figure II-29, and Chapter III, *Environmental Setting*); and (iv) a brief statement of the intended uses of the EIR (see Draft EIR Section I.1, Purpose of the Draft EIR). As such, the commenter’s assertion that the Project description does not comply with CEQA is unsubstantiated.

⁸⁹ *Washoe Meadows Cmty. v. Dep’t of Parks & Recreation*, 17 Cal. App. 5th 277, 287; *S. of Mkt. Cmty. Action Network v. City & Cty. of San Francisco* (2019) 33 Cal. App. 5th 321, 332; and CEQA Guidelines Section 15124.

Comment No. ORG 44-11

3. The Project Description's failure to identify a single, defined and stable project hides the development's true impacts.

In *Washoe Meadows*, the lead agency argued that its multiple project permutations were not misleading because the EIR provided a thorough analysis of the environmental effects of the project version ultimately approved as the project. (*Ibid.*) The Court flatly rejected this argument, given that an agency's failure to propose a stable project is not confined to the informative quality of the EIR's environmental forecasts, noting that when an EIR contains unstable or shifting descriptions of the project, meaningful public participation is stultified because "the public is presented with a moving target, and commenters are required to offer input on a wide range of project combinations." (*Ibid.*, citing to *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 197.) Regardless, the Hollywood Center Draft EIR does **not** provide a thorough analysis of each of the eight permutations that would be permitted with Project approval.

Here, a member of the public knows only that one of **eight** Project iterations will ultimately be undertaken, but has no idea which one, and has no sense of what the various interactions of potential impacts would be in any given scenario. The Draft EIR's attempt to shoehorn these eight distinct iterations into a traditional Project Description format means that none of the eight has been adequately analyzed.

For example, the Draft EIR attempts to characterize the Capitol Records Lot Scenario as a difference in open space only. But a footnote on p. II-59 and Figure II-27 of the Draft EIR clearly indicate that the Capitol Records Lot Scenario also includes differences in uses, a reduction in ground floor restaurant square footage, and a reduction in the building envelope. The Capitol Records Lot Scenario's reduction in the building footprint on the East Site is not shown in any Project simulations, diagrams showing massing or building design, or analyzed in any way by the Draft EIR. Will the Capitol Records Lot Scenario result in changes to the views depicted in the Draft EIR? Will the applicant use the loss of massing here as justification to increase massing elsewhere on the site? Will it reduce the noise and vibration impacts on Capitol Record's historic echo chambers? Will the change result in different trip generation rates, as a result of a different land use mix? For example, will the reduction in community- serving retail and restaurant uses mean that Project residents would increase their vehicle usage? Will pedestrian connectivity, or operational noise associated with outdoor uses change? What impacts will this have on AMDA students, who constitute a significant portion of the pedestrians utilizing surrounding sidewalks and crosswalks to access AMDA's various campus buildings and the nearby Metro station? Will the footprint change result in different construction staging or stockpiling locations, or provide additional opportunities for noise mitigation measures? How does the Capitol Records Lot Scenario interact with the "Project" versus the "Project with the East Site Hotel Option"? ***A reader has no way of knowing the impacts of any of the Capitol Records Lot Scenario project iterations—of which there are four—because the Draft EIR provides absolutely no analysis.***

Similarly, there is no full analysis of the differences in the “Overlapping Construction Scenario” and the “Sequential Construction Scenario.” For example, if the Sequential Construction Scenario moves forward first, how can the public be assured that the East Site will actually be developed? This is important because the DEIR states that “[a]s the East Site is larger than the West Site, the West Site would be the recipient of the proposed averaging of floor area and residential density. The West Site would utilize approximately 64,300 square feet of floor area from the East Site, which would permit an additional 97 to 98 units on the East Site.” (Draft EIR, p. II-17.) Putting aside the fact that it appears the DEIR actually intended to state that the additional 97 to 98 units would go to the **West Site** (yet another example of the unstable, enigmatic Project Description), it should follow that development should start on the East Site first to ensure that the Project that ultimately gets built is a true Unified Development. Otherwise, the West Site may receive all the additional FAR and density transfers without a Unified Development ever being built. And while the Draft EIR’s air quality and noise analyses purport to, at least at a high level, consider the differences in the two scenarios in terms of maximum daily emissions and noise from overlapping construction equipment, no other differences in the scenarios are analyzed. If the concurrent construction schedule is chosen, how does this affect pedestrian hazards (especially on AMDA students and faculty crossing Yucca Street, and walking between the AMDA campus and the nearby Metro station), construction staging, and the feasibility of placing temporary sound barriers? Does the concurrent construction schedule permit more construction staging and stockpiling to be placed onsite, further from adjacent sensitive uses, instead of on surrounding roadways? What happens to pedestrian connectivity if the sequential construction schedule is chosen? Under the sequential construction schedule, will the West Site’s new residents be subjected to higher levels of pollutant emissions during the East Site construction phase? **Again, a reader has no way of knowing, given none of these issues were addressed in the Draft EIR.**

This is a complex project with a combination of uses, several massive structures, and open space on multiple levels, undertaken on two large parcels separated by a public street and surrounded with sensitive land uses and historic resources. CEQA requires the full analysis of the potential environmental impacts of not only the components of the project and its various iterations, but the interaction of all of the various improvements and uses. Here, the public is being asked to dig through the Draft EIR to piece together distinct analysis for what in fact amounts to eight different projects. “[I]nconsistencies in a project’s description, or...the failure to identify or select any project at all, impairs the public’s right and ability to participate in the environmental review process. A description of a broad range of possible projects, rather than a preferred or actual project, presents the public with a moving target [].”² (*Washoe Meadows, supra*, 17 Cal.App.5th 277 at p. 288.) CEQA forbids such an approach. The Draft EIR must be revised and recirculated after the applicant chooses one true Project from the menu of eight presented.

Footnote 2: For an example of the burden that the “moving target” of so many project iterations places on the public and the City’s decisionmakers, see Table IV.E-7 of the Draft EIR, which identifies **ten different permutations of the Project** for purposes of

disclosing the greenhouse gas emissions that will occur. Of course, a reader has no idea which of the 10 different greenhouse gas emissions disclosed will actually come to pass as a result of the Project's approval – will it be 4,825 metric tons of CO₂e? 10,795? 7,867? We know only that it will be somewhere within this broad range, and disclosing only a range amounts to no true disclosure at all.

Response to Comment No. ORG 44-11

The comment expresses opposition to the Project by claiming that the project description does not comply with CEQA and poses questions and hypotheticals without any facts to support the contention that any of these hypotheticals have the potential to have a significant environmental impact.

The commenter is referred to Response to Comment Nos. IND 8I-14, IND 8I-17, ORG 42-4, and ORG 44-9, which address the Draft EIR's Project Description consistency with CEQA and the guiding case law, the Project's two considered options – the Project and the Project with the East Site Hotel Option (although the Project with the East Site Hotel Option is no longer under consideration), and the Project's construction phasing.

As explained in the above-referenced response to comment sections, the Draft EIR's Project Description is accurate, stable and finite, and presents the information required by CEQA to provide a meaningful basis for environmental review. The Project Description complies with the requirements set forth in Section 15124 of the CEQA Guidelines. An EIR requires an accurate and stable project description as described by the commenter. This does not mean, however, that the project description must be rigid or inflexible.⁹⁰ Moreover, an EIR's project description may also present alternative development or design schemes for a single proposed project so long as the possible variations are fully described and separately evaluated, and the maximum possible scope of the project is clearly disclosed.⁹¹ The Project is a single proposed project with a Hotel Option on the East Site (although the Project with the East Site Hotel Option is no longer under consideration), and any possible variations are fully described and separately evaluated, with the maximum possible scope of the project is clearly disclosed.

Also, as explained in the above-referenced response to comment sections, the construction phasing and loss of open space discussions in the Draft EIR are set forth so that the public is made aware of all currently foreseeable potential variables in the development and design schemes and so that the public is not misled about potential impacts. Other than nominal loss of open space, the Project would not change whether or not the "Capitol Records Lot Scenario" occurs, and, similarly, the construction phasing would remain the same. The Draft EIR provides a reasonable worst-case impact analysis for each category of impact under both Project options. For each category, the Draft EIR

⁹⁰ See *County of Inyo v. City of Los Angeles* (1977) 71 Cal. App. 3d 185, 199.

⁹¹ *South of Market Community Action Network v City & County of San Francisco* (2019) 33 CA5th 321, 332.

uses the scenario that would produce the greatest impact to provide a conservative analysis of the Project's potential impacts.

Regarding the assertion that the development should start on the East Site first to ensure that the Project that ultimately gets built is a true Unified Development, this comment does not raise an issue on the content or adequacy of the Draft EIR; as such, no further responses is warranted. Nonetheless, the commenter is also referred to Topical Response No. 5 – Land Use and Planning, above, which explains the Project's updated list of entitlements, including the request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. As one of the incentives is for FAR and density averaging across the Project Site, the Project shall be conditioned to build a single project on the Project Site, comprised of the East Site and West Site, in substantial conformance with the Exhibit A. Whether the Project is built under the "Overlapping Construction Scenario" or the "Sequential Construction Scenario" has no bearing on whether the full Project would be built.

Regarding the assertion that other than the Draft EIR's air quality and noise analyses, no other differences in the construction scenarios are analyzed, such as how the differences in the construction schedule might affect construction staging/stockpiling, the feasibility of placing temporary sound barriers, and pedestrian hazards. The differences in how construction is carried out between the East Site and West Site does not change the analysis for most of the issues addressed in the Draft EIR, and the issues of most consequence related to construction, are air quality and noise, which rely on worst-case assumptions between the two construction scenarios for their analysis. Under both construction scenarios, construction staging would still occur on the Project Site, and no matter which site or where on the Project Site construction staging would occur, worst-case/maximum assumptions were used in the Draft EIR for equipment use, proximity of activities to adjacent sensitive uses, and associated noise and air quality effects. Furthermore, the construction sequence would in no way influence the ability of placing temporary sound barriers in the manner prescribed in the mitigation measures provided in Section IV.I, *Noise*, of the Draft EIR. Regarding concerns about how pedestrian hazards in the area would be addressed under the different construction scenarios, these details would be appropriately covered once the specifics of construction activities are developed prior to issuance of a building permit. In addition, as analyzed in the Section IV.L, *Transportation*, of the Draft EIR, the safety of pedestrians in the area under either construction scenario would be ensured through the implementation of a Construction Management Plan (CMP), as presented on page IV.L-28 of the Draft EIR. As stated therein, the CMP would be subject to City review and approval and would formalize how construction will be carried out and identify specific actions required to reduce effects on the surrounding community. The CMP would be based on the nature and timing of the specific construction activities and other projects in the vicinity of the Project Site.

Regarding the Project's greenhouse gas (GHG) emissions, the comment expresses a concern that the level of GHG emissions that would result from the Project is unclear and cites to the reported GHG emissions in Section IV.E, *Greenhouse Gas Emissions*, of the

Draft EIR. Table IV.E-7 in the Draft EIR provides modeled GHG emissions for the Project and the Project with the East Site Hotel Option (although as previously stated the Project with the East Site Hotel Option is no longer under consideration). For informational purposes, Table IV.E-7 also provides, for comparison, GHG emissions of the Project without GHG emissions reductions that would be incorporated into the Project's design and location. The table has 10 columns with numerical GHG emissions values; however, each column is clearly labeled at the top describing what the values in each of the 10 columns represent. For instance, Table IV.E-7 clearly labels the GHG emissions level of 4,825 MTCO_{2e} as emissions that would occur from buildout of the Project's West Site without reduction features. Furthermore, the Methodology subsection of Section IV.E of the Draft EIR fully explains the comparison of the Project's GHG emissions to the emissions that would occur without GHG emissions reductions that would be incorporated into the Project's design and location. This explanation is provided on pages IV.E-40 and IV.E-41 of the Draft EIR. As explained above, the Project's evaluation of air quality, noise, and GHG emissions for the Project under the overlapping and sequential construction scenarios have been discussed, clearly labeled, and analyzed in the respective sections of the Draft EIR.

The commenter is also referred to Topical Response No. 7 – Noise and Vibration, for a discussion of noise impacts, and Section IV.B, *Air Quality*, of the Draft EIR, for a discussion of air quality impacts, and Section IV.E, *Greenhouse Gas Emissions*, of the Draft EIR, for a discussion of GHG impacts.

Comment No. ORG 44-12

4. The Project Description omits key details necessary for a full assessment of potentially significant impacts.

In addition to providing too many menu options to constitute a true stable and finite Project Description, the Draft EIR also omits the details necessary to fully and accurately assess the Project's environmental impacts. A complete project description is necessary to ensure that all of the Project's environmental impacts are considered. (*City of Santee v. County of San Diego* (1989) 214 Cal.App.3d 1438, 1454.) Yet, here, the Project Description fails to disclose numerous key aspects of the Project that affect the assessment of environmental impacts. These details include, but are not limited to:

- Identification and description of construction staging areas, which is relevant to the Draft EIR's analysis of aesthetics, air quality, noise, traffic and pedestrian hazard impacts. The identification of construction staging areas cannot be deferred.
- Whether the dwelling units will be rental or for-sale units. This aspect of the Project Description affects the Draft EIR's analysis of consistency with land use plans and policies, and the ability of the Project to qualify for the myriad development concessions sought by the applicant.

- The full nature of surrounding uses, which are inaccurately described in the Project Description. For example, AMDA residential uses are located at the northwest corner of Yucca Street and Ivar Avenue, yet this building is described as a commercial use in Figure II-2 of the Draft EIR. This error results in a flawed impact analysis, as residential uses are more sensitive to air quality, human health, and noise impacts than are commercial uses.
- The type and location of planned commercial retail. The Project's commercial uses are described only as "restaurant/retail space" which is inconsistent with how the uses are later described in the Draft EIR's land use and planning impact analysis. "Retail" and "commercial" uses are not all the same – the impacts associated with a grocery store are vastly different from the impacts associated with a movie theater which are vastly different from the impacts associated with an upscale restaurant which are vastly different from the impacts associated with a drive through restaurant. These details are pertinent to the Draft EIR's analysis of traffic, noise, air quality, odor, and land use planning analyses. Further, the Project seeks issuance of a Master Conditional Use Permit for the sale or dispensing of alcoholic beverages for on-site and off-site consumption within 12 establishments, but no description of what types of uses are planned to sell or dispense alcoholic beverages is provided, or where these uses will be located. Because these details are clearly known to the Project applicant, the Project Description must identify where these establishments are, and what kind of commercial uses are proposed. (See *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1213 ["When the particular type of retail business planned for a proposed project will have unique or additional adverse impacts, then disclosure of the type of business is necessary in order to accurately recognize and analyze the environmental effects"].)
- A breakdown of the number of housing units that will be reserved for Extremely Low Income and the number of units that will be reserved for Very Low Income, under each of the eight Project iterations. This is germane to the Draft EIR's analysis of the Project's consistency with land use plans and policies, as well as the calculation of the numerous development concessions sought for the Project, which affect building height and FAR.
- A detailed description of the terms of the 20-year Development Agreement sought as part of the Project's entitlements. Physical improvements, offsite improvements, restrictions on or required land uses are all relevant to the assessment of physical environmental impacts. All provisions of the Development Agreement that affect these issues must be disclosed, and analyzed, in the Draft EIR.
- Description of any and all off-site improvements, including, but not limited to, utility improvements, roadway improvements, or offsite park improvements, whether directly contemplated by the Project or included within or funded by the

Development Agreement. An accurate accounting of off-site improvements is relevant to all impact analyses contained within the Draft EIR.

Other missing, but procedurally required, aspects of the Project Description include a description of the intended uses of the EIR (State CEQA Guidelines, § 15124(d)) and a list of responsible and trustee agencies (State CEQA Guidelines, § 15124(d)(1)).

Because the omissions listed above are so fundamental to the ability of the Draft EIR to act as a meaningful information document, the Project Description must be revised and recirculated for public review, and each impact analysis chapter of the Draft EIR must be revised to accommodate a full accounting of potentially significant impacts arising from all aspects of the Proposed Project, including those details that were omitted from the Draft EIR circulated for public review.

Response to Comment No. ORG 44-12

The comment expresses opposition to the Project by making several assertions that the Draft EIR, particularly the Project Description does not comply with CEQA but does not provide substantial evidence to support this claim. Nonetheless, the following discusses each of the areas of deficiency alleged in the comment:

1. Project Description: The commenter is referred to Response to Comment Nos. IND 8I-14, IND 8I-17, ORG 42-4, ORG 44-9, and ORG 44-11 for a discussion of the Draft EIR Project Description's consistency with CEQA, including providing an accurate, stable, and finite project description, and a discussion of what warrants recirculation of an EIR.
 2. The commenter specifically states that the Project Description does not identify the construction staging areas. However, Section II.g(2), Construction Overview of the Draft EIR provides that: "All construction staging activities would be located within the West and/or East Sites. No import of soil, additional staging or use of off-site areas is proposed." The exact location of the staging areas within the West and East Sites is not known at this time since the areas would change as Project construction evolves. Accordingly, the entirety of each site was considered in the evaluation of potential environmental impacts. For example, as to noise impacts, the analysis conservatively assumes that noise causing activities would occur at the edge of the construction site closest to the effected receptor (see Section IV.I, *Noise*, page I-39, of the Draft EIR). CEQA does not require extensive detail beyond that needed for the evaluation and review of potential impacts (CEQA Guidelines Section 15124). Having identified the two on-site locations for staging and specified that no off-site locations would be used, the Draft EIR has satisfied CEQA requirements. Therefore, the construction overview in Section II.g(2) and construction environmental impact analysis in general were not deferred but adequately identified the Project's construction staging areas and potential impacts of all construction activities.
2. Dwelling units for sale or rent: The commenter also states that the Project Description does not identify whether the Project's dwelling units will be rental or for-sale units as this may affect the Draft EIR's

analysis of consistency with land use plans and policies and the ability of the Project to qualify for certain development concessions sought. However, the commenter does not provide any facts that such a breakdown is required to determine consistency with land use plans and policies and, therefore, no substantial evidence to support this claim or identification of what land use policies would be violated. With regard to qualifying for the requested development incentives, the commenter is referred to Topical Response No. 5 – Land Use and Planning, above, which explains the Project’s requested Density Bonus affordable housing incentives and affordable housing requirement pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. As explained therein, the Project would provide 13.2 percent of the total base permitted density for Very Low Income units Government Code Section 65915 and pursuant to LAMC Section 12.22 A.25, whether or not the Project’s residential units would be for-sale or for-rent. The State Density Bonus Law permits a developer to request a waiver or reduction of development standards. With the inclusion of at least 10 percent of the base permitted units for Very Low Income households, the Project Applicant is entitled to two incentives and the Waiver of Development Standards.⁹² (However, LAMC Section 12.22 A.25(c) requires the Applicant to provide at least 11 percent of the units as Very-Low Income households to be eligible for the 35 percent FAR increase On-Menu Incentive.) The distinction between the for sale or for rent units would have no bearing on the Project’s entitlements and environmental analysis.

3. Nature of the surrounding uses: The commenter further states that the full nature of surrounding uses is inaccurately described in the Project Description, including identifying the AMDA building at the northwest corner of Yucca Street and Ivar Avenue as a commercial use in Figure II-2 of the Draft EIR. However, the Draft EIR identifies the referenced AMDA building as a mixed-use building. According to the Los Angeles County Assessor map,⁹³ the property located on the northwest corner of Yucca Street and Ivar Avenue is zoned as commercial with no listed dwelling or bedroom units. Nonetheless, regarding noise impacts, even if the use contains residential uses as indicated by the commenter, contrary to the information from the Los Angeles County Assessor map, the use at the northwest corner of Yucca Street and Ivar Avenue is located near the off-site noise-sensitive receptors 1 and 13, as described in Section IV.I, *Noise*, of the Draft EIR, and would result in similar noise levels from the Project as reported for receptors 1 and/or 13. As stated in Table IV.I-8 and Table IV.I-9 of the Draft EIR, the estimated noise levels for receptors 1 and 13 would exceed the significance threshold, and noise impacts at both the West Site and East Site would be potentially significant. As stated, even with mitigation measures, impacts would be lessened but would remain significant and unavoidable. Since the use in question is located within the same area as receptors 1 and 13 and that area is already

⁹² Government Code Section 65915 (e)(2) states that that a proposal for the waiver or reduction of development standards shall neither reduce nor increase the number of incentives or concessions to which the applicant is entitled

⁹³ Los Angeles County Officer of the Assessor, Property Assessment Information System, <http://maps.assessor.lacounty.gov/>, accessed August 25, 2020.

determined to have a significant construction noise impact, no new impact has been identified.

4. Regarding air quality and human health, even if the AMDA building contains residential uses as indicated by the commenter, contrary to the information from the Los Angeles County Assessor map, localized air quality impacts were analyzed for the closest air quality sensitive receptors, which are directly adjacent to the Project Site. The use at the northwest corner of Yucca Street and Ivar Avenue is located diagonally across the intersection of Yucca Street and Ivar Avenue from the Project's West Site, which provides a buffer distance of approximately 120 feet and is clearly a farther distance away than a directly adjacent air quality-sensitive receptor. As stated on page IV.B-31 of the Draft EIR, air quality-sensitive uses located at greater distances from the Project Site than the specifically listed locations would experience lower air pollutant impacts from potential sources of pollutants from the Project Site due to atmospheric dispersion effects. Thus, localized air quality impacts at the use at the northwest corner of Yucca Street and Ivar Avenue would be less than the localized air quality impacts disclosed in the Draft EIR. Therefore, since the analysis in the Draft EIR, page IV.B-65, demonstrated that the maximum localized construction and operational emissions under the Project would not exceed the localized thresholds for NO_x, CO, PM₁₀, or PM_{2.5}, construction and operational emissions impacts to sensitive receptors would be less than significant. Regarding human health, while the City is not required to conduct a quantified health risk assessment (HRA) for mixed-use residential and commercial projects, such as the Project, a quantitative construction HRA was prepared for the Draft EIR. The HRA included the sensitive receptors identified in Figure IV.B-2 of the Draft EIR nearest to the Project Site, which included the AMDA Vine Building and the AMDA Tower Building. The findings showed that the Project would result in cancer risk below 10 in one million for the maximum impacted air quality sensitive receptors with implementation of feasible mitigation measures, including for the AMDA receptor. The calculation details of the HRA are provided in Section 4 of Appendix E-1 of the Draft EIR. As discussed on pages IV.B-71 and IV.B-72 of the Draft EIR, Project operations would comply with applicable SCAQMD rules that are specifically developed to minimize and control toxic air contaminant (TAC) emissions, such as Rule 1138 for restaurant charbroiling and Rule 1470 for emergency generators. Furthermore, the Project does not include the installation of industrial-sized stationary sources of TAC emissions; therefore, potential long-term operational impacts associated with the release of TACs would be minimal, regulated, and controlled, and would not exceed the SCAQMD thresholds of significance. As such, the Draft EIR addressed human health in the air quality analysis, and no additional analysis is required.
5. Types of retail/commercial uses proposed: The commenter also states that the Project Description does not identify the type and location of planned commercial uses. However, Chapter II, *Project Description*, of the Draft EIR, clearly identifies the location, square footage, and potential types of commercial uses proposed (i.e., retail and restaurant) within the Project and the Project with the East Site Hotel Option

(although the Project with the East Site Hotel Option is no longer under consideration). Figures II-8, II-9, II-14, II-15, II-21, II-22, II-27 all illustrate the commercial spaces under the Project and Project with the East Site Hotel Option, as applicable. Moreover, Table II-1, Proposed Development Program of the Draft EIR provides a detailed calculation of the Project's commercial uses, including the square footage and whether it is located within the East Site or West Site, and Table II-2, Proposed Development Program for the Project with the East Site Hotel Option. Section II.7(b)(1), Development Program, West Site, and Figures II-8 and II-9 of the Draft EIR provide a detailed explanation of the Project's commercial uses on the West Site, and Section II.7(b)(2), Development Program, East Site, and Figures II-14 and II-15 of the Draft EIR provide a detailed explanation of the Project's commercial uses on the East Site. While it is currently unknown what type of tenants will occupy each commercial space within the Project, the Draft EIR includes conservative development analyses for the Project's commercial component to identify the potential impacts. For example, the Project's trip generation assumptions conservatively utilized trip generation rates that assume 15 percent "fast-food restaurant without drive thru window" and 85 percent "high-turnover restaurant", which provides a conservative trip generation estimate (as compared to lower trip generating retail and restaurant uses), which are used in calculations for determining operational air quality and vehicular mobile-source noise impacts. With respect to odors, as discussed on pages IV.B-18 and IV.B-19 of the Draft EIR, South Coast Air Quality Management District (SCAQMD) Rule 402 prohibits the discharge of air contaminants that cause nuisance to any considerable number of persons or to the public and Rule 1138 requires controls for particulate matter, volatile organic compound (VOC), and odorous emissions for commercial cooking operations that use chain-driven charbroilers to cook meat. Furthermore, SCAQMD Rule 1113 limits the amount of VOCs in architectural coatings and solvents, and the California Air Resources Board (CARB) Air Toxics Control Measure that specified idling limitations for diesel trucks. These rules would ensure that Project operations, as well as construction, would not result in other emissions, such as those leading to objectionable odors, affecting a substantial number of people. Additionally, Project operations would not include any uses identified by the SCAQMD as being associated with substantial odors. As a result, Project operation or construction is not expected to discharge contaminants into the air in quantities that would generate objectionable odors, affecting a substantial number of people. No information in the Draft EIR implies that the Project's commercial uses would be grocery stores or drive-thru restaurants. In addition, the quality of space available for lease along the paseo within the Hollywood/Vine location would indicate high quality restaurants and outside dining, or boutique shopping. However, the identification of specific tenants at the completion of the Project in several years would be speculative and not appropriate for inclusion in an EIR. For high quality restaurants, requesting a Master Conditional Use Permit for the sale or dispensing of alcoholic beverages for on-site and off-site consumption within three or more establishments, in this case 12 establishments, is standard practice for any uses anticipating restaurants and would be available for any indoor and outdoor dining establishments. Given the character of the Project and because the specific tenants and locations of restaurant uses are not

currently known, the Master Conditional Use Permit would provide that restaurants leasing any of the commercial spaces would be able to dispense alcohol. As such, the Draft EIR clearly identified the type and location of planned commercial uses and conservatively analyzed potential impacts by assuming the most impactful uses for these locations.

6. Breakdown of Housing Units: The commenter states that the Project Description does not provide a breakdown of the number of housing units that will be reserved for Extremely Low Income and Very Low Income as this information may be germane to the Draft EIR's analysis of the Project's consistency with land use plans and policies, as well as the calculation of the numerous development concessions sought for the Project, which affect building height and floor area ratio (FAR). However, the commenter does not provide any facts that such a breakdown is required to determine consistency with land use plans and policies and, therefore, no substantial evidence to support this claim. Moreover, Section II.1 and Table II-1, *Proposed Development Description*, in Chapter II, *Project Description*, of the Draft EIR, clearly identified the number and location of affordable units. As such, the commenter's assertion that the Draft EIR did not provide a breakdown of the number of affordable housing units is incorrect. With regards to qualifying for the requested development incentives, the commenter is referred to Topical Response No. 5 – Land Use and Planning, above, which explains the Project's updated list of entitlements, including the request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. As explained therein, the Project is only required to set aside 10 percent of the base permitted density residential units for Very Low Income households to qualify for the requested development incentives and waivers, although the Project's provided affordable housing would exceed the requirement by setting aside approximately 13.2 percent of the total proposed residential units for Very Low Income households (however, LAMC Section 12.22 A.25(c) requires the Applicant to provide at least 11 percent of the units as Very-Low Income households to be eligible for the 35 percent FAR increase On-Menu Incentive). The Project does not request a development incentive to increase the Project's height.
7. Development Agreement: The commenter states that the Draft EIR must provide a detailed description of the terms of the 20-year Development Agreement sought as part of the Project's entitlements as the physical improvements, offsite improvements, restrictions on or required land uses are all relevant to the assessment of physical environmental impacts. All the physical improvements, off-site improvements, restrictions on or required land uses relevant to the assessment of physical environmental impacts of the Project are provided and discussed in the Draft EIR. Section II.7(g) of the Draft EIR also provides that, although the Project Applicant expects to construct the Project prior to the expiration of the Development Agreement, the Project Applicant would have the legal ability to develop the Project through 2040. Accordingly, where 2040 conditions would be the worst-case scenario, a 2040 buildout is assumed and utilized in the Draft EIR. However, 2040 conditions would be the

worst-case scenario for the analysis of noise impacts only. For all other issue areas, in which impacts are quantified, including air quality, energy, and greenhouse gas emissions, either the overlapping construction scenario with an anticipated buildout year of 2025, or the sequential construction scenario with an anticipated buildout year of 2027, is assumed. CEQA does not require any further detail in regard to the entitlements requested. (CEQA Section 15124(d)(1)(B)). The exact details of the Development Agreement will be determined through the entitlement process. However, since approval of the Development Agreement is contingent on certification of the EIR, the Development Agreement would not involve a different project than what is approved and could not contain conditions that would create environmental impacts that were not analyzed in the certified EIR. Accordingly, all impacts related to the worst-case buildout year have been disclosed in the Draft EIR.

8. Off-site Improvements: Regarding the assertion that the Project Description fails to disclose numerous key aspects of the Project, such as off-site improvements, including, but not limited to, utility improvements, roadway improvements, or off-site park improvements. There was no failure to disclose such improvements, as alterations to sidewalks and the Hollywood Walk of Fame, curb cuts, and street tree replacement, were identified in the Chapter II, *Project Description*, of the Draft EIR. In addition, as presented in Section IV.K.4, *Parks and Recreation*, no new parks are proposed or foreseeable in association with the Project. Furthermore, as presented in Section IV.L, *Transportation*, Section IV.N.1, *Wastewater*, Section IV.N.2, *Water Supply*, and IV.O, *Energy Conservation and Infrastructure*, other off-site improvements would be minor, such as provision of a traffic signal, pedestrian cross walks, and connections to wastewater, sewer, and utility lines in the public right-of-way. Such minor improvements would not involve construction not already accounted for within the maximum construction assumptions used in the Draft EIR. Accordingly, there was no omission of required information in the Project Description, and the Draft EIR provided a full accounting of potentially significant impacts associated with the Project. As such, recirculation of the Draft EIR is not warranted.
9. Uses of the EIR: Lastly, the commenter states that the Draft EIR does not identify a description of the intended uses of the EIR and a list of responsible and trustee agencies. However, Section I.1., Purpose, of the Draft EIR, stated the EIR will be used in connection with all other permits and all other approvals necessary for the construction and operation of the Project and identified the list of agencies that are expected to use the EIR in their decision making. However, CEQA Guidelines Section 15124(d)(1) does not require a list of responsible and trustee agencies to be provided. Furthermore, see the discussion under the heading “Anticipated Project Approvals,” on page II-74 and II-75, in Chapter II, *Project Description*, of the Draft EIR, and note as stated therein that beyond the environmental requirements being carried out in association with the EIR and to the extent known, there are no other related federal, State, or local environmental review and consultation requirements that need to be integrated with this CEQA review.

Comment No. ORG 44-13

5. The Project Description provides no assurances that the full Project will actually be constructed.

In both construction scenarios presented in the Project Description, the West Site is constructed first, and the East Site completed second. The Project Description fails to account for, and protect against, the possibility that only the West Site, or even worse, only part of the West Site, will actually be constructed. The Project seeks a conditional use permit (“CUP”) to allow Floor Area Ratio (“FAR”) to be averaged and residential density to be transferred between the East and the West Sites – but without controls in place, there is nothing to stop the applicant from constructing only that portion of the Project that is most lucrative, while the City and surrounding community see nothing in the way of benefit. Were that to happen, it would not be the first time the City has been left holding the bag. Take for example the New Tradition digital billboard at the The Reef, a state-of-the-art entertainment, residential, and commercial mixed use project in South Los Angeles. There, the applicant ultimately constructed only an acre’s worth of lucrative digital display, aimed directly at the freeway. The community has seen none of the project’s true purported benefits and possibly never will, but the applicant there has made a multimillion dollar windfall by building the massive digital billboard only. To avoid that same outcome here, the Project Description must include controls that require the Project’s benefits to be constructed first (i.e. the two senior housing towers and the public open space) before the applicant is permitted to benefit from any FAR averaging or development concessions. And since all the extra FAR and density will be transferred from the much larger East Site, yet the West Site is being built first (or is it, given that the DEIR Project Description has another option?), assurances need to be made that the East Site will actually be developed to make for a Unified Development Project. Or is this the reason why an East Site-first construction possibility is not contemplated? In other words, is this all geared at transferring development rights from one parcel to the other under false pretenses? If no controls are going to be added, the Draft EIR should consider the potential impacts of a scenario where only half the Project is actually constructed. Likewise, the Statement of Overriding Considerations for the Project should consider the various Project permutations, since all the supposed benefits of the Project touted by the Applicant may never materialize.

Response to Comment No. ORG 44-13

The comment requests that controls be added to the Project approvals to ensure that the entire Project is constructed. As such, this is not a comment on the content or adequacy of the Draft EIR and no further response is warranted. Nonetheless, on the adequacy of the Project Description, see Response to Comment Nos. ORG 44-9 through ORG 44-11. With regard to the Conditional Use Permit (CUP) for a Unified Development request, the commenter is referred to Topical Response No. 5 – Land Use and Planning, above, which introduces an update to the Project’s proposed entitlement program. The Project Applicant has revised the request for the proposed Zone and Height District Change to allow, under a JJJ concession pursuant to LAMC Section 11.5.11(e), a floor area ratio

(FAR) increase up to 7:1, as presented in Chapter II, *Project Description*, of the Draft EIR, to a Density Bonus Compliance Review pursuant to the State Density Bonus Law and the City's Density Bonus Ordinance. Both the State Density Bonus Law and the City's Density Bonus Ordinance permit the Waivers of Development Standards to the extent the Waivers are necessary to allow for the development of affordable housing. Pursuant to State Density Bonus Law and in conjunction with the requested Density Bonus Incentives and Waiver of Development Standards, the Project is not inconsistent with the zoning on the Project Site, inclusive of the "D" Limitation. The Project's updated list of entitlements also includes revision of the CUP for a Unified Development to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25, with an Off-Menu Incentive to allow FAR and density averaging across the Project Site.

Comment No. ORG 44-14

B. The Draft EIR's Noise Analysis Violates CEQA.

AMDA, as an adjacent sensitive receptor, is seriously concerned about the noise and vibration impacts of the Proposed Project on AMDA operations, classes, performances, students, instructors, and residence halls. Every day, the AMDA campus is a thriving hub of productions, recitals, rehearsals, and classes from early morning until about 11:30 p.m., and in summer months AMDA's outdoor stage hosts multiple productions. The Draft EIR, for all of its flaws and inaccuracies, still makes clear that AMDA operations will not be able to continue while construction takes place just feet away, ***for a period of up to seven years***.

Pursuant to the Draft EIR's analysis, which, as discussed below, grossly underestimates the true construction noise impacts, AMDA will experience extreme and near-continuous noise impacts throughout the seven year construction period. The Draft EIR admits that average—not even maximum—construction noise levels on the AMDA campus will frequently exceed 100 dBA L_{eq} , which is louder than a gas lawn mower operating three feet away, louder than the inside of a New York subway train, and nearly as loud as a low jet flyover—but taking place at a constant level, throughout the entire day. Worse yet, for all the reasons outlined below, the Draft EIR actually significantly underestimates the actual noise and vibration impacts that AMDA will experience, through the mis-categorization or omission of sensitive uses and the application of incorrect standards of significance.

AMDA operations are not just noise-sensitive—they are ***wholly dependent*** upon a quiet environment. Theaters, acting rehearsal rooms, dance studios, private voice rooms, musical studio spaces, classrooms, film production rooms, outdoor performance space, and residence halls operate on a daily basis, immediately adjacent to the Project site and directly across Yucca Street. Yet despite the onerous construction noise impacts described in the Draft EIR, which nonetheless downplay and hide even greater impacts, the mitigation measures identified are wholly insufficient to address the impacts on any

scale. AMDA requires, and it is the City's duty to ensure, specific mitigation that deals with AMDA as a sensitive receptor.

Because the Draft EIR's noise analysis fails to adequately identify and correctly categorize noise-sensitive receptors adjacent to the Project Site, and fails to mitigate the noise and vibration impacts of the Project to the extent that is technically feasible, the analysis must be revised to disclose additional significant impacts, substantially more severe environmental impacts than were previously disclosed, and identify revised and new mitigation measures. These revisions would trigger the need for recirculation under State CEQA Guidelines, section 15088.5.

Response to Comment No. ORG 44-14

The commenter asserts that the Draft EIR minimized the construction noise impacts at the AMDA facility immediately adjacent to the Project site and directly across Yucca Street (also referenced in Section IV.I, *Noise*, of the Draft EIR as the AMDA Tower Building) and hid impacts, and that the mitigation measures are insufficient.

As stated on page IV.I-39 of the Draft EIR, construction noise levels experienced at a receptor would fluctuate throughout a given workday as construction equipment move from one location to another within a project site. Therefore, the average noise level (L_{eq}) of construction equipment is the appropriate metric from which to calculate construction noise impacts at each receptor. As shown in Table IV.I-8 and Table IV.I-9 in the Draft EIR, the estimated construction noise levels under the sequential construction scenario at the off-site noise-sensitive receptors for construction activities at the West Site and East Site were analyzed. The Draft EIR presents a conservative impact analysis by assuming that the multiple noisiest pieces of construction equipment would operate simultaneously at construction areas nearest to the affected receptors (the fence line of the Project Site nearest of the receptor) (see Appendix K-1 of the Draft EIR). This is a conservative assumption because, in reality, multiple pieces of equipment cannot occupy the same physical space at the same time, and, as such, construction equipment are mobile and are physically spaced throughout a construction site. In addition, the analysis accounts for overlapping construction phases that would occur on each of the individual sites (i.e., the West Site and the East Site) to provide maximum construction noise levels from on-site construction activities on each site. Therefore, noise impacts at the AMDA facility located across Yucca Street were not minimized or hidden. Because Section IV.I, *Noise*, of the Draft EIR presents a conservative noise impact analysis by assuming that the multiple noisiest pieces of construction equipment would operate simultaneously at construction areas nearest to the affected receptors (the fence line of the Project Site nearest of the receptor) (see Appendix K-1 of the Draft EIR), the Draft EIR does not state or imply anywhere that the conservatively estimated maximum noise levels would "frequently exceed 100 dBA L_{eq} " as stated in the comment. The Draft EIR discloses maximum potential construction noise levels in order to avoid underestimating maximum noise impacts. Accordingly, the commenter's assertion that noise levels would "frequently exceed 100 dBA L_{eq} " is not based on fact.

As discussed on page IV.I-8 of the Draft EIR, the Federal Transit Administration's (FTA) published Transit Noise and Vibration Impact Assessment Manual, which provides technical guidance for conducting noise and vibration environmental analyses, uses a screening distance of 100 feet for highly vibration-sensitive buildings and 50 feet for lesser vibration-sensitive buildings including residential uses. The screening levels recognize that vibrations caused by construction equipment diminish in strength with increasing distance from the construction equipment.⁹⁴ The AMDA Vine Building, which is immediately adjacent and north of the West Site is within the screening distance and was therefore included in the vibration analysis. Maximum vibration impacts were estimated based on the assumption that vibration-generating equipment would be used very close to (within 2 feet of) the AMDA Vine Building. The AMDA Tower Building is located approximately 125 feet from the West Site and 295 feet from the East Site construction area, therefore it is outside of the screening distances from the Project Site and no quantified analysis is required for vibration impacts.

The noise and vibration analyses used conservative assumptions and were presented in the Draft EIR. The commenter states that the mitigation measures are insufficient and should be more specific; however, additional feasible mitigation measures were not presented by the commenter. The mitigation measures presented in the Draft EIR, as revised (see Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR), would reduce construction noise impacts and include clear and specific performance standards, and no additional analyses are required.

Comment No. ORG 44-15

1. Multiple factual errors and omissions relating to AMDA downplay significant impacts and result in a legally indefensible analysis.

The Draft EIR fails to identify the AMDA dormitories located at the corner of Yucca Street and Ivar Avenue as a residential, noise-sensitive receptor. Instead, this parcel is identified, in error, as a commercial use. (Draft EIR, pp. IV.I-15, -16.) As a result of this omission, the full extent of noise and vibration impacts on an adjacent, noise-sensitive residential use is wholly ignored by the Draft EIR's analysis. The Draft EIR must be revised to identify the AMDA residences on this parcel as a noise-sensitive receptor both within the list of noise-sensitive uses on page IV.I-15, and on Figure IV.I-3. The AMDA residential use on this parcel must be given its own identification number, like the other noise-sensitive uses identified in Figure IV.I-3, and the noise impacts on this parcel must be calculated and added to each noise impact table of this chapter of the Draft EIR. If impacts to this newly-added residential use are significant, all feasible mitigation measures that could reduce these impacts to a level of less than significant must be identified. Such measures could include, but certainly are not limited to, relocating the residences to another location for the duration of construction on the West Site, construction of additional temporary or permanent sound barriers, and additional monitoring and/or notification. We point out that identification and disclosure of a **new**

⁹⁴ FTA, Transit Noise and Vibration Impact Assessment Manual, 2018, p. 182.

potentially significant impact, after a draft environmental impact report has already been circulated for public review, triggers the need for recirculation. (See State CEQA Guidelines, § 15088.5(a)(1), (a)(2).)

The Draft EIR also mischaracterizes the building type of both the AMDA Vine Building and the AMDA Tower Building (noise-sensitive receptor #6 and #7). These buildings are both unreinforced, non-ductile, concrete buildings. It should be noted that the City is aware that these two buildings are unreinforced non-ductile concrete buildings, and in fact, was the party responsible for bringing this issue to AMDA's attention. (See **Exhibit A.**) In error, the Draft EIR characterizes these buildings as "Category I: Reinforced concrete, steel, or timber," which they are not. This mis-categorization results in the application of the wrong threshold of significance for building damage, and as a result, greatly minimizes the level of significance of construction vibration impacts and the likelihood that AMDA's buildings will be severely damaged by the Proposed Project.

For example, Table IV-17, Construction Vibration Impacts – Building Damage, applies a significance threshold of "0.50 dBA(L_{eq})" to the AMDA Vine Building. Assuming that the table actually meant to apply a threshold of "0.50 inch/second (PPV)" instead of dBA, the correct threshold should be no more than 0.3 inch/second (PPV). Table IV.I-17 indicates that, with application of the wrong threshold, the AMDA Vine Building will experience vibration levels **nearly seven times the acceptable level**. However, in actuality, if the correct threshold for a Category II building had been applied, this table would have disclosed that **the AMDA Vine Building will actually experience vibration levels more than eleven times the acceptable level**. We again point out that where information discloses a **substantial increase** in the severity of an environmental impact already disclosed, after a draft environmental impact report has already been circulated for public review, recirculation is required. (See State CEQA Guidelines, § 15088.5(a)(2).) This is particularly important here, where it is unclear if vibration levels this high would jeopardize the building's structural integrity and the life and safety of its occupants.

Separate from the mischaracterization of the AMDA buildings for purposes of building structural damage (i.e. the FTA Building Category), the analysis also mis-categorizes the AMDA buildings for purposes of vibration annoyance. FTA's vibration thresholds associated with the potential for human annoyance are based on land use sensitivity to vibration. Category 1 is assigned to land uses with high sensitivity to vibration, "where vibration would interfere with interior operations." (Draft EIR, p. IV.I-9.) Given the types of activities that occur in AMDA's buildings (e.g., breathing exercises, music classes, ballet), AMDA should be considered a Category 1 Building and a 65 VdB threshold must be applied (not the Category 3 threshold of 83 VdB) to determine the significance level of vibration impacts on human activities.

Finally, the noise analysis fails to account for the location of any construction staging, construction vehicle waiting areas, and construction equipment warm up areas. Instead, these key details which would have direct impacts on adjacent noise-sensitive receptors are punted to a future date, to be decided out of the public eye. Instead of disclosing and

analyzing construction staging activities, the Draft EIR references only a future construction traffic management plan, to include haul routes and a staging plan. (Draft EIR, p. IV.I-76.) The past iteration of this Project, the Millennium Hollywood, proposed construction vehicle staging and waiting on Yucca Street, directly adjacent to **both** AMDA buildings, literally dividing AMDA's main campus area. Given that the Hollywood Center Project is completely silent on its plans for construction staging, there is no reason to think that Yucca Street will not be used. The Draft EIR must identify, describe and analyze the direct and indirect noise and vibration impacts from staging—or, in the alternative, incorporate a mitigation measure prohibiting construction staging near noise-sensitive uses.

The failure to identify an existing residential use at Yucca Street and Ivar Avenue, the mischaracterization of the AMDA buildings as Category I Buildings for purposes of vibration analysis and a Category 3 use for purposes of human annoyance from vibration, and the failure to identify construction staging areas indicates that the Draft EIR has failed to identify all significant impacts, and the true severity of the impacts it does disclose. The only way to remedy this is to revise the noise analysis and recirculate it for public review.

Response to Comment No. ORG 44-15

The commenter states the Draft EIR did not identify the AMDA dormitories located at the corner of Yucca Street and Ivar Avenue as a residential noise-sensitive receptor but instead listed it as a commercial. According to the Los Angeles County Assessor map⁹⁵ the properties located on the northwest, northeast, and southwest corners of Yucca Street and Ivar Avenue are zoned as commercial with no listed bedroom units. Nonetheless, even if the uses contain residential uses, contrary to the information from the Los Angeles County Assessor map, these uses identified as commercial in the Draft EIR are located near off-site noise-sensitive receptors 1 and 13 and would result in similar noise levels from the Project as reported for receptors 1 and 13. As stated in Table IV.I-8 and Table IV.I-9 of the Draft EIR, the estimated noise levels for receptors 1 and 13 would exceed the significance threshold, and noise impacts at both the West Site and East Site would be potentially significant. Even with mitigation measures, impacts would be lessened but would remain significant and unavoidable. Since the use in question is located within the same area as receptors 1 and 13 and that area is already determined to have a significant construction noise impact, no new impact has been identified and recirculation is not required.

The commenter asserts that the AMDA Vine Building and the AMDA Tower Building were mischaracterized as Category I, reinforced concrete, steel, or timber since they are not reinforced. As discussed on page IV.I-15 of the Draft EIR, the AMDA Tower Building is located on the northwest corner of Yucca Street and Vine Street and approximately 125 feet from the West Site and 295 feet from the East Site construction area.

⁹⁵ Los Angeles County Officer of the Assessor, Property Assessment Information System, <http://maps.assessor.lacounty.gov/>, accessed August 25, 2020.

Regarding the AMDA Vine Building, as stated in Table IV.I-17 of the Draft EIR, the estimated vibration velocity levels from all construction equipment would exceed the Category I threshold of 0.5 inch/second PPV at the AMDA Vine Building. As per the information supplied in the comment regarding the structural characteristics of the AMDA Vine Building, including the information in commenter's Exhibit A, the AMDA Vine Building has been changed from FTA Category I to a Category II for the structural damage analysis with a significance threshold of 0.3 inch/second PPV. The revision is provided in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR. However, this change does not affect the calculations provided in the vibration analysis for the Draft EIR and would result in the same vibration level disclosed in the Draft EIR and the same impact determination as provided in the Draft EIR. Therefore, no new or substantially more significant impact has been identified.

Regarding human annoyance vibration impacts, as stated on page IV.I-9 of the Draft EIR, FTA Category 1 are buildings where vibration would interfere with operations within the building, including vibration-sensitive research and manufacturing facilities, hospitals with vibration-sensitive equipment, and university research operations. Vibration-sensitive equipment includes, but is not limited to, electron microscopes, high-resolution lithographic equipment, and normal optical microscopes. Category 2 refers to all residential land uses and any buildings where people sleep, such as hotels and hospitals. Category 3 refers to institutional land uses, such as schools, churches, other institutions, and quiet offices, that do not have vibration-sensitive equipment but still have the potential for activity interference. AMDA states in Comment No. ORG 44-8 that they are "accredited by the National Association of Schools of Theater" and that "AMDA offers a High School Summer Conservatory Program." Since AMDA is a school, the potential for human annoyance vibration impacts is based on the FTA Category 3. No revision to the human annoyance vibration impact analysis presented in the Draft EIR is required.

As discussed on page IV.I-8 of the Draft EIR, the FTA's published Transit Noise and Vibration Impact Assessment Manual, which provides technical guidance for conducting noise and vibration environmental analyses, uses a screening distance of 100 feet for highly vibration-sensitive buildings and 50 feet for lesser vibration-sensitive buildings, including residential uses. The screening levels recognize that vibrations caused by construction equipment diminish in strength with increasing distance from the construction equipment.⁹⁶ As the AMDA Tower Building is outside of the screening distances from the Project Site, no quantified analysis is required for vibration impacts.

The commenter also claims that the Draft EIR did not identify construction staging areas or haul routes. The construction haul routes and staging areas were identified on page II-73 in Chapter II, *Project Description*, of the Draft EIR. As discussed, there are two proposed haul routes. The first haul route would have inbound and outbound trucks heading to and from US-101 utilizing entry and exit ramps north of the Project Site (e.g., entry ramps on Argyle Street and exit ramps on Gower Street. The second haul route

⁹⁶ FTA, Transit Noise and Vibration Impact Assessment Manual, 2018, p. 182.

option for both outbound and inbound trips would utilize entry and exit ramps to and from US-101 on Hollywood Boulevard and not on Franklin Avenue or Argyle Avenue. Additionally, all construction staging activities would be located within the West and/or East Sites. No additional staging or use of off-site areas is proposed. Section IV.I, *Noise*, of the Draft EIR presents a conservative noise and vibration impact analysis by assuming that the multiple noisiest pieces of construction equipment would operate simultaneously at construction areas nearest to the affected receptors (the fence line of the Project Site nearest of the receptor) (see Appendix K-1 of the Draft EIR). This conservative analysis fully accounts for noise and vibration from staging areas, as well as construction activity areas. Construction traffic noise impacts were also fully analyzed in the Draft EIR, inclusive of the haul routes, and were summarized in Table IV.I-11 of the Draft EIR.

Comment No. ORG 44-16

1. Additional factual errors and omissions relating to non-AMDA sensitive receptors result in inaccurate analysis.

The Draft EIR's mischaracterizations are not limited to only AMDA facilities. On page IV.I-36 of the Draft EIR, vibration susceptibility categories applied to nearby non-AMDA buildings is also contradictory and misleading. For example, the text states that both the Capitol Records Building and the Gogerty Building are evaluated based on the significance threshold for FTA Building Category I (meaning the most lax vibration threshold for building damage will be applied to these historic buildings). Yet later in the same paragraph, the text states that historic structures are evaluated based on the vibration significance threshold for FTA Building Category IV (which mandates that the most conservative vibration threshold for building damage be applied). As with the AMDA buildings, mischaracterization of buildings considerably downplays the significance of the vibration impacts. As historic buildings, the more conservative 0.12 inch/second (PPV) threshold should be applied to both the Capitol Records Building and the Gogerty Building, to ensure the true magnitude of the Project's impacts is considered by both the public and the City's decisionmakers. Yet Table IV.I-17, Estimated Vibration Velocity Levels at the Nearest Off-Site Structures from the Project Construction Equipment, indicates that the most lax significance threshold of 0.50 inch/second (PPV) was applied to these historic resources.³ The analysis should be redone to apply the correct threshold and disclose the true magnitude of potentially significant impacts.⁴

Footnote 3: Further, given that the FTA Building Categories for vibration impacts assigned to the AMDA buildings were incorrect, the building categories for all other sensitive receptors identified in Figure IV.I-4 should be re-confirmed.

Footnote 4: Even if Table IV.I-17 discloses a potentially significant impact when applying the more lax significance threshold, this is not enough to overcome the need to revise and recirculate the analysis. Stating that an impact will be significant is not enough – an EIR's analysis must also **correctly** disclose **how** significant an impact will be. Here, an exceedance of a lower threshold by a greater amount is not the same as disclosing the exceedance of a higher threshold by a smaller amount. Under State CEQA Guidelines,

section 15088.5, when information indicates that an environmental impact will be substantially more severe than was previously disclosed in a circulated draft EIR, recirculation to correct the error is required.

Response to Comment No. ORG 44-16

The commenter asserts that the Draft EIR's analysis of nearby non-AMDA building sensitive receptors is inaccurate. The commenter is correct in stating that both the Capitol Records Building and the Gogerty Building were evaluated based on the significance threshold for a FTA Building Category I. As discussed on page IV.I-36 of the Draft EIR, the FTA building category for vibration-sensitive receptors were determined based on their building type and not simply the age of the structure. The Capitol Records Building and Gogerty Building are constructed of reinforced concrete with no plaster. Plaster is a material that is susceptible to vibration damage. Thus, these buildings are considered Category I. Therefore, building categories of vibration-sensitive structures have been properly categorized in the Draft EIR. Implementation of a vibration monitoring program would ensure that potential damage to adjacent structures would be avoided, and/or repaired in the event that Project construction results in cosmetic damage. However, the text on page IV.I-36 of the Draft EIR states that historic structures, which includes the Capitol Records Building and Gogerty Building, were evaluated based on the vibration significance threshold for FTA Building Category IV. This statement is intended to refer to the off-site historic structures and has been clarified in this Final EIR (see Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*). Similarly, The Historic Structures section of Table IV.I-4 of the Draft EIR has been corrected in this Final EIR to reference FTA Building Category I for the Capitol Records Building and Gogerty Building (see Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*). With the clarifications and corrections, no new significant impact has been identified and recirculation is not required.

This is a conservative assumption because, in reality, multiple pieces of equipment cannot occupy the same physical space at the same time and as such, construction equipment are mobile and are physically spaced throughout a construction site. In addition, the analysis accounts for overlapping construction phases that would occur on each of the individual sites (i.e., the West Site and the East Site) to provide maximum construction noise levels from on-site construction activities on each site.

Comment No. ORG 44-17

- 2. The construction noise methodology is flawed, flatly mischaracterizes the thresholds of significance in the 2006 L.A. CEQA Thresholds Guide, and must be revised and recirculated.**

The Draft EIR fails to fully disclose Project impacts by only reporting L_{eq} and not the full range of dBA increases that would result from the Project. To hide this flawed methodology, the Draft EIR blatantly misstates the thresholds established in the 2006 L.A. CEQA Thresholds Guide.

L_{eq} , or the equivalent energy noise level, “is the **average** sound level.” (Draft EIR, p. IV.I-4, emphasis added.) The Draft EIR is required to not only disclose the average dBA over a period of time, but the full range of dBA, including L_{max} (the maximum, instantaneous noise level experienced during a day). Disclosure of the full range of dBA is important for many reasons. First, LAMC section 111.02 defines a noise violation as a noise level increase of 5 dBA over the existing average ambient noise level at an adjacent property line. (Draft EIR, p. IV.I- 13.) Second, the *2006 L.A. CEQA Thresholds Guide* provides that a Project will have a significant impact if “construction activities lasting more than one day would exceed existing ambient exterior noise levels by 10 dBA or more at a noise-sensitive use.” (*2006 L.A. CEQA Thresholds Guide*, p. I.1-3.) Similarly, the *2006 L.A. CEQA Thresholds Guide* provides that a Project will also have a significant impact if “construction activities lasting more than 10 days in a three month period would exceed existing ambient exterior noise levels by 5 dBA or more at a noise sensitive use.” (*Ibid.*) These thresholds are not based on L_{eq} — they are based on dBA alone.

Despite the plain text of the *2006 L.A. CEQA Thresholds Guide*, the Draft EIR mischaracterizes and just plainly revises these thresholds and states that the *2006 L.A. CEQA Thresholds Guide* identifies the following criteria to evaluate construction noise: “Construction activities lasting more than one day would exceed existing ambient exterior noise levels by 10 dBA L_{eq} or more at a noise sensitive use; [and] [c]onstruction activities lasting more than 10 days in a three-month period would exceed existing ambient exterior noise levels by 5 dBA L_{eq} or more at a noise sensitive use.” (Draft EIR, p. IV.I-31.) ***The 2006 L.A. CEQA Thresholds Guide does not establish L_{eq} thresholds. In fact it does not even reference L_{eq} except in the context of traffic volume noise.*** The fact that the Draft EIR tries to rewrite the City’s noise thresholds to downplay the environmental impacts experienced by surrounding noise-sensitive uses is an egregious violation of CEQA and results in an EIR that fails to disclose and inform the public and City decisionmakers. As such, the noise analysis must be revised and recirculated to disclose the true impacts of the proposed Project.

Even under the Draft EIR’s flawed methodology, AMDA will experience construction noise levels of more than 100 dBA L_{eq} . Again, as discussed above, L_{eq} is the **average** noise experienced— L_{max} , one would assume, would be much higher. However, a reader would not know, given that L_{max} impacts are not reported or measured against a threshold. Thus, impacts to AMDA are grossly underreported by the Draft EIR.

Response to Comment No. ORG 44-17

The commenter asserts that the Draft EIR’s noise analysis is inaccurate by claiming the Draft EIR misstates the *2006 L.A. CEQA Thresholds Guide*. The *2006 L.A. CEQA Thresholds Guide* Exhibit I.1-1 and I.1-2 (pages I.1-8 and I.1-9 of the Draft EIR) cite construction noise levels from the United States Environmental Protection Agency (USEPA) research and documentation.⁹⁷ As noted on page 12 of the USEPA document,

⁹⁷ USEPA, Noise from Construction Equipment and Operations, Building Equipment and Home Appliances, PB206717, 1971.

engine noise typically predominates, with exhaust noise using being most significant. Other sources of noise from construction equipment includes mechanical and hydraulic transmission and actuation systems, and cooling fans. According to the USEPA, the typical operating cycles of construction equipment includes one or two minutes of full-power (and therefore full power noise levels) followed by three or four minutes at lower power. Fluctuating engine power levels combined with the fact that construction equipment would be mobile throughout the Project Site, the average (L_{eq}) noise level of construction equipment is the appropriate metric to use for construction noise analyses. The L_{max} or the maximum, instantaneous noise level experienced during a given period of time is not appropriate since it assumes construction equipment is operating at full power for the entire construction period, which is not consistent with USEPA research which, as stated above, assumes a majority of the noise cycle is at a lower engine power. Additionally, to ensure that construction noise is not underestimated, the Draft EIR presents a conservative impact analysis by assuming that the multiple noisiest construction equipment would operate simultaneously at construction areas nearest to the affected receptors (at the fence line of the Project Site nearest the noise-sensitive receptor) (see Appendix K-1 of the Draft EIR). This is a conservative assumption because, in reality, multiple pieces of equipment cannot occupy the same physical space at the same time, are mobile, and are physically spaced throughout a construction site. In addition, the analysis accounts for overlapping construction phases that would occur on each of the individual sites (i.e., the West Site and the East Site) to provide maximum construction noise levels from on-site construction activities on each site.

Comment No. ORG 44-18

In addition to the above noted issues, AMDA has several other questions and comments relating to the noise and vibration analysis methodology, the responses to which are necessary for a full understanding and assessment of the impacts analysis. These include:

Response to Comment No. ORG 44-18

The comment introduces additional questions related to noise and vibration methodology, which are addressed in Response to Comment Nos. ORG 44-19 through ORG 44-35, below.

Comment No. ORG 44-19

- **Methodology for identifying existing ambient noise levels is unclear.** Neither the Draft EIR nor the Construction Noise & Vibration Impact Study clearly identify how existing ambient noise levels were measured. When were the noise measurements taken? How long were noise measurements taken for on the survey days? How does this adequately represent true existing conditions? What methodology was used to determine the location of noise measurement locations identified in Figure IV.I-4? Why is no noise measurement location identified at the

Capitol Records Building? Why were no noise measurement locations identified east of Argyle Avenue?

Response to Comment No. ORG 44-19

This comment asserts that the Draft EIR's methodology for identifying existing ambient noise levels is unclear. As discussed on page IV.I-20 of the Draft EIR, the predominant existing noise source near the Project Site is roadway noise from Yucca Street, Vine Street, Hollywood Boulevard, and other major roadways in the surrounding area. Additionally, US-101 located approximately 380 feet north of the East Site's northernmost boundary contributes to ambient noise levels. Other noise sources include general residential and commercial-related activities associated with trash collection activities, loading and unloading activities, and surface parking lots. Ambient noise measurements were taken at eight locations along or near the public right-of-way. The measured environmental noise levels at R1 through R8 represent the current ambient noise levels in the vicinity of the Project Site and are used to establish the existing ambient noise level at the noise-sensitive receptors within the Project area. The ambient noise measurements at all measurement locations exceed the City's requirement for ambient noise as defined in LAMC Section 111.01. As described on page IV.I-13 of the Draft EIR, the LAMC clearly identifies the location (at an adjacent property line), length of time period (at least 15 minutes L_{eq}), and thresholds (an increase of 5 dBA over the existing average ambient noise level for noise occurring more than five but less than fifteen minutes in any one-hour period and an increase of 10 dBA for noise occurring five minutes or less in any one-hour period). Please see below for the relevant sections from the LAMC.

- LAMC Sections 111.01(a) and 111.03 define the ambient noise as the actual measured ambient noise level or the City's presumed ambient noise level, whichever is greater. The actual ambient noise level is the measured noise level averaged over a period of at least 15 minutes L_{eq} .
- LAMC Section 111.02 provides procedures and criteria for the measurement of the sound level of "offending" noise sources. In accordance with the LAMC, a noise level increase of 5 dBA over the existing average ambient noise level at an adjacent property line is considered a noise violation. To account for people's increased tolerance for short-duration noise events, the Noise Regulation provides a 5-dBA allowance for noise occurring more than five but less than fifteen minutes in any one-hour period and an additional 5-dBA allowance (total of 10 dBA) for noise occurring five minutes or less in any one-hour period.

The noise measurements represent the nearby land uses in the vicinity of the Project Site and were used to establish ambient noise levels as shown in Figure IV.I-3 on page IV.I-16 of the Draft EIR. The ambient noise measurement locations are described in detail on pages IV.I-15 and IV.I-16. The locations were selected because they are considered representative of the noise environment of the existing off-site noise-sensitive receptors, including residential, hotel, performance venue, and institutional uses, such as the AMDA. As shown in the monitoring data files provided in Appendix K (specifically, please refer to

Appendix K-2, Exhibit A), the monitoring occurred on Wednesday-Thursday, May 23-24, 2018, for durations that meet or exceed the LAMC as listed above. The dates May 23-24, 2018 did not correspond to a holiday or unique event day that would cause elevated noise above typical conditions in the Project area. Thus, this location and time period for the ambient noise level measurement comply with the LAMC specifications and provide representative ambient noise data measured in the Project area.

As previously mentioned, the predominant existing noise source surrounding the Project Site is traffic noise from Yucca Street, Vine Street, Hollywood Boulevard, and other major roadways in the surrounding area. All ambient noise measurement locations near the Project Site are placed along the nearby streets and the nearby noise-sensitive receptors; therefore, these locations are representative of the ambient noise levels surrounding the Project Site, and no additional analysis is required.

The ambient noise level was measured for a period of 15 minutes consistent with the requirement of LAMC Section 111.01. Some of the noise measurement locations represent noise levels at multiple noise sensitive receptor locations, as noted in Table IV.I-5 of the Draft EIR. Therefore, the selection of the measurement locations and time period in which the ambient noise level measurements were collected complies with the LAMC specifications.

The commenter asks why noise measurements were not collected at the Capitol Records Building. As stated on page IV.I-17 of the Draft EIR, the Capitol Records Building was not treated as a noise sensitive receptor because it is an applicant-controlled facility and is located within the Project Site boundary. The Project's effect on an on-site use is not considered to be an impact under CEQA and need not be analyzed in the Project's EIR. See *Parker Shattuck Neighbors v. Berkeley City Council* (2013) 222 Cal.App.4th 768, 782 ("In general, CEQA does not regulate environmental changes that do not affect the public at large: "the question is whether a project [would] affect the environment of persons in general, not whether a project [would] affect particular persons." [Citations omitted]). Therefore, the on-site Capitol Records Building does not need to be analyzed as a sensitive receptor in the noise impact assessment.

Ambient noise measurement locations R3 and R8 are located along Argyle Avenue and are used to represent the ambient noise levels at the approved hotel site and approved multifamily residential buildings on the east side of Argyle Avenue. Noise measurements were not collected further east from Argyle Avenue since those receptors would experience lower noise levels from potential sources of noise on the Project Site due to distance loss. In addition, as noted on page IV.I-88 of the Draft EIR, the 2006 L.A. CEQA Thresholds Guide identifies a distance of 500 feet as the screening criterion with respect to construction activities. Therefore, receptors located greater than 500 feet from the Project Site have not been evaluated and ambient noise levels at distances greater than 500 feet are not required.

Comment No. ORG 44-20

- **No information specific to each vibration-sensitive receptor is provided, even though it is wholly feasible to have completed inspections prior to releasing the Draft EIR for public review.** Have the Capitol Records Building, the Gogerty Building, and other adjacent historic buildings been recently inspected for vibration-related damage or susceptibility? If so, what were the findings of those inspections? If not, such inspections should be completed now, and the findings included in a recirculated Draft EIR in order to fully disclose the potential impacts to these historic resources caused by vibration levels that exceed, by several times, the FTA threshold for building damage. While we note that Mitigation Measure NOI-MM-4 requires a building inspector or structural engineer “to visit” these buildings prior to the start of construction, such inspections must be done **now** because the findings of these inspections will indicate the likelihood and extent of vibration impacts. The Draft EIR’s deferral of this analysis violates CEQA, which permits deferral only when it is wholly infeasible to complete a meaningful analysis during the environmental review, which is not the case here.

Response to Comment No. ORG 44-20

The commenter asserts that no information specific to each vibration-sensitive receptor is provided in the Draft EIR. As stated on page IV.I-17 of the Draft EIR, structures in close proximity to the Project Site, including a number of historic structures, are considered vibration sensitive receptors. Table IV.I-4 of the Draft EIR lists the surrounding vibration receptors categorized by those near the West Site and the East Site, while also separately listing those that are historic structures. Although the Capitol Records Complex, which includes the Capitol Records Building and the Gogerty Building, is located within the Project Site, it is included in the vibration analysis due to the potential for structural damage to a historical resource.⁹⁸ Table IV.I-17 of the Draft EIR presents the estimated vibration levels from all construction equipment to off-site vibration-sensitive receptors and the Capitol Records Complex.

Pages IV.C-24 through IV.C-45 of the Draft EIR include detailed descriptions of potentially historical architectural resources within the Project Site vicinity. As described on page IV.C-50 of the Draft EIR, field examinations of these resources were conducted in addition to the review of historic building permits, Sanborn Fire Insurance maps, historic photographs, aerial photos, and local histories. Detailed examination of existing building condition and damage cannot be conducted without permission from property owners to enter private property. There are no known reports of inspections specifically for vibration-related damage or susceptibility for the Capitol Records Building, the Gogerty Building, and other adjacent historic buildings. Thus, as discussed on page IV.I-84 of the Draft EIR,

⁹⁸ The Capitol Records Complex is located on-site within the Project’s East Site and is an Applicant-controlled facility. Therefore, the Capitol Records Complex is not considered an off-site receptor for evaluating impacts to the environment. For the purposes of the noise and vibration analysis in the Draft EIR, the Capitol Records Complex is evaluated for potential structural vibration damage as it is a historical resource.

Mitigation Measure NOI-MM-4(a) states that prior to the start of construction, the Applicant shall retain the services of a licensed building inspector or structural engineer, or other qualified professional as approved by the City, to visit the buildings which are located adjacent to the Project Site and to the west, to inspect and document (video and/or photographic) the apparent physical condition of the building's readily-visible features. This includes both historic buildings and non-historic buildings in proximity to the Project Site. For the historic buildings identified in (a), inspection and documentation shall also be carried out by, and in coordination with, a qualified preservation consultant. The timing of building inspections required by Mitigation Measure NOI-MM-4 is appropriate because upon certification of the EIR and approval of the Project, the Applicant will coordinate with neighboring property owners to gain access for inspection. Further, it is not reasonable to conduct inspections prior to certification of the EIR and approval of the Project as the Project has no responsibility to provide repairs that are caused by existing conditions in the absence of the Project and that are not caused by the Project. The timing of building inspections required by Mitigation Measure NOI-MM-4 provides for a baseline determination of building conditions that exist prior to the onset of Project construction. The known facts of vibration-sensitive receptors have been utilized in the noise and vibration analysis. The estimated extent of vibration impacts has been summarized in the Draft EIR, and mitigation has been identified to reduce and minimize those impacts. Therefore, mitigation and the timing of inspections identified in the Draft EIR are adequate and are not deferred. Furthermore, in consideration of public comments received on the vibration-related mitigation measures in the Draft EIR, additional detail has been added to Mitigation Measure NOI-MM-4 to clarify monitoring and reporting requirements (see Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*; please also refer to Response to Comment No. ORG 44-34 below for the revisions to Mitigation Measure NOI-MM-4, shown in double-underlined text).

Comment No. ORG 44-21

- **The analysis fails to analyze noise and vibration impacts of on-site historic resources.** What are the Project's impacts on the Capitol Records recording studios and historic echo chambers? This City-designated Historic Cultural Monument cannot be ignored simply because it is located on the Project site. The Draft EIR provides no impact analysis and no mitigation related to these sensitive resources, which would be rendered wholly unusable for the entire duration of construction, and possibly beyond if vibration damage is sustained. No valid study (or any study, at all) has been done on the likely impacts that construction will have on the echo chambers so that potential mitigation measures can be developed. No acoustical engineer has analyzed both short term and long term effects on the chambers, and no analysis has been done to determine whether other feasible construction methods are available that could reduce impacts. These are basic requests and ones that Capitol Records/EMI Music North America has made in relation to development projects in the past when it has not been related in some fashion to the project applicant. (See **Exhibit B**, attached.) As Capitol Records has stated in relation to other adjacent construction projects, "The sound in the [Capitol

Records] Studios is one that cannot be replicated anywhere else in the world. The echo chambers are as much a part of the Hollywood history as the Capitol Tower and the Hollywood sign. One of [Capitol Record's] concerns is that when the chambers have to be shut down due to the construction noise and vibration interference, they may never be able to reopen due to the lost revenue. This would be a huge detrimental impact....” (See **Exhibit B**, pp. 5, 7; see also **Exhibit C** [regarding the historic and unique nature of the echo chambers].)

Response to Comment No. ORG 44-21

This comment asserts that the Draft EIR failed to analyze noise and vibration impacts on-site historic resources. Please refer to Response to Comment No. ORG 44-20 and the discussion of vibration impacts and the on-site Capitol Records Complex.

Regarding the Capitol Records Complex reverberation chambers located underground beneath the associated (rear) surface parking lot, the Capitol Records Complex is an Applicant-controlled facility on the Project Site, as stated on page IV.I-17 of the Draft EIR (see footnote 27). As stated on page II-36, in Chapter II, *Project Description*, of the Draft EIR, pursuant to a lease between the Project Applicant and Capitol Records, Capitol Records must consent to certain proposed improvements that may impact their use of the property. As such, any interference with on-going activities within the building, including the reverberation chambers, would be coordinated directly with the building occupants. The Project's effect on an on-site use is not considered to be an impact under CEQA and need not be analyzed in the Project's EIR. See *Parker Shattuck Neighbors v. Berkeley City Council* (2013) 222 Cal.App.4th 768, 782 (“In general, CEQA does not regulate environmental changes that do not affect the public at large: “the question is whether a project [would] affect the environment of persons in general, not whether a project [would] affect particular persons.” [Citations omitted]). Additionally, the regarding Project's potential effect on the use of the Capitol Records Complex reverberation chambers and recording studios, as stated on page II-36 in Chapter II, *Project Description*, of the Draft EIR, pursuant to a lease between the Applicant and Capitol Records that can be extended until 2026, Capitol Records must consent to certain proposed improvements that may impact their use of the property. As the Capitol Records Building's underground recording studios and reverberation chambers are located on the Project Site, which is owned and operated by the Applicant, any interference with on-going activities within the building, or scheduling to avoid such, would be coordinated directly between the Applicant and Capitol Records through tenant-landlord agreements.

Comment No. ORG 44-22

- **The analysis fails to account for operational noise impacts from truck loading and idling.** The operational noise analysis states that “[l]oading areas for vendors, deliveries, and trash pickups would be completely enclosed at both sites and would shield the surrounding sensitive receptors from any noise...” What is the substantial evidence supporting this conclusory statement? Where will the loading docks be located? How will they be enclosed and shielded? Were the noise

impacts associated with loading modeled at all, or completely omitted from the operational noise analysis on grounds the noise would be “shielded”? Were refrigerated trucks (“TRUs”), which generate more noise than non-refrigerated trucks, taken into consideration?

Response to Comment No. ORG 44-22

This comment asserts that the Draft EIR fails to account for operational noise impacts from truck loading and idling. As discussed on page II-23 in Chapter II, *Project Description*, of the Draft EIR, the loading areas and trash receptacles for the West Building would be located in the parking garage for the West Building, and all trash pickup areas would be in enclosed interior areas. Similarly, the loading areas and trash receptacles will be located in the parking garage for the East Building as stated on page II-29 of the Draft EIR. These loading areas for the West Site and the East Site would incorporate noise shielding to the off-site environment via barriers, such as solid building walls. Furthermore, the loading area for the West Site is to the south of the West Senior Building and for the East Site on the south side of the East Building (please refer to Figures II-9 and II-15 of the Draft EIR), which are located away from the AMDA Tower and AMDA Vine buildings, and there would be no direct line-of-sight from the AMDA buildings to the access and loading areas at both sites. Since loading areas for vendors (including vendor trucks that may or may not contain potential transportation refrigeration units [TRUs]), deliveries, and trash pickups would incorporate noise shielding at both sites, which would block the surrounding sensitive receptors from Project-related noise from loading/unloading and refuse operations, an analysis of these noise sources is not warranted as there would be no significant impact.

Comment No. ORG 44-23

- **The analysis fails to account for operational noise impacts from emergency generators.** The operational noise analysis also states that “[t]he emergency generators would be located on the building rooftops within an enclosure that would substantially minimize noise levels to the environment.” What is the substantial evidence supporting this conclusory statement? Will the generators be fully or only partially enclosed? Where will they be located? Were the noise impacts associated with the generators modeled at all, or completely omitted from the operational noise analysis?

Response to Comment No. ORG 44-23

This comment asserts that the Draft EIR failed to account for operational noise impacts from emergency generators. As stated in Project Design Feature NOI-PDF-4 on page IV.I-37 of the Draft EIR, the Emergency generators will be designed to meet the requirements of LAMC Chapter XI, Section 112.02. Section 112.02 of the LAMC requires that any mechanical system within any zone of the City not cause an increase in ambient noise levels on any other occupied property or if a condominium, apartment house, duplex, or attached business, within any adjoining unit to exceed the ambient noise level by more than 5 dBA.

As discussed on page IV.I-46 of the Draft EIR, noise level modeling was conducted for on-site mechanical equipment, including the emergency generators that would be located on the building rooftops. The results of the modeling analysis are provided in Table IV.I-12 of the Draft EIR. As shown, the combined operational noise sources from the Project East Site and West Site would not generate noise levels that would exceed 5 dBA above the applicable ambient noise level at noise receivers in the project vicinity. Therefore, noise impacts from mechanical equipment, including emergency generators would be less than significant.

Comment No. ORG 44-24

- **The analysis downplays operational traffic noise by omitting any analysis of impacts in 2025.** The operational noise analysis wholly omits any analysis of off-site traffic noise impacts under the concurrent construction scenario, which would result in an opening year of 2025, not 2027. The Draft EIR states that evaluating only off-site roadway noise impacts for the buildout year 2027 provides for a more conservative analysis. But the impact is determined by the delta between the “Future + Project” and the “Future” CNEL levels. Future CNEL is likely to be lower in 2025 than in 2027, therefore the increment between Future and Future + Project would be greater. Thus, a more conservative analysis would consider the impacts of the Project’s traffic in 2025. Please either revise Table IV.I-14 in the Draft EIR, or provide a new, additional table, that discloses off-site traffic noise impacts in 2025.

Response to Comment No. ORG 44-24

This comment asserts that the Draft EIR underestimates operational traffic noise impacts by omitting any analysis of impacts in 2025. The commenter states that the incremental increase from the future CNEL in 2027 would be lower than the future CNEL in 2025, and, therefore, provides a more conservative analysis. However, the Draft EIR summarizes the most conservative traffic noise impacts analysis based on existing and existing plus Project traffic conditions. As discussed at the bottom of page IV.I-34 of the Draft EIR, with respect to operational traffic noise, impacts are evaluated for the buildout year 2027 under the sequential construction scenario, which provides for a more conservative analysis compared to buildout year 2025 under the overlapping construction scenario since total roadway traffic volumes are generally assumed to increase in future years. As discussed at the top of page IV.I-53 of the Draft EIR, the maximum increase in Project-related traffic noise levels over existing traffic noise levels would be approximately 0.8 dBA CNEL (from 61.4 to 62.2 dBA CNEL) along Yucca Street between Argyle Avenue and North Gower Street and would not exceed the significance threshold of a 5-dBA CNEL increase for the “conditionally acceptable” category. Therefore, even under the most conservative analysis, increases in traffic noise along this segment or any of the analyzed segments would not be significant. It is noted that Section IV.I, *Noise*, of the Draft EIR inadvertently omitted Table IV.I-13, which would have provided the numerical results of the traffic noise modeling for existing and existing plus Project conditions for the individual roadway segments. Nonetheless, this information is provided in Table 5 of Appendix K-2 of the Draft EIR, which was publicly circulated as part of the Draft EIR. Furthermore, as

discussed above, the top of page IV.I-53 of the Draft EIR contains an accurate summary of the traffic noise modeling results for existing and existing plus Project traffic conditions. Therefore, Project traffic noise impacts are fully evaluated in the Draft EIR, and traffic noise impacts are not downplayed. No new information is presented, and no additional analysis is required. The inadvertent omission of Table IV.I-13 in Section IV.I, *Noise*, of the Draft EIR has been corrected in this Final EIR (see Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*).

Comment No. ORG 44-25

- **The analysis fails to consider impacts on nearby residential streets.** Are there residential streets that may be impacted by traffic noise, even if those streets will not receive the most Project traffic? Ignoring the potential for residential roadways, which have a lower significance threshold than major arterials, masks potentially significant construction and operational noise impacts.

Response to Comment No. ORG 44-25

This comment asserts that the Draft EIR failed to consider impacts on nearby residential streets. As stated on page IV.I-52 of the Draft EIR, existing roadway noise levels were calculated along various roadway segments within the study area. The 162 roadway segments analyzed for traffic noise impacts include street segments with residential uses. The roadway segments are provided in Tables IV.I-14 and IV.I-15 of the Draft EIR. As shown, off-site traffic for Future Plus Project in 2027 and Future plus Project in 2040 would not result in increases in traffic noise in excess of City standards along any of the analyzed roadway segments, and impacts would be less than significant. Traffic noise impacts from Project construction were also analyzed in the Draft EIR on pages IV.I-44 and IV.I-45 with the results summarized in Table IV.I-11, with potentially significant construction traffic noise impacts identified for Yucca Street between Argyle Avenue and Gower Street. The commenter incorrectly claims that residential streets have a lower significance threshold than major arterials. The increase in ambient noise thresholds, as described on page IV.I-32, applies to all roadway types.

Comment No. ORG 44-26

We anticipate that to adequately respond to the above questions and comments, significant new information must be added to the Draft EIR. As you know, any revision to the Draft EIR to incorporate new, significant information, triggers the need for recirculation of the Draft EIR. (State CEQA Guidelines, § 15088.5.)

Response to Comment No. ORG 44-26

This comment makes a general statement that the commenter believes the issues raised require recirculation of the Draft EIR. As discussed in Response to Comment Nos. ORG 44-19 through 44-25, no new or significant information has been introduced to address the comments or questions raised in the comment letter. Therefore, recirculation of the Draft EIR is not warranted.

Comment No. ORG 44-27

3. **The noise-related Project Design Feature and Mitigation Measures are internally inconsistent, fail to include performance standards, fail to meaningfully reduce impacts to adjacent properties, and fail to include a variety of technically feasible measures.**

CEQA mandates that an environmental impact report propose mitigation measures that will minimize a project's significant environmental impacts. Here, the Draft EIR relies on NOI-PDF-2 to reduce construction noise impacts. However, this measure is, like many others in the Draft EIR, internally inconsistent. NOI-PDF-2 states that temporary diesel and gasoline generators will not be used during construction. But then the PDF goes on to state that if diesel or gasoline powered generators are used, such equipment will be located at least 100 feet from off-site sensitive land uses. A reader is left unsure whether such generators are permitted, or not permitted. This measure must be revised to clarify that generators will not be permitted. Further, this measure is clearly drafted to reduce an identified environmental impact, making it a mitigation measure, and not a project design feature. (See *Salmon Protection and Watershed Network* (2005) 125 Cal.App.4th 1098, 1106 [conditions placed upon a project in response to its potential impacts constitute mitigation measures].)

Response to Comment No. ORG 44-27

The commenter states that Project Design Feature NOI-PDF-2 is inconsistent and does not provide clarity as to whether or not generators are permitted or not permitted during construction. The purpose of Project Design Feature NOI-PDF-2 is not to prohibit diesel or gasoline generators. Project Design Feature NOI-PDF-2 states that, among electric-powered, solar-powered, and gasoline/diesel-powered temporary generators, the Project construction site will elect to use electric-powered (where power poles are available) or solar-powered generators. However, under the circumstance that neither of these options is available, temporary gasoline or diesel-powered generators may be used. If temporary gasoline or diesel-powered temporary generators are used on the Project Site, they will be placed at least 100 feet away from off-site sensitive land uses, whenever possible, and flexible sound control curtains will be placed around the equipment when in use as per Mitigation Measure NOI-MM-2, as revised for clarification in this Final EIR (see Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*) and shown below with the additional information provided in double-underlined text below.

NOI-MM-2: Equipment Noise Shielding, Mufflers, and Stationary Curtains.

The Project contractor shall use power construction equipment with ~~state-of-the-art~~factory-installed noise shielding and muffling devices. In addition, no impact pile driving shall be utilized; augured, or drilled piles are permitted. Flexible sound control curtains that achieve a performance standard of a minimum 12-dBA insertion loss with appropriate open access points or gates to allow for adequate and safe worker, vehicle, and equipment access shall be placed around all drilling

apparatuses, drill rigs, stationary concrete pumps, stationary generators, and jackhammers when in use.

Therefore, Project Design Feature NOI-PDF-2 clearly states that, when necessary, gasoline/diesel-powered temporary generators will be used and provides distance limits to be imposed to avoid noise impacts to adjacent sensitive receivers, whenever possible. Moreover, flexible sound control curtains will be placed around the equipment when in use as per Mitigation Measure NOI-MM-2, as updated in this Final EIR (see *Chapter 3, Revisions, Clarifications, and Corrections to the Draft EIR*). Therefore, temporary construction generators are appropriately evaluated, and feasible mitigation is required as discussed above. No additional analysis is required.

Comment No. ORG 44-28

Mitigation Measure NOI-MM-1 is also flawed. It requires that construction equipment “whose specific location on the Project Site may be flexible” be either located away from the nearest off-site sensitive land uses (at least 100 feet away), “or natural and/or manmade barriers (i.e., intervening construction trailers) shall be used to screen propagation of noise from such equipment.” Yet this measure lacks any meaningful detail or performance criteria. Which pieces of construction equipment are “flexible” in terms of location? Who shall decide? Where a “natural and/or manmade barrier” is required, what performance standards must be met? What materials must the barrier be made of? How distant from either the source or the receptor must the barrier be located? How tall must the barriers be? What quantifiable noise reduction must be achieved and how will the reduction be verified? Without these details it is impossible to determine whether such barriers will actually attenuate noise in any way. Further compounding the failure of this measure is the fact that, under a straight reading of the measure’s text, it would seem that barriers are only required for construction equipment that is flexible in terms of location. For equipment that is not flexible in terms of location, are no noise barriers required? This is counterintuitive, and renders the measure nonsensical. Mitigation Measure NOI-MM-1 must be revised to: (1) identify which pieces of construction equipment it actually applies to; and (2) clearly establish what types of effective noise barriers are permitted and what standards those barriers must meet. Without these details, the measure is ineffective, meaningless, and fails to meet CEQA’s requirements for enforceable, effective, and concrete mitigation measures. Worse, it fails to show that the mitigation measure will reduce impacts to the greatest extent feasible.

Response to Comment No. ORG 44-28

The comment expresses concern regarding performance criteria and lack of detailed information in Mitigation Measure NOI-MM-1. Mitigation Measure NOI-MM-1 has been clarified to include additional details regarding performance standards and noise reduction levels from implementation of the measures. Specifically, Mitigation Measure NOI-MM-1, as revised, provides clarifying information on the noise reduction levels for the temporary construction noise barriers and the locations and durations the barriers shall be installed. The additional clarifications to Mitigation Measure NOI-MM-1 are incorporated in this Final EIR (see Chapter 3, *Revisions, Clarifications, and Corrections*

to the Draft EIR) and shown below with the additional information provided in double-underlined text below.

NOI-MM-1: Setback Distances and Boundary Noise Curtains. Noise and vibration construction equipment whose specific location on the Project Site may be flexible (e.g., compressors and generators) shall be located away from the nearest off-site sensitive land uses (at least 100 feet away), or natural and/or manmade barriers (e.g., intervening construction trailers) shall be used to screen propagation of noise from such equipment towards these land uses. Even with natural and/or manmade barriers, in no case shall fixed stationary equipment, stockpiling of construction materials, equipment warm-up areas, water tanks, and equipment storage areas be within 40 feet from the property line of off-site historic buildings. If manmade barriers are to be used, the contractor shall be required to use temporary construction noise barriers, such as sound deadening blankets or curtains, with a height up to 20 feet above ground that shall achieve a performance standard of a minimum 12-dBA insertion loss along the Project Site's boundary where significantly impacted noise-sensitive land uses are within 500 feet of the Project Site. The temporary construction noise barriers shall be installed on or around the Project Site perimeter and/or along soldier piles that shall be drilled and cast in place during shoring activities. Open access points or gates leading to street frontages, including along Ivar Avenue, Vine Street, and Argyle Avenue, shall be permissible to allow for adequate and safe worker, vehicle, and equipment access to the construction area. The temporary construction noise barriers installed on or around the soldier piles shall remain in-place during ground disturbance activities until exterior vertical building construction commences, when the use of on-site noise-generating heavy-duty construction equipment is prevalent.

Additionally, as stated on page IV.I-75 of the Draft EIR, Mitigation Measure NOI-MM-3 requires that a construction liaison will be provided to inform nearby receptors 1, 3, and 5 through 13 when peak noise and vibration activities are scheduled to occur. The construction liaison would also notify the nearby receptors of construction two weeks prior to the commencement of the construction, the construction schedule, and the various types of activities and equipment that would be occurring throughout the duration of the construction period. Implementation of Mitigation Measure NOI-MM-3 in addition to Mitigation Measure NOI-MM-1, as revised, would reduce construction noise to the extent feasible and are not ineffective or meaningless and meet CEQA's requirements for enforceable, effective, and concrete mitigation measures.

Comment No. ORG 44-29

Similarly, Mitigation Measure NOI-MM-2 requires the use of "state-of-the-art noise shielding and muffling devices." But what constitutes "state-of-the-art"? Again, who shall decide? Does the reference to "noise shielding" devices include structural noise barriers, such as temporary sound walls? The measure also requires the use of "flexible sound control curtains" but as with the noise barriers referred to in NOI-MM-1, not a single performance standard is incorporated into the measure to ensure that the noise curtains

will be effective (e.g., curtain height, properties, materials, distance, and quantified noise reduction). This measure must also be revised.

Response to Comment No. ORG 44-29

The comment expresses concern regarding performance criteria in Mitigation Measure NOI-MM-2. Mitigation Measure NOI-MM-2 has been clarified to include information regarding performance standards and noise shielding and muffling devices. The additional clarifications to Mitigation Measure NOI-MM-2 are incorporated in this Final EIR (see Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*) and are shown with the additional information provided in double-underlined text in Response to Comment No. ORG 44-27. Please refer to Response to Comment No. ORG 44-28 regarding Mitigation Measure NOI-MM-1.

Comment No. ORG 44-30

Mitigation Measure NOI-MM-3 also fails to meet CEQA's requirements given that it does nothing to address the impacts disclosed in this chapter. While we agree that AMDA should be notified of the Project's construction activities in advance, we note that this measure does not reduce the levels of noise experienced by AMDA sensitive receptors and thus does not actually mitigate any noise impacts.

Response to Comment No. ORG 44-30

The commenter states that Mitigation Measure NOI-MM-3 fails to meet CEQA's requirement since it does not reduce the noise levels experienced by AMDA sensitive receptors. Mitigation Measure NOI-MM-3 is provided to require notification and disclosure of the Project construction schedule and activities to the noise and vibration sensitive receptors specified in the measure. Notification will be provided to AMDA as an entity, which will serve as adequate notice for its noise- and vibration-sensitive receptors in the Project vicinity. The purpose of Mitigation Measure NOI-MM-3 is to provide information in advance of scheduled Project construction activities, which would allow occupants of the specified locations to make their own decisions regarding future plans and activities to reduce their exposure. Mitigation Measure NOI-MM-3 is consistent with the general CEQA premise that an "environmental impact report is an informational document" (see CEQA Guidelines Section 21061). Mitigation Measure NOI-MM-3 is provided in tandem with Mitigation Measures NOI-MM-1 and NOI-MM-2, which have been clarified to include information on the implementation of the mitigation measures, specifically to clarify how the noise impacts would be reduced. Please refer to Response to Comment Nos. ORG 44-28 and ORG 44-27 regarding Mitigation Measures NOI-MM-1 and NOI-MM-2.

Comment No. ORG 44-31

In regards to vibration impacts, Mitigation Measure NOI-MM-4 is woefully inadequate. This measure establishes a monitoring system, ***but then proceeds to allow construction activities that result in vibration several times the significance threshold for building damage.*** Nothing in NOI-MM-4 actually reduces vibration

impacts at any sensitive receptor. Instead, it includes only a generic statement that, when certain vibration triggers are hit, the contractor shall “provide feasible steps to reduce the vibration level.” There is no discussion of whether there actually are feasible ways to do so. Regardless, NOI-MM-4 allows vibration above the trigger levels, and above the significant thresholds, to proceed, only requiring the contractor to “visually inspect the building for any damage.” What about non-visible damage? Worse, the measure seems to only result in any action on behalf of the developer if visible damage occurs to **historic** buildings. When visual damage to a historic building is observed, NOI-MM-4 requires that the building be repaired, but makes no similar commitment for non-historic buildings damaged by vibration, and of course there is no commitment to repair non-visible damage in any building. Further, historic buildings that are damaged by vibration **may** be restored consistent with the Secretary of the Interior’s Standards for Historic Buildings, but only “if warranted.” There is no explanation or performance standards included to determine when the Standards for Historic Buildings are “warranted” or who makes such a determination. Further, the Draft EIR concludes that because it is up to the private property owners affected to participate or not in the monitoring program, impacts will remain significant. However, ***even if AMDA or other property owners participate in the monitoring program, significant impacts will still be experienced, and in AMDA’s case, these impacts are more than eleven times the acceptable significance threshold.***

Response to Comment No. ORG 44-31

This comment expresses concern regarding Mitigation Measure NOI-MM-4 of the Draft EIR, which the comment asserts establishes a monitoring system, but then proceeds to allow construction activities that result in vibration several times the significance threshold for building damage. The estimated construction vibration impacts to the nearest off-site structures, both historic and non-historic structures, to the Project Site are presented in Table IV.I-17 on page IV.I-79 of the Draft EIR.

Mitigation Measure NOI-MM-4 (see page IV.I-84 of the Draft EIR) requires that structural vibration monitoring be performed during Project construction. Prior to the start of construction, investigations of each vibration-sensitive receptor would be conducted of both historic and non-historic buildings to document the physical condition of those buildings’ readily-visible features. The Applicant is also required to prepare and implement a vibration monitoring program during site demolition and grading/excavation. Vibration monitoring systems will be placed at receptor building façades (with the permission of property owners) or other appropriate locations to measure and document vibration velocities during construction activity. The vibration monitoring systems will be set to transmit notifications and warnings (via text, email, etc.) prior to the vibration threshold being reached. The commenter claims that there is no discussion of whether there are feasible ways to reduce vibration if vibration triggers are hit. This is incorrect. The mitigation measure lays out the steps to be taken should the warning and/or regulatory vibration thresholds be reached. Steps include making feasible adjustments to construction activities in the vicinity of the receptor, such as staggering concurrent

vibration-generating construction activities and utilizing lower vibratory techniques (see Section d. of Mitigation Measure NOI-MM-4). Conducting visual inspections if the regulatory vibration threshold is reached would ensure that any visual signs of damage are logged and can be addressed. Should Project construction result in damage to vibration-sensitive receptor buildings (both historic and non-historic), Mitigation Measure NOI-MM-4 requires that repairs be conducted. For historic buildings, repairs would be conducted pursuant to the Secretary of the Interior's standards, if warranted. This provision is intended to ensure that historic buildings are restored pursuant to the Secretary of the Interior's Standards. Mitigation Measure NOI-MM-4 does not limit repairs to historic structures alone. Non-historic structures would be repaired but would not be required to meet the Secretary of the Interior's Standards for historic buildings.

In addition, the commenter states that non-visible damage is not addressed. However, the vibration monitoring equipment would transmit notifications and warnings (via text, email, etc.) prior to the vibration threshold being reached. By definition, it is not possible to visually detect non-visible damage to structures. Nonetheless, the transmission of notifications and warnings by the vibration monitoring equipment does not rely on the presence of visible damage to structures. Therefore, the Draft EIR analyzes and proposes adequate and feasible mitigation regarding potential structural vibration impacts to both historic and non-historic buildings.

As discussed on page IV.I-86 of the Draft EIR, the conclusion of "significant and unavoidable" was based on the reason that Mitigation Measure NOI-MM-4 requires the consent of other property owners. The impact conclusion of "significant and unavoidable" was determined not because Mitigation Measure NOI-MM-4 does not have adequate measures to reduce the potential vibration impacts. If damage occurs as a result of Project construction, and if all affected property owners agree to coordinate and work with the Project contractors on repairs (should repairs be needed), vibration impacts would be reduced to less than significant. As vibration impacts are fully discussed and feasible mitigation provided in the Draft EIR, no additional analysis is required.

Additionally, the commenter expresses concern regarding the protection of non-historic buildings. Mitigation Measure NOI-MM-4 applies to structural damage from Project construction vibration to both historic and non-historic buildings that would be potentially affected.

In response to the concerns raised in the comment, Mitigation Measure NOI-MM-4 has been clarified to describe how the mitigation measures would be implemented, as detailed in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR. In addition, in response to concerns raised in Comment Letter No. ORG 35-30 that the proposed process in Mitigation Measure NOI-MM-4 for increasing the vibration monitoring warning and threshold levels if no damage has occurred under the established warning and threshold levels could increase the risk of damage to the buildings, parts "f." and "g." have been removed to ensure no potential for increased risk to buildings from increasing the vibration monitoring warning and threshold levels even if no damage has occurred

under the current warning and threshold levels; thus, “h.” has been renumbered as “f.” Vibration warning and threshold levels have also been made more protective for the AMDA Vine Building. The clarifications and revisions to Mitigation Measure NOI-MM-4 are also provided in double-underlined and strikeout text below:

NOI-MM-4: Vibration Monitoring. The Applicant shall perform structural vibration monitoring during Project construction as follows:

- a. Prior to start of construction, the Applicant shall retain the services of a licensed building inspector or structural engineer, or other qualified professional as approved by the City, to visit the following buildings, which are located either on-site or immediately adjacent to the Project Site ~~and to the west~~, to inspect and document (video and/or photographic) the apparent physical condition of the building’s readily-visible features. This includes both historic buildings and non-historic buildings in proximity to the Project Site. For the historic buildings listed below, inspection and documentation shall also be carried out by and in coordination with a qualified preservation consultant. The non-historic buildings are as follows:
 - AMDA Vine Building
 - Argyle House
 - Single-story commercial building at 1718 N. Vine Street (if this building has been issued demolition permits or has already been demolished as part of Related Project No. 2, the provisions of this mitigation measure do not apply to this structure).

The historic buildings are as follows:

- Capitol Records Building (on-site)
 - Gogerty Building (on-site)
 - Pantages Theatre (off-site)
 - Avalon Hollywood (off-site)
 - 6316-24 Yucca Street/Art Deco Building Storefront (off-site)
- b. The Applicant shall retain the services of a qualified acoustical engineer and/or structural engineer to develop and implement a vibration monitoring program during the site demolition and grading/excavation, capable of documenting the construction-related ground vibration levels at the buildings listed above. The vibration monitoring systems shall be placed at receptor building façades closest to Project construction activity or placed at a representative location if a receptor building façade is not accessible and shall continuously measure (in vertical and horizontal directions) and store the peak particle velocity (PPV) in inch/second. The systems shall also be programmed for two preset velocity levels: a warning level of ~~0.10~~ 0.09 inch/second (PPV) for the off-site historic structures, 0.15 inch/second (PPV) for the single-story commercial building at 1718 N. Vine Street (not

required if this building has been issued demolition permits or has already been demolished as part of Related Project No. 2), 0.25 inch/second (PPV) for the AMDA Vine Building, and 0.45 inch/second (PPV) for the Capitol Records Building, Gogerty Building, ~~AMDA Vine Building~~ and the Argyle House and a regulatory level of 0.12 inch/second (PPV) for the off-site historic structures, 0.2 inch/second (PPV) for the single-story commercial building at 1718 N. Vine Street (not required if this building has been issued demolition permits or has already been demolished as part of Related Project No. 2), 0.30 inch/second (PPV) for the AMDA Vine Building, and 0.50 inch/second (PPV) for the Capitol Records Building, Gogerty Building, ~~AMDA Vine Building~~ and the Argyle House. In cases where a receptor building façade is not accessible, the two preset velocity levels shall be programmed at equivalent levels based on distance and soil characteristics that affect vibration transmission over that distance. The systems shall also provide real-time alert when the vibration levels exceed the two preset levels. The noise and vibration monitoring program shall include a description of the monitoring equipment specifications, calibration certificates, exact monitoring locations (which shall be coordinated with the property owners for the buildings listed in “a.” above), and protocols for data collection, reporting, alerting, maintenance and calibration, and unplanned outage. Selected monitoring systems shall be capable of unmanned operation during periods of on-site Project construction activity, with internal storage and remote data download. Systems shall be capable of measuring the inch/second PPV in all three axes (vertical and two horizontal) simultaneously. The monitoring program shall specify the protocols for threshold exceedance, including, but not be limited to, which personnel are designated to receive alerts, how the alerts shall be sent (text message, email, etc.), and how the vibration event shall be documented and reported. The program shall include regular reporting no less frequently than weekly.

- c. The vibration monitoring program shall be submitted, for review and approval to the Department of Building and Safety, prior to initiating any construction activities.
- d. In the event the warning level (i.e., ~~0.10–0.09~~, 0.15, 0.25, and 0.45 inch/second [PPV], or equivalent levels) is triggered, the contractor shall identify the source of vibration generation and provide feasible steps to reduce the vibration level, including but not limited to staggering concurrent vibration-generating construction activities (if doing so would not pose a safety risk to personnel or damage risk to buildings or facilities) and utilizing lower vibratory techniques.
- e. In the event the regulatory level (i.e., 0.12, 0.20, 0.30, and 0.50 inch/second [PPV], or equivalent levels) is triggered, the contractor shall identify the source of vibration generation and implement feasible steps identified in Item “d” above to reduce the vibration level from construction activities to avoid or minimize damage from construction activities in the vicinity of the building.

The contractor shall visually inspect the building for any damage. Results of the inspection must be logged.

~~f. In the event that the regulatory ground vibration levels are exceeded and there is documented evidence including a visual inspection that no damage to historic structures has occurred, the ground vibration levels can be increased to the criteria for the previous building structural category in increments as follows, subject to review and approval by the City, up to a maximum regulatory ground vibration level of 0.5 inch/second (PPV), or equivalent level.~~

- ~~• From Category IV to Category III (0.12 to 0.2 inch/second [PPV], or equivalent level),~~
- ~~• From Category III to Category II (0.2 to 0.3 inch/second [PPV], or equivalent level), or~~
- ~~• From Category II to Category I (0.3 to 0.5 inch/second [PPV], or equivalent level).~~

~~If the regulatory ground vibration level is increased, the warning level shall also be increased matching the corresponding Category as follows (or equivalent levels):~~

- ~~• Category I: 0.45 inch/second [PPV]~~
- ~~• Category II: 0.25 inch/second [PPV]~~
- ~~• Category III: 0.15 inch/second [PPV]~~
- ~~• Category IV: 0.10 inch/second [PPV]~~

~~g. If new regulatory and warning levels are set pursuant to Item “f” above, they can be exceeded and increased again pursuant to the same requirements in Item “f”.~~

~~f.h. In the event damage occurs to the historic features of historic buildings (finish materials) due to construction vibration, such features/materials shall be repaired in consultation with a qualified preservation consultant, and, if warranted, in a manner that meets the Secretary of the Interior’s Standards.~~

Furthermore, as stated on page IV.I-78 of the Draft EIR, the Project would be subject to LAMC Section 91.3307.1 (Protection of Adjoining Property) which states adjoining public and private property would be protected from damage during construction, remodeling and demolition work. This regulation applies to properties of all types, not just historic structures. Therefore, potential damage to historic and non-historic structures would be controlled through regulatory compliance and implementation of feasible mitigation measures.

Comment No. ORG 44-32

The Draft EIR concludes that implementation of Mitigation Measures NOI-MM-1 and NOI-MM-2 “would reduce the Project’s on-site construction noise impacts at the off-site noise sensitive receptors, to the extent technically feasible.” This is false. As discussed above, there are several revisions that could be made to these measures that would increase their effectiveness and further reduce impacts, such as including performance standards and criteria for noise barriers. No reason is given in the Draft EIR for why performance standards cannot be incorporated into the measures.

Response to Comment No. ORG 44-32

The comment asserts that the Draft EIR’s analysis regarding the implementation of Mitigation Measures NOI-MM-1 and NOI-MM-2 are incorrect. Please refer to Response to Comment Nos. ORG 44-28 and No. ORG 44-29 for discussion and clarifications regarding performance standards for Mitigation Measures NOI-MM-1 and NOI-MM-2, respectively.

Comment No. ORG 44-33

The Draft EIR similarly concludes that with implementation of Mitigation Measure NOI-MM-4, any potentially significant vibration impacts to the historic Capitol Records Building and Gogerty Building would be reduced to less than significant. This conclusion is not supported by any evidence, ignores the fact that impacts to the Capitol Records echo chamber and recording studios were omitted from the analysis, and ignores the fact that while Mitigation Measure NOI-MM-4 requires monitoring, it does not reduce the potential for significant and unavoidable impacts. If these historic buildings are damaged by construction vibration, there is potential for that damage to be unrepairable. Even where damage is repairable, there is no guarantee that the necessary repairs would not adversely impact the historic integrity of either building. Impacts would remain significant and unavoidable, even after incorporation of Mitigation Measure NOI-MM-4. The Draft EIR’s conclusion to the contrary is wrong.

Response to Comment No. ORG 44-33

The comment asserts that the Draft EIR’s analysis that Mitigation Measure NOI-MM-4 would reduce any potentially significant vibration impacts to the historic Capitol Records Building and Gogerty Building to less than significant is incorrect. The Capitol Records Complex is located within the Project Site (within the East Site) and is Applicant-controlled. As stated on page II-36, in Chapter II, *Project Description*, of the Draft EIR, pursuant to a lease between the Applicant and Capitol Records, Capitol Records must consent to certain proposed improvements that may impact their use of the property. As such, any interference with on-going activities within the building, including the reverberation chambers, would be coordinated directly with the building occupants. Additionally, regarding the Project’s potential effect on the use of the on-site Capitol Records Complex reverberation chambers and recording studios, as stated on page II-36 in Chapter II, *Project Description*, of the Draft EIR, pursuant to a lease between the

Applicant and Capitol Records that can be extended until 2026, Capitol Records must consent to certain proposed improvements that may impact their use of the property. As the Capitol Records Building's underground recording studios and reverberation chambers are located on the Project Site, which is owned and operated by the Applicant, any interference with on-going activities within the building, or scheduling to avoid such, would be coordinated directly between the Applicant and Capitol Records through tenant-landlord agreements. Further, the Project's effect on an on-site use is not considered to be an impact under CEQA and need not be analyzed in the Project's EIR. See, e.g., *Parker Shattuck Neighbors v. Berkeley City Council* (2013) 222 Cal.App.4th 768, 782 ("In general, CEQA does not regulate environmental changes that do not affect the public at large: "the question is whether a project [would] affect the environment of persons in general, not whether a project [would] affect particular persons." [Citations omitted]). Therefore, the on-site Capitol Records Complex does not need to be analyzed as a sensitive receptor. Nonetheless it was conservatively included in the in the vibration analysis, as discussed on page IV.I-17 of Section IV.I, *Noise*, of the Draft EIR due to the potential for structural damage to a historical resource.

As stated in Mitigation Measure NOI-MM-4 on page IV.I-84 of the Draft EIR, the Capitol Records Building is listed as a historic building and is included as part of the mitigation measure. As discussed in Response to Comment No. ORG 44-31, the purpose of the vibration monitoring program is to minimize structural damage impacts that could result from Project construction. As stated in Mitigation Measure NOI-MM-4, should Project construction result in damage to vibration-sensitive receptor buildings (both historic and non-historic), Mitigation Measure NOI-MM-4 requires that repairs be conducted. For historic buildings, the repairs would be conducted pursuant to the Secretary of the Interior's Standards, if warranted. This provision is intended to ensure that historic buildings are restored pursuant to the Secretary of the Interior's Standards. Therefore, Mitigation Measure NOI-MM-4 provides sufficient requirements to mitigate potential building damage due to Project construction-related vibration to the Capitol Records Building and Gogerty Building. As discussed in Response to Comment No. 44-31, Mitigation Measure NOI-MM-4 has been clarified as detailed in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR. The clarifications to Mitigation Measure NOI-MM-4 are also shown in Response to Comment No. ORG 44-31, above.

Comment No. ORG 44-34

Finally, the Draft EIR concludes that despite the incorporation of all feasible mitigation measures, construction noise and vibration impacts to offsite buildings remain significant and unavoidable. However, there are a myriad of other mitigation measures that are available to be incorporated into the Draft EIR, and that would substantially reduce these impacts, in particular the impacts to AMDA facilities. These include, but are certainly not limited to:

- Installation of protective sound walls and barriers around the Vine Street Building for the duration of Project construction. The sound walls must be required to meet specific performance standards relating to acceptable materials, thickness, placement, orientation, and maintenance. Monitoring must be required to confirm the sound walls' effectiveness.
- Temporarily relocate all AMDA classrooms and dormitories to another location for the duration of Project construction.
- Prohibit the use of stationary construction equipment, equipment warm-up areas, construction truck staging, and other noise-generating equipment and activities within a given buffer area adjacent to the site boundary, and identifying specific and limited locations where tower cranes, personnel lifts, construction staging, materials stockpiling, etc. may occur.
- Pause and/or limit construction during peak class hours.
- Identify specific construction equipment that may not operate simultaneously.
- Prohibit any construction and vehicle staging for the Project on Yucca Street, between Ivar Avenue and Vine Street.
- Identify specific locations for sound walls, barriers, and sound curtains, and specifying the height, materials, and other properties of the sound walls and curtains necessary to result in a reduction in noise levels at all adjacent noise-sensitive uses.
- Provide acoustical retrofits of AMDA buildings, such as window replacements and improved installation, to reduce construction noise impacts on residence halls and classrooms.
- Provide seismic retrofits of AMDA buildings, to protect against construction vibration, which has the potential to result in the loss of both property and life.

Each of the above proposed mitigation measures would dramatically reduce significant noise and vibration impacts that are disclosed (and yet, underestimated) in the Draft EIR. Where a feasible mitigation measure, considerably different from others previously analyzed would clearly lessen the significant environmental impacts of a project, but the project's proponents decline to adopt it, recirculation of the Draft EIR is required. (State CEQA Guidelines, § 15088.5(a)(3).)

Response to Comment No. ORG 44-34

The comment provides suggestions regarding mitigation measures. Regarding the measures in the first, seventh, and eighth bullets for the installation of protective sound walls, barriers and curtains, as discussed in Response to Comment No. ORG 44-28, Mitigation Measure NOI-MM-1 has been clarified to include additional details regarding

performance standards and noise reduction levels from implementation of the measures. Specifically, Mitigation Measure NOI-MM-1, as revised, provides clarifying information on the noise reduction levels for the temporary construction noise barriers, barrier height, and the locations and durations the barriers shall be installed. The additional clarifications to Mitigation Measure NOI-MM-1 are incorporated in this Final EIR (see Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*). Mitigation Measure NOI-MM-1, as revised, would provide for sound reduction barriers that would help reduce noise at the AMDA Tower and AMDA Vine buildings.

As discussed in Response to Comment No. ORG 44-27, Mitigation Measure NOI-MM-2 has been clarified to include information regarding performance standards and noise shielding and muffling devices. The additional clarifications to Mitigation Measure NOI-MM-2 are incorporated in this Final EIR (see Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*).

Regarding the measure in the second bullet, relocation of all AMDA classrooms and dormitories to another location is not feasible. No location is identified that would serve all of the needs for classrooms and dormitories.

Regarding the measure in the third bullet, as provided in Response to Comment No. ORG 44-28, Mitigation Measure NOI-MM-1 includes a buffer distance requirement for construction equipment whose specific location on the Project Site may be flexible.

Regarding the measure in the fourth bullet, times for peak class hours are not provided. Therefore, this measure cannot be implemented. As discussed in Section IV.I, Noise, of the Draft EIR, LAMC Section 41.40 prohibits construction between the hours of 9:00 p.m. and 7:00 a.m., Monday through Friday, 6:00 p.m. and 8:00 a.m. on Saturday, and at any time on Sunday. Project construction would be consistent with the LAMC. Mitigation Measure NOI-MM-3 is provided to require notification and disclosure of the Project construction schedule and activities to the noise and vibration sensitive receptors specified in the measure. The purpose of Mitigation Measure NOI-MM-3 is to provide information in advance of scheduled Project construction activities, which would allow occupants of the specified locations to make their own decisions regarding future plans and activities to reduce their exposure. Mitigation Measure NOI-MM-3 is consistent with the general CEQA premise that an “environmental impact report is an informational document” (see CEQA Guidelines Section 21061). Mitigation Measure NOI-MM-3 is provided in tandem with Mitigation Measures NOI-MM-1 and NOI-MM-2, which as stated above, have been clarified to include information on the implementation of the mitigation measures, specifically to clarify how the noise impacts would be reduced.

Regarding the measure in the fifth bullet, as explain on page IV.I-119 of the Draft EIR, this measure is not feasible. As stated therein, measures to reduce the types and numbers of construction equipment were considered. The noise analysis considered the expected types and numbers of construction equipment that would need to be used during the various construction activities and also considered the closest distances the

construction activities would need to occur relative to the noise-sensitive uses in order to construct the proposed Project uses and achieve the Project objectives identified in Chapter II, *Project Description*, of the Draft EIR. Given the logarithmic nature of sound and the decibel scale, reducing the types and numbers of construction equipment by a few pieces of equipment would not result in a substantial reduction in noise levels. A 3-dBA reduction in noise requires a halving of the sound energy. Thus, there would be little benefit in terms of the construction noise levels by requiring a reduction in the types and numbers of construction equipment by only a few pieces of equipment. Given that a 3-dBA reduction in noise would require a halving of the construction sound energy, it would not be feasible to construct the proposed Project by substantially reducing the types and number of construction equipment used by half or more without severely impacting the ability to build the proposed Project within a reasonable schedule and the ability to safely and adequately construct the proposed Project buildings and facilities without access to the full range of the needed equipment.

Regarding the sixth bullet, Section II.g(2), Construction Overview, of the Draft EIR provides that: “All construction staging activities would be located within the West and/or East Sites. No import of soil, additional staging or use of off-site areas is proposed.” Therefore, staging will not occur on the referenced streets, and no mitigation is required.

Regarding the ninth bullet, as provided by the commenter in Comment No. ORG 44-15 (and in Exhibit A of the commenter’s letter), AMDA states both of their buildings (AMDA Tower and AMDA Vine buildings) are required by the Los Angeles Department of Building and Safety to meet seismic standards. Since existing City regulations require seismic improvements, no additional mitigation measure is required.

With respect to Project vibration impacts, page IV.1-86 of the Draft EIR states that:

With implementation of mitigation measures, structural vibration impacts would be reduced to less-than-significant levels for the Capitol Records Building and Gogerty Building. However, while implementation of Mitigation Measure NOI-MM-4 would provide the same or similar protections to the other buildings subject to potential structural damage from vibration which would reduce impacts to less-than-significant levels, because Mitigation Measure NOI-MM-4 requires the consent of other property owners, who may not agree, it is conservatively concluded that structural vibration impacts on the AMDA Vine Building, the Argyle House at southwest corner of Yucca Street and Argyle Avenue, the Pantages Theatre, Avalon Hollywood, Art Deco Building (6320 Yucca), and the single-story commercial building at 1718 N. Vine Street (except if this building has already been demolished as part of Related Project No. 2) would be significant and unavoidable because it cannot be assured that all components of Mitigation Measure NOI-MM-4 can be implemented.

The conclusion of “significant and unavoidable” was based on the reason that Mitigation Measure NOI-MM-4 requires the consent of other property owners. The impact

conclusion of “significant and unavoidable” was determined not because Mitigation Measure NOI-MM-4 does not have adequate measures to reduce the potential vibration impacts. If all affected property owners agree to coordinate and work with the project contractors, should damage occur, as documented by the required inspections, the implementation of appropriate repairs would correct the building damage impact. Nonetheless, Mitigation Measure NOI-MM-4 has been clarified to describe how the mitigation measures would be implemented, as detailed in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR. In addition, in response to concerns raised in Comment Letter No. ORG 35-30 that the proposed process in Mitigation Measure NOI-MM-4 for increasing the vibration monitoring warning and threshold levels if no damage has occurred under the established warning and threshold levels could increase the risk of damage to buildings, parts “f.” and “g.” have been removed to ensure no potential for increased risk to buildings from increasing the vibration monitoring warning and threshold levels even if no damage has occurred under the current warning and threshold levels; thus, “h.” has been renumbered as “f”. The clarifications to Mitigation Measure NOI-MM-4 are also shown in Response to Comment No. ORG 44-31, above.

Comment No. ORG 44-35

4. The Draft EIR makes no attempt to quantify, or even qualitatively describe, how and in what degree noise and vibration impacts will actually be reduced.

Even if the above described Project Design Feature and Mitigation Measures were effective—and, as discussed, they are not—there is no discussion provided showing the extent to which noise and vibration impacts will actually be reduced by their implementation. CEQA requires that environmental impact reports include evidence that identified mitigation measures will be effective in reducing potentially significant impacts. Courts ***do not defer to a city’s determination that mitigation measures will work when their efficacy is not apparent*** and there is no evidence in the record showing the measures will actually be effective in reducing or remedying the identified environmental problem. (See, e.g., *Sierra Club v. County of San Diego* (2014) 231 Cal.App.4th 1152, 1168.)

Here, absolutely no effort at all has been made to identify and describe the actual reduction in noise levels that will result from any of the identified PDFs or Mitigation Measures. Without post-mitigation noise projections, community members and stakeholders affected by the Project have no way of knowing with any certainty if the mitigation measures are, in fact, effective in reducing noise levels, or to what extent noise levels will be reduced. As described above, the identified PDFs and Mitigation Measures are rife with issues. They will not be effective at reducing noise and vibration impacts, and the Draft EIR does not even attempt to show otherwise. As such, significant additional analysis is required before the public, or the City’s decisionmakers, can determine the true noise and vibration impacts, and the feasibility of mitigating these impacts to the extent possible.

Response to Comment No. ORG 44-35

The comment asserts that the Draft EIR had no discussion showing the extent to which noise and vibration impacts will actually be reduced by their implementation. The level of significance for construction noise impacts after Mitigation Measures NOI-MM-1 through NOI-MM-3 are qualitatively discussed on pages IV.I-75 and 76 of the Draft EIR. While no substantial changes to Mitigation Measure NOI-MM-1 were made, this measure has been clarified to include details on performance standards assumed in the analysis and the implementation of the measures. Specifically, Mitigation Measure NOI-MM-1, as revised, requires that temporary construction noise barriers achieve a performance standard of a minimum of 12 dBA at the Project Site's boundary (see Response to Comment No. ORG 44-28 for revised Mitigation Measure NOI-MM-1). As discussed on page IV.I-75 of the Draft EIR, reducing the types and number of construction equipment by a few pieces would provide minimal benefit in terms of noise reduction due to the logarithmic nature of noise. Due to the proximity of sensitive noise receptors to the Project Site, impacts would remain significant and unavoidable.

The level of significance for construction structural vibration impacts are discussed after Mitigation Measure NOI-MM-4 is discussed on page IV.I-86 of the Draft EIR. The conclusion of "significant and unavoidable" for Mitigation Measure NOI-MM-4 was based on the reason that Mitigation Measure NOI-MM-4 requires the consent of other property owners. The impact conclusion of "significant and unavoidable" was determined not because Mitigation Measure NOI-MM-4 does not have adequate measures to reduce the potential vibration impacts. However, if damage occurs as a result of Project construction, and if all affected property owners agree to coordinate and work with the Project contractors on repairs (should repairs be needed), the implementation of appropriate repairs would correct the building damage impact from vibration.

As described above, the level of significance for construction noise and structural vibration impacts were discussed in the Draft EIR, and feasible mitigation measures for reducing or remedying the identified environmental problems were presented. Therefore, no further analysis is required.

Comment No. ORG 44-36

C. The Draft EIR Impermissibly Ignores Aesthetic Impacts to Historic and Cultural Resources and Aesthetics-Related Land Use Policies.

According to the Draft EIR, the Project is a "mixed-use residential development located on an infill site...within an urban area that [has] been previously developed," and therefore the Project's aesthetic impacts "would not be considered significant" pursuant to Public Resources Code, section 21099(d)(1). (Draft EIR pp. II-12, IV.A-1.) But section 21099(d)(1) is modified by Public Resources Code section 21099(d)(2)(B), which provides that "aesthetic impacts," as used in section 21099(d)(1), do not include impacts on historical or cultural resources. This means that aesthetic impacts to historical or cultural resources are still considered significant for projects that meet the criteria of

section 21099(d)(1), such as the Project. Further, nothing in section 21099 excuses a lead agency from analyzing a project's consistency with land use policies and programs addressing aesthetics, building massing, shade/shadow, etc., or the ability for a lead agency to make findings necessary for a project's entitlements. Here, the Draft EIR sidesteps analysis of all of these issues, and impermissibly attempts to hide behind section 21099 to excuse its failure to provide a full accounting of Project impacts.

The Draft EIR acknowledges that "aesthetic impacts do not include impacts to historic or cultural resources," and provides that "[s]uch impacts are evaluated pursuant to CEQA in Section IV.C, Cultural Resources, of [the DEIR]." But Section IV.C provides no analysis of the Project's aesthetic impacts to nearby historical resources. The Draft EIR incorrectly conflates the requirement to analyze cultural resources impacts with the requirement to analyze the aesthetic impacts to cultural and historical resources. CEQA requires not only the independent analysis of the Project's cultural resources impacts, but also the analysis of the Project's potential aesthetic impacts to nearby historical resources, including shade and shadow and view impacts. As described below, the Draft EIR fails to analyze and disclose aesthetic impacts to historic resources, and as such, must be revised and recirculated.

Response to Comment No. ORG 44-36

This comment asserts that the Draft EIR ignored aesthetic impacts to historic and cultural resources and aesthetics-related land use policies. However, changes in the CEQA Guidelines under Public Resources Code (PRC) Section 21099(d)(1) provide that aesthetic impacts of mixed-use projects within a transit priority area (TPA) are not significant with respect to scenic vistas, scenic resources, visual character/conflicts with regulations governing scenic quality, and light and glare. Shade/shadow impacts are not identified in CEQA Guidelines Appendix G and are not currently evaluated in the City's Draft EIR. As such, the discussions in Section IV.A, *Aesthetics*, of the Draft EIR are provided for informational purposes only (not required by CEQA).

PRC Section 21099(d)(2)(B) provides that that aesthetics impacts shall not be considered significant impacts on the environment. However, this does not apply to impacts on historical or cultural resources. Although historical resources are included as scenic resources under CEQA Guidelines Appendix G, Aesthetics Threshold (b), the full evaluation of historical and cultural resources is provided in Section IV.C, *Cultural Resources*, of the Draft EIR. The approach to provide the full analysis of direct and indirect analyses of historical resources in Section IV.C is because the evaluation of urban projects within a TPA under PRC Section 21099(d) does not require the evaluation of scenic resources (which includes historical buildings) under the Aesthetics category of CEQA Guidelines Appendix G. The exemption of the urban Project from the evaluation of visual character is consistent with the CEQA Guidelines Appendix G, Aesthetics question (c) and is not "impermissible," as stated in the comment. The provision of an analysis of impacts on historical resources in Section IV.C ensures that a full evaluation of these resources is provided in the Draft EIR, including referencing the Project's impacts

on views of the Capitol Records Building partly based on information provided in simulations presented in Section IV.A, *Aesthetics*, of the Draft EIR. The analysis in Section IV.C included the evaluation of other indirect impacts, such as potential conflicts in scale or size and other aesthetic concerns.

Because of the evaluation of the Project's direct and indirect impacts on historical resources, including aesthetic effects in Section IV.C, the Draft EIR does analyze and disclose aesthetic impacts to historic resources. The comment does not demonstrate that indirect and direct aesthetic impacts were not adequately addressed in the Draft EIR and does not support the revision and recirculation of the Draft EIR.

Comment No. ORG 44-37

1. The Draft EIR fails to analyze shade and shadow impacts.

The Draft EIR correctly notes that the Project Site is surrounded by dozens of historical resources. (Draft EIR Table IV.C-2.) Given the close proximity of the Project Site to so many historical resources, including two historical resources located within the East Site itself, the Capitol Records Tower and the Gogerty Building, the Project's impacts to those resources must be fully disclosed and analyzed. The Draft EIR provides no analysis whatsoever of potential shade and shadow impacts on the Capitol Records Tower, the Gogerty Building, or any of the other historical resources located near the Project Site. The Draft EIR therefore cannot adequately consider or disclose the potential for the significant shade and shadow impacts that could be caused by the construction of two massive towers (469 feet and 595 feet) which as a matter of simple geometry will certainly cast massive shadows.

Further, the Project's shade and shadow impacts on AMDA must also be addressed. Even if all of AMDA's buildings are not considered historic buildings, the public and the City's decisionmakers must analyze the Project's consistency with myriad land use plans and policies, many of which seek to preserve the scale and character of established neighborhoods, promote and protect the entertainment industry in Hollywood—of which AMDA is a significant part— and encourage compatible adjacent development. Not only would the Project's shade-shadow effects impact historic buildings nearby, they would create significant shadows in the key outdoor areas of the AMDA campus, including those used for performances. The aesthetics analysis in the Draft EIR is therefore inadequate and must be revised and recirculated.

Response to Comment No. ORG 44-37

This comment asserts that the Draft EIR failed to analyze shade and shadow impacts. In the past, Draft EIR threshold standards were based on the 2006 City of Los Angeles CEQA Thresholds Guide. This document provided a threshold standard related to shade/shadow impacts. The City currently uses the threshold standards set forth in the 2020 CEQA Guidelines Appendix G, which does not provide a threshold standard for

shade/shadow impacts. Therefore, shade/shadow is not evaluated as a CEQA impact in the Draft EIR.

Comment No. ORG 44-38

2. New visual simulation renderings of the Project and view impacts on the Capitol Records Tower are required.

As explained above, the Draft EIR is required to provide an analysis of the potential view impacts to historic resources, including the Capitol Records Building and Gogerty Building. The Draft EIR includes an analysis of view impacts to the Capitol Records Building, but incorrectly asserts that such an analysis is required only pursuant to City regulations and for information purposes. The Draft EIR's analysis of visual impacts to the Capitol Records Building and Gogerty Building are inadequate because they are based upon misleading and inaccurate visual simulations.

The Draft EIR's visual simulations minimize the size of the Capitol Records Tower, making it appear extremely small in most images provided. Without accurate visual simulations that convey the potential impacts to views of this iconic landmark, the Draft EIR cannot provide the public with a meaningful opportunity to evaluate those impacts, as required by CEQA. Most of the Draft EIR's view simulations are based on photographs taken from inappropriately great distances that minimize the appearance of the Capitol Records Tower. Any visual impact can appear to be reduced by taking the photograph from farther away, but CEQA requires accuracy and true mitigation rather than obfuscation. As such, additional analysis must be completed and circulated to the public for review and comment.

Response to Comment No. ORG 44-38

This comment asserts that new visual simulation renderings of the Project and view impacts on the Capitol Records Tower are required. The Draft EIR is required to evaluate direct and indirect impacts on historical resources, which may include view impacts. This includes the historical impacts analysis in Section IV.C, *Cultural Resources*, of the Draft EIR and, where applicable, the evaluation of impacts on historical resources as scenic resources.

Specially, the comment claims that view impacts based on photographs were taken from inappropriately great distances that minimize the appearance of the Capitol Records Tower are unsubstantiated. A great effort was made to find public views of the Capitol Records Building for the EIR. Outside of elevated areas, such as the hillsides (which are more distant from the Capitol Records Building as shown in the simulations) and US-101, the areas around the Capitol Records Building are relatively flat and does not accommodate direct views of the Capitol Records Building. As shown the simulations in Section IV.A, *Aesthetics* of the Draft EIR, views of the Capitol Records Building a block or two from the Project Site are generally obstructed by intervening existing buildings.

Public views of the Capitol Records Building are so limited that two of the clearer views from the hillside areas were from private property, with no available views from the public streets. With the exception of US-101 and streets adjacent to the Capitol Records Building, few existing closer public views of the Capitol Records Building are available. As previously mentioned, the simulations also illustrate that closer views of the Capitol Records Building from surrounding blocks are limited because of intervening buildings.

However, the simulations provided in the Draft EIR show that recognizable, existing public views of the Capitol Records building are available from the eastbound US-101 (Draft EIR, Figure IV.A-9, Key View 3), and from the intersection of Hollywood Boulevard and Vine Street (Draft EIR, Figure IV.A-12, Key View 6). Views from Yucca Street at Vine Street adjacent to the Project Site are also available but are not depicted in the Draft EIR. As further shown in Figures IV.A-9 and IV.A-12 of the Draft EIR, these recognizable, existing views would be preserved. Also note that Draft EIR Figure IV.A-20 (Key View 14 from Argyle Avenue) shows that the East Senior Building on Argyle Avenue would block the existing view of the Capitol Records Building from Argyle Avenue. However, views of the Capitol Records Building through the Project's open paseo, located a few steps to the north of the Senior Building, would continue to be available. The publicly-accessible paseo would also afford more near views and visual enjoyment of the Capitol Records Building than under existing conditions. No other representative view sites are available in the area that were not represented in the Draft EIR, and, as such, no additional analysis of view impacts on the Capitol Records Building would be required.

In addition, the simulations presented in Section IV.A, *Aesthetics*, of the Draft EIR, are provided also for informational purposes so that the public has the opportunity to see the visual effects of the Project compared to the existing setting. The simulations in the Draft EIR were not just to evaluate the effects of the views on the Capitol Records Building but to show the effects of the Project on the skyline views of Hollywood, of which the Capitol Records Building is a component. The simulations from the Hollywood Bowl Overlook is a requirement of CEQA since it is one of the nearest public park with a direct view of the Hollywood skyline and the Capitol Records Building. The purpose of the simulation is to demonstrate the distance of the Project Site and the Capitol Records Building from the nearest, important view location.

Because impacts related to scenic vistas, scenic resources, visual character/regulations governing scenic quality, and light and glare for mixed-use projects within a TPA shall not be considered significant impacts on the environment under PRC Section 21099(d)(1), in order to ensure that scenic historical resources are addressed in the Draft EIR, a full evaluation of the direct and indirect impacts on the aesthetic character of historical resources is provided in Section IV.C, *Cultural Resources*, as cross-referenced in Section IV.A. of the Draft EIR. With respect to view impacts, Section IV.C. referenced the simulations provided in Section IV.A, *Aesthetics*, of the Draft EIR.

The comment does not cite any specific regulations applicable to architectural massing and scale that would apply to regulations that govern scenic resources. Such regulations

are not provided in the City Code or in enforceable plan policies and would not be pertinent to CEQA Guidelines Appendix G Aesthetics Threshold (c).

The comment does not demonstrate with fact that superior photographs of the Capitol Records Building setting would be obtainable from the surrounding area or that any mitigation with respect to scenic vistas would be required. It also does not support the claim that the Draft EIR obfuscated data. As such, based on the aforementioned reasons, no further response is warranted.

Comment No. ORG 44-39

3. Even though the Draft EIR's aesthetics analysis is insufficient, it is nonetheless clear that aesthetic impacts relating to historic resources will occur.

Although the Draft EIR concludes that views will not be adversely impacted, the visual simulations, despite being misleading as detailed above, clearly indicate that several views, including those of the Capitol Records Building, will be adversely impacted. Figure IV.A-18 shows that the Project does block view of the Downtown Los Angeles Skyline. While the analysis on Draft EIR page IV.A-48 states that the Project's 35-story West Building and 46-story East Building "would not substantially diminish this broad scenic view or views of notable visual features" this is flatly contradicted by the simulation itself, which shows the towers dominating the middle ground of the view. This same impact would occur from other mountainous parts of the community, including other views and open space areas in the vicinity of Mulholland Drive, a City of Los Angeles Scenic Parkway.

Similarly, Figure IV.A-19 shows that the historically and culturally significant Capitol Records Building will be completely blocked from views from Hollywood Boulevard. The analysis makes the nonsensical conclusion that because viewers elsewhere will be able to still view the Capitol Records Building, impacts to this historic resource are "considered intermittent." Figure IV.A-20 shows another completely blocked view of the Capitol Records Building.

Even if these impacts could be ignored under Public Resources Code section 21099(d)(1)—and, as described above, they cannot—these visual simulations show a clear conflict with several land use plans and policies promoting the preservation of views, the protection of historic buildings, the compatibility of architectural massing and scale, just to name a few. Inconsistencies and conflicts with land use plans and policies is discussed in more detail, *infra*.

Response to Comment No. ORG 44-39

This comment asserts that the Draft EIR's aesthetics analysis is insufficient and that aesthetic impacts relating to historic resources will occur. The comment also claims that views, particularly views of the Capitol Records Building, would be adversely impacted.

As discussed in Section IV.A, *Aesthetics*, and illustrated in Figures IV.A-7 through IV.A-20 of the Draft EIR, because of the setbacks of the East and West Buildings, the Project would retain existing views of the Capitol Records from Hollywood Boulevard and Vine Street, Yucca Street, US-101, and hillside neighborhoods to the north of the freeway. Protected are public locations, such as streets, public open space, and public buildings. Although the Project would partially close the existing view of the Capitol Records Building from Argyle Avenue, the open paseo at Argyle Avenue would maintain a direct view of the Capitol Records Building, as well as provide direct public access and closer views of the Capitol Records Building than currently available to the public. Existing views of the Hollywood Hills from public streets are generally available through the open corridors of the north/south-oriented roadways, such as Gower Street, Argyle Avenue, and Vine Street. Because of the setbacks of the East and West Buildings from the streets, existing north-facing views of the hills would continue to be available. The commercial area to the south of the Project Site offer limited views of the hills across the Project Site and, as such, the Project would not significantly affect such views. It is also noted that the evaluation of view impacts (with the exception of views of the historic Capitol Records Building or views from historical buildings) are not applicable to a development project within a TPA. The Draft EIR correctly concluded that impacts on such historical resources would be less than significant. Please refer to Response to Comment No. ORG 44-38 for a discussion regarding photographic data.

PRC Section 21099(d)(1) provides that aesthetic impacts of residential projects on an infill site in a transit priority area, which would include impacts on scenic vistas, scenic resources, visual character/regulations governing scenic quality, and light and glare, shall not be considered significant impacts on the environment. As such, these issues were evaluated in the Draft EIR for informational purposes only.

Because impacts related to aesthetics shall not be considered significant impacts on the environment, in order to ensure that scenic historical resources are addressed in the Draft EIR, the full evaluation of historical and cultural resources is now provided in Section IV.C, *Cultural Resources*, of the Draft EIR, as cited in Section IV.A of the Draft EIR. The evaluation of impacts on historical resources relative to view blockage of the Capitol Records Building, includes a reference to the simulations provided in Section IV.A of the Draft EIR. The evaluation in Section IV.C of the Draft EIR also includes the evaluation of other indirect historical resources impacts, such as potential conflicts in scale or size and other aesthetic concerns. The approach to provide the full analysis of direct and indirect impacts on historical resources in Section IV.C of the Draft EIR is because the PRC Section 21099(d) provides that urban projects in a TPA have no significant impact on scenic resources (which may include historical buildings) and are, thus, not evaluated in the Aesthetics section of the Draft EIR. The provision of the analysis of historical resources in Section IV.C of the Draft EIR ensures that a full evaluation is provided in the Draft EIR.

Section IV.A of the Draft EIR illustrates that some view blockages of the Capitol Records Building would occur. Based on this information and the preservation of most existing

public views of the Capitol Records Building (as supported by the provided simulations), based on the reference to the information provided in Section IV.A of the Draft EIR, the environmental analysis of direct and indirect impacts on the Capitol Records Building in Section IV.C of the Draft EIR determined this impact to not be significant. Therefore, the impact analysis with relation to this resources met the requirements of CEQA for such disclosure.

Comment No. ORG 44-40

A. The Draft EIR's Air Quality Analysis Is Flawed, Ignores Adjacent Sensitive Receptors, Fails To Explain Choices in Methodology and Data Manipulations, and Makes Conclusions Unsupported by Substantial Evidence.

AMDA is a sensitive receptor located both immediately adjacent to the Project, and across Yucca Street. AMDA includes several outdoor spaces that are used by students, and several student residence halls. As such, AMDA is extremely concerned about the myriad failings of the air quality impact analysis. As a threshold matter with respect to air quality impacts, all of AMDA's buildings must be accurately identified in the DEIR as sensitive receptors and studied as such, including the Vine Street Building which hosts high school students during summer programs.

Response to Comment No. ORG 44-40

This comment expresses concern that the Draft EIR's air quality analysis is inaccurate, and should have analyzed AMDA as a sensitive receptor. The Project's air quality analysis provides a conservative analysis of potential impact to sensitive receptors surrounding the Project Site. Figure IV.B-2 of Section IV.B, *Air Quality*, of the Draft EIR, presents the air quality sensitive receptor locations nearest to the Project Site. Air quality sensitive receptors include residential land uses and schools, including those utilized by the AMDA as seen in the shaded areas and labeled as "Multi-family residential", AMDA Tower Building and AMDA Vine Building. Air quality-sensitive uses that are located at greater distances from the Project Site than those called out in Figure IV.B-2 of the Draft EIR would experience lower air pollutant impacts from potential sources of pollutants from the Project Site due to atmospheric dispersion effects from being located at greater downwind distances.

As stated on page IV.B-40 of Section IV.B, *Air Quality*, of the Draft EIR, Project construction activities have the potential to create local air quality impact from on-site Project construction emissions to the nearby sensitive receptor locations. The localized effect from the on-site construction emissions were evaluated in accordance with the SCAQMD Final Localized Significance Threshold Methodology and used the most conservative screening criteria since sensitive receptors are located adjacent to the Project Site.⁹⁹ As shown in Table IV.B-13 on page IV.B-66 of the Draft EIR, maximum

⁹⁹ SCAQMD, Final Localized Significance Threshold Methodology, June 2003 and revised July 2008.

localized construction emission impacts for sensitive receptors would be below the localized screening thresholds for NO_x, CO, PM₁₀, and PM_{2.5}, and the Project's maximum localized construction emissions would not exceed the localized thresholds; therefore, impacts to sensitive receptors would be less than significant.

The localized effects from the on-site portion of the maximum daily emissions from Project operation were evaluated at the nearby sensitive receptor locations that would be potentially impacted by operation of the Project according to the SCAQMD's Final Localized Significance Threshold Methodology.¹⁰⁰ As with the construction analysis, operations used the most conservative screening criteria since sensitive receptors are located adjacent to the Project Site. As shown in Tables IV.B-14 through IV.B-16 of the Draft EIR, on pages IV.B-67 and IV.B-68 of the Draft EIR, the maximum localized operational emissions of the Project would not exceed the localized thresholds operational emissions impacts to sensitive receptors would be less than significant.

While the City is not required to conduct a quantified HRA for mixed-use residential and commercial projects, such as the Project, a quantitative construction HRA was prepared and included in Section 4 of Appendix E-1 of the Draft EIR. The HRA included the sensitive receptors identified in Figure IV.B-2 of the Draft EIR nearest to the Project Site, which as previously stated, included the AMDA Vine Building and the AMDA Tower Building. The findings show that the Project would result in cancer risk below 10 in one million for the maximum impacted air quality sensitive receptors with implementation of feasible mitigation measures, including for the AMDA receptor. The calculation details of the HRA are provided in Section 4 of Appendix E-1 of the Draft EIR. As such, the Draft EIR has accounted for the AMDA receptor in the air quality analysis, and no additional analysis is required.

Comment No. ORG 44-41

1. Health risks to sensitive receptors, including AMDA and the Project's own future residents, are not properly disclosed.

Both a freeway Health Risk Assessment ("HRA") and a construction HRA were completed for the proposed Project. However, neither HRA's results are meaningfully described or summarized in the air quality chapter of the Draft EIR. Instead, the Draft EIR states that "the City is not required to conduct a quantified health risk assessment (HRA) for mixed-use residential and commercial projects" but that "in the spirit of the Project proving environmental leadership from the ELDP program, a refined quantitative construction HRA has been prepared and is included in Appendix E of this Draft EIR." (Draft EIR, pp. IV.B-43, -45.) Absolutely no mention of the freeway HRA is made in the chapter at all.

In regards to the construction HRA, the Draft EIR **only discloses the post-mitigation findings**, and makes no mention of the pre-mitigation health risks that would be

¹⁰⁰ SCAQMD, Final Localized Significance Threshold Methodology, June 2003 and revised July 2008.

experienced by nearby sensitive receptors, including AMDA. Worse yet, even the technical appendix containing the construction HRA requires a reader to dig through various output tables to try and determine the actual unmitigated cancer risk calculations. Instead of providing a forthright disclosure, Appendix E-1 contains pages of “unmitigated” cancer risk calculations, some of which are barely legible. This makes it impossible for a reader to determine actual health risk impacts associated with **seven straight years of construction emissions**. However, if armed with patience and a magnifying glass, a reader can find a table appended to the appendix entitled “Maximum Individual Cancer Risk Calculations – Sensitive School Receptor” which seems to identify an unmitigated cancer risk of 12.45, which exceeds the threshold of 10 in one million. **This impact must be disclosed in the Draft EIR.** The Draft EIR’s statement on page IV.B-70 that “the Project and the Project with the East Site Hotel Option, with incorporation of Mitigation Measure AQ-MM-1... would result in cancer risk below 10 in one million for the maximum impacted residential and worker receptors” does not fix this omission. CEQA requires that the potentially significant impacts without mitigation be disclosed, not just the impacts after mitigation.

Further, the construction HRA’s hidden unmitigated impacts are likely grossly underestimated. The construction HRA utilized a methodology that is based on outdated Office of Environmental Health Hazard Assessment (“OEHHA”) guidance. Using an outdated methodology significantly undercounts the actual health risks that will be experienced by students, faculty and student residents of AMDA, as well as persons at other surrounding properties. To provide a full and accurate reporting of true health effects resulting **from seven years of construction**, the 2015 OEHHA Guidance, not the outdated 2003 OEHHA Guidance, must be applied. While Draft EIR Appendix E-1 attempts to support its choice to apply the outdated 2003 OEHHA Guidance with citations, these citations **predate the 2015 OEHHA Guidance**, and are therefore irrelevant to the question of whether the 2015 OEHHA Guidance is more accurate.

In regards to the freeway HRA, it found a carcinogenic risk of **9.83 in one million for future residents of the Project**, and did not identify a single mitigation measure to reduce this risk. Notably, this cancer risk will be borne by the Project’s most vulnerable residents, the seniors living in the East Senior Building on Argyle Avenue. Of course, there is no way for a reader to know this by reading only the Draft EIR’s air quality analysis, because this potentially significant impact is not disclosed.⁵ It is also not clear if the freeway HRA in any way accounted for the increased vulnerability of seniors, or whether the analysis treated the residents of the East Senior Building as healthy adults. This information must be disclosed.

Footnote 5: Any argument that the Draft EIR is not required to analyze the impacts of the freeway on the Project’s future residents fails, as the Draft EIR acknowledges that the Project’s greatest source of air quality emissions is mobile sources. (Draft EIR, p. IV.B-43.) Under *California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369, the California Supreme Court has held that where a Project

will **exacerbate** an existing hazard (here, freeway emissions exacerbated by the Project's increased traffic), analysis is required.

Response to Comment No. ORG 44-41

The comment asserts that the Draft EIR failed to provide a meaningful discussion regarding the freeway HRA conducted in the Air Quality Section of the Draft EIR. However, the freeway HRA is discussed on page IV.B-36 of Section IV.B, *Air Quality*, of the Draft EIR and further directs the reader to the location of the analysis in Section IV.H, *Land Use and Planning*, of the Draft EIR. As discussed on page IV.H-16 of the Draft EIR, the City does not require an HRA, however in response to the City's Zoning Information (ZI) File No. 2427, as well as recommendations from CARB, an HRA was prepared to assess the proposed siting of new residential land uses in proximity to US-101. The HRA analyzes potential health impacts of siting future sensitive receptors (in particular future residents of the Project, including senior residents) in proximity to US-101 on the Project Site.

As discussed on page IV.B-43 of the Draft EIR, the City is not required to conduct a quantified HRA for mixed-use residential and commercial projects, such as the Project. The Project's emissions are largely from mobile sources, and, while the Project would generate localized TAC emissions during construction, the associated activities and exposures would be short- rather than long-term. However, the commenter states that a quantitative HRA was completed for the Project and, with incorporation of Mitigation Measure AQ-MM-1, would result in cancer risk below 10 in one million for the maximum impacted residential and worker receptors. While the results of the unmitigated values are not in the body of the report, they are included in Appendix E of the Draft EIR fulfilling the requirements of CEQA.

CEQA Guidelines Section 15147 provides that "[t]he information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public." Consistent with this guideline, relevant summarized information was provided in the Section IV.B, *Air Quality*, of the Draft EIR, including information not required, such as a construction HRA. CEQA Guidelines Section 15147 goes on to recommend that "[p]lacement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR." Consistent with CEQA Guidelines Section 15147, additional detailed information was presented in relevant Draft EIR appendices. For example, Draft EIR Appendix E-1 includes detailed modeling results of both mitigated and unmitigated construction HRA results. Draft EIR Appendix E-2 includes detailed modeling results for the freeway HRA.

The commenter also asserts the construction HRA was underestimated and relied on an outdated version of the Office of Environmental Health Hazard Assessment ("OEHHA") guidance. The 2015 Guidance Manual, the most recent version, was developed by OEHHA, in conjunction with the CARB, for use in implementing the Air Toxics "Hot Spots"

Program. The Air Toxics “Hot Spots” Program requires stationary sources (e.g., power generation facilities, refineries, and chemical plants) to report the types and quantities of certain substances routinely released into the air. The intent in developing the 2015 Guidance Manual was to provide health risk assessment procedures for use in the Air Toxics Hot Spots Program or for the permitting of new or modified stationary sources. The Project is not a “Hot Spots” Program project but rather involves the construction and operation of a mixed-use development that includes residential, office and retail.

The guidance states:

The local air pollution control districts sometimes use the risk assessment guidelines for the Hot Spots program in permitting decisions for short-term projects such as construction or waste site remediation. Frequently, the issue of how to address cancer risks from short-term projects arises. Cancer potency factors are based on animal lifetime studies or worker studies where there is long-term exposure to the carcinogenic agent. There is considerable uncertainty in trying to evaluate the cancer risk from projects that will only last a small fraction of a lifetime. (Page 8-17)

While OEHHA provides limited guidance on how to conduct HRAs for short-term projects, it acknowledges the “considerable uncertainty” in evaluating cancer risk over short-term durations. In addition, the guidance document does not identify short-term projects or non-stationary source projects that warrant the preparation of a HRA recommend the preparation of HRAs for short-term construction projects or non-stationary source projects, such as the proposed mixed-use development. Therefore, the most relevant HRA guidance for short-term construction was used, and the results are not underestimated. Lastly, the commenter incorrectly asserts the results of the freeway HRA were not disclosed in the Draft EIR. The assumptions and results of the freeway HRA were provided on pages IV.H-25 to IV.H-27 in Section IV.H, *Land Use and Planning*, of the Draft EIR with supporting calculations provided in Appendix E-2 of the Draft EIR. As discussed on page IV.H-26 of the Draft EIR, the Project’s maximum impacted multi-family residential receptor would be located at the northeastern corner of the West Building. The maximum modeled cancer risk at this location would be approximately 9.02 in 1 million for the 30-year residential exposure scenario. The Project’s maximum impacted senior building receptor would be located at the northeastern corner of the East Senior Building. The maximum modeled cancer risk at this location would be approximately 9.83 in 1 million for the 30-year residential exposure scenario. Both scenarios are below the 10 in 1 million significance threshold. The health risk factors used in the long-term freeway HRA are conservative by design and, thus, likely overpredict health risk impacts. The freeway HRA incorporates health-protective risk assessment assumptions, such as assuming future Project residents, including those residents in the senior affordable units, would experience long-term exposure to freeway TAC emissions for 30 years at the Project Site location, which corresponds to the SCAQMD-recommended long-term residential exposure period. The conservative factors included in the freeway HRA provide reasonable assurance that impacts would not be underestimated. In addition, the

freeway HRA results discussed above do not account for the effect of indoor air filtration from the required installation of MERV 13 filters, which would lower indoor air concentrations of diesel particulate matter (DPM) and lower the cancer risks. Thus, the analysis provided is conservative, likely overestimates the impact, and is, thus, a health protective analysis.

As previously discussed in Section IV.H.2, *Regulatory Framework*, of the Draft EIR, the City adopted pollutant control requirements in LAMC Sections 99.04.504 and 99.05.504, which require the installation of MERV 13 filters in residential and non-residential uses with mechanically ventilated buildings within 1,000 feet of a freeway. The ASHRAE 52.2 standard provides removal efficiencies for mechanical filtration. According to the ASHRAE 52.2 standard, MERV 13 filters have reduction efficiencies of 50, 85, and 90 percent for particles with diameter ranges of 0.3 to 1.0 micrometers (μm), 1.0 to 3.0 μm , and 3.0 to 10.0 μm , respectively.¹⁰¹ As a conservative assumption, the assessment assumed a 50-percent control efficiency even though the portion of DPM between 1.0 μm and 3.0 μm would be controlled at 85 percent and the portion of DPM between 3.0 μm and 10.0 μm would be controlled at 90 percent. With incorporation of MERV 13 indoor air filters, the maximum cancer risk from TAC emissions for the maximum impacted multi-family residential receptor would be reduced to approximately 5.64 in 1 million, which would be below the 10 in 1 million significance threshold. With incorporation of MERV 13 indoor air filters, the maximum impacted senior building residential receptor would be reduced to approximately 6.13 in 1 million, which would be below the 10 in 1 million significance threshold. Therefore, the Draft EIR adequately provided sufficient disclosure of the freeway HRA and accounted for the on-site sensitive receptors.

Comment No. ORG 44-42

2. Numerous revisions and adjustments are needed to truly account for all air quality impacts.

In addition to the above noted issues, AMDA has several other questions and comments relating to the air quality analysis methodology and underlying assumptions. These include:

Response to Comment No. ORG 44-42

This comment asserts that numerous revisions and adjustments are needed to truly account for all air quality impacts in the Draft EIR. The specific issues referred to in this comment are provided by the commenter in Comment Nos. ORG 44-43 through ORG 44-48. Responses to these specific issues are provided in Response to Comment Nos. ORG 44-43 through ORG 44-48 below.

¹⁰¹ National Air Filtration Association, Understanding MERV, <https://www.nafahq.org/understanding-merv-nafa-users-guide-to-ansi-ashrae-52-2/>, updated October 2018, accessed August 25, 2020.

Comment No. ORG 44-43

- **Explanation of hauling trip manipulation is missing.** On page IV.B-39 of the Draft EIR, the text explains that the number of days of hauling activities was manipulated from the CalEEMod default assumptions, but does not explain what assumptions were made in place of these defaults. How and why were the CalEEMod hauling trip assumptions manipulated, and how does this provide an accurate account of Project impacts? How many days of haul activities were assumed? How is the assumption consistent with the amount of export anticipated for the Project?

Response to Comment No. ORG 44-43

The commenter asserts the worker and vendor trips were manipulated in the Draft EIR; however, the comment does not provide substantial evidence to support their claims. As stated on page IV.B-39 of Section IV.B, *Air Quality*, of the Draft EIR, emissions from haul trucks and concrete trucks were estimated outside of the California Emissions Estimator Model software (CalEEMod) software because the software assumes the number of heavy-duty truck trips would occur across the entire length of the applicable construction phases. Since the applicable construction phases would not have hauling activities and haul trucks on-site every day within each particular phase, the emissions calculations were performed outside of CalEEMod to account for the varying maximum numbers of daily haul truck and concrete truck trips within each of the demolition, grading/excavation, foundations/concrete pour, and building construction phases. Since the number of haul trips would be calculated based on a maximum number of trucks within each phase instead of being spread across the entire 4.5 years or 7 years of construction, this method portrays a more accurate and conservative account of haul trip emissions associated with the Project since number of daily haul truck trips would actually be higher than under default CalEEMod assumptions (i.e., fewer hauling days which equates to more haul truck trips per day than under CalEEMod default assumptions). As indicated in Appendix E of the Draft EIR (specifically, please refer to Section 2 of Appendix E), the number of hauling days for the West Site and the East Site would be 209 days and 194 days, respectively. Additionally, the CalEEMod model worker trips and vendor truck trips were estimated outside of CalEEMod to account for the CARB 2017 on-road vehicle emissions factor (EMFAC2017) model because EMFAC2017 has not yet been incorporated in the current version of CalEEMod, instead CalEEMod uses EMFAC2014.

As stated on page IV.B-39 of the Draft EIR, the Project would export approximately 542,300 cubic yards of soil and approximately 1,616 cubic yards of demolition debris based on excavation volumes obtained from the Project's construction representative. Haul trip estimates were based on 14 cubic yard soil capacity haul trucks and 9 cubic yard concrete capacity for concrete trucks. Truck capacities, export amounts, amount of concrete, and duration of each construction phase where haul trips were required were the basis for the number of haul days required for the Project. A detailed listing of the Project's construction phasing and equipment list, is provided in Appendix E-1 of the Draft EIR.

Comment No. ORG 44-44

- **Reductions from project design features are not quantified.** On page IV.B-45 of the Draft EIR, the text claims that Project Design Feature GHG-PDF-1, which requires LEED Gold Certification, “will minimize building energy demand and associated air pollutant emissions.” But the text does not provide any meaningful explanation of how much air pollutant emissions are reduced by this feature, and which specific criteria pollutants will be reduced.

Response to Comment No. ORG 44-44

This comment asserts that reductions from project design features are not quantified. On page IV.B-45 of the Draft EIR, the first sentence of the paragraph to which the commenter quotes from refers the reader “to Project Design Feature GHG-PDF-1 (Green Building Features) in Section IV.E, *Greenhouse Gas Emissions*, of this Draft EIR” where additional information regarding the Project’s LEED Gold Certification can be found. In Section IV.E, *Greenhouse Gas Emissions*, of the Draft EIR, project design features are discussed on pages IV.E-41 and IV.E-42 of the Draft EIR. As discussed therein, details regarding certain measures that would be implemented towards the LEED Gold Certification and that would minimize building energy demand and associated air pollutants include optimizing “building energy performance with a 20 percent reduction from the LEED Version 4 (v4) baseline consistent with LEED requirements (equivalent to approximately 11.6 percent reduction from the 2016 Title 24 standards).” Another measure includes reducing “water consumption by 40 percent for indoor water and 100 percent for outdoor water from the LEED v4 usage baseline” which “would be achieved through potential strategies such as the installation of water efficient fixtures that exceed applicable standards and water efficient landscaping.

Air pollutant emissions from building energy demand for operation of the Project are provided in Table IV.B-7 of the Draft EIR in the row labeled “Energy.” An 11.6-percent reduction from the 2016 Title 24 standards equals a reduction of approximately one-half pound of NO_x per day, approximately one-third pound of CO per day, and less than one-tenth pound per day of VOC, SO₂, PM₁₀, and PM_{2.5}. These reductions are included in the values shown in Table IV.B-7 since they would occur as a result of the Project’s proposed design.

Comment No. ORG 44-45

- **Unsupported statements regarding differences in air pollutant emissions under the “Project with the East Site Hotel Option” scenario.** Page IV.B-46 of the Draft EIR states that, during operation, “the Project and the Project with the East Site Hotel Option would result in nominally different daily emissions.” However, absolutely no substantial evidence in support of this conclusion is provided, and the analysis that follows under Threshold (b) of the air quality chapter specifically shows that operational emissions differ between the two land use scenarios. Additional discussion of how the pollutant emissions under the

“Project with the East Site Hotel Option” will be only “nominally” different from the Project scenario, when hotel uses have different trip generation rates, different water and energy demands, etc., must be provided.

Response to Comment No. ORG 44-45

The commenter asserts that the Draft EIR did not provide substantial evidence characterizing the operational emissions difference between the Project and the Project with the East Site Hotel Option; however, this assertion is incorrect.

Although the Project with the East Site Hotel Option is no longer under consideration, as shown in Table IV.B-7 and Table IV.B-8 in Section IV.B, *Air Quality*, of the Draft EIR, the difference in maximum daily regional emissions for each of the modeled pollutants is no greater than approximately 4 pounds per day. As noted in Table IV.B-7 and Table IV.B-8 of the Draft EIR, detailed modeling calculations are provided in Appendix E of the Draft EIR (beginning on page 9 of Section 1 of Appendix E-1, Air Quality/Greenhouse Gas Emissions Technical Documentation). Appendix E contains all technical information such as assumptions, emissions calculations, modeling outputs for both land use scenarios. Specifically, the following lists the location in the Draft EIR that Project information used in the air quality analysis can be found.

- Trip Generation - As noted on page IV.B-57, daily trip generation and vehicle miles traveled (VMT) for both Project land use scenarios were provided in the Project’s Transportation Assessment (TA) (Appendix N-1 of the Draft EIR). Table 7 and Table 8 of the TA summarize the daily trip generation estimates of the Project (5,987 driveway trips and 4,931 external trips) and the Project with the East Site Hotel Option (6,671 driveway trips and 5,633 external trips), respectively.
- Electricity Demand – As discussed on page IV.O-27 of the Draft EIR, full buildout of the Project and would increase annual electricity consumption by approximately 11,768,088 kWh per year and full buildout of the Project with the East Site Hotel Option would increase annual electricity consumption by approximately 12,252,572 kWh.
- Natural Gas Demand - As discussed on page IV.O-28 of the Draft EIR, full buildout of the Project and would increase annual natural gas consumption by approximately 16,535,490 kBtu per year and full buildout of the Project with the East Site Hotel Option would increase annual electricity consumption by approximately 18,448,420 kBtu.
- Water Supply – Table IV.N.2-3 of the Draft EIR indicates that the Project would result in additional water demand of 182.71 acre-feet per year (afy) and Table IV.N.2-4 indicates that the Project with the East Site Hotel Option would result in additional water demand of 204.89 afy.

As shown by the data above, Project with the East Site Hotel Option would result in additional daily trips and require additional electricity, natural gas, and water during operations. This is reflected in the differences in maximum daily operational emissions, where the operation of the Project with the East Site Hotel Option would result in nominally

greater criteria pollutant emissions, as shown in Tables IV.B-7 and IV.B-8 of the Draft EIR.

Comment No. ORG 44-46

- **Unsupported statements regarding SO_x emissions.** On page IV.B-46 of the Draft EIR, the text states that SO₂ emissions “would be negligible” during both construction and operations, but the analysis provides no backup for this conclusory statement and admittedly does not analyze any SO_x emissions from the Project.

Response to Comment No. ORG 44-46

The commenter asserts that SO₂ emissions from the Project have not been analyzed in the Draft EIR. Construction- and operation-related SO₂ emissions for the Project were calculated (see Appendix E-1 of the Draft EIR for modeling assumptions and outputs) and shown in Tables IV.B-5 through IV.B-12 in Section IV.B, *Air Quality*, of the Draft EIR. These tables clearly show that SO₂ emissions would be less than 1 pound per day for the modeled scenarios. Therefore, page IV.B-46 of the Draft EIR is correct in stating that SO₂ emissions “would be negligible,” and the Draft EIR did not make a conclusory statement without substantial evidence as support.

Comment No. ORG 44-47

- **Analysis ignores and omits any demolition activities on the East Site.** Pursuant to Table IV.B-5 on page IV.B-55 of the Draft EIR, no demolition on the East Site is accounted for in the air pollutant emissions calculations. Similarly, Table IV.B-9 on page IV.B-61 of the Draft EIR does not seem to consider East Site demolition. Demolition of pavement and structures on the East Site will be required, and would increase construction NO_x emissions from the levels disclosed, which, notably, already exceed the SCAQMD construction threshold. Given that omission of East Site demolition will result in an increase in NO_x emissions above what is disclosed, recirculation is required.

Response to Comment No. ORG 44-47

The commenter asserts that the Draft EIR did not include a “Demolition” phase of construction for the East Site. Although the East Site would not require the demolition of any buildings, the removal or demolition of pavement on the East Site has been accounted for in the “Site Preparation” phase of the modeled construction activity. As shown in the *Construction Schedule and Vehicle Data* included in Appendix E of the Draft EIR (Section 2 of Appendix E-1 of the Draft EIR), the removal of 704 cubic yards of material (i.e., pavement material) has been properly accounted for within the construction “Site Preparation” phase for the Project East Site. Accordingly, haul trips and off-road construction equipment required have been accounted for in the analysis. Therefore, no increase in NO_x emissions above what was disclosed in the Draft EIR would result.

Comment No. ORG 44-48

- **Inconsistent impact conclusions regarding NO_x emissions.** Page IV.B-56 of the Draft EIR states, “construction-related daily emissions would exceed the SCAQMD thresholds of significance for NO_x and emissions levels would be below the applicable thresholds of significance.” This statement is nonsensical and internally inconsistent, and misleads a reader on the issue of whether SCAQMD thresholds are exceeded during construction.

Response to Comment No. ORG 44-48

The commenter identifies an error on page IV.B-56 of the Draft EIR. As shown in Table IV.B-5, Project construction would exceed the significance threshold for NO_x. The text following the table contains an error that has been corrected as follows:

As shown in Table IV.B-5, construction-related daily emissions would exceed the SCAQMD thresholds of significance for NO_x ~~and emissions levels would be below the applicable thresholds of significance.~~

Because the impact determination for NO_x has been correctly identified in Table IV.B-5 of the Draft EIR and in the conclusion of the section, the correction of the error in the text does not result in a change in a significance determination and does not result in a significant impact not identified in the Draft EIR. The above correction has been incorporated into this Final EIR (see *Chapter 3, Revisions, Clarifications, and Corrections to the Draft EIR*).

Comment No. ORG 44-49

3. Mitigation Measure AQ-MM-1 fails to meet CEQA’s requirements.

As is the case in numerous places throughout the Draft EIR, Mitigation Measure AQ-MM-1 is internally inconsistent such that its effectiveness cannot be confirmed. AQ-MM-1 requires that “construction equipment, such as tower cranes, shall utilize electricity from power poles of alternative fuels (i.e., non-diesel) rather than diesel power generators and/or gasoline power generators.” But then the same measure goes on to state that “if stationary construction equipment, such as diesel- or gasoline-powered generators, must be operated... they shall be located at least 100 feet from sensitive land uses...” As a result, it is wholly unclear whether diesel- or gasoline-powered generators are permitted, or whether, as the measure states, equipment “shall utilize electricity from power poles or alternative fuels.” Do the construction emissions calculations shown in Table IV.B-9 contemplate the use of any diesel- or gasoline-powered generators? If not, how is this consistent with Mitigation Measure AQ-MM-1, which seems to permit diesel and gasoline-powered construction equipment? Mitigation Measure AQ-MM-1 must be revised to address these inconsistencies, and the emissions calculations shown in Table IV.B-9 must be confirmed to adequately account for whether diesel- or gasoline-powered generators will or will not be permitted.

Response to Comment No. ORG 44-49

The comment asserts that Mitigation Measure AQ-MM-1 is inconsistent with CEQA, as its effectiveness cannot be confirmed. Mitigation Measure AQ-MM-1 (second bullet) of the Draft EIR requires construction equipment, such as tower cranes, to utilize electricity from power poles or alternative fuels (i.e., non-diesel) rather than diesel power generators and/or gasoline power generators. Should diesel-powered generators be required and the only option, the measure requires that they be located at least 100 feet from sensitive land uses. While the commenter claims that the measure is inconsistent, the measure provides for further restrictions should non-diesel generators be unavailable or infeasible. Recognizing that non-diesel generators may not always be available or feasible, construction emissions calculations account for the use of diesel generators (See CalEEMod Output files included in Appendix E-1 of the Draft EIR) as a conservative analysis. Therefore, Mitigation Measures AQ-MM-1 does not need to be revised. However, the first paragraph on page IV.B-60 of the Draft EIR has been revised to clarify the use of diesel-powered generators under the mitigated case as follows:

Although Mitigation Measure MM-AQ-1 requires the utilization of non-diesel generators, in the event that non-diesel generators are not available or feasible, use of diesel-powered generators has been accounted for. By implementing mitigation that requires Tier 4 Final off-road emissions standards or equivalent for equipment rated at 50 horsepower (including diesel-powered generators), employs construction equipment, such as tower cranes that utilize electricity from power poles or alternative fuels (i.e., non-diesel), daily construction equipment emissions would be reduced compared to construction equipment without these features.

The above text additions have been incorporated into Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR. Since the above text additions clarify information in Section IV.B, *Air Quality*, of the Draft EIR to make consistent with the quantitative emissions modeling analysis, no changes are needed to the emissions modeling calculations or impact determinations.

Comment No. ORG 44-50

B. The Draft EIR's Cultural Resources Analysis Violates CEQA.

- 1. The mitigation measures identified to address vibration impacts on historic structures are ambiguous, ineffective, nonsensical, and fail to reduce impacts in any way, let alone to the extent feasible.**

More sinister than impacts relating to views of the historic buildings is the Draft EIR's failure to meaningfully protect the Capitol Records Building from vibration damage. Page IV.C-59 of the Draft EIR states, without support, that if vibration damage to the Capitol Records Building occurred, "such damage would likely be surficial and repairable based

on industry practice and knowledge of construction activities in similar settings.” But no information on the current structural integrity of the Capitol Records Building is provided.

As discussed above in relation to the Draft EIR’s failure to adequately analyze and disclose noise and vibration impacts, no acoustical engineer has analyzed both short term and long term effects on the historical Capitol Records echo chambers, and no analysis of whether other construction methods are available that would reduce impacts has been provided. These are basic requests and ones that Capitol Records/EMI Music North America has made in relation to other projects proposed in the vicinity. (See Exhibit B, attached.) In Capitol Records’ own words, “The sound in the [Capitol Records] Studios is one that cannot be replicated anywhere else in the world. The echo chambers are as much a part of the Hollywood history as the Capitol Tower and the Hollywood sign. One of [Capitol Record’s] concerns is that when the chambers have to be shut down due to the construction noise and vibration interference, they may never be able to reopen due to the lost revenue. This would be a huge detrimental impact....” (See Exhibit B, pp. 5, 7.) The attached submittals by Capitol Records/EMI Music North America are hereby explicitly incorporated into AMDA’s comments on this Project’s Draft EIR.

As discussed in the Draft EIR’s noise chapter, the analysis relies on Mitigation Measure NOI-MM-4 to reduce impacts associated with vibration, but for all the reasons discussed above, NOI-MM-4 does nothing to actually prevent vibration that far, far exceeds the threshold for structural damage, and if damage does occur, there is no guarantee that the historic integrity of the building can be maintained. The same can be said of the Gogerty Building, the Pantages Theatre, the Avalon Hollywood, and the Art Deco Commercial Building/6316-6324 Yucca Street.

Response to Comment No. ORG 44-50

This comment asserts that the mitigation measures identified in the Draft EIR fail to address vibration impacts on historic structures, are ambiguous, ineffective, nonsensical, and fail to reduce impacts in any way. Although the Capitol Records Complex is located within the Project Site (within the East Site) and is Applicant-controlled, it was included in the in the vibration analysis, as discussed on page IV.I-17 of Section IV.I, *Noise*, of the Draft EIR due to the potential for structural damage to a historical resource. Vibration effects on the Capitol Records Complex were also evaluated on pages IV.C-59 through IV.C-61, in Section IV.C, *Cultural Resources*, of the Draft EIR. The Capitol Records Building and Gogerty Building are constructed of reinforced concrete. Although the potential for damage to the Capitol Records Building and the Gogerty Building due to construction-related vibration and settlement is considered a significant impact, with implementation of Mitigation Measures CUL-MM-2 and NOI-MM-4 during construction, indirect impacts on these resources would be less than significant. As stated in Mitigation Measure NOI-MM-4, the measure requires monitoring of the vibration levels during construction; establishing vibration warning levels that, if triggered, would provide real-time notification to the contractor to investigate the construction sources or activities generating vibration affecting the subject building; and providing feasible steps to reduce

the vibration level, including, but not limited to, staggering concurrent vibration-generating construction activities and utilizing lower vibratory techniques. Should Project construction result in damage to vibration-sensitive receptor buildings (both historic and non-historic), Mitigation Measure NOI-MM-4 requires that the Applicant provide for repairs. For historic buildings, including the Capitol Records Complex, the repairs would be conducted pursuant to the Secretary of the Interior's Standards, if warranted. This provision is intended to ensure that historic buildings are restored pursuant to the Secretary of the Interior's Standards. However, similar protections to other off-site buildings subject to potential structural damage from vibration and settlement, require the consent of other property owners, including the Pantages Theatre, Avalon Hollywood, and the Art Deco Building (6316-6324 Yucca Street), who may not agree to participate in the mitigation measure; therefore, it was conservatively concluded that structural vibration and settlement impacts on certain historical resources adjacent to the Project Site would remain significant and unavoidable. If consent is not obtained for placing vibration monitoring equipment at off-site structures, part "b." of Mitigation Measure NOI-MM-4 states: "In cases where a receptor building façade is not accessible, the two preset velocity levels shall be programmed at equivalent levels based on distance and soil characteristics that affect vibration transmission over that distance." This would allow for vibration monitoring equipment to be placed in an accessible location to represent the inaccessible off-site structure.

Comment No. ORG 44-51

2. The mitigation measure identified to address impacts to the Hollywood Walk of Fame is unenforceable and ineffective.

To address impacts to the Hollywood Walk of Fame, the Draft EIR identifies Mitigation Measure CUL-MM-1. However, this measure fails in a number of ways. First, the Hollywood Chamber of Commerce/Hollywood Historic Trust ("Chamber/Trust") is not a government branch of the City of Los Angeles and therefore is not bound by the Draft EIR's mitigation measures. Should the Chamber/Trust fail to carry out the duties identified in the mitigation measure (e.g., reply via letter with required alteration procedures, conduct formal consultation meetings, etc.), there is no valid enforceable mechanism by which an individual or entity can compel the Chamber/Trust to act in accordance with the measure. Further, while the mitigation measure identifies "general procedures" (e.g., photographic and documentary recordation, removal, reinstallation) to be followed, it does not specify who or what entity will be responsible for these procedures – is it the Chamber/Trust? The applicant? The construction contractor? The City? The measure similarly fails to identify who will determine whether any given construction or demolition activity shall "have the potential to damage the sidewalk along Vine Street." Further still, the measure does not specify a time for when reinstallation of each affected star will take place. The measure only specifies that "following completion of Project construction" such reinstallation will occur. But construction may take up to seven years to complete. Will stars be reinstalled when construction work in the immediately vicinity is completed? Or at the end of the entire Project's construction? If the Project is never completed as

described in the EIR, when will stars will be replaced? Mitigation Measure CUL-MM-1 provides no direction on any of these points. Finally, the measure requires “monitoring” of excavation and construction activities in the vicinity of the Hollywood Walk of Fame but it is unclear what “in the vicinity” means. Arguably, the entire Project occurs “within the vicinity” of Vine Street, given that Vine Street bisects the West Site and East Site. Further, it is unclear what impact completion of a monitoring report (where no monitoring report contents are specified in the measure) actually mitigates, or how. Given these uncertainties, Mitigation Measure CUL-MM-1 cannot be relied upon to effectively reduce impacts to the Walk of Fame to a less than significant degree.

Response to Comment No. ORG 44-51

The comment asserts that Mitigation Measure CUL-MM-1 cannot be relied upon to reduce impacts to the Hollywood Walk of Fame to a less than significant level, questioning the involvement of the Chamber/Trust and raising numerous other questions regarding monitoring and involvement with implementation of the measure. In response, alterations to the Walk of Fame that have occurred regularly and successfully over the years in Hollywood have been coordinated with input from the Chamber/Trust, with the direct involvement of the City, and with the contractors implementing procedures specified in the Draft EIR. While the comment suggests that no government branch would be involved and that the Chamber/Trust alone would be responsible for the measure, the comment fails to account for details provided in the Draft EIR and in the cited mitigation measure itself. The omitted details include specific reference in the mitigation measure to direct involvement by staff from the Office of Historic Resources and the Department of Public Works Bureau of Engineering, and that work would be completed to the satisfaction of these City departments. In addition, as stated on page IV.C-55, in Section IV.C, *Cultural Resources*, of the Draft EIR, all restoration work within the Hollywood Walk of Fame will be reviewed and approved by the Bureau of Engineering as required by LAMC Section 62.105, in conjunction with the review of the City Cultural Heritage Commission and in accordance with LAMC Section 62.110 that all work shall be performed under a Public Works (A or B Permit) work permit, issued by the Bureau of Engineering. Accordingly, given the details provided in the Draft EIR and in the mitigation measure, involvement of various City departments, a long record of success with the Hollywood Walk of Fame with Chamber/Trust involvement, and required conformance with LAMC Sections 62.105 and 62.110, there is no basis for the statement that Mitigation Measure CUL-MM-1 cannot be relied upon to effectively reduce impacts to the Hollywood Walk of Fame. Furthermore, regarding other details associated with monitoring responsibility for Mitigation Measure CUL-MM-1, see the Mitigation Monitoring Program (MMP) prepared pursuant to Public Resources Code Section 21081.6, provided in Chapter 4, *Mitigation Monitoring Program*, in this Final EIR.

Comment No. ORG 44-52

C. The Draft EIR’s Greenhouse Gas Emissions Analysis Relies On Offsets To Reduce Its Impacts, But Provides No Enforceable, Meaningful Commitment To Purchase Offsets.

The Draft EIR's analysis of greenhouse gas ("GHG") emissions relies solely on the argument that under the *Jobs and Economic Improvement Through Environmental Leadership Act*, it can be determined that the Project would not result in any additional emission of GHGs. There is absolutely no factual or legal justification provided for this conclusion.

On page IV.E-83, the Draft EIR states that "the Project will incorporate GHG emission offsets as necessary to achieve a net zero increase in site GHG emissions, relative to the baseline annual GHG emissions, for the estimated Project lifetime." This alleged commitment to purchase offsets **is not a mitigation measure** and therefore cannot be relied upon under CEQA. Further, there are no details provided as to when the offsets will be purchased, and no standards are provided as to the quality of emission reductions credits that will be deemed acceptable by the City. Will the credits come from mitigation banks that have demonstrated emission reductions that are real, permanent, verifiable, enforceable and not otherwise required by law or regulation? Without these details, the Draft EIR provides no explanation as to how the applicant's purchase of offset credits would ensure actual reductions in GHG emissions.

Draft EIR Table IV.I-7 identifies **10 different land use scenarios**, each with their own calculated total of GHG emissions. These range from 3,757 MTCO_{2e} to nearly 11,000 MTCO_{2e}. As discussed above in the comments relating to the Project Description's failings, a reader has no way of knowing the extent of the GHG emissions that will actually occur as a result of Project approval, because a reader cannot know which iteration of the Project the applicant will ultimately carry out. Similarly, a reader has no way of knowing how many GHG offsets will be purchased. As such, the Draft EIR's GHG analysis both fails to adequately disclose the impacts that will occur as a result of the Project, and fails to mitigate those impacts. The only way to correct these failings is to revise the GHG analysis and recirculate it for public review.

Response to Comment No. ORG 44-52

The comment asserts that the Draft EIR's analysis of GHG emissions relies solely on the argument that under the *Jobs and Economic Improvement Through Environmental Leadership Act*, it can be determined that the Project would not result in any additional emission of GHGs. The comment also raises issues regarding the real, permanent, verifiable, enforceable, and not otherwise required by law or regulation reduction in GHG emissions from the purchase of offset credits. The comment also raises issues regarding the Project's GHG emissions in Draft EIR Table IV.I-7.

Regarding the Draft EIR's analysis of GHG emissions, the comment is incorrect in asserting that the EIR relies solely on the argument that under the *Jobs and Economic Improvement Through Environmental Leadership Act*, it can be determined that the Project would not result in any additional emission of GHGs. As discussed on page IV.E-79 of the Draft EIR, the Project would generate an incremental increase in GHG emission over existing conditions. However, the Project's design and transportation efficiency features and location would reduce the Project's GHG emissions by approximately 22 to

25 percent (depending on the buildout scenario) compared to a project without the Project-specific designs and transportation efficiencies. The Project's Environmental Leadership Development Program (ELDP) Application provides a discussion of potentially utilizing GHG offsets or credits to further reduce GHG emissions and achieve no net increase in GHG emissions from the Project emissions.

Furthermore, regarding the real, permanent, verifiable, enforceable, and not otherwise required by law or regulation reduction in GHG emissions from the purchase of offset credits, CARB has approved the Project's ELDP Application (see Appendix B of the Draft EIR), which outlines carbon offset measures to be followed to reduce GHG emissions to no net additional GHG emissions, which are binding and enforceable. If the Project were to purchase offset credits to meet the ELDP certification, only CARB Registry Offset Credits would be purchased, per the CARB certification documents, which are "real, additional, quantifiable, permanent, verifiable, and enforceable" under the California Code of Regulations (CCR) Title 17, Section 95970. As carbon offsets would be purchased through a CARB-approved registry, the Project would follow CARB-approved protocols, including the listing, reporting, and verification of offset projects and issue registry offset credits. Additionally, as an enforcement tool, the City of Los Angeles will issue the Certificate of Occupancy, CARB will issue a final determination that the Project will not result in any net additional GHG emissions, and OPR will certify the Project once emissions and offsets have been determined and contracts for offsets have been put in place.

Exhibit 3 in Appendix B of the Draft EIR described how the GHG offsets would be enforced. The Applicant proposes to meet the requirement set forth in PRC Section 21183(c), which requires that the Project demonstrate that it will not result in net additional emissions of GHG, through the implementation of GHG-reducing Project Design Features and/or acquisition of voluntary carbon credits sufficient to offset all projected additional emissions, in the following manner:

1. No later than six (6) months after the issuance of a Temporary Certificate of Occupancy for the Project, the Applicant shall commit to providing to the lead agency, the City of Los Angeles, a calculation of the net additional emissions resulting from the construction of the Project (the "Construction Emissions"), to be calculated in accordance with the methodology agreed upon by CARB in connection with the AB 900 certification of the Project (the "Agreed Methodology"). The Applicant shall provide courtesy copies of the calculations to CARB and the Governor's Office promptly following transmittal of the calculations to the City of Los Angeles. The Applicant shall enter into one or more contracts for the implementation of GHG-reducing Project Design Features and/or purchase voluntary carbon credits from a recognized and reputable carbon registry in an amount sufficient to offset the Construction Emissions. The Applicant shall provide courtesy copies of any such contracts to CARB and the Governor's Office promptly following the execution of such contracts.

2. Prior to issuance of any Certificate of Occupancy for the Project, the Applicant or its successor shall commit to entering into one or more contracts to purchase carbon credits from a recognized and reputable carbon registry (to be selected from an accredited registry), which contract, together with any previous contracts for the purchase of carbon credits, shall evidence the purchase of carbon credits in an amount sufficient to offset the Operational Emissions attributable to the Project, and shall be calculated on a net present value basis for a 30-year useful life.

Prior to execution of the contract(s), the Applicant and its consultant shall calculate the Operational Emissions, in accordance with the methodology described in the Applicant's "Application for Environmental Leadership Development Project," specifically the "Greenhouse Gas Emissions Methodology and Documentation" prepared by Environmental Science Associates (ESA).

Once the City has had an opportunity to review and approve the methodology and associated calculations, the Project Applicant shall provide copies of the calculation methodology to the CARB and Governor's Office of Planning and Research (OPR), which is then subject to a determination signed by the Executive Officer of CARB pursuant to the procedures set forth in Section 6 of OPR's Guidelines. The City will issue a Certificate of Occupancy upon receipt of the following: (1) a fully executed copy of the carbon offset purchase agreement(s); (2) a final CARB Determination that the Project will not result in any net additional GHG emissions; and (3) a copy of OPR's Certification Letter for the Project.

Prior to execution of the contract(s), the Applicant and its consultant shall calculate the Operational Emissions, in accordance with the methodology described in the Applicant's "Application for Environmental Leadership Development Project," specifically the "Greenhouse Gas Emissions Methodology and Documentation" prepared by Environmental Science Associates (ESA).

Once the City has had an opportunity to review and approve the methodology and associated calculations, the Project Applicant shall provide copies of the calculation methodology to the CARB and Governor's Office of Planning and Research (OPR), which is then subject to a determination signed by the Executive Officer of CARB pursuant to the procedures set forth in Section 6 of OPR's Guidelines. The City will issue a Certificate of Occupancy upon receipt of the following: (1) a fully executed copy of the carbon offset purchase agreement(s); (2) a final CARB Determination that the Project will not result in any net additional GHG emissions; and (3) a copy of OPR's Certification Letter for the Project.

Section IV.E, *Greenhouse Gas Emissions*, of the Draft EIR, fully disclosed and described the adequacy of the threshold used to determine Project GHG impacts for all the Project scenarios and how the Project's GHG impacts are less than significant. As stated on page IV.E-29 of the Draft EIR, CEQA Guidelines Section 15064.4 gives lead agencies the

discretion to determine whether to assess those emissions quantitatively or qualitatively.” Additionally, as stated on page IV.E-30 of the Draft EIR, “Per CEQA Guidelines Section 15064(h)(3), a project’s incremental contribution to a cumulative impact can be found not cumulatively considerable if the project would comply with an approved plan or mitigation program that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area of the project...Thus, CEQA Guidelines Section 15064(h)(3) allows a lead agency to make a finding of non-significance for GHG emissions if a project complies with a program and/or other regulatory schemes to reduce GHG emissions.” Therefore, in the absence of any adopted quantitative threshold by CARB, SCAQMD, and the City, the significance of the Project’s GHG emissions was sufficiently determined to be less than significant as it was consistent with CEQA Guidelines Section 15064.4(b)(2) as the Project complies with applicable plans, policies, regulations and requirements adopted to implement a Statewide, regional, or local plan for the reduction or mitigation of GHG emissions. As presented in Section IV.E.3.d(1)(a), *Project Consistency with Applicable Plans and Policies*, of the Draft EIR, the Project is shown to be consistent with CARB’s 2017 Climate Change Scoping Plan, Southern California Association of Government’s (SCAG’s) 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), L.A.’s Green New Deal (Sustainable City’ pLAN 2019), and the Los Angeles Green Building Code. In addition, as stated in Section 15126.4(a)(3) of the CEQA Guidelines, “Mitigation measures are not required for effects which are not found to be significant”. In addition, as discussed in the impact discussion in Section IV.E.3.d of the Draft EIR, the Project is less than significant under all the thresholds of significance that are presented in Section IV.E.3.a of the Draft EIR. Thus, no mitigation measures are presented in Section IV.E, *Greenhouse Gas Emissions*, of the Draft EIR.

In addition, the purpose of the comparison to a Project scenario without GHG reduction characteristics, features, and measures was clearly discussed on page IV.E-74 of Section IV.E, *Greenhouse Gas Emissions*, of the Draft EIR, where in order to evaluate the efficacy of the GHG reduction characteristics, features, and measures that would be implemented as part of the Project as required by these GHG reduction plans and policies, the analysis compared the Project’s GHG emissions to the emissions that would be generated by the Project without implementation of GHG reduction characteristics, features, and measures. This comparison was provided to evaluate the Project’s efficiency with respect to GHG emissions but was not the threshold of significance used for impact analysis. The analysis assumed the Project without implementation of GHG reduction characteristics, features, and measures would incorporate the same land uses and building square footage as the Project and did not include certain VMT reductions from the Project’s TA and land use characteristics, such as increased destination accessibility and increased transit ability, or reductions resulting from the Project’s Transportation Demand Management (TDM) program. Therefore, the Project scenarios presented without GHG reduction characteristics, features, and measures were strictly hypothetical projects that would not be built out and were used only for comparison and informative purposes.

Exhibit 8 of Appendix B of the Draft EIR includes the signed Project Applicant's acknowledgement of the ELDP obligations under PRC Section 21183 with the City (Acknowledgment). The Acknowledgment provides that the Project Applicant agrees, amongst other obligations, that all mitigation measures required pursuant to CEQA to certify the Project will be conditions of approval, and those conditions will be fully enforceable by the City, or another agency designated by the City, and those mitigation measures will be monitored and enforced by the City for the life of the obligation.

Regarding the 10 operational scenarios referenced by the comment, this statement is in regard to Table IV.E-7 on pages IV.E-72 and IV.E-73 in the Draft EIR, which provides modeled GHG emissions for the Project and the Project with the East Site Hotel Option. The Project with the East Site Hotel Option is no longer under consideration. For informational purposes, Table IV.E-7 also provides, for comparison, GHG emissions of the Project without GHG emissions reductions that would result from the Project's design and location. The table has 10 columns with numerical GHG emissions values; however, each column is clearly labeled at the top describing what the values in each of the 10 columns represent. For instance, Table IV.E-7 clearly labels the first two columns with numeric values as applicable to buildout of the West Site without Project reduction features and buildout of the West Site under the Project (i.e., with Project reduction features). The next four columns apply to the overlapping construction scenario and provide full Project buildout (i.e., West Site and East Site) for the two options, without and with Project reduction features. The last four columns apply to the sequential construction scenario and provide full Project buildout (i.e., West Site and East Site) for the two options, without and with Project reduction features. Furthermore, the Methodology Subsection of Section IV.E of the Draft EIR fully explains the comparison of the Project's GHG emissions to the emissions that would occur without GHG emissions reductions that would result from the Project's design and location. This explanation is provided on pages IV.E-40 and IV.E-41 of the Draft EIR.

Comment No. ORG 44-53

D. The Land Use and Planning Analysis Downplays the True Enormity of the Entitlements Sought for the Proposed Project, Fails to Show How the Project Qualifies for the Myriad Development Concessions Sought by the Applicant, and Is Rife with Consistency Determinations Not Supported by Substantial Evidence.

This Project is massive. It will construct two high-rise towers, 469 feet and 595 feet, in the middle of Hollywood, ***where no other buildings even close to this size and scale are permitted, let alone constructed.*** Draft EIR Figures IV.A-7, IV.A-8, IV.A-15, IV.A-16 clearly show just how out of place and gargantuan these buildings will be. Yet, the Draft EIR flatly mischaracterizes and downplays the nature of the entitlements sought, leaving the impression that it is seeking only small concessions, only tiny changes, only minute increases from what is currently permitted. Such statements mislead the public and the City's decisionmakers, and violate CEQA.

In fact, the Project seeks approval of no less than eight varied entitlements, including a vesting zone change, removal of height limitations, development concessions that include a floor area bonus, multiple conditional use permits, site plan review, a vesting tentative tract map, and a development agreement.

Response to Comment No. ORG 44-53

This comment asserts that the Draft EIR misrepresents the scale of entitlement requests needed for Project approval. However, the Draft EIR presents the entitlements and scope of the Project in multiple descriptions and renderings. All of the proposed approvals needed to develop the Project are clearly listed on pages II-72 and II.75, Section 8 of Chapter II, *Project Description*, of the Draft EIR. The commenter is also referred to Topical Response No. 5 – Land Use and Planning, above, which explains the Project’s updated list of requested entitlements and affordable housing incentives and requirements. As explained therein, the Project Applicant revised the Zone and Height District Change request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. These revisions have also been addressed in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR.

With regard to the Project’s floor area ratio (FAR), consistency with the applicable zoning and land use plans, the commenter is also referred to Topical Response No. 5 – Land Use and Planning, above. As discussed in Topical Response No. 5, the Project’s consistency and, therefore, potential conflicts, with applicable local and regional plans, along with related land use and planning impacts, were fully analyzed in the Draft EIR’s Section IV.H, *Land Use and Planning*. The analysis in Section IV.H of the Draft EIR was supported by Land Use Plans and Policies: Project Consistency Tables included in Appendix J of the Draft EIR.

Regarding the issue of scale, the scale of the Project is clearly set forth throughout the Draft EIR, including Chapter II, *Project Description*, of the Draft EIR. However, since scale or mass is a component of the discussion of a project’s compatibility to its surroundings, it is a part of the aesthetics analysis. Aesthetics impacts, other than as they relate to historical or cultural resources, are not significant impacts since the Project is an in-fill, mixed-use project within a Transit Priority Area (TPA) in an urbanized area. As such, the Draft EIR is not required to evaluate the significance of scale or any of the aesthetics issues, such as impacts with respect to scenic vistas, scenic resources (with the exception of impacts to historical buildings, which are evaluated in Section IV.C, Cultural Resources, of the Draft EIR), scenic quality/conflicts with regulations governing scenic quality, and light and glare. Nonetheless, Section IV.A, *Aesthetics*, of the Draft EIR, provided an overview discussion of the Project’s effects on scenic vistas, scenic resources, conflicts with regulations governing scenic quality, and light and glare for informational purposes only. Please refer to Draft EIR pages IV.A-57 *et. seq.*

With respect to the entitlements, these are approval vehicles through which the City’s decision-makers can review and determine the need for additional development conditions to protect the interests of the community. Approval of the requested

entitlements are all dependent on certification of the EIR and, therefore, cannot involved a project other than what is approved by the City after certification of the EIR and, as such, cannot contain any conditions that would create environmental impacts not disclosed and analyzed in the EIR.

With regard to the Project's requested Conditional Use Permits, as explained in Topical Response No. 5 – Land Use and Planning, above, the Project is no longer requesting approval of a Conditional Use Permit for a Unified Development to average FAR and density across the Project Site and, instead, requests approval of a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25, including an Off-Menu Incentive to allow FAR and density averaging across the Project Site. With regard to the Project's requested Conditional Use Permit to allow for the service of alcoholic beverages in the Project's future restaurants, this entitlement is typical for a project with commercial uses and would not be excessive. The comment asserts that the Draft EIR makes consistency determinations that are not supported by substantial evidence but does not identify the policies to which the consistency determinations would apply. More importantly, the comment letter does not substantiate that the Draft EIR violates CEQA.

Comment No. ORG 44-54

1. The Draft EIR grossly downplays the true extent of the FAR increase sought for the proposed Project.

On page IV.H-22, the Draft EIR claims that the Project is seeking an increase in FAR from 6:1 to 7:1, but this is completely misleading. ***The zoning controls on the Project site currently limit the FAR to 3:1 and 2:1. Thus the Project is seeking an increase in FAR from 3:1 and 2:1 to 7:1.*** (See Draft EIR, pp. II-10, -11.)

The increase in FAR is subject to City findings that the Project would further the goals and intent of the Hollywood Redevelopment Plan, by meeting such objectives as providing new development which compliments existing buildings in areas with architecturally and/or historically significant structures, and protecting entertainment oriented uses. (Draft EIR, p. IV.H-22.) But here, the Project ***dwarfs*** existing historically significant structures—in fact it dwarfs ***all*** surrounding structures as shown in the Project's visual simulations. The Project's inconsistency with the scale and character of the surrounding neighborhoods, and the Project's negative impacts on AMDA (and, by extension, the entertainment industry) mean that no finding of consistency with the Hollywood Redevelopment Plan can be made. By downplaying the true increase in FAR the Draft EIR fails to adequately disclose key aspects of the Project, hides the true impacts resulting from the increase in FAR, and ignores the Project's inconsistency with land use policies that require certain findings be made before FAR can be increased.

Response to Comment No. ORG 44-54

The comment expresses opposition to the Project by claiming that the Draft EIR Project Description did not accurately describe the existing zoning controls but does not provide any facts and, therefore, no substantial evidence to support this claim.

Nonetheless, the commenter states that page IV.H-22 of the Draft EIR claims that the Project is seeking an increase in FAR from 6:1 to 7:1, but the comment is misleading because the commenter fails to note that pages IV.H-10 and IV.H-23 of the Draft EIR provide a detailed description of the Project Site's existing zoning designations, including the existing 3:1 and 2:1 FARs and how the requested entitlements would allow the Project to obtain the desired FAR increase to 7:1. The commenter is referred to Topical Response No. 5 – Land Use and Planning, above, which addresses the Project's updated list of requested entitlements and the Project's affordable housing obligations. As explained therein, the Project Applicant has revised the Zone and Height District Change request and, instead, has requested a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. By providing at least 11 percent of the total units for Very-Low Income Households (although the Project would exceed this requirement), the Project would qualify for an FAR of 7:1 through the requested development incentives pursuant to the State Density Bonus law, a State-mandated law intended to promote the development of affordable housing.

Moreover, page IV.H-22 of the Draft EIR explains that the increase in FAR beyond 6:1 would be subject to City findings that the Project would further the goals and intent of the Hollywood Redevelopment Plan by meeting such objectives as: concentrating high intensity and/or density development in areas with reasonable proximity or direct access to high capacity transportation facilities; providing new development which compliments existing buildings in areas with architecturally and/or historically significant structures; and, providing focal points for entertainment, tourism and pedestrian oriented uses. The Project would meet these objectives by providing a mixed-use, higher-density development within a Regional Center and near public transit, including the Metro B (Red) Line Hollywood/Vine Station, with a design that complements the architecturally and historically significant Capitol Records Building. The Project would also provide a focal point for entertainment and tourism through a design that includes restaurants, outdoor dining areas, plazas, and a two-block paseo between Argyle Avenue and Ivar Avenue, with improved access to the adjacent Hollywood Walk of Fame and Capitol Records Building.

In regard to density and consistency with planned development in Hollywood, see Topical Response No. 5 – Land Use and Planning. As discussed in Topical Response No. 5, the Project's consistency and, therefore, potential conflicts, with applicable local and regional plans, along with related land use and planning impacts, were fully analyzed in the Draft EIR's Section IV.H, *Land Use and Planning*. The analysis in Section IV.H is supported by Land Use Plans and Policies: Project Consistency Tables included in Appendix J of the Draft EIR.

Comment No. ORG 44-55

2. The Draft EIR fails to explain how the Project qualifies for the multiple development concessions sought by the applicant.

Page IV.H-23 of the Draft EIR states that the Project is seeking several development concessions under LAMC section 11.5.11. However, the Draft EIR does not explain how the Project will qualify for these concessions, making it impossible for a reader to determine if the Project is in fact consistent with the relevant code sections and planning policies. Absolutely no details are provided here, or in the Project Description, regarding the breakdown of unit affordability levels, whether the units are for rent or for sale, or how the Project will comply with the percentage affordable unit requirements identified in LAMC section 11.5.11(a)—all facts necessary to determine whether the Project qualifies for the requested density bonus. Further, nearly half of the Project’s affordable units are proposed on the East Site, which will be constructed after the West Site—at the very end of the seven year construction period. Will the applicant be permitted to take advantage of multiple development concessions prior to the construction of half of the affordable units? What happens if Project construction halts during the seven year construction period, and the East Senior Tower is never constructed?

Also, it is unclear at what time the applicant could choose to forgo a significant number of residential units on the East Site and replace them with hotel rooms under the “Project with East Site Hotel Option.” These ambiguities beg the question of whether the Project will be taking advantage of development concessions based on units that may never get built until some time far into the future, or, in the worst case scenario, never get built at all. This analysis is wholly relevant to the question of whether the Project is consistent with land use plans and policies adopted for the purpose of protecting the environment, and must be addressed.

Response to Comment No. ORG 44-55

The comment expresses opposition to the Project by claiming that the Draft EIR fails to explain how the Project qualifies for the multiple development concessions sought by the Applicant but does not provide any facts and, therefore, no substantial evidence to support this claim.

Nonetheless, the commenter is referred to Topical Response No. 5 – Land Use and Planning, above, which addresses the proposed Density Bonus Compliance Review and the revised entitlement requests in detail. As explained therein, the Project would provide 133 senior affordable housing units reserved as affordable for Very Low Income households (or approximately 13.2 percent), in excess of the 10 percent for Very Low Income households required to qualify for the requested affordable housing incentives and waivers under California Government Code Section 65915 and LAMC Section 12.22 A.25 (however, LAMC Section 12.22 A.25(c) requires the Applicant to provide at least 11 percent of the units as Very-Low Income households to be eligible for the 35 percent FAR increase On-Menu Incentive).

The commenter is also concerned about the Project's construction phasing, which the commenter asserts may result in certain affordable housing units being built at a later phase. With regard to construction phasing, the commenter is referred to pages II-70 to II-74 in Chapter II, *Project Description*, of the Draft EIR, and also Response to Comment Nos. ORG 42-4, ORG 44-6, ORG 44-10, and ORG 44-11. As explained therein, the Project is a single project proposed on the East Site and West Site and construction phasing is necessary due to the logistical site needs.

The commenter also asserts that the Project can choose to forgo a significant number of residential units on the East Site and replace them with hotel rooms under the "Project with East Site Hotel Option." However, the Project with East Site Hotel Option is no longer under consideration.

Refer also to Topical Response No. 5 – Land Use and Planning, for a discussion of the Project's consistency with land use plans and policies adopted for the purpose of protecting the environment. As discussed in Topical Response No. 5, the Project's consistency and, therefore, potential conflicts, with applicable local and regional plans, along with related land use and planning impacts, were fully analyzed in the Draft EIR's Section IV.H, *Land Use and Planning*. The analysis in Section IV.H of the Draft EIR is supported by Land Use Plans and Policies: Project Consistency Tables included in Appendix J of the Draft EIR.

Comment No. ORG 44-56

3. The Project conflicts with numerous land use plans and policies, and the Draft EIR's conclusions to the contrary are not supported by substantial evidence.

The Draft EIR's land use and planning analysis, and Draft EIR Appendix J, purport to consider whether the Project is consistent with or in conflict with the relevant goals, objectives and policies of the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy ("RTP/SCS"), the City's Framework Element, the Hollywood Community Plan, and the Hollywood Redevelopment Plan. However, the analysis, and the tables prepared in support, contain numerous flaws, as detailed below:

- **The Project does not improve housing opportunities for all income and age groups.** Page IV.H-21 of the Draft EIR states that the Project "would both increase the supply and improve the quality of housing for all income and age groups, especially for persons with low and moderate incomes..." But nearly 90 percent of the Project's units are market rate units that will not be reserved for low or moderate income households. The only affordable units proposed are for seniors. Thus, the Draft EIR's findings that the Project is consistent with plans and policies that encourage additional housing opportunities for all income and age groups are unsupported.

Response to Comment No. ORG 44-56

The comment asserts that the Project conflicts with numerous land use plans and policies, and the Draft EIR's conclusions are not supported by substantial evidence.

The Draft EIR compares the Project with the applicable policies of the SCAG 2016-2040 RTP/SCS, the General Plan Framework Element, the Hollywood Community Plan, and the Hollywood Redevelopment Plan within Section IV.H, *Land Use and Planning*, and Appendix J of the Draft EIR, and correctly concludes that the Project would not conflict with the policies of this adopted plan. The Project would be developed in compliance with the provisions of applicable land use plans and policies. The comment provides only one example of presumed conflict with land use plans and policies. The referenced policy is Policy 9 of the Hollywood Redevelopment Plan, discussed in Table LU-4, *Consistency of the Project with Applicable Sections of the Redevelopment Plan*, in Appendix J of the Draft EIR, which states: "Provide housing choices and increase the supply and improve the quality of housing for all income and age groups, especially for persons with low and moderate incomes; and to provide home ownership opportunities and other housing choices which meet the needs of the resident population."

In determining that the Project would not conflict with this policy, the Draft EIR states:

"No Conflict. The Project would provide up to 1,005 new housing units, including up to 133 senior affordable housing units to meet housing needs established in SCAG's Regional Housing Needs Assessment and the Housing Element of the General Plan. The Project would increase the supply of ownership and rental units in the neighborhood and provide quality housing for a range of income and age groups. The Project would include senior affordable housing units that would be set aside for Extremely Low and Very Low Income households."

Thus, the assertion that the Project would conflict with the stated Redevelopment Plan policy is not fully supported in the comment or by the facts.

Comment No. ORG 44-57

- **The Draft EIR is not consistent with the RTP/SCS on multiple grounds.** Table LU-1 of Appendix J claims that the Project is consistent with the RTP/SCS goal of protecting the environmental health of residents. However, the analysis relies on greenhouse gas offsets, which, as discussed above, **are not incorporated into any binding mitigation measure.** Further, the analysis claims that the Project would reduce air quality impacts, consistent with the RTP/SCS, but this generic statement is not based on any substantial evidence. Reduce air quality impacts from what baseline? "EIR requirements are not satisfied by saying an environmental impact is something less than some previously unknown amount." (*California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 210.)

Response to Comment No. ORG 44-57

The comment expresses opposition to the Project by claiming the Project is inconsistent with the 2016-2040 RTP/SCS goal of protecting the environmental health of residents but does not provide any substantial evidence to support this claim and, thus, does not raise any issues with respect to the content and adequacy of the Draft EIR.

The commenter further asserts that the ELDP provisions are not binding to the Applicant. On August 16, 2018, Governor Brown certified that the Project meets the criteria set forth in the statute, including the applicable updated requirements in AB 246. In order to be certified as an ELDP, the Governor determined that the Project would result in a minimum investment of \$100 million, would create high-wage jobs, and would not result in net additional greenhouse gas (GHG) emissions, as determined by the CARB. Further, a mixed-use project, such as the Project, must meet additional requirements. [emphasis added] Specifically, it must be located on an infill site, be designed to achieve Leadership in Energy and Environmental Design (LEED) Gold certification, be consistent with the relevant regional sustainable communities strategy, and exceed by at least 15 percent the transportation efficiency for comparable projects. The Governor's certification determined that the Project complies with all of these applicable requirements. The Governor's certification and related documentation are provided in Appendix B of the Draft EIR. See Section II.7(e)(1), page II-68 of the Draft EIR.

Exhibit 8 of Appendix B of the Draft EIR includes the signed Applicant's acknowledgement of the ELDP obligations under PRC Section 21183 with the City (Acknowledgment). The Acknowledgment provides that the Project Applicant agrees, amongst other obligations, that all mitigation measures, including the GHG obligations, required pursuant to CEQA to certify the Project will be conditions of approval, and those conditions will be fully enforceable by the City, or another agency designated by the City, and those mitigation measures will be monitored and enforced by the City for the life of the obligation. As such, the commenter's assertion that the Project's GHG obligations are not binding is unsubstantiated.

Regarding GHG emission offsets, as discussed on page IV.E-79 in Section IV.E, *Greenhouse Gas Emissions*, of the Draft EIR, Project GHG emissions would be less than significant based on the Project's proposed design and its transit-oriented infill location. Relevant Project Design Features are listed on pages IV.E-41 and IV.E-42 of the Draft EIR and include LEED Gold energy and water saving features and electric vehicle and carpool parking provisions. The Project's transit-oriented infill location benefits that would minimize VMT are discussed in detail on pages IV.E-54 through IV.E-60 of the Draft EIR. GHG emission offset credits are not required as CEQA mitigation for the Project since GHG emissions are less than significant. However, GHG emission offset credits may be used to achieve no net increase in GHG emissions as required under the ELDP Application, which the Applicant has voluntarily committed to meeting.

The commenter is also referred to Section IV.B, *Air Quality*, of the Draft EIR, which addressed air quality impacts with supporting data provided in Appendix E of the Draft

EIR. Pages IV.B-48 and IV.B-49 of the Draft EIR provide specific analysis of consistency with SCAG's 2016-2040 RTP/SCS growth projections based on quantified values. As analyzed therein, the Project's proposed 1,005 housing units would comprise approximately 0.9 percent of SCAG's estimated increase of households within the City at opening year for 2027. The Project's proposed 1,005 housing units would comprise approximately 0.4 percent and 0.3 percent of SCAG's 2040 estimated increase of households within the City. The Project would result in a slight increase in the number of employees on the West and East Sites of approximately 206 and 445 employees, respectively, and would comprise approximately 0.1 and 0.3 percent of SCAG's estimated increase of jobs within the City at opening year, respectively, and approximately 0.1 and 0.1 percent of SCAG's year 2040 estimated increase of jobs within the City, respectively. As such, the Project would have a very small effect on the overall housing and employment projections for the City and Hollywood area. Therefore, the Project's contribution to housing and employment would be consistent with SCAG housing and employment projections for the City. The increases in population, housing, and employment would, therefore, be consistent with SCAG's 2016-2040 RTP/SCS goals and would be consistent with the growth projections contained in SCAG's 2016-2040 RTP/SCS, which form the basis of the growth projections in the SCAQMD 2016 Air Quality Management Plan (AQMP). As such, the Draft EIR concluded that since the Project would be consistent with the 2016-2040 RTP/SCS, the Project would be consistent with the 2016 AQMD. As such, air quality impacts would be less than significant for assumptions and growth projections in the 2016-2040 RTP/SCS, which form the basis of the growth projections in the 2016 AQMP.

Comment No. ORG 44-58

- **The Project is not consistent with City Framework Element Policy 3.2.1 or 3.2.4.** Table LU-2 of Appendix J analyzes the Project's consistency with Framework Element Policy 3.2.1, which directs the City to provide for "a pattern of development consisting of distinct districts, centers, boulevards and neighborhoods that *are differentiated by their functional role, scale, and character.*" Yet here, the Project inserts two enormous high rise buildings in the middle of a smaller scale, historic neighborhood. Table LU-2 even admits that regional center neighborhoods, of which the Project site is a part, are characterized by buildings only six to 20 stories high, *while this Project proposes a high rise of 46 stories.* The analysis focuses on the fact that this Project, alone and unto itself, will provide a "center," but ignores the surrounding neighborhood, which is the focus of Policy 3.2.1. Similarly, Framework Policy 3.2.4 directs the City to "provide for the siting and design of new development that maintains the prevailing scale and character" of existing neighborhoods. The Project is inconsistent with this policy on the same grounds.

Response to Comment No. ORG 44-58

The comment asserts that the Project is not consistent with Framework Element Policy 3.2.1 or 3.2.4. The Draft EIR adequately evaluated the related objective, goals, and

policies in the Framework Element and correctly concluded that the Project would not conflict with the policies of this adopted plan. The comment cites only portions of the policies the commenter claims the Project would conflict with. The Project is compared to Framework Element Policies 3.2.1 and 3.2.4 in Table LU-2, *Comparison of the Project to Applicable Objectives of the General Plan Framework*, in Appendix J of the Draft EIR. Policy 3.2.1 states in full:

Provide a pattern of development consisting of distinct districts, centers, boulevards, and neighborhoods that are differentiated by their functional role, scale, and character. This shall be accomplished by considering factors such as the existing concentrations of use, community oriented activity centers that currently or potentially service adjacent neighborhoods, and existing or potential public transit corridors and stations.

The Project was determined to not conflict with Policy 3.2.1 because the Project would introduce high-density, mixed-use buildings and stand-alone senior residential housing that would be compatible within an area designated as a TPA and Regional Center. The Project is located in an area that is targeted for high-density growth on the Framework Element Land Use Diagram and a district that has been evolving into an increasingly mixed-use area. Typical characteristics and uses of a Regional Center are focal points of regional commerce, identity, and activity characterized by six to 20 stories (or higher) buildings, including mixed-use structures and multifamily housing (independent of commercial). The Project would include four new buildings constructed around the existing Capitol Records Complex and connected by a series of public open spaces on the ground level. The West Site would be developed with the 35-story West Building and 11-story West Senior Building and would contain ground floor open space, including the paseo, where visitors can view the Capitol Records Building. Under the Project, the East Site would preserve the existing Capitol Records Complex and include development of a 46-story East Building and 11-story East Senior Building and would provide distinct ground floor open space areas and amenities, including an outdoor performance area with a stage to host local acoustic performances. Shopping, outdoor seating, landscaping, open-air dining, public performances, art installations, and special events would be available in the East Plaza. The Project would provide higher density development and a broader range of uses on parcels primarily operated as surface parking, thereby creating a more concentrated, transit-oriented center and providing additional residential, commercial, open space and entertainment opportunities for residents, employees, and visitors to the Project Site.

Policy 3.2.1 does not dictate compatibility of building scale but recommends that new development be created in distinct districts that take into consideration existing concentrations of uses. The Hollywood and Vine area has been an iconic location with respect to the entertainment business, world-known, and originally (going back to the 1930s) one of the City's most concentrated high-rise districts. The Project would build upon this by modernizing the public element, introducing vibrant and notable architecture and tall buildings, and providing publicly accessible, landscaped open space and a paseo

linking three streets; thus, bringing greater distinction to an area that has been a tourist destination and commercial center for the City.

Policy 3.2.4 states in full:

Provide for the siting and design of new development that maintains the prevailing scale and character of the City's stable residential neighborhoods and enhance the character of commercial and industrial districts.

The Project was determined to not conflict with this policy because the Project Site is surrounded by residential, commercial, and mixed-use buildings that vary in building style and scale. The Project would be consistent with the on-going mixed-use redevelopment in the area and targeted growth policies applicable to Regional Centers and TPAs and would be sited and designed to enhance the character of the Regional Center mixed-use, commercial district. The Project is sited and designed to focus greater intensity development adjacent to Vine Street, with the 35-story West Building and 46-story East Building located toward the center of the development. The 11-story West Senior Building would be located at the corner of Ivar Avenue and Yucca Street and would provide a transition between the West Building and the lower-scale (one- to two-story) buildings located to the north across Yucca Street and west across Ivar Avenue. Under the Project, the 11-story East Site Senior Building would be located along Argyle Avenue, providing a transition from the East Building to the 18-story Argyle House located at the corner of Yucca Street and Argyle Avenue and the seven-story Eastown project located to the east across Argyle Avenue. While the West and East Buildings would have a substantially greater height and intensity than existing development in the area, the Project is consistent with the higher density, mixed-use redevelopment trend in Hollywood and would boost residential densities, significantly increasing housing opportunities in the Hollywood Community Plan area. The Project would also provide ground level dining and open space uses for residents, employees, and visitors. These ground level uses and the proposed mix of uses within the Project would increase the diversity of uses consistent with the Regional Center designation and would improve the pedestrian experience at the Project Site. The Project would enhance the urban character of the area, with an emphasis on activating Vine Street for pedestrians and bicyclists and create a stronger connection to the Hollywood Walk of Fame and Capitol Records Complex.

Policy 3.2.4 does not mean that buildings cannot be constructed taller than existing structures but that maintain the prevailing scale and character (in this case, a Regional Center) to prevent encroachment into stable neighborhoods. The Hollywood Commercial District went through decades of stasis, in which tourism and the vibrancy of the area declined. The current rejuvenation of interest in the area, with the concentration of development around the Metro B (Red) Line Hollywood/Vine Station, is consistent with designation of the Project Site as Regional Center. Although the Project is taller than adjacent development it would be consistent with the FAR for the Project Site provided by the zoning and Redevelopment Plan. The taller buildings and notable architecture

would also be consistent with the Hollywood and Vine location. Please also refer to Topical Response No. 4 – Aesthetics, regarding the issue of building scale.

Comment No. ORG 44-59

- **The Project is not consistent with Hollywood Redevelopment Plan Goals relating to the preservation of and adherence to architectural and urban design standards.** Table LU-4 of Appendix J considers whether the Project is consistent with the Hollywood Redevelopment Plan Goals. However, it is clear that the Project is not consistent with Goal 5(b), which directs the City to promote architectural and urban design standards, including standards for height and compatibility of new construction with existing structures. Here, the Project obliterates the FAR limitations of 3:1 and 2:1 on the Project site, and instead is requesting approval of a FAR limitation of 7:1. The Project is inconsistent with Goal 6, which requires the preservation of landmarks related to the entertainment industry, as indicated by the Project's dwarfing of the Capitol Records Building, and myriad adverse impacts on AMDA.

Response to Comment No. ORG 44-59

This comment asserts that the Project is not consistent with Hollywood Redevelopment Plan Goals relating to the preservation of and adherence to architectural and urban design standards. Pursuant to PRC Section 21099(d)(1) and City of Los Angeles Zoning Information File No. 2452 (ZI No. 2452), the aesthetic impacts, including impacts associated with scenic vistas, scenic resources, aesthetic character/conflicts with regulations governing scenic quality, and light and glare, of a residential, mixed-use residential, or employment center project on an infill site within a TPA shall not be considered significant impacts on the environment. As described in Chapter II, *Project Description*, of the Draft EIR, the Project meets these conditions, and, as such, aesthetic impacts associated with the Project would not be considered significant. Thus, evaluation of the Project's physical impacts associated with aesthetics is not required in the EIR and was provided in the Draft EIR for informational purposes only. The provisions of PRC Section 21099 are also discussed in detail in Section IV.A, *Aesthetics*, of the Draft EIR, and in Topical Response No. 4 – Aesthetics, above.

With regard to the Project's requested development incentives, including the FAR increase, the commenter is referred to Topical Response No. 5 – Land Use and Planning, which addresses the Project's updated list of requested entitlements and the Project's affordable housing obligations. As explained therein, the Project Applicant has revised the Zone and Height District Change request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25, and would seek Density Bonus Incentives and Waivers of Development Standards to allow for an increase in FAR pursuant to the State Density Bonus Law and the City's Density Bonus Ordinance. The proposed FAR of 7:1 would exceed the Project Site's existing zoning designation ("D" Limitation), which limits FAR to 3:1 for most of the Project Site and 2:1 FAR for one parcel.

With the inclusion of at least 10 percent of the base permitted units for Very Low Income households, the Project Applicant is entitled to two incentives and the Waiver of Development Standards¹⁰² for the requested increase in FAR (however, LAMC Section 12.22 A.25(c) requires the Applicant to provide at least 11 percent of the units as Very-Low Income to be eligible for the 35 percent FAR increase On-Menu Incentive).

Pursuant to the State Density Bonus Law, a city shall grant a density bonus, and, if requested by the applicant and consistent with the applicable requirements of Government Code Section 65915, incentives or concessions, and waivers or reductions of development standards. The State Density Bonus Law supersedes any local ordinances, including the “D” Limitations pursuant to Ordinance No. 165,659. Both the State Density Bonus Law and the City’s Density Bonus Ordinance permit the Waivers of Development Standards to the extent the Waivers are necessary to allow for the development of affordable housing.

The Project would not conflict with Goal 6 of the Redevelopment Plan since it would not directly or indirectly adversely impact the Capitol Records Building. It would preserve the well-known views of the Capitol Records Building from the eastbound US-101 and from the intersection of Hollywood Boulevard and Vine Street; it would create a publicly-accessible landscaped plaza around the Capitol Records Building to enhance public enjoyment of and access to the building; and it would be designed with distinctive architecture that is sensitive to the design theme of the Capitol Records Building. Please also refer to Topical Response No. 6 – Historical Resources for additional information regarding this historical resource.

Comment No. ORG 44-60

- **The Project is not consistent with Hollywood Redevelopment Plan Goals centered on supporting and promoting Hollywood as the center of the entertainment industry.** Table LU-4 of Appendix J assesses the Project’s consistency with goals aimed at protecting entertainment industry uses within the area. As described throughout this comment letter, AMDA is a key part of the entertainment industry in Hollywood, Los Angeles, and the country at large. Yet, this Project disrupts and nearly annihilates AMDA’s ability to continue providing theater, dance, film and art classes for the *next seven years*. Similarly, the Project is likely to have massive, and yet undisclosed, impacts on the Capitol Records Building located on the Project site. These negative impacts result in an inconsistency with Hollywood Redevelopment Plan goals centered on protecting Hollywood’s entertainment industry. These include, but are not limited to, Section 300, Goal 6 and Section 506.2.1(4).

¹⁰² Government Code Section 65915 (e)(2) states that that a proposal for the waiver or reduction of development standards shall neither reduce nor increase the number of incentives or concessions to which the applicant is entitled.

Response to Comment No. ORG 44-60

This comment asserts that the Project would not support or promote Hollywood as the center of the entertainment industry, as the Project would disrupt AMDA's ability to continue providing theater, dance, film and art classes for the duration of the Project construction. However, the comment does not explain how the Project's intermittent construction activities would disrupt AMDA's ability to continue providing theater, dance, film and art classes. Pedestrian and vehicle access to the AMDA site would be maintained, and construction activities would be intermittent and non-continuous adjacent to the AMDA's Vine Building campus. It would not adversely impact AMDA's Tower Building Campus, located to the north of Yucca Street. No encroachment into the AMDA property would occur. Furthermore, as shown in Table II-5, *Project Construction Schedule*, in Chapter II, *Project Description*, of the Draft EIR, demolition would occur over a period of two months, utilities and trenching would occur over a period of 0.5 months, site preparation would occur over a period of one month, grading and excavation (the greatest noise generator) would occur over a period of 11 months, foundation/concrete pour would occur over a period of 2 months, paving would occur over a period of 3 months. These activities, some of which would be overlapping would be the greatest relative to off-site annoyance. Architectural coatings and total building construction (which would have fewer noticeable off-site effects), would be completed in 15.5 months and 24.5 months, respectively. The period of time in which a construction activity would occur adjacent to AMDA's Vine Building campus would not approach the seven years cited in the comment. Although construction activities would create an intermittent annoyance, it is not anticipated to bring the AMDA campus to a close or permanently affect Hollywood's entertainment industry.

Comment No. ORG 44-61

- **The Project is not consistent with the objectives of the Hollywood Boulevard District.** The Hollywood Redevelopment Plan, section 506.2, identifies objectives for the Hollywood Boulevard District, within which the Project site is located. These objectives include assuring that "new development is sympathetic to and complements the *existing scale of development*." Here, the Project *dwarfs the existing scale of development* by several times, requests an increase in FAR from 3:1 and 2:1 to a massive 7:1, and is therefore inconsistent with these objectives.

Response to Comment No. ORG 44-61

This comment asserts that the Project is not consistent with the objectives of the Hollywood Boulevard District. As discussed in Table LU-4, *Consistency of the Project with Applicable sections of the Hollywood Redevelopment Plan*, the Project would not conflict with Policy 506.2(2) to "assure that new development is sympathetic to and complements the existing scale of development." As stated in the analysis, the Project is sited and designed to focus greater development intensity adjacent to Vine Street, with the 35-story West Building and 46-story East Building located toward the center of the development.

The 11-story senior residential building on the West Site would be located at the corner of Ivar Avenue and Yucca Street and would provide a transition between the West Building and the lower-scale (one- to two-story) buildings located to the north across Yucca Street and west across Ivar Avenue. The 11-story senior residential building on the East Site would be located along Argyle Avenue, providing a transition between the East Building and the 18-story Argyle House located at the corner of Yucca Street and Argyle Avenue and the seven-story Eastown project located to the east across Argyle Avenue. Because the Project's lower-height buildings would interface with surrounding lower density off-site buildings, with the focus of building height at the center of the Project Site, it would demonstrate sensitivity to the scale of the surrounding area and would not conflict with this policy.

The proposed building heights represent the Applicant's interest in maintaining the maximum ground level open space and paseo, which would have a public benefit and upgrade the character of the Hollywood and Vine location. The architectural style of the buildings would complement the architectural theme of the Capitol Records Building and upgrade the iconic Hollywood and Vine location. It is noted, also, that the historic buildings along Hollywood Boulevard were among the City's first high-rises dating to the early 1930s. At that time, these buildings created a strong architectural presence and represented ground-breaking ideas. With new buildings rising to 70 stories in downtown Los Angeles, the revitalization of Hollywood with new architecture up to 46 stories, landscaped plazas, and a two-block paseo and would help to maintain the iconic character and upgrade the quality of the Hollywood Boulevard and Vine Street locale. Also, please refer to Topical Response No. 4 – Aesthetics, for additional discussion of building scale.

Comment No. ORG 44-62

E. The Draft EIR's Traffic Analysis Fails To Account for the Capitol Records Lot Scenario, and Grossly Undercounts Traffic Generated By the Project's Outdoor Performance Venue.

Page IV.L-23 of the Draft EIR provides that the Project's outdoor performance space floor area was categorized as a "movie theater" in the City's VMT Calculator. The Draft EIR provides that "[b]ecause a movie theater is likely to draw from a larger area than a small outdoor space with smaller performances, this provides a more conservative VMT analysis." (Draft EIR, pp. IV.L-23 and -24) In fact, the opposite is just as likely to be true. Movie theaters, which are generally located throughout every urban and suburban area, are potentially less likely to draw from a large geographic area as compared to a performance space displaying a unique performance that is by its very nature not available to be viewed anywhere else at the same time. This could potentially generate much greater VMT than a movie theater.

The Draft EIR's characterization of the outdoor space as "small" and having "smaller performances," is likewise inaccurate. The outdoor performance space in question is 10,198 sf and described as being able to "host public acoustic performances by nearby

school and community music groups,” with a maximum attendance capacity of 350 people. (Draft EIR, p. II-58.) The Draft EIR further provides that performances will be limited to two per day, up to a total of 10 per week. (*Ibid.*) But no enforcement mechanism is proposed that would prevent this space from hosting a much larger number of people, and there is no indication how attendance could be capped effectively at 350 attendees. The outdoor performance space’s location in the center of Hollywood’s live entertainment district, blocks away from some of the City’s premier performance venues, makes the possibility of much larger events here a very real one.

Further, there are no project design features or mitigation measures proposed that would regulate or limit the types of performances to be held in this space. The Draft EIR provides that “performances would primarily consist of acoustic musical performances, plays or other theatrical performances, and outdoor fitness classes,” and that “each performance would be up to approximately one to two hours in duration[.]” (Draft EIR, p. II-59.) But without specific regulations that would enforce these limits, the Project essentially includes no limits on the types of performances.

The VMT Calculator included in Appendix D of the Draft EIR’s Appendix N, shows that the 10,198 sf of outdoor performance space with a maximum attendance of 350 people was calculated as a “movie theater” **of 175 seats**. The use of a 175 seat movie theater, when up to 350 people are anticipated to attend performances at the outdoor space, is nonsensical and renders the VMT analysis flawed and inaccurate.

Response to Comment No. ORG 44-62

The comment discusses the outdoor performance space and suggests the analysis was inadequate. The comment challenges the size, use, and analysis of the outdoor performance space.

There will not be amplified music, advertisements, or commercial acts at the outdoor performance space. The space is intended to be an amenity where ambient music can be played by live musicians. As discussed on pages II-58 and II-59 in Chapter II, *Project Description*, of the Draft EIR, the East Site Plaza Performance Stage would host public acoustic performances by nearby school and community music groups. It is not expected to be a regional draw and would provide opportunities for local activities, such as if a string quartet plays an afternoon at the Grove – the vast majority of people who stop to enjoy the music do not go to that site for the performance but would be able to enjoy it by virtue of patronizing another establishment or being a resident.

Based on this operation, the performance space would not be expected to draw from a large area and many of the spectators are expected to be walk-ins from surrounding uses in the Hollywood area. The trip generation estimates for the performance space were developed based on the types of performances anticipated for the site, the amount of physical space that will be available for performance watching (accounting for pedestrian circulation and walkways), and conservatively assuming the majority of the spectators would drive to the performance.

The VMT Calculator analysis accounts for 350 potential attendees. Since potential attendees may park in either the Project's East Site or West Site, 175 potential attendees were accounted for on each site and the 350 total potential attendees are fully accounted for in the VMT analysis, as shown on pages 30 and 31 and in Appendix D of the Draft EIR's Appendix N-1 cited by the comment.

While the specific types of performances by nearby school and community music groups may vary, as discussed on page IV.I-50 in Section IV.I, *Noise*, of the Draft EIR, the Project would implement design features for the East Site Plaza Performance Stage that would limit the volume of the performances to 85 dBA at 25 feet from the musicians (see Project Design Feature NOI-PDF-3: Outdoor Performance Sound Restrictions). As discussed on page IV.I-50 of the Draft EIR, noise level modeling was conducted for on-site noise from the East Site Plaza Performance Stage. The results of the modeling analysis are provided in Table IV.I-12 of the Draft EIR. As shown, the combined operational noise sources from the Project East Site and West Site inclusive of the noise from the East Site Plaza Performance Stage would not generate noise levels that would exceed 5 dBA above the applicable ambient noise level at noise receivers in the project vicinity.

Regarding the statement that there are no project design features or mitigation measures proposed that would regulate or limit the types of performances to be held in this space, this statement is incorrect. As stated above, noise levels associated with the performance space would be controlled through Project Design Feature NOI-PDF-3: Outdoor Performance Sound Restrictions. In addition, regarding the statement that no enforcement mechanism is proposed that would prevent this space from hosting a much larger number of people, and how attendance would be limited to 350 attendees, the number of occupants was calculated based on an occupancy load factor of 15 square feet per person for an assembly area without fixed seats, according to the California Building Code Table 1004.5 Maximum Floor Area Allowances Per Occupant as stated on page IV.I-35 in Section IV.I, *Noise*, of the Draft EIR. Furthermore, this discussion indicates that actual capacities for the Project outdoor spaces would be lower and, in some cases substantially lower, due to more detailed design considerations such as landscaped areas, planters, and designated walkways/throughways.

Comment No. ORG 44-63

F. The Draft EIR's Alternatives Analysis Must Include an East Site First Construction Alternative.

The Draft EIR must consider all reasonable alternatives that effectively reduce the Project's significant impacts, while still meeting most of the Project objectives. Here, the Project results in significant and unavoidable construction noise and vibration impacts to AMDA. However, beginning construction on the East Site, and then moving AMDA classrooms into empty retail shell space on the East Site while construction on the West Site commences would reduce these impacts. The Draft EIR provides no evidence that beginning construction on the East Site is infeasible, and the construction progression has no effect on whether the Project will meet the Project objectives identified in the Draft

EIR. Where a feasible project alternative, considerably different from others previously analyzed, would clearly lessen the significant environmental impacts of a project, but the project's proponents decline to adopt it, a Draft EIR must be recirculated. (State CEQA Guidelines, § 15088.5(a)(3).)

Response to Comment No. ORG 44-63

The comment asserts that the Draft EIR does not provide evidence the construction of the East Site first is not feasible and that the Draft EIR should include the commenter's preferred Alternative.

In Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR, additional analysis is provided to present the East Site commencing construction first. As provided therein, no substantially different impacts would occur, and no new significant impacts would occur from construction of the East Site first compared to construction of the West Site first.

With regards to the Draft EIR's alternatives, the commenter is referred to Response to Comment Nos. IND 8I-53 and ORG 44-6.

Nonetheless, Project alternatives were selected to reduce impacts related to the scale of the Project, reduce duration of the construction phase, or reduce impacts related to the Project's residential/mixed use. Alternatives included Alternative 2, Development under Existing Zoning Alternative (representing reduced scale); Alternative 3: Reduced Maximum Height Alternative (representing reduced height and view effects); Alternative 4: Office, Hotel and Commercial Alternative (representing a change in the mix of uses); Alternative 5: Proposed Community Plan Update Compliant Alternative (representing less change in entitlement and consistency with the Community's current planning policies); Alternative 6: Above-Grade Parking Alternative (to reduce the scale of excavation); Alternative 7: Primarily Office Alternative (representing a change in the proposed use); and Alternative 8: Office, Residential and Commercial Alternative (representing a change in the proposed use). The purpose of these alternatives was to determine whether any of these could change the impacts of the Project with respect to CEQA threshold standards.

All Alternatives constructed within the Project Site would result in significant and unavoidable noise and vibration impacts, which are based on maximum construction activity. Any construction activities are concluded to exceed threshold standards. The comment does not identify specific harm to AMDA beyond that which would also be experienced during any construction activities on the West Site. The temporary relocation of AMDA into the Project's commercial uses also does not rise to the level of an Alternative but suggests a mitigation that would favor only one of the off-site impacted sensitive uses. A large component of the AMDA campus is located to the north of Yucca Street, and AMDA could have a recourse that would not be available to residents who would also be impacted by construction noise. AMDA is free to discuss any process that would provide relief from the Project's construction noise impacts. However, the Project's exclusion of this procedure as a Project Alternative does not mean that the Draft EIR does

not adequately evaluate a range of Alternatives to reduce the Project's impacts. As the Draft EIR evaluated a range of Alternatives consistent with the requirements of CEQA Guidelines Section 15088.5(a)(3), a recirculation of the Draft EIR is not warranted.

Comment No. ORG 44-64

III. CONCLUSION

Again, AMDA appreciates the opportunity to review and comment upon the proposed Project and Draft EIR. We are hopeful that AMDA's concerns can be addressed through the administrative process alone, and appreciate the City's careful consideration of the above issues. Should you have any questions concerning the contents of this letter, or the potential impacts of the proposed Project on AMDA, please reach out to discuss as soon as possible.

Response to Comment No. ORG 44-64

The comment concludes the commenters review of the Draft EIR and expresses the commenter's interest in an administrative process to address AMDA's concerns. As the comment does not identify any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. ORG 44-65

Exhibit A: City of Los Angeles Board of Building and Safety Commissioners, Notification for Mandatory Compliance with Seismic Retrofit Ordinance No. 183893, dated March 21, 2017.

Exhibit B: Corrected Appeal Transmittal to City Council from EMI Music North America and Jim H. McQuiston, dated March 1, 2008.

Exhibit C: Reuters, Proposed development near Capitol tower raises furor, June 22, 2008.

Response to Comment No. ORG 44-65

This comment provides exhibits that are referenced in the comment letter. Response to Comment No. ORG 44-34 addresses the concerns of the commenter regarding providing seismic retrofit to AMDA's buildings (Exhibit A). With the implementation of Mitigation Measure NOI-MM-4, no structural damage would be unmitigated and seismic retrofitting of AMDA's buildings would be necessary. The other exhibits comprise a 2008 appeal to City County by EMI and Jim H. McQuiston and a 2008 news article regarding the prior Millennium project, addressed under Response to Comment Nos. ORG 44-7, ORG 44-9, and ORG 44-10, above. The latter exhibits are not related to the Project or to the content or adequacy of the Draft EIR and, as such, no further response is warranted.

Comment Letter No. ORG 45

John Given, Vice President
The Federation of Hillside and Canyon Associations, Inc.
P.O. Box 27404
Los Angeles, CA 90027
Received June 1, 2020

Comment No. ORG 45-1

Attached please find a comment letter from the Federation of Hillside and Canyon Associations, Inc. regarding the above- captioned Hollywood Center project DEIR.

Please ensure a copy is placed in the project record and the Hillside Federation receives all notices associated with the project.

Response to Comment No. ORG 45-1

This comment is an introduction to an attached letter. Responses to the referenced letter are provided below in Response to Comment Nos. ORG 45-2 to ORG 45-11. A copy of this letter will be provided in Appendix A in this Final EIR. As requested, the commenter will receive all notices associated with the Project.

Comment No. ORG 45-2

The Federation of Hillside and Canyon Associations, Inc., founded in 1952, represents 44 homeowner and resident associations with approximately 250,000 constituents spanning the Santa Monica Mountains.

Response to Comment No. ORG 45-2

This comment provides an introduction to the commenter's organization, The Federation of Hillside and Canyon Associates, Inc. However, the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. ORG 45-3

This letter supplements previous objections the Hillside Federation has already submitted to the record with respect to the City's stubborn refusal to use its broad discretion and common sense to extend the public comment period for the above-captioned Draft EIR for the Hollywood Center Project. In addition, this letter will serve to underline issues of great concern of several of our constituent member organizations, which we hope the City will adequately address. This letter is obviously not intended to serve as an exhaustive review and analysis of the project.

Indeed, because we have not had adequate time or ability to undertake our own detailed review of the project environmental document due to the COVID-19 pandemic, we

reserve our right to raise any issue or objection raised in any other submissions to the environmental record as if fully set forth herein.

We also note for the record that our and our members' communications with staff members of Council District 4 show CD4 staff have repeatedly deferred to Council District 13 staff, and presumably Councilmember O'Farrell, with respect to whether the public comment period should be extended. The City of Los Angeles is the lead agency for this project, not CD13 staff, and not Councilmember O'Farrell. We find it highly inappropriate for one Councilmember and his staff to be delegated such an important decision that will cause the City to significantly limit public participation during the highly unusual circumstance of the global COVID-19 pandemic we all are currently living through.

Moreover, there appears to be confusion by CD4 staff, and perhaps others, as to whether the City even has discretion to extend. Planner Nguyen has repeatedly asserted in responses to requests for extension that: "Per CEQA Guidelines Section 15105, the public review period for a Draft EIR should not be less than 30 days nor should it be longer than 60 days, except under unusual circumstances."¹ That states the general rule, but denies that our current circumstance is in any way unusual. But in an email between CD4 Field Deputy Madelynn Taras and Tom Davila, president of Outpost Neighborhood Association, Ms. Taras suggests that both her office and the office of Council District 13 are under the false impression that the City has limited discretion to extend the comment period and even that they have been directed by a state agency not to extend EIR review timeframes. Ms. Taras states:

Given that CD13 is the lead office on this project our office will be deferring to them on the DEIR timeframe. I did speak to my counterpart at CD13 and he indicated that **the directives from the state Planning office is also not to extend EIR review timeframes** so that's what they'll be working off of.²

But there is no evidence that any state agency has so advised or directed the City not to extend this comment period, and such advice would be improper, given that the lead agency has broad discretion in these matters. This was made extremely clear in a communication the Hillside Federation already shared with the City regarding this project on Friday, May 29, 2020. Jeannie Lee, Chief Counsel of the Governor's Office of Planning and Research, the state agency charged with direct oversight of the California Environmental Quality Act. Ms. Lee wrote to the Hillside Federation to explain:

We agree that public review of projects is an important part of the CEQA process. **CEQA provides a floor and not a ceiling for the deadlines for public review and comments.** Accordingly, **public agencies may use their discretion to extend the time for public review and comment.** We have included language on our website making that clear.³

Since the apparent basis for the City's refusal to extend the comment period appears to be based on the delegation of this decision to the Council District 13 office, and the CD13 office decision is apparently based on the legally specious premise that a state agency

directed the City that it could or should not extend the comment period here, as part of the City's responses to public comment in the Final EIR for this project we demand to know which Council District 13 staff member(s) received advice from a state agency directing it not to extend the period for review and comment, which agency issued the advice, and the specific language of the advice or directive received. It is nonsensical and outrageous that such a massive project, with a more than 12,000-page Draft EIR would not have a period for review and comment longer than 45 days.

Footnote 1: See, e.g., email from Mindy Nguyen to Mary Ledding, May 5, 2020, available at:

[https://planning.lacity.org/eir/HollywoodCenter/Deir/ELDP/\(H\)%20Remainder%20of%20Administrative%20Record/Public%20Comments/Public%20Correspondence/20200511%201819%20M.%20Ledding%20HC%20Request.pdf](https://planning.lacity.org/eir/HollywoodCenter/Deir/ELDP/(H)%20Remainder%20of%20Administrative%20Record/Public%20Comments/Public%20Correspondence/20200511%201819%20M.%20Ledding%20HC%20Request.pdf).

Footnote 2: See email exchange between and among Tom Davila (President Outpost Neighborhood Association), Madelynn Taras (CD4), and Marian Dodge, Chairperson of the Hillside Federation, May 31, 2020 and June 1, 2020, attached as an exhibit to this letter.

Footnote 3: The email from Ms. Lee is found in the Hillside Federation's May 29, 2020 submission.

Response to Comment No. ORG 45-3

The comment expresses opposition to the Project based on the City's decision to keep the public review period at 47 days and the Council District 4 staff's deferral to Council District 13. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review. As stated therein, the Draft EIR public review period began on April 16, 2020 and ended on June 1, 2020, which provided a review period that met requirements pursuant to CEQA Guidelines Section 15105(a). The public circulation period for the Draft EIR complied with the minimum 45 days required by CEQA Guidelines Section 15105(a) for Draft EIRs submitted to the State Clearinghouse for public review by State agencies. The decision for Council District 4's staff to defer to Council District 13's staff is not a CEQA issue and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. ORG 45-4

The remainder of this letter is intended to underline issues of concern raised by some of our member organizations and other community groups concerned about the obvious significant environmental impacts of this project.

Response to Comment No. ORG 45-4

Responses to the referenced letter are provided below in Response to Comment Nos. ORG 45-5 to ORG 45-11.

Comment No. ORG 45-5

Several member organizations and other community groups have expressed concern that the DEIR is inadequate in determining that impacts on police and fire services will not be significant. The Beachwood Canyon Neighborhood Association is extremely concerned, due to its proximity to brush and wildland areas of the eastern Santa Monica Mountains, that emergency response times will be negatively impacted by the project and current evacuation planning for their community will no longer be adequate due to the project. The DEIR does not adequately address those issue.

The submission made by United Neighborhoods for Los Angeles raises the concern that the population estimates used by the DEIR are not accurate. The City has variously used 165,000 and 300,000 as the population number for this part of the City. Any public services impacted by this broad discrepancy must be addressed in the Final EIR so that members of the public and City decision makers understand the significant project impacts to police, fire, and other services.

Response to Comment No. ORG 45-5

The comment expresses concern that the Draft EIR inadequately analyzed the Project's impact on public services (i.e., police and fire services). Fire and police services impacts were addressed, respectively, in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, with supporting data provided in Appendix M of the Draft EIR. Pursuant to the CEQA Guidelines and the thresholds used by the City to determine the significance of impacts to fire and police services, the focus of the analyses is on whether or not new or expanded facilities are needed to maintain adequate public service and whether a potential physical impact could occur if construction of facilities was warranted. In the case of the Project, it was determined that the Project would not generate a demand for additional police and fire protection services that would result in the need for new or expanded fire and police services facilities. As such, Sections IV.K.1 and IV.K.2 of the Draft EIR concluded that impacts to fire and police services, respectively, would be less than significant.

In regard to emergency response, Section IV.F, *Hazards and Hazardous Materials*, analyzed whether the Project would impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. As analyzed therein, these impacts would be less than significant. None of the streets adjacent to the Project Site are designated disaster routes or City-selected disaster routes. Further, as discussed on pages IV.K.1-17 and IV.K.1-18 in Section IV.K.1, *Fire Protection*, the Draft EIR included an evaluation of response distance and emergency access. As analyzed therein, despite the Project increase in traffic, the Project would not significantly impair the LAFD from responding in a timely manner to emergencies at the

Project Site or the surrounding area. In regard to increases in traffic in hillside areas, as part of the non-CEQA analysis in the Transportation Assessment (TA) in Appendix N-1 of the Draft EIR conducted in response to the City's Transportation Assessment Guidelines (TAG), the TA evaluated the potential for the Project to create excessive burdens on the residential street segments of Argyle Avenue, Vista Del Mar Avenue, and Carmen Avenue north of Franklin Avenue. With application of the City's evaluation criteria for residential streets, none of these streets were determined to be excessively burdened by the addition of Project traffic (see pages 109 through 127 of the TA). Also refer to Response to Comment No. ORG 40-6 above.

With regards to concerns over the populations estimates raised by United Neighborhoods for Los Angeles, refer to Response to Comment No. ORG 16B-4.

Comment No. ORG 45-6

Transportation planning for the project clearly raises potentially significant environmental impacts, and our affected members and other community organizations do not believe they are adequately addressed. There are several impacted intersections with significant impacts, on- and off-ramps to the 101 Freeway are significantly impacted, and as a traffic report submitted by KOA on behalf of our member Oaks Homeowners Association shows, there are at least two projects that were listed on the cumulative impact list for the DEIR whose contributions to the roadway analysis were apparently elided, causing that analysis to be insufficient. Beachwood Canyon Neighborhood Association has noted there is already parking overflow in the lower part of its canyon neighborhood from existing projects, and their local expert opinion is that this project will exacerbate parking demand and cause an even greater impact than at current. This will especially be true during the project construction period when it is unclear where temporary parking for the Capitol Records building and parking lot will be located. The DEIR should be revised to address these concerns.

Response to Comment No. ORG 45-6

The comment expresses opposition to the Project based on its potential to cause traffic impacts. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

The comment references a traffic report prepared by KOA that is provided in Comment Letter IND 8I. Responses to this attachment are provided in Response to Comment Nos. IND 8I-74 to IND 8I-78.

The comment also expresses opposition to the Project based on parking issues experienced in the surrounding community. The concern of CEQA is the effect of the Project on existing conditions, not to resolve existing conditions. It is noted in Chapter II, *Project Description*, of the Draft EIR, however, that the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required

by the LAMC (i.e., 1,513 spaces), to adequately serve the Project. Development of the Project is not anticipated to worsen the existing conditions described in the comment. Furthermore, as the Project Site is located within a TPA, parking impacts would not be considered significant under CEQA.

Comment No. ORG 45-7

Many of our member organizations are understandably concerned that the City is repeating the catastrophic mistake of allowing residential and other structures to be built directly atop an existing earthquake fault with this new project iteration. We believe the information provided in the DEIR regarding this issue is inadequate to conclude that it is safe to allow construction of massive buildings atop the fault zone. Since the previous project at this site by the same developer should be considered as part of the record of this case, we draw your attention to any and all objections made with respect to the earthquake fault zone issue in that record, and also to any comments that may be submitted by others on this topic now.

Response to Comment No. ORG 45-7

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

The comment expresses opposition to the Project due to the Project Site's location relative to an earthquake fault (the Hollywood Fault). Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D of the Draft EIR concluded that geology impacts, including fault-related impacts, would be less than significant and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. ORG 45-8

Several of our members raised the concern that the environmental documents shared with the public are corrupted and illegible and they have therefore been unable to understand the record sufficient to make intelligible comments. In particular, we note that all of the plates in the Appendix G-1 related to project-site Geology are corrupted and unclear. On this basis alone, the DEIR must be corrected and recirculated since the earthquake issue above relies heavily on this appendix.

Response to Comment No. ORG 45-8

This comment states that a full and complete Draft EIR was not released to the public as some of the figures in Appendix G included square boxes. Refer to Response to Comment No. 8H-3, which addresses this comment.

Comment No. ORG 45-9

We also note that the project is not consistent with the Hollywood Community Plan. It requests an almost 7:1 Floor Area Ratio, when the local planning permits at most a 6:1 ratio. Some members have expressed concern that the calculations used to determine the actual Floor Area Ratio do not comply with normal City procedures. The DEIR should make the process by which it determined the FAR clear, and it should conform precisely to required City procedures.

In addition, member organizations have pointed out that the D Limitations currently imposed at the site are being improperly removed, since they were put in place as an environmental mitigation. This may require further study and consideration by the City in a revised DEIR to ensure the City and applicant are complying with all legal requirements.

Response to Comment No. ORG 45-9

This comment asserts that the Project is not consistent with the Hollywood Community Plan by requesting an almost 7:1 FAR and that the removal of the “D” Limitation is improper since the commenter asserts that it was put in place as an environmental mitigation. With regards to the Project’s FAR, the commenter is referred to Topical Response No. 5 – Land Use and Planning, which explains the Project’s requested entitlements to obtain the proposed FAR. As discussed, therein, the Project would be allowed to exceed 6:1 FAR under the previously requested affordable housing incentive pursuant to LAMC Section 11.5.11(e), described throughout Chapter II, of the Draft EIR, with the provision of a minimum of 11 percent Very Low Income residential units. The Project Applicant has revised the request for the proposed Zone and Height District Change to allow, under a Measure JJJ concession pursuant to LAMC Section 11.5.11(e), an FAR increase up to 7:1, as presented in Chapter II, Project Description, of the Draft EIR, to a Density Bonus Compliance Review pursuant to the State Density Bonus Law and the City’s Density Bonus Ordinance. Both the State Density Bonus Law and the City’s Density Bonus Ordinance permit the Waivers of Development Standards to the extent the Waivers are necessary to allow for the development of affordable housing. With the inclusion of at least 10 percent of the units for Very Low Income households, the Project Applicant is entitled to two incentives and the Waiver of Development Standards.¹⁰³ However, LAMC Section 12.22 A.25(c) requires the Applicant to provide at least 11

¹⁰³ Government Code Section 65915 (e)(2) states that that a proposal for the waiver or reduction of development standards shall neither reduce nor increase the number of incentives or concessions to which the applicant is entitled.

percent of the units as Very-Low Income to be eligible for the 35 percent FAR increase On-Menu Incentive.

Pursuant to State Density Bonus Law and in conjunction with the requested Density Bonus Incentives and Waiver of Development Standards, the Project is not inconsistent with the zoning on the Project Site, inclusive of the “D” Limitation. In addition, the Project’s updated list of entitlements includes removal of the CUP for a Unified Development and, instead, requests approval of a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25, with an Off-Menu Incentive to allow FAR and density averaging across the Project Site. With regard to the assertion that the “D” Limitation is an environmental mitigation measure, the commenter is referred to Response to Comment No. IND 8I-31, which explains that neither the Hollywood Community Plan nor the Hollywood Redevelopment Plan identify the “D” Limitation as a CEQA mitigation measure.

Comment No. ORG 45-10

Based on all of the above and on review of several submissions to the project and the project DEIR, it is our conclusion that it is premature for the environmental process to move forward toward a Final EIR while there are so many significant procedural concerns and where additional public comment at this early stage would provide for a better decision making process. The Draft EIR should be revised and re-circulated taking into account the many concerns raised above as well as those raised in other submissions. Such an approach would be more consistent with the highest standards of public participation in the environmental review process than the rushed review and comment period that has been provided to this point.

Thank you for the opportunity to comment.

Response to Comment No. ORG 45-10

This concluding comment is noted. Refer to Response to Comment Nos. ORG 45-3 to ORG 45-9 for responses to address the issues raised in this comment. As this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Comment No. FORM 1-1

I am writing today to support the proposed Hollywood Center project. After reviewing the proposal and its Draft Environmental Impact Report, I'm convinced that this project will address the needs of Los Angeles all while minimizing impacts and providing a beautiful, architecturally significant centerpiece for the Hollywood community.

Most importantly, this project is providing a game-changing amount of both market-rate and rent-restricted affordable housing for our community. Los Angeles has proven itself a world-class city time and again, and more people will continue to want to call Los

Angeles home. The best way to address the persistent housing shortage that afflicts not just the Los Angeles region, but the entire state of California is to build more housing. This project does that, and most importantly it does that with inclusionary housing that will be set aside for very low- and extremely low-income seniors. At 133 units and over 15% of the project, both the number and percentage of these affordable units set a new standard for developments in Los Angeles. The commitment this project makes to our at-risk seniors is exemplary.

By certifying Hollywood Center as an Environmental Leadership Development Project, our Governor has ensured that we will be getting the greenest possible project. The criteria for ELDP status are stringent and guarantee that this project will have no net new greenhouse gas emissions. Sustainable development is the responsible way to plan for our future. And from an environmental perspective, the location of this project steps away from the Hollywood/Vine subway is exactly where we want new housing to be built. If we want to reduce our carbon footprint, reducing driving is the only way to bring about real change. We need more projects like this in the areas of the City well-served by transit. The commitments made by Hollywood Center to build green and build sustainability represent the gold-standard in green building.

The over \$1 billion in economic investment for Hollywood represents one of the largest private investments for the area. Thousands of prevailing wage jobs will be created, both during construction and once the project opens. Especially now, investment in our community is vital to creating jobs. And with unemployment increasing at historically high rates, these jobs are sorely needed. It was recently reported that less than half of Los Angeles County residents currently have jobs, with that number continuing to grow. Hollywood Center's positive impacts on job creation will make a meaningful difference for thousands of Angelenos currently out of work.

I support the project in general but am particularly excited about the following features:

SITE IMPROVEMENT:

The plans for the Hollywood Center project represent an incredible upgrade for the property. All that exists at the site today are surface parking lots. With this proposal comes incredible offerings that will create more positive impacts on Hollywood than any proposal to date. Residential living will be provided for various income levels. Beautiful architecture will complement and enhance the Capitol Records building. Commercial offerings will populate the ground floor, offering neighborhood-serving restaurants and stores. And the community will get nearly one-acre of open space designed by the landscape architects responsible for the High Line in New York City.

BICYCLE INFRASTRUCTURE:

I appreciate that this project is truly committed to transforming Los Angeles into a bike-friendly City. We have perfect weather and mostly flat ground, there is no reason LA cannot be a great place to ride your bike. Sadly that is not the current state of things, but

with projects like this that focus on bicycle infrastructure and cater to the needs of commuting cyclists, we can achieve a new cycling reality in LA where a car is not necessary.

HISTORIC PRESERVATION:

Capitol Records is one of the most iconic buildings in all of Los Angeles, if not the world. By making the Capitol Records Building the focal point of the project, Hollywood Center meshes old and new seamlessly. This is how historic preservation should be done – the old being preserved and honored, and the new giving respect to the old while at the same time boasting an elegance in and of itself.

PEDESTRIAN ACTIVATION

At street level, Hollywood Center calls for 30,000 square feet of shops and restaurants, linked by a pedestrian paseo running east to west between Argyle Avenue and Vine Street. Combined with the revisioning of Hollywood Boulevard, the project's ample public space will create a walkable Hollywood, one that offers a pedestrian-friendly experience for locals and visitors alike. Additionally, this public space will be designed by the Field Operations, the same landscape designers who created the High Line in Manhattan. This space represents a commitment to Hollywood's pedestrian experience while simultaneously incorporating future elements of the Walk of Fame Master Plan.

Overall, Hollywood Center is an exemplary project. I support Hollywood Center, and I urge you to move this project forward without any delay.

Response to Comment No. FORM 1-1

The comment expresses support for the Project. However, the comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

This comment letter, with some minor non-substantive comment variations, was submitted by the individuals listed above. Copies of the individual letters are included in Appendix A in this Final EIR.

Comment No. FORM 2-1

I am writing to express my support for the proposed Hollywood Center Project.

As a certified Environmental Leadership Development Project (ELDP), Hollywood Center has committed to building a project that is carbon net-neutral both during construction and through operation. Hollywood Center will qualify as a LEED Gold project by providing environmentally sustainable design. Located 600 feet from the Hollywood and Vine Red Line station, the project is able to build around the use of mass transit, allowing residents, locals and visitors the opportunity to access Hollywood and other parts of Los Angeles without the need for an automobile.

Most important, this project speaks to the city's paramount needs including the need for jobs and housing, especially affordable housing for older adults. Average monthly income from Social Security alone puts most seniors very close to the federal individual poverty level. Even the maximum benefit -- which is very difficult to obtain -- nets an annual income that is far below the cost of a decent living in many larger cities.

The World Health Organization has identified Eight Domains of Livability that influence the quality of life for older adults. These domains include: Outdoor Spaces and Buildings, Transportation, Housing, Social Participation, Respect and Social Inclusion, Civic Participation and Employment, Communication and Information, Community and Health Services.

Hollywood Center would provide older adults with access to these domains, by allowing future residents the opportunity to live in a vibrant community that provides access to essential resources such as convenient transportation options, well-designed pedestrian experiences, and access to world class healthcare all within a short subway ride from their home.

Hollywood's future residents will depend on this project. Just because they are not here now, we cannot ignore their voice. We must not continue to think that the Los Angeles planning of old will be the answer for the problems we will face tomorrow, or even now.

For these reasons I support Hollywood Center, and I urge you to move this project forward without any delay.

Response to Comment No. FORM 2-1

The comment expresses support for the Project. However, the comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. FORM 3-1

I am a [resident/homeowner] at the Broadway Hollywood Building Stakeholder and Historic Resource: The building and sign are a LA Historical-Cultural Monument and the building is a contributor to the Hollywood Blvd Commercial and Entertainment District with its primary entrance now located at 1645 Vine Street, at the corner of Hollywood Blvd. The building is identified in the EIR as: 6300 Hollywood Boulevard (B.H. Dyas Department Store Building/Broadway Department Store), Map No. B.12.

Response to Comment No. FORM 3-1

This introductory comment includes reference to the residents' building as a City Historical-Cultural Monument and a contributor to the Hollywood Boulevard Commercial and Entertainment District, which was identified and evaluated in the Draft EIR as 6300 Hollywood Boulevard (B.H. Dyas Department Store Building/Broadway Department Store), Map No. B.12. As this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Comment No. IND FORM 3-2

I am shocked that the EIR was released on April 15, in the middle of a pandemic, with only a 45-day comment period. To expect me to review a 1500-page document in the middle of a Shelter at Home order that has completely disrupted my daily life is clearly inappropriate. My review has necessarily been limited by this administrative failure.

Response to Comment No. IND FORM 3-2

The comment objects to the timing of the 47-day Draft EIR public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review.

Comment No. IND FORM 3-3

The EIR fails to adequately examine the very negative aesthetic impact of the Hollywood Center. Its two gigantic skyscrapers irreversibly damage the integrated visual look of the Hollywood area from whatever direction you look. Additionally, an iconic feature of Hollywood is the Broadway Hollywood sign, which can be viewed by cars on the 101 Freeway as they enter Hollywood. This view will be lost. The aesthetic damage is equally severe at the Broadway Hollywood (and neighboring buildings), since the Hollywood Center will block views of such Hollywood landmarks as the Hollywood Sign and the Griffith Park Observatory, diminishing the aesthetic and cultural significance of the building.

Response to Comment No. IND FORM 3-3

The comment expresses opposition to the Project based on its size and scale relative to the Hollywood community, and its negative aesthetic impact, including blocking views of the B.H. Dyas Department Store Building/Broadway Department Store (Broadway Hollywood Building) and sign, neighboring buildings, and the Hollywood Sign and Griffith Park Observatory, while diminishing the aesthetic and cultural significance of the building. Aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. Specifically, potential effects on views of the Broadway Hollywood Building sign and views to the Hollywood Sign were evaluated on page IV.A-42 and shown in Figure IV.A-14, Key View 8 - Existing and Simulated Views of the Project Site from Just West of the Intersection of Sunset Boulevard and Ivar Avenue, on page IV.A-44 in Section IV.A, *Aesthetics*, of the Draft EIR. As further described in the analysis, the rooftop Broadway Hollywood Building sign is shown in the foreground of the Project Site in Figure IV.A-14, and, as such, the Project would be a background feature with respect to this and other signage along Hollywood Boulevard and would not reduce the importance of any signs as contributors to the aesthetic character of the Hollywood Boulevard Commercial and Entertainment District.

Regarding views from the US-101 and of the Broadway Hollywood Building sign, see page IV.A-36 of the Draft EIR, which discusses east and westbound views from the freeway of areas of Hollywood in and around the Project Site. Although effects on views of more prominent features, such as the Capitol Records Building and the Knickerbocker Building rooftop sign are the primary focus of the discussion, visual effects on the Broadway Hollywood Building sign are expected to be similar but less affected by the

Project. As stated in the analysis, the limited and transient nature of view blockage associated with the Knickerbocker Building rooftop sign and the view corridor that would highlight views of the Capitol Records Building, the Project as viewed from this location would not substantially block focal views of the Capitol Records Building or other scenic features in the urban setting. Therefore, the Project would also not substantially block focal views of the Broadway Hollywood Building sign. Accordingly, impacts to views of the Broadway Hollywood building and sign from US-101 and other vantage points would be less than significant.

Regarding views of the Hollywood Sign, as discussed on page IV.A-58, because the street corridors with views toward the Project Site do not include prominent or significant views of the Hollywood Sign, the Project would not have the potential to substantially block any significant existing views of the Hollywood Sign. Further, and as also applicable to views of the Griffith Park Observatory, with limited available views of the Hollywood Hills through nearby street corridors or across the Project Site, the Project would not block any significant existing views of the Hollywood Hills through street corridors. Regarding view concerns pertaining to views from private residences, as stated on page IV.A-26, the focus of the view analysis is on views from public vantage points, which is consistent with CEQA and City practice. Under the City's 2006 L.A. CEQA Thresholds Guide, an office building or private residence would not be considered a viewing location since views of broad horizons, aesthetic structures, and other scenic resources would not be available to the public. In addition, the California courts have routinely held that "obstruction of a few private views in a project's immediate vicinity is not generally regarded as a significant environmental impact."¹⁰⁴

Regarding effects on the cultural significance of the Broadway Hollywood Building and other buildings within the Hollywood Boulevard Commercial and Entertainment District, because of the Project's proximity to the District, potential impacts were evaluated in Draft EIR Section IV.C, *Cultural Resources*, and in the Historical Resources Technical Report, provided in Appendix F of the Draft EIR. As shown in Figure IV.C-1 on page IV.C-14, in Section IV.C, *Cultural Resources*, of the Draft EIR, and as shown in Figure C, on page 111 of the Historical Resources Technical Report included in Appendix F of the Draft EIR, the Project Site is not located within a designated or identified historic district. However, the potential for indirect impacts on the Hollywood Boulevard Commercial and Entertainment District—including effects associated with building heights and integrity, including potential impacts to Broadway Hollywood Building — were fully evaluated in the Draft EIR. See pages IV.C-71, and pages IVC-77 through IVC-79 in Section IV.C, *Cultural Resources*, of the Draft EIR, and pages 122 through 125, in Appendix F, of the Draft EIR. The analyses provided therein stated in part that despite introducing substantial new height to the skyline, new construction would not result in significant adverse effects to the District as the immediate setting of the District would not be altered, and the area surrounding the District has been characterized by juxtapositions between building

¹⁰⁴ *Banker's Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App. 4th 249, 279.

heights since the prevailing height limit of 150 feet was removed in Hollywood in the late 1950s. The analysis also states that features important to the significance of the District are largely contained within and are best experienced within the District and that new construction associated with the Project would not interrupt the configuration of buildings, their spatial relationships to each other, or their relationship to the street that characterize the District as it is experienced. Therefore, the Project would not affect the cultural significance of the Broadway Hollywood Building and other buildings within the Hollywood Boulevard Commercial and Entertainment District.

See also Topical Response No. 4 – Aesthetics, and Topical Response No. 6 – Historical Resources, above.

Comment No. IND FORM 3-4

Perhaps most importantly, the EIR is completely deficient in its conclusion that the Hollywood Center will have no significant transportation impact. Before the pandemic traffic was jammed at the Hollywood/Vine intersection. This has been exacerbated by the recent installation of a four-way walk sign (which was not taken into account in the EIR). Traffic will be even worse in future years since diminished ridership on public transportation will result from concerns over the spreading of infectious diseases in crowded spaces. Neither of these factors is considered in the EIR.

The Broadway Hollywood will be particularly negatively impacted because its only entrance is a narrow alley that can be entered only by going south on Vine past Hollywood Blvd and then turning right. The increase in traffic at the Hollywood/Vine intersection will make it even more difficult to enter our building.

Notwithstanding this, the EIR reaches the ridiculous conclusion that the Hollywood Center Project will result in no increased traffic. I am shocked by this conclusion and request that the traffic study be redone appropriately.

Response to Comment No. IND FORM 3-4

The comment expresses general opposition to the Project based on its potential to cause traffic impacts and asserts that the Project's traffic at the Hollywood/Vine intersection will make it more difficult to enter the Broadway Hollywood Boulevard building. However, the Project would not change the direct access to the Broadway Hollywood Building. In addition, the Draft EIR does not state or imply "that that the Hollywood Center Project will result in no increased traffic." Draft EIR Section IV.L, *Transportation*, Subsection 3(b)(2) makes clear that the methodology used to address traffic impacts as they relate to Vehicle Miles Traveled (VMT), the quantitative metric used to assess traffic impacts, accounts for the Project's daily trips as a component of the VMT Calculator. Accordingly, the Project would increase traffic trips compared to existing on-site conditions; however, based on the City's CEQA Transportation Thresholds as shown on page IV.L-19 of the Draft EIR, transportation impacts would be less than significant. See also see Topical Response

No. 2 – Transportation and Traffic, above, for additional details on the transportation impact analysis and findings in the Draft EIR.

The comment states that the Transportation Assessment contained in Appendix N-1 to the Draft EIR did not consider the diagonal “scramble” crosswalk. In regards to the scramble phase and no right turn on red signing implemented by the City at the Hollywood Boulevard/Vine Street intersection, the Critical Movement Analysis (CMA) methodology and intersection analysis sheets that contain the analysis results do not have an input that allows for the selection of a scramble phase. However, to account for observed conditions at this location, the minimum intersection capacity allowed by the CMA methodology was decreased and the level of service (LOS) tables accurately identify this as a location that is operating at a LOS F due to congestion in the area. As acknowledged in the comment, this pertains to the level of service analysis, which is not a CEQA metric used to determine significant transportation impacts. In regards to the Project increasing congestion, the Transportation Assessment in Appendix N-1 of the Draft EIR acknowledged that over-capacity conditions and poor levels of service are anticipated at this intersection both without and with the Project and that the projected V/C ratios would be increased with the Project, indicating additional congestion. For additional detail regarding analysis of the “scramble” crossing at the Hollywood/Vine intersection please see Response to Comment No. IND 8I-67.

The comment also states that the traffic analysis did not account for the effects of COVID-19 and the potential for diminished use of public transportation. However, CEQA does not require analysis of speculative conditions related to the potential for diminished use of public transportation. Pursuant to CEQA Guidelines Section 15143, “[t]he significant effects should be discussed with emphasis in proportion to their severity and probability of occurrence.” Furthermore, CEQA Guidelines Section 15064(d)(3) states that “[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable.” Therefore, forecasting the impact of COVID-19 on traffic conditions, particularly the public’s use of public transit during future Project operations is speculative. In addition to being speculative, COVID-19 is not a project or, more specifically, a component of this Project. Rather, COVID-19 is part of the environment and CEQA generally does not require an analysis of the environment’s impact on the Project (see CEQA Guidelines Section 15126.2). Thus, the Draft EIR meets the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

Comment No. IND FORM 3-5

Finally, the EIR notes that the Hollywood Center may take up to six years to build. This will clearly result in major traffic disruption for a long period. This factor by itself demands that the utmost scrutiny be given to the project before it disrupts Hollywood for the better part of a decade. It is clear to me that such scrutiny has not occurred.

Response to Comment No. IND FORM 3-5

The comment expresses opposition to the Project based on potential for traffic disruption over a six-year period. Regarding the duration of construction for the Project, see pages II-70 through II-74, in Chapter II, Project Description, of the Draft EIR. As stated therein, the duration of construction would range from 4.5 years with concurrent construction on both the East Site and West Site, to under approximately seven years if they are constructed in sequence. See also Topical Response No. 2 – Transportation and Traffic, above, for details on construction management features and plans to be implemented during Project construction that would minimize traffic disruption to the local circulation network.

Comment Letter No. IND 1

Deborah Brosseau
2135 Ivar Avenue, Apt. 5
Los Angeles, CA 90068
Received April 16, 2020

Comment No. IND 1-1

I vehemently oppose this project in its entirety. Hollywood is already overdeveloped, and lacking the social infrastructure for residents in particular to live safely and conveniently in this area. This project not only does not add necessities to Hollywood residents, but it actually creates further barriers to quality of life.

We don't need another hotel. In light of the new world that we are ushering in, travel will change. We already have sufficient, if not too many, hotel rooms. This does not in any meaningful way assist our homeless crisis but providing legitimately affordable units for an appreciated amount of people.

Social space will be entirely different in light of C-19. This proposal creates space that will be dangerous and then likely unused.

Response to Comment No. IND 1-1

The commenter expresses opposition to the Project generally indicating that Hollywood is already overdeveloped, lacks the social infrastructure for residents in particular to live safely and conveniently in this area, and that hotel uses are not needed. Further, the commenter asserts that the Project would create space that will be dangerous and then likely unused. The comment does not provide any specific facts and, therefore, no substantial evidence, to support these claims; and does not raise any issues with respect to the content and adequacy of the Draft EIR. Therefore, no further response is warranted. However, it should be noted that, as discussed in Chapter 1, *Introduction*, in this Final EIR, the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project.

Comment No. IND 1-2

It's on a fault line. It's unconscionably irresponsible to build here.

Response to Comment No. IND 1-2

The comment expresses opposition to the Project due to the Project Site's location relative to an earthquake fault (the Hollywood Fault). Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 1-3

In general, it will destroy the impact of one of Hollywood's few remaining cultural touchstones: the Capitol Records building.

Response to Comment No. IND 1-3

While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame, and indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to some adjacent historic resources if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

Comment No. IND 1-4

Visual blight – we've had enough.

Response to Comment No. IND 1-4

While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

Comment No. IND 1-5

This project takes and doesn't give to our community. I can't hate it more.

Response to Comment No. IND 1-5

This comment expresses general opposition to the Project but does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 2

Kent Beyda

Received April 16, 2020

Comment No. IND 2-1

Thanks for keeping everyone in the loop. I strenuously object to this project and see it as merely an opportunity for the developers to make a huge profit. I feel the size of the project is way out of scale for Hollywood. Who else should I contact with comments? Are you gathering these emails as part of the comments process?

Response to Comment No. IND 2-1

In regard to the commenter's question on contact information, the Department of City Planning will be collecting and responding to all comments received on the Draft EIR as part of the Final EIR.

The comment expresses opposition to the Project based on its size and scale relative to the Hollywood community. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies or regulations related to location, form and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Comment Letter No. IND 3

Tony Kellam

Received April 16, 2020

Comment No. IND 3-1

I am a concerned neighbor of this proposed massive building project. We have an ugly tent city underneath Gower Pass that the City doesn't give a shit about. Sorry for this language, but it's so damn dangerous and filthy there—most women I know are scared to walk by. This is mere meters from this bldg site. I am worried your project will just push even more homeless towards this site. Bleeding *[sic]* heart liberals I know are a lot less bleeding heart now; everyone is upset with public leadership. Leadership? Where?

The police do nothing, the mayor—who is really hated more and more across the city in part due to this stuff that doesn't get address—and the council people also do nothing. We have crazy people wandering around our apartment spaces and breaking into our cars and yesterday one crazy dude was threatening neighbors with a 6 foot pole—he hit one woman w *[sic]* this and threatened a man. Police finally picked this guy up and after MANY calls.

Two nights ago, a crazy asshole homeless woman was singing outside of our apt at 3-4am—probably just waiting for someone to come out and engage her (or give her a Hollywood contract).

Once again City builds stuff and homeless get pushed out and into residential areas that have been paying taxes for decades—but not as much money as these corporate massive projects bring in I guess.

Can you all provide a hotline or something since *[sic]* once this starts..... ?

Response to Comment No. IND 3-1

The comment expresses concern about the potential for the Project to cause homeless people to move into nearby residential areas. While the comment includes examples of various acts and behavior witnessed by the commenter, homeless-related concerns in relation to the Project would be speculative. Furthermore, as stated in the CEQA Guidelines, Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. As such, this topic was not evaluated in the Draft EIR.

This comment also inquires about the availability of a hotline once construction and/or operation of the Project commences. During Project construction, the Project would implement Project Design Feature TRAF-PDF-2 (Construction Traffic Management Plan) as described on pages IV.L-28 and -29 of Section IV.L, *Transportation*, of the Draft EIR. The Construction Management Plan (CMP) would formalize how construction will be carried out and identify specific actions that will be required to reduce effects on the

surrounding community. As part of implementation of the CMP, construction management meetings with City Staff and other construction-related project representatives (i.e., construction contractors) will be conducted bimonthly, or as otherwise determined appropriate by City Staff. At this time, City Staff will identify a point of contact for the Project's construction. This information can be provided to the public, as requested.

During Project operation, as discussed in Chapter II, *Project Description* (see page II-68), of the Draft EIR, the Project would incorporate a security program to ensure the safety of Project residents, employees, and visitors. As part of the program, security would include provision of 24-hour video surveillance and full-time security personnel. Specifically, as provided in Project Design Feature POL-PDF-2, the Project will incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding signage and lighting for walkways and entries. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for LAPD services. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a seven day a week security patrol and could assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services.

Comment No. IND 3-2

Yes please add those in. Of course we call 311 sand [*sic*] these other numbers. It must be the policy of the current admin to do NOTHING about homeless tent cities (some imply it's a Dem [*sic*] city sanctuary thing I dunno about that angle, but many folks are very fed up). God Bless some of them, but homeless can be outside or be in parks but I get a ticket if I do this LOL.

311 gets called and eventually cleaners come the people drag their stuff away and come right back, so its [*sic*] like a maid service for them. Nobody I know walks by there now. Sigh.

To me the homeless tent cities began in earnest in Hwood [*sic*] areas when the big construction projects began—3-5 years ago.

Response to Comment No. IND 3-2

This comment confirms that the commenter would like their prior comment, provided in Comment No. IND 3-1, to be submitted as an official public comment on the Draft EIR. The comment was received and included as part of the record for the Project.

This comment provides additional feedback on non-CEQA related homeless issues, which is discussed in Response to Comment No. IND 3-1. As this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 4

Alek Friedman
Urban Development/Smart Growth
Beautification Team Committee Member
Central Hollywood Neighborhood Council
Received April 17, 2020

Comment No. IND 4-1

Thank you for informing me about this completed DEIR, ref. project # ENV-2018-2116-EIR.

I am a nearby resident, living just within walking distance of the jobsite, and would like to express my full **SUPPORT** for the project. I like the height of the project, as well as the contemporary design; this project would set a great precedent for similar future projects, which should help bringing Hollywood up to the 21st century standards. The project should also help transforming the blighted spots (currently still in existence in the area) to the family-friendly, safe, upscale environment. The development will also bring many much needed jobs to the area,

As to the environmental impacts: in my opinion, the impacts would be insignificant --when considering the tremendous benefits the project will bring.

Response to Comment No. IND 4-1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 4-2

I do have one suggestion: the developer should implement decorative sidewalks / pavers onto all sidewalks adjacent to the new development. In order to promote walkability and improve the aesthetics of a new development, a major improvement to our sidewalks is needed. I'm sure you agree, Los Angeles overall -- and Hollywood in particular -- severely lacks sidewalk aesthetics (and thus, affecting our walkability), since most of the sidewalks in L.A. are comprised of just plain, naked concrete; which makes Los Angeles appear as one massive "Concrete Jungle". Therefore, each new development is strongly encouraged to install decorative sidewalks / pavers.

Response to Comment No. IND 4-2

The commenter provides a suggestion to implement decorative sidewalks/pavers onto the sidewalks adjacent to the new development and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 4-3

Thank you for accepting my comments.

I look forward to the full endorsement of this much needed project!

Response to Comment No. IND 4-3

The comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 5

Laura Dupuis

Received April 16, 2020

Comment No. IND 5-1

Does this document address the increase in population density and therefor *[sic]* the increased need for traffic related improvements? If not where is that being addressed by the city? It may well be there. I have never read one of these documents before and it is quite long.

The streets in Hollywood have never been improved for the current traffic conditions much less for the future additional needs. In addition this area is already a traffic nightmare due to the choke points of the onramps to the Hollywood freeway thru the Cahuenga pass in the evening rush hour traffic.

Response to Comment No. IND 5-1

The comment inquires whether the Draft EIR addresses the Project's increase in population density and the need for traffic-related improvements. The Draft EIR addressed population and housing impacts in Section IV.J, *Population and Housing*. As analyzed therein, population and housing impacts would be less than significant under the Project, in that the Project would not induce substantial unplanned population growth to the area (based on the Southern California Association of Governments' [SCAG] adopted 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy [2016-2040 RTP/SCS]), either directly (for example by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).

The comment expresses a general opinion about existing traffic conditions due to the choke points of the onramps to the Hollywood freeway through the Cahuenga pass in the evening rush hour traffic. The comment also states that the streets in Hollywood have never been improved for the current traffic conditions, much less for the future additional needs. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Also, the City did receive two letters from Caltrans with comments on the transportation analysis to be conducted for the Project. Although the analyses requested by Caltrans are not a required CEQA analysis per the City's Transportation Assessment Guidelines (TAG), adopted in July 2019, the analyses were presented for informational purposes in Appendix I to the TA for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of

Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also, refer to Response to Comment No. ORG 2-7 which discusses a recent meeting on July 1, 2020 between the City Department of Planning and Caltrans. As discussed therein, Caltrans' concerns were non-CEQA concerns and Caltrans did not raise any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

Comment No. IND 5-2

Yes the project is being built near the Metro station but anyone who believes that the people who can afford to rent those apartments will be "taking the metro" is either misinformed or incompetent.

Response to Comment No. IND 5-2

The opinion in this comment states that people who would be living in the Project would not take the Metro. The comment does not provide any facts and, therefore, no substantial evidence, to support this claim; and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 5-3

Hi Mindy,

Available today if you have time 213-220-1128. Also where can I voice my opposition to this project? Just saw a picture and I now recall this project. It is out of scale to the area, too tall, it is wholly inconsistent with the neighborhood architecture, it does not fit. This project is an absolute no. And I would add funny how they have the option of converting part of the residential to a hotel which then significantly decreases the number of affordable rental units being offered. This project is of benefit no one other than the developer who will make a lot of money at the expense of the neighborhood residents.

Response to Comment No. IND 5-3

This comment expresses general opposition to the Project based on scale, height, and inconsistency with neighborhood architecture. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

Also, as discussed in Chapter I, *Introduction*, of the Draft EIR, upon the close of the public review period, the City would proceed to evaluate and prepare responses to all relevant comments received from public agencies and other interested parties during the public review period. In addition, see Topical Response No. 1 – Public Participation and Review, above, for a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with this EIR.

This comment includes general concerns regarding insufficient water supply, the problematic sewer system, worsened traffic, and building near faults. The comment does not provide any facts and, therefore, no substantial evidence, to support these claims; and does not raise any issues with respect to the content and adequacy of the Draft EIR.

The Project's impacts on wastewater and water supply were analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, of the Draft EIR. As analyzed within both sections, the Project would result in less-than-significant impacts on wastewater facilities and water supply.

In regard to wastewater, as stated on page IV.N.1-13 in Section IV.N.1, *Wastewater*, of the Draft EIR, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under City's Building and Safety Code and the Los Angeles Department of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with LAMC Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

In regard to water supply, as stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved Water Supply Assessment (WSA), as required by Senate Bill (SB) 610, for the Hollywood Center Project that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Furthermore, the Project would implement Project Design Feature WS-PDF-1 and provide specific water efficiency features to conserve water and reduce Project water demand. Therefore, there would be sufficient water supplies available to service the Project.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant

transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Additionally, the commenter states that people who would be living in the Project would not take available public transportation. However, the comment does not provide any specific facts and, therefore, no substantial evidence, to support this claim; and does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 6

William Bergmann
1701 N. Orange Grove Avenue
Hollywood, CA 90046
Received April 17, 2020

Comment No. IND 6-1

I want to put my 2 cents in for this project. As a 35 year resident of Hollywood I've seen dramatic proposals come and go, and am involved with one myself aimed to memorialize California's contribution to world culture as the center of the creative universe.

I've followed this from the beginning and compliment the developers for their patience and fortitude while facing the classic NIMBY challenges always present.

Much progress has been made in the last 25 years in Hollywood in spite of what I think is a moribund Chamber of Commerce. But we need much, much more! This is only one of what should be 50 similar sized developments!

Response to Comment No. IND 6-1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 7

Andrew Carrollman
Received April 17, 2020

Comment No. IND 7-1

We are in the midst of the Corona Virus Pandemic and now the City is trying to approve an enormous high density project. One of the main reasons New York City has had such a deadly tragedy is the density of the City. Building this monstrosity will cause enormous problems with utilities such as water and sewer. We don't have sufficient supply of water and certainly our antiquated sewer system will have many more problems with burst pipes etc. Traffic, already a nightmare will become even worse for everyone.

If you think people who can afford these units will use the inadequate public transportation, you are kidding yourself. Building on and around a major earthquake fault is just criminal.

We submit our strong objection.

Response to Comment No. IND 7-1

Regarding approval of the Project during the pandemic, it should first be clarified that no decision is being made at this time. The purpose of the public review period is to solicit comments from public agencies and other interested parties on the contents of the Draft EIR. As stated in Chapter I, *Introduction*, of the Draft EIR, upon the close of the public review period, the City would proceed to evaluate and prepare responses to all relevant comments received from public agencies and other interested parties during the public review period. In addition, see Topical Response No. 1 – Public Participation and Review, above, for a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with this EIR.

This comment includes general concerns regarding insufficient water supply, the problematic sewer system, worsened traffic, and building near faults. The comment does not provide any facts and, therefore, no substantial evidence, to support these claims; and does not raise any issues with respect to the content and adequacy of the Draft EIR.

The Project's impacts on wastewater and water supply were analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, of the Draft EIR. As analyzed within both sections, the Project would result in less-than-significant impacts on wastewater facilities and water supply.

In regard to wastewater, as stated on page IV.N.1-13 in Section IV.N.1, *Wastewater*, of the Draft EIR, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary

improvements to achieve adequate service under City's Building and Safety Code and the Los Angeles Department of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with LAMC Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

In regard to water supply, as stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved Water Supply Assessment (WSA), as required by Senate Bill (SB) 610, for the Hollywood Center Project that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Furthermore, the Project would implement Project Design Feature WS-PDF-1 and provide specific water efficiency features to conserve water and reduce Project water demand. Therefore, there would be sufficient water supplies available to service the Project.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Additionally, the commenter states that people who would be living in the Project would not take available public transportation. However, the comment does not provide any specific facts and, therefore, no substantial evidence, to support this claim; and does not

raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 8A-1

Dear City Officials:

Please see attached urgent letter. Please promptly respond. Thank you.

Response to Comment No. IND 8A-1

This comment letter indicates that there is an attached letter to the email. Responses to that letter are provided in Response to Comment Nos. IND 8A-2 and IND 8A-3.

Comment No. IND 8A-2

Re: Objection to 45-Day Comment Period for Hollywood Center Project Draft Environmental Impact Report (“DEIR”); Case Number ENV-2018-2116-EIR; State Clearinghouse Number 2018051002

Dear Ms. Nguyen:

This firm and the undersigned represent stopthemillenniumhollywood.com (“STMH”), a community group that actively participated in, and litigated against, the prior iteration of the newly-named “Hollywood Center” project. STMH and its supporters have an interested in actively and meaningfully participating in the current DEIR comment process, but cannot do so in the constrained, 45-day comment period imposed by the City.

We object to the City providing only the minimum allowed comment period during the unprecedented economic, social and public health upheaval resulting from the COVID-19 pandemic. The pandemic has resulted in City and State emergency declarations and

stay-at-home orders that prohibit members of the public from conducting travel to visit the Department of City Planning offices for in-person review of documents. Members of the public who rely on in-person document review risk being silenced altogether, as public libraries have closed and residents are legally prohibited from non-essential travel to use a friend or neighbor's computer and internet. Greater time is essential for the public to safely and lawfully access the DEIR and to be able to formulate comments on it.

The bare minimum 45-day comment period further prejudices STMH and the public by preventing other governmental agencies from having adequate time to fairly review and comment on the DEIR. At least two state agencies, Caltrans and the California Geological Survey, were previously involved in and actively commented on the prior iteration of the proposed project. There is every reason to expect they will be concerned about the public safety impacts posed by the project this time. However, they are hobbled by limited staffing and access to their offices and materials. For example, Caltrans District 7's entire offices are closed and its personnel scattered. Indeed, I assume that you yourself, as well as Planning Department officials copied on this letter, are not physically in your offices in any normal sense.

It cannot be possible that Mayor Garcetti, Councilman O'Farrell, and City Planning believe the minimum 45 days for the public to comment is appropriate under these trying circumstances.

The commencement of the running of the DEIR comment period, which period should be at least 90 days, should be tolled to a date after the lifting of local and state stay-at-home orders. At a minimum, it should be extended to 120 days from yesterday.

Given the thousands of pages of technical documents just released, and the impacts of the crisis now raging, anything less will prejudice the public and governmental agencies whose duties are to protect the public health, safety and welfare.

Response to Comment No. IND 8A-2

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review.

The comment also makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment No. IND 8A-3

Please include this letter in the administrative record for this matter, and please promptly reply with a public announcement tolling or extending the comment period.

Response to Comment No. IND 8A-3

The letter has been included in the administrative record. A public announcement that the public comment period would not be extended is not a requirement of CEQA or the City of Los Angeles, as the Lead Agency. However, the commenter was notified that the comment period would not be extended for the reasons outlined in Topical Response No. 1 – Public Participation and Review.

Comment No. IND 8B-1

Dear Ms. Nguyen:

Thank you. Is my request for tolling or extending the public comment period being considered, and by whom?

Given the currently extremely short, 45-day window and the critical issues associated with this project and the pandemic (see Mayor Garcetti's pronouncements as reported in the LA Times today: <https://www.latimes.com/california/story/2020-04-19/garcetti-state-of-city-la-address-coronavirus> [please print and include the full article as part of this communication for the record]), when can we expect a clear response from City officials to my letter?

Response to Comment No. IND 8B-1

Refer to Response No Comment Nos. IND 8A-2 and IND 8A-3. The commenter was notified that the comment period would not be extended for the reasons outlined in Topical Response No. 1 – Public Participation and Review.

Comment No. IND 8B-2

As with all my communications, please include this in the record for this matter. Thank you.

Response to Comment No. IND 8B-2

The comment has been included in the administrative record.

Comment No. IND 8B-3

Attachment: Los Angeles Times, Garcetti: L.A. is 'under attack' and will need to furlough thousands of city workers, April 19, 2020.

Response to Comment No. IND 8B-3

This comment is a news article referenced in Comment No. IND 8B-1, above. This comment does not raise any specific issues regarding the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 8C-1

Re: Further Objection to 45-Day Comment Period for Hollywood Center Project Draft Environmental Impact Report (“DEIR”); Case Number ENV-2018-2116-EIR; State Clearinghouse Number 2018051002

Dear Ms. Nguyen and City Officials:

As a follow-up to my April 17, 2020 letter requesting a tolling or extension of the minimal 45-day public comment period provided for the controversial “Hollywood Center” (aka Millennium Hollywood) project Draft EIR, and as a further follow-up to my April 20, 2020 email to you which, as of the date of this letter, has not been responded to, please see the link below and relevant language excerpted from the State Office of Planning and Research (“OPR”) encouraging public agencies to extend CEQA public review and comment periods during the COVID-19 crisis.

My office, my clients, many other community members with whom I have spoken, and governmental agencies – most of which are operating at extremely reduced capacity – are all severely prejudiced by the City’s imposition of a minimum comment period during these unprecedented times.

I renew my April 17, 2020 request for a tolling or extension of the current, 45-day public comment period on the Draft EIR.

<http://opr.ca.gov/ceqa>

“Public Meetings and Public Review of Documents

“As to providing CEQA documents to public libraries, CEQA Guidelines section 15087(g) states that “[l]ead agencies should furnish copies of draft EIRs to public library systems serving the area involved.”

Providing copies of CEQA documents at libraries may not be feasible at this time, as many libraries are closed. Agencies should be considered other methods to make CEQA documents publicly available, such as posting on the Internet and on CEQAnet, that do not require the public to obtain copies in person.

“Regarding public review and comment periods for CEQA documents, such as notices of preparation and EIRs, OPR encourages public agencies to consider extending those periods. Given that public agencies are using new methods to make public documents available in light of the

current pandemic, additional time for public review and comment periods may be appropriate.” (emphasis added.)

While Mayor Garcetti announces that “LA is ‘under attack’ and will need to furlough thousands of city workers” (LA Times, April 19, 2020), the public is doubly under attack by a process so transparently designed to harm community members and groups under attack not only by COVID-19, but by a cynical Draft EIR comment process meant to elevate the interests of a developer over the rights of the public that City officials were elected to serve.

The commencement of the running of the DEIR comment period, which period should be at least 90 days, should be tolled to a date after the lifting of local and state stay-at-home orders. At a minimum, it should be extended to 120 days.

Please confirm that the comment period will be tolled or extended as requested not only by this office and the groundswell of similar requests you are receiving, but also pursuant to OPR’s recommendation.

Alternatively, if the City refuses to act responsibly and fairly, please prominently announce to the public that the comment period will not be extended.

Response to Comment No. IND 8C-1

Refer to Response to Comment Nos. IND 8A-2 and IND 8A-3.

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment No. IND 8D-1

Please see attached. Please confirm receipt. Hard copy with flash drive to follow via overnight delivery.

Response to Comment No. IND 8D-1

This comment references the attachments to the comment letter but does not address the content or adequacy of the Draft EIR. Confirmation of receipt was provided by the Department of City Planning.

Responses to the referenced letter are provided below in Response to Comment Nos. IND 8D-2 to IND 8D-3.

Comment No. IND 8D-2

Re: Objection to Denial of Request for Extension of 45-Day Comment Period for Hollywood Center Project Draft Environmental Impact Report (“DEIR”); Case Number ENV-2018-2116-EIR; State Clearinghouse Number 2018051002

Dear Ms. Nguyen and City Officials:

This letter and all complete documents and materials contained in the links set forth within this letter are to be included in the administrative record for the above-referenced matter.

Response to Comment No. IND 8D-2

The comment and letter have been included in the administrative record.

Comment No. IND 8D-3

The City’s April 28, 2020 response to our and others’ request for an extension of the Hollywood Center Project DEIR comment period is repugnant, verging on mocking the public. To acknowledge as your April 28, 2020 email does that “these are unprecedented times,” and yet for the Planning Dept. to treat them for public comment purposes as regular times, defies logic. Its import also ignores how everyone’s lives have been upended as people are busy trying to stay safe, to home school children, to care for sick relatives, to manage entirely new and disruptive routines, etc. This no less includes the staff of governmental agencies expected to comment on this DEIR, and which should have the fullest time possible to comment as part of their duties to ensure the public health, safety and welfare.

It is also to deny Mayor Garcetti’s repeated emotional pleas, and even threats, to the community about obedience to his “Stay-at-Home” orders. The Planning Dept. buck of unreasonable denial of a tolling or extension of the public comment period for this massive project and EIR stops with Garcetti. We incorporate by reference the articles contained at these links quoting Mayor Garcetti in this regard:

“In a remarkable State of the City address, one that comes five weeks into the shutdown of many businesses, government buildings and other facilities, Garcetti declared that the city is ‘under attack’ from the coronavirus and the economic fallout that has come with it.

‘I’ve never before hesitated to assure you that our city is strong,’ he said. ‘But I won’t say those words tonight. Our city is under attack. Our daily life is unrecognizable.’”¹

“Los Angeles Mayor Eric Garcetti unveiled a \$10.5-billion budget for the city Monday that imposes cuts across an array of city agencies, with nearly 16,000 city workers being furloughed in response to the economic fallout from the coronavirus outbreak.”²

“This weekend we saw too many images of too many people crowding beaches or canyons beyond their capacity. Too many people, too close together, too often,’ Garcetti said during his daily briefing on the impact of the novel coronavirus. ‘The longer we do that, the more people will get sick, and the more people will die. There’s no way to sugarcoat that.’

‘Asked by a reporter whether the city would hold residents accountable for breaking quarantine orders, Garcetti said that law enforcement officers will ‘not be why’ when it comes to approaching those who are seen doing so.’”³

“I know your heart breaks.... This is such a great tradition for the many families we have,’ L.A. Mayor Eric Garcetti said. ‘But we can’t afford to have one cluster of even just a few people together spread this disease to more people and kill them.’⁴

“Unfortunately among the fallen ‘is a city employee, Garcetti said Friday. ‘It wasn’t just lip service that these are going to be tough days.’”⁵

“If a business refuses to provide face coverings for its workers, it could be fined, but the hope is that businesses and customers will follow the order without issue, Garcetti said.”⁶

“At least five nights a week, Garcetti has appealed directly to Angelenos on live television – of Facebook, for those with smaller screens – to get them to comply with public health orders and keep up with the region’s rapidly changing response to the spread of the novel coronavirus.”⁷

“Garcetti said that his office is still receiving daily reports of nonessential businesses that continue to operate as normal – behavior he called ‘irresponsible and selfish.’”

“He also announced a Safer at Home business ambassadors initiative that aims to help push greater adherence from nonessential businesses who aren’t complying with the city’s order to close.

Such businesses should also expect to get a warning call from local prosecutors before the city takes more aggressive action, including turning off their water and power, he said.

‘The easiest way to avoid a visit from the city is to follow the rules,’ he said.”⁸

“Los Angeles Mayor Eric Garcetti said Wednesday that he’s authorized the Department of Water and Power to shut off service to nonessential businesses that continue to operate despite the strict Safer at Home restrictions designed to slow the spread of the coronavirus.”⁹

Your April 28, 2020 email also implies or assumes that everyone who wants to review the EIR should be able, on their own, to have an internet connection and sufficient

bandwidth to download this very hefty DEIR. There is a serious Environmental Justice issue in the City's unreasonable conduct during this time.

We and our clients are indeed prejudiced, including by my difficulty in accessing all of our hard files, including from the previous StopTheMillenniumHollywood.com vs. City of Los Angeles, et al. (LASC Case No. BS144606; Court of Appeal Case No. B282319; CA Supreme Court Case No. S258643) litigation. Large parts of the administrative record from that original case must be included in the current administrative record because of its relevance to the instant application and DEIR. However, we cannot more discreetly select those documents because of lack of access to our physical offices.

As a result, we incorporate by reference the entire administrative record from the original Millennium case. Although the City Attorneys' Office and, presumably, the City Planning Department have the entire Administrative Record and Reference Library from the original Millennium case, which we ask to be incorporated by reference, nonetheless, in an abundance of caution, we are also sending you by overnight delivery a flash drive containing the full bates-stamped administrative record and full bates-stamped reference library from the original Millennium case administrative record. The entirety of those files must be uploaded and included in the present administrative record and on the City Planning Department's running web page of the ongoing additions to the present administrative record for the Hollywood Center Project DEIR. We would suggest those materials be noted in the description as follows:

- AR from StopTheMillenniumHollywood.com v. City of LA (LASC Case No. Bs144606 ("Original Millennium Case") 1 of 6
- AR from StopTheMillenniumHollywood.com v. City of LA (LASC Case No. Bs144606 ("Original Millennium Case") 2 of 6
- AR from StopTheMillenniumHollywood.com v. City of LA (LASC Case No. Bs144606 ("Original Millennium Case") 3 of 6
- AR from StopTheMillenniumHollywood.com v. City of LA (LASC Case No. Bs144606 ("Original Millennium Case") 4 of 6
- AR from StopTheMillenniumHollywood.com v. City of LA (LASC Case No. Bs144606 ("Original Millennium Case") 5 of 6
- AR from StopTheMillenniumHollywood.com v. City of LA (LASC Case No. Bs144606 ("Original Millennium Case") 6 of 6
- RL from StopTheMillenniumHollywood.com v. City of LA (LASC Case No. Bs144606 ("Original Millennium Case") 1 of 2
- RL from StopTheMillenniumHollywood.com v. City of LA (LASC Case No. Bs144606 ("Original Millennium Case") 2 of 2

You are required to include all of these documents from the original administrative record in the current administrative record for this Hollywood Center application and Draft EIR, including pursuant to Consolidated Irrigation District:

"We conclude that the term "submitted to" – which generally means presented or made available for use or study – is concerned with the effort that must be expended by the lead agency in using or studying the "written evidence" presented. (§21167.6, subd. (e)(7).) Consequently, we think that the term should be interpreted as applied pragmatically to fairly allocate the burden of handling the written evidence. Applying the term too broadly could place an unacceptable burden on lead agency personnel by requiring them to expend time and limited resources tracking down information that could have been provided more efficiently by the commenter. Based on considerations regarding the allocation of burden, we conclude that "written evidence" has been "submitted to" a lead agency for purposes of section 21167.6, subdivision (e)(7) when the commenter has made the document readily available for use or study by lead agency personnel." Consolidated Irrigation Dist. V. Superior Court (2012) 205 Cal.App.4th 697, 723.

"The third category contains five documents named in the comment letters of CID and the air pollution control district along with a citation to the specific Web page containing the document. We conclude that the information provided made these documents readily available to City personnel. To access the document, the person need only type the URL into a computer connected to the Internet. The document will appear on the computer screen and no further searching is required. Thus, the burden placed on lead agency personnel is minimal when a commenter provides the URL to the specific Web page containing the document." Consolidated Irrigation Dist. V. Superior Court (2012) 205 Cal.App.4th 697, 724-725.

The burden placed on the City is minimal, actually non-existent. We have provided a flash drive with all of the bates-stamped files comprising the prior administrative record and reference library that the City itself certified. If you have any difficulty accessing or in utilizing the City's own set of the same materials, please promptly advise.

Finally, please understand that this by no means remedies or sufficiently mitigates the prejudice to us, and others, from the truncated 45-day comment period during the pandemic. Our request (and that of numerous other community members) for a tolling or extension of that deadline remains active. Thank you.

Response to Comment No. IND 8D-3

This comment includes opinions on the City's decision to not extend the Draft EIR comment period. This comment does not address the content or adequacy of the Draft EIR.

The comment also makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project. This comment does not address the content or adequacy of the Draft EIR.

The comment seeks to incorporate into the Administrative Record for this Project the entire administrative record from the previous Millennium Project, stating that the commenter did not have access to his physical office and, therefore, was not able to specifically identify the portions of the prior record which are relevant to the Draft EIR on the current Project. However, as is evidenced by the submittal of a flash drive containing the record, the commenter did have access to the prior administrative record and, therefore, could have reviewed it and only included relevant portions, if any. Nonetheless, as stated above, the Millennium Hollywood Project was an entirely different project, and a completely new EIR has been prepared for the Project that is currently proposed. The comment does not contain or specifically refer to any readily available information contained in the flash drive and does not explain the relevance of any portion of that

material. (See CEQA Guidelines Section 15088(c).) As a result, the comment does not present evidence on the contents or adequacy of the Draft EIR, which is independent of any environmental review done on the previous project, and, therefore, no further response is warranted.

Nonetheless, although the City has determined that an administrative record of a prior project is not relevant to an analysis on the content or adequacy of the Draft EIR for the Project that is currently proposed, the administrative record of the previous project at the Project Site, as submitted on the USB drive, has been included in this Project's administrative record but only because it was included in this comment letter.

- [20200427 1538 V. Lebron](#) Further Objection to 45-Day Comment Period

Response to Comment No. IND 8E-1

This comment does not address the content or adequacy of the Draft EIR. As such, no further response is warranted. However, it should be noted that City staff responded with an explanation that the naming convention established for the administrative record, labels all emails by the email sender's first initial and last name.

Comment No. IND 8E-2

Please also advise the significance of the number that follows the date of the letters submitted for this matter.

Response to Comment No. IND 8E-2

This comment does not address the content or adequacy of the Draft EIR. As such, no further response is warranted. However, it should be noted that City staff responded with an explanation that the number that follows the date of the emails indicates the time the email was sent

Comment No. IND 8E-3

This comment is a duplicate of Comment No. IND 8E-1 and 8E-2.

Response to Comment No. IND 8E-3

Responses to this comment are provided in Response to Comment Nos. IND 8E-1 and 8E-2.

Comment No. IND 8F-1

Dear Mayor Garcetti, Planning Director Bertoni, City officials, and Ms. Nguyen:

We are placing Mayor Garcetti's May 7, 2020 email below and this communication into the record.

The mayor's email reveals a sad hypocrisy as he and the Planning Dept. refuse repeated requests from the public for an extension of the comment period on the Draft EIR for the Millennium Hollywood skyscrapers on the earthquake fault project (aka "Hollywood Center").

Why are city officials giving aid and comfort to Millennium Partners, developer of the Leaning Tower of San Francisco, while the public daily struggles to cope with our new reality, much less meaningfully be able to comment on a 13,000-page EIR in a few short weeks?

The mayor's "I will be here for you" promise rings quite hollow, unless directed to the developers who have contributed to his campaigns.

With city officials under FBI investigation, the mayor and Planning Dept. now more than ever should seek to reassure an apprehensive citizenry that there is integrity in the land use and planning process.

We renew all prior requests. Do the right thing: substantially extend the public comment period.

Response to Comment No. IND 8F-1

This comment does not address the content or adequacy of the Draft EIR. As such, no further response is warranted. However, refer to Response to Comment Nos. IND 8A-2 and IND 8A-3. In addition, the comment has been included in the administrative record.

Attachment: Mayor Eric Garcetti, Safer L.A. Newsletter, May 7, 2020.

Response to Comment No. IND 8F-2

This comment is a newsletter attached as part of Comment No. 8F-1, above. This comment does not raise any specific issues regarding the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 8G-1

Re: Inclusion of Original Millennium Case Administrative Record for Hollywood Center Project Draft Environmental Impact Report ("DEIR"); Case Number ENV-2018-2116-EIR; State Clearinghouse Number 2018051002.

In our April 29, 2020 letter to you, we submitted for inclusion in the Hollywood Center administrative record the entire administrative record and reference library of emails from the StopTheMillenniumHollywood.com vs. City of Los Angeles, et al. (LASC Case No. BS144606; Court of Appeal Case No. B282319; CA Supreme Court Case No. S258643) litigation.

Although the City Attorneys' Office and, presumably, the City Planning Department have the entire administrative record and reference library from the original Millennium case, which we asked to be incorporated by reference, nonetheless, in an abundance of caution, we also sent to you by overnight delivery a flash drive containing the full bates-stamped administrative record and full bates-stamped reference library from the original Millennium case administrative record. That must be included here and now. Please immediately confirm that you will do so.

As of today, we see that the original Millennium case record has not been uploaded to the running administrative record for the Hollywood Center Project DEIR as requested or provided. Because of this and because we hope that the lack of inclusion in the current record is simply an oversight, we are sending an updated flashdrive containing clearer versions of the same documents we sent to you on a flashdrive via overnight delivery on April 29, 2020. We request that the set of documents enclosed with this letter be uploaded in place of the April 29, 2020 set. If you have any questions, please contact us immediately for further clarification of this request.

The entirety of those files must be uploaded and included in the present administrative record and on the City Planning Department's running web page of the ongoing additions to the present administrative record for the Hollywood Center Project DEIR. We would suggest those materials be noted in the description as follows:

You are required to include all of these documents from the original administrative record in the current administrative record for this Hollywood Center application and Draft EIR, including pursuant to Consolidated Irrigation District:

"We conclude that the term "submitted to" - which generally means presented or made available for use or study - is concerned with the effort that must be expended by the lead agency in using or studying the "written evidence" presented. (§ 21167.6, subd. (e)(7).) Consequently, we think that the term should be interpreted and applied pragmatically to fairly allocate the burden of handling the written evidence. Applying the term too broadly could place an unacceptable burden on lead agency personnel by requiring them to expend time and limited resources tracking down information that could have been provided more efficiently by the commenter. Based on considerations regarding the allocation of burden, we conclude that "written evidence" has been "submitted to" a lead agency for purposes of section 21167.6, subdivision (e)(7) when the commenter has made the document readily available for use or study by lead agency personnel." Consolidated Irrigation Dist. v. Superior Court (2012) 205 Cal.App.4th 697, 723.

"The third category contains five documents named in the comment letters of CID and the air pollution control district along with a citation to the specific Web page containing the document. We conclude that the information provided made these documents

readily available to City personnel. To access the document, the person need only type the URL into a computer connected to the Internet. The document will appear on the computer screen and no further searching is required. Thus, the burden placed on lead agency personnel is minimal when a commenter provides the URL to the specific Web page containing the document." Consolidated Irrigation Dist. v. Superior Court (2012) 205 Cal.App.4th 697, 724-725.

The burden placed on the City is minimal, actually non-existent. We have provided a new flash drive with all of the bates-stamped files comprising the prior administrative record and reference library that the City itself certified. If you have any difficulty accessing or in utilizing the City's own set of the same materials, please promptly advise.

Separately, we requested in our April 20, 2020 email to you that you include in the record an April 19, 2020 LA Times article for which we provided a link. As of today, that article was not included in the record with our email. For your convenience, we are including the complete email and article below this letter. We hope this is also simply an oversight on the part of City Planning, and not an intentional failure to maintain a complete record as is required. Any linked documents referenced in a letter or other document submitted to you must be printed and included for the running record.

Response to Comment No. IND 8G-1

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project. However, as the administrative record of the previous project was submitted with Comment No. IND 8D-3, it has been included in the Administrative Record for the Project. Response to Comment No. IND 8D-3 also provides additional information regarding the administrative record for the Millennium Hollywood Project.

Comment No. IND 8G-2

Attachment: Duplicate of Comment Letter No. IND 8B.

Response to Comment No. IND 8G-2

Responses to this comment are provided in Response to Comment Nos. IND 8B-1 through 8B-3.

Comment No. IND 8H-1

Please see attached urgent letter, and please reply. Thank you.

Response to Comment No. IND 8H-1

This comment is an introductory statement that references an attached letter. Responses to the referenced letter are provided below in Response to Comment Nos. IND 8H-2 to IND 8H-5.

Comment No. IND 8H-2

Re: Further Request for Extension of 45-Day Comment Period for, and Objections to Substantive Corruption in, Hollywood Center Project Draft Environmental Impact Report; Case Number ENV-2018-2116-EIR; State Clearinghouse Number 2018051002

This firm and the undersigned represent Stopthemillenniumhollywood.com (“STMH”), a community group that actively participated in, and successfully litigated against, the prior version of the newly-named “Hollywood Center” project. STMH, its supporters and other members of the public have an interest in meaningfully participating in the current Draft EIR comment process, but are impaired from fully doing so in the constrained, 45-day comment period imposed by the City. They are also impaired from fully doing so because the Draft EIR contains multiple pages with corrupted and illegible text and figures, including in every single Figure and Plate of Appendix G-1 regarding the most pressing issue of public health and safety related to earthquake fault risk.

As to the City’s continued unreasonable and illegal (see below) refusal to extend the comment period on a 13,000-page Draft EIR dropped on the public during the pandemic, we note that for the prior Millennium Hollywood Draft EIR on the same site and by the same developer, then-Councilman Garcetti requested an extension of that 45-day public comment period, which was granted. In his November 2, 2012 letter, he wrote:

“The Planning Department has released the draft Environmental Impact Report (EIR) for the proposed Millennium Project at 1750 Vine Street, which commenced a 45 day public comment period.

The proposed project is large in scale and includes what could be one of the tallest buildings in all of Hollywood. As I’m sure you are aware, the proposed project has generated controversy among my constituents. Accordingly, I request that the public comment period be extended to 60 days to increase the public’s opportunity to comment on the draft EIR.” **(Exhibit 1.)**

That the City Planning Department and City officials, including Mayor Garcetti and Councilmen O’Farrell and Ryu have not yet secured for the public an extension to comment on a similarly massive project, and in the midst of the COVID-19 pandemic, is truly a deplorable low even for this City government.

Mayor Garcetti’s comment quoted above remains accurate today: “The proposed project is large in scale and includes what could be one of the tallest buildings in all of Hollywood.” **(Exhibit 1.)**

It is actually an understatement. The proposed project is over a million square feet and would indisputably contain the tallest building in all of Hollywood – not to mention, place it on an active 7.0 earthquake fault as shown by the State of California in its Alquist-Priolo Map.

Further, “[a]s I’m sure you are aware, the proposed project has generated controversy.” (**Exhibit 1.**) That, too, remains accurate, and an understatement. From the groundswell of requests for an extension that you have already received, you know of the controversy generated by the current proposed project.

As you are also aware from my office’s litigation against the Millennium Hollywood project and our exposure of repeated violations of the law by the City related to this site and developer (see trial court and Court of Appeal rulings in Stopthemillenniumhollywood.com, et al. v. City of Los Angeles, et al., Case Nos. BS144606 and B282319; see also **Exhibit 2**, May 20, 2020 Los Angeles Times article, “*Here’s a closer look at the ex-deputy mayor enmeshed in City Hall corruption probe*”), the proposed project is generating extreme controversy among City residents, property owners and stakeholders.

It should go without saying that an extension of the public comment period is appropriate and warranted. That the City refuses to provide that, even against its own precedent related to the same site, only adds to the controversy.

We also note how routinely such extensions are normally granted. For example, the City’s July 30, 2019 Notice of Extension of the comment period, for an additional 30 days, for the nearby citizenM Hollywood & Vine project (**Exhibit 3**), when no pandemic was present, further highlights the outrageousness of the City’s refusal to extend the public comment period now.

As our Supreme Court has held:

“The EIR is . . . intended ‘to demonstrate to an **apprehensive citizenry** that the agency has, in fact, analyzed and considered the ecological implications of its action.’ [Citations.] Because the EIR must be certified or rejected by public officials, it is a document of accountability. . . . The EIR process protects not only the environment but also informed self-government.” Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal.3d 376, 392 (emphasis added).

As instructed in a Court of Appeal decision in another California Environmental Quality Act (“CEQA”) case where the City lost:

“The fundamental goals of environmental review under CEQA are information, participation, mitigation, and accountability.” Lincoln Place Tenants Ass’n. v. City of Los Angeles (2007) 155 Cal.App.4th 425, 443-444.

Mayor Garcetti, the City Council and City Planning have an apprehensive citizenry – heightened by the City’s past and present actions. Those actions, including the refusal to extend the Hollywood Center public comment period, impair CEQA’s fundamental goals.

Finally, we note not only the City’s disingenuous position, but the actual illegality of refusing to extend the public comment period during the pandemic. The City’s due process violations in this regard have been raised by this office and many others dealing with the impacts of the COVID-19 situation and the shut-down orders.

As one further example, Hollywood resident Mary Ledding has written to you regarding the prejudice to herself, her neighbors and the general public by the City’s conduct, which conduct is not ameliorated by the City’s offers to provide flash drives (useless for people without computers) or dilatory delivery of reams of paper print-outs.

Ms. Ledding noted in a May 21, 2020 email:

“I did get the flashdrive but of course that requires a computer to use. It will be of no help to our neighbor who doesn’t use computers. I have not received the print-outs [requested many days earlier]. [¶] My question, of course, is how are people expected to be able to review this vast report in the extremely short time frame the City is allowing? . . . I don’t know the total pages of the DEIR but assuming it approaches 3000 pages including the essential appendices and cites [it is actually 13,000 pages], and assuming you get us a print copy by end of business tomorrow, that means we have to review 300 pages a day AND write intelligent comments hopefully with the benefit of some sort of community zoom conversation all while citizens are still "sheltering at home", doing their own schooling, cooking, and, if they are lucky, working their jobs. This is not reasonable nor does it provide the City with thoughtful, relevant comments to this massive, community-rending project. The City needs to grant an extension on the deadline. Please take this matter up again. This process is a disgrace to the community that will have to live with it for decades to come.”

In my April 27, 2020 letter, I objected to the City’s failure to extend the public comment period in light of the COVID-19 crisis, and in particular, the absence of public access to hard copies of the Draft EIR in the usual locations of (now-closed) local libraries and the (now-closed without appointment) City Planning Department. I noted:

“While Mayor Garcetti announces that “LA is ‘under attack’ and will need to furlough thousands of city workers” (LA Times, April 19, 2020), the public is doubly under attack by a process so transparently designed to harm community members and groups under attack not only by COVID-19, but by a cynical Draft EIR comment process meant to elevate the interests of a developer over the rights of the public that City officials were elected to serve.”

The City responded on April 28, 2020 with an email that gave the facile and untrue response that “the Draft EIR remains accessible to all individuals” because the documents were all on line, thereby implying that everyone who wanted to review the Draft EIR should be able, on their own, to have a computer, an internet connection and sufficient bandwidth to download this 13,000-page document and lengthy technical appendices.¹ I again objected, in a letter dated April 29, 2020, reminding the City of Mayor Garcetti’s lock-down order that closed the libraries and City Hall.

Response to Comment No. IND 8H-2

The comment asserts that the time to submit comments to the Draft EIR was inadequate and that portions of an appendix to the Draft EIR were illegible, thereby depriving the public of full access to the Draft EIR. With regard to the adequacy of the Draft EIR public review period and for additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above. Note that during the public review period, the City provided electronic copies of the Draft EIR, as well as hardcopies of the Draft EIR, when requested.

Regarding the alleged illegal activities as presented in Exhibit 2 of the comment, the comment does not raise a substantive issue on the content or adequacy of the Draft EIR, and, as such, no further response is warranted.

The Department of City Planning also acknowledges the extension to the comment period for the Draft EIR prepared for the citizenM Hotel Project. However, the citizenM Hotel Project is independent of the Hollywood Center Project, and each project is assessed independently by the City considering the circumstances applicable to each given project. In the case of the Hollywood Center Project, as discussed in Topical Response No. 1– Public Participation and Review, the City met the requirements under CEQA for public noticing of the Draft EIR.

Refer to Response to Comment No. IND 8I-13 with regards to the issue of an illegible portion of an exhibit in one of several available formats for viewing the Draft EIR. The comment also states that the Project would be on an active fault. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 8H-3

Footnote 1: Further, in the City’s haste to release the Draft EIR during the most painful and inconvenient time for the public, the City released a Draft EIR PDF document with

file corruption containing “bugs” that have distorted critical information, including throughout the “Figures and Plates” in Appendix G-1, 2015 Fault Activity Investigation. Every figure and plate has critical text and/or numbers replaced or overwritten by blank square boxes. (See, e.g., sample pages G-1, 50 & 51, and enlargements of same, attached at **Exhibit 4**.)

This is true of all of the figures and plates in Appendix G, totaling 18 pages (8 figures; 10 plates). The same distorted text also occurs in Appendix E within Appendix G-1.) This is not intended to be an inventory of all the distorted pages, figures and images marring the Draft EIR. There may be more. However, it is the City’s duty to identify and fix through a recirculated Draft EIR. It is enough that we have pointed out to you the double injustice of forcing people to try to comment in this truncated time frame, on pages – in one of the most critical subject areas, i.e., earthquakes and seismology – which are obviously and substantively distorted.

To confirm this fatal informational flaw in the Draft EIR, we downloaded PDFs and got the same result with boxes masking critical text and figures. We used Adobe 2017, which states that it is the same as Adobe DC. We used different computer systems to view the PDF in Adobe 2017 Professional and Adobe DC Professional. We also hard printed. The pages came out with the same boxes blanking out text and figures, often in ways that are completely unreconstructable. Finally, to be 100% sure, we had an IT consultant upload the file to a new PC with Adobe DC Pro, and had the same result.

That the City has circulated a Draft EIR with information concealed or obliterated concerning the most pressing issue of public health and safety related to earthquake fault risk is especially unacceptable.

Accordingly, a full and complete Draft EIR has not yet been released to the public, even assuming everyone could access the current distorted version on the internet. This is an additional legal basis for requiring that the Draft EIR public comment period be extended, or more appropriately, restarted once a correct Draft EIR is prepared and made available to the public, with all text, numbers, figures and plates fully legible.

Response to Comment No. IND 8H-3

This comment states that a full and complete Draft EIR was not released to the public as some of the figures in Appendix G included square boxes and that, as a result, the Draft EIR should be recirculated. However, when looking at the files on the City’s website (<https://planning.lacity.org/development-services/eir/hollywood-center-project-1>), no such boxes can be seen. When the documents were downloaded or printed, a limited amount of text on some figures became illegible and included the square boxes. When the City was notified of this, all relevant files were replaced expeditiously, and all inquiring parties were notified of the update. Moreover, in addition to being legible and available as viewed directly on the City’s website, a CD-ROM (or USB drive) copies of the Draft EIR (including Appendix G-1) were made available for delivery to interested parties upon request. A total of one individual requested a hard copy and digital USB copy of the Draft

EIR during the Draft EIR comment period, for whom legible copies were provided by the City. Refer to Response to Comment No. IND 8I-13 which explains that the corrupted pages occurred when viewing the Appendix in PDF format only and not when viewing in any of the other available computer and hard copy formats including the City's website.

Nonetheless, although the comment does not raise any specific issues with the adequacy of the geological analysis, the analysis provided in Section IV.D, *Geology and Soils*, of the Draft EIR, which relies on this Appendix, is adequate and would not require recirculation. See also Topical Response No. 3 – Geology and Fault Hazards, above.

As to the request for recirculation, pursuant to CEQA Section 15088.5, the City is only required to recirculate an EIR when “significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review...”. As stated in Section 15088.5, new information is not significant “unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect...” CEQA does not require extension of the Draft EIR public review period or recirculation of the Draft EIR if there is an illegible portion of an exhibit in one of many available formats for viewing or when the relevant information is included elsewhere in the EIR. See generally Public Resources Code (PRC) Section 21091 and 21092.1; CEQA Guidelines Section 15087, 15105, 15205, and 15088.5. See also *Mountain Lion Coalition v. Fish and Game Com.*, (1989) 214 Cal.App.3d 1043, which determined that “significant new information” requiring recirculation of a Draft EIR includes, for example, when the Draft EIR is so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

The comment asserts that recirculation is required because the public was deprived of the opportunity to view the corrupted figures. However, the information was not only available in other formats of the Draft EIR, but also in the discussion of the geotechnical assessment in the Draft EIR. Appendix G-1, 2015 Fault Activity Investigation, of the Draft EIR includes a thorough discussion and analysis of the investigation and data covered by the report, including a presentation of the data provided on those certain pages that were corrupted in the downloaded or printed PDF formats, allowing an opportunity for meaningful public review and comment of the Draft EIR. See Appendix G-1 for the discussion and analysis of those “Figures” and “Plates” in question. See also CEQA Guidelines Section 15147, providing that technical data should be summarized; and *City of Fremont v San Francisco Bay Area Rapid Transit Dist.* (1995) 34 CA4th 1780, 1787, providing that the use of charts or tables to present components of the analysis is acceptable [and implicitly not required]. Not being able to access a portion of an exhibit in some, but not all, of the various available formats does not rise to the level of failing to provide information, which was readily available to the commenter in other viewing formats (e.g., the City's website) or is equivalent to omission of an entire discussion topic. As such, for the aforementioned reasons, the assertion in the comment does not warrant extension of the Draft EIR's public comment period or a complete recirculation of the Draft EIR.

Comment No. IND 8H-4

The City's cavalier, let-them-use-internet attitude ignores the very real fact that not all communities have the same access to computers, and sometimes lack the ability to access the internet. The libraries where they might usually access the internet are closed, making the City's assertion about universal and timely access to the Draft EIR patently untrue. This inability to access the internet is particularly and painfully true now, when rampant unemployment is making many people choose between food and rent payments. The City's assumption that they can afford a laptop and internet access is both arrogant and discriminatory, and denies many the ability to meaningfully participate in the City's decision-making about this proposed project.

The City's conduct does not comport with both long-standing and recent legislation defining environmental justice. Assembly Bill 1628 was signed into law by Governor Newsom on September 27, 2019, and took effect this year. The bill's Section 1, subd. (b), provides:

"It is therefore the intent of the Legislature to ensure that the populations and communities disproportionately impacted by pollution have equitable access to, and can meaningfully contribute to, environmental and land use decisionmaking, and can enjoy the equitable distribution of environmental benefits." (Emphasis added.)

This definition of "environmental justice" expanded the existing definition in Government Code Section 65050.12, subd. (e):

"[E]nvironmental justice' means the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies."

While AB 1628 only formally amended the Coastal Act and the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000, the intent of the Legislature is clear that environmental justice must include equal access by all communities to information about governmental decisions that may affect them, and equal opportunity to participate in the making of those governmental decisions. The City has denied equal access and "fair treatment" regarding the Hollywood Center project and the impacts it may have on the community's physical environment.

As with all of our communications, please ensure that this letter and attachments or printed out links therein are included in the running administrative record for this case.

To conclude, we renew our requests, and that of multiple community members and groups, for a tolling or extension of the current, June 1, 2020 public comment deadline.

In light of the seismic/earthquake fault Figures and Plates being corrupted, this is even more urgent, and legally mandated. Sadly, corruption permeates the Draft EIR, literally and figuratively.

Please publicly advise – as far in advance of June 1, 2020 as possible – regarding extending or restarting the public comment period. Thank you.

Response to Comment No. IND 8H-4

The comment suggests that access to the Draft EIR is only available for those who have access to the internet. However, as explained above, the City made hard copies of the Draft EIR available upon request. As this comment does not raise any issues with respect to the content and adequacy of the Draft EIR, no further response is warranted. The comment also requests that the letter and attachments be included in the administrative record for the case; both of which have since been included.

Comment No. IND 8H-5

Exhibit 1: Comment letter dated November 2, 2012 from then Councilmember Eric Garcetti to Planning Director Michael LoGrande to request an extension of the comment period.

Exhibit 2: Los Angeles Times, Here's a closer look at the ex-deputy mayor enmeshed in City Hall corruption probe, May 20, 2020.

Exhibit 3: Notice of Extension for the citizenM Hollywood & Vine Draft EIR comment period dated July 30, 2019.

Exhibit 4: Pictures from the Draft EIR as referenced within the comment letter.

Response to Comment No. IND 8H-5

This comment provides exhibits referenced in Comment Nos. IND 8H-1 through 8H-4. The responses above address the contents of these exhibits. As the referenced exhibits do not raise any specific issues regarding the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 8I-1

Dear Ms. Nguyen:

Please click on below link containing our letter for the above-referenced matter.

<https://www.dropbox.com/s/e6xgr2dfc4j2nic/6-120%20%20%5BSCAN%5D%20Initial%20Comment%20On%20%26%20Objections%20To%20DEIR%20for%20Hollywood%20Center%20Project.pdf?dl=0>

We had difficulties assembling the documents because of the file size. However, everything should be readable and totals 2,596 pages.

Please confirm receipt. Thank you.

Response to Comment No. IND 8I-1

This comment letter indicates that there is a letter included in the link. Responses to the letter are provided in Response to Comment Nos. IND 8I-2 through 8I-79.

Comment No. IND 8I-2

Dear Mr. Bertoni and Ms. Nguyen:

I. INTRODUCTION AND PRELIMINARY OBSERVATIONS.

This firm represents StopTheMillenniumHollywood.com (“StopMillennium”), a community group focused on securing a livable environment and honesty in LA City government decision making.

From 2013-2019, StopMillennium succeeded in overturning the City’s illegal approvals for a similar mega-project, on the same site, by the same developer. (Incredibly, that same developer, Millennium Partners, is responsible for the notorious Leaning Tower of San Francisco.) StopTheMillenniumHollywood.com vs. City of Los Angeles, et al. (LASC Case No. BS144606; Court of Appeal Case No. B282319; CA Supreme Court Case No. S258643).

We prevailed at trial, the Court of Appeal, and the California Supreme Court. Our lawsuit exposed repeated violations of law and abuses by Los Angeles City officials. It also resulted in an appellate opinion that has helped all Californians. (**Exhibit 1.**)

Although Millennium seeks to distance itself from its tainted brand due to our successful litigation, the international scandal surrounding Millennium’s slipshod construction of the Millennium Tower in San Francisco, and the 7.0 Hollywood Earthquake Fault (more on that below) running through its Hollywood site, “Hollywood Center” is basically a redo of the original failed, and still illegal project. We hereafter refer to the Hollywood Center project as the “Project”.

As discussed below, the 13,000-page Draft Environmental Impact Report and technical appendices (“DEIR”) for the Project – forced on the public with no extension of time to comment granted, despite the COVID pandemic, and now rioting, curfews and the National Guard on the streets – is a disgrace. The DEIR is also a procedural and substantive sham.

Response to Comment No. IND 8I-2

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and

II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

The comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

However, see Topical Response No. 1 – Public Participation and Review, above, for a discussion regarding the City’s determination that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period.

Comment No. IND 8I-3

From our prior lawsuit’s spotlighting of multiple illegal acts by City officials in approving the original project and its EIR (see also the related May 20, 2020 Los Angeles Times article, “*Here’s a closer look at the ex-deputy mayor enmeshed in City Hall corruption probe*” [Exhibit 2]¹), and from the many requests for extension of the public comment period, the City knows the current Project is generating tremendous controversy.

As our Supreme Court has held:

“The EIR is . . . intended ‘to demonstrate to an **apprehensive citizenry** that the agency has, in fact, analyzed and considered the ecological implications of its action.’ [Citations.] Because the EIR must be certified or rejected by public officials, it is a document of accountability. . . . The EIR process protects not only the environment but also informed self-government.” Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal.3d 376, 392 (emphasis added).

In another California Environmental Quality Act (“CEQA”) case where the City lost, the Court of Appeal explained:

“The fundamental goals of environmental review under CEQA are information, participation, mitigation, and accountability.” Lincoln Place Tenants Ass’n. v. City of Los Angeles (2007) 155 Cal.App.4th 425, 443-444.

Yet City officials and Millennium are proceeding with the utmost speed, racing for new approvals. If granted, those approvals would not only be illegal, but immoral, as they would imperil thousands of lives by placing skyscrapers atop the State-mapped 7.0-magnitude active Hollywood Earthquake Fault. Mayor Garcetti, the City Council and City Planning’s bizarre actions in this case are intensifying the citizenry’s apprehension.

Footnote 1: <https://www.latimes.com/california/story/2020-05-20/federal-corruption-investigation-la-city-hall-ray-chan>

We specifically request that all hyperlinks in this letter (and in all other objections letters submitted by all other persons, entities and groups) be downloaded and printed out and/or downloaded, submitted to the agency, and included in the City's control file and administrative record for the Project.

Response to Comment No. IND 8I-3

The comment expresses opposition to the Project based on alleged illegal activities by public officials related to a previous project at the Project Site; however, the comment does not raise a substantive issue on the content or adequacy of the Draft EIR, and, thus, no further response is warranted.

The comment also expresses opposition to the Project based on the Draft EIR's public review comment period and alleges that the City officials are "racing for new approvals." The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, per the Draft EIR's NOC/NOA, dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above, which includes a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with this EIR. All required CEQA notice periods were observed, and the Draft EIR was circulated for the required time period.

The comment further requests that all hyperlinks in the comment letter (and in all other objections letters submitted by all other persons, entities and groups) be downloaded and printed out and/or downloaded, submitted to the agency (i.e. presumably the City, the lead agency), and included in the City's control file and administrative record for the Project. As previously stated in Response to Comment No. IND 8D-3, the Millennium Hollywood Project was an entirely different project, and a completely new EIR has been prepared for the Project that is currently proposed. The comment does not contain or specifically refer to any readily available information contained in the flash drive and does not explain the relevance of any portion of that material. (See CEQA Guidelines Section 15088(c).) As a result, the comment does not raise specific issues with respect to the content or adequacy of the Draft EIR, which is independent of any environmental review done on the previous project, and, therefore, no further response is warranted.

Comment No. IND 8I-4

This haste is more perplexing in light of the fact that after the City Council's July 2013 approvals in the original project, several significant developments have occurred. These include:

- (1) In 2014, the State of California, through the California Geological Survey, officially mapped the 7.0-magnitude active Hollywood Earthquake Fault directly through the site, making the proposed Project even more clearly illegal than at the time of the

original, 2013 approvals. Although Millennium and the City had the right, and duty, to exhaust administrative remedies if they sought to challenge the State's official determination, they failed to exhaust those administrative remedies. The City and Millennium are, therefore, estopped from arguing that the fault does not run through the property, or that the fault is not active. The facts on the ground and their failure to exhaust administrative remedies as required by law bar their attempt now, in this DEIR, to redefine the fault as allegedly being "inactive." The DEIR's entire premise that the fault is "inactive" is a legal nullity. From the outset, the DEIR thus fails on this critical issue (as well as numerous others). The DEIR collapses under the weight of its own lies. *Jasmine Networks, Inc. v. Superior Court* (2009) 180 Cal.App.4th 980, 1005-1006 ("part of our job is to resist such devices, and to declare, when so it seems to us, that the emperor in fact has no clothes").

Response to Comment No. IND 8I-4

The comment expresses concern with failure to increase the time for public review of the Draft EIR due to the alleged geological hazards on the Project Site and other unidentified deficiencies. However, the Project would not be constructed on an active fault line. Please refer to Topical Response No. 3 – Geology and Fault Hazards, regarding development near a fault line. As discussed in Topical Response No. 3, the Project's geology and fault-related impacts were fully analyzed in the Draft EIR's Section IV.D, *Geology and Soils*, which were primarily based on a Geotechnical Investigation report and a Surface Fault Rupture Hazard Evaluation Report (2015 and 2019 Fault Study), both of which were reviewed and approved by the City of Los Angeles Department of Building and Safety, as provided in Appendix G of the Draft EIR. As discussed therein, the Project evaluated in the Draft EIR would result in less than significant geology and fault-related impacts.

Neither the City nor the Applicant are estopped from confirming that the fault does not run through the Property. Pursuant to state law, it is the City's responsibility to review and approve a geologic investigation prepared by a licensed geologist concluding whether an active fault exists on the Property. The State of California has no further decision-making role; it is not within the State of California's discretion or scope to conclude or opine whether an active fault exists on the property. For this Project, a licensed geologist has submitted a geologic investigation to the City demonstrating that proposed buildings will not be constructed across active faults, and the City has concurred with the licensed geologists' professional opinion. Moreover, the allegation that the City is estopped from doing a site specific analysis of the Project Site is not consistent with CEQA which requires an EIR to "identify and focus on the significant effects of the proposed project on the environment." (CEQA Section 15126.2(a)) A claim of failure to present information at a 2014 state hearing does not convert the comment into an issue that is related to the significant effects of the Project on the environment and, therefore, does not present evidence on the content or adequacy of the Draft EIR.

Comment No. IND 8I-5

- (2) Beginning in 2018, multiple City officials and developers have come under FBI investigation for pay-to-play corruption. That FBI investigation is widening on an almost daily basis, as reported in the media.
- (3) Former Councilman Mitch Englander in March 2020 pled guilty to federal obstruction of justice for his taking of bribes related to development projects. Councilman Jose Huizar has also been a focus of the FBI's investigation.

Is it a mere coincidence that two of the three votes on the City Council's Planning and Land Use Management Committee that approved the original project in June 2013 came from Englander and Huizar? They ignored all evidence of the Hollywood Fault crossing the site, while simultaneously dismissing evidence of Millennium's falsification of seismic maps and data.²

Is it also a mere coincidence that Englander ran the final City Council hearing that fully approved the original project in July 2013, when the project was not in his district, and when he was not the Council President? Indeed, then City Council President Herb Wesson, who normally would run the meeting (and, we note, whose office has also been implicated in the FBI investigation) was present and voted. That is the hearing when the full City Council mysteriously approved the original Millennium project – over the objections of dozens of community groups and hundreds of thousands of residents, and even over the objections of two State agencies, Caltrans and the California Geological Survey.

- (4) Another subject of the FBI investigation is former LA Building & Safety ("LADBS") head, Raymond Chan. Throughout the U.S. Attorney's court filings, Chan is referred to as "Individual 1." As revealed to date (see, e.g., **Exhibit 2**), the FBI investigation and U.S. Attorney filings have pointed towards influence peddling and/or corrupt activities by Chan.

During the original proceedings, we argued that LADBS's approval of Millennium's earthquake fault studies was per se illegal because, overlapping with the time that LADBS was overseeing those approvals, Chan's son was simultaneously being paid by Millennium's chief lobbyist and law firm, Sheppard Mullin. Among other things, an ethics complaint was filed against Chan related to this state of affairs (**Exhibit 4**), but the City did nothing. Instead, Garcetti promoted Chan to Deputy Mayor.

We also discovered Chan lying about his alleged non-involvement in Millennium's seismic review and issues. Emails obtained through Public Records Act requests (**Exhibit 5**) show Chan at the center of discussions with Millennium's attorneys about the Hollywood Earthquake Fault potentially running through the project site. Those attorneys worked at the law firm of Sheppard Mullin (which according to City

Ethics Committee reports, received millions of dollars in lobbying fees from Millennium).

This remains relevant because significant portions of the seismic studies and alleged data undergirding the current DEIR's assertions that "there is nothing to see here, move on", were processed and accepted by Chan's LADBS in connection with the original project. Those studies should never have been accepted by the City in the first place, much less play an ongoing starring role in this DEIR now. The scandal continues.

Footnote 2: We incorporate the entire administrative record for the original Millennium Hollywood Project, LASC Case No. BS144606. By letters dated April 29 and May 20, 2020 (collectively at **Exhibit 3**), we provided a flash drive with the entire administrative record and reference library from the original case. We incorporate by reference all objections made by any and every party in the original case, most of which objections continue to apply with full force to the current Project. As a result, as part of responding to comments during this EIR process, the City must apply every objection from the original Millennium case to this matter and this DEIR, and must respond to every such objection as part of this EIR. Indeed, given the unreasonably short period of time you have allowed the public within which to submit comments during this public comment period, many individuals or groups who might otherwise have tried to comment now have not been able to, or simply gave up. Therefore, the prior comments and objections from the original matter serve a particularly important role in this matter. In any event, by our providing of that complete administrative record, and by this demand, but in light of the prior trial court and Court of Appeal rulings against the City and Millennium (i.e., you cannot simply reproduce the faulty Final EIR from the original case as your "responses" to our re-assertion of the original objections), you must include and respond to each and every one of those earlier objections, which we incorporate herein and reassert.

Response to Comment No. IND 8I-5

The comment expresses opposition to the Project and the alleged haste in which the City is processing the request for Project approvals based, in part, on assertions of alleged illegal activities by public officials related to a previous project at the Project Site. However, this is an entirely new project with new environmental analysis. Furthermore, see Section 3 of the Project Description, page II-9 of the Draft EIR, which states "[t]his analysis contained in this EIR is for a new Project and does not, in any way, rely on the environmental review prepared for the previous project, which was invalidated." The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project. Accordingly, in so far as this comment relies on the alleged activities related to a different project, it does not raise any specific issues with respect to the content and adequacy of the Draft EIR, and, thus, no further response is warranted.

To the extent that the comment also expresses opposition to the Project based on the adequacy of certain seismic studies related to a previous project at the Project Site, the

Draft EIR is for an entirely new project at the Project Site with new environmental analysis and seismic studies prepared for the Project. Please refer to Topical Response No. 3 – Geology and Fault Hazards, regarding development near a fault line. As discussed in Topical Response No. 3, the Project’s geology and fault-related impacts were fully analyzed in the Draft EIR’s Section IV.D, *Geology and Soils*, which were primarily based on a Geotechnical Investigation report and a Surface Fault Rupture Hazard Evaluation Report (2015 and 2019 Fault Study), both of which were reviewed and approved by the City of Los Angeles Department of Building and Safety (LADBS), as provided in Appendix G of the Draft EIR. As discussed therein, the Project evaluated in the Draft EIR would result in less-than-significant geology and fault-related impacts.

The comment also requests that the entire administrative record of a previous project at the Project Site to be included in the Project’s EIR and requests that this Final EIR respond to and apply each of the objections raised in the prior project’s environmental analysis. The entire administrative record of the previous project at the Project Site has been included in this Project’s administrative record because it was included in Comment No. IND 8D-3 in readily accessible form. However, the City has independently determined that that administrative record for the previous project has no relevance to the current Project or the content and adequacy of the Draft EIR for the current Project. Pursuant to CEQA Section 15088(c), the City is not required to provide detailed responses to comments that do not explain the relevance of the evidence submitted with the comment. This comment does not state which prior comments are relevant to the review of the current Draft EIR or why they would be relevant. Since the comments to the prior EIR are comments to the environmental review of a different project and since the current Draft EIR is for an entirely new project at the Project Site with new environmental analysis, the City has determined that the prior EIR and the comments to the prior EIR have no relevance to this Project. Therefore, as the Project does not rely on the prior EIR and since the comment does not provide evidence of significant environmental effects which are not analyzed adequately in the Draft EIR for the current Project, no further response is warranted for the objections raised on the previous project at the Project Site. See *City of Irvine v County of Orange* (2015) 238 Cal. App. 4th 526, 549, 558. See also Response to Comment No. 8D-3, which addresses the inclusion of the entire administrative record of a previous project at the Project Site in the current Project’s EIR.

Comment No. IND 8I-6

- (5) The current DEIR’s failings result not only from the inclusion of tainted material as described above. They also come from the exclusion of information that must be included in a recirculated DEIR for the public and decision makers. This includes, but is not limited to, a **new report issued in May 2020 by the United States Geological Survey, based on the newest and most precise form of detecting earthquake faults**, called Guided Wave Study (**Exhibit 6** [<https://pubs.usgs.gov/of/2020/1049/ofr20201049.pdf> ; note that the title refers to 2018 studies, but the document was published in May 2020]; see also Seismic Section and discussion, infra), with critical new information and data for projecting

3 more active fault splays of the Hollywood Earthquake Fault across the Project site.

Response to Comment No. IND 8I-6

The Draft EIR technical support documents prepared by Group Delta Consultants (2015 and 2019) for the evaluation of surface fault rupture hazard at the Project Site remain the most relevant data pertaining to the recency of faulting below the Project Site, according to the current California Geological Survey (CGS) Special Publication 42 (*Earthquake Fault Zones, A Guide for Government Agencies, Property Owners / Developers, and Geoscience Practitioners for Assessing Fault Rupture Hazards in California*, 2018) and LABDS P/BC 2020-129 (*Surface Fault Rupture Hazard Investigations*, January 1, 2020). The CGS and LABDS publications are the standard of practice in investigating the hazard of surface fault rupture. The referenced 2018 U.S. Geological Survey (USGS)-California Geological Survey (CGS) report, dated May 8, 2020, presents geophysical data not in conflict with the Draft EIR technical support documents. Both investigators (i.e., Group Delta and USGS-CGS) present evidence for the potential of near surface faulting below the Project Site. Faults are a common occurrence anywhere in Southern California because it is a seismically active region. However, extensive trenching and subsurface stratigraphic explorations performed at the Project Site by Group Delta and others provide direct observation for evaluating the recency (i.e., timing) of faulting history. It is this recency of faulting history by which the potential hazard of future surface fault rupture is evaluated. The 2018 USGS-CGS (2020) report data are limited and cannot present evidence of the activity of faulting. As stated in the 2018 USGS-CGS report, “the seismic data provide little or no information about the rupture history of the fault traces,” as well as in the CGS 2018, *Guide for Assessing Fault Rupture Hazards in California*, “geophysical methods alone can only provide a range of alternative interpretation for what exists in the subsurface.”

Furthermore, the fault investigations at the Project Site presented in the Draft EIR technical documents prepared by Group Delta Consultants (2015 and 2019) were performed with full transparency and witnessed by the CGS and City reviewing officials. The CGS representatives who participated on-site in review sessions in the West Trench February 2014, in the East Trench July 2014, and SEC Ivar and Yucca Trench October 2018, included Janice Hernandez, Brian Olsen, Jerry Treiman, and Gorgon Seitz. Janice Hernandez, who has authored the CGS Fault Evaluation Reports, as well as the 2018 USGS-CGS Seismic Survey. Five Group Delta Certified Engineering Geologists, participated in different phases of the investigations. The trenches and transects were observed by paleoseismic specialists, including Thomas Rockwell and Roy Shlemon, as well as expert third party reviewer Eldon Gath with Earth Consultants Inc (ECI). All parties are well-respected professionals, considered experts in fault studies in Southern California. It is with cooperation with the regulatory officials and fault study experts that the Project Site was determined to have a history of no recent fault rupture in the last at least 30,000 years.

Additional discussion of the 2018 USGS-CGS report is provided below in Response to Comment Nos. IND 8I-49, IND 8I-59, IND 8I-60, and IND 8I-61.

Comment No. IND 8I-7

The above overview brings us to the present, to this DEIR, and to the ongoing violations of law and public trust by Mayor Garcetti, Councilman Mitch O'Farrell (whose district the Project is in), the Planning Department, and LADBS.

The law requires the City to reject the DEIR and the Hollywood Center Project.

Response to Comment No. IND 8I-7

This comment reiterates the commenter's assertion that the City should not approve the Project. As this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 8I-8

II. PRELIMINARY PROCEDURAL ISSUES.

Please keep this office on the list of interested persons to receive timely advance notice of all hearings, votes and determinations related to the Project, its DEIR and requested entitlements.

Pursuant to Public Resources Code Section 21167(f), please provide a copy of each and every Notice of Determination issued by the City in connection with the Project.

We adopt and incorporate by reference all Project comments and objections raised by all others during the environmental review and land use entitlement processes for the Project.

As noted above, we incorporate by reference the entire administrative record for the original Millennium Hollywood project, Los Angeles County Superior Court Case No. BS144606.

Response to Comment No. IND 8I-8

This comment does not raise a substantive issue on the content or adequacy of the Draft EIR but rather contains several procedural requests. As requested, the commenter will be on the list of interested persons to receive timely advance notice of all hearings, votes and determinations related to the Project, the Draft EIR and requested entitlements, and will be provided a copy of each Notice of Determination issued by the City in connection with the Project. As the commenter provided the entire administrative record for the previous project at the Project Site in conjunction with a hard copy letter submitted to the case file, it has been included in this Project's administrative record. Refer to the responses to comments for each of the comments and objections raised by each specific commenter.

As this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 8I-9

III. ALL NOP AND ELDP COMMENTS AND OBJECTIONS MUST BE INCLUDED IN A RECIRCULATED DEIR AND RESPONDED TO.

Critical to the environmental review process is the opportunity of the public and other public agencies to identify information they require to be included in the Draft EIR to enable informed public review and comment. This also means that it is the lead agency's job to assure that negative and inconvenient information is not withheld from the public in the DEIR, so as to impair the public and expert agencies in their vital role to help shape a project and to hold the lead agency accountable in the process. All required information must be included at the Draft EIR stage, and not later in the process, as occurred during the earlier project's CEQA review process.

Unfortunately, the instant DEIR has violated this critical, early step of the CEQA process by refusing to acknowledge, much less address in the DEIR, various comments and demanded study parameters as contained in comment letters submitted in response to the City's Notice of Preparation ("NOP"). Some of those comments came from this office. We incorporate by reference all of the NOP comment letters from all sources. We demand that you recirculate the DEIR to include all issues and study areas raised by, and then to properly address each such issue and study area, from each of the comments raised in those NOP letters.

Response to Comment No. IND 8I-9

This comment asserts that comments provided in response to the NOP were not addressed in the Draft EIR. An example is provided in Comment No. IND 8I-10, which is addressed in Response to Comment No. IND 8I-9. The NOP comments pertaining to the scope and content of the Draft EIR were reviewed by the City during preparation of the Draft EIR. The Draft EIR analyzed issues and included technical studies, as necessary, to support the impact findings concluded therein. In consideration of the NOP comments, the content of the Draft EIR was prepared consistent with CEQA Guidelines Sections 15120 to 15132. In addition, besides the example provided in Comment IND 8I-10, no specific issues or study areas are referenced in the comment, nor does the comment provide any facts. As no substantial evidence is provided to support this claim, nor substantive issues on the content or adequacy of the Draft EIR raised, no further response is warranted.

Comment No. IND 8I-10

As but one example, our September 27, 2018 NOP comment letter (**Exhibit 7**) observed that the City's "Initial Study asserts that the Project will have no direct impact on cultural and historic resources in the area. That contention is not accurate." As will be discussed further below, the City violated AB 52 consultation requirements regarding

cultural and historic resources by failing to include tribal representatives in trenching activities³ conducted on the East and West Sites as part of the Project review and approval process. The City's dismissive handling (**Exhibit 10** [April 8, 2020 City letter]) of the on-the-record tribal requests for participation (**Exhibit 11** [Gabrieleño Band of Mission Indians – Kizh Nation, September 10, 2018 letter]) is illegal.

Footnote 3: See <https://www.youtube.com/watch?v=JRVttDWBvOo&feature=youtu.be>, for a 3-minute, breathtaking drone video taken by StopMillennium of one of the East Site trenches upon which the present DEIR bases much of its critical seismic conclusions, incorporated by reference. We note that although the trench appears “impressive” for seismic review purposes, it actually was part of the propaganda campaign being waged by Millennium and the City. The California Geological Survey as part of its official Alquist-Priolo Study FER-253 specifically noted that the trench terminated too early; it did not reach the point to the south where the CGS had plotted the main fault scarp to be crossing the property. See at **Exhibit 8** (FER-253 Supplement No.1; <https://gmw.conservation.ca.gov/SHP/EZRIM/Reports/FER/253/>, on page 26, second to last paragraph, next to last sentence: “The eastern trench at GDC Site 2 (and extending south into GDC Site 1) **did not extend far enough south to fully explore** these possible faults and their potential connection to the scarp at Carlos Avenue.” (Emphasis added.) In other words, Millennium stopped before reaching the most critical location. That video is incorporated by reference into the present administrative record. See also **Exhibit 9** (photos of the East Site trench).

As to tribal cultural resources, the video and photos graphically demonstrate how destructively and surreptitiously (behind green fencing, and without tribal cultural monitors) the trenches were dug. In violation of law, the City failed to invite the tribal representatives in to observe. The more recent West Site trenching from approximately 2018, the alleged data from which is also included in this DEIR, suffers from the same problem. The City and this DEIR cannot literally and figuratively plow under the potential existence of Tribal Cultural Resources.

Prior to any further review of the Project or its DEIR, the City should order Millennium to fully reopen the trench locations and/or retrench to give unfettered access to representatives of the Gabrieleño Band of Mission Indians – Kizh Nation, as well as scientists from the California Geological Survey and United States Geological Survey.

Response to Comment No. IND 8I-10

The comment expresses opposition to the Project by asserting that Gabrieleño Band of Mission Indians – Kizh Nation tribal representatives were not present during the trenching activities on the Project Site and that the said trenching activities were not adequate. However, CEQA does not require the presence of tribal representatives during exploratory site work. AB 52 requires consultation, if requested by a Tribe, prior to release of the Draft EIR; but does not specify the need for tribal presence during studies conducted to review potential environmental impacts of the Project. Moreover, the trenching was conducted by a company with a trenching license which is renewed every

year through OSHA. Each trench exploration was observed by multiple licensed geologists, and no potential resources of significance were recorded.

In regard to the extent of trenching performed, the initial West Trench (within a portion of East Site on Project Site) was excavated in February of 2014 in coordination with a neighboring property. The planning of the location of this trench was performed prior to the February 14, 2014, release of the Fault Evaluation Report (FER) 253 for the Hollywood Fault, and was intended to investigate the Yucca Street strand as mapped out by Dolan et al. in 1997, which was considered at the time to be the leading evidence for active faulting along the Hollywood Fault Zone. During this time, hundreds of feet of transects were also investigated with closely spaced cone penetrometer tests (CPT) and core borings. Following the release of the FER 253, the East Trench (within a portion of East Site on Project Site) was planned and performed to extend the investigation to the southern property line to intercept all potential faulting as mapped by the FER 253 report. Following the completion of the trenching on the East Site, the CGS prepared the FER 253 Supplement No. 1 dated November 5, 2014, in which the fault traces were relocated outside the limits of the trenching. At the time of the release of this supplemental report, the 2015 Fault Study was still ongoing, and, therefore, the Supplement No. 1 FER 253 is not representative of the most complete knowledge about the faulting below the Project Site as the Fault Studies 2015 and 2019. These scientific explorations (trenching) were conducted in accordance with applicable regulations and were not subject to discretionary actions, such as building or grading permits or conditional use permits. As such, CEQA requirements regarding TCRs were not applicable. The AB 52 Statute, codified as PRC Section 21080.3.1, requires notification and consultation with a California Native American tribe, traditionally and culturally affiliated with the geographic area, within 14 days of the completion of an application. This notification applies only to those activities that would require a discretionary action, which, in turn, would mandate a negative declaration, mitigated negative declaration, or environmental impact report. Such notification was performed by the City with regard to the Project's Draft EIR but did not apply to the earthquake fault studies that required a discretionary action.

Moreover, State and City officials were present during the trenching. During exploration, each trench site had several geologists present who scoured over the exposures in the trench walls. No artifacts suspected of cultural sensitivity were observed. Also, as previously mentioned, the West Site trench (2019) excavation was performed in 100,000+ year old deposits, which has minimal potential to contain TRCs.¹⁰⁵

After the release of FER 253 Supplement No. 1, additional fault studies in 2015 and 2019 were performed. The Draft EIR relied on the most site-specific information regarding faulting beneath the Project Site. In addition to the fault trenching, Group Delta investigations included four transects of continuous core borings and CPTs, which extended to the southern property line of the Project Site. The investigations intersected

¹⁰⁵ Group Delta, Michelle Sutherland, P.G., C.E.G., Senior Geologist, statement in email to ESA dated July 15, 2020. Correspondence is provided in Appendix C in this Final EIR.

all the CGS mapped Hollywood Fault traces and show evidence of unfaulted soil layers estimated to be at least 30,000 years old.

Comment No. IND 8I-11

In addition to the NOP comment letters, the City must include all objection letters related to the Environmental Leadership Development Project (“ELDP”) AB 900 application request process initiated by Millennium for this Project. It appears that the City in its running administrative record (as required by AB 900) has not included in the administrative record for the DEIR process the ELDP objection letters themselves. That too distorts the purpose of the DEIR, which is to fully disclose, evaluate and mitigate all environmental impacts of the Project. By attempting to censor from this administrative record and DEIR those ELDP letters and their detailed objections and concerns (akin to NOP objection letters), the City again undermines CEQA’s core purposes of: (1) enabling and encouraging informed public participation; (2) enabling informed public agency decision making; and (3) mitigating impacts.

As a result, we have compiled all of the ELDP objection letters at **Exhibit 12** hereto. We incorporate by reference all of the those ELDP objection comment letters. We demand that you recirculate the DEIR to include all issues and study areas raised by, and then to properly address each such issue and study area, from each of the comments raised in those ELDP objection letters.

Response to Comment No. IND 8I-11

This comment expresses opposition to the Project by asserting that the City is required to include all of the objection letters in the Draft EIR and respond to said letters related to the Project’s application and subsequent certification by the Governor as an Environmental Leadership Development Program (ELDP) project pursuant AB 900. Neither CEQA nor AB 900 require the City to keep a running record of comment letters submitted to the Governor’s Office and Research and Planning for an ELDP application and further do not require the City to include the ELDP comment letters in the Draft EIR and respond to those comments raised during the ELDP certification process in the Draft EIR since the ELDP certification is not within CEQA’s purview.

The comment also asserts that the Draft EIR attempts to conceal that the Project is an ELDP. However, Section II.7(e)(2), *Environmental Leadership Development Project*, page II-68 of the Draft EIR, provides that:

The Project has been certified by Governor Brown as an eligible project under the Jobs and Economic Improvement through Environmental Leadership Act of 2011 (AB 900). The Notice of Environmental Leadership Development Project (ELDP), dated August 17, 2018, was circulated in accordance with PRC Chapter 6.5 (commencing with Section 21178). AB 900, which is codified in PRC Sections 21178 through 21189.3, was intended to encourage California’s economic recovery by providing a streamlined process for judicial review of compliance with CEQA for development

projects that qualify as an ELDP. On August 16, 2018, Governor Brown certified that the Project meets the criteria set forth in the statute, including the applicable updated requirements in AB 246. In order to be certified as an ELDP, the Governor determined that the Project would result in a minimum investment of \$100 million, would create high-wage jobs, and would not result in net additional greenhouse gas (GHG) emissions, as determined by the California Air Resources Board. Further, a mixed-use project, such as the Project, must meet additional requirements. Specifically, it must be located on an infill site, be designed to achieve Leadership in Energy & Environmental Design (LEED) Gold certification, be consistent with the relevant regional sustainable communities strategy, and exceed by at least 15 percent the transportation efficiency for comparable projects. The Governor’s certification determined that the Project complies with all of these applicable requirements. The Governor’s certification and related documentation are provided in Appendix B of this Draft EIR.

The comment also requests that Exhibit 12, which includes the compiled ELDP comment letters, be incorporated into the administrative record. The compiled ELDP objection letters incorporated into the comment letter are noted, and will be included in the administrative record.

Comment No. IND 8I-12a

IV. THE CITY HAS VIOLATED ENVIRONMENTAL JUSTICE AND DUE PROCESS RIGHTS BY ALLOWING ONLY 45-DAYS FOR A PUBLIC COMMENT PERIOD ON A 13,000-PAGE DEIR, RELEASED TO THE PUBLIC DURING THE COVID-19 CRISIS.

Despite an outpouring of written requests for a tolling or extension of the public comment period (including from Councilman David Ryu, whose District 4 constituents would experience the brunt of the Project’s environmental impacts, including degradation of emergency services response times, even though the Project is in District 13 – O’Farrell), all of which we incorporate by reference, the City has pursued a sort of “Hunger Games” ugliness towards the public. We attach some of our correspondence on this subject collectively at **Exhibit 13**.

Response to Comment No. IND 8I-12a

The comment expresses opposition to the Project by asserting that the Draft EIR’s public comment period should be extended, in part, because certain constituents in City Council District 4 “would experience degradation of emergency services response times, even though the Project is in” City Council District 13. However, this comment does not provide any facts and, therefore, no substantial evidence to support this claim. With regard to the adequacy of the Draft EIR public review period and for additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above. As this comment does not raise any

specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Nonetheless, the Draft EIR addresses and considers the Project's potential effects on the emergency service response times in the analyses of impacts regarding public services. For example, see Section IV.K.1(2)(b)(3), *Fire Protection Response Time*, and Section IV.K.1(3), *Fire Protection Project Impacts*. Appendix M-1 of the Draft EIR also includes statistical data regarding fire protection services, response times, and emergency access. See also Section IV.K.2(3), *Police Protection Project Impacts* of the Draft EIR. Appendix M-2 of the Draft EIR also includes statistical data regarding police protection facilities, services, and response times. While response times are considered in the analyses, the focus of the public services analyses is on whether or not new or expanded facilities are needed to maintain adequate public service and whether a potential physical impact could occur if construction of facilities was warranted. In the case of the Project, it was determined that the Project would not generate a demand for additional police and fire protection services that would result in the need for new or expanded fire and police services facilities. As such, Section IV.K.1 and IV.K.2 of the Draft EIR concluded that impacts to fire and police services, respectively, would be less than significant.

Comment No. IND 8I-12b

The City's refusal to extend the 45-day comment period has been fundamentally unfair to the public in myriad ways described in those letters. But it has also been unfair to public agencies such as the SCAQMD, Caltrans, the California Geological Survey, and others that likely will comment (or would have), but whose staff members have been operating remotely, without all of their files and normal equipment, and under the same reduced capacity and pressures from the COVID crisis and lockdown orders affecting all of us. The City's blithe, let-them-use-internet responses are repugnant.⁴

To read the entire tale of the public's pleading for more time, and the City's twisted retorts, recalls the statement by Chief Counsel of the U.S. Army, Joseph Welch, in his confrontation with Sen. Joseph McCarthy, where Welch famously asked McCarthy: "Have you left no sense of decency?" https://en.wikipedia.org/wiki/Joseph_N._Welch.

The City's refusal to extend, or restart, the public comment period also violates the public's constitutional due process rights, requiring fair notice to all who may be affected by land use decisions. See the Supreme Court's holdings in, e.g., Horn v. County of Ventura (1979) 24 Cal.3d 605, 612 & 616-619; Scott v. City of Indian Wells (1972) 6 Cal.3d 541, 548-550.

That we managed to produce this letter does not take away from the fact that we could and would have produced far more had time allowed. Nor does it negate the reality of most others who either gave up in the face of the City's adamant refusals to extend the public comment period, or produced something far less substantive because of the sheer inability to get through 13,000 pages of highly technical, and often impenetrable to a lay person, material.

Response to Comment No. IND 8I-12b

As this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Nonetheless, the comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, per the Draft EIR's NOC/NOA, dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above, which includes a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with this EIR.

The Draft EIR's public comment period was conducted in compliance with the statutory requirements, including, but not limited to, PRC Section 21091 and CEQA Guidelines Sections 15087, 15105, and 15205. The Draft EIR Notice of Availability was mailed out to all owners and occupants within a 500-foot radius from the Project Site. In addition, the Notice of Availability was advertised in the Los Angeles Times on the first day of public review, April 16, 2020. The Draft EIR was also made available for review, a hard copy of the Draft EIR, and digital copies on CD-ROM or USB drive, were also made available to anyone who requested one, from the Department of City Planning. Moreover, a hard copy of the entire Draft EIR was made available at the Department of City Planning for any interested party to view. Although the official public comment period closed on June 1, 2020, several comment letters were submitted after the official closing period and those that contained substantive CEQA-related comments have been included and responded to in this Final EIR even though responses to late comments are not required by CEQA. PRC Section 21091(d)(1); *Residents Against Specific Plan 380 v. County of Riverside* (2017) 9 CA5th 941, 972; *Gilroy Citizens for Responsible Planning v. City of Gilroy* (2006) 140 CA4th 911, 924. The City also received and responded to comment letter by the organizations referenced by the commenter, including, but not limited to, SCAQMD and Caltrans. As such, the public was provided an opportunity to review the Draft EIR pursuant to CEQA review time requirements.

Moreover, on April 22, 2020, Governor Gavin Newsom issued Executive Order N-54-20 (Executive Order) temporarily suspending certain consultation and public filing, posting, notice, and public access requirements by CEQA, including those for the notice of availability of a Draft EIR until June 21, 2020 (unless extended or modified) due to COVID-19. The Executive Order provides that lead agencies operating during this suspension period and pursuing review of a Draft EIR must: (i) post the required public notices on the lead agency's website for the same length of time that would be required for physical posting; (ii) submit all required notices to the State Clearinghouse's CEQAnet web portal; and (iii) perform public noticing and outreach to all interested parties as permitted and required by CEQA (e.g., providing notice to all interested parties who have requested notice). The Project's Draft EIR Notice of Availability was mailed, published, and posted

online on April 16, 2020, prior to the Executive Order's effective date of April 22, 2020. However, the notices provided for the Draft EIR complied with the Executive Order's requirements for lead agencies operating during the suspension by: (i) posting the Draft EIR Notice of Availability online on the Department of City Planning's website (<https://planning.lacity.org/development-services/eir/hollywood-center-project-1>) for the entirety of the public review period and thereafter; (ii) submitting all required notices to the State Clearinghouse's CEQAnet web portal (<https://ceqanet.opr.ca.gov/2018051002/3>); and (iii) performing public noticing and outreach to all interested parties as permitted and required by CEQA (e.g., providing notice to all interested parties who have requested notice). As such, the public was provided an opportunity to review the Draft EIR in accordance with CEQA and the Executive Order.

The comment also asserts that the City's refusal to extend, or restart, the public comment period violates the public's constitutional due process rights, requiring fair notice to all who may be affected by land use decisions. However, this comment does not provide any facts and, therefore, no substantial evidence to support this claim and does not raise a CEQA issue on the content or adequacy of the Draft EIR. As such, no further response is warranted.

Finally, Footnote 4, as included in this comment, is addressed as Comment No. IND 81-12c below.

Comment No. IND 81-12c

Footnote 4: We also note that as a sort of "consolation prize" for violating AB 52 and tribal rights, the City informed the Gabrieleño tribal chairman that the tribe would still have the ability to comment on the DEIR. Of course, that is no substitute for observing and monitoring the earth movement and trenching real time. The City then informed the chairman that the public comment period would be 60 days. (**Exhibit 10.**) Even that was a lie, as only 45 days was given.

Response to Comment No. IND 81-12c

This comment makes a general statement that the City informed the Gabrieleño Tribe that they would have the opportunity to comment on the Draft EIR and states that the City misinformed the Gabrieleño Tribe of the Draft EIR's public comment period. However, this comment does not raise a substantive issue on the content or adequacy of the Draft EIR, and, thus, no further response is warranted.

Nonetheless, the City did not violate AB 52 consultation requirements. See Response to Comment No. IND 81-10 and Response to Comment No. ORG 43 regarding tribal consultation requirements for trenching activities. Also, Exhibit 10, as referenced in this comment, includes a letter from the City to the Gabrieleño tribal chairman summarizing the AB 52 consultation that occurred for the Project. Also, Section IV.M, *Tribal Cultural Resources*, of the Draft includes an assessment of tribal cultural resources impacts based

on Native American consultations pursuant to AB 52. The AB 52 consultation documentation is presented in the Hollywood Center Project Assembly Bill 52 Consultation Summary Report, which is provided in Appendix O, of the Draft EIR.

Also, the City directly mailed a copy of the NOA/NOC to the Gabrieleño Tribe, which included the correct public review period for the Draft EIR and directly informed the tribe that they had the opportunity to review the Draft EIR and provide comment. It should be noted that the Gabrieleño Tribe provided comments on the Draft EIR within the 45-day comment period.

Comment No. IND 8I-12d

We also wish to point out that the City has violated new Public Resources and Government Code sections dealing with environmental justice, and the requirements for agencies like the City to ensure that environmental justice communities have a full and fair opportunity to understand and participate fully in governmental decisions.

In a letter dated April 29, 2020, we objected to the City's failure to extend the public comment period for the DEIR in light of the COVID-19 crisis, and in particular, the absence of public access to hard copies of the DEIR in the usual locations of (now- closed) local libraries and the (now-closed) City Planning Department. The City responded on April 28, 2020 with an email that gave the facile and patently untrue response that "the Draft EIR remains accessible to all individuals" because the documents were all on line, thereby implying or assuming that everyone who wanted to review the EIR should be able, on their own, to have a computer, an internet connection and sufficient bandwidth to download this very hefty DEIR and its lengthy appendices. We again objected, in a letter dated April 29, 2020, reminding the City of Mayor Garcetti's lockdown order that closed the libraries and City Hall.

The City's cavalier, let-them-use-internet attitude ignores the very real fact, widely known to the general public, that members of some communities may not have computers or, if they do, may be unable to afford internet access. The libraries where they might usually access the internet are closed, making access to both a hard copy of the DEIR and the online version of the DEIR unavailable. The City's assertion about universal access to the DEIR is simply untrue, unsupported by observable facts, and contradicted by evidence. Unaffordability of access to the internet is particularly and painfully true now, when rampant unemployment is making many people choose between food and rent payments. Assuming that all people can afford both a laptop and internet access is arrogant and discriminatory, and impairs or denies the ability to meaningfully participate in the City's decision-making about the Project.

Attached hereto at **Exhibit 14** is the report that ran on radio station KPCC's LAist feature, describing the difficulties poorer families are encountering when they attempt to get their children connected to on-line school classes. The article describes that internet access is simply not available to all parts of some communities (e.g., Watts), and is available in other locations only at prices that families may not now be able to afford. If

some poorer communities (and Hollywood certainly has poorer communities) cannot get their children on line to continue their education, how can the City justify assuming that all families can get on line to read, study, and comment on the DEIR?

The City's conduct does not comport with both long-standing and recent legislation defining environmental justice. Assembly Bill 1628 was signed into law by Governor Newsom on September 27, 2019, and took effect this year. The bill's Section 1, subd. (b), provides:

“It is therefore the intent of the Legislature to ensure that the populations and communities disproportionately impacted by pollution *have equitable access to, and can meaningfully contribute to, environmental and land use decisionmaking,* and can enjoy the equitable distribution of environmental benefits.” (Emphasis added.)

This definition of “environmental justice” expanded the existing definition in Government Code Section 65050.12, subd. (e):

“‘[E]nvironmental justice’ means the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.”

While AB 1628 only formally amended the Coastal Act and the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000, the intent of the Legislature is clear that environmental justice must include equal access by all communities to information about governmental decisions that may affect them, and equal opportunity to participate in the making of those governmental decisions. The City has denied equal access and “fair treatment” regarding the Project and the impacts it may have on the community's physical environment.

Response to Comment No. IND 8I-12d

The comment expresses opposition to the Project by asserting that the Draft EIR's public comment period was not in compliance with CEQA because reliance on internet access would violate the principles of environmental justice. However, this comment does not provide any facts or supporting evidence that any communities or individuals were denied access to the Draft EIR.

The commenter is referred to Response to Comment No. IND 8I-12b and Topical Response No. 1 – Public Participation and Review, which include a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with this EIR. Moreover, as the comment notes, Assembly Bill 1628 and the commenter's referenced Government Code and PRC sections do not apply to CEQA and have no bearing on this EIR or Project. However, as addressed in Response to Comment No. IND 8I-12b and Topical Response No. 1 – Public Participation and Review, the public was provided an opportunity to review the Draft EIR in accordance

with CEQA and applicable laws. Internet access was not the only available means to access the Draft EIR. As further explained in Response to Comment No. IND 8I-12b and Topical Response No. 1 – Public Participation and Review, in addition to the Draft EIR being available for review on the City’s website, hard copies of the Draft EIR and digital copies via CD-ROM or USB drive copies were also made available to anyone who requested one, from the Department of City Planning. Moreover, a hard copy of the entire Draft EIR was made available at the Department of City Planning for any interested party to view. In fact, one individual requested a hard copy and digital USB copy of the Draft EIR during the Draft EIR comment period, for whom legible copies were provided by the City.

See also Response to Comment No. IND 8I-12c, which explains that even though the Gabrieleño Tribe was originally misinformed on the exact Draft EIR public review period, the City nevertheless provided them a copy of the NOC/NOA of the Draft EIR, which afforded the Tribe an opportunity to review and comment on the Draft EIR. As described above, the Gabrieleño Tribe provided comments on the Draft EIR within the 45-day comment period.

Comment No. IND 8I-13

V. THE DEIR FURTHER VIOLATES CEQA: CORRUPTED DOCUMENTS IN APP. G-1 AND ELSEWHERE REQUIRE RECIRCULATION AND RESTART OF THE PUBLIC COMMENT PERIOD.

The City’s refusal to extend the public comment period, or more appropriately, to restart it altogether, is even more abusive considering that all of the Plates and Figures in Geology Appendix G-1 were corrupted as distributed by the City in the format most likely to be used by the public, i.e., downloading (for those with computers and internet access) the pdf files and viewing them in that manner. (See also p. 5 of our May 22, 2020 letter, included as part of **Exhibit 13** hereto.) The City’s response after we raised this issue speaks volumes about the corruption in this process.

First the City argued that the DEIR was fully available because the public could allegedly view it via computer (even though many would only be able to view a DEIR of this type and size at a public library). Then the City said it was fully available if only the public didn’t download it (that one is particularly risible, as the files cannot be downloaded as anything other than a pdf, in order to preserve the integrity of the underlying document). That the City for more than 5 weeks of the 45-day public comment period had a document with corrupted text and numbers in every single Plate and Figure (totaling 18 critical exhibits), which it did not even bother to check before releasing to the public, is again inexcusable.

The burden cannot be on the public to figure all of this out. It is the responsibility solely of the public agency to make all of the DEIR materials fully available, and in time for the public to review and frame meaningful comments (i.e., not less than a week for a 13,000-page DEIR, during a pandemic). See, *inter alia*, CEQA Guidelines Sections 15200(b)(c)

and (d) (purposes of public review include checking the EIR’s analysis, checking for errors, and identifying omissions); 15201 (public participation is essential to the CEQA process), 15203 (public agency shall allow adequate time for public review [implicitly, for public review of an accurate and complete document]).

Restarting the public comment period after properly releasing a full and corrected version should go without saying. That is particularly true when, as here, there could literally be a catastrophic inability of community members and their technical advisors to assess the earthquake data in the DEIR because of the corruption in Appendix G-1.

Response to Comment No. IND 8I-13

This comment expresses opposition to the Project by asserting that certain pages of Appendix G-1 of the Draft EIR (18 pages to be exact) were illegible when downloaded and viewed as a .pdf file and, as such, warrants extension of the Draft EIR’s public comment period or complete recirculation of the Draft EIR. See Response to Comment No. IND 8H-3, which discusses the issues raised in this comment.

Comment No. IND 8I-14

VI. THE DEIR ALSO VIOLATES CEQA BECAUSE OF ITS LACK OF CLARITY FOR THE LAY PERSON.

CEQA is intended to be a document of public information. Pub. Res. Code §§ 21002.1(a), 21003(b) (“Documents prepared pursuant to this division [CEQA] shall be organized and written in a manner that will be meaningful and useful to decisionmakers and to the public”); Guidelines § 15140 (“EIRs shall be written in plain language . . . so that decisionmakers and the public can rapidly understand the documents”). See also, Vineyard Area Residents for Responsible Growth, Inc. v. City of Rancho Cordova (2007) 40 Cal.4th, 412, 442 (“Vineyard”) (“The data in an EIR must not only be sufficient in quantity, it must be presented in a manner calculated to adequately inform the public and decisions makers, who may not be previously familiar with the details of the project. ‘[I]nformation scattered here and there in EIR appendices’ or a report ‘buried in an appendix’ is not a substitute for ‘a good faith reasoned analysis.’”)

Here, the DEIR does not meet CEQA’s requirement for a document that is fully understandable by and accessible to the public and decision makers. Some discussions are so full of technical information that they cannot easily be followed by a lay reader. One example is the confusing and inadequate discussion at DEIR, p. II-10 to 11, which purports to explain the Site’s existing “D” limitation, without providing any background on what a “D” limitation is or why this particular “D” limitation was imposed on the site, a discussion of the FAR [meaning floor area ratio] for the site that does not make clear what an FAR is or what it does, a reference to an Owner Participation Agreement without an explanation of what such an agreement usually contains, and others.

Similarly, despite the ubiquitous references to air quality modeling in general, and to the EMFAC and CalEEMOD models in particular (see, e.g., DEIR p. IV.B-41), no real explanation is given as to what an air quality model is or does, or what the differences between EMFAC and CalEEMod are.

An especially egregious example of presenting information in a way that is not easily accessible to the lay reader is that the DEIR has technical appendices that run over 1,000 pages, but lack overall Tables of Contents (“TOCs”) and sequential page numbering of the appendix. This makes finding any particular technical discussion or specific piece of information a time-consuming, labor-intensive, very frustrating, and sometimes virtually impossible task. An example is Appendix E-1 (Air Quality), which has 1,160 pages with no TOC. Another example is Appendix N (Transportation analysis), which has more than 1,400 pages, with no overall TOC or sequential page numbering, just separate sets of page numbers for individual analyses within the overall Appendix. Locating any given analysis or bit of data is impossible without a greatly disproportionate investment of time and labor. Equally baffling and frustrating is the passage at the top of page IV.B-40 that refers the reader to Appendix E-1 for a full discussion of the Project’s construction phasing and equipment list, without providing any clue as to how the reader is to find that information in the 1,160-page Appendix E-1, which lacks overall consecutive page numbers and has no TOC.

A blatant violation of the Vineyard dictate that information should not be “buried” in appendices is the plethora of footnotes in the DEIR that cite to documents as a whole, without page citations that would allow a reader to actually find and verify the information being cited, or to understand the context of the quotes from reference documents that the DEIR reproduces. Examples of footnotes referring to entire documents are: (1) footnotes in the Air Quality section numbers 66-68, 70, 73, 77, 82, 91, 98, 112; and (2) footnotes in the Greenhouse Gas section numbers 4, 5, 23, 31, 35, 36, 49, 63, 69-73, 77-79, 82, 87, 108, 109, 111, 113-115, 117, 120, 121, 136, 155, 156, 159, and 160. Here, the information is not only buried, but there are not even tombstones or a map of where the data are buried.

A further violation of CEQA Guidelines Section 15140’s command that “EIRs shall be written in plain language” is the use of technical terms and acronyms without definition, e.g., “SOON” used at DEIR p. IV.B-17 and undefined there or in Appendixes E, N-1, or the Acronyms list.

Based on this firm’s prior litigation, the courts invalidated the previous Millennium project and its EIR on several grounds, including because its project description failed to disclose what the project would actually be. This second time, while some aspects of the physical project are better defined, now the City and Millennium are hiding the impacts in text that is impenetrable to the lay person. It would be hard to have written a more turbid, less clear document. One can reasonably surmise that with the years that the City and Millennium have had to work on this document, that was a deliberate choice. Regardless, this document circulated to the public further violates CEQA.

The DEIR should be thoroughly revised to make it a readable document that allows a lay reader to find, and to understand, what is being said. Until it is, it is *void ab initio* and fails as a matter of law.

Response to Comment No. IND 8I-14

The comment expresses opposition to the Project based on the format of the Draft EIR but does not provide any substantial evidence to support the contention that the Draft EIR fails to comply with CEQA.

The contents and format of the Draft EIR are in compliance with CEQA. See Public Resource Section 21003(b) and CEQA Guidelines Sections 15140 and 15147. The Draft EIR is organized and written in a manner (i.e. using plain language and in an intelligible manner) that make it meaningful and useful to decision-makers and to the public. Maps, charts, diagrams, and other means of presenting information graphically were also used to enhance the Draft EIR's clarity, with technical data summarized and the full analysis incorporated by reference. For example, See Section II.7, *Project Description*, of the Draft EIR, which includes a high-level and a detailed description of the Project, as well as Table II-1 detailing the various uses and floor area per use, density, FAR, open space, and vehicle and bicycle parking for the East Site, West Site, and the entire Project.

The Draft EIR is also written in a way that readers are not forced to sift through obscure minutiae or appendices to find important components of the analysis. See the Table of Contents of the Draft EIR, for a high-level outline of the Draft EIR sections, including the Introduction (Chapter I), Project Description (Chapter II), Environmental Setting (Chapter III), Environmental Impact Analysis for each individual resources (Chapter IV), Alternatives (Chapter V), Other CEQA Considerations (Chapter VI), References (Chapter VII), List of EIR Preparers and Organizations and Persons Contacted (Chapter VIII), Acronyms and Abbreviations (Chapter IX), and a list of appendices, figures, and tables. The Draft EIR's analysis is also summarized in a succinct, yet thorough, manner in the Executive Summary of the Draft EIR.

Moreover, Appendix E-1 and Appendix N-1 of the Draft EIR both include table of contents and page numbers. CEQA leaves the design and formatting of the EIR to the sound discretion of the lead agency, subject to the general requirement that the discussion of environmental impacts is adequate. See PRC Section 21100 and CEQA Guidelines Sections 15120 and 15150 (addressing the contents and formatting of an EIR). So long as the public and decisionmakers can locate relevant portions of the Draft EIR, then the chosen indexing format of the Draft EIR does not deprive the public and decisionmakers of meaningful review.

With regard to a discussion of the "D" Limitation, the commenter is referred to Section II.5, *Land Use and Zoning Designations*, of the Draft EIR, which explained that:

The Project Site is subject to 'D' Limitations, pursuant to Ordinance No. 165,659, which restricts lots with Assessor's Parcel Numbers (APN) 5546-004-006, 5546-004-

020, 5546-004-021, 5546-004-029, 5546-030- 028, 5546-030-031, 5546-030-033, and 5546-030-034 to a 3:1 FAR; and the corner lot on the southeast corner of Yucca Street and Vine Street, with APN 5546- 030-032, to a 2:1 FAR.

The same was also explained in Section IV.H, *Land Use and Planning*, of the Draft EIR (see page IV.H-10 and IV.H-23, respectively):

The ‘D’ indicates a Development Limitation, which restricts all the lots on the Project Site to a 3:1 FAR, with the exception of one lot (occupying the northwestern corner of the East Site, which comprises a portion of the Gogerty Building) to a 2:1 FAR.

Note that Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR, includes a correction to the above-referenced “D” Limitation which provides that the 2:1 FAR applies to the portions of the Project Site located at the corner lot on the southeast corner of Yucca Street and Ivar Avenue (not Vine Street) and associated with APN 5546-004-032 (not APN 5546-030-032).

Regardless, the Project Applicant has revised the Zone and Height District Change request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. Furthermore, compliance findings will still be required and will be included in the City Planning Case (CPC) Staff Recommendation Report. These revisions have been listed in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR. The Density Compliance Review and the change in proposed entitlements are discussed in detail in Topical Response No. 5 – Land Use and Planning, above.

With regard to the assertion that the Draft EIR provides no real explanation as to what an air quality model is or does, or what the differences between the on-road vehicle emissions factor (EMFAC) model and the California Emissions Estimator Model (CalEEMod) are, see Section IV.B, *Air Quality*, of the Draft EIR. As stated on page IV.B-36, CalEEMod is a Statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions from a variety of land use projects. Furthermore, as discussed throughout Subsection 3.b, *Methodology*, of Section IV.B, the Draft EIR described how CalEEMod is used throughout the analysis to calculate the Project’s construction and operational emissions. Regarding EMFAC, the Draft EIR provided explanation on page IV.B.39 that EMFAC is the CARB on-road vehicle emissions factor model and used when CalEEMod is not applicable. For instance, as stated on page IV.B-39 of the Draft EIR, the EMFAC2017 model was used because EMFAC2017 emission factors have not yet been incorporated in the current version of CalEEMod. Also, as explained on page IV.B-39 of the Draft EIR, emissions from haul trucks and concrete trucks were also estimated outside of CalEEMod using EMFAC2017 emission factors for haul and concrete trucks because CalEEMod assumes that the number of heavy-duty trucks input into the model occurs across the entire length of the applicable construction phases. However, since the applicable construction phases would

not have hauling activities and haul trucks on-site every day within each particular phase, the emissions calculations performed outside of CalEEMod were able to account for the varying maximum numbers of daily haul truck and concrete truck trips within each of the demolition, grading/excavation, foundations/concrete pour, and building construction phases.

Comment No. IND 8I-15

VII. THE FBI INVESTIGATION OF CORRUPT CITY OFFICIALS HANGS OVER THIS DEIR.

In the Introduction section we noted the active FBI investigation into City officials related to bribery and corruption. Based on public disclosures made to date, focuses of that investigation include former Councilman Mitch Englander (already pled guilty), current Councilman Jose Huizar (perhaps soon to plead guilty), and former LADBS head and then Deputy Mayor, Raymond Chan (also perhaps soon to plead guilty). All were actively involved in critical approvals for the original Millennium project, their actions then continue to infect the current DEIR now, particularly as to seismic/geologic studies from the earlier project that are being used to support the current DEIR.

As the January 16, 2020 federal indictment of Englander explains, there is presently a

“federal criminal investigation into public corruption throughout the City of Los Angeles (the “City”) related to multiple suspected “pay-to-play” schemes (the “Federal Investigation”).” This investigation involves “multiple City officials, developers, investors, consultants, lobbyists, and other close associates working in furtherance of the potentially illegal schemes.” (Several of the federal indictments, plea deals, and information documents are attached collectively at Exhibit 15 hereto; emphasis added.)

Regarding Chan, as reported in a January 18, 2019 Los Angeles Times Article, “*Garcetti appointee named in FBI warrant quits his post*”:

“Agents served the warrant on Google in July, seeking information from a private email account for Ray Chan, who served as Garcetti’s deputy mayor for economic development in 2016 and 2017. Prior to that, Chan was Garcetti’s top executive at the city’s Department of Building and Safety.” (**Exhibit 16.**)

The time frame when Chan headed LADBS overlapped with the highly controversial approvals for Millennium and its seismic studies, a process as to which the California State Geologist and Geological Survey expressed grave concerns. (See, e.g., **Exhibit 17** [initial letter from State Geologist; and then-City Geologist Dana Prevost’s notes about phone call from State Geologist expressing alarm].)

We alleged then that Chan was acting improperly, and we allege it again. The entire Millennium approval process, past and present, is marred by strong evidence of corruption. We urge the FBI to continue to probe Chan and other City officials' dealings related to the past and present projects. **We also urge Mayor Garcetti, the City Council, and the Planning and LADBS heads to stop any further processing of the DEIR and Project applications until the FBI investigation has concluded.**

We will not be surprised if former Planning Director Michael LoGrande who presided over the original Millennium approvals, and who recently agreed to pay a nearly \$300,000 fine for ethics violations, is also exposed in the ongoing FBI investigation.

Although articles abound confirming the depth and breadth of the FBI's investigation into City officials and the pay-to-play corruption that permeates LA City Hall (see **Exhibit 2**), we add for the record the Los Angeles Times May 15, 2020 editorial, "Just how dirty is L.A. City Hall?" (**Exhibit 18.**)

As detailed in the May 13, 2020 Information filed by the U.S. Attorney against Defendant George Chiang, at ¶ 28:

"a. In order to enrich its members and associates, the CDA Enterprise operated a pay-to-play scheme within the City of Los Angeles, wherein public officials demanded financial benefits from developers and their proxies in exchange for officials acts. **Specifically, through a scheme that involved bribery, mail and wire fraud, and extortion,** Councilmember A, City Staffer A-1, **Individual 1 and other City officials demanded, solicited, accepted, and agreed to accept from developers and their proxies,** including defendant CHIANG, some combination of the following types of financial benefits, among others: (1) cash; (2) consulting and retainer fees; (3) favorable loans; (4) casino chips at casinos; (5) flights on private jets and commercial airlines; (6) stays at luxury hotels; (7) expensive meals; (8) spa services; (9) event tickets to concerts, shows, and sporting events; (10) escort and prostitution services; and (11) other gifts.

"b. In exchange for such financial benefits from developers and their proxies, Councilmember A, City Staffer A-1, **Individual 1** and other City officials agreed to perform and performed the following types of official acts, among others: (1) filing motions in various City committees to benefit projects; (2) voting on projects in various City committees, including the PLUM Committee, and City Council;

(3) taking, or not taking, action in the PLUM Committee to expedite or delay the approval process and affect project costs; (4) **exerting pressure on other City officials to influence the approval process of projects**" (See **Exhibit 15**; emphasis added.)

As stated in the Information at ¶ 13: "Individual 1 was the General Manager of the LADBS until in or about May 2016. In or about May 2016, Individual 1 was appointed by the Mayor as the City's Deputy Mayor for Economic Development. As Deputy Mayor,

Individual 1 directed LADBS and the Planning Department, among other City departments.” “Individual 1” is Raymond Chan.

Response to Comment No. IND 8I-15

The comment expresses opposition to the Project based on alleged illegal activities by public officials related to a previous project at the Project Site; however, this an entirely new project that has undergone an entirely new environmental analysis. It is further noted that the speculation as to illegal activities related to a different project and an allegation that this Project is somehow tainted by the previous project are not facts related to the adequacy of the Draft EIR. Accordingly, insofar as this comment relies on the alleged activities related to a different project, and does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 8I-16

To summarize:

- This Project is the nominally-revised version of the prior project that Mayor Eric Garcetti and Councilman Mitch O’Farrell greenlighted to put skyscrapers on top of the 7.0-magnitude active Hollywood Earthquake Fault.
- Councilman Mitch Englander in July 2013 mysteriously conducted the hearing that led to the City Council’s original approvals. https://www.youtube.com/watch?v=xMe7fq_ZXcQ&t=13s
- Englander in March 2020 agreed to plead guilty to federal obstruction of justice, part of the wider-ranging federal corruption probe of LA City officials.
- This Project is the nominally-revised version of the prior project that won the City Council’s Planning and Land Use Management Committee approval in June 2013. Two of the PLUM Committee’s three members who voted to approve the earlier project were Councilman Jose Huizar, who is under FBI investigation, and Englander, perhaps soon to be in prison.
- This Project is the nominally-revised version of the prior project where the City’s Department of Building and Safety, then under Raymond Chan, approved Millennium’s bogus earthquake studies. The FBI is actively investigating Chan.
- This Project is the nominally-revised version of the prior project where the California State Geologist warned the City Council of grave threat to human life because of the project’s location over the Hollywood Earthquake Fault. The Mayor and City Council ignored the state’s top geologist.
- Since then, the California Geological Survey through its official Alquist-Priolo Earthquake Fault Zone Map and Fault Evaluation Report (“FER”) No. 253 has come out even more explicitly in its determination – which is now law – that the

Project site is traversed by the 7.0-magnitude active Hollywood Earthquake Fault (**Exhibit 8**), making it unbuildable and unapprovable as currently proposed.

- This Project is the nominally-revised version of the prior project that Caltrans fought, stating the City and Millennium's traffic studies were fraudulent and dangerous. (**Exhibit 19.**)
- This Project is by the same developer guilty of the Leaning Tower of San Francisco disaster, one of the biggest construction screw ups in modern times.
- But like the bad penny that keeps turning up, Millennium is back. They slightly tweaked the project and are lurking under a new name, Hollywood Center. However, a rose by any other name stinks just as bad.

Response to Comment No. IND 8I-16

The comment expresses opposition to the Project based on alleged illegal activities by public officials related to a previous project at the Project Site, speculation, and inaccurate characterizations of the Project. However, the comment does not provide facts related to this Project, which, as discussed in the previous Response to Comment No. IND 8I-15, is an entirely new project that has undergone an entirely new environmental analysis and, thus, does not raise any issue related to the Draft EIR. Accordingly, insofar as this comment relies on the alleged illegal activities related to a different project, it does not raise any specific issues with respect to the content and adequacy of the Draft EIR, and, as such, no further response is warranted.

Nonetheless, since this comment summarizes the prior comments set forth by the commenter, the commenter is referred to Response to Comment Nos. IND 8I-3 and IND 8I-15 (related to alleged illegal activities and concerns with a previous project); IND 8I-4, IND 8I-5, IND 8I-6, IND 8I-9, and IND 8I-59 to 8I-61 (related to seismic concerns); and Topical Response No. 3 – Geology and Fault Hazards, above, which address all the same issues summarized in this comment.

In addition, a Transportation Assessment (TA) was prepared in accordance with LADOT's Transportation Assessment Guidelines (TAG) adopted in July 2019 and pursuant to a memorandum of understanding (MOU) with LADOT dated December 3, 2019, documenting its assumptions and technical methodologies. The LADOT MOU is included in Appendix A of the TA. LADOT reviewed the TA and provided an approval letter of the TA on April 10, 2020, which is included as Appendix N-2 of this Draft EIR. The applicable CEQA results of the TA are presented in Section IV.L, *Transportation*, of the Draft EIR. On pages IV.L-49 and IV.L-49, an overview of the supplemental Caltrans analysis prepared for the Project is provided based on the current Project description and applicable City and CEQA regulations.

Comment No. IND 8I-17

VIII. THE DEIR'S PROJECT DESCRIPTION AND LAND USE ANALYSES VIOLATE CEQA.

A. The DEIR Lacks an Accurate, Stable and Finite Project Description Regarding Multiple Critical Issues Required for Informed Public Participation.

1. The DEIR Misrepresents the Project's Proposed and Requested FAR.

We emphasize, as the Court of Appeal held in ruling against the City and Millennium in the prior matter, that the DEIR's "project description must be accurate, stable and finite." Stoepthemillenniumhollywood.com v. City of Los Angeles (2019) 39 Cal.App.5th 1, 16.

"The requirement of an accurate, stable, and finite project description as the *sine qua non* of an informative and legally sufficient EIR has been reiterated in a number of cases since County of Inyo. (See, e.g., Treasure Island, *supra*, 227 Cal.App.4th at p. 1052, 174 Cal.Rptr.3d 363 ["This court is among the many which have recognized that a project description that gives conflicting signals to decision makers and the public about the nature and scope of the project is fundamentally inadequate and misleading"]; Communities for a Better Environment v. City of Richmond (2010) 184 Cal.App.4th 70, 85–89, 108 Cal.Rptr.3d 478 [EIR failed as an informal document because the project description was inconsistent and obscure as to the true purpose and scope of the project]; San Joaquin Raptor Rescue Center v. County of Merced (2007) 149 Cal.App.4th 645, 653, 57 Cal.Rptr.3d 663 [an EIR must include detail sufficient to enable those who did not participate in its preparation to understand and to consider 309 meaningfully the issues raised by the proposed project].)" *Id.* at 17.

"Only through an accurate view of the project may affected outsiders and public decision makers balance the proposal's benefit against its environmental costs, consider mitigation measures, assess the advantage of terminating the proposal . . . and weigh other alternatives in the balance.' [Citation.]" *Id.* at 18-19.

As a starting point, an accurate FAR (floor area ratio) is the *sine qua non* of a legally sufficient project description. Without a truthful disclosure of FAR, community members are deprived of one of the few readily-understood land use metrics to understand and comment on the Project. That is missing in the DEIR.

Among the primary characteristics of a development informing the public's conception of what environmental impacts to investigate, FAR is uniquely important to meaningful public participation. The public utilizes approximate FAR comparisons as a heuristic to judge whether a development warrants participation in the public process. A misleading FAR, therefore, taints the entire public process because it impairs informed decision-making by the public and the City.

However, rather than calculate FAR based on the definition in LAMC Section 12.03 and the LADBS Bulletin attached as **Exhibit 20**, as the public and the City have done for decades, the DEIR instead creates its own project-specific definition and represents only what the FAR would be if the City excluded portions of the Project. As a result, the DEIR artificially reduces the actual FAR by excluding *168,320 square feet* of covered residential terraces and balconies from FAR calculations. Table II-4, Footnote (c) states that the FAR calculations exclude 78,120 square feet on the West Site and 90,200 square feet on the East Site. These figures total 168,320 square feet of area excluded from FAR. Far from a rounding error, this omission reduces disclosed FAR by approximately 0.837 to 1 (168,320 square feet divided by 200,971 square feet of lot area).⁵ The true FAR of the Project, rather than 6.973 to 1, is in fact 7.81 to 1 – an undisclosed increase of over 12 percent.⁶

The DEIR's customized definition of FAR fails to make a good faith effort to inform the public. The unconventional calculation is clarified only in a technical footnote, while the DEIR conspicuously omits any calculation of total FAR under the LAMC definition. Rather than providing a simple ratio commonly understood by the public to facilitate an apples-to-apples comparison to other developments, the DEIR jumps through hoops to meticulously sum every square foot of covered open space (i.e., the balconies and terraces) throughout the Project, to subtract those numbers from the LAMC definition of Floor Area, and to ensure that only the reduced FAR is disclosed in the DEIR.

The misrepresentation of the Project's FAR advances no legitimate informational purpose. No other development in Hollywood, or Citywide, has been approved and constructed⁷ based on the proposed alternative calculation of FAR. Nor does the FAR calculation serve an entitlement or technical land use purpose. Millennium elsewhere represents that the Project is allegedly entitled to an FAR of 8.1 to 1 due to affordable housing set-aside.⁸ If so, why does the DEIR reverse-engineer definitions to assert that FAR is only 6.973 to 1 when FAR actually exceeds 7.810 to 1? The only conclusion is that the FAR calculation is a transparent attempt to deceive the public into believing the Project's FAR is substantially smaller than proposed by omitting covered balconies and terraces that the Zoning Code requires to be included. It serves no purpose but to mislead.

Footnote 5: 168,320 square feet divided by 200,971 square feet equals 0.753.

Footnote 6: $7.810 / 6.973 = \text{FAR}$. $0.75 / 6.973 = 0.12 = 12$ percent increase.

Footnote 7: The previous iteration of the Project had requested a Zoning Administrator Interpretation to exclude balcony area, but was defeated in court and never constructed.

Footnote 8: DEIR p. II-11.

Response to Comment No. IND 8I-17

The comment expresses opposition to the Project by claiming that the Project description does not comply with CEQA since the Project's FAR is not accurately described in the Draft EIR.

The Draft EIR provides an accurate, stable, and finite project description as required by CEQA and the guiding case law including the cited *Stopthemillenniumhollywood.com* case (*Stopthemillenniumhollywood.com v. City of Los Angeles* (2019) 39 Cal.App.5th 1). To be sufficient, an EIR's project description must include: (i) the precise location and boundaries of the proposed project, (ii) a statement of project objectives, (iii) a general description of the project's technical, economic, and environmental characteristics, and (iv) a brief statement of intended uses of the EIR. A project description must be accurate, stable, and finite to avoid confusing and misleading decision makers and the public about the nature of the project. *S. of Mkt. Cmty. Action Network v. City & Cty. of San Francisco*, 33 Cal. App. 5th (2019) 321, 332, and CEQA Guidelines Section 15124.

The Draft EIR's Project Description includes: (i) the precise location and boundaries of the Project (see Section II.2, Project Location and Surrounding Uses, of the Draft EIR, including Figure II-1, Regional and Site Location Map and Figure II-2, Aerial Photograph of Project Site and Vicinity); (ii) a statement of Project objectives (see Section II.6, Project Objectives, of the Draft EIR); (iii) a general description of the Project's technical, economic, and environmental characteristics (see Draft EIR Section II.3, Project Background; Section II.4, Existing Project Site Conditions; Section II.5, Land Use and Zoning Designations; Section II.7, Description of the Project, including Table II-1, Proposed Development Program of the West Site, East Site, and entire Project Site, including Figure II-5, Conceptual Site Plan, Figure II-6, Conceptual Plot Plan, West Site, Figure II-7, Building Sections, West Site, Figure II-16, Publicly Accessible Open Space, Figure II-8, Level 1 Plan, Figure II-9, Level 1 Mezzanine Plan, Figure II-10, Amenity Deck, West Site, Figure II-11, Senior Affordable Housing Amenities, West Site, Figure II-12, Conceptual Plot Plan, East Site, Figure II-13, Building Sections, East Site, Figure II-14, Level 1 Plan, East Site, Figure II-15, Level 1 Mezzanine Plan, East Site, Figure II-16, Publicly Accessible Open Space, Figure II-17, Amenity Deck (Level 2), East Site, Figure II-18, Senior Affordable Housing Amenities, East Site, Table II-4, Project and Project with the East Site Hotel Option Gross and LAMC Floor Area Square Footages by Building, Figure II-25, Simulated Aerial View from the East, Figure II-26, Simulated View from the North, Figure II-27, Comparison of East Site Capitol Records Lot Scenario, Figure II-28, Project Site Vehicular Access, Figure II-29, Project Site Bicycle Parking, and Section III, Environmental Setting); and (iv) a brief statement of the intended uses of the EIR (see Draft EIR Section I.1, Purpose of the Draft EIR). It should be noted that the Project with the East Site Hotel Option analyzed in the Draft EIR is no longer being considered by the Applicant as part of the Project.

The comment alleges that the Project Description is not accurate because it improperly calculates the FAR for the Project and, generally, alleges that the discussion of the FAR

is misleading. However, the Draft EIR Project Description, both in narrative form and in table form, clearly identifies the Project's 6.973:1 FAR, including a breakdown of floor area for the East Site, West Site, and the entire Project Site. See Section II.7, Description of the Project, including Table II-1, Proposed Development Program of the West Site, East Site, and entire Project Site.

Regarding the calculation of FAR for the Project, page II-17 of the Draft EIR, and as corrected in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR further explains that:

The Project would have a maximum FAR of 6.973:1, ... which includes the existing approximately 114,303-square-foot Capitol Records Complex (consisting of the 92,664-square-foot Capitol Records Building and the 21,639-square-foot Gogerty Building). The maximum developable floor area for the Project Site would be 1,401,453 square feet. The Project is requesting a Conditional Use Permit pursuant to LAMC Section 12.24 W.19 for a unified development to allow FAR averaging and residential density transfer between the East Site and the West Site. As the East Site is larger than the West Site, the West Site would be the recipient of the proposed averaging of floor area and residential density. The West Site would utilize approximately ~~64,300~~ 93,309 square feet of floor area from the East Site, which would permit an additional ~~97~~ 119 units on the East Site.

The Project Applicant has revised the Zone and Height District Change request, as well as the Conditional Use Permit for a Unified Development request, to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25 (State Density Bonus Law). As such, the commenter is referred to Topical Response No. 5 – Land Use and Planning, above, which provides a detail explanation of the revised entitlements, including the requests for an increase in FAR, as well as the Project's affordable housing requirement. As explained therein, the State Density Bonus Law mandates that local governments shall grant certain development incentives to projects that provide the requisite percentage of affordable housing. As such, the State Density Bonus Law supersedes any local ordinances, including the "D" Limitations on the FAR pursuant to Ordinance No. 165,659. The proposed revision in requested entitlements and the function of the proposed Density Bonus Compliance Review is described in detail in Topical Response No. 5 – Land Use and Planning, above. The revised entitlement list is presented in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR.

Under the Density Bonus Compliance Review, the Applicant is seeking the following incentives and waivers: (a) an On-Menu Incentive to permit a 35 percent increase in the maximum allowable floor area ratio (FAR) from 2:1 to 2.7:1 (for portions of the Project Site located at the corner lot on the southeast corner of Yucca Street and Ivar Avenue and associated with APN 5546-004-032); and from 3:1 to 4.05:1 FAR (for the balance of the Project Site); (b) an Off-Menu Incentive to allow FAR and density averaging for a

Housing Development Project located on non-contiguous lots; (c) a Waiver of Development Standards to permit a 7:1 FAR averaged across the Project Site; and (d) a Waiver of Development Standards to permit the floor area of any residential balconies and terraces to be excluded for purposes of calculating the total floor area, as applicable.

The Draft EIR was very clear in describing the formerly proposed Zone and Height District Change, and the request to modify the calculation of FAR, and is repeatedly identified and explained in Chapter II, *Project Description*, on pages II-2, II-11, II-15, II-16, II-17, II-48 through II-50, and II-74, and also included in Section II.8, Anticipated Project Approvals, of the Draft EIR, and Section IV.H, *Land Use and Planning*, pages IV.H-7, IV.H-10, and IV.H-22 of the Draft EIR.

With regards to the request to modify the calculation of FAR, the request does not create a new definition for FAR. The Project's FAR is calculated pursuant to the definition in LAMC 12.03, however the Waiver of Development Standards request proposes to permit the floor area of residential balconies and terraces to be excluded for purposes of calculating the total floor area, in a similar manner as the On-Menu incentive pursuant to LAMC Section 12.22 A.25(f)(7), which allows the lot area for the purposes of calculating the maximum density permitted to be modified. Pages II-50 and II-74 of the Draft EIR specifically identify this request, including the amount of gross square footage of residential balconies and terraces to be excluded for purposes of calculating the total floor area. Per City Zoning Administrator Interpretation ZA-2007-3430-ZAI, the areas of balconies which are not recessed but project beyond the perimeter of the building; remain unenclosed except for the guard rails required by the Building Code; and qualify as private open space pursuant to LAMC Section 12.31 G.2(b)(2) shall not be considered floor area. The requested Waiver of Development Standards would apply to residential balconies that are considered floor area per ZA-2007-3430-ZAI.

To further inform the public and decision-makers and avoid confusion of the Project's proposed FAR, Table II-1, Proposed Development Program of the West Site, East Site, and entire Project Site, of the Draft EIR provide both the gross square footage (as defined by the California Building Code 2019 Chapter 2) and the square footage calculated per the LAMC. As such, the Draft EIR provides an accurate, stable, and finite project description, including an accurate description of the Project's FAR. It is noted that the FAR would be the same under the proposed change in entitlement request.

Lastly, the comment asserts that a previous project at the Project Site requested a Zoning Administrator's Interpretation to exclude balcony area from the floor area calculation, and that the previous project was defeated in court and never constructed. However, the comment, states that the court in the *Stopthemillenniumhollywood.com* case ([Stopthemillenniumhollywood.com v. City of Los Angeles](#) (2019) 39 Cal.App.5th 1) ruled against the previous project at the Project Site on the requested Zoning Administrator's Interpretation. However, the court in the *Stopthemillenniumhollywood.com* case did not opine on and did not determine that that the Zoning Administrator's Interpretation was improper. It is noted that the proposed entitlement request would also require a Waiver

of Development Standards to permit the floor area of any residential balconies and terraces to be excluded for purposes of calculating the total floor area, as applicable.

Comment No. IND 8I-18

The Project Description has the effect of cutting the community out of some of the most important questions about the Project. Members of the public reading the DEIR are left with the mistaken impression that the Project is 12 percent smaller than it is in fact, tainting their understanding of the Project from square one. It is reasonable to assume that at least some community members would not object to a 6.9 to 1 FAR on the basis that it is *only slightly denser* than the most massive developments approved in Hollywood, but would strenuously protest the Project upon understanding the apples-to-apples FAR exceeds 7.81 to 1. By concocting a project-specific calculation of FAR, the DEIR actively undermines public understanding of the Project and thwarts informed public participation.

Response to Comment No. IND 8I-18

This comment adds no new facts to the previous comment, but merely speculates as to potential community opposition. As the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Nonetheless, the commenter opposes the Project by asserting that the Draft EIR Project Description does not accurately state the Project's FAR. The commenter is referred to Response to Comment No. IND 8I-17, which thoroughly addresses the Project's FAR, including the previously requested Developer's Incentive to allow the floor area of any residential balconies and terraces to be excluded for purposes of calculating the total floor area. Moreover, Response to Comment No. IND 8I-17 explains that to further inform the public and decision-makers and avoid confusion of the Project's proposed FAR, Table II-1, Proposed Development Program of the West Site, East Site, and entire Project Site of the Draft EIR provide both the gross square footage (as defined by the California Building Code 2019 Chapter 2) and the square footage per the LAMC. As such, the Draft EIR provides an accurate description of the Project's FAR to provide the public and decision makers an accurate and transparent account of the Project. However, as further explained in Topical Response No. 5 – Land Use and Planning, above, please also note that the Project Applicant has revised the Zone and Height District Change request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. Topical Response No. 5 – Land Use and Planning, above, discusses the proposed revision in requested entitlements and the function of the Density Bonus Compliance Review in detail, including the Project's requested FAR increase and affordable housing requirement. The revised entitlement request would not change the Project's proposed FAR or any uses, mix of uses, units, building configuration, building height, or other components of the Project presented in the Project Description.

Comment No. IND 8I-19

2. The Description of Alcohol Service Fails to Disclose the Magnitude of Outdoor Alcohol Consumption.

The DEIR's discussion of proposed alcohol service is so deficient, members of the public are left in the dark as to core aspects of the Project description. The terms "alcohol" and "alcoholic" appear only five times in the 1,061-page main document: once in the entitlement request and four times in the Land Use and Planning section of the DEIR. The entirety of the DEIR's discussion of alcohol service consists of a single paragraph that is stunning in its lack of specificity.

"The Project proposes the sale of a full line of alcoholic beverages in association with the proposed 30,176 square feet of commercial/restaurant uses and for any alcohol uses associated with the hotel under the Project with the East Site Hotel Option. Pursuant to LAMC Section 12.24 W.1, a Conditional Use Permit for the sale or dispensing of alcoholic beverages for on-site and off-site consumption at 12 establishments would be required, and a Master Conditional Use Permit may be requested. Several restaurants/bars and entertainment uses with permits to serve alcohol are already located near the Project Site."⁹

The DEIR fails to disclose that alcohol service is proposed outdoors,¹⁰ instead requesting an entitlement to permit alcohol service only "within" commercial establishments. The DEIR misleadingly describes the CUP request as "a Master Conditional Use Permit for the sale or dispensing of alcoholic beverages for on-site and off-site consumption within 12 establishments."¹¹ (Emphasis added.) A request to permit alcohol service and consumption within an establishment, however, does not put the public on notice to consider the environmental impacts of alcohol service and intoxicated crowds outside of such establishments, such as the increased operational noise levels, the increased freeway trips generated by larger functional restaurant area, or a host of other environmental impacts.

The DEIR further cryptically mentions approval of "any alcohol uses associated with the hotel under the Project and East Site Hotel Option."¹² Yet, when members of the public would try to understand what alcohol approvals are requested for the Hotel Option, they would be left guessing. The plans appear to suggest 4,850 square feet of outdoor area with alcohol service for the hotel component alone, but the DEIR and running administrative record lack the required site plans explicitly labeling areas of alcohol service. The DEIR fails to provide the faintest description of alcohol service under the Hotel Option and neglects to even describe the alcohol license type requested.¹³ In comparable approvals, community members have insisted on myriad mitigation measures to address operational noise impacts from intoxicated hotel guests. Here, however, the DEIR is so vague the public would have no indication the Project warrants similar scrutiny.

Finally, the DEIR fails to accurately describe the numerous bars included in the alcohol-serving establishments. The Plans depict numerous areas identified explicitly as bars.¹⁴ The distinction between a restaurant and a restaurant with a bar is profoundly consequential for the public to understand – especially if numerous restaurants with bars are concentrated on the same property. Whereas a restaurant requires food service in

conjunction with the service of alcohol, a bar allows members of the public to consume alcohol without food, greatly increasing the prevalence of loud, intoxicated and disruptive behavior.

The Project description, however, mentions only “retail and restaurant uses”¹⁵ Nowhere in the DEIR is any component of the Project described as a “bar,” which is particularly misleading because in its description of other nearby developments, a restaurant with a bar is described as a “restaurant/bar.”¹⁶ The lifetime experience of Hollywood residents dictates that restaurants with bars are more prone to alcohol-related disruption due to public intoxication. Concealing the Project’s numerous bars stifles public engagement generally and precludes informed comment on environmental impacts such as noise and public safety specifically.

Footnote 9: DEIR p. IV.H-25.

Footnote 10: The closest the developer comes to an honest disclosure of this fact is a footnote on page A-152 of the plans indicating “NO ALCOHOL SERVICE IN THIS AREA” – suggesting, by inference, that alcohol service is proposed in every other outdoor area of the Amenity Deck.

Footnote 11: DEIR p. II-74.

Footnote 12: DEIR p. IV.H-25.

Footnote 13: A site plan with clear identification of alcohol-serving areas and a listing of license numbers are required for a complete application per the Department of City Planning’s Special Instructions for Alcohol (CP-7773). (**Exhibit 21**; [https://planning.lacity.org/odocument/f911abb0-a5c5-44f4-932f-07a560dc90c6/Alcohol%20\(CUB\)%20and%20Adult%20Entertainment%20Establishments%20\(CUX\)%20-%20Special%20Instructions.pdf](https://planning.lacity.org/odocument/f911abb0-a5c5-44f4-932f-07a560dc90c6/Alcohol%20(CUB)%20and%20Adult%20Entertainment%20Establishments%20(CUX)%20-%20Special%20Instructions.pdf)) Yet the City not only deemed the entitlement application complete, but also published the DEIR without this information.

Footnote 14: Plans p. A-141 (depicting bars in Restaurants 1, 2 and 3 on the West Site); Plans p. A-142 (depicting bars in Restaurants 1, 2, 3 and 4 on the East Site); Plans p. A-151 (depicting a bar on the West Site Amenity Deck); Plans p. A-509 (depicting a bar within an unnumbered restaurant on the East Site).

Footnote 15: E.g., DEIR p. II-2.

Footnote 16: E.g., DEIR p. IV.H-14, III.3 and III-8.

Response to Comment No. IND 8I-19

This comment alleges deficiencies in the Draft EIR due to failure to include plans related to locations where alcohol would be dispensed. This comment does not raise any specific issues regarding the content and adequacy of the Draft EIR. As such, no further response is warranted. However, as explained below, additional details regarding the exact

locations where alcohol would be dispensed within the Project would be submitted as part of the request for a Master Conditional Use Permit and Master Project Approval once sufficient tenant information is determined for the entitlement.

Since information regarding future tenants would be speculative, the Draft EIR identified all the locations within the Project Site that could contain establishments that would dispense alcohol. The Project's request for a Master Conditional Use Permit for on-site and off-site alcohol consumption within 12 establishments is clearly identified in the Draft EIR, including the list of approvals provided on page II-74 in Chapter II, *Project Description*, of the Draft EIR. Any references to a Conditional Use Permit, as opposed to a Master Conditional Use Permit when referencing alcohol sale and consumption is revised in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR and is reproduced below:

The Project proposes the sale of a full line of alcoholic beverages in association with the proposed 30,176 square feet of commercial/restaurant uses ~~and for any alcohol uses associated with the hotel under the Project with the East Site Hotel Option.~~ Pursuant to LAMC Section 12.24 W.1, a Master Conditional Use Permit for the sale or dispensing of alcoholic beverages for on-site and off-site consumption at 12 establishments would be required, ~~and a Master Conditional Use Permit may be requested.~~ Several restaurants/bars and entertainment uses with permits to serve alcohol are already located near the Project Site.

The impacts of the Project's retail, restaurant, bar, and/or hotel spaces thereof were fully analyzed in the Draft EIR, including, but not limited to, potential noise and traffic impacts. See Subsection 3.d, Analysis of Project Impacts, on pages IV.I-49 through IV.I-51, in Section IV.I, *Noise*, of the Draft EIR, which includes the noise analysis of the Project's outdoor spaces, including the East and West Plazas where any outdoor seating may occur as part of the Project's restaurant or bar spaces. Also note that the Project with the East Site Hotel Option analyzed in the Draft EIR is no longer being considered by the Applicant as part of the Project.

In addition, the TA in Appendix N-1 to the Draft EIR considered the potential transportation impacts of the restaurant spaces. To be conservative from a trip generation perspective, the TA assumed that all 30,176 square feet of the proposed retail/restaurant space would be restaurant. Because the retail/restaurant space is less than 50,000 square feet, the use is considered to be local-serving and the VMT impacts are considered to be insignificant. The increase in peak hour trips generated by the restaurant use was considered in the non-CEQA portion of the TA, including in the freeway analysis presented in Appendix I to the TA.

The requested Master Conditional Use Permit would also require each individual establishment within the Project to obtain a Master Plan Approval (MPA) determination pursuant to LAMC Section 12.24 M for on-site alcohol sales in conjunction with the operation of Project's commercial uses, in order to implement and utilize the Master

Conditional Use Permit. The MPA process would allow the City to review each establishment in greater detail and to tailor site-specific conditions of approval for each of the premises subject to analysis of the venue's individual mode and character of operations, including, but not limited to, hours of operation, seating capacity, size, security, live entertainment, the length of a term grant and/or any requirement for a subsequent MPA application to evaluate compliance and effectiveness of the conditions of approval. In addition, the Project's commercial uses with alcohol service would operate in conjunction with all applicable laws to ensure the safety of patrons, employees, and nearby residents, as well as harmony with the character of the surrounding area. Moreover, the type of detailed plans needed for an MPA are not required at this time since the tenants are unknown. As such, the Draft EIR provides the requisite information and detail to appropriately analyze the Project's potential environmental impacts.

Further, the assertions by the commenter that alcohol service within restaurants/bars and hotels naturally results in the prevalence of loud, intoxicated, and disruptive behavior is speculative and unsubstantiated and is not treated as a potential impact on the environment under CEQA. See CEQA Guidelines Section 15131(a). CEQA defines "environment" as the *physical* conditions that exist within an area affected by a proposed project, including land, air, water, minerals, flora and fauna, noise, and objects of historic or aesthetic significance [emphasis added]. PRC Section 21060.5 and CEQA Guidelines Sections 15360 and 15358(b) describe the environmental topics and issues that must be addressed under CEQA.). Under these definitions, social effects that are not related to physical impacts need not be evaluated in an EIR. See CEQA Guidelines Section 15131(a) (addressing economic and social impacts under CEQA). For example, see also *Saltonstall v City of Sacramento* (2015) 234 CA4th 549, 585 (allegations that proposed basketball stadium would result in post-event impacts to safety by event crowds raised social issue rather than environmental issue that must be reviewed under CEQA); and also *Preserve Poway v City of Poway* (2016) 245 CA 4th 560 (change in "community character" due to new use of site is social and psychological impact, not impact on physical environment). As such, speculation about lawful use of the Project is not evidence of an issue with the content or adequacy of the Draft EIR. Therefore, no further response is warranted. Nonetheless, as described on page IV.K.2-13 of Section IV.K.2, *Police Protection*, of the Draft EIR, and as corrected in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR (reproduced below), Project Design Feature POL-PDF-2 (Security Features During Operation) provides for a 24-hour/seven-day security program which would include 24-hour security cameras and full-time security personnel who could respond to any unlawful behavior, if any, resulting from on-site alcohol consumption, including excessively loud and disruptive behavior, thus reducing the demand for police protection services.

These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for LAPD services. Project Design Feature POL-PDF-2 provides for a 24-hour/seven-day security program which would include 24-hour security cameras and full-time security personnel who could respond to any unlawful behavior, if any, resulting from on-site alcohol consumption.

including excessively loud and disruptive behavior, thus reducing the demand for police protection services. Additionally, the Project Applicant would contribute to the local Business Improvement District (BID), which has a seven day a week security patrol, which would assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services.

To the extent that the commenter is referencing behavior that is not unlawful, the comment is similar to those in the cited cases above in that it relates to the social impact of the Project which is not to a CEQA issue.

Comment No. IND 8I-20

3. The Land Use Analysis Fails to Disclose or Compare Outdoor Dining Regulations in the C4 Versus C2 Zones.

One of the Project's core entitlement requests is a Zone Change from C4 to C2, yet not one word of the DEIR articulates why this request is included. In fact, this request is highly consequential for two reasons. First, the C4 Zone is highly restrictive regarding outdoor eating or drinking. Eating or drinking areas are prohibited above the ground level, must not exceed 50 percent of the indoor dining area of the establishment, must be located between a building and a yard abutting a street, and must take place in conjunction with a ground floor restaurant.¹⁷ Based on the current C4 Zone regulations, negligible outdoor eating and drinking would be permitted.

The proposed Zone Change to C2 would erase all these limitations on outdoor eating and drinking, at least according to the questionable interpretation implied in the DEIR. Outdoor eating areas in the C2 Zone may be permitted *unlimited area*, may be located above ground level or on rooftops, and do not need to be permitted in conjunction with a restaurant.¹⁸ The Project could propose outdoor eating and drinking on potentially over a hundred thousand square feet of outdoor area, leaving only walkways as true publicly-accessible open space.

The Zone Change from C4 to C2 has profound land use implications omitted entirely from the DEIR. Rather than a serene pool deck with garden views, the West Site Amenity Deck is transparently intended to function as an alcohol-fueled party venue for the Project's thousands of residents and their hordes of guests. The Amenity Decks include an indoor bar with alcohol storage and two multipurpose rooms with built-in alcohol storage rooms.¹⁹ Alcohol service is prohibited on only a small fraction of the East Site Amenity Deck.

The DEIR's failure to disclose the land use effects of the Zone Change subverts CEQA's core purpose of facilitating informed decision-making. Within the Hollywood Community, noise and other environmental impacts of outdoor dining are prime concerns for new developments. Despite this, the City Council and the public are being asked to approve a Zone Change from C4 to C2 with *literally no information* on the implications of that change. By withholding this factual foundation from the public, the DEIR evaded

scrutiny of the extent of outdoor drinking, whether the DEIR adequately analyzed the environmental impacts of an unprecedented increase in outdoor drinking, and whether the DEIR should consider an alternative maintaining the existing C4 Zone. Because the disruptive impacts of noise and public intoxication are uniquely amenable to testimonial evidence from impacted residents, silencing their voices precludes highly relevant information from being presented to the decision maker.

The Zone Change is one of just two requested legislative zoning approvals and is listed countless times in the DEIR and Application – the absence of any discussion of its implications cannot plausibly be an oversight. Rather than a good faith effort at full disclosure, the DEIR’s omission of any discussion of the Zone Change deprives the public of the factual foundation needed to intelligently comment on environmental impacts of urgent concern to the affected community. How can the public maintain trust that the City has honestly reckoned with the Project’s environmental implications if it neglects to ask what is being approved? The City and Applicant must disclose to the public in a recirculated DEIR what they knew from the start: that the Zone Change is intended to permit an unprecedented area of outdoor alcohol consumption.

Footnote 17: LAMC § 12.03 defines Outdoor Eating Area and LAMC § 12.13-A.2(b)(2) allows Outdoor Eating Areas only between a building and its front yard, or between a building and a side or rear yard abutting a street.

Footnote 18: Zoning Administrator Interpretation 1808 and LADBS Zoning Manual p. 36-37, attached as **Exhibit 22**.

Footnote 19: Zoning Administrator Interpretation 1808 and LADBS Zoning Manual p. 36-37, attached as **Exhibit 22**.

Response to Comment No. IND 8I-20

The comment expresses opposition to the Project based on hypothetical assumptions about the Project’s certain uses which would serve alcohol; by asserting that the Draft EIR does not address the requested Zone Change entitlement, without stating any facts that reflect the potential environmental impacts; and further stating that the Draft EIR fails to discuss critical aspects of the Project. As the comment does not provide any facts to support any specific CEQA issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Nonetheless, the commenter is referred to Response to Comment No. IND 8I-19, for a discussion of the Project’s request for a Master Conditional Use Permit for on-site and off-site alcoholic consumption within 12 establishments, and the environmental impact analysis conducted in the Draft EIR regarding the same. Also, refer to Response to Comment No. IND 8I-19 for a discussion of noise and traffic impacts for the Project’s proposed commercial uses, including restaurant and bar spaces.

The commenter also makes unsubstantiated assumptions about the Project's previously requested Zone Change entitlement by asserting that the intent of the Zone Change is to allow the Project's West Site Amenity Deck to "function as an alcohol-fueled party venue for the Project's thousands of residents and their hordes of guests." However, as addressed in Response to Comment No. IND 8I-19, CEQA only requires an EIR to analyze a project's *physical* impacts on the environment that exist within an area affected by a proposed project, including land, air, water, minerals, flora and fauna, noise, and objects of historic or aesthetic significance [emphasis added]. See PRC Section 21060.5; CEQA Guidelines Sections 15360 and 15358(b) (addressing what qualifies as environmental impacts under CEQA). Under these definitions, social effects that are not related to physical impacts need not be evaluated in an EIR. See CEQA Guidelines Section 15131(a) (addressing economic and social impacts under CEQA). As such, speculation about lawful use of the Project, or use which the commenter apparently finds offensive, is not evidence of an issue with the content or adequacy of the Draft EIR.

With regard to the Project's requested Zone Change, the Project Applicant has revised the Project's Zone and Height District Change request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. The Density Bonus Compliance Review, which would allow the same FAR as under the formerly proposed Zone and Height District Change, is discussed in detail in Topical Response No. 5 – Land Use and Planning, above. Applicable plans and policies were fully analyzed in the Draft EIR's Section IV.H, *Land Use and Planning*. The analysis in Section IV.H was supported by Land Use Plans and Policies: Project Consistency Tables included in Appendix J of the Draft EIR.

Comment No. IND 8I-21

4. The Project Description Fails to Specify Temporary Off-Site Parking for Capitol Records During Construction.

The LAMC mandates that all required parking shall be continuously maintained for a building. At any time, when a building maintains fewer parking spaces than required, LADBS shall notify the property owner and shall "automatically" cancel the Certificate of Occupancy if the parking is not provided on-site or off-site by a covenant.²⁰ The Project proposes demolition of the Capitol Records parking lot and construction of new parking and structures over a minimum of 4.5 years.²¹ Therefore, the Project must procure a covenant guaranteeing sufficient off-site parking for the Capitol Records Complex, or else LADBS would have a ministerial obligation to give the developer notice and initiate proceedings to cancel the Certificate of Occupancy.

The DEIR makes no mention of operation of the Capitol Records tower during construction, giving the false impression that it would be closed during construction. The precise location of off-site parking influences which streets and freeways employees and visitors take, impacting both VMT on surface streets and LOS on US-101. None of that has been disclosed, analyzed or mitigated in the DEIR.

Moreover, if the Applicant is unable to procure the required parking spaces within 750 feet of the property in compliance with the LAMC, a separate entitlement would be required to allow parking by lease, or by covenant on a site further than 750 feet from the property. Furthermore, if the developer intends to operate Capitol Records without temporary off-site parking, the DEIR must analyze the anticipated altered traffic patterns of removing all currently-provided parking for 114,303 square feet of office space, requiring potentially hundreds of employees to park elsewhere in the Project vicinity.

The location of interim off-site parking is material to an accurate Project description not only because of the vast scale of replacement parking required, but also because the parking could be displaced intermittently through the year 2040. The DEIR's vagueness regarding this fundamental land use and operational feature requires recirculation.

Footnote 20: LAMC § 12.26-E.1(b).

Footnote 21: DEIR p. IV.O-16.

Response to Comment No. IND 8I-21

The comment asserts that the Draft EIR does not include a discussion of any temporary parking that may be needed for the Capitol Records building during construction. As the comment does not provide any facts to support any specific CEQA issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Nevertheless, consistent with LAMC requirements, the Project will provide sufficient parking. During the site preparation phase and the first portion of the building construction, while the parking levels are under construction, it is anticipated that Capitol Records employees would be parked off-site in a rented parking lot. Potential off-site parking locations would be identified in the Construction Management Plan (included as TRAF-PDF-2 on page IV.L-28 of the Draft EIR). If the off-site parking location is beyond walking distance, the Capitol Records employees would be shuttled to the Project Site. Once the subterranean parking structure component of the Project is complete, Capitol Records employees would be parked on-site in the garage. LOS, and any such resulting change due to minor alterations in traffic patterns around the Project Site during construction, is a "non-CEQA" impact under the City's new TAG adopted on August 9, 2019, which changed the transportation significance metric under CEQA from LOS to VMT. Furthermore, the City's TAG required construction analysis as a non-CEQA analysis (which was done and is part of the TA), but does not require construction VMT. Regardless, the temporary change in VMT by current Capitol Records employees would be minimal since they are already driving to work. Depending on the temporary parking location, some employees would drive further and others would drive less, depending on the direction from which they are arriving. Thus, the final location of any off-site parking during construction would reasonably not be expected to materially change the current VMT by Capitol Records employees, with any such change only occurring temporarily during construction. As noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more

than the number of spaces required by the LAMC (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area (TPA), parking impacts would not be considered significant.

Comment No. IND 8I-22

5. The DEIR's Description of Non-Existent "Extremely Low Income" Units Appears Calculated to Suppress Project Opposition Due to its Supposed Affordable Component.

The DEIR stifles public input into the Project by misleadingly suggesting that affordable units would be set aside for Extremely Low Income ("ELI") seniors, when in **fact the Project has no obligation to provide any ELI units**. Rather, the Project could potentially satisfy the legal minimum affordable requirement by setting aside units at the less-restrictive Very Low Income ("VLI") level. The DEIR repeatedly asserts that the senior units would be set aside for "Extremely Low and/or Very Low Income households." Nearly every time the term "Very Low Income" appears, it is preceded by the phrase "Extremely Low and/or."²²

Why is the DEIR so meticulous about this wording? By listing ELI units *before* VLI units, the DEIR creates the false impression that the affordable units are primarily ELI. The effect will be to trick the public into believing that the Project benefits persons of greater financial need than it would in fact assist. The lack of affordable housing is a grave concern to many within the Hollywood Community, and members of the public would be more likely to withhold objection to the DEIR due to the allure of ELI senior units. By suppressing accurate information about the level of affordable housing, the DEIR also will suppress public comment on the DEIR. Therefore, the misleading suggestion that the Project contains any ELI units precludes informed public participation and decision-making and renders the DEIR deficient as an informational document.

Footnote 22: E.g., DEIR p. II-2, II-11, II-17, II-26, II-38 and IV.J-13.

Response to Comment No. IND 8I-22

This comment claims, without providing evidence, that the Project's provision of Extremely Low Income units is illusory. The comment questions as to why the terms "Extremely Low Income" and "Very Low Income" are used in tandem in the Draft EIR. As defined by the California Department of Housing and Community Development, the term "Extremely Low Income" households is a subset of "Very Low Income" households.¹⁰⁶ The terms are typically used as a set in relation to and discussions of State and local affordable housing regulations. However, note that the proposed Density Bonus Compliance Review, discussed in detail in Topical Response No. 5 – Land Use and Planning, above, and in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft*

¹⁰⁶ California Department of Housing and Community Development, Extremely Low-Income Housing Needs, <https://www.hcd.ca.gov/community-development/building-blocks/housing-needs/extremely-low-income-housing-needs.shtml>, accessed August 24, 2020.

EIR, in this Final EIR is very clear in its terminology and refers to the proposed affordable housing as “Very Low Income.”

The commenter asserts that the Draft EIR does not identify the Project’s affordable housing obligation. Section II.7(a), page II-16 of the Draft EIR explains that LAMC Section 11.5.11 (Measure JJJ) requires projects which propose a minimum of 10 or more residential dwelling units in conjunction with a General Plan Amendment, Zone Change or Height District Change that do not result in a residential density increase greater than 35 percent, or do not result in allowing a residential use where previously not allowed density, to set aside an affordability percentage corresponding to the level of density increase as provided in California Government Code Section 65915(f), which the Project would provide. In addition, the Draft EIR repeatedly identifies that the Project’s affordable housing component, both in narrative and table form (see Chapter II, *Project Description*, pages II-2, II-16, II-17, II-26, II-38, II-46 of the Draft EIR; and Table II-1, Proposed Development Program, and Table II-4, Project and Project with the East Site Hotel Option Gross and LAMC Floor Area Square Footages by Building, of the Draft EIR, although the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project. As such, while the Project is no longer subject to Measure JJJ, as explained below, the Draft EIR is clear as to the Project’s affordable housing obligation.

As explained in detail in Topical Response No. 5 – Land Use and Planning, above, the Project Applicant has revised the Zone and Height District Change request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. Under this request, LAMC Section 11.5.11 [Measure JJJ] would not be applicable. Pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25, the Project is required to provide at least 10 percent of the units for Very Low Income households to qualify for two development incentives and the requested increase in FAR (however, LAMC Section 12.22 A.25(c) requires the Applicant to provide at least 11 percent of the units as Very-Low Income to be eligible for the 35 percent FAR increase On-Menu Incentive). In addition, Government Code Section 65915 (e)(2) states that that a proposal for the waiver or reduction of development standards shall neither reduce nor increase the number of incentives or concessions to which the applicant is entitled. The Project would provide 133 units as senior affordable for Very Low Income households, or approximately 13.2 percent, in excess of the minimum 11 percent required to qualify for the requested incentives and waivers.

Comment No. IND 8I-23

6. The Project Description Misrepresents Senior Access to Amenity Decks.

Immediately after misleading the public on ELI senior units, the Project description touts the luxurious amenities the seniors would have access to. The DEIR states: “In pursuit of a healthy environment, all residential and senior housing units can access the shared outdoor amenity space to take advantage of the California climate.”²³ This statement is materially misleading, however, because the Project functionally denies

seniors access to the Amenity Decks. Seniors must run a gauntlet of loading driveways and intoxicated tourists at ground level.²⁴ The Project Description is materially misleading because it creates a false impression that seniors have meaningfully equal access to the Amenity Decks, which is simply not the case. In addition, the DEIR fails to acknowledge that the Amenity Decks would likely be crowded with intoxicated residents and their guests, rendering the Amenity Decks unsuitable for senior recreation. These misrepresentations, and others discussed, taint any future approval of a statement of overriding considerations because it precludes members of the public and the City from intelligently balancing the Project's environmental costs against the false allure of dignified senior housing.

Footnote 23: DEIR p. 33.

Footnote 24: On the West Site, Plans p. A-106-108 provide no convenient access from the senior units to the Amenity Deck, requiring seniors to either travel through the underground garage or exit Ivar Avenue past alcohol-serving seating areas and the loading dock to enter the market-rate unit entrance. On the East Site, Plans p. A-126-128 provide no convenient access from the senior units to the Amenity Deck, requiring seniors to travel through the underground garage or exit Argyle Avenue, walk the length of the entire plaza, and enter the market-rate unit building.

Response to Comment No. IND 8I-23

This comment contains the commenter's opinions regarding the accessibility and quality, or appropriate uses, of the amenities provided by the Project for seniors. This comment does not raise a substantive issue on the content or adequacy of the Draft EIR. Therefore, as the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Nevertheless, both of the Project's affordable senior housing buildings would have their own amenity spaces, which would include a variety of recreational amenities for their residents and their guests. For example, see page Chapter II, *Project Description*, page II-26 and Figure II-11, *Senior Affordable Housing Amenities, West Site, Level 2*, of the Draft EIR, which provides that the West Site Senior Building:

would contain a multi-purpose room and senior support services office measuring 1,895 square feet, and a 1,080-square-foot senior residents' outdoor amenity terrace. The multi-purpose room would be used for group activities, such as fitness, games, and entertainment; and the senior support services office could be used by social workers to provide a wide array of assistance to the senior residents. The rooftop would contain an approximately 4,935-square-foot open-air terrace that could also be used for a variety of activities, gatherings, and other programs.

See also page II-38 and Figure II-18, *Senior Affordable Housing Amenities, East Site, Level 2*, of the Draft EIR, which provides that the East Site Senior Building:

would contain a multi-purpose room and a senior support services office measuring 2,000 square feet. The multi-purpose room would be used for group activities, such as but not limited to fitness, games, and entertainment, and the senior support services office could be used by social workers to provide a wide array of assistance to the senior residents. The rooftop would contain a 4,800-square-foot open-air terrace that would be used for a variety of activities, gatherings, and other programs.

The Project's senior buildings would have their own amenity decks even under the Project with the East Site Hotel Option (even though this option is no longer under consideration). See page II-38 and Figure II-18, *Senior Affordable Housing Amenities, East Site*, of the Draft EIR.

Moreover, residents of the Project's senior buildings would have access to the balance of the Project, including East and West building recreational amenity spaces and the Project's ground floor retail and restaurant spaces, which could be accessed by walking through the landscaped ground floor paseo connecting the East Site and West Site. Chapter II, *Project Description*, Page II-58, of the Draft EIR provides that the wide, landscaped paseo is proposed for pedestrian use and would extend east-west through the Project Site, connecting Ivar Avenue to Vine Street and Vine Street to Argyle Avenue. The paseo would function as a public open space amenity at the terminus of the Hollywood Walk of Fame. Along the paseo, residential lobbies and commercial spaces would add pedestrian interest and support outdoor uses. The West Plaza would include flexible space, such as portions of the paseo, where visitors, including residents of the senior housing can view the Capitol Records Building (Figure II-16). Within the East Plaza, shopping, outdoor seating, landscaping, open-air dining, public performances, art installations, and special events, [...] would be available to the public. Both the West Plaza and East Plaza include ground floor restaurant uses that would activate the respective street frontages along Vine Street and Argyle Avenue. As such, the commenter's assertion about the Project's senior residents, guests, and the Project Site's surrounding community are unsubstantiated, misleading, and infuses unfounded hypothetical assumptions. The commenter is also referred to Response to Comment No. IND 8I-19, which addressed the Project's request for a Master Conditional Use Permit to allow the on-site and off-site sale and consumption of alcohol within 12 establishments, as well as the Project's proposed uses which would may include alcohol service.

Comment No. IND 8I-24

7. Capitol Records Has Not Consented to Development of its Parking Lot, Rendering the Public Plaza Illusory.

The DEIR highlights the alluring prospect of vast public plazas and gardens, yet much of this public open space would be an empty promise if Capitol Records withheld its consent to redevelop the surface parking lot. As illustrated in Figure II-27, Capitol Records' failure to consent would require a significant re-design of the street-level public plaza on the East Site, shrinking open space, narrowing walkways and removing the garden entirely.²⁵ Much of the remaining open space consists of a relatively narrow

walkway of limited recreational use. Although nearly two years passed between the filing of the application and the publication of the DEIR, the developer has still been unable to obtain the consent of Capitol Records to convert its surface parking to a public plaza to this day.

Fundamentally, the lack of consent from the Applicant's tenant does not relieve the City of its obligation under CEQA to establish a stable, accurate and finite Project description. As the Project proponent and the owner of the property, Millennium is responsible for resolving its tenant disputes without muddying the DEIR. The DEIR must be recirculated to accurately define the Project as the scenario identified in Figure II-27 to correct the misconception of illusory open space.

Footnote 25: DEIR p. II-59 and Figure II-27.

Response to Comment No. IND 8I-24

This comment challenges the Project description with respect to certain Project components, but does not present any facts to support its contentions that the Project description is not stable, accurate, or finite.

The Draft EIR does address the "Capitol Records Lot Scenario" in Subsection 7.d, Open Space, Landscaping, and Public Art, on page II-59 (as cited in the comment) of Chapter II, *Project Description*, of the Draft EIR indicates that:

*Capitol Records must grant its consent to portions of the proposed open space area on the East Site. Depending upon negotiations on use of the space, the East Site's open space area may be reduced to accommodate Capitol Records. Under this Capitol Records Lot Scenario, the lounge and plaza areas described above would be slightly reduced in size, and the garden would be removed. As shown in **Figure II-27, Comparison of East Site Capitol Records Lot Scenario**, the publicly accessible ground floor open space on the East Site for the Project, as well as the Project with the East Site Hotel Option, would be reduced from 24,990 square feet to 23,373 square feet (a reduction of 1,617 square feet). Additionally, common open space on the Level 2 amenity deck would be reduced from 15,178 square feet to 14,138 square feet (a reduction of 1,040 square feet). In total, open space would be reduced by 2,657 square feet.¹³ Under any scenario, the proposed open space area would comply with all applicable open space requirements pursuant to LAMC Section 12.21 G.*

(Footnote 13: As a result of this change in open space, the ground floor restaurant/retail space would be reduced by 1,800 square feet. See Figure II-27.)

It should be noted that a correction to the reduced square footage will be included in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR and is reproduced below:

Depending upon negotiations on use of the space, the East Site's open space area may be reduced by up to ~~5,995~~ 2,657 square feet and redesigned to accommodate Capitol Records and/or to comply with the lease.

Based on the above, the commenter's assertions are unsubstantiated.

Comment No. IND 8I-25

8. The Proposed Outdoor Theater is Illusory.

The DEIR spares no detail describing the supposed public benefits afforded by the proposed outdoor theater. Named after Nat King Cole, the performance area and stage would comprise 10,198 square feet with an occupancy of 350 people.²⁶ To entice members of the public to swallow the bitter pill of supporting the Project, the DEIR highlights future performances by nearby schools and community groups.

Selling the Project based on the outdoor theater, however, misleads the public because outdoor theaters are not a permitted use in the C2 Zone. Park and recreation facilities exceeding 200 seats are permitted only in the OS Zone.²⁷ The C2 Zone permits "auditoriums having a seating capacity for not more than three thousand (3,000) people" but auditoriums, but definition, are seating areas located *within buildings*.²⁸ Moreover, "theaters" are permitted in the C2 Zone but are subject to a limitation requiring that "all activities, including storage, shall be conducted wholly within an enclosed building."²⁹ The Chief Zoning Administrator has promulgated a List of Uses Permitted in Various Zones affirming that theaters, auditoriums and recreation areas are permitted in the C2 Zone only when the uses are conducted "wholly within an enclosed building" with the sole exception of accessory outdoor storage.³⁰

The DEIR fails to address or study the clear conflict between the proposed outdoor theater and the LAMC prohibition on such uses in the C2 Zone. The DEIR endeavors to convince members of the public to withhold opposition with the inducement of obtaining supposed public benefits such as the proposed theater. Not only does this render the Project description a moving target, it misleads the public because the bargained-for community benefit cannot legally be provided.

Footnote 26: DEIR p. II-58.

Footnote 27: LAMC § 12.04.05-B.1(a)(i).

Footnote 28: See Webster's Dictionary defining "auditorium" as "the part of a building where an audience sits" and "a room, hall or building used for public gatherings."

Footnote 29: LAMC § 12.14-A.1(a)(1) permits C1.5 uses within the C2 Zone. LAMC § 12.13.5-A.2(a)(30) permits theaters in the C1.5 Zone; and LAMC § 12.13.5-A(2)(b)(3) requires all activities to occur within an enclosed building.

Footnote 30: ZA-2015-2348-ZAI, attached as **Exhibit 23**. For the C2 Zone auditoriums are addressed on p. 61, theaters are addressed on p. 71, and recreation areas are addressed on p. 69.

Response to Comment No. IND 8I-25

This comment asserts that the Draft EIR does not accurately describe the Project's outdoor open space but does not provide any facts to support this claim and, therefore, no substantial evidence. As this comment does not raise a substantive issue on the content or adequacy of the Draft EIR, no further response is warranted.

Regardless, the Project's outdoor programmable open space is not a "theater" or "auditorium," and nowhere in the Draft EIR did the Draft EIR identify or consider the Project's outdoor programmable space as including a "theater" or "auditorium." However, it is acknowledged that the VMT calculator used for the VMT analysis does not include outdoor performance space as land use. Thus, the most similar option was determined to be "movie theater" which is clearly stated to be utilized in place of the outdoor performance area (see page IV.L-23 of the Draft EIR). The Project's ground floor would include publicly accessible outdoor open space, which is permitted in the C4 Zone (LAMC Section 12.16) and would allow for community gathering and programmable events. However, the Project Applicant has revised the Zone and Height District Change request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. Under the proposed Density Bonus Compliance Review, the zoning would remain C4. Topical Response No. 5 – Land Use and Planning, above, discusses the change in the entitlement request and the Density Bonus Compliance Review in detail. Section IV.H, *Land Use and Planning*, as supported by the policy tables provided in Appendix J, of the Draft EIR, evaluated the Project's consistency and, therefore, potential conflicts, with applicable local and regional plans.

Furthermore, the Project's East Plaza, an approximately 10,198-square-foot performance area, with a stage to host public acoustic performances by nearby school and community music groups, is not identified as the "Nat King Cole" plaza. See page e.g., Chapter II, *Project Description*, page II-58 and Figure II-16, of the Draft EIR.

Page II-58 of the Draft EIR explains that:

The performance area and events would be situated on the East Plaza, with a maximum event attendance capacity of 350 people. There could be up to two performances daily, including one during the mid-day period and one during the afternoon, not to exceed 10 performances per week, including weekends. The performances would not allow use of an amplified sound system but could include ambient music speakers with prerecorded, low-level, background music. The performances would primarily consist of acoustic musical performances, plays or other theatrical performances, and outdoor fitness classes. Each performance would be up to approximately one to two hours in duration and shall end by dusk. When special events occur within these spaces, set-up may begin

as early as 10:30 A.M., events would start no earlier than 11:00 A.M., and events would end at dusk. Janitorial services would be performed regularly each day to ensure proper maintenance of the plaza for the enjoyment of residents and visitors.

The Draft EIR analyzes potential environmental impacts of the East Plaza in Section IV.I. *Noise*, and Section IV.L, *Transportation*, which accounts for the performance area within the VMT calculations.

Comment No. IND 8I-26

9. The DEIR Must Be Recirculated to Disclose that the Applicant May Abandon AB 900 Obligations.

The DEIR misleads the public yet again by failing to disclose that the Applicant is not obligated to proceed as an Environmental Leadership Development Project (“ELDP”) and provide the associated community benefits, such as a prevailing and living wages, required for such developments. The DEIR emphasizes how the Project was blessed by the Governor himself as a development guaranteed to “create high-wage jobs”:

“In order to be certified as an ELDP, the Governor determined that the Project would result in a minimum investment of \$100 million, would create high-wage jobs, and would not result in net additional greenhouse gas (GHG) emissions, as determined by the California Air Resources Board. [...] The Governor’s certification determined that the Project complies with all of these applicable requirements. The Governor’s certification and related documentation are provided in Appendix B of this Draft EIR.”³¹

To members of the public who review Appendix B to verify these claims, the obligation to provide these community benefit appears absolute: the developer “will comply with” prevailing wage standards; “will include the prevailing wage requirement in all contracts for the performance of the work”; and “will enter into a project labor agreement[.]”³²

An ELDP certification is synonymous with mandatory public benefits, yet Millennium has the option to abandon the ELDP process altogether and abandon its hollow promise to provide these benefits. Yet the only hint that it could renege on these promises is buried in the last paragraph in an exhibit to an appendix. According to the Project’s letter of commitment, prevailing and living wages would not be required if the Project loses AB 900 certification.³³ This might occur, for example, if public outcry forces the City to temporarily reconsider a rubber-stamp approval – even if the City approves the exact same Project in January 2021.³⁴

The DEIR omits material information to public participation by failing to clarify that the developer has no obligation to proceed as an ELDP Project. For much of the public, public benefits are the only aspect of the Project not offensive. The absence of this

disclosure leaves the public with the false impression that the public benefits of ELDP certification are built into the Project description, precluding informed public participation.

Footnote 31: DEIR p. II-69.

Footnote 32: DEIR Appendix B, p. 17-18.

Footnote 33: DEIR p. 292.

Footnote 34: While we are aware that Millennium is seeking a legislative amendment to extend the current, January 1, 2021 sunset provision for ELDP certification, that extension might not be granted. It certainly should not be granted by State legislators for this developer, this Project, and its almost countless violations of law. We also find it in character for Millennium that its lobbyists on May 13, 2020 testified to the State Assembly Natural Resources Committee that it should vote to extend the ELDP sunset provision by another year (beyond the 3-year extension they were already seeking) “because of the COVID situation.” Yet the City here has not given the public a single additional day for commenting during the pandemic and Mayor Garcetti’s shutdown orders.

Response to Comment No. IND 8I-26

This comment addresses the commenter’s concern with the enforceability of the ELDP certification. The comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, and, therefore, no further response is warranted.

Nonetheless, the Draft EIR thoroughly identifies the Project’s ELDP certification and how it would impact the Project. Chapter II, *Project Description*, Section II.7(e)(2), page II-68 of the Draft EIR, provides that:

The Project has been certified by Governor Brown as an eligible project under the Jobs and Economic Improvement through Environmental Leadership Act of 2011 (AB 900). The Notice of Environmental Leadership Development Project (ELDP), dated August 17, 2018, was circulated in accordance with PRC Chapter 6.5 (commencing with Section 21178). AB 900, which is codified in PRC Sections 21178 through 21189.3, was intended to encourage California’s economic recovery by providing a streamlined process for judicial review of compliance with CEQA for development projects that qualify as an ELDP. On August 16, 2018, Governor Brown certified that the Project meets the criteria set forth in the statute, including the applicable updated requirements in AB 246. In order to be certified as an ELDP, the Governor determined that the Project would result in a minimum investment of \$100 million, would create high-wage jobs, and would not result in net additional greenhouse gas (GHG) emissions, as determined by the California Air Resources Board. Further, a mixed-use project, such as the Project, must meet additional requirements. Specifically, it must be located on an infill site, be designed to achieve Leadership in Energy & Environmental Design (LEED) Gold certification, be consistent with the relevant

regional sustainable communities strategy, and exceed by at least 15 percent the transportation efficiency for comparable projects. The Governor's certification determined that the Project complies with all of these applicable requirements. The Governor's certification and related documentation are provided in Appendix B of this Draft EIR.

Exhibit 8 of Appendix B of the Draft EIR includes the signed Project Applicant's acknowledgement of the ELDP obligations under PRC Section 21183 with the City (Acknowledgment). The Acknowledgment provides that the Project Applicant agrees, amongst other obligations, that all mitigation measures required pursuant to CEQA to certify the Project will be conditions of approval, and those conditions will be fully enforceable by the City, or another agency designated by the City, and those mitigation measures will be monitored and enforced by the City for the life of the obligation.

As the comment notes, the ELDP statute is set to expire on January 1, 2021, which is not within the Project Applicant's control. There is currently pending legislation to extend the ELDP statute which would allow the Project to maintain its EDLP certification beyond January 1, 2021. However, the Project's certification as an ELDP has no bearing on the content or adequacy of the Draft EIR, as the Draft EIR fully analyzed the Project's environmental impacts. See, e.g., Chapter IV, *Environmental Impact Analysis*, and Chapter VI, *Other CEQA Considerations*, of the Draft EIR.

Lastly, the comment's assertion that the Project construction would not include prevailing and living wages if the ELDP certification expires is also unsubstantiated. The Project has entered into a Project Labor Agreement, which would create high-paying union construction jobs regardless of the Project's ELDP status.

Comment No. IND 8I-27

10. The DEIR's Myriad Project Description Deficiencies Require Recirculation.

CEQA mandates complete and honest disclosure of all relevant information. The Project description, however, is so riddled with material misrepresentations and bad faith omissions that it is effectively a piece of propaganda published by the City.

The public has a right to know (1) the true FAR of the Project to compare it to other developments; (2) the precise locations and extent of outdoor alcohol service; (3) the regulatory consequences of the Project's Zone Change from C4 to C2; (4) the location of Capitol Records parking during Project construction; (5) whether the Project is in fact committed to providing ELI senior units, and how many units are guaranteed; (6) whether seniors would enjoy meaningful access to the Amenity Decks; (7) whether the developer can abandon large swaths of the street level plaza on the flimsy basis that its own tenant prefers surface parking; (8) whether the developer will discard the much-touted outdoor theater entirely because it is not a permitted use in the C2 Zone; and (9) whether the Project can abandon the public benefits described in the ELDP application.

The totality of the misleading, confusing and omitted information in the Project Description renders informed public participation and decision-making impossible.

Consistent with the Project description, the City could potentially issue permits for a development with zero ELI units, alcohol service around every corner, a substantially reduced public plaza due to Capitol Records' objections, a further reduction in open space due to the Applicant's choice to proceed with the Hotel Option requiring less open space and a site plan actively hostile to senior access to the Amenity Decks. This scenario, though apparently consistent with the vague Project description, bears no resemblance to the Project as conceived by the public and the City during the DIER comment period. The Project description, therefore, is impermissibly vague, inaccurate and misleading. The DEIR must be recirculated to disclose all Project details that can be reasonably ascertained and precisely defining minimum standards for open space, affordability and senior access to ensure the developer does not abandon these crucial public benefits after approval.

Response to Comment No. IND 8I-27

This comment summarizes the previous comments made, and addressed above, and restates opposition to the Project by asserting the Draft EIR does not comply with CEQA. The comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, and, therefore, no further response is warranted.

Nevertheless, the commenter is referred to the following responses: Response to Comment No. IND 8I-14, Response to Comment No. IND 8I-17, and Response to Comment No. IND 8I-18, addressing "the true FAR of the Project to compare it to other developments"; Response to Comment No. IND 8I-19, addressing "the precise locations and extent of outdoor alcohol service"; and Response to Comment No. IND 8I-20, addressing "the regulatory consequences of the Project's Zone Change from C4 to C2." Note, however, that the Project Applicant has revised the Zone Change request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25 and, as such, the proposed Zone Change to C2 is no longer being pursued. The Density Bonus Compliance Review and change in entitlement request are discussed in detail in Topical Response No. 5 – Land Use and Planning, above. Also please see Response to Comment No. IND 8I-21, addressing "the location of Capitol Records parking during Project construction"; Response to Comment No. IND 8I-22, addressing "whether the Project is in fact committed to providing ELI senior units, and how many units are guaranteed"; Response to Comment No. IND 8I-23, addressing "whether seniors would enjoy meaningful access to the Amenity Decks"; Response to Comment No. IND 8I-24, addressing "whether the developer can abandon large swaths of the street level plaza on the flimsy basis that its own tenant prefers surface parking"; Response to Comment No. IND 8I-25, addressing "whether the developer will discard the much-touted outdoor theater entirely because it is not a permitted use in the C2 Zone" (note, however, that the Zone Change to C2 is no longer being pursued); and

Response to Comment No. IND 8I-26, addressing “whether the Project can abandon the public benefits described in the ELDP application”.

Comment No. IND 8I-28

B. The DEIR’s Land Use Analysis is Fatally Flawed.

1. The Land Use Analysis Improperly Cherry-Picks Consistent Policies.

CEQA requires that a DEIR’s analysis under the Land Use topic disclose and analyze how the Project is *inconsistent* with plans, programs, statutes, ordinances and policies adopted to avoid or mitigate environmental impacts. The Land Use and Planning section of the DEIR, however, consists of an extended “analysis” of the Project’s *consistency* with these documents. This methodological flaw permeates the DEIR’s analysis of consistency with the Hollywood Redevelopment Plan, masks numerous conflicts, and misleads the public about the Project’s irreconcilable conflicts with land use policies.

Response to Comment No. IND 8I-28

The comment expresses concern that the evaluation of land use plans “cherry-picked” policies for the evaluation of potential conflict. As discussed in Section IV.H, *Land Use and Planning*, of the Draft EIR, the CEQA Guidelines threshold related to land use is whether a project would cause a significant environmental impact due to a conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. The Los Angeles Department of City Planning interprets this as meaning a policy that has a direct nexus to a physical environmental impact. The policies selected for evaluation in Section IV.H were based on those policies, such as TPA policies that had a direct connection to traffic, air quality, GHG emissions or other physical environmental effects. Policies related, for instance, to neighborhood character or economics were not evaluated with relation to the Project’s conflict with such policies. Note also that the purpose of the analysis was not to find consistency with land use policies but to determine potential conflict with policies adopted specifically to address environmental effects. Topical Response No. 5 – Land Use and Planning, for further discussion regarding the focus of the evaluation on specific policies.

Comment No. IND 8I-29

2. The DEIR Fails to Disclose Pending Litigation or Identify the CRA/LA as a Responsible Agency.

The DEIR’s analysis of the Project’s consistency with Community Redevelopment Law³⁵ and the Hollywood Redevelopment Plan³⁶ rests on a fatally flawed premise: that the City recently lawfully took over all of the redevelopment plans and functions from the CRA/LA – the successor agency to the City’s former redevelopment agency that planned and enacted these plans under state redevelopment law. This purported transfer, however, is under challenge in court.³⁷ The lawsuit alleges that the City’s transfer resolution and ordinance were *ultra vires*, among other bases of challenge. The

lawfulness of the purported transfer has not been judicially reviewed. Thus, until the end of that litigation, the CRA/LA is a “responsible agency” under CEQA, and should be treated as one in the DEIR. It has powers and duties over review and approval of parts of the Project, including the requested increase of the FAR from 4.5 to 1 to 6 to 1 under the Hollywood Redevelopment Plan.

Consultation with responsible agencies involves multiple precedent procedural steps including notifying the CRA/LA and sending the full EIR through the State Clearinghouse to the CRA/LA for comment. Here, the CRA/LA has been written out of the process entirely. The City and Millennium have entirely omitted this information, and the existence of pending litigation which, if successful, would invalidate the purported transfer to the City of the CRA/LA’s land use functions and oversight related to the Project and Project site, which are in the Hollywood Redevelopment Plan area. This omitted information is crucial to informed public participation and decision-making. As a result, omitting the CRA/LA from its role in this CEQA process is a violation that cannot be cured without recirculation.

Footnote 35: Health and Safety Code § 33000, et seq.

Footnote 36: Ordinance No. 175,236, eff. July 12, 2003, attached as **Exhibit 24**

Footnote 37: AIDS Healthcare Foundation v. City of Los Angeles, LASC Case No. 19STCP04589. First Amended Verified petition for writ of mandate attached as **Exhibit 25**.

Response to Comment No. IND 8I-29

This comment alleges that the City has not lawfully assumed the land use responsibilities of the CRA/LA and that the City has an obligation to discuss the pending litigation on this issue in the Draft EIR and refrain from approving the Project until a determination is made on the litigation. The comment further alleges that the CRA/LA is a responsible agency until such time as the litigation is resolved. These allegations, even if they were correct, do not contain facts related to the potential impacts of the Project on the environment and, therefore, do not raise a substantive issue on the content of the Draft EIR. As such, no further response is warranted.

Nonetheless, CEQA does not require that an EIR disclose pending litigation that is not directly involved with the Project or the Project Site. See *Santa Clarita Org. For Planning the Env’t v. City of Los Angeles* (2007) 157 Cal. App. 4th 149, 159, which involved a claim that pending litigation was not properly disclosed in an EIR for a water transfer agreement. The required contents of an EIR are clearly set forth in CEQA Guidelines Sections 15120 *et. seq.* An unresolved lawsuit challenging the City’s authority to assume the land use functions of the former redevelopment agency is not one of the items required to be disclosed by CEQA. Similarly, disclosure in the Draft EIR would not add to the public’s knowledge of whether or not the Project would cause a significant impact on the environment, which is the focus of any EIR. (See CEQA Section 15126.2(a).)

Moreover, as further discussed below, the pending litigation is not relevant as it relates to the City's authority to transfer the CRA/LA land use functions to itself and not the validity of the Hollywood Redevelopment Plan or the Project's consistency with the Plan. That is, even if the plaintiff in the pending litigation prevails against the City with their asserted claims, the only change with respect to the Project would be who provides the Redevelopment Plan approvals and makes the necessary findings and would have no bearing on whether such findings could be made since the litigation is primarily regarding a breach of contract claim. Regardless, this Final EIR identifies the pending litigation and clarifies that the litigation outcome would have no impact on the Project or the EIR's environmental analysis. The Final EIR also identifies another pending litigation not mentioned in this comment which similarly involves challenges to the City's administration of the Hollywood Redevelopment Plan. The Final EIR clarifies that the second litigation involves an alleged breach of a settlement agreement and, therefore, the outcome would have no impact on the environmental analysis for this Project. See the clarifications reproduced below and in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR:

On September 30, 2019, under authority granted in the Redevelopment Dissolution statutes, the Los Angeles City Council and Mayor approved a resolution and accompanying Ordinance No. 186,325 to transfer from the CRA/LA to the City of Los Angeles all responsibility for land use related plans and functions in the 19 remaining Redevelopment Project Areas.²²

Footnote 22: There is pending litigation (*AIDS Healthcare Foundation v. City of Los Angeles*, LASC Case No.19STCP04589) regarding the validity of the City's transfer of the land use function of the CRA/LA to itself. However, this pending case is not relevant to the Project's CEQA analysis of the Project because the litigation outcome would not change the Project EIR's CEQA analysis. That is, the pending litigation is not relevant as it only relates to the City's authority to transfer the CRA/LA land use functions to itself and is not dispositive of the Project's consistency with the Plan. Consequently, even if the plaintiff in the pending litigation prevails against the City with their asserted claims, the only change with respect to the Project would be who provides the Redevelopment Plan approvals and makes the necessary findings. Thus, the litigation outcome would have no impact on the environmental impacts of the Project nor the EIR's environmental analysis.

Additionally, there is pending litigation (*Hollywood Heritage, Inc. v. City of Los Angeles*, LASC Case No. 19STCV45352) similarly challenging the City's transfer of the land use function of the CRA/LA to itself and specifically to compliance with a settlement agreement between the CRA/LA and plaintiffs regarding implementation of portions of the Hollywood Redevelopment Plan which constitutes a contractual dispute between the parties. Like the *AIDS Healthcare Foundation* case, this pending litigation is not relevant since the litigation outcome

would have no impacts on the environmental impacts of the Project nor the EIR's environmental analysis.

As to the issue of whether the CRA/LA is a responsible agency for this Project, a responsible agency under CEQA is defined as any public agency that proposes to carry out or approve a project, for which a lead agency is preparing or has prepared an EIR or negative declaration and for which it has discretionary approval over all or part of that project.¹⁰⁷ If an agency's approval is required for any activity 'integral to the project' and the agency could, in its discretion, deny approval, then that agency is a responsible agency under CEQA."¹⁰⁸

However, because the City took over all land use related functions from CRA/LA-DLA, the CRA/LA-DLA is no longer a responsible agency. In 2011, the state enacted Assembly Bill (AB) X1 26 to address the state's budget crisis. The legislation, enacted provisions of the Health and Safety Code (HSC) that, among other matters, stripped community redevelopment districts (CRAs) of all authority to "[p]repare, approve, adopt, [or] amend" redevelopment plans, HSC §34164(a); withdrew all authority of CRAs to exercise any powers previously granted under the community redevelopment law, HSC §34172(b); repealed all provisions of community redevelopment law that depend on the allocation of tax increment, HSC §34189; and dissolved all CRAs, HSC §34172(a)(1). The legislation designated Successor Entities to "expeditiously wind down the affairs" of the dissolved CRAs.¹⁰⁹ The legislation also provided for designation by the Governor of a designated local authority as Successor Agency of a dissolved CRA where the body creating the dissolved CRA declined to become Successor Agency, and vested Successor Agencies with all rights, powers, and obligations previously vested with the former CRA, except to the extent "repealed, restricted, or revised".¹¹⁰

On January 11, 2012, the City elected not to serve as Successor Agency to the Former Agency. On February 1, 2012, the Governor designated CRA/LA-DLA as Successor Agency to the former Community Redevelopment Agency of the City of Los Angeles. On June 27, 2012, the State passed AB 1484, which provides for transfer of all land use related plans and functions. As relevant here, AB 1484 states:

*At the request of the city ... all land use related plans and functions of the former redevelopment agency are hereby transferred to the city ... provided, however, that the city ... shall not create a new project area, add territory to, or expand or change the boundaries of a project area, or take any action that would increase the amount of obligated property tax (formerly tax increment) necessary to fulfill any existing enforceable obligation beyond what was authorized as of June 27, 2011.*¹¹¹

¹⁰⁷ See CEQA Section 15381 (defining a "Responsible Agency").

¹⁰⁸ See *RiverWatch v. Olivenhain Mun. Water Dist.* (2009) 170 Cal. App. 4th 1186, 1205–06, 88 Cal. Rptr. 3d 625, 638–39, as modified (Jan. 30, 2009).

¹⁰⁹ ABX1 26 at Sec. 1(j)(4)(Legislative Findings).

¹¹⁰ Health and Safety Code, Sections 34173(b) and (d)(1)(3).

¹¹¹ Health and Safety Code, Section 34173(i).

While State redevelopment dissolution law does not define “land use related plans and functions”, a transfer however does not include enforceable responsibilities, which remain with the CRA/LA, Successor Agency. See, HSC §34173(e) and (g).

In conformance with State law, the City, by Transfer Resolution effective November 11, 2019, requested transfer of all land use related plans and functions to maintain local control of land use policy in redevelopment plan areas and ensure certainty for the development community and that the City’s economic development goals are achieved. City Ordinance No. 186325, effective at the same time, establishes uniform procedures for processing project applications in the remaining redevelopment plan areas, including the Hollywood Redevelopment Plan area.

Further, Ordinance No. 186325, which effectuated the Transfer Resolution, states:

As of the effective date of this ordinance, the City shall review and take action regarding any Redevelopment Plan Amendment or land use approval or entitlement pursuant to Section 11.5.14 and other applicable provisions of this Code. Notwithstanding any contrary provision of this Code, the Community Redevelopment Law, the Redevelopment Regulations, or any applicable specific plan, supplemental use district, or other land use regulation adopted by the City, the City shall not be required to consult with or provide notice to the former Community Redevelopment Agency of the City of Los Angeles (CRA/LA) or the CRA/LA, a Designated Local Authority Successor to the Community Redevelopment Agency of the City of Los Angeles (CRA/LA-DLA). In addition, CRA/LA-DLA shall have no further authority or responsibility to perform related land use functions including, but not limited to, preparing staff reports pertaining to land use decisions; making findings; making interpretations; imposing conditions; making recommendations; reviewing, granting or denying land use approvals or entitlements; hearing appeals; and/or amending Redevelopment Regulations.

Accordingly, the CRA/LA-DLA no longer has any approval authority over the Project and, as a result, is not a Responsible Agency for the Project.

Comment No. IND 8I-30

3. The DEIR Fails to Disclose Required Discretionary Approval to Exceed 4.5 to 1 FAR.

Regardless of the outcome in the pending CRA/LA transfer litigation, the DEIR fails to disclose that the Hollywood Redevelopment Plan and the Development Limitation on the property require that the Project obtain a discretionary determination to exceed 4.5 to 1 FAR – from whichever agency properly maintains that authority. Hollywood Redevelopment Plan Section 506.2.3 provides:

“Proposed development in excess of 4.5:1 F.A.R. up to but not to exceed 6:1 F.A.R. or such other density may be permitted by future amendments to the Community Plan, on a specific site may be permitted as hereinafter set forth [...]”

Consistent with the Redevelopment Plan, the D Limitation on the Project Site reads:

“The total floor area contained in all buildings on a lot shall not exceed three (3) times the buildable area of the lot. A project may exceed the 3:1 floor area ratio provided that – The Community Redevelopment Agency Board finds that the project conforms to: (1) the Hollywood Redevelopment Plan, (2) a Transportation Program adopted by the Community Redevelopment Agency Board pursuant to Section 518.1 of the Redevelopment Plan, (3) the Hollywood Boulevard District urban design plan as approved by the City Planning Commission and adopted by the CRA Hollywood Redevelopment Plan; and, if applicable, (4) any Designs for Development adopted pursuant to Section 503 of the Redevelopment Plan; and

- a. The project complies with the following two requirements: A Disposition and Development Agreement or Owner Participation Agreement has been executed by the Community Redevelopment Board; and the Project is approved by the City Planning Commission, or the City Council on appeal, pursuant to the procedures set forth in Municipal Code Section 12.24-B.3.”³⁸

Prior to the purported transfer of land use authority from the CRA/LA to the City, the CRA/LA adhered to the requirement within both the Redevelopment Plan and D Limitation to review developments exceeding 4.5 to 1 FAR, requiring board approval and owner participation agreements (“OPAs”) pursuant to Hollywood Redevelopment Plan Section 402.3. The City’s Transfer Resolution and Ordinance, currently under legal challenge, purportedly only transferred the Section 500 series of provisions of the Hollywood Redevelopment Plan.³⁹ In so doing, as one example of how the City’s actions were *ultra vires*, the City purported to “leave behind” Section 402.3 of the Hollywood Redevelopment Plan that obligated the redevelopment agency and its successors to use the OPA to extract from the developer additional public benefits to continue implementation of the redevelopment plan.

OPAs, far from an impotent procedure, implement a core redevelopment function by allowing the CRA/LA to substantively review and condition a development to ensure consistency with the Redevelopment Plan goals – including extracting the cost of other street improvements, safety measures, and programs to actually implement the redevelopment plans. In this case, Project-specific conditions to ensure consistency with Redevelopment Plan goals could mitigate some of the Project’s most offensive components. For example, the Hollywood Redevelopment Plan’s robust affordable housing objectives encourage – if not mandate – a greater affordable set-aside in the Project, especially in the Hotel Option which transparently abuses Measure JJJ’s affordable set-aside calculations. Implementing these policies, the City or CRA/LA could justifiably impose a condition mandating better and more affordable housing.

As part of the CRA/LA Transfer Ordinance, the City adopted procedures for implementing its supposed limited land use authority. The City purported to establish a parallel discretionary procedure called Redevelopment Plan Project Compliance review, defined in LAMC § 11.5.14-C as “a decision by the Director that a Redevelopment Plan Project complies with the applicable Redevelopment Regulations, either as submitted or with conditions imposed to achieve compliance with the Redevelopment Regulations.”⁴⁰

Even if the City’s unlawfully created approval process applied, which it does not,⁴¹ the DEIR fails to describe that the Project is subject to a discretionary approval to exceed 4.5:1 FAR (either by the CRA/LA or the City lawfully stepping into the shoes of the CRA/LA under the Community Redevelopment Law). Members of the public reviewing the requested discretionary approvals would have no clue that the Project requests a Project-specific dispensation to exceed 4.5:1 FAR, or that this approval entails the authority to condition the Project to implement the Redevelopment Plan.

Emphatically, ***the Hollywood Redevelopment Plan does not permit 6 to 1 FAR by-right*** – it is permitted only when the listed findings are made in the affirmative. Although the procedural requirements for an OPA are identified in Hollywood Redevelopment Plan Section 402.3, the substantive requirement for a discretionary approval is contained within Section 506.2.3 itself because it requires findings of fact. In fact, the DEIR concedes that an FAR exceeding 4.5 to 1 is permitted only upon “findings” that the Project’s FAR “would be compatible with and would not degrade adjacent properties[.]”⁴²

The DEIR further states that approval of an FAR exceeding 4.5 to 1 “***would be conducted by the Planning Department***” in clear violation of the City’s own Redevelopment approval process and CEQA.⁴³ The City’s Multiple Approvals Ordinance requires that projects requiring legislative approvals (such as the requested Zone and Height District Changes) and quasi-judicial approvals (such as the determination to exceed 4.5 to 1 FAR) shall be initially heard by the City Planning Commission and decided by the City Council.⁴⁴

Planning Department staff, even acting under the delegated authority of the Director of Planning, have no legal authority to make a determination reserved for the City Council. To make matters worse, the DEIR effectively grants carte blanche power to Planning Department staff because it fails to identify performance standards pursuant to which the staff would make this determination. By failing to identify the discretionary actions required to approve the Project, including a hypothetical future determination by Planning Department staff, the Project description is fatally deficient.

Footnote 38: Ordinance No. 165,659, eff. March 21, 1990, Section 4.

Footnote 39: Resolution dated September 6, 2019 and adopted September 24, 2019 attached as **Exhibit 26**.

Footnote 40: Ordinance 186,325, effective November 11, 2019.

Footnote 41: The current litigation challenges the City's adoption of such a process because state law only allows the City to step into the shoes of the former redevelopment agency and successor agency as already set forth in the state's redevelopment laws.

Footnote 43: DEIR Appendix J, p. 22.

Footnote 44: LAMC § 12.36-C.

Response to Comment No. IND 8I-30

This comment objects to LAMC provisions for review and approval of projects within the Hollywood Redevelopment Plan area. However, while the comment states the basis for the commenter's objections with the City's approval process, the comment does not relate to any potential significant environmental impacts of the Project. The comment also references the need for findings prior to allowing an increase to the FAR. Findings are made by the City at such time and only if a project is approved or approved as modified, not in the Draft EIR. Even if the commenter's interpretation of State and local law was accurate, the comment would not support a contention that the Draft EIR is inadequate. The comment conflates the alleged responsibilities of the City under the Redevelopment Plan with alleged deficiencies in the Project's Draft EIR. Under CEQA, an EIR is only required to "identify and focus on the significant effects of the proposed project **on the environment.**" (CEQA Section 15126.2(a), emphasis added.) Claiming that failure to address a non-CEQA issue is a failure to provide full disclosure or causes the Project to be inconsistent with the Hollywood Redevelopment Plan does not convert the issue into one that is related to the significant effects of the Project on the environment. As the comment does not raise a substantive issue on the content or adequacy of the Draft EIR, no further response is warranted.

Nonetheless, refer to Response to No. Comment IND 8I-29 regarding the process for City review of projects within the Hollywood Redevelopment Plan and the City's authority to assume the land use functions of the CRA/LA-DLA for the Hollywood Community Plan area; Response to Comment No. IND 8I-17, regarding discussion of the FAR calculations in the Draft EIR; Response to Comment No. IND 8I-18, Response to Comment No. ORG 44-12, Response to Comment No. ORG 44-54. Also note that the Project Applicant has revised the Zone and Height District Change request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. The existing zoning has no height limitation, and the building height and FAR would be the same as under the Project. As discussed on page IV.A-1, in Section IV.A, *Aesthetics*, of the Draft EIR and pursuant to PRC Section 21099(d)(1) and City of Los Angeles Zoning Information File No. 2452, the issues of building height and relative scale as aesthetic impacts of the Project are not considered significant impacts on the environment. The discussion of the Project in Section IV.A of the Draft EIR was provided for informational purposes only. See also Topical Response No. 4 – Aesthetics, for additional discussion of the Project's aesthetics impacts. Land use and planning impacts

were fully analyzed in the Draft EIR's Section IV.H, *Land Use and Planning*, and supported by Land Use Plans and Policies: Project Consistency Tables provided in Appendix J of the Draft EIR. Also, please see Topical Response No. 5 – Land Use and Planning, regarding the Project's consistency and, therefore, potential conflicts, with applicable local and regional plans.

Comment No. IND 8I-31

4. The Height District Change Neuters the Mitigation Measures Incorporated into the D Limitation.

The DEIR fails to properly analyze the provisions of the existing D Limitation as mitigation measures adopted to avoid and mitigate infrastructure impacts. The D Limitation was imposed to Regional Center Commercial properties in Hollywood as a mitigation measure in compliance with AB 283, and reflects the intent of both the former redevelopment agency and the City in applying correct zoning limitations to the properties.

The 1988 Hollywood Community Plan, the 1986 Hollywood Redevelopment Plan, and the associated EIRs for those plans all acknowledged that if Hollywood were built out at the density permitted by the City's original 1946 zoning code, public infrastructure would be completely overwhelmed. These two Hollywood Plans acknowledged the inadequacy of the City's infrastructure to accommodate the 1946 zoning code density and carried out a vital downzoning process as a mitigation measure to avoid the worst infrastructure impacts.

To illustrate, the 1988 Hollywood Community Plan Revision DEIR summary, attached as **Exhibit 27**, describes the ongoing "implementation of . . . development standards" as a land use mitigation measure.⁴⁵ These development standards were adopted "to ensure that land use capacity and transportation service are in balance and that land use conflicts and incompatibilities are minimized."⁴⁶ Directly tying the "development standards" to an intention to mitigate specific significant impacts, the DEIR observes:

"Without consideration of the mitigation effects of development standards, the Current Plan would continue to allow a level of development, particularly high density residential and office/commercial projects, that could foster land use conflicts and incompatibility, including parking conflicts, height conflicts, shade/shadow effects, obstruction of views and vistas and potential nuisances."⁴⁷

As the "development standards" contemplated in the DEIR, the City's D Limitations establish substantive and detailed procedural requirements to monitor and mitigate infrastructure impacts. Principally, the D Limitation permits a development to exceed 4.5 to 1 FAR *only* if it complies with a long-term transportation plan specifically prepared for the Hollywood Redevelopment Plan area pursuant to Section 518.1. These D limitations reflect the agreement by the former redevelopment agency to accept responsibility and

liability for transportation, open space, parking, pedestrian safety and other infrastructure improvements needed before changes to zoning could be made.

The D Limitation provides a highly-detailed procedure to permit developments exceeding their by-right FAR, including compliance with a transportation plan. However, neither the City nor CRA/LA has ever adopted the mandatory transportation plan, a necessary pre-requisite finding to approve FAR in excess of 4.5 to 1. Nor can the Mobility Element function as the required transportation plan, because it failed to specifically address five priority corridors identified in Redevelopment Plan Section 518.1. Therefore, the City's removal of the D Limitation improperly side-steps existing mitigation measures requiring preparation of, and compliance with, a comprehensive transportation plan for the Hollywood Redevelopment Plan area.

Footnote 47: Id. at p. 24.

Response to Comment No. IND 8I-31

This comment reflects the commenter's opposition to the Project by asserting that the "D" Limitation is an environmental mitigation measure not analyzed in the Draft EIR, without presenting substantial evidence that the analysis in the Draft EIR is inadequate.

Nonetheless, neither the Hollywood Community Plan nor the Hollywood Redevelopment Plan identify the "D" Limitation as a CEQA mitigation measure, nor does it identify the specific environmental effect that those restrictions purport to mitigate, and, therefore, the comment is incorrect in its assertion that the "D" Limitation was imposed as a mitigation measure. On the other hand, the LAMC is clear that "D" Limitations are zoning classifications. As such, these "D" Limitations are within the scope of the City's police powers to remove or make changes to them without making any additional CEQA findings.

The Project EIR adequately analyzed the potential impacts to the environment associated with the Project, inclusive of the increase in FAR. The "D" Limitation is described throughout the EIR in Chapter II, *Project Description*, pages II-10, II-11, II-17, II-74, and in Section IV.H, *Land Use and Planning*, pages IV.H-10 and IV-H-23 as part of the existing zoning regulation that applies to the Project Site, and is recognized as the existing regulatory condition and land use baseline in that regard. However, pursuant to State Density Bonus Law and in conjunction with the requested Density Bonus Incentives and Waiver of Development Standards, the Project is not inconsistent with the zoning on the Project Site, inclusive of the "D" Limitation. In addition, both the State Density Bonus Law and the City's Density Bonus Ordinance permit the Waivers of Development Standards to the extent the Waivers are necessary to allow for the development of affordable housing.

Also note that the Project Applicant has revised the Zone and Height District Change request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. The existing zoning has no height limitation, and the building height and FAR would be the same as under the Project. As discussed on page IV.A-1, in Section IV.A, *Aesthetics*, of the Draft EIR and pursuant to PRC Section 21099(d)(1) and City of Los Angeles Zoning Information File No. 2452, the issues of building height and relative scale as aesthetic impacts of the Project are not considered significant impacts on the environment. The discussion of the Project provided in Section IV.A of the Draft EIR was provided for informational purposes only. See also Topical Response No. 4 – Aesthetics, for additional discussion of the Project’s aesthetics impacts. Topical Response No. 5 – Land Use and Planning, above, discusses the proposed revision in proposed entitlements and the function of the Density Bonus Compliance Review in detail.

Additionally, see Response to Comment No. IND 8I-29 and Response to Comment No. IND 8I-30, regarding the Hollywood Redevelopment Plan and the City’s procedures for review and approval of projects and entitlements in the Hollywood Redevelopment Plan area. As stated therein, conflating disagreements around the process the City has adopted with a deficiency in those processes does not raise any issues with regard to the Project’s potential environmental impacts on the environment. Refer to Topical Response No. 5 – Land Use and Planning, regarding the Project’s consistency with the applicable land use plans.

As this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 8I-32

5. The DEIR Lacks Substantial Evidence that the Project Complies with the Hollywood Redevelopment Plan’s Infrastructure Monitoring Mandates.

The DEIR altogether omits discussion of the mandatory infrastructure monitoring required by the Hollywood Redevelopment Plan. Section 506.3.2 requires that the Agency, or the City if properly standing in its shoes, “shall monitor” all development in the Regional Center Commercial designation. When the average density in the Regional Center Commercial designation reaches 2 to 1, the Agency or City “shall submit to the City Planning Commission and to the City Council” a plan to acquire open space or restrict density to regulate future development as density approaches the maximum 4.5 to 1 FAR averaged across the Regional Center Commercial designation.

The DEIR not only fails to disclose this mandatory provision essential to monitoring and mitigating environmental impacts in the Redevelopment Plan area, it fails to provide a scintilla of evidence that the Project would not exceed the 2 to 1 FAR threshold. At a moment when the public’s faith in the City has been shattered by allegations of

brehtaking corruption, the City must make its tabulations available to the public for verification.

Response to Comment No. IND 8I-32

This comment alleges that the Draft EIR is inadequate for failure to disclose infrastructure monitoring requirements of the Hollywood Redevelopment Plan. However, the comment conflates the alleged responsibilities of the City under the Redevelopment Plan with alleged deficiencies in this private Project's Draft EIR. Under CEQA, an EIR is only required to "identify and focus on the significant effects of the proposed project **on the environment.**" (CEQA Section 151262, emphasis original.) Merely claiming that failure to address a non-CEQA issue is an inadequacy of full disclosure or that the Project would violate any City requirements regarding open space or limitations on density in the Draft EIR does not convert the issue into one that is related to the significant effects of the Project on the environment.

The Project neither conflicts with the Plan as it currently exists nor interferes with the City's alleged responsibility. As shown in Section IV.H, *Land Use and Planning*, pages IV.H-21 through IV.H-23, of the Draft EIR and Appendix J, Table LU-4, Consistency of the Project with Applicable Sections of the Hollywood Redevelopment Plan, the Project would be consistent and not conflict with the applicable Hollywood Redevelopment Plan goals related to private projects dealing with employment, land use and design, housing, sound residential neighborhoods, circulation, and open space/recreation. Redevelopment Plan sections that require the City rather than a private developer to effectuate are not relevant provisions for the purposes of determining whether the Project would cause a significant environmental impact due to a conflict with any land use plan adopted for the purpose of avoiding or mitigating an environmental effect as required by CEQA.

As stated in the Draft EIR, Appendix J, Table LU-4, among the objectives of the Redevelopment Plan are ones that relate to circulation system. The Project would be consistent and not conflict with those objectives, in part, since the Project would encourage a circulation system which would improve the quality of life in Hollywood by increasing population density in proximity to the Metro B (Red) Line Hollywood/Vine Station, services, retail uses, restaurants, and jobs, all within walking distance.

Moreover, the Draft EIR discusses the need for findings to obtain the requested FAR. As stated in Section IV.H, *Land Use and Planning*, of the Draft EIR, page IV.H-22:

The "Project is requesting an increase from a base 6:1 FAR to a 7:1 FAR. The increase in FAR beyond 6:1 is allowed by the LAMC but would be subject to City findings that the Project would further the goals and intent of the Hollywood Redevelopment Plan by meeting such objectives as: concentrating high intensity and/or density development in areas with reasonable proximity or direct access to high capacity transportation facilities; providing new development which compliments existing buildings in areas with architecturally and/or historically significant structures; and, providing focal points for entertainment, tourism and

pedestrian oriented uses. The Project would meet these objectives by providing a mixed-use, higher-density development within a Regional Center and near public transit, including the Metro Red Line Hollywood/Vine Station, with a design that complements the architecturally and historically significant Capitol Records Building. The Project would also provide a focal point for entertainment and tourism, through a design that includes restaurants, outdoor dining areas, plazas and a two-block paseo between Argyle Avenue and Ivar Avenue, with improved access to the adjacent Hollywood Walk of Fame and Capitol Records Building.

The Draft EIR further states:

Through compliance with such objectives and appropriate findings to be made by the City, and as further supported by the analysis provided in Appendix J of the Draft EIR, impacts with respect to the applicable goals and policies of the Hollywood Redevelopment Plan, which were adopted for the purpose of avoiding or mitigating an environmental effect, would be less than significant, and the Project and the Project with the East Site Hotel Option would be consistent with and not conflict with the goals set forth in the Hollywood Redevelopment Plan.

As the comment does not present any facts to contradict this analysis, no further response is warranted.

Comment No. IND 8I-33

6. The DEIR Misrepresents Measure JJJ's Authority to Supersede the 6:1 FAR Limitation in the Hollywood Redevelopment Plan.

The Project proposes an FAR of 6.973 to 1 in violation of Hollywood Redevelopment Plan provisions explicitly disallowing development in excess of 6:1 FAR.⁴⁸ Section 506.2.3 provides:

"The Agency may permit development in excess of 4.5:1 F.A.R. up to but not to exceed 6:1 F.A.R. or such other density as may be permitted by future amendments to the Community Plan, only if the Agency makes the following findings and determinations: [...]" (Emphasis added.)

The strict 6:1 FAR limitation is also reflected in Hollywood Community Plan Footnote 9, which provides:

"This designation is limited to the Hollywood Redevelopment Project Area. Development intensity is limited to 4.5:1 FAR with a maximum of 6:1 FAR possible through a Transfer of Development Rights procedure and/or City Planning Commission approval."

Despite this clear prohibition on FAR exceeding 6:1, the DEIR omits any meaningful analysis of how the Project's FAR complies. The DEIR's discussion of Section 506.3.2 is

legally erroneous and conclusory, stating that “the Project is eligible for an FAR bonus of up to 35 percent (8.1:1 FAR) pursuant to LAMC Section 11.5.11 for providing at least 11 percent of the total residential units as Very Low Income households.”⁴⁹

However, neither LAMC Section 11.5.11 nor any other provision of the LAMC can legally supersede the Hollywood Redevelopment Plan, which has the superior authority of state law. To distract from this inconvenient legal truth, the DEIR repeatedly – and falsely – states that the requested incentives and concessions are authorized “pursuant to California Government Code 65915.”⁵⁰ By purportedly relying on State Density Bonus Law, the DEIR lays the foundation for its conclusion that the Project may properly exceed the 6:1 FAR limit of the Hollywood Redevelopment Plan, itself having the authority of state law.⁵¹

Based on the absurd analysis in the DEIR, the Applicant seeks and receives a development bonus pursuant to Section 65915 to allow an increase in FAR from 6 to 1 to 7 to 1. However, LAMC § 11.5.11(a) clearly states that developments receiving development bonuses pursuant to Section 65915 are not eligible for processing under LAMC § 11.5.11:

“A Developer seeking and receiving a density or development bonus under the provisions of California Government Code Section 65915 or any other State or local program that provides development bonuses shall not be eligible for the development bonuses pursuant to this Section. For purposes of this provision, development bonuses shall include discretionary General Plan amendments, zone changes, and height district changes.” (Emphasis added.)

Because Measure JJJ itself precludes the Project from relying on State Density Bonus Law for any development bonus, the Project’s FAR is not permitted.

Furthermore, the authority to approve the requested incentives and concessions originates not in the State Density Bonus Law, but in LAMC § 11.5.11(e):

“Developer Incentives. In addition to the requested General Plan amendments, zone changes and/or height district changes, a Project that provides affordable housing consistent with this Section shall also be entitled to three incentives or concessions specified in California Government Code Section 65915(k) or the applicable Affordable Housing Incentive Program.” (Emphasis added.)

Even a cursory analysis of this language makes it abundantly clear that the incentives and concessions are requested pursuant to LAMC § 11.5.11(e), rather than Government Code Section 65915.

First, the LAMC references Subdivision (k) of Section 65915, which is merely a definition of types of incentives – not the entire Density Bonus Law itself. Subdivision (k), crucially, contains only a definition of the phrase “concession or incentive.”

Second, the LAMC references incentives or concessions “specified in” the Density Bonus Law, further supporting the conclusion that the LAMC merely draws upon the definitions found in the Density Bonus Law and adopts those definitions by reference into the LAMC. The only procedure to exceed the 6 to 1 FAR maximum in the Hollywood Redevelopment Plan is a Variation pursuant to Section 521 requiring findings of unnecessary hardship and exceptional site-specific circumstances. The DEIR’s assertion that the Project’s entitlement is authorized “pursuant to” State Density Bonus Law is not only mistaken, it is calculated to muddy the community’s understanding of applicable regulations. The DEIR deprives the reviewing public of the opportunity to correctly understand the sources of authority that the City purports to utilize to boost the FAR of the Project to new astronomical heights.

It is transparent that Millennium and the City are trying to bootstrap a further boost of the FAR by misrepresenting to the public that the legal authority for the entitlement is the State Density Bonus Law. This gives the City a false argument that the further density increase is authorized by a state law program (Density Bonus Law) that must be construed to override the lesser FAR limit of the state law enacted Hollywood Redevelopment Plan. But the argument is simply wrong. Measure JJJ as set forth in LAMC Section 11.5.11(e) is a local enactment that simply borrows definitions from a state law. It provides no legal basis to override the FAR limit of state law as enacted in the Hollywood Redevelopment Plan. To contend otherwise is false and misleading to the reviewing public. These false statements are prejudicial because they deprive the reviewing public of the opportunity to correctly understand that sources of authority that the City purports to utilize to boost the FAR of the Project site to new astronomical heights.

Footnote 48: Consistent with the strict 6:1 FAR limitation in the Hollywood Redevelopment Plan, Footnote 9 of the Hollywood Redevelopment Plan permits a “maximum 6:1 FAR” in areas designated Regional Center. LAMC § 12.21.1 further restricts Height District 2 to a maximum FAR of 6:1.

Footnote 49: DEIR Appendix J, p. 19.

Footnote 50: E.g., DEIR p. II-2, II-74 and IV-H.23.

Footnote 51: See DEIR p. II-11 and IV-H.23.

Response to Comment No. IND 8I-33

This comment claims that the Project cannot exceed 6:1 FAR because of certain limitations in the Hollywood Redevelopment Plan and the Hollywood Community Plan. The Project would be allowed to exceed 6:1 FAR under the previously requested density bonus pursuant to LAMC Section 11.5.11(e), described throughout Chapter II, *Project*

Description, with the provision of a minimum of 10 percent Very Low Income residential units. The Project Applicant has revised the request for the proposed Zone and Height District Change to allow, under a Measure JJJ concession pursuant to LAMC Section 11.5.11(e), a FAR increase up to 7:1, as presented in Chapter II, *Project Description*, of the Draft EIR, to a Density Bonus Compliance Review pursuant to the State Density Bonus Law and the City's Density Bonus Ordinance. Both the State Density Bonus Law and the City's Density Bonus Ordinance permit the Waivers of Development Standards to the extent the Waivers are necessary to allow for the development of affordable housing. Pursuant to State Density Bonus Law and in conjunction with the requested Density Bonus Incentives and Waiver of Development Standards, the Project is not inconsistent with the zoning on the Project Site, inclusive of the "D" Limitation. In addition, the Project's updated list of entitlements includes removal of the CUP for a Unified Development and, instead, requests approval of a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25, with an Off-Menu Incentive to allow FAR and density averaging across the Project Site.

As explained in detail in Topical Response No. 5 – Land Use and Planning, above, the State Density Bonus Law codified in LAMC Section 12.22 A.25, is a State-mandated program that allows the Project to be eligible to receive certain development incentives and waivers of development standards by providing the requisite percentage of affordable housing.

LAMC Section 12.22 A.25(e) specifically provides that projects which set aside at least 10 percent of the base permitted density for Very Low Income households may request up to two (2) development incentives or concessions (On-Menu or Off-Menu). Moreover, Government Code Section 65915 (e)(2) states that that a proposal for the waiver or reduction of development standards shall neither reduce nor increase the number of incentives or concessions to which the applicant is entitled. With the inclusion of 133 affordable senior housing units, the Project would provide more than the requisite 10 percent of the units for Very Low Income households, thereby entitling the Project Applicant to two (2) incentives, and Waivers of Development Standards (as per above, the request for which shall neither reduce nor increase the number of incentives or concessions to which the applicant is entitled).

Pursuant to LAMC Section 12.22 A.25(f)(4)(i), the Applicant requests the On-Menu incentive to permit an FAR increase in a percentage equal to the percentage of Density Bonus for which the Housing Development Project is eligible, not to exceed 35 percent. By setting aside a minimum of 11 percent for Very Low Income households, the Project is eligible for a 35 percent density bonus and, therefore, a 35 percent increase in FAR. Thus, as a departure from the entitlement request in Chapter II of the Draft EIR, the Project requests one (1) On-Menu incentive to increase the Project Site's maximum allowable FAR by 35 percent from 2:1 FAR to 2.7:1 FAR (for portions of the Project Site located at the corner lot on the southeast corner of Yucca Street and Ivar Avenue and associated with APN 5546-004-032) and from 3:1 FAR to 4.05:1 FAR (for the balance of the Project Site); and one (1) Off-Menu incentive to allow FAR and density averaging

across the Project Site for a Housing Development located on non-contiguous lots (i.e. the West Site and East Site bisected by Vine Street). The Project also requests one (1) Waiver of Development Standards to permit a 7:1 FAR averaged across the Project Site; and one (1) Waiver of Development Standards to permit the floor area of any residential balconies and terraces to be excluded for purposes of calculating the total floor area, as applicable.

Comment No. IND 8I-34

7. The DEIR Fails to Disclose a Conflict with the Hollywood Redevelopment Plan Definition of Floor Area.

The Project requests a purported incentive or concession to exclude the area of covered balconies and terraces from the definition of Floor Area. However, the Hollywood Redevelopment Plan defines Floor Area in Section 506 as “the ratio of total floor area of all buildings in a parcel to the parcel area. The floor area of a building excludes space devoted to stairwells, elevator shafts, light courts vehicular parking and mechanical equipment.” In practice, the CRA/LA has consistently interpreted it to have the same meaning as the LAMC to harmonize FAR calculations among the CRA/LA, the Department of Building and Safety and the Department of City Planning.

The Project proposes to deviate from this consistent and logical practice by re-defining the scope of Floor Area under the LAMC. However, because the incentive or concession is requested under the authority of Measure JJJ – a local ordinance – it cannot alter the implementation of the Hollywood Redevelopment Plan, which is a creature of state law. For purposes of calculating the Redevelopment Plan limitation on development exceeding 6:1 FAR, Floor Area shall include the area of covered terraces and balconies.

The DEIR fails to identify the conflict with the Hollywood Redevelopment Plan’s definition of Floor Area, rendering its analysis of consistency with policies and objectives legally deficient. The DEIR’s analysis refers to development of “up to 7:1 FAR”⁵² – yet it fails to analyze the true Project FAR of 7.81 to 1. By basing its analysis on a foundation of fictitious FAR numbers, the DEIR fails to present a coherent and good faith analysis of land use consistency.

Footnote 52: DEIR Appendix J, p. 19.

Response to Comment No. IND 8I-34

This comment objects to the Draft EIR’s analysis of the FAR for the Project and concludes that the requested FAR is based only on State law and in conflict with applicable land use plans. As discussed in Response to Comment No. IND 8I-33, with the inclusion of a minimum of 11 percent Very Low Income units, the Project would be allowed to exceed 6:1 FAR under the proposed Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25.

The State Density Bonus Law, codified in LAMC Section 12.22 A.25, is a State-mandated program that allows the Project to be eligible to receive certain development incentives (modification of a City development standard) by providing the requisite percentage of affordable housing.

The Project does not request an increase in the residential density as the Project's residential component is consistent with the underlying C4 Zone and Regional Center Commercial land use designation, pursuant to LAMC Section 12.22 A.18 and in conjunction with the requested Vesting Tentative Tract Map (Case No. VTT-82152).¹¹²

LAMC Section 12.22 A.25(e) specifically provides that projects which set aside at least 10 percent of the base permitted density for Very Low Income households may request up to two (2) development incentives or concessions (On-Menu or Off-Menu) (however, LAMC Section 12.22 A.25(c) requires the Applicant to provide at least 11 percent of the units as Very-Low Income to be eligible for the 35 percent FAR increase On-Menu Incentive). Moreover, Government Code Section 65915 (e)(2) states that that a proposal for the waiver or reduction of development standards shall neither reduce nor increase the number of incentives or concessions to which the applicant is entitled. With the inclusion of 133 affordable senior housing units, the Project would provide more than the requisite 10 percent of the units for Very Low Income households, thereby entitling the Project Applicant to two (2) incentives, and Waivers of Development Standards (the request for which shall neither reduce nor increase the number of incentives or concessions to which the applicant is entitled).

Pursuant to LAMC Section 12.22 A.25(f)(4)(i), the Applicant requests the On-Menu incentive to permit an FAR increase in a percentage equal to the percentage of Density Bonus for which the Housing Development Project is eligible, not to exceed 35 percent. By setting aside a minimum of 11 percent for Very Low Income households, the Project is eligible for a 35 percent density bonus and, therefore, a 35 percent increase in FAR. Thus, as a departure from the entitlement request in Chapter II of the Draft EIR, the Project requests one (1) On-Menu incentive to increase the Project Site's maximum allowable FAR by 35 percent from 2:1 FAR to 2.7:1 FAR (for portions of the Project Site located at the corner lot on the southeast corner of Yucca Street and Ivar Avenue and associated with APN 5546-004-032) and from 3:1 FAR to 4.05:1 FAR (for the balance of the Project Site); and one (1) Off-Menu incentive to allow FAR and density averaging across the Project Site for a Housing Development located on non-contiguous lots (i.e. the West Site and East Site bisected by Vine Street). The Project also requests one (1) Waiver of Development Standards to permit a 7:1 FAR averaged across the Project Site; and one (1) Waiver of Development Standards to permit the floor area of any residential balconies and terraces to be excluded for purposes of calculating the total floor area, as applicable. The proposed Density Bonus Compliance Review would not change the Project's FAR, but the method under which the FAR is calculated. The proposed Density

¹¹² Developments combining residential and commercial uses located within a C4 Zone provided that such lot is located within an area designated as Regional Center Commercial by the adopted community plan, are permitted the R5 Zone density of 1 unit per 200 square feet of lot area.

Bonus Compliance Review and the revised entitlement request are described in further detail in Topical Response No. 5 – Land Use and Planning, above. The revised entitlements are also listed in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR.

Comment No. IND 8I-35

IX. THE DEIR'S AIR QUALITY ANALYSIS VIOLATES CEQA.

An EIR is intended to be a document of full environmental information, informing the public and the decision makers of all significant impacts of a proposed project. (Pub. Res. Code § 21002.1(a); Guidelines §15121.) Here, the DEIR fails at full environmental disclosure by failing to show adequately the baseline of air pollution that exists in the South Coast Air Basin (SCAB), where Los Angeles and the Project are located (DEIR, p. IV.B-16), and by failing to show adequately that the Project's impacts on that pollution have been mitigated.

Response to Comment No. IND 8I-35

The comment asserts that the Draft EIR is inadequate for failure to disclose the baseline air pollution conditions in the South Coast Air Basin and show adequately that all the Project air quality impacts are mitigated. The Draft EIR's Air Quality section fully describes, in Subsections IV.B.2.b and IV.B.2.c, the regulatory framework, attainment status of all criteria pollutants, and ambient background levels of these pollutants for the most recent 3-year period. In addition, Subsection IV.B.3.d presents Project pollutant levels and mitigation measures where Impact Threshold (b) was found to be potentially significant. Mitigation measures were described and quantified, with impacts after mitigation found to be less than significant. Table IV.B-9 presents the mitigated emissions and compares them to significance thresholds. Therefore, the Draft EIR fully discloses the mitigated emissions and impacts after implementation of mitigation measures and, thus, provides decision makers with full environmental information of all significant and mitigated air quality impacts of the Project.

Comment No. IND 8I-36

A. The DEIR Fails to Disclose the Existing Ozone Problem.

The DEIR grossly understates the existing air pollution problem. The American Lung Association's publication, *State of the Air 2020*, attached hereto as **Exhibit 28**, relies on publicly available data to report that "Los Angeles has been the most polluted city in the US for ozone for 20 of the 21 years the Lung Association has been issuing this Report" (*State of the Air*, p. 7), and it has that woeful distinction now. (*Id.*, p. 20.) The Los Angeles-Long Beach area is reported by the Lung Association as exposing 4,270,638 persons under 18 and 2,583,214 people 65 or over to these harmful levels of ozone. (*Id.*, p. 22.)

Although the DEIR does acknowledge that the South Coast Air Basin ("Basin") is in "extreme nonattainment" with the federal National Ambient Air Quality Standards

(NAAQS) and nonattainment with the California Ambient Air Quality Standards (CAAQS) (DEIR, pp. IV.B-24 and 25), it does not explain what “extreme” nonattainment means: it is the worst category of ozone pollution in which the U.S. EPA can categorize an air basin under the federal Clean Air Act (42 U.S.C. § 7511(a)), having among the highest ozone concentrations in the air anywhere in the nation.

U.S. EPA’s Green Book states that only two areas in the nation are in “extreme” nonattainment for ozone, namely the Los Angeles portion of the South Coast Basin (“Basin”), and the San Joaquin Valley. (<https://www3.epa.gov/airquality/greenbook/jnc.html>. **Exhibit 29.**)⁵³ Further the San Bernardino County and Riverside portions of the Basin are in the next-worst category, being in “severe” nonattainment of the NAAQS for ozone. (*Id.*) The Project is proposed to be built in the middle of an air quality disaster, but fails to properly identify and explain this.

Footnote 53: EPA’s Green Book is cited as a reference in the DEIR, but without guidance as to how to find the data referred to here.

Response to Comment No. IND 8I-36

The comment asserts that the Draft EIR fails to disclose the existing ozone problem. Draft EIR Subsection IV.B.2.c describes the South Coast Air Basin’s existing ozone conditions and presents, in Table IV.B-2 on page IV.B-25, its non-attainment status for federal and State ozone standards, with the ‘extreme’ classification. The U.S. Environmental Protection Agency (USEPA) classifies ozone nonattainment areas based on the severity of their ozone problem, with the ‘extreme’ classification as the most severe. For the federal 2015 ozone standard of 0.070 parts per million (ppm) (8-hour average), the ‘extreme’ classification is for areas that have a design value of 0.163 ppm (8-hour average) and above.¹¹³ This information has been included in the Final EIR as additional clarifying information.

Further, in Table IV.B-3 on pages IV.B-27 and IV.B-28 of the Draft EIR, ambient ozone levels are presented along with the number of days over the most recent 3-year period for which the 1-hour and 8-hour ozone standards were exceeded. With this information, the Draft EIR, along with clarifications incorporated into the Final EIR, have adequately characterized the air quality conditions of the Project area based on factual information.

Comment No. IND 8I-37

B. The Air Quality Management Plan for the Basin Does Not Show That the Basin Will Meet Applicable Federal and State Air Quality Standards for Ozone.

¹¹³ USEPA, Ozone Designation and Classification Information, <https://www.epa.gov/green-book/ozone-designation-and-classification-information>, accessed August 25, 2020.

Further, the DEIR fails to inform the public and the decision makers that the Basin has any prospects in the foreseeable future to remedy this critical public health threat. The DEIR does disclose some of the serious damage to human health that ozone causes, including aggravating asthma, causing asthma attacks, contributing to pulmonary diseases, inhibiting (perhaps permanently) children’s lung capacity and development, and causing lung inflammation and difficulty breathing. (DEIR, p. IV.B-1 to 3, and the references in footnotes 1 through 7.)

The State of the Air adds to this dismal catalogue of ozone health damage, reporting that “[e]xposure to ozone may also cause cardiovascular harm (e.g., heart attacks, strokes, heart disease, congestive heart failure), [may] cause harm to the central nervous system. And [m]ay cause reproductive and developmental harm.” (State of the Air, p. 42.)

The DEIR fails to inform the public and the decision makers of how far the Basin still has to go to meet the federal and state ozone standards. Instead, the DEIR focuses on the California Air Resources Board’s (“CARB”) and South Coast Air Quality Management District’s (“SCAQMD”) plan to meet the federal and state ozone standard: namely, the 2016 Air Quality Management Plan (“AQMP”) for the Basin, and the Project’s purported consistency with that plan.

The DEIR treats the AQMP as the operative air quality plan for the Basin because “the 2016 AQMP has been adopted by the SCAQMD and CARB” (DEIR, p. IV.B-37), and implies that the AQMP will solve the ozone problem. The DEIR does not make it clear that not only does the Basin fail to meet the National Ambient Air Quality Standard (“NAAQS”) for ozone, but that it may not meet that standard by the 2023 deadline. This is a serious violation of the City’s duty under CEQA to provide full environmental information about the existing environment in which the Project would be built. (Guidelines § 15125(a.)

The Guidelines specify that “[k]nowledge *[sic]* of the regional setting is critical to the assessment of environmental impacts” (Guidelines § 15125(c)), and that is especially true here. The DEIR fails to tell the public how significantly the Basin needs to severely reduce its NOx emissions in order to meet the NAAQS for ozone and receive full approval from the U.S. EPA.⁵⁴ Until the AQMP is fully federally approved, the Basin still cannot show that it will meet the NAAQS for ozone by the deadline, nor can the DEIR show that consistency with the AQMP is enough to prove that Project emissions will not have a significant impact by worsening an existing, critical, air pollution problem.

In fact, the Basin still has a serious ozone problem, to which the Project will add.

CARB issued a report in November, 2019 entitled “South Coast 8-Hour Ozone SIP⁵⁵ Update,” (“SIP Update”) attached hereto as **Exhibit 31**, which clarified this point, stating:

“The 2016 AQMP attainment demonstration specified that NOx emissions in the South Coast [Basin] need to be reduced to a level of 141 tpd [tons per day] of NOx to achieve the ozone standard. As stated above, baseline NOx emissions in 2023

have been reduced to 269 tpd due to current regulations, *leaving an additional 128 tpd of NOx emissions reductions to be achieved.*” (Emphasis added.)

CARB’s SIP Update also described CARB’s and SCAQMD’s proposed measures to bring NOx emissions down sufficiently to meet the federal 8-hour ozone standard by the deadline of 2023. (SIP Update, p. 3-5.) The SIP Update makes clear that after CARB and the SCAQMD have done all they can, the federal government must undertake various actions, either adopting strict control measures for NOx emissions sources that California cannot legally regulate (such as ocean-going vessels at sea, aircraft, locomotives, and out-of-state heavy-duty trucks), or providing federal funding for incentive measures to reduce NOx (e.g., to induce owners of high-emitting vehicles to replace them with new, low-emitters), or California will not meet the NAAQS for ozone by the deadline. (SIP Update, p. 3-4.)

Of the 128 tpd shortfall, CARB believes that the federal government must take actions to reduce 67-69 tpd, well over half of the shortfall. (*Id.*, at Table ES-1, p. 4.) CARB notes that “if, due to federal inaction, we do not achieve the standard by 2023, the [Clean Air] Act will require a new SIP setting a new attainment date, *up to ten years later.*” (*Id.*, p. 6, emphasis added.) Although the SIP Update expresses hope that the federal government will take the actions needed for the Basin to meet the federal ozone standard “based on U.S. EPA’s authority to control emissions and responsibility to act as a good partner to achieve healthy air”, it does not cite to any commitment by the federal government to do so. (SIP Update, p. 3.)

The DEIR does not inform the public of how far the Basin still has to go to meet the federal and state ozone standards, nor that, lacking federal action that has not been promised to occur, that the Basin’s residents will continue to be exposed to the serious health effects of ozone exposure for many years. This is a serious failure to meet CEQA’s requirement that an EIR provide full disclosure of the baseline against which the Project’s impacts will be measured for significant environmental effects.

Footnote 54: Nor is the 2016 AQMP fully approved by U.S. EPA, another vital piece of information about the baseline that is omitted by the DEIR. The U.S. EPA website shows that the Los Angeles portion of the South Coast Air Basin’s AQMP is only *partially* approved, with many control regulations/strategies still not approved by EPA. https://www3.epa.gov/airquality/urbanair/sipstatus/reports/ca_elembypoll.html#ozone-1hr1979_413.) **Exhibit 30.**

Footnote 55: The State Implementation Plan (“SIP”) is the compilation of each air basin’s own AQMP, plus state measures.

Response to Comment No. IND 8I-37

The comment asserts that the Draft EIR fails to disclose air quality problems in the South Coast Air Basin, specifically in the areas of nonattainment and ozone. The impact discussion in Section IV.B, *Air Quality*, of the Draft EIR, under Impact Threshold (a)

provides substantial evidence under CEQA that the Project would not conflict with implementation of the SCAQMD 2016 AQMP. The 2016 AQMP has been adopted by both the SCAQMD and CARB. While the 2016 AQMP has not been fully approved by the USEPA and has been partially approved with a conditional approval for the reasonable further progress contingency measure requirement,¹¹⁴ as discussed on pages IV.B-15 through IV.B-18 of the Draft EIR, the 2016 AQMP incorporates emissions control measure strategies from the prior USEPA-approved 2012 AQMP that are relevant to the Project, which include control measures designated as ONRD-04 and OFFRD-01 in the 2012 AQMP and designated as MOB-08 and MOB-10 in the 2016 AQMP. These control strategies are intended to reduce emissions from on-road and off-road heavy-duty vehicles and equipment, as stated on page IV.B-17 of the Draft EIR. Furthermore, as the 2016 AQMP builds from the 2012 AQMP, pages IV.B-16 and IV.B-17 of the Draft EIR also provide a discussion of the key elements of the 2016 AQMP, which include strategies to demonstrate attainment of the NAAQS, which are set at levels considered safe to protect public health, including the health of sensitive populations, for federal non-attainment pollutants of ozone and PM_{2.5} while accounting for regional growth, increasing development, and maintaining a healthy economy. Since the 2016 AQMP has been approved by the SCAQMD and CARB, Section IV.B, *Air Quality*, of the Draft EIR includes discussion and impact analyses that reference the 2016 AQMP appropriately for CEQA purposes. In light of the fact that the USEPA has only issued a partial approval of the 2016 AQMP, Section IV.B, *Air Quality*, of the Draft EIR also discusses the 2012 AQMP. Thus, the Draft EIR provides sufficient environmental information regarding the AQMP to meet the intent and purposes of CEQA as an informational document.

An individual land use development project is not responsible for implementing the entirety of an AQMP. The purpose of the AQMP is to evaluate integrated strategies and control measures to meet the NAAQS as expeditiously, as practicable, but no later than the statutory attainment deadlines. Implementation is achieved by promulgation of control strategies, such as SCAQMD rules and regulations to control emissions and by compliance by facilities, fleet operators, and other entities subject to the controls. As discussed on page IV.B-32 of the Draft EIR, a project would have a significant impact on air quality if it would conflict with or obstruct implementation of the applicable air quality plan. Pages IV.B-46 through IV.B-52 of the Draft EIR provide a detailed analysis of why the Project would not conflict with or obstruct implementation of the AQMP because the Project would not exceed those criteria set forth by the SCAQMD. As discussed therein, the Project would not increase the frequency or severity of an existing air quality violation or cause or contribute to new violations for the pollutants regulated in the AQMP. Construction and operation of the Project would comply with required rules and control strategies to reduce emissions, such as the heavy-duty truck and bus regulation (i.e., 13 CCR, Section 2025 [CARB Truck and Bus regulation]), and other applicable SCAQMD rules specified and incorporated in the 2016 AQMP. Thus, the Project would not delay timely attainment of air quality standards or emission reductions specified in the AQMP. Furthermore, the Project's growth would be consistent with the growth projections

¹¹⁴ Federal Register, Vol. 84, No. 190, 52005 – 52015, October 1, 2019.

contained in the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), which forms the basis of the growth projections analyzed in the 2016 AQMP. Thus, the Project would be consistent and would not be in conflict with the assumptions and growth projections in the 2016 AQMP. Therefore, based on the SCAQMD criteria for evaluating potential impacts under Impact Threshold (a), the Project would result in a less-than-significant impact and would not conflict with or obstruct implementation of the AQMP, including for implementation of control measures for ozone precursor emissions (volatile organic compounds [VOC] and nitrogen oxides [NO_x]).

Comment No. IND 8I-38

C. The Project May Have Significant Impacts on Air Quality in the Basin.

The DEIR also fails as a full environmental disclosure document in that it fails to discuss the impact of Project construction emissions on air quality throughout the Basin, and also fails to discuss any resulting public health impacts. (Guidelines § 15126.2 (a) [EIR must provide information on health and safety problems that the proposed project would cause].) The DEIR purports to discuss the “regional context” of the Project (DEIR, p. IV.B-23), but fails to discuss accurately and fully the Project’s potential impacts on regional air quality.

The Project’s construction will add significant amounts of NO_x to the Basin over the three to four and one-half years of its construction. (See Fig. II-30, Project Construction Scenarios.) We note that the DEIR neither calculates nor estimates the total amount of NO_x that the Projects construction will emit into the Basin’s toxic soup; rather, it focuses on the vastly smaller daily emissions amounts. The NO_x emissions from construction will contribute to the formation of ozone. The DEIR briefly states that “[o]zone is a secondary pollutant formed by the chemical reaction of volatile organic compounds (VOCs) and nitrogen oxides (NO_x) in the presence of sunlight under favorable meteorological conditions, such as high temperature and stagnation episodes” (DEIR, p. IV.B-1), and “ozone . . . is a secondary pollutant that forms through photochemical reactions in the atmosphere.” (DEIR, p. IV.B-24.) However, at no point does it explain that NO_x is a vital precursor to the formation of ozone. The SIP Update states that “reaching the ozone standard would require significant emissions reductions in oxides of nitrogen (NO_x).” (SIP Update at p. 1.) In fact, the SIP Update focuses almost entirely on the need to reduce NO_x emissions in order to meet the federal ozone standard. (See the chart on page 2 of the SIP Update, which shows the amount of NO_x that must still be eliminated.) The DEIR does not make clear the critical importance of NO_x reductions.

Neither does the DEIR disclose that ozone precursor emissions (including NO_x) and ozone itself are regularly transported across the Basin, and even beyond. The 2016 AQMP describes ozone and ozone precursor transport as follows:

“The prevailing daytime sea breeze tends to transport pollutants and precursor emissions from coastal areas into the Basin’s inland valleys, and from there, still further inland into neighboring areas of the SSAB (especially the Coachella Valley)

and the MDAB. Concentrations of primary pollutants (those emitted directly into the air) are typically highest close to the sources which emit them. However, secondary pollutants (those formed in the air by chemical reactions, such as ozone and the majority of PM_{2.5}) reach maximum concentrations some distance downwind of the sources that emit the precursors, due to the fact that the polluted air mass is moved inland by the prevailing winds many miles to areas where maximum concentrations are reached.” (2016 AQMP, Appdx. II Current Air Quality, pp. II-1-5 to 6; attached hereto as **Exhibit 32.**)

As an example of how far ozone precursors may be transported and the significance they may have, we note that the SCAQMD is now asking the U.S. EPA to reclassify the Coachella Valley, over 130 miles east of the City of Los Angeles⁵⁶ in the South Coast Basin, to a less serious classification for ozone than it now has. The SCAQMD bases the request on the fact that:

“[W]hen high levels of ozone are formed in the South Coast Air Basin, it is transported to the Coachella Valley. Similarly, when ozone precursors such as nitrogen oxides (NO_x) and volatile organic compounds (VOCs) are emitted from mobile sources and stationary sources located in the South Coast Air Basin, they are also transported to the Coachella Valley. As a result, ozone levels in the Coachella Valley are primarily due to emissions in the South Coast Air Basin.” (Press Release dated April 12, 2019, attached at **Exhibit 33.**)

See also a 2016 SCAQMD White Paper entitled “VOC Controls” and attached hereto as **Exhibit 34**, which states at pages 2-3:

“Certain air quality monitoring stations located in San Bernardino and Riverside counties exceed the current 75 ppb federal ozone standard over 60 days per year (FIGURE 2). Higher local ozone concentrations in these regions can be attributed to the significant upwind O₃, NO_x, and VOC precursor emissions transported by the daily sea-breeze in the summer, local emissions, and the timing of the daily emissions and peak sunlight intensity.”

The DEIR briefly states that the Project’s construction-related NO_x emissions would exceed the regional significance thresholds set up by the AQMD, but does not explain what the regional thresholds are obviously intended to reflect: that the Project would contribute to ozone formation and regional transport of both NO_x and ozone across the Basin. By emphasizing the local air quality and only cursorily discussing the regional air pollution patterns, the DEIR trivializes the Project’s impacts.⁵⁷

The DEIR takes the position (DEIR, pp. IV.B-47) that because Project NO_x emissions do not exceed SCAQMD’s *localized* significance thresholds, “the Project and the Project with the East Site Hotel Option would not increase the frequency or severity of an existing violation or cause or contribute to new violations for these pollutants. As the Project would not exceed any of the State and federal standards, the Project would also not delay timely attainment of air quality standards or interim emission reductions specified in the AQMP.”

This conclusion is breathtakingly overbroad and misleading, and should be revised to make clear that it covers *only* localized pollutant impacts, and not ozone impacts. As the DEIR recognizes (DEIR, p. IV.B-46), the localized significance thresholds are applicable only to NO₂, CO, PM₁₀, and PM_{2.5}, *not* ozone formation or concentrations. A project can be consistent with the localized thresholds, have no significant local impacts, and still “delay timely attainment of air quality standards or interim emission reductions specified in the AQMP” if those standards are regional ones for ozone.

Further, the statement at DEIR p. IV.B-47 that compliance with the AQMP can be shown *even if the actual criteria pollutant emissions significance thresholds set by SCAQMD* are exceeded by the project, if the project includes the control strategies (such as project location in a High Quality Transit Area, use of TDM measures, use of cleaner diesel trucks) that are called for in the AQMP, is incorrect and lacks legal authority. The DEIR asserts that projects or activities “consistent with the applicable growth projections and control strategies used in the development of the AQMP would not jeopardize attainment of the air quality levels identified in the AQMP even if their emissions exceed the SCAQMD’s thresholds of significance.” However, as shown above, the AQMP itself does not show attainment of the federal ozone standard by the deadline. Instead, what it shows is a contingent demonstration of attainment that could succeed only if the federal government adopts more stringent control standards for sources that only the federal government has legal authority to control, or provides significant new incentive funding; neither is shown as likely to occur in the foreseeable future. Even if the Project complies with all applicable control regulations in the AQMP, and would not exceed the growth planned for in the AQMP, its emissions could still cause a cumulatively significant contribution to violating the ozone standard. The DEIR pushes the legal effect of the localized significance thresholds beyond their limit. (See also p. IV.B-49.)

In short, the DEIR has not shown the Project’s construction emissions of NO_x to be consistent with the AQMP, or otherwise below the level of significance.

Footnote 56: <https://www.travelmath.com/drive-distance/from/Los+Angeles,+CA/to/Coachella,+CA>.

Footnote 57: We note that, in the discussion of local air quality at DEIR p. IV.B-27 and 28, Table IV.B-3 shows exceedances of the NAAQS for ozone, PM₁₀ and PM_{2.5}, all pollutant with serious health impacts (see DEIR at pp. IV.B-1-3, and 6-7). However, the DEIR categorizes these exceedances as “the CAAQS and NAAQS were not exceeded in the Project Site vicinity for most pollutants between 2016 and 2018, except for O₃, PM₁₀, and PM_{2.5}.” This is roughly equivalent to saying that one graduated in the upper 90% of one’s class, or that the weather was sunny and fair both before and after the tornado; the statements may be technically accurate, but do not reflect the gravity of the data being characterized. The serious nature of these exceedances should have been emphasized and explained, given that the Project’s construction could add to them.

Response to Comment No. IND 8I-38

The comment asserts that the Draft EIR has not sufficiently explained the extent of the ozone problem in the air basin and the contribution of NO_x to the formation of ozone, relying on localized significance thresholds to evaluate the Project's impact significance. The comment relies on a number of opinions and narratives to describe the extreme non-attainment status of the South Coast Air Basin using phrases, such as "toxic soup," and references to metaphors, such as describing that the "weather was sunny and fair both before and after the tornado." Such phrases and metaphors are unsubstantiated opinion and narrative which do not qualify as substantial evidence under CEQA. Furthermore, the comment attempts to argue that Project emissions could still cause a cumulatively significant contribution to violating the ozone standard but provides no factual evidence to support the argument.

In addition, Section IV.B, Air Quality, of the Draft EIR, along with additional clarifying information in this Final EIR, fully discloses and describes the role of VOCs and NO_x emissions in ozone formation and the extent of the extreme non-attainment status of the South Coast Air Basin, the region in which the Project is located, relying on substantial evidence. Furthermore, Section IV.B, Air Quality, of the Draft EIR analyzes the air quality impacts of the Project based on facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts consistent with PRC Section 21082.2(c), which states that: Argument, speculation, unsubstantiated opinion or narrative, evidence which is clearly inaccurate or erroneous, or evidence of social or economic impacts which do not contribute to, or are not caused by, physical impacts on the environment, is not substantial evidence. Substantial evidence shall include facts, reasonable assumptions predicated upon facts, and expert opinion supported by facts.

The very first page of Section IV.B, *Air Quality*, of the Draft EIR (i.e., page IV.B-1) states that "Ozone is a secondary pollutant formed by the chemical reaction of volatile organic compounds (VOCs) and nitrogen oxides (NO_x) in the presence of sunlight." In fact, numerous pages of Section IV.B, *Air Quality*, highlight the fact that VOCs and NO_x are ozone precursors and contribute to the formation of ozone. For instance, page IV.B-3 of the Draft EIR states that "VOCs...contribute with NO_x to form ozone, and are regulated to prevent the formation of ozone." Page IV.B-34 of the Draft EIR references "emissions of ozone precursors (VOC and NO_x)." Page IV.B-54 of the Draft EIR also references "ozone precursors of VOCs and NO_x." Thus, the Draft EIR makes a clear and reasonable disclosure of information that VOC and NO_x emissions contribute to the formation of ozone.

The comment claims that Draft EIR does not present the total amount of NO_x that the Project's construction will emit over the duration of construction and suggests that the Draft EIR incorrectly focuses on the vastly smaller daily emissions amounts. The comment relies on unsubstantiated opinions on air quality emissions. The comment suggests that the total NO_x emissions estimate is a more relevant metric than those presented in the Draft EIR and overlooks established air quality thresholds. The Draft EIR

fully describes why daily emissions thresholds established by the SCAQMD and daily maximum emission estimates presented by the Draft EIR are appropriate. As described on page IV.B-34 of Section IV.B, *Air Quality*, under Construction and Operational Emission Air Quality Standards, “the SCAQMD has established numerical significance thresholds for construction and operational activities. The numerical thresholds are based on the recognition that the Air Basin is a distinct geographic area with a critical air pollution problem for which ambient air quality standards have been promulgated to protect public health.”⁹

(Footnote 9 from the Draft EIR: SCAQMD, CEQA Air Quality Handbook, April 1993.)

Therefore, the maximum construction daily unmitigated and mitigated air quality emissions as presented in the Draft EIR for the Project are the applicable emission estimates to present as the daily maximum emissions estimates address the relevant thresholds established by SCAQMD. In addition, as presented on page IV.B-33 of Section IV.B, *Air Quality*, of the Draft EIR, “pursuant to the CEQA Guidelines (Section 15064.7), a lead agency may consider using, when available, significance thresholds established by the applicable air quality management district or air pollution control district when making determinations of significance.” Thus, the City’s reliance on SCAQMD thresholds to assess the potential air quality impacts of the Project is consistent with CEQA guidelines and is further supported by PRC Section 21082.2(c) as presented earlier in this response, where the City appropriately relies on the SCAQMD as the experts on establishing applicable air quality thresholds. Furthermore, the comment fails to recognize that daily thresholds are more conservative than thresholds averaged over longer durations as a daily threshold restricts emissions on a daily basis, whereas a threshold that averages emissions over a longer duration, such as an annual threshold, could potentially smooth over peak daily maximum emissions over the course of the longer time duration. The comment also fails to consider the confusion and irrelevance of presenting the total amount of NO_x that the Project’s construction would emit over the duration of construction as there is no established numerical air quality impact threshold to which to compare this value. Thus, presenting the total NO_x emissions emitted over the course of Project construction in the Draft EIR would add no additional value and would not provide pertinent environmental information for decision makers.

The comment asserts that the Draft EIR states that the Project’s construction-related NO_x emissions would exceed the regional significance thresholds; however, as clearly presented on page IV.B-60, and through emissions values presented in Table IV.B-9 of Section IV.B, *Air Quality*, with implementation of Mitigation Measure AQ-MM-1, regional NO_x emissions from construction would be reduced to below the regional threshold for NO_x. Therefore, the Draft EIR sufficiently provides evidence that the Project’s construction-related NO_x emissions would be mitigated to be below regional significance thresholds. In addition, the Draft EIR clearly explains the intention of regional significance thresholds where, as described earlier, on page IV.B-34 of the Draft EIR, “the SCAQMD has established numerical significance thresholds for construction and operational activities. The numerical thresholds are based on the recognition that the Air Basin is a

distinct geographic area with a critical air pollution problem for which ambient air quality standards have been promulgated to protect public health.”

The comment claims that it is insufficient for the Draft EIR to state that, since Project NO_x emissions do not exceed SCAQMD’s localized significance thresholds (LSTs), “the Project and the Project with the East Site Hotel Option would not increase the frequency or severity of an existing violation or cause or contribute to new violations for these pollutants. As the Project would not exceed any of the State and federal standards, the Project would also not delay timely attainment of air quality standards or interim emission reductions specified in the AQMP.” However, as explicitly stated in the SCAQMD’s Final Localized Significance Threshold Methodology on page 1-1, “LSTs represent the maximum emissions from a project that will not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard, and are developed based on the ambient concentrations of that pollutant for each source receptor area.” Therefore, as stated in the comment, Project localized construction NO_x emissions and as presented in Table IV.B-13, Project localized CO, PM₁₀ and PM_{2.5} emissions, would not exceed the localized thresholds for NO_x, CO, PM₁₀, or PM_{2.5}. Therefore, construction emissions impacts to sensitive receptors would be less than significant, the Project would not exceed any of the State and federal standards, and the Project would also not delay timely attainment of air quality standards or interim emission reductions specified in the AQMP. Please see Response to Comment No. IND 8I-37 for discussion on the purpose of the AQMP, which is to evaluate integrated strategies and control measures to meet the NAAQS as expeditiously, as practicable, but no later than the statutory attainment deadlines, and how based on the SCAQMD criteria for evaluating potential impacts under Impact Threshold (a), the Project would result in a less-than-significant impact and would not conflict with or obstruct implementation of the AQMP, including for implementation of control measures for ozone precursor emissions (volatile organic compounds [VOC] and nitrogen oxides [NO_x]).

Thus, as discussed, the Draft EIR uses the relevant significance thresholds to evaluate impact significance and the potential need for mitigation measures to reduce those pollutants that exceed them.

Comment No. IND 8I-39

D. Mitigation Measure AQ-MM-1 is Not Shown to be Enforceable.

The DEIR states that emissions of NO_x during construction will exceed the SCAQMD regional significance threshold for NO_x, and concedes that mitigation is required. (DEIR, p. IV.B-53.) It also claims that, with application of Mitigation Measures AQ-MM-1 and AQ-MM-2, the Project’s NO_x emissions will be below the SCAQMD regional threshold for NO_x. However, this assertion presumably rests on the assumption that AQ-MM-1 will be carried out in full.⁵⁸ But another part of the DEIR contradicts and appears to belie that assumption.

In pertinent part, AQ-MM-1 reads:

“Construction equipment, such as tower cranes, shall utilize electricity from power poles or alternative fuels (i.e., non-diesel) rather than diesel power generators and/or gasoline power generators. Pole power shall be made available for use for electric tools, equipment lighting, etc. If stationary construction equipment, such as diesel- or gasoline-powered generators, must be operated continuously, such equipment shall be operated at least 100 feet from sensitive uses (e.g., residences, schools, child care centers, hospitals, parks, or similar uses), whenever possible.”

Thus, AQ-MM-1 states that tower cranes shall use electricity from power poles or shall use non-diesel fuels. However, the DEIR’s Energy Conservation and Infrastructure section states:

“On a *limited and incidental basis*, electricity may be used for small equipment, such as lighting, electronic devices, and other *minor construction activities* necessitating electrical power; however, it is speculative to quantify these *minor uses*, and such equipment may already be in use under existing conditions (i.e., computer laptops and mobile phones already owned and in use by contractors). Furthermore, these sources would generally be negligible compared to the clearly new electricity usage associated with the supply and conveyance of water for construction dust control, which is quantified in this analysis.” (DEIR p. IV.O-16, emphasis added.)

The DEIR here clearly calls the use of electric power at the Site “minor,” used only on a “limited and incidental basis,” and does not list tower cranes as one of those expected uses for electricity. The Energy Conservation and Infrastructure section also states:

“*Construction equipment would primarily be diesel-fueled* (with the exception of construction worker commute vehicles, which would primarily be gasoline-fueled). For purposes of this assessment, it is conservatively assumed that *heavy-duty construction equipment* and haul trucks *would be diesel-fueled*. This represents a worst-case scenario to cover maximum potential energy use during construction.” (Id.; emphasis added.) (DEIR, p. IV.O-17.)

These statements are irreconcilable with the statement in the Air Quality section that tower cranes will be powered electrically. The assertions in both DEIR sections cannot be accurate. If the Energy Conservation and Infrastructure section is the one that is accurate, and diesel power will be used for “heavy-duty construction equipment” in general, presumably including tower cranes, then the calculation of NOx emissions from construction equipment in the Air Quality section of the DEIR is not correct. Instead, the Project’s construction emissions of NOx must be higher – perhaps much higher – than the DEIR reports.

Even considering the Energy Conservation and Infrastructure section’s caveat that it is using a worst-case scenario by assuming all heavy-duty construction equipment to be

diesel-fueled,⁵⁹ NO_x emissions must be higher than the Air Quality section reports if the use of electrically-fueled construction equipment is only “minor,” as the Energy Conservation and Infrastructure section reports, rather than being used to power such major pieces of construction equipment as tower cranes at a Site that proposes to build Project that will have towers of 36 and 47 stories apiece. (Draft EIR, p. II.14.)

Accordingly, the actual amount of construction equipment that is going to be powered by electricity – and the amount that is not – must be made clear, and the equipment’s contribution to the total maximum day NO_x emissions from construction should be disclosed fully, with revised total daily NO_x emissions compared to the SCAQMD significance threshold for NO_x from construction. This internal contradiction in the DEIR is further proof that the DEIR has not proven its assertion that the Project’s construction, as mitigated, will have no significant impacts on regional air pollution, including the formation of ozone, for which the Basin is in extreme nonattainment. A recirculated DEIR must either supply the proof, or supply a corrected assessment of NO_x emissions and provide full mitigation for any exceedance of the SCAQMD regional threshold. (Pub. Res. Code §§ 21002, 21081(a).)

Footnote 58: Mitigation is required by CEQA to be fully enforceable, and to be carried out. Guidelines § 15126.4(a)(2); Lincoln Place Tenants Assn. v. City of Los Angeles (2005) 130 Cal.App.4th 1491, 1508.

Footnote 59: Appendix E identifies jackhammers as being powered by a generator, putting the notation in parentheses by the equipment’s name (Appdx. E at p. 42 of pdf [West Site], p. 43 of pdf [East Site]); other construction equipment is not so identified.

Response to Comment No. IND 8I-39

The comment claims that NO_x emissions from construction were under-estimated due to differing language in the Air Quality and Energy sections. However, despite this claim the Draft EIR presents the maximum construction emissions under both the unmitigated and mitigated construction emissions, where as shown on page IV.B-55 and Table IV.B-5, the unmitigated construction emissions presented assume all heavy-duty construction equipment to be diesel-fueled; and on page IV.B-60 and Table IV.B-9, where mitigated construction emissions presented account for Mitigation Measure AQ-MM-1: Construction Equipment Features, that includes features, such as that the Project shall utilize off-road diesel-powered construction equipment that meets or exceeds the California Air Resources Board (CARB) and U.S. Environmental Protection Agency (USEPA) Tier 4 Final off-road emissions standards or equivalent for equipment rated at 50 horsepower (hp) or greater during Project construction where available within the Los Angeles region. Such equipment shall be outfitted with Best Available Control Technology (BACT), which means a CARB-certified Level 3 DPM or equivalent, and that construction equipment, such as tower cranes, shall utilize electricity from power poles or alternative fuels (i.e., non-diesel) rather than diesel power generators and/or gasoline power generators. Pole power shall be made available for use for electric tools, equipment, lighting, etc. If stationary construction equipment, such as diesel- or gasoline-powered

generators, must be operated continuously, such equipment shall be located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible. Mitigation Measure AQ-MM-1 (page VI.B-59) did not underestimate NOx emissions. The analysis accounted for tower cranes that would be electrically-powered or would use alternative fuels (i.e., non-diesel) rather than diesel power. Appendix E-1 includes all emissions calculations and CalEEMod modeling assumptions that show how the mitigated NOx emissions were estimated.

The comment claims that Section IV.O, *Energy Conservation and Infrastructure*, of the Draft EIR contradicts the Section IV.B, *Air Quality*, of the Draft EIR since the energy analysis does not explicitly state tower cranes as one of those expected uses for electricity as presented in Mitigation Measure AQ-MM-1 in the air quality analysis. However, as stated Section 15126.4(a)(3) of the CEQA Guidelines, “Mitigation measures are not required for effects which are not found to be significant”. And, as discussed in the impact discussion in Section IV.O.3.d) of the Draft EIR, the Project is less than significant under all the thresholds of significance that are presented in Subsection IV.O.3.a, including for construction electricity and fuel consumption. While the electric tower cranes used pursuant to Mitigation Measure AQ-MM-1 in the air quality analysis would be electric powered, Section IV.O, *Energy Conservation and Infrastructure*, analyzed energy impacts in the unmitigated state for tower cranes, consistent with the unmitigated air quality analysis. As such Section IV.O, *Energy Conservation and Infrastructure*, and Section IV.B, *Air Quality*, of the Draft EIR do not provide contradictory analyses and are consistent. With implementation of Mitigation Measure AQ-MM-1 to reduce air quality impacts, the tower cranes would trade one form of energy (e.g., diesel fuel) for another form of energy (e.g., electricity). The displacement of diesel fuel with electricity pursuant to the air quality mitigation measure would have little to no effect on energy impacts since the energy would be used for the same type of equipment and the equipment would serve the same function during Project construction. Because there are no significant Project energy impacts, Section 15126.4(a)(3) of the CEQA Guidelines supports the analysis presented. Therefore, there is no basis to the argument made in the comment since not including Mitigation Measure AQ-MM-1 in the Energy Section does not suggest that Mitigation Measure AQ-MM-1 is not enforceable and will not be carried out in full to address air quality Impacts as presented in Draft EIR Section IV.B, *Air Quality*.

Comment No. IND 8I-40

X. THE DEIR’S GREENHOUSE GAS ANALYSIS VIOLATES CEQA.

In preparing the Greenhouse Gas section and reports for the DEIR, the City has failed to proceed in accordance with the requirements of law. See, e.g., Pub. Res. Code §§ 21002, 21002.1, and 21081(a), Guidelines §§ 15064.4, 15126.4(a)(1)(B) and (a)(2), and 15126.4 (a)(2) and (c)(3); and Health and Safety Code § 38562(a)(1) and (a)(2).

Among other violations, the City has (1) adopted an illusory threshold of significance that masks the obvious significant GHG emissions of the Project, (2) falsely asserted that GHG emissions must be based upon a 30-year useful life when the Project is clearly

intended to operate well beyond this time, and (3) proposed illusory offsets in mitigation measures that fail to meet the legal requirement of being real, permanent, quantifiable, verifiable and legally enforceable.

It is important to note at the outset that the DEIR makes clear that the Project's greenhouse gas ("GHG") emissions would be high – very high. The construction emissions, calculated using the overlapping construction scenario, are listed by the DEIR in Table IV.E-6 shows construction GHG emissions as 13,476 MTCO₂e. Table IV.E-7 calculates the 2025 GHG emissions for the overlapping construction scenario (with Hotel) as 8,339 MTCO₂e per year of Project operation, and calculates the 2027 GHG emissions for the sequential build-out scenario as 7,867 MTCO₂e per year of Project operation.

The operational GHG estimates include amortization of construction emissions over the assumed 30-year life of the Project. Assuming that 30-year life (which we contest, infra), the 30-year total GHG emissions for the two scenarios are 250,170 MTCO₂e over 30 years, and 236,010 MTCO₂e over 30 years, respectively. These are substantial figures, especially for a project that claims full consistency with all applicable local, regional, and state plans to reduce GHG emissions. Further, the DEIR states that these emissions "would conservatively be considered entirely net new." (DEIR, p. IV.E- 24.)

Yet, the DEIR finds these emissions to be not significant. We contest this finding on grounds that an unjustified threshold of significance is used, a false and inaccurate baseline is employed, and the Project's assumed life is impermissibly presumed to be short, as set out below.

Response to Comment No. IND 8I-40

The comment uses descriptor words to raise suspicion of the Project GHG emissions as "high – very high" and that the values are "substantial figures", yet it fails to explain or provide evidence that substantiates these claims. In addition, the comment relies on the opinion and the unsupported claim that the GHG threshold used in the Draft EIR to determine the project's GHG impacts as "illusory" while not presenting any evidence of why the threshold and consistency analysis used in the GHG section is inadequate. Section IV.E, *Greenhouse Gas Emissions*, of the Draft EIR, fully discloses and describes the adequacy of the threshold used to determine Project GHG impacts. As described on page IV.E-29 of the Draft EIR, CEQA Guidelines Section 15064.4 gives lead agencies the discretion to determine whether to assess those emissions quantitatively or qualitatively." Additionally, on page IV.E-30 of the Draft EIR,

Per CEQA Guidelines Section 15064(h)(3), a project's incremental contribution to a cumulative impact can be found not cumulatively considerable if the project would comply with an approved plan or mitigation program that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area of the project...Thus, CEQA Guidelines Section 15064(h)(3) allows a lead agency to make a finding of non-significance for GHG emissions if a project complies with a program and/or other regulatory schemes to reduce GHG emissions.

Therefore, in the absence of any adopted quantitative threshold by CARB, SCAQMD, and the City, the significance of the Project's GHG emissions was sufficiently determined to be less than significant through consistency with CEQA Guidelines Section 15064.4(b)(2). The Project complies with applicable plans, policies, regulations and requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions, as shown in Subsection 3.d)(1)(a), Project Consistency with Applicable Plans and Policies, where the Project is shown to be consistent with CARB's 2017 Climate Change Scoping Plan, SCAG's 2016-2040 RTP/SCS, L.A.'s Green New Deal (Sustainable City pLAN 2019), and the Los Angeles Green Building Code.

A 30-year Project life for GHG emissions calculations is accepted by both the SCAQMD and CARB. Moreover, the City, as the lead agency, has the discretion to adopt SCAQMD's interim guidance in setting thresholds of significance for this Project. The SCAQMD provides for GHG significance thresholds and calculation methodology is its Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans. This is the most recent guidance for project lifetime calculations. This guidance states:

Emission Calculations and Significance Threshold Proposal – For the purposes of determining whether or not GHG emissions from affected projects are significant, project emissions will include direct, indirect, and, to the extent information is available, life cycle emissions during construction and operation. Construction emissions will be amortized over the life of the project, defined as 30 years.¹¹⁵

In addition, the CARB has issued guidance to use the 30-year project lifetime in its GHG Quantification Methodology for the Affordable Housing and Sustainable Communities program. The calculation formulas in the methodology explicitly states that projects must use a 30-year project lifetime to complete this methodology.¹¹⁶ In addition, CARB, an expert State agency on evaluating GHG emissions, has agreed with and accepted a 30-Year Project life for the analysis in the ELDP application for the Project, which is provided in Appendix B of the Draft EIR. The ELDP application for the Project thoroughly analyzed the GHG emissions and provides descriptions of features that will reduce GHG emissions to net zero. While CEQA does not require achieving net zero emissions, the Project would need to provide GHG reductions based on the Project's total annual GHG emissions in order to meet the requirements of AB 900 of no net additional GHG emissions. On August 16, 2018, Governor Brown, in concurrence with CARB, certified that the Project meets the criteria for the Project to qualify as an ELDP.

Comment No. IND 8I-41

A. The DEIR Uses an Inapplicable and Improperly Supported Threshold of Significance

Lead agencies are given several options in choosing the threshold by which they will determine the significance or insignificance of a Project's environmental effects, in light of the fact that the same impact may be significant in some settings but not in others.⁶⁰ At a minimum, a threshold requires support by substantial evidence. (Guidelines § 15064(b).) The CEQA Guidelines encourage each public agency to “develop and publish thresholds that the agency uses in the determination of the significance of environmental effects.” (Guidelines § 15064.7.) The City of Los Angeles has not developed or adopted a threshold for the significance of GHG emissions, and therefore has no numeric or other established threshold by which to evaluate the Project's GHG emissions. (DEIR, p. IV.B-28.) Nor has the City adopted a climate action plan specifically setting GHG emissions reduction targets that can be applied to specific projects. Guidelines Section 15183.5 sets out the elements such a climate action plan should have:

- (1) Quantify greenhouse gas emissions, both existing and projected over a specified time period, resulting from activities within a defined geographic area;
- (2) Establish a level, based on substantial evidence, below which the contribution to greenhouse gas emissions from activities covered by the plan would not be cumulatively considerable;
- (3) Identify and analyze the greenhouse gas emissions from activities covered by the plan would not be cumulatively considerable;
- (4) Specify measures or a group of measures, including performance standards, that substantial evidence demonstrates, if implemented on a project-by-project basis, would collectively achieve the specified emissions level;
- (5) Establish a mechanism to monitor the plan's progress toward achieving the level and to require amendment if the plan is not achieving specified levels;
- (6) Be adopted in a public process following environmental review.

These requirements for a climate action plan include the setting, based on substantial evidence, of actual, numerical levels of GHG emissions that would not be significant, as well as a mechanism for tracking the plan's progress towards an overall GHG reduction goals. (See also, Cool California's Climate Action Resource Guide, which provides tools for the development of a Climate Action Plan. (<https://coolcalifornia.arb.ca.gov/local-government/toolkit>.) A notable example is the City of San Diego's Climate Action Plan, which set numerical GHG emissions reduction targets (CAP, p. 22; https://www.sandiego.gov/sites/default/files/final_july_2016_cap.pdf), and has been the subject of monitoring to determine how well the plan is working

(https://www.sandiego.gov/sites/default/files/2019_cap_digital_version.pdf.) (See Exhibits 35-37.)

The City of Los Angeles has no such plan, and therefore the DEIR cannot legally rely on a City climate action plan pursuant to CEQA Guidelines Section 15064.4, subd. (b)(3).

Instead, the DEIR argues that:

“[I]n the absence of any adopted quantitative threshold, the significance of the Project’s GHG emissions is evaluated consistent with CEQA Guidelines Section 15064.4(b)(2) [*sic*, perhaps 15064.4(b)(3) is meant] by considering whether the Project complies with applicable plans, policies, regulations and requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions, including CARB’s 2017 Climate Change Scoping Plan, SCAG’s 2016-2040 RTP/SCS, L.A.’s Green New Deal (Sustainable City Plan 2019), and the Los Angeles Green Building Code. . . . This evaluation of consistency with such plans is the sole basis for determining the significance of the Project’s GHG- related impacts on the environment.” (DEIR, p. IV.-30-31, emphasis added.)

Later, the DEIR claims:

“[C]ompliance with a GHG emissions reduction plan renders a less- than-significant impact. The analyses below demonstrate that the Project is consistent with the applicable GHG emission reduction plans and policies included within the state’s 2017 Climate Change Scoping Plan, the SCAG 2016-2040 RTP/SCS, the City of L.A.’s Green New Deal (Sustainable City Plan 2019), and Los Angeles Green Building Code. As shown herein, the Project would be consistent with the applicable GHG reduction plans and policies.” (DEIR, p. IV.E-43.)

Putting these two assertions together, the DEIR argues that mere consistency or compliance with applicable “plans and policies” of the named plans, without more, makes the Project’s GHG impacts insignificant, even though it will cause the emission of up to an additional quarter of a million metric tonnes of climate-forcing gases into the atmosphere and, perhaps more importantly, even though most of these plans do not claim to reduce GHG emissions to any set amount, or to meet all of the GHG reduction requirements established by California statutes and Executive Orders. The City has failed to establish a lawful standard of significance against which it can measure the impact of the Project’s GHG emissions.

First, CEQA Guidelines Section 151064.4, subd.(b) specifies that the extent to which a project complies with adopted plans to reduce GHG emissions is only one of several “factors, among others [to be considered] when determining the significance of impacts from greenhouse gases on the environment”⁶¹ and, by implication, not the “sole” factor the DEIR claims it is.

Second, many provisions of the Los Angeles City Building Code and the Green LA Plan are mandatory. As the DEIR states, “Since the Project is subject to the Los Angeles Green Building Code, Project Design Features reflect the minimum requirements.” (DEIR, p. IV.E-39, emphasis added.) The Project is not reducing the level of GHGs it would otherwise emit by complying with mandatory code provisions; it has no choice but to include the features the Building Code requires. These limitations on GHG emissions are already part of the regulatory baseline. Further, the green building codes by themselves are not designed to achieve zero emissions, meaning that compliance with them will not produce zero emissions; insignificance is not automatic or guaranteed. If compliance with these codes actually reduced the Project’s GHG emissions to zero, or to an unquestionably de minimis amount, then a conclusion of no significant impact could be supportable. Here, that is not the case. The Project would emit GHG emissions in the hundreds of thousands of tons, certainly not a de minimis amount.

Third, the green building codes do not have GHG reduction as their primary goal, and do not even purport to achieve specific GHG reductions. Reliance on compliance with these codes does not show actual progress towards any state GHG reduction goal.

Fourth, this so-called threshold allows the Project to rely on provisions in the named plans that are imposed upon, and carried out by, other entities than the Project. They do not reflect any action or choice by the applicant to reduce GHG emissions; the Project neither aids them nor can it stop them. They are, in essence, Project-neutral. In this category are the state’s vehicle emissions standards, its Renewable Portfolio requirements for generation of electricity, the Low Carbon Fuel Standard, and other state requirements. The Project does not have the option to not be consistent with these measures, and they should not be counted as active reduction by the Project of its GHG emissions. The DEIR correctly describes them as part of the Regulatory Framework. (DEIR, p. IV.E-3.) They are part of the regulatory baseline for the Project, not Project features. Again, if these statewide measures, in concert with compliance with mandatory building codes, resulted in a Project that emitted zero GHGs or an unquestionably de minimis amount, then there would not be a significant impact, and the matter would be closed. But that is not the case here.

Fifth, the SCAG Regional Transportation Plan/Sustainable Communities Strategy (“RTP/SCS”) does not set GHG reduction targets that would achieve the statewide reductions called for in AB 32. The RTP/SCS aims, if met, would be only a limited, partial step towards meeting the state GHG reduction goals. The RTP/SCS’ modest goals are to reduce per capita vehicle miles traveled (VMT) by passenger cars and light-duty trucks by limited amounts, namely 8 percent by 2020, 18 percent by 2035, and 21 percent by 2040 compared to the 2005 levels. The SCAG plan does not even aim at any reductions past that point, regardless of whether overall climate change goals have or have not been met. (DEIR, p. IV.E-19.) The 2050 goals in Executive Order S-03-05, set out at DEIR, p. IV.E-9, are largely ignored.

SCAG itself recognized the limits of its plan. In the Appendix to the 2016-2040 RTP/SCS, SCAG stated:

“Though ARB has not adjusted SCAG’s regional targets since the 2012 RTP/SCS, SCAG anticipates the region’s targets may change, considering Governor Brown’s recent Executive Order (B-30-15) that establishes a California greenhouse gas reduction target of 40 percent below 1990 levels by 2030. Because the transportation sector is the largest contributor to California’s greenhouse gas emissions (more than 36 percent), SCAG anticipates updated and more stringent regional greenhouse gas emissions goals are forthcoming.” (**Exhibit 38** [RTP/SCS Appendix at p. 59].)

We note that Executive Order B-30-15’s target of a 40% reduction in GHG emissions over 1990 levels was enacted into law by SB 32, and is legally binding. That means that mere consistency with the GHG emissions targets in the SCAG plan cannot be relied on to meet state GHG reduction goals, and consistency with the RTP/SCS Plan does not constitute substantial evidence of no significant impact on GHG emissions by the Project.

The DEIR attempts to cobble together compliance or consistency with several plans, and claim that whatever level of GHG emissions from the Project result from compliance/consistency with these plans is, per se, not significant, *regardless of how high it is*. This makes no sense as the use of compliance with individual plan components provides no objective emission standard against which the Project’s substantial GHG emissions may be measured. CEQA Guidelines Section 15064.4, sub.(b)(3) applies the substantial evidence test to any threshold chosen that is based on consistency with plans that are adopted to reduce climate forcing greenhouse emissions. That test requires that substantial evidence must exist in the record that supports the City’s “conclusion that the project’s incremental contribution is not cumulatively considerable.” The DEIR fails to make any showing that the Project’s incremental contribution is not cumulatively considerable just because it will comply with applicable laws and regulations either actively (in the case of building codes) or passively (in the case of state vehicle and electricity standards). In fact, this so-called threshold of significance would find any number of differently configured Projects, with any number of different GHG emissions total, to not cause significant GHG emissions levels, regardless of how high such emissions totals might run. This standard lacks sufficient specificity to actually advise the decision makers or the public as to what impacts on state GHG levels will actually be. The DEIR fails as a matter of law. Any attempt to “fix” it would need to be made in a recirculated DEIR.

Footnote 60: See No Oil, Inc. v. City of Los Angeles (1974) 13 Cal.3d 68, 83, fn. 16, quoting a federal opinion saying that “[significant] covers a spectrum ranging from ‘not trivial’ through ‘appreciable’ to ‘important’ and even ‘momentous.’” This definition is aptly suited to setting a threshold for emissions of climate-forcing gases, since the level of emissions may seem small, but the cumulative consequences may be momentous.

Footnote 61: Other factors listed by Guidelines § 15064.4(b): (1) any increase in GHG emissions the project will cause over existing emissions (here, that increase is 100% of the Project's emissions, or between 230,000 and 250,000 or so metric tonnes total GHG emissions, a staggering increase); and (2) whether the project emissions exceed a level of significance the agency has established (here, the City has not established a threshold upon which it could rely).

Response to Comment No. IND 8I-41

The commenter asserts that the less-than-significant impact finding for GHG emissions is incorrect and unsubstantiated. CEQA Guidelines Section 15064.4 states that a lead agency shall make a good-faith effort, based on available information, to describe, calculate or estimate the amount of GHG emissions resulting from a project. A lead agency has the discretion to determine, in the context of a particular project, whether to: (1) quantify greenhouse gas emissions resulting from a project; and/or; or (2) rely on a qualitative analysis or performance based standards. The City has exercised its discretion to utilize qualitative thresholds, as stated on pages IV.E-30 and IV.E-31, and fully explained on pages IV.E-80 through IV.E-82 of Section IV.E, *Greenhouse Gas Emissions*, of the Draft EIR. The statement in the comment that the Project's GHG emission impacts would be significant is incorrect and unsubstantiated. Please see Response to Comment No. IND 8I-40 for discussion on how the Draft EIR thresholds of significance for determining GHG impacts were selected, supported by CEQA Guidelines, and how the Project's GHG impacts were determined to be less than significant as the Project is shown to be consistent with CARB's 2017 Climate Change Scoping Plan, SCAG's 2016-2040 RTP/SCS, L.A.'s Green New Deal (Sustainable City pLAN 2019), and the Los Angeles Green Building Code. Furthermore, as stated in Response to Comment No. IND 8I-40, while CEQA does not require achieving net zero emissions, the Project would need to provide GHG reductions based on the Project's total annual GHG emissions in order to meet the requirements of AB 900 of no net additional GHG emissions. On August 16, 2018, Governor Brown, in concurrence with CARB, certified that the Project meets the criteria for the Project to qualify as an ELDP.

Comment No. IND 8I-42

B. The DEIR's Comparison of the Project with Its GHG-Reducing Features to a Fictional Project Without Such Features, is Invalid.

The DEIR also attempts to show that the Project's GHG emissions are not significant by concocting a comparison between the Project as proposed, with all its GHG-reducing Project Features, and a Project without such GHG-reducing Features. The DEIR states that "since this comparison is intended to mirror the concepts used in CARB's Climate Change Scoping Plan, the GHG emissions for the Project without implementation of GHG reduction characteristics, features, and measures is evaluated based on the specific and defined circumstances that CARB relied on when it projected the State's GHG emissions in the absence of GHG reduction measures in the First Update to the Climate Change Scoping Plan." (DEIR, p. IV.E-41.)

To create this comparison, the DEIR posits a project that could not now exist, using the “specific and defined characteristics” CARB used to develop the Scoping Plan:

“The specific and defined circumstances used by CARB include conditions that existed during the 2009 to 2011 period, which include the vehicle fleet regulations that existed during the 2009 to 2011 period and the 2008 Title 24 Building Energy Efficiency Standards. The specific Project Site characteristics and Project Design Features such as GHG-PDF-1 (Green Building Features – described below) and WS-PDF-1 (Water Conservation Features, refer to Section IV.N.2, Water Supply, of this Draft EIR) are not included as they encompass GHG reduction strategies and features that would be consistent with State, regional, and local GHG reduction plans and policies or would go above and beyond regulatory requirements.” (Id.)

In short, the DEIR goes through a time portal to compare the current Project as proposed to a completely fictional project that could not possibly exist, one existing in a California without the vehicle emissions standards now in effect, one without the Renewable Portfolio for energy or Low Carbon Fuel standards as they now exist, and without local or regional GHG-reducing measures like the LA Green New Deal. Unsurprisingly, the proposed Project would emit considerably less GHGs than the fictional time-portal plan. (DEIR, Table IV.E-7, at p. IV.E-72 to 73.)

We note first that this time-portal project does not include the application of the zoning, density, and height limitations that would have applied to the site at this prior time, and whose provisions would have precluded building the Project’s two towers at their proposed skyscraping height.⁶² A comparison that included the City’s zoning and General Plan as they applied to the site at the prior time the straw man Project posits might have produced a project that had far lower levels of GHG emissions than the DEIR’s straw man project, perhaps even lower than those expected from the Project as actually proposed.

However, the comparison is invalid and irrelevant. While CARB did develop the Scoping Plan in the manner the DEIR describes, CARB did so for a specific reason that does not apply to this Project. CARB was under a statutory mandate to develop a plan that would reduce California’s GHG emissions to the level they were in 1990. (Health and Saf. Code § 38550.) To do so, CARB was forced to go through the time portal and reconstruct the state’s GHG levels as they were in 1990, then project what GHG emissions would be in 2020, and, finally, develop a plan that would limit the 2020 emissions to the 1990 levels (namely, the Scoping Plan). In CARB’s case, the re-creation of a past situation was essential to comply with a state statute; the degree of future emissions reductions that would be needed to meet AB 32’s targets could only be calculated by re-creating the past.

CARB’s process in responding to a statutory mandate cannot reasonably be compared to the DEIR’s process, which sets up a straw man project, then compared its GHG emissions to those of the GHG emissions posited by the DEIR for the Project as

proposed.⁶³ CARB's purpose was to comply with the law, while the Project applicant's purpose here is only to create a Project that will maximize its profits. The comparison is not just apples to oranges, it is apples to prehistoric cycads. It is clearly a strawman argument that will in every case "prove" that the Project will emit less than a theoretical project from the past without current regulations. It's like saying the new airplane with its ban of cigarette smoking will be less harmful to human health than a TWA airliner with a twelve-row smoking section in the back of the plane as they once existed in 1970. Of course the new plane with such current regulations will be better for human health than that fictional plane from the past, just as the Project with its features will emit less GHGs than the straw-man Project without them. The comparison is not valid, and does not constitute substantial evidence that the Project's GHG emissions would not be significant. Thus, the entire use of the fictional straw man project from the past to "evaluate" emissions is a failure to proceed in accordance with law.

Footnote 62: The Project applicant has proposed that these restrictions be overridden with a zoning change and other land use entitlements to substantially increase the density and height of the project. (DEIR, p. II-10 to 11.) The value of these changes transfers millions of dollars of value to the developer, yet the City requires no meaningful evaluation or mitigation of the huge GHG emissions from such densification.

Footnote 63: We say "posited" because the Project's GHG emissions are significantly under-estimated, as discussed below.

Response to Comment No. IND 8I-42

Please see Response to Comment No. IND 8I-40 for discussion on how the Draft EIR thresholds of significance for determining GHG impacts were selected, supported by CEQA Guidelines, and how the Project's GHG impacts were determined to be less than significant as the Project is shown to be consistent with CARB's 2017 Climate Change Scoping Plan, SCAG's 2016-2040 RTP/SCS, L.A.'s Green New Deal (Sustainable City pLAn 2019), and the Los Angeles Green Building Code. Furthermore, while the comment disagrees with the methodology used in the Draft EIR's analysis of GHG, the comment provides no alternative methodology suggestion. Section IV.E, *Greenhouse Gas Emissions*, of the Draft EIR, fully disclosed and described the adequacy of the threshold used to determine Project GHG impacts. As described on page IV.E-29 of the Draft EIR, CEQA Guidelines Section 15064.4 gives lead agencies the discretion to determine whether to assess those emissions quantitatively or qualitatively." The City, as lead agency, has complied with CEQA Guidelines Section 15064.4 in the evaluation of GHG emissions.

The purpose of the comparison to a Project scenario without GHG reduction characteristics, features, and measures and how it was not used to determine significance of impacts is clearly discussed on page IV.E-74 of Section IV.E, *Greenhouse Gas Emissions*, of the Draft EIR. The Draft explains that "[i]n order to evaluate the efficacy of the GHG reduction characteristics, features, and measures that would be implemented as part of the Project as required by these GHG reduction plans and policies, this analysis

compares the Project's GHG emissions to the emissions that would be generated by the Project without implementation of GHG reduction characteristics, features, and measures. This comparison is provided to evaluate the Project's efficiency with respect to GHG emissions but is not the threshold of significance used for impact analysis. The analysis assumes the Project without implementation of GHG reduction characteristics, features, and measures would incorporate the same land uses and building square footage as the Project, and does not include certain VMT reductions from the Project's TA and land use characteristics, such as increased destination accessibility and increased transit ability, or reductions resulting from the Project's TDM program.

While other methodologies for calculating Project GHG reduction efficiencies exist, a comparison of Project GHG reduction efforts compared to a Project without Reduction Features scenario provides valuable information regarding the efficiency of the Project's GHG reduction features and is presented here for informational purposes only. This analysis compares the Project's GHG emissions to the emissions that would be generated by the Project in the absence of any GHG reduction features. It is not a threshold of significance, and is not used as the basis for any significance finding."

The analysis also did not take credit for existing site GHG emissions in its offset calculations. The analysis of the Project's GHG emissions is conservative in that it assumes all of the GHG emissions are new additions to the atmosphere.

Exhibit 7 of the ELDP Application states that baseline Condition operational GHG emissions were not calculated; the Project's GHG emissions would be considered net new. This is a conservative approach since the Project would need to provide GHG reductions based on the Project's total annual GHG emissions in order to meet the requirements of AB 900 of no net additional GHG emissions.

Comment No. IND 8I-43

C. The Project's GHG Emissions Have Been Underestimated Through the Assumption of a 30-Year Project Lifespan That is Not Mandated by Law or Supported by Facts.

The DEIR claims that the Project will have only a 30-year lifespan for purposes of GHG impacts, and that the Project need not analyze or mitigate GHG impacts past that time. The claim is based on a 2008 *draft* guidance document⁶⁴ from the SCAQMD that *recommended* assuming a 30-year project life for industrial projects subject to SCAQMD permitting, *for purposes of amortizing GHG emissions* over a longer time than the first year of a project's life. (DEIR, p. IV.E-34.) The DEIR refers to this 30-year life span as SCAQMD "guidance" (*id.*), but admits elsewhere in the DEIR that the provision was not actually adopted by the SCAQMD as applicable to residential/commercial projects, only to industrial projects directly subject to SCAQMD permitting. (DEIR, p. IV.E-18, footnote 47.)

The Draft SCAQMD Guidance document does not support, much less mandate, the 30-year lifespan for the residential/commercial Project that is assumed throughout the DEIR (and whose mixed-use nature is relied upon for considerable GHG reductions, through VMT reductions. [DEIR, pp. IV.E-36, 56, 57, and 58]. Because the assumption of a 30-year life for the Project greatly limits its expected GHG emissions, these comments will show the inapplicability to the Project of the Draft SCAQMD Guidance.

Footnote 64: Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold. (Hereafter “Draft SCAQMD Guidance.”)

Response to Comment No. IND 8I-43

Please see Response to Comment No. IND 8I-40 for discussion on how the 30-year Project lifespan is accepted by SCAQMD and CARB.

Comment No. IND 8I-44

1. SCAQMD Did Not Adopt Guidance That Requires Use of a 30-Year Project Life.

The document on which the DEIR relies was attached as Exhibit E to a staff report to the SCAQMD Board (hereafter “Board”) discussing the proposed Draft SCAQMD Guidance. The Board agenda for the December 5, 2008 Board meeting included an item discussing the possible setting of GHG significance thresholds for residential/commercial projects under the heading “GHG Significance Threshold Components Deferred to the Future,” stating:

“Residential/Commercial Sectors GHG Significance Threshold – To achieve the same policy objective of capturing 90 percent of GHG emissions from new development projects in the residential/commercial sectors and implement a “fair share” approach to reducing emission increases from each sector, staff discussed with the working group a proposal combining performance standards and screening thresholds. The performance standards primarily focus on energy efficiency measures beyond Title 24 and a screening level of 3,000 MTCO₂eq/yr based on the relative GHG emissions contribution between residential/commercial sectors and stationary source (industrial) sectors. Additional analysis is needed to further define the performance standards and to coordinate with CARB staff’s interim GHG proposal. Staff, therefore, recommends bringing this item back to the Board for discussion and possible action in March 2009 if the CARB board does not take its final action by February 2009.” (Emphasis added.)

We point out that the SCAQMD Board did not adopt any significance threshold for GHGs emitted by residential or commercial projects at this December 5, 2008 Board meeting, or at any other time that the DEIR identifies or we know of.

The DEIR seems to rely upon the Board Letter, a kind of staff report, that was provided to the Board for the December 5, 2008 Board meeting. This Board Letter (hereafter “Board

Letter”) is included in the References for the Air Quality section of the DEIR, and is entitled “Final Localized Significance Threshold Methodology.” In the Board Letter, the SCAQMD staff presented the proposal that the Board considered, and deferred, on December 5, 2008. At page 10 of the Board letter, staff states clearly that it is “not recommending specific GHG significance thresholds for residential/commercial sectors at this time.” (Emphasis added.)

The portion of the Board letter upon which the DEIR apparently is relying is at page 5 of the document, which states:

“Emission Calculations and Significance Threshold Proposal – For the purposes of determining whether or not GHG emissions from *affected projects* are significant, project emissions will include direct, indirect, and, to the extent information is available, life cycle emissions during construction and operation. *Construction emissions will be amortized over the life of the project, defined as 30 years, added to the operational emissions, and compared to the applicable interim GHG significance threshold tier.*” (Emphasis added.)

The Draft SCAQMD Guidance explicitly states that it applies only to projects where the SCAQMD is the lead agency under CEQA, principally industrial projects. (See DEIR, p. IV.E-18, footnote 47, where the DEIR admits that all the SCAQMD adopted was “a GHG significance threshold of 10,000 MTCO_{2e} per year for industrial stationary source projects for which the SCAQMD is the lead agency.”) The City, not the SCAQMD, is the lead agency here; the SCAQMD’s only direct role is that the Project’s emergency generators require a permit from the SCAQMD to operate, due to their diesel emissions. (DEIR, p. IV.B-42.) Therefore, the policy, by its own terms, does not apply to the Project.

Further, Exhibit E to the Board Letter, which is not in the DEIR’s References but is attached hereto as **Exhibit 39**, expressly *declines* to recommend applicability of the 30-year lifespan of projects for GHG calculation purposes to residential or commercial projects. Table 3-4, at page 3-18 of Exhibit E to the Board letter has a column to the far right labeled “Residential/Commercial Sector Projects.” This column has under it a column labeled “AQMD (Not Recommended at this Time).” This second column has an entry that specifically lists “construction amortization over 30 years & added to operational GHG emissions.” Thus, the staff did *not* recommend the 30-year lifespan for residential/commercial projects, and the Board did not adopt such a recommendation, let alone guidance.

It is simply not the case, as a matter of law, that the SCAQMD requires, or even officially recommends, that the Project’s lifespan be limited to 30 years. Even if it wished to, the SCAQMD does not have land use project approval powers, and could not impose or enforce a 30-year limit to the Project’s life. The DEIR neither proves that the Project will not emit GHGs after 30 years, nor accounts in any way for such emissions. That the Project will continue to cause GHG emissions after 30 years of operation is reasonably foreseeable, and those reasonably foreseeable emissions – and their environmental

impact – must be discussed, evaluated, and mitigated as part of a recirculated DEIR. (Pub. Res. Code §§ 21002, 21081(a); Guidelines §15064 (d)(1).)

Accordingly, the City’s false characterization of the 2008 Draft SCAQMD Guidance as somehow requiring or limiting the useful life of the Project to only 30 years is a failure to proceed in accordance with law by deliberately refusing to calculate, disclose or mitigate the true GHG emissions of the Project.

Response to Comment No. IND 8I-44

As stated in the L.A. CEQA Thresholds Guide, the “City of Los Angeles has not adopted specific Citywide significance thresholds for air quality impacts. However, because of the SCAQMD’s regulatory role in the South Coast Air Basin, the L.A. CEQA Thresholds Guide references the screening criteria, significance thresholds and analysis methodologies in the SCAQMD CEQA Air Quality Handbook to assist in evaluating projects proposed within the City.”¹¹⁷

The Draft EIR does not use a quantitative GHG threshold from the December 5, 2008 SCAQMD Board Meeting proposal, which was never adopted by the SCAQMD. This document was used to present the most recent SCAQMD guidance on the 30-year Project lifespan. In addition, CARB has accepted a 30-Year Project life, as shown in the analysis in the ELDP application (Appendix B of the Draft EIR). Please also see Response to Comment No. IND 8I-40 for discussion on how the 30-year Project lifespan is accepted by SCAQMD and CARB.

Comment No. IND 8I-45

2. Substantial Evidence Does Not Support the Use of a 30-Year Project Life.

Nor is there any substantial evidence that the Project’s life will be limited to 30 years. The DEIR makes no showing that the Project will cease to exist or to function, or that it will cease to cause GHG emissions through use of electricity, e.g., for lights, heat, and cooling, after 30 years of operation. It makes no showing that Project residents will cease to drive to and from their homes in the Project, or that the Project’s retail and restaurant uses will cease to function.

While the DEIR lacks any facts supporting the assumption of a 30-year Project life limit, extrinsic facts not presented in the DEIR contradict any assumption of a 30-year life limit for what is primarily a housing project. The Housing Element Update of the Los Angeles City General Plan states:

“The median dwelling unit in Los Angeles was built in 1960, more than 50 years ago. More than half of the City’s housing units were constructed prior to 1950 (51%), while almost 90% were built prior to 1990. The percentage of housing built in the 1990s and 2000s is the lowest of any decades listed in Table 1.12. This table

¹¹⁷ City of Los Angeles, L.A. CEQA Thresholds Guide, 2006, p. B-1.

identifies the age of the City’s housing stock by decade. Rental housing tends to be a bit newer than owner-occupied housing, with a median year- built of 1964 versus 1956.”

(Page 1-40, Housing Element 2013-2021, Adopted Date: December 3, 2013 (CPC-

TABLE 1.12
Age of Housing Stock, by Tenure

Year Built	Percent of Owner-Occ.	Percent of Renter Occ.
Built 2000 to 2009	4.9%	6.4%
Built 1990 to 1999	4%	6.6%
Built 1980 to 1989	8.5%	11.3%
Built 1970 to 1979	10.3%	15.6%
Built 1960 to 1969	12.8%	16%
Built 1950 to 1959	24.6%	15.3%
Built 1940 to 1949	14%	9.5%
Built 1939 or earlier	21%	19.4%

Source: U.S. Census Bureau, 2010 ACS 1-year estimate: Tenure by Year Structure Built

2013-1318-GPA.)

More generally, of the approximately 12,942,000 houses in California statewide, the US Census Bureau reports that about 2,172,000 were built between 1970 and 1979 (making them between 40 and 50 years old). Yet, they are apparently still in service. The federal Department of Housing and Urban Development reported in 2014 that the average age of public housing was 43 years. (hud.gov/sites/documents/RADPROG_062414.PDF; **(Exhibit 40)**.) Given the applicant’s representations about the quality of the Hollywood Center Project’s design, materials, and construction (of course, assuming the buildings do not split open and collapse in an earthquake), we do not believe that it would be less durable than housing built 50 years ago, or that it would fall to pieces or into disuse at the end of 30 years.

Positing an arbitrarily short life for the Project, unsupported by facts, serves only to decrease the amount of GHG emissions it admits it will add to the atmosphere, thereby attempting to reduce the duty to mitigate the effects of those emissions. The City must drop this artificially short expectation for the Project’s life, and assume a realistic lifespan for the Project.

The DEIR does not indicate that the Project will accept as a condition of approval that it will cease to operate after 30 years, nor has the City proposed to impose one. No practical or legally binding 30-year limitation on the Project's life exists, or will exist unless the City now chooses to impose one. Hence, the DEIR should calculate – insofar as is now possible – what the GHG emissions of the Project will be after 30 years and for as long as the Project is expected to remain in operation. These emissions must be publicly disclosed in a recirculated DEIR, and must be mitigated to the extent feasible. (Pub. Res. Code §§ 21002, 21081(a).) That the Project will continue to cause GHG emissions after 30 years of operation is obvious. That must be disclosed, evaluated, and mitigated via a recirculated DEIR.

The DEIR must be revised to reflect a realistic life span for this Project. All GHG emissions for the full physical, operational life of the Project must be identified, calculated, disclosed to the public, and (as set out below), mitigated as required by CEQA and by Public Resources Code Section 21159.28. Failure to do all of the above is a violation of CEQA as a matter of law.

Response to Comment No. IND 8I-45

The comment asserts that the Project should not be analyzed based on a 30-year lifespan. A 30-year Project life for GHG emissions calculations is accepted by both the SCAQMD and CARB. Moreover, the City, as the Lead Agency, has the discretion to adopt SCAQMD's interim guidance in setting thresholds of significance for this Project. In addition, the CARB has issued guidance to use the 30-year project lifetime in its GHG Quantification Methodology for the Affordable Housing and Sustainable Communities program. The calculation formulas in the methodology explicitly states that projects must use a 30-year project lifetime to complete this methodology.¹¹⁸ In addition, CARB, an expert State agency on evaluating GHG emissions, has agreed with and accepted a 30-Year Project life for the analysis in the ELDP application for the Project, which is provided in Appendix B of the Draft EIR.

Comment No. IND 8I-46

D. The GHG Offsets Proposed by the Project Are Not Shown to Be Real, Permanent, Additional, and Enforceable.

The DEIR incorrectly concludes that because the Project is consistent with the various state, regional, and local plans to reduce GHG emissions, that the Project's emissions of between 250,170 MTCO_{2e} over 30 years, and 236,010 MTCO_{2e} over 30 years, depending on the construction scenario used, are not significant. (DEIR, page IV.E-82.) Based on that conclusion, the DEIR concludes that no mitigation is necessary.⁶⁵

We have shown that this conclusion is neither mandated by law nor supported by substantial evidence. Further, all the applicable requirements for GHG offsets, as set

¹¹⁸ CARB, Greenhouse Gas Quantification Methodology for the Strategic Growth Council Affordable Housing and Sustainable Communities Program, November 1, 2019.

forth in Health and Safety Code Section 38562, subs. (a)(1) and (2), that GHG offsets be real, permanent, quantifiable, verifiable, enforceable, and additional (i.e., otherwise would not occur) shall apply. These requirements complement CEQA's requirements for all mitigation measures, per Guidelines Section 15126.4, subd. (a)(2), subd.(c)(3), and Lincoln Place Tenants Ass'n. v. City of Los Angeles (2007) 155 Cal.App.4th 425, 440. See also, Sacramento Old City Assn. v. City Council (1991) 229 Cal.App.3d 1011, 1027 (substantial evidence of mitigation measures' effectiveness and enforceability must be included in the record). GHG emissions offsets are required to reduce the Project's GHG emissions to net zero. The DEIR again fails as a matter of law.

Footnote 65: As a corollary, the DEIR concludes that the Project would make no contribution to any cumulative impacts on climate change or any other impact of GHG emissions, and therefore no mitigation is required for cumulative impacts. This is wrong as a matter of law for the reasons set out in the remainder of this section of these comments.

Response to Comment No. IND 8I-46

The comment alleges that the GHG offsets proposed by the Project are not real, permanent, additional to regulatory compliance requirements, or enforceable. Please see Response to Comment No. IND 8I-40 for discussion on how the Draft EIR thresholds of significance for determining GHG impacts were selected, supported by CEQA Guidelines, and how the Project's GHG impacts were determined to be less than significant as the Project is shown to be consistent with CARB's 2017 Climate Change Scoping Plan, SCAG's 2016-2040 RTP/SCS, L.A.'s Green New Deal (Sustainable City pLAn 2019), and the Los Angeles Green Building Code.

Section IV.E, *Greenhouse Gas Emissions*, provides a comprehensive description on how the Project would incorporate GHG emission offsets as necessary to achieve a net zero increase in site GHG emissions, relative to the baseline annual GHG emissions, for the estimated Project lifetime. Furthermore, as described in Response to Comment No. IND 8I-40, while CEQA does not require achieving net zero emissions, the Project would need to provide GHG reductions based on the Project's total annual GHG emissions in order to meet the requirements of AB 900 of no net additional GHG emissions. The net zero emissions are not a requirement needed to mitigate GHG impacts as the Project's GHG impacts were determined to be less than significant. As described on page IV.E-83-84 of the Draft EIR, the Project proposes to achieve a net zero increase in site GHG emissions through Project-based or community-based program measures that would reduce GHG emissions. Examples of the types of Project-based or community-based program measures that could be considered and implemented by the Applicant or its successor are as follows:

- Seek opportunities for installing solar photovoltaic panels on Project building rooftops based on available physical roof space taking into account space dedicated for rooftop amenities, open space/landscaping, decks/pool areas, and space required for rooftop equipment, such as heating, ventilation, and air conditioning units.

- Purchase certified green-power (e.g., power derived from renewable sources) from the local utility provider to offset Project-related GHG emissions from electricity demand.
- Coordinating with property owners in the City of Los Angeles or in other cities or communities in California for the installation of rooftop solar photovoltaic panels in accordance with State and local permitting standards on existing buildings, parking structures, carports, or other facilities.
- Seek opportunities for offsetting GHG emissions from existing sources in the City of Los Angeles or in other cities or communities in California or elsewhere in the world. Examples include coordinating with local transportation agencies and property owners and establishing electric vehicle supply equipment (EVSE) at park-and-ride lots or other appropriate locations, coordinating with local transportation agencies and school districts and replacing diesel- or gasoline-fueled buses with less-polluting technologies such as compressed natural gas, electric, hybrid-electric, fuel cell, or other commercially available technologies, implementing methane capture and destruction programs at dairy farms, or other GHG emissions offset programs.
- Seek opportunities for planting new drought-tolerant, high-carbon sequestering, and/or native trees of appropriate size and type at off-site locations such as parks in the City of Los Angeles or in other cities or communities in California or elsewhere, that would result in a net sequestration of CO₂ emissions.
- Purchase carbon credits from CARB approved registries. Priority should be given to those credits generated within the City of Los Angeles, and in decreasing preference, credits generated within the region, in-State, and out-of-State.

The acquisition of carbon credits as part of the Project-based or community-based GHG reduction program will serve to ensure that all projected additional GHG emissions are offset. If acquiring carbon credits, the Applicant or its successor shall enter into one or more contracts to purchase carbon credits from a qualified GHG emissions broker (to be selected from CARB approved registries), which contract, together with any previous contracts for the purchase of carbon credits, shall evidence the purchase of carbon credits in an amount sufficient to achieve a net zero increase in site GHG emissions. CARB made clear in the ELDP certification documents that a reputable carbon market would need to be a CARB approved registry. Consistent with SCAQMD's definition of the "life of the project" for CEQA GHG purposes, provided in SCAQMD's Governing Board Agenda Item 31, December 5, 2008, the Project would be required to offset emissions over a 30-year lifetime. The SCAQMD recommends that offsets should have a 30-year project life, should be real, quantifiable, verifiable, and surplus and will be considered in the following prioritized manner: (1) project design feature/on-site reduction measures; (2) off-site within the neighborhood; (3) off-site within the SCAQMD jurisdiction; (4) off-site within the State; (5) off-site out-of-State. The Project would obtain offsets following this prioritization.

Furthermore, as provided Appendix B, Exhibit 3, of the Draft EIR, the Project describes how the GHG offsets would be enforced. The Applicant proposes to meet the requirement set forth in PRC Section 21183(c), which requires that the Project demonstrate that it will not result in net additional emissions of GHG through the implementation of GHG-reducing Project Design Features and/or acquisition of voluntary carbon credits sufficient to offset all projected additional emissions, as summarized in the following manner:

1. No later than six (6) months after the issuance of a Temporary Certificate of Occupancy for the Project, the Applicant shall commit to providing to the lead agency, the City of Los Angeles, a calculation of the net additional emissions resulting from the construction of the Project, to be calculated in accordance with the methodology agreed upon by CARB in connection with the AB 900 certification of the Project. The Applicant shall implement GHG-reducing Project Design Features and/or purchase voluntary carbon credits from CARB approved registries sufficient to offset the construction emissions.
2. Prior to issuance of any Certificate of Occupancy for the Project, the Applicant or its successor shall commit to purchase carbon credits from CARB approved registries to offset the operational emissions attributable to the Project.

Once the City has had an opportunity to review and approve the methodology and associated calculations, the Project Applicant shall provide copies of the calculation methodology to the CARB and Governor's Office of Planning and Research (OPR), which is then subject to a determination signed by the Executive Officer of CARB pursuant to the procedures set forth in Section 6 of OPR's Guidelines. The City will issue a Certificate of Occupancy upon receipt of the following: (1) a fully executed copy of the carbon offset purchase agreement(s); (2) a final CARB Determination that the Project will not result in any net additional GHG emissions; and (3) a copy of OPR's Certification Letter for the Project.

The Project has been certified by Governor Brown as an eligible project under the Jobs and Economic Improvement through Environmental Leadership Act of 2011 (AB 900). On August 16, 2018, Governor Brown certified that the Project meets the criteria set forth in the statute. In order to be certified as an ELDP, the Governor determined that the Project would result in a minimum investment of \$100 million, would create high-wage jobs, and would not result in net GHG emissions, as determined by CARB.

Further, a mixed-use project, such as the Project, must meet additional requirements. Specifically, it must be located on an infill site, be designed to achieve Leadership in Energy and Environmental Design (LEED) Gold certification, be consistent with the relevant regional sustainable communities strategy, and exceed by at least 15 percent the transportation efficiency for comparable projects. The Governor's certification determined that the Project complies with all of these applicable requirements. The Governor's certification and related documentation are provided in Appendix B (ELDP Application and Certification) of the Draft EIR.

To achieve the goal of the Project not resulting in any net additional GHG emissions, the Project would implement GHG reduction measures and programs that may include community-based programs that reduce sources of GHG emissions in the regions. These may include installing solar panels on existing rooftops and carports or other similar community-based measures. The Project may also purchase green-power to offset the GHG emissions from the Project's building electricity demand, obtain GHG credit offsets, or other similar types of GHG reductions. Detailed GHG emissions calculations demonstrating a net zero increase in GHG emissions are included in Appendix B to the Draft EIR, Exhibit 7.

Lastly, Exhibit 8 of Appendix B of the Draft EIR includes the signed Project Applicant's acknowledgement of the ELDP obligations under PRC Section 21183 with the City (Acknowledgment). The Acknowledgment provides that the Project Applicant agrees, amongst other obligations, that all mitigation measures required pursuant to CEQA to certify the Project will be conditions of approval, and those conditions will be fully enforceable by the City, or another agency designated by the City, and those mitigation measures will be monitored and enforced by the City for the life of the obligation.

Comment No. IND 8I-47

E. The DEIR Uses the Wrong GHG Emissions Total When Determining Necessary Offsets.

The DEIR proposes to offset to "net zero" only those GHG emissions that constitute the increase in site GHG emissions, relative to the baseline annual GHG emissions, caused by the Project "for the estimated Project lifetime." (DEIR, p. IV.E- 83.) We first point out that the DEIR identifies the baseline emissions for the Site at zero (DEIR, p. IV.E -24), meaning that all of the Project's GHG emissions must be offset by valid offsets in order to get to "net zero." The Project may not, for example, use the straw man project that lacks the Project Features set out in the DEIR as reducing GHG emissions, described above, as its baseline. Second, we note that because, as argued above, the Project's GHG emissions are significant under CEQA, the mitigation – here, offsets – must meet CEQA's standards for offsets, also as set forth above. Third, we point out that the DEIR impermissibly limits the need for offsets to the artificially-limited and invalid 30- year life of the Project posited by the DEIR. (DEIR, p. IV.E-84.) As argued above, this limitation is invalid. *All* GHG emissions for the *entire* expected physical, operational life of the Project must be offset.

Response to Comment No. IND 8I-47

This comment asserts that the Draft EIR uses the wrong GHG emissions to determine the necessary offsets. Please see Response to Comment No. IND 8I-40 for discussion on how the Draft EIR thresholds of significance for determining GHG impacts were selected, supported by CEQA Guidelines, and how the Project's GHG impacts were determined to be less than significant as the Project is shown to be consistent with CARB's 2017 Climate Change Scoping Plan, SCAG's 2016-2040 RTP/SCS, L.A.'s Green

New Deal (Sustainable City pLAn 2019), and the Los Angeles Green Building Code. Please see Response to Comment No. IND 8I-42, on how the comparison to a Project scenario without GHG reduction characteristics, features, and measures and how it was not used to determine significance of impacts.

Please see Response to Comment No. IND 8I-40 for discussion on how the 30-year Project lifespan is accepted by SCAQMD and CARB. Further, CEQA does not require GHG emissions to be offset to net zero to be less than significant. The GHG emissions will be offset to zero to satisfy the requirements of being an ELDP. Please see Response to Comment No. INP 8I-46 for discussion on how the Project will meet the requirement set forth in PRC Section 21183(c), which requires that the Project demonstrate that it will not result in net additional emissions of GHG through the implementation of GHG-reducing Project Design Features and/or acquisition of voluntary carbon credits sufficient to offset all projected additional emissions.

Comment No. IND 8I-48

F. The DEIR Impermissibly Relies on “Accredited” GHG Offset Registries.

The DEIR states that, for any GHG offsets it requires:

“[T]he Applicant or its successor shall enter into one or more contracts to purchase carbon credits from a qualified GHG emissions broker (to be selected from an accredited registry), which contract, together with any previous contracts for the purchase of carbon credits, shall evidence the purchase of carbon credits in an amount sufficient to achieve a net zero increase in site GHG emissions.” (Id.)

The DEIR also states that, for such carbon registry purchased offsets:

“Priority should be given to those credits generated within the City of Los Angeles, and in decreasing preference, credits generated within the region, in-state, and out-of-state.” (Id.)

The DEIR proposes to use “accredited registr[ies]” as the source of “qualified GHG emissions broker[s],” but does not define either term. This is crucial since, insofar as we are aware, no federal, state or local agency regulates or “accredits” carbon offset registries in the private market, nor does the DEIR show that one does. CARB does accredit carbon registries to develop potential carbon offsets for regulated entities to propose for use solely in the state’s Cap and Trade program (California Code of Regulations [“CCR”] title 17, § 95975), but CARB does not “accredit” any registry as to its dealings in the private market. The DEIR offers no description of how the private registries the Project would supposedly use are “accredited,” but if it is relying on CARB’s use of such registries in the state’s Cap and Trade program without more, that reliance is misplaced, for several reasons.

First, the DEIR apparently would accept any GHG offsets identified by an “accredited” carbon offset registry. (DEIR, p. IV.E-84.) However, CARB itself does not simply accept an offset because it is developed and presented by one of the registries it uses. CARB accepts only proposed offsets that conform to CARB-approved Protocols (i.e., templates for developing techniques to reduce or permanently eliminate GHG emissions from such sources as industrial plants, dairies, or forest practices.) (CCR title 17, § 95987(a).) For regulations addressing Protocols, see, e.g., CCR, title 17, §§ 95971, 95972.) CARB’s decades of air pollution control experience have gone into developing the over 400 pages of regulations governing the Cap and Trade program and its Protocols (CCR, title 17, §§ 95800-96022, plus appendices), and CARB keeps close watch on how registries do the bookkeeping on the offsets they develop for submission to CARB. (See, e.g., CCR, title 17, §§ 95975, 95976, 05980.) The DEIR describes no such vetting process for its proposed offsets, nor does it show that the City either would vet such offsets, or that the City has the capacity and expertise to do so. It is not even clear that the City, let alone the public, would have the legal ability to enforce the contractual terms governing these offsets.

Second, CARB’s regulations governing offsets are extensive and demanding. They require GHG offsets (also referred to as “carbon offsets” or “carbon credits”) to represent “reductions [that] are ‘additional’” to those required by law (CCR title 17, § 95973), and make them subject to strict, CARB-enforced monitoring, reporting, and record retention requirements. (CCR title 17, § 95976.) The offsets must be “verifiable,” which means that the verification report complies with CARB’s own Compliance Offset Protocols. (CCR title 17, § 95802, subd. (a).) They must also be “permanent,” which means that the GHG reductions must either be irreversible or must last for 100 years (id.), not the paltry and unjustified 30 years to which the DEIR would limit the Project’s offsets. (Id.) Crucially, offset credits in the Cap and Trade program may only be used to offset a *maximum of only 8%* of a regulated business’ emissions that are subject to the program (CCR title 17, § 95854), and they must all occur within the United States or its Territories (CCR, title 17, § 95972(c)), whereas the DEIR would explicitly allow use of offsets “within the region, in-state, and out-of-state” (DEIR, p. IV.E-84), without specifying whether out-of-country offsets would be acceptable. The DEIR does not describe any such regulations to which the Project’s offsets would be subject that are even remotely comparable to the CARB, regulations, sets out no limit on the amount of Project GHG emissions that could be offset, and does not demonstrate that the City is prepared to and capable of exercising adequate oversight and enforcement of these offsets.

A San Diego Superior Court evaluated a set of GHG offsets proposed by the County of San Diego that also proposed use of supposedly accredited registries, and found their use invalid, comparing the County’s proposed offset requirements, and particularly their enforceability, to CARB’s. Attached to these comments is a copy of the trial court’s decision, the Honorable Timothy Taylor, as **Exhibit 41**. We incorporate the full opinion by reference herein.

The DEIR's discussion of offsets is shockingly short, and almost farcical. It does not and cannot support a determination that the Project's GHG emissions, even if they were calculated correctly, would be fully offset to net zero, or to any amount that would be less than significant, or that the offsets would comply with CEQA's requirement that offsets be real, permanent, additional, and enforceable. The City must revise and recirculate the DEIR to contain such a showing, appropriately supported both in law and in fact.

Accordingly, the City's has failed to proceed as required by law because it relies upon a mitigation strategy that has not been shown to conform to CEQA's legal requirements for offsets, and also because it is not shown to be factually supported. Preparation of the proper GHG emissions analysis, disclosure of full GHG emissions of the Project over its realistic useful life, and non-illusory and legally enforceable mitigation is required in a recirculated DEIR before the City may proceed.

Response to Comment No. IND 8I-48

The comment states that the Draft EIR does not define "accredited registry" and claims that no federal, State, or local agency regulates or "accredits" carbon offset registries in the private market.

California's Cap and Trade regulations direct CARB to approve Offset Project Registries to help administer its Compliance Offset Program. To be approved, Offset Project Registries must meet CARB's rigorous requirements and professional standards as stated under 17 California Code of Regulations (CCR) §§ 95986 - 94987. Potential Offset Project Registries must submit an application and meet the requirements for education and experience as defined in CCR Section 95986. If the applicant satisfies all the requirements of the regulation, they must successfully complete training classes by Registry Staff and then be approved by CARB's Executive Officer. The requirements for CARB's approval of an Offset Carbon Registry require that its primary business must be operating an Offset Project Registry for *voluntary* and regulatory purposes.

The CARB-approved registries meet the requirements spelled out in 17 CCR §§ 95986 - 94987. Furthermore, 17 CCR §§ 95802 and 95970(a)(1) set forth the requirement that carbon offsets be "real, permanent, additional, quantifiable, verifiable, and enforceable." Thus, CARB's future approval of additional registries would have to be predicated on adherence to these fundamental requirements, which are the basis for ensuring confidence in the compliance and voluntary offset markets alike.

Comment No. IND 8I-49

XI. THE DEIR'S SOILS/GEOLOGY/SEISMIC ANALYSES VIOLATE CEQA.

As discussed above, the release of a new, May 2020 United States Geological Survey ("USGS") official Open File Report constitutes significant new information about the existence and location of multiple active Hollywood Earthquake Fault traces through and beneath the Project site from the east (one probably beneath the very center of the

proposed 46-story East Tower), further requiring recirculation of the April 16, 2020 DEIR. (**Exhibit 6.**)

This recent data indicates that potentially four faults/fault splays enter the Project site from the east at Argyle Street (**Exhibit 6** [USGS, 2020, Figures 4 and 22 through 25]; Wilson Geosciences Report, **Exhibit 42** [Figure 3]), with the southernmost fault very closely coincident with the southern fault in the CGS's FER-253 Supplement. All of these faults pass through or adjacent to the proposed 35- and 46-story skyscrapers or the senior buildings.

We incorporate by reference in full the Wilson Geosciences report and figures attached hereto at **Exhibit 42**, which discusses many of the ways in which the DEIR's seismic studies and conclusions are improper, and incompletely presented.

To conclude that there is no active fault running through the site, the DEIR's geologic and seismic discussions fail to acknowledge multiple studies and data showing that the Hollywood Fault as a continuous unit is active. (**Exhibit 42** [Wilson report].) Moreover, when one section of the fault is active, all sections are considered active. The DEIR's attempt to "sanitize" the Millennium property and effectively cut it off from the rest of the Hollywood Earthquake Fault and amazingly find that the fault just through the Millennium site stops being active, is a sham. It also misses a larger point: the fault(s) crossing the project site are part of an indisputably active Hollywood Earthquake fault *system*.

In short, inclusion of these studies (not currently contained in the DEIR) in a recirculated DEIR is essential, especially when dealing with life and death issues and potentially catastrophic impacts to the environment.

With towers built over the fault – and, more likely, multiple fault splays – Millennium asks the City to put at risk not only the lives of residents and users of the onsite Project, but the lives and property of persons in immediately adjoining buildings and streets. Public and public agency comment during the original matter expressed tremendous concern about catastrophic collapse of the towers if portions of the site suddenly moved, shearing the buildings' supporting columns, foundations and structures. The collapsed buildings could block streets for months or longer, creating severe traffic impacts and impacts to public services and emergency response times. Air quality and health risk impacts to the surrounding environment would also be severe.

As our Supreme Court has repeatedly held:

“Besides informing the agency decision makers themselves, the EIR is intended ‘to demonstrate to an apprehensive citizenry that the agency has in fact analyzed and considered the ecological implications of its actions.’” Save Tara v. City of West Hollywood (2008) 45 Cal.4th 116, 136, citing No Oil, Inc. v. City of Los Angeles (1974) 13 Cal.3d 68, 86, accord, Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal.3d 376, 392.

We are an extremely apprehensive citizenry, and the current DEIR, and its omissions of critical information, do not allay that apprehension. Only a correct and complete DEIR, with a scaled down project off of the faults, might.

We again note that during the State's administrative proceedings prior to the 2014 Alquist-Priolo Map adoption, Millennium's attorneys insisted that its consultant, Group Delta, had evidence showing no active fault on or through the East Site, and promised to submit such evidence to the State. However, as noted by the State in its FER-253 report, no such evidence was produced by Millennium as part of the administrative Alquist-Priolo process.⁶⁶ The State's findings about the **active** Hollywood Earthquake Fault running through the Project site are **final**, and cannot now be collaterally challenged by this DEIR or process. The City and Millennium are estopped from so doing.

The DEIR's denial of the existence of an active earthquake fault through the site means that the entire classification of the environment was wrong, and thus the DEIR lacks a proper baseline, and derivatively, fails to undertake an accurate assessment of the Project's impacts, mitigation measures, or project alternatives.

Footnote 66: We note that the DEIR ignored many of the CGS's requests in the CGS's September 24, 2018 NOP comment letter (**Exhibit 45**), and thus the DEIR is further fatally deficient on this additional ground.

Response to Comment No. IND 8I-49

To support regulatory officials in their service to public safety, the fault investigations performed by Group Delta Consultants (Group Delta) at the Project Site were conducted in cooperation with both State and City officials. The methods of investigation were in accordance with State and City guidelines published in the California Geological Survey, Special Publication 42 (*Earthquake Fault Zones, A Guide for Government Agencies, Property Owners / Developers, and Geoscience Practitioners for Assessing Fault Rupture Hazards in California*, 2018), and Note 49 (*Guidelines for Evaluating the Hazard of Surface Fault Rupture*, 2002), and City of Los Angeles Department of Building and Safety P/BC 2017-129 (*Surface Fault Rupture Hazard Investigations*, January 1, 2020). The intention of these guidelines for conducting investigations of faulting history for a new development is to assure that no new buildings of human occupancy are constructed on an active earthquake fault. The Alquist-Priolo Act is the State regulatory measure that establishes the criteria of what is considered to be an active fault, which is defined as "Holocene-active" faulting. Holocene-active faulting is faulting that has ruptured the ground surface within approximately the last 11,700 years (Holocene time). This age determination of faulting recency is critical in the evaluation of surface fault rupture hazard. It requires detailed evaluation of stratigraphic continuity¹¹⁹ and depositional history,¹²⁰ including the environment, source materials, and climate cycles, which can

¹¹⁹ The principle of stratigraphic continuity states that layers of sediment initially extend laterally in all directions. An observed break in that continuity can be an indication of fault movement.

¹²⁰ The depositional history describes the sequence and timing of the deposition of sediments.

only be reliably obtained through direct observation and testing of fault trench exposures. When fault trenching is considered infeasible, transect method¹²¹ of continuous core borings with supplemental CPT soundings can be used to interpret a stratigraphic continuity and depositional history. Geophysical surveys, like the ones presented in the 2018 USGS-CGS (2020) report, are considered preliminary and highly dependent on pre-established stratigraphic data. While the 2018 USGS-CGS report's data shows evidence of faulting extending east-west near the Project Site, the 2018 USGS-CGS (2020) report specifically states, "the seismic data provide little or no information about the rupture history of the fault traces." Therefore, the 2018 USGS-CGS report (2020) does not comment on the recency of the interpreted faulting, contrary to the inference of the Wilson Geosciences letter (Exhibit 42), as well as Comment No. IND 81-59.

The evidence of near surface faulting presented in the 2018 USGS-CGS (2020) report is not in conflict with the data presented in the Group Delta Fault Studies (2015 and 2019). As stated in the Fault Studies, faulting was exposed in fault trench walls and faulting evidence was found in transects of CPT and core boring stratigraphic correlations. However, with detailed and extensive evaluation of the stratigraphy, it was determined that all the observed/inferred fault features were truncated by pre-Holocene soils. The age of the soils was evaluated by three different outside experts, including Dr. Roy Shlemon, Dr. Tom Rockwell, and Tanya Gonzalez of ECI. It is with these fully vetted investigations that the fault history below the Project Site was determined to be not Holocene-Active and recommended for new development.

The location and extent of trenching was limited to open and accessible areas on the occupied Project Site. The southern portion of the property was determined infeasible for fault trenching due to the required depth to observe pre-Holocene stratigraphy and existing structures and utilities. In lieu of trenching, Group Delta performed tightly spaced CPTs and continuous core borings. In areas where anomalies in stratigraphy were inferred, additional continuous core borings were performed to collect stratigraphic point data which could be further evaluated for continuity. These areas of closer data collection included the 2015 Fault Study buried pre-Holocene fault across the southern portion of the property.

The CGS September 24, 2018 NOP comment letter requested the EIR review referenced regional and site geology maps; and evaluate geologic hazards associated with fault zones, faulting hazards and ground shaking hazards. The subject items of the comments were adequately addressed through site specific geological studies and fault studies reviewed and approved by the City. As the CGS letter states "Please note that these fault traces have been prepared at a regional scale (1:24,000) for the purpose of delineating the hazard zones. They should not replace site-specific geologic fault studies."

Regarding the finality of CGS findings, earthquake and fault knowledge is constantly evolving due to new technology that can record seismic events and surface rupture occurrences. This new technology results in more informative understanding of the conditions surrounding seismic events and allows for better ability to predict future events.

¹²¹ The transect method interpolates site conditions between borings.

The CGS findings on fault traces and activity have also evolved over time as evident in the recent updated Earthquake Fault Zone maps and the 2018 revised Special Publication 42. As the fault maps are produced, site specific investigations that follow can and do change the location of CGS fault traces and the record of activity. As illustrated in the latest Supplemental Fault Evaluation Report 253 (FER) for the Hollywood Quadrangle (2014), where the findings from the Project fault trenches proved valuable in relocating the possible fault traces outside of the trenched areas. However, the 2014 Supplemental FER was finalized before the completion of the Group Delta Fault Studies (2015 and 2019) and the CGS evaluation did not include the closely spaced continuous core boring data performed to investigate the southern portion of the Project Site, where trenching was not feasible.

In addition, the following paragraph is from Page 10 of the previously referenced CGS Special Publication 42 that discusses roles and responsibilities:

The State Geologist (Chief of the California Geological Survey) is required by the A-P Act to delineate Earthquake Fault Zones (EFZ) along known Holocene-active faults in California. The EFZs are distributed as Earthquake Fault Zone maps (Figure 2-4), as well as Geographic Information System (GIS) shapefiles. The zones are regulatory in nature, and are one class of Earthquake Zones of Required Investigation, which include other geologic hazards such as liquefaction and earthquake-induced landslides (Figure 2-4c). Any proposed projects within these EFZ must address the potential for surface fault rupture through a fault investigation prior to a permit being issued by the lead agency.

Page 12 of CGS Special Publication 42 further discusses the responsibilities of owner/developers as follows:

Owner/Developers are the group most directly impacted by the A-P Act as they bear the cost of site-specific fault investigations and may be required to revise development plans to avoid construction on Holocene-active fault traces. If a project proposed by an owner/developer is located within an EFZ, a fault investigation will need to be conducted by a project geologist, and the fault investigation report, produced as part of this study, will need to be reviewed by the lead agency's reviewing geologist. Owner/Developers are referred to Section 4 of this document, which contains additional information pertinent to the owner/developer of projects within Earthquake Fault Zones.

Section 2.8 of Special Publication 42 specifically discusses the appropriate uses and limitations of the Earthquake Fault Zone Maps, as follows:

Earthquake Fault Zones (EFZ) are delineated to define those areas where fault investigations are required prior to building structures for human occupancy. The Earthquake Fault Zone maps include both the EFZ as well as the mapped traces of faults that are used to delineate zone boundaries. These fault traces are plotted as accurately as the sources of data permit; however, no degree of the relative

potential for future surface displacement or hazard is implied for the faults shown on the EFZ maps.

Fault traces shown on Earthquake Fault Zone maps are not mapped at a scale suitable to meet the requirement for site-specific fault investigations, nor should the faults depicted be used as the basis for defining building setback requirements. Lead agencies must require owners/developers with projects within the EFZ to determine if a potential hazard from any fault, whether heretofore recognized or not, exists with regard to proposed structures.

As discussed above, the CGS recognizes the limitations of the Earthquake Fault Zone maps, which is the reason the CGS prepared the above-referenced Special Publication 42 and Note 49 to help guide geologist, property owners, and regulators. These guidelines describe the standard of practice procedures to conduct site-specific fault investigations to more accurately assess whether active faulting does in fact pass through a given site. The 2015 and 2019 site-specific fault investigations performed for at the Project Site fulfill these requirements.

Finally, the comment makes reference to the Millennium Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project. In addition to the above, see also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 8I-50

XII. THE DEIR'S PALEONTOLOGY / TRIBAL CULTURAL RESOURCES ANALYSIS VIOLATES CEQA.

See discussion at pp. 7-8 and fn. 3, supra. The City violated CEQA and AB 52 by not properly consulting with tribal representatives, and by making the process a post hoc rationalization for a decision already made, i.e., to disregard tribal participation and monitoring when trenching happened. Millennium's trenching was in what is known as high paleontologic sensitivity formations. (DEIR, p. IV.D-25.)

We also incorporate by reference the June 1, 2020 letter from the Gabrieleño Band of Mission Indians – Kizh Nation, and their attorney, Ms. Kara Grant.

Response to Comment No. IND 8I-50

The comment asserts that the City failed to consult properly with tribal representatives and incorporates by reference a letter by Ms. Kara Grant. The letter is provided as Comment Letter No. ORG 43 in this Final EIR. As the comment does not raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Nonetheless, the Draft EIR consulted the applicable tribal representatives in compliance with AB 52 and PRC Section 21080.3.1, as provided in Section IV.M, *Tribal Cultural Resources*, and Appendix O, Hollywood Center Project Assembly Bill 52 Consultation Summary Report, of the Draft EIR. See also, Response to Comment Nos. IND 8I-10 and 8I-12c. Responses to Ms. Kara Grant's letter are provided in Response to Comment Nos. ORG 43-1 to 43-9.

Comment No. IND 8I-51

XIII. THE DEIR'S TRAFFIC ANALYSIS AND ASSERTIONS VIOLATE CEQA.

We incorporate by reference the May 28, 2020 traffic and pedestrian safety analysis prepared by traffic expert Tom Brohard, attached at **Exhibit 43** hereto.

We also incorporate by reference the June 1, 2020 expert report by KOA, attached at **Exhibit 44** hereto.

We further incorporate by reference, and require good faith responses to, all of the previous Caltrans objection letters (**Exhibit 19**), as well as to the internal Caltrans memorandum criticizing the previous project, all of which criticisms remain valid, and are expressly adopted by us herein, requiring responses to each issue raised. (Exhibit 46.)⁶⁷

Footnote 67: Our invocation of these documents and the need for the City to respond to all objections and criticisms contained therein is not intended to suggest, and does not mean, that the City can avoid responding to all other objections contained in the administrative record from the original case, which we have re-filed in this matter. See fn. 2, ante, and p. 6, supra.

Response to Comment No. IND 8I-51

The comment alleges that the traffic analysis violates CEQA without specifying in what manner it does so. The comment also incorporates by reference a traffic report by Tom Brohard, a KOA report, and Caltrans objection letters and internal memorandum related to a prior different project and asserts that the City is required to respond to all the comments in the attachments. The comment does not present facts related to the content or adequacy of the Draft EIR, and, as such, no further response is warranted.

Responses to the May 28, 2020, traffic and pedestrian safety analysis prepared by Tom Brohard are provided in Response to Comment Nos. 8I-65 to 8I-73.

Responses to the June 1, 2020, report by KOA are provided in Response to Comment Nos. 8I-74 to 8I-78.

The comment makes reference to Caltrans comment letters and an internal memorandum for the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project*

Description, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project. As such, responses to comment letters on the previous project are not relevant to the current Draft EIR. It is noted that the City did receive two letters from Caltrans with comments on the transportation analysis to be conducted for the Project. Although the analyses requested by Caltrans are not a required CEQA analysis per the City's TAG, adopted in July 2019, the analyses were presented for informational purposes in Appendix I to the TA for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR.¹²² As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. See also Topical Response No. 2 – Transportation and Traffic, above, for a discussion of traffic impacts from the Project, including impacts to US-101 and its on- and off-ramps.

Comment No. IND 8I-52

XIV. THE DEIR VIOLATES CEQA'S BASELINE AND NOISE ANALYSIS MANDATES.

CEQA requires a realistic baseline that will give the public and decision makers the most accurate picture practically possible of the Project's likely environmental impacts. The DEIR assumes the baseline Property conditions consist primarily of surface parking lots which are not sensitive to noise impacts.⁶⁸ As applied to the Project's construction noise analysis, however, the baseline conceals construction noise impacts with potentially disastrous impacts on the public.

The requested Development Agreement would allow the Applicant to construct the Project over 20 years, including a Sequential Construction Scenario in which one site is fully developed prior to the other.⁶⁹ The second phase of sequential construction would – with *absolute certainty* – occur within an environmental setting radically different from existing conditions and adjacent to numerous highly noise sensitive uses. The second phase of the Project would be developed immediately adjacent to ***a thousand dwelling units, over ten thousand square feet of retail/restaurant/bar area, a public garden, an outdoor theater and hundreds of vulnerable seniors.***⁷⁰ Yet, *none* of the DEIR's mitigation measures address how to mitigate the impacts of, for example, construction noise on seniors sitting in the ground level garden.

The DEIR's baseline, as applied to the Sequential Construction Scenario, is so untethered from reality that it lacks substantial evidence. After a portion of the Project

¹²² Subsequent to release of the Draft EIR, the City of Los Angeles Department of Transportation (LADOT) published new *Interim Guidance for Freeway Safety Analysis* in May 2020. This guidance requires analysis of freeway off-ramp queuing when certain screening criteria are met. The analyses presented in Appendix I to the TA for the Hollywood Center Project go beyond the requirements of this new City guidance in that it includes off-ramp queuing analyses and mainline merge/diverge/weaving analyses.

has been issued a certificate of occupancy, its market and senior affordable units are occupied *by the public*, its commercial space is patronized *by the public* and its open space is relied on *by the public*. It becomes part of the background environment entitled to protection under CEQA. In defiance of CEQA's statutory purpose, the DEIR improperly applies existing conditions as the baseline to conceals environmental impacts of profound public concern. The second phase of sequential construction would render the Project's public open space utterly unusable, would at least inconvenience market rate tenants by limiting use of the Amenity Deck bars and alcohol cabinets, and would devastate vulnerable seniors who depend on outdoor access for physical and mental health, as well as the surrounding community.

The DEIR must be recirculated to address these issues fully and accurately, and must be required to incorporate mandatory mitigation measure to prohibit issuance of a certificate of occupancy for either tower until construction is substantially completed for both. This mitigation measure is technically feasible because the Project Description concedes that concurrent or overlapping development is viable and realistic, and it would altogether avoid significant environmental impacts of the Sequential Construction Scenario.

Furthermore, because of the DEIR's misleading baseline for construction noise impacts, it fails to disclose unique environmental impacts, such as rendering public open space unusable and disturbing vulnerable seniors, that were not even contemplated in the DEIR. The DEIR must be recirculated to allow informed public participation and decision-making.

Footnote 68: DEIR p. IV.I-14.

Footnote 69: DEIR p. II-73.

Footnote 70: This characterization assumes assuming the Applicant, a New York-based LLC, has not weaseled out of its promises of community benefits.

Response to Comment No. IND 8I-52

The comment asserts that the Draft EIR violate CEQA's baseline noise analysis requirements. As described on page IV.I-13 of the Draft EIR, the LAMC clearly identifies the location (at an adjacent property line), length of time period (at least 15 minutes L_{eq}), and thresholds (an increase of 5 dBA over the existing average ambient noise level for noise occurring more than five but less than 15 minutes in any one-hour period and an increase of 10 dBA for noise occurring five minutes or less in any one-hour period). Please see below for the relevant sections from the LAMC.

- LAMC Sections 111.01 and 111.03 define the ambient noise as the actual measured ambient noise level or the City's presumed ambient noise level, whichever is greater. The actual ambient noise level is the measured noise level averaged over a period of at least 15 minutes L_{eq} .

- LAMC Section 111.02 provides procedures and criteria for the measurement of the sound level of “offending” noise sources. In accordance with the LAMC, a noise level increase of 5 dBA over the existing average ambient noise level at an adjacent property line is considered a noise violation. To account for people’s increased tolerance for short-duration noise events, the Noise Regulation provides a 5 dBA allowance for noise occurring more than five but less than fifteen minutes in any one-hour period and an additional 5 dBA allowance (total of 10 dBA) for noise occurring five minutes or less in any one-hour period.

The existing ambient noise level representative of the Pantages Theatre property was taken at its northeastern property line where it is directly adjacent to the Proposed Project’s East Site, for a period of 15 minutes. This location and time period for the ambient noise level measurement complies with LAMC specifications.

Comment No. IND 8I-53

XV. THE DEIR VIOLATES CEQA’S ALTERNATIVES MANDATES.

As our Supreme Court has repeatedly held, the “EIR is the heart of CEQA, and the mitigation and alternatives discussion forms the core of the EIR.” In re Bay-Delta cases (2008) 43 Cal.4th 1143, 1162.

Here, the DEIR further fails because it did not consider a reasonable range of alternatives, as required by CEQA. In fact, not a single alternative considered a build-out scenario that would place habitable structures off of the California Geological Survey Alquist-Priolo mapped earthquake fault that runs through the property. In our 2018 NOP comment letter, we requested exactly that:

“Alternatives. The Draft EIR must include a reasonable range of alternatives that do **not** place habitable structures, including buildings for occupancy and parking structures (above ground or subterranean) over or across the officially-mapped fault zones, or within 50 feet thereof. Further, alternatives that are scaled down to reduce height, density and FAR must also be included and analyzed in the Draft EIR.” (**Exhibit 7** [p. 6; emphasis in original].)

Yet the DEIR failed to do so, nor did it even attempt to justify this arrogant failure. Particularly because they are all illegal, but even from just a commonsense standpoint, the self-serving alternatives considered in the DEIR are, by definition, not a “reasonable range.” The DEIR and the City have again violated CEQA.

Of course, this was eminently doable. Millennium principal Phil Aarons admitted so in a September 20, 2013 Wall Street Journal article, “*Fault Line Splits Hollywood*”. “Even if a portion of the fault is found to cross the site, he [Aarons] said, the size of the nearly 4½-acre site allows him flexibility to build so the towers aren’t on top of the fault”. (**Exhibit 47**; <https://www.wsj.com/articles/fault-line-splits-hollywood-1379715068>.)

The City and the DEIR were required to include at least one alternative that would have done exactly that. The failure to do so is yet another failure to proceed in the manner required by law.

Response to Comment No. IND 8I-53

The comment expresses opposition to the Project based on a claim that the Draft EIR did not provide a “reasonable range of alternatives,” because it did not include an alternative that has no structures overlying an active fault. However, this objection is based on an assumption of the geological conditions underlying the Project Site.

Moreover, the Draft EIR provided a reasonable range of alternatives, as well as justification as to why alternative sites and other development scenarios were considered. It should be noted that while an EIR must describe a range of reasonable alternatives to the Project, it is not required to discuss every alternative to the Project. Instead, an EIR should present a “reasonable range of potentially feasible alternatives.”¹²³ The CEQA Guidelines do not establish ironclad rules relating to the range of alternatives to be discussed in an EIR.¹²⁴ Rather, the nature and scope of the alternatives studied in an EIR is governed by the rule of reason.¹²⁵ Under the rule of reason, an EIR need discuss only those alternatives necessary to permit a reasoned choice.¹²⁶

The Draft EIR considered eight alternatives: Alternative 1: No Project/No Build Alternative; Alternative 2: Development under Existing Zoning Alternative; Alternative 3: Reduced Maximum Height Alternative; Alternative 4: Office, Hotel and Commercial Alternative; Alternative 5: Proposed Community Plan Update Compliant Alternative; Alternative 6: Above-Grade Parking Alternative; Alternative 7: Primarily Office Alternative; and Alternative 8: Office, Residential and Commercial Alternative. Chapter V, *Alternatives*, of the Draft EIR clearly described each of these alternatives, provided an environmental impacts analysis, explained whether or not these alternatives would meet the Project’s objectives, and described which of the Alternatives, other than the No Project Alternative, would be the environmentally superior alternative.

CEQA and case law make clear that not all possible alternatives need to be included. The purpose of the Alternatives section of an EIR is to consider alternatives which would reduce the significant impacts of a project.¹²⁷ Accordingly, there is no requirement to include an alternative that addresses an alleged impact that the EIR demonstrates is not a significant project impact. In this case, there is substantial evidence presented in Section IV.D, *Geology and Soils*, and Appendices G-1, G-2 and G-3, of the Draft EIR, that the Project would not be constructed on an active fault line. Since all the alternatives in Chapter V, *Alternatives*, of the Draft EIR, contemplate construction on the Project Site,

¹²³ 14 CCR Section 15126.6(a).

¹²⁴ *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 576.

¹²⁵ CEQA Guidelines Section 15126.6(a).

¹²⁶ CEQA Guidelines Section 15126.6(f). See *California Native Plant Soc’y v City of Santa Cruz* (2009) 177 CA4th 957.

¹²⁷ CEQA Guidelines Section 15126.6.

all of them would satisfy the concern expressed in this comment as none of them would be constructed on an active fault line. As such, the Draft EIR provides a reasonable range of alternatives to the Project in compliance with CEQA.

Please also refer to Topical Response No. 3 – Geology and Fault Hazards, regarding development near a fault line. As discussed in Topical Response No. 3, the Project's geology and fault-related impacts were fully analyzed in the Draft EIR's Section IV.D, *Geology and Soils*, which were primarily based on a Geotechnical Investigation report and a Surface Fault Rupture Hazard Evaluation Report (2015 and 2019 Fault Study), both of which were reviewed and approved by the LADBS, as provided in Appendix G of the Draft EIR. As discussed therein, the Project evaluated in the Draft EIR would result in less-than-significant geology and fault-related impacts.

Comment No. IND 8I-54

XVI. CONCLUSION.

The DEIR fails as a matter of law on multiple procedural and substantive grounds. At a minimum, it should be revised and recirculated before further consideration is given to approval of this outrageously impactful and dangerous Project. This should include presenting and fully addressing all of the new earthquake fault information from the May 2020 United States Geological Survey Guided Wave study and other sources. To do less would be to present an incomplete and inaccurate picture for the public and decision makers.

More appropriately the DEIR and Project should be rejected outright. Nothing that the DEIR proposes is legal given the active Hollywood Earthquake fault traversing the Project sites. The DEIR as presented is a nullity from its inception.

A different proposal – one that observes the legally required offsets from the fault lines and by force would be smaller in scale – should be the only project the City considers. In turn, we hope any such consideration would occur after the FBI investigation into City Hall's unfolding pay-to-play scandal has concluded. Thank you.

Response to Comment No. IND 8I-54

The comment summarizes the commenter's prior comments wherein the commenter expresses opposition to the Project based on certain alleged procedural grounds and unspecified substantive grounds, with an emphasis on geologic hazards, but does not provide any facts and, therefore, no substantial evidence to support these general concerns. In as much as this comment does not contain any new facts, refer back to the following: Response to Comment No. IND 8I-3 and Response to Comment No. IND 8I-5, regarding potential illegal activities by public officials related to a previous project at the Project Site, and Response to Comment No. IND 8I-13, regarding recirculation of the Draft EIR.

As to the one substantive issue raised in this comment, the commenter is also referred to Topical Response No. 3 – Geology and Fault Hazards, for a discussion of geology impacts, including those associated with faulting. Additional details addressing specific comments on faulting are addressed in the Response to Comment Nos. IND 8I-6, IND 8I-49, and IND 8I-58 to IND 8I-62.

Response to Comment No. IND 8I-55

This comment includes exhibits referenced throughout the comment letter. The responses provided above in Response to Comment Nos. IND 8I-1 to 8I-54 address the

contents of these exhibits, as appropriate and applicable. As such, no further response is warranted.

Comment No. IND 8I-56

EXHIBIT 42

SUBJECT: Review and Analysis of the Hollywood Center (HC) Draft Environmental Impact Report (DEIR) and Appended/Referenced Documents Related to Active Faulting Associated with the Alquist-Priolo Earthquake Fault Zone (APEFEZ) within the Hollywood 7.5-Minute Topographic Quadrangle; DEIR Dated April 16, 2020 by Environmental Science Associates, Inc. (ESA)

Dear Mr. Silverstein:

INTRODUCTION, QUALIFICATIONS AND REPORT ORGANIZATION

This firm was retained by your office to review the Hollywood Center (HC) Draft Environmental Impact Report (DEIR) and appended/referenced documents related to active faulting associated with the Alquist-Priolo Earthquake Fault Zone (APEFZ) within the Hollywood 7.5-Minute Topographic Quadrangle. The DEIR, dated April 16, 2020, was prepared by Environmental Sciences Associates, Inc. (ESA). Our review focused on the IV-D Geology and Soils section, and those associated appendices and reports utilized to determine the activity and/or location of faults within or adjacent to the proposed HC development area. In general, the previous studies for Millennium Hollywood (MH) are assumed to be included under the HC reference. Listed under the subsection titles used in this letter, the other primary referenced documents reviewed are a part of the DEIR referenced materials and can be found within the DEIR (City of Los Angeles, 2020; <https://planning.lacity.org/development-services/eir/hollywood-center-project-1>), or by an internet search. The primary references within three categories include:

The Draft Environmental Impact Report (DEIR) for the Hollywood Center Project (2020)

- 1) DEIR Appendix G-1 - 2015 Fault Activity Investigation (which, as made available by the City to the public during the majority of the public comment period, contained substantial amounts of unreadable text and numbers on all of the Plates and Figures);
- 2) Appendix G-2 - Surface Fault Rupture Hazard Evaluation Report;
- 3) Appendix G-3 - Geotechnical Investigation;

California Geological Survey Reports

- 4) California Geological Survey (CGS), 2018, Revised Special Publication 42, Earthquake Fault Zones, A Guide for Government Agencies, Property

Owners/Developers, and Geoscience Practitioners for Assessing Fault Rupture Hazards in California, Revised 2018;

J., May 2020, 2018 U.S. Geological Survey-California Geological Survey Fault-imaging Surveys across the Hollywood and Santa Monica Faults, Los Angeles County, California: U.S. Geological Survey Open-File Report 2020-1049, 42 p., <https://doi.org/10.3133/ofr20201049> (**Exhibit C**); and,
- 11) Ninyo and Moore, 2015, Supplemental Fault Rupture Hazard Evaluation, Hollywood Courthouse, Los Angeles, California, Project No. 402132007, June 15, 2015 (**Exhibit D**).

The undersigned has been a licensed Professional Geologist and Certified Engineering Geologist in the State of California since 1974. His resume is attached as **Exhibit A**.

This letter report includes: 1) a brief description of the proposed project as we understand it from the April 2020 DEIR; 2) a statement of the purpose of this report; 3) a discussion/evaluation of, and comments on, the DEIR as related to Project Site fault rupture potential, which is a specific issue called out in the CEQA Appendix G Guidelines for environmental impact studies; and 4) a summary and conclusions. The report **Figures** (see **Exhibit B**), a 2020 United States Geological Survey (USGS) technical report (**Exhibit C**), and a 2015 Ninyo & Moore report (**Exhibit D**) are attached. A list of Exhibit

B figures is provided after the **References Cited** and **Figures 1** through **5** are noted in this report in bold text (e.g., **Figure 1**)

Response to Comment No. IND 8I-56

The comment introduces Exhibit 42, the Wilson Geosciences Report. The comment states that Wilson Geosciences has reviewed the Draft EIR and provides a summary of the experience and qualifications of the Wilson Geosciences firm. As this comment does not does not raise any issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 8I-57

HOLLYWOOD CENTER PROJECT DESCRIPTION

The Hollywood Center Project is a proposed mixed-use development on an approximately 4.46-acre site, generally bounded by Yucca Street on the north, Ivar Avenue on the west, Argyle Avenue on the east, adjacent development and Hollywood Boulevard on the south, and bifurcated by Vine Street (see DEIR Section II, Figure 11-5). The portion of the Project Site located between Ivar Avenue and Vine Street is identified as the "West Site", and the portion located between Vine Street and Argyle Avenue is identified as the "East Site". The Project Site would be redeveloped with up to 1,005 residential units and up to 30,176 square feet of commercial uses within four new mixed-use buildings (West Building, East Building, West Senior Building, East Senior Building) with proposed heights of 35, 46, 11, and 11 stories, respectively. Overall, the Project would contain up to 1,287,150 square feet of floor area. This represents the largest option by square feet as described in the DEIR Notice of Completion and Availability. Also, there would be up to 1,521 vehicle parking spaces within five- and six-level subterranean parking garages and enclosed at-grade parking.

Response to Comment No. IND 8I-57

The comment provides a brief summary of the Hollywood Center Project. The comment does not does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 8I-58

PURPOSE OF THIS REVIEW

The Hollywood Center (HC; formerly Millennium Hollywood) project has generated years of investigations and technical studies related to geologic/earthquake faulting at the proposed Project Site (Site). In this author's consideration of these thousands of pages of studies, this Draft Environmental Impact Report (DEIR) review is focused on the following three questions you proposed that we address. The answers to these questions govern the suitability of the Site with respect to the earthquake hazard of ground displacement due to a probable earthquake on the Hollywood Fault segment of the Santa

Monica-Hollywood-Raymond Fault System, or due to a larger earthquake encompassing the entire (~ 125-mile long) fault system. The three questions are:

1. Are there faults within the HC Project Site?
2. Where are the faults located within the HC Project Site based on the evidence available?
3. What is the activity level (Holocene or pre-Holocene) of the faults?

This review has utilized the key reports addressing faulting at the Site, some reports not included as part of the DEIR, including a very significant May 2020 report from the United States Geological Survey. The reader is encouraged to look at these reports, particularly the pages, figures, plates, and tables specifically referenced herein. Where emphasis is needed or some expansion is required, new Figures 1 through 5 are provided with this report. Figure 1 from the DEIR is the Site map prepared by the developer's geologist, Group Delta Consultants (GDC), showing previous exploration (Cone Penetration Test [CPTs], borings, and trenches) within the East and West divisions of the proposed development. The base map for Figures 1, 2 and 3 is faulty due to missing words, letters, and numbers as are all Portable Document Format (PDF) Plates and Figures from the DEIR's Appendix G-1, as circulated and published by the City, preventing the reader from determining the content of the data provided.

Response to Comment No. IND 8I-58

This comment is primarily a preliminary introduction into the analysis requested of the commenter. As the comment does not raise any issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Nonetheless, as the comment contends that portions of some of the pages of an appendix were not legible, please refer to Response to Comment No. IND 8I-13, regarding the problems only occurring in the pdf format and the legibility of this information in other formats made available by the City.

Also see Response to Comment Nos. IND 8I-59 to IND 8I-61, which address faults on the Project Site, as well as the May 2020 report from the USGS.

The commenter is also referred to Topical Response No. 3 – Geology and Fault Hazards, for a discussion of geology impacts, including those associated with faulting.

Comment No. IND 8I-59

DISCUSSION AND EVALUATION OF HC PROJECT SITE FAULTING, AND THE ACTIVITY OF FAULTS WITHIN AND NEAR THE PROJECT SITE

Question 1: Are there Faults within the HC Project Site?

The DEIR begins (page 2, Table IV.D-1) by claiming, numerous times, that prior geotechnical investigations found no Holocene-active faults on either the East or the West Sites. Further Site-specific references to active faulting are found starting on DEIR page IV.D-17 (further referred to as simply 17). The statements are as follows with the corresponding DEIR abbreviated page numbers:

17 - "The nearest significant active fault to the Project Site is the Hollywood Fault."

18 - "Figure IV.D-2 showing earthquake fault zones and active fault traces."

20 - "... the 2015 and 2019 Fault Studies for the Project Site, which are informed by specific investigations of and on the Project Site, indicate that no Holocene-active faulting occurs beneath or extends toward the Project Site, including the Hollywood Fault."

22 - "Within the Hollywood Fault Zone, there is evidence of Holocene-activity, and, therefore, the zone is considered active." And, "The 2015 and 2019 Fault Studies conducted for the Project Site, along with fault investigations conducted for projects in the surrounding areas, including sites north and west of the Project Site, indicate there is no active faulting beneath or extending toward the Project Site."

23 - "This continuous pre-Holocene stratigraphy precludes the possibility of active faulting underlying these (sic) the Project Site."

32 - "As discussed above in the Existing Conditions section, the site-specific 2015 and 2019 Fault Studies included a soil profile horizons evaluation and other investigations that concluded that there is no active faulting beneath the Project Site or extending toward the Project Site." And, "Therefore, because the 2015 and 2019 Fault Studies concluded there is no active faulting beneath the Project Site, development of the Project or the Project with the East Site Hotel Option would not directly or indirectly cause substantial adverse effects, including risk of loss, injury, or death involving fault rupture, and, as such, the impact relative to fault rupture would be less than significant."

33 - "As discussed above, the 2015 and 2019 Fault Studies and Geotechnical Investigations, which also reference various fault investigation studies conducted near the Project Site (see Subsection IV.D. I, Introduction, above), have concluded that there is no active faulting beneath the Project Site or extending toward the Project Site."

Despite the repeated claims of "no active faulting", the following discussion demonstrates the important first fact that GDC has agreed that faults do underlie the site including a continuous fault nearly coincident with the "southern strand", "southern trace", or "southern fault" (or some combination of these terms as generally synonymously used by the CGS) as shown and discussed by the California Geological Survey (CGS, 2014) in its Alquist-Priolo Earthquake Fault Zone (APEFZ) evaluation FER-253 Supplement No. 1 (pages 26 and 27).

In a May 17, 2015 response to a March 17, 2015 letter from the City of Los Angeles (City), GDC responds to California Geological Survey (CGS) comments presenting the CGS conclusions regarding fault features discovered based on the Cone Penetration Test (CPT) soundings used in preparation of GDC cross-sections M-M', N-N', 0-0', and P-P' within the HC East and West sites (Figure 2; black dotted line). The CGS showed not only more numerous faults on the cross-sections than GDC, but also fault offsets in younger deposits than the GDC showed. Other implications of the CGS conclusions are discussed below, however as related to this question the GDC response states "Our own analysis indicates the potential presence of an inferred inactive fault near CPT-20. This inferred inactive fault was found on other CPT transects 0-0' and P-P' on the West Millennium Site. Therefore, its interpretation has both vertical and lateral correlation across the explorations of both the East and West Millennium Sites." This verifies that GDC accepts that a continuous fault passes near CPT 20 on cross-section M-M' adjacent to Argyle Avenue and extends across the Project Site to at least cross-section 0-0' near Ivar Avenue.

The stated purpose of the 2015 and 2019 GDC Fault Studies was to evaluate the Project Site for Holocene-age faulting, as discussed for Question 2 below. The 2019 GDC Fault Study at the southeast corner of Ivar Avenue and Yucca Street confirms the presence of numerous faults crossing the West Senior Building site, with what appears to be the most significant fault F10 (Figure 3, Inset 3a) trending nearly east-west through the West Building Second Floor Amenity Deck as it approaches 2015 cross-section 0-0' (shown as OE-OE' for the 2019 study).

Accordingly, as to Question 1, there are faults agreed to be across and within the HC Project Site, and the DEIR and Appendix G-1 clearly accept that there are such faults, although consistently claiming there is "no active faulting" or that such faults are "inferred". Faults exist at or near the locations noted by GDC in its May 17, 2015 response letter to the City (black dotted line) and the CGS analysis/conclusions regarding cross-sections M-M', P-P', and 0-0' indicate other such young faults exist within the Project Site (see Question 3 below).

Response to Comment No. IND 8I-59

As discussed in the Response to Comment Nos. IND 8I-6 and IND 8I-49, Southern California is a seismically active region and faulting is common. In an effort to mitigate the potential hazard of surface rupture due to faulting, the State enacted the Alquist-Priolo Act, which has a simple and well-defined criteria for what is considered an "active" fault, for which new development is restricted. An "active" fault is a fault which has ruptured in the Holocene time period (i.e., within the approximately last 11,700 years). As previously discussed in the Response to Comment No. IND 8I-49, the zone of an "active fault" is regulated by requiring an investigation to evaluate the recency of faulting below a specific site before new development can be constructed. New construction is held to the latest standards in seismic design and may benefit the public safety in the event of a major earthquake.

The Group Delta 2015 and 2019 Fault Study reports are transparent and inclusive with the data collected to evaluate the faulting history below the Project Site. As evident in the fault trench exposures and stratigraphic correlations between closely spaced continuous soil core borings, faulting below the Project Site has been inactive since at least 30,000 years ago, which well predates the State-designated criteria of “active” surface fault rupture within approximately the last 11,700 years (Holocene). The pre-Holocene faulting exposed in the trenches and interpreted in transect explorations far predates what is considered a recent, active, reoccurring hazardous history of fault rupture.

Regarding specific parts of Comment No. IND 8I-59, it should also be noted that CPT data alone cannot determine fault activity, but needs to be correlated with other data, especially fault trenching and continuous soil core data. Finally, while there are fault traces that extend across the Project Site, the traces are below soil layers dated to at least 30,000 years ago and are, therefore, not Holocene-active faults or considered be high risk as a source for future surface fault rupture hazard.

Finally, as discussed above in Response to Comment No. IND 8I-49, the State established procedures for conducting site-specific fault investigations to assess the recency of faulting, including sites where the CGS has previously mapped an active fault. The fault investigations performed by Group Delta at the Project Site were conducted in cooperation with both State and City officials and in compliance with the requirements of the Alquist-Priolo Act and the guidance in Special Publication 42.

Comment No. IND 8I-60

Question 2: Where are the Faults Located within the HC Project Site Based on the Evidence Available?

The CGS Alquist-Priolo Fault Evaluation Report (FER) 253 Supplement No. 1 (2014) Figure 7 (page 11) shows a compilation of the Hollywood Fault locations (somewhat approximate on this small map scale) with the origins of each fault section noted as S- and a number, referring to a study location referenced in the FER-253 Supplement No. 1. CGS shows the previous FER fault locations that were removed with X's. The southern red dashed line is the "southern fault" referred to by GDC (2015, pages 15 and 16) and fits the red dashed line for the Yucca Street Strand shown on the CGS's FER-253 Supplement No. 1 Figure 7.

As noted in the previous subsection, in their May 17, 2015 response to the City of Los Angeles, GDC responds to California Geological Survey (CGS) comments presenting the CGS analysis/conclusions regarding fault features. The CGS geologists observed additional fault features based on the Cone Penetration Test (CPT) soundings used in GDC's 2015 preparation of cross-sections M-M' (Plate 7, CPT C-20), N-N', P-P' (Plate 8, CPT C-104), and 0-0' (Plate 9, boring B-4) within the HC East and West Sites (**Figure 1**). Given the evidence described in the GDC May 17, 2015 letter discussed above, faults exist beneath the Project Site and in particular three fault locations are linked from cross-section M-M' at the east edge of the East Site to cross-section 0-0' in the western half of

the West Site (DEIR, Appendix G-1, Figure 8). GDC (2015, Plate 1; **Figures 1 and 2**) shows the fault as a black dotted line crossing the East and West Sites. Planning for the GDC East Trench (DEIR, Appendix G-1, Figure 8) did not allow for it to extend far enough south to intercept the "southern fault" shown by the CGS in FER-253 (see CGS Figure 7 gold-colored trench location lines and **Figure 2**).

GDC (2019) maps faults that they show as continuous across the northwest corner of the West Site at Ivar Avenue with fault F10 showing approximately 30-feet of up-on-the-north reverse fault movement (GDC 2019, Appendix G-2, page 11 and Figure 9.1; **Figure 3**). GDC recognizes and acknowledges the 2019 GDC fault investigation at the southeast corner of Ivar Avenue and Yucca Streets shows numerous faults in trenches that are shown as trending northeast to southwest and east-northeast to west-southwest (Figures 9.1 and 9.2). The fault trenches do not extend far enough to the south to intercept similarly oriented faults, like fault F10, that may trend toward the main West and East Buildings.

As a part of the United States Geological Survey (USGS) mission for the advancement of scientific knowledge, the USGS recently conducted north-south oriented guided-wave and related seismic surveys (USGS, April 2020) along Argyle Avenue between Hollywood Boulevard on the south and Yucca Street on the north. This USGS report, which is directly relevant to the proposed Project Site, was published on May 8, 2020, after release of the DEIR on April 16, 2020. It is attached as **Exhibit C** hereto. The USGS report contains significant new information confirming the location and recency of activity of the main Hollywood Fault, which projects into the HC Site along Argyle Avenue just south of Carlos Avenue. The USGS confirmed Hollywood Fault location is projected in this report (**Figure 3**) onto the East Site cross-section M-M' near CPTs 27 and 29 where CGS has analyzed/concluded Holocene (and late Pleistocene) faulting exists. This is approximately 35- to 40-feet south of CPT C-20 where CGS and GDC agreed on a fault location (black dots) and approximately 25-feet north of the CGS FER-253 Supplement I location of the southern fault trace (**Figure 2**). This southern main Hollywood Fault passes within 50 feet of the East Senior Building, through the center of the 46- story East Building, through the East Site Plaza Ground Floor, and through the south edge of the West Site Plaza Ground Floor.

This most recent USGS data suggests that at least four faults enter the Project Site from the east at Argyle Street (USGS, 2020, Figures 4 and 22 through 25) with the southern USGS fault coincident with the southern fault in the CGS FER-253 Supplement No I (their Figure 7). The other three USGS faults at stations (STA) 117, 151, and 191 (**Figure 3**) with an expected similar orientation to the southern fault would pass through the East Senior Building and the north edge of the 46-story East Building, within 10- to 20-feet of the 35-story West Building, through the West Site Plaza Ground Floor, through the East Site Plaza Ground Floor, and through or within 50-feet of the West Building Second Floor Amenity Deck and the West Senior Building.

Response to Comment No. IND 8I-60

The referenced USGS report released in 2020 (note that the USGS survey was conducted in 2018 and published in 2020) does not reference the Group Delta 2015 and 2019 Fault Study data nor draw correlations between interpreted, inferred, or observed faults across the Project Site. The referenced USGS report is discussed in the Response to Comment Nos. 8I-6, 8I-49, 8I-60 (this comment), and 8I-61 (next comment). Nowhere in the referenced USGS report do they comment on the recency of faulting interpreted along the seismic line sections extended north-south across the Alquist-Priolo Fault Zone along east of Gower Street and Argyle Avenue, HW-1 and HW-2 respectively. In fact, the referenced USGS report specifically states, “the seismic data provide little or no information about the rupture history of the fault traces.” Furthermore, the 2015 and 2019 Fault Studies provide evidence that faulting has become inactive since the deposition of strata that is estimated by experts to be at least 30,000 years old.

Regarding specific parts of Comment IND 8I-60, the comment notes that the CGS Alquist-Priolo Fault Evaluation Report (FER) 253 Supplement No. 1 (2014) Figure 7 (page 11) shows a compilation of the Hollywood Fault locations that is “somewhat approximate on this small map scale.” As discussed in the Response to Comment No. IND 8I-49, this is the reason that site-specific fault studies are required and provide more accurate mapping of fault traces. The comment repeats comments about CPT borings and the 2015 discussions, which are addressed above in the Response to Comment No. IND 8I-59.

Comment No. IND 8I-61

Question 3: What is the Activity Level (Holocene or pre-Holocene) of the Faults?

As noted above, GDC (2015 and 2019) consistently claims there is no active faulting beneath the Project Site or extending toward the Project Site. These claims are based on GDC's estimating the ages of soils and alluvial layering in trenches and CPT cross-sections. However, the CGS hand-drawn analysis/conclusions on cross-sections M-M', N-N', P-P', and 0-0' that were the subject of the May 17, 2015 GDC response to the City showed faulting much higher (younger) in the alluvial layering than shown by GDC (**Figure 4**). These higher layers appear to be Holocene in age, further showing the faults are active. There was a reliance by GDC (2015, Appendix GI) on non-quantitative, visual age estimates based on factors such as soil coloration for the alluvial layers exposed in the East and West trenches. The DEIR and GDC age estimates (DEIR, 2020; page IV.D-12) use relative soil-profile development, variously called soil stratigraphy, soil profile horizon, and a soil development index involving visual alluvial layer descriptions.

Regarding the extrapolation of alluvial layering continuity we considered: 1) GDC logging of the 2014-2015 East and West fault trenches paralleling Argyle Avenue from near Yucca Street to Carlos Avenue and 2) bore hole and CPT logging and stratigraphic correlations by GDC along north-south cross-sections M-M', N-N', P-P', and 0-0' shown on the GDC 2015 Figure 8. The GDC logging of the East and West fault trenches was conducted by GDC personnel and subcontractors. Significantly, CGS personnel were only allowed very

limited access to the trenches (CGS, 2014; FER-253 Supplement, Appendix B page 35) to observe details and look for possible young faults. Subsequent to the GDC interpretations, the CGS documented their fault conclusions with hand-drawn faults on cross-sections M-M', N-N', P-P', and 0-0' that were a subject of the May 17, 2015 GDC response to the City discussed above. These hand-drawn CGS conclusions show not only more numerous faults than GDC recognized, but also showed fault offsets in younger deposits, i.e., "active" faulting, where the GDC interpretations did not (GDC, 2015, PDF pages 468 through 473; one example shown on **Figure 4**).

The CGS conclusions, as part of the State's Alquist-Priolo Earthquake Fault Zone (APEFZ) map process, are stated in the 2014 FER-253 Supplement No. 1 on page 26 as follows, with the mentioned "transect" being cross-section M-M':

"The most prominent horizon in this transect, the base of the Argyle Channel, has several anomalous south-side-up steps that may be related to faulting, and several less-continuous units lower in the section appear to support corresponding disruptions. Some of the latter may correspond to the faults observed near the southern GDC Site 2 property line in the eastern trench for that site. However, the main zones of disruption, extending highest in the section, may lie between CPTs C-21 to C-22 and C-26 to C-29. The eastern trench at GDC Site 2 (and extending south into GDC Site 1) did not extend far enough south to fully explore these possible faults and their potential connection to the scarp at Carlos Avenue. Data from a boring log transect on GDC Site 1, that might cross the fault, have not been released."

The "main zones of disruption, extending highest in the section, may lie between CPTs C-21 to C-22 and C-26 to C-29" (CGS FER-253, page 26); these zones correspond to the location of the main Hollywood Fault identified by the USGS (2020; Exhibit C, Figures 22 through 25) guided-wave seismic study along Argyle Avenue (Profile HW2) very close to CPTs C-22 to C-24 (**Figures 4 and 5**). This USGS 2020 fault location connects to another location of the Hollywood Fault approximately 350 meters to the east at their other seismic profile line (Profile HW1; USGS Figures 7 through 14). The USGS comments (*emphasis added*) on the Hollywood Fault effects on shallow deposits and therefore the faults' recency of movement are as follows (in quotes):

"An abrupt change in shallow velocities (~400 mis) is observed at Carlos Avenue, with higher velocities to the north at shallow depths and progressively thicker lower velocity materials southward toward Hollywood Boulevard. *The abrupt change in shallow V_P at Carlos Avenue is similar to the change in V_P Seen along Profile HWJ at the apparent Hollywood Fault (fig. 7).*"

"Thus, *both guided waves and V_P are suggestive of near-surface faulting slightly south (1 0-25 m) of the center of Carlos Avenue and about 20 to 35 m south of the center of Yucca Street.*" (At STA 106 on **Figure 3**.)

"From the south end of Profile HW2 (at Hollywood Boulevard) to approximately Carlos Avenue, *a 7- to 10-m-thick zone of low- V_s (<300 m/s) materials is present in the near*

surface; this layer pinches out at Carlos Avenue in a manner similar to that seen in the tomographic V_P model (fig. 7). Between that 7- to 10-m-thick layer and the base of the model, V_s is high relative to the north end of Profile HW2."

"All of these models show prominent changes in shallow-depth structure near Carlos Avenue and slightly south of Yucca Street that are consistent with shallow faulting in those locations."

The reference to "pinching out" in the third comment above indicates the extent of the shallow alluvial layer ended over a rather short distance, likely due to shallow Holocene faulting. Comparing **Figure 4C** with the East Trench East Wall trench log (GDC, 2015, Plate 4a), the thickness of the Argyle sand (Qs = yellowish layer, but the symbols are not readable on the GDC PDF file from the DEIR circulated to the public) is about 15-feet, nearly identical to the dark blue plus the light blue (roughly 2.5 V_p/N_s ratio) alluvial layering in **Figure 4C** at about distance STA 115 m (meters). USGS (2020) shows a fault at station 117 m (**Figure 3**). The Qs begins to rapidly thicken at Carlos Avenue indicating uplift on the north (right) side of the Hollywood Fault cutting through/offsetting the Holocene alluvial layer. All of this indicates active faulting through the HC Site.

Similarly showing that the fault is active, located approximately 675-feet east of the USGS guided-wave survey Profile HW1 is the Hollywood Courthouse located at 5925 Hollywood Boulevard (Ninyo & Moore, 2015). The 2015 Ninyo & Moore study (formally received by the CGS as an APEFZ investigation in June 2015) found active faulting (offset Holocene alluvial layers) through the northern one-half of the two-story court building and the south side of the one-story underground parking structure. We understand that the improvements planned for this federal courthouse have been cancelled due to the presence of the active faults. These are active faults within the Hollywood Fault zone that directly align with the USGS (2020) locations of the Hollywood Fault (e.g., USGS Figures 13 and 14) confirming the linkage of active faults east of the HC Site continuously to the HC Project Site.

To the west of the HC Project Site two studies again demonstrate Holocene faulting on the Hollywood Fault, the first in line with the southern trace only 0.7- to 1.3-miles west of the HC Site. From Dolan et al. (2001) it is stated (*emphasis added*):

"The *most recent faulting* at Camino Palmero occurred after deposition of - 9 ka sediments and prior to deposition of sediments dated as - 6 ka (Dolan et al., 1997; 2000b). However, a pronounced ground-water barrier at Highland Ave, between La Brea Avenue and Cahuenga Boulevard, suggests that steeply north-dipping faults extend upward into late Holocene deposits there (Lindvall et al., 2001)."

The USGS 2020 investigation (their Figure 26) also performed seismic studies in the Santa Monica Fault segment west of HC and found (*emphasis added*): "The seismic sources for the BHGWI seismic survey were located about 500 and 647 m southwest of the southernmost and northernmost ends of Profile BH1, respectively (fig. 27). We chose

this site (SPI) to generate seismic sources because it was the location of a previous coring and CPT transect, in which an active trace of the Santa Monica Fault was identified."

"In addition, the BHGW2 data also are consistent with the presence of as many as three other fault traces along Lasky Drive. Importantly, all five of these high-POV zones can be inferred on both the BHGWI and BHGW2 data (figs. 28, 30). Thus, we suggest that distributed shallow-depth faulting likely is present at several locations along Lasky Drive."

In 2013 the U. S. Geological Survey, the California Geological Survey, and the Southern California Earthquake Center published the *Uniform California Earthquake Rupture Forecast - Version 3* (referred to as UCERF3, 2013; <https://pubs.usgs.gov/of/2013/1165/>) with the purpose to examine the faults in California and develop a mathematically based forecast as to the frequency and magnitude of earthquake ruptures occurring on these faults. As noted in the publication, all the findings and conclusions of this study were independently reviewed by scientists and engineers from independent institutions. UCERF3 indicates that the Hollywood Fault is repeatedly active between 4,000 and 11,000 years and produced rupture earthquake magnitudes between 5.0 and about 7.0 during this portion of the Holocene. Also, the faults to the east and west of the Hollywood Fault (the Raymond Fault to the east, the Santa Monica Fault and the Malibu Coastal Fault to the west) show a likely earthquake fault participation (all four faults being the source of at least a magnitude 7.0 earthquake) about every 4,000 years. Therefore, the UCERF3 study shows that the Hollywood Fault is "active" with the highest large magnitude earthquake recurrence rate in the approximately 4,000-year cycle, along with other faults that make up this larger fault system. This larger continuous system is approximately 125 miles in length, and all of it is Holocene "active".

Response to Comment No. IND 8I-61

The 2015 and 2019 Fault Studies acknowledge that the Hollywood Fault Zone is considered active. However, it is only the "active" fault traces within a fault zone that are considered to have a higher potential for surface fault rupture hazard and are restricted from new structure development by City and State regulations, specifically the Alquist-Priolo Earthquake Fault Zoning Act. As discussed in the Response to Comment No. IND 8I-49, CGS Special Publication 42 and Note 49 provide guidelines for conducting fault studies to evaluate the recency of faulting. The 2015 and 2019 Fault Studies were conducted in accordance with these regulations and guidelines. In addition, and as discussed in Response to Comment No. IND 8I-49, the evidence of near surface faulting presented in the 2018 USGS-CGS (2020) report is not in conflict with the data presented in the Fault Studies (2015 and 2019). As stated in the Fault Studies, faulting was exposed in fault trench walls, and faulting evidence was found in transects of CPT and core boring stratigraphic correlations. However, with detailed and extensive evaluation of the stratigraphy, it was determined that the faulting has been inactive for at least the last 30,000 years. The age of the soils was evaluated by three different outside experts, including Dr. Roy Shlemon, Dr. Tom Rockwell, and Tanya Gonzalez of ECI. It is with

these fully vetted investigations that the fault history below the Project Site was determined to be not Holocene-Active and recommended for new development.

The potential for surface fault rupture in Southern California is never negligible. Consider the active fault zone as a traffic intersection. Anywhere one crosses into the intersection one has a potential to be hit by a car. The City puts up crosswalks and street lights to mitigate the hazard of crossing the intersection. One would consider adhering to the street lights and staying within the cross walk to reduce one's risk. Within a fault zone, the "active" fault traces are considered higher risk, similar to walking outside the crosswalk and against the traffic signals, as they have higher potential for surface fault rupture hazards and are restricted from new development. The older faults with less recent and lower reoccurrence rupture history are considered lower risk, similar to walking in a cross walk. As discussed in Response to Comment Nos. IND 8I-6, IND 8I-49, IND 8I-59, and IND 8I-60, the 2015 and 2019 Fault Studies show substantial evidence that the faulting below the site has a lower risk of surface fault rupture hazard.

Documentation of significant earthquakes within Southern California over the last approximate 100 years by the USGS has provided insight as to the nature and behavior of active fault zones. Documented historical surface fault rupture events presented in UCERF3 and the USGS-CGS Quaternary Fault and Fold Database illustrates the fault rupture that regularly occurs over segments of fault zones and not simultaneously occurring along the entire fault zone, as Wilson's conclusions incorrectly infer. That is to say, portions of a fault zone typically rupture independently with other portions expressing no rupture. The evidence that there are "active" fault traces within the Hollywood Fault Zone are not disputed, nor does this information invalidate the fact that the faults below the Project Site are not "active".

In response to the alternate interpretations of transect data presented along cross sections, they do not reconcile all the data and factors which create the environment for that interpretation of the data as a whole to be likely and defensible. The transect data reviewed by CGS included the CPT signatures only, without the benefit of the closely spaced core boring data, which were available to them to review. In addition, the information gathered during the trenching on the East Site, as well as six perimeter sites in the local area, provided a wide base of local stratigraphic knowledge. The stratigraphic knowledge in correlation with the record of climate cycles within the last 200,000 years of glaciation and interglaciation, illustrates a depositional history that allows a higher level of faulting history evaluation. As discussed in the 2015 Group Delta Fault Study, the pre-Holocene stratigraphic layers that were found unfaulted in trench exposures and transects were evaluated by experts Dr. Roy Shlemon and Dr. Tom Rockwell, as well as ECI. The most recent fault rupture observed below the Project Site occurred prior to the deposition and pedologic development of a layer that is estimated to have a minimum age of 30,000 years. Alternative interpretations of active fault break across this 30,000 year-old layer should exhibit offsets of multiple reoccurring rupture events in line with at least the lower end estimated slip rates on the Hollywood Fault of 0.33 mm/yr (according to Southern California Earthquake Data Center). In this scenario of "active" faulting, 30,000-year old stratigraphy should exhibit roughly 10 meters of offset. Nowhere on the Project Site were faults with magnitudes of offset remotely close to this estimate within the pre-Holocene

layer. In addition, the offsets observed in trench walls exposing the much older underlying stratigraphy, estimated to be on the order of 200,000 years old, were on the magnitude of centimeters (Group Delta, 2019). This faulting history data illustrates a low frequency of faulting, which occurred well before the current Holocene time.

Comment No. IND 8I-62

CONCLUSIONS

Significant evidence is presented by the California Geological Survey (CGS), the United States Geological Survey (USGS), and the reports of Group Delta Consultants, Inc. (GDC) to demonstrate conclusively that:

- 1) There is at least one continuous fault extending from Argyle Street on the East Site to within a few hundred feet from Ivar Street on the West Site (DEIR, Appendix G-1 [GDC, 2015], Figure 8; CGS, 2014, FER-253 Supplement Figure 7). This is agreed upon by GDC and CGS (GDC, Appendix G-1, PDF page 464 Conclusion and PDF page 466, Plate 1, black dots [**Figure 1**]).
- 2) The fault in item (1) above is nearly parallel to, but separate from, the southern fault slightly re-located by CGS (2014, FER-253 Supplement No. 1, Figure 7 and pages 14, 16, 21, 26, and 28; **Figure 2**) for the FER Supplement No. 1. More recent USGS (2020) data suggests that at least four other faults enter the Project Site from the east at Argyle Avenue (USGS, 2020, Figures 4 and 22 through 25: **Figure 3**) with the southernmost fault coincident with the southern fault in the FER-253 Supplement No. 1. All of these projected faults (**Figure 3**) pass through or very near the proposed 35- and 46-story skyscrapers and/or the senior buildings.
- 3) The CGS hand-drawn analysis/conclusions on cross-sections M-M', N-N', P-P', and O-O' that were a subject of the May 17, 2015 GDC response to the City show faulting much higher in the alluvial layering (therefore younger) than shown by GDC (**Figure 4**). These higher layers appear to be Holocene in age, further showing the faults are active. Due to GDC's lack of quantitative age dates for the key alluvial layers (e.g., Qm) exposed in the East and West trenches, the DEIR and GDC (2015) age estimates are dependent on dating by soil stratigraphy.
- 4) Shallow depth faulting in the area of an active Hollywood Fault trace (**Figure 5**) indicates the Santa Monica Fault west of the HC Site is Holocene active (USGS, 2020), the Hollywood Fault west of the HC Site is Holocene active (Dolan et al., 2001), and the Hollywood Fault east of the HC Site is Holocene active (Ninyo & Moore, 2015 and USGS 2020). The UCERF3 (USGS and CGS, 2013) demonstrates that the Hollywood fault is part of an approximately 125-miles long active fault system. These studies unequivocally demonstrate that the Hollywood Fault within the HC Site is Holocene active.

Response to Comment No. IND 8I-62

The summary conclusions listed in Comment No. IND 8I-62 have been addressed in the responses to previous Response to Comment Nos. IND 8I-6, IND 8I-49, IND 8I-59, IND 8I-60, and IND 8I-61.

Comment No. IND 8I-63

CLOSURE

This report has been prepared for the sole use and benefit of our client. Any errors or omissions noted by any party reviewing this report, and/or any other engineering geology/fault conditions aspect of the project, should be reported to Wilson Geosciences Inc. in a timely fashion. No subsurface investigation was authorized or performed by Wilson Geosciences Inc., and conclusions, recommendations, opinions, and other information contained in this report are based upon the evaluation of investigations, analyses, and reports prepared by others within/beneath/near where the project improvements would ultimately be made.

The analysis, results, and conclusions were prepared in general compliance with normal industry practice in the City and County of Los Angeles and meet the standard of care of our profession at this time. Final decisions on matters presented are the responsibility of the client and/or the governing agencies. Wilson Geosciences Inc. and its employees make no warranties either expressed or implied in any respect as to the engineering geology/fault conditions at the site. The Client should consider any transferring of information or other-directed use by the Client as "advice by the Client".

Thank you for the opportunity to participate in this process and to offer the above comments.

Response to Comment No. IND 8I-63

The comment concludes the review presented by Wilson Geosciences Inc. and includes standard language related to compliance with industry practices. The comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Response to Comment No. IND 8I-64

The remainder of Exhibit 42 includes references and exhibits as referenced in the comment and which are included in full in Appendix A in this Final EIR. The comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 8I-65

EXHIBIT 43

SUBJECT: Hollywood Center Project – Draft Environmental Impact Report – Transportation and Traffic Issues

Dear Mr. Bescher:

Tom Brohard, P.E., has reviewed the April 2020 Draft Environmental Impact Report (Draft EIR) and the April 2020 Transportation Assessment for the Proposed Hollywood Center Project bisected by Vine Street just north of Hollywood Boulevard in the Hollywood Community Plan area of the City of Los Angeles. Overall, the Project would contain nearly 1.3 million square feet of developed floor area including 1,005 residential housing units, retail and restaurant uses totaling 30,176 square feet, open space of 166,582 square feet, up to 1,521 vehicle parking spaces, and up to 551 bicycle parking spaces. Four new buildings are proposed including a 35-story building on the West Site, a 46-story building on the East Site, and two 11-story buildings (one on each site) set aside for housing for seniors. The Project also contains a Hotel Option within the East Site, with 220 hotel rooms on Levels 3-12 replacing 104 residential units.

My review disclosed that the Draft EIR and the Transportation Assessment for the Hollywood Center Project are fatally flawed. Several transportation and traffic issues have not been thoroughly or properly studied. This letter points out those deficiencies that must be addressed before considering the Project further.

Education and Experience

Since receiving a Bachelor of Science in Engineering from Duke University in Durham, North Carolina in 1969, I have gained over 50 years of professional traffic engineering and transportation planning experience. I am licensed as a Professional Civil Engineer both in California and Hawaii and as a Professional Traffic Engineer in California. I formed Tom Brohard and Associates in 2000 and have served many diverse communities as the City Traffic Engineer and/or the Transportation Planner. During my career in both the public and private sectors, I have reviewed numerous environmental documents and traffic studies for various projects as shown in a short summary of my experience in the enclosed resume.

Response to Comment No. IND 8I-65

The comment introduces the credentials and background of the reviewing consultant and provides a brief summary of the Hollywood Center Project. While the comment expresses the general concern that the Draft EIR and transportation evaluation are fatally flawed, it does not contain specific issues regarding the adequacy and content of the Draft EIR, and, as such, no further response is warranted. However, specific comments regarding the Draft EIR are responded to below.

Comment No. IND 8I-66

Transportation and Traffic Issues

Based on the information in the Draft EIR and the Transportation Assessment, each of the following traffic issues must be fully addressed and evaluated:

Response to Comment No. IND 8I-66

The comment introduces the commenters analysis with the request that each issue be addressed and evaluated. The comment does not contain specific issues regarding the adequacy and content of the Draft EIR, and, as such, no further response is warranted. However, specific comments regarding the Draft EIR are responded to below.

Comment No. IND 8I-67

- 1) Hollywood/Vine Traffic Impacts Have Not Been Properly Studied – Traffic counts at Hollywood Boulevard and Vine Street of vehicles, bicyclists, and pedestrians were made for the Transportation Assessment on May 23, 2018. Google Earth photographs made on June 8, 2018 as well as the traffic counts made for the Transportation Assessment do not show or consider the diagonal "scramble" crosswalk markings or the "No Right Turn on Red" signing at the intersection installed and then celebrated on August 2, 2018 (see <https://www.youtube.com/watch?v=COIpuXNy9c4>).

The Notice of Preparation of the Environmental Impact Report was issued on September 4, 2018. The Transportation Assessment fails to properly study and evaluate the Project traffic impacts at Hollywood/Vine with the "scramble" crosswalks and "No Right Turn on Red" signing that was installed a month earlier. This significant change in the operation of the intersection causes additional congestion, queuing, and delay for vehicles beyond what previously existed without these devices.

Page 34 of the July 2019 LADOT Transportation Assessment Guidelines requires a quantitative evaluation of the project's expected access and circulation operations. "Project access is considered constrained if the project's traffic would contribute to unacceptable queuing on an Avenue or Boulevard at project driveways or would cause or substantially extend queuing at nearby

signalized intersections. Unacceptable or extended queuing may be defined as follows:

- Spill over from turn pockets into through lanes.
- Block cross streets or alleys.
- Contribute to "gridlock" congestion. For the purposes of this section, "gridlock" is defined as the condition where traffic queues between closely spaced intersections and impedes the flow of traffic through upstream intersections."

Page 12 of the Transportation Assessment identifies Hollywood Boulevard as an Avenue I and Page 13 identifies Vine Street as an Avenue II in the City's Mobility Plan 2035. Queuing has not been evaluated in the Transportation Assessment for HollywoodNine before the "scramble" and the "No Right Turn on Red" restrictions were installed or under future scenarios. According to residents living at HollywoodNine, queuing has increased substantially since these changes were made.

The 96 residential units at 1645 Vine Street have only a single alley/driveway that accesses their parking lot from the west side of Vine Street only 160 feet south of Hollywood Boulevard. Traffic on Vine Street has deteriorated with the "scramble" and "No Right Turn on Red" as it is now frequently queued beyond their alley/driveway, blocking turns into and out of Vine Street. This is a significant safety concern to the residents as well as the City's Police and Fire Departments.

Page 48 of the Transportation Assessment states "There are conditions at specific locations, such as congestion, queuing, and pedestrian activity, where the CMA (Critical Movement Analysis) methodology can be adjusted to more accurately reflect intersection operating conditions at specific intersections. Additionally, the analysis includes several intersections along major thoroughfares that experience heavy congestion during morning and evening peak traffic periods. The congestion along these streets can result in a reduction in the vehicles counted in the peak direction of travel and reduced capacity during peak travel times. Based on field observations, this reduction in vehicle throughput was determined to inaccurately reflect the existing Level of Service (LOS) experienced by motorists at four of the study intersections. At these intersections, the LOS that is presented in the analysis was adjusted to reflect the observed conditions of a worse LOS than was initially calculated using the CMA methodology."

The CMA methodology formerly used by the City of Los Angeles involved an analysis of the critical movements at intersections, essentially the larger sum of the time required by the through movement and the opposing left turn

movement in each direction. Depending on the magnitude of the sums without and then with Project traffic added as well as the starting point, traffic impacts were considered significant requiring mitigation, or not. With the recent change in state law involving CEQA (the California Environmental Quality Act), agencies are now required to examine VMT (vehicle miles traveled) as the only measure of significant impacts. The Level of Service (LOS) using the CMA methodology was provided in the Transportation Assessment at several intersections for information but it is no longer used to identify significant traffic impacts.

Calculations in the Transportation Assessment for Hollywood Boulevard and Vine Street, one of the four intersections where LOS adjustments were made, indicate volume to capacity (V/C) ratios of 0.685 and 0.679 respectively in the AM and the PM peak hours for existing conditions in ear 2018. These calculations do not properly account for the "scramble" and "No Right Turn on Red" conditions. Without LOS adjustments, those V/C values equate to LOS B. In Table 6A of the Transportation Assessment, the LOS for both peak hours for Hollywood/Vine was adjusted from B to "F*", with the footnote indicating "* LOS based on field observations since the CMA methodology does not account for vehicular queues along corridors, pedestrians, conflicts, etc. in every case. Thus, the calculated average operating conditions may appear better than what is observed in the field.

Additional time is required for pedestrians to diagonally cross Hollywood Boulevard and Vine Street. Right turns on red are now prohibited in all directions at Hollywood Boulevard and Vine Street. Neither of these measures were properly reflected in any LOS calculations in the Transportation Assessment. None of the calculations properly reflect the impacts of the "scramble" and the "No Right Turn on Red".

In their April 10, 2020 review of the Transportation Assessment, LADOT admits that "....the trips generated by the proposed development will likely result in adverse circulation conditions at several locations. DOT has reviewed this analysis and determined that it adequately discloses operational concerns." Unfortunately, the significant transportation and traffic impacts have not been addressed or mitigated by the Project Requirements, Project Design Features, or other proposed measures.

The Hollywood Center Project is proposed on both side of Vine Street less than 400 feet north of Hollywood Boulevard. With generous credits and unsupported reductions for a Transportation Demand Management (TOM) Program that has not yet been developed or adopted, the Hollywood Center Project is still forecast to generate at least 10,564 daily trips, including 792 trips in the AM peak hour and 1,201 trips in the PM peak hour (Tables 7 and 8 of the Transportation Assessment). At least 60 to 80 percent of the trips for the

residential, commercial and hotel portions of the Project will travel through Hollywood Boulevard and Vine Street (Figures 7A, 7B, and 7C of the Transportation Assessment). The additional trips to and from the Hollywood Center Project will cause additional queuing and congestion at Hollywood/Vine above and beyond what already occurs without the Project, making resident vehicular access to and from 1645 Vine Street even more difficult.

In addition to adding many more daily and peak hour trips to the already overburdened conditions at Hollywood/Vine, the Hollywood Center Project will also add many more pedestrian and bicycle trips through that intersection. TOM items, while intended to reduced solo peak hour vehicle trips, will also add significant volumes of pedestrians and bicyclists to the congestion and queuing at Hollywood/Vine.

Response to Comment No. IND 8I-67

The comment raises concerns regarding the site access and circulation evaluation in the TA provided in Appendix N-1 of the Draft EIR. As discussed in Topical Response 3 – Transportation and Traffic, measures that focus on automobile delay and vehicle LOS are no longer used to measure the significance of transportation impacts for CEQA. As the site access and circulation analysis is separate from the CEQA significance criteria for transportation impacts, these concerns do not affect the transportation impact analysis or the significance findings provided in Section IV.L of the Draft EIR or require CEQA project design features or mitigation measures. Nevertheless, responses are provided below.

The comment states that the TA contained in Appendix N-1 to the Draft EIR did not consider the diagonal “scramble” crosswalk or “No Right Turn on Red” signing at the Hollywood Boulevard/Vine Street intersection, that required queuing analysis was not conducted, that access for residents of 1645 Vine Street has been impacted by queuing, that significant transportation and traffic impacts have not been addressed or mitigated, that the Hollywood Center Project will cause additional queuing and congestion, and that the Hollywood Center Project will add more pedestrian and bicycle trips through the Hollywood Boulevard/Vine Street intersection.

The comment raises issue with the fact that a queuing analysis was not provided in the access and circulation analyses presented in the TA contained in Appendix N-1 to the Draft EIR. LADOT issued a memorandum dated August 9, 2019, at the time the City’s new TAG was issued adopting the change from LOS to VMT as the transportation significance metric under CEQA. This memo provided that LADOT would honor executed transportation impact study MOUs for transportation impact studies that were already underway under the prior LOS-based guidelines at the time of transition but recommended that VMT analysis should be added to the study. The Project’s original MOU was signed in December 2018 and a draft transportation impact study prepared in accordance with that MOU was submitted to LADOT for review in March 2019. That study utilized the Critical Movement Analysis (CMA) intersection methodology as required by LADOT at that time.

Subsequent to the City's adoption of the new VMT-based guidelines, a new MOU was executed with LADOT in December 2019 in order to confirm the parameters of the VMT analysis and revised study area in accordance with the TAG requirements. In September 2019, LADOT confirmed that the CMA methodology should continue to be used since the analysis had already been conducted, even though a new MOU would be executed to confirm the parameters of the VMT analysis. Accordingly, the intersection LOS analysis presented in the TA contained in Appendix N-1 to the Draft EIR was conducted using the prior CMA methodology. The CMA methodology does not provide queuing as an output but rather provides volume/capacity (V/C) ratio and LOS values.¹²⁸ Appendix D provides a letter from LADOT reaffirming this guidance.

In regards to the scramble phase and no right turn on red signing implemented by the City at the Hollywood Boulevard/Vine Street intersection, the CMA methodology and intersection analysis sheets that contain the analysis results do not have an input that allows for the selection of a scramble phase. However, to account for observed conditions at this location, the minimum intersection capacity allowed by the CMA methodology was decreased and the level of service tables accurately identify this as a location that is operating at LOS F due to congestion in the area. Analysis of the year 2027 and year 2040 without and with Project scenarios carried these assumptions forward, and the right-turn phasing is accurate for three of the four approaches. The southbound and westbound directions do not have right-turn lanes; therefore, the CMA methodology does not allow for a right-turn on red with this setting. In the eastbound direction, there is a right-turn overlap that remains and is accurately reflected in the CMA outputs. The northbound right-turn overlap was removed from the CMA spreadsheets as that right-turn phasing was incorrect. The CMA spreadsheets for the future (2027 and 2040) without and with the Project have been updated to reflect this change and are provided in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR. The updated analysis results do not change the LOS results or significant impact conclusions related to transportation. As acknowledged in the comment, this pertains to the level of service analysis, which is no longer a CEQA metric used by the City of Los Angeles, in compliance with State mandates, to determine significance of impacts for transportation.

In regards to deterioration of access to the residential units at 1645 Vine Street due to the scramble phase at Hollywood Boulevard and Vine Street, the comment attributes this information to residents living at the Hollywood/Vine Building. While no actual or substantial evidence is provided, it should be noted that, regardless, this would not be an effect of the Project since 1645 Vine Street is located at the southwest corner of the Hollywood Boulevard/Vine Street intersection, and the access point mentioned in this comment is the first driveway on Vine Street south of Hollywood Boulevard. This driveway is opposite a double-double yellow line, across which it is illegal to make a left-turn. Any

¹²⁸ Level of service is a measure of the operating condition of an intersection, which inherently reflects queuing in that there are greater levels of queuing at worse levels of service. As an example, the definition of LOS F as shown in Table 5A of the TA in Appendix N-1 to the Draft EIR is: "Failure. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths."

queuing on Vine Street caused by the Hollywood/Vine scramble that affects this location would be northbound on Vine Street approaching the Hollywood/Vine intersection. While the Project would add trips to northbound Vine Street, if this queuing is affecting access at the driveway, it would only be because illegal left-turns are being made by 1645 Vine Street residents across the double-double yellow line along Vine Street.

In regards to “significant” transportation and traffic impacts not being addressed or mitigated, the Draft EIR concluded that the Project would not have significant impacts in regards to the impact significance criteria set forth in the City’s TAG for CEQA analysis of consistency with local programs, plans, ordinances and plans, VMT, and geometric hazards. Thus, no mitigation measures are required. Level of service, congestion, and queuing issues raised in the comment are no longer CEQA metrics used by the City of Los Angeles, in compliance with State mandates, to determine significance of impacts for transportation.

The comment refers to “generous credits and unsupported reductions” for a TDM program. Please see the Response to Comment No. IND 8I-68.

In regards to the Project increasing congestion, the TA in Appendix N-1 of the Draft EIR acknowledged that over-capacity conditions and poor levels of service are anticipated at this intersection both without and with the Project and that the projected V/C ratios would be increased with the Project, indicating additional congestion. As an example, an increase in V/C ratio from 1.019 without the Project to 1.054 with the Project is shown in Table 13A in the TA. No feasible physical measures were found that would address these conditions. As discussed in the TA and in the LADOT Assessment Letter provided in Appendix N-2 of the Draft EIR, the following corrective measures were identified that would be funded by the Project:

- One time financial contribution to the LADOT to be used in the implementation of a Mobility Hub in the general area of the Project.
- One-time financial contribution to the City’s Bicycle Trust Fund to implement bicycle improvements in the vicinity of the Project.
- Financial contribution towards transportation system management improvements within the project area.
- Financial contribution to fund for constructing approved neighborhood traffic management measures within the project area.

In regards to the Project adding more pedestrian and bicycle traffic through the Hollywood Boulevard/Vine Street intersection, this is acknowledged and in fact would be a positive outcome of the Project consistent with City *Mobility Plan 2035* objectives to increase use of non-vehicular modes.

Use of an alternative analysis methodology regarding the scramble phase and operational characteristics at this location would not affect the conclusions of the Draft EIR pertaining to the CEQA analysis of plans, programs, ordinances, or policies, causing substantial VMT, or geometric hazards.

Comment No. IND 8I-68

- 2) Trip Reductions with TDM Plan Are Overstated and Overemphasized - TDM (Transportation Demand Management) Plans are typically utilized to reduce single occupant vehicle trips during normal worker commute hours. These plans are most effective when most workers leave from or arrive at their residences at the same time. Page 4 of the April 10, 2020 LADOT letter identifies 29 possible TDM strategies, many of which have already been assumed as "given" in the LADOT VMT Calculator.

At this point, there is no TDM Program for the Hollywood Center Project. Instead, LADOT will require that a "...preliminary TDM Program shall be prepared and provided for DOT review prior to the issuance of the first building permit for this project and a final TDM program approved by DOT is required prior to the issuance of the first certificate of occupancy for the project." The Transportation Assessment cannot rightfully take credits for a TDM Program that does not exist.

Furthermore, there is no program to periodically monitor the effectiveness of the yet to be developed TDM Program for the Hollywood Center Project. In addition, there are no enforcement provisions for the TDM Program if the trip reduction goals are not achieved. Regular monitoring and enforcement provisions must be added to the TDM Program to ensure that the assumed trip reduction goals are achieved or exceeded.

Response to Comment No. IND 8I-68

The comment states that at this point there is no TDM Program for the Project. However, the TDM Program is described in Project Design Feature TRAF-PDF-1 on pages IV.L-26 to IV.L-28 of the Draft EIR. The TDM Program is required as a condition of approval in LADOT's assessment letter. Furthermore, the Project is committed to implementing the TDM Program as a condition in its ELDP certification by the State of California, and for which the City and the Applicant have executed a letter confirming this obligation. The VMT Calculator tool for the City of Los Angeles allows projects to include TDM measures as Project Design Features or as mitigation. As is the case with the Hollywood Center Project, these are considered to be PDFs given their inclusion in the ELDP certification and, therefore, accounted for as part of the Project. These were not "given" but the result of careful thought and research by professional engineers to identify strategies that would be effective for the Project's mix of land uses and local context. It is common practice in the City, and elsewhere, for projects to take credit for TDM measures that are undertaken to reduce vehicle trips, with the amount of trip reduction backed by available research.

The trip reductions that were applied as part of the TDM program in the VMT analysis were estimated based on the City's VMT Calculator tool as discussed and documented on page 26 of the TA in Appendix N-1. The effectiveness of TDM measures contained in the VMT Calculator is estimated based on empirical research from the California Air Pollution Control Officers Association (CAPCOA) which currently represents the latest state of the practice TDM research. Appendix H to the TA provides calculations in support of the specific TDM measures applied for this project, including the applicability of select measures and equations used in the analysis. The combined effects of project location, land use mix, TDM measures, and proximity to the built environmental characteristics such as density of destinations, diversity of travel options, and distance to transit are well documented and applied here.¹²⁹ Also see Attachment G, Transportation Demand Management Strategies in the LA VMT Calculator to the LADOT's TAG, which provides more detail regarding the research sources and calculation of effectiveness for the TDM measures included in the VMT Calculator.¹³⁰

The resources and documents above provide substantial evidence in support of the methodology, application of reductions, and resulting analysis outcomes demonstrating that a project with this land use mix, provision of effective TDM measures, in this location, would experience substantial reductions in single occupant vehicle trips.

In regards to monitoring, monitoring of the TDM Program is required by the Project's certification as ELDP. Monitoring requirements are discussed further in the Mitigation Monitoring Program (MMP) in this Final EIR.

Comment No. IND 8I-69

- 3) TSM Improvements Have Not Been Quantified - Page 5 of the April 10, 2020 LADOT letter indicates that the Hollywood Center Project will be required to install new conduits and cables to increase capacity for additional CCTV cameras for real-time video monitoring of intersection, corridor, transit, and pedestrian operations in the Hollywood area along portions of Gower Street and Hollywood Boulevard. The letter concludes that these improvements will provide a system-wide benefit by reducing delays experienced by motorists at study intersections. The benefit of these improvements must be quantified.

The TSM Improvements along Hollywood Boulevard required by LADOT appear to directly conflict with the Hollywood Walk of Fame Concept Plan discussed below. These conflicts and contradictions must be resolved.

¹²⁹ For additional research and information, see USEPA Smart Growth: <https://www.epa.gov/smartgrowth/mixed-use-trip-generation-model>, accessed August 25, 2020.

¹³⁰ Los Angeles Department of Transportation, Development Review for Transportation Assessment, <https://ladot.lacity.org/businesses/development-review#transportation-assessment>, accessed August 25, 2020.

Response to Comment No. IND 8I-69

The Project has agreed to fund transportation system management (TSM) improvements at several locations along Hollywood Boulevard and Gower Street. In support of the City's ATSAC and ATCS systems, these signal enhancements are intended to assist the City with traffic signal communications infrastructure that allow for dynamic operation of the signals in response to observed conditions on the ground. As a result of the ability to operate signals in a manner that better serves traffic, these improvements would offer operational benefits to these locations. Consistent with LADOT analysis guidance, a reduction of 0.01 V/C was applied at the specific intersections where the TSM upgrades would be provided.

The comment states that the TDM improvements along Hollywood Boulevard appear to conflict with the Hollywood Walk of Fame Concept Plan but provides no evidence to support this statement. New conduits and cables would be located underground beneath the street. As discussed in the Response to Comment No. IND 8I-71, since there are several options for the Hollywood Walk of Fame Concept Plan that are under study and the effort has not been completed, adopted by City Council, funded, or programmed for implementation, it is premature to assume how the Hollywood Walk of Fame Concept Plan might be implemented, if at all (also see the Response to Comment No. IND 8I-71). The TSM improvements can be installed and would offer benefits to local circulation independent and irrespective of whether the Hollywood Walk of Fame Concept Plan proceeds.

Thus, the level of effectiveness of the TSM improvements would not affect the conclusions of the Draft EIR pertaining to the CEQA analysis of plans, programs, ordinances, or policies, causing substantial VMT, or geometric hazards.

Comment No. IND 8I-70

- 4) Benefits of Improvements Must Be Quantified and Validated - Page 3 of the April 10, 2020 LADOT letter indicates that the Project applicant has agreed to fund four measures in the area of the Project under a Development Agreement including:
 - a) Implement the Mobility Hub.
 - b) Implement bicycle improvements.
 - c) TSM improvements.
 - d) Construct Neighborhood Traffic Management measures.

None of these measures are defined to allow reviewers of the Draft EIR to understand the expected benefits that implementation of these measures will provide. Without quantification and further explanation of what these

improvements will entail, the value and potential benefit of these offers of financial participation cannot be determined.

Response to Comment No. IND 8I-70

The items listed in the comment are conditions of approval that the Project has agreed to help fund, and the Project cannot solely implement them as they would be located within City right-of-way and are under the purview of City agencies. The CEQA analysis in the Draft EIR does not assume benefits to the Project from the items above.

The Project has agreed to help support City efforts to reduce vehicle trips and manage traffic operations by providing funding towards a mobility hub, bicycle improvements, TSM improvements, and neighborhood traffic management measures in the area. As the exact nature of the improvements is subject to future City efforts and are not presently known, the benefits cannot be quantified at this point in time, and no trip credits were taken in the analysis for the mobility hub or bicycle improvements. As described in the Response to Comment No. IND 8I-69, a credit of 0.01 V/C was applied to the non-CEQA circulation LOS analysis to reflect the benefit of the TDM improvements.

Thus, the potential benefits of these offers to the City would not affect the conclusions of the Draft EIR pertaining to the CEQA analysis of plans, programs, ordinances, or policies, causing substantial VMT, or geometric hazards.

Comment No. IND 8I-71

- 5) "Hollywood Walk of Fame Concept Plan" Has Not Been Considered – The January 2020 Concept Plan for the Hollywood Walk of Fame envisions expanding the existing sidewalk on both sides of Hollywood Boulevard between La Brea Avenue and Argyle Avenue from 15' to 25'. Implementation would require the elimination of on-street parking and one travel lane in each direction.

The Transportation Assessment indicates that conditions for pedestrians on the Walk of Fame along Vine Street will be improved by the closure of six driveways with the Hollywood Center Project, with vehicle access relocated to the side streets instead. However, the Transportation Assessment fails to address or consider impacts associated with the removal of the parking lane and one travel lane in each direction on Hollywood Boulevard.

Response to Comment No. IND 8I-71

The comment correctly notes that conditions for pedestrians on the Hollywood Walk of Fame along Vine Street will be improved by the closure of six driveways and relocation of vehicle access to side streets.

The circulation analysis prepared for the Project predates the discussion or public availability of data pertaining to the Hollywood Walk of Fame Concept Plan. The Heart

of Hollywood website contains a link to the Hollywood Walk of Fame Concept Plan that is dated January 2020. The document discusses outreach and project activities conducted in 2019, which is subsequent to the Project NOP, and, at that time, there was no information about Hollywood Walk of Fame Concept Plan project alternatives that could be incorporated into the analysis. The Hollywood Walk of Fame Concept Plan document evaluates potential reconfiguration options of Hollywood Boulevard. Because this effort was not known at the time of the NOP, there are several options that continue to be under study, and the effort has not been completed, adopted by City Council, funded, or programmed for implementation, it is premature to assume how the Hollywood Walk of Fame Concept Plan might be implemented, if at all. At this point, only concepts have been presented and technical analysis and refinement is anticipated to continue independent of the Project EIR.

Comment No. IND 8I-72

In summary, the Proposed Project must fully evaluate and disclose the potential traffic impacts and conflicts pointed out in this letter. Further study must be undertaken and more detailed information must be provided in order to properly identify and address the traffic impacts and the scope of the traffic improvements that will be created by the Proposed Hollywood Center Project. If you have questions regarding these comments, please contact me at your convenience.

Response to Comment No. IND 8I-72

The TA included in Appendix N-1 of the Draft EIR provides a full and complete analysis of CEQA and non-CEQA issues that is consistent with the City's guidance. The report provides substantial evidence and documentation in the body of the document and technical appendices that explain, support, and justify the study approach, methodology, and conclusions. Response to Comment Nos. IND 8I-67 to IND 8I-72 above demonstrate that the report and technical appendices provide calculations, citations, and explanation of the various governmental agencies (i.e., USEPA, OPR, LADOT) and industry organizations (i.e., ITE, CAPCOA) that have contributed to the advancement and application of state of the practice techniques, applied in this analysis, for estimating trip generation, transportation demand benefits, and VMT.

Comment No. IND 8I-73

Attachment: Tom Brohard, PE's Resume

Response to Comment No. IND 8I-73

The attachment introduces the resume of the reviewing consultant. This attachment does not contain specific issues regarding the adequacy and content of the Draft EIR, and, as such, no further response is warranted.

Comment No. IND 8I-74

EXHIBIT 44

This letter provides a review of potential impact areas not reviewed to an adequate level by the Hollywood Center (formerly Millennium Hollywood project) traffic study and EIR, focusing on areas of particular concern to The Oaks Homeowners Association.

Area resident associations and the local Neighborhood Council have expressed concerns over the adequacy of the traffic analysis in comment letters submitted to the City on the EIR. The Oaks Homeowners Association submitted a comment letter on the project Notice of Preparation on October 4, 2018, stating concerns over high existing traffic volumes on Franklin Avenue and the potential negative effects on this corridor from the proposed project. The Argyle Civic Association, representing the local neighborhood on Argyle Avenue, submitted a letter on September 4, 2018, with similar concerns on routes to and from freeway access points via Argyle Avenue, Franklin Avenue, and other local roadway routes. The Hollywood United Neighborhood Council provided a list of issues requested to be included in the EIR analysis, including an expanded analysis of freeway access and traffic impacts on area roadways including Franklin Avenue. The Hollywood Dell Civic Association filed an appeal in opposition to the former Millennium Project, and traffic needs were defined in that appeal for the Argyle/Franklin intersection and the Franklin Avenue corridor

Concerns over the adequacy of analysis of project traffic to the north of the site, to the US-101 and Franklin Avenue corridors, are described in more detail below.

Response to Comment No. IND 8I-74

The comment describes prior communications that have expressed concerns regarding the traffic and congestion on Argyle Avenue and the intersection of Argyle Avenue and Franklin Avenue, which is an intersection that is used to access the freeway and surrounding area, as well as to an unrelated project on the Project Site. The comment contains no substantial evidence regarding the adequacy or content of the Draft EIR, and, therefore, no further response is warranted.

Nonetheless, the TA contained in Appendix N-1 to the Draft EIR contains an analysis, in Appendix I, of the locations requested in the Caltrans comment letter to the NOP dated April 22, 2019, other documents received during the scoping process, and that meet lead agency criteria for analysis as discussed in the Response to Comment IND 8I-76 below.

Comment No. IND 8I-75

Freeway Impacts

Appendix N-1 of the Draft EIR for the proposed project is the Traffic Assessment document. Attachment D of that document is the “State Highway Level of Service Analysis Summary of Results” The following was stated in this document regarding the applied methodology to the freeway facilities analysis:

“Based on discussions with Caltrans, a Project-related effect is considered substantial if the traffic generated by the Project: (a) causes the freeway mainline segment level of

service (LOS) to deteriorate to LOS F; or (b) when the segment is already at LOS F, causes an increase in the demand/capacity ratio of greater than or equal to 2%.” The mainline is the primary roadway of a freeway facility, or the segments between interchanges.

The Caltrans Traffic Impact Study Guide is currently being updated and will be adopted soon, as part of State efforts at incorporating guidance from Senate Bill (SB) 743, and the related implementation of the new California Environmental Quality Act (CEQA) guidelines for transportation analysis that includes the vehicle miles traveled (VMT) metric. The previous version of the Guide, however, stated that the addition of any trips to a facility with deficient LOS (usually E or F, but depending upon the facility) is considered significant. The application of a volume-to-capacity (V/C) ratio increase of 0.02 or higher is more adopted from local jurisdictional guidelines (although many including those defined by LADOT for City roadways are 0.01 at LOS E or F) than consistent with any guidelines for State facilities that have been adopted by Caltrans. The reasoning for the selective adoption of this standard for this project deserves further discussion in the EIR. Many projects that are smaller in size than the proposed project are often determined to have significant impact determinations on freeway facilities.

Response to Comment No. IND 8I-75

Documents published by Caltrans do not provide a clear or consistent impact criterion for capacity-based transportation impact analysis on the State highway system. The comment states that the previous version of the Caltrans Traffic Impact Study Guide states that the addition of any trips to a facility with deficient LOS is considered significant. However, there is no such statement in Caltrans’ Guide for the Preparation of Traffic Impact Studies¹³¹ (believed to be the document to which the comment refers). The Guide provides criterion for when a traffic impact study should be conducted, but no specific guidance on when an impact is considered significant. Therefore, it was necessary to define a criterion for use in the TA for when operational impacts on the freeway system would be considered substantial.

As the comment points out, Caltrans is currently working on updated guidelines that also implement the State-mandated shift to VMT. While the remainder of the comment provides a response to the question posed, it is worth noting that the implementation of SB 743 and shift to VMT as the primary CEQA metric for transportation provide that a metric pertaining to LOS and V/C ratio is not a significant impact per State law.

Absent published impact criteria that can be applied in this analysis, City staff and the Applicant’s technical experts met with Caltrans to discuss scoping of the analysis and impact thresholds for the State highway system. Caltrans’ letter dated April 22, 2019 offered an impact threshold for the off-ramp queuing analysis but did not provide or define the desired threshold for operational LOS impacts on the freeway system. Therefore, consistent with discussion with Caltrans prior studies that apply a similar threshold and

¹³¹ Caltrans, Guide for the Preparation of Traffic Impact Studies, December 2002.

thresholds previously established in the Los Angeles County Congestion Management Program, operational impacts were determined to be deficient if the LOS declined from LOS E or better to LOS F or by a volume/capacity increase of 0.02 or higher if already at LOS F.

Due to the shift to VMT and the Draft EIR's compliance with SB 743, the Draft EIR has provided capacity analysis on the State highway system for informational purposes. This analysis is provided in Appendix I of the TA contained in Appendix N-1 to the Draft EIR. As this is no longer a CEQA metric used by the City of Los Angeles, in compliance with State mandates, this analysis is not material to the significance conclusions in the Draft EIR.

Comment No. IND 8I-76

Appendix I of the updated traffic study is entitled "Intersection Analysis Results Not Required by Transportation Assessment Guidelines". This appendix documents an analysis using the recent but superseded LADOT traffic study guidelines. The following conclusions can be made from the presented data:

- The existing plus-project impact at Argyle/Franklin intersection was 0.009 and 0.010 for the AM and PM peak hours at LOS F.
- The future with-project impact at this location was determined to be 0.009 and 0.011.
- The incremental impact of 0.010 or higher at LOS values of E or F would have been significant under the previous LADOT guidelines. Therefore, the values of 0.010 and 0.011 above would have been significant under the previous LADOT guidelines.

Under current LADOT guidelines, vehicle delay is applied to local intersection analysis in Traffic Assessments reviewed by LADOT, instead of volume-to-capacity values. But the analysis in Appendix I shows the potential for proposed project impacts in the Franklin Avenue corridor, but analysis of this roadway has not been provided in the delay-based analysis.

Response to Comment No. IND 8I-76

The comment implies that under the prior guidelines and CEQA transportation analysis methodology performed by the City, analysis of the Argyle Avenue/Franklin Street intersection may have resulted in significant transportation impacts. As addressed in the Draft EIR, as a result of State law (SB 743) and action by the City, the adopted CEQA significance metric is VMT, not LOS whether based on V/C ratio or delay. Therefore, based on the City's adopted thresholds of significance, this is not a significant impact.

The comment also does not reflect the guidance in the City’s recently adopted TAG that were used for this analysis. The section describing the scope of analysis states the following:

Study locations should be determined in consultation with LADOT and should include:

- *All primary project driveways*
- *At a minimum, intersections at either end of the block(s) on which the project is located or up to 600 feet from the primary project driveway(s), whichever is closer*
- *Unsignalized intersections that are adjacent to the project or that are expected to be integral to the project’s site access and circulation plan*
- *All signalized intersection in proximity to the project to where 100 or more net new peak hour trips would be added by the project*

Applying the criteria above resulted in the identification of the nine intersections discussed and analyzed in the main body of the TA report. Appendix F of the TA (included in Appendix N-1 of the Draft EIR) displays analysis volumes for all of the analysis years and scenarios. As shown in Appendix F, the Project is not projected to add 100 or more peak hour trips to the Argyle Avenue/Franklin Street intersection and analysis of that location was, therefore, not required.

However, the Project analysis went above and beyond the required intersection analysis at nine locations to conduct quantitative operational analysis for a total of 68 intersections in Appendix I of the TA in Appendix N-1. This additional analysis is referred to in the comment. As described, this analysis was not required, and, therefore, no conclusion regarding operational impacts was drawn. Considerations mentioned in the comment that pertain to analysis metrics that are no longer in effect due to the application of current State law and lead agency transportation metrics for VMT do not affect the CEQA analysis or significance findings for the Project.

Comment No. IND 8I-77

Study Area and Lack of Analysis to the North

In Appendix E (Added Intersections Analysis, January 2013) of the Final EIR for the previously proposed Millennium project, the following was discussed:

“...in comments on the Draft EIR, concerns were raised about significant Project impacts extending beyond the northern boundary of the area analyzed in the Traffic Study. Two intersections located on the northern boundary of the study area were considered to be significantly impacted - Highland Avenue/Franklin Avenue (north) and Argyle Avenue/Franklin Avenue/I-101 Freeway Northbound On- Ramp in the Traffic Study.”

It was stated in this Appendix that the analysis was for informational purposes only, but was provided to address the impacts of the project within an added area beyond what had been included in the study area. These locations were north of the significantly impacted intersections in the traffic study.

There was concerns expressed in public comments on the 2013 study about potential impacts to the north of the project, and the traffic study defined an existing plus-project and a future with-project impact at the Argyle/Franklin intersection. In the future period, the incremental impact was at 0.029 of the volume-to-capacity ratio when the maximum impact standard is 0.010 at the stated LOS value of F.

On the 2012 Draft EIR, Comment No. 03-6 was submitted by Caltrans, which requested that six freeway ramp/roadway intersections be added to the study area. The Argyle/Franklin/US-101 northbound ramp intersection was included in this request. Therefore, Caltrans had previous strong concerns about project traffic at ramp intersections, but these were excluded from the Hollywood Center Project Traffic Assessment, other than the queuing analysis conducted at some for the freeway corridor analysis. The project trip distribution in the 2012 Draft EIR Traffic Study included the following pattern to the north of the project:

- 10 percent outbound trip distribution north on Argyle Avenue from site, six percent to US-101 northbound ramp at Argyle/Franklin.
- 5 percent inbound trip distribution to Beachwood Drive exit connection and 4 percent westbound on Franklin Avenue. Both of these paths then combined as a 9 percent distribution to make left-turn movement southbound onto Argyle Avenue. An additional one percent is added from the area to the north of Franklin Avenue.

On Figure 7A of the 2020 traffic study, 20 percent of project trips are shown to generally travel north in the Cahuenga Boulevard corridor. An additional 5 percent of traffic is generally assigned to the Vine Street corridor, without any definition as to east-west corridors where traffic may be destined or originating. This is a reduction in distribution to the Vine Street and Franklin Avenue corridors without any justification for this change. Restoration of the previous trip generation pattern applied in the 2012 study could trigger significant impacts to the north of the project that are potentially avoided by this change in distribution.

The study area map illustrates the geographic holes that have been left in the analysis, in that three local roadway segments were analyzed to the north, but major intersections in between those location [*sic*] and the project site were omitted from the analysis. The three analyzed local roadway segments on Argyle Avenue, Vista del Mar Avenue, and Carmen Avenue, all to the north of Franklin Avenue, represent the north end of the study area. If the study area was defined based on where impacts could occur, the omission of major intersections in the Franklin Avenue corridor between the project site and these roadway segment analysis locations is an omission that should be rectified.

The use of the VMT metric in traffic studies in the City of Los Angeles to fulfill updated CEQA guidelines has created a hybrid approach to studies under LADOT review. This includes more focused local intersection and segment study areas for vehicle volumes and level of service, and a regional approach to larger area impacts analysis through VMT analysis. This approach should not truncate study areas so far that local routes to and from major regional travel routes such as the US-101 corridor along Franklin Avenue are excluded. Potential impacts in this corridor represent a local issue.

Response to Comment No. IND 8I-77

The comment discusses aspects of the trip distribution and analysis presented in the TA for the current Project contained in Appendix N-1 of the Draft EIR, while also referring to trip distribution and comments that were previously submitted for a different project and EIR; however, this an entirely new project with new environmental analysis. Furthermore, the comment repeatedly refers to the potential for significant transportation impacts based on exceeding level of service thresholds that are no longer applicable per State law and lead agency action.

The trip distribution pattern developed for the current Project is separate and independent from the previous project, which reflected a different project description, access scheme, and baseline setting. Furthermore, see Section 3 of the Project Description, page II-9 of the Draft EIR, which states “[t]his analysis contained in this EIR is for a new Project and does not rely on the environmental review prepared for the previous project, which was invalidated.” The development of the trip distribution for the current project was discussed in detail in the TA. This discussion describes the use of the City’s travel demand forecasting model (TDFM), characteristics of the street system, surrounding land uses and destinations, and review of other developments in the area. The development of this trip distribution is an independent process and should be evaluated for reasonableness and accuracy in the context of this Project, not in relation to past projects. The TA for the Project was prepared in accordance with LADOT’s TAG adopted in July 2019 and pursuant to a MOU with LADOT dated December 3, 2019, documenting its assumptions and technical methodologies. LADOT reviewed the TA and provided an approval letter of the TA on April 10, 2020, which is included as Appendix N-2 of this Draft EIR.

The comment suggests that additional intersections should have been analyzed along Franklin Avenue. An analysis of 68 intersections, including a number of intersections along Franklin Avenue, specifically: Highland Avenue/Franklin Avenue, Wilcox Avenue/Franklin Avenue, Cahuenga Boulevard /Franklin Avenue, Vine Street/Franklin Avenue/US-101 SB On-ramp, Argyle Avenue/Franklin Avenue/US-101 NB On-ramp, Gower Street/Franklin Avenue, Beachwood Drive/Franklin Avenue, and Bronson Avenue/Franklin Avenue, are provided in Appendix I of the TA in Appendix N-1. The Project applied the screening criteria discussed in Response to Comment No. IND 8I-76 based on current City guidelines and identified nine locations for analysis and contained in the main body of the report.

Comment No. IND 8I-78

Cumulative Project Impacts

Other projects in the area have added new daily and peak-hour vehicle volumes to the Argyle Avenue and Franklin Avenue corridors, due to their proximity to these roadways:

- Argyle House (1755 Argyle / 6220 West Yucca) – This project has two buildings. One is 32 stories in height, including 6,980 square feet of commercial/restaurant space, residential and hotel areas. 191 multi-family residential units, and 260 hotel rooms.
- Kimpton Everly Hotel (1800 Argyle) – A 225-room hotel.

Both of these projects were included in the cumulative/planned projects list in the traffic study and are currently operational, but their effects on the roadways to the north of Yucca Street where access is provided to and from the US-101 freeway is not considered in the Hollywood Center Project Traffic Assessment. Yucca Street is the northern limit of the project study area. An expansion of the study area to the north would disclose potential impacts in this area but currently this is not analyzed under current guidelines in the study.

Response to Comment No. IND 8I-78

The comment asserts that the Argyle House and Kimpton Everly Hotel related projects were not taken into consideration in the cumulative intersection analysis. The comment identifies the Argyle House Project as located in part at 6220 Yucca Street and includes additional uses proposed as part of the 6220 W. Yucca Project, which is a separate related project. However, the Project's Transportation Assessment traffic analysis did in fact account for all three of these related projects. As discussed on pages 65 through 73 in the TA (Appendix N-1), cumulative development volumes were developed using a comprehensive approach that accounted for 150 related development projects known at that time of the Project analysis. All three of the referenced projects discussed in the comment were included on this list, as the comment acknowledges. Regardless of whether the Argyle House or the Kimpton Everly Hotel related projects were operational at the time counts were taken, the traffic analysis fully accounted for these projects by listing them as related projects and assigning their traffic to the street network for the analysis of future volumes. Additionally, the Project traffic analysis applied a growth factor derived from the City's travel demand model. This is consistent with state of the practice and provides a conservative analysis by accounting for related projects (including those mentioned above within the 150 total related projects in the Cities of Los Angeles and West Hollywood), conducting the analysis with intersection counts that include those related projects that may have already been in operation, and also layering on a growth factor from the TDFM.

<https://planning.lacity.org/eir/HollywoodCenter/deir/Appendices/Apx%20A-4%20-%20NOP%20and%20Scoping%20Meeting%20Comments.pdf>

Pursuant to Pub. Res. Code Section 21186d(d)-(f), the City must make any comment "available to the public in a readily accessible electronic format."

The quoted requirement stems from the general requirement in Pub. Res. Code Sec. 21186(a) stating: "The lead agency for the project shall prepare the record of proceedings pursuant to this division **concurrently with** the administrative process." (Emph. added.)

While CEQA does not define what the "readily accessible electronic format" for the administrative record is, such definition is provided by Rule of Court Rule 3.1367(a), requiring that the administrative record be in PDF format (subdivision (2)) and "**capable of full text searching**" (subdivision 5). (Emph. added.)

Not all documents in the Project's running administrative record are "capable of full text searching" -- in violation of Rule 3.1367(a)(5),

Besides these violations of CEQA and the Court Rules, the City's failure to provide a fully compliant administrative record concurrently with the administrative process is a major impediment for us and for the public to be apprised of the full contents of the administrative record, including to fully participate in the administrative process in a meaningful, timely and more fully informed manner.

We request that the City immediately correct these violations to ensure that the Project's entire administrative record is concurrently prepared in a readily accessible electronic format "**capable of full text searching**".

Please confirm that you will do so, and that all documents previously uploaded that are not yet full text searchable are immediately made so, and that all documents going forward similarly conform. Thank you.

Response to Comment No. IND 8J-1

This comment asserts that the Draft EIR is not in compliance the Rules of Court and PRC, which require the administrative record to be "capable of full text searching."

However, as the commenter concedes, CEQA does not mandate the administrative record to be "capable of full text searching." Second, Rule of Court 3.1367(a) (now renumbered 3.2207) (Rule) specifies that (**emphasis added**), "The electronic version of the administrative record **lodged in the court** in a proceeding brought under [CEQA] must be . . . Capable of full text searching". From the plain language of the Rule, it follows that *when* the administrative record is lodged with the court, it must *then* be text-searchable, and conform with the other formatting requirements of the Rule. But that does not mean that the City is obligated to meet these formatting requirements before it lodges the record with the court, as it prepares that record concurrent with the administrative process. Indeed, Rule of Court 3.2206 (formerly Rule 3.1366) contemplates that the party preparing the administrative record for a CEQA challenge may lodge it with the court either in paper or electronic format—meaning that the text-searchable requirement of 3.2207(a) would not necessarily apply to all administrative records lodged in CEQA suits. As such, the commenter is incorrect that the City must make the Draft EIR "capable of full text searching".

As this comment contains no substantial evidence regarding the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 8K-1 [LATE COMMENT RECEIVED AFTER CLOSE OF PUBLIC REVIEW PERIOD ENDING JUNE 1, 2010.]

Please see attached. Please confirm receipt.

Response to Comment No. IND 8K-1

This comment letter indicates that there is an attachment to the comment letter but does not address the content or adequacy of the Draft EIR. Confirmation of receipt was provided by the Department of City Planning.

Comment No. IND 8K-2 [LATE COMMENT RECEIVED AFTER CLOSE OF PUBLIC REVIEW PERIOD ENDING JUNE 1, 2010.]

Dear Mr. Bertoni and Ms. Nguyen:

This firm represents StopTheMillenniumHollywood.com. The attached page is a supplement to Exhibit 42, page 2,400, of our June 1, 2020 comment letter. Please include this letter and the attachment in the administrative record for this matter. Thank you.

Response to Comment No. IND 8K-2

This comment letter indicates that the attached page supplements Exhibit 42 of Comment No. IND 8I. The attachment does not address the content or adequacy of the Draft EIR. The letter has been included in the administrative record.

Comment No. IND 8K-3 [LATE COMMENT RECEIVED AFTER CLOSE OF PUBLIC REVIEW PERIOD ENDING JUNE 1, 2010.]

Exhibit 1: Additional References Cited by the Wilson Geosciences Inc. comment letter.

Response to Comment No. IND 8K-3

The exhibit does not address the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 9

Thomas Watson
7582 Mulholland Drive
Los Angeles, CA 90046
Received April 18, 2020

Comment No. IND 9-1

Dear Ms. Nguyen,

I write as a homeowner of 20 years in the Hollywood Hills overlooking the proposed project. I strongly object to the scope and scale of it, most particularly the height. There is no basis to create a new downtown-like area in Hollywood. 45 stories?!!! That is not keeping with the neighborhood or the area. Moreover, it would cause enormous congestion and pollution issues. Please keep the project to existing, reasonable heights, which are necessary not to overshadow (literally) the Capital *[sic]* Records Building *[sic]* and other key landmarks.

Response to Comment No. IND 9-1

The comment expresses opposition to the Project based on its size and scale, congestion, and pollution issues. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, the size and scale of the Project were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies or regulations related to location, form and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Regarding congestion, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Regarding air pollution, air quality impacts related to sensitive receptors were addressed in Section IV.B, *Air Quality*, of the Draft EIR, with supporting data provided in Appendix E of the Draft EIR. As analyzed therein, construction and operational air quality impacts would be less than significant after mitigation. The prescribed mitigation which requires certain types of construction equipment and features to be utilized by the Project, would

ensure that Project construction activities do not expose sensitive receptors to substantial pollutant concentrations or result in violations to applicable daily air quality standards. During operation, mitigation to address standard emergency generator testing would also ensure that applicable daily air quality standards are not violated.

Regarding noise pollution, noise impacts were analyzed in Section IV.I, *Noise*, of the Draft EIR, with supporting information provided in the Construction Noise and Vibration Study and a Construction Traffic and Operational Noise Study, both included in Appendix K of the Draft EIR. The analysis in Section IV.I concluded that that Project's construction activities would result in significant and unavoidable noise and vibration impacts to nearby noise and vibration sensitive residential and commercial uses; however, it should be noted that these impacts would be temporary and that during Project operation, noise and vibration impacts would be less than significant. See also Topical Response No. 7 – Noise and Vibration, above.

Comment Letter No. IND 10

Charles A. Adelman
6146 Eleanor Avenue, #107
Los Angeles, CA 90038
Received April 21, 2020

Comment No. IND 10-1

In reviewing the DEIR for the Hollywood Center Project, I discovered the following error in chapter III-2: related projects: Project 37, 6050 Sunset Blvd, from the list of projects in table III-1 was omitted from the map (figure III-1). Project 38 (1717 Bronson) is shown as 37, project 39 as 38 and so on through to the end of the LA City project list. Oops! You might want to correct that. My formal comments will follow at a later date.

Response to Comment No. IND 10-1

The error on the Figure II-1 has been noted. In response, Figure III-1 of the Draft EIR has been revised. Please see Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR.

Comment Letter No. IND 11

Meghan

Received April 23, 2020

Comment No. IND 11-1

I received your letter. I'm sure none of the neighbors are excited about a construction site, but the more important issues will arise once construction is over.

Response to Comment No. IND 11-1

The comment expresses opposition to the Project. However, the comment does not raise any specific issues regarding the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 11-2

I am really hoping you will significantly limit the number of new parking spaces that are built to help reduce demand for car trips. It would be better if the developer incentivized public transit use since the neighborhood is one of the best served by transit in the county. Building a lot of parking will make traffic worse. I'm also concerned about the number of driveways. Already the neighborhood is hazardous for pedestrians and cyclists due to careless drivers coming in and out of the road. I think the standard clearance between street parking spaces and driveways is insufficient for visibility.

I love the bulb-out that was built at Yucca and Vine to protect pedestrians. I would like to see the developer fund more of those, and more permanent versions of them. The other city planning amenity that has been great recently is the turning off of the "beg buttons" due to the pandemic. It is very difficult in this neighborhood to get the light to change for pedestrians, causing people to frequently. *[sic]* have to dart across the street. I would love if pedestrians could be prioritized.

Response to Comment No. IND 11-2

The comment requests that the Project limit the number of new parking spaces to help reduce demand for cars. As noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the LAMC (i.e., 1,513 spaces), to adequately serve the Project. The Project is also providing bicycle parking compliant with the LAMC requirements.

There are currently 11 driveways serving uses on the Project Site, and the Project will consolidate that number to a total of five driveways, which would be located on Ivar Avenue, Yucca Street, and Argyle Avenue, while avoiding Vine Street. The Project is consistent with City Mobility Plan 2035 Policy PL.1 which requires driveway access to buildings from non-arterial streets or alleys (where feasible) in order to minimize interference with pedestrian access and vehicular movement.

Installation of improvements on the public right-of-way are under the purview of the City of Los Angeles. The Project has agreed to the following approval conditions that may be used to fund similar improvements:

- Financial contribution to the LADOT, to be used in the implementation of the Mobility Hub in the general area of the Project Site.
- Financial contribution to City's Bicycle Plan Trust Fund to implement bicycle improvements in the vicinity of the Project Site.
- Financial contribution towards Transportation System Management improvements within the Project area.
- Financial contribution to fund for constructing approved Neighborhood Traffic Management measures within the Project area.

In addition to the conditions of approval listed above, the Project has also developed and committed to a transportation demand management (TDM) program including the following measures to incentivize the use of transit:

- Providing a location on-site to purchase Metro passes and display bus info.
- Transit subsidies for residents and commercial employees.
- Parking for Metro users.
- Upgrades to immediately adjacent Metro bus stops.

Lastly, to facilitate pedestrian connectivity and comfort, the Project is proposing to provide a midblock signalized crosswalk on Argyle Avenue that would align with the existing midblock crosswalks on Vine Street and Ivar Avenue.

Comment No. IND 11-3

Finally, if the developer will have real estate facing Vine and Ivar, and traffic will be increased, I would love to see them fund protected bike lanes, similar to how the LGBT Center was compelled to allow space for bike lanes on Santa Monica.

Response to Comment No. IND 11-3

The City's Mobility Plan 2035 proposes Tier 1 protected bicycle lanes on Hollywood Boulevard and Tier 2 bicycle lanes on Vine Street (south of Yucca Street) and Yucca Street (west of Vine Street). Please see Response to Comment No. IND 11-2 regarding the funding and implementation of modifications to the public right-of-way.

Comment No. IND 11-4

Basically, I know more development is going to happen, so how can we use that to fund the needed street safety improvements the neighborhood desperately needs? How can we subsidize the transit we need? That is my primary concern as a neighbor.

Response to Comment No. IND 11-4

Please see Response to Comment No. IND 11-2 regarding the funding and implementation of modifications to the public right-of-way and of Project measures to incentivize transit.

Comment Letter No. IND 12

Cynthia Burns
Received April 24, 2020

Comment No. IND 12-1

I received this notice in my mailbox at 6201 Hollywood Blvd. I am inquiring about the new Hollywood Center Project.

Are these units finished? And if they are, when are they available for rental? I am interested in the senior units and the pricing.

Response to Comment No. IND 12-1

This comment inquires about the availability of units as part of the Project. The Hollywood Center Project is not yet approved by the City of Los Angeles. If approved, Project operation could occur as early as 2024, with the timing ultimately to be determined based on the final Project approval schedule and approved construction scenario. Pricing and availability of furnished units would become available at a time to be determined time in the future by the Project operator based on future market conditions and timing of development.

The comment does not raise any specific issues regarding the content and adequacy of the Draft EIR. As such, no further response is warranted.

See Response to Comment Nos. ORG 2A-2 through 2A-5.

Comment Letter No. IND 14

Shannon Woodward
Received April 26, 2020

Comment No. IND 14-1

I hope this email finds you well. I'm writing to request that the comment period for the Hollywood Center project be extended to 90 days after the stay at home *[sic]* order is lifted.

Many who would be deeply impacted are traumatized and unfocused at the moment. I believe rushing thru this process could be horribly detrimental to the community, and everyone in our community deserves a fair opportunity to be aware of this massive proposal.

Response to Comment No. IND 14-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 15

Dean Katz
6376 Quebec Drive
Los Angeles, CA 90068
Received April 27, 2020

Comment No. IND 15-1

A massive development project proposed for Hollywood does not have a large enough window of time for Public Response. Due to the “Safer at Home” order, I am unable to to *[sic]* participate in a proper forum of the impact this proposed development will have on me, and my community here in Hollywood.

The DEIR was released in the midst of April. It is a complex report that requires more time so we can respond in a cogent manner.

Response to Comment No. IND 15-1

The comment requests that the City extend the Project’s 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 15-2

It should be noted that this project will exceed the heights of all building in Hollywood, and it will forever change our community. This alone is certainly worth allowing more time for our community to discuss and have input on the project.

Please extend the public response time.

Response to Comment No. IND 15-2

The commenter asserts that more time is needed for public review of the Draft EIR because the Project would exceed the heights of all buildings in Hollywood, thereby changing the community. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, see Topical Response No. 1 – Public Participation and Review, above, for a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with this EIR, and regarding the City’s determination that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Additionally, the comment states that the Project being the highest in Hollywood will forever change the community. Aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

Please include in Public Comment

RE: Hollywood Center Project

Case Number: ENV-2018-2116-EIR

Response to Comment No. IND 16B-1

The comment was received and included as part of the record for the Project.

Comment No. IND 16B-2

Attachment: LA WATCHDOG--One of Mayor Eric Garcetti’s Back to Basic tenets was to “increase transparency and civic engagement.”

But this is not the case when it comes to the \$1 billion Millennium Hollywood, now rebranded as the Hollywood Center Project.

In 2013, the New York City developers, Millennium Partners, working with Councilmen Eric Garcetti, Jose Huizar, and Mitch Englander, “persuaded” the Herb Wesson led City Council to more than double the size of this megadevelopment, boosting Millennium’s profits by hundreds of millions of dollars.

The City Council approved the up zoning of this 1.2 million square foot project despite the vehement opposition of the surrounding Neighborhood Councils whose stakeholders were concerned about increased traffic congestion. The community also objected to the out-of-character twin towers (39 and 35 stories) that would exceed the existing height limits in Hollywood by over 200 feet. The City Council also ignored the fact that the development was on the active Hollywood Earthquake Fault and that Caltrans was concerned about the adverse impact on the Hollywood Freeway and its on and off ramps.

Of course, it helped that Millennium Partners spent over \$4 million on lobbyists, lawyers, campaign contributions, and contributions to other pet projects such as the controversial 44 acre Hollywood Central Park that will cover a portion of the Hollywood Freeway and promised almost \$20 million in community benefits.

However, in 2015, Superior Court Judge James Chalfant ruled that the Millennium’s Environmental Impact Report (“EIR”) was deficient, essentially blocking the project. The community won, or so it thought.

Response to Comment No. IND 16B-2

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project. Furthermore, the comment does not raise any specific issues regarding the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 16B-3

On April 15, 2020, the developers filed a new EIR. But how will opponents be able to comment on this 12,000-page opus when they are confined to their homes because of Garcetti’s Stay at Home order? As part of their effort to ramrod this deal through the planning process, Garcetti, his director of Planning, Vince Bertoni, and local czar, Councilman Mitch O’Farrell, have refused, despite numerous requests, to extend the 45 day comment period that ends on May 31.

Response to Comment No. IND 16B-3

See Response to Comment No. IND 16A-1. The comment expresses opposition to the Project. However, the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 16B-4

While the Millennium has reconfigured the project, not much has changed. The proposed 1.2 million square foot development is still on an active earthquake fault. The twin towers (46 and 35 stories) will dwarf all the other buildings in the area. Congestion will only be worse now that numerous luxury high rise developments have been erected in Hollywood. Caltrans will still have major objections. And Millennium will still reap hundreds of millions of dollars in additional profits.

Response to Comment No. IND 16B-4

The commenter expresses general opposition to the Project based on its location with respect to a fault line, size and scale, and congestion. While this comment does not present any evidence supporting the claims with respect to the content and adequacy of the Draft EIR, impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies or regulations related to location, form and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

The comment also states that Caltrans will have objections. However, the commenter does not specify what these objections are or provide any specific information to support this claim. It should be noted that the City did receive two letters from Caltrans with comments on the transportation analysis to be conducted for the Project. Although the analyses requested by Caltrans are not a required CEQA analysis per the City's TAG,

adopted in July 2019, the analyses were presented for informational purposes in Appendix I to the TA for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also, refer to Response to Comment No. ORG 2-7 which discusses a recent meeting on July 1, 2020 between the City Department of Planning and Caltrans. As discussed therein, Caltrans' concerns were non-CEQA concerns and Caltrans did not raise any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR. Finally, the comment does not raise any issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 16B-5

But what has changed is that there is an “ongoing federal criminal investigation into public corruption throughout the City of Los Angeles related to multiple suspected pay-to-play schemes.”

And City Hall is the epicenter of this criminal investigation by the FBI and the United States Attorney's Office. Former City Councilman Mitch Englander will plead guilty to obstructing justice. Justin Kim will plead guilty to a federal bribery charge that implicated Councilman Jose Huizar in this \$500,000 scheme. George Chiang will plead guilty to racketeering charges. George Esparza, a former Huizar aide, will also plead guilty to racketeering charges. And everybody is wondering who's next.

The Millennium has always had “scent of swindle” about it. And this stench is augmented by the unwillingness of O'Farrell and Garcetti to extend the deadline for comments to the EIR and Millennium's failure to disclose how it has greased the skids.

Angelenos are appalled that City Hall is a “criminal enterprise” and pay-to-play corruption is front page news. We are appalled that there will be additional indictments. We are appalled that City Hall places the interests of real estate developers ahead of those of ordinary Angelenos. We are appalled by the failure of Mayor Garcetti and the City Council to address pay-to-play corruption. And we are appalled that they approved a budget busting labor agreement that is now crippling the City.

Response to Comment No. IND 16B-5

The comment expresses opposition to the Project based on potential alleged illegal activities by public officials unrelated to the Millennium Hollywood Project. As discussed in Response to Comment No. IND 16B-2, the Millennium Hollywood Project is a different project that was previously proposed at the same Project Site, and for which planning

approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project. Accordingly, in so far as this comment relies on the alleged activities related to a different project, it does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 16B-6

We have two simple recommendations for Mayor Garcetti and the Nury Martinez led City Council that are consistent with his policy of transparency and civic engagement.

One, extend the public comment period for the EIR for 90 days after the Stay at Home order is lifted. That will allow the public and other governmental agencies to have an opportunity to comment intelligently on the 12,00-page EIR.

Response to Comment No. IND 16B-6

See Response to Comment No. IND 16A-1, which addresses the Draft EIR's public comment period.

Comment No. IND 16B-7

Two, the Planning and Land Use Management Committee should hold open and transparent hearings on this \$1 billion megaproject, its impact on Hollywood and the surrounding neighborhoods, and the developers' relationships with the City. Importantly, O'Farrell, who has benefitted from developer campaign contributions, should not have the final say.

Angelenos deserve an open and transparent government, not one where pay-to-play real estate deals are concocted behind closed doors.

<https://www.citywatchla.com/index.php/la-watchdog-hidden/19847-millenniumhollywood-poster-child-for-pay-to-play-corruption>

Response to Comment No. IND 16B-7

The comment requests that the Planning and Land Use Management Committee hold open and transparent hearings for the Project. By law, public hearings are held in accordance with the Brown Act, which guarantees the public's right to attend and participate in the meetings of local legislative bodies. Furthermore, the comment does not raise any specific issues regarding the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 17

Jeff Straebler
Received April 27, 2020

Comment No. IND 17-1

Mindy,

I hope you are well. I was concerned to learn that the City has provided the minimum allowed comment period for the Hollywood Center Project (ENV-2018-2116-EIR) during the current COVID-19 pandemic. This virus has resulted in emergency declarations and “Safer At Home” orders that prohibit our community from gathering for neighborhood meetings and organizing discussions and in-person review of the documents.

The proposed project is of great concern and I think many Hollywood-area residents would want to understand and comment on the full impact on our community, especially as it regards to public safety, traffic and other long-term effects.

I ask that the City grant an extension of the public comment period to the DEIR of at least 90 days AFTER the lifting of local and state “Safer At Home”-type orders. This seems the reasonable and fair way to proceed given the extraordinary circumstances under which we are all operating.

Response to Comment No. IND 17-1

The comment requests that the City extend the Project’s 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment also expresses concerns regarding public safety and traffic. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, fire and police services impacts were addressed, respectively, in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, with supporting data provided in Appendix M of the Draft EIR. Pursuant to the CEQA Guidelines, and the thresholds used by the City to determine the significance of impacts to fire and police services, the focus of the analyses is on whether or not new or expanded facilities are needed to maintain adequate public service and whether a potential physical impact could occur if construction of facilities was warranted. In the case of the Project, it was determined that the Project would not generate a demand for additional police and fire protection services that would result in the need for new or expanded fire and police services facilities. As such, Section IV.K.1 and IV.K.2 concluded that impacts to fire and police services, respectively, would be less than significant. Notably, regarding public safety, as provided in Project Design Feature POL-PDF-2, the Project would incorporate

a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout the parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding signage and lighting for walkways and entries. This is in contrast to existing conditions in the area, which include surface parking lots and long alleys between blocks, where buildings are partially cut off from the street. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for LAPD services. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a seven day a week security patrol and could assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services. Implementation of Project Design Feature POL-PDF-2 would help to offset the Project's operational demand for police protection services from LAPD.

Similarly, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Comment Letter No. IND 18

Michele Keeler

Received April 27, 2020

Comment No. IND 18-1

Hello – I live in the hills above this planned mega space intrusion. I am devastated over it. We can barely get home from *[sic]* the grocery store and forget about going anywhere from 3 on. I don't think our neighborhood can handle this kind of impact and I don't think an earthquake would do well well *[sic]* as it sits over a fault line. I have been following this for a long while when it was the other name and I thought without a doubt it was not approved so why now? money? something like this belongs downtown or century city not our neighborhood. I would also ask that we move the date to come and express our concerns as the covid19 has impacted everything and its *[sic]* really not a fair time to have people get in their cars to come voice a fair opinion.

I would like to be kept informed on that.

Response to Comment No. IND 18-1

This comment expresses general concerns regarding traffic and development near a fault. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

The comment makes reference to a previous project proposed for the Project Site, the Millennium Hollywood Project, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Finally, the comment references COVID-19 and public participation. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 19

Neal Roscoe

Received April 27, 2020

Comment No. IND 19-1

Re: Case Number: ENV-2018-2116-EIR – I suggest Alternative 2 with modifications

I'm not opposed to development in Hollywood, and I also applaud the developer of Hollywood Center for reducing offices, however, the project scale and massing is still too large. I urge you to not approve and instead encourage the developer to deliver Alternative 2 with the affordable housing and add some guarantees to keep small, non-chain businesses in the complex.

You owe it to the City to strike a reasonable balance – “downtown” Hollywood should be unique and not another Grove or Orange County development.

Response to Comment No. IND 19-1

The comment expresses opposition to the Project based on its size and scale. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies or regulations related to location, form and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

This comment also expresses support for Alternative 2, Development under Existing Zoning Alternative, with some guarantees to keep small, non-chain businesses in the complex, but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 20

Michael Andreas & Julie Fleischer
6740 Whitley Terrace
Hollywood, CA 90068
Received April 27, 2020

Comment No. IND 20-1

The fact that the Hollywood Center Development (aka Millennium Project) builders are using the Covid-19 provisions to try and ram through approval for their twin monstrosities is repugnant on its face but, totally not unexpected.

Millennium Partners has been trying to ram this project down our throats from the start and in spite of all local neighborhoods' almost universal objection to the scope and size of this project, they have kept coming back with new plans that do little to address our problems with it.

Response to Comment No. IND 20-1

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Also, the comment asserts that the Project is using COVID-19 to approve the Project, but does not present any evidence supporting the assertion. A public review period of 47 days, began on April 16, 2020 and ended on June 1, 2020, which provided a review period that met requirements pursuant to CEQA Guidelines Section 15105(a). The public circulation period for the Draft EIR complied with minimum the 45 days required by CEQA Guidelines Section 15105(a) for Draft EIRs submitted to the State Clearinghouse for public review by State agencies. For additional details regarding the City's compliance with the CEQA Guidelines for the public review period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 20-2

The abbreviated comment period on their EIR just makes things worse. An EIR which does a masterful job of obfuscating the fact that their buildings are to sit on an active fault line and fails to mention the State's own traffic reports that highlight the long term detrimental effect these buildings will have on our freeway off ramps and the physical danger this will create.

Response to Comment No. IND 20-2

The comment provides a general statement that the length of the comment period exacerbates the public's review of the Draft EIR. As mentioned in Response to Comment No. IND 20-1, see Topical Response No. 1 – Public Participation and Review, for a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with this EIR.

The comment further states that the Draft EIR does not clearly state that the Project would be located on an active fault line. Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

This comment also states that the Draft EIR fails to mention the State's own traffic reports that highlight the long term detrimental effect these buildings will have on our freeway off ramps and the physical danger this will create. However, the commenter does not provide any specific detail regarding the detrimental effects or physical danger, a reference to the specific State traffic reports being referred to or any substantial evidence to support this claim. It should be noted that the City did receive two letters from Caltrans with comments on the transportation analysis to be conducted for the Project. Although the analyses requested by Caltrans are not a required CEQA analysis per the City's Transportation Assessment Guidelines (TAG), adopted in July 2019, the analyses were presented for informational purposes in Appendix I to the Transportation Assessment (TA) for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also, refer to Response to Comment No. ORG 2-7 which discusses a recent meeting on July 1, 2020 between the City Department of Planning and Caltrans. As discussed therein, Caltrans' concerns were non-CEQA concerns and Caltrans did not raise any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR. Finally, the comment does not raise any issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 20-3

Please let this letter serve as a statement against the project and their very biased EIR.

Response to Comment No. IND 20-3

The comment expresses general opposition to the Project and indicates the EIR is biased. The Draft EIR was prepared in accordance with California Public Resources Code (PRC) Section 21082.1, which requires the City of Los Angeles, as the Lead Agency, to independently review the Draft EIR and supporting technical documentation. The City has determined the level of significance of environmental impacts in the Draft EIR based on its impartial judgement of the Draft EIR analyses. Further, as the comment does not provide any facts and, therefore, no substantial evidence, to demonstrate otherwise, no further response is warranted.

Comment No. IND 20-4

At the very minimum, the public comment period on the Draft Environmental Impact Report should be extended to a minimum of 90 days AFTER the city and state “Stay At Home” order has been lifted.

Response to Comment No. IND 20-4

As mentioned in Response to Comment No. IND 20-1, the City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s NOC/NOA, dated April 16, 2020. For further details, see Topical Response No. 1 – Public Participation, above, for a discussion of the City’s determination not to extend the Draft EIR comment period.

Comment No. IND 20-5

Let’s develop Hollywood yes but, let’s do it in a way that reflects the lifestyle associated with its name and with an awareness of the unique and valuable icon our city is to the rest of the world. We aren’t Manhattan, we aren’t Chicago or even downtown L.A., we are Hollywood... don’t kill the unique quality of our mini-city with this horrible project.

Response to Comment No. IND 20-5

This comment expresses the commenter’s general opinion of how development in Hollywood should occur, presumably in support of a smaller scale project. However, the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 21

Lori Hughes

Received April 27, 2020

Comment No. IND 21-1

As there are no real and constructive changes to the plans that might avoid all previous objections I still think this is a destructive addition to the area. Ignoring all Hollywood history and creating an ugly, useless and expensive anthill adds nothing but problems for the area. The massive “dwellings” are beyond the budgets of most who live here and those who could afford it will find it ugly and inconvenient.

It’s a no on every level! Hideous to look at, useful only to the investors and construction group, costly to the city and Hollywood stakeholders, destructive to the environment and designed to attract more and more homeless to the area. The increase in traffic problems, alone should be a disqualifier for this project!

No. No. No.

Response to Comment No. IND 21-1

The comment expresses general opposition to and opinions regarding the Project’s massing and traffic. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above. Additionally, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

The comment also expresses concern about the potential for the Project to cause homeless people to move into nearby residential areas without any specific facts or substantial evidence to support this claim. Homeless-related concerns in relation to the Project are speculative; furthermore, as stated in the CEQA Guidelines Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. As such, this topic was not evaluated in the Draft EIR, and no further response is warranted.

Comment Letter No. IND 22

Jim and Ann Geoghan (Annie Gagen)
Received April 28, 2020 (IND 22A)
Received May 11, 2020 (IND 22B)

Comment No. IND 22A-1

We are contacting you to request an extension for comments on The Hollywood Center project.

The minimum allowed comment period provided is not nearly enough time since we are obeying 'Safer at Home' orders...

We are unable to gather or have meetings with our neighbors....

Our Neighborhood Councils are not meeting.....

Viewing documents IN PERSON is not possible now...

Many of us have children at home and are home schooling them.....

Some sadly have loved ones who have come down with the virus....some recovering at home...

We are doing all we can to protect our families and neighbors from this horrible coronavirus....

Our lives have been upended and nothing is as it was right now.....

Due to all that we are having to do, to get through this crisis...

We request more time to submit public comments.

The DEIR is lengthy and complicated and we are obviously unable to give it the full attention it needs right now.

In all fairness to our communities, that will be so greatly impacted by this project, a comment extension of at least 90 days AFTER the "Safer at Home' [sic] local and state orders have been lifted would be reasonable.

We urge you to please grant this extension to our communities.

Stay safe and be well.

Response to Comment No. IND 22A-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above. Furthermore, Neighborhood Councils are not required to meet in person in order to confer, nor is it a CEQA or City requirement that Neighborhood Councils have to meet in person in order to provide comments. In fact, on May 28, 2020, during the 47-day public review period, the Hollywood United Neighborhood Council met, discussed the Project, and voted to submit a comment letter to the City. During this publicly noticed Special Joint Board and Planning Land Use and Management (PLUM) Committee meeting, the Applicant's team made a public presentation and community members were provided an opportunity to, and did provide comments to the Neighborhood Council.

Comment No. IND 22B-1

I am asking for a Period Extension for the Millennium project also known as the "Hollywood Center Project."

Response to Comment No. IND 22B-1

See Response to Comment No. IND 22A-1 regarding the requested extension.

The comment also makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment Letter No. IND 23

Amy Bessone
Received April 29, 2020

Comment No. IND 23-1

I am writing to ask the LA Department of City Planning to extend the public comment period for the proposed Millennium Group Hollywood Center Development, specifically that the public comment period on the Draft Environmental Impact Report be extended to a minimum of 90 days **after** the city and state "Stay-At-Home" order has been lifted.

Response to Comment No. IND 23-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 24

Jennifer, Rudy and Parker van Zyl
6426 La Punta Drive
Los Angeles, CA 90068
Received April 30, 2020

Comment No. IND 24-1

Our family lives in the Hollywood Dell neighborhood, a short distance away from the proposed Hollywood Center Project. We are dismayed to hear that the City has approved the minimum allowed comment period during this time of quarantine because it prevents our community from meeting and discussing the options.

As surely you and the other City officials know, the proposed project is of GREAT CONCERN to our community and residents...there is much to consider from infrastructure to traffic to safety. Our area is already burdened with heavy freeway activity (which hasn't been upgraded in the 22 years we've lived in the area) and tourism and Hollywood Bowl/Ford traffic and this project must include improvements to our infrastructure and quality of life.

Therefore, we ask that the City grant an extension of the public comment period to the DEIR for at least 90 days AFTER the lifting of local and state "Safer At Home" orders. This seems the reasonable and fair way to proceed given the extraordinary circumstances we are all operating under.

Response to Comment No. IND 24-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above. Further, there is no requirement under CEQA that in person meetings occur in order to provide comments.

While the commenter expresses that the Project is of great concern to the community due to infrastructure, traffic, and safety, this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, in regard to utilities, the Project's impacts on wastewater and water supply were fully analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, of the Draft EIR. Supporting technical infrastructure information is included in Appendix P-1 of the Draft EIR. A City approved Water Supply Assessment (WSA) for the Project is included in Appendix P-2 of the Draft EIR. As discussed therein, the Project would result in less-than-significant utility and water supply impacts. Construction of the Project would include all necessary water and sewer pipe improvements and connections to adequately connect to the City's existing infrastructure system. Furthermore, the water and

wastewater infrastructure analysis in the Draft EIR concluded that the infrastructure serving the Project Site has adequate capacity to serve the Project. In addition, system-wide infrastructure improvements throughout the greater Hollywood area and the City are regularly assessed by the City's Department of Public Works and other departments, as applicable, through capital improvement programs.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Also, the City did receive two letters from Caltrans with comments on the transportation analysis to be conducted for the Project. Although the analyses requested by Caltrans are not a required CEQA analysis per the City's Transportation Assessment Guidelines (TAG), adopted in July 2019, the analyses were presented for informational purposes in Appendix I to the TA for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Refer to Response to Comment No. ORG 2-7 which discusses a recent meeting on July 1, 2020 between the City Department of Planning and Caltrans. As discussed therein, Caltrans' concerns were non-CEQA concerns and Caltrans did not raise any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

Finally, regarding safety, as provided in Project Design Feature POL-PDF-2, the Project would incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding signage and lighting for walkways and entries. This is in contrast to existing conditions in the area, which include surface parking lots and long alleys between blocks, where buildings are partially cut off from the street. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a seven day a week security patrol and could assist in safety services and potentially increase patrols.

Please find attached my letter in support of the proposed Hollywood Center Project.

I will also send a copy via email.

Response to Comment No. IND 25A-1

This comment letter indicates that there is an attached letter to the email. A response to that letter is provided in Response to Comment No. IND 25A-2.

Comment No. IND 25A-2

Greetings. Thank you for this opportunity to participate in the public comment period for the proposed Hollywood Center Project. This is a long-awaited addition to the Hollywood community, and I want to offer my enthusiastic support for proceeding with the project as planned.

My reasons for this enthusiastic support are even more pragmatic as we live through the collective suffering and uncertainty of a global pandemic. **Now more than ever, projects that represent hope for the future, investment in our city, and jobs for our community are critical and to be welcomed.**

Those who might resort to pre-pandemic tactics to stymie, slow or sue to stop the forward progress of this project are living in the past. It is time to plan for the future in a city that *will be forever changed* by the human and economic dislocation that is emerging all around us. We are not going to wake up one day and find that this “is over.” This is our new normal and Los Angeles needs this investment.

For some perspective: I arrived in Hollywood in 1996 when a small group of property owners decided to take the risk and invest their time, talent and treasure to jumpstart the Hollywood renaissance. I served as the executive director of the business improvement district (BID) for 22 years and lived through every day of the slow progress forward to revitalize this neighborhood. People who take this story for granted did not do the hard work to bring Hollywood this far.

Back in those days, the neighborhood was on life support, having experienced the triple whammy of the '92 civil unrest, the '94 Northridge earthquake and the mid-90's tunneling under Hollywood Blvd to build out the METRO Red Line. I learned to celebrate every risk taken by a property or business owner to invest in the betterment of the community.

Whether it be a coffee shop, a façade improvement or the construction of the W Hotel; slowly but surely, the community began to come back to life. And even with setbacks – such as 9/11 and the financial collapse of 2008 – the intrepid community members who believed in this community soldiered on.

The fact that this developer – who has been working for over 10 years to bring a project to this community and transform parking lots into housing, commercial, retail, and civic open space that the community desperately needs – is still willing to hang with Hollywood in the face of the current world-wide crisis is noteworthy. The project provides over 1,000 housing units in a city that suffers from a housing shortage, 133 of which are for low and very low-income senior households. This is significant given that homelessness among seniors is the fastest growing cohort according to the Los Angeles Homeless Services Authority. MP sets a good example for others by setting aside a portion of their project for this population.

Additionally, the DEIR shows that the project has taken into consideration and mitigated environmental concerns, such as the developer's commitment to be carbon net-neutral during construction and operation, incentivizing public transportation use and building on the city's growing transit infrastructure, and including a new geotechnical investigation which only adds to the multiple other studies conducted in the immediate area, where *other proposed projects have already been completed and built.*

This country is reeling under the weight of dislocation unlike we've experienced in our lifetime. I write this one month before the comment period ends for the DEIR, but already we are seeing the signs of a protracted economic recession. The first quarter GDP dropped by 4.8%, the largest drop since the Great Recession. According to a forecast issued by the LA County Economic Development Corporation, the unemployment rate in L.A. County could **exceed more than 30 percent within the month.**

Los Angeles needs Hollywood Center. From their website:

Construction of the project will create approximately 7,560 full-time and part-time jobs throughout the City of Los Angeles economy, of which 4,670 will be construction jobs located on the project site. Annual operation of the project will support another 1,230 full-time and part-time jobs. In addition, the project is estimated to generate more than \$9.2 million in one-time revenues to the City of Los Angeles General Fund during project construction, and over \$226 million in net new General Fund revenue through 2050, after accounting for the cost of City services delivered to the project site and City property tax revenue currently generated from the project site.

For the City of Los Angeles to delay or deny this project, after nearly a dozen years of effort, multiple redesigns, and countless dollars spent on litigation, environmental and seismic studies would send a chilling message to future investors. That is the old Los Angeles. Let's work together to rebuild this city and make it better. Hollywood Center is a project around which we can unit and be proud.

Response to Comment No. IND 25A-2

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 25B-1

Greetings, I am submitting an addendum to my original support letter (sent April 30) which was submitted more than a month ago at the beginning of the comment period for the DEIR. Much has changed in the world and in community in this short time, and the events underscore the need to ask the city to support initiatives that move us into a better future, and not keep us mired in a 20th century “preserve and protect” mindset.

I perused over 100 of the letters submitted during this comment period. I was struck by two dichotomies: there are those that are anchored in the past (protect “old Hollywood”) and those that look to the future in Los Angeles. The future is represented by a diverse coalition of voices supporting Hollywood Center – members of the faith community, business owners, labor, entertainment venues, residents young and old, senior services, nonprofits associated with climate change, housing production and homeless services. That these individuals and organizations took the time to connect with this project and evaluate its attributes speaks to the collaboration we seek in Hollywood to build a better future.

Conversely, dozens of letters were submitted seeking a delay in the comment period owing to coronavirus. It is hard to imagine that these voices, after their requested delay, would move into the column of those who support a 21st century vision for Hollywood. Essentially their request for delay is equated with their voice to oppose. The diversity of opinion is valued in the public comment process, and after reading so many letters, I felt prompted to present this question: Why is it particularly compelling, at this stage in the history of Los Angeles, that the city proceed with the approval of Hollywood Center?

- **Senior housing is at stake.** The developers took the risk to include 133 units of affordable senior housing in their project. This sets a new standard for developers of privately financed projects in Los Angeles – to identify and meet community needs. If the city rejects Hollywood Center, the city sends a message that senior or affordable housing is not valued as part of a conventional project.
- **It’s time to set aside the myth that “Old Hollywood” will return.** Relying on antiquated land use and zoning policies (preserving “Old Hollywood”) is not going to equip Hollywood to contribute as an economic engine for Los Angeles in the future. Hollywood’s community plan has not been updated since 1988 – pre-internet as we know it. *Several of those mobilized to delay the forward progress on this DEIR have been behind holding back the forward progress on the Hollywood Community Plan.* The lawsuit filed against the city, which resulted in the

tossing of the 2012 version of the Hollywood Community Plan was filed, in part by the very same attorney who is active with those who oppose this project. Several letters were submitted by this attorney during the comment period. He is notorious for aligning with parties who seek to stop or delay project after project in Hollywood; this is his business model.

- **Imagining our 21st century city.** Those who wrote letters to delay the comment period or to oppose are those who already have what they want or need in this city – be it a home, some real estate or a view. The voices of those who will come and make a place in this community in the future are not heard. It is important that we imagine a more collective way forward as we build out a community to benefit a whole new group of neighbors. Again, we are already 20 years into the 21st century and it is time to plan for the next generation. Los Angeles can only “grow up” if it is going to accommodate the population growth that is inevitable.
- **Job creation and economic stimulus.** Finally, the prospect that the city would deny or delay a project that represents an investment in a community that is reeling from the dislocations associated with this pandemic is worrisome. This investment will bring jobs (both construction and permanent), housing, civic space, tax revenue. Against this background of investment, we face the sobering reality of the following:
 - According to an estimate released April 22 by the L.A. County Economic Development Corporation, the unemployment rate could reach 32% in May and the projected loss of payroll jobs could exceed 1.2M owing to the business shutdown related to Covid.
 - L.A. County may experience a \$2B drop in sales tax revenue between now and end of FY 2021. This will have a particular impact on county safety net programs and the Measure H funding source that impacts homelessness initiatives. This is in the face of what is anticipated to be an uptick in homelessness due to job and housing dislocation.
 - According to the city controller, who announced his estimates in April, the city budget could experience a shortfall of between \$194 to \$598M in fiscal year 20-21, depending upon the length of this pandemic impact.

Thank you for adding this letter to the public record. As a final note, those who said that the response period should be delayed due to the coronavirus are suggesting that civic affairs should come to a halt for the foreseeable future. The situation we are living through together as a society is not going to magically end in 30 to 60 days. We are learning as a people to adapt to this new global reality – public meetings (including even the U.S. Supreme Court) are adapting to these circumstances and technology allows for involvement, access to documents and the continuation of civic engagement.

Response to Comment No. IND 25B -1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 26

Anastasia Mann

Received April 30, 2020

Comment No. IND 26-1

I am president of the HHWNC and a lifelong resident of Hollywood. HHWNC is the largest and one of the first NCs formed within the City of Los Angeles. Due to current circumstances, I am now writing to you as an individual.

Our Eastern border is the Western border of HUNC and we are a mere few blocks away from the Vine Street project now designated as Hollywood Center, formerly the Millennium project.

As a reminder, due to COVID-19, our NC and others have not been able to meet to discuss what's shamefully happening now to expedite this "re-classified" project through the system without the opportunity for impacted communities to discuss in open public meetings. Our last Board meeting was February 19th.

We have @ 220,000 stakeholders within HHWNC's borders many of whom – if not all – will feel the impact, let alone the inevitable fear associated with this project, both during its construction and ultimate sheer existence.

Response to Comment No. IND 26-1

This is an introductory comment and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. Neighborhood Councils are not required to meet in person in order to confer, nor is it a CEQA or City requirement that Neighborhood Councils have to meet in person in order to provide comments. In fact, on May 28, 2020, during the 47-day public review period, the Hollywood United Neighborhood Council met, discussed the Project, and voted to submit a comment letter to the City. During this publicly noticed Special Joint Board and PLUM Committee meeting, the Applicant's team made a public presentation and community members were provided an opportunity to, and did provide comments to the Neighborhood Council.

Comment No. IND 26-2

There have been countless amounts of proof from credible sources including the State of California on the dangers and threats to the safety of residents, workers, commuters, etc. inherent with this development that will continue forever including the potential loss of life and property from "the Big One" which is now considered EMINENT, not just probable, due to its incredible proximity to our serious earthquake faults.

Response to Comment No. IND 26-2

The comment states that there is proof that the Project would result in potential loss of life and property due to the proximity to earthquake faults, but does not provide any

specific facts and, therefore, no substantial evidence, to support this claim. Nonetheless, geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 26-3

CalTrans has shared objections based in its proximity to the 101 freeway, safety, air quality plus other issues.

And more.

Response to Comment No. IND 26-3

This comment states that Caltrans has objections based on proximity to the 101 freeway, safety, air quality and other issues. However, the commenter does not specify what these objections are and no specific information has been provided. Further, the comment does raise any issues with respect to the content or adequacy of the Draft EIR. However, it should be noted that the City did receive two letters from Caltrans with comments on the transportation analysis to be conducted for the Project. Although the analyses requested by Caltrans are not a required CEQA analysis per the City's Transportation Assessment Guidelines (TAG), adopted in July 2019, the analyses were presented for informational purposes in Appendix I to the Transportation Assessment (TA) for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Finally, the comment does not raise any issues with respect to the content or adequacy of the Draft EIR. Also, refer to Response to Comment No. ORG 2-7 which discusses a recent meeting on July 1, 2020 between the City Department of Planning and Caltrans. As discussed therein, Caltrans' concerns were non-CEQA concerns and Caltrans did not raise any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR. As such, no further response is warranted.

Comment No. IND 26-4

How can the City Planners and Council Members ignore these warnings while denying our stakeholders their local forum?

You have referenced the online accessibility of the DEIR, etc. Do you seriously believe that every day during the last three + months Angelenos have been glued to their computers in order to search for and study this EIR?

We are in the midst of an international pandemic. People are engulfed in saving their businesses, their jobs, their homes, their families, their children's educations, their health, etc. These are scary times.

Response to Comment No. IND 26-4

The comment asserts that the City has denied stakeholders a forum for discussing the Draft EIR and that online accessibility of the Draft EIR is not adequate for public review. However, as there is no requirement under CEQA that in person meetings (i.e., the stakeholders' local forum) occur in order to provide comments. As the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted. For details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 26-5

A project of this size and long-term controversy should not be smuggled through the process...particularly at a time when the citizens of LA are reading daily of bribery and graft going on at City Hall and within our City Council. There is little trust factor currently re our "Planning" process and implied shenanigans re development deals happening within City Hall – particularly as this is a High End project. This project is not fixing or assisting low income apartments – and let's not use the term "affordable" as we know that's a devious misnomer. Affordable compared to what? We have been called "NIMBYs" because we have been a forum for those citizens – our stakeholders – who've been victimized by evictions and the consequences of new "projects" with rents out of reach for average Angelenos. Projects that were promised as "affordable" that were converted to Hotels. And on and on.

Response to Comment No. IND 26-5

The comment expresses general concerns about the Planning process, bribes at City Hall, and development deals happening within City Hall. However, the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

With regard to affordable units, the Project includes 133 senior affordable units. Note that the Project Applicant has revised the Zone and Height District Change request to a Density Bonus Compliance Review pursuant to California Government Code Section 65915 and LAMC Section 12.22 A.25. By setting aside a minimum of 11 percent for Very Low Income households, the Project is eligible for a 35 percent density bonus and, therefore, a 35 percent increase in FAR. Both the State Density Bonus Law and the City's Density Bonus Ordinance permit the Waivers of Development Standards to the extent the

Waivers are necessary to allow for the development of affordable housing. As such, the Zone Change from C4 to C2 is no longer being pursued. See Topical Response No. 5 – Land Use and Planning, above, which discusses the revision in the proposed entitlements and the function of the Density Bonus Compliance Review in detail. Maximum allowed rent level schedules are determined by Los Angeles Housing and Community Investment Department (HCIDLA) based on Rent-Income Schedules which take into consideration area median income, land use, family size, and type of project. Further, recordation of a Master Covenant and Agreement would be required, committing the Project to the subject affordability levels for 55 years.

Comment No. IND 26-6

At the very least allow publicly noticed NC meetings that will be given respect and taken seriously – not by ZOOM – but once this pandemic has passed the critical point so people can come together to be properly informed. Show this City can be fair.

Show compassion for the people of the Hollywood community who will be the most impacted by this project. And please – ask the FBI – while they are in town – to look into the deep layers of whose money is all behind this. There are unanswered questions within layers of corporations.

Hopefully you will take these comments to heart. Thank you for your valuable time.

Response to Comment No. IND 26-6

The comment expresses concern for the lack of in person meetings of the Neighborhood Council but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted. Nonetheless, refer to Response to Comment Nos. IND 26-7 regarding in-person meetings.

Comment No. IND 26-7

PS: I am Writing as an individual with a reminder that HHWNC came out forcibly against this project in the past, but has been unable to meet since February-all our previous CIS's are on file.

Response to Comment No. IND 26-7

The comment makes reference to the Millennium Hollywood Project, and the Neighborhood Council's previous opposition to that project, which is a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project. The comment does not raise any specific issues regarding the content and adequacy of the

Draft EIR. Furthermore, Neighborhood Councils are not required to meet in person in order to confer or provide comments. As such, no further response is warranted.

Comment Letter No. IND 27

Miranda Richards
Received April 30, 2020

Comment No. IND 27-1

Dearest Mindy Nguyen,

I am asking that the public comment timeline on the Hollywood Center Development be extended to ninety days after the Safer at Home ordinance is lifted. It is a direct conflict of interest to schedule public comments from April 16-May 31st, while public is ordered to remain home.

Response to Comment No. IND 27-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 27-2

The Hollywood Center Development has been a huge point of contention without proper earthquake, safety, and transportation studies. Another project that the same developer spearheaded in San Francisco, is facing a \$100 million dollar retrofit due to a sinking foundation. For two buildings that will be nearly fifty stories high, we need to be extremely cautious about developing on sites with slope and grade, which this project proposes, in an earthquake-prone area. I am not opposed to development in Hollywood, but please be cautious of special interest developers who do not have the best interest or safety of the community at heart.

Response to Comment No. IND 27-2

The comment expresses general concerns about earthquake hazards, seismic safety, transportation, and an unrelated project in San Francisco, but does not raise any issues with respect to the content and adequacy of the Draft EIR.

Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Finally, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 27-3

This comment is a duplicate of Comment Nos. 27-1 and 27-2 that was originally sent to Vince Bertoni, the Director of City Planning. However, there is an additional sentence at the end of the letter saying, “Our skyline may be forever changed.”

Response to Comment No. IND 27-3

Refer to Response to Comment Nos. 27-1 and 27-2. The added opinion that the skyline may be forever changed does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 28

Leslie Hendry and Steve Lawrence
Received May 1, 2020

Comment No. IND 28-1

I'm am *[sic]* writing to ask that you extend comment on the EIR in relation to the the *[sic]* Millennium planned development in Hollywood that would greatly impact our neighborhood. We ask that the Draft EIR be extended to a minimum of 90 days after the city and state "Stay at Home" order has been lifted.

Please extend the comment period.

Response to Comment No. IND 28-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 29

Ellen Vinitsky
6359 Primrose Avenue
Los Angeles, CA 90068
Received May 1, 2020

Comment No. IND 29-1

My name is Ellen Vinitsky. I live at 6359 Primrose Avenue, Los Angeles 90068.

I have lived on Primrose Avenue in the Hollywood Dell for over twenty years; I have lived in Los Angeles, on the side of the hill since the 1981, which includes Downtown through the 80s, MacArthur Park when Otis Parsons was still there, Los Feliz when you could actually park and drive, and finally in 1999 the Hollywood Dell.

Since my transplant to the Dell and the first seven / eight years here, traffic has worsened (Paris and Rome have better traffic now), it has gotten hotter with the wonderful afternoon wind ceasing because of taller and taller buildings acting as wind blocks, the streets have gotten more congested, there are more homeless wondering the streets, the streets are dirtier, there are cars stored on my and other adjoining streets constantly, there is little parking, it is impossible to get through Hollywood in less the *[sic]* twenty minutes during rush hour so I am compelled to I *[sic]* go to the Valley or farther east for all of my shopping, dining, entertainment, etc. My taxes have increased with services being diminished, the air is fouler because of fewer plants and trees and more of us, etc.

Response to Comment No. IND 29-1

This comment expresses general concerns regarding traffic, the homeless population in Hollywood observed by the commenter over the past 20+ years, and air quality. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

While the comment regarding the homeless population includes observations witnessed by the commenter, homeless-related concerns in relation to the Project are speculative; furthermore, as stated in the CEQA Guidelines Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. As such, this topic was not evaluated in the Draft EIR.

In addition, air quality impacts related to sensitive receptors were addressed in Section IV.B, *Air Quality*, of the Draft EIR, with supporting data provided in Appendix E of the Draft EIR. As analyzed therein, construction and operational air quality impacts would be less

than significant after mitigation, where applicable. The prescribed mitigation which requires certain types of construction equipment and features to be utilized by the Project, would ensure that Project construction activities do not expose sensitive receptors to substantial pollutant concentrations or result in violations to applicable daily air quality standards. During operation, mitigation to address standard emergency generator testing would also ensure that applicable daily air quality standards are not violated. Also, Section IV.B of the Draft EIR analyzed the Project's potential for odor impacts during construction and operation. As analyzed therein, through mandatory compliance with South Coast Air Quality Management District (SCAQMD) rules, no construction activities or materials are expected to result in other emissions, such as those leading to objectionable odors, affecting a substantial number of people. Also, the Project does not include any uses identified by the SCAQMD as being associated with substantial odors. As a result, the Project is not expected to result in odors or discharge contaminants into the air in quantities that would cause a nuisance, injury, or annoyance to the public or property.

Comment No. IND 29-2

HOW WOULD THE MILLENNIUM PROJECT IMPROVE ANY OF THESE PROBLEMS FOR MYSELF AND MY NEIGHBORS AND HOLLYWOOD IN GENERAL?

It will not. It will add money to the coffers of developers and leave the aftermath and ensuing problems to us, the residents and tax payers.

As usual, we the tax-payers and citizens will be left holding the bag while you, the planning committees and politicians and developers will benefit in big and small ways.

Our elected officials will act on behalf of interests other than ours, often with impunity, but always to our demise.

I am begging you – please – do not let this continue by allowing the Millennium Group building this projected monolithic monstrosity.

Hollywood has seen an incredible increase in buildings, many of which are or will be lying partially empty because of the outrageous pricing. One or two “low rent housing units” is a joke beyond jokes.

What is left of the local small business that defined Hollywood will die completely, leaving only big corporate conglomerates disguised as boutique stores. What happened to the mom & pop books stores, clothings *[sic]* stores, markets, restaurants that used to fill Hollywood? Gone; all gone. There isn't even a hint they existed.

Please do not further this impossible problem by selling us out once again.

Please try to use an older city as a model, where old and new exist. Please do not eradicate Hollywood's history further by destroying the very things that made Hollywood Hollywood.

Response to Comment No. IND 29-2

The comment expresses general opposition to Project. However, the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 30

Jim Geoghan
Received May 1, 2020

Comment No. IND 30-1

The last time Mayor Garcetti tried to “improve” Hollywood with Millennium’s hideous buildings was a nightmare. I still dream of Millennium promising to put a “bicycle repair shop” on the ground floor for “all the bike riders who needed repair.” OMG! I also remember Mitch O’Farrell telling the assembled crowd “When buildings sway during an earthquake... it’s kind of fun!” OMG!

The earthquake fault is STILL there. Unfortunately so are Garcetti and O’Farrell.

The city needs to back off and listen to what the voters have to say. Trying to okay this hideous development by sneaking it in the back door isn’t clever – it’s foul.

Response to Comment No. IND 30-1

This comment expresses general opposition to the Project, including concerns in regard to earthquake and fault hazards. While the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment Letter No. IND 31

Carolyn Mohr
2514 Rinconia Drive
Los Angeles, CA 90068
Received May 2, 2020

Comment No. IND 31-1

I'm writing to request an extension to the public comment period for the proposed Hollywood Center Development (Millennium Group).

Response to Comment No. IND 31-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 31-2

The concerns of this project that directly impact my family and our residence in the Hollywood Dell are numerous, but here are a few:

Response to Comment No. IND 31-2

This comment serves as an introduction to the remainder of the comment letter. Responses to these comments are provided in Response to Comment Nos. IND 31-3 through IND 31-6.

Comment No. IND 31-3

--Since we have owned our home here, we have seen the traffic grow to be unbearable. Often, it takes up to an hour just to get past the lines of cars waiting to get onto the 101 when we are returning from work and school with our children. This massive project will exacerbate the traffic problem, blocking us from getting home to our houses.

Response to Comment No. IND 31-3

The comment expresses concern regarding the Project's potential to cause traffic impacts. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 31-4

--The construction noise and disruption of the streets will directly impact our health and ability to get to and from our home safely and within a reasonable time.

Response to Comment No. IND 31-4

The comment states that construction noise and disruption will impact the commenter's health and ability to get to and from their homes safely and within a reasonable time. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, noise and vibration impacts were analyzed in Section IV.I, *Noise*, of the Draft EIR, with supporting information provided in the Construction Noise and Vibration Study and a Construction Traffic and Operational Noise Study, both included in Appendix K of the Draft EIR. The analysis in Section IV.I concluded that that Project's construction activities would result in significant and unavoidable noise and vibration impacts to nearby noise and vibration sensitive residential and commercial uses; however, it should be noted that these impacts would be temporary, and that during Project operation, noise and vibration impacts would be less than significant. See also Topical Response No. 7 – Noise and Vibration, above.

In regard to construction traffic, per Project Design Feature TRAF-PDF-2 as provided on page IV.L-26 in Section IV.L, *Transportation*, of the Draft EIR, the Project would implement a Construction Management Plan (CMP), including street closure information, a detour plan, haul routes, and a staging plan, which will be prepared and submitted to the City for review and approval. The CMP will formalize how construction will be carried out and identify specific actions that will be required to reduce effects on the surrounding community. The CMP will be based on the nature and timing of the specific construction activities and other projects in the vicinity of the Project Site. The CMP would provide safety and minimize traffic delays in and around the Project Site during construction.

Comment No. IND 31-5

--This project will forever impact the beauty, view, charm, and aesthetic of our Hollywood neighborhood that has kept our 5th-generation Hollywood family in the area.

Response to Comment No. IND 31-5

This comment raises concerns regarding aesthetic impacts of the Project. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies or regulations related to location, form and density of development adopted for the purpose of avoiding or mitigating a

significant environmental effect, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Comment No. IND 31-6

The proposed project is of great concern to our community and we are alarmed to hear that the City had only provided the minimum comment period (April 16 – May 31st), despite our being under a “Safer At Home” order due to the COVID-19 pandemic. This is a huge project that will have a major impact on the entire city and should be carefully considered.

Please extend the public comment period on the Draft Environmental Impact Report to a minimum of 90 days AFTER the city and state “Stay At Home” order has been lifted so that everyone’s voices may be heard.

Response to Comment No. IND 31-6

Refer to Response to Comment No. IND 31-1.

Comment Letter No. IND 32

Stanley Johnson
Received May 4, 2020

Comment No. IND 32-1

Mindy,

I hope this email finds you well.

L.A. is in the middle of change. And I am hoping that change comes soon as we have a lot of work to do for the 2028 Olympics. Hollywood routinely gets called the worst travel destination place in the world (A reputation that does not help bring dollars and jobs to our city). So I am definitely excited about the Makeover on Hollywood Blvd. And projects like Hollywood Center and Crossroads have to happen quickly in Hollywood. With so many jobs, tourists, and entertainment, we want people living here, walking here, taking the subway here, and actually having the feeling of being in a CITY!!

I am very excited about the Hollywood Center project (Which has been in the works for over 5 years). Please do not extend the comment period. We have waited long enough. Please no more delays.

On a side note: I am a Homeowner, Renter, Tenant, and Landlord here in L.A. I love that you all gather input from the local community. But please understand the negative biasness that goes into seeking feedback. You end up not hearing from the vast majority of the community because they simply do not care one way or another. It is not like they are going to be moving to a new development if they are happy where they are. The only ones motivated to go out that way to say something are those against it. When we only hear that one voice, it hurts us all. And the fact that one voice is usually part of a demographic that is minority (age, wealth and race), it is very unfair that we get much needed development delayed or cancelled due to this.

There has to be a better way.

Response to Comment No. 32-1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 33

Mary S. Ledding, Esq.
6348 La Punta Drive
Los Angeles, CA 90068
Received on May 4, 2020 (IND 33A)
Received May 31, 2020 (IND 33B)

Comment No. IND 33A-1

Please see the attached letter.

Response to Comment No. 33A-1

This comment letter indicates that there is an attached letter to the email. Responses to that letter are provided in Response to Comment Nos. IND 33B-1 through IND 33B-3.

Comment No. IND 33A-2

I write to request that you extend the period to file comments in connection with the above-referenced EIR to a date to expire 90 days following the lifting of current “Shelter in place” orders.

Response to Comment No. IND 33A-2

The comment requests that the City extend the Project’s 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 33A-3

The Hollywood Center Project is a massive re-development that will impact my neighborhood. I live in Council District 4, directly above Hollywood and Vine and I shop, and provide services in Council District 13 where the Hollywood Center Project is planned. I have lived in Hollywood since 1975 and seen many developments and improvements. But this huge building project needs to be fully understood by the people and neighbors it will impact.

Response to Comment No. IND 33A-3

This comment states that the Project will impact the commenter’s neighborhood and is noted, but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 33A-4

The Draft EIR was presented to the public *during the lockdown for co-vid 19!!* The DEIR, whole casefile, and documents are only available for public examination by appointment at the closed-to-the-public Department of City Planning. There is no way to ask questions of those involved in its preparation and the minimal 45 day time period allowed during the quarantine period is simply too short a time for informed, careful evaluation by the public.

This project has been in the works for years. To allow a few more months to ensure fair and public evaluation and comment is reasonable and consistent with the whole purpose of sharing information with citizens that will be affected. To present this massive DEIR during the quarantine and allow only 45 days for comment smacks of developer corruption. At a time when the City Council – and the former head of the Council planning committee – has just plead guilty to corruption, this is a time when transparency and public involvement need to be welcomed, not rushed out the door and down the street. Your rush approach to getting this past the public does nothing to enhance the reputation of Los Angeles or its politicians.

You do a great disservice to the citizens of Los Angeles by rushing this huge development in Historic Hollywood past fair and careful citizen review. Please do the right thing and give us more time to understand, comment, and perhaps even improve the end result.

Response to Comment No. IND 33A-4

The commenter's asserts that the Draft EIR, whole case file, and documents were made only available by appointment at the Department of City Planning. However, the Draft EIR was also made available for review, a hard copy of the Draft EIR, and digital copies on CD-ROM or USB drive were also made available to anyone who requested one, from the Department of City Planning. Furthermore, as noted on the NOC/NOA, the Staff Planner's phone number and address were also provided for additional accommodations, and should any interested party have questions regarding the Draft EIR. For additional details regarding the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 33B-1

Please note the attached letter regarding the Hollywood Center Project DEIR.

Response to Comment No. IND 33B-1

This comment letter indicates that there is an attached letter to the email. Responses to that letter are provided in Response to Comment Nos. IND 33B-2 through IND 33B-18.

Comment No. IND 33B-2

Please include the following in the Public Comments and concerns about this massive project.

Response to Comment No. IND 33B-2

This comment was received and included as part of the record for the Project.

Comment No. IND 33B-3

1. I live in the Hollywood Dell, which is part of the neighborhood community the Project will affect. I object to the size and scope of the Project. For the City to approve the construction of two towers that are over 3 times the height of the Capitol Records Building and generally twice as tall as the Related Projects surrounding it shows a total lack of concern for the historic and architectural environment and the obligation to maintain the prevailing scale and character. The DEIR finds "no conflict" with policy 3.2.4 which requires developments to maintain the prevailing scale and character of the area and simply says the height and intensity is consistent with the building "trend in Hollywood". Where are there any buildings in the neighborhood surrounding the Project that are significantly over 20 stories (being the general height of Related Projects that have been approved)? Where in CEQA is a development permitted to comply with "trends" rather than the stated policies of the Framework element?

Response to Comment No. IND 33B-3

The comment expresses opposition to the Project based on size and scope, lack of concern for cultural resources, and land use consistency. Aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

Regarding cultural resources, impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

In addition, in regard to the size and scope of the Project, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of

the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies or regulations related to location, form and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, therefore, impacts would be less than significant. Specifically, with regard Framework Policy 3.2.4, referenced in the comment, the Policy states: "Provide for the siting and design of new development that maintains the prevailing scale and character of the City's stable residential neighborhoods and enhance the character of commercial and industrial districts." The Project Site is located within a designated Regional Center and is not located within a residential neighborhood. The analysis in Table LU-2 in Appendix J of the Draft EIR acknowledges that the Project would be have a substantially greater height and intensity than existing development in the area, however, the policy's applicability to the Project focuses on whether the Project would "... enhance the character of commercial and industrial districts." As discussed in Table LU-2, the Project would be sited and designed to enhance the character of the Regional Center mixed-use, commercial district. That is, despite its height, the Project would provide ground level dining and open space uses for residents, employees, and visitors. These ground level uses and the proposed mix of uses within the Project would increase the diversity of uses consistent with the Regional Center designation and would improve the pedestrian experience at the Project Site. The Project would enhance the urban character of the area, with an emphasis on activating Vine Street for pedestrians and cyclists and create a stronger connection to the Hollywood Walk of Fame and Capitol Records Complex.

Furthermore, page IV.H-22 of Section IV.H, *Land Use and Planning*, of the Draft EIR acknowledged that the Project would concentrate high intensity and/or density development in areas with reasonable proximity or direct access to high capacity transportation facilities. The Project would be sited and designed to focus greater intensity development adjacent to Vine Street, with the 35-story West Building and 46-story East Building located toward the center of the development. The 11-story West Senior Building would be located at the corner of Ivar Avenue and Yucca Street and would provide a transition between the West Building and the lower-scale (one- to two-story) buildings located to the north across Yucca Street and west across Ivar Avenue. The 11-story East Site Senior Building would be located along Argyle Avenue, providing a transition from the East Building to the 18-story 6226 Yucca project (Argyle House) located at the corner of Yucca Street and Argyle Avenue, and the seven-story Easttown project located to the east across Argyle Avenue. See also Topical Response No. 5 – Land Use and Planning, above.

Comment No. IND 33B-4

2. The Project is asking for greater height and density in return for, among other things, the implementation of a TDM Plan to promote public transit utilization. Where are the specifics of such TDM Plan? The recent report on public ridership by the Regional Ridership Improvement Task Force states "ridership is declining in Los Angeles County" and cites "deep recessions then rising incomes, increasing auto ownership, steep jumps in housing prices, and the advent of new mobility

services potentially changing how and when people choose to ride". The report, prepared by the same consultants who reported a rosy look for public transit usage promoted by the Project, suggests unproven strategies which the Project embraces. What proof is offered that the TDM Plan will increase ridership of public transit and not increase auto ownership? Similarly, given the CoVid 19 pandemic, what impact will the pandemic have on the number of autos and consequent parking spaces, impact on traffic, air quality, and noise set forth in the DEIR?

Response to Comment No. IND 33B-4

The commenter asserts that the Project is requesting greater heights and density in exchange for implementing a Transportation Demand Management (TDM) Plan to promote public transit. It should be noted that the TDM Program is unrelated to the height and density of the Project. The TDM Program is described in Project Design Feature TRAF-PDF-1 on pages IV.L-26 to IV.L-28 of Section IV.L, *Transportation*, of the Draft EIR, and is required as a condition of approval in the Los Angeles Department of Transportation's (LADOT) assessment letter. Furthermore, independent of the requested Project's discretionary approvals, the Project is committed to implementing the TDM Program as a condition in its Environmental Leadership Development Program (ELDP) certification by the State of California.

The trip reductions that were applied as part of the TDM program in the vehicle miles traveled (VMT) analysis were estimated using the City's VMT Calculator tool as discussed and documented on page 26 of the Transportation Assessment (TA) in Appendix N-1 of the Draft EIR. The effectiveness of TDM measures contained in the VMT Calculator is estimated based on empirical research from the California Air Pollution Control Officers Association (CAPCOA) which currently represents the latest state of the practice TDM research. Appendix H to the TA provides calculations in support of the specific TDM measures applied for this Project, including the applicability of select measures and equations used in the analysis. The combined effects of project location, land use mix, TDM measures, and proximity to built environment characteristics such as density of destinations, diversity of travel options, and distance to transit are well documented and applied here.¹³² Also see Attachment G, Transportation Demand Management Strategies, in the Los Angeles VMT Calculator to the LADOT Transportation Assessment Guidelines (TAG), which provides more detail regarding the research sources and calculation of effectiveness for the TDM measures included in the VMT Calculator. The resources and documents above provide substantial evidence in support of the methodology, application of reductions, and resulting analysis outcomes demonstrating that a project with this land use mix, provision of effective TDM measures, in this location, would experience substantial reductions in single occupant vehicle trips.

The Project may be operational as early as 2024 with buildout of either the West Site or the East Site. It is not possible at this time to predict with accuracy what the status of the

¹³² United States Environmental Protection Agency, Smart Growth, <https://www.epa.gov/smartgrowth/mixed-use-trip-generation-model>, accessed August 25, 2020.

COVID-19 virus will be in 2024, which represents the earliest year in which either the West Site or the East of the Project would be in operation. Furthermore, the comment does not provide any substantial evidence that Project operation would exacerbate the effects of the COVID-19 virus. CEQA does not require analysis of speculative conditions related to the potential for diminished use of public transportation. Pursuant to CEQA Guidelines Section 15143, “[t]he significant effects should be discussed with emphasis in proportion to their severity and probability of occurrence.” Furthermore, CEQA Guidelines Section 15064(d)(3) states that “[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable.” Therefore, forecasting the impact of COVID-19 with regard to impacts on air quality, traffic, and noise is speculative. In addition to being speculative, COVID-19 is not a project or, more specifically, a component of this Project. Rather, COVID-19 is part of the environment and CEQA generally does not require an analysis of the environment’s impact on the Project (see CEQA Guidelines Section 15126.2). Thus, the Draft EIR meets the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

Comment No. IND 33B-5

3. The DEIR notes significant unavoidable impacts to cultural resources, including the Pantages Theatre, Avalon Hollywood, and certain Art Deco adjoining buildings. These are significant irreplaceable historic buildings. In addition to the Project, the DEIR notes that the effect of nearby construction together with the Project will be cumulatively significant and unavoidable. How can the City sacrifice the future of these unique historical and cultural landmarks in return for building a massively oversized Project that is not consistent with the neighborhood skyline and will negatively impact so many other elements of the framework element?

Response to Comment No. IND 33B-5

This comment raises concerns regarding Project impacts on historic resources and aesthetics. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect project-level and cumulative impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame and other nearby historical resources. The Project’s direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame, and indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended

mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

In addition, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

Comment No. IND 33B-6

4. The DEIR repeatedly mentions the addition of over 30,000 square feet of retail/commercial space and asks for 12 liquor licenses. Why does the DEIR not mention the addition of grocery stores, personal services, and other daily-needs types of stores? How does the addition of solely retail/commercial/liquor licensed businesses provide for the stability and enhancement of multi-family residential neighborhoods in accordance with Objective 3.7 of the framework element?

Response to Comment No. IND 33B-6

The comment inquires about why grocery stores and other daily-needs types of stores are not mentioned in the Draft EIR and how the addition of the Project's retail/commercial space provide for the enhancement of multi-family residential neighborhoods in accordance with Objective 3.7 of the Framework Element, which is to: "Provide for the stability and enhancement of multi-family residential neighborhoods and allow for growth in areas where there is sufficient public infrastructure and services and the residents." As stated in Appendix J, Land Use Plans and Policies: Project Consistency Tables, of the Draft EIR, the Project would be an infill project in a highly urbanized area with sufficient public infrastructure and services to meet Project needs. The Project's commercial uses, which would include a mix of retail and restaurant uses, would represent growth in an area where there is sufficient public infrastructure and would be beneficial for the residents that the Project would bring to the Project Site. However, the Project's commercial tenants are not known ahead of the anticipated completion of the Project in 2024, or whether any of the Project's commercial space would include grocery stores or personal services. Because the Project's Regional Center designation, along with proximity to the Hollywood Boulevard Commercial and Entertainment District and the Capitol Records Building site anticipates visitors, the requested entitlements include restaurant uses with liquor licenses consistent with the proposed public access plazas and historic character of the existing entertainment-directed commercial area. The Project will introduce new commercial activity on a location currently occupied by surface parking lots. It will provide landscaped plazas, an outdoor stage, and paseo, and include retail uses that would serve some interests of the surrounding residential neighborhoods. The Project, which is located within an entirely commercial area, would not encroach into the area's residential neighborhoods and would, thus, not destabilize the surrounding area.

Comment No. IND 33B-7

5. As a general matter, the Project DEIR has been prepared with the intent, and the blessing of the city and state, that it provide density and that residents and occupants will predominantly use public transit and reduce the use of private automobiles. However, the occurrence of the Covid 19 pandemic has caused permanent change in the minds of the public. The virus is known to have been widely spread on crowded public transit vehicles in New York City and elsewhere. Before the pandemic Los Angeles County use of public transit was documented to be continuing to decline by the Regional Ridership Improvement Task Force. The virus will further reduce ridership. Has the effect of Covid 19 and the likely permanent societal changes been evaluated in all of the applicable areas of potential impact, including traffic, use of private autos, use of ride-services, need for parking spaces, change in economic climate, decline in attendance at restaurants and bars, decline in attendance at public venues such as the proposed public performance space and other public spaces in the Project?

Response to Comment No. IND 33B-7

The comment questions whether the effect of COVID-19 was taken into account in the Draft EIR. See Response to Comment No. IND 33B-4 for a discussion of impacts with regard to the COVID-19 pandemic.

Comment No. IND 33B-8

6. It is publicly known that the developers of the earlier version of the Project (the Millennium Hollywood Project) also built the Millennium Towers in San Francisco, which were found to have sunk and started to lean. Substantial litigation is still pending there, including a case filed by the City of San Francisco at great cost to the taxpayers. Has the DEIR confirmed that the geological report for the Project was not done by the same experts for San Francisco Millennium? How does the DEIR assure the public that the massive towers of the Project will not result in geological errors and expose the City and its taxpayers to significant litigation costs?

Response to Comment No. IND 33B-8

This comment inquires about whether or not the same experts who prepared the geological report for the Millennium Towers in San Francisco, which is currently under litigation, also prepared the report for the Project, and assurance that the Project will not also result in litigation. The geotechnical report for the Hollywood Center Project was not conducted by the same firm as for the Millennium Towers in San Francisco. Furthermore, while this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, geology impacts regarding the Hollywood Fault and other geologic hazards were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix

G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 33B-9

7. The DEIR wrongly states that the Project is not within a quarter of a mile (1,320 ft) of a school. In fact, Delaney Fine Arts Preschool is within 602 ft of the Project and Hollywood Presbyterian Children's Center and Preschool is within 943 ft of the Project. And Cheremoya Avenue Public School is within 1,437 ft of the Project. Has the Project been evaluated as to the impact on the children in these schools caused by the construction and operation of the Project and each of its Alternatives (including but not limited to haul routes, increased traffic and traffic safety concerns, air pollution, and hazardous waste)?

Response to Comment No. IND 33B-9

The commenter states that the Draft EIR does not list various schools within a 0.25-miles of the Project Site. As stated on page IV.F-17 of Section IV.F, *Hazards and Hazardous Materials*, of the Draft EIR, there are no Los Angeles Unified School District (LAUSD) elementary, middle, or high schools located within one-quarter mile of the Project Site. Additionally, as stated on page IV.F-26 and -27, the Draft EIR notes that day care centers and/or pre-schools are sometimes associated with civic, business, and residential uses in the area and are considered sensitive receptors to hazardous materials or substances. The schools referenced in Section IV.F are the Hollywood Presbyterian Children's Center Preschool, located 0.2 miles east of the Project Site, and the Montessori Shir-Hashirim Los Angeles, located 0.25 miles southeast of the Project Site. While the Delaney Fine Arts Preschool and Hollywood Presbyterian Children's Center and Preschool were not specifically referenced, the Draft EIR analyzed impacts to sensitive receptors, which included schools that were immediately adjacent to the Project Site. As stated in Section IV.F, an analysis of the Project toxic air contaminants (TACs) emissions (including volatile organic compounds [VOCs] emissions) was conducted as part of the analysis in Section IV.B, *Air Quality*, of this Draft EIR, and includes analysis of the sensitive receptors. As indicated therein, Project construction-related TACs would have less-than-significant impacts on adjacent sensitive receptors with the Project's use of Tier IV construction equipment required as mitigation. In addition, Mitigation Measure HAZ-MM-1 would establish requirements for the handling, management and disposal of any contaminated soils or structures, which prevent unacceptable exposure to contaminated soils or vapors during construction at any nearby school, including the referenced schools in this comment. In regard to Project operation, all hazardous materials on the Project Site would be handled, used, stored, and disposed of in accordance with all manufacturers' specifications and all applicable federal, state, and local requirements such that schools are not adversely impacted. Project emissions would be typical of urban mixed-use development in the area and would not include hazardous emissions that would affect any off-site land uses, including schools.

Furthermore, as stated on page IV.I-44 of the Draft EIR and as discussed in the Transportation Assessment (see Appendix N-1 of this Draft EIR), Project haul trucks (e.g., trucks hauling dirt) would be required to use City-approved haul truck routes. Haul routes would account for school zones identified per the Safe Routes to School Program. For Project haul trucks, two approved haul routes are available from the Project Site, depending on which landfill is being used to deposit materials and which site the haul trucks are servicing.

Haul Route Option 1 would represent 70 percent of truck traffic with Option 2 covering the remaining 30 percent of trips. Haul Route Option 1 from the West Site follows northbound Ivar Avenue to eastbound Yucca Street to northbound Argyle Avenue, and then takes the US-101 ramp. Haul Route Option 1 from the East Site starts from northbound Vine Street to eastbound Yucca Street and then follows the same directions as the West Site. Haul Route Option 2 from the West Site follows Ivar Avenue, to the US-101 ramp via eastbound Hollywood Boulevard. Haul Route Option 2 from the East Site follows southbound Vine Street to eastbound Hollywood Boulevard, and then takes the US-101 ramp. The use of these haul routes was analyzed in Section IV.B, *Air Quality*, and Section IV.I, *Noise*, of the Draft EIR, both of which concluded that air quality and mobile-source noise impacts, respectively, would be less than significant.

In addition, as noted on page IV.L-22 of Section IV.L, *Transportation*, of the Draft EIR, the Draft EIR's analysis of geometric design feature or incompatible use hazards takes into account the Project's location relative to proximity to a Safe Routes to School program area. Therefore, as analyzed under Threshold (c) on page IV.L-45 of Section IV.L, the Project would not substantially increase geometric hazards due to a design feature or incompatible uses, and, as such, the Project would not result in adverse safety impacts related to traffic to nearby schools.

Comment No. IND 33B-10

8. The Project proposes 133 senior units but does not state the square footage or whether 1- or 2-bedroom units. The Project is asking the City for numerous waivers to city zoning return for building the absolute minimum percentage of senior/affordable housing (11%). Is allowance made in these units for the customary need of a caregiver for seniors? How does the size of these senior units (square footage, number of bedrooms) compare to the size of other senior housing in the area and how does it compare to the size of the supportable housing the City has been building for the homeless? Seniors should receive at least the same amount of living space that public tax dollars are paying for the homeless affordable housing.

Response to Comment No. IND 33B-10

The commenter states that the Draft EIR does not disclose the sizes of the affordable housing units as proposed under the Project. Table II-1, Proposed Development Program, on page II-15 of the Draft EIR includes the breakdown of one-, two and three-bedroom

units proposed by the Project. The specific size of the units will be determined in the design phase of the Project and is not relevant to the environmental analysis included in the Draft EIR. As the comment does not raise any specific issues regarding the content and adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 33B-11

9. From a design and aesthetic standpoint, the plans for the senior housing units being proposed are strikingly similar to cell blocks from Eastern Europe and the failed "projects" of the Eastern United States. Why are the senior units so boxy and without any design grace? How are such boxy buildings consistent with Policy 3.2.4 of the framework element which requires development to maintain the prevailing character of the city's stable residential neighborhoods? There are no cell-block living structures surrounding the Project.

Response to Comment No. IND 33B-11

The comment provides a general opinion that the design of the senior housing units. The specific size, shape and design of the units will be determined in the design phase of the Project and is not relevant to the environmental analysis included in the Draft EIR. While the comment is noted, because the requested information is not required under CEQA to be analyzed within an EIR and the comment does not raise any specific issues regarding the content and adequacy of the Draft EIR, no further response is warranted.

Nonetheless, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies or regulations related to location, form and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Comment No. IND 33B-12

10. Under State CEQA Guidelines a project that physically divides an established community has a significant impact related to land use and planning. The Hollywood Dell neighborhood is part of the community of Hollywood. Residents of the Dell have no commercial district other than those retail and grocery shopping locales to the south of the Project and must take the main southern streets of Argyle, Cahuenga and Vine to get to those shops and services. The building of the Project will significantly increase the traffic the Dell residents must encounter to reach the retail portion of our community and dividing it. Why was no review made of the impact of the Project in dividing the Dell or other surrounding neighborhoods from the Hollywood community?

Response to Comment No. IND 33B-12

The commenter provides a general statement that implementation of the Project would divide the established community and have a significant impact related to traffic. As analyzed on page B-37 of the Initial Study, provided in Appendix A-2 of the Draft EIR, while the Project would result in changes to the way vehicles access the Project Site, it would not re-route existing streets or create new public streets, and, as such, traffic in the surrounding community would continue to utilize the same circulation facilities and patterns as occur presently. Further, the Project would not create a physical barrier or otherwise disrupt the physical arrangement of an existing community. Therefore, the Project would not physically divide an established community, and no impact would result.

Comment No. IND 33B-13

11. The DEIR avoids mentioning the height of the historical Capitol Records building which appears to be only 13 stories from examination of the Project illustrations. The Project and all Alternatives which actually build something dwarf this historic building. The developers are requesting a waiver from the City to applicable height limits in return for building the absolute minimum of cell-block units for seniors - 11%. That in itself is a horrible bargain, but even worse is the monumental dwarfing of Hollywood's most iconic building. The Project is triple the size of Capitol Records. Alternatives #3, #4, #5, #6, #7, and #8 all dwarf it as well - Alternative #8 being the most egregious with a proposed 48 stories! Only Alternative #2 at 18 stories is anywhere similar to the Capitol Records building. In addition, all of the Related Projects close to the Project are permitted at about 20 stories. How can the City conclude that the Project - at 46 and 35 stories - maintains the prevailing scale of the neighborhood, in accordance with Policy 3.2.4 of the Framework Element? How did the approved Related Projects' evaluation of this Policy in obtaining their approvals compare to the evaluation of this important Policy in respect of the Project and why is there a different conclusion?

Response to Comment No. IND 33B-13

The comment asserts that the height of the Capitol Records Building is not disclosed in the Draft EIR. However, the height of the Capitol Records Building is indicated on page II-9 of the Draft EIR as being 13-stories. The comment also provides opinions on the size and scale of the Project in relation to the Capitol Records Building, as well as the Alternatives evaluated in the Draft EIR, but does not raise any specific issues regarding the content and adequacy of the Draft EIR. See Response to Comment No. 33B-3, which discusses the Project's aesthetics and indirect historic resources impacts with respect to the Capitol Records Building, as well as whether the Project would conflict with Policy 3.2.4 of the Framework Element. Note that the Policy is misstated in the comment, which is specific only to "the prevailing scale of the City's stable residential neighborhoods."

As discussed in Appendix J of the Draft EIR, the determination that the Project would not conflict with the prevailing scale of a stable residential neighborhood is based on the fact

that the Project would not encroach into, or be located within an existing residential neighborhood. Further, the Project would be consistent with the on-going mixed use redevelopment in the area and targeted growth policies applicable to Regional Centers and TPAs. In addition, the Project is sited and designed to focus greater intensity development adjacent to Vine Street, with the 35-story West Building and 46-story East Building located toward the center of the development and farther from nearby residential neighborhoods. The Project would also provide setbacks from the 13-story Capitol Records Building that would preserve direct views of this building from the Hollywood Freeway and Hollywood and Vine Street. The issue of height and scale was not found in conflict since the Project is not located within an established residential neighborhood.

In the evaluation of Project Alternatives in Chapter V, *Alternatives*, of the Draft EIR, the analysis described the types of setbacks and street interfaces of the Alternatives compared to the Project, which vary among the various alternatives.

Regarding related projects, building setbacks and the specific character and uses of the various neighborhood interfaces for the 123 City of Los Angeles related projects and 27 City of West Hollywood related projects are not known, and such detailed level of analysis for related projects is not required. The evaluation of cumulative land use impacts did not address Policy 3.2.4 or make a finding that contradicts the conclusion of consistency of the Project with Policy 3.2.4. The Draft EIR stated that related projects would be evaluated for consistency with existing and proposed zoning and land use designations and, because each would be evaluated, the Draft EIR concluded that related projects that would not conflict with the City's applicable plans and goals to concentrate high-density, mixed-use development in TPAs.

Comment No. IND 33B-14

12. Policy 4.1.1 of the Framework element requires the City to accommodate an adequate supply of housing units by type and cost to meet projections. In response the DEIR simply repeats the proposed number of units it plans. Los Angeles is already facing a glut of empty expensive apartments which do nothing to provide affordable housing. Where is an analysis of the existing income levels of Hollywood residents and how the pricing of these "market-rate" units fit into citizen's income levels? How does the DEIR assure that the 872 market-rate units are actually at a rate that the community can afford? There is nothing about pricing in the DEIR.

Response to Comment No. IND 33B-14

The comment asserts that the Draft EIR does not analyze the existing income levels of Hollywood residents and whether the community can afford the market-rate units, as required by Policy 4.1.1 of the Framework Element. As stated in the CEQA Guidelines Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. As such, pricing information was not evaluated in the Draft EIR, and no further response is warranted.

Comment No. IND 33B-15

13. The DEIR provides comparisons of Alternates and their various impacts on 56 different uses or features. At least three Alternatives - #2, #3, and #5 - all partially or fully meet all Project objectives yet offer lesser impacts on various uses or features. Alternative #2 offers 30 "Less" impacts, Alternative #3 offers 23 "Less" impacts, and Alternative #5 offers 20 "Less" impacts. All of Alternatives #2, #3, and #5 provide for a smaller scale Project with fewer stories than those being proposed. How can the City approve the Project which dwarfs surrounding buildings and Related Projects when Alternatives are available that partially or fully meet all of the Project objectives? Why is the proposed Project superior to those Alternatives in serving the needs of the community?

Response to Comment No. IND 33B-15

The comment identifies Alternatives 2, 3, and 5 partially or fully meet all Project objectives and offer lesser impacts on various uses or features, and inquires how the City can approve the Projects that dwarfs its surrounding when other Alternatives are available. Regarding approval of the Project, it should first be clarified that no decision is being made at this time. Furthermore, as stated on page V-317 of Chapter V, *Alternatives*, of the Draft EIR, Alternative 2 would result in the most reduction of impacts compared to the Project and is therefore considered to be the Environmentally Superior Alternative. The City, during the approval process, for the Project, will review and consider all the Alternatives presented in the Draft EIR.

Comment No. IND 33B-16

14. The DEIR acknowledges that if the Project and the Related Projects are to be built, by 2027, when the Project is completed and occupied, there will be an additional 18,064 students in the relevant area, and that all except Hollywood High School will experience significant overcrowding. The DEIR states that under Ca. Gov Code Sec. 65995 the payment of fees by a developer mitigates to "less than significant" this impact. But that code section merely says additional fees cannot be charged beyond those set forth. It does not determine that a construction permitted by the City cannot be declined if the City determines there is a detrimental impact. Building a smaller Project, with fewer stories and fewer units, or with more senior housing would have a mitigating effect on the schooling deficit that the current Project will create. Why has the City not requested an evaluation of the effect that fewer stories or more senior housing on this Project would have on the projected deficit in student capacity? And why does the DEIR not project the deficit beyond the initial year (2027) when the Project would be completed, since students grow up and greater crowding would no doubt occur?

Response to Comment No. IND 33B-16

The commenter correctly states the number of additional students in the service area that would be generated by the Project and related projects, but disagrees with the conclusion

that impacts would be mitigated to a less-than-significant impact. However, as stated on page IV.K.3-2 of Section IV.K.3, *Schools*, of the Draft EIR, SB 50 permits the LAUSD to levy a building permit fee, charge, dedication requirement, or other requirement against any development project within its boundaries, for the purpose of funding the construction or reconstruction of school facilities. SB 50 also caps the fees a developer may be required to pay. Fees are established by the State Allocation Board every two years based on demonstrated need as set forth in the LAUSD's School Facilities Needs Analysis. Therefore, pursuant to California Government Code Section 65995, all related projects would be required to pay developer fees under the provisions of SB 50 to address the impacts of new development on school facilities. Payment of such fees is intended for the general purpose of addressing the construction of school facilities, whether schools serving the Project in question are at capacity or not. Pursuant to California Government Code Section 65995(h), payment of such fees is deemed full mitigation of a project's development impacts. In addition, a portion of the property taxes generated by the Project and related projects would be allocated by the State to LAUSD for future school operations. This would be in addition to LAUSD's bond program that funds improvements and upgrades to LAUSD school facilities. Therefore, the payment of SB 50 fees would mitigate any of the Project's impacts on school services. The comment also questions why the Draft EIR does not project the deficit beyond 2027. As stated on pages IV.K.3-8 and -9, school planning for future enrollments is done by the LAUSD at five-year intervals, and is based on the estimated future residential enrollment (i.e., estimated number of eligible resident students). Therefore, projections beyond 2027 at this time are not available.

Comment No. IND 33B-17

15. The developer is requesting 12 liquor licenses yet is touting this as a multifamily/senior housing project. Ignoring the square footage dedicated to housing, the 30,176 square feet of commercial (retail and restaurants), results in one liquor license for every 2,500 square feet. If you further reduce for possible grocery and other non-restaurant space, the square footage anticipated to be utilized by liquor consumption is staggering. As a project touted as "multi-family" and "senior housing", how is the concentration of so many liquor vending locales consistent with the objective of developing neighborhood oriented retail space such as groceries, clothing, hair salons and the like?

Response to Comment No. IND 33B-17

The comment questions how the request for 12 liquor licenses is consistent with the objective of developing neighborhood oriented retail space. See Response to Comment No. IND 33B-6.

Comment No. IND 33B-18

I want to also note that the public was not given sufficient time to review this thousands-of-pages report given that only 15 days were allowed during a time the Covid-19

pandemic has shut down -and continues to shut down – access to the document, to officials who are cited in it, and to the ability for the community to publicly meet and discuss its broad impacts on our daily lives and the lives of future generations. Shame on the City and its officials. Especially at a time when City corruption is well-documented and City officials are admitting taking money from developers. You are trampling on public trust.

Response to Comment No. IND 33B-18

The comment asserts that the public did not have sufficient time to review the Draft EIR and only given 15 days to access the document. However, the Draft EIR’s public comment period was conducted in compliance with the statutory requirements, including but not limited to Public Resources Section 21091 and CEQA Guidelines Sections 15087, 15105, and 15205. The Draft EIR was made available for review for a period of 47 days on the City’s website, and digital copies on CD-ROM or USB drive were also made available to anyone who requested one, from the Department of City Planning. A hard copy of the entire Draft EIR was also made available at the Department of City Planning for any interested party to view. Furthermore, as noted on the Notice of Completion/Notice of Availability, the Staff Planner’s phone number and address were provided for additional accommodations. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 34

David Quinte

Received May 5, 2020

Comment No. IND 34-1

Thank you for taking the time to read this letter. My husband and I have been supporters of the proposed Hollywood Center Project since it was first announced two years ago, and we continue to stand in support of this forward-thinking project.

The project was certified by the Governor in 2018 as an Environmental Lead Development Project, ensuring that it would be an environmentally thoughtful project, provide 15% transportation efficiency compared to others in the area, be certified LEED Gold, and have no net new greenhouse gas emissions during construction and operation.

While I applaud the developer for making these commitments, what I appreciate the most is how they were able to incorporate these important features into a project that will provide over 1,000 units of housing for individuals from a mix of incomes.

As someone who lives in the area and daily walks around, I can tell you that what I have always appreciated about Hollywood is the diversity here. You have an office building, next to an apartment building, next to an affordable senior building, next to a theater, next to the Capitol Records building. Where else on the planet do you get this in a neighborhood?

Hollywood Center will be a welcome addition to our neighborhood allowing older adults to continue to live in place and bringing a new energy and life to the area surrounding the iconic Capitol Records building. This project represents an over \$1 Billion investment in Hollywood, at a time when jobs and investment are desperately needed.

I ask that you please consider this project for approval within the regular review period, and do not put unnecessary delays on this proposed development. Hollywood has waited long enough. Thank you for your time.

Response to Comment No. IND 34-1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 35

Edward Stanza
Received May 5, 2020

Comment No. IND 35-1

I am writing to share my support for the proposed Hollywood Center Project. My husband and I have lived in Hollywood for many years, and have seen this community go through a number of changes, some good and some bad.

Projects like Hollywood Center represent the good. This is a project that has taken into consideration a community that is growing and needs resources such as jobs, housing, open space, and neighborhood serving retail. I live down the street from the proposed project site, which is currently occupied by surface parking lots. One thing I have seen in this pandemic is just how sad Hollywood is without people on the streets. To allow these lots to remain a “living space” for vehicles, instead of people, seems grossly out of touch with what a community should be. Communities should have open areas for individuals to enjoy, a mix of residents, young and old from a variety of backgrounds, and neighborhood serving commercial offerings that make it easy for you to live in place.

Developments in our community have brought several benefits such as grocery stores, live entertainment, and more. Hollywood Center will be another great addition to these offerings.

Lastly, as a Hollywood resident I know that the need for shelter is real, now more than ever. This project will set aside over 130 units for low to very-low income adults 62 and over. This will provide a quickly growing population with a place to call home in a neighborhood that is the center of Los Angeles.

I have been online and seen some of the other comment letters and they appear to be more about extending the comment period for this project, or how this project is “too tall.” With all due respect to their authors, these letters do not seem to speak to what the need in our world is right now...the need for jobs and housing.

I strongly urge you to not postpone this project, but instead move it forward so that Hollywood will continue to become a place where others can call home.

Thank you.

Response to Comment No. IND 35-1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 36

Noah Taubman
Received May 6, 2020

Comment No. IND 36-1

I'm writing today to support the Hollywood Center and ask that you approve construction without any further delay.

Growing up, we were always told to avoid Hollywood. Thankfully over the last few years the area continues to improve, but I would love to see it continue to evolve and realize its full potential.

I've recently learned that the plan that governs what can be built in Hollywood hasn't been updated since 1988. How can a city expect to evolve and change with the times with a charter that is over 30 years old? These zoning rules are completely out of date.

To put it simply, the proposal for Hollywood Center fills that potential. It's exciting, it's architecturally significant, and it will bring new housing and people to Hollywood. I support the Center as well as any other projects that continue to address the unfilled potential Hollywood has to offer.

I kindly ask you to approve construction of Hollywood Center and please do not delay this any further by extending the comment period.

Response to Comment No. IND 36-1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 37

Sheldon Bond

Received May 6, 2020

Comment No. IND 37-1

Thank you for the opportunity to comment on this project. I support it. It should be approved not delayed by any comment extensions – we are all struggling enough as it is because of COVID and we need the jobs this project will create to bring back our economy. I moved to the LA area approximately 10 years ago and haven't looked back. Coming from Boston, I'm used to a walkable and bikeable city. I wish Hollywood could be more of those things. It has the subway stops and lots of things to do, but the pedestrian/bicycle experience is lacking in places. This project will take one of those less pedestrian-oriented places and make it a destination.

And what more could you ask for? I love this area, but I'm increasingly disappointed with the folks who are happy with and advocate for the status quo. Those that don't want to see this site improve from the paved asphalt that exists today. Hollywood today is not the Hollywood of 10 years ago, and it's certainly not the Hollywood of the '80s. We all can't continue thinking that we deserve parking spaces steps from our destination and 20 minute drives from any two points in the City. If COVID has taught us one thing, it's that people actually enjoy not being stuck in their cars for hundreds of hours per year. People want to live and work and play in Hollywood, and I commend this project for designing something that not only addresses the needs of today but contemplates the evolution of the area, envisioning a forward looking project that plans for tomorrow. I'm happy to support it.

Response to Comment No. IND 37-1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 38

Brian Ann Letofsky

Received May 6, 2020 (IND 38A)

Received May 6, 2020 (IND 38B)

Received May 13, 2020 (IND 38C)

Comment No. IND 38A-1

The commenter originally emailed Vince Bertoni, Director of City Planning, on April 26, 2020. This email was forwarded to Mindy Nguyen and received on May 6, 2020. The commenter's original letter is as follows:

Dear Sir:

I am writing to ask you to please STOP the Hollywood Millennial [*sic*] Project. We are in the midst of a Pandemic, probably the first of many and what we really don't require for our future is more urban density. The areas that have been hardest hit are areas with high density living and commuting. One of the factors that has probably helped Los Angeles is that most people commute in cars and live in single family dwellings. The idea of high density, multi purpose building is no longer a prospect for a hopeful future. 5 years ago this might have seemed like a smart idea, but not since February of this year. In February of this year the world changed and we have to adapt. Continuing with this project is a hideous idea. It is time to give this one up and go for a long rethink. High density has become a very bad idea for the future. You need to find some new solutions.

Response to Comment No. IND 38A-1

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

This comment also expresses general opposition to the Project based on its proposed density. It should be noted that the proposed density for the Project is compliant with the Project Site's zoning designation. Furthermore, as discussed in Topical Response No. 5 – Land Use and Planning, above, the Project's consistency, and therefore, potential conflicts, with applicable local and regional plans, along with related land use and planning impacts, were fully analyzed in Section IV.H, *Land Use and Planning*, of the Draft EIR. The analysis in Section IV.H is supported by Land Use Plans and Policies: Project Consistency Tables included in Appendix J of the Draft EIR. While this comment is noted, as it does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

The Project may be operational as early as 2024 with buildout of either the West Site or the East Site. It is not possible at this time to predict with accuracy what the status of the COVID-19 virus will be in 2024, which represents the earliest year in which either the West Site or the East of the Project would be in operation. Furthermore, the comment does not provide any substantial evidence that Project operation would exacerbate the effects of the COVID-19 virus. CEQA does not require analysis of speculative conditions related to the potential for diminished use of public transportation. Pursuant to CEQA Guidelines Section 15143, “[t]he significant effects should be discussed with emphasis in proportion to their severity and probability of occurrence.” Furthermore, CEQA Guidelines Section 15064(d)(3) states that “[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable.” Therefore, forecasting the impact of COVID-19 is speculative. In addition to being speculative, COVID-19 is not a project or, more specifically, a component of this Project. Rather, COVID-19 is part of the environment and CEQA generally does not require an analysis of the environment’s impact on the Project (see CEQA Guidelines Section 15126.2). Thus, the Draft EIR meets the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

Comment No. IND 38B-1

Thank you for your response. This project should not go forward given a new reality for out *[sic]* city and country. This is the wrong time to be continuing the same pattern of High Density living.

Response to Comment No. IND 38B-1

See Response to Comment No. IND 38A-1.

Comment No. IND 38C-1

I write to ask that you extend the comment period on the Hollywood Center Project do to people having to shelter in place. Voters need more time and there should be no rush on this important issue. There are many new factors to discuss about high density living given what we are still learning about viruses and the possibilities for more pandemics.

Response to Comment No. IND 38C-1

The comment requests that the City extend the Project’s 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 40

Mary Brown
William C. Brown
Received May 7, 2020

Comment No. IND 40-1

As a resident of Hollywood I am asking for the LA Department of City Planning to extend the public comment period for the proposed Hollywood Center Development (aka: Millennium Group) for a period of 90 days minimum once the “Safer at Home” order has been lifted. This proposed project is of great concern to our community, and while we are under a “Safer at Home” order due to the COVID-19 pandemic, we request more time in regards to stating our concerns on the project.

Response to Comment No. IND 40-1

The comment requests that the City extend the Project’s 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 40-2

Personally, I am opposed to this project. Not just for its irresponsible architecture that is both unsafe (active fault line) and unappealing, or because it strips away the historical value that is Hollywood, or because it has no intention of solving a housing crisis in L.A. that is economically drive *[sic]* by offering rents no Hollywood resident should have to afford. NO. Today, we have a new threat, it’s called social proximity. And I find it surprising that the cities solution is to stack people on top of one another. Have we not learned anything from our cousins in New Jersey/Long Island, who are so densely packed in high-rise communities (and public transportation) that 1/3 of the nations *[sic]* 70,000 COVID-19 deaths can be accounted for in this region alone?

Response to Comment No. IND 40-2

This comment expresses general opposition to the Project based on its proximity to an active fault line, aesthetics, impacts to historic character of Hollywood, affordability and current COVID-19 related concerns but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Geology impacts, including those regarding the Project Site’s location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that

geology impacts, including fault-related impacts, would be less than significant and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

The comment also expresses opposition to the Project based on its architecture. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

This comment further asserts that the Project strips away the historical value that is Hollywood. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

Finally, the comment suggests that the density of the Project is synonymous with COVID-19 deaths occurring elsewhere in the country. The Project may be operational as early as 2024 with buildout of either the West Site or the East Site. It is not possible at this time to predict with accuracy what the status of the COVID-19 virus will be in 2024, which represents the earliest year in which either the West Site or the East of the Project would be in operation. Furthermore, the comment does not provide any substantial evidence that Project operation would exacerbate the effects of the COVID-19 virus. CEQA does not require analysis of speculative conditions related to the potential for diminished use of public transportation. Pursuant to CEQA Guidelines Section 15143, “[t]he significant effects should be discussed with emphasis in proportion to their severity and probability of occurrence.” Furthermore, CEQA Guidelines Section 15064(d)(3) states that “[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable.” Therefore, forecasting the impact of COVID-19 is speculative. In addition to being speculative, COVID-19 is not a project or, more specifically, a component of this Project. Rather, COVID-19 is part of the environment and CEQA generally does not require an analysis of the environment's

impact on the Project (see CEQA Guidelines Section 15126.2). Thus, the Draft EIR meets the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

Comment No. IND 40-3

Space, that is something we need to be concerned about. Restoring and re-thinking our preexisting infrastructures that California has been known for – instead of striping them away and rebuilding a “modern” vision from non-Californian developers, would still drive our construction economy, create jobs; and all without caving to the international conglomerates and special interests groups. Because, stacking people on top of each other in NOT the answer.

Response to Comment No. IND 40-3

This comment expresses general opposition to the Project based on its proposed density. However, this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 40-4

I believe that everyone should be able to have their opinion heard in an open forum. And it is for that reason I, like many other voting continuants, am alarmed to hear that the City has only provided the minimum comment period (April 16 – May 31st), during the “Safer At Home” order. This projects overall impact on the city needs to be thoroughly considered, and everyone deserves the right to speak. Not everyone has access to the internet to be able to review and comment in the time frame allotted. Further more [*sic*], those opposed to this action deserve more time to inform the public on what we can do to voice our opinions, considering physical public forums, rallies and other group actions are not possible.

Response to Comment No. IND 40-4

The comment states that the public’s opinions should be heard in an open forum. See Topical Response No. 1 – Public Participation and Review, above, which includes a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with this EIR.

Comment No. IND 40-5

Comment No. IND 41-1

To whom it may concern, I am writing in support the Hollywood Center project and ask that you move this project ahead with without *[sic]* delay or extension to the 45-day comment period.

I am a born and raised Angeleno and I care deeply about this city. I am passionate about the environment and making the world a livable, sustainable place not just for me but for my two daughters. The direction we are heading is not a good one – we need to completely rethink human’s impact on the environment and what it means for our future, our children’s future, and their children’s future. We can all make a difference by being conscious of our energy consumption and living sustainably. On a personal and smaller level, this means driving less and biking more. This means going plastic free. It means using less water and turning the AC down. These are all things we can do as individuals.

On a larger scale, our development needs to be sustainable and green. I’m attracted to Hollywood Center because it is a GHG net neutral project. Candidly all projects should hit this goal. I applaud this project for committed to this standard of no new emissions as a result of the project. If all projects did this, we would see no increase in pollution as a result of construction or operation of new buildings and projects.

It’s transformational commitments like these that we need to tip the scales against global climate change.

Please move this project forward without delay, and please continue your efforts to address climate change. It’s the biggest issue we face.

Response to Comment No. IND 41-1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 42

Name Unknown

Received May 8, 2020

Comment No. IND 42-1

Thank you for pasting the template response you have included in several other email inquires *[sic]* on this same topic.

I would ask that instead of doing so, these requests made by the public are taken a little more seriously by your department. Per your email: **"The City has received many requests for an extension of the Hollywood Center Project Draft EIR comment period in light of COVID-19."**

I will also remind you that the city, your department specifically has granted extensions to the public comment period for one of the related projects, Citizen M. Attached to this email is a copy of the notice of extension to be included in the administrative record.

The city has also extended the public comment period for its sidewalks program stating: "Due to the current COVID-19 emergency, the Draft EIR public review and comment period has been further extended"

<https://sidewalks.lacity.org/environmental-impact-report>

I would like to know what your response is to the individuals who do not use or have access to internet or files online? Or disabled individuals? Or individuals who need time to read and review the several thousand pages of the EIR. Your department is continuing to take advantage of a national pandemic and it is truly appalling.

Please answer the question *[sic]* asked in previous email which I will include again:

On what basis the city refuses to extend the comment period for the Hollywood Center project and how this compares to the extension the city provided to the related citizen M case.

Response to Comment No. IND 42-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Also, the Department of City Planning acknowledges the extensions to the comment periods for the Draft EIRs prepared for the citizenM Project and the City's Sidewalk Repair

Program. These projects are independent of the Hollywood Center Project, and each project is assessed independently by the City considering the circumstances applicable to each given project. In the case of the Hollywood Center Project, as discussed in Topical Response No. 1 – Public Participation and Review, above, the City met all the requirements under CEQA for public noticing of the Draft EIR. It should be noted that only one individual requested special accommodations during the comment period.

Comment No. IND 42-2

Attachment: The notice of extension for the citizenM project, as referenced in Comment No. IND 42-1.

Comment No. IND 43-1

Please count my support for Hollywood Center. It's projects like these that will get us out of the housing crisis we face and create a better Los Angeles for generations to come.

It's very simple, virus or no virus, we need housing. It's too expensive to live here, and the best thing we can do is build more housing. This project does that, and it does that in a big way. It's infinitely better than the parking lots that are there right now.

Please lend my name to moving this project forward, and please do not delay this project any further by extending any comment periods. This iteration of the project has been in the works for over 2 years. It's these long approval timelines that have contributed to the housing crisis we face. Please do not add to the crisis by lengthening the already extremely long process.

Response to Comment No. IND 43-1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 44-1

Please extend the 45 day comment period on the Hollywood Center Project for 45 days AFTER the stay at home is lifted. This is only fair to the citizens of the area to make their case on a project that is simply renamed after it was turned down because of being built on a fault line. This is ridiculous that it must be approached again.

Please add my name to those who want to extend this and please let me know your thoughts on the situation.

Response to Comment No. IND 44-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Regarding development on a fault line, impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Received May 11, 2020 (IND 45B)

Comment No. IND 45A-1

I have been a resident and home owner in Hollywood for 36 years.

Please extend the time for public review and comment on the Hollywood Center Project.

With Mayor Garcetti's 'Safer At Home' order, the residents of Hollywood have not had sufficient access to information about the Hollywood Center Project nor have we had opportunity to make our feelings known.

Prior to the covid shutdown, we have been experiencing severe gridlock in Hollywood. Increasing density in our neighborhood will only exacerbate this situation and make it more difficult for us to keep ourselves safe and virus-free.

Adjustments must be made to the Hollywood Center Project to mitigate the impact of the project on the health, safety and livability of Hollywood, which is not just "a famous place in Los Angeles", but the place where we live and raise our children.

Please extend the comment period to at least 90 days AFTER Mayor Garcetti completely lifts the Safer At Home order.

Thank you.

Response to Comment No. IND 45A-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment also makes a general statement that adjustments must be made to the Hollywood Center Project to mitigate the impact of the Project on the health, safety and livability of Hollywood. While this comment is noted, it does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 45B-1

Thank you for your response.

However, it makes zero sense that the public should not be afforded the same extension that the governor has extended to the clerk's office – as if the public is not under the same constraints as the county clerk and everyone else in Los Angeles who is doing their best to stay safe and healthy and avoid the virus, illness and death.

In Los Angeles, we are in the epicenter of covid-19 for the state of California. Your reasoning is absurd. The governor never intended the public to be disadvantaged by his order involving the clerks. It makes no sense for you or anyone else to interpret his order that way.

I strongly object to that interpretation and I do not believe it was the governor's intention to disadvantage the public. If you or your office choose to interpret his order in that way, I think you are making an unfortunate error.

At the very least, your office should query the governor's office to ensure that his intention is being carried out as he intended.

Please ensure that such a query is made – and please let me know the response you receive FROM THE GOVERNOR'S OFFICE.

Again – I am very sure that Governor Newsom never intended to disadvantage the public in the midst – and at the epicenter – of the covid pandemic in Los Angeles.

Please do forward a copy to me of your correspondence with the governor's office when you have queried his office on this particular point, which I believe you had misinterpreted.

Response to Comment No. IND 45B-1

The comment states that the public should be afforded the same extension that the governor extended to the County Clerk's office. The Governor's Executive Order N-54-20 provides that lead agencies operating during this suspension period and pursuing review of a Draft EIR must: (i) post the required public notices on the lead agency's website for the same length of time that would be required for physical posting; (ii) submit all required notices to the State Clearinghouse's CEQAnet web portal; and (iii) perform public noticing and outreach to all interested parties as permitted and required by CEQA (e.g., providing notice to all interested parties who have requested notice). The Project's Draft EIR Notice of Availability was mailed, published, and posted online on April 16, 2020, prior to the Executive Order's effective date of April 22, 2020. However, the notices provided for the Draft EIR nevertheless complied with the Executive Order's requirements for lead agency's operating during the suspension by: (i) posting the Draft EIR Notice of Availability online on the Department of City Planning's website (<https://planning.lacity.org/development-services/eir/hollywood-center-project-1>) for the entirety of the public review period and thereafter; (ii) submitting all required notices to

the State Clearinghouse's CEQAnet web portal (<https://ceqanet.opr.ca.gov/2018051002/3>); and (iii) performing public noticing and outreach to all interested parties as permitted and required by CEQA (e.g., providing notice to all interested parties who have requested notice).

Refer to Response to Comment No. IND 45A-1 for a discussion of the City's decision to not extend the Project's public review period. Additionally, please note, as stated in Topical Response No. 1, pursuant to the Governor's Executive Order N-54-20, signed April 22, 2020, while the Governor suspended some statutory time lines, deadlines for public review and comment periods for draft EIRs were not suspended and, therefore, CEQA provisions governing public review remain unchanged.

Comment Letter No. IND 46

Helena Lipstadt
Received May 10, 2020

Comment No. IND 46-1

As a resident of Los Angeles and a near neighbor of the proposed development, I am writing to **demand an extension for the comment period on The Hollywood Center project.**

Los Angeles is on lockdown. Libraries where hard copies of the DEIR have been distributed for viewing are closed. Transportation to view a copy of the document downtown is very limited and access is problematic.

The surrounding community has many concerns about this project. **We demand more time to review the planned development. Closing the comment period on June 1 during a city-wide lockdown is unacceptable.**

Response to Comment No. IND 46-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 47

Frederick Rappaport
Received May 10, 2020

Comment No. IND 47-1

My name is Frederick Rappaport and I am a resident of the Hollywood foothills. I am writing to respectfully request an extension to the 45 day comment period vis-à-vis the Millennium Project.

Why the Planning Department fails to consider the Covid-19 crisis an extenuating circumstance to the comment period is beyond my comprehension.

I beg you to reconsider.

Thank you for taking the time to consider this vital issue.

Response to Comment No. IND 47-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The also comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment Letter No. IND 48

Susan Core

Received May 10, 2020

Comment No. IND 48-1

I am writing to ask for an extension to the comment period for the Millennium Project, now known as the Hollywood Center Project. I am not against development in Hollywood, but this oversized project is troubling on so many levels—radically changing the Hollywood skyline and threatening traffic flow. Its outsized proportion is entirely inappropriate for our neighborhood, and we cannot let it go through without comment.

Now, during a Pandemic is not the time to move forward.

Please postpone!

Response to Comment No. IND 48-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

This comment expresses general opposition to the Project based on its scope, scale, and height, as well as traffic concerns. The comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. Regarding the Project's size, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies, or regulations related to location, form, and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, and, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

In regard to traffic, as noted on page IV.L-2 of Section IV.L, *Transportation*, of the Draft EIR, CEQA Guidelines Section 15064.3, Determining the Significance of Transportation Impacts, indicates that "...vehicle miles traveled is the most appropriate measure of transportation impacts." The revised guidelines require that lead agencies remove automobile delay, as described solely by level of service (LOS) or similar measures of vehicular capacity or traffic congestion, as a criterion for determining a significant impact on the environment pursuant to CEQA, except in locations specifically identified in the

revised guidelines, if any. In accordance with this requirement, CEQA Guidelines Section 15064.3(a), adopted in December 2018, states “a project’s effect on automobile delay does not constitute a significant environmental impact.” Therefore, traffic flow is no longer considered a CEQA issue and is not addressed in the Draft EIR. See Topical Response No. 2 – Transportation and Traffic, above, for additional details regarding the analysis of traffic impacts in the Draft EIR. As discussed in Topical Response No. 2, the Project’s transportation/traffic-related impacts were fully analyzed in the Draft EIR’s Section IV.L, *Transportation*, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) and prepared pursuant to the City’s Transportation Assessment Guidelines (TAG) adopted in July 2019. The TA is included in Appendix N-1 of the Draft EIR. As discussed therein, the Project would result in less-than-significant transportation/traffic related impacts.

Comment Letter No. IND 49

Russell Brown

Received May 10, 2020

Comment No. IND 49-1

I am a homeowner who lives within 5 minutes walking distance to the proposed Hollywood Center Project.

I am writing to STRONGLY URGE YOU to extend the comment period for this project. It is completely unreasonable for the city to expect a fair and comprehensive process can take place during this time. It would be irresponsible and a betrayal of the public's trust to not allow a fair hearing on this process.

Response to Comment No. IND 49-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 50

Marc Silverman

Received May 10, 2020

Comment No. IND 50-1

While the LA public is hobbled by the Covid-19 lockdown in Los Angeles, the City Planning Dept., taking a page from the Donald Trump handbook of dirty business tactics that always start with ignoring all constituents except the moneyed powers, insisting the minimal 45 day comment period not be extended regarding the Millenium [sic] Partners' plans for The Hollywood Center. With innumerable other building projects around the city also in the works and most businesses both large and small either temporarily or permanently shut down there will soon be a massive glut of empty office, apartment and condos only to be increased with the unwanted Hollywood Center...unwanted by all but the Millenium [sic] Partners. Hollywood is already beyond congested with a glut high end retail and private living space...which makes the decision by the City Planning Dept even more suspect as to why they will not extend the public comment period. Its [sic] yet another scam to award those with power and deep pockets at the expense of the existing local community of Hollywood which the LA Planning Dept should be serving the needs of first.

Response to Comment No. IND 50-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

This comment further expresses general opposition to the Project based on vacancies in Hollywood. This comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 56-1

I request that the time for public comments be extended in light of the mandated shutdown. It is only right that the public be given the full opportunity to comment on a project that will so greatly impact the neighborhood.

Response to Comment No. IND 56-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 57

David Bishop
1933 Carmen Avenue
Los Angeles, CA 90068
Received May 11, 2020

Comment No. IND 57-1

I am writing this as a request to extend the CEIR *[sic]* comment period. I live three blocks from this project. I have lived here 41 years. The impact this project will have on the traffic in Hollywood, especially the 101 on and off ramps at Vine and Franklin will become an absolute nightmare.

Due to the lock-down, personal, social and business burdens have understandably kept this project off the radar. Considering the magnitude of this project and the monumental changes it will cause, it is only reasonable and fair to give people more time to register their comments.

Response to Comment No. IND 57-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment also expresses a general concern that the Project will have an impact on traffic in Hollywood, especially on the US-101 on- and off-ramps at Vine Street and Franklin Avenue. However, the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. It should be noted that the City did receive two letters from Caltrans with comments on the transportation analysis to be conducted for the Project. Although the analyses requested by Caltrans are not a required CEQA analysis per the City's Transportation Assessment Guidelines (TAG), adopted in July 2019, the analyses were presented for informational purposes in Appendix I to the Transportation Assessment (TA) for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also, refer to Response to Comment No. ORG 2-7 which discusses a recent meeting on July 1, 2020 between the City Department of Planning and Caltrans. As discussed therein, Caltrans' concerns were non-CEQA concerns and Caltrans did not raise any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

Comment Letter No. IND 58

Kathleen York
Received May 11, 2020

Comment No. IND 58-1

We simply must have an extension regarding the Millennium Project. How is it Constitutional that we are on lockdown, but your office is going forward as though nothing is happening. Just STOP and allow those affected to review the documents properly, which are held in the “closed” library, and have their say.

Response to Comment No. IND 58-1

The comment requests that the City extend the Project’s 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The also comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment Letter No. IND 59

Adam Fischer

Received May 11, 2020

Comment No. IND 59-1

Please extend the deadline for comment on the Hollywood center project. It is not feasible for the public to review and express their opinions about this project during a global pandemic and a citywide lockdown. I am shocked that this is moving forward right now, and the cynical side of me thinks that certain interests are trying to force this on the public surreptitiously and during a time when it would receive little attention (which is disgusting).

Response to Comment No. IND 59-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 59-2

Alternatively you could just deny the project which would be the second time the public has stated that we don't want oversized monster projects like this in our city- especially in Hollywood which is not like downtown and would not support skyscrapers – and especially when it would be built on a major fault line!

How many times do we have to tell the city we don't want this project in Hollywood? Send these developers away for good!

Response to Comment No. IND 59-2

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

This comment also expresses general concerns regarding height and scale, as well as development on a fault line fault. However, the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. Nevertheless, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above. In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of

the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies, or regulations related to location, form, and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, and, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Regarding development on a fault line, impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

The comment period for the Millennium Hollywood Center Project should be extended and expanded to allow for public input during and after the pandemic shut down. The project is traffic disaster on an already compacted area.

Response to Comment No. IND 64-1

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

The comment also requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

This comment further states that the Project is a traffic disaster on an already compacted area but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, traffic impacts were addressed in Section IV.L *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Comment Letter No. IND 65

Theodora and Robert Primes
2062 Watsonia Terrace
Los Angeles, CA 90068
Received May 11, 2020

Comment No. IND 65-1

We hope this is the proper forum to express our concerns about and objection to the mammoth “Hollywood Center Project.”

We moved into the Whitley Heights area of Hollywood in October 1978 and have lived in our home there for almost 42 years. We are aware that rising property values have caused long commutes into Hollywood and are among the causes of the gridlock that has paralyzed almost all of Los Angeles. Our perspective of the proposed development is that it offers only token amounts of housing that is truly affordable compared to a disproportional amount of expensive housing that will only further exasperate our problems.

The effects of the Covid19 pandemic will change everything in ways that are not yet foreseeable. The entertainment industry will look quite different and may never return to its prior robustness. Certainly, it is a time for caution until we can clearly see how our world will change during the next decade or so. Yet paradoxically, some mysterious force seems to be exerting pressure to close the public comment period despite the objections of many of our well informed and caring neighbors.

If you are not serving the interests of the people living in Hollywood, it begs the question, “Whose interests are you serving?”

Surely, waiting until we can predict the permanent effect of the destructive pandemic is better than exposing the planning department to charges of rushing through a controversial project for less than altruistic reasons!

Response to Comment No. IND 65-1

The commenter expresses general opposition to the Project based on its proportion of affordable housing compared to market-rate housing. While this comment is noted, it does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

The comment requests that the City extend the Project’s 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 67-1

I hope you are staying well.

I am writing to request an extension for the comment period fo *[sic]* Hollywood Center Project DEIR.

Considering the city shutdown and the disruption this virus has caused for local business' *[sic]* as well as residents and employee stakeholders it seems only reasonable to extend this comment period. As a business and property owner that abuts this project I can tell you that I have had to spend every waking moment dealing with the disastrous repercussions from this unexpected virus. I am also a resident in the adjacent Hollywood Dell neighborhood. Stakeholders are currently absorbed with self-survival and deserve an extended window to concentrate on this complex project which will greatly impact their daily lives.

Response to Comment No. IND 67-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 68

Comment No. IND 69-1

My name is Luminita Roman, and I am a resident of Hollywood, CA. I also happen to be the housing chair for the Hollywood Hills West Neighborhood Council. However, I am writing to you right now not in my official capacity but as a resident of Hollywood.

Response to Comment No. IND 69-1

This comment serves as an introduction to the remainder of the comment letter. Responses to these comments are provided in Response to Comment Nos. IND 69-2 through IND 69-4.

Comment No. IND 69-2

The reason why I am reaching out to you is to voice my concern over the project that is being fast-tracked through your office, without a real community input on this project. I live not too far from this proposed project and I will be personally impacted by it via additional traffic, noise, and everything that comes with a tsunami wave of people moving into my neighborhood, as the services are limited and we will have to compete for all those services.

Response to Comment No. IND 69-2

The comment expresses general concerns regarding the Project's traffic, noise and services. The comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, traffic impacts were addressed in Section IV.L *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Regarding noise concerns, noise and vibration impacts were analyzed in Section IV.I, *Noise*, of the Draft EIR, with supporting information provided in the Construction Noise and Vibration Study and a Construction Traffic and Operational Noise Study, both included in Appendix K of the Draft EIR. The analysis in Section IV.I concluded that that Project's construction activities would result in significant and unavoidable noise and vibration impacts to nearby noise and vibration sensitive residential and commercial uses; however, it should be noted that these impacts would be temporary; and that during Project operation, noise and vibration impacts would be less than significant. See also Topical Response No. 7 – Noise and Vibration, above.

The comment also asserts that public services are already overburdened and that the Project will further this condition. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, fire and police services impacts were addressed, respectively, in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, with supporting data provided in Appendix M of the Draft EIR. Pursuant to the CEQA Guidelines, and the thresholds used by the City to determine the significance of impacts to fire and police services, the focus of the analyses is on whether or not new or expanded facilities are needed to maintain adequate public service and whether a potential physical impact could occur if construction of facilities was warranted. In the case of the Project, it was determined that the Project would not generate a demand for additional police and fire protection services that would result in the need for new or expanded fire and police services facilities. As such, Section IV.K.1 and IV.K.2 concluded that impacts to fire and police services, respectively, would be less than significant. Notably, regarding public safety, as provided in Project Design Feature POL-PDF-2, the Project would incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding signage and lighting for walkways and entries. This is in contrast to existing conditions in the area, which include surface parking lots and long alleys between blocks, where buildings are partially cut off from the street. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for LAPD services. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a seven-day a week security patrol, and could assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services.

Comment No. IND 69-3

First and foremost, it is imperative for the DEIR comment period to be extended, and I am asking for this to take place. The Covid-19 pandemic has taken people by storm and their lives have been turned upside down. With millions of job loss, people are focused now on how they will put food on the table for them and their families, meet their rental/mortgage obligations and thus are in the Survival mode. As we speak, the State of California is in the second phase of re-opening the economy. The DEIR for this project is the last thing on their minds right now, even though this project will affect their lives a great deal in the future. Since people are not in their right minds right now, it would behoove your department to allow for this pandemic to pass or for the economy to fully open before they would close the comment period for the DEIR for this project.

The Neighborhood Councils are shut down, our NC had its last meeting in February of 2020. How can you expect for the NCs to get the pulse of their stakeholders when everything is still on lockdown?

Response to Comment No. IND 69-3

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above. Furthermore, Neighborhood Councils are not required to meet in person in order to confer, nor is it a CEQA or City requirement that Neighborhood Councils have to meet in person in order to provide comments. Furthermore, the Department of City Planning accepts comments up until the final decision is made on the Project.

Comment No. IND 69-4

I am asking the City of Los Angeles, and in special your department, to proceed with caution, as litigation over this project is most likely to follow and you will all have to answer in a court of law why you rushed this project through over so many objections that you received from the community.

Please advise accordingly.

Response to Comment No. IND 69-4

This comment mentions the potential for litigation on the Project, but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 70

Anita Rosenberg
Received May 11, 2020

Comment No. IND 70-1

Mindy – please extend the period of comment on the Millennial [*sic*] project – which is a horrible project for our historic and beloved neighborhood. I am not sure what else to add in this email.

Response to Comment No. IND 70-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

The comment states that this is a horrible project for our historic and beloved neighborhood. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

Received May 11, 2020

Comment No. IND 73-1

Due to the coronavirus pandemic:

- Libraries where hard copies of the DEIR have been distributed for viewing are closed due to City mandate.
- Some people cannot drive. Taking public transit to view a copy downtown is not a choice for some, if they could even get into the building
- Your choice, hoping that the USPS will get to a mailbox your \$6.00 copy of the DEIR in time to comment, or download 100s of pdfs to review.

Accordingly, **this is to request that the comment period regarding the Hollywood Center Project be extended to at least 45 days after the libraries housing copies of the DEIR have been re-opened, or the lockdown has been rescinded.** Please add my name to any petition requesting any such extension.

Response to Comment No. IND 73-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. Received May 11, 2020

Comment No. IND 74-1

As a 40 year resident of the Hollywood Hills, I am writing to request an extension to the current 45 day public comment period on the Hollywood Center Project.

We are not living in normal times, and to expect that a comment period end in 45 days on a project that has such HUGE ramifications for local residents, during a time when most of the city is shutdown due to COVID 19, is ridiculous.

1. Libraries, where hard copies of the DEIR can be viewed are closed.
2. Many people cannot drive, and public transportation isn't an option for many, not to mention even being able to gain entrance to a public building in order to review the DEIR.
3. While it is possible to order a copy of the DEIR for \$6.00 that will ship via USPS, there is no certainty that these reports can even be sent in time for proper review, or be sent at all.

So please, stand with residents and help us by allowing the comment period on Hollywood Center DEIR to be extended for at least 90 more days from June 1st.

Response to Comment No. IND 74-1

The comment requests that the City extend the Project's 47-day public review period. Comment Letter No. IND 76

Thomas Calderon

Received May 11, 2020

Comment No. IND 76-1

It has come to my attention that the public comment period for the Hollywood Center development will be drawing to a close in the midst of the corona virus pandemic safer-at-home restrictions. I strongly urge city officials and agencies involved in this process to reconsider the June 1st deadline and accommodate a longer timeline due to the extraordinary pressures we are all enduring. At the very least, pressing forward on a DEIR commentary period will leave an enduring blemish on this particular project and the city's already questionable history regarding development. This is shaping up to appear like yet another win for powerful special interest developers and their political partners against the best interest of the community and citizens of Los Angeles in general. When will government get this kind of process right? The city should strive to weigh more heavily on the input of less privileged constituents as a matter of course. My impression is that my voice, and that of the community's interest typically is at the end of the line as far as priorities go. It should be your job to make sure it's the opposite.

Response to Comment No. IND 76-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. Comment No. IND 78-1

Please find attached my letter in support of the Hollywood Center Project. Please acknowledge receipt.

Response to Comment No. IND 78-1

This comment letter indicates that there is an attached letter to the email. A response to that letter is provided in Response to Comment No. IND 78-2.

Comment No. IND 78-2

I am an original owner of a condominium parcel at the Broadway building, just one block south of the proposed Hollywood Center project. Thank you for this opportunity to provide public comment upon the release of the draft environmental impact report. **I am writing to support this project and urge the city to approve the EIR and move this forward.** It has been more than 10 years in the making.

This central part of historic downtown Hollywood has been on the rise for the past two decades. It has not been an easy road. I invested in this property and proudly used this location as my office for many years.

I note that the opposition to this project has adopted the strategy to seek an extension of the public comment period because of the city's stay at home order in the wake of the pandemic. There is nothing about adhering to the "stay at home order" that makes it difficult to read the documentation that allows one to make an informed choice. To the contrary, it should be easier to read, because we have more time on our hands.

If anything, the devastating impact of the economic dislocation brought on by this global pandemic warrants keeping this project on schedule. Delaying a review period for an EIR that everyone has been waiting for sends a risky message to others who might have the courage to invest in Los Angeles in the age of covid.

This core part of Hollywood is inextricably tied to tourism and entertainment. As a result of this pandemic of indeterminate length, the Hollywood micro-economy is going to suffer severe setbacks. Delaying this project will have serious impacts on the ability of Hollywood to resume its contribution as an economic engine to the city and county.

An article (link: <https://www.sgvtribune.com/2020/05/04/devastated-california-tourism-industry-losing-72-billion-report-says/>) this past week in the San Gabriel Valley Tribune reported that California tourism is on track to lose \$72B in visitor spending this year, nearly

half of what was generated in 2019. One can only imagine what the continued impact will be into 2020. With respect to the theaters that employ so many and keep our restaurants alive, experts suggest it may well be mid 2021 before it will be safe for people to sit in close proximity to each other again.

I encourage our city leaders to keep their eyes on the future of our city and to stay focused upon the vision of a Hollywood where people live and work in the neighborhood, use public transportation and benefit from having neighborhood amenities in walking distance. By the time this project opens its doors, we will have moved through this difficult chapter in the life of our city, our country and the world and we will have something to celebrate together.

Response to Comment No. IND 78-2

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 79

Tree Lockie

Comment Letter No. IND 81

Diane Weiss

Received May 12, 2020

Comment No. IND 81-1

Re: case no. ENV-2018-2116-EIR

As a resident of Hollywood, I am writing you to ferociously express my opinion about the so-called Hollywood Center/Millennium Project.

This development is one of the most disastrous ideas to come to now overdeveloped Hollywood. No one who actually lives in this neighborhood wants this monstrously oversized, lifestyle destroying, sure-to-be-unaffordable eyesore!

Response to Comment No. IND 81-1

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

The comment expresses general opposition to Project regarding aesthetics and size, but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies, or regulations related to location, form, and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, and, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Comment No. IND 81-2

The developer has had a colossal failure in San Francisco. But even more importantly, the gridlock it would wreak on this already over-congested area would be hell for the residents and commuters and would result in fewer people visiting the area for commercial reasons. It is about 5 times over-sized. And on a faultline! The burden it would put on the electrical, sewer and water infrastructure is unacceptable. It could hardly be a worse idea!

Blocking views, dwarfing the Capitol Records building and looking ridiculous in it's [sic] size, this spells nothing but disaster for Hollywood. The phony notion that building near the metro to ease traffic is a joke. No one who can afford these over-priced new buildings rides the metro.

Response to Comment No. IND 81-2

The commenter expresses general opposition to the Project based on impacts related to traffic gridlock, massing too big, faulting, utility infrastructure demand, and view blockage. The commenter also states that no one who can afford these over-priced new buildings rides the metro. While these comments are noted, the comments do not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, traffic impacts were addressed in Section IV.L *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

In regard to aesthetics impacts, see Response to Comment No. IND 81-1.

In addition, geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Regarding utilities and infrastructure, the Project's impacts on wastewater and water supply are fully analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, of the Draft EIR. Also, Chapter IV.O, *Energy Conservation and Infrastructure*, of the Draft EIR, evaluates the energy implications of the Project, focusing on the following three energy resources: electricity, natural gas, and transportation-related energy (petroleum-based fuels). Supporting technical infrastructure information is included in Appendix P-1 of the Draft EIR. A City approved Water Supply Assessment (WSA) for the Project is included in Appendix P-2 of the Draft EIR. As discussed therein, the Project would result in less-than-significant utility, water supply, and energy infrastructure impacts.

Impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame and other nearby historical resources. The Project's direct impacts to

historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

Comment No. IND 81-3

We need AFFORDABLE, sensible, scale-appropriate housing that will not ruin traffic flow in the neighborhood.

I hope this committee uses their heads and tells bad developers to go away.

Response to Comment No. IND 81-3

This comment expresses the desire for affordable housing. The Project would propose 133 senior affordable housing units.

The comment also expresses general opposition and opinions regarding the Project's massing and traffic but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, in regard to aesthetics impacts, see Response to Comment No. IND 81-1. In regard to transportation impacts, see Response to Comment No. IND 81-2.

Comment Letter No. IND 82

Kent Beyda

Received May 12, 2020 (IND 82A)

Received on May 16, 2020 (IND 82B)

Comment No. IND 82A-1

I am requesting an extension of the 45 day comment period on the Hollywood Center Project. In this time of pandemic many people do not have the time to devote to exploring the issues around what I feel will be a major disruption to our way of life in Hollywood. Thank you for your time.

Response to Comment No. IND 82A-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 82B-1

Thank you for your reply. For those of us suffering under the current cover restrictions and who are dismayed at these horrible skyscrapers moving ahead this is not good news. Please enter these comments into the record.

Response to Comment No. IND 82B-1

The comment expresses general opposition to the Project. The comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 83

Todd Manion
Received May 12, 2020

Comment No. IND 83-1

I am writing to request an extension for comments on the Millennium Hollywood Center. As we are all house bound it has been difficult for many of our neighbors to provide feedback as they have not viewed the documents.

Response to Comment No. IND 83-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment also makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment Letter No. IND 84

Comment Letter No. IND 85

Cherilyn Smith
Received May 12, 2020

Comment No. IND 85-1

I am writing regarding the above referenced subject, located in Council District: 13 – [O’Farrell] in Hollywood, requesting that the response time be extended.

With the city being on lock down, *as ordered by Mayor Garcetti*, due to Covid 19, I find it unconscionable that this DEIR was even released and then there’s the response period. With the city on lockdown it difficult to obtain from the city or search for additional records for responding. As well, with DEIR’s being on a disk they can be very confusing unlike when all were printed!

Therefore, due to the extenuating circumstances, the response period for responding to the Hollywood Center Project DEIR is unreasonable and must be extended.

Thank you for your consideration during this difficult time.

Take care and stay safe!

Response to Comment No. IND 85-1

The comment requests that the City extend the Project’s 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 87

Brian Folb
6464 Sunset Boulevard, Suite 700
Hollywood, CA 90028
Received May 12, 2020

Comment No. IND 87-1

When my father built his first office building on Sunset Blvd. in Hollywood almost 60 years ago, he had a vision. At the time, there had been no new office product provided in this area for almost 30 years. He took the risk and created something different and unique, which provided space for those wanting to move their businesses to Hollywood and would in turn help revive the area. Over the next 10 years he built 3 additional high rise office buildings, 2 more on Sunset Blvd. and one on Highland and Franklin, totaling almost 300,000 sq. ft. of new office product in Hollywood which my family continues to own and operate today.

Now almost 60 years later, the buildings my father built, and others that have risen since, stand as symbols of a Hollywood that has become the home of residents, employees, and individuals who want to be a part of the center of Los Angeles.

Hollywood Center is a project that will continue this vision, and as my father's first building did, give a diversity of individuals the opportunity to call Hollywood their home. From young residents to seniors, Hollywood Center is a project we believe will be the catalyst this community needs as we look to revive our neighborhood following this pandemic.

This project will provide necessary open space, plans around the continued expansion of public transportation in Los Angeles, and stands for environmental stewardship by committing to LEED Gold Certification, the reduction of water usage, and no net new GHG emissions during construction and operation.

As longstanding members of the Hollywood community, my family and I have been focused on the revitalization of Hollywood and have taking an active leadership role in helping the community change for the better. Many of these positive changes came through the leadership and sacrifice of many people in addition to my family and the risks taken by those who chose to invest in Hollywood. Economic Development is essential to ensure that a community continues to stay relevant and a resource to its residents and visitors alike.

When housing is an essential need, we need to identify sites like this where density can occur. The DEIR has taken into consideration what this project will mean to our community and has shown where mitigation can occur in order to ensure that it is both built and operated correctly for years to come.

For these reasons and more, I strongly support this project and ask that you move it forward. Hollywood is ready for its next chapter, and visionary proposals like this is what we were built on.

Response to Comment No. IND 87-1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 88

Comment Letter No. IND 89

Cody Winchester

Received May 13, 2020

Comment No. IND 89-1

I'm an architectural designer living in Hollywood heights, and I have serious concerns over the proposed Hollywood Center Project. My understanding is that the footprint of these building span across the Hollywood Fault which is capable of producing at least a magnitude 6.0 seismic event. I believe the engineering team and client are grossly misrepresenting the potential risk to life that the project poses and I ask that you reject the development in the interest of public safety.

Response to Comment No. IND 89-1

The comment expresses general concerns about earthquake hazards. Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Please see attached for my Letter of Recommendation for the Hollywood Center Project.

Response to Comment No. IND 90-1

This comment letter indicates that there is an attached letter to the email. A response to that letter is provided in Response to Comment No. IND 90-2.

Comment No. IND 90-2

This letter is to voice my support the proposed Hollywood Center project. It's a project we've been following for some time and after going over the public details (Plans, Environmental Impact Report), I believe this project will help bring a greater sense of community to the neighborhood. I've had my business in the area near the project for a long time and we've watched developments help create a real sense of neighborhood that was never there before.

We're in the recording studio business and work closely with Capitol and have longed for a better pedestrian experience, more nearby green spaces and a more centralized space to hang and eat. I support the project and am particularly excited for the continued preservation of Capitol Records, an important landmark to music business people and that the neighborhood around this will now be more accessible and attractive. We always believed that famous intersection would repopulate with exciting new developments and the development partners all have great experience. It will be very good for the neighborhood to have this development fit into the revised elements of the Walk of Fame revitalization.

I support Hollywood Center, and we hope to see this project move forward swiftly.

Response to Comment No. IND 90-2

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 91

Jeff McDonough
Received May 13, 2020

Comment No. IND 91-1

So, you really think its [sic] ethical to open and close the comment period for this project that was already rejected, during this time when all council meetings are closed to the public? You think its [sic] ethical for your office to be both open and closed simultaneously depending on who one is?

I think you're underestimating the growing sentiments of the citizens of this city, especially now that more and more city employee/developer corruption is being revealed and prosecuted, and federal investigations are underway.

https://www.latimes.com/california/story/2020-05-13/la-city-hall-corruption-consultant-guilty-plea?utm_source=sfmc_100035609&utm_medium=email&utm_campaign=News+Alert:+L.A.+City+Hall+corruption:+Consultant+agrees+to+plead+guilty+in+racketeering+scheme+-+00&utm_term=https://www.latimes.com/california/story/2020-05-13/la-city-hall-corruption-consultant-guilty-plea&utm_id=6648&sfmc_id=2418629

Response to Comment No. IND 91-1

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

The comment also makes reference to the fact that the City has chosen not to extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The referenced Los Angeles Times article does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

We are writing to request an extension to the comment period for the “Hollywood Center Project” DEIR.

In the interest of fairness to the public...this extension is absolutely necessary during the current Corona pandemic.

Please do not allow the interests of the “Hollywood Center Project” developer to override the unusual demands of our public health at this time.

Response to Comment No. IND 92-1

The comment requests that the City extend the Project’s 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 93

Chiara Santi

Received May 14, 2020

Comment No. IND 93-1

I am submitting this letter to offer support during this public comment period for the proposed project, Hollywood Center. I am in support of this project and feel it will be an asset to the Hollywood community.

I have lived in Hollywood for several years now and I want to tell you that I appreciate this community...what it was, what it is, and what it can still become. In recent years this once entertainment industry hub, has struggled with the transition of becoming a neighborhood, especially in the area south of the Hollywood Hills.

Hollywood Center will bring over 1,000 units to the area, with 133 of those set aside for seniors – a population that is rapidly growing and seriously rent burdened. These units, and the individuals that come with them, will further grow our community as a neighborhood.

The project will also provide much needed jobs and open space. As someone with children I know how critical it is to have space in a city environment for us to go where our family can experience the community around us.

In closing, in addition to considering my support for Hollywood Center, I ask that you do not extend the public comment period and continue to move forward with the review of this project. In this time, we need big ideas like this, we need projects like this, we need neighborhoods that are lived in and that will continue to grow.

Thank you again for this opportunity to participate in the public comment process.

Response to Comment No. IND 93-1

The comment expresses support for the Project and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Please extend the 45 day comment period on The Hollywood Center DEIR!

Response to Comment No. IND 94-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 95

Adam Burke

Received May 15, 2020

Comment No. IND 95-1

I am an impacted resident of the development and request that the public comment period be extended.

Response to Comment No. IND 95-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 95-2

Are there any statistics on the efforts to increase density in transport corridors vs Metro ridership? From the research I've done, you're just creating traffic nightmares as ridership sinks and more residents are crammed into certain neighborhoods based on a failed infill theory. The condos are pricey, not helping the situation overall, and the people who occupy them, being wealthier, can and prefer to drive and don't use the Metro. If the stats are not panning out, the City needs to re-think. I live in a residential street in the Hollywood Dell that often has traffic jam in regular times, particularly when the Bowl is open.

Response to Comment No. IND 95-2

The comment expresses general opinions that the Project would create traffic issues as they related to an increase in density. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, the Project's transportation/traffic-related impacts were fully analyzed in the Draft EIR's Section IV.L, *Transportation*, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) and prepared pursuant to the City's TAG adopted in July 2019. The TA is included in Appendix N-1 of the Draft EIR. As discussed therein, the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

It should also be noted that the proposed density for the Project is compliant with the underlying zoning designation. Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies or regulations related to location, form and density of development adopted for the purpose

of avoiding or mitigating a significant environmental effect, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Comment Letter No. IND 96

Rebecca Waer
Received May 15, 2020

Comment No. IND 96-1

I hope this email finds you well during these tumultuous times.

I am a resident of Hollywood/Beachwood Canyon, and have lived here for nearly 12 years. We have seen much change in Hollywood during that time, some good, some not good. The Hollywood Center project, aka Millennium Project, falls under “not good.” I oppose the construction of this project, and am writing to express my opinion – as many other citizens have been urged to do, as well.

Response to Comment No. IND 96-1

The comment expresses general opposition to the Project. As this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

The comment also makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment No. IND 96-2

The traffic generated by such a huge project would overwhelm all the onramps to the 101 freeway. Beachwood Canyon Neighborhood Association shares that concern and is also well aware that this same traffic will clog all of the streets in Hollywood.

Response to Comment No. IND 96-2

The comment expresses a personal concern shared with the Beachwood Canyon Neighborhood Association that the Project will have an impact on traffic at the on-ramps to US-101 and on all the streets of Hollywood. While the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above, for a discussion of traffic impacts from the Project, including impacts to US-101 and its on- and off-ramps.

Comment No. IND 96-3

The project involves two multi-use towers 35 and 46 stories adjacent to and across the street from the Capitol Records Building. The issues that were present with that first rendition are the same with this new one. New name – same issues:

Response to Comment No. IND 96-3

The comment introduces issues that, in the commenter's opinion, is shared with the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. Responses to the comments are addressed in Response to Comment Nos. IND 96-4 through 96-7 below.

Comment No. IND 96-4

-Emergency Response: We know that such a monstrosity of a development will tap the already thin emergency response resources we now count on. Also, we are surrounded on three sides by parkland and need to know that the the *[sic]* fire department can get up here and quickly.

Response to Comment No. IND 96-4

This comment raises concerns about emergency response but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. See Topical Response No. 2 – Transportation and Traffic, above, which addresses emergency response.

Comment No. IND 96-5

-Traffic/Parking: Parking on every street near the development will be impacted and overflow cars will be driving up Beachwood in search for parking. Our parking situation is already a nightmare and these extra cars will only make it worse. Beyond that, all those extra cars will mean exiting the canyon in an emergency will only be more difficult.

Response to Comment No. IND 96-5

The comment expresses a general concern that the Project would impact parking on every street near the Project Site and cause cars to park near the commenter's residence, but does not provide any specific issues with respect to the content or adequacy of the Draft EIR. However, as noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Comment No. IND 96-6

-Infrastructure: Imagine the amount of water that will be siphoned off to support this development not to mention the sewer and other services.

Response to Comment No. IND 96-6

The comment expresses a general concern about the Project's impact on water and sewer infrastructure. While the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, the Project's impacts on wastewater and water supply are fully analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, in the Draft EIR. Supporting technical infrastructure information is included in Appendix P-1 of the Draft EIR. A City approved Water Supply Assessment (WSA) for the Project is included in Appendix P-2 of the Draft EIR. As discussed therein, the Project would result in less-than-significant utility and water supply impacts. In regard to wastewater, as stated on page IV.N.1-13 of Section IV.N.1, *Wastewater*, of the Draft EIR, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under City's Building and Safety Code and the Los Angeles Department of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with LAMC Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

In regard to water supply, as stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved WSA, as required by SB 610, for the Hollywood Center Project that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Therefore, there would be sufficient water supplies available to service the Project.

Comment No. IND 96-7

Please consider these concerns, as expressed by tax payers of Los Angeles and Hollywood. Consider what is good, and best, for Hollywood and Los Angeles in the long

term. This project is is *[sic]* not that. There a thousand other better ways to update Hollywood – this isn't it.

Thank you for your work and consideration of this urgent matter.

Response to Comment No. IND 96-7

This concluding comment is noted; however, as this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 97

Evan Saona
1645 Vine Street, #509
Los Angeles, CA 90028
Received May 15, 2020

Comment No. IND 97-1

I own a condo at 1645 Vine Street, Los Angeles 90028. I'm a bit concerned about the proposed Hollywood Center Project. First, I want to make it clear that I'm all for development in Hollywood. My concerns with he *[sic]* project are the height of the builds and traffic. A) Hollywood has a fairly uniform look and feel to it. I don't think the proposed buildings fit with the community. They seem way too big and out of place.

Response to Comment No. IND 97-1

The comment expresses general concerns about the height of the Project and its potential impact on traffic. While the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Regarding traffic, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 97-2

B) Traffic on Vine during peak hours is already a mess. What is the city planning to do about this? Construction and additional residents will only make this worse. Vine has 3 lanes going in each direction and a turning lane, yet traffic is often choked to one lane in each direction. Street parking is permitted 24/7 and takes up 1 lane. In addition, you have ride share vehicles frequently double parked waiting for passengers. Construction and adding additional residents with no change to the current traffic situation will be disastrous. Please take these comments into consideration as you work through the development planning process.

Response to Comment No. IND 97-2

The comment expresses concerns about traffic conditions, including traffic congestion during construction and operation, with specific reference to traffic impacts along Vine Street. The comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. See Topical Response No. 2 – Transportation and Traffic,

above, which discusses traffic impacts resulting from the Project, including construction traffic.

Comment Letter No. IND 98

Gary Buchschacher Jr., MD, PhD
Received May 15, 2020

Comment No. IND 98-1

This letter is to express my strongest possible opposition to the proposed Hollywood Center project. The size and scale of the project, if completed, would be disastrous and ruinous to the main area of Hollywood and the surrounding neighborhoods, and is the complete antithesis of the type of projects that should be supported and approved for the Hollywood area.

Briefly, the project is much too large for the area and would result in an extraordinary plummeting of the quality of life for those living in the main Hollywood area and surrounding neighborhoods (and also for those visiting or commuting through the area), and would also detract from the experience of tourists who visit Hollywood.

From an aesthetic and neighborhood development standpoint: the skyline and views of the Hollywood Hills, including views of the Hollywood sign, would be destroyed. Nothing should ever be allowed to be built so large that it would cause such major damage to the views. The view of the Hills and the sign are one of the things that Hollywood is known for; these views are recognized as iconic throughout the world; people travel from all over the world just to experience and enjoy these views, as it makes people feel connected to Hollywood in a personal way; these tourists then bring their excitement home, which encourages others to visit Hollywood as well. The position of the proposed project is especially problematic in this regard as it would obscure much of the main and closest views from the Hollywood area. But it is not just tourists affected; many residents from the greater Los Angeles area also visit Hollywood for this experience as well. In addition, there are an incredible number of permanent residents in the area, many of whom have lived in the area for many years; these are the people primarily responsible for the progressing “rebirth” of Hollywood, and to destroy what is an integral part of their lives and neighborhood would be tragic and unjust.

Response to Comment No. IND 98-1

The comment expresses opposition to the Project based on its size and scale, effects on views of the Hollywood Hills and the Hollywood sign for residents, as well as tourists in Hollywood. Aesthetics and effects on views were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See pages IV.A-29 through IV.A-54 in Section IV.A of the Draft EIR, where the analysis supported by multiple visual simulations indicates that the Project would not significantly block views of the Hollywood Sign, the Hollywood Hills, or the Downtown skyline, and that the proposed buildings would comprise a small portion of the view fields, and would not substantially diminish broad scenic views from the hills. See also Topical Response No. 4 – Aesthetics, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies, or regulations related to location, form, and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, and, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Regarding effects on tourism, as described in Chapter II, *Project Description*, of the Draft EIR, the Project would redeveloped a Site that is largely comprised of surface parking and would add a number of pedestrian enhancements to the area, including elimination of several curb cuts on Vine Street, as well as a plaza and Paseo that would provide greater access to views of the Capitol Records Building and Jazz Mural, all of which could be utilized by tourists.

Comment No. IND 98-2

From a practical standpoint, there is absolutely no way that the area would be able to handle the additional population and, importantly, the traffic that such a project would generate. The traffic now is barely manageable; it is not unusual for traffic to be backed up for over a block, resulting in the necessity to sit through more than one cycle of stoplights simply to travel a half block. In addition to all of the residents who must travel through the area, there are thousands of commuters who use the corridor to both enter and exit the nearby freeway. The residents of the area deserve to be able to come and go from their home in a relatively free manner. The overwhelming issue of traffic would result in an inhospitable environment that would be torture to try to navigate-- and this situation, in turn, would actually reverse the progress made in the re-development and re-birth of Hollywood, as the area would become known as a place to avoid at all costs.

Response to Comment No. IND 98-2

The comment asserts that the area would not be able to handle the Project's additional population and traffic, but does not raise specific issues regarding the content or adequacy of the Draft EIR. The Draft EIR addressed population and housing impacts in Section IV.J, *Population and Housing*. As analyzed therein, population and housing impacts would be less than significant under the Project as the Project would not induce substantial unplanned population growth to the area (based on the Southern California Association of Governments' [SCAG] adopted 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy [2016-2040 RTP/SCS]), either directly (for example by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure). The Project's increases in population and housing would be within SCAG's projections for the City in the Project's operational year and in 2040, the SCAG 2016-2040 RTP/SCS's horizon year.

Regarding traffic, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles

Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The traffic effects of the Project, including congestion, were discussed in the TA in Appendix N-1 of the Draft EIR. While it is acknowledged that the Project would contribute traffic to the local roadway network, traffic congestion is not a CEQA issue and is, therefore, not evaluated in the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 98-3

I have been a condominium owner in the Broadway Hollywood building for 13 years and have seen the neighborhood make progress in revitalization. I am not against change or progress. However, the type of project proposed would be a disaster and destroy the revitalizing neighborhood and sense of community that has been developing. The types of projects that should be encouraged and approved should be those that fit into and respect the neighborhood, its historic significance, its pre-existing architecture, and the residents and visitors to the area (an example would be the building on Vine Street that now houses h-Club; although it was new construction, the building looks like it has been around since the 1930's or 1940's and was perfectly integrated into the neighborhood). Projects should be of scale to the pre-existing structures, should be limited in height so as not to destroy iconic views, and should be of an overall size as not to overwhelm with their physical size or impact on infrastructure, traffic, or quality of life.

The right thing must be done: this project must not be approved and the project must be terminated; at the very least the project needs to be extremely scaled back such that the height of the buildings would top out at the maximum height of other buildings located within the surrounding block or two. Do not let another big developer trample and destroy yet another neighborhood and the spirit of the people who live, work and visit it. There are many other ways that a developer can invest in the revitalization of Hollywood-- and can do it in a respectful manner that celebrates the history of the neighborhood and does not destroy the neighborhood by transforming it into another generic area of high rise buildings which does nothing but fill the pockets of the developers.

Response to Comment No. IND 98-3

The comment expresses opposition to the Project based on concerns with regard to effects on the neighborhood, scale, historic resources, infrastructure, and traffic, but does not raise any specific issues with respect to the content or adequacy of the Draft EIR.

In regard to and the scale of the Project and effects on the neighborhood, see Response to Comment No. IND 98-1. In regard to traffic, see Response to Comment No. IND 98-2. Regarding effects on historic resources, impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F-1 of the Draft EIR. Section IV.C of the Draft EIR analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame, and

other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources.

Regarding infrastructure, the Project's impacts on wastewater and water supply are fully analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, in the Draft EIR. Supporting technical infrastructure information is included in Appendix P-1 of the Draft EIR. A City approved Water Supply Assessment (WSA) for the Project is included in Appendix P-2 of the Draft EIR. As discussed therein, the Project would result in less-than-significant utility and water supply impacts. In regard to wastewater, as stated on page IV.N.1-13 of Section IV.N.1, *Wastewater*, of the Draft EIR, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under City's Building and Safety Code and the Los Angeles Department of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with Los Angeles Municipal Code (LAMC) Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

Regarding water supply, as stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved WSA, as required by Senate Bill (SB) 610, for the Hollywood Center Project that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Therefore, there would be sufficient water supplies available to service the Project.

Comment Letter No. IND 99

Rachelle Lefevre

Received May 16, 2020

Comment No. IND 99-1

Please extend the comment period on the Hollywood Center Project DEIR. Due to COVID-19, the residents of Hollywood and the surrounding hills, have not had ample opportunity to research and submit comments. Proceeding in this way feels, at best, dishonest and, at worst, corrupt.

Response to Comment No. IND 99-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 100

Diane Alancraig
Received May 16, 2020

Comment No. IND 100-1

I would like to add my voice to those asking for an extension to the Hollywood Center Development Project. Covid is interrupting all our daily lives and it is inconceivable to that the City Planning Department does not consider this a reason to extend the 45 day public comment period for this Project.

Please reconsider and extend the deadline for 90 days after the “Safer at Home” order has been lifted. This will give everyone enough time to really look at the specs on this project that will affect so many lives in our neighborhood and city

Response to Comment No. IND 100-1

The comment requests that the City extend the Project’s 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 101

Aaron Jansen

Received May 16, 2020

Comment No. IND 101-1

First – Earthquake Fault: this project consists of building two *huge* towers on an earthquake fault. Enough said.

Response to Comment No. IND 101-1

The comment expresses an opinion regarding the Project's size and location on an earthquake fault, but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. However, aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 101-2

Second – Emergency Response: Such a monstrosity development will tap the already thin emergency response resources we now count on. We are surrounded on three sides by parkland and need to know that the fire department can get up here and quickly. Also, all those extra cars will mean exiting the canyon in an emergency will only be more difficult.

Response to Comment No. IND 101-2

This comment raises concerns about emergency response but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. See Topical Response No. 2 – Transportation and Traffic, above, which addresses emergency response.

Comment No. IND 101-3

Third – Traffic/Parking: The traffic generated by such a huge project would overwhelm all the nearby 101 freeway. The already limited parking on every nearby street will be severely impacted. Overflow cars will be driving up Beachwood Drive searching for parking where the situation is already a nightmare, with these extra cars only making it worse.

Response to Comment No. IND 101-3

The comment expresses a general concern that the Project would adversely impact US-101 and parking on every street near the Project Site and cause cars to park near the commenter's residence. However, the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Comment No. IND 101-4

Fourth - Infrastructure: Imagine the amount of water and electricity for air conditioning that will be siphoned off to support this development not to mention the sewer and other services.

Response to Comment No. IND 101-4

The comment expresses a general concern about the Project's impact on water, electricity and sewer infrastructure. While the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, the Project's impacts on wastewater and water supply are fully analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, in the Draft EIR. Supporting technical infrastructure information is included in Appendix P-1 of the Draft EIR. A City approved Water Supply Assessment (WSA) for the Project is included in Appendix P-2 of the Draft EIR. As discussed therein, the Project would result in less-than-significant utility and water supply impacts. In regard to wastewater, as stated on page IV.N.1-13 of Section IV.N.1, *Wastewater*, of the Draft EIR, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under City's Building and Safety Code and the Los Angeles Department of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with LAMC Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

In regard to water supply, as stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved WSA, as required by SB 610, for the Hollywood Center Project that there is adequate water supplies available from existing LADWP entitlements and supplies to

meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Therefore, there would be sufficient water supplies available to service the Project.

The Project's impacts on energy, including electrical power, are analyzed in Section IV.O, *Energy Conservation and Infrastructure*, of the Draft EIR. The Project's annual operational energy use is provided in Table IV.O-2 on page IV.O-25. As concluded on page IV.O-27, operation of the Project would not result in the wasteful, inefficient, or unnecessary consumption of electricity.

Comment Letter No. IND 102

Ann Haugen
6240 Scenic Avenue
Los Angeles, CA 90068
Received May 17, 2020

Comment No. IND 102-1

Hello. I live in Beachwood Canyon and feel very strongly against having this monstrosity built in our neighborhood. We don't have the capacity on the streets as it is now to handle all the traffic.

Response to Comment No. IND 102-1

The comment expresses an opinion about the Project's size and potential impact on traffic, but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. While it is acknowledged that the Project would contribute traffic to the local roadway network, capacity of the streets is not a CEQA issue and is, therefore, not evaluated in the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 102-2

Please extend the comment period by 45 days. Thank you.

Response to Comment No. IND 102-2

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 103

Scott Addison Clay
Received May 18, 2020

Comment No. IND 103-1

I'm writing to you to express my opposition to the Hollywood Center Project Draft EIR. With a degree in Environmental/Civil Engineering, I can confidently say this is not a wise project due to the severe strain it will cause on our city's resources, infrastructure, emergency response, and our environment.

Many of you remember the first generation of this effort to build two huge towers next to Capitol Records and on an earthquake fault.

Response to Comment No. IND 103-1

The comment expresses opposition to the Project due to the Project's potential strain on resources, infrastructure, emergency response, and the environment. However, as this comment does not raise specific issues regarding the content and adequacy of the Draft EIR, no further response is warranted.

Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D of the Draft EIR concluded that geology impacts, including fault-related impacts, would be less than significant and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

The comment also makes reference to the "first generation" of this Project, also known as the Millennium Hollywood Project. However, the Millennium Hollywood Project is a different project that was previously proposed at the same Project Site, for which planning approvals and the environmental determination were invalidated. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment No. IND 103-2

That version failed because the developer tried to skirt around CalTrans. The traffic generated by such a huge project would overwhelm all the onramps to the 101 freeway. Beachwood Canyon Neighborhood Association shares that concern and is also well aware that this same traffic will clog all of the streets in Hollywood.

Response to Comment No. IND 103-2

This comment summarizes traffic issues with the previous project, as they relate to Caltrans and freeway onramps. Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above, for a discussion of traffic impacts from the Project, including impacts to US-101 and its on- and off-ramps.

It is also acknowledged that Caltrans submitted two letters with comments on the transportation analysis to be conducted for the Project. The analyses requested by Caltrans are presented for informational purposes in Appendix I to the TA for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. The Caltrans analysis is not a required CEQA analysis per the City's Transportation Assessment Guidelines (TAG), adopted in July 2019. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also see Response to Comment No. AG 2-7, which discusses a recent meeting between the City and Caltrans in July 2020 during which Caltrans did not identify any particular concerns or make any particular requests for new analysis beyond those included in the Draft EIR. Additionally, the Caltrans representative indicated that Caltrans' concerns were non-CEQA concerns. Based on this, Caltrans has not identified any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

Comment No. IND 103-3

The project involves two multi-use towers 35 and 46 stories adjacent to and across the street from the Capitol Records Building.

The issues that were present with that first rendition are the same with this new one. New name - same issues:

Response to Comment No. IND 103-3

The comment notes the heights of the towers proposed by the Project and their location and makes an introductory statement regarding the issues with the Project are the same as with the prior Millennium Hollywood Project. As stated above, the analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project. Specific comments regarding the Draft EIR are provided and responded to below in Response to Comment Nos. IND 103-4 through 103-8.

Comment No. IND 103-4

Emergency Response: We know that such a monstrosity of a development will tap the already thin emergency response resources we now count on. Also, we are surrounded on three sides by parkland and need to know that the the *[sic]* fire department can get up here and quickly.

Response to Comment No. IND 103-4

This comment raises concerns about emergency response but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. See Topical Response No. 2 – Transportation and Traffic, above, which addresses emergency response.

Comment No. IND 103-5

Traffic/Parking: Parking on every street near the development will be impacted and overflow cars will be driving up Beachwood in search for parking. Our parking situation is already a nightmare and these extra cars will only make it worse. Beyond that, all those extra cars will mean exiting the canyon in an emergency will only be more difficult.

We already have one of the most congested areas in the entire city. With the sharp increase in traffic due to Netflix, the new Columbia center, and more recent construction, people loathe coming into Hollywood now. This project would not only clog more of Hollywood, it will slow down the 101 even more.

Response to Comment No. IND 103-5

The comment expresses a general concern that the Project would impact parking on streets near the Project Site and cause cars to park near the commenter's residence, but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, as noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Comment No. IND 103-6

Environmental Resources: Imagine the amount of water that will be siphoned off to support this development not to mention the sewer and other services.

Response to Comment No. IND 103-6

The comment expresses a general concern about the Project's impact on water and sewer infrastructure. While the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, the Project's impacts on wastewater and water supply are fully analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2,

Water Supply, respectively, in the Draft EIR. Supporting technical infrastructure information is included in Appendix P-1 of the Draft EIR. A City approved Water Supply Assessment (WSA) for the Project is included in Appendix P-2 of the Draft EIR. As discussed therein, the Project would result in less-than-significant utility and water supply impacts. In regard to wastewater, as stated on page IV.N.1-13 of Section IV.N.1, *Wastewater*, of the Draft EIR, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under City's Building and Safety Code and the Los Angeles Department of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with LAMC Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

In regard to water supply, as stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved WSA, as required by SB 610, for the Hollywood Center Project that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Therefore, there would be sufficient water supplies available to service the Project.

Comment No. IND 103-7

Aesthetically, I think two massive towers right off of the highway will diminish the impact of all the other timeless icons of Hollywood.

Response to Comment No. IND 103-7

The comment expresses an opinion about the how the Project's size and location with respect to the freeway will have an impact on Hollywood icons, but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Regarding the commenter's opinion that the Project would diminish the impact of the timeless icons of Hollywood, impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F-1 of the Draft EIR. Section IV.C of the Draft EIR analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame, and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

Comment No. IND 103-8

Please do not just shove this one through because of money. Such a project as this will tear at the fabric of Hollywood in a very negative way.

Response to Comment No. IND 103-8

This concluding comment is noted; however, as this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 104

Nick Egan

Received May 18, 2020

Comment No. IND 104-1

I am writing in support of the 45 Day extension comment period with [sic] regard to the Hollywood Center Project.

Response to Comment No. IND 104-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 104-2

Although in the 30 years I have lived in Hollywood, most of the development of restaurants and retail outlets in Hollywood has been a positive one. However we are just about at breaking point with our small neighborhood streets now being used as short cuts to the 101 Freeway causing traffic jams at what had been quiet intersections for decades, therefore affecting the potential safety of residents on streets that were not built for heavy traffic usage and streets that have no sidewalks. I'm wondering how long before some one [sic] is killed by a car racing along narrow streets. Franklin Ave is jammed every evening around 5:00pm and the journey from Gelson's Supermarket on Franklin to my house on Scenic Ave, just off of Beachwood Drive can take up to 20 minutes on what should be a 3 minute drive. In addition the Parking in our street has become a nightmare from the overspill from the Restaurants between Bronson and Cheremoya.

Response to Comment No. IND 104-2

The comment expresses opposition to the Project based on how traffic will have impacts on safety within surrounding residential neighborhoods, as well as the potential for parking spillover, but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. However, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Specifically, as it relates to the potential safety of residents on streets, as analyzed on pages IV.L-44 and IV.L-45 of Section IV.L, the Project would be designed to comply with City standards and would provide adequate sight distance, sidewalks, crosswalks, and

pedestrian movement controls that meet the City's requirements to protect pedestrian safety. All roadways and driveways would continue to intersect at right angles. Street trees would be designed and located so as to not significantly impede driver and pedestrian visibility and would not present a hazard. Pedestrian entrances separated from vehicular driveways would provide access from the adjacent streets, parking facilities, and transit stops. Therefore, as determined therein, the Project would not substantially increase geometric hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses, and impacts would be less than significant.

In addition, as noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Comment No. IND 104-3

The last thing we need is to add to a further problem that hasn't been fixed in it's [sic] current disarray by the development of the Hollywood Centre.

Response to Comment No. IND 104-3

This concluding comment is noted; however, as this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 105

Luca Draccar

Received May 18, 2020

Comment No. IND 105-1

My name is Luca Draccar, I am a Broadway Hollywood resident.

I was trying to understand on the website <https://mplosangeles.com/> what does “PRESERVE AN ICONIC VISION” mean?

Aesthetics destruction of a whole neighborhood probably?

Or put the area at risk in an already sensitive zone?

The developer uses a slogan like “ ... enhancement and historic preservation ...” but he is probably having fun taking [*sic*] joke of people’s common intelligence sense.

I see only economic speculation and nothing really related to the development of Hollywood.

I’m not against development, it’s really welcome, but at the same high as the existing standard.

Response to Comment No. IND 105-1

This comment expresses general opposition to the Project based on aesthetics, its location within a sensitive zone, and historic preservation but does not raise any specific issues regarding the content and adequacy of the Draft EIR.

Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

The comment does not identify what type of sensitive zone within which the Project Site is located. In regard to the Project’s location in a geologically-sensitive area, impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

In regard to the Project’s potential to generate emissions in an air quality-sensitive area, air quality impacts related to sensitive receptors were addressed in Section IV.B, *Air Quality*, of the Draft EIR, with supporting data provided in Appendix E of the Draft EIR. As analyzed therein, construction and operational air quality impacts would be less than

significant after mitigation, where applicable. The prescribed mitigation which requires certain types of construction equipment and features to be utilized by the Project, would ensure that Project construction activities do not expose sensitive receptors to substantial pollutant concentrations or result in violations to applicable daily air quality standards. During operation, mitigation to address standard emergency generator testing would also ensure that applicable daily air quality standards are not violated.

In regard to the Project's potential to generate noise in a noise-sensitive area, noise impacts were analyzed in Section IV.I, *Noise*, of the Draft EIR, with supporting information provided in the Construction Noise and Vibration Study and a Construction Traffic and Operational Noise Study, both included in Appendix K of the Draft EIR. The analysis in Section IV.I of the Draft EIR concluded that that Project's construction activities would result in significant and unavoidable noise and vibration impacts to nearby noise and vibration sensitive residential and commercial uses; however, it should be noted that these impacts would be temporary and that during Project operation, noise and vibration impacts would be less than significant. See also Topical Response No. 7 – Noise and Vibration, above.

In regard to the Project's proximity to a potentially wildfire-sensitive zone, the Project Site is located within an urbanized area and is not within a Very High Fire Hazard Severity Zone. Additionally, the Project Site is surrounded by urban areas and not wildlands and, thus, would not expose people or structures, directly or indirectly, to a significant risk involving wildland fire.

Regarding historic resources, impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F-1 of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

Comment Letter No. IND 106

Jill Stewart

Received May 26, 2020

Comment No. IND 106-1

I hope all is well with you. Your transparency newsletter today was nicely written but very disappointing given its lack of transparency about how things are unfolding on the most controversial project on your desk, Hollywood Center, as well as a few other projects I now hear are moving too fast for the public to catch up.

I completely agree with Sean Hecht, at Frank G. Wells Environmental Clinic, who urged you to not follow the path of fast-tracking environmental review times on important projects -- because the public is highly constrained, and there is no getting around that fact. Hecht should know, as he is in the thick of these issues.

I keep getting emails from various Neighborhood Council leaders about how they have urged you to give them more time. How can these highly aware people deal with complex environmental document in any cogent manner when you go for fast-tracking?

It's a bad precedent and I hope you rethink this approach.

Response to Comment No. IND 106-1

The comment expresses opposition to the Project and the time allotted for environmental review due to the constraints of COVID-19, but does not raise any specific issues regarding the content or adequacy of the Draft EIR. As such, no further response is warranted. However, the City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. Furthermore, Neighborhood Councils are not required to meet in person in order to confer or meet in person in order to provide comments. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 107

Gary Clemmer

Received May 26, 2020

Comment No. IND 107-1

Please find attached my letter in support of the Hollywood Center Project. I send it to add my voice to the conversation during this public comment period.

Response to Comment No. IND 107-1

Responses to the referenced letter are provided below in Response to Comment No. IND 107-2.

Comment No. IND 107-2

I am submitting this letter to offer support during this public comment period for the proposed project, Hollywood Center. I am in support of this project and feel it will be an asset to the Hollywood community.

I have lived and worked in Hollywood since 2000. For the past 12 years I have been a pastor on staff at Ecclesia Hollywood church. We have leased space at several buildings and parking lots over the years, most notably the Hollywood Pacific Theatre, from 2007 until it closed in July, 2013. Currently we lease office space on Gower Street and meeting space at the Hollywood Adventist Church building.

Throughout our existence Ecclesia has partnered with other Hollywood churches and non-profits to provide crucial human services to those in our city who are most vulnerable.

Some of these non-profits include Covenant House, The Center, and Oasis of Hollywood. For eight years we've partnered with Hollywood Presbyterian Church and Reality LA church to provide a Winter Refuge for chronically homeless people in Hollywood. We've garnered the support and partnership of the Department of Mental Health (DMH) and the Los Angeles Homeless Services Authority (LAHSA) and have seen many people get access to city services and find a life off of the streets.

At this unique point in time, with the ravages of COVID-19 felt so strongly in our world, nation and city, I think that it's crucial that we do everything we can do to both support the vulnerable among us and also to support the economic engines that can bring new jobs, new businesses and new vitality to our city. It is for this reason that I support the Hollywood Center Project. It will provide much needed residential space, senior housing, open civic space, and most importantly, it will create many jobs during both the construction phase and after completion in the form of service and support industries.

Additionally, the tax revenue will be essential to the LA city budget in order to maintain the existing level of support for essential human services.

Thank you for this opportunity to participate in the public comment for the Hollywood Center Project. I encourage the city to proceed with the plans to bring this exciting addition to Hollywood to life after so many years of waiting.

Response to Comment No. IND 107-2

The comment expresses support for the Project. However, the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 108

Stacie Surabian
2769 Hollyridge Drive
Los Angeles, CA 90068
Received May 26, 2020

Comment No. IND 108-1

For the reasons below, I thoroughly oppose the construction of the Hollywood Center of the 2 huge towers next to Capitol Records.

Response to Comment No. IND 108-1

The comment expresses opposition to the Project for reasons that are referenced and responded to below in Response to Comment Nos. IND 108-2 through 108-5, and makes commentary on the height of the Project. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Comment No. IND 108-2

The traffic generated by such a huge project would overwhelm all of the onramps to the 101 Freeway, Beachwood Canyon neighborhood (of which I've lived since 1995) and all of the streets in Hollywood which are already overflowing with traffic!

Response to Comment No. IND 108-2

The comment asserts that the Project would create traffic issues on the Hollywood Freeway (US-101), Beachwood Canyon neighborhood, and the streets of Hollywood, but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. However, the Project's transportation/traffic-related impacts were fully analyzed in the Draft EIR's Section IV.L, *Transportation*, based on a Transportation Assessment (TA) approved by the LADOT and prepared pursuant to the City's Transportation Assessment Guidelines (TAG) adopted in July 2019. The TA is included in Appendix N-1 of the Draft EIR. As discussed therein, the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above, for a discussion of traffic impacts from the Project, including impacts to US-101 and its on- and off-ramps.

Comment No. IND 108-3

Emergency Response: We know that such a monstrosity of a development will tap the already thin emergency response resources we now count on.

Response to Comment No. IND 108-3

This comment raises concerns about emergency response but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. See Topical Response No. 2 – Transportation and Traffic, above, which addresses emergency response.

Comment No. IND 108-4

Traffic/Parking: Parking on every street near the development will be impacted and overflow cars will be driving into neighborhoods nearby in search of parking. Parking throughout Hollywood is already a nightmare and these extra cars will only make it worse!

Response to Comment No. IND 108-4

The comment expresses a general concern that the Project would impact parking on every street near the Project Site and cause cars to park in the nearby neighborhoods, but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, as noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Comment No. IND 108-5

The project is planned right on top of the Hollywood Earthquake Fault and all studies point to the expectation that these towers will collapse.

Response to Comment No. IND 108-5

The comment asserts the Project is located on an earthquake fault and that there are studies which indicate the proposed towers will collapse. Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment Letter No. IND 109

Victoria M. Box
2018 Vine Street
Los Angeles, CA 90068
Received May 26, 2020

Comment No. IND 109-1

I am a resident living in upper Vine Street and I am directly impacted by this project.

I have several questions regarding the upcoming Hollywood Center Project proposed construction.

Response to Comment No. IND 109-1

This introductory comment is noted. Specific comments regarding the Draft EIR are provided and responded to below in Response to Comment Nos. IND 109-2 through 109-8.

Comment No. IND 109-2

1. Will additional lanes on the 101 Freeway be added to handle the large increase in car traffic caused by your Hollywood Center Project?
2. Will alternate routes for cars traveling through the Franklin and Argyle on ramps north and south to the 101 Freeway be found to accommodate the additional traffic?

Response to Comment No. IND 109-2

The comment expresses concern about the potential for the Project to impact traffic on US-101. Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L of the Draft EIR concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, for a discussion of traffic impacts from the Project, including impacts to US-101 and its on- and off-ramps.

Comment No. IND 109-3

3. What compensation will the city give to current property owners living in the Hollywood Hills for their transportation, air quality, water quality, noise, sewage and parking inconveniences caused by the project?

4. What compensation will the city give to property owners that will have their current views of Hollywood and the surrounding areas obscured by the Hollywood Center Project?
5. Will property taxes go down for current homeowners impacted negatively because of the Hollywood Center Project?

Response to Comment No. IND 109-3

The comment expresses the opinion that compensation should be provided to the property owners who will be negatively affected by the Project but does not raise any specific issues regarding the content or adequacy of the Draft EIR. As such, no further response is warranted. In regard to the inconveniences caused by the Project, the Project's transportation/traffic-related impacts were fully analyzed in the Draft EIR's Section IV.L, *Transportation*, based on a Transportation Assessment (TA) approved by the LADOT and prepared pursuant to the City's Transportation Assessment Guidelines (TAG) adopted in July 2019. The TA is included in Appendix N-1 of the Draft EIR. As discussed therein, the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Air quality impacts related to sensitive receptors were addressed in Section IV.B, *Air Quality*, of the Draft EIR, with supporting data provided in Appendix E of the Draft EIR. As analyzed therein, construction and operational air quality impacts would be less than significant after mitigation, where applicable. The prescribed mitigation, which requires certain types of construction equipment and features to be utilized by the Project, would ensure that Project construction activities do not expose sensitive receptors to substantial pollutant concentrations or result in violations to applicable daily air quality standards. During operation, mitigation to address standard emergency generator testing would also ensure that applicable daily air quality standards are not violated.

Water quality impacts, as it relates to water quality standards and pollution, were addressed in Section IV.G, *Hydrology and Water Quality*, of the Draft EIR. As analyzed therein, Project construction would not result in discharge that would cause pollution, contaminate the quality of the water to a degree which creates a hazard to the public health, or be a nuisance that would be injurious to health. Project construction would comply with all applicable federal, State, and local requirements concerning the handling, storage, and disposal of waste to reduce the potential for Project construction to release contaminants. During Project operation, the Project would implement Low Impact Development (LID) Best Management Practices (BMPs), such that the Project would not result in any discharges that would cause regulatory standards to be violated. Therefore, impacts to water quality impacts would be less than significant.

Water quality impacts, as it relates to water supply, were addressed in Section IV.N.2, *Water Supply*, of the Draft EIR, with supporting technical infrastructure information included in Appendix P-1 of the Draft EIR. A City-approved Water Supply Assessment (WSA) for the Project is included in Appendix P-2 of the Draft EIR. As discussed therein,

the Project would result in less-than-significant utility and water supply impacts. As stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved WSA for the Hollywood Center Project, as required by SB 610, that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Therefore, there would be sufficient water supplies available to service the Project.

Noise impacts were analyzed in Section IV.I, *Noise*, of the Draft EIR, with supporting information provided in the Construction Noise and Vibration Study and a Construction Traffic and Operational Noise Study, both included in Appendix K of the Draft EIR. The analysis in Section IV.I of the Draft EIR concluded that that Project's construction activities would result in significant and unavoidable noise and vibration impacts to nearby noise and vibration sensitive residential and commercial uses; however, it should be noted that these impacts would be temporary; and that during Project operation, noise and vibration impacts would be less than significant. See also Topical Response No. 7 – Noise and Vibration, above.

Regarding the sewer system, the Project's impacts on wastewater were fully analyzed within Section IV.N.1, *Wastewater*, of the Draft EIR. As analyzed therein, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under City's Building and Safety Code and the Los Angeles Department of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with Los Angeles Municipal Code (LAMC) Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

Regarding parking, as noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the LAMC (i.e., 1,513 spaces), to adequately serve the Project, including the residential and commercial components. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Regarding views, the California courts have routinely held that “obstruction of a few private views in a project’s immediate vicinity is not generally regarded as a significant environmental impact.”¹³³ Furthermore, as stated in the CEQA Guidelines Section 15131, economic effects of a project shall not be treated as significant effects on the environment. As such, economic impacts are not required for consideration under CEQA and are not addressed in the Draft EIR.

Comment No. IND 109-4

6. How many years will the project take to complete?
7. If the builder cannot finish the project on time – will the city give extensions of time? If so for how long will that be allowed?
8. Will the builder be allowed to leave the project unfinished?
9. Should the builder default-what legal recourses will the city have to recoup losses?
10. Will the city take out additional Earthquake insurance for the huge skyscraper being built should an earthquake cause it to fall?
11. If the builder should default and leave the property unfinished-what will be the actions of the City of Los Angeles?

Response to Comment No. IND 109-4

The comment expresses concern over the construction period and activities associated with the Project. As stated on page II-71 of Chapter II, *Project Description*, of the Draft EIR, in the overlapping construction scenario, construction could be completed in approximately 4.5 years (beginning 2021 and completed as early as 2024). In the sequential construction scenario in which the two sites are built one after another with no overlap, construction of the Project would be completed in under approximately seven years (beginning in 2021 and completed in 2027). The construction timeframe is based on reasonable assumptions developed specifically for the Project. Should unforeseeable circumstances arise, it is possible that construction could be extended. The comment inquires about circumstances where the Project is unfinished, the builder defaults, and whether the City will take out earthquake insurance. However, these comments do not raise any specific issues regarding the content or adequacy of the Draft EIR. Further, speculative circumstances are not required to be evaluated in the Draft EIR and are outside the scope of the CEQA process, and, as such, no further response is warranted.

Nonetheless, it is acknowledged that concerns about earthquake faults and geology impacts, including those regarding the Project Site’s location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft

¹³³ *Banker’s Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App. 4th 249, 279.

EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D of the Draft EIR concluded that geology impacts, including fault-related impacts, would be less than significant and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 109-5

12. Will the city provide detailed inspections to the public of the builder's progress and end result?

Response to Comment No. IND 109-5

The comment asks if the City will provide inspections available to the public of the builder's progress and end result. As the comment does not raise any specific issues regarding the content or adequacy of the Draft EIR, no further response is warranted. However, it should be noted that inspections of the builder's progress and end result are under the jurisdiction of the Los Angeles Department of Building and Safety (LADBS).

Comment No. IND 109-6

13. What additional accommodations for health and safety of homeowners when homeless populations and their camps under the freeway at Franklin Ave. are relocated because of the new project?

Response to Comment No. IND 109-6

The comment expresses concern about the potential for the Project to cause homeless people to move into nearby residential areas without any specific facts or substantial evidence to support this claim. Homeless-related concerns are social issues that are unrelated to the Proposed Project; as stated in CEQA Guidelines Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. As such, this topic was not evaluated in the Draft EIR, and no further response is warranted.

Comment No. IND 109-7

14. How will the city pay for the additional services: police, water, sewer and firemen needed to accommodate new residents in this Hollywood Center Project?

Response to Comment No. IND 109-7

The commenter asks how the City will pay for additional public services and utilities needed to accommodate the Project. Economic effects are not the focus of the Draft EIR, which addresses the physical impacts of the Project on the environment. As noted in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, in *City of Hayward v. Board of Trustees of California State University* (2015) 242 Cal.App.4th

833, the court found that Section 35 of Article XIII of the California Constitution requires local agencies to provide public safety services, including fire and police protection, and that it is reasonable to conclude that the City will comply with that provision to ensure that public safety services are provided.¹³⁴

As the comment does not raise any issues with respect to the content or adequacy of the Draft EIR, no further response is warranted. Nonetheless, please note that fire and police services impacts were addressed, respectively, in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, with supporting data provided in Appendix M of the Draft EIR. Pursuant to the CEQA Guidelines and the thresholds used by the City to determine the significance of impacts to fire and police services, the focus of the analyses is on whether or not new or expanded facilities are needed to maintain adequate public service and whether a potential physical impact could occur if construction of facilities was warranted. In the case of the Project, it was determined that the Project would not generate a demand for additional fire and police protection services that would result in the need for new or expanded fire and police services facilities, and impacts would be less than significant. Furthermore, as provided in Project Design Feature POL-PDF-2, the Project would incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding signage and lighting for walkways and entries. This is in contrast to existing conditions in the area, which include surface parking lots and long alleys between blocks, where buildings are partially cut off from the street. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for the Los Angeles Police Department (LAPD) services. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a seven-day a week security patrol and could assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services. Implementation of Project Design Feature POL-PDF-2 would help to offset the Project's operational demand for police protection services from LAPD.

Regarding the sewer system, the Project's impacts on wastewater were fully analyzed within Section IV.N.1, *Wastewater*, of the Draft EIR. As analyzed therein, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under City's Building and Safety Code and the Los Angeles Department

¹³⁴ *City of Hayward v. Board of Trustees of California State University* (2015) 242 Cal.App.4th 833, 847.

of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with LAMC Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

Regarding water supply, the Project's impacts on water supply were fully analyzed within Section IV.N.2, *Water Supply*, of the Draft EIR. As stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved Water Supply Assessment (WSA) for the Hollywood Center Project, as required by Senate Bill (SB) 610, that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Therefore, there would be sufficient water supplies available to service the Project.

Comment No. IND 109-8

15. How will the City provide complete transparency to the public of the monies spent on this project?

16. What is the city's watchdog policy if crime or corruption is found regarding this project?

Response to Comment No. IND 109-8

The comment raises questions about public expenditures and policies related to corruption that may be associated with the Project but does not raise any specific issues regarding the content or adequacy of the Draft EIR. Furthermore, these issues are beyond the purview of CEQA. As such, no further response is warranted.

Comment Letter No. IND 110

Sarajane Schwartz

Received May 26, 2020 (IND 110A)

Received June 1, 2020 (IND 110B)

Comment No. IND 110A-1

The Homeowners on Beachwood Drive United is joining with almost every other organization in Hollywood in demanding an extension in the public comment period regarding the Hollywood Center Project.

We will be negatively impacted by the enormous increase in traffic, the congestion it will cause, and the inability to evacuate the hills in case of an emergency. For us it is a matter of life and death.

It is extraordinary that under the "unprecedented nature of Covid-19"--your own words--involving the largest project in Hollywood history with an over 3000 page report from out of town developers with a checkered past--to put it mildly-- the City appears to be ramming and sneaking this through at this time. It is shocking that at the very least you chose not to mandate an initial 60 day review period.

Not only is following the law mandatory, but also for public officials, the appearance of following the law and being fair and transparent is of the utmost importance.

We are no strangers to litigation and neither are these developers. Currently the Millennium group who is building this project is involved in the largest real estate litigation in the country concerning their "leaning tower of San Francisco". Extra care must be taken here. Why are the interests of constituents and tax payers being ignored while favoring those of shady developers? The FBI has already set up shop in Los Angeles with their successful investigations into corrupt relationships between City officials and developers while citizens' rights were squelched. Is this what is going on here?

Under these circumstances the greatest leeway must be given to residents to have the most possible time to examine this extremely flawed project that has been seriously questioned by various state officials as well as those directly impacted.

Under the best of conditions with no Covid this project should have obviously, justly, and appropriately been assigned the maximum comment period of 60 days, which you failed to do. But these are not the best or even usual times. ***Per CEQA Guidelines, Section 15105, the public review period for a Draft EIR should not be less than 30 days nor should it be longer than 60 days, except under unusual circumstances.*** Citizens are locked down in their homes. Citizens are locked out of public buildings. During this once in a century pandemic a proper, fair, and appropriate public comment period cannot occur. If these are not "unusual circumstances" one wonders what is. You are making a

mockery of these words. **Not only should the public comment period be extended, but the whole process should be postponed with a new deadline of August 1.**

We cannot state these views more strongly.

We await your response.

Response to Comment No. IND 110A-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment also makes reference to a different project located in San Francisco. The Project, as analyzed in the Draft EIR, retained experts to conduct fault studies specific to the Project Site. The fault investigations at the Project Site presented in the Draft EIR technical documents prepared by Group Delta Consultants (2015 and 2019) were performed with full transparency and witnessed by the CGS and City reviewing officials. All parties are considered experts in fault studies in Southern California. Furthermore, it should be noted that the speculation as to alleged illegal activities are not related to the adequacy of the Draft EIR. Accordingly, no further response is warranted regarding these issues.

The comment also expresses general concerns about impacts associated with traffic and emergency response. Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, for additional discussion of traffic impacts and emergency response.

The remainder of the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 110B-1

I want to comment on the content of the DEIR for the Hollywood Center Project.

Response to Comment No. IND 110B-1

This introductory comment is noted. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. IND 110B-2

Neither the transportation or fire department sections adequately address the acute issues of being able to safely and effectively evacuate the Hollywood Hills which border this project several blocks to the north for miles in case of a fire. They are in close proximity to this project and would be strongly, negatively, and devastatingly impacted. These areas sit in a very high fire severity zone with limited infrastructure and ingress as well as egress. The only evacuation direction is to the south into commercial Hollywood.

For example Hollywoodland, a limited, historic hillside residential neighborhood, sits a mile north of Franklin in Beachwood Canyon, is a bottleneck into Griffith Park, and is 80% surrounded by dry brush. The only way to evacuate is to the south away from the hills, but Beachwood Drive, the main artery ends in a dead end about 30 yards south of Franklin because it is cut off by the Hollywood Freeway.

Instead one must go west on Franklin in order to go south. The streets are either very narrow, like Gower, or several left turns are required to get on to wider Vine, because other streets are cut off by the Hollywood Freeway. These streets are already gridlocked. The increased traffic caused by The Hollywood Center Project would result in a massive number of deaths because a large necessary evacuation would simply be impossible. It will dwarf the number of fatalities in the Paradise, California fire caused by the inability to evacuate.

The limited infrastructure of Hollywood developed in the 1920's with the now additional newly built projects just barely is able to handle the capacity needed to adequately serve public safety. The massive unprecedented in scale and size Hollywood Center will be an even bigger disaster for Hollywood when there is a disaster.

Response to Comment No. IND 110B-2

The comment expresses the opinion that the Draft EIR does not adequately address evacuation of the Hollywood Hills in the case of a fire based on current perceived constraints in the hillside areas, and traffic added by the Project. See Topical Response No. 2 – Transportation and Traffic, which addresses emergency response, including within the hillside areas north of the Project Site.

Comment Letter No. IND 111

John McCarthy
2222 Holly Drive
Los Angeles, CA 90068
Received May 26, 2020

Comment No. IND 111-1

My name is John McCarthy and I lived with my family in the Hollywood Dell for 22 years at 2222 Holly Drive Los Angeles, CA 90068.

It has come to my attention, again, that the city may grant a permit to a company to build a huge structure that will dwarf the Capitol Records Building at 1750 Vine St, Los Angeles, CA 90028, which is .08 miles from my home.

Please explain to me how you will let this happen?

Beside the current Covid 19 situation that we are ALL living our neighborhood has MANY other pressing issues that this proposed site will only exacerbate.

At the top of the list is the growing (by the day) homeless issue that we and my fellow Dell residents are facing.

It is common knowledge that the number of people grows by the day...these are American Citizens who by the grace of God have found themselves on the street. Many are dealing with mental issues and the unfortunate individuals who find themselves in dire financial need will sure develop mental issues through the struggle they find themselves in trying to live on the street.

Please tell me what you are planning to do about the situation?

Seems to me that all the new construction going up and around Hollywood is targeting high earning individuals.

Take a look at the new Condos on Cahuenga just south of Sunset Blvd...right beside the new multi million dollar building is a camp set up on the sidewalk, right in front on the new building!!...I mean what do you plan to do to help these people?

I have been a 20 year member at the YMCA on Schrader in Hollywood, the new temporary/ permanent structure built in the parking lot, just south of the YMCA, to house a few hundred needy is a great start but that is just a band aid.

When are you going to build permanent low cost housing for the needy?

Response to Comment No. IND 111-1

The comment expresses opposition to the Project based its size, on homelessness in the vicinity, and lack of permanent low cost housing for the needy but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Homeless-related concerns are social issues that are unrelated to the Proposed Project. As stated in CEQA Guidelines Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. As such, this topic was not evaluated in the Draft EIR, and no further response is warranted.

The comment also inquires whether the Project is going to build permanent low cost housing for the needy. As shown in Table II-1 on page II-14 of Chapter II, *Project Description*, of the Draft EIR, the Project would provide 133 senior affordable housing units on the Project Site.

Comment No. IND 111-2

Another grave concern is the already congested traffic...not only is the 101 a parking lot currently for much of the day now, try getting around on a Hollywood Bowl night, which in better times, are numerous...adding hundreds of cars to an already insane situation is beyond comprehension...what do you plan to do to curb the already over congested car reality?

Response to Comment No. IND 111-2

The comment expresses concern about the Project's impacts on traffic. While the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The traffic effects of the Project, including congestion, were discussed in the TA in Appendix N-1 of the Draft EIR. While it is acknowledged that the Project would contribute traffic to the local roadway network, traffic congestion is not a CEQA issue and was, therefore, not evaluated in the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, for a discussion of traffic impacts from the Project, including impacts to US-101 and its on- and off-ramps.

More specifically regarding traffic effects related to the Hollywood Bowl, Highland Avenue and Franklin Avenue are the primary access routes to the Hollywood Bowl. The intersections analyzed in the TA in Appendix N-1 of the Draft EIR were selected based on guidance from the City's adopted Transportation Assessment Guidelines (TAG) that were followed for that analysis. Applying the TAG criteria resulted in the identification of

the nine intersections illustrated in Figure 6 of the TA and discussed and analyzed in the main body of the TA. None of the required study intersections were along Highland Avenue or Franklin Avenue in the vicinity of the Hollywood Bowl (the westernmost study intersection was the intersection of Cahuenga Boulevard and Hollywood Boulevard). The Cahuenga Boulevard/Hollywood Boulevard intersection was identified in that analysis as operating at LOS F, with the Project adding trips to this location. As Cahuenga Boulevard is a route to the Hollywood Bowl, the Project could affect trips to the Hollywood Bowl. However, as discussed in Topical Response No. 2 – Transportation and Traffic, above, intersection level of service (LOS) is no longer the CEQA significance metric for transportation impacts.

Comment No. IND 111-3

Another concern is that the new structure is RIGHT ON AN EARTHQUAKE FAULTLINE!!! Please tell me how you plan to allow this structure to go up right on top of it??? I am very interested in your answer as I hope to never have to told you that what I have read (FROM PROPPER [sic] SCIENTIST) that it is not IF but WHEN a big earthquake will hit this well known fault line...how will you account for the many years of research alluding to this fact?...we all live with the understand that we must be ready if a big earthquake happens but to build right on this fault line is just crazy.

Response to Comment No. IND 111-3

The comment expresses concern about the Project's proposed location on an earthquake fault. Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 111-4

Hope this sheds a light on my feelings and please know I am talking for a lot of residence [sic] who have been opposed to this development since its inception.

I look forward to your reply and hope that clearer heads prevail in this David vs Goliath situation.

Response to Comment No. IND 111-4

This concluding comment is noted; however, as this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 112

L. Walker

Received May 27, 2020

Comment No. IND 112-1

I am writing to you to express my strong opposition to the construction of 2 huge towers adjacent to Capitol Records (Millennium Project.). I have been a resident of Beachwood Canyon since 1981.

Response to Comment No. IND 112-1

The comment expresses opposition to the Project but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment No. IND 112-2

This project (during and after construction) would generate traffic and traffic holdups that cannot be accommodated on the surface streets nor by the on/off ramps to the 101 Freeway. Traffic is currently a huge problem in Hollywood and this would push it over the top. Currently construction in Hollywood is rampant and road blockages have really impacted any travel through Hollywood.

Parking in Hollywood is already a problem. This development will not help this situation and will add to an existing problem.

Response to Comment No. IND 112-2

The comment expresses concern about the Project's impact on traffic and parking but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L of the Draft EIR was based on CEQA requirements and evaluated vehicle miles traveled (VMT), rather than traffic intersection service levels, which no longer serve as a basis under CEQA for determining transportation impacts. The total traffic effects of the Project, including congestion, are discussed in the TA in Appendix N-1 of the Draft EIR. It is noted that traffic congestion is not a CEQA issue and is not evaluated in the Draft EIR. As such, the analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

As noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Comment No. IND 112-3

Emergency Response: This monstrosity of a development will tap the already thin emergency response resources we now count on.

Response to Comment No. IND 112-3

This comment raises concerns about emergency response, but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. See Topical Response No. 2 – Transportation and Traffic, which addresses emergency response.

Comment No. IND 112-4

If this development is allowed to proceed, the historic and iconic Capitol Records Studios will be impacted and affected.

Response to Comment No. IND 112-4

The comment expresses a concern that the Capitol Records Studios will be impacted by the Project. Impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame, and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above. Also note that the Project does not involve any proposals for changes to the occupancy and use of the Capitol Records Building, and no such changes are foreseeable. As stated on page II-36 in Chapter II, *Project Description*, of the Draft EIR, the Applicant has a lease with Capitol Records that can be extended until 2026. As the Capitol Records Building's underground recording studios and reverberation chambers are located on the Project Site, which is owned and operated by the Applicant, any interference with on-going activities within the building, or scheduling

to avoid such, would be coordinated directly between the Applicant and Capitol Records through tenant-landlord agreements.

Comment No. IND 112-5

I understand this project will be built on top of the Hollywood Earthquake Fault. Enough said.

Response to Comment No. IND 112-5

The comment asserts that the Project is located on an earthquake fault. Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 112-6

This development will further erode any charm or history that Hollywood currently has.

Again, I VEHEMENTLY OPPOSE this project.

Response to Comment No. IND 112-6

The comment expresses an opinion that the Project will remove the charm and history of Hollywood but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

In regard to historic resources, see Response to Comment No. IND 112-4.

Comment Letter No. IND 113

Aaron M. Epstein
13455 Ventura Boulevard, #225
Sherman Oaks, CA 91423
Received May 27, 2020

Comment No. IND 113-1

I am a Hollywood property owner writing to ask that the public comment period on the *Hollywood Center Project* be extended for a minimum of 90 days after the City and State STAY AT HOME order has been lifted.

These are EXTENUATING CIRCUMSTANCES in that in-person meetings are not held, City Council and State Legislature meetings cannot be attended in person, travel by public transportation is a life threatening health risk, etc.

The proposed project itself must receive maximum examination in that it is similar to a project of the same developers in San Francisco that is presently SINKING because inadequate engineering and the Hollywood project is directly over the earthquake fault that has been designated by John G. Parrish, recently retired California State Geologist.

To risk safety and lives, both today and in the future, extension of the existing 45 day time is of the highest necessity.

Response to Comment No. IND 113-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Regarding concerns about earthquake faults, geology impacts, including those regarding the Project Site's location relative to an active earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment Letter No. IND 114

Lynn Rosenberg
Received May 27, 2020

Comment No. IND 114-1

I have lived at Menorah Housing in Long Beach for approximately 8 years, and have found the staff friendly and helpful and the apartment building well run. It was a God send to me to find this housing as I am a low-income senior and there are few options out there that are affordable with caring people running it. The maintenance and support staff are also excellent.

I would definitely recommend Menorah Senior Housing as a good place for seniors to live.

Response to Comment No. IND 114-1

The comment expresses support for Menorah Senior Housing but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 115

Beverly Freeman
2018 Vine Street
Hollywood, CA 90068
Received May 27, 2020

Comment No. IND 115-1

I have lived on upper Vine Street, just above Franklin Ave. for most of my life and I am very concerned about the proposed Hollywood Center Project.

The following questions are but a few I have concerning the impact I have regarding my quality of life, property value and general well-being.

Response to Comment No. IND 115-1

The comment expresses concern about the Project's impact on the commenter's quality of life, property value, and well-being but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. Specific comments regarding the Draft EIR are provided and responded to below in Response to Comment Nos. IND 115-2 through 115-8.

Comment No. IND 115-2

1. Will additional lanes on the 101 Freeway be added to handle the large increase in car traffic caused by your Hollywood Center Project?
2. Will alternate routes for cars traveling through the Franklin and Argyle on ramps north and south to the 101 Freeway be found to accommodate the additional traffic?

Response to Comment No. IND 115-2

The comment expresses concern about the potential for the Project to impact traffic on US-101, including at on-ramps at Franklin Avenue and Argyle Avenue, which is the same comment presented in Comment No. IND 109-2 above. Accordingly, see Response to Comment No. IND 109-2.

Comment No. IND 115-3

3. What compensation will the city give to current property owners living in the Hollywood Hills for their transportation, air quality, water quality, noise, sewage and parking inconveniences caused by the project?
4. What compensation will the city give to property owners that will have their current views of Hollywood and the surrounding areas obscured by the Hollywood Center Project?

5. Will property taxes go down for current homeowners impacted negatively because of the Hollywood Center Project?

Response to Comment No. IND 115-3

The comment expresses the opinion that compensation should be provided to the property owners who will be negatively affected by the Project, which is the same comment presented in Comment No. IND 109-3 above. Accordingly, see Response to Comment No. IND 109-3.

Comment No. IND 115-4

6. How many years will the project take to complete?
7. If the builder cannot finish the project on time – will the city give extensions of time? If so for how long will that be allowed?
8. Should the builder default-what legal recourses will the city have to recoup losses?
9. Will the city take out additional Earthquake insurance for the huge skyscraper being built should an earthquake cause it to fall?
10. If the builder should default and leave the property unfinished-what will be the actions of the City of Los Angeles?

Response to Comment No. IND 115-4

The comment expresses concern over the construction period and activities associated with the Project, which is the same comment presented in Comment No. IND 109-4 above. Accordingly, see Response to Comment No. IND 109-4.

Comment No. IND 115-5

11. Will the city provide detailed inspections to the public of the builder's progress and end result?

Response to Comment No. IND 115-5

The comment asks if the City will provide inspections available to the public of the builder's progress and end result, which is the same comment presented in Comment No. IND 109-5 above. Accordingly, see Response to Comment No. IND 109-5.

Comment No. IND 115-6

12. What additional accommodations for health and safety of homeowners when homeless populations and their camps under the freeway at Franklin Ave. are relocated because of the new project?

Response to Comment No. IND 115-6

The comment expresses concern about the potential for the Project to cause homeless people to move into nearby residential areas, which is the same comment presented in Comment No. IND 109-6 above. Accordingly, see Response to Comment No. IND 109-6.

Comment No. IND 115-7

13. What funds have been set aside to cover the up-grade of the infrastructure of our historic area to accommodate this massive project?

Response to Comment No. IND 115-7

The comment expresses concern about upgrading infrastructure to accommodate the Project, which is the same comment presented in Comment No. IND 109-7 above. Accordingly, see Response to Comment No. IND 109-7.

Comment No. IND 115-8

14. How will the City provide complete transparency to the public of the monies spent on this project?

15. What is the city's watchdog policy if crime or corruption is found regarding this project?

Response to Comment No. IND 115-8

The comment raises questions regarding public expenditures and policies related to corruption that may be associated with the Project but does not raise any specific issues regarding the content or adequacy of the Draft EIR. Furthermore, these issues are beyond the purview of CEQA. As such, no further response is warranted.

Comment Letter No. IND 116

Stuart Freeman
2018 Vine Street
Los Angeles, CA 90068
Received May 27, 2020

Comment No. IND 116-1

I am a resident living in upper Vine Street and I am directly impacted by this project.

I have several questions regarding the upcoming Hollywood Center Project proposed construction.

Response to Comment No. IND 116-1

This introductory comment is noted. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. IND 116-2

1. I have read many stories about how people who move into these areas when built do not actually take the subway or other rapid transit but rather use their cars. It is also typical for these projects to claim to not need as many car parking spaces because of their proximity to rapid transit. How many parking spaces are going to be provided and what guarantees can be provided that people living in the new construction will not each have a car and seek parking on the adjacent neighborhood streets as a result?

Response to Comment No. IND 116-2

The comment expresses concern about transit usage and the amount of parking provided by the Project but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. While the Project cannot guarantee that new residents will not each have a car, as noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area (TPA), parking impacts would not be considered significant under CEQA. Additionally, the Project would implement a variety of Transportation Demand Management (TDM) strategies as Project Design Feature TRAF-PDF-1 to support strategies to encourage public transit such as providing unbundled parking, on-site locations to purchase Metro passes, transit subsidies, a commute trip reduction program; shared mobility features (i.e., bike and car share); bicycle friendly infrastructure, education and encouragement programs on available transit options; and on-site management of TDM programs.

Comment No. IND 116-3

2. What steps will be taken to assure local residents that all of the trucks hauling away dirt from the construction site will be handled with forethought to avoid traffic accidents, smog, and pavement erosion in the area?

Response to Comment No. IND 116-3

The comment expresses concern about construction trucks causing traffic, smog, and pavement erosion in the area. As stated in Project Design Feature TRAF-PDF-2 on pages IV.L-28 and -29 of Section IV.L, *Transportation*, of the Draft EIR, the Project would implement a Construction Management Plan (CMP), which would include street closure information, a detour plan, haul routes, and a staging plan. The CMP will formalize how construction will be carried out and identify specific actions that will be required to reduce effects on the surrounding community. The CMP will be based on the nature and timing of the specific construction activities and other projects in the vicinity of the Project Site. Construction management meetings with City Staff and other surrounding construction-related project representatives (i.e., construction contractors), whose projects will potentially be under construction at around the same time as the Project, will be conducted bimonthly, or as otherwise determined appropriate by City Staff. This coordination will ensure construction activities of the concurrent related projects and associated hauling activities are managed in collaboration with one another and the Project.

Regarding smog emissions, as stated on page IV.B-54 of Section IV.B, *Air Quality*, of the Draft EIR, construction of the Project has the potential to generate temporary regional criteria pollutant emissions through the use of heavy-duty construction equipment, such as excavators and forklifts, through vehicle trips generated by workers and haul trucks traveling to and from the Project Site and through building activities. As discussed on page IV.B-49 of the Draft EIR, regulatory compliance with applicable emission control standards, including the California Air Resources Board (CARB) air toxics control measure (ATCM) that limits heavy-duty diesel motor vehicle idling to five minutes at any location (Title 13 CCR, Section 2485), the Truck and Bus regulation that reduces NO_x, PM₁₀, and PM_{2.5} emissions from existing diesel vehicles operating in California (13 CCR, Section 2025), and the In-Use Off-Road Diesel Fueled Fleets regulation that reduces emissions by the installation of diesel soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission controlled models (13 CCR, Section 2449) would minimize air pollutant emissions from haul trucks. Furthermore, as concluded on page IV.B-60, with implementation of Mitigation Measure AQ-MM-1, which would implement construction equipment features for equipment operating at the Project Site, the regional NO_x emissions would be reduced to a level below the SCAQMD regional threshold of 100 pounds per day. Therefore, smog emissions from construction trucks and activities would be reduced to less-than-significant levels.

Regarding pavement erosion, new development projects are typically required by the City to pay its fair share of costs to repair eroded pavement as a result of construction activities.

Comment No. IND 116-4

3. How loud will back-up generators be if power is intermittent for a time, and back-up power generation is needed? The Everly had this problem, and the neighborhood suffered listening to loud noises for many, many hours.

Response to Comment No. IND 116-4

The comment expresses concern about the noise level from back-up generators. As stated on page IV.I-52 of Section IV.I, *Noise*, of the Draft EIR, emergency generators for the residential buildings on the West Site and East Site would provide emergency power for lighting and other emergency building systems. The emergency generators would be located on the building rooftops within an enclosure that would substantially minimize noise levels to the environment. Given their location on the rooftops (providing vertical distance) within an enclosure, and their limited use, emergency generators would not contribute to an increase in day-to-day operational ambient noise levels, and impacts would be less than significant.

Comment No. IND 116-5

4. Our neighborhood is already woefully deficient in having enough parking spaces for the apartments on Argyle. This causes people to park up on our street, Vine so that parking is very difficult. Is there provision for creating more parking spaces than the project needs, and making the spots available to local apartment dwellers? In Pasadena, there are large public parking structures available for people coming into the city to eat, drink, or see a play. Is there a large public parking structure included with this development?

Response to Comment No. IND 116-5

The comment expresses concern about the amount of parking required for the Project but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. As noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the LAMC (i.e., 1,513 spaces) to adequately serve the Project, including the residential and commercial components. Furthermore, as the Project Site is located within a TPA, parking impacts would not be considered significant under CEQA. However, no public parking structure is proposed as part of the Proposed Project.

Comment No. IND 116-6

5. What tax concessions have been awarded this project, and for how long? Increased traffic, and more densely populated buildings will require more fire, police, and other public services to be available. If tax concessions are given to

the project, does that mean that the rest of us poor homeowners will be picking up the tab?

Response to Comment No. IND 116-6

The comment expresses concern that homeowners will be paying for fire, police, and other public services to support the Project. Impacts to fire and police protection services were addressed in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, respectively, with supporting data provided in Appendix M of the Draft EIR. It was determined that the Project would not generate a demand for additional police and fire protection services that would result in the need for new or expanded fire and police services facilities.

Regarding fire protection services, as stated on page IV.K.1-16 of Section IV.K.1, *Fire Protection*, of the Draft EIR, the Project would comply with all applicable health and safety requirements, including: the provision of fire resistant doors, materials, walkways, stairwells, and elevator systems (including emergency and fire control elevators); installation of a fire sprinkler suppression system, smoke detectors, signage, fire alarms, building emergency communication systems, smoke control systems; implementation of an Emergency Safety Plan; compliance with Los Angeles Fire Department (LAFD) fire apparatus and personnel access requirements; and water systems and roadway improvements improved to the satisfaction of the LAFD. In addition, the LAFD recommended a variety of fire prevention and protection features, including installation of Knox Boxes, building identification, emergency access lanes, building setbacks, and a required Fire Annunciator panel or Fire Control Room. Compliance with applicable Los Angeles Building Code and Fire Code requirements would be demonstrated as part of LAFD's fire/life safety plan review and LAFD's fire/life safety inspection for new construction projects, as set forth in LAMC Section 57.118, and which are required prior to the issuance of a building permit. All of these requirements would reduce the demand on LAFD facilities, equipment, and fire protection services.

Furthermore, as provided in Project Design Feature POL-PDF-2, the Project would incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding signage and lighting for walkways and entries. This is in contrast to existing conditions in the area, which include surface parking lots and long alleys between blocks, where buildings are partially cut off from the street. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for the Los Angeles Police Department (LAPD) services. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a

seven-day a week security patrol and could assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services. Implementation of Project Design Feature POL-PDF-2 would help to offset the Project's operational demand for police protection services from LAPD.

Regarding other public services, such as parks and recreational facilities, as stated on page IV.K.4-18 of Section IV.K.4, *Parks and Recreation*, of the Draft EIR, given the Project's open space and recreational amenities, including common space areas, pools, outdoor seating and lounging, fitness areas, locker rooms, children's rooms, game rooms, private libraries, and multi-purpose rooms, it is expected that the Project-related recreational demand would be at least partially accommodated on the Project Site. Likewise, it can be reasonably assumed that residual off-site park usage would likely be dispersed among the seven neighborhood parks, five community parks, and three regional parks that the Los Angeles Department of Recreation and Parks (RAP) has indicated would serve the Project Site. Therefore, the various open space amenities provided on the Project Site would offset the demand of the Project on off-site parks and recreational facilities.

Comment No. IND 116-7

6. We as residents have endured the Everly, the W, and many more projects being constructed here in Hollywood in the last few years. As you might imagine, we grow tired of the never ending construction issues. Can we put a stop to other additional projects in the area after this one? This one will go on for quite some time, and residents should be given a break from this endless construction.

Response to Comment No. IND 116-7

The comment requests that there should be a stop to other projects and construction in the area after this Project but does not raise any specific issues regarding the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 116-8

7. Why is such a tall tower needed for this project? It is taller than any other in the area, and seems out of place of Hollywood.

Response to Comment No. IND 116-8

The comment expresses concern for the height of the Project but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Comment No. IND 116-9

8. Hollywood traffic is a nightmare at about 5pm each weekday. People que [*sic*] up for entrance to the freeway, or go up Cahuenga to Barham to get to the valley.

What steps can be taken to mediate the impact that so many new vehicles to the area will cause? Are freeway onramps going to be made to flow better?

Response to Comment No. IND 116-9

The comment expresses concern for the Project's impact on traffic in the area and freeway ramps but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. See also Topical Response No. 2 – Transportation and Traffic, for a discussion of traffic impacts from the Project, including impacts to the US-101 and its on- and off-ramps.

Comment No. IND 116-10

9. I grew up here. I went to Cheremoya Elementary, LeConte Jr. High, and Hollywood High School. What impact on the schools will this project have? How many school age children are envisioned to live in this new project? What tax revenue will the schools receive?

Response to Comment No. IND 116-10

The comment expresses concern about the Project's impact on nearby schools. School impacts, specifically the three schools mentioned by the commenter, were addressed in Section IV.K.3, *Schools*, of the Draft EIR. As stated in Table IV.K.3-2 on page IV.K.3-11 of the Draft EIR, the Project could generate 239 elementary school students, 65 middle school students, and 137 high school students for a total increase of 441 school students. As further discussed on page IV.K.3-13 of the Draft EIR, pursuant to California Government Code Section 65995, the Project Applicant would be required to pay fees in accordance with SB 50. Payment of such fees is intended for the general purpose of addressing the construction of new school facilities, whether schools serving the Project in question are at capacity or not. Pursuant to California Government Code Section 65995(h), payment of such fees is deemed full mitigation of a project's development impacts. Therefore, the Project's operational impacts on schools would be less than significant.

Comment No. IND 116-11

10. Homeless people have taken over many of the underpasses, and freeway medians in Hollywood. What steps are being considered by the city government and your project to help mitigate this problem? If you create loud noise, and congestion, it is likely they will just head up into the hills to our properties to camp out which would be unacceptable to property owners who have been here far longer than any of these many, many building projects and the people living in them?

Response to Comment No. IND 116-11

The comment expresses concern about the potential for the Project to cause homeless people to move into nearby residential areas without any specific facts or substantial evidence to support this claim. Homeless-related concerns are social issues that are

unrelated to the proposed Project; as stated in CEQA Guidelines Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. As such, this topic was not evaluated in the Draft EIR, and no further response is warranted.

Comment No. IND 116-12

11. What new infrastructure will be required to provide power and water to all of these new residents, and how much will existing homeowners in the area be expected to pay in increased taxes to provide that new infrastructure?

Response to Comment No. IND 116-12

The comment asks what new infrastructure will be required to provide water and power for the Project and if the existing homeowners will be expected to pay increased taxes to provide the new infrastructure. The Project's impacts on energy are analyzed in Section IV.O, *Energy Conservation and Infrastructure*, of the Draft EIR. The Project's annual operational energy use is provided in Table IV.O-2 on page IV.O-25 of the Draft EIR. Furthermore, the Project would implement Project Design Features GHG-PDF-1, which would include key green building and LEED measures to optimize energy performance to reduce Project energy demand. As concluded on page IV.O-27 of the Draft EIR, operation of the Project would not result in the wasteful, inefficient, or unnecessary consumption of electricity.

The Project's impacts on water supply are fully analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, in the Draft EIR. Supporting technical infrastructure information is included in Appendix P-1 of the Draft EIR. A City approved Water Supply Assessment (WSA) for the Project is included in Appendix P-2 of the Draft EIR. Furthermore, the Project would implement Project Design Feature WS-PDF-1 and provide specific water efficiency features to conserve water and reduce Project water demand. As discussed therein, the Project would result in less-than-significant utility and water supply impacts.

In regard to water supply, as stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved WSA, as required by SB 610, for the Hollywood Center Project that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Therefore, there would be sufficient water supplies available to service the Project.

Comment No. IND 116-13

This comment letter is a repeat of the first email sent by the commenter.

Response to Comment No. IND 116-13

See Response to Comment Nos. IND 116-1 through IND 116-12.

Comment Letter No. IND 117

Nick Freeman
2018 North Vine Street
Los Angeles, CA 90068
Received May 27, 2020

Comment No. IND 117-1

I write as a six-year resident of upper Vine St. and I have some pressing concerns and questions over the project proposed nearby.

Response to Comment No. IND 117-1

This introductory comment is noted. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. IND 117-2

1. Why is construction proposed on a confirmed fault line? Is that not recklessly endangering the lives of citizens in the area?

Response to Comment No. IND 117-2

The comment asserts that the Project is proposed on an earthquake fault line. Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 117-3

2. Are there any plans to address the local homeless population, with some large camps within a hundred feet of the construction zone, particularly along the freeway overpass? Most efforts seen thus far merely shuffle the homeless somewhere else, a process which repeats until they invariably return to where they were.

Response to Comment No. IND 117-3

The comment expresses concern about the potential for the Project to move the homeless population without any specific facts or substantial evidence to support this claim. Homeless-related concerns are social issues that are unrelated to the proposed Project; as stated in CEQA Guidelines Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. As such, this topic was not evaluated in the Draft EIR, and no further response is warranted.

Comment No. IND 117-4

3. Will there be any infrastructure improvements, especially in the case of the freeway? Before the quarantine, I was essentially forced to make use of the metro to make the commute to CalState LA, and I can only see additional construction further impacting the roads that already reach gridlock at rush hours.

Response to Comment No. IND 117-4

The comment asks if there will be additional infrastructure improvements for the freeway to accommodate the Project's construction but does not raise any specific issues regarding the content or adequacy of the Draft EIR. Although freeway analyses for the Project were not required for CEQA per the City's Transportation Assessment Guidelines (TAG), the analyses were presented for informational purposes in Appendix I of the Transportation Assessment (TA) for the Hollywood Center Project. The analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections. Regarding congestion in Hollywood, the total traffic effects of the Project during construction and operation were discussed in the TA in Appendix N-1 of the Draft EIR. It should be noted that traffic congestion is not a CEQA issue and is not evaluated in the Draft EIR. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 117-5

4. Is there a timetable for the proposed construction, and will the city be transparent about its progress? I cannot help but think of the large 'Target' shopping center on Sunset and Western that was locked in a legal quadmire [*sic*] for years, staying as a big, half-built eyesore for all those around.

Response to Comment No. IND 117-5

The comment asks about the timeline for completion of the Project. As stated on page II-71 of Chapter II, *Project Description*, of the Draft EIR, in the overlapping construction scenario, construction could be completed in approximately 4.5 years (beginning 2021 and completed as early as 2024). In the sequential construction scenario, in which the two sites are built one after another with no overlap, construction of the Project would be completed in under approximately seven years (beginning in 2021 and completed in 2027). The remaining concern from the commenter regarding transparency does not raise any specific issues regarding the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 117-6

5. Is there any compensation planned for the property owners in the area for having their quality of life negatively impacted due to the noise, pollution, and traffic that an active construction zone produces?

Response to Comment No. IND 117-6

The comment expresses the opinion that compensation should be provided to the property owners who will be negatively affected by the Project but does not raise any specific issues regarding the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 118

Nick Hryciw

Received May 27, 2020

Comment No. IND 118-1

I hope you and your loved ones are staying safe and healthy during this time.

I am writing you to express my firm opposition to the Hollywood Center Project as currently planned. With the height of the towers, all views north of my residence at The Broadway Hollywood will be obstructed and an overload of traffic would be introduced within just a few blocks of Hollywood and Vine.

More importantly, these towers will overshadow the iconic Capitol Records building which is an historic mainstay of the Hollywood skyline. These towers that are better suited for downtown and will disrupt our skyline and the more 'neighborhood' feel of Hollywood.

Response to Comment No. IND 118-1

The comment expresses opposition to the Project based on the Project's height, blocking of views, and traffic. Regarding the Project's effects on views, this analysis was provided in Section IV.A, *Aesthetics*, of the Draft EIR. Regarding effects on views from private residences, as stated on page IV.A-26, the focus of the view analysis, consistent with CEQA and City practice, was on views from public vantage points. Under the City's 2006 L.A. CEQA Thresholds Guide, an office building or private residence would not be considered a viewing location since views of broad horizons, aesthetic structures, and other scenic resources would not be available to the public. In addition, the California courts have routinely held that "obstruction of a few private views in a project's immediate vicinity is not generally regarded as a significant environmental impact."¹³⁵ See also Topical Response No. 4 – Aesthetics and Topical Response No. 5 – Land Use and Planning, above.

Impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F-1 of the Draft EIR. Section IV.C of the Draft EIR analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building. As analyzed therein, and also in Topical Response No. 6 – Historical Resources, above, operational impacts on the Capitol Records Building would be less than significant.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L of the Draft EIR concluded that the Project would result in less-than-

¹³⁵ *Banker's Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App. 4th 249, 279.

significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Regarding other concerns related to the Hollywood Broadway Building, see the responses to comments provided to the Broadway Hollywood Homeowners Association in Comment Letter No. ORG 37.

Comment No. IND 118-2

Although I (and every neighbor I know) adamantly oppose the current plan, I fully support alternate plans to construct the towers no more than 14-18 stories. The new construction in Hollywood has been exciting and is bringing a new vibrance to our streets, however, I believe it is important we don't lose the architectural integrity and ambiance of our Neighborhood.

Response to Comment No. IND 118-2

The comment expresses support for alternate plans to construct the towers no more than 14 to 18 stories. The Draft EIR provides analysis for Alternative 2, which analyzes an alternative that would conform to the Project Site's existing zoning designation. As stated on page V-28 of Chapter V, *Alternatives*, of the Draft EIR, the East Building would be 18 stories and reach a height of 243 feet at the top of the 18th story and 293 feet at the top of the bulkhead. The West Building would be 14 stories and reach a height of 195 feet at the top of the 14th story and 235 feet at the top of the bulkhead.

Regarding general concerns about architectural integrity and the ambiance of the neighborhood, the architecture of the Project has been designed to be distinct from, but compatible with, the modernist architectural character of the Capitol Records Building and the greater Hollywood neighborhood. The proposed buildings have been located and configured to preserve important views of the Capitol Records Building and to promote compatibility between new construction and the historic Capitol Records Complex. See also Topical Response No. 6 – Historical Resources, above.

Comment No. IND 118-3

Thank you in advance for logging this communication as an official vote of opposition in the record of public comment.

Response to Comment No. IND 118-3

The conclusory comment is noted. The comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 119

Theresa Meyers
Received May 27, 2020

Comment No. IND 119-1

I am a neighbor and friend of Nick. He has expressed the feelings of many of us, and quite beautifully. The neighborhood, and I have strong feelings in opposition to this project and I join all the voices in urging you to protect our neighborhood and our property values.

Response to Comment No. IND 119-1

The comment refers to Comment Letter No. IND 118 but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. Accordingly, see Response to Comment Nos. IND 118-1 through 118-3.

Comment Letter No. IND 120

Monet Corso

Received May 27, 2020

Comment No. IND 120-1

I hope you are [*sic*] your families are staying safe and busy during this interesting time.

I am writing this evening, along with several other neighbors I believe, to express how opposed I am to the addition of the two towers of the Hollywood Center Project. Please read because I think I make a few good points.

I have been following the “Heart of Hollywood” and your plans and ideas for “Hollywood Blvd” are incredible. They honestly made me feel so much pride and joy.

I have been driving to Hollywood to visit the Pantages since I was 4 years old (1984), and the moment the KOR Development Group announced they were building lofts on the corner of Hollywood and Vine in the old Broadway Hollywood Building I was one of the first three owners. I owned my very first condo in the Heart of Hollywood at age 26, and I have not left. Instead I dove in, met everyone around me, watched my neighborhood grow into something incredible, and I am now raising my daughter here. I know all my neighbors, and my neighborhood. And we are all devastated by the thought of two monstrosities infiltrating our classic Hollywood. **The is a neighborhood that is meant to be improved and restored, not taking over and congested.** This entire project feels corrupt.

Response to Comment No. IND 120-1

The comment provides an introduction to the commenter and expresses concern about the size of the Project and corruption but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 120-2

While I agree with improving the neighborhood, I DO NOT agree with harming the parts that make it so special. The view, the hills, the landmarks are what make Hollywood special. **The Hollywood sign rising high above and overlooking all of us is why we moved to Hollywood and not downtown.** To block that view, and take that from so many people is taking the heart out of Hollywood. I moved here to look at the sign and see Capitol Records every day. This is a historic neighborhood and we need to try to keep some things sacred. What we have here is an incredible metropolitan type neighborhood that is accessible and does not have the feel of a big city.

Response to Comment No. IND 120-2

The comment expresses concern about the Project blocking views of the Hollywood sign and the Capitol Records Building but does not raise any specific issues with respect to

the content or adequacy of the Draft EIR. However, aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. Although the aesthetics analysis provided in the Draft EIR is informational and not required by CEQA, see pages IV.A-29 through IV.A-54 in Section IV.A, where the analysis supported by multiple visual simulations indicates that the Project would not significantly block views of the Hollywood Sign, the Hollywood Hills, or the Downtown skyline, and that the proposed buildings would comprise a small portion of the view fields, and would not substantially diminish broad scenic views from the hills. In the event the comment includes concerns about effects on private views, as stated on page IV.A-26, the focus of the view analysis, consistent with CEQA and City practice, is on views from public vantage points. Under the City's 2006 L.A. CEQA Thresholds Guide, an office building or private residence would not be considered a viewing location since views of broad horizons, aesthetic structures, and other scenic resources would not be available to the public. In addition, the California courts have routinely held that "obstruction of a few private views in a project's immediate vicinity is not generally regarded as a significant environmental impact."¹³⁶ See also Topical Response No. 4 – Aesthetics, above.

Comment No. IND 120-3

But, if this project starts, 4-6 years of construction and congestion will be unbearable to the people that call Hollywood home. We will not be able to enjoy our outdoor space for years. It was rough when the W was being built, but at least the W set itself inside the city and respected the neighborhood and did not put 46 stories in the middle of our blocks.

Response to Comment No. IND 120-3

The comment states that construction and congestion will be unbearable to residents and that they will not be able to enjoy outdoor spaces. However, the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 120-4

Below:

This will be us in the shadows of those towers,

¹³⁶ *Banker's Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App. 4th 249, 279.

The people that first bought homes and started investing in this neighborhood and building business here.

Response to Comment No. IND 120-4

The comment expresses concern about the Project's shade and shadow impacts on the commenter's residence. Shade/shadow impacts are not identified in CEQA Guidelines Appendix G and, thus, are not required to be evaluated in the City's Draft EIR.

Comment No. IND 120-5

I agreed with last year's ruling that this development is "Fatally Defective"

A California appeals court determined Wednesday that the environmental analysis of a \$1 billion, skyline-altering development next to Hollywood's iconic Capitol Records building is "fatally defective."

The three-judge panel affirmed that the project description in the environmental analysis was too ambiguous, inhibiting the public from fully reviewing a development that could have profound impacts on the neighborhood.

"Missing from this application was any description or detail regarding what Millennium intended to build," wrote Second District Court of Appeal pro-tem judge Ann Jones. "The project description is not simply inconsistent, it fails to describe the siting, size, mass, or appearance of any building proposed."

Response to Comment No. IND 120-5

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment No. IND 120-6

The traffic on these 4 corners is already bad enough that during morning traffic hour when I am trying to take my daughter to school 3 miles away, I spend 70% of the trip on Vine trying to get up to Franklin, or back down from Franklin to my loft. I cannot even begin to imagine what the traffic will be like if you add 1000 units.

Response to Comment No. IND 120-6

The comment expresses concern about traffic on Vine Street and Franklin Avenue but does not raise specific issues regarding the content and adequacy of the Draft EIR. However, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 120-7

I am not sure exactly what needs to be done to have this project be reevaluated. A building around 11-15 floors would be something our neighborhood would happily entertain, but as the design currently stands, it will devastate this neighborhood. I DO want Hollywood to grow. It is great for businesses and the economy for our city, but not like this.

Response to Comment No. IND 120-7

The comment expresses that the Project should be reevaluated to be around 11 to 15 floors but does not raise specific issues regarding the content or adequacy of the Draft EIR. It should be noted that Alternatives 2 and 4, as described in Chapter V, *Alternatives*, of the Draft EIR, present alternatives that would have buildings between 11 to 15 floors. It should be noted that as stated on page V-69 and V-152 of Chapter V, *Alternatives*, of the Draft EIR, Alternative 2 and Alternative 4, respectively, would not include senior affordable residential units and would not meet the Project Objective to provide affordable senior housing with outdoor spaces in proximity to public transportation, allowing an age-specific demographic to continue to live in their residence of preference while maintaining access to services and goods.

Comment Letter No. IND 121

Theo Green
1645 Vine Street, Apt 510
Los Angeles, CA 90028
Received May 27, 2020

Comment No. IND 121-1

As a resident and homeowner at the Broadway Hollywood Building at 1645 Vine St, I'm writing to register my opposition to the proposed Hollywood Center Project.

Response to Comment No. IND 121-1

The comment expresses general opposition to the Project. Specific comments regarding the Draft EIR are provided and responded to below in Response to Comment Nos. IND 121-2 through 121-5.

Comment No. IND 121-2

I'm broadly in favour [*sic*] of the development of Hollywood. New buildings have been appearing regularly in the five years I've lived here, and I welcome them all. I would welcome this new development too, but only if its height was restricted to match the other buildings in the area.

For almost a hundred years since the Hollywoodland sign went up, city planners in this area have carefully preserved line-of-sight views of the hills and the iconic sign. Those views, from streets such as Vine, Hollywood Blvd, but also Argyle, Gower, Ivar and others add value and iconic beauty to whole blocks of this neighborhood.

Views of the hills and iconic sign from my property, and most of the properties in those streets, will be blocked if the towers are built at the proposed height. I believe that would reduce the intrinsic [*sic*] value of whole swathes of Hollywood, and damage both property values and tourism in the area. Those views from street level and from properties, not only of the Hollywood sign, but also the iconic Capitol Records building have been preserved for decades by careful development.

To block the views and introduce to the skyline two giant skyscrapers seems to violate the care previous decades of city planners have taken to preserve what makes this area special.

Response to Comment No. IND 121-2

The comment expresses concern about the Project's height and blockage of views of the Hollywood Sign and Hollywood Hills. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. Although the aesthetics analysis provided in the Draft EIR is informational and not required by CEQA, see pages IV.A-29 through IV.A-54 in Section IV.A, where the analysis supported by multiple visual simulations indicates that the

Project would not significantly block views of the Hollywood Sign, the Hollywood Hills, or the Downtown skyline. Also, as stated in Section IV.A, public views along the street corridors referenced in the comment, such as Vine Street, Hollywood Boulevard, Argyle Avenue, Gower Street, and Ivar Avenue, would not be obstructed by the Project. In the event the comment includes concerns about effects on private views, as stated on page IV.A-26, the focus of the view analysis, consistent with CEQA and City practice, is on views from public vantage points. Under the City's 2006 L.A. CEQA Thresholds Guide, an office building or private residence would not be considered a viewing location since views of broad horizons, aesthetic structures, and other scenic resources would not be available to the public. In addition, the California courts have routinely held that "obstruction of a few private views in a project's immediate vicinity is not generally regarded as a significant environmental impact."¹³⁷ See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Comment No. IND 121-3

When considered together with the inevitable strain such huge buildings would put on the area's already congested traffic, the aesthetic concerns become existential ones. Rather than attract more residents to the area, impossibly congested streets and a loss of iconic views will surely encourage many to look elsewhere, for well-planned streets without constant traffic jams.

Response to Comment No. IND 121-3

The comment asserts that the Project will have strains on aesthetics and traffic but does not raise specific issues regarding the content or adequacy of the Draft EIR. In regard to aesthetics concerns, see Response to Comment No. IND 121-2.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 121-4

Finally, I'm concerned that this developer's other Californian skyscraper, the Millennium Tower in San Francisco, is a famously poorly planned and executed building: leaning, sinking, tilting and now subject to over \$500 million of lawsuits, its residents bitterly regret having moved into a building where the lack of diligence by developers has wiped out their investment. To build such an oversized development in an inappropriate area of Los

¹³⁷ *Banker's Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App. 4th 249, 279.

Angeles, with a troubled developer, on streets not designed to take even as much traffic as they currently have, seems to be folly however you look at it.

Response to Comment No. IND 121-4

The comment refers to a different project and does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted. Nonetheless, impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards.

Comment No. IND 121-5

Again, I would support this application if the height of the building were in the 12 storey [*sic*] range, but not at the current proposed height.

Response to Comment No. IND 121-5

The comment states that the commenter would support a 12-story development but not the Project as currently proposed. As the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 122

Leslie Blumberg
6126 Hollywood Boulevard
Los Angeles, CA 90028
Received May 28, 2020

Comment No. IND 122-1

I would like to take this opportunity to offer my support for the Hollywood Center project.

I am the owner of the Fonda Theatre on Hollywood and Gower, so this development will be part of my neighborhood. I welcome the addition to the eastern side of the Hollywood Blvd community. It will change things. I look forward to the change. I am also a board member of the Hollywood BID, now the Hollywood Partnership.

It is impossible to write a letter at this time without mentioning the devastating situation we find ourselves in. The pandemic has pulled back the curtain on many conditions that have exacerbated the effects of the pandemic, not the least of which is the marginalization of the elderly. It is heartbreaking and frightening to see our seniors become the most vulnerable victims of this catastrophe. It is also dangerous for our society. I believe strongly that good housing for low-income seniors, integrated within mixed use housing complexes, is the most felicitous solution to a grim problem. I applaud this development for making space for seniors in their plans, and I hope this approach is a harbinger of things to come in other developments in L.A. and across the country.

It is mainly because of this allowance for seniors -- and also the project's LEED Gold certification and provision of outdoor space -- that I applaud this development and encourage the city to facilitate its forward movement.

Response to Comment No. IND 122-1

The comment expresses support for the Project but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 123

Yoni Chriqui
1601 Vine Street, 6th Floor
Los Angeles, CA 90028
Received May 28, 2020

Comment No. IND 123-1

I am a resident at the Broadway Hollywood Building Stakeholder and Historic Resource: The building and sign are a LA Historical-Cultural Monument and the building is a contributor to the Hollywood Blvd Commercial and Entertainment District with its primary entrance now located at 1645 Vine Street, at the corner of Hollywood Blvd. The building is identified in the EIR as: 6300 Hollywood Boulevard.

Response to Comment No. IND 123-1

The comment serves as an introduction to the commenter's residence but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 123-2

I urge your department to prevent the construction of the two towers (35 and 46 stories). As a developer myself, I am all for mindful developments but those two towers will be out of context and will have a large impact on our neighborhood. I have been living in Hollywood since 2006 and would love to see it grow. 1000 units and 30,000 sq. ft. of retail will create more traffic, block our views of the hills and Hollywood and have us in the shadows of those towers. In addition, the towers will not blend among the historic structures surrounding them.

A building around 12-15 floors would be something I would happily entertain but as it currently stands, the project will devastate our neighborhood. W Hollywood and 1600 Vine for instance were large scale developments but blend in the neighborhood.

Response to Comment No. IND 123-2

The comment expresses opposition to the Project based on its height, traffic, views, shadows, and historic surroundings but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. Although the aesthetics analysis provided in the Draft EIR is informational and not required by CEQA, see pages IV.A-29 through IV.A-54 in Section IV.A, where the analysis supported by multiple visual simulations indicates that the Project would not significantly block views of the Hollywood Sign, the Hollywood Hills, or the Downtown skyline. In the event the comment includes concerns about effects on private views, as stated on page IV.A-26, the focus of the view analysis, consistent with CEQA and City practice, is on views from public vantage points. Under the City's 2006 L.A. CEQA Thresholds Guide, an office building or private residence would not be

considered a viewing location since views of broad horizons, aesthetic structures, and other scenic resources would not be available to the public. In addition, the California courts have routinely held that “obstruction of a few private views in a project’s immediate vicinity is not generally regarded as a significant environmental impact.”¹³⁸ See also Topical Response No. 4 – Aesthetics and Topical Response No. 5 – Land Use and Planning, above. Regarding the potential for the Project to shade the surrounding residential buildings, shade/shadow impacts are not identified in CEQA Guidelines Appendix G and, thus, are not required to be evaluated in the City’s Draft EIR.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Regarding the commenter’s opinion that the Project’s towers would not blend among the historic structures surrounding the Project Site, the architecture of the Project has been designed to be distinct from, but compatible with, the modernist architectural character of the Capitol Records Building and the greater Hollywood neighborhood. The proposed buildings have been located and configured to preserve important views of the Capitol Records Building and to promote compatibility between new construction and the historic Capitol Records Complex. See also Topical Response No. 6 – Historical Resources, above.

The comment expresses preference to buildings with heights between 12 to 15 floors but does not raise specific issues regarding the content or adequacy of the Draft EIR. It should be noted that Alternatives 2 and 4, as described in Chapter V, *Alternatives*, of the Draft EIR, present alternatives that would have buildings between 11 to 15 floors. It should be noted that as stated on page V-69 and V-152 of Chapter V, *Alternatives*, of the Draft EIR, Alternative 2 and Alternative 4, respectively, would not include senior affordable residential units and would not meet the Project Objective to provide affordable senior housing with outdoor spaces in proximity to public transportation, allowing an age-specific demographic to continue to live in their residence of preference while maintaining access to services and goods.

¹³⁸ *Banker’s Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App. 4th 249, 279.

Comment Letter No. IND 124

Connie G. Gurich
5733 Arbor Vitae
Los Angeles, CA 90045
Received May 28, 2020

Comment No. IND 124-1

The Hollywood Area, especially Hollywood and Vine has always maintained a height restriction for new residential construction in keeping with its environs. Unless the City was willing to condemn existing structures to widen streets and allow more traffic in these streets, including adjacent streets, it must deny the construction of the two proposed towers as designed. It should immediately impose a redesign at half the height and half the density. By adding another 1000 residential units on Vine and Yucca it is assuring the area will become like “downtown LA” with all its congestion and emissions. The quality of life will deteriorate rather than improve by such dense construction in both number of units and height of the buildings. Pure profit cannot be the sole measure of why a project is approved. We need to consider the present and future surroundings of the area for the betterment of a healthy, happy life. The sole purpose of governmental authorities is to provide and enforce regulations that promote the health, safety and welfare of its constituencies. It is time that someone in your position stands up for our rights to live in a healthy environment. You cannot prioritize the rights of the Developer to make a profit in preference to the community’s right to a healthy environment. Thank you.

Response to Comment No. IND 124-1

The comment expresses opposition to the Project based on its height, density, and impacts on traffic but does not raise any specific issues regarding the content and adequacy of the Draft EIR. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

It should be noted that the proposed density for the Project is compliant with the zoning designation. Furthermore, as discussed in Topical Response No. 5 – Land Use and Planning, above, the Project’s consistency and, therefore, potential conflicts, with applicable local and regional plans, along with related land use and planning impacts, were fully analyzed in the Draft EIR’s Section IV.H, *Land Use and Planning*. The analysis in Section IV.H is supported by Land Use Plans and Policies: Project Consistency Tables included in Appendix J of the Draft EIR.

The Project’s transportation/traffic-related impacts were fully analyzed in the Draft EIR’s Section IV.L, *Transportation*, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) and prepared pursuant to the City’s Transportation Assessment Guidelines (TAG) adopted in July 2019. The TA is included in Appendix N-1 of the Draft EIR. As discussed therein, the Project would result

in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment Letter No. IND 125

Eric Maclver

Received May 28, 2020

Comment No. IND 125-1

I am a homeowner at the Broadway Hollywood Building Stakeholder and Historic Resource: The building and sign are a LA Historical-Cultural Monument and the building is a contributor to the Hollywood Blvd Commercial and Entertainment District with its primary entrance now located at 1645 Vine Street, at the corner of Hollywood Blvd. The building is identified in the EIR as: 6300 Hollywood Boulevard (B.H. Dyas Department Store Building/Broadway Department Store), Map No. B.12.

Response to Comment No. IND 125-1

The comment serves as an introduction to the commenter's residence but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 125-2

Firstly, thank you for everything you are all doing to protect our community during the COVID-19 pandemic. However, the EIR being released on April 15, in the middle of this pandemic, with only a 45-day comment period, will certainly limit the quality and number of responses to it. The time required to review a 1500-page document in the middle of a Shelter at Home order that has everyone scrambling daily to find ways to survive financially is an undue burden. My review has necessarily been limited by this administrative failure.

Response to Comment No. IND 125-2

The comment expresses concern that their review was limited due to the 45-day comment period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 125-3

The EIR fails to adequately examine the very negative aesthetic impact of the Hollywood Center. Its two gigantic skyscrapers irreversibly damage the integrated visual look of the Hollywood area from whatever direction you look. Additionally, an iconic feature of Hollywood is the Broadway Hollywood sign, which can be viewed by cars on the 101 Freeway as they enter Hollywood. This view will be lost. The aesthetic damage is equally severe at the Broadway Hollywood (and neighboring buildings), since the Hollywood Center will block views of such Hollywood landmarks as the Hollywood Sign and the

Griffith Park Observatory, diminishing the aesthetic and cultural significance of the building.

Response to Comment No. IND 125-3

The comment states that the Draft EIR failed to examine the aesthetic impacts of the Project. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. Although the aesthetics analysis provided in the Draft EIR is informational and not required by CEQA, see pages IV.A-29 through IV.A-54 in Section IV.A of the Draft EIR, where the analysis supported by multiple visual simulations indicates that the Project would not significantly block views of the Hollywood Sign, the Hollywood Hills, or the Downtown skyline. In the event the comment includes concerns about effects on private views, as stated on page IV.A-26 of the Draft EIR, the focus of the view analysis, consistent with CEQA and City practice, is on views from public vantage points. Under the City's 2006 L.A. CEQA Thresholds Guide, an office building or private residence would not be considered a viewing location since views of broad horizons, aesthetic structures, and other scenic resources would not be available to the public. In addition, the California courts have routinely held that "obstruction of a few private views in a project's immediate vicinity is not generally regarded as a significant environmental impact."¹³⁹ See also Topical Response No. 4 – Aesthetics, above. Regarding other concerns related to effects on historic resources in the area and on the Hollywood Broadway Building and sign, see the responses to comments provided to the Broadway Hollywood Homeowners Association, in Comment Letter No. ORG 37.

Comment No. IND 125-4

Perhaps most importantly, the EIR is completely deficient in its conclusion that the Hollywood Center will have no significant transportation impact. Before the pandemic traffic was jammed at the Hollywood/Vine intersection. This has been exacerbated by the recent installation of a four-way walk sign (which was not taken into account in the EIR). Traffic will be even worse in future years since diminished ridership on public transportation will result from concerns over the spreading of infectious diseases in crowded spaces. Neither of these factors is considered in the EIR.

The Broadway Hollywood will be particularly negatively impacted because its only entrance is a narrow alley that can be entered only by going south on Vine past Hollywood Blvd and then turning right. The increase in traffic at the Hollywood/Vine intersection will make it even more difficult to enter our building.

Notwithstanding this, the EIR reaches the ridiculous conclusion that the Hollywood Center Project will result in no increased traffic. I am shocked by this conclusion and request that the traffic study be redone appropriately.

¹³⁹ *Banker's Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App. 4th 249, 279.

Response to Comment No. IND 125-4

The comment states that the Draft EIR is deficient in its finding that the Project would have no significant transportation impact. It should be noted that the Draft EIR did not state that there would be no increased traffic, as stated by the commenter. Based on the City's new methodology, and as detailed below, the Project would result in less-than-significant transportation impacts. The Project's transportation/traffic-related impacts were fully analyzed in the Draft EIR's Section IV.L, *Transportation*, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) and prepared pursuant to the City's Transportation Assessment Guidelines (TAG) adopted in July 2019. The TA is included in Appendix N-1 of the Draft EIR. As discussed therein, the Project would result in less-than-significant transportation/traffic related impacts. Also see the responses to comments provided to the Broadway Hollywood Homeowners Association, in Comment Letter No. ORG 37, and see traffic related responses provided in Response to Comment Nos. IND 81-74 to 81-78. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 125-5

Finally, the EIR notes that the Hollywood Center may take up to six years to build. This will clearly result in major traffic disruption for a long period. This factor by itself demands that the utmost scrutiny be given to the project before it disrupts Hollywood for the better part of a decade. It is clear to me that such scrutiny has not occurred.

Response to Comment No. IND 125-5

The comment states that construction of the Project would result in a major traffic disruption but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. See Topical Response No. 2 – Transportation and Traffic, above, for a discussion of traffic impacts during construction.

Comment Letter No. IND 126

Penny Safranek
Received May 29, 2020

Comment No. IND 126-1

My letter was in support of the proposed Hollywood Center specifically. Many of my friends are in desperate need of affordable housing. And I would be grateful to know when the waiting lists are open!

Response to Comment No. IND 126-1

The comment expresses support for the Project but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. However, as noted on page II-71 of Chapter II, *Project Description*, of the Draft EIR, in the overlapping construction scenario, construction could be completed in approximately 4.5 years (beginning 2021 and completed as early as 2024). In the sequential construction scenario in which the two sites are built one after another with no overlap, construction of the Project would be completed in under approximately seven years (beginning in 2021 and completed in 2027). The disclosure of waiting lists is beyond the purview of CEQA, and as such, no further response is warranted.

Comment Letter No. IND 127

Lanny Ziering
1645 Vine Street, Apt 507
Los Angeles, CA 90028
Received May 28, 2020

Comment No. IND 127-1

I live in Hollywood at 1645 Vine Street, Apt 507, LA, CA 90028

I am deeply concerned about the planned Hollywood Center Project. This project is totally out of scale with the surrounding neighborhood and will have significant negative impact on the quality of life for all residents in the area. I am not against there being any residential development in the area, but I am very strongly against a development which is out of scale and character with our community, especially a project that will have such a large negative impact on traffic, noise, pollution and our urban life.

Response to Comment No. IND 127-1

The commenter expresses concern about the Project's impact on scale, views, traffic, noise, pollution, and urban life but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Regarding traffic, the Project's transportation/traffic-related impacts were fully analyzed in the Draft EIR's Section IV.L, *Transportation*, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) and prepared pursuant to the City's Transportation Assessment Guidelines (TAG) adopted in July 2019. The TA is included in Appendix N-1 of the Draft EIR. As discussed therein, the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Regarding noise, noise impacts were analyzed in Section IV.I, *Noise*, of the Draft EIR, with supporting information provided in the Construction Noise and Vibration Study and a Construction Traffic and Operational Noise Study, both included in Appendix K of the Draft EIR. The analysis in Section IV.I concluded that that Project's construction activities would result in significant and unavoidable noise and vibration impacts to nearby noise and vibration sensitive residential and commercial uses; however, it should be noted that these impacts would be temporary; and that during Project operation, noise and vibration impacts would be less than significant. See also Topical Response No. 7 – Noise and Vibration, above.

Regarding pollution, air quality impacts related to sensitive receptors were addressed in Section IV.B, *Air Quality*, of the Draft EIR, with supporting data provided in Appendix E of the Draft EIR. As analyzed therein, construction and operational air quality impacts would

be less than significant after mitigation, where applicable. The prescribed mitigation which requires certain types of construction equipment and features to be utilized by the Project, would ensure that Project construction activities do not expose sensitive receptors to substantial pollutant concentrations or result in violations to applicable daily air quality standards. During operation, mitigation to address standard emergency generator testing would also ensure that applicable daily air quality standards are not violated.

Comment No. IND 127-2

I was shocked to learn that the approval process for the project is taking place during the Covid-19 pandemic while we are under both State of California and City of Los Angeles Shelter at Home orders. How can the Mayor's office and City Council have allowed this? It certainly appears that the City of LA is facilitating an attempt by the developer to ram through a project while local residents have little or no way to respond.

At a minimum the consideration period for project approval must be extended until residents are able to move around freely so that we can respond to the EIR in an appropriate manner. Hopefully, we can stop this wholly inappropriate project before it does permanent damage to our community.

Response to Comment No. IND 127-2

This comment expresses opposition about the Draft EIR's public comment period during the COVID-19 pandemic. Regarding approval of the Project, it should first be clarified that no decision is being made at this time. The purpose of the public review period is to solicit comments from public agencies and other interested parties on the contents of the Draft EIR. As stated in Chapter I, *Introduction*, of the Draft EIR, upon the close of the public review period, the City will proceed to evaluate and prepare responses to all comments received from public agencies and other interested parties during the public review period. The comment also requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 128

Michael Shaner
Received May 28, 2020

Comment No. IND 128-1

I live at 1645 North Vine street in a condo in the Broadway/Hollywood building which is about 12 stories.

The incredibly massive high rise HOLLYWOOD CENTER project that's being proposed to be developed is overdone in the extreme,, [*sic*] and why is the city allowing 36 & 45 story buildings that dwarf everyone else in Hollywood??

The Highest buildings in that specific area are 12 to 14 stories? It totally blights the whole view of anyone in the vicinity, they would be the Godzilla of Hollywood. Seems unfair, not thought out, and greed based.

Response to Comment No. IND 128-1

The comment expresses concern about the Project's height and blocking of views but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, Topical Response No. 5 – Land Use and Planning, above.

Comment No. IND 128-2

How has this developer been able to circumvent that? Besides bringing 1000 units plus of residential living, it will also cause a massive traffic jam in an area that already takes forever to negotiate.

Please vote NO on this monstrosity.

Response to Comment No. IND 128-2

The comment expresses opposition to the Project based on its potential to cause traffic but does raise any specific issues with respect to the content and adequacy of the Draft EIR. The Project's transportation/traffic-related impacts were fully analyzed in the Draft EIR's Section IV.L, *Transportation*, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) and prepared pursuant to the City's Transportation Assessment Guidelines (TAG) adopted in July 2019. The TA is included in Appendix N-1 of the Draft EIR. As discussed therein, the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Received May 28, 2020

Comment No. IND 129-1

We submit this joint comment letter as the owner and operator of the property located at 1775 Ivar Avenue, directly abutting the proposed Hollywood Center Project to the west, at the southwesterly corner of the intersection of Ivar Ave. and Yucca St. Our property was originally built in 1931 and has operated as Joseph's Café, a restaurant with public dancing and live entertainment for over thirty years. Our property was recently featured in Quentin Tarantino's *Once Upon A Time In... Hollywood* depicting classic Hollywood and taking advantage of the iconic view of the Capital [sic] Records from our site. While we recognize the importance of thoughtful development in Hollywood, in reviewing the Draft EIR for the Hollywood Center Project we note the following concerns and potential for impacts on one of its immediately adjacent neighbors, Josephs [sic] Café.

Response to Comment No. IND 129-1

The comment provides an introduction to the commenter and expresses concerns about the Project. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. IND 129-2

First, we are concerned over the project's impacts at the intersection and Ivar Ave. and Yucca St. and parking in the area. Our property is situated at the southwestern corner of the intersection and we are all too familiar with the heavy congestion and traffic that occurs daily. We also fear the project would exacerbate existing disastrous parking conditions in the vicinity—this is particularly important as the project not only creates additional need for parking but also removes a large number of existing surface parking spaces from the area. As proposed, we are not sure how the intersection and parking could possibly support a project of this scale.

Response to Comment No. IND 129-2

The comment expresses concern about the Project's impacts on traffic and parking but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. The Project's transportation/traffic-related impacts were fully analyzed in the Draft EIR's Section IV.L, *Transportation*, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) and prepared pursuant to the City's Transportation Assessment Guidelines (TAG) adopted in July 2019. The TA is included in Appendix N-1 of the Draft EIR. As discussed therein, the Project would result

in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

As noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project, including the residential and commercial components. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Comment No. IND 129-3

Second, we are concerned over losing our views of the Capital *[sic]* Records Building. Our property has had a clear view of the Capital *[sic]* Records Building since it was constructed.

Response to Comment No. IND 129-3

The comment expresses concern about the Project blocking views from the commenter's location of the Capitol Records Building. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. While the concern regarding loss of views from the property is noted, as stated on page IV.A-26, the focus of the view analysis, consistent with CEQA and City practice, is on views from public vantage points. Under the City's 2006 L.A. CEQA Thresholds Guide, private properties are not considered as viewing locations since views of broad horizons, aesthetic structures, and other scenic resources would not be available to the general public. In addition, the California courts have routinely held that "obstruction of a few private views in a project's immediate vicinity is not generally regarded as a significant environmental impact."¹⁴⁰ See also Topical Response No. 4 – Aesthetics, above.

Comment No. IND 129-4

Third, we note the Draft EIR lacks an accurate characterization of our property and is devoid of analysis on mitigating potential impacts to our property and its uniquely sensitive and long-standing use. The Draft EIR does not mention Joseph's Café and only generally references the following on page III-3: "The structures directly west of the Project Site on the west side of Ivar Avenue include two, three-story multi-family buildings and various retail, restaurant, and service uses." Joseph's Café should be specifically analyzed as an established entertainment and restaurant venue, with live entertainment, dancing, and night/morning hours. There should be an analysis not only about the project's impact on surrounding uses, but also existing uses' impact and compatibility on the incoming project. If a residential or senior living structure is proposed directly next to our operation, noise and other considerations should be studied.

¹⁴⁰ *Banker's Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App. 4th 249, 279.

Response to Comment No. IND 129-4

The comment expresses concern about the Draft EIR mischaracterizing the commenter's property and not including analysis and mitigation addressing the property. The property is located west of the Project Site on the west side of Ivar Avenue. In regard to air quality impacts, as detailed on pages IV.B-29 and IV.B-30 of Section IV.B, *Air Quality*, of the Draft EIR, certain land uses that are occupied by these population groups, such as residences, hospitals, and schools, are considered to be air quality-sensitive land uses. Therefore, Joseph's Café would not be considered a sensitive receptor or air quality-sensitive land use. As such, the Project would not result in an air quality impact on Joseph's Café.

In regard to noise, as detailed on pages IV.I-14 and IV.I-15 on page IV.I, *Noise*, of the Draft EIR, the City's 2006 L.A. CEQA Thresholds Guide states that residences, schools, motels and hotels, libraries, religious institutions, hospitals, nursing homes, auditoriums, concert halls, amphitheaters, playgrounds, and parks are generally more sensitive to noise than commercial and industrial land uses. Therefore, Joseph's Café would not be classified as a noise-sensitive receptor as it is a commercial land use. Nonetheless, mitigation measures to address construction noise provided in Section IV.I, *Noise*, of the Draft EIR, would benefit the property. In regard to vibration, Joseph's Café is identified as a vibration-sensitive receptor. As shown in Table IV.I-4 on page IV.I-18 of Section IV.I of the Draft EIR, the single-story commercial buildings on the west side of Ivar Avenue are identified as Locations 16 and 17 in the analysis. As further stated in Table IV.I-17 on page IV.I-79 of the Draft EIR, there would be no construction vibration impacts on Joseph's Café. Therefore, all applicable considerations have been analyzed within the Draft EIR.

Comment No. IND 129-5

Fourth, we echo the potential impacts and increased stress on existing public services availability and aging infrastructure such a wastewater, police, and fire that have been commented on by other interested parties and surrounding property owners.

Response to Comment No. IND 129-5

The comment expresses concern about the Project's impacts on existing public services and aging infrastructure. Impacts related to fire and police protection services were addressed in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, respectively, with supporting data provided in Appendix M of the Draft EIR. Pursuant to the CEQA Guidelines and the thresholds used by the City to determine the significance of impacts to fire and police services, the focus of the analyses is on whether or not new or expanded facilities are needed to maintain adequate public service and whether a potential physical impact could occur if construction of facilities was warranted. In the case of the Project, it was determined that the Project would not generate a demand for additional police and fire protection services that would result in the need for new or expanded fire and police services facilities. As such, Section IV.K.1 and IV.K.2 of the Draft

EIR concluded that impacts to fire and police services, respectively, would be less than significant. Notably, regarding public safety, as provided in Project Design Feature POL-PDF-2, the Project would incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding signage and lighting for walkways and entries. This is in contrast to existing conditions in the area, which include surface parking lots and long alleys between blocks, where buildings are partially cut off from the street. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for LAPD services. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a seven-day a week security patrol and could assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services. Implementation of Project Design Feature POL-PDF-2 would help to offset the Project's operational demand for police protection services from LAPD.

The Project's impacts on wastewater and water supply are fully analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, in the Draft EIR. Supporting technical infrastructure information is included in Appendix P-1 of the Draft EIR. A City approved Water Supply Assessment (WSA) for the Project is included in Appendix P-2 of the Draft EIR. As discussed therein, the Project would result in less-than-significant utility and water supply impacts. In regard to wastewater, as stated on page IV.N.1-13 of Section IV.N.1, *Wastewater*, of the Draft EIR, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under City's Building and Safety Code and the Los Angeles Department of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with LAMC Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

In regard to water supply, as stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved WSA, as required by SB 610, for the Hollywood Center Project that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water

years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Furthermore, the Project would implement Project Design Feature WS-PDF-1 and provide specific water efficiency features to conserve water and reduce Project water demand. Therefore, there would be sufficient water supplies available to service the Project.

Comment No. IND 129-6

Lastly, we ask the City consider our comments and also that the public comment period on the Draft EIR be extended to at least 90 days following the end of the "Stay At Home" order.

Response to Comment No. IND 129-6

The comment is a request to the City to extend the comment period to at least 90 days following the end of the "Stay At Home" order. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 130

Marie de Varennes
5950 Foothill Drive
Los Angeles, CA 90068
Received May 28, 2020

Comment No. IND 130-1

I am writing to request that you extend the time for public comment on the proposed Hollywood Center. A period of 90 days after the lifting of the shelter in place order has been proposed, and this seems fair to me. At the present time, many of the residents and businesses that would be impacted by this project are struggling to cope with unprecedented circumstances. Some are even struggling for survival. Concluding the comment period during this time, when people are distracted by their basic needs, and when there is no way of posing questions in person about this complex project, seems a gift to the developers at the expense of residents. Every day brings more charges of corruption to City Hall and its officials; it is a sensitive time when the appearance of fairness has even more weight than usual.

Response to Comment No. IND 130-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 130-2

I have been a resident of District 4 for 45 years, and live about a 15-minute walk from this project. I do not object to the building boom in Hollywood – it is the massive size of this project, grossly out of scale with the neighborhood, that I object to, along with the strains it will put on our crumbling infrastructure.

Response to Comment No. IND 130-2

The comment expresses opposition to the Project based on its size, scale, and strain on infrastructure but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

In regard to infrastructure, the Project's impacts on wastewater and water supply are fully analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, in the Draft EIR. Supporting technical infrastructure information is included in Appendix P-1 of the Draft EIR. A City approved Water Supply Assessment (WSA) for

the Project is included in Appendix P-2 of the Draft EIR. As discussed therein, the Project would result in less-than-significant utility and water supply impacts. In regard to wastewater, as stated on page IV.N.1-13 of Section IV.N.1, *Wastewater*, of the Draft EIR, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under City's Building and Safety Code and the Los Angeles Department of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with Los Angeles Municipal Code (LAMC) Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

In regard to water supply, as stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved WSA, as required by SB 610, for the Hollywood Center Project that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Furthermore, the Project would implement Project Design Feature WS-PDF-1 and provide specific water efficiency features to conserve water and reduce Project water demand. Therefore, there would be sufficient water supplies available to service the Project.

Comment No. IND 130-3

I implore you to extend the comment time, out of respect to residents, businesses, and the historic dignity of Hollywood's classic buildings, which the whole world comes to see, and which will be dwarfed by this behemoth.

Response to Comment No. IND 130-3

The commenter's concluding statement re-asserts the previous concerns about the Draft EIR's public comment period. See Response to Comment No. IND 130-1.

Steven Fierberg, ASC
Received May 29, 2020

Comment No. IND 131-1

I'm writing to protest the construction of the Hollywood Center. It will dwarf every other building in Hollywood and destroy the 'feel.'

I am very in favor of more development, but these are horrendous. Please STOP them.

Response to Comment No. IND 131-1

The comment expresses opposition to the Project based on its size and scale but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Comment Letter No. IND 132

John Given
2461 Santa Monica Boulevard, #438
Santa Monica, CA 90404
Received May 29, 2020

Comment No. IND 132-1

It is truly unconscionable that the 45-day public comment period for the massive and complex reboot of the Millennium Hollywood project, now dubbed the Hollywood Center, with its *[sic]* highly technical and lengthy Draft EIR (well over 12,000 pages), has not already been extended. The public review and comment period for this project should have been much, much longer, even if our state and local communities were not still in the midst of the Safer At Home period, which promises to extend well into the summer if not beyond.

A project of this size and impact could never have been adequately vetted by community members in a mere 45 days, even in the best of times. But during the COVID-19 pandemic there are significant environmental justice issues in denying an extension, and in pretending that greater online access, or in some cases delivery of cd-rom or thumb drives or massive print editions (of course, only to those who know to request them) will be adequate to the task. More likely, people with no legitimate hope of making a meaningful review and comment do *[sic]* to lack of time or access will take the chance that they may rely on others with better access and technology.

The City's decision not to use its discretion to do the right thing in this case is beyond perplexing, especially as it occurs against a backdrop of daily news articles on corruption at the highest levels of our City government (for example, today's online story by Ms. Alpert Reyes and Mr. Zahniser, available at <https://www.latimes.com/california/story/2020-05-29/josehuizar-george-esparza-alleged-secret-sexual-harassment-settlement>). The City hides behind the weak argument that its hands are essentially tied and it *must* limit the public review period. But this is false. As the Hillside Federation's email makes clear, the City has broad discretion to determine the appropriate review period, discretion it has used readily in the past. This is confirmed by the Chief Counsel for the state agency charged with oversight of CEQA.

Our California Supreme Court has held that the environmental review process is intended "to demonstrate to an apprehensive citizenry that the [City] has, in fact, analyzed and considered the ecological implications of its action." An EIR "is a document of accountability . . . protect[ing] not only the environment but also informed self government." *Laurel Heights Improvement Assn. v. Regents of the University of California* (1988) 47 Cal.3d 376, 392.

Angelenos are deservedly apprehensive about the environmental review process in Los Angeles due to the terrible corruption in our City government of which we seem to learn

more every day, and also due to the City's business-as-usual approach to planning and land use decision-making, even while we are at the height of the worst public health emergency in the modern era that limits public access to public buildings such as libraries, where environmental review documents are ordinarily available for review, and where computer systems are available to be used by members of the public who do not have the personal resources to own that technology. One cannot review a 12,400 page DEIR on a smartphone.

The City's decision to do the right thing in this case would go a long way to resolving the apprehension of its citizens. I urge you to extend the public comment period in the Hollywood Center by a reasonable amount, but certainly by no less than an additional 45 days. (A more reasonable extension to ensure environmental justice concerns are adequately met would be to extend until 60 days *after* public libraries reopen so that the usual public access to environmental documents is available to interested members of the public.)

Response to Comment No. IND 132-1

The comment expresses concern that their review was limited due to the 45-day comment period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 133

Sheri Hellard

Received May 29, 2020

Comment No. IND 133-1

Please extend the public comment period for the Hollywood Center Draft EIR. It is inconceivable to give such a short amount of time to review the 12,400 page document. There must be time to allow for fully informed public participation by extending the public comment period by a reasonable amount.

Response to Comment No. IND 133-1

The comment expresses concern that their review was limited due to the 45-day comment period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 133-2

The amount of traffic on Franklin avenue without this project already makes it close to impossible to get out of my neighborhood of The Oaks during rush hour in the morning and the evening.

Response to Comment No. IND 133-2

The comment expresses concern about the existing traffic and the Project's potential to impact traffic but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. The Project's transportation/traffic-related impacts were fully analyzed in the Draft EIR's Section IV.L, *Transportation*, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) and prepared pursuant to the City's Transportation Assessment Guidelines (TAG) adopted in July 2019. The TA is included in Appendix N-1 of the Draft EIR. As discussed therein, the Project would result in less-than-significant transportation/traffic related impacts. Furthermore, the Project would implement Project Design Feature TRAF-PDF-1 for a Transportation Demand Management (TDM) Program, which would discourage single-occupancy vehicle trips and encourage alternative modes of transportation, thus slightly reducing and offsetting increases in traffic. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 134-1

Attached please find my letter of support for Hollywood Center Project.

Response to Comment No. IND 134-1

Responses to the referenced letter are provided below in Response to Comment No. IND 134-2.

Comment No. IND 134-2

Thank you for this opportunity to submit a letter to express my support for the Hollywood Center project. This is a long awaited project and it will be an exciting addition to the Hollywood community.

I have a dental practice serving the businesses and residences in Hollywood since 2006. I have also had the honor of serving as the Chair of Hollywood Chamber of Commerce in 2016. During my Tenure I have witnessed many great changes, but there is still so much to do.

Please do not delay the proceedings on this project. It is important to take seriously the opportunity to contribute to the economic recovery of our city and state in this time. As an owner of a dental business, I have had to shut down my operation for an indeterminate time, and it is hard to imagine what “recovery” will look like. This journey we are on will likely be measured by years, not months. I see the impact on my colleagues and my patients.

Hollywood has been waiting for this project for over 10 years. This company has listened to the community and is bringing much needed housing and, in particular, housing for low income senior citizens, a fast growing component of our society. In a dense urban neighborhood where there is virtually no open space for people to gather or to sit and take a break, they have created walk-through areas, which our neighborhood sorely needs.

I encourage the city to proceed with the plans to bring this exciting addition to Hollywood to life.

Response to Comment No. IND 134-2

The comment expresses support for the Project but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 135

David Bolour
2720 S. La Cienega Boulevard, Suite A
Los Angeles, CA 90034
Received May 27, 2020

Comment No. IND 135-1

I am submitting this letter to offer support during this public comment period for the proposed project, Hollywood Center. I am in support of this project and feel it will be an asset to the Hollywood community.

My family has owned residential and commercial property in Hollywood since 1984. We have seen the growth of Hollywood over the years but would love to see Hollywood continue growing to accommodate the businesses, residents and visitors of the community.

The team who has designed this project have imagined an exciting and 21st century design that will be an enhancement to this community. The housing that is proposed, will give a much-needed open space for pedestrian access that will create a safer environment for the people in our community. Jobs will be created for both construction and ongoing business operations which are also critical to Los Angeles.

Thank you for this opportunity to participate in the public comment for the Hollywood Center Project. I encourage the city to proceed with the plans to bring this exciting addition to Hollywood to life after so many years of waiting.

Response to Comment No. IND 135-1

The comment expresses support for the Project but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 136

Hunter Jackson
Received May 29, 2020

Comment No. IND 136-1

I am a resident at the Broadway Hollywood Building at 1645 Vine Street.

The building and sign are a LA Historical-Cultural Monument and the building is a contributor to the Hollywood Blvd Commercial and Entertainment District with its primary entrance now located at 1645 Vine Street, at the corner of Hollywood Blvd. The building is identified in the EIR as: 6300 Hollywood Boulevard (B.H. Dyas Department Store Building/Broadway Department Store), Map No. B.12.

Response to Comment No. IND 136-1

The comment serves as an introduction to the commenter's residence, but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 136-2

I am writing w/r/t the above captioned EIR regarding the Hollywood Center Project. It was surprising to me that the EIR was released on April 15, in the middle of a pandemic, with only a 45-day comment period. This is far too short a period for review and comment.

Response to Comment No. IND 136-2

The comment expresses concern that their review was limited due to the 45-day comment period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 136-3

The EIR fails to adequately examine the very negative aesthetic impact of the Hollywood Center. Its two gigantic skyscrapers are inconsistent with the height and scale of every other building in the area. I am not opposed to developing these parking lots with facilities like those proposed. I am opposed to the scope of this project as described in the EIR.

One great feature of this area is the Broadway Hollywood sign located at my buiding [*sic*], which can be viewed by cars on the 101 Freeway as they enter Hollywood. This view will be lost. The aesthetic damage is equally severe at the Broadway Hollywood (and neighboring buildings), since the Hollywood Center will block views of such Hollywood

landmarks as the Hollywood Sign and the Griffith Park Observatory, diminishing the aesthetic and cultural significance of the building.

Response to Comment No. IND 136-3

The comment states that the Draft EIR failed to examine the aesthetic impacts of the Project. Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR, required by CEQA, see pages IV.A-29 through IV.A-54 in Section IV.A of the Draft EIR, where the analysis supported by multiple visual simulations indicates that the Project would not significantly block views of the Hollywood Sign, the Hollywood Hills, or the Downtown skyline. In the event the comment includes concerns about effects on private views, as stated on page IV.A-26 of the Draft EIR, the focus of the view analysis, consistent with CEQA and City practice, is on views from public vantage points. Under the City's 2006 L.A. CEQA Thresholds Guide, an office building or private residence would not be considered a viewing location since views of broad horizons, aesthetic structures, and other scenic resources would not be available to the public. In addition, the California courts have routinely held that "obstruction of a few private views in a project's immediate vicinity is not generally regarded as a significant environmental impact."¹⁴¹ See also Topical Response No. 4 – Aesthetics, above. Regarding other concerns related to effects on the Hollywood Broadway Building and sign, see the responses to comments provided to the Broadway Hollywood Homeowners Association, in Comment Letter No. ORG 37.

Comment No. IND 136-4

Perhaps most importantly, the EIR is completely deficient in its conclusion that the Hollywood Center Project will have no significant transportation impact. Before the pandemic, traffic was jammed at the Hollywood/Vine intersection. This has been exacerbated by the recent installation of a four-way walk sign (which was not taken into account in the EIR). Traffic will be even worse in future years since diminished ridership on public transportation will result from concerns over the spreading of infectious diseases in crowded spaces. Neither of these factors is considered in the EIR.

The Broadway Hollywood will be particularly negatively impacted because its only entrance is a narrow alley that can be entered only by going south on Vine past Hollywood Blvd and then turning right. The increase in traffic at the Hollywood/Vine intersection will make it even more difficult to enter our building.

Notwithstanding this, the EIR reaches the somewhat ridiculous conclusion that the Hollywood Center Project will result in no increased traffic. I am shocked by this conclusion and request that the traffic study be redone appropriately.

¹⁴¹ *Banker's Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App. 4th 249, 279.

Response to Comment No. IND 136-4

The comment states that the Draft EIR is deficient in its finding that the Project would have no significant transportation impact. See Response to Comment No. IND 125-4.

Comment No. IND 136-5

Finally, the EIR notes that the Hollywood Center may take up to six years to build. This will clearly result in major traffic disruption for a long period. This factor by itself demands that the utmost scrutiny be given to the project before it disrupts Hollywood for the better part of a decade. It is clear to me that such scrutiny has not occurred.

Response to Comment No. IND 136-5

The comment states that construction of the Project would result in a major traffic disruption but does not any specific issues with respect to the content or adequacy of the Draft EIR. See Topical Response No. 2 – Transportation and Traffic, above, for a discussion of traffic impacts during construction.

Comment Letter No. IND 137

Andrew Quintero

Received May 29, 2020

Comment No. IND 137-1

The Covid Crisis has made many of the basic responsibilities that must be carried out by the citizens of Los Angeles and the local leadership exponentially more difficult. When contacting local government it is common and expected to be told that services and operations are functioning more slowly due to the requirements of dealing with the pandemic.

This is reasonable and fair.

By the same token, the public comment period for the Hollywood Center Draft EIR must be extended so that the residents of Hollywood are are *[sic]* afforded the same courtesy our local leadership enjoys. The people who will be affected by the development of Hollywood Center face as many if not more of the struggles and responsibilities that slow the productivity of our local government. Reviewing a 12,400 page document is already a difficult task. Adding the delays and restrictions of the shutdown to the process make it close to impossible for people to exercise their rights as city residents.

This being Los Angeles, traffic is a huge concern and the recent impact of the Covid Crisis on public transportation - which has long been touted as the solution to congestion problems that will be made worse by the Hollywood Center Development - must be given more thorough review. Especially in light of how ridership of public transportation has suffered due to safety concerns relating to the virus.

I am asking that the good faith act of extending the public comment period be implemented so that those who live, work and love in Hollywood - and throughout Los Angeles - can make a proper assessment of the impact that his enormous development will have on the community.

Response to Comment No. IND 137-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment expresses general concern about traffic and impacts on public transportation but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved

by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. Furthermore, the Project would implement Project Design Feature TRAF-PDF-1 for a Transportation Demand Management (TDM) Program, which would discourage single-occupancy vehicle trips and encourage alternative modes of transportation, thus slightly reducing and offsetting increases in traffic. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment Letter No. IND 138

Brian Dyer

Received May 29, 2020 (IND 138A)

Received June 1, 2020 (IND 138B)

Comment No. IND 138A-1

Please include this email and attachments in the file for ENV-2018-2116-EIR.

It is baffling that, although the Planning Department has a myriad of requests for an extension to the comment period for the ENV-2018-2116-EIR, the Planning Department, as of yet, has not done so. Planning will not give Los Angeles residents the courtesy of extending the comment period for two weeks, from 45 days to 60 days, per CEQA Guidelines Section 15105, which is well within Planning's jurisdiction to do so. This behavior appears to be a strategic and hostile action against the Los Angeles citizenry and extremely beneficial to the developer, which Planning's behavior appears to only serve.

Attached is an article in the planning report, which quotes, Ray Chan, Vince Bertoni, Joel Jacinto, and John Vildovich. I would like to point out that since the article was written in 2016, two of the gentlemen mentioned in the article, Mr. Chan and Mr. Jacinto, are now being investigated by the FBI for corrupt practices while managing the Planning Department. This is not to say the Hollywood Center project was under their aegis, since this second iteration of Millennium's project was published in 2018. It is only to show that residents continue to be way sided by a Planning Department that has moved from "Safety" to one of "Economic Development" and to do so, actively courts outside developers, making it easy for such corruption to occur.

As a further demonstration of Planning's maddeningly response mechanism to its citizenry, besides the article, I am attaching two correspondences which I received from Planning (please note, even though the emails were sent as a neighborhood council officer, I want to make it clear that I am requesting the extension as a resident. Bylaws and plain old ethics prevent me from doing so. In the attached emails, it is demonstrated that Planning volunteered to organize and initiate a meeting with the developer of a controversial project for my stakeholders to strategize and steer the developer through the planning and planning commission process.

Mr. Bertoni has boasted recently of transparency in Planning, but the truncation of a comment period for the public during the Covid Crisis, where people are now being not only parents, but teachers, food deliverers to elderly family members, and disruptively unemployed and needing to look for work is, paints his comments as a hollow statement.

In this day and age when the Planning Department and City Council members are continually being exposed as betraying the public trust, this resistance by Planning to open the comment period up, even with a meager one of two weeks, comes off as

aggressively strategic for the developer, rather than legal. That, and the effects of this pandemic, prevents me from actively participating in my neighborhood.

Planning can and should be able to serve both the citizenry of Los Angeles and the developer by making the extension.

Ms. Nguyen, I know that you do not set Planning's policies, and only apply them to a project.

Please log my request for an extension to the comment period for ENV-2018-2116-EIR.

Response to Comment No. IND 138A-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 138A-2

Attachment 1: ULI-LA Forum: LA City Leaders Collaborate to Improve Planning and Development Process, May 23, 2016.

Attachment 2: Email between Nuri Cho, with the City of Los Angeles, and the commenter, dated between October 15, 2018 and October 22 2018.

Response to Comment No. IND 138A-2

The two attachments are in reference to an article and emails from people referenced in the prior comment. However, the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 138B-1

Please submit the message below (also attached) and the accompanying attachments to comments of the DEIR for the Hollywood Center Project ENV-2018-2116-EIR.

June 1, 2020

To Whom It May Concern,

Please note that I am submitting this as a resident, and not on behalf of any organization.

Response to Comment No. IND 138B-1

Responses to the referenced letter and attachments are provided below in Response to Comment Nos. IND 138B-2 and 138B-3.

Comment No. IND 138B-2

The reason for these comments is to request City Planning to alleviate concerns with Conflicts of Interest(s) in Section IV of the Draft Environmental Report for the Hollywood Center Project with Group Delta with its work with Millennium Partners. It is requested that the City request outside interpretation and consultation of the report with the California Geological Survey. the California Geological Survey as Group Delta may prove to strongly biased on behalf of its employer, Millennium Partners.

(Please note, that even though many community stakeholders requested a delay during the pandemic for comments on the 13,000 page DEIR, and Planning Departments *[sic]* decision to not grant it, assumptions on the validity of Group Delta's studies need to be challenged more closely).

There is no denying that a trace of the Hollywood Fault runs under the project site. The Group Delta studies admit as much. The question is whether or not it is active during the Holocene era. Group Delta has said it is not, the State Geologist, as quoted in the LA Times, November 2014, said, "Our conclusion from the data is that there is an active fault, and it does run right along the course that's right along the map." The California Geological Survey has not indicated a change of position from Group Delta's studies. It is up to the City to accept that.

Alarming, the applicants are asking for the removal of the 50 foot setback, which infers the Eastside of the project will be built over the fault.

Before going forward with project approval, the City should look at past behaviors of the Millennium Partners application from the previous DEIR iteration for the first project, Millennium Hollywood (originally locating the fault on quarter mile north of the project, moving the footprint of the project North, so it wouldn't lie on the fault, etc.). In this case, why would Group Delta use illustrations from LA Weekly in its referenced Argyle study, rather than pulling from the public FER 253 document itself to place the fault lines?) It should be requested that the City study all supplied illustrations, to make sure the trenching was done along the original 2014 FER 253, and/or note any variances in what was submitted.

The studies also do not state where the determined active sections/trace faults are in the vicinity, and how they will affect the "inactive" fault. There are generalities given about other faults, Whittier, Newport-Inglewood, etc., but nothing specific about the Hollywood fault's active traces. In 2014, the Napa quake happened on what was previously an "inactive" fault. More troubling, is the knowledge that the Napa earthquake was caused by a fault considered to be "inactive" for 1.6 million years. Once again, there is no question if there is a fault underneath the project. It is whether or not it is active, so the City can give its blessing, rather than saying "no" because of State law.

Extremely troubling, is that these studies cannot be taken as un-biased. Group Delta has a conflict of interest with Millennium Partner's association with the CAP Park.

Friends of CAP Park was set up as a non-profit by members of Phil Aarons' office and had Mr. Aarons and his staff on the Board (see attached form 990 and attached Millennium presentation, page 14). The Friends of CAP Park are housed in the Millennium Partners offices. CAP Park, Millennium's sister project, would effectively be a one-mile long overpass.

Group Delta specializes in, and has won awards for designing overpasses. Thus, Group Delta cannot be an uninterested concern in its studies of the area. It is not known if the possibility of awarded construction of the Park without any bidding process might have influenced the reports in favor of Millennium's investment. Group Delta was hired by Millennium Partners to do the geological studies for the project site, after the original plans for Millennium were seen as faulted (they located the fault one quarter mile North of the project site).

Group Delta, should the CAP Project proceed, stands in line to reap millions of public and private funds. There is no statement if the construction of Millennium's CAP Park project will go out to bid. In fact, there is language that this might not need happen, since CAP Project is a private concern, mixed with public government financing.

The FBI is currently investigating Pay or Play activities with the Planning Department, Building and Safety and City Council members and staff. We should expect a project of this magnitude, that all of its participants, including outside concerns wielding money and influence in the community for their own betterment, to follow the dictates of the California Fair Political Practice Commission, which all City employees are obligated to follow.

Once again, it is requested that the City confer with the unbiased California Geological Survey on the validity of the studies presented by Group Delta.

Response to Comment No. IND 138B-2

The comment expresses concern about the Group Delta studies that are provided and analyzed in the Draft EIR. Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D of the Draft EIR concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Regarding concerns about Group Delta and a request that their report be subject to outside interpretation and consultation, see Response to Comment Nos. 8I-6 and 8I-10.

With regard to the FER 253 report cited in the comment, the FER 253 was published in 2014. The pre-dates the 2015 and 2019 Group Delta investigations and thus does not

have the benefit of the additional and more recent data. See Response to Comment No. 8I-10 for additional details.

Comment No. IND 139-1

Comments for Millennium Hollywood Center DEIR.....

http://clkrep.lacity.org/onlinedocs/2013/13-0593_misc_5-15-13.pdf

Due to the Coronavirus Pandemic Crisis.....it was impossible to go through the massive Millennium Hollywood Center DEIR...with no physical meetings, stay at home orders, no Neighborhood Council meetings.. ..

It would have been nice, decent, to have a comment period extension, as per many requests...so I am submitting comments on The Hollywood Millennium DEIR, from 2013...which I'm more familiar with..it is the same developer, of yet another oversized, traffic inducing, Hollywood historic compromising, out of context project, on the same state geologist confirmed dangerous building site....

It's the story of the opposition expressed, and the lawyers comments representing the opposition, before all the lawsuits were withdrawn once Millennium contributed generously so they would like the obscene projects

.....\$\$\$\$\$\$\$\$

Response to Comment No. IND 139-1

The comment expresses concern about the City's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above. Furthermore, Neighborhood Councils are not required to meet in person in order to confer or meet in order to provide comments.

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment No. IND 139-2

It has all of Caltrans issues with the Millennium projects that CD13 councilmember stood up and claimed at the city council hearing that Caltrans wasn't opposed to Millennium projects.

'Caltrans waves red flag on Millennium Hollywood project'....

Caltrans has made it clear that without significant changes in the giant Millennium Hollywood project, the effect on the 101 Freeway could be disastrous. <http://www.latimes.com/business/realestate/la-fi-hiltzik-20130619,0,1425817.column#>

The Judge shut the projects down and agreed with Caltrans ..'Inadequate Traffic Studies'..

Response to Comment No. IND 139-2

The comment expresses concern with the Project's impacts on US-101 by referencing the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

It should be noted that the City did receive two letters from Caltrans with comments on the transportation analysis to be conducted for the Project. Although the analyses requested by Caltrans are not a required CEQA analysis per the City's Transportation Assessment Guidelines (TAG), adopted in July 2019, the analyses were presented for informational purposes in Appendix I to the Transportation Assessment (TA) for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also see Response to Comment No. AG 2-7, which discusses a recent meeting between the City and Caltrans in July 2020 during which Caltrans did not identify any particular concerns or make any particular requests for new analysis beyond that included in the Draft EIR. Additionally, the Caltrans representative indicated that Caltrans' concerns were non-CEQA concerns. Based on this, Caltrans has not identified any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

Comment No. IND 139-3

It's the story of a developer paid historic preservation consulting firm, and the city went along with their analysis/claim there was no historic compromise plopping the monster skyscrapers in front of the Historic Cultural Monument #857, Capitol Records Building, or

compromising the National Historic Register of Famous Places area of Hollywood, totally ignoring, and in conflict with, Hollywood Heritage reasons why they were all wrong for and would compromise the Historic area.

<https://www.hollywoodheritage.org/millennium>

Once again, Millennium got what it paid for, and the city went with the PAID CONSULTANT'S historic 'analysis'....\$\$\$\$\$\$\$\$

Everyone was/is shamefully on board with blocking, overwhelming, and basically trashing Hollywood's iconic, world renown Historic Resources, The Capitol Records Building and The Hollywood Sign.

What kind of city allows this?

It also might have LA Conservancy issues/problems/opposition there, until THEY withdrew their law suit and then they liked the projects too..Millennium \$\$\$\$\$\$\$\$\$

Response to Comment No. IND 139-3

The comment expresses concern about the Project's historic analysis, scale, and blocking of views but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. Impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame, and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

Aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

It should be noted that the Los Angeles Conservancy provided a comment letter to the Draft EIR. Responses to the Los Angeles Conservancy letter are provided in Response to Comment Nos. ORG 41-1 through 41-9.

Comment No. IND 139-4

And AMDA's issues/problems with the projects until Millennium made a generous contribution, enough for them to withdraw their law suit and like the projects.

...as well as The W Hotel.

Response to Comment No. IND 139-4

The comment makes reference to alleged problems with the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Furthermore, the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

It should be noted that AMDA provided a comment letter to the Draft EIR. Responses to the AMDA letter are provided in Response to Comment Nos. ORG 44-1 through 44-65.

Comment No. IND 139-5

Since the city refused to give Angelenos a DEIR Comment Extension, for Millennium's newest projects, ...this is the best I can do, with the kids home from school, the mother in law not well, both husband and myself out of work, lining up and waiting to get into the grocery store, disinfecting everything that comes into the house...and trying to keep the rest of us virus free and healthy and survive A STRESSFUL, FRIGHTENING, PANDEMIC CRISIS.

So, thank you, Planning Director, CD13 Councilmember, and L.A. Mayor for being so very, very understanding.....

Response to Comment No. IND 139-5

The concluding comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 139-6

2013 Millennium DEIR

http://clkrep.lacity.org/onlinedocs/2013/13-0593_misc_5-15-13.pdf

IN 2013...COUNCILMEMBER GARCETTI ASKED FOR A MILLENNIUM DEIR COMMENT PERIOD EXTENSION HE GOT IT.....

THERE WERE NO 'UNUSUAL CIRCUMSTANCES', LIKE A PANDEMIC CRISIS.....

City of Los Angeles
February 2013
Millennium Hollywood Project

LETTER NO. 04 - COUNCIL OFFICE OF ERIC GARCETTI (pg. 41)

Eric Garcetti Councilmember
13th District Council
member City of Los Angeles
District 13
November 2, 2012

Comment No. 04-1

The Planning Department has released the draft Environmental Impact Report (EIR) for the proposed Millennium Project at 1750 Vine Street, which commenced a 45 day public comment period:

The proposed project is large in scale and includes what could be one of the tallest buildings in all of Hollywood. As I'm sure you are aware, the proposed project has generated controversy among my constituents.

Accordingly, I request that the public comment period be extended to 60 days to increase the public's opportunity to comment on the draft EIR.

Letter #4..Page 41..

Response to Comment No. IND 139-8

The comment includes links to various websites with content referencing corruption but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 139-9

Millennium.....HOLLYWOOD CENTER IS MILLENNIUM

The Millennium project is disturbing example of L.A. City leaders trying to get a massive development approved despite formal warnings by the State of California of the project's proximity to the Hollywood Earthquake Fault.

This “rupture fault” is capable of actually rupturing the surface of the land, splitting buildings into pieces.

In 2013, when the project was being considered by the City Council, a rare letter was sent to Council President Herb Wesson by the head of the state's California Geological Survey, alerting Wesson that the project “may fall within an earthquake fault zone.”

State Geologist John Parrish said his agency launched a study of the Hollywood fault after several independent studies suggested it may be active.

He warned that that if a deeper study, expected by 2014, found the Hollywood fault to be active, the City of L.A. would be required by state law to withhold permits for new development projects until testing could prove that there is no risk. (See Attachment 20. Letter from John Parrish, State Geologist, California Geological Survey).

LA Weekly reported: “State geologists released a long-awaited new map of the Hollywood fault, which confirmed that the Millennium twin skyscraper project, as activists claimed, sits directly atop a fault trace – an old rupture that marks the active fault – and thus is illegal to build.”

Caltrans also jumped in, warning that the massive proposed twin skyscrapers, of a precedent-setting height and size for Hollywood, would severely back up the 101 Freeway, creating hazards and environmental effects that could not be mitigated.

Community activist George Abrahams called for a Grand Jury investigation to review how the Millennium project won backing from the City Geologist, Building & Safety, Planning Commission, City Council and the Mayor.

He told LA Weekly: “This whole matter stinks so badly that it's time for a criminal investigation to get to the bottom of how City Hall colluded with the developer for so long to hide the truth.”(See Attachment 21. LA Weekly, March 6, 2014, “An Earthquake Could Topple Hundreds of Buildings, and L.A. Leaders Are Doing Nothing“)

City safety officials agreed with the developer and ignored the California State Geologist, using old maps pre-dating the new findings, and insisting that there was no active fault and the proposed twin skyscrapers were appropriate.

On July 24, 2013, in a 13-0 vote and backed by Mayor Eric Garcetti, the project was approved by City Council.

In 2015, a judge halted the project, ruling that the City of Los Angeles failed to fully assess how the \$1-billion project would affect surrounding neighborhoods.

According to the Los Angeles Times, “In a 46-page decision, Los Angeles County Superior Court Judge James C. Chalfant said Los Angeles inappropriately disregarded the concerns of Caltrans that traffic on the 101 Freeway might significantly worsen with the development and be unsafe.” (See Attachment 22. Los Angeles Times, “Judge halts Millennium Hollywood skyscraper project”)

It is chilling that today, the investor-developers still seeking to build the Millennium skyscrapers in Hollywood, are the same investment partners who built the disastrous sinking Millennium Tower in San Francisco. That building is sinking into the earth, and leaning over because of its failing foundation.

Millennium Partners anchored the building in sand, not rock.

In 2015, residents of the luxury condo units, which range from \$1.6 to \$10 million, realized their building was sinking. By 2018, Millennium Tower had sunk 17 inches and tilted 14 inches.

In September 2018, large cracks appeared in a thick window, prompting the City of San Francisco to issue a notice of violation. (See Attachment 23. NBC Bay News, September 4, 2018, “New Crack in San Francisco’s Tilting Millennium Tower”)

More than 50 lawsuits are underway in San Francisco by condominium owners living in the tilting and sinking Tower. This rare disaster has been widely exposed by New York Times, The Wall Street Journal, and “60 Minutes.”

Yet today, the same Millennium Partners group of investor-developers are trying, a second time, to get their twin skyscrapers approved — and they have moved one of their proposed towers directly atop the Hollywood Quake Fault, in defiance of the California State Geologist.

The proposed Millennium twin skyscrapers also have a new name, “Hollywood Center,” to escape the Millennium Partners’ stained name from its sinking building in San Francisco.

The name change has worked so far: there's been no L.A. media coverage linking the sinking San Francisco skyscraper to the two men proposing twin skyscrapers next to and atop an L.A. quake fault.

However, the Los Angeles Times did report the following:

"Most alarming is the fact that the proposed new project is sited astride the Hollywood Fault Zone and the 7.0 magnitude active Hollywood Earthquake Fault, as officially Alquist-Priolo mapped by the State of California."

Any construction of an occupied building across this fault is unsafe folly. (See Attachment 24. Los Angeles Times, April 12, 2018, "Controversial \$1-billion Hollywood high-rise project relaunched by developer").

In the fall of 2018, The New York Times reported even worse news:

Earthquake scientists gathering in Los Angeles unveiled a seminal new study that upwardly revises estimates of damage to West Coast skyscrapers from a quake.

The Southern California Earthquake Center, a research organization of seismologists and engineers, has found that the severity of shaking in L.A. and West Coast cities has been significantly under-estimated.

L.A.'s tall buildings are, as a result, dangerously under-designed.

Engineers found that buildings higher than 20 stories can suffer far more damage, with greater potential for collapse and widespread death, than believed by local engineers.

The Mayor, City Council and City Departments took no steps to respond, yet researchers at the Southern California Earthquake Center warned that municipal engineers would undoubtedly push back against the shocking findings. (See Attachment 25. New York Times, June 27, 2018, "A Seismic Change in Predicting How Earthquakes Will Shake Tall Buildings").

STATE GEOLOGIST WARNINGS IGNORED...

"We feel very confident..we're very confident it's there," Parrish told reporters.. "Surface rupture is very dangerous.

In fact, it's calamitous to structures that are built across the surface trace of an active fault."State Geologist Dr. John Parrish....

"It has the potential to rupture sometime in the future..the best thing to do is stay off the trace.."State Geologist Tim McCrink)

MASSIVE HOLLYWOOD PROJECT SITS ATOP QUAKE FAULT, CALIFORNIA SAYS

<http://www.latimes.com/local/lanow/la-me-ln-hollywood-fault-map-20141106-story.html>

"Our conclusion from the data is that there is an active fault, and it does run right along the course that's right along the map," state geologist John Parrish said.

STATE MAP SHOWS ACTIVE FAULT LINE UNDER PROPOSED HOLLYWOOD SKYSCRAPER PROJECT

<http://abc7.com/news/map-shows-fault-line-under-proposed-hollywood-skyscraper-project/384590/>

"It has the potential to rupture sometime in the future..the best thing to do is stay off the trace.." State Geologist Tim McCrink

NEW STATE FAULT MAPS SHOW HIGHER EARTHQUAKE RISKS IN HOLLYWOOD

<http://articles.latimes.com/2014/jan/08/local/la-me-0109-hollywood-fault-20140109>

The state's new map shows that the proposed Millennium Hollywood skyscraper project is within the roughly 500-foot fault zone.

State geologist John Parrish said the state's fault line goes underneath Millennium

"We feel very confident about where we drew that line, within a 50-foot accuracy back and forth..we're very confident it's there," Parrish told reporters at a downtown Los Angeles news conference.

"Surface rupture is very dangerous. In fact, it's calamitous to structures that are built across the surface trace of an active fault."

Los Angeles officials did not order trenching for any of the three projects before the City Council approved those projects.

L.A. COUNCIL OK'S HOLLYWOOD SKYSCRAPERS DESPITE CONCERNS OVER QUAKE FAULT LINE

<http://articles.latimes.com/2013/jul/24/local/la-me-millennium-vote-20130725>

"...concerns about seismic safety were raised, citing the project's proximity to the Hollywood fault.

On Saturday, the head of the California Geological Survey, John Parrish, sent a letter to Council President Herb Wesson alerting him that the skyscrapers "may fall within an earthquake fault zone."

Parrish said Wednesday that a map drawn by his agency in 2010 showed that the Hollywood fault "goes right through the Millennium site."

He criticized a seismic report produced by the developer that said extensive testing showed that the building site was safe and did not lie on the fault line.

Parrish said the report did not refer to his agency's map and left out other important information.

Mayor Garcetti announced Wednesday that he would sign the deal.."

San Francisco's Big Seismic Gamble.....

FULLER, ANJALI SINGHVI and JOSH WILLIAMS

New York Times APRIL 17, 2018

Link: <https://www.nytimes.com/interactive/2018/04/17/us/san-francisco-earthquake-seismic-gamble.html>

With Millennium Tower, San Francisco got a foretaste of what it means to have a structurally compromised skyscraper

The area around Millennium Tower is considered among the most hazardous for EARTHQUAKES

The US Geological survey rates the ground there - layers of mud and clay- as having a very high risk of acting like quicksand during an earthquake, a process known as liquification."

Millennium Tower has sunk almost a foot and a half and is leaning 14 inches toward neighboring high rises.

THE DEVELOPER AND CITY OFFICIALS KNEW OF THE BUILDING'S FLAWS FOR YEARS BUT KEPT THEM CONFIDENTIAL UNTIL 2016, WHEN NEWS LEAKED TO THE PUBLIC.

San Francisco's Landmark Tower for the Rich and Famous is Sinking and Tilting
<http://www.sfchronicle.com/bayarea/article/SF-s-landmark-tower-for-rich-and-famous-is-8896563.php?t=1ef0887a203aa214ae&cmpid=twitter-premium>

P.J. Johnston, spokesman for tower builder Millennium Partners and its principal owner, Sean Jeffries, said a nine-month, independent structural safety review in 2014 “determined the settlement has not significantly affected the seismic performance of the building, and does not represent a safety risk.”

Millennium’s engineers anchored the building over a thick concrete slab with piles driven roughly 80 feet into dense sand.

“To cut costs, Millennium did not drill piles to bedrock,” or 200 feet down, the transit center authority said in its statement.

Had it done so, the agency said, “the tower would not be tilting today

L.A. IGNORES STATE GEOLOGIST FOR MILLENNIUM PROJECTS.....

State Geologist Dr. John Parrish confirmed Millennium Hollywood Vine building site is on an active EQ fault line, and warned is too dangerous to build on.

MASSIVE HOLLYWOOD PROJECT SITS ATOP QUAKE FAULT, CALIFORNIA SAYS

<http://www.latimes.com/local/lanow/la-me-ln-hollywood-fault-map-20141106-story.html>

“Our conclusion from the data is that there is an active fault, and it does run right along the course that’s right along the map,” state geologist John Parrish said.

NEW STATE FAULT MAPS SHOW HIGHER EARTHQUAKE RISKS IN HOLLYWOOD

<http://articles.latimes.com/2014/jan/08/local/la-me-0109-hollywood-fault-20140109>

The state's new map shows that the proposed Millennium Hollywood skyscraper project is within the roughly 500-foot fault zone.

"We feel very confident about where we drew that line, within a 50-foot accuracy back and forth..we're very confident it's there," Parrish told reporters at a downtown Los Angeles news conference.

"Surface rupture is very dangerous. In fact, it's calamitous to structures that are built across the surface trace of an active fault."

Los Angeles officials did not order trenching before the City Council approved projects.

Response to Comment No. IND 139-9

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

The comment also asserts that the Project is located on top of a quake fault. Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

The comment also makes reference to a different project located in San Francisco. The Project, as analyzed in the Draft EIR, retained experts to conduct fault studies specific to the Project Site. The fault investigations at the Project Site presented in the Draft EIR technical documents prepared by Group Delta Consultants (2015 and 2019) were performed with full transparency and witnessed by the CGS and City reviewing officials. All parties are considered experts in fault studies in Southern California. Therefore, the fault investigations prepared for the Project and as analyzed in the Draft EIR have no connections to the studies and development of the building located in San Francisco.

Comment No. IND 139-10

PRESS RELEASE:

WHILE PANDEMIC RAGES, CITY OF LA RELEASES ENVIRONMENTAL IMPACT REPORT FOR NEW MILLENNIUM HOLLYWOOD PROJECT

Under a Cloud of FBI Investigations, and for Same Developer that Built the “Leaning Tower of San Francisco,” LA Officials Slap Public in the Face

In the midst of the COVID-19 crisis, the City of Los Angeles on April 16, 2020 released the draft environmental impact report for the new Millennium Hollywood skyscrapers project. And the City did so with the bare minimum 45 days for the public to comment.

“Could the city be any more corrupt at this time?” said attorney Robert P. Silverstein, who has successfully fought the LA City Council and Millennium developer for several years.

Regarding the city’s action today (see notice from City Planning Dept. at bottom of this email), Silverstein noted:

“This is the project that the Mayor Eric Garcetti and Councilman Mitch O’Farrell greenlighted to put skyscrapers on top of the 7.0-magnitude Hollywood Earthquake Fault.”

“This is the project where Councilman Mitch Englander in July 2013 mysteriously conducted the hearing that led to the City Council’s approval.”

https://www.youtube.com/watch?v=xMe7fq_ZXcQ&t=13s

“Englander last month agreed to plead guilty to federal obstruction of justice, part of a wider-ranging federal corruption probe of LA City officials.”

“This is the project that won the City Council’s Planning and Land Use Management Committee approval in June 2013. Two of the committee’s three members were Councilman Jose Huizar, who is himself under FBI investigation, and Englander, soon to be in federal prison.”

“This is the project where the City’s Department of Building and Safety, under then head Raymond Chan, approved the developer’s bogus earthquake studies. The FBI is also investigating Chan, as repeatedly reported in the media.”

“This is the project where the California State Geologist warned the City Council of grave threat to human life because of the project’s location over the Hollywood Earthquake Fault. The mayor and City Council ignored the state’s top geologist.”

“This is the project that Caltrans fought, stating the city and Millennium’s traffic studies were fraudulent.”

“This is the project from the same developer, Millennium Partners, guilty of the ‘Leaning Tower of San Francisco’ disaster.”

“And this is the project that more than 40 community groups and thousands of residents pleaded with city leaders to deny, all to no avail.”

That forced stopthemillenniumhollywood.com, community groups represented by Silverstein, to sue the City Council and Millennium in 2013.

In 2015, Silverstein and the community won the trial against the City Council and Millennium.

The City Council and Millennium appealed and lost.

The City Council then went to the California Supreme Court and again lost. “But like Jason from the grave, Millennium is back.”

“This time they slightly tweaked the project and are lurking under a new name, called ‘Hollywood Center’.

But a rose by any other name stinks just as bad,” Silverstein said. “ ‘Hollywood Epicenter’ is more accurate,” he added.

“These massive proposed skyscrapers will have all the dangers of the original project, and more.”

Silverstein explained that developer Millennium Partners rebranded the project

...“to avoid the taint of their bogus earthquake studies, and to hide their connection to the San Francisco leaning and sinking tower, one of the biggest construction screw ups in modern times.”

On the same day Garcetti is reported in the LA Times to be looking at pay cuts and furloughs for city workers because of the COVID-19 crisis, and announced “there will be big cuts,” his Planning Department drops this bomb on the public, said Silverstein.

“In this dire time, it’s a disgrace that Garcetti and his strained city staff are working so tirelessly for a developer with such a shady record,” Silverstein said.

“What kind of leadership is this, and how many more city officials should the FBI investigate?” asked Silverstein.

Response to Comment No. IND 139-10

The comment includes a press release but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

The comment makes reference to a different project located in San Francisco. The Project, as analyzed in the Draft EIR, retained experts to conduct fault studies specific to the Project Site. The fault investigations at the Project Site presented in the Draft EIR technical documents prepared by Group Delta Consultants (2015 and 2019) were performed with full transparency and witnessed by the CGS and City reviewing officials. All parties are considered experts in fault studies in Southern California. Therefore, the fault investigations prepared for the Project and as analyzed in the Draft EIR have no connections to the studies and development of the building located in San Francisco.

The comment also makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in the Draft EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Furthermore, it should be noted that the speculation as to alleged illegal activities are not related to the adequacy of the Draft EIR. Accordingly, no further response is warranted regarding these issues.

Comment No. IND 139-11

Sent last week but have not received response it arrived..sending again..for the record

Response to Comment No. IND 139-11

The comment is noted. However, the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 139-12

Attachment: Duplicate letter

Response to Comment No. IND 139-12

The attachment is a duplicate of the prior letter. Responses are provided above in Response to Comment Nos. IND 139-1 through 139-12.

Comment Letter No. IND 140

Chip Clements

Received May 30, 2020

Comment No. IND 140-1

I write this email to object to the latest version of the grossly over-sized development currently named "The Hollywood Center," which would stab a couple of mega-structures, 46 and 35 stories, into the heart of Hollywood. They are better-suited for the Los Angeles downtown area than the Hollywood community.

I currently live in Beachwood Canyon and I've lived in Hollywood for more than 40 years. I'm mostly a fan of the vast revitalization we've seen in that time. But a 46-story building seems a vast over-reach and one that will do more damage than good for Hollywood residents. And if this kind of development is permitted at this point, what kinds of gross over-developments will follow?

Response to Comment No. IND 140-1

The comment expresses opposition to the Project based on size and height. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Comment No. IND 140-2

More specifically, I'm concerned about this development's impact on the traffic on our already-crowded streets, our already heavily-burdened water and sewage systems, and the limited parking in the Hollywood/Vine area.

Response to Comment No. IND 140-2

The comment expresses concern about the Project's impact on traffic, water and sewage, and parking. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L of the Draft EIR concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

The Project's impacts on wastewater and water supply are fully analyzed within Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, in the Draft EIR. Supporting technical infrastructure information is included in Appendix P-1 of the Draft EIR. A City approved Water Supply Assessment (WSA) for the Project is included in Appendix P-2 of the Draft EIR. As discussed therein, the Project would result in less-than-

significant utility and water supply impacts. In regard to wastewater, as stated on page IV.N.1-13 of Section IV.N.1, *Wastewater*, of the Draft EIR, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under City's Building and Safety Code and the Los Angeles Department of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with LAMC Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

In regard to water supply, as stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved WSA, as required by SB 610, for the Hollywood Center Project that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Furthermore, the Project would implement Project Design Feature WS-PDF-1 and provide specific water efficiency features to conserve water and reduce Project water demand. Therefore, there would be sufficient water supplies available to service the Project.

As noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Comment No. IND 140-3

I would support the Hollywood Center development if it proposed buildings compatible with other multi-story developments in Hollywood. But this Hollywood Center development, as proposed, is like plopping an elephant into a rabbit habitat and it should be sent back to the drawing board.

Response to Comment No. IND 140-3

The comment expresses that the Project should be compatible with other developments in Hollywood. Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the

Project's land use compatibility and the extent to which existing neighborhoods would be disrupted, divided, or isolated. As analyzed therein, and as stated in Topical Response No. 5 – Land Use and Planning, above, the Project Site is located within a designated Regional Center and would be developed within existing surface parking lots and, thus, would not encroach into existing, surrounding residential neighborhoods. Furthermore, the Project Site is surrounded by residential, commercial, and mixed-use, buildings that vary in building style and scale. The Project would be consistent with the on-going mixed-use redevelopment in the area and targeted growth policies applicable to Regional Centers and Transit Priority Areas (TPAs), and would be sited and designed to enhance the character of the Regional Center. In regard to the Project's height, see Response to Comment No. IND 140-1 and Topical Response No. 4 – Aesthetics, above, which discusses aesthetics impacts of the Project.

Comment Letter No. IND 141

Morris Berman

Received May 30, 2020

Comment No. IND 141-1

I am writing in behalf of myself and my neighbors regarding the proposed Hollywood Center Project. This project is completely out of scale to anything in the neighborhood and will have a deleterious effect on nearly aspect of the area; huge increases in traffic and congestion and general degradation of the environment. I hope that this project will be scaled back or abandoned altogether to help retain the quality of life in Hollywood and adjoining areas.

Response to Comment No. IND 141-1

The comment expresses an opinion that the Project is out of scale with the neighborhood and would cause increases in traffic, congestion, and degradation of the environment but does not raise any specific issues with respect to the content or adequacy of the Draft EIR.

Regarding scale, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Regarding traffic, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

In regard to degradation of the environment, while the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, as stated on page ES-1 of the *Executive Summary* of the Draft EIR, the purpose of the Draft EIR is to inform decision-makers and the general public of the potential environmental impacts resulting from the proposed Project. As stated on page ES-4, the Project would result in significant and unavoidable impacts with regard to cultural resources and noise and vibration during Project construction; these impacts are temporary and would cease at the completion of construction activities. All other impacts, including operational impacts, would be less than significant.

Comment Letter No. IND 142

George Sunga
Received May 30, 2020

Comment No. IND 142-1

If possible please extend to comment period on the Hollywood Center Project DEIR.

Response to Comment No. IND 142-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 143

Diane Laskin

Received May 30, 2020

Comment No. IND 143-1

This project is out of scale with this community. It's an abomination. There is already severe traffic flow issues in and around this area. It has on occasion taking 20 minutes to drive from Sunset to Franklin on Vine. There has been and should continue to be a height moratorium on structures in Hollywood, that of the height of the mast on the Capitol Records building.

Response to Comment No. IND 143-1

The comment expresses concern about the Project's scale, height, and traffic impacts. While the comment does not raise any specific issues with the respect to the content or adequacy of the Draft EIR, aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above. As described in Topical Response No. 5, the Project's height would be allowed under existing State and City zoning provisions and would comply with the zoning for the Project Site.

Regarding traffic, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 143-2

It was already determined when the Millennium project tried to force its way into our community, that it was out of scale, problematic for safe traffic flow, and seismically dangerous. Please put a halt to these skyscrapers in Hollywood.

Response to Comment No. IND 143-2

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project. The comment does not raise any specific issues regarding the content or adequacy of the Draft EIR. As such, no further response is warranted.

See Response to Comment No. IND 143-1 for a discussion of the Project's aesthetic and traffic impacts. Also, geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D of the Draft EIR concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment Letter No. IND 144

Susan and Warren Jason
Received May 30, 2020

Comment No. IND 144-1

As homeowners and members of both the Hollywood Dell Community Association (HDCA) and the Broadway Hollywood Homeowners Association, as well as being owners of four condominiums in the Broadway Hollywood Building at the iconic corner of Hollywood Boulevard and Vine Street, we fully object to the Hollywood Center Project for several reasons:

Response to Comment No. IND 144-1

The comment expresses opposition to the Project. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. IND 144-2

The Broadway Hollywood building and neon sign are a LA Historical and Cultural Monument. The building is a contributor to the Hollywood Blvd Commercial and Entertainment District with the primary entrance now located at 1645 Vine Street, at the corner of Hollywood Boulevard. The building is identified in the EIR as: 6300 Hollywood Boulevard.

Response to Comment No. IND 144-2

The comment provides background of the commenter's building but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 144-3

We are appalled that the EIR was released on April 15, in the middle of a pandemic, with only 45 days to review an over 1,300 page document. It fails to address obstruction of iconic views, 101 freeway and street traffic, access and density, among other issues.

Response to Comment No. IND 144-3

The comment objects to the review period and time of release of the Draft EIR. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment also states that the Draft EIR does not address obstruction of views, the US-101 freeway and street traffic, access, and density. Aesthetics impacts were analyzed

in Section IV.A, *Aesthetics*, of the Draft EIR. Although the aesthetics analysis provided in the Draft EIR is informational and not required by CEQA, see pages IV.A-29 through IV.A-54 in Section IV.A, where the analysis supported by multiple visual simulations indicates that the Project would not significantly block views of the Hollywood Sign, the Hollywood Hills, or the Downtown skyline. In the event the comment includes concerns about effects on private views, as stated on page IV.A-26, the focus of the view analysis, consistent with CEQA and City practice, is on views from public vantage points. Under the City's 2006 L.A. CEQA Thresholds Guide, an office building or private residence would not be considered a viewing location since views of broad horizons, aesthetic structures, and other scenic resources would not be available to the public. In addition, the California courts have routinely held that "obstruction of a few private views in a project's immediate vicinity is not generally regarded as a significant environmental impact."¹⁴² Also see the responses to comments provided to the Broadway Hollywood Homeowners Association, in Comment Letter No. ORG 37, and Topical Response No. 4 – Aesthetics, above.

Regarding density, as analyzed in Section IV.H, *Land Use and Planning*, of the Draft EIR and Topical Response No. 5 – Land Use and Planning, above, the Project's density would be allowed under existing State and City zoning provisions. Furthermore, the Project would be consistent with the allowable densities under the existing Redevelopment Plan designations and allowances of the Los Angeles Municipal Code (LAMC).

Regarding traffic, freeway, and access, these impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic-related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 144-4

This project will not enhance this area. Two gigantic, out-of-place skyscrapers will change the culture, livability and sense of community Hollywood is trying so hard to achieve and maintain.

Views from in four directions will be blocked. Views from the hills to the South will be obstructed. Views to the Hollywood Sign, the hills and the Griffith Observatory will be blocked, especially from our north facing unit.

These two buildings will be an eyesore, out of place and not in scale for the Hollywood District.

¹⁴² *Banker's Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App. 4th 249, 279.

Response to Comment No. IND 144-4

The comment expresses opposition to the Project based on height, scale, and blockage of views. See Response to Comment No. IND 144-3, which addresses view obstruction and Topical Response No. 4 – Aesthetics, above, for a discussion of height and scale.

Comment No. IND 144-5

Traffic is already a nightmare. Construction could take up to six years and our building has only one alley entrance on Vine.

The EIR doesn't even address the extreme existing traffic nightmare that occurs every Summer during Hollywood Bowl season which has been an ongoing issue that remains unresolved. This project will add further insult to injury with respect to an already overwhelming local traffic debacle.

The EIR also fails to address the serious objections raised by CalTrans. The 101 freeway entrance at Argyle, Vine and Franklin has traffic backed up several blocks for several hours each weekday and Hollywood Bowl evenings.

Response to Comment No. IND 144-5

The comment expresses concern about traffic, access to the commenter's building, and traffic from the Hollywood Bowl. While the comment does not provide any facts and, therefore, no substantial evidence, to support this claim and does not raise any specific issues with respect to the content and adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. It should also be noted that the Project would not change the direct access into the commenter's building. Also see the responses to comments provided to the Broadway Hollywood Homeowners Association, in Comment Letter No. ORG 37, and see traffic-related responses provided in Response to Comment Nos. IND 8I-74 to 8I-78.

More specifically regarding traffic effects related to the Hollywood Bowl, Highland Avenue and Franklin Avenue are the primary access routes to the Hollywood Bowl. The intersections analyzed in the TA in Appendix N-1 of the Draft EIR were selected based on guidance from the City's adopted Transportation Assessment Guidelines (TAG) that were followed for this analysis. Applying the TAG criteria resulted in the identification of the nine intersections illustrated on Figure 6 of the TA and discussed and analyzed in the main body of the TA. None of the required study intersections are along Highland Avenue or Franklin Avenue in the vicinity of the Hollywood Bowl (the westernmost study intersection was the intersection of Cahuenga Boulevard and Hollywood Boulevard). The Cahuenga Boulevard/Hollywood Boulevard intersection was identified in this analysis as operating at LOS F, with the Project adding trips to this location. As Cahuenga Boulevard is a route to the Hollywood Bowl, the Project could affect trips to the Hollywood Bowl.

However, as discussed in Topical Response No. 2 – Transportation and Traffic, above, intersection LOS is no longer the CEQA significance metric for transportation impacts.

The comment states that the Draft EIR fails to address objections raised by Caltrans. However, the commenter does not identify what these objections are and does not provide any specific information. Further, the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. It is also acknowledged that Caltrans prepared two letters with comments on the transportation analysis to be conducted for the Project. The analyses requested by Caltrans are presented for informational purposes in Appendix I to the TA for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. The Caltrans analysis is not a required CEQA analysis per the City's TAG. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also see Response to Comment No. AG 2-7, which discusses a recent meeting between the City and Caltrans in July 2020 during which Caltrans did not identify any particular concerns or make any particular requests for new analysis beyond that included in the Draft EIR. Additionally, the Caltrans representative indicated that Caltrans' concerns were non-CEQA concerns. Based on this, Caltrans has not identified any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

Comment No. IND 144-6

The EIR fails to examine the negative aesthetic impact of the Hollywood Center. It fails to address the density, the traffic, the transportation aspect. We already have more traffic in this area due to ride sharing. Due to the pandemic, people will rethink taking public transportation. This pandemic will have lasting effects. With over 1,000 more apartments in the Hollywood Historic District, our streets will begin to resemble Hong Kong.

Response to Comment No. IND 144-6

The comment states that the Draft EIR fails to analyze the Project's impacts on aesthetics, density, traffic, and transportation. See Response to Comment No. IND 144-3 and 144-4 for responses to the commenter's concerns related to aesthetics and density. See Response to Comment No. IND 144-5 for a response to the commenter's concerns related to traffic and transportation.

Comment No. IND 144-7

We thoroughly and completely disapprove of the Hollywood Center Project and the ridiculous time limit placed on examining and digesting an over 1,300 page EIR.

Response to Comment No. IND 144-7

The comment expresses general opposition to the Project and the public review period. The City determined that the Draft EIR comment period for the Project would not be

extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 144-8

Thank you very much for your anticipated time, attention and action in both extending the EIR response time and in thoroughly reevaluating and extensively reconceptualizing the Hollywood Center project.

Your immediate response to this very urgent matter will be appreciated.

Response to Comment No. IND 144-8

The comment requests action in extending the Draft EIR response time and reconceptualizing the Project, but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 145

Linda Deutsch
Received May 30, 2020

Comment No. IND 145-1

I am a property owner in the Hollywood Dell where I have resided for 23 years and I am a member of the Hollywood Dell Civic Association (HDCA).

I am writing about project Case Number: ENV-2018-2116-EIR and State Clearinghouse Number: 2018051002.

Response to Comment No. IND 145-1

The introductory comment is noted. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. IND 145-2

I am joining in the letter written to you on behalf of our entire neighborhood regarding the draft environmental impact report (DEIR) on the proposed Hollywood Center Project. I have been shocked by the timing of your actions, issuing a major report when the Covid-19 emergency has prevented residents from appearing in person to lodge objections and pose questions regarding a project that is likely to negatively affect our quality of life for decades to come.

Please answer these questions:

- Why was it necessary for you to issue a 13,000 page report at the time that an unprecedented health emergency requires the full attention of all residents? It was released on April 16, a full month after the Stay At Home order had been put in place for all residents.
- Why did you reject requests to extend the comment period given the situation?
- Did you consider the fact that residents, many of whom were suddenly out of work, would be too involved in their very survival to take time to read your voluminous report and comment on it?
- Did you consider that some residents fell ill with Covid-19 and others, who were considered essential workers, were called on to save lives during this time?
- Your report was not going to draw their attention during this period. Was it your intention to prevent them from commenting?
- Do you realize now that life in Hollywood will be so drastically altered in the aftermath of this crisis that the conclusions of your Draft EIR may be irrelevant?

I am requesting that you table your report until after the Covid-19 emergency has passed and allow residents the time to study it and comment on it in person. This is a huge project that will have a major impact on the entire city and should be carefully considered.

Response to Comment No. IND 145-2

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 146

Mary Ann Skweres
Received May 30, 2020

Comment No. IND 146-1

The issues listed below -- present in the development of the Hollywood Center ENV-2018-2116- EIR -- will adversely impact my neighborhood, the Hollywood Dell. I also believe this development is dangerous for the people and tourists who live in and frequent Hollywood.

Response to Comment No. IND 146-1

The comment expresses an opinion that the Project is dangerous for the people and tourists in Hollywood but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. IND 146-2

1) Emergency Response: his massive development will tap the already thin emergency response resources we now count on.

Response to Comment No. IND 146-2

This comment raises concerns about emergency response but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. See Topical Response No. 2 – Transportation and Traffic, above, which addresses emergency response.

Comment No. IND 146-3

2) Traffic/Parking: Parking on every street near the development will be impacted. Not enough parking is provided and overflow cars will be driving into nearby neighborhoods like the Dell in search of parking. Parking throughout Hollywood is already a nightmare and these extra cars will only make it worse.

Response to Comment No. IND 146-3

The comment expresses a general concern that the Project would impact parking on every street near the Project Site and cause cars to park near the commenter's residence but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. However, as noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Comment No. IND 146-4

3) Infrastructure: How much water will be siphoned off to support this development not to mention sewer and other services?

Response to Comment No. IND 146-4

The comment expresses a general concern about the Project's impact on water and sewer infrastructure. However, the comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. The Project's impacts on wastewater and water supply are fully analyzed in Section IV.N.1, *Wastewater*, and Section IV.N.2, *Water Supply*, respectively, in the Draft EIR. Supporting technical infrastructure information is included in Appendix P-1 of the Draft EIR. A City-approved Water Supply Assessment (WSA) for the Project, as required by SB 610, is included in Appendix P-2 of the Draft EIR. As discussed therein, the Project would result in less-than-significant utility and water supply impacts. In regard to wastewater, as stated on page IV.N.1-13 of Section IV.N.1, *Wastewater*, of the Draft EIR, construction of the Project would include all necessary on- and off-site sewer pipe improvements and connections to adequately connect to the City's existing sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under the City's Building and Safety Code and the Los Angeles Department of Public Works requirements. All necessary improvements would be verified through the permit approval process of obtaining a sewer connection permit from the City. Furthermore, as stated on page IV.N.1-14 of the Draft EIR, in accordance with LAMC Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system.

In regard to water supply, as stated on page IV.N.2-29 in Section IV.N.2, *Water Supply*, of the Draft EIR, the Los Angeles Department of Water and Power (LADWP) determined in the approved WSA, as required by SB 610, for the Hollywood Center Project that there is adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP, annually during normal, single-dry, and multiple-dry water years over the next 20 years, as well as through at least 2040 (the planning horizon of the LADWP's 2015 Urban Water Management Plan [UWMP]). In addition, as stated in the approved WSA for the Hollywood Center Project, the Project's water demand falls within the LADWP's 2015 UWMP's projected increases in Citywide water demands, while anticipating multi-dry year water conditions during the planning period. Furthermore, the Project would implement Project Design Feature WS-PDF-1 and provide specific water efficiency features to conserve water and reduce Project water demand. Therefore, there would be sufficient water supplies available to service the Project.

Comment No. IND 146-5

4) This developer has a terrible record. During the first generation of this effort to build two huge towers next to Capitol Records, this developer tried to skirt around CalTrans. The traffic generated by such a huge project would overwhelm all the on ramps to the 101 freeway. Beachwood Canyon Neighborhood Association shares the Dell's concern and is also well aware that this same traffic will clog all of the streets in Hollywood.

For their Millennium Tower San Francisco, this same developer cut corners and the tower is leaning – the condo owners in that development risk their lives while the tower moves every day.

Response to Comment No. IND 146-5

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

It is also acknowledged that Caltrans prepared two letters with comments on the transportation analysis to be conducted for the Project. The analyses requested by Caltrans are presented for informational purposes in Appendix I to the TA for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. The Caltrans analysis is not a required CEQA analysis per the City's Transportation Assessment Guidelines (TAG), adopted in July 2019. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also see Response to Comment No. AG 2-7, which discusses a recent meeting between the City and Caltrans in July 2020 during which Caltrans did not identify any particular concerns or make any particular requests for new analysis beyond that included in the Draft EIR. Additionally, the Caltrans representative indicated that Caltrans' concerns were non-CEQA concerns. Based on this, Caltrans has not identified any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

The comment also makes reference to a different project located in San Francisco, which has no relation to the Project analyzed in the Draft EIR. As such, no further response is warranted.

Comment No. IND 146-6

5) Another dangerous idea from this developer: The Hollywood Center is planned right on top of the Hollywood Earthquake Fault. All studies point to the expectation that these towers will collapse.

Response to Comment No. IND 146-6

The comment assumes that the Project would be located on the Hollywood Fault and expresses the opinion that the towers will collapse as a result. However, the comment does not provide any facts and, therefore, no substantial evidence, to support this claim and does not raise any specific issues with respect to the content and adequacy of the Draft EIR. Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 146-7

6) With the outbreak of Covid-19, we need to be conscious of the dangers of dense housing. We all know how New York City has been impacted.

Response to Comment No. IND 146-7

The comment expresses a general opinion about density but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 146-8

We do not need such a dangerous project by an untrustworthy developer in the Heart of Hollywood. Shut this warped idea down forever.

Response to Comment No. IND 146-8

The comment expresses a general opinion about the Project but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 147

Kathleen Martin

Received May 31, 2020

Comment No. IND 147-1

I am very concerned with the proposed tower project, particularly being implemented in such a rushed fashion during Covid-19 quarantine.

I am in leadership with the following organizations which work for the health and welfare of people in the Hollywood community:

- Rotary Club of Hollywood
- The Salvation Army, located on Hollywood Blvd
- First Presbyterian Church of Hollywood on Gower and Carlos, which includes The Children's Center on LaBaig and Yucca.

Response to Comment No. IND 147-1

The comment expresses concern about the Project and establishes the commenter's affiliations in the Hollywood community but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 147-2

One question:

'Why is the building of 46 stories deemed appropriate for the cultural and historic community of Hollywood, when currently the tallest buildings are not more than 20 stories?'

Response to Comment No. IND 147-2

The comment expresses concern about the Project's height. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above, which addresses the issue of building height with respect to the existing development. Regarding cultural and historic concerns, impacts on historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. As concluded therein, the Project would not materially impair the historic setting of historical resources in the Project vicinity.

Comment Letter No. IND 148

Mathias Sapper

Received May 31, 2020

Comment No. IND 148-1

I'm mostly concerned with the traffic impact.

Vine Street, Cahuenga Blvd and Gower Street are major Artery Freeway Exits that connect the San Fernando Valley with the city and in this case Hollywood. As it stands today the existing traffic during rush hour is a nightmare. A 1,000 unit apartment building complex is going to create total havoc on Hollywood streets. At rush hour you will see up to 1,500 cars coming out of the project parking structures and spill into the local streets.

I have witness how a smaller 20 story apartment building on Gower Street turned Gower into total gridlock. If you drive down Gower Street in early morning rush hour heading south you get stuck at a red traffic light at Selma. While the light is red the traffic light on the next street at Sunset turns green. The waiting cars on Gower clear the block. Once the traffic light at Sunset turns red, the block between Selma and Sunset fills up with cars that come out of the Viacom building parking garage at 1575 North Gower Street and cars that come from Selma Ave and turn right onto Gower. Once the Selma traffic light turns green the block between Selma and Sunset is stuffed with cars so much so you can't drive through the light. It's as if the light was timed for the people who live in that Viacom 20 story Apartment building. Most of the cars that turn from Selma into Gower (going south) come from that same Viacom Building. There's another parking garage exit on 1500 N. El Centro. Here the cars turn right on El Centro, then right at Selma and finally right on Gower. For the people who live in the community this intersection duo Selma and Sunset has turned into an impossible wait. I have waited 4 rotations of red lights before being able to move one or two car positions forward and enough to cross the intersection. Traffic on Gower has never been this bad in the 30 years I have lived here.

And this is a 20 story building. Now imagine a 50 story building and a 40 story building.

Does the city believe that the future owners of these apartments will be using the subway to go to work? They won't. Of the 872 units for sale you will have her driving a car and the partner driving a car as well. You can expect 1,500 cars at rush hour spilling into Vine street. And you will have complete and total Gridlock.

The current Corona Virus Pandemic makes it even worse. You are safer in your car than on a public bus or Subway. Don't expect anyone using public transport anytime soon.

Response to Comment No. IND 148-1

The commenter describes his experience of the current traffic conditions and expresses concern about the Project's potential to significantly increase congestion on local street. However, the comment does not raise any specific issues with respect to the content and

adequacy of the Draft EIR. The Project's traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment Letter No. IND 149

Kwock Koe

Received May 31, 2020

Comment No. IND 149-1

As a resident of Hollywood, I ask for an extension of the period for public comment concerning the "Hollywood Center Development". Because of the Covid pandemic, and now the public unrest, citizens could not attend meetings downtown. More time should be given to consider all the issues of the Hollywood Center. Issues like public safety, geology assessment, and traffic should be of major concern. Please allow people more time to make comments and ask questions.

thank you,

Response to Comment No. IND 149-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment expresses concern about public safety, geology assessment, and traffic. However, this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR. Public safety, including fire and police services impacts, were addressed, respectively, in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, with supporting data provided in Appendix M of the Draft EIR. Pursuant to the CEQA Guidelines, and the thresholds used by the City to determine the significance of impacts to fire and police services, the focus of the analyses is on whether or not new or expanded facilities are needed to maintain adequate public service and whether a potential physical impact could occur if construction of facilities was warranted. In the case of the Project, it was determined that the Project would not generate a demand for additional police and fire protection services that would result in the need for new or expanded fire and police services facilities. As such, Section IV.K.1 and IV.K.2 concluded that impacts to fire and police services, respectively, would be less than significant. Notably, regarding public safety, as provided in Project Design Feature POL-PDF-2, the Project would incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding

signage and lighting for walkways and entries. This is in contrast to existing conditions in the area, which include surface parking lots and long alleys between blocks, where buildings are partially cut off from the street. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for LAPD services. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a seven-day a week security patrol and could assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services. Implementation of Project Design Feature POL-PDF-2 would help to offset the Project's operational demand for police protection services from LAPD.

Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment Letter No. IND 150

Milan Kalra
Received May 31, 2020

Comment No. IND 150-1

PLEASE REVIEW AND PRINT ATTACHED FOR ADMINISTRATIVE & PUBLIC RECORD.

Response to Comment No. IND 150-1

The comment is noted. Specific comments regarding the Draft EIR are provided and responded to below.

Comment No. IND 150-2

This letter and all materials contained in the links within this letter are to be included in the administrative record for the above-referenced matter.

Response to Comment No. IND 150-2

The comment is noted; however, as the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 150-3

The DEIR Executive Summary outlines various Alternatives explored in relation to this Project.¹

Granting entitlement beyond what the zoning currently allows – 3: 1 FAR vs. the Project’s proposed 6.97 : 1 FAR, representing a 230% FAR increase, is grossly negligent and morally repugnant given the effect of density & air quality on respiratory illness and fatality in the pandemic & post-pandemic era.

Only Alternative 2 is conforming with the existing zoning and still with its proposed buildings at 18 and 14 stories respectively, represents greater magnitude than nearly all existing buildings in Hollywood.²

Even Alternative 5 addressing the Proposed Hollywood Community Plan is inappropriate and mercenary with its 4 buildings at 29, 20, and dual 7 stories each, allowing a 4.5 :1 FAR, with heights & density **exceeding all of current Hollywood.**² As the Coronavirus pandemic has & will continue to force us to reassess the dangers & lethality of a high-density urban plan, **approving any project beyond its current zoning allowance exceeds rational & prudent judgment by the City.**

Footnote 1:

<https://planning.lacity.org/eir/HollywoodCenter/deir/Draft%20EIR%20Sections/ES.%20Executive%20Summary.pdf>

Footnote 2: https://en.wikipedia.org/wiki/List_of_tallest_buildings_in_Los_Angeles

1. Sunset Gordon (23 stories)
2. Comerica (22 stories)
3. Sunset Vine Tower (20 stories)
4. Argyle House (17 stories)
5. Kimpton Everly Hotel (16 stories)

Response to Comment No. IND 150-3

The comment expresses concern that the Project and alternatives would be beyond what the zoning currently allows but does not comment on or present any evidence with respect to the content or adequacy of the Draft EIR. Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies, or regulations related to location, form, and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, and, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above, which addresses density and FAR.

Comment No. IND 150-4

Density & Air pollution largest risk factors for COVID-19 & other respiratory contagions:

Density

- “Density is New York City’s Big ‘Enemy’ in the Coronavirus Fight”³
- “New York is far more crowded than any other major city in the United States. It has 28,000 residents per square mile, while San Francisco, the next most jammed city, has 17,000, according to data from the U.S. Census Bureau.”³ **And yet, Hollywood, the site of the proposed megalithic project, has a density range of 23,870⁴ to 41,740⁵, grappling with a significantly greater risk factor for pandemic exposure, illness, & death even before this proposed development of unprecedented scale & density in Hollywood’s history.**
- Garcetti’s vision of “Manhattanizing”⁶ Hollywood is now dangerously lethal, with this mega density project further forcing subway & mass transit use that is being heavily cautioned against in NYC with massive shutdowns as primary pandemic mitigation measures. In fact, the CDC urges people to drive alone instead of taking public transit for the foreseeable future. ⁷

Response to Comment No. IND 150-4

The comment expresses concern about the Project's density and air pollution impacts but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. In regard to the Project's density, see Response to Comment No. IND 150-3.

Regarding air pollution, air quality impacts related to sensitive receptors were addressed in Section IV.B, *Air Quality*, of the Draft EIR, with supporting data provided in Appendix E of the Draft EIR. As analyzed therein, construction and operational air quality impacts would be less than significant after mitigation, where applicable. The prescribed mitigation which requires certain types of construction equipment and features to be utilized by the Project, would ensure that Project construction activities do not expose sensitive receptors to substantial pollutant concentrations or result in violations to applicable daily air quality standards. During operation, mitigation to address standard emergency generator testing would also ensure that applicable daily air quality standards are not violated.

Comment No. IND 150-5

Air Pollution

From Section IV. Air Quality of the DEIR8 (p.2), the risks & undeniable links to respiratory disease & lung damage of Ozone are clearly stated:

“According to the USEPA, ozone can cause the muscles in the airways to constrict potentially leading to wheezing and shortness of breath. Ozone can make it more difficult to breathe deeply and vigorously; cause shortness of breath and pain when taking a deep breath; cause coughing and sore or scratchy throat; inflame and damage the airways;

aggravate lung diseases, such as asthma, emphysema, and chronic bronchitis; increase the frequency of asthma attacks; make the lungs more susceptible to infection; continue to damage the lungs even when the symptoms have disappeared; and cause chronic obstructive pulmonary disease. Long-term exposure to ozone is linked to aggravation of asthma, and is likely to be one of many causes of asthma development and long-term exposures to higher concentrations of ozone may also be linked to permanent lung damage, such as abnormal lung development in children. According to the California Air Resources Board (CARB), inhalation of ozone causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms and exposure to ozone can reduce the volume of air that the lungs breathe in and cause shortness of breath.

Similar risks are outlined for NO_x on p. 3:

“VOCs are organic chemical compounds of carbon and are not “criteria” pollutants themselves; however, **they contribute with NO_x to form ozone**, and are regulated to prevent the formation of ozone. According to CARB, some VOCs are highly reactive and play a critical role in the formation of ozone, other VOCs have adverse health effects, and, in some cases, VOCs can be both highly reactive and have adverse health effects.”

And yet, the Project would violate both California state & National Ozone (O₃) standards of .09 ppm [1 hour] and .07 ppm [8 hour]. (p.11)

Even the very prejudiced thresholds SCAQMD developed that far exceed state & national guidelines would be violated, both during Construction of 4.5 years (2021-2025) & Operationally:

“As shown in Table IV.B-5, construction-related daily emissions **would exceed the SCAQMD thresholds of significance for NO_x** [emphasis] and emissions levels would [Not] be below the applicable thresholds of significance. Therefore, the Project’s or the Project with the East Site Hotel Option’s construction impacts would be potentially significant.” (p. 56)

“The operational-related daily emissions from the Project and the Project with the East Site Hotel Option **would exceed the SCAQMD thresholds of significance for NO_x** [emphasis] in year 2025. Therefore, operational impacts would be considered potentially significant.” (p.57)

The boiler plate mitigation measures to manipulate a summary assessment of ‘No Significant Impact’ are egregiously false & criminal in light of what we know regarding air pollution’s contribution to respiratory disease & markedly increased fatality:

“The Harvard study suggests lower pollution levels in the years before the pandemic could have resulted in a significant decrease in Covid-19 death rates.”⁹

“A US study suggests **Covid-19 death rates rise by about 15% in areas with even a small increase in fine-particle pollution levels** [emphasis] in the years before the pandemic.”⁹

“The Lombardy and Emilia Romagna regions had death rates of about 12%, compared with 4.5% in the rest of Italy. The study, published in Science Direct, says: “The high level of pollution in northern Italy should be considered an additional co-factor of the high level of lethality recorded in that area.””⁹

“**People with COVID-19 who live in U.S. regions with high levels of air pollution are more likely to die from the disease** than people who live in less polluted areas, according to a new nationwide study from Harvard T.H. Chan School of Public Health.”¹⁰

“The study found, for example, that someone who lives for decades in a county **with high levels of fine particulate pollution is 8%* more likely to die from COVID-19 than someone who lives in a region that has just one unit (one microgram per cubic meter) less of such pollution.** [emphasis]”¹⁰

“Research shows almost 80% of deaths across four countries were in most polluted regions”¹¹

“High levels of air pollution may be “one of the most important contributors” to deaths from Covid-19, according to research. The analysis shows that of the coronavirus deaths across 66 administrative regions in Italy, Spain, France and Germany, **78% of them occurred in just five regions, and these were the most polluted** [emphasis].”¹¹

As documented in Table IV. B-2 (p. 25)⁸, **the area already is Non-Attainment – Extreme in violation of both California state (CAAQS) and National (NAAQS) standards.** The City’s priority & focus must be at minimum sustaining, if not improving, air quality. **Allowing 4.5 years of this Project’s non-compliant construction pollution that continues indefinitely through its operational phase is a documented danger & lethality to all of Hollywood’s 146,000 residents.** Much of the project’s net air quality analysis was predicated on the substantial substitution of mass transit for vehicular use, which in a post-pandemic age, is a dangerous & unsound premise. The resulting vehicular pollution from idling in clogged on and off ramps of the 101 freeway at Cahuenga/Wilcox, Vine St, and Argyle/Gower were well-demonstrated in CALTrans’ condemning study of the pre-cursor Millenium project.

Further manipulated EIRs or boilerplate mitigation measures to yield a ‘No Impact’ or ‘Less Than Significant Impact’ assessment defy common sense & unprejudiced judgment. **The City must be liable for preventable illnesses & deaths from its position of pursuing such high-density projects and the granting of Entitlements that threaten public health during and after the COVID-19 crisis.**

To perpetuate & incite egregious density and forever degraded air quality, documented as leading contributors to respiratory death, is undeniably criminal & morally unconscionable in a post-pandemic age.

Footnote 11: <https://www.hsph.harvard.edu/news/hsph-in-the-news/air-pollution-linked-with-higher-covid-19-death-rates/>

Response to Comment No. IND 150-5

The comment states that the Draft EIR's air quality analysis provides mitigation measures that are boilerplate and inadequate to reduce NO_x but does not provide any facts and, therefore, no substantial evidence, to support this claim. As stated on pages IV.B-60 through IV.B-63 in Section IV.B, *Air Quality*, of the Draft EIR, the Project would implement mitigation measures applicable to both construction and operational emissions to reduce impacts to a less than significant level. As noted therein, with implementation of Mitigation Measure AQ-MM-1, regional NO_x emissions from construction would be reduced to below the regional threshold for NO_x, and impacts related to regional NO_x construction emissions would be less-than-significant. Furthermore, with implementation of Mitigation Measure AQ-MM-2, regional NO_x emissions from operations would be reduced to below the regional threshold for NO_x, and impacts related to regional NO_x operational emissions would be mitigated to a less-than-significant level.

The commenter asserts that the Project's air quality analysis is predicated on the use of mass transit and is unsubstantiated due to COVID-19. CEQA does not require analysis of speculative conditions. Pursuant to CEQA Guidelines Section 15143, "[t]he significant effects should be discussed with emphasis in proportion to their severity and probability of occurrence." Furthermore, CEQA Guidelines Section 15064(d)(3) states that "[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable." Therefore, forecasting the impact of COVID-19 on air quality emissions due to public transportation use during future Project operations is speculative. In addition to being speculative, COVID-19 is not a project or, more specifically, a component of this Project. Rather, COVID-19 is part of the environment and CEQA generally does not require an analysis of the environment's impact on the Project (see CEQA Guidelines Section 15126.2). Thus, the Draft EIR meets

the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

As discussed in Chapter 1, *Introduction*, in this Final EIR, the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project. Therefore, no further response regarding the construction and operational impacts of this option is warranted.

Comment Letter No. IND 151

Tinker Lindsay

Received May 31, 2020

Comment No. IND 151-1

I am begging you to extend the comment period on the Hollywood Center Project DEIR. The procedure has been handled outrageously - we have all been in lockdown with no way to attend meetings or even access the reports. This project will be devastating to residents in Hollywood, and ruin historic landmarks. At least give us a chance to weigh in on the negative effects of this greed-driven building project.

Thank you for taking action on behalf of your constituents.

Response to Comment No. IND 151-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment expresses an opinion that the Project will ruin historic landmarks but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. Impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

Comment Letter No. IND 152

Michael Wiesinger
Received May 31, 2020

Comment No. IND 152-1

I've had to revise this before sending, due to yet again more tragedy taking place in our lives and that of so many others throughout the country - right here in the City of Angels. We could sure use some *ANGELS* at this time. That said, Now is not the time for the City of Angels to be concentrating their efforts on obtaining the 'go ahead' to construct a project that has no business in the heart of Hollywood. Better yet, city officials, specifically, Mayor Garcetti should be focusing their energies on how to make us safe from the pandemic at large, taking care of our homeless epidemic, cleaning up our streets, and protecting us from the outrage at large now plaguing us.

Response to Comment No. IND 152-1

The comment expresses concern about how the City should not concentrating on constructing the Project. It should be clarified that no decision is being made at this time about the Project. The purpose of the public review period is to solicit comments from public agencies and other interested parties on the contents of the Draft EIR. As stated in Chapter 1, *Introduction*, in the Draft EIR, upon the close of the public review period, the City will proceed to evaluate and prepare responses to all relevant comments received from public agencies and other interested parties during the public review period. In addition, see Topical Response No. 1 – Public Participation and Review, above, for a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with this EIR.

Comment No. IND 152-2

On that note, I am writing as a concerned resident with regard to comment for the Hollywood Center Project ("DEIR). My husband and i [*sic*] live in Whitley Heights, the historic HPOZ district in the LA area, which is within 550m of the proposed project. In fact, the view from our home looks directly out at the proposed site. If this project were to commence, the environmental impact would without a doubt permanently damage & degrade the historic structures, OUR HOMES by the level of subterranean construction of such scale.

First, we cannot understand why a project of this magnitude is once again being pursued, when it was already defeated nearly seven years ago when it was found that the land to which this project will sit on was deemed unsafe due to the fact an active fault runs beneath the property. Yet, here we are again, numerous neighboring communities - Larchmont Village, Hancock Park, Greater Wilshire Neighborhood Council, Brentwood Hills HOA, and Holmby Hills [*sic*], to name a few, which now have to spend time battling what we all deem ***irresponsible development***. You are no doubt aware of said

opposition. So our question to you is WHY the need for such "out of character" development in the Hollywood area? These are our thoughts:

Response to Comment No. IND 152-2

The comment expresses an opinion that the Project would permanently damage and degrade historic structures and the commenter's residence. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C of the Draft EIR analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

The comment also expresses concern for the Project's scale. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, the Project's scale as it relates to aesthetics impacts was analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

The comment also states that the Project will be developed on an active fault. Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 152-3

Your proposed rationale:

1. Job creation
2. Economic stimulation
3. Continued revitalization of the Hollywood area

Our assumption of your rationale:

1. POLITICAL GAIN!!!
2. A denser, more populated Hollywood equals more crime and congestion, if not properly planned and executed
3. Out of touch with, and utter disregard for public safety and its impact on the IMMEDIATE surrounding communities!!!

What do we support:

1. YES, we believe in job creation
2. YES, we believe in economic stimulation
3. YES, we believe in the on-going gentrification of Hollywood, however..

What is FAIR, ACCEPTABLE and NECESSARY:

1. Responsible development with height restrictions that compliment *[sic]* the existing, beautiful and historic Hollywood skyline and community - nothing above 15-20 stories.
2. Genuine respect and regard for the concerns about the existing proposal.
3. The commitment to an INCREASE of law enforcement manpower, which will be necessary to ensure public safety - not only in the immediate public space, but for the surrounding neighborhood communities.

During the last round of the Millennium Project - same developer - now branded The Hollywood Project, Mayor Eric Garcetti, whom at that time was running for Mayor of Los Angeles, to my recollection, flip flopped on his support for this project...originally, he was in favor of the development. However, pre-election, it was reported that he was against the project. Once again, where does he stand now?

As our Mayor, and a proclaimed "Angeleno", one would hope he would stand with council districts in the surrounding area and support the cause to preserve the historical integrity and future of Hollywood, and not sell out to greedy developers.

I (we) will close by stating that we support the revival of a new Hollywood. But, let's achieve this through a plan that benefits everyone involved and not just those that are out for themselves.

Response to Comment No. IND 152-3

The commenter expresses concern about the Project's height and density, its potential to increase crime and congestion, and its impact on public safety. In regard to height and density, see Response to Comment No. IND 152-2.

Regarding crime and public safety, fire and police services impacts were addressed, respectively, in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, with supporting data provided in Appendix M of the Draft EIR. Pursuant to the CEQA Guidelines, and the thresholds used by the City to determine the significance of impacts to fire and police services, the focus of the analyses is on whether or not new or expanded facilities are needed to maintain adequate public service and whether a potential physical impact could occur if construction of facilities was warranted. In the case of the Project, it was determined that the Project would not generate a demand for additional police and fire protection services that would result in the need for new or expanded fire and police services facilities. As such, Section IV.K.1 and IV.K.2 concluded that impacts to fire and police services, respectively, would be less than significant. Notably, regarding public safety, as provided in Project Design Feature POL-PDF-2, the Project would incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding signage and lighting for walkways and entries. This is in contrast to existing conditions in the area, which include surface parking lots and long alleys between blocks, where buildings are partially cut off from the street. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for LAPD services. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a seven-day a week security patrol and could assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services. Implementation of Project Design Feature POL-PDF-2 would help to offset the Project's operational demand for police protection services from LAPD.

Regarding congestion, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles

Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Response to Comment No. IND 153-1

The comment is noted. Specific comments regarding the Draft EIR are provided and responded to below in Response to Comment Nos. IND 153-2 through 153-7.

Comment No. IND 153-2

Dear Ms. Nguyen: I am a homeowner and twenty-four year resident of the Hollywood Dell. I have been an active member of the Hollywood Dell Civic Association since 1996, served on the HDCA Executive Board, and was the past President of HDCA for roughly 8 years. The Hollywood Dell is the hillside neighborhood directly north of the Project site.

These comments are specific to IV.K.4-Public Services - Parks and Recreation

Response to Comment No. IND 153-2

The introductory comment is noted. Specific comments regarding the Draft EIR are provided and responded to below in Response to Comment Nos. IND 153-3 through 153-7.

Comment No. IND 153-3

I. Existing Parks in the Project Area

According to the Report- page IV.K.4- 12

“The nearest public park, Selma Park at 6567 is located approximately 0.35 miles southwest of the Project Site.”

This is incorrect. This is incorrect (actually .42 miles). The Department of Recreation and Parks (RAP) has been operating and maintaining the Franklin Ivar Park at 6351 Franklin Avenue since July 1, 2018. Franklin Ivar Park is just a two blocks (.20 miles) from the Project site See attached Board of Recreation and Park Commissioner’s Board Report Dated July 17, 2019 (No. 19-139)

Excerpt from the Board Report:

SMMC, a state agency, is the sole owner of real property commonly referred to as Franklin-Ivar Park (Park), a 0.75 acre passive park located at 6351 Franklin Avenue in the community of Hollywood, which opened to the public in 2017. SMMC had previously requested that RAP operate the Park on its behalf. This request was approved by the Board on June 11, 2018 (Report No. 18- 148)....

QUESTIONS:

Why was the Franklin Ivar park not included in your Project Analysis? This park is just 2 blocks (.2 miles) from the Project site and will certainly be the main park utilized both during construction and by the Project's residents once the project is completed.

What is the impact on the Franklin Ivar park that would be generated by the long term operation of the Project?

What is the potential impact on the Franklin Ivar park caused by the temporary construction activities?

Response to Comment No. IND 153-3

The comment requests clarifications on various questions related to Section IV.K.4, *Parks and Recreation*, of the Draft EIR. The commenter states that Selma Park is 0.42 miles from the Project Site. The Draft EIR is correct regarding the distance of Selma Park from the Project Site. As stated on page IV.K.4-12 in Section IV.K.4, *Parks and Recreation*, of the Draft EIR, Selma Park is located approximately 0.35 miles southwest of the Project Site. This distance is measured from the mid-block of Ivar Avenue, which is the west edge of the Project Site.

The comment asks why Franklin Ivar Park is not included in the Project analysis. The analysis for parks and recreational facilities are dependent on the list of City of Los Angeles Department of Recreation and Parks (RAP) facilities provided in Appendix M-4 of the Draft EIR. While RAP operates and maintains the Franklin Ivar Park, Franklin Ivar Park is under the jurisdiction of the Mountains Recreation and Conservation Authority (MRCA). In addition, at the time the original research was conducted for the Draft EIR, Franklin Ivar Park was not operational or listed in the City's RAP data base. Furthermore, it was also not mentioned in any community and agency responses to the Notice of Preparation.

The comment inquires about the impact on the Franklin Ivar Park that would be generated by the Project's temporary construction. Similar to what was analyzed in the Draft EIR for the Project's construction impacts on nearby RAP facilities, the Franklin Ivar Park is not located along a major street that would provide access to the Project Site during construction (e.g., along a haul route). Project Design Feature PDF-TRAF-2 (the Construction Traffic Management Plan) would also ensure that access will remain unobstructed for land uses in proximity to the Project Site during Project construction.

Additionally, the distance of this park from the construction activity and the intervening development would avoid potential noise or conflict with construction activities. A small number of construction workers may visit the park during or after a workday. However, construction workers are temporary employees with high turnover associated with the various phases of construction, so such park use would be rare and short-term. Because Franklin Ivar Park has neither on-site or adjacent parking, and it is not highly likely that construction workers would want to walk the 0.2 miles find a table or seat to have lunch. The Franklin Ivar Park does not provide any active recreational facilities that would draw construction workers before or after work. As such, it is reasonably expected that construction workers would not use the park to the extent that it would result in the accelerated deterioration of the park. Therefore, temporary construction impacts on the Franklin Ivar Park would be less than significant.

Regarding the impact on the Franklin Ivar Park during Project operation, the CEQA threshold standard regarding impacts on parks and recreational facilities is whether an increase in the use of existing neighborhood and regional parks or other recreational facilities would occur that would cause or accelerate substantial physical deterioration. Franklin Ivar Park is a 0.75-acre passive park offering an art plaza, stage, seating, gardens, and landscaping. The Project provides for 0.779 acres of public open space, art plaza, paseo, stage, seating, gardens, and landscaping. The Project would also include space for outside dining or coffee. Because Franklin Ivar Park would not have on-street or off-street parking, residents would walk or ride bicycles to the park. However, because the Franklin Ivar Park would not provide facilities not already enjoyed in the Project's open space, as well as not having any dining options, it is not anticipated that it would be heavily used by Project residents to the extent that it would cause or accelerate substantial physical deterioration.

The comment that Franklin Ivar Park "will certainly be the primary park utilized," is not supported by substantial evidence since Franklin Ivar Park would provide the same recreational facilities and slightly less open space enjoyed at the Project Site, and Franklin Ivar Park does not provide a children's playground. As such, this park would not draw families to the same extent as Selma Park or Yucca Park, the latter of which has both a playground and outdoor fitness equipment. Both of these parks, located approximately 0.35 and 0.38 miles from the Project Site, respectively, are also within easy walking or cycling distance from the Project Site. The addition of the Franklin Ivar Park to the list of parks described in the Draft EIR would increase rather than deplete the supply of parks in the area, and as such would not change the evaluation or conclusion of the Draft EIR that the Project would have a less-than-significant impact with respect to parks and recreational facilities.

Comment No. IND 153-4

II. Hollywood Community Plan

According to the Report - page IV.K.4-7

“Policy I- states that the desires of the local residents should be considered in the planning of recreational facilities”

Local residents have met with representatives of this project on numerous occasions and discussed neighborhood mitigations relating to park and recreation services, yet there’s been no commitment by the applicant to address any of them.

QUESTION:

Is there a draft Development Agreement designating of some, or all, of the Quimby Fee payment by the Project for the use of the Franklin Ivar Park, the nearest park to the Project?

Please let us know if there is a draft Development Agreement? And, how the community can receive a copy so that we may comment on it.

This park will most certainly be used by the construction workers during construction and by the residents of the Project, once completed.

Quimby Fees could be utilized by the Franklin Ivar Park to improve lighting and security; purchase children’s play equipment and shade structures, add to the tree canopy in the par, and fund Phase II of the Franklin Ivar Park plan.

As the closest existing park to the Project site it should receive the bulk of the Quimby Fees from the Project to maintain and improve the park experience for the Hollywood community.

Response to Comment No. IND 153-4

The comment states that local residents met with the Project’s representatives to discuss parks and recreational services. The commenter then inquires if the Development Agreement designates some, or all, of the Quimby Fee payment by the Project for Franklin Ivar Park. While a Development Agreement is anticipated for the Project, no draft documents or details of the agreement are currently available.

The commenter also states that the Franklin Ivar Park will be used by the construction workers and residents of the Project. However, this assertion is not supported by substantial evidence and is not likely for the reasons discussed in Response to Comment No. IND 153-3.

Regarding dedicating Quimby Fees to the Franklin Ivar Park, the Applicant cannot choose the recipients of the City’s required Dwelling Unit Construction Tax and Quimby fees, which are distributed at the City’s discretion. The requirement for such fees is indicated at the completion of the developer’s initial application with the City. Such fees are pending with final determination of fees occurring with the approval of the Vesting Tentative Tract Map. This would occur subsequent to the certification of Final EIR and Project approval.

Comment No. IND 153-5

III. Inconsistency in DEIR

According to the Report- page IV.K.4-9

“The Project’s entitlement applications, including its Vesting Tentative Map application, were deemed complete on April 10, 2018, subsequent to the Park Fee Ordinance becoming effective. As such, the Project is subject to the park fee provisions of the Park Fee Ordinance.”

According to the Report - page IV.K.4-20

“On April 5, 2017, the RAP Board of Commissioners approved payment of in-lieu fees for the Project via a recommendation to the Advisory Agency.”

Questions:

How can the RAP Board of Commissioners approve payment in-lieu fees for the Project (April 5, 2017) before the Vesting Tentative Map is complete (April 10, 2018)? Please explain.

Please provide a copy of the documents supporting this approval. The RAP website does not have a resolution for this approval on April 5, 2017. <https://www.laparks.org/commissioners/agendas-minutes-reports/2017>

Will the RAP Board of Commissioners approve a new payment of in-lieu fees based on the Park Fee Ordinance in effect at the time the Vesting Tentative Map was completed?

Where is the Park Fee Calculation Application (PF- 1001) required to be submitted for this project? Please provide a copy. <https://www.laparks.org/planning/park-fees>.

Response to Comment No. IND 153-5

This comment asks several questions regarding the City’s Park Fee Ordinance and how the Project would comply with the Ordinance, but does not comment on the content or adequacy of the Draft EIR. As such, no further response is warranted.

The Board Report to which the commenter referenced was for an Early Consultation, which, pursuant to Los Angeles Municipal Code (LAMC) Section 12.33 D.1, requires the Applicant to meet with RAP and the Department of City Planning prior to submitting a tract map application with the City. Per LAMC Section 12.33 D.1, “[t]he purpose of this early consultation is to discuss whether the City requires land dedication for the project and/or to discuss credit available to the applicant, if any”. Pursuant to LAMC Section 12.33 D, “All new residential dwelling units [...] shall be required to dedicate land, pay a fee, or provide a combination of land dedication and fee payment for the purpose of acquiring,

expanding and improving park and recreational facilities for new residents.” The RAP submitted a letter dated August 5, 2018 to the Department of City Planning, recommending that the Project dedicate land to the City or provide a combination of land dedication and fee payment in order to fulfill the Project’s requirements under provisions of LAMC Section 12.33. This recommendation is incorporated as a Condition of Approval for the Vesting Tentative Tract Map (VTTM). Should the VTTM be approved, its approval would be contingent upon compliance with the Condition of Approval prior to the recordation of the map. The Project’s Park Fee Calculation Application is public record and would be available from the City. However, the final fees will depend on the scope of development approved by the City approval of the Project. The analysis of parks and recreation services impacts is based on an estimate of the Project’s residential population size (based on the number of approved dwelling units).

Comment No. IND 153-6

IV. Project Impacts – Methodology

According to the Report- page IV.K.4- 16

“The commercial, retail, and potential hotel uses are not considered to generate additional demand to park and recreational facilities.”

QUESTIONS:

How many people are expected to be at the commercial, retail or hotel properties on a daily basis?

Why are these additional people to the project considered not to generate additional demand to the park and recreational facilities. Especially the Franklin Ivar park only 2 blocks away?

Considering the COVID-19 impacts, and the desire for safe outdoor recreation, how will the increased demand for park and outdoor recreation be addressed by the Project?

Response to Comment No. IND 153-6

The commenter expresses concern about the methodology used to address the Project’s impacts on parks and recreational facilities. For the purpose of the EIR analysis, commercial and other retail uses are not considered to generate demand on parks since Dwelling Unit Construction Tax and Quimby fees are based on residential units and increases in residential population. In addition, the City of Los Angeles Public Recreation Plan and RAP’s 2009 Citywide Community Needs Assessment calculate demand on parks according to residential/parkland ratios. The RAP considers demand on parks based on new residential population to the City, not on total daytime population within a geographic area. In many cases, employees and visitors are already residents of the City

(or will be residents of the City) and, as such, are already considered in the RAP's existing and future demand calculations.

With regard to COVID-19 impacts, see Response to Comment No. ORG 2B-13. As stated therein, CEQA does not require analysis of speculative conditions. Therefore, forecasting the impact of COVID-19 on park facilities use is speculative. Thus, the Draft EIR meets the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

Comment No. IND 153-7

These comments are my specific observations and questions to the Parks and Recreations section of the EIR. I would also like to go on record and say that it is absolutely disgraceful that the Planning Department has continued with this limited public comment period (45 days) during a global pandemic, despite the pleas of numerous community-members, despite the quarantine orders, which can only be described as "unusual circumstances," and despite the massive size of the EIR.

Response to Comment No. IND 153-7

The comment expresses an opinion about the length of the public comment period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 154

Mark Rasmussen

Received May 31, 2020

Comment No. IND 154-1

As a resident of Hollywood for 49 years I would like to ask you to extend the deadline for the DEIR for the Hollywood Center Project. Because of the pandemic it has been difficult to consider that ill-advised project.

Response to Comment No. IND 154-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 155

Mary Ann Cherry
Received May 31, 2020

Comment No. IND 155-1

Question regarding THE (rebranded) MILLENNIUM TOWERS/HOLLYWOOD CENTER

Considering recent FBI investigations (delayed due to COVID) into corrupt dealings between high end real estate developers and city council members, wouldn't it be wise to hold off any more questionable real estate development? It'd be in your best interest, to avoid the appearance of impropriety.

Response to Comment No. IND 155-1

The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

The remainder of the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 156

Julie Carter

Received June 1, 2020

Comment No. IND 156-1

Supporting the advancement of this project is irresponsible in every way. Ignoring the safety and future of Hollywood and all the people in the community, surrounding communities and visitors is to prioritize greed.

Response to Comment No. IND 156-1

The comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 157

Anna Josenhans & Greg Hayden
2748 Westshire Drive
Los Angeles, CA 90068
Received June 1, 2020

Comment No. IND 157-1

As residents of Beachwood Canyon, we strongly disapprove of the Hollywood Center/Millennium Project! Building a skyscraper on an earthquake fault line is simply ludicrous! In addition, the blight on the landscape is of serious concern. Capitol Records, a historic landmark, will be effectively destroyed and dwarfed by a behemoth completely out of a place in a landscape of two to four story buildings. Please consider and respect my community's feelings.

Also, please feel free to call us with questions or further clarification of our comments at 323.463-6303.

Response to Comment No. IND 157-1

The commenter expresses opposition to the Project due to an assertion that the Project would be built on an earthquake fault (the Hollywood Fault), and that it would destroy and dwarf the Capitol Records Building (a historic landmark). Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

The size and scale of the Project as it relates to aesthetics were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Regarding impacts to the Capitol Records Building, historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to the Capitol Records Building and other nearby historical resources. No direct impacts to the Capitol Records Building would occur and potential indirect impacts on the building due to construction vibration and settlement were determined to be less than significant with implementation of mitigation measures. See also Topical Response No. 6 – Historical Resources, above.

Comment Letter No. IND 158

C. Stephen Grant
Received June 1, 2020

Comment No. IND 158-1

Please do not approve this project to be built in Hollywood. The structures are too high for the surrounding area, too large for the road/traffic infrastructure, too unresponsive to the housing requirements of residents.

This is a (literally) huge mistake.

Response to Comment No. IND 158-1

The commenter expresses opposition to the Project based on its size and scale, lack of road/traffic infrastructure, and housing concerns. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, impacts regarding the size and scale of the Project were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

The comment expresses a general opinion about being unresponsive to the housing requirements of residents. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, the Draft EIR addressed population and housing impacts in Section IV.J, *Population and Housing*. As analyzed therein, population and housing impacts would be less than significant under the Project.

Comment Letter No. IND 159

Anne Crawford deZonia
2471 Hollywood Drive
Los Angeles, CA
Received June 1, 2020

Comment No. IND 159-1

As a resident of Beachwood Canyon, and someone who tries to navigate through Hollywood on a daily basis, with little success, **I oppose this project** on many levels.

It is too large for the neighborhood, the streets can not [*sic*] handle the traffic it will generate, parking is insufficient, and it is out of scale and need for Hollywood.

Please add my name to those of residents of the area who oppose this project.

Response to Comment No. IND 159-1

The commenter expresses opposition to the Project based on its size and scale, traffic that it will generate, and insufficient parking. However, this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. The concern regarding the size and scale of the Project is addressed in the Response to Comment No. IND 158-1.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. Per Los Angeles Municipal Code (LAMC) Section 12.21 A, the Project would be required to provide 1,513 parking spaces and proposes to provide a total of 1,521 to adequately serve the Project, which would be slightly more than the number of spaces required by the LAMC. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA. The Project is also providing bicycle parking compliant with the LAMC requirements. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment Letter No. IND 160

Marvin Van Ekeren
1957 N. Bronson Ave.
Los Angeles, CA 90068
Received June 1, 2020

Comment No. IND 160-1

I am a recent owner of property here in a Hollywood at 1957 N Bronson Ave. Before the pandemic traffic would back up off the 101 highway. Sol [*sic*] can guess as we reopen traffic will be back soon. This project will create even more issues with traffic. Please don't let this project make an already difficult situation even worse.

Response to Comment No. IND 160-1

The commenter expresses opposition to the Project based on traffic it would generate. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, impacts regarding traffic were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 160-2

I also want to share my fear with this developer. We are all aware of what is going on with the dangerous tower in San Francisco and it would be a shame to let the same thing happen here in Hollywood. Thank you for your time and consideration in my request.

Response to Comment No. IND 160-2

The commenter expresses concern about the Millennium Towers project in San Francisco. The comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. Furthermore, the referenced tower in San Francisco is unrelated to the Project. However, geology impacts were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment Letter No. IND 161

Elena Beecher
1723 Ivar Avenue
Los Angeles, CA 90028
Received June 2, 2020

Comment No. IND 161-1

I hope this email finds you well. I am writing on behalf of 1723 Ivar Avenue in hopes that you are still accepting written comments on the Hollywood Center Project due to the current climate.

Response to Comment No. IND 161-1

This introductory comment is noted; however, as the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 161-2

We are concerned that the current plan routes every piece of vehicular traffic for the West building onto Ivar Ave., instead of putting entrances/exits onto Yucca or Vine. We are supportive of the development but deeply concerned about focussing [*sic*] all of the traffic onto our street.

Response to Comment No. IND 161-2

The comment expresses opposition to the Project based on its potential to cause traffic impacts on Ivar Avenue. Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above. It also acknowledged that the Project has been designed to eliminate curb cuts along Vine Street to reduce vehicle conflicts and interference with pedestrian activity along the Hollywood Walk of Fame. Also, no new driveways are proposed along Yucca Street (one existing driveway to remain on Yucca Street east of Vine Street). Yucca Street, west of Vine Street, and Vine Street are both within a Pedestrian Enhanced District (PED) and designated for Tier 2 bicycle lanes within the City's Bicycle Lane Network (BLN) in Mobility Plan 2035. With no new driveways along either of these street frontages, the removal of one existing curb cut along Yucca Street on the West Site, and the removal of five existing curb cuts along Vine Street, the Project would promote pedestrian circulation and safety along these streets within a PED. For these reasons, the Project's driveways on the West Site are located on Ivar Avenue.

Furthermore, traditional circulation analysis related to intersection level of service (LOS) was conducted for the intersection of Ivar Avenue and Yucca Street (Intersection No. 18)

and the intersection of Ivar Avenue and Hollywood Boulevard (Intersection No. 32) within the non-CEQA analysis provided within Appendix I of the TA. However, as stated in Topical Response No. 2, intersection LOS no longer serves as the basis for determining significant impacts related to transportation pursuant to CEQA and is only included for informational purposes. See Appendix I of the TA for detailed discussion and results of the LOS analysis.

Comment No. IND 161-3

Thank you for taking our concerns into consideration and please let me know if you have any questions or would like to discuss further.

Response to Comment No. IND 161-3

This conclusion comment is noted; however, as the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 162

William J Doig
6358 Yucca Street, #310
Hollywood, CA 90028
Received June 1, 2020

Comment No. IND 162-1

This is a comment about the proposed Hollywood Center project ENV-2018-2116-EIR.

Response to Comment No. IND 162-1

This introductory comment is noted; however, as this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 162-2

As a local tenant living on Yucca Street near the corner of Ivar Street this project would effect *[sic]* me greatly. I have enjoyed living here and working from home since 2014. As it stands currently the neighborhood is crowded and noisy, especially in the summertime when tourists abound. The idea of HC bringing in the amount of additional people proposed would be a disaster. It is already very difficult to cross the streets in this area without danger of being struck by a vehicle driven by someone unfamiliar with the neighborhood and distracted.

Response to Comment No. IND 162-2

The comment expresses a general opinion about the Project area being overly congested and populated, especially by tourists, and is concerned that the Project would exacerbate this problem. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, impacts regarding population and housing were addressed in Section IV.J, *Population and Housing*. As analyzed therein, the Project's population and housing impacts would be less than significant. That is, the Project would not induce substantial unplanned population growth to the area [based on the Southern California Association of Governments' adopted 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016-2040 RTP/SCS)], either directly (for example by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).

Regarding congestion, while this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. Furthermore,

the Project would implement Project Design Feature TRAF-PDF-1 for a Transportation Demand Management (TDM) Program, which would discourage single-occupancy vehicle trips and encourage alternative modes of transportation, thus slightly reducing and offsetting increases in traffic. See also see Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 162-3

Also, if those somewhat reasonable parking lots are gone it would be very difficult for anyone on a budget to visit, as street parking is severely limited. One of the nicest things which the lots provide, aside of course from parking, is a tremendous amount of glorious sunshine. This is what California is famous for and a key feature for tourism.

Response to Comment No. IND 162-3

The comment expresses an opinion that it would be very difficult for anyone on a budget to visit the area if the parking lots are removed and that the parking lots are open to the sunshine. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, as noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA. The Project is also providing bicycle parking compliant with the LAMC requirements to encourage bicycling to and from the Project Site.

Comment No. IND 162-4

The view of the HOLLYWOOD sign and the lovely hills where it sits will definitely be obstructed for many walking down the Boulevard, as well as the longtime tenants that live in original low profile buildings.

Response to Comment No. IND 162-4

This commenter is concerned that views of the Hollywood Sign and hills would be obstructed by the Project. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. However, as described therein, there are no existing views across the Project Site of the historic Hollywood Sign from adjacent streets or other public areas. As such, high-rise construction would not block views of this scenic resource. Public views of broader scenic resources, such as the mountains and Hollywood Sign, would be available through street corridors; however, these views would not be affected by development of the Project. The comment includes concerns about effects on private views; as stated on page IV.A-26, the focus of the view analysis, consistent with CEQA and City practice, is on views from public vantage points. Under the City's 2006 L.A. CEQA Thresholds Guide, an office building or private residence would not be considered a viewing location since views of broad horizons, aesthetic

structures, and other scenic resources would not be available to the public. In addition, the California courts have routinely held that “obstruction of a few private views in a project’s immediate vicinity is not generally regarded as a significant environmental impact.”¹⁴³ See also Topical Response No. 4 – Aesthetics, above.

Comment No. IND 162-5

In conclusion I do Not consider this project a welcome addition to my neighborhood. The years of construction, noise and inconvenience for all residents and businesses would be unbearable to say the least. On top of all that, as a seasoned Set Designer and architecture buff I find the proposed project visually unappealing.

Response to Comment No. IND 162-5

This comment expresses general opposition to the Project, especially in regard to construction noise and aesthetic impacts. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, noise and vibration impacts were analyzed in Section IV.I, *Noise*, of the Draft EIR, with supporting information provided in the Construction Noise and Vibration Study and a Construction Traffic and Operational Noise Study, both included in Appendix K of the Draft EIR. The analysis in Section IV.I concluded that that Project’s construction activities would result in significant and unavoidable noise and vibration impacts to certain nearby noise and vibration sensitive receptors; however, it should be noted that these impacts would be temporary and that during Project operation, noise and vibration impacts would be less than significant. See also Topical Response No. 7 – Noise and Vibration, above.

In addition, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

¹⁴³ *Banker’s Hill, Hillcrest, Park West Community Preservation Group v. City of San Diego* (2006) 139 Cal.App. 4th 249, 279.

Comment Letter No. IND 163

Alexa Iles Skarpelos
6421 La Punta Drive
Hollywood, CA 90068
Received June 1, 2020

Comment No. IND 163-1

Here attached are my comments as a resident of Hollywood on the DEIR for the Hollywood Center Project

Please confirm receipt.

Response to Comment No. IND 163-1

Responses to the referenced letter are provided below in Response to Comment Nos. IND 163-2 to IND 163-15.

Comment No. IND 163-2

I am a homeowner and twenty-year resident of the Hollywood Dell. I have been an active member of the Hollywood Dell Civic Association since 2000, served on the HDCA Executive Board since 2010, and currently President of the HDCA. I also serve on the Hollywood Community-Police Advisory Board. Over the years I have volunteered with numerous community organizations, projects and events.

Response to Comment No. IND 163-2

This introductory comment is noted; however, as this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 163-3

To begin, I would like to register my deep disappointment and shock that the decision makers in the City of Los Angeles have ignored the numerous requests from residents and neighborhood organizations to extend the public comment period due to the unusual circumstances around the COVID-19 pandemic. To release this draft environmental impact report in the midst of this crisis, while we are being told to “shelter at home” and allow just 45 days to review thousands of pages in this report, is appalling.

Additionally, to suggest that the report was available to anyone who wanted to review it online, does not address the members of my community who may not have access to a computer at home, or reliable Internet service. The report must be made available and accessible for the public to review. Since your own offices and the public libraries where one might view the documents in person were both closed to the public due to the Mayor’s

“Safer At Home” orders, the only option was for you to arrange for a printout of the report be delivered to whomever requested it. That’s a lot of paper.

Response to Comment No. IND 163-3

The comment expresses disappointment that the City did not extend the Project’s 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and remain at 47 days, as indicated on the Draft EIR’s Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City’s determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment No. IND 163-4

I have a lot of questions about how this project will impact my neighborhood. The Hollywood Dell is located a mere block north of the Project site. There has been a lot of development in Hollywood since I came to the area 20 years ago. As a rule, I don’t object to thoughtful and appropriate development. However, I also have seen first-hand how lengthy construction efforts for massive projects can cause real and lasting problems for the surrounding community.

Response to Comment No. IND 163-4

The commenter questions how the Project will impact their neighborhood and generally mentions problems with lengthy construction efforts in Hollywood. Specific questions are responded to below in Response to Comment Nos. IND 163-5 through 163-15.

Comment No. IND 163-5

- I. **Scale.** 46-story high-rise buildings in an environment of buildings a fraction of that height will result in a huge and long-lasting eyesore for those of us who live and work in this area. Why were the applicants allowed to create a design that is so massive in height? Why aren’t they being asked to come up with a plan that is more in scale with the existing and proposed projects around the Project site?

Response to Comment No. IND 163-5

The commenter expresses concern about the size, height, and scale of the Project. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, impacts regarding the size and scale of the Project were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above. As described in Topical Response No. 5, the Project’s height would be allowed under existing State and City zoning provisions and would comply with the zoning for the Project Site.

The comment also questions whether a plan was considered that is more in scale with the existing and proposed projects around the Project Site. Chapter V, *Alternatives*, of the

Draft EIR, provides a discussion of alternatives to the Project, including reduced height alternatives. As described therein, Alternative 2, Development under Existing Zoning Alternative, would conform to the Project Site's existing zoning designation and would reduce heights to 18 stories for the East Building and 14 stories for the West Building.

Comment No. IND 163-6

- II. **Historic.** One of my great joys is seeing the historic Capitol Records building as I come in and out of my neighborhood. How could this project claim that the historic views of this Hollywood icon will be retained? Seeing it through slivers of openings doesn't really honor its place in Hollywood's history.

Response to Comment No. IND 163-6

The commenter questions how historic views of the Capitol Records Building would be retained. As described on page IV.C-57 in Section IV.C, *Cultural Resources*, of the Draft EIR, the juxtaposition of substantially taller buildings would alter the visual setting of the Capitol Records Building, which historically was one of the most visually prominent buildings in the Hollywood skyline until the late 1960s when several taller buildings were constructed on Sunset Boulevard. Protection of the historical significance of the Capitol Records Building is a stated objective of the Project. To meet that objective, the Project includes setbacks, grade-level open space, and tower massing that would maintain important public street views to the Capitol Records Building and would ensure that new construction would be appropriately distanced so that the mass and scale would not obscure the distinctive shape and architectural features of the Capitol Records Building from public view. In addition to maintaining important views of the Capitol Records Building, the Project architecture has been purposely designed to respond to the architectural character of the Capitol Records Building, long celebrated as an outstanding example of Mid-Century Modern architecture.

The Project architecture would maximize focal views toward and through the Project Site, as discussed in Section IV.A, *Aesthetics*, (1) Scenic Vistas, of the Draft EIR, such as views of the Capitol Records Building and the Gogerty Building from sidewalks along Vine Street, Argyle Avenue, and Yucca Street, from the intersection of Hollywood Boulevard and Vine Street, and a view through a surface parking lot between the Pantages Theatre and the Equitable Building. As described in Section IV.A, page IV.A-10, focal views of the Capitol Records Building from Hollywood Boulevard are partially blocked by existing buildings, primarily the Pantages Theatre near Argyle Avenue and the Equitable Building (at Hollywood Boulevard and Vine Street). However, from Hollywood Boulevard, the Capitol Records Building is visible from the intersection of Hollywood Boulevard and Vine Street and substantially visible through a 50-foot-wide surface parking lot located between the Pantages Theatre and the Equitable Building. Broad views or vistas of the Capitol Records Building are also available from the hillside neighborhoods to the north and northwest of the Project Site. While the Project would block some focal views of the historic Capitol Records Building from sections of Ivar Avenue, Hollywood Boulevard, and Argyle Avenue, the Capitol Records Building would continue to be visible from more

prominent view locations, such as the Hollywood Hills and the intersection of Hollywood and Vine, or other sections along local streets.

In addition, as described in Chapter II, *Project Description*, and in Section IV.C, *Cultural Resources*, of the Draft EIR, there are several Project objectives and design features that emphasize the importance of the Capitol Records Complex and its architectural/historical heritage. As it relates to consideration of aesthetics, the Project includes architecturally distinct buildings that pay homage to and are compatible with the Capitol Records Complex. See also Topical Response No. 4 – Aesthetics, above.

Comment No. IND 163-7

- III. **Traffic.** One of the biggest impacts from the recent development in the Hollywood Entertainment District is the increase in traffic. Since the DEIR fails to provide traffic studies that address the key intersection at Franklin Avenue and Argyle, just a block north of the project, there's a lack of information on how the Project will add to the problem. Why weren't the applicants required to submit something on this? In the previous (2012 DEIR) CALTRANS commented that the traffic analysis didn't include anything looking at the key 101 freeway ramp intersections closest to the Project site. CALTRANS rightly pointed out that there needed to be a traffic analysis to show the projected queue build-up for the on and off-ramps at Argyle, Cahuenga, Gower and Vine Street. That was six years ago. Why haven't the applicants been advised to provide this for the current DEIR?

Response to Comment No. IND 163-7

The commenter states that the Draft EIR failed to provide a traffic study that addresses the increase in traffic at Franklin Avenue and Argyle Avenue. In addition, the commenter is concerned that the traffic analysis did not consider queue build-up for the on and off-ramps from US-101. Impacts regarding traffic were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. As discussed in Section IV.L, page IV.L-1 of the Draft EIR, the TA was prepared in accordance with LADOT's Transportation Assessment Guidelines (TAG) adopted in July 2019 and pursuant to a memorandum of understanding (MOU) with LADOT dated December 3, 2019, documenting its assumptions and technical methodologies. In accordance with TAG and consistent with the City CEQA Transportation Thresholds (adopted July 30, 2019), the Draft EIR includes an assessment of whether the Project would result in: (1) potential conflicts with transportation-related plans, ordinances, or policies; (2) a substantial increase in vehicle miles traveled (VMT); or (3) increased hazards due to a geometric design feature or incompatible use. In addition, in accordance with the City's CEQA Transportation Thresholds, an assessment of whether the Project would result in inadequate emergency access is included. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts.

As further discussed in Section IV.L, page IV.L-1 of the Draft EIR, TAG also requires an assessment of “non-CEQA” transportation issues; however, given that these are not required under CEQA, this analysis was included in the TA and not the Draft EIR, unless they related to the assessment of potential conflicts with transportation-related plans, ordinances, or policies. The “non-CEQA” analysis in the TA (Appendix N-1) included (1) pedestrian, bicycle, and transit access; (2) project access, safety, and circulation; (3) construction traffic; and (4) residential street cut-through analysis. As described on page 42 of the TA, study intersections were developed in conjunction with LADOT. Nine study intersections were chosen based on guidance from LADOT’s TAG, which indicates that intersections immediately adjacent to the site and those in proximity to the site through which 100 or more project-generated trips would travel should be analyzed. Given the distance to the Project Site, the Franklin Avenue and Argyle Avenue intersection was not selected as a study intersection. Furthermore, given that the study of impacts on intersections is a “non-CEQA” transportation issue, it is not required to be evaluated as a part of the analysis in the Draft EIR as the commenter suggests.

The commenter also raised concerns that the traffic analysis did not consider queue build-up for the on and off-ramps from the US-101. See Topical Response No. 2 – Transportation and Traffic, above, for a discussion of traffic impacts from the Project, including impacts to US-101 and its on- and off-ramps.

Comment No. IND 163-8

- IV. **Transit.** The idea of density forcing Angelenos out of their cars and into public transportation is an idealistic theory. Assuming that 100% of the residents of these buildings will forgo car travel because of the proximity to mass transit is a fantasy. Where are the studies that show the rates of transit usage, and more important, that reveal the continued use of automobiles in similar scale projects with access to comparable mass transit options? How about the very real reluctance to use mass transit after this COVID-19 pandemic?

Response to Comment No. IND 163-8

The comment asserts that forcing transit use instead of vehicle use is an “idealistic theory” and assuming 100 percent of residents of the Project would use mass transit is “a fantasy.” The comment questions if there are studies that show the rates of transit usage compared to automobile use in similar developments. In accordance with LADOT’s TAG, the Project’s VMT analysis does not assume 100 percent transit use by Project residents. Rather, the trips and trip lengths included in the VMT calculation based on LADOT’s VMT calculator, which averages all types of trips generated by residents, such as commute trips, school trips, shopping trips, etc., across a 24-hour period. Based on these trips and their distances, VMT is calculated.

Furthermore, the Project is committing to implementing a variety of Transportation Demand Management (TDM) strategies as a Project Design Feature (PDF) (Project Design Feature TRAF-PDF-1). As part of the TDM Program, the Project would support

strategies to encourage public transit such as providing unbundled parking, on-site locations to purchase Metro passes, transit subsidies, a commute trip reduction program; shared mobility features (i.e., bike and car share); bicycle friendly infrastructure, education and encouragement programs on available transit options; and on-site management of TDM programs. The TDM Program measures are aimed at discouraging single-occupancy vehicle trips and would collectively serve to reduce dependence on single-occupancy vehicles. The trip reductions that were applied as part of the TDM program in the VMT analysis were estimated based on the City's VMT Calculator tool as discussed and documented on page 26 of the TA in Appendix N-1. The effectiveness of TDM measures contained in the VMT Calculator is estimated based on empirical research from the California Air Pollution Control Officers Association (CAPCOA) which currently represents the latest state of the practice TDM research. Appendix H to the TA provides calculations in support of the specific TDM measures applied for this project, including the applicability of select measures and equations used in the analysis. The combined effects of project location, land use mix, TDM measures, and proximity to the built environmental characteristics such as density of destinations, diversity of travel options, and distance to transit are well documented and applied here.¹⁴⁴ Also see Attachment G, Transportation Demand Management Strategies in the LA VMT Calculator to the LADOT's TAG, which provides more detail regarding the research sources and calculation of effectiveness for the TDM measures included in the VMT Calculator.¹⁴⁵ These resources and documents provide substantial evidence in support of the methodology, application of reductions, and resulting analysis outcomes demonstrating that a project with this land use mix, provision of effective TDM measures, in this location, would experience substantial reductions in single occupant vehicle trips.

The commenter also expresses concern about transit use after the COVID-19 pandemic. CEQA does not require analysis of speculative conditions. The comment does not provide any substantial evidence that Project operation would exacerbate the effects of the COVID-19 virus. Consideration of post-pandemic traffic is speculative and does not require analysis pursuant to CEQA Guidelines Section 15384(a). Furthermore, CEQA Guidelines Section 15064(d)(3) states that "[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable." Therefore, forecasting the impact of COVID-19 on the public's use of public transit during future Project operations is speculative. In addition to being speculative, COVID-19 is not a project or, more specifically, a component of this Project. Rather, COVID-19 is part of the environment and CEQA generally does not require an analysis of the environment's impact on the Project (see CEQA Guidelines Section 15126.2).

¹⁴⁴ For additional research and information, see USEPA Smart Growth:

<https://www.epa.gov/smartgrowth/mixed-use-trip-generation-model>, accessed August 25, 2020.

¹⁴⁵ Los Angeles Department of Transportation, Development Review for Transportation Assessment,

<https://ladot.lacity.org/businesses/development-review#transportation-assessment>, accessed August 25, 2020.

Thus, the Draft EIR meets the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

Comment No. IND 163-9

- V. **Homeless.** I am a member of the Hollywood Community-Police Advisory Board and I have worked with our LAPD partners in the Hollywood Division to address the key issues in our community. I was quite surprised that there was no mention of the ongoing and overwhelming homelessness crisis that we have been dealing with for the past several years. Hollywood has (as of 2019) approximately 2,953 people un-housed, living on the streets. Many of them are in encampments around the Project site, under the freeway overpasses and ramp embankments. This is a huge problem throughout Los Angeles, but it is front and center in this area. The associated garbage and disease concerns have been amplified during the COVID-19 pandemic. How could this Project ignore such a major issue in the area?

Response to Comment No. IND 163-9

The commenter questions why the Draft EIR did not consider the homelessness crisis, including associated garbage and disease concerns that have been amplified during the COVID-19 pandemic. Homeless-related concerns are social issues that are unrelated to the Proposed Project. As stated in the CEQA Guidelines, Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. As such, this topic was not evaluated in the Draft EIR, and no further response is warranted.

Comment No. IND 163-10

- VI. **Public Green Space.** One of the great accomplishments of our neighborhood has been the creation of the Franklin Ivar Community Park. It took years and countless volunteer hours to secure the property, create a design (with much public input) and fund the project. One of the reasons that we were so intent on seeing this pocket park completed, was the lack of public green space in Hollywood. The report talks about public spaces, but it doesn't paint a full picture of how green or natural the experience will be for visitors. Providing a cement plaza with a few planters doesn't really create the much needed "park" experience people look for (especially now, in a post COVID-19 reality). How can we ensure that our Franklin Ivar Community Park, the closest park to the Project site, doesn't become overwhelmed with people and lose its neighborhood charm? What are the requirements for the public spaces? How green will they be?

Response to Comment No. IND 163-10

The comment indicates a lack of clarity in the Draft EIR related to public open space, associated requirements, and expresses concern regarding parks/public spaces and the potential degradation to Franklin Ivar Park due to the Project.

Regarding public open space provided by the Project, as described in Chapter II, *Project Description*, starting on page II-52 of the Draft EIR, pursuant to Los Angeles Municipal Code (LAMC) Section 12.21 G, based on the proposed number of housing units and the mix of unit types, the Project would be required to provide at minimum of 120,175 square feet of usable open space. The Project proposes approximately 166,582 square feet of open space, including approximately 33,922 square feet of publicly accessible open space, 89,060 square feet of common open space, and 43,600 square feet of private open space in the form of private balconies. Table II-1, on page II-14 of the Draft EIR, provides a breakdown of all open space components provided for the Project overall. As described on page II-58 of the Draft EIR, ground floor, publicly accessible open space would be provided to connect the Project Site to the surrounding uses, including the Pantages Theatre and the Hollywood Walk of Fame. The Open Space Plan would remove surface parking lots and provide cultural and social amenities, such as paseo linkages, plazas, enhanced and activated street fronts, and would also incorporate a public art program in conjunction with landscape and open space design. The Project's open space amenities at the ground level would include areas for shopping, outdoor seating, landscaping, open-air dining, public performances, art installations, and special events. As shown in Figure II-16, on page II-35 of the Draft EIR, this includes three distinct areas including:

- **Lounge:** An approximately 8,163-square-foot outdoor gathering space, with seating, fireplace, and library.
- **East Plaza:** An approximately 10,198-square-foot performance area with a stage to host public acoustic performances by nearby school and community music groups, accented by the existing "Hollywood Jazz 1942–1972" mural and proposed outdoor seating to view performances or gather when the stage is inactive. The Plaza would also feature a landscaped palm tree grove and a bike center.
- **Garden:** An approximately 4,499-square-foot landscaped area, situated away from the adjacent streets and located inside of the block to provide a grassy area, seating alcoves, and a water feature to serve as a transition between the Lounge and Plaza areas.

In addition to the above, Project residents would also have access to their own recreational amenities, as stated on page II-23 through II-26, in Chapter II, these amenities would include pools, fitness areas, locker rooms, and recreational rooms. Given these open space and recreational amenities, it is expected that Project residents and visitors would primarily utilize on-site open space and amenities for their recreational needs, and it is not anticipated that nearby parks, including Franklin Ivar Park, would be

heavily used by Project residents or visitors to the extent that it would cause or accelerate substantial physical deterioration.

Regarding the impact analysis of Project effects on parks and recreation, see Section IV.K.4, *Public Services – Parks and Recreation*, of the Draft EIR, which concludes that the Project would have a less-than-significant impact with respect to parks and recreational facilities, including the potential for the Project to cause substantial physical deterioration of existing parks.

Comment No. IND 163-11

- VII. **Parking.** The biggest negative by-product of the development boom in the area of Hollywood just south of the Hollywood Dell is the fact that workers and patrons of the businesses use our neighborhood streets for free parking. Again, the reality is that even though there is mass transit, people still use their cars to get to work. What part of the report addresses that concern? There's not enough parking planned onsite for the residents, customers, workers, and hotel guests as it is.

Response to Comment No. IND 163-11

As discussed in Chapter 1, *Introduction*, to this Final EIR, the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project. Therefore, no further response regarding hotel uses is warranted.

The comment asserts that recent development in the Hollywood area has resulted in an increased use of street parking but does not provide substantial evidence to support this claim. The comment further asserts that people use their vehicles rather than use mass transit, that the Project does not provide enough parking, and questions where this is addressed in the Draft EIR. Issues related to transit and vehicle use were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a TA approved by the LADOT included in Appendix N-1 of the Draft EIR. As discussed in Section IV.L, page IV.L-1 of the Draft EIR, the TA was prepared in accordance with LADOT's TAG adopted in July 2019 and pursuant to a MOU with LADOT dated December 3, 2019, documenting its assumptions and technical methodologies. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

As noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the LAMC (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA. The Project is also providing bicycle parking compliant with the LAMC requirements. Thus, the commenter is incorrect in their assertion that the Project does not provide enough parking for residents, customers,

workers, and hotel guests. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 163-12

VIII. **Inclusion.** In general, I was very disappointed at how little consideration was given in the report to the nearby residential neighborhoods like ours. We have struggled over the years with the weird boundary line that falls at Franklin Avenue. LA City Council District 4 (ours) is north of Franklin, while LA City Council District 13 (Project site) is south of Franklin. Many of the issues that affect those of us north of Franklin, originate in the area directly south of Franklin. Just because we don't live in the district of the Project site, doesn't mean it won't be a huge impact on our lives. Where is the outreach effort? Why weren't the sound studies, traffic studies and other impacts measured from our location?

Response to Comment No. IND 163-12

The comment expresses disappointment that the impacts to the neighborhoods north of Franklin Avenue were not considered in the Draft EIR, specifically within the noise and traffic studies, and generally for other topics where impacts were measured. In addition, the comment questions where the public outreach effort was during this process. As discussed in Section IV.I, *Noise*, of the Draft EIR, noise propagates over a distance, and noise level reduces with distance depending on the type of noise source and the propagation path. Thus, as described on page IV.I-15 of the Draft EIR, the noise evaluation considered noise-sensitive uses, or receptors, within 500 feet of the Project Site. These 13 noise-sensitive receptors were shown in Figure IV.I-3, *Noise-Sensitive Receptor Locations*, on page IV.I-16 of the Draft EIR. The Project is bordered by Yucca Street to the north and Franklin Avenue is approximately 537 feet north of Yucca Street. Thus, it is not anticipated that there would be significant noise impacts on the neighborhoods north of Franklin Street. Furthermore, many of the neighborhoods north of Franklin Street are also north of US-101, which is considered a major noise source. Given this noise source and that noise levels reduce with distance, the potential for noise impacts from the Project on these neighborhoods was determined to be low.

Issues related to traffic are addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a TA approved by the LADOT included in Appendix N-1 of the Draft EIR. Page 10 of the TA described the Project's study area as extending to Gower Street to the east, Franklin Avenue to the north, Wilcox Avenue to the west, and Selma Avenue to the south. As described therein, this study area is a 0.25-mile radius around the Project Site and was selected based on guidance from the LADOT TAG. The study area also contains segments of US-101. Based on the guidance provided by the LADOT TAG, the neighborhoods north of Franklin Avenue were not required to be considered in the analysis, and, thus, for the purpose of CEQA, the Draft EIR presented a thorough traffic analysis.

While the comment does not identify other topics that should have included a discussion of potential impacts to the neighborhoods north of Franklin, such as noise and traffic, these environmental topics typically include a discussion of impacts relative to the Project Site. Given the distance, it is unlikely that the neighborhoods north of Franklin would be impacted by the Project.

In response to the comment that questioned the public outreach effort, as described in Sections 15121(a) and 15362 of the CEQA Guidelines, an EIR is an informational document that will inform decision-makers and the general public of the environmental impacts resulting from the project, identify possible ways to minimize any significant effects, and consider reasonable project alternatives. In compliance with the CEQA Guidelines, the City of Los Angeles, as the lead agency, provided opportunities for participation throughout the environmental process. This included the distribution of an Initial Study and Notice of Preparation (NOP) for a 30-day period, commencing August 28, 2018, and ending September 27, 2018 (see Appendix A of the Draft EIR). The City distributed the NOP to State, regional, and local agencies, interested organizations, and members of the public to formally convey that the City was preparing a Draft EIR for the Project and to solicit input regarding the scope and content of the Draft EIR. In addition, the NOP included notification that a public scoping meeting would be held on September 12, 2018 to further solicit input regarding the Draft EIR from the public. The meeting was held in an open house or workshop format and provided public agencies and interested parties the opportunity to view materials, ask questions, and provide oral and written comments to the City regarding the scope and focus of the Draft EIR as described in the NOP and Initial Study. A total of 204 written comment letters and emails responding to the NOP were submitted to the City and were considered in preparation of the Draft EIR. Thus, there was public outreach conducted and feedback received on the Project.

Comment No. IND 163-13

- IX. **Fire.** I have very real concerns about fire danger. With the recent and devastating wildfires, the fact that the hillside is a Very High Fire Hazard Severity Zone (VHFHSZ) keeps us all on our toes. Our neighborhood streets are typically narrow / substandard widths. They are steep and have lots of sharp curves. That, combined with the limited access points into our neighborhood from the areas where emergency vehicles would come from makes me along with my neighbors very concerned about how quickly the fire and police could arrive on the scene during an emergency. How come the Project site proximity to a VHFHSZ is not addressed in the report?

Response to Comment No. IND 163-13

The comment questions why wildfire impacts and the Project Site's proximity to a VHFHSZ zone is not considered in the Draft EIR. Wildfire impacts are discussed in Section IV.F, *Hazards and Hazardous Materials*, of the Draft EIR. As discussed therein, the Project Site is located within an urbanized area and is not within a VHFHSZ. Additionally, the Project Site is surrounded by urban areas and not wildlands and, thus,

would not expose people or structures, directly or indirectly, to a significant risk involving wildland fire, and no impacts would occur. This comment also raises concerns about emergency response. See Topical Response No. 2 – Transportation and Traffic, above, which addresses emergency response, including within the hillside areas north of the Project Site.

Comment No. IND 163-14

- X. **Earthquakes.** We have been preparing our neighborhood for what we are told is the inevitable major earthquake event. We have participated in evacuation exercises, my husband and I have both taken CERT training and we work public safety officials to prepare our neighborhood and ourselves. How then, can this very real safety concern not be an issue for this Project?

Response to Comment No. IND 163-14

This comment expresses general concerns about earthquakes. Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 163-15

I know there are likely many more questions, but due to the restrictive process and time limits, it's all I can muster.

I look forward to a response.

Response to Comment No. IND 163-15

This conclusion comment is noted; however, as this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 164

Katie Haupt
Received June 1, 2020

Comment No. IND 164-1

My vote is NO on this. We already
Have too much traffic in Hollywood and
It's
Overbuilt already plus the on and off ramps won't support the influx.

Response to Comment No. IND 164-1

The comment expresses opposition to the Project based on traffic and density in Hollywood. While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Although freeway on- and off-ramp analyses are not a required CEQA analysis per the City's Transportation Assessment Guidelines (TAG), adopted in July 2019, a ramp queuing analysis was presented for informational purposes in Appendix I to the TA for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR, including an analysis of the Project's traffic effects in service levels at Argyle Avenue/US-101 southbound on-ramp. The southbound on-ramp was evaluated because it would experience the greater distribution of Project traffic compared to the northbound ramp.

Although not a CEQA topic, Table 6B, *Hollywood Center Existing Year (2018) Intersection Levels of Service Unsignalized Study Intersections*; Table 13B, *Future Year (2027) Plus Project Intersection Analysis – Project Unsignalized Study Intersections*; and Table 15B, *Future Year (2040) Plus Project Intersection Analysis – Project Unsignalized Study Intersections*, presents the existing and future service levels at the southbound Argyle/US-101 on-ramp. As shown in these tables, the on-ramp would continue to operation at LOS A. The delay time is cited as 1.9 seconds in the A.M. and 3.2 seconds delay in the P.M. Existing conditions are based on direct observation as discussed in Appendix N-1 and on computed future use. Field observations described on page 49 of Appendix N-1, identified several intersections that currently experience congestion but did not identify the US-101 on-ramps as problem areas. As further shown in Appendix I of the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and associated intersections.

Comment Letter No. IND 165

Anna Judy and Jeff Dowden
6375 La Punta Drive
Hollywood, CA 90068
Received June 1, 2020

Comment No. IND 165-1

Please find attached to this email my comments and questions on the DEIR for the Hollywood Center Project.

Response to Comment No. IND 165-1

This comment is an introduction to an attached letter. Responses to the referenced letter are provided below in Response to Comment Nos. IND 165-2 to IND 165-6.

Comment No. IND 165-2

I, along with my husband, am a 23-year resident of the Hollywood Dell. I have been an active member of the Hollywood Dell Civic Association, and currently serve on the HDCA Board as Outreach Chair. My husband was integral in writing the grant proposal that funded the creation of the Franklin Ivar Park, which was dedicated in November of 2017. We are both very concerned that any large-scale developments in Hollywood be done thoughtfully and sensitively.

The Hollywood Dell Neighborhood is situated in the hills just north of the Project site. The Dell is bordered by Cahuenga Blvd. to the west, Argyle Avenue to the east, Franklin Avenue to the south and extends north to the Hollywood Reservoir.

Figure 1: Hollywood Dell Civic Association Neighborhood Map

Figure 2: Photo from residence in Hollywood Dell facing south towards the proposed Project

Response to Comment No. IND 165-2

This introductory comment is noted; however, as the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 165-3

1. Despite its proximity to the Project site, why was the Hollywood Dell neighborhood omitted in the noise-sensitive receptor locations?

2. What was the rationale for excluding the hillside neighborhoods north of the Project site from consideration with regards to NOISE?

“Noise is unwanted sound and, therefore, is an important factor in the quality of urban life. There are two main types of sound: ambient and intrusive. Ambient sound is the background sound that aggregates all sound emissions, far and near, as received within a particular locale. It is the “given” level of sound to which we are accustomed in our residential, work or other particular environments; the generally not unpleasant “hum” of sound about us. Intrusive sound is greater than the ambient sound level; it is perceived as ‘noise’.”

“Noise-sensitive receptors are locations where people reside or where the presence of unwanted sound could adversely affect or disrupt the types of activities associated with the land use...”

Generally, noise is most audible when traveling by direct line-of-sight. Line-of-sight is the straight line along which an observer has unobstructed vision. Barriers such as walls, berms, trees or buildings that break the line-of-sight between the sound source and the receiver greatly reduce noise levels by filtering or interrupting the projection. Sound barriers can reduce sound levels by up to 20 dBA. However, if a barrier is not high or long enough to break the line-of-sight from the source to the receiver, its effectiveness is greatly reduced

In recent years Hollywood Dell residents have been impacted by noise from concerts emanating from the Hollywood Bowl. The volume had become an issue as the Hollywood Bowl sound system became more powerful. Neighbors on my street, as far as 2,300 feet away from the Bowl, were unable to ignore the din from both inside and outside their homes. In response to feedback from the community, the Hollywood Bowl management took steps to address the issue. They conducted sound tests and made significant efforts to monitor sound levels and adjust their operations to minimize the negative impacts on adjacent neighborhoods.

Over the past 10 years, south of our neighborhood, there has been a proliferation of rooftop venues at trendy boutique hotels in the Hollywood Entertainment District. The amplified music and noise from these popular hotspots have become intrusive and annoying to many hillside residents, as it flows without a break in the line-of-sight across great distance.

In January of 2010 the W Hotel Hollywood (12 stories) opened its popular rooftop pool deck at Hollywood and Argyle.

In June of 2016, Mama Shelter, at Selma & Wilcox is a boutique hotel (6 stories) with a rooftop venue that projects sound into the surrounding neighborhoods.

The Dream Hotel, (10 stories) which opened in July of 2017, near the intersection of Selma & Wilcox, features an 11,000 square foot rooftop venue called the Highlight Room.

All three of these examples are south of the Project site, and further away from the Hollywood Dell. They are also significantly lower (less than 50% on average) in overall height than the 46-story proposed towers of the Project, and equivalent in height to the two 11-story structures. The sound carries, unimpeded from these rooftops to our hillside and can be heard as far as 4,000 feet away.

The planned outdoor spaces listed for this Project are:

- (i) Westside Site Plaza
- (ii) Amenity Deck (level 2), West Site

- (iii) Amenity Terrace, West Senior Building
- (iv) Rooftop Terrace, West Senior Building
- (v) East Site Plaza, Performance Stage
- (vi) Amenity Deck (level 2), East Site
- (vii) Roof Terrace, East Senior Building

3. What is the plan for making sure similar NOISE resulting from the operation of the completed Project doesn't have a significant negative impact on the adjacent neighborhoods? How can this be enforced?

4. How can the sound emanating from these massive skyscrapers be stopped from flowing, especially from the upper floors and outdoor spaces that face the hills to the north?

5.. [sic] Why wasn't there any mention of the Community-Police Advisory Board (CPAB) "Recommended Conditions for Unenclosed / Open Rooftop / Elevated Patio operations?" Please see attachment at end of this letter.

These conditions were created to ensure public safety and maintain a quality of life for the visitors and stakeholders within the Hollywood community. They were in response to the proliferation of rooftop venues and the increase in noise complaints. The recommendations address hours of use, low / ambient sound and amplified sound. The full document is included as an attachment to this letter.

Response to Comment No. IND 165-3

As discussed in Chapter 1, *Introduction*, to this Final EIR, the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project. Therefore, no further response regarding hotel uses is warranted.

The comment questions the rationale for excluding the Hollywood Dell neighborhood and neighborhoods to the north of the Project Site as noise-sensitive receptor locations and from the noise impact analysis. The comment notes that noise from the rooftop decks in Hollywood carries up to the surrounding hillside neighborhoods and asks what the Project is going to do to reduce this impact, and how it can be enforced. Lastly, the comment questions why the Community-Police Advisory Board "Recommended Conditions for Unenclosed/Open Rooftop/Elevated Patio Operations" was not considered in the Draft EIR.

As discussed in Section IV.I, *Noise*, of the Draft EIR, noise propagates over a distance, and noise level reduces with distance depending on the type of noise source and the propagation path. The comment lists Project open spaces areas. The West Site Plaza would be an open space pedestrian area located on Level 1. No event programming or use of amplified speakers would occur in this area. The West Site Amenity Deck and East Site Amenity Deck (both on Level 2) would each feature a pool, garden, and open space area and would include ambient/background music speakers (not loud "concert-level")

entertainment speakers) used to provide soft ambient music for the listening enjoyment of the amenity deck (Level 2) users. As identified in Project Design Feature NOI-PDF-3 in the Draft EIR, the Project will require that these speakers be downward- or inward-facing and used for background music only. The West Senior Building Amenity Terrace would be an open space area for the senior residents and guests and would be located on Level 1. No event programming or use of amplified speakers would occur in this area. The West Senior Building and East Senior Building Rooftop Terraces would each be an open space area for the senior residents and guests and would be located on the rooftop of the 11-story building as proposed under the Project. No event programming or use of amplified speakers would occur in these areas.

The East Site Plaza Performance Stage area would be an open space pedestrian area location on Level 1. This area would host occasional live, acoustic performances or provide pre-recorded, low-level, background music via ambient music speakers. Acoustic performances or ambient music speakers with pre-recorded, low-level, background music on the East Site Performance Stage will be limited to a sound level equivalent to 85 dBA measured at 25 feet from the performers. Compliance with this performance standard will be ensured through pre-performance noise tests/measurements for performances or ambient music speakers with potential to exceed the sound level, along with any necessary adjustments to the location and nature of proposed performances or ambient music speakers. Furthermore, the East Site Plaza Performance Stage generally faces southward towards the East Site Building. Thus, the design of the East Site Plaza Performance Stage would be such that performance noise would generally be directed into the Project Site's East Site Plaza area and not towards the residential community to the north of the Project Site. As discussed, the design of the Project is such that potential noise-generating activities associated with ambient/background music speakers and acoustic performances on the East Site Plaza Performance Stage would be located on the lower levels of the Project (i.e., Levels 1 and 2) and not on the rooftops, and that the ambient/background music speakers and East Site Performance Stage would be oriented to face the Project Site interior and away from the residential community to the north of the Project Site. Furthermore, controls would be in place minimize noise to the off-site environment as specified in Project Design Feature NOI-PDF-3. Thus, the Project would not include loud or amplified rooftop noise sources that may be associated with the W Hotel, Mama Shelter, and Dream Hotel uses referenced in the comment. Thus, the Project would not cause significant noise impacts on the neighborhoods north of Franklin Street.

As described on page IV.I-35 of the Draft EIR, since the Project has various open air areas (e.g. decks, rooftops, plazas) that create a relatively complex soundscape, on-site operational noise was modeled using CadnaA noise propagation program to estimate the various noise sources and their effects on the ambient noise environment. CadnaA considers environmental factors, such as noise reflection and attenuation from intervening structures, topography, and distance (both horizontally and vertically) from a noise source. For purposes of providing a conservative noise analysis for outdoor spaces, the maximum occupant load of Project outdoor spaces was calculated based on an

occupancy load factor of 15 square feet per person for an assembly area without fixed seats, according to the California Building Code Table 1004.5 Maximum Floor Area Allowances Per Occupant.¹⁴⁶ Although this occupancy load factor provides an overestimation of the occupancy load and associated noise within passive landscaped areas, it has been applied to the square footage of the Project's outdoor spaces to provide a conservative worst-case noise analysis and actual capacities would be much lower. The Rooftop Terraces on the West Senior Building (page IV.I-50) and the East Senior Building (page IV.I-51) were both evaluated for potential ambient noise impacts and, as shown in Table IV.I-12 on page IV.I-47, both had noise levels that would be well below the ambient noise levels at all sensitive receptor locations due to noise attenuation over distance and, in some cases, the presence of intervening structures that interrupt the line-of-sight to receptors, including the Hollywood Dell neighborhood to the north of the Project Site. As discussed above, the Project has been designed to locate potential noise-generating activities associated with ambient/background music speakers and acoustic performances on the East Site Plaza Performance Stage on the lower levels of the Project (i.e., Levels 1 and 2) and not on the rooftops. The Project would not include loud or amplified rooftop noise sources that may be associated with the W Hotel, Mama Shelter, and Dream Hotel uses referenced in the comment. Therefore, the Project would not generate unobstructed rooftop noise that would cause noise impacts to the residential community to the north of the Project Site. Given that there were no noise impacts at all sensitive receptor locations within 500 feet, the noise impacts beyond this boundary, including neighborhoods north of Franklin Avenue, would be less. Additionally, as stated on page IV.I-52 of the Draft EIR, the composite noise level of all operational sources at each sensitive receptor, which represents the worst-case scenario for all activity at all outdoor spaces and assumes an acoustic performance taking place at the East Site Plaza, Performance Stage, would result in less-than-significant noise impact. Moreover, the cumulative noise impact analysis on pages IV.I-90 to IV.I-120 concluded that cumulative impacts regarding operational noise would be less than significant without mitigation. When considered together with related projects, operational noise impacts would not result in a cumulatively considerable impact. Accordingly, cumulative impacts would be less than significant without mitigation.

While the Hollywood Community-Police Advisory Board's "Recommended Conditions for Unenclosed/Open Rooftop/Elevated Patio Operations" is noted, as indicated above, noise from the rooftop use areas of the Project were evaluated, and impacts were determined to be less than significant.

Comment No. IND 165-4

6.. [sic] Why isn't the environmental impact of light pollution addressed in the EIR?

Light pollution is the presence of artificial light in the night environment and is exacerbated by excessive, misdirected or obtrusive use of light. Light trespass occurs when unwanted

¹⁴⁶ California Building Standards Commission, 2019 Title 24, Part 2, Volume 1 – California Building Code.

light enters one's property from another property. Over-illumination is the excessive use of light.

Recent developments in lighting technology, and specifically LED lighting has resulted in a new source of intrusion in our residential neighborhoods. Newly built, ultra modern homes integrate elaborate lighting systems that can run 24/7, use low amounts of energy, and project light across greater distance. These "light boxes" create glaring and jarring impacts on those who live around them.

While light might not seem like "noise" it does travel and impact neighbors in similar ways. Uninterrupted bright lighting can create a visual disturbance and invade the space of neighbors.

Response to Comment No. IND 165-4

The comment is concerned with light pollution and incorrectly asserts the issue was not addressed in the Draft EIR. Aesthetic impacts, including artificial light, were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

An analysis of operation artificial light was included in Section IV.A, on page IV.A-60 of the Draft EIR. As described therein, the Project would introduce new lighting, including wayfinding lights, security lighting, landscape lighting, street-level commercial signs, paseo lighting, architectural accent lighting, and interior lighting visible through windows, all of which would be installed pursuant to Los Angeles Municipal Code (LAMC) lighting requirements. None of the proposed architectural accent lighting would include any moving lights or dynamic lighting effects, such as electronic message display. All proposed lighting would be steady in intensity and color throughout a single night. No still or moving images would be projected onto the buildings. Furthermore, the Project's architectural and rooftop lighting and commercial signs would be consistent with the intent of Hollywood Signage Supplemental Use District (HSSUD) to complement the character-defining features of a historic building. In addition, the use of rooftop illumination would be consistent with HSSUD policy encouraging illuminated signage to reflect a modern, vibrant image of Hollywood as a global center of the entertainment industry.¹⁴⁷ Generally, the Project is anticipated to include rooftop lighting with "uplighting" or backlighting, to provide a soft glow. Existing pole-mounted parking lot flood lights located on both the West and East Sites would be removed as parking would be located within the interior and subterranean parking levels. As such, the effects of vehicle headlights would be reduced.

All lights in public areas would comply with LAMC lighting regulations that include approval of street lighting plans by the Bureau of Street Lighting. Additionally, the Project would implement Project Design Feature AES-PDF-4, which requires that construction and operational lighting will be shielded and directed downward (or on the specific on-site

¹⁴⁷ City of Los Angeles Department of City Planning, Ordinance No. 181,340, effective November 17, 2010.

feature to be lit) in such a manner so as to avoid undue glare or light trespass onto adjacent uses. With the incorporation of Project Design Feature AES-PDF-4 and compliance with the applicable LAMC regulations, the Draft EIR concluded that lighting and illuminated signage associated with the Project would not adversely affect day or nighttime views in the area.

Comment No. IND 165-5

We're deeply troubled that the public comment period of 45 days was not given an extension under the very "unusual circumstances" caused by the safer at home restrictions of the COVID-19 pandemic. If not for these unusual circumstances, the Hollywood Dell Civic Association and Hollywood Dell residents would be frequently meeting and discussing this DEIR—as would many of our neighboring communities. The public has been left at a great disadvantage due to these circumstances. I can't help but wonder if this was a strategic decision by the City to fast-track this Project.

We also must ask why our City leadership, and The City Planning Department always seem to be behind rather than in front of planning, with the residents being the ones to plead with the City to ameliorate the outcome of a lack of City Planning. Examples are the McMansion laws, the Party House Ordinance, and the present problem of the intense annoyance and quality of life issues caused by rooftop / outdoor decks. Rather than working on city planning for residents, it sometimes feels that the City of Los Angeles works on developer support.

Avoiding a problem is more effective than trying to correct an existing one.

We look forward to your response to our questions.

Response to Comment No. IND 165-5

The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above. The comment also asserts that the Department of City Planning is not providing solutions to help residents and is instead helping developers. These comments do not raise any specific issues with respect to the content and adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 165-6

Attachment: Community-Police Advisory Board, Recommended Conditions for Unenclosed / Open Rooftop / Elevated Patio Operations, May 29, 2019.

Response to Comment No. IND 165-6

This comment notes that the Community-Police Advisory Board “Recommended Conditions for Unenclosed/Open Rooftop/Elevated Patio Operations” is provided as an attachment. This comment is noted; however, as the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 166

Judith Whitman

Received June 1, 2020

Comment No. IND 166-1

The planning commission may not consider Covid19 a reason for extension, but:

The IRS extended payment

The basketball season extended

All conferences do

Disneyland is closed

Mortgages are extended

Rents are cut in half

Movie theatres closed

Criminal Courts only emergencies

Children's Court only emergencies

Schools and Colleges

Theme parks closed

But the planning commission doesn't think Covid 19 is a reason for extension? Seriously?

Response to Comment No. IND 166-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 167

Barbara Hodous

Received June 1, 2020

Comment No. IND 167-1

TO DAVID RYU AND HIS STAFF -- As a voting constituent of your district and a long-time Hollywood resident, I ask you to do whatever is possible to extend the date for comments on the EIR for this disaster of a project known as Hollywood Center or Millenium [sic]. The whole city has come to a standstill in the 45 days since the report was made available and, as I understand it, even the planning commission does not hold meetings as normally required because of the coronavirus. Yet this deadline ---- alone among almost every other deadline -- is not being extended. For example, the courts of appeal extended all briefing deadlines because of the virus situation, even though briefing does not require in-person meetings. There is no excuse except corruption for this deadline not to be extended. This whole project stinks to high heaven, as they used to say. The traffic mess alone that this project will cause is sufficient to have it be denied.

I urge you and anyone else involved to demand an extension for comments on this EIR. Thank you.

Response to Comment No. IND 167-1

The comment requests that the City extend the Project's 47-day public review period. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment also makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

The comment also asserts that the Project's traffic will cause a mess but does not raise specific issues regarding the content and adequacy of the Draft EIR. However, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Comment Letter No. IND 168

Emily Ferry
1958 Vista Del Mar
Los Angeles, CA 90068
Received June 1, 2020

Comment No. IND 168-1

I live on Vista del Mar in Hollywood and am terribly concerned about the Hollywood Center Project.

Response to Comment No. IND 168-1

This introductory comment is noted; however, as the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 168-2

First, it has been established that the proposed structures are on an earthquake fault. In addition to the many lives that might be lost were the tower(s) to come down, both in the building(s) themselves and in the surrounding area, what would the responsibility of Millennium Partners be in terms of repair and/or demolition? I cannot be blamed for distrusting the construction and management skills of this corporation, as they are the developers of the infamous, disaster ridden Millennium Tower in San Francisco.

Response to Comment No. IND 168-2

The comment expresses opposition to the Project due to the Project Site's location relative to an earthquake fault (the Hollywood Fault) and concerns about construction of another project outside of the Project vicinity. Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 168-3

Secondly, traffic in the Hollywood area has become (Prior to Covid-19, of course.) a nightmare. There is already virtually no available parking on my street, and, at rush hour, the backup of cars going west on Franklin, waiting to enter the 101 freeway going north, sometimes comes to a complete standstill, backing up for twenty blocks. If rush hour has become nonnegotiable now, what will happen when thousands of cars are added to the

mix? Has Caltrans actually approved this plan? I find it hard to imagine so, and there is no opinion from Caltrans attached to the DEIR.

Response to Comment No. IND 168-3

The comment expresses opposition to the Project based on its potential to cause traffic impacts, including impacts to US-101 and its ramps. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above. As stated therein, traditional circulation analysis related to intersection level of service was conducted within the non-CEQA analysis provided within Appendix I of the TA. The intersection of Argyle Avenue and Franklin Avenue/US-101 Northbound on-ramp (Intersection No. 10) and the intersection of North Gower Street and Franklin Avenue (Intersection No. 11), the two of which are nearest to the unsignalized intersection of Franklin Avenue and Vista Del Mar, are both analyzed. See Appendix I of the TA for detailed discussion and results of the LOS analysis. However, intersection level of service no longer serves as the basis for determining significant impacts related to transportation pursuant to CEQA and are only included for informational purposes.

Also, Section IV.L, *Transportation*, page IV.L-49 of the Draft EIR, contains a summary of engagement with Caltrans and describes Caltrans' request for additional analysis that focused on potential traffic conflicts pertaining to direct and cumulative trips on State facilities in the Project vicinity, including off-ramp queuing and mainline merge and weaving analysis at requested locations. As described therein, the analyses requested by Caltrans were presented for informational purposes and contained in Appendix I of the TA, which is provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also see Response to Comment No. AG 2-7, which discusses a recent meeting between the City and Caltrans in July 2020 during which Caltrans did not identify any particular concerns or make any particular requests for new analysis beyond that included in the Draft EIR. Additionally, the Caltrans representative indicated that Caltrans' concerns were non-CEQA concerns. Based on this, Caltrans has not identified any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR. See also Topical Response No. 2 – Transportation and Traffic, above, for a discussion of traffic impacts from the Project, including impacts to US-101 and its on- and off-ramps.

Comment No. IND 168-4

Thirdly, City services. Where will the water come from? Will our water pressure be effected? Will more firemen and policemen be hired? How will the city pay for this? Will there be a raise in our taxes? And what about our aging sewers? Many of the main lines in this neighborhood were installed in the 1940's [*sic*] and are already breaking from the strain.

Response to Comment No. IND 168-4

The comment questions the Project's impacts on city services, including water, fire, police, and sewers. With respect to water supply, Section IV.N.2, *Water Supply*, of the Draft EIR evaluated the impacts of the Project on domestic water infrastructure and water supply. The section also quantified the Project's water demand and evaluated the ability of the local municipal water infrastructure and water supply to meet this demand. As described therein, the Los Angeles Department of Water and Power (LADWP) determined in the approved Water Supply Assessment for the Hollywood Center Project that there are adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP. Thus, sufficient domestic water supplies are available to service the Project and surrounding areas and impacts are anticipated to be less than significant. As the domestic water supplies would be available and sufficient, there would not be a decrease in the amount of water or water pressure that is available to serve the surrounding areas. As such, water pressure in the surrounding areas would not change.

With respect to fire and police protection services, impacts to these services were addressed in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, respectively, with supporting data provided in Appendix M of the Draft EIR. Pursuant to the CEQA Guidelines and the thresholds used by the City to determine the significance of impacts to fire and police protection services, the analyses focused on whether or not new or expanded facilities are needed to maintain adequate public service and whether a potential physical impact could occur if construction of facilities was warranted. In the case of the Project, it was determined that the Project would not generate a demand for additional police and fire protection services that would result in the need for new or expanded fire and police protection services facilities. As such, Sections IV.K.1 and IV.K.2 of the Draft EIR concluded that impacts to fire and police protection services would be less than significant. Notably, regarding public safety, as provided in Project Design Feature POL-PDF-2, the Project would incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding signage and lighting for walkways and entries.

This is in contrast to existing conditions in the area, which include surface parking lots and long alleys between blocks, where buildings are partially cut off from the street. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for LAPD services. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a seven-day a week security patrol and could assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services. Implementation of Project Design Feature POL-PDF-2 would help to offset the Project's operational demand for police protection services from LAPD.

With respect to sewer infrastructure, Section IV.N.1, *Wastewater*, of the Draft EIR, addresses potential Project impacts on existing wastewater conveyance infrastructure and treatment facilities that would serve the Project Site. The analysis provides an overview of existing infrastructure and facilities and evaluates whether sufficient capacity is available to serve the Project's estimated wastewater generation. As described on page IV.N.1-15 of the Draft, Project-related sanitary sewer connections and on-site infrastructure would be designed and constructed in accordance with applicable Los Angeles Sanitation District and California Plumbing Code standards. Furthermore, in accordance with Los Angeles Municipal Code Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system. If, during construction, existing sewer lines are found to be substandard or in deteriorated condition, the Project Applicant would be required to make necessary improvements to achieve adequate service under the City's Building and Safety Code and the Los Angeles Department of Public Works requirements. In addition, system-wide infrastructure improvements throughout the greater Hollywood area and the City are regularly assessed by the City's Department of Public Works and other departments, as applicable, through capital improvement programs. Thus, the Project's infrastructure would be able to accommodate the Project.

Comment No. IND 168-5

Finally, what about air quality? All those additional cars - how can they not make the smog ever so much worse?

Response to Comment No. IND 168-5

The comment expresses concern over the air quality impacts of the Project. Air quality impacts were addressed in Section IV.B, *Air Quality*, of the Draft EIR, with supporting data provided in Appendix E of the Draft EIR. As analyzed therein, air quality impacts associated with operational mobile-source and stationary-source emissions (NO_x) would be potentially significant, with occasional maintenance and testing of the emergency generators as the primary contributor to the significant impact. However, the Project would implement Mitigation Measures AQ-MM-2 which would reduce regional NO_x emissions from operations to below the regional threshold for NO_x, and impacts related to regional NO_x operational emissions would be mitigated to a less-than-significant level.

Additionally, as addressed in Section IV.B and Appendix E of the Draft EIR, construction and operational air quality impacts would be less than significant after mitigation, where applicable. The prescribed construction mitigation, which requires certain types of construction equipment and features to be utilized by the Project, would ensure that Project construction activities do not expose sensitive receptors to substantial pollutant concentrations or result in violations to applicable daily air quality standards. During operation, mitigation to address standard emergency generator testing would also ensure that applicable daily air quality standards are not violated. This includes daily nitrogen oxides (NO_x), which is a primary contributor to smog.

Comment No. IND 168-6

The real issue here is transparency. From the very beginning, the Millennium Hollywood, now the Hollywood Center, has reeked of cronyism and malfeasance. As more and more news articles appear about the bribery of City Council members, how do the citizens of Los Angeles know that this practice has been curtailed? How can any resident of this city place trust in the DEIR for the Hollywood Center Project, considering its history?

I beg you to consider these objections.

Response to Comment No. IND 168-6

The comment expresses concern with the Draft EIR based on news articles regarding alleged illegal activities. The speculation as to alleged illegal activities are not related to the adequacy of the Draft EIR. Accordingly, no further response is warranted regarding these issues.

The comment also makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project. The commenter's concerns of corruption do not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 169

Michael Brittain
2228 Vista Del Mar Pl.
Hollywood, CA 90068
Received June 1, 2020

Comment No. IND 169-1

I wish to state my total opposition to this construction project. It could continue only if it is a third as high as proposed. Would be great win [*sic*] Las Vegas but not in such a dense site as Hollywood Blvd. It's just inappropriate.

Response to Comment No. IND 169-1

The comment expresses opposition to the Project based on its size and scale relative to the Hollywood community. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Comment Letter No. IND 170

Billy Mallery

Received June 1, 2020

Comment No. IND 170-1

I am concerned about such development in Hollywood (image attached) as there has already been SO MUCH BUILDING already !! We the local residents can already feel the impact as traffic has become MUCH WORSE. It feels like Hollywood has become OVERPOPULATED as is!! And now these towering building are being considered??? Honestly I think that the current new buildings are appropriate in height (under 20 stories I believe) for Hollywood's quaintness and historical charm.

Let the developers go DOWNTOWN if they really want to go that high. It would be ridiculous and impractical to "squeeze" [*sic*] into Hollywood's landscape.

Therefore me and my family and neighbors too, are AGAINST THIS NEW DEVELOPMENT IDEA 100%.

Response to Comment No. IND 170-1

The comment expresses opposition to the Project based on potential traffic impacts and its size and scale. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

The size and scale of the Project were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Comment Letter No. IND 171

Alyssa Van Breene
Received June 1, 2020

Comment No. IND 171-1

I am sending this email to offer support during this public comment period for the proposed project, Hollywood Center. I am in support of this project and feel it will be an asset to the Hollywood community.

My family has owned the property located at 6051 Hollywood Blvd. for three generations. We want to see projects like Hollywood Center be built and provide opportunity for the Hollywood community. Hollywood NEEDS this project.

The team who have designed this project have [*sic*] imagined an exciting and 21st century design that will be an enhancement to the Hollywood community. I have discussed the project with team members who are thoughtful and CARE about Hollywood.

The project creates affordable housing units for senior citizens, open civic space for recreation and interaction, density near public transportation and will create jobs.

Please hear those of us who want to see Hollywood improve with projects like the Hollywood Center. Hollywood needs development just like this to reinvigorate and re-brand a neighborhood many Angelenos think poorly of.

Thank you for this opportunity to participate in the public comment for the Hollywood Center Project. I encourage the city to proceed with the plans to bring this exciting addition to Hollywood life after so many years of waiting.

Response to Comment No. IND 171-1

The comment expresses support for the Project but does not raise any issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 172

Yvonne Westbrook
2815 N. Beachwood Dr.
Hollywood, CA 90068
Received June 1, 2020

Comment No. IND 172-1

I am opposed to the Millennial project, as a home owner in Beachwood Canyon and as a resident of Hollywood. I have lived in the canyon since 1971 and while I am not opposed to change, I am opposed to changes that will negatively impact the general environment. LA is notoriously ahistorical and there comes a point when it's not just about erasure of this or that building, but doing damage by overloading the existing infrastructure to the extent at which a locale becomes unfriendly, difficult, barely livable. The Millennium project will push Hollywood, which is already so impacted that it can take 25 minutes to drive the two mile stretch on Franklin Ave from Western/Los Feliz to the 101 frwy on ramps at Argyle. From Beachwood Canyon there is no longer a reliable route or time to avoid bumper to bumper traffic. The proposed project—no matter the amount of lip service paid to pedestrian “traffic”—will greatly, negatively impact the air quality, the traffic, the skyline and its being built atop a fault that will make the structure unreliable.

Response to Comment No. IND 172-1

The comment expresses opposition to the Project based on traffic, historical resources, and general environmental impacts. The comment makes reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Regarding the current Hollywood Center Project and concerns about traffic, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The traffic effects of the Project, including congestion, were discussed in the TA in Appendix N-1 of the Draft EIR. While it is acknowledged that the Project would contribute traffic to the local roadway network, traffic congestion is not a CEQA issue and was, therefore, not evaluated in the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

The comment also states that the Project will negatively impact air quality, traffic, and the skyline. Air quality impacts were addressed in Section IV.B, *Air Quality*, of the Draft EIR,

with supporting data provided in Appendix E of the Draft EIR. As analyzed therein, construction and operational air quality impacts would be less than significant after mitigation, where applicable. The prescribed mitigation which requires certain types of construction equipment and features to be utilized by the Project, would ensure that Project construction activities do not expose sensitive receptors to substantial pollutant concentrations or result in violations to applicable daily air quality standards. During operation, mitigation to address standard emergency generator testing would also ensure that applicable daily air quality standards are not violated.

Regarding the skyline, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

Regarding the Project Site's location on top of a fault, seismic impacts were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 172-2

Mr Garcetti, a guy who talks liberal and acts Trump-like, policy-wise, seems to beholden to the NY developers, or just developers period. I'm so sick of yes-men and yes-women on the City Counsel [*sic*]...it's extremely disheartening that LA is a [*sic*] the top of the most corrupt cities in America list. The latter makes me think writing my opinion is a complete waste of time. I hope those of you on the take rot is the worst kind of hell, though I've surmised for the person that has no conscience, there is no hell...also no love, no sense of real meaning, no depth, utter stupidity and shortsightedness.

Response to Comment No. IND 172-2

The comment expresses opposition to the Project. The comment does not raise any issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 173

Marian Dodge
2648 N. Commonwealth Ave.
Los Angeles, CA 90027
Received June 1, 2020

Comment No. IND 173-1

Please enter my comments in the Hollywood Center Project in the file.

Response to Comment No. IND 173-1

This comment is an introduction to an attached letter. Responses to the referenced letter are provided below in Response to Comment Nos. IND 173-3 and IND 173-4.

Comment No. IND 173-2

There are several aspects of the Hollywood Center Project that are troubling and need to be addressed further.

Response to Comment No. IND 173-2

This introductory comment is noted; however, as the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 173-3

The most egregious of these is the analysis of earthquake fault line rupture. The consultant rather miraculously determined that the impact of the project built right on top of an earthquake fault line would be Less than Significant. Is the consultant saying that the construction of the building would not cause an earthquake? Perhaps they are asking the wrong question. What would be the impact of an earthquake on the buildings and the surrounding community?

The City has already suffered the consequences of not asking the right questions in the Porter Ranch debacle. That project underwent CEQA which determined that the project would have little or no impact on the community. No one asked if the surrounding community would have an impact on the project. Then in October 2015 gas started leaking from an underground SoCalGas storage facility in the Santa Susana Mountains near Porter Ranch. More than 11,000 residents had to be temporarily relocated by SoCalGas and two schools were relocated. Now there are multiple lawsuits. This entire disaster could have been avoided if the City had asked the right question during the CEQA process.

Apparently the consultant was not in Hollywood during the Northridge earthquake in 1994. Hollywood suffered considerable damage due to liquefaction – which was noted in the

analysis – although the Northridge fault lies 16 miles north of the site. The historic Egyptian Theatre in Hollywood was red-tagged and closed. A section of the Santa Monica freeway collapsed. Will stronger seismic regulations protect the City from harm?

I can predict the answer the consultants will give: today's more technologically advanced engineering and construction techniques will protect the buildings.

Response to Comment No. IND 173-3

The comment expresses opposition to the Project due to the Project Site's location relative to an earthquake fault (the Hollywood Fault). Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. While the comment notes several examples of damage pertaining to the Northridge earthquake, they are not directly applicable to the content or adequacy of the Draft EIR. The Project's building design and construction must conform to the current seismic design provisions of the City's Building Code, which incorporates relevant provisions of the California Building Code (CBC). The Los Angeles Building Code incorporates the latest seismic design standards for structural loads and materials to accommodate maximum ground accelerations expected from known faults affecting the Project Site. See also Topical Response No. 3 – Geology and Fault Hazards, above.

The comment also asserts that the surrounding community would potentially have an impact on the Project. There is no requirement under CEQA to analyze the impact of existing environmental conditions on a Project. See *California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369.

Comment No. IND 173-4

The City must bear in mind that the Hollywood Center Project is being planned by Millennium Partners, the same firm that constructed the Millennium Tower project in San Francisco which is now referred to as The Leaning Tower. A December 3, 2018 article in the San Francisco Chronicle described it this way:

One of the city's flashiest luxury condo towers when it opened in April 2009, the Millennium, at 301 Mission St., has become notorious internationally over the past two years as San Francisco's leaning tower, settling 18 inches and leaning 14 inches to the west. The flawed foundation sparked multiple lawsuits from residents against the developer, Millennium Partners, as well as the architect and engineers who designed the concrete and glass building.

Millennium's dubious track record does not give me comfort. Does the City want to take the same risk with the same firm? Does the City want to face multiple lawsuits from flawed design and construction?

Millennium Partners is a New York-based firm. Given the San Francisco fiasco, their performance rating is not stellar. Why aren't we giving projects to Los Angeles-based firms or California firms so that we can truly support the local economy?

The Millennium Hollywood project keeps resurrecting itself from the dead. It's time to have the zombie declared legally dead.

Response to Comment No. IND 173-4

The comment expresses opposition to the Project based on the developer being Millennium Partners. The commenter also expresses concern about the Millennium Towers project in San Francisco. The comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. Furthermore, the referenced tower in San Francisco is unrelated to the Project. However, geology impacts were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

The comment also makes reference to the Millennium [Hollywood] Project, a different project that was previously proposed at the same Project Site and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Comment Letter No. IND 174

Hilary McLeod

Received June 1, 2020

Comment No. IND 174-1

This letter is to protest the approval of the Hollywood Center project, based upon the excessive size and scope of the planned facility. Since the founding of the Hollywood civic area in the 1880's *[sic]*, the constraints of the geographic features of the region have directed the placement, size, and use of buildings constructed in the area. As businesses developed, the movie industry flourished, and it constructed the buildings needed to support that craft.

As the entertainment industry grew in size, it recognized the need to build venues to make and show films without overwhelming it's *[sic]* budget. The industry also recognized the need to attract an audience to a venue that had enjoyable films and an appropriate, comfortable theater. Films were made featuring amazingly attractive stars, creative animated features, and historical places; think Audrey Hepburn, Shrek, Gone With the Wind.

What do you think would have happened if the movie makers had cast Shrek as the star of Gone With the Wind? What if Audrey Hepburn had undergone a body make-over to resemble an over-endowed hooker?

What would have happened, is that the audiences would have been appalled. No one would have believed that Shrek belonged in Gone With the Wind. No one would have wanted to see Audrey Hepburn look any way other than her beautiful self.

People would have rejected these films, and money would have been lost, because people know when things look wrong. People know when things are out of scale. People know when "one thing is not like the other."

The Hollywood Center project is wrong. It is wrong because it is out of scale with regard to it's *[sic]* size in area. It is wrong because it is excessively taller than any nearby structure. It is wrong because it mocks the geology and landscape of the area planned for it's *[sic]* construction. It is wrong because the scope and scale is not like any other nearby development.

This project should not be approved to continue development, as this "audience member" is appalled.

Response to Comment No. IND 174-1

The comment expresses opposition to the Project based on its size and scale relative to the Hollywood community. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, aesthetic impacts were analyzed in

Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Comment Letter No. IND 175

Richard Gerger
Received June 1, 2020

Comment No. IND 175-1

Please confirm receipt.

Response to Comment No. IND 175-1

This comment request acknowledgement of receipt of the Draft EIR by the City. Receipt was acknowledged as requested.

Comment No. IND 175-2

I have been a homeowner and resident of the Hollywood Dell for the past twenty-four years. My wife and I have been active members of the Hollywood Dell Civic Association since we moved to the neighborhood from Beachwood Canyon in 1996. The Hollywood Dell is the hillside neighborhood directly north of the Project site.

The majority of my comments and questions are specific to Section IV.J. – Population and Housing of the Draft EIR.

Response to Comment No. IND 175-2

This introductory comment is noted. Specific comments regarding the Draft EIR are provided and responded to below in Response to Comment Nos. IND 175-3 through 175-11.

Comment No. IND 175-3

1. The report indicates the Land Use Element of the City's General Plan is comprised of 35 Community Plans and states the "City's Community Plans are intended to provide an official guide for future development and propose approximate locations and dimensions of land use at the community level." Furthermore, the report acknowledges the Project is located within the Hollywood Community Plan area and the 1988 Hollywood Community Plan is still in effect. However, the report professes that:

"The Project or the Project with the East Side Hotel Option would not induce substantial unplanned population growth in an area, either directly (for example by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure). Therefore, the Project would result in less than significant impacts related induced (sic) substantial unplanned population growth."

without including analysis of the impact from the Project or the Project with the East Side [*sic*] Hotel Option on population and housing growth within in the Hollywood Community Plan area. Rather, in an effort to support the opinion quoted above, the report relies on analyses based on population, housing, and employment growth estimates for the entire City of Los Angeles, not population, housing, and employment growth estimates for the Hollywood Community Plan area.

Why does the evaluation of population growth rely on growth estimates for the entire City of Los Angeles and what analyses have been done to support the opinion quoted above based on growth estimates for the Hollywood Community Plan area?

Response to Comment No. IND 175-3

The comment questions why the population growth relies on growth estimates for the entire City of Los Angeles as opposed to the Hollywood Community Plan area. As discussed in Chapter 1, *Introduction*, to this Final EIR, the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project. Therefore, no further response regarding hotel uses is warranted. As described in Section IV.J, *Population and Housing*, on page IV.J-11 of the Draft EIR, because the 1998 Hollywood Community Plan did not provide growth projections beyond 2010, the growth projections provided for the Hollywood Community Plan area do not reflect current conditions or future projections. As such, the Southern California Association of Governments (SCAG) 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016-2040 RTP/SCS) is the most recently adopted regional plan that provides population, housing, and employment projections for the City of Los Angeles for the period between 2012 and 2040. Therefore, for the purpose of the Project's analysis, population, housing, and employment projections based on the 2016-2040 RTP/SCS for the City are analyzed with the Project growth to determine impacts. As the 2016-2040 RTP/SCS provides data and projections for 2012 and 2040 only, projections for Project Baseline Year 2018 and Project Buildout Year 2027 are interpolated from the 2012 and 2040 data (see calculations in Appendix L of this Draft EIR).

The Project's proposed residential population was calculated based on the Citywide Person Per Household Factor for multi-family units.¹⁴⁸ The employment estimates for the Project are based on an Economic and Fiscal Impact Report (Economic Report) of the Environmental Leadership Development Program (ELDP) Application prepared for the Project, provided in Appendix B of this Draft EIR.¹⁴⁹

¹⁴⁸ Based on 2017 Census American Community Survey 5-Year Estimate data (2013–2017), www.census.gov/programs-surveys/acs/technical-documentation/table-and-geography-changes/2015/5-year.html, per correspondence with Jack Tsao, Housing Planner, Los Angeles Department of City Planning, July 31, 2019.

¹⁴⁹ HR&A Advisors, Economic and Fiscal Impact Report, Hollywood Center Project, April 2018. Provided in Appendix B of the Draft EIR.

The Project's population, housing, and employment impacts were then compared to projections from SCAG for the City of Los Angeles. The Project's impacts are also evaluated against other applicable City and regional/household goals, objectives and policies, and other CEQA significance thresholds.

Comment No. IND 175-4

2. The report includes discussion of the cumulative impacts of the Project or the Project with the East Side Hotel Option and Appendix L of the report includes a "calculation of the cumulative number of housing units, population, and employees attributable to" the 123 projects located in the City of Los Angeles and the 27 projects located in the City of West Hollywood listed in Table III-1 of Chapter III of the report. As noted by the report, the Project is located within the Hollywood Community Plan area and the 1988 Hollywood Community Plan is still in effect. However, the report professes that:

"...the Project's or the Project with the East Side Hotel Option's contribution to cumulative impacts would not be cumulatively considerable. As such, cumulative impacts on population and housing would be less than significant."

without including analysis of the cumulative impact from the Project or the Project with the East Side Hotel Option and other projects listed in Table III-1 of Chapter III of the report located in the Hollywood Community Plan area on population and housing within in the Hollywood Community Plan area. Rather, in an effort to support the opinion quoted above, the report relies on analyses based on population, housing, and employment growth estimates for the entire City of Los Angeles, not population, housing, and employment growth estimates for the Hollywood Community Plan area.

Why does the evaluation of the cumulative impacts on population and housing rely on growth estimates for the entire City of Los Angeles and what analyses have been done to support the opinion quoted above based on growth estimates for the Hollywood Community Plan area?

Response to Comment No. IND 175-4

The comment questions why cumulative impacts of population growth rely on growth estimates for the entire City of Los Angeles as opposed to the Hollywood Community Plan area. As discussed in Chapter 1, *Introduction*, to this Final EIR, the Project with the East Side Hotel Option is no longer being considered by the Applicant as part of the Project. Therefore, no further response regarding hotel uses is warranted. See Response to Comment No. IND 1785-3 which explains that because the 1998 Hollywood Community Plan did not provide growth projections beyond 2010, the growth projections provided for the Hollywood Community Plan area do not reflect current conditions or future projections. As such, the 2016-2040 RTP/SCS is the most recently adopted regional plan that provides population, housing, and employment projections for the City of Los Angeles for

the period between 2012 and 2040. Thus, projections for cumulative impacts is based on the 2016-2040 RTP/SCS for the City as opposed to projects in the Hollywood Community Plan area.

Comment No. IND 175-5

3. The report acknowledges the Project is located within the Hollywood Community Plan area and the 1988 Hollywood Community Plan is still in effect. Furthermore, the report states that key provisions relating to population and housing of the Hollywood Community Plan regarding preferred development in the Project vicinity include:

Objective 3: To make provision[s] for the housing required to satisfy the varying needs and desires of all economic segments of the Community, maximizing the opportunity for individual choice.

Objective 4a: To promote economic well-being and public convenience through allocating and distributing commercial lands for retail, service, and office facilities in quantities and patterns based on accepted planning principles and standards.

The report, however, does not identify Objective 7 of the Hollywood Community Plan as a key provision relating to population and housing. Objective 7 states:

Objective 7: To encourage the preservation of open space consistent with property rights when privately owned and to promote the preservation of views, natural character and topography of mountainous parts of the Community for the enjoyment of both local residents and persons throughout the Los Angeles region.

Section IV.J., Population and Housing of the report also does not include the proposed residential density categories and their capacities pursuant to the Hollywood Community Plan. Under the Hollywood Community Plan, the proposed dwelling units per gross acre for high density residential areas is 60+ - 80.

What is the proposed number of dwelling units per gross acre (as defined in the Hollywood Community Plan) of the Project or the Project with the East Side [*sic*] Hotel Option?

It appears the Project proposes approximately 200 dwelling units per gross acre (as defined in the Hollywood Community Plan), how is this proposal consistent with the 60+ - 80 range identified for high density residential areas in the Hollywood Community Plan?

What is the impact on population growth within the Hollywood Community Plan area of substantially increasing the density for high density residential areas in the Hollywood Community Plan area?

The Project increases the number of dwelling units per gross acre by proposing two towers with heights substantially higher than existing developments, what is the impact of the Projects proposed increase in density on Objective 7 of the Hollywood Community Plan, i.e., “to promote the preservation of views ... for the enjoyment of both local residents and persons throughout the Los Angeles region” pursuant to Objective 7 of the Hollywood Community Plan?

Response to Comment No. IND 175-5

The comment questions the consistency of the Project and the Project with the East Site Hotel Option with the Hollywood Community Plan with regard to permissible density, and asks how the density and height of the Project over existing development relate to consistency with Objective 7 of the Hollywood Community Plan. As discussed in Chapter 1, *Introduction*, to this Final EIR, the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project. Therefore, no further response regarding hotel uses is warranted.

Regarding the Project’s consistency with the Hollywood Community Plan, refer to the discussion contained in Section IV.H, *Land Use and Planning*, of the Draft EIR and Topical Response No. 5 – Land Use and Planning, above. As discussed in Topical Response No. 5, the Project would be consistent with the allowable densities under the existing Hollywood Community Plan designations and allowances of the Los Angeles Municipal Code (LAMC). The analysis in Section IV.H is supported by Land Use Plans and Policies: Project Consistency Tables included in Appendix J of the Draft EIR. Moreover, with regards to the Hollywood Community Plan’s 80 dwelling unit per acre density, the commenter is referred Response to Comment No. ORG 13B-14, which provides that the 80 dwelling unit per acre density does not apply to the Project Site.

Regarding the density and heights of the Project and how they related to Objective 7 of the Hollywood Community Plan, consistency with Objective 7, as it relates to view preservation is evaluated in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

Comment No. IND 175-6

4. The report states “[w]hile HQTAs account for only three percent of the total land area in SCAG’s region, HQTAs are expected to accommodate 46 percent and 55 percent of future household and employment growth, respectively, between 2012 and 2040. The report frequently refers to the expectation that HQTAs will accommodate a significant portion of population and employment growth in section IV.J, Population and Housing, of the report. However, these expectations were

developed prior to the COVID-19 pandemic. As a result of the pandemic it is currently known that public confidence and use of public transit is significantly reduced. People do not want to be in enclosed environments where they may be exposed to the virus. Furthermore, people may become less willing to reside in high density developments.

What is the expected impact of the COVID-19 pandemic on population and employment growth in HQTAs?

Response to Comment No. IND 175-6

The comment states that the population and housing analysis did not account for the effects of COVID-19 and the potential for diminished use of public transportation. CEQA does not require analysis of speculative conditions. Pursuant to CEQA Guidelines Section 15143, “[t]he significant effects should be discussed with emphasis on in proportion to their severity and probability of occurrence.” Furthermore, CEQA Guidelines Section 15064(d)(3) states that “[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable.” Therefore, forecasting the impact of COVID-19 on population and housing increases within High Quality Transit Areas, particularly from transportation behaviors surrounding future Project operations, is speculative. In addition to being speculative, COVID-19 is not a project or, more specifically, a component of this Project. Rather, COVID-19 is part of the environment and CEQA generally does not require an analysis of the environment’s impact on the Project (see CEQA Guidelines Section 15126.2). Thus, the Draft EIR meets the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

Comment No. IND 175-7

5. The report professes that:

“...the Project’s or the Project with the East Side Hotel Option’s contribution to cumulative impacts would not be cumulatively considerable. As such, cumulative impacts on population and housing would be less than significant.”

However, the report also acknowledges that the “West and East Buildings would have a substantially greater height and intensity than existing development in the area” and the Project would boost residential densities, significantly increasing housing opportunities in the Hollywood Community Plan area.” However, the analysis in Section IV.J, Population and Housing of the report does not appear to include discussion or analysis of the expected cumulative impact on population and housing in the Hollywood Community Plan area of boosting residential densities consistent with densities proposed by the Project.

What is the expected cumulative impact on population and housing for the Hollywood Community Plan area resulting from the boost in residential densities proposed by the Project?

Response to Comment No. IND 175-7

The comment questions the cumulative impact on population and housing result from increased residential densities proposed by the Project and the Project with the East Site Hotel Option. As discussed in Chapter 1, *Introduction*, to this Final EIR, the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project. Therefore, no further response regarding hotel uses is warranted. Furthermore, as described in Response to Comment No. IND 175-4 projections for cumulative impacts is based on the 2016-2040 RTP/SCS for the City because the Hollywood Community Plan does not reflect current conditions or future projections. As noted on page IV.J-24 of Section IV.J, *Population and Housing*, of the Draft EIR, the projected cumulative population, household, and employment growth from the Project and the related projects would be within the 2040 SCAG projections identified in the 2016-2040 RTP/SCS for the City.

Comment No. IND 175-8

6. The report opines the Project presents “No Conflict” with Objective 7 of the Hollywood Community Plan. Objective 7 states:

Objective 7: To encourage the preservation of open space consistent with property rights when privately owned and to promote the preservation of views, natural character and topography of mountainous parts of the Community for the enjoyment of both local residents and persons throughout the Los Angeles region.

However, in supporting this opinion the report does not address the impact of the West and East Buildings, which the report acknowledges “would have a substantially greater height and intensity than existing development in the area,” on views of local residents or persons throughout the Los Angeles region. Towers which are of substantially great height and intensity than any existing or other currently proposed development in the Hollywood Community Plan area will certainly have an impact of the views of local residents or persons throughout the Los Angeles region.

What is the impact on views of the Hollywood Hills from existing developments south of the Project and of views of the area south of the Hollywood Hills from existing residential areas located in the Hollywood Hills?

Would the impact on views of the Hollywood Hills from existing developments south of the Project and of views of the area south of the

Hollywood Hills from existing residential areas located in the Hollywood Hills be mitigated by reducing the height and intensity of the West and East Buildings to levels consistent with existing development in the area and proposed densities described in the Hollywood Community Plan?

Response to Comment No. IND 175-8

The comment raises questions regarding the “No Conflict” determination in the Draft EIR associated with Objective 7 of the Hollywood Community Plan, including impacts on views of local residents, residential areas south of the Project Site, and throughout the region. Consistency with this objective is discussed on page IV.A-58 and page IV.A-59, in Section IV.A, *Aesthetics*, of the Draft EIR. As stated therein, and as supported by visual simulations the Project would not block any significant existing views of the Hollywood Hills through street corridors, or adversely impact views or change the natural character and topography of mountainous parts of the Hollywood Community. Thus, the Project would not conflict with the objective of the Community Plan to provide enjoyment of open space by both local residents and persons throughout the Los Angeles region. In addition, regarding views from the south and to the Hollywood Hills, see the analysis on page IV.A-42 and the visual simulation referenced and provided in Figure IV.A-13, Key View 7 – Existing and Simulated Views of the Project Site from Vine Street, South of Sunset Boulevard at De Longpre Avenue, as well as the discussion on page IV.A-54, which states: “As shown in the discussion and simulations of view impacts, construction and operation of the Project would not significantly block views of the Hollywood Sign, the Hollywood Hills, or the Downtown skyline. While the Project would block some focal views of the historic Capitol Records Building from sections of Ivar Avenue, Hollywood Boulevard, and Argyle Avenue, the Capitol Records Building would continue to be visible from more prominent view locations, such as the Hollywood Hills and the intersection of Hollywood and Vine, or other sections along local streets.” See also Topical Response No. 4 – Aesthetics, above, for further discussion of visual impacts resulting from the Project.

Also, as stated on page IV.A-26, the focus of the view analysis, consistent with CEQA and City practice, is on views from public vantage points. Under the City’s 2006 L.A. CEQA Thresholds Guide, an office building or private residence referenced in the comment would not be considered a viewing location since views of broad horizons, aesthetic structures, and other scenic resources would not be available to the public.

Comment No. IND 175-9

7. The report does not address the traffic impact of the Project or the Project with the East Side [*sic*] Hotel Option on the Franklin Avenue/Argyle Avenue intersection. This intersection is one block to the north of the project site. Prior to COVID-19, commuters waited several light cycles to pass through this intersection during heavy traffic periods. The project will increase traffic at this intersection.

Why was the Franklin Avenue/Argyle Avenue intersection excluded from the report's traffic analysis?

What is the expected impact of the Project or the Project with the East Side [sic] Hotel Option on traffic at the Franklin Avenue/Argyle Avenue intersection?

Response to Comment No. IND 175-9

The comment questions why the Franklin Avenue and Argyle Avenue intersection was excluded from the Draft EIR's traffic analyses for the Project and the Project with the East Site Hotel Option, and if there is an expected impact at that intersection. As discussed in Chapter 1, *Introduction*, to this Final EIR, the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project. Therefore, no further response regarding hotel uses is warranted.

Impacts regarding traffic were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. As discussed in Section IV.L, page IV.L-1 of the Draft EIR, the TA was prepared in accordance with LADOT's Transportation Assessment Guidelines (TAG) adopted in July 2019 and pursuant to a memorandum of understanding (MOU) with LADOT dated December 3, 2019, documenting its assumptions and technical methodologies. In accordance with TAG and consistent with the City CEQA Transportation Thresholds (adopted July 30, 2019), the Draft EIR includes an assessment of whether the Project would result in: 1) potential conflicts with transportation-related plans, ordinances, or policies; 2) a substantial increase in vehicle miles traveled (VMT); or 3) increased hazards due to a geometric design feature or incompatible use. In addition, in accordance with the City's CEQA Transportation Thresholds, an assessment of whether the Project would result in inadequate emergency access is included. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts.

As further discussed in Section IV.L, page IV.L-1 of the Draft EIR, TAG also requires an assessment of "non-CEQA" transportation issues; however, given that these are not required under CEQA, this analysis is included in the TA and not the Draft EIR, unless they relate to the assessment of potential conflicts with transportation-related plans, ordinances, or policies. The "non-CEQA" analysis in the TA (Appendix N-1) includes 1) pedestrian, bicycle, and transit access; 2) project access, safety, and circulation; 3) construction traffic; and 4) residential street cut-through analysis. As described on page 42 of the TA, study intersections were developed in conjunction with LADOT. Nine study intersections were chosen based on guidance from LADOT's TAG, which indicates that intersections immediately adjacent to the Project Site and those in proximity to the Site through which 100 or more project-generated trips would travel should be analyzed. Given the distance to the Project Site, the Franklin Avenue and Argyle Avenue intersection was not selected as a study intersection. Furthermore, given that the study

of impacts on intersections is a “non-CEQA” transportation issue, it is not required to be evaluated as a part of the analysis in the Draft EIR as the commenter suggests.

Comment No. IND 175-10

8. The report does not address the traffic impact of the Project or the Project with the East Side *[sic]* Hotel Option on the north bond on-ramp to U.S. Highway 101 from Cahuenga Avenue or the north bond on-ramp to U.S. Highway 101 from Franklin Avenue. Prior to COVID-19, these on-ramps and the streets providing access to these on-ramps were heavily congested on a daily basis during the evening commute. The project will increase traffic at these on-ramps and the streets providing access to these on-ramps.

Why were the north bond *[sic]* on-ramp to U.S. Highway 101 from Cahuenga Avenue and the north bond on-ramp to U.S. Highway 101 from Franklin Avenue excluded from the report’s traffic analysis?

What is the expected impact of the Project or the Project with the East Side *[sic]* Hotel Option on traffic at the north bond on-ramp to U.S. Highway 101 from Cahuenga Avenue, the north bond on-ramp to U.S. Highway 101 from Franklin Avenue, and the streets providing access to these on-ramps?

Response to Comment No. IND 175-10

The commenter questions why the Draft EIR’s traffic analysis did not consider queue build-up for the on and off-ramps from the US-101 Freeway for the Project and the Project with the East Site Hotel Option. As discussed in Chapter 1, *Introduction*, to this Final EIR, the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project. Therefore, no further response regarding hotel uses is warranted. Section IV.L, *Transportation*, page IV.L-49 of the Draft EIR, contains a summary of engagement with Caltrans and describes Caltrans’ request for additional analysis that focused on potential traffic conflicts pertaining to direct and cumulative trips on State facilities in the Project vicinity, including off-ramp queuing and mainline merge and weaving analysis at requested locations. As described therein, the analyses requested by Caltrans were presented for informational purposes and contained in Appendix I of the TA, which is provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans’ letters. See also see Topical Response No. 2 – Transportation and Traffic, above. Also see Response to Comment No. AG 2-7, which discusses a recent meeting between the City and Caltrans in July 2020 during which Caltrans did not identify any particular concerns or make any particular requests for new analysis beyond that included in the Draft EIR. Additionally, the Caltrans representative indicated that Caltrans’ concerns were non-CEQA concerns. Based on this, Caltrans has

not identified any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

Comment No. IND 175-11

9. The report does not address the traffic impact of the Project or the Project with the East Side *[sic]* Hotel Option on U.S. Highway 101. Prior to COVID-19, traffic on U.S. Highway 101 through the Hollywood area was heavily congested on a daily basis during the morning and evening commute. The project is located one block to the south of U.S. Highway 101; the project will increase traffic on this highway.

Why was the U.S. Highway 101 excluded from the report's traffic analysis?

What is the expected impact of the Project or the Project with the East Side Hotel Option on traffic on U.S. Highway 101?

Response to Comment No. IND 175-11

The commenter questions why the US-101 was excluded from the Draft EIR's traffic analysis and what the expected impact of the Project or the Project with the East Site Hotel Option on traffic on the US-101. As discussed in Chapter 1, *Introduction*, to this Final EIR, the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project. Therefore, no further response regarding hotel uses is warranted.

Regarding impacts on the US-101, see page IV.L-49, in Section IV.L, *Transportation*, of the Draft EIR, which contains a summary of engagement with Caltrans and identifies an analyses requested by Caltrans and presented for informational purposes in Appendix I of the TA, which is provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters.

Regarding the comment that the traffic analysis did not account for the effects of COVID-19 and the potential for diminished use of public transportation, CEQA does not require analysis of speculative conditions. Pursuant to CEQA Guidelines Section 15143, "[t]he significant effects should be discussed with emphasis on in proportion to their severity and probability of occurrence." Furthermore, CEQA Guidelines Section 15064(d)(3) states that "[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable." Therefore, forecasting the impact of COVID-19 on traffic conditions, particularly from transportation behaviors surrounding future Project operations, is speculative. In addition to being speculative, COVID-19 is not a project or, more specifically, a component of this Project. Rather, COVID-19 is part of the environment and CEQA generally does not require an analysis

of the environment's impact on the Project (see CEQA Guidelines Section 15126.2). Thus, the Draft EIR meets the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

Comment Letter No. IND 176

Augusta Weaver-Johnson
3130 Deronda Drive
Hollywood CA, 90068
Received June 1, 2020

Comment No. IND 176-1

I am addressing this letter to you regarding concerns I have about the Millennium project scheduled for commencement of building in Hollywood in the near future. As a lifelong resident of Hollywoodland, in Beachwood Canyon, I have watched with interest the explosion of development in Hollywood in the past few years. Yes, it is wonderful to see our city restored and brought into world-class status, but I am also deeply concerned that traffic mitigation issues are simply not being addressed for a project of this size, nor the density of the surrounding area considered.

What is the plan for traffic mitigation around this area? With two-lane streets on Yucca, Argyle, and Vine, the surrounding streets simply do not seem wide enough to support the vehicular traffic that would accompany the occupancy of TWO 46-story buildings. I feel it would be far more reasonable to reduce the building size by half, if only to ameliorate any potential traffic mitigation issues.

I am eager to find out what is planned by the City to alleviate such a dilemma. Right now, it does not seem viable to prevent a hazardous traffic situation from occurring in that area should a project of this size be built. It seems logical and reasonable that it should be required by the City to be reduced in both size and scope.

Thank you for your attention to this letter of grievance.

Response to Comment No. IND 176-1

The comment expresses concern with traffic impacts as a result of the Project's size and the density of the surrounding area. The comment also makes reference to the Millennium [Hollywood] Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Traffic impacts for this Project were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts and, thus, no mitigation is proposed. However, the Project would implement Project Design Features, as described on page IV.L-26, which

requires the implementation TRAF-PDF-1, Transportation Demand Management Program, which is aimed at discouraging the use of single-occupancy vehicle trips and encouraging alternative modes of transportation, and TRAF-PDF-2, Construction Traffic Management Plan, which includes measures to reduce traffic impacts during construction. See also see Topical Response No. 2 – Transportation and Traffic, above.

Specifically, as it relates to the hazardous traffic situations, as analyzed on pages IV.L-44 and IV.L-45 of Section IV.L of the Draft EIR, the Project would be designed to comply with City standards and would provide adequate sight distance, sidewalks, crosswalks, and pedestrian movement controls that meet the City's requirements to protect pedestrian safety. All roadways and driveways would continue to intersect at right angles. Street trees would be designed and located so as to not significantly impede driver and pedestrian visibility and would not present a hazard. Pedestrian entrances separated from vehicular driveways would provide access from the adjacent streets, parking facilities, and transit stops. Therefore, as determined therein, the Project would not substantially increase geometric hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses and impacts would be less than significant.

Response to Comment No. IND 177B-1

Responses to the attached files are provided below in Response to Comment No. IND 177B-2.

Comment No. IND 177B-2

The comment letter is comprised of Comment No. ORG 37A and two additional comments.

The first additional comment states the following: The Transportation section fails to adequately explain how a proposed 1.3 million square foot project will have insignificant traffic impacts to the neighboring residences and businesses at Hollywood and Vine. Specifically, we request that a traffic study be conducted to take a focused approach on the various items approved in the April 10, 2020 LADOT memorandum (DEIR Appendix N-2) including, but not limited to, 1) the TDM Program and the assumptions that have been used to reduce trips in the VMT Calculator, and 2) a review of the Neighborhood Traffic Management Program, the Traffic Signal Warrant Analysis, Project Access, and Driveway Access and Circulation.

The second additional comment states the following: I request that Alternative 2 be considered *[sic]*

Response to Comment No. IND 177B-2

Responses to the portions of the letter that are provided in Comment No. ORG 37A are provided in Response to Comment No. ORG 37A-2 through 37A-11.

The commenter also asserts that Section IV.L, *Transportation*, of the Draft EIR does not adequately explain how the Project will have insignificant traffic impacts and requests that a traffic study be conducted to focus on the TDM Program, Neighborhood Traffic Management Program, Traffic Signal Warrant Analysis, Project Access, and Driveway Access and Circulation. Traffic impacts, and all of the requested focus areas by the commenter, were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Specifically, the Transportation Demand Management (TDM) Program was included in the analysis as Project Design Feature TRAF-PDF-1 and was provided on pages IV.L-26 to IV.L-28 of the Draft EIR. The Vehicle Miles Traveled (VMT) analysis in the Draft EIR was conducted using the City's VMT Calculator. The VMT Calculator uses a combination of empirical trip generation rates based on actual data collected in the City and data from the Institute of Transportation Engineers (ITE), the City's travel demand forecasting model (itself calibrated to local Los Angeles conditions), and empirical research from the California Air Pollution Control Officers Association (CAPCOA) and other relevant research regarding TDM measures, and importantly integrates the MXD (mixed-use) methodology from the U.S. Environmental Protection Agency (USEPA). The MXD methodology considers the combined effects of land use diversity/internalization, proximity to transit, and various built environment factors and was calibrated and validated.¹⁵⁰ The transit mode split assumptions in the VMT Calculator are directly from the calibrated City travel demand forecasting model. The Traffic Signal Warrant Analysis is provided within Appendix K of the TA.

As further discussed in Section IV.L, page IV.L-1 of the Draft EIR, TAG also requires an assessment of "non-CEQA" transportation issues; however, given that these are not required under CEQA, this analysis was included in the TA and not the Draft EIR, unless they related to the assessment of potential conflicts with transportation-related plans, ordinances, or policies. The "non-CEQA" analysis in the TA (Appendix N-1) included (1) pedestrian, bicycle, and transit access; (2) project access, safety, and circulation; (3) construction traffic; and (4) residential street cut-through analysis. Neighborhood traffic, specifically referred to as Residential Street Cut-Through, was analyzed within the TA on

¹⁵⁰ The USEPA MXD methodology was based on and calibrated to travel survey data gathered from 239 mixed-use developments in six major metropolitan regions and was validated against an additional 28 mixed-use sites. See <https://www.epa.gov/smartgrowth/mixed-use-trip-generation-model> for further information.

pages 109 through 122. Project access, which includes driveway access and circulation, was analyzed within the TA on pages 42 through 100.

The comment also expresses support for Alternative 2 analyzed in Chapter V, *Alternatives*, of the Draft EIR. The comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 178

Rosalind Helfand

Received June 1, 2020

Comment No. IND 178-1

I'm writing to submit my comments on the Hollywood Center, case no. ENV-2018-2116-EIR.

Response to Comment No. IND 178-1

This introductory comment is noted; however, as the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 178-2

The construction period and ongoing maintenance and uses of the Center will have a huge environmental impact on the region. While housing is greatly needed, the type of housing provided by the Center, which will mostly be for upper income people, will only serve to lock in inequity rather than reducing it.

Response to Comment No. IND 178-2

The commenter provides a general statement that construction and operational impacts of the Project will have an environmental impact on the region and concern about income inequality, but does not raise any specific issues regarding the content or adequacy of the Draft EIR. Income inequality is a social issue and, as stated in the CEQA Guidelines, Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. Furthermore, the Project would provide 133 senior affordable housing units on the Project Site. As such, no further response is warranted.

Comment No. IND 178-3

In addition, the proposed design does not add nearly enough to goals to green Los Angeles. We are in a time of great environmental crisis and every new development must add to environmental resilience not detract from it. Although the Center may possibly help fulfill a goal of infill and taking advantage of public transport (but this seems iffy) rather than continuing to expand outwards, because it mostly caters to the rich, these benefits are hugely reduced.

Response to Comment No. IND 178-3

The commenter provides a general statement that the Project does not propose enough goals to green Los Angeles, but does not raise any specific issues regarding the content or adequacy of the Draft EIR. As such, no further response is warranted. Nonetheless, see pages II-68 and II-69 of the Draft EIR which discuss the Project's sustainability features. Also, as stated on pages IV.E-41 and IV.E-42 of Section IV.E, *Greenhouse Gas*

Emissions, of the Draft EIR, the Project would implement Project Design Feature GHG-PDF-1 as part of the Project, which would allow the Project to achieve the United States Green Building Council (USGBC) Leadership in Energy and Environmental Design (LEED) Gold Certification. A summary of key green building and LEED measures is provided below:

- The Project will incorporate heat island reduction strategies for 50 percent of the Project Site hardscapes or provide 100 percent structured parking and incorporate heat island reduction strategies for the Project roof areas.
- The Project will promote alternatives to conventionally fueled automobiles by designating a minimum of 8 percent of on-site non-residential parking for carpool and/or alternative-fueled vehicles and shall pre-wire, or install conduit and panel capacity for a minimum of 30 percent of the Code-required parking spaces, with 10 percent of the Code-required spaces further improved with electric vehicle charging stations.
- The Project will optimize building energy performance with a 20 percent reduction from the LEED Version 4 (v4) baseline consistent with LEED requirements (equivalent to approximately 11.6 percent reduction from the 2016 Title 24 standards).
- The Project will reduce water consumption by 40 percent for indoor water and 100 percent for outdoor water from the LEED v4 usage baseline. The reductions would be achieved through potential strategies such as the installation of water efficient fixtures that exceed applicable standards and water efficient landscaping.

Comment No. IND 178-4

This project's impacts cannot be sufficiently mitigated and it should not go forward.

Response to Comment No. IND 178-4

The comment expresses opposition to the Project based on a statement that the Project's impacts cannot be sufficiently mitigated. As the comment does not explain what significant impacts need mitigation, nor does the commenter provide any substantial evidence to support his claim. As such, no further response is warranted.

Comment Letter No. IND 179

Pamela Vanderway
1851 Ivar Ave, Apt. 406
Hollywood CA, 90028
Received June 1, 2020

Comment No. IND 179-1

Thank you for your response to the unrest in the streets. It is much appreciated.

As today is the deadline to respond with concerns regarding the Hollywood Center Project, I am responding despite the unrest.

Response to Comment No. IND 179-1

This introductory comment is noted; however, as the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 179-2

As residents of Ivar between Yucca and Franklin, my neighbors and I will be negatively affected by the project as currently proposed. It's *[sic]* scale is immense for this area, and my research indicates it will end up costing the citizens money and cause frustrations rather than bringing benefit to the community.

Response to Comment No. IND 179-2

The comment expresses opposition to the Project based on its size and scale relative to the Hollywood community. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies, or regulations related to location, form, and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, and, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Comment No. IND 179-3

First, there is the issue of traffic. At present it sometimes it takes 20 minutes to drive 5 or 6 blocks down Vine. The 101 freeway (when we are not in quarantine!) is a virtual parking lot for a 1/2 mile each direction off of Cahuenga during rush hour. On Franklin where my

building's driveway exits, I have experienced traffic jams at the base of the driveway! The addition of the enormous number of residences intended to be in The Hollywood Center will make driving much worse, and in addition the congestion along with the height of these buildings will trap unhealthy air from exhaust pipes here.

Response to Comment No. IND 179-3

The comment expresses opposition to the Project based on its potential to cause traffic impacts along the US-101, Cahuenga Boulevard, and Franklin Avenue. Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. While it is acknowledged that the Project would contribute traffic to the local roadway network, traffic congestion is not a CEQA issue and is, therefore, not evaluated in the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above, for a discussion of traffic impacts from the Project, including impacts to US-101 and its on- and off-ramps.

Regarding the commenter's assertion on unhealthy air from exhaust pipes trapped from congestion along with the height of the buildings, air quality impacts were addressed in Section IV.B, *Air Quality*, of the Draft EIR, with supporting data provided in Appendix E of the Draft EIR. As analyzed therein, operation of the Project has the potential to generate criteria pollutant emissions through vehicle and truck trips traveling to and from the Project Site. However, the Project would be located within an identified Transit Priority Area (TPA) that has multiple public transit options (with access to existing regional bus and rail service), and employment opportunities, restaurants and entertainment, all within walking distance. The Project's location within a TPA would minimize the Project's vehicle trips and VMT and minimize the corresponding mobile source air pollutant emissions generated by the Project residential and commercial uses. Furthermore, the Project's mobile source operational emissions were evaluated for the potential to generate carbon monoxide (CO) hotspots from traffic congestion. It is not buildings that trap pollutants but rather stable atmospheric conditions that hinder the horizontal and vertical dispersion of pollutants in the atmosphere. As discussed on page IV.B-43 of the Draft EIR, the greatest quantities of CO emissions are produced from motor vehicle combustion and are usually concentrated at or near ground level because they do not readily disperse into the atmosphere, particularly under cool, stable (i.e., low or no wind) atmospheric conditions. Localized areas where ambient concentrations exceed State and/or federal standards are termed "CO hotspots." As discussed on pages IV.B-68 and IV.B-69 of the Draft EIR, the Project would not result in CO hotspots inclusive of existing background CO concentrations, even under conservative assumptions of congested roadway intersections and stable atmospheric conditions that would tend to trap or hinder pollutant dispersion into the atmosphere. As determined within the Draft EIR, the Project's localized operational air quality impacts would be less than significant.

Comment No. IND 179-4

We are likely to see increased health issues, traffic related issues, road rage incidents and the like and these will require MORE policing, more EMT support, MORE road repair. These things cost money publicly and privately. (But will not be paid for the developers who caused the problems...)

Response to Comment No. IND 179-4

The commenter provides a general statement that there will be increased health, traffic-related, and road rage issues that would result in an increased need for public services and repair to public infrastructure at the cost of the City and private residents, but does not raise any specific issues regarding the content or adequacy of the Draft EIR.

Regarding health risk, a quantified construction Health Risk Assessment (HRA) was performed. As discussed on pages IV.B-70 and IV.B-71 of Section IV.B, *Air Quality*, of the Draft EIR, the findings of the HRA show that the Project, with incorporation of Mitigation Measure AQ-MM-1 would result in cancer risk below 10 in one million for the maximum impacted residential and worker receptors. The maximum non-cancer impacts for the Project would be below a hazard index of 1.0. The results of the refined AERMOD dispersion modeling provides further substantial evidence that toxic air contaminant (TAC) emissions from construction activities would not expose sensitive receptors to substantial TAC concentrations. With regard to operation, toxic or carcinogenic air pollutants are not expected to occur in any substantial amounts in conjunction with operation of the proposed land uses within the Project Site. Based on the uses expected on the Project Site, potential long-term operational impacts associated with the release of TACs would be minimal, regulated, and controlled, and would not be expected to exceed the South Coast Air Quality Management District (SCAQMD) thresholds of significance. Therefore, impacts would be less than significant.

Regarding traffic, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a TA approved by the LADOT included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Regarding policing and EMT support, fire and police services impacts were addressed, respectively, in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, with supporting data provided in Appendix M of the Draft EIR. It should be noted that economic effects are not the focus of the Draft EIR, which addresses the physical impacts of the Project on the environment. As noted in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, in *City of Hayward v. Board of Trustees of California State University* (2015) 242 Cal.App.4th 833, the court found that Section 35 of Article XIII of the California Constitution requires local agencies

to provide public safety services, including fire and police protection, and that it is reasonable to conclude that the City will comply with that provision to ensure that public safety services are provided.¹⁵¹ Furthermore, regarding public safety, as provided in Project Design Feature POL-PDF-2, the Project would incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding signage and lighting for walkways and entries. This is in contrast to existing conditions in the area, which include surface parking lots and long alleys between blocks, where buildings are partially cut off from the street. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for Los Angeles Police Department (LAPD) services. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a seven-day a week security patrol and could assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services. Implementation of Project Design Feature POL-PDF-2 would help to offset the Project's operational demand for police protection services from LAPD.

Comment No. IND 179-5

Please don't let the enchantment of 100 or so homes for low income seniors trick you into allowing this project to move forward as is. It will be cheaper for the city just to build a single building for those very same seniors than for the city's residents to pay the increased costs associated with this size of development.

Response to Comment No. IND 179-5

The commenter provides a general statement that it would be cheaper for the City to build senior housing than the cost for private residents with the inclusion of low-income senior housing as a part of the Project, but does not raise any specific issues regarding the content or adequacy of the Draft EIR. As such, no further response is warranted.

Regarding costs for the residents, as stated in the CEQA Guidelines, Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. As such, this topic was not evaluated in the Draft EIR, and no further response is warranted.

Comment No. IND 179-6

As for our neighborhood on Ivar in particular, parking is already very difficult in the area and would become nearly impossible if the staff and patrons of businesses included in

¹⁵¹ *City of Hayward v. Board of Trustees of California State University* (2015) 242 Cal.App.4th 833, 847.

the development began driving around looking for a spot [sic] our tiny street, which is walking distance from the proposed site. ([sic] We are not included in the Hollywood Dell Parking pass group. We are a block of residential buildings, most with not enough parking garages for residents. Already our residents are often forced to circle the neighborhood and night, park up to 1/2 mile or more away from our homes due to this situation. Some of our residents have been mugged on the way home from work at night because of this. (We used to be able to park in Hollywood Dell entry area, but no more.) The Hollywood Center is sure to make these matters worse.

Response to Comment No. IND 179-6

The commenter states that the Project would exacerbate an already difficult parking situation for the surrounding neighborhood. As noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Comment No. IND 179-7

I am also very concerned about the seismic reports done on this project. A building of this size collapsing would turn Hollywood into the likes of NYC on 911. Why would we as risk that on behalf of the profit of private investors?

Response to Comment No. IND 179-7

The comment expresses opposition to the Project due to the Project Site's location relative to an earthquake fault (the Hollywood Fault). While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 179-8

Lastly, this behemoth development will mar the sight of Capital [sic] Records, one of the most iconic buildings in all of Los Angeles.

Response to Comment No. IND 179-8

The commenter asserts that the Project would impair the view of the Capitol Records Building, an iconic building in Los Angeles. As described in Chapter II, *Project Description*, and in Section IV.C, *Cultural Resources*, of this Draft EIR, there are several

Project objectives and design features that emphasize the importance of the Capitol Records Complex and its architectural/historical heritage. As further described in Section IV.C, *Cultural Resources*, page IV.C-57 of the Draft EIR, the juxtaposition of substantially taller buildings would alter the visual setting of the Capitol Records Building, which historically was one of the most visually prominent buildings in the Hollywood skyline until the late 1960s when several taller buildings were constructed on Sunset Boulevard. However, protection of the historical significance of the Capitol Records Building is a stated objective of the Project. To meet that objective, the Project includes setbacks, grade-level open space, and tower massing that would maintain important public street views to the Capitol Records Building and would ensure that new construction would be appropriately distanced so that the mass and scale would not obscure the distinctive shape and architectural features of the Capitol Records Building from public view. In addition to maintaining important views of the Capitol Records Building, the Project architecture has been purposely designed to respond to the architectural character of the Capitol Records Building by maximizing focal views toward and through the Project Site, as discussed in Section IV.A, *Aesthetics*, (1) Scenic Vistas, of the Draft EIR. Such views include that of the Capitol Records Building and the Gogerty Building from sidewalks along Vine Street, Argyle Avenue, and Yucca Street, from the intersection of Hollywood Boulevard and Vine Street, and a view through a surface parking lot between the Pantages Theatre and the Equitable Building. As described in Section IV.A, page IV.A-10, focal views of the Capitol Records Building from Hollywood Boulevard are partially blocked by existing buildings, primarily the Pantages Theatre near Argyle Avenue and the Equitable Building (at Hollywood Boulevard and Vine Street). However, from Hollywood Boulevard, the Capitol Records Building is visible from the intersection of Hollywood Boulevard and Vine Street and substantially visible through a 50-foot-wide surface parking lot located between the Pantages Theatre and the Equitable Building. Broad views or vistas of the Capitol Records Building are also available from the hillside neighborhoods to the north and northwest of the Project Site. While the Project would block some focal views of the historic Capitol Records Building from sections of Ivar Avenue, Hollywood Boulevard, and Argyle Avenue, the Capitol Records Building would continue to be visible from more prominent view locations, such as the Hollywood Hills and the intersection of Hollywood and Vine, or other sections along local streets. See also Topical Response No. 4 – Aesthetics, above.

Comment No. IND 179-9

In short, this project, if built, would make our neighborhood and our surrounding neighborhoods unlivable, un navigable and potentially dangerous. Hollywood welcomes change, but we expect it to be thoughtful change. We can do better. Send this group back to the drawing board.

Response to Comment No. IND 179-9

The commenter asserts that the Project would make the local neighborhood unlivable and potentially dangerous, but does not raise any specific issues regarding the content or adequacy of the Draft EIR. Specifically, as it relates to un navigable and potentially

dangerous neighborhoods, as analyzed on pages IV.L-44 and IV.L-45 of Section IV.L, the Project would be designed to comply with City standards and would provide adequate sight distance, sidewalks, crosswalks, and pedestrian movement controls that meet the City's requirements to protect pedestrian safety. All roadways and driveways would continue to intersect at right angles. Street trees would be designed and located so as to not significantly impede driver and pedestrian visibility and would not present a hazard. Pedestrian entrances separated from vehicular driveways would provide access from the adjacent streets, parking facilities, and transit stops. Therefore, as determined therein, the Project would not substantially increase geometric hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses and impacts would be less than significant.

Comment Letter No. IND 180

Alison Leslie
1645 N. Vine St., Suite #712,
Los Angeles, CA 90028
Received June 1, 2020

Comment No. IND 180-1

We have a unit in the Broadway Building at 1645 Vine St. in Hollywood. I believe the addition of these two buildings in the Hollywood Center Project will severely impact the quality of life in our neighborhood. These tall buildings belong in downtown LA, not here. Have you driven north on Vine St. towards the 101 during rush hour? There is so much traffic now that it will become absolute gridlock with the addition of these two buildings. The streets and the freeway on-ramps will not be able to handle the increased traffic. Can you let me know what you will be doing to rectify the traffic situation if the buildings are built?

Response to Comment No. IND 180-1

The comment expresses opposition to the Project based on the proposed building heights and the Project's potential to exacerbate existing traffic congestion on freeway onramps and surrounding streets. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts.

Regarding congestion in Hollywood, the total traffic effects of the Project, including congestion, are discussed in the TA in Appendix N-1 of the Draft EIR. It should be noted that traffic congestion is not a CEQA issue and is not evaluated in the Draft EIR. See also Topical Response No. 2 – Transportation and Traffic, above.

Regarding traffic on the US-101 Freeway and ramps, see page IV.L-49, in Section IV.L, *Transportation*, of the Draft EIR, which contains a summary of engagement with Caltrans and identifies an analyses requested by Caltrans and presented for informational purposes in Appendix I of the TA, which is provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. See also see Topical Response No. 2 – Transportation and Traffic, above.

Comment No. IND 180-2

This comment contains a letter from the Broadway Hollywood Homeowners Association to its homeowners/residents to submit a comment letter in opposition of the Project and includes a sample letter, which is a duplicate of Comment No. FORM 3.

Response to Comment No. IND 180-2

Responses to the comments in the sample letter are provided in Response to Comment Nos. FORM 3-1 through 3-5. As the main letter from the Broadway Hollywood Homeowners Association does not raise any specific issues regarding the content or adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 181

Rosemary DeMonte
Received June 1, 2020

Comment No. IND 181-1

Save Hollywood.Org is opposed to the new over-developed Hollywood Center Project, which is brought to us by the same creators of the denied Millennium Project. This same development team gave San Francisco the Millennium Tower that is sinking, and then blamed the City of San Francisco for not doing due diligence and has left investors and the city with huge debt and mitigation.

Response to Comment No. IND 181-1

This introductory comment expresses opposition to the Project; however, as the comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 181-2

The project is still to be built over the active Hollywood fault line in a city destined to suffer a major quake, and this project has a high likelihood to cause an unaccountable cost of lives and destruction for a city whose services and infrastructure are overtaxed as it is. The City shouldn't be willing to trust these bad actors to guarantee an acceptable and safe development. The state seismologists deem this site dangerous. We should listen to the scientists and not those who want to make a large profit at the cost of the safety of our city.

Response to Comment No. IND 181-2

The comment expresses opposition to the Project due to the Project Site's location relative to an earthquake fault (the Hollywood Fault). While this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the

Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 181-3

Traffic. This development is surrounded by F-rated failing intersections now. Adding more unneeded hotels and market-rate deluxe housing cannot be justified just because there is a Metro stop nearby. Luxury living people do not take public transportation and the City needs to accept that in order to have smart planning. We should be pushing Senior and low-cost housing, but the developers want to make money, not make a better planned city. This project as proposed is thereby creating traffic hell for all of Hollywood and the hills above. Developing such a huge project below the Hollywood Hills will make a difficult situation for delivering aid and services in case of emergencies and natural disasters. The streets cannot and do not support the traffic or provide the parking now and this project and all the others do not provide enough parking for the population they will bring. Caltrans says that the project will exacerbate the traffic conditions and the infrastructure will ultimately fail.

Response to Comment No. IND 181-3

The comment expresses opposition to the Project based on its potential to cause traffic impacts. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. Furthermore, the Project would implement Project Design Feature TRAF-PDF-1 for a Transportation Demand Management (TDM) Program, which would discourage single-occupancy vehicle trips and encourage alternative modes of transportation, thus slightly reducing and offsetting increases in traffic. See also see Topical Response No. 2 – Transportation and Traffic, above.

Specifically, about the intersections, as discussed in Topical Response No. 2 – Transportation and Traffic, above, intersection level of service (LOS) is no longer the CEQA significance metric for transportation impacts. The intersections analyzed in the Transportation Assessment (TA) in Appendix N-1 of the Draft EIR were selected based on guidance from the City's adopted Transportation Assessment Guidelines (TAG) that were followed for this analysis.

As discussed in Chapter 1, *Introduction*, to this Final EIR, the Project with the East Site Hotel Option is no longer being considered by the Applicant as part of the Project. Therefore, no further response regarding the construction and operational impacts of this

option is warranted. Furthermore, the Project would provide 133 senior affordable housing units on the Project Site and not just market-rate residential units.

Regarding the commenter's assertion that "luxury living people" would not take public transportation, CEQA does not require analysis of speculative conditions related to the potential for future residents to take public transportation. Pursuant to CEQA Guidelines Section 15143, "[t]he significant effects should be discussed with emphasis in proportion to their severity and probability of occurrence." Furthermore, CEQA Guidelines Section 15064(d)(3) states that "[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable." Therefore, forecasting the potential for future residents and their use of public transportation is speculative. Thus, the Draft EIR meets the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

The comment states that "We should be pushing Senior and low-cost housing." The Project is proposing to include 133 of its 1,005 units as senior affordable housing units. As such, the Project includes senior and affordable housing.

With regard to emergency response and traffic effects in hillside areas, refer to Topical Response No. 3 – Transportation and Traffic, above.

Regarding the commenter's concerns on parking, as noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

The comment states that Caltrans says that the Project will exacerbate traffic conditions and infrastructure will fail. However, the commenter does not raise any specific issues with respect to the content or adequacy of the Draft EIR. It is also acknowledged that Caltrans prepared two letters with comments on the transportation analysis to be conducted for the Project. The analyses requested by Caltrans were presented for informational purposes in Appendix I to the TA for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. The Caltrans analysis is not a required CEQA analysis per the City's TAG. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also see Response to Comment No. AG 2-7, which discusses a recent meeting between the City and Caltrans in July 2020 during which Caltrans did not identify any particular concerns or make any particular requests for new analysis beyond that included in the Draft EIR. Additionally, the Caltrans representative indicated that Caltrans' concerns were

non-CEQA concerns. Based on this, Caltrans has not identified any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

Comment No. IND 181-4

Housing – This project does not comply with the CRA Hollywood Community Plan. The DEIR and Plan fail to acknowledge the affordable housing requirements demanded by [CA HSC 33413 \(2\) \(A\) \(i\)](#) which shall be implemented under CA AB 1505. The total base number of affordable units must be increased prior to any density bonus being applied. This must be re-analyzed in all projects asking for entitlements under any specific or community plan in place prior to *Palmer v. City of Los Angeles*.

Response to Comment No. IND 181-4

The comment asserts that the Project does not comply with the affordable housing obligations of the CRA Hollywood Community Plan, which is assumed to reference the Hollywood Redevelopment Plan demanded by the California Health and Safety Code.

The provision states that “[t]he requirements of this subdivision shall apply, in the aggregate, to housing made available pursuant to paragraphs (1) and (2), respectively, and not to each individual case of rehabilitation, development, or construction of dwelling units, unless an agency determines otherwise,” and is also provided in Section 410.4 of the Hollywood Redevelopment Plan, which provides that “[t]he percentage requirements set forth in this Section shall apply in the aggregate to housing in the Project Area and not to each individual case of rehabilitation, development or construction of dwelling units.” As such, the asserted affordable housing requirement is not a Project-specific requirement.

Comment No. IND 181-5

Infrastructure- Resources. This State and City have a water deficiency and the sewage system. The overall systems are antiquated and failing to transport sewage to treatment facilities which are thereby polluting the ocean. We just don’t have enough water or the infrastructure to provide it to the residents and businesses of this City. Even if the development installs new underground plumbing systems, it will still be an increase of usage on the older pipes throughout Hollywood. How is this being addressed?

Response to Comment No. IND 181-5

The comment questions the Project’s impacts on city services, including water and sewers. With respect to water supply, Section IV.N.2, *Water Supply*, of the Draft EIR evaluates the impacts of the Project on domestic water infrastructure and water supply. The section also quantifies the Project’s water demand and evaluates the ability of the local municipal water infrastructure and water supply to meet this demand. As described therein, the Los Angeles Department of Water and Power (LADWP) determined in the approved Water Supply Assessment for the Hollywood Center Project that there are adequate water supplies available from existing LADWP entitlements and supplies to

meet the Project's projected water demand, when considering the existing and planned future demand on LADWP. Furthermore, the Project would implement Project Design Feature WS-PDF-1 and provide specific water efficiency features to conserve water and reduce Project water demand. Thus, sufficient domestic water supplies are available to service the Project and surrounding areas and impacts are anticipated to be less than significant. As the domestic water supplies would be available and sufficient, there would not be a decrease in the amount of water that is available to serve the surrounding areas. As such, water pressure in the surrounding areas would not change.

With respect to sewer infrastructure, Section IV.N.1, *Wastewater*, of the Draft EIR, addresses potential Project impacts on existing wastewater conveyance infrastructure and treatment facilities that would serve the Project Site. The analysis provides an overview of existing infrastructure and facilities and evaluates whether sufficient capacity is available to serve the Project's estimated wastewater generation. As described on page IV.N.1-15 of the Draft, Project-related sanitary sewer connections and on-site infrastructure would be designed and constructed in accordance with applicable Los Angeles Sanitation District and California Plumbing Code standards. Furthermore, in accordance with Los Angeles Municipal Code Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system. Thus, the Project's infrastructure would be able to accommodate the Project.

Comment No. IND 181-6

Power. Our Power grid is failing, old and with inadequate capacity to service the demand now, let alone all the new demands from this project.

Response to Comment No. IND 181-6

The comment makes a general assertion that the power grid is failing and has inadequate capacity to serve the Project, without providing any specifics or substantial evidence. Energy infrastructure was addressed in Section IV.O, *Energy Conservation and Infrastructure*, of the Draft EIR. As stated on pages IV.O-34 electricity consumption would be serviceable by LADWP and included in LADWP's total load growth of the City's power system, and SoCalGas' existing and planned natural gas capacity and supplies would be sufficient to serve the Project, and would not require additional capacity. And as analyzed on pages IV.O-45 through IV.O-47, based on the required load forecast projections by LADWP and by SoCalGas, infrastructure impacts would be less than significant and would not require the construction of new energy facilities or the expansion of existing facilities.

Comment No. IND 181-7

Emergency Services – Having vehicles equipped with sirens isn't enough when the traffic is so congested that vehicles can't move out of the way. The location of this project will be a huge bottleneck for delivering police and the fire department services in emergencies

and fires which threaten the hillsides of Los Angeles especially now with the climate changes.

Response to Comment No. IND 181-7

This comment raises concerns about emergency response and services but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. See Topical Response No. 2 – Transportation and Traffic, above, which addresses emergency response, including within the hillside areas north of the Project Site. In addition, See Section IV.K.1 *Fire Protection*, and IV.K.2, *Police Protection*, of the Draft EIR, and note that impacts associated with fire and police services, including emergency response, were determined to be less than significant.

Comment No. IND 181-8

City Councilman O’Farrell said he had reservations about the old plan but he fully supported it, he never said so at that time and we are supposed to believe him now?

Please deny this project especially due to the delinquent behavior of the developers in this and the San Francisco project.

Response to Comment No. IND 181-8

The comment expresses general opposition to the Project due to its history and the developers. As the comment does not raise any issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 182

Joan Ehrlich

Received June 1, 2020

Comment No. IND 182-1

I'm extremely upset you are not extending the comment period during a pandemic/stay at home and curfews with riots and National Guard on the street!

I am very opposed to the Hollywood Center Project / formerly Millennium for many reasons. But very distracted by the above.

I hope I remember all the reasons at this time [sic]

Response to Comment No. IND 182-1

The comment expresses concern about the comment period. The City determined that the Draft EIR comment period for the Project would not be extended, and remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

The comment also makes reference to the former Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Last, the comment expresses opposition to the Project. Specific comments regarding the Draft EIR are provided and responded to below in Response to Comment Nos. IND 182-2 through 182-8,.

Comment No. IND 182-2

On an earthquake fault

Response to Comment No. IND 182-2

The comment expresses opposition to the Project due to the Project Site's location relative to an earthquake fault (the Hollywood Fault). Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-

related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 182-3

traffic is already extreme and this makes it worse- Caltrans feels freeway exits and 101 will be negatively impacted in addition to the streets.

Response to Comment No. IND 182-3

The comment expresses opposition to the Project based on its potential to exacerbate existing traffic conditions. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Regarding the US-101, it should be noted that the City did receive two letters from Caltrans with comments on the transportation analysis to be conducted for the Project. Although the analyses requested by Caltrans are not a required CEQA analysis per the City's Transportation Assessment Guidelines (TAG), adopted in July 2019, the analyses were presented for informational purposes in Appendix I to the TA for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also see Response to Comment No. AG 2-7, which discusses a recent meeting between the City and Caltrans in July 2020 during which Caltrans did not identify any particular concerns or make any particular requests for new analysis beyond that included in the Draft EIR. Additionally, the Caltrans representative indicated that Caltrans' concerns were non-CEQA concerns. Based on this, Caltrans has not identified any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

Comment No. IND 182-4

old infrastructure- water, sewage, power already over stressed and old.

Response to Comment No. IND 182-4

The comment questions the Project's impacts on city services, including water, sewers and power although it does not state specific facts to indicate that the Draft EIR's analysis of these topics is deficient and, as such, no further response is warranted. Nonetheless, with respect to water supply, Section IV.N.2, *Water Supply*, of the Draft EIR evaluates the

impacts of the Project on domestic water infrastructure and water supply. The section also quantifies the Project's water demand and evaluates the ability of the local municipal water infrastructure and water supply to meet this demand. As described therein, the Los Angeles Department of Water and Power (LADWP) determined in the approved Water Supply Assessment for the Hollywood Center Project that there are adequate water supplies available from existing LADWP entitlements and supplies to meet the Project's projected water demand, when considering the existing and planned future demand on LADWP. Furthermore, the Project would implement Project Design Feature WS-PDF-1 and provide specific water efficiency features to conserve water and reduce Project water demand. Thus, sufficient domestic water supplies are available to service the Project and surrounding areas and impacts are anticipated to be less than significant. As the domestic water supplies would be available and sufficient, there would not be a decrease in the amount of water that is available to serve the surrounding areas. As such, water pressure in the surrounding areas would not change.

With respect to sewer infrastructure, Section IV.N.1, *Wastewater*, of the Draft EIR, addresses potential Project impacts on existing wastewater conveyance infrastructure and treatment facilities that would serve the Project Site. The analysis provides an overview of existing infrastructure and facilities and evaluates whether sufficient capacity is available to serve the Project's estimated wastewater generation. As described on page IV.N.1-15 of the Draft, Project-related sanitary sewer connections and on-site infrastructure would be designed and constructed in accordance with applicable Los Angeles Sanitation District and California Plumbing Code standards. Furthermore, in accordance with Los Angeles Municipal Code Sections 64.11 and 64.16.1, the Project would pay the required sewer connection fees to help offset the Project's contribution to the City's wastewater collection infrastructure needs and would require approval of sewer permits prior to connection to the sewer system. Thus, the Project's infrastructure would be able to accommodate the Project.

Regarding power, the Project's impacts on energy are fully analyzed with Section IV.O, *Energy Conservation and Infrastructure*, of the Draft EIR. As detailed on page IV.O-32, based on LADWP's 2017 Power Strategic Long-Term Resource Plan's forecasts, LADWP's existing and planned electricity capacity and electricity supplies would be sufficient to serve the Project's electricity demand, which are provided in Table IV.O-2. Furthermore, the Project's electricity consumption during operation would be included in LADWP's total load growth of the City's power system. Therefore, the Project would result in less-than-significant impacts on energy.

Comment No. IND 182-5

I live North of Franklin and ALREADY worry about fire trucks(HIGH risk firezone [sic]), ambulance [sic] and LAPD getting to my neighborhood when needed

Adding so many more people in these structures without requiring additional emergency services.

Response to Comment No. IND 182-5

This comment raises concerns about emergency response but does not raise any specific issues with respect to the content and adequacy of the Draft EIR. See Topical Response No. 2 – Transportation and Traffic, above, which addresses emergency response.

Comment No. IND 182-6

After COVID MORE people NOT less people will be driving personal cars to avoid contact with others – avoiding rideshare and public transport there would need to be 2 parking spots per bedroom.

Response to Comment No. IND 182-6

The comment asserts that the effects of COVID-19 would result in the potential for diminished use of ridesharing and public transportation, and an increase need for parking. However, CEQA does not require analysis of speculative conditions. Pursuant to CEQA Guidelines Section 15143, “[t]he significant effects should be discussed with emphasis on in proportion to their severity and probability of occurrence.” Furthermore, CEQA Guidelines Section 15064(d)(3) states that “[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable.” Therefore, forecasting the impact of COVID-19 on traffic conditions, particularly from transportation behaviors surrounding future Project operations, is speculative. In addition to being speculative, COVID-19 is not a project or, more specifically, a component of this Project. Rather, COVID-19 is part of the environment and CEQA generally does not require an analysis of the environment’s impact on the Project (see CEQA Guidelines Section 15126.2). Thus, the Draft EIR meets the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

Furthermore, as noted in Chapter II, *Project Description*, of the Draft EIR, the Project would provide up to 1,521 vehicle parking spaces, which would be slightly more than the number of spaces required by the Los Angeles Municipal Code (LAMC) (i.e., 1,513 spaces), to adequately serve the Project. Furthermore, as the Project Site is located within a Transit Priority Area, parking impacts would not be considered significant under CEQA.

Comment No. IND 182-7

After COVID people will be avoiding high density high rise living including elevators.

Response to Comment No. IND 182-7

The comment asserts that the effects of COVID-19 include people avoiding living in high-rise housing. Please refer to Response to Comment No. IND 182-6 regarding speculative impacts.

Comment No. IND 182-8

I moved to Hollywood for it's *[sic]* Hollywood character not to see Hollywood look like Manhattan - most tourists come for same reason ad *[sic]* tourism brings A LOT of money

Build this Downtown instead !!

I am out of time to reach you by 4pm as emergency curfew warnings keep blaring on my phone and distracting me *[sic]*

Response to Comment No. IND 182-8

The comment expresses general opposition to the Project asserting that it would detract from Hollywood's character and tourism, and suggests it be built in Downtown Los Angeles instead. As this comment does not raise any issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment Letter No. IND 183

William A. Miller

Received June 1, 2020

Comment No. IND 183-1

(Note: The following are in reference to the Millennium Hollywood Project, not the currently proposed Hollywood Center Project)

Kevin K. McDonnell
KKM@jmbm.com

"high probability that a seismic fault runs through Millennium project site"

The fault interpreted from these data reasonably projects eastward from Cahuenga Boulevard, through the Hollywood Millennium Project to a prominent scarp previously located between Argyle Street and Gower Street (Figure 2).

Page 2

Although the ability to "zoom" this map is limited, at the highest zoom available, a branch of the Hollywood fault appears to be located near, if not directly beneath the Hollywood Millennium project.

A web search of the "Hollywood fault" would have returned numerous links to the more detailed studies outlined above.

Any one of these references, and certainly their combined influence would have alerted the consultant to the inaccuracy of the other references, and the need for a detailed groundrupture hazard assessment at the site.

DISMISSED....

STATE MAP SHOWS ACTIVE FAULT LINE UNDER PROPOSED HOLLYWOOD SKYSCRAPER PROJECT

<http://abc7.com/news/map-shows-fault-line-under-proposed-hollywood-skyscraper-project/384590/> "It has the potential to rupture sometime in the future..the best thing to do is stay off the trace.." State Geologist Tim McCrink

NEW STATE FAULT MAPS SHOW HIGHER EARTHQUAKE RISKS IN HOLLYWOOD

<http://articles.latimes.com/2014/jan/08/local/la-me-0109-hollywood-fault-20140109>

The state's new map shows that the proposed Millennium Hollywood skyscraper project is within the roughly 500-foot fault zone.

State geologist John Parrish said the state's fault line goes underneath Millennium "We feel very confident about where we drew that line,

within a 50-foot accuracy back and forth..we're very confident it's there," Parrish told reporters at a downtown Los Angeles news conference.

"Surface rupture is very dangerous. In fact, it's calamitous to structures that are built across the surface trace of an active fault."

Los Angeles officials did not order trenching for any of the three projects before the City Council approved those projects.

MASSIVE HOLLYWOOD PROJECT SITS ATOP QUAKE FAULT, CALIFORNIA SAYS <http://www.latimes.com/local/lanow/la-me-ln-hollywood-fault-map-20141106-story.html>

"Our conclusion from the data is that there is an active fault, and it does run right along the course that's right along the map," state geologist John Parrish said.

L.A. COUNCIL OK'S HOLLYWOOD SKYSCRAPERS DESPITE CONCERNS OVER QUAKE FAULT LINE

<http://articles.latimes.com/2013/jul/24/local/la-me-millennium-vote-20130725>

"...concerns about seismic safety were raised, citing the project's proximity to the Hollywood fault.

On Saturday, the head of the California Geological Survey, John Parrish, sent a letter to Council President Herb Wesson alerting him that the skyscrapers "may fall within an earthquake fault zone."

Parrish said Wednesday that a map drawn by his agency in 2010 showed that the Hollywood fault "goes right through the Millennium site."

He criticized a seismic report produced by the developer that said extensive testing showed that the building site was safe and did not lie on the fault line.

Parrish said the report did not refer to his agency's map and left out other important information.

DISMISSED.....

CALTRANS WARNINGS....THREAT TO PUBLIC SAFETY.....

Transportation - Caltrans issues...Caltran (ignroed) warning letter to Mayor Garcetti:

After reviewing the Response to Comments from the City, Caltrans sent a letter, dated February

19, 2013, commenting on the FEIR (see attachment 3).

We have not received a response from the City regarding our comments.

The Los Angeles Planning Commission approved the project on April 27, 2013.

As a commenting agency, we would like to, once again, bring to the City's attention that the project impacts will likely result in unsafe conditions due to additional traffic congestion, unsafe queuing, and difficult maneuvering.

As mentioned in our previous letters, these concerns have not been adequately addressed in the EIR.summary, without the necessary traffic analysis, Caltrans cannot agree that the FEIR substantively identifies and mitigates the Project's impacts to the State highway facilities as required under CEQA.

Caltrans Waves a Red Flag on Millennium
<http://articles.latimes.com/2013/jun/19/business/la-fi-hiltzik-20130619>

JUDGE THROWS OUT HOLLYWOOD MILLENNIUM
SKYSCRAPER PROJECT
<http://www.laweekly.com/news/judge-throws-out-hollywoodmillennium-skyscraper-project-5530876>

"Superior Court Judge James C. Chalfant has stopped the Millennium Hollywood twin skyscrapers project in its tracks, finding that top city officials ILLEGALLY IGNORED required parts of the Environmental Impact Review process and warning that the project could dramatically worsen traffic on the Hollywood Freeway and in the surrounding neighborhood.

His ruling means the investors cannot get any building permits from the city.

THE JUDGE FOUND THAT TOP LOS ANGELES ELECTED AND APPOINTED OFFICIALS IGNORED CALTRANS WARNINGS about the dual towers' effects on traffic heading on and off the often backed-up ramps on the nearby 101 freeway.

Chalfant lectured city leaders, saying:

"The congestion of freeways in L.A. is subject to review because it's so terrible, and anything that may make it worse needs to be examined.

The issue is whether you need to follow the provisions of the responsible agency, Caltrans.

And the language and scholarly work on the issue says overwhelmingly 'yes.'
...

There were many aspects Caltrans wanted you to look at, that you didn't look at."

Instead of including in its Environmental Impact Report, or EIR, the required traffic studies conducted by Caltrans, Garcetti and the City Council chose to press forward with their own freeway traffic studies.

Judge Chalfant says this was illegal.

He ruled, the city is not allowed to conduct studies on freeway traffic using its own definitions and methods.

"Freeway traffic is the responsibility of experts at Caltrans, specifically, and not of the Los Angeles Planning Dept. or any other city department."

DISMISSED.....
HISTORIC RESOURCES... PRESERVATION....

The City ignored Hollywood Heritage PRESERVATION concerns and instead went with Millennium's paid consultant 'analysis'.

*L.A. Conservancy had PRESERVATION concerns, and a law suit, withdrawn once Millennium

contributed more money to the organization...(link above)

Dear Ms. Hewawitharana:

Re: Millennium Hollywood Project, ENV-2011-675-EIR

The Board of Directors of Hollywood Heritage, its Preservation Issues Committee and its members, thank you for the opportunity to review and comment on the Millennium Hollywood Project, and the accompanying Draft Environmental Impact Report (DEIR).

For three decades Hollywood Heritage has been an advocate of the preservation and protection of Hollywood's historic resources. We support the goal of preserving what is most significant in Hollywood, while encouraging responsible new and infill development.

Our organization has nominated many of the current Historic Cultural Monuments, listed the Hollywood Boulevard Commercial and Entertainment District in the National Register of Historic Places at the national level of significance, provided technical assistance to developers and owners of significant properties, and participated in public policy discussions through the formulation of the Community Redevelopment Plan of 1986 and subsequent urban design plans, specific plans and in property entitlement discussion involving historic resources.

These efforts have resulted in the rehabilitation of significant landmarks and districts in Hollywood.

Our expertise in this area has led us to the conclusion that the Millennium Hollywood project has significant and adverse impacts on a number of Hollywood's historic resources.

CEQA guidelines define a project as having a significant environmental impact when the project causes a substantial adverse change in significance of a historical resource as defined in State CEQA Section 15064.

The City of Los Angeles CEQA Thresholds Guide (2006, p. D.3-3) also maintains that a project would have a significant impact on historic resources if the project results in a substantial adverse change in the significance of a historic resource by construction that reduces the integrity or significance of important resources on the site or in the vicinity via alteration of the resource's immediate surroundings.

While we appreciate some of the mitigation measures designed to preserve the historic Capitol Records and Gogerty Building, we believe that the proposed project would substantively alter the context in which these buildings gained their significance by compromising the immediate surroundings.

Portions of the project are grossly out of proportion with the identified resources, thereby minimizing them and irretrievably altering their setting.

Additionally, while we appreciate the inclusion of open space, the current design significantly changes the pedestrian environment of Hollywood.

Like many previous developments, it draws pedestrians away from the street and irrevocably alters the historic street wall along Vine and Argyle.

We also find the current version of the Millennium Hollywood Draft EIR to be deficient in its assessment that the project would not cause an adverse change in significance for the Hollywood Boulevard Commercial and Entertainment Historic District.

The heart of Hollywood is listed in the National Register of Historic Places and functions as one of the City of Los Angeles' major tourist destinations and economic engines.

The Hollywood Boulevard Commercial and Entertainment Historic District is a 12 block area of the commercial core.

The district contains 103 of the most important buildings in Hollywood, listed at the national level of significance in the National Register of Historic Places.

The development pattern of the 1920s and 1930s was characterized by the construction of buildings of generally 12 stories at major intersections, flanked by one and two-story retail structures.

The District was formally designated by the National Park Service on behalf of the Secretary of the Interior in 1985.

At the time, there were over 60 contributors and approximately 40 non-contributors which all dated from the 1905-1935 period of significance.

Since its listing, the District has seen significant and positive restorations, now having the largest collection of restored historic theaters in use in the nation.

The District can count the beneficial reuse of the Broadway and Equitable Buildings, the Hollywood Professional Building, and the Nash Building, and many restorations, spurring the renaissance of Hollywood.

But the District has suffered the loss of several contributors, and has seen the addition of overly-large developments such as Hollywood and Highland, the W Hotel and Madame Tussaud's.

The current Millennium Hollywood project fails to significantly address the negative impact created by the mass and height of the proposed development in regards to the existing structures in the vicinity.

This will be the largest tower in the area.

While creating opportunities to see landmarks such as the Hollywood Sign from areas within the development, the project fails to address the fact that these new view lines will alter views that have been publicly available since the inception of these landmarks.

In the "Related Projects" section of the DEIR, which compares this project with other projects nearby, unapproved, proposed developments are used alongside existing structures, allowing the square footage increase that this project suggests to be seen as more reasonable.

However, the structures included on the comparative chart are all less than one-third the size of the proposed Millennium tower.

The only project that is as large is the proposed redevelopment of the Paramount Studios Lot. At 1,385,700 sq. ft., the Paramount Lot is a much larger property and does not have any single building of a comparative height as proposed by Millennium.

The addition of the proposed tower will overwhelm contributing properties in the district and the proposed "separation" of new and old construction is simply not an adequate mitigation measure.

Hollywood Heritages appreciates the efforts of the project's developers and will work diligently with them to ensure the preservation and protection of all of Hollywood's historic resources.

Sincerely,

Bryan Cooper

President, Hollywood Heritage, Inc.

Hollywood Residents Get the Millennium Shaft

Response to Comment No. IND 183-1

The comment provides various links to articles in reference to the Millennium Hollywood Project, a different project that was previously proposed at the same Project Site, and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project, and does not rely on the environmental review prepared for the Millennium Hollywood Project.

Furthermore, as stated in Response to Comment No. IND 81-5, pursuant to CEQA Section 15088(c), the City is not required to provide detailed responses to comments that do not explain the relevance of the evidence submitted with the comment. Since the current Draft EIR is for an entirely new project at the Project Site with a new environmental analysis, the City has determined that the prior EIR and the comments to the prior EIR are not relevant to this Project. Therefore, as the comment does not identify or provide any supporting evidence of significant environmental effects which were not analyzed adequately in the Draft EIR for the current Project, no further response is warranted.

Nevertheless, impacts regarding the Hollywood Fault and geologic hazards were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D, *Geology and Soils*, concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above. With regard to the commenters question regarding the composition of the soil underlying the Project Site, pages IV.D-12 through IV.D-13 provides a detailed description of the subsurface conditions under the Project Site and were considered as part of the geotechnical analyses conducted for the Project.

Furthermore, it should be noted that the City did receive two letters from Caltrans with comments on the transportation analysis to be conducted for the Project. Although the analyses requested by Caltrans are not a required CEQA analysis per the City's Transportation Assessment Guidelines (TAG), adopted in July 2019, the analyses were presented for informational purposes in Appendix I to the Transportation Assessment (TA) for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing, and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also see Response to Comment No. AG 2-7, which discusses a recent meeting between the City and Caltrans in July 2020 during which Caltrans did not identify any particular concerns or make any particular requests for new analysis beyond that included in the Draft EIR. Additionally, the Caltrans representative indicated that Caltrans' concerns were non-CEQA concerns. Based on this, Caltrans has not identified any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

Comment No. IND 183-2

The 2013 DEIR is relevant since not much has changed...

Hollywood Center is STILL Millennium.

The Millennium disaster in San Francisco, unsafe leaning and tilting Millennium Tower, that used the same consultants as Millennium used to claim Millennium Hollywood building site is SAFE, that Millennium KNEW was tilting and sinking but kept it secret while they continued to sell condos, blamed everyone else..claimed nothing was their fault, is still tilting and in the news, now an infamous nightmare development, with more law suits than San Francisco has ever seen, and a tourist attraction.

Response to Comment No. IND 183-2

The commenter claims that the Hollywood Center Project is still the Millennium Hollywood Project, which, as explained in Response to Comment No. 183-1, is a different project that was previously proposed at the same Project Site, on which the environmental review prepared for the current Project does not rely on. The com. The commenter also references to the Millennium Tower in San Francisco. As this comment does not raise any specific issues with respect to the content and adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 183-3

What's new about Millennium Hollywood Center?

The buildings are still the best example of obscene developer greed, a NYC developer who could care less about HOLLYWOOD, and his funded puppet politicians generously paid, and helped get elected, to look the other way regarding traffic safety, earthquake safety, peoples *[sic]* lives, and destruction of Hollywood HISTORIC RESOURCES, compromising the National Historic Register of Famous Places area and the world renown Historic Cultural Monument Capitol Records Building and Hollywood Sign.

Response to Comment No. IND 183-3

The comment expresses general opposition to the Project. As the comment does not raise any issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Nevertheless, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also Topical Response No. 2 – Transportation and Traffic, above.

Specifically, as it relates to traffic safety, as analyzed on pages IV.L-44 and IV.L-45 of Section IV.L of the Draft EIR, the Project would be designed to comply with City standards and would provide adequate sight distance, sidewalks, crosswalks, and pedestrian movement controls that meet the City's requirements to protect pedestrian safety. All roadways and driveways would continue to intersect at right angles. Street trees would be designed and located so as to not significantly impede driver and pedestrian visibility and would not present a hazard. Pedestrian entrances separated from vehicular driveways would provide access from the adjacent streets, parking facilities, and transit stops. Therefore, as determined therein, the Project would not substantially increase geometric hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses and impacts would be less than significant.

Regarding earthquake safety, impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D of the Draft EIR concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

The commenter asserts that the Project would result in the destruction of Hollywood's historic resources, including the Capitol Records Building and the Hollywood Sign. It should be noted that the Project would not directly impact the Hollywood Sign. As analyzed on pages IV.A-29 to IV.A-54 in Section IV.A, *Aesthetics*, of the Draft EIR, construction and operation of the Project would not significantly block views of the Hollywood Sign. Also, impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame, and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame; indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to certain off-site historic resources (specifically the Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur. See also Topical Response No. 6 – Historical Resources, above.

Comment No. IND 183-4

Traffic in the area is WORSE, than it was when Judge Chalfant shut Millennium projects down due to the phony EIR, that made traffic stuff up, and pretended the traffic would have no impacts, and ignored Caltrans warnings about the 'deadly, unsafe' traffic

It's WORSE now with all the new oversized projects the city has approved and are up...

Response to Comment No. IND 183-4

The comment states that traffic has worsened since the Millennium Hollywood Project approvals were invalidated, as new projects have since been built; and references the previous EIR's neglect for Caltrans' concerns. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, traffic impacts

were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

It is also acknowledged that Caltrans prepared two letters with comments on the transportation analysis to be conducted for the Project. The analyses requested by Caltrans were presented for informational purposes in Appendix I to the TA for the Hollywood Center Project, provided in Appendix N-1 of the Draft EIR. The Caltrans analysis is not a required CEQA analysis per the City's TAG. As shown in Appendix I to the TA, the analyses determined that the addition of Project traffic would not result in substantial direct or cumulative effects to the freeway mainline or off-ramp queuing and is also not considered to have a traffic safety effect on the off-ramps, freeway segments, and intersections identified in Caltrans' letters. Also see Response to Comment No. AG 2-7, which discusses a recent meeting between the City and Caltrans in July 2020 during which Caltrans did not identify any particular concerns or make any particular requests for new analysis beyond that included in the Draft EIR. Additionally, the Caltrans representative indicated that Caltrans' concerns were non-CEQA concerns. Based on this, Caltrans has not identified any specific issues related to the content or adequacy of the CEQA analysis related to the Draft EIR.

Comment No. IND 183-5

The building site still has a state geologist confirmed active EQ fault running through it....still denied by Millennium.

Response to Comment No. IND 183-5

The comment states that the Project Site has an active earthquake fault running under it. However, impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Comment No. IND 183-6

Groups, organizations opposed are already lining up for those generous Millennium bribes to 'like' the projects they hate and know will disrupt their businesses, ruin the area, and compromise the beautiful historic resources.

The same politicians are still there, the councilmembers, mayor, etc., who have sold out Hollywood and Hollywoodians and Angelenos who love

Hollywood and its Iconic Cultural Resources....the politicians who owe their political careers to Millennium.

What HAS changed is the developer politico 'PAY to PLAY' corruption has been revealed, and many that enabled Millennium projects being approved the last time have been, are being, investigated by the FBI, indicted, or resigned. And the investigations are on going

Response to Comment No. IND 183-6

The comment expresses general opposition to the Project based on corruption in the City. It should be noted that the speculation as to alleged illegal activities is not related to the adequacy of the Draft EIR. Accordingly, as the comment does not raise any issues with respect to the content or adequacy of the Draft EIR, no further response is warranted.

Comment No. IND 183-7

In the rush to make the comment deadline yesterday, I neglected to include the correct link to the EIR Millennium 2013

Should I send another comment email with the added link, or can you use this?

It has been added below 'EIR...Millennium...2013

Response to Comment No. IND 183-7

The comment provides a link to the EIR for the Millennium Project, but does not raise any specific issues regarding the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment No. IND 183-8

EIR...Millennium...2013

http://clkrep.lacity.org/onlinedocs/2013/13-0593_misc_05-15-2013.pdf

Response to Comment No. IND 183-8

The comment provides a link to the EIR for the Millennium Project. As stated in Response to Comment No. IND 81-5, pursuant to CEQA Section 15088(c), the City is not required to provide detailed responses to comments that do not explain the relevance of the evidence submitted with the comment. Since the current Draft EIR is for an entirely new project at the Project Site with a new environmental analysis, the City has determined that the prior EIR and the comments to the prior EIR are not relevant to this Project. Therefore, the comment does not identify or provide any supporting evidence of significant environmental effects which were not analyzed adequately in the Draft EIR for the current Project, no further response is warranted.

Comment Letter No. IND 184

Helen Jacks
2036 Holly Hill Terrace,
Los Angeles, CA 90068
Received June 1, 2020

Comment No. IND 184-1

This proposed project is unethical. We all know it is in violation of existing zoning laws and would further exacerbate the traffic congestion and air pollution in the Hollywood community.

As I sit in my home, receiving emergency alerts about curfews due to civil unrest, I wonder if any of my elected city officials have read Eric Klinenberg's excellent book, *PALACES FOR THE PEOPLE: How Social Infrastructure Can Help Fight Inequality, Polarization, and the Decline of Civic Life*. I highly recommend you take a look at it, set aside your thoughts about campaign donations from developers, and do the right thing. There is no honest way to evaluate this project as beneficial to the citizens of Hollywood. Instead, it typifies political corruption and looting.

Response to Comment No. IND 184-1

The comment asserts that the Project is unethical, violates existing zoning laws, and would increase traffic and air pollution in the Hollywood Community. The commenter's assertion that the Project is unethical is an opinion and does not raise any issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

With regards violations of existing zoning laws, see Topical Response No. 5 – Land Use and Planning, above, which discusses the Project's requested discretionary approvals and consistency with applicable zoning regulations.

Regarding traffic impacts, while this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Regarding air pollution, while this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, air quality impacts related to sensitive receptors were addressed in Section IV.B, *Air Quality*, of the Draft EIR, with supporting data provided in Appendix E of the Draft EIR. As analyzed therein, construction and operational air quality impacts would be less than significant after mitigation. The prescribed mitigation which requires certain types of construction equipment and features

to be utilized by the Project, would ensure that Project construction activities do not expose sensitive receptors to substantial pollutant concentrations or result in violations to applicable daily air quality standards. During operation, mitigation to address standard emergency generator testing would also ensure that applicable daily air quality standards are not violated.

Comment Letter No. IND 185

Hannah Beavers

Received June 1, 2020

Comment No. IND 185-1

My name is Hannah Beavers and I have lived at Franklin and Ivar for 12 years now. I am responding to case no. ENV-2018-2116-EIR. I am very concerned for our neighborhood with the prospect of such a massive project. I am all for change and I know this city need more housing, but this is not the place for these kinds of buildings.

Response to Comment No. IND 185-1

The comment expresses concern about the Project's size but does not raise any specific issues with respect to the content or adequacy of the Draft EIR. However, aesthetic impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, and Topical Response No. 5 – Land Use and Planning, above.

Comment No. IND 185-2

These sites are located DIRECTLY on the St [*sic*] Andreas fault line. I do not believe the city has taken into account the thousands of lives that will be at risk.

Response to Comment No. IND 185-2

The comment states that the Project Site is located directly on the San Andreas Fault. It should be noted that the Project Site is not located atop the San Andreas fault line. Note that the nearest fault to the Project Site is the Hollywood Fault and not the San Andreas Fault. Impacts regarding the Hollywood Fault were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

Furthermore, the Los Angeles Department of Building and Safety (LADBS) issues building and grading permits for construction projects. Building permits are required for any building or structure that is erected, constructed, enlarged, altered, repaired, moved, improved, removed, converted, or demolished. The function of the City's Building Code is to protect life safety and compliance with the Los Angeles Municipal Code (LAMC). The sections of LAMC Chapter IX address numerous topics, including earthwork and grading activities, import and export of soils, erosion and drainage control, and general construction requirements that address flood and mudflow protection, slides and unstable soils. The LADBS approves building plans based on accepted engineering principles and facts, including seismic safety analyses, in accordance with the Building Code.

Additionally, LAMC Section 91.1803 includes specific requirements addressing seismic design, grading, foundation design, geologic investigations and reports, soil and rock testing, and groundwater. Specifically, LAMC Section 91.7006 requires that a Final Geotechnical Report with final design recommendations prepared by a California-registered geotechnical engineer and submitted to the LADBS for review prior to issuance of a grading permit. Final foundation design recommendations must be developed during final Project design, and other deep foundation systems that may be suitable would be addressed in the Final Geotechnical Report.

Comment No. IND 185-3

In addition to my concerns about earthquakes, these buildings would immediately effect the residential housing that already exists. Historical buildings and quiet neighborhoods will be forced out and inevitably our rent will go up, which we can not *[sic]* afford.

Response to Comment No. IND 185-3

The commenter provides a general statement that historical buildings and quiet neighborhoods would be forced out and rent would increase, but does not raise any specific issues regarding the content or adequacy of the Draft EIR. Furthermore, as stated in CEQA Guidelines Section 15131, economic or social effects of a project shall not be treated as significant effects on the environment. As such, this topic was not evaluated in the Draft EIR, and no further response is warranted.

Comment No. IND 185-4

These construction sites will also be filled with people -bringing many people into our neighborhood during a pandemic and that increases our risk of catching the virus.

Response to Comment No. IND 185-4

The commenter provides a general statement that construction sites would be filled with people during a pandemic. However, CEQA does not require analysis of speculative conditions related to the potential for construction workers spreading the virus. Pursuant to CEQA Guidelines Section 15143, “[t]he significant effects should be discussed with emphasis in proportion to their severity and probability of occurrence.” Furthermore, CEQA Guidelines Section 15064(d)(3) states that “[a]n indirect physical change is to be considered only if that change is a reasonably foreseeable impact which may be caused by the project. A change which is speculative or unlikely to occur is not reasonably foreseeable.” Therefore, forecasting the potential for construction sites to bring COVID-19 to the neighborhood and increase the risk of residents catching the virus is speculative. In addition to being speculative, COVID-19 is not a project or, more specifically, a component of this Project. Rather, COVID-19 is part of the environment and CEQA generally does not require an analysis of the environment’s impact on the Project (see CEQA Guidelines Section 15126.2). Thus, the Draft EIR meets the standards for adequacy under CEQA Guidelines Section 15151 and Section 15064(d)(3).

Comment No. IND 185-5

To that point, there is WAY too much going on right now to give this our full attention. Please, oh please, wait until the residents of this neighborhood can be focused and have a constructive conversation with you about this.

Please wait.

Thank you so much for listening to me and please stay safe out there.

Response to Comment No. IND 185-5

The comment requests that more time be provided for residents to provide constructive feedback. The City determined that the Draft EIR comment period for the Project would not be extended and would remain at 47 days, as indicated on the Draft EIR's Notice of Completion and Availability (NOC/NOA), dated April 16, 2020. For additional details regarding the City's determination not to extend the Draft EIR comment period, see Topical Response No. 1 – Public Participation and Review, above.

Comment Letter No. IND 186

Paul Barron
7225 Hollywood Blvd, Apt 321
Los Angeles, CA 90046
Received June 1, 2020

Comment No. IND 186-1

I would like to register my formal objection to the proposed *Hollywood Center Project* in the vicinity of Hollywood Blvd, Vine Street, Ivar Ave and Yucca Street in Hollywood, CA.

As a long-standing Hollywood resident, I am extremely concerned by the likely increase in traffic, footfall and the cost of living in the area, not to mention the shockingly disproportionate overshadowing of the iconic Capitol Records building. I am aghast that the city would consider such a proposal.

I believe the building of two huge towers - some three times higher than the Capitol Records building - would be nothing short of disastrous to the aesthetic nature of the area.

As you are aware, in addition to the area being a significant tourist magnet, footfall becomes especially unbearable on Hollywood & Vine during daily performances at the Pantages Theater.

If the city introduces two huge buildings to this location, I fear they would forever destroy the intrinsic character of the neighborhood, and tip the work / life balance of its residents immeasurably, irreversibly and detrimentally.

I strongly urge the city to reconsider this proposal.

Response to Comment No. IND 186-1

The comment expresses opposition to the Project based on its size and scale, impacts on historic resources, and noise and traffic impacts. Footfall refers to the number of people entering a store or shopping area in a given time and is used in retail as an economic indicator but is not an environmental impact considered under CEQA. While this comment does not raise any specific issues with respect to the content or adequacy of the Draft EIR, the size and scale of the Project were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics and Topical Response No. 5 – Land Use and Planning, above.

Regarding impacts to the Capitol Records Building, historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C of the Draft EIR analyzed the potential for direct and indirect impacts to the Capitol Records Building and other nearby historical resources. No direct impacts to the Capitol Records Building would occur and potential indirect impacts on the building due to construction vibration

and settlement were determined to be less than significant with implementation of mitigation measures. See also Topical Response No. 6 – Historical Resources, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies or regulations related to location, form and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

The comment also expresses concern about the Project's impact on the intrinsic character of the neighborhood. Impacts regarding historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F-1 of the Draft EIR. See also Topical Response No. 6 – Historical Resources, above. As described therein, the architecture of the Project has been designed to be distinct from, but compatible with, the modernist architectural character of the Capitol Records Building and the greater Hollywood neighborhood. The proposed buildings have been located and configured to preserve important views of the Capitol Records Building and to promote compatibility between new construction and the historic Capitol Records Complex. The West and East Buildings have been articulated in a manner that responds to the design of the Capitol Records Building. The West and East Buildings, together with the Capitol Records Building, are asymmetrically centered on Vine Street, highlighting the Capitol Records Building's prominence. The façades of the West and East Buildings oriented toward the Capitol Records Building and the Hollywood Hills have been designed to curve softly to respond to the form of the Capitol Records Building while maximizing the width of view corridors into and through the Project Site. These curved exterior walls of the West and East Buildings also include balconies intended to evoke the signature sunshades of the Capitol Records Building. The remaining façades, oriented south toward Hollywood, adopt the rectilinear language of the City's grid and more traditional buildings.

Comment Letter No. IND 187

Daisy Holden

Received June 1, 2020

Comment No. IND 187-1

I am writing as a concerned resident with regard to comment for the Hollywood Center Project ("DEIR[sic]). I was born and raised in Whitley Heights, the historic HPOZ district in the LA area, which is within 550m of the proposed project. In fact, the view from our [sic] my apartment looks directly out at the proposed site. If this project were to commence, the environmental impact would without a doubt permanently damage & degrade the historic structures, OUR HOMES by the level of subterranean construction of such scale.

Response to Comment No. IND 187-1

The commenter is concerned about the Project damaging and/or degrading the historic structures in the Whitley Heights HPOZ district. Historic resources were analyzed in Section IV.C, *Cultural Resources*, of the Draft EIR based on a Historical Resources Technical Report included in Appendix F of the Draft EIR. Section IV.C analyzed the potential for direct and indirect impacts to historic resources, including the Capitol Records Building, Pantages Theatre, Hollywood Walk of Fame and other nearby historical resources. The Project's direct impacts to historic resources were determined to be less than significant with implementation of a mitigation measure to protect the Hollywood Walk of Fame, and indirect impacts related to vibration during construction activities were determined to be significant and unavoidable to some adjacent historic resources if mitigation measures requiring consent of other property owners could not be implemented. However, with the consent of the property owners to implement the recommended mitigation measures, monitoring, preventative and corrective measures, if needed, would be in place throughout construction to ensure that temporary impacts to historic resources are fully mitigated such that no long-term effects occur.

More specifically in regard to the Whitley Heights HPOZ district, Section IV.C, evaluated indirect impacts on more proximate historic resources; however, the analysis of potential indirect impacts on the Hollywood Boulevard Commercial and Entertainment District are generally relevant, understanding that the effects would be less pronounced on the Whitley Heights HPOZ. See pages IV.C-71, and pages IVC-77 through IVC-79 in Section IV.C, and pages 122 through 125, in Appendix F, of the Draft EIR. The analyses provided therein state in part that despite introducing substantial new height to the skyline, new construction would not result in significant adverse effects to the District, as the immediate setting of the District would not be altered, and the area surrounding the District has been characterized by juxtapositions between building heights since the prevailing height limit of 150 feet was removed in Hollywood in the late 1950s. The analysis also states that features important to the significance of the District are largely contained within and are best experienced within the District and that new construction associated with the Project

would not interrupt the configuration of buildings, their spatial relationships to each other, or their relationship to the street that characterize the District as it is experienced. See also Topical Response No. 6 – Historical Resources, above.

Comment No. IND 187-2

What is FAIR, ACCEPTABLE and NECESSARY:

1. Responsible development with height restrictions that compliment *[sic]* the existing, beautiful and historic Hollywood skyline and community - nothing above 15-20 stories.
2. Genuine respect and regard for the concerns about the existing proposal.
3. The commitment to an INCREASE of law enforcement manpower, which will be necessary to ensure public safety - not only in the immediate public space, but for the surrounding neighborhood communities.

Response to Comment No. IND 187-2

This comment expresses general opposition to the Project related to height, historic resources, and public safety, but does not raise any issues with respect to the content or adequacy of the Draft EIR. Regarding height, aesthetics impacts were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies, or regulations related to location, form, and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, and, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Regarding public safety, fire and police services impacts were addressed, respectively, in Section IV.K.1, *Fire Protection*, and Section IV.K.2, *Police Protection*, of the Draft EIR, with supporting data provided in Appendix M of the Draft EIR. Pursuant to the CEQA Guidelines, and the thresholds used by the City to determine the significance of impacts to fire and police services, the focus of the analyses is on whether or not new or expanded facilities are needed to maintain adequate public service and whether a potential physical impact could occur if construction of facilities was warranted. In the case of the Project, it was determined that the Project would not generate a demand for additional police and fire protection services that would result in the need for new or expanded fire and police services facilities. As such, Section IV.K.1 and IV.K.2 concluded that impacts to fire and police services, respectively, would be less than significant. Notably, regarding public safety, as provided in Project Design Feature POL-PDF-2, the Project would incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, and site visitors; and install and utilize a 24-hour security camera network throughout parking garages, elevators, common and amenity spaces, lobby areas, and rooftop and

ground level outdoor open spaces. The Project's security personnel and features would provide natural surveillance through visual connections between residential/commercial units and public areas, locating common areas as centrally as possible or near major circulation paths, and providing adequate way-finding signage and lighting for walkways and entries. This is in contrast to existing conditions in the area, which include surface parking lots and long alleys between blocks, where buildings are partially cut off from the street. These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for LAPD services. Additionally, the Project Applicant has the ability to contribute to the local Business Improvement District (BID), which has a seven-day a week security patrol, and could assist in safety services and potentially increase patrols, thereby reducing the Project's need for additional LAPD services. Implementation of Project Design Feature POL-PDF-2 would help to offset the Project's operational demand for police protection services from LAPD.

Comment No. IND 187-3

I will close by stating that we support the revival of a new Hollywood. But, let's achieve this through a plan that benefits everyone involved and not just those that are out for themselves. We are not Manhattan. We are Los Angeles.

Response to Comment No. IND 187-3

This comment expresses general opposition to the Project, but does not raise any issues with respect to the content or adequacy of the Draft EIR. As such, no further response is warranted.

Comment Letter No. IND 188

Olivia Duke

Received June 2, 2020

Comment No. IND 188-1

I am writing this letter in hopes that it may save lives.

I left Hollywood and moved back to Texas when my aunt passed in 2013. At the time that I had to move I had lived in my apt. on Beachwood Drive for 25 years. It was heart breaking that I had to go but I was already seeing at the time, the obvious buy outs by developers that were being allowed to build structures that caused ridiculous *[sic]* traffic back ups, structures that did not fit the height or respect of the height of the other buildings: in short, greed had been allowed to take over. The traffic had gotten so bad that the quality of life for everyone in the Hollywood Hills *[sic]* was being grossly affected. In the 7 years that I have now been gone it has now gotten 10 times worse.

At the time, I suspected that there had to be bribes by the developers to the planning and development office as well as city council members but had no proof of it. Well, as of the other day, it has come to light that I was correct. I have to ask myself, why then if the Hollywood Hills residents have to pay massive taxes for their views, the building of two Millennium Towers, on earth quake faults, that overpower all of the other buildings in Hollywood - the very reason tourists *[sic]* come from miles around, to see old Hollywood, not a couple of sky scappers *[sic]* that they can see in their own cities -- why would these two buildings even be considered? Moreover, didn't anyone see the movie, Titanic and learn what happens when you push common sense. Well, since building these buildings makes "no" common sense, then I have to surmise that money must again be being exchanged between the developers and the departments in the city that are even thinking about letting these buildings be built. After nine years, I think it is quite clear that the only people that want these monstrosities built is the builder. The citizens have made it very clear that they don't. And if those towers are allowed, and an earthquake happens; as it surly will, and these towers collapse killing many people well, then you all will have to live knowing that. So, I have to ask you, is it worth it? Is the money being exchanged by the developers to get their way worth it? I would think not. Please consider these words with the upmost of seriousness because your actions will ultimately, probably be responsible *[sic]* for the demise of many. I sure would not want to live with that.

Response to Comment No. IND 188-1

The comment expresses opposition to the Project based on its size and scale, traffic impacts, and location with respect to an earthquake fault. The size and scale of the Project were analyzed in Section IV.A, *Aesthetics*, of the Draft EIR. See also Topical Response No. 4 – Aesthetics, above.

In addition, Section IV.H, *Land Use and Planning*, of the Draft EIR analyzed the Project's potential to result in conflicts with land use plans, policies and regulations, with supporting

information included in Appendix J of the Draft EIR. As analyzed in Section IV.H, the Project would not conflict with relevant plans, policies or regulations related to location, form and density of development adopted for the purpose of avoiding or mitigating a significant environmental effect, therefore, impacts would be less than significant. See also Topical Response No. 5 – Land Use and Planning, above.

Traffic impacts were addressed in Section IV.L, *Transportation*, of the Draft EIR, based on a Transportation Assessment (TA) approved by the Los Angeles Department of Transportation (LADOT) included in Appendix N-1 of the Draft EIR. The analysis in Section IV.L of the Draft EIR concluded that the Project would result in less-than-significant transportation/traffic related impacts. See also see Topical Response No. 2 – Transportation and Traffic, above.

Geology impacts, including those regarding the Project Site's location relative to an earthquake fault (the Hollywood Fault), were analyzed in Section IV.D, *Geology and Soils*, of the Draft EIR, with supporting information provided in the Geotechnical Investigation and the Surface Fault Rupture Hazard Evaluation Reports (2015 and 2019 Fault Studies) included in Appendix G of the Draft EIR. The analysis in Section IV.D concluded that geology impacts, including fault-related impacts, would be less than significant, and that the Project would not be constructed on an active fault line. See also Topical Response No. 3 – Geology and Fault Hazards, above.

The comment also makes reference to the Millennium Towers project, which is a different project located in San Francisco. The information and analysis provided within the Draft EIR for the Project have no connections to the studies and development of the Millennium Towers project in San Francisco. The commenter also makes reference to a different project that was previously proposed at the same Project Site and for which planning approvals and the environmental determination were invalidated. The previous project is discussed in Chapter II, *Project Description*, Subsection 3, Project Background, (see pages II-6 and II-9) of the Draft EIR. The analysis contained in this EIR is for a new project and does not rely on the environmental review prepared for the Millennium Hollywood Project.

CHAPTER 3 – REVISIONS, CLARIFICATIONS, AND CORRECTIONS TO THE DRAFT EIR

In accordance with CEQA Guidelines Section 15132(a), this chapter of the Final EIR provides revisions, clarifications, and corrections to the Draft EIR that have been made to clarify, correct, or supplement the information provided in that document. These revisions, clarifications, and corrections are the result of the responses to public and agency comments received on the Draft EIR, new information that has become available since publication of the Draft EIR, or due to recognition of inadvertent errors or omissions. The revisions, clarifications, and corrections provided in this chapter do not add significant new information or support a conclusion that the Project would result in new or substantially more severe significant environmental impacts as compared to those disclosed in the circulated Draft EIR.

More specifically, CEQA requires recirculation of a Draft EIR only when “significant new information” is added to a Draft EIR after public notice of the availability of the Draft EIR has occurred (refer to PRC Section 21092.1 and CEQA Guidelines Section 15088.5) but before the EIR is certified. CEQA Guidelines Section 15088.5 specifically states the following:

New information added to an EIR is not ‘significant’ unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project’s proponents have declined to implement. ‘Significant new information’ requiring recirculation includes, for example, a disclosure showing that:

- *A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.*
- *A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted to reduce the impact to a level of insignificance.*
- *A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project’s proponents decline to adopt it.*
- *The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.*

CEQA Guidelines Section 15088.5 also provides that “[re]circulation is not required where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in an adequate EIR... A decision not to recirculate an EIR must be supported by substantial evidence in the administrative record.”

As demonstrated in this Final EIR, the changes presented in this chapter do not constitute new significant information warranting recirculation of the Draft EIR as set forth in CEQA Guidelines Section 15088.5. Rather, the Draft EIR is comprehensive and has been prepared in accordance with CEQA.

The supplementary information to the Draft EIR is indicated below under the respective EIR section heading, page number, paragraph, and the line within the referenced paragraph. Deletions are shown with ~~strikethrough~~ and additions are shown with double underline. Existing text to remain unchanged is included as plain text, without strikethrough or double underlines, to provide context for the revisions, clarifications, and corrections.

Executive Summary

The revisions, clarifications, or corrections for the Draft EIR sections described below also apply to the executive summary of the Draft EIR.

Chapter II. Project Description

1. Page II-9, the first sentence in the second paragraph under Subsection II.4, Existing Project Site Conditions, is revised as follows:

The West Site slopes down from northwest to southeast, and ~~Both the West and East Sites~~ slope down from northeast to southwest with elevations ranging from approximately 404 feet above mean sea level (amsl) to 383 feet amsl (i.e., a grade change of approximately 21 feet).

2. Page II-10, the last sentence in the last paragraph, which extends to the first paragraph on page II-11, is revised as follows:

However, the Project Site is subject to D Limitations, pursuant to Ordinance No. 165,659, which restricts lots with Assessor’s Parcel Numbers (APN) 5546-004-006, 5546-004-020, 5546-004-021, 5546-004-029, 5546-030-028, 5546-030-031, 5546-030-032, 5546-030-033, and 5546-030-034 to a 3:1 FAR; and the corner lot on the southeast corner of Yucca Street and ~~Vine Street~~ Ivar Avenue, with APN ~~5546-030-032~~ 5546-004-032, to a 2:1 FAR.

3. Page II-14, the shown row in Table II-1 is revised as follows:

Site Area (Post-Dedication) ^a	83,792 <u>79,632</u> sf	417,179 <u>121,339</u> sf	200,971 sf (4.61 acres)
--	-------------------------	---------------------------	----------------------------

4. Page II-16, footnotes “a” and “d” in Table II-1 are revised as follows:

^a Post-dedication square footage is calculated with the inclusion of the ~~4,312~~ 1,313-square-foot East Site Alley Merger and the 5,163-square-foot sidewalk merger (along the sidewalk of Yucca Street, Argyle Avenue, and both sides of Vine Street) area.

~~^d As stated further below under Section 8, Anticipated Project Approvals, the Project is requesting a Conditional Use Permit pursuant to LAMC Section 12.24 W.19 for a unified development to allow FAR/FAR averaging and residential density transfer between the East Site and the West Site. This would allow for the Project to park more on one site to meet the total vehicular parking requirements.~~

5. Page II-17, the first full paragraph is revised as follows:

The Project would have a maximum FAR of 6.973:1,¹ which includes the existing approximately 114,303-square-foot Capitol Records Complex (consisting of the 92,664-square-foot Capitol Records Building and the 21,639-square-foot Gogerty Building). The maximum developable floor area for the Project Site would be 1,401,453 square feet. ~~The Project is requesting a Conditional Use Permit pursuant to LAMC Section 12.24 W.19 for a unified development to allow FAR averaging and residential density transfer between the East Site and the West Site. As the East Site is larger than the West Site, the West Site would be the recipient of the proposed averaging of floor area and residential density. The West Site would utilize approximately 64,300~~ 93,309 square feet of floor area from the East Site, which would permit an additional ~~97 to 98~~ 119 units on the ~~East~~ West Site.

6. Page II-36, the third sentence in the last paragraph is revised as follows:

Depending upon negotiations on use of the space, the East Site’s open space area may be reduced by up to ~~5,995~~ 2,657 square feet and redesigned to accommodate Capitol Records and/or to comply with the lease.

7. Page II-40, the shown row in Table II-2 is revised as follows:

Site Area (Post-Dedication) ^a	83,792 <u>79,632</u> sf	447,479 <u>121,339</u> sf	200,971 sf (4.61 acres)
--	------------------------------------	--------------------------------------	----------------------------

8. Page II-41, footnote “a” in Table II-2 is revised as follows:

Gross square footage is calculated with the inclusion of the 1,313 square-foot East Site Alley Merger and the 5,163-square-foot sidewalk merger (along the sidewalk of Yucca Street, Argyle Avenue, and both sides of Vine Street) area.

¹ With the removal of the D Limitation, the maximum permitted FAR for the Project Site would be 6.0:1. By setting aside at least 11 percent of the total residential units for Extremely Low and/or Very Low Income households, the Project would be eligible for an 8.1:1 FAR. The Applicant requests up to 7.0:1 FAR.

9. The Draft EIR cites that a proposed signal would be located at the intersection of Argyle Avenue and Carlos Avenue. The portion of Carlos Avenue, as referenced in the Draft EIR, is not a public street and is a private alley owned by Easttown. A small sign located at the entrance of the alley from Argyle Avenue states that the alley is named “James M. Nederlander Way, Private Drive Residents Only.” References to Carlos Avenue have been revised to be James M. Nederlander Way. Google Maps, Google Earth, and Bing Maps each identify the driveway as Carlos Avenue, but the correct identification is James M. Nederlander Way. Any other references to Carlos Avenue in the Draft EIR should be revised to reflect James M. Nederlander Way. Page II-64, the fourth and fifth sentences in the first paragraph is revised as follows:

Access to all subterranean levels (B1 through B5) of the parking garage would be provided from the northern Argyle Avenue driveway located directly opposite of ~~Carlos Avenue~~ James M. Nederlander Way and north of the existing alley. This four-way intersection at Argyle ~~Avenue~~ and ~~Carlos Avenues~~ James M. Nederlander Way would be signalized and provide a pedestrian crossing across Argyle Avenue.

10. Page II-70, the first sentence in the last paragraph is revised as follows:

Construction of the Project would begin as early as 2021 and commence on the West Site or the East Site.

11. Pages II-71, the last paragraph is revised as follows:

The sequential and overlapping construction scenarios are shown graphically in **Figure II-30, Project Construction Scenarios**. In the overlapping construction scenario with the West Site commencing construction first, the East Site’s Site Preparation, Utilities/Trenching and Grading/Excavation phases would overlap construction activities on the ~~with~~ West Site starting with the West Site’s Building Construction phase. There would be no overlap of the East Site construction during grading/excavation of the West Site. In the overlapping construction scenario with the East Site commencing construction first, the West Site’s Demolition, Site Preparation, Utilities/Trenching and Grading/Excavation phases would overlap construction activities on the East Site starting with the East Site’s Building Construction phase. There would be no overlap of the West Site construction during grading/excavation of the East Site. In ~~the either~~ overlapping construction scenario, construction could be completed in approximately 4.5 years (beginning 2021 and completed in 2025). In the sequential construction scenario in which the two sites are built one after another with no overlap, construction of the Project would be completed in under approximately seven years (beginning in 2021 and completed in 2027).¹⁶ In either scenario, buildout of the West Site or the East Site (whichever Site commences construction first) is anticipated to be in 2024.

12. Pages II-74 and II-75, Subsection II.8, Anticipated Project Approvals, are revised as follows:

Discretionary entitlements, reviews, and approvals required for implementation of the project would include, but not necessarily be limited to, the following:

- ~~1. Pursuant to LAMC Section 12.32 F & Q, a Vesting Zone Change from C4-2-SN to C2-2-SN.~~
- ~~2. Pursuant to LAMC Section 12.32 F, a Height District Change for the Project Site to remove the D Limitation to allow a 7.0:1 FAR.~~
- ~~3. Pursuant to LAMC Section 11.5.11(e) and California Government Code Section 65915(k) or the Applicable Housing Incentive Program, one (1) incentive, concession, reduction, or modification of zoning code requirements to provide for affordable housing costs as follows:

 - ~~— A floor area bonus (35 percent from 6:1 FAR base) to allow additional floor area up to 7:1 FAR; and~~
 - ~~— The floor area of any residential balconies and terraces may be excluded for purposes of calculating the buildable floor area.~~~~
1. Pursuant to LAMC Section 12.22 A.25, a Density Bonus Compliance Review, reserving at least 11 percent of the Project's units for Very Low Income Households, seeking the following incentives and waivers:
 - a. An On-Menu Incentive to permit a 35-percent increase in the maximum allowable floor area ratio (FAR) from 2:1 to 2.7:1 (for portions of Project Site located at the corner lot on the southeast corner of Yucca Street and Ivar Avenue and associated with APN 5546-004-032); and from 3:1 to 4.05:1 FAR (for the balance of the Project Site).
 - b. An Off-Menu Incentive to allow FAR and density averaging for a Housing Development Project located at non-contiguous lots.
 - c. A Waiver of Development Standards to permit a 7:1 FAR averaged across the Project Site.
 - d. A Waiver of Development Standards to permit the floor area of any residential balconies and terraces to be excluded for purposes of calculating the total floor area, as applicable.
- ~~4 2. Pursuant to LAMC Section 12.24 W.1, a Master Conditional Use Permit for the sale or dispensing of alcoholic beverages for on-site and off-site consumption within 12 establishments.~~
- ~~5. Pursuant to LAMC Section 12.24 W.19, a Conditional Use Permit for a unified development to allow Floor Area Ratio (FAR) averaging and residential density transfer between the East and the West Sites.~~
- ~~6 3. Pursuant to LAMC Section 16.05, Site Plan Review for a development that results in an increase of 50 or more dwelling units and/or guest rooms or generates more than 1,000 average daily trips.~~

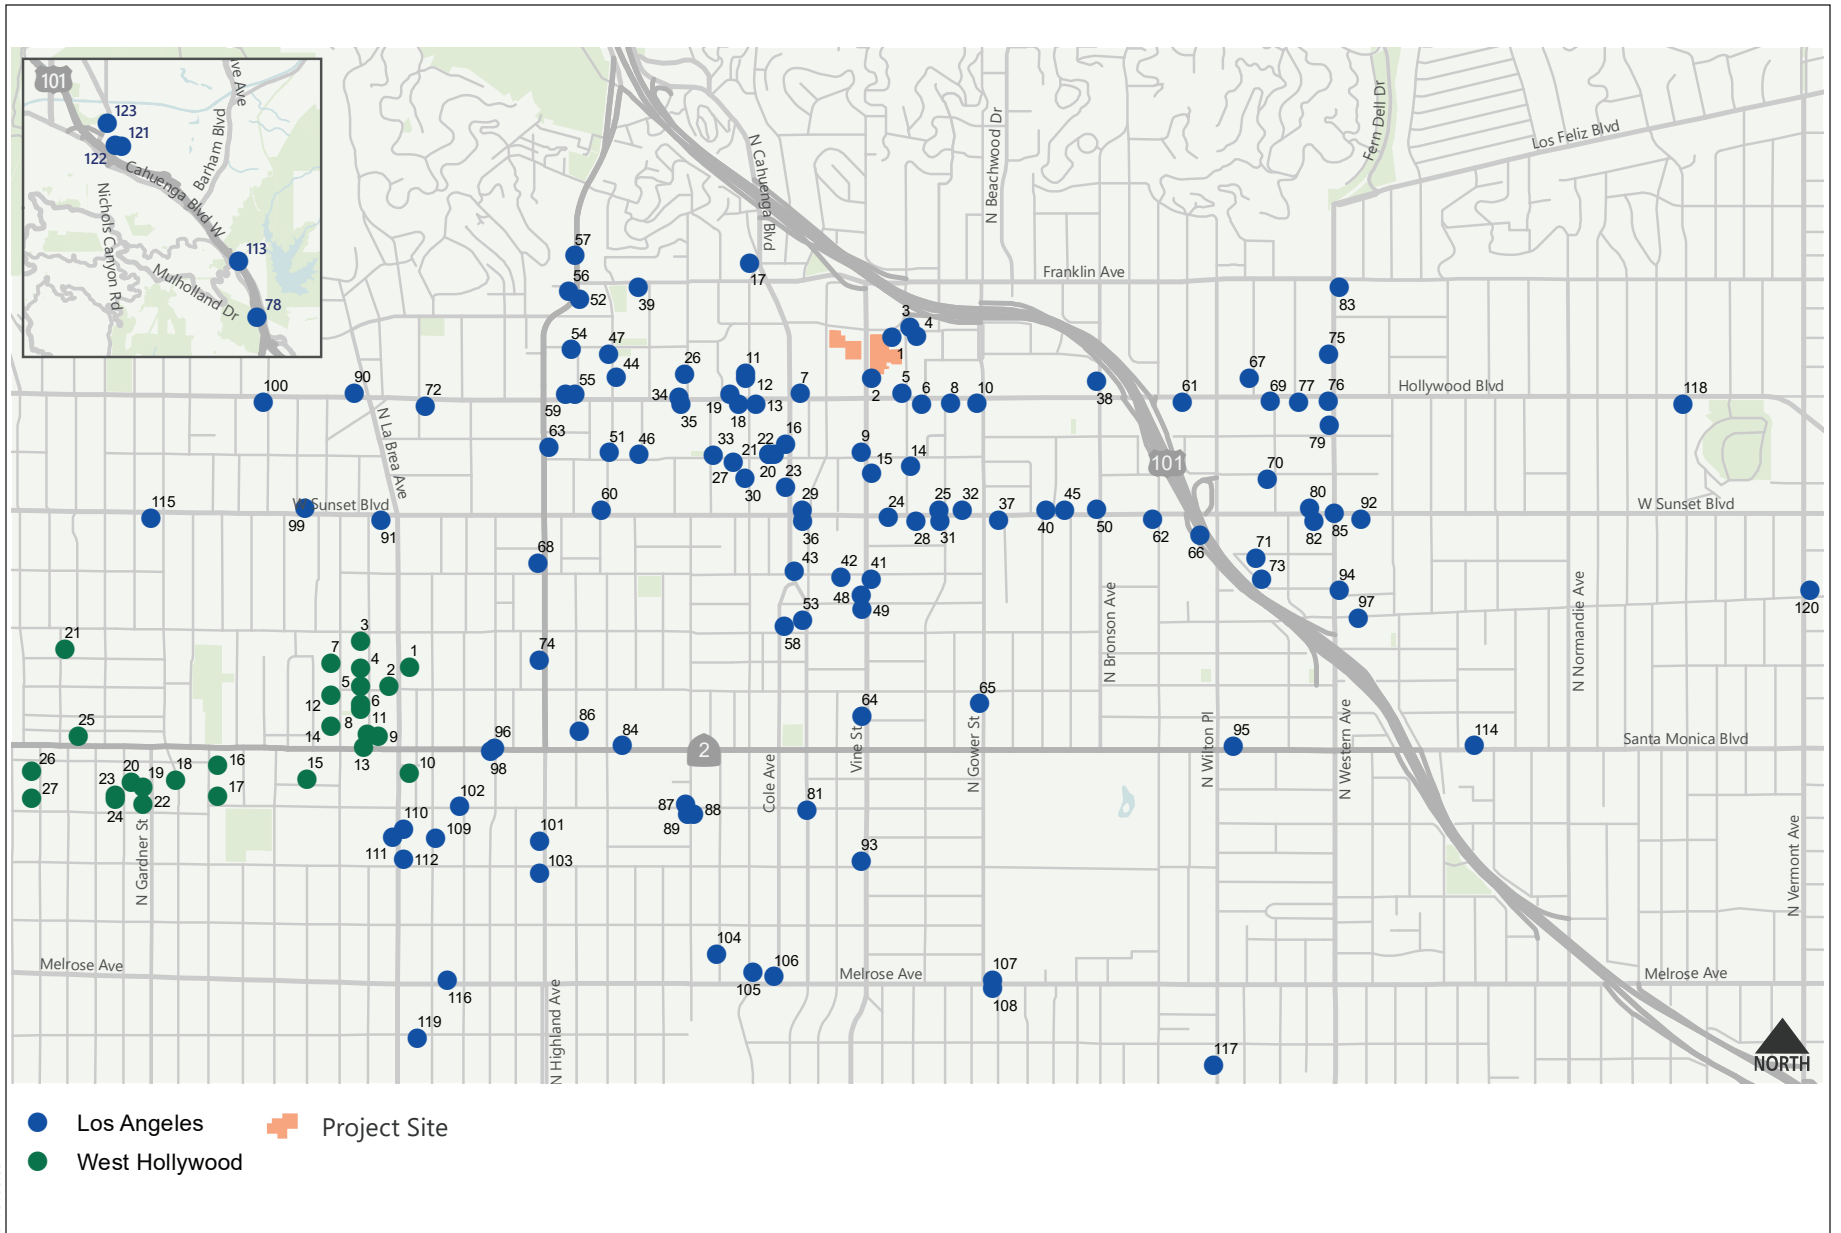

- 7 4. Pursuant to LAMC Section 17.15, a Vesting Tentative Tract Map No. 82152 to allow the merger of 16 existing lots and the subsequent re-subdivision of a 4.613-acre site into three (3) ground lots and 35 airspace lots for a total of 38 lots; the merger of an alley to add 1,313 square feet to the Project Site; ~~and the merger of~~ portions along the sidewalk of Yucca Street, Argyle Avenue, and both sides of Vine Street to add 5,163 square feet to the Project Site, dedicating five-foot wide sidewalk easements over said sidewalk merger areas; an associated haul route for the export of 542,300 cubic yards of soil; and the removal of 16 street trees.
- 8 5. Pursuant to California Government Code Sections 65864 through 65869.5, a Development Agreement between the Applicant and the City of Los Angeles ~~(anticipated to extend through 2040).~~

Chapter III. Environmental Setting

1. Page III-2, the first sentence in the third paragraph under is revised as follows:

The West Site slopes down from northwest to southeast, and ~~Both the West and East Sites slope down from northeast to southwest with elevations ranging from approximately 404 feet above mean sea level (amsl) to 383 feet amsl (i.e., a grade change of approximately 21 feet).~~

2. Page III-18, Figure III-1 is revised as follows:

Chapter IV. Environmental Impact Analysis

Section IV.A, Aesthetics

1. Page IV.A-1, the last sentence of the first paragraph is revised as follows:

~~However, ZI No. 2452 requires that projects in transit priority areas (TPA) be evaluated for consistency with relevant City land use plans and regulations governing scenic quality.~~

2. Page IV.A-6, the third sentence in the last paragraph and the corresponding footnote are revised as follows:

The land use regulations in the Redevelopment Plan remain in effect and continue to be administered by the ~~CRA/LA~~ City.¹²

Footnote 12: CRA/LA, Memorandum dated June 12, ~~2402~~ 2012, Attachment A, Resolution No. 16, adopted June 21, 2012.

3. Page IV.A-25, the second sentence in the last paragraph is revised as follows:

Therefore, pursuant to PRC Section 21099(d)(1) and ZI No. 2452, aesthetic impacts on the environment, ~~other than those related to historical resources, and consistency with regulations that govern scenic quality,~~ are not considered significant.

4. Page IV.A-27, the third sentence of the first full paragraph is revised as follows:

~~The CEQA Guidelines allow that projects in urbanized areas need not evaluate visual character and quality, but must show consistency with zoning and regulations that govern scenic quality.~~

5. Page IV.A-57, the last paragraph, which extends to the first paragraph on page IV.A-58, is revised as follows:

The Project must comply with lighting regulations that govern the orientation and intensity of outdoor lighting, such as illuminated signage, pursuant to LAMC Section 14.4.4 E, and the intensity of exterior lighting at windows and decks of off-site, adjacent residential units, or residential outdoor spaces used for recreational purposes, pursuant to LAMC Section 93.0117(b). However, the determination of compliance is a City police action and is outside the requirements of CEQA for inclusion in the Draft EIR. Respectively, a plan for any new street lighting would be submitted to and must be approved by the Bureau of Street Lighting to ensure that adjacent properties, such as adjacent, off-site residential uses would not be adversely impacted in accordance with City standards.

6. Page IV.A-59, the second paragraph is revised as follows:

Therefore, the Project or the Project with the East Site Hotel Option would not conflict with LAMC lighting regulations, tree replacement regulations, the HSSUD, or the Community Plan's Objective 7 to preserve Hollywood's open space resources. Further, pursuant to PRC Section 21099(d)(1) and ZI No. 2452, scenic resource impacts of a residential mixed-use or employment center project located within a TPA shall not be considered significant impacts on the environment. ~~Therefore, impacts with respect to conflicting with regulations that govern scenic quality would be less than significant.~~

7. Page IV.A-59, the first sentence under (2) Mitigation Measures is revised as follows:

Impacts related to conflicts with applicable zoning and other regulations governing scenic quality were determined to be ~~less than~~ not significant.

8. Page IV.A-59, the paragraph under (3) Level of Significance After Mitigation is revised as follows:

Impacts related to conflicts with applicable zoning and other regulations governing scenic quality were determined to be ~~less than~~ not significant. Therefore, no mitigation measures were required or included, and the impact level remains ~~less than~~ not significant.

Section IV.B, Air Quality

1. Page IV.B-24, the eighth sentence in the first paragraph is revised and new text and footnote are added as follows:

Health and Safety Code Section 39607(e) requires CARB to establish and periodically review area designation criteria. **Table IV.B-2, *South Coast Air Basin Attainment Status (Los Angeles County)***, shows the attainment status of the Air Basin for each criteria pollutant with respect to the ~~State standards~~ NAAQS and CAAQS. The USEPA classifies ozone nonattainment areas based on the severity of their ozone problem, with the 'extreme' classification as the most severe. For the federal 2015 ozone standard of 0.070 parts per million (ppm) (8-hour average), the 'extreme' classification is for areas that have a design value of 0.163 ppm (8-hour average) and above.⁷⁸ The Air Basin is currently in extreme non-attainment for O₃ under the NAAQS.

New Footnote 78: U.S. Environmental Protection Agency, Ozone Designation and Classification Information, <https://www.epa.gov/green-book/ozone-designation-and-classification-information>, accessed June 23, 2020.

2. Page IV.B-38, the first bullet in the last paragraph is revised as follows:

- **Overlapping Construction Scenario:** A construction scenario where construction of the West and East Sites have some overlap (overlapping scenario, with shorter overall construction duration). Under the overlapping construction scenario, with the West Site commencing construction first, the utilities/trenching, site preparation, and grading/excavation phases could begin on the East Site, while the West Site is in the building construction phase. With the East Site commencing construction first, the demolition and utilities/trenching phases followed by site preparation and grading/excavation phases could begin on the West Site, while the East Site is in the building construction phase. ~~the Utilities/Trenching, Site Preparation, and early Grading/Excavation phases could begin on the East Site while the West Site is in the Building Construction phase.~~ In this overlapping construction scenario, construction could be completed in approximately 4.5 years (beginning in 2021 and completion in 2025).

3. Page IV.B-55, the first full paragraph is revised as follows:

The results of the criteria pollutant calculations are presented in **Table IV.B-5, Estimated Maximum Regional Construction Emissions for Project under the Overlapping Construction Scenario – West Site First Scenario** and **Table IV.B-5A, Estimated Maximum Regional Construction Emissions for Project under the Overlapping Construction Scenario – East Site First Scenario**. The calculations in Table IV.B-5 and Table IV.B-5A incorporate compliance with dust control measures required to be implemented during each phase of construction by SCAQMD Rule 403 (Control of Fugitive Dust) and fugitive VOC control measures required to be implemented by architectural coating emission factors based on SCAQMD Rule 1113 (Architectural Coatings).

4. Page IV.B-55 and IV.B-56, the title and shown rows in Table IV.B-5 are revised as follows:

TABLE IV.B-5
ESTIMATED MAXIMUM REGIONAL CONSTRUCTION EMISSIONS FOR THE PROJECT UNDER THE OVERLAPPING CONSTRUCTION SCENARIO – WEST SITE FIRST SCENARIO (POUNDS PER DAY)^a

<u>SCAQMD Thresholds of Significance</u>	<u>75</u>	<u>100</u>	<u>550</u>	<u>150</u>	<u>150</u>	<u>55</u>
<u>Exceeds Thresholds?</u>	<u>No</u>	<u>Yes</u>	<u>No</u>	<u>No</u>	<u>No</u>	<u>No</u>

^a Totals may not add up exactly due to rounding in the modeling calculations. Detailed emissions calculations are provided in Appendix A of this Technical Appendix.

^b Emissions include fugitive dust control measures consistent with SCAQMD Rule 403.

SOURCE: ESA, 2020.

6. Page IV.B-56, the first sentence in the first paragraph is revised as follows:

As shown in Table IV.B-5 and Table IV.B-5A, construction-related daily emissions would exceed the SCAQMD thresholds of significance for NO_x and ~~emissions levels would be below the applicable thresholds of significance.~~

7. Page IV.B-57, a new paragraph is inserted after the second paragraph as follows:

Under the overlapping construction scenario with the West Site commencing construction first, the West Site would be expected to be built out and operational in 2024 with concurrent continued construction of the East Site in 2024, and the full build out of the East Site in 2025. Under the overlapping construction scenario with the East Site commencing construction first, the East Site would be expected to be operational in 2024 with concurrent continued construction of the West Site in 2024, and the full build out of the East Site in 2025. Therefore, the emissions from the overlap of operations of the West Site and East Site construction in year 2024 under the West Site First Scenario, and the emissions from the operations of the East Site and the construction of the West Site in year 2024 under the East Site First Scenario were also calculated and presented below.

8. Page IV.B-57, the last paragraph is revised as follows:

The results of the regional criteria pollutant emission calculations for VOC, NO_x, CO, SO₂, PM10, and PM2.5 are presented in Table IV.B-6, Estimated Maximum Regional Operational Emissions for West Site Buildout and Concurrent East Site Construction in 2024 – West Site First Scenario, Table IV.B-6A, Estimated Maximum Regional Operational Emissions for East Site Buildout and Concurrent West Site Construction in 2024 – East Site First Scenario, Table IV.B-6B, Estimated Maximum Regional

Operational Emissions for West Site Buildout in 2024 – West Site First Scenario, Table IV.B-6C, Estimated Maximum Regional Operational Emissions for East Site Buildout in 2024 – East Site First Scenario, Table IV.B-7, Estimated Maximum Regional Operational Emissions for Project Buildout in 2025, and Table IV.B-8, Estimated Maximum Regional Operational Emissions for the Project with the East Site Hotel Option Buildout in 2025. The operational emissions for West Site Buildout and concurrent East Site construction emissions in 2024 under the West Site First Scenario and the operational emissions for East Site Buildout and concurrent West Site construction emissions in 2024 under the East Site First Scenario would exceed the SCAQMD thresholds of significance for NO_x in year 2024, and the operational-related daily emissions from the Project and the Project with the East Site Hotel Option would exceed the SCAQMD thresholds of significance for NO_x in year 2025. Therefore, operational impacts would be considered potentially significant.

SOURCE: ESA, 2020.

12. Page IV.B-60, the second and third sentences of the first full paragraph are revised as follows:

With implementation of Mitigation Measure AQ-MM-1, the regional NO_x emissions would be reduced to a level below the SCAQMD regional threshold of 100 pounds per day, as shown in **Table IV.B-9, Estimated Maximum Mitigated Regional Construction Emissions for the Project under the Overlapping Construction – West Site First Scenario (Pounds Per Day)** and **Table IV.B-9A, Estimated Maximum Mitigated Regional Construction Emissions for Project under the Overlapping Construction Scenario – East Site First Scenario**. Although Mitigation Measure AQ-MM-1 requires the utilization of non-diesel generators, in the event that non-diesel generators are not available or feasible, use of diesel-powered generators has been accounted for. By implementing mitigation that requires Tier 4 Final off-road emissions standards or equivalent for equipment rated at 50 horsepower (including diesel-powered generators) and employs construction equipment, such as tower cranes, that utilizes electricity from power poles or alternative fuels (i.e., non-diesel), daily construction equipment emissions would be reduced compared to construction equipment without these features.

13. Pages IV.B-60 and IV.B-61, the title and shown rows in Table IV.B-9 are revised as follows:

TABLE IV.B-9

^b The SCAQMD LSTs are based on Source Receptor Area 1 (Central Los Angeles County) for a 2.69-acre site with sensitive receptors conservatively assumed to be located adjacent to the Project Site for operational emissions for LST purposes.

SOURCE: ESA, 2020.

24. Page IV.B-73, the third sentence in the first full paragraph is revised as follows:

Through mandatory compliance with SCAQMD rules, no construction activities or materials are expected to result in other emissions, such as those leading to objectionable odors, affecting a substantial number of people. Furthermore, as shown in Table IV.B-5 and Table IV.B-5A, construction emissions would not exceed the SCAQMD regional significance thresholds for attainment, maintenance, or unclassifiable criteria air pollutants (i.e., CO and SO₂).

25. Page IV.B-73, the fourth sentence in the last paragraph is revised as follows:

Furthermore, as shown in Table IV.B-6, Table IV.B-6A, Table IV.B-6B, Table IV.B-6C, Table IV.B-7, and Table IV.B-8, operational emissions would not exceed the SCAQMD regional significance thresholds for attainment, maintenance, or unclassifiable criteria air pollutants (i.e., CO and SO₂).

26. Page IV.B-75, the second sentence in the last paragraph, which extends to the first paragraph on page IV.B-76, is revised as follows:

Based on the Project-specific level of emissions, cumulative impacts would be potentially significant for construction and operation because regional NO_x emissions would exceed the threshold of significance, as shown in Table IV.B-5, Table IV.B-5A, Table IV.B-6, Table IV.B-6A, and Table IV.B-8.

Section IV.C, Cultural Resources

1. Page IV.C-58, the second sentence of the last paragraph, which extends to the first paragraph on page IV.C-59, is revised as follows:

The Project architecture would maximize focal views toward and through the Project Site, as discussed in Section IV.A. Aesthetics (1) Scenic Vistas, such as views of the Capitol Records Building and the Gogerty Building from sidewalks along Vine Street, Argyle Avenue, and Yucca Street, and from the intersection of Hollywood Boulevard and Vine Street, ~~and a view through a surface parking lot between the Pantages Theatre and the Equitable Building.~~

2. Page IV.C-82 and IV.C-83, the last bullet of Mitigation Measure CUL-MM-2 is revised as follows:

- Appropriate parties shall be notified immediately and corrective steps shall be identified and implemented if movement exceeds predetermined thresholds, calculated amounts, or if new cracks, ~~or~~ distress, or other damage are observed in adjacent structures, sidewalks, buildings, utilities, façades, etc. In the event that settlement due to excavation or construction activity causes damage requiring ~~touch-ups or~~ repairs to the ~~finishes~~ historic features of adjacent historic buildings, (specifically the Capitol Records Building, the Gogerty Building, Pantages Theatre,

Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), that work shall be performed in consultation with a qualified preservation consultant and in accordance with the California Historical Building Code and the Secretary of the Interior's Standards, as appropriate.

- Foundation systems are to be designed in accordance with all applicable loading requirements, including seismic, wind, settlement, and hydrostatic loads, as determined by the California Building Code and in accordance with the recommendations provided by the Project Geotechnical Engineer. Foundation systems are anticipated to consist of a cast-in-place concrete mat foundations supported by cast-in-place concrete drilled shaft or auger cast piles. Driven piles shall not be used.

Section IV.H, Land Use and Planning

1. Page IV.H-10, the last two sentences of the third paragraph and the associated Footnote 15 are revised as follows:

However, the "D" indicates a Development Limitation, which restricts all the lots on the Project Site to a 3:1 FAR, with the exception of one lot (occupying the northwestern corner of the East West Site, which comprises a portion of the Gogerty Building) to a 2:1 FAR.¹⁵ The Applicant has requested a Density Bonus Compliance Review pursuant to California's Density Bonus Law and the City's Density Bonus Ordinance related to the inclusion of Very Low Income residential units. The change in the entitlement request would allow for an FAR of 7:1. The Project proposes to remove this "D" Limitation through a proposed Zone Change and Height District Change for the Project Site.

Footnote 15: The Development Limitation is pursuant to Ordinance No. 165,659. Ordinance No. 165,659 restricts the lots with Assessor's Parcel Numbers (APN) 5546-004-006, 5546-004-020, 5546-004-021, 5546-004-029, 5546-030-028, 5546-030-031, 5546-030-032, 5546-030-033, and 5546-030-034 to a 3:1 FAR, whereas the lot with APN 5546-030-032-5546-004-032 has a 2:1 FAR.

2. Page IV.H-12, the following footnote is added to the last sentence of the first full paragraph as follows:

On September 30, 2019, under authority granted in the Redevelopment Dissolution statutes, the Los Angeles City Council and Mayor approved a resolution and accompanying Ordinance No. 186,325 to transfer from the CRA/LA to the City of Los Angeles all responsibility for land use related plans and functions in the 19 remaining Redevelopment Project Areas.²²

Footnote 22: There is pending litigation (AIDS Healthcare Foundation v. City of Los Angeles, LASC Case No.19STCP04589) regarding the validity of the City's transfer of the land use function of the CRA/LA to itself. However, this pending case is not relevant to the Project's CEQA analysis of the Project because the litigation outcome would not change the Project EIR's CEQA analysis. That is, the pending litigation is not relevant as it only relates to the City's authority to transfer the CRA/LA land use functions to itself and is not dispositive of the Project's consistency with the Plan. Consequently, even if the plaintiff in the pending litigation prevails against the City with their asserted claims, the only change with respect to the Project would be who provides the Redevelopment Plan approvals and makes the necessary findings. Thus, the litigation outcome would have no impact on the environmental impacts of the Project nor the EIR's environmental analysis.

Additionally, there is pending litigation (Hollywood Heritage, Inc. v. City of Los Angeles, LASC Case No. 19STCV45352) similarly challenging the City's transfer of the land use function of the CRA/LA to itself and specifically to compliance with a settlement agreement between the CRLA/LA and plaintiffs regarding implementation of portions of the Hollywood Redevelopment Plan which constitutes a contractual dispute between the parties. Like the AIDS Healthcare Foundation case, this pending litigation is not relevant since the litigation outcome would have no impacts on the environmental impacts of the Project nor the EIR's environmental analysis.

3. Page IV.H-23, the last paragraph is revised as follows:

To allow for development of the Project, the Applicant has requested a Density Bonus Compliance Review pursuant to California's Density Bonus Law and the City's Density Bonus Ordinance related to the inclusion of Very Low Income residential units, the zoning would be amended to C2-2-SN to eliminate the "D" Limitation, which limits FAR to 3:1 and 2:1 on certain parcels. The Project Site is not subject to height limits. The requested removal of the "D" Limitation would allow an increase in floor area, which is consistent with the Project Site's Regional Center designation. The Project also requests a Conditional Use Permit as a unified, mixed-use development pursuant to LAMC Section 12.24 W.19 to allow FAR averaging to permit the FAR to be calculated as a whole rather than by individual parcel or lot and for a residential density transfer between the West Site and East Site.

Under the Density Bonus Compliance Review, which requires reserving at least 11 percent of the Project's units for Very Low Income households, the Applicant is seeking the following incentives and waivers: (a) An On-Menu Incentive to permit a 35 percent increase in the maximum allowable floor area ratio (FAR) from 2:1 to 2.7:1 (for portions of the Project Site located at the corner lot on the southeast corner of Yucca Street and Ivar Avenue and associated with APN 5546-004-032); and from 3:1 to 4.05:1 FAR (for the balance of the Project Site); (b) An Off-Menu Incentive to allow FAR and density averaging for a Housing Development Project located on non-contiguous lots; (c) A Waiver of Development Standards to permit a 7:1 FAR averaged across the Project Site; and (d) A Waiver of Development Standards to permit the floor area of any residential

~~balconies and terraces to be excluded for purposes of calculating the total floor area, as applicable. In addition, pursuant to LAMC Section 11.5.11(e) and California Government Code Section 65915(k) or the Transit Oriented Communities Affordable Housing Incentive Program, three incentives, concessions, reductions, or modifications of zoning code requirements would be requested to offset affordable housing costs as follows: and include a 35 percent FAR bonus (from 6:1 FAR) to allow an FAR up to 7:1; and a development modification to allow the floor area of any residential balconies and terraces to be excluded for purposes of calculating the buildable floor area.~~

4. Page IV.H-23, footnote 25 is revised as follows:

The Development Limitation is pursuant to Ordinance No. 165,659. Ordinance No. 165,659 restricts the lots with Assessor’s Parcel Numbers (APN) 5546-004-006, 5546-004-020, 5546-004-021, 5546-004-029, 5546-030-028, 5546-030-031, 5546-030-032, 5546-030-033, and 5546-030-034 to a 3:1 FAR whereas the lot with APN ~~5546-030-032~~ 5546-004-032 has a 2:1 FAR.

5. Page IV.H-25, the first and second sentences in the first full paragraph are revised as follows:

The Project proposes the sale of a full line of alcoholic beverages in association with the proposed 30,176 square feet of commercial/restaurant uses ~~and for any alcohol uses associated with the hotel under the Project with the East Site Hotel Option.~~ Pursuant to LAMC Section 12.24 W.1, a Master Conditional Use Permit for the sale or dispensing of alcoholic beverages for on-site and off-site consumption at 12 establishments would be required, ~~and a Master Conditional Use Permit may be requested.~~

6. Page IV.H-27, the first sentence in the last paragraph is revised as follows:

Approval of the Project’s requested entitlements, ~~including the Zone and Height District Change, Conditional Use Permits,~~ Site Plan Review and related findings and conditions to ensure compatibility with surrounding land uses would bring the Project into consistency with the Framework Element, Hollywood Community Plan, Hollywood Redevelopment Plan, and LAMC.

Section IV.I, Noise

1. Page IV.I-18, the shown rows in Table IV.I-4 are revised as follows:

6	North – AMDA Vine building	Category II
18 and 19	Capitol Records Complex (Capitol Records Building and Gogerty Building located on-site within the Project East Site)	Category IV

2. Page IV.I-31, the first sentence in the last paragraph under (1) Construction is revised as follows:

As discussed in Chapter II, *Project Description*, of this Draft EIR, construction of the Project is anticipated to commence as early as 2021 at the West Site or at the East Site and be completed as early as 2025 (assuming overlap between West Site and East Site construction).

3. Page IV.I-33, the bullets under the first paragraph are revised as follows:

- Project construction and operational activities cause groundborne vibration levels to exceed 65 VdB at off-site sensitive buildings where vibration would interfere with interior operations.
- Project construction and operational activities cause groundborne vibration levels to exceed 72 VdB at off-site sensitive uses, including residential and ~~theater~~ uses buildings where people normally sleep.

4. Page IV.I-34, the third sentence in the first paragraph is revised as follows:

Under the overlapping construction scenario with the West Site commencing construction first, the utilities/trenching, site preparation, and grading/ excavation phases could begin on the East Site, while the West Site is in the building construction phase. With the East Site commencing construction first, the demolition and utilities/trenching phases followed by site preparation and grading/excavation phases could begin on the West Site, while the East Site is in the building construction phase.

5. Page IV.I-36, the second sentence and the last sentence in the second paragraph are revised as follows:

For similar reasons, ~~the AMDA Vine Building, the AMDA Tower Building,~~ the Argyle House at the southwest corner of Yucca Street/Argyle Avenue, and the Easttown residential building are also evaluated based on the significance threshold for FTA Building Category I for potential structural damage. The AMDA Vine Building is evaluated based on the significance threshold for FTA Building Category II for potential structural damage. ... Vibration receptor buildings that are considered off-site historic structures, as listed in Table IV-I-4, are evaluated based on the significance threshold for FTA Building Category IV for potential structural damage.

6. Page IV.I-40, the first and second sentences in the last paragraph are revised as follows:

In addition, **Table IV.I-10, *Construction Noise Levels – Overlapping Construction Scenario – West Site First*, and Table IV.I-10A, *Construction Noise Levels – Overlapping Construction Scenario – East Site First***, provides the estimated noise levels due to overlapping construction activities between the West Site and East Site. **As indicated in Table IV.I-10 and Table IV.I-10A, the estimated noise levels due to overlapping construction activities between the West Site and East Site under both the Project and the Project with the East Site Option would exceed the significance threshold**

at receptors 1, 3, and 5 through 13, and, therefore, construction noise impacts under the overlapping construction scenario would be potentially significant.

7. Page IV.I-43, Table IV.I-10's title is revised as follows:

Table IV.I-10
Construction Noise Levels – Overlapping Construction Scenario – West Site First

8. Page IV.I-44, Table IV.I-10A is inserted as follows:

**TABLE IV.I-10A
CONSTRUCTION NOISE LEVELS – OVERLAPPING CONSTRUCTION SCENARIO – EAST SITE FIRST**

<u>Estimated Noise Levels by Overlapping Construction, dBA (L_{eq})</u>										<u>Significance Threshold,^a dBA (L_{eq})</u>	<u>Potentially Significant Impact?</u>
<u>Location</u>	<u>East Site Demo and Drainage/Utilities/Trenching</u>	<u>East Site Building Const., West Site Demo, and Drainage/Utilities/Trench</u>	<u>East Site Building Const., West Site Demo, Site Prep., and Grading</u>	<u>East Site Building Const. and Arch. Coating, and West Site Grading</u>	<u>East Site Building Const. and Arch. Coating, and West Site Found-ation</u>	<u>East Site Building Const. and Arch. Coating, and West Site Building Const.</u>	<u>East Site Building Const., Arch. Coating, and Paving, and West Site Building Const.</u>	<u>East Site Building Const. and Arch. Coating, and West Site Building Const. and Arch. Coating</u>	<u>West Site Building Const., Arch. Coating, and Paving</u>

<u>8</u>	<u>69.4</u>	<u>70.2</u>	<u>84.4</u>	<u>80.7</u>	<u>81.2</u>	<u>81.4</u>	<u>81.6</u>	<u>81.9</u>	<u>85.6</u>	<u>65.1</u>	<u>Yes</u>
<u>9</u>	<u>74.8</u>	<u>75.4</u>	<u>99.8</u>	<u>94.6</u>	<u>96.4</u>	<u>96.5</u>	<u>96.5</u>	<u>97.1</u>	<u>100.5</u>	<u>65.1</u>	<u>Yes</u>
<u>10</u>	<u>74.8</u>	<u>75.4</u>	<u>82.9</u>	<u>79.6</u>	<u>79.9</u>	<u>80.1</u>	<u>80.9</u>	<u>80.6</u>	<u>83.8</u>	<u>73.1</u>	<u>Yes</u>
<u>11^b</u>	<u>73.3</u>	<u>73.6</u>	<u>83.6</u>	<u>80.1</u>	<u>80.5</u>	<u>80.7</u>	<u>81.2</u>	<u>81.2</u>	<u>84.6</u>	<u>73.1</u>	<u>Yes</u>
<u>12</u>	<u>84.1</u>	<u>84.4</u>	<u>81.2</u>	<u>81.2</u>	<u>81.2</u>	<u>81.2</u>	<u>84.8</u>	<u>81.2</u>	<u>74.7</u>	<u>68.2</u>	<u>Yes</u>
<u>13^b</u>	<u>75.5</u>	<u>75.9</u>	<u>73.1</u>	<u>73.0</u>	<u>72.8</u>	<u>72.9</u>	<u>76.3</u>	<u>72.9</u>	<u>68.1</u>	<u>67.7</u>	<u>Yes</u>

^a Significance thresholds are equivalent to the measured daytime ambient noise levels plus 5 dBA.

^b Receptor locations with acoustic line-of-sight to the Project construction site blocked.

Bold-faced represents noise levels exceeded the significance threshold.

SOURCE: AES, Construction Noise & Vibration Impact Study, March 2020. Provided in Appendix K-1 of this Draft EIR.

9. Page IV.I-44, new text at the end of the first paragraph is added as follows:

Similar numbers of worker and truck trips would occur if the East Site commences construction first, with overlapping of the building construction phase at the East Site and the utilities/trenching, site preparation, and grading/excavation phases at the West Site. Therefore, the analysis is representative of the maximum noise levels from construction of the West Site commencing first or construction of the East Site commencing first.

10. Page IV.I-54, Table IV.I-13, which was inadvertently omitted in the Draft EIR, is inserted as follows:

SOURCE: ESA, 2020.

11. Pages IV.I-74 and IV.I-75, Mitigation Measures NOI-MM-1, NOI-MM-2, and NOI-MM-3 are revised as follows:

NOI-MM-1: Setback Distances and Boundary Noise Curtains. Noise and vibration construction equipment whose specific location on the Project Site may be flexible (e.g., compressors and generators) shall be located away from the nearest off-site sensitive land uses (at least 100 feet away), or natural and/or manmade barriers (e.g., intervening construction trailers) shall be used to screen propagation of noise from such equipment towards these land uses. Even with natural and/or manmade barriers, in no case shall fixed stationary equipment, stockpiling of construction materials, equipment warm-up areas, water tanks, and equipment storage areas be within 40 feet from the property line of off-site historic buildings. If manmade barriers are to be used, the contractor shall be required to use temporary construction noise barriers, such as sound deadening blankets or curtains, with a height up to 20 feet above ground that shall achieve a performance standard of a minimum 12-dBA insertion loss along the Project Site's boundary where significantly impacted noise-sensitive land uses are within 500 feet of the Project Site. The temporary construction noise barriers shall be installed on or around the Project Site perimeter and/or along soldier piles that shall be drilled and cast in place during shoring activities. Open access points or gates leading to street frontages, including along Ivar Avenue, Vine Street, and Argyle Avenue, shall be permissible to allow for adequate and safe worker, vehicle, and equipment access to the construction area. The temporary construction noise barriers installed on or around the soldier piles shall remain in-place during ground disturbance activities until exterior vertical building construction commences, when the use of on-site noise-generating heavy-duty construction equipment is prevalent.

NOI-MM-2: Equipment Noise Shielding, Mufflers, and Stationary Curtains. The Project contractor shall use power construction equipment with state-of-the-art factory-installed noise shielding and muffling devices. In addition, no impact pile driving shall be

utilized; augured, or drilled piles are permitted. Flexible sound control curtains that achieve a performance standard of a minimum 12-dBA insertion loss with appropriate open access points or gates to allow for adequate and safe worker, vehicle, and equipment access shall be placed around all drilling apparatuses, drill rigs, stationary concrete pumps, stationary generators, and jackhammers when in use.

NOI-MM-3: Construction Liaison. A construction liaison shall be provided to inform the nearby receptors 1, 3, and 5 through 13 when peak noise and vibration activities are scheduled to occur. Two weeks prior to the commencement of construction at the Project Site, notification shall be provided to these receptor properties that discloses the construction schedule, including the various types of activities and equipment that would be occurring throughout the duration of the construction period. The construction liaison shall coordinate with the owner/operator of the Pantages Theatre to minimize disruptions to performances during the performance times starting at 8:00 p.m., Tuesday through Saturday, and 2:00 p.m. on Saturday afternoon from Project construction noise and vibration near the Pantages Theatre.

12. Page IV.I-78, the first full sentence in the first paragraph is revised as follows:

The estimated vibration levels at the buildings adjacent to the north and south of the West Site and East Site construction areas would be up to 3.379 inch/second PPV, which would exceed the 0.50 inch/second PPV significance threshold (FTA Category I, Reinforced concrete, steel, or timber building) at ~~the AMDA Vine building and the Argyle House at the southwest corner of Yucca/Argyle,~~ the 0.30 inch/section PPV significance threshold (Category II, Engineered concrete and masonry) at the AMDA Vine Building, and the 0.12 inch/second PPV significance threshold (FTA Category IV, Buildings extremely susceptible to building damage) at the Avalon Hollywood and the Pantages Theatre.

13. Pages IV.I-79, the shown rows in Table IV.I-17 is revised as follows:

North – 6. AMDA Vine building ^f	3.379	1.432	1.432	1.223	0.563	0.048	<u>0.30^g</u> 0.50 ^e	Yes
---	-------	-------	-------	-------	-------	-------	---	------------

^a Represents off-site building structures located nearest to the Project Site to the north, south, east and west.

^b Vibration level calculated based on FTA reference vibration level at 25-foot distance.

^c FTA criteria buildings extremely susceptible to building damage. Significance threshold for the Hollywood Equitable Building is conservative as it is a concrete building, which would have higher vibration limits.

^d FTA criteria for non-engineered timber and masonry buildings.

^e FTA criteria for reinforced concrete, steel or timber buildings.

^f The Project construction activities would be up to the property line adjacent to the buildings. Vibration levels at the property line are best estimate as the FTA reference data are at 25 feet distance and FTA calculation procedure is generally applicable to distances greater than 25 feet.

^g FTA criteria for engineered concrete and masonry buildings.

SOURCE: AES, Construction Noise & Vibration Impact Study, March 2020. Provided in Appendix K-1 of this Draft EIR.; ESA, 2020.

14. Pages IV.I-82, the shown rows in Table IV.I-18 have been revised as follows:

Off-Site Receptor Location	Estimated Vibration Velocity Levels at the Nearest Off-Site Structures from the Project Construction Equipment, ^a VdB						Significance Threshold, dBA (L _{eq}) VdB	Potentially Significant Impacts?
	Vibratory Roller	Large Bulldozer	Caisson Drilling	Loaded Trucks	Jack-hammer	Small Bulldozer		
9	63	56	56	55	48	27	72 <u>65</u>	No

15. Page IV.I-83, the shown rows in Table IV.I-19 have been revised as follows:

Off-Site Receptor Location	Estimated Vibration Velocity Levels at the Nearest Off-Site Structures from the Project Construction Equipment, ^a VdB						Significance Threshold, dBA (L _{eq}) VdB	Potentially Significant Impacts?
	Vibratory Roller	Large Bulldozer	Caisson Drilling	Loaded Trucks	Jack-hammer	Small Bulldozer		
9	119	112	112	111	104	83	72 <u>65</u>	Yes

16. Pages IV.I-84 to IV.I-86, the first paragraph and Mitigation Measure NOI-MM-4 are revised as follows:

The In addition to Mitigation Measure NOI-MM-1, which restricts the use of stationary equipment near off-site historic buildings, the following mitigation measures would reduce potentially significant impacts regarding structural vibration damage:

NOI-MM-4: Vibration Monitoring. The Applicant shall perform structural vibration monitoring during Project construction as follows:

- a. Prior to start of construction, the Applicant shall retain the services of a licensed building inspector or structural engineer, or other qualified professional as approved by the City, to visit the following buildings, which are located either on-site or immediately adjacent to the Project Site and to the west, to inspect and document (video and/or photographic) the apparent physical condition of the building’s readily-visible features. This includes both historic buildings and non-historic buildings in proximity to the Project Site. For the historic buildings listed below, inspection and documentation shall also be carried out by and in coordination with a qualified preservation consultant. The non-historic buildings are as follows:
 - AMDA Vine Building
 - Argyle House

- Single-story commercial building at 1718 N. Vine Street (if this building has been issued demolition permits or has already been demolished as part of Related Project No. 2, the provisions of this mitigation measure do not apply to this structure).

The historic buildings are as follows:

- Capitol Records Building (on-site)
 - Gogerty Building (on-site)
 - Pantages Theatre (off-site)
 - Avalon Hollywood (off-site)
 - 6316-24 Yucca Street/Art Deco Building Storefront (off-site)
- b. The Applicant shall retain the services of a qualified acoustical engineer and/or structural engineer to develop and implement a vibration monitoring program during the site demolition and grading/excavation, capable of documenting the construction-related ground vibration levels at the buildings listed above. The vibration monitoring systems shall be placed at receptor building façades closest to Project construction activity or placed at a representative location if a receptor building façade is not accessible and shall continuously measure (in vertical and horizontal directions) and store the peak particle velocity (PPV) in inch/second. The systems shall also be programmed for two preset velocity levels: a warning level of 0.10-0.09 inch/second (PPV) for the off-site historic structures, 0.15 inch/second (PPV) for the single-story commercial building at 1718 N. Vine Street (not required if this building has been issued demolition permits or has already been demolished as part of Related Project No. 2), 0.25 inch/second (PPV) for the AMDA Vine Building, and 0.45 inch/second (PPV) for the Capitol Records Building, Gogerty Building, ~~AMDA Vine Building~~ and the Argyle House and a regulatory level of 0.12 inch/second (PPV) for the off-site historic structures, 0.2 inch/second (PPV) for the single-story commercial building at 1718 N. Vine Street (not required if this building has been issued demolition permits or has already been demolished as part of Related Project No. 2), 0.30 inch/second (PPV) for the AMDA Vine Building, and 0.50 inch/second (PPV) for the Capitol Records Building, Gogerty Building, ~~AMDA Vine Building~~ and the Argyle House. In cases where a receptor building façade is not accessible, the two preset velocity levels shall be programmed at equivalent levels based on distance and soil characteristics that affect vibration transmission over that distance. The systems shall also provide real-time alert when the vibration levels exceed the two preset levels. The noise and vibration monitoring program shall include a description of the monitoring equipment specifications, calibration certificates, exact monitoring locations (which shall be coordinated with the property owners for the buildings listed in “a.” above), and protocols for data collection, reporting, alerting, maintenance and calibration, and unplanned outage. Selected monitoring systems shall be capable of unmanned operation during periods of on-site Project construction activity, with internal storage and remote data download. Systems shall be

capable of measuring the inch/second PPV in all three axes (vertical and two horizontal) simultaneously. The monitoring program shall specify the protocols for threshold exceedance, including, but not be limited to, which personnel are designated to receive alerts, how the alerts shall be sent (text message, email, etc.), and how the vibration event shall be documented and reported. The program shall include regular reporting no less frequently than weekly.

- c. The vibration monitoring program shall be submitted, for review and approval to the Department of Building and Safety, prior to initiating any construction activities.
- d. In the event the warning level (i.e., ~~0.10-0.09~~, 0.15, 0.25, and 0.45 inch/second [PPV], or equivalent levels) is triggered, the contractor shall identify the source of vibration generation and provide feasible steps to reduce the vibration level, including but not limited to staggering concurrent vibration-generating construction activities (if doing so would not pose a safety risk to personnel or damage risk to buildings or facilities) and utilizing lower vibratory techniques.
- e. In the event the regulatory level (i.e., 0.12, 0.20, 0.30, and 0.50 inch/second [PPV], or equivalent levels) is triggered, the contractor shall identify the source of vibration generation and implement feasible steps identified in Item “d” above to reduce the vibration level from construction activities to avoid or minimize damage from construction activities in the vicinity of the building. The contractor shall visually inspect the building for any damage. Results of the inspection must be logged.
- ~~f. In the event that the regulatory ground vibration levels are exceeded and there is documented evidence including a visual inspection that no damage to historic structures has occurred, the ground vibration levels can be increased to the criteria for the previous building structural category in increments as follows, subject to review and approval by the City, up to a maximum regulatory ground vibration level of 0.5 inch/second (PPV), or equivalent level.~~
- ~~• From Category IV to Category III (0.12 to 0.2 inch/second [PPV], or equivalent level),~~
 - ~~• From Category III to Category II (0.2 to 0.3 inch/second [PPV], or equivalent level), or~~
 - ~~• From Category II to Category I (0.3 to 0.5 inch/second [PPV], or equivalent level).~~

~~If the regulatory ground vibration level is increased, the warning level shall also be increased matching the corresponding Category as follows (or equivalent levels):~~

- ~~• Category I: 0.45 inch/second [PPV]~~
- ~~• Category II: 0.25 inch/second [PPV]~~
- ~~• Category III: 0.15 inch/second [PPV]~~
- ~~• Category IV: 0.10 inch/second [PPV]~~

- ~~g. If new regulatory and warning levels are set pursuant to Item “f” above, they can be exceeded and increased again pursuant to the same requirements in Item “f”.~~
- ~~h. f. In the event damage occurs to the historic features of historic buildings (finish materials) due to construction vibration, such features/materials shall be repaired in consultation with a qualified preservation consultant, and, if warranted, in a manner that meets the Secretary of the Interior’s Standards.~~

17. Page IV.I-86, the first sentence in the last paragraph is revised as follows:

Vibration impacts regarding human annoyance at the nearby noise sensitive receptors would exceed the significance thresholds (65 VdB at buildings where vibration would interfere with interior operations, 72 VdB at residential uses and buildings where people normally sleep, and 75 VdB at institutional uses).

Section IV.K.1, Fire Protection

1. Page IV.K.1-10, the shown row in Table IV.K.1-1 is revised as follows:

Fire Station 76 3111 N. Cahuenga Boulevard	2.3 miles northwest ^e	7:41	7:35	Assessment Engine Paramedic Rescue Ambulance
--	----------------------------------	------	------	---

Section IV.K.2, Police Protection

1. Page IV.K.2-19, the last two sentences of the first paragraph are revised as follows:

These security features would help reduce the potential for on-site crimes, including loitering, theft, and burglaries, and would reduce demand for LAPD services. Project Design Feature POL-PDF-2 provides for a 24-hour/seven-day security program which would include 24-hour security cameras and full-time security personnel who could respond to any unlawful behavior, if any, resulting from on-site alcohol consumption, including excessively loud and disruptive behavior, thus reducing the demand for police protection services. Additionally, the Project Applicant would contribute to the local Business Improvement District (BID), which has a seven day a week security patrol, which would assist in safety services and potentially increase patrols, thereby reducing the Project’s need for additional LAPD services.

Section IV.N.1, Wastewater

- Page IV.N.1-14, the shown rows in Table IV.N.1-2 are revised as follows:

Retail ^f	16,882 sf	50/1,000 sf	844
---------------------	-----------	-------------	-----

NOTES: du = dwelling units; sf = square feet, gpd = gallons per day, cf = cubic feet

- a The generation rates are based on the LASAN sewerage generation factors.
- b ~~To calculate the number of seats, 1 seat per 15 sf was assumed. The number of restaurant seats is based on the assumption that the entirety of the commercial uses are full service restaurant. The number of seats provided is based on design estimates regarding the number of seats that can fit within the commercial space and outdoor seating.~~
- c The lounge use includes a library, multipurpose rooms, kid rooms, and general amenity space.
- d The swimming pool use includes a 21-cubic-foot water feature.
- e Totals may not add up due to rounding.
- f The wastewater generation for retail is in addition to the restaurant use wastewater generation, which accounts for the entire 30,176 sf of commercial space as restaurant space. As such, the inclusion of retail wastewater generation provides a conservative estimate of wastewater generation.

Chapter V. Alternatives

- Page V-6, the shown row in Table V-1 is revised as follows:

Work VMT per Employee	N/A	4.8	N/A	N/A	N/A	5.0	N/A	N/A	4.5	4.7 <u>5.0</u>
-----------------------	-----	-----	-----	-----	-----	-----	-----	-----	-----	---------------------------

- Page V-43, the third sentence in the second to last paragraph is revised as follows:

Although the State and City have not established quantitative values for GHG emissions, in order to comply with policies and regulations adopted for the purpose of reducing or mitigating GHG emissions, Alternative 2, as with the Project, would incorporate ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1.

- Page V-43, the first sentence in the last paragraph is revised as follows:

Alternative 2, as with the Project, with incorporation of ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1, would be consistent with applicable strategies outlined in CARB’s Climate Change Scoping Plan, SCAG’s 2016-2040 RTP/SCS, Sustainable City pLAN, and the City’s Green Building Code.

- The construction traffic noise analysis for Alternative 2 correctly indicates that off-site construction traffic noise would be “Similar to the Project”, which were identified in Section IV.I, *Noise*, on page IV.I-76 as less than significant, with exception of temporary significant and unavoidable impacts on Yucca Street between Argyle Avenue and N. Gower Street. Table V-15, on page V-323, also indicates construction noise impacts under Alternative 2 would be significant and unavoidable. Page V-52, the fourth sentence in the first paragraph is corrected as

follows to indicate Alternative 2's construction noise impacts would be similar to the Project, which is stated as such in the Alternative 2 analysis:

Similar to the Project, maximum construction traffic would not result in significant noise levels (greater than 5 dBA L_{eq}) compared to existing traffic noise levels along any of the studied roadway segments, ~~and impacts would be less than significant with the exception of Yucca Street between Argyle Avenue and Gower Street.~~

5. Page V-66, the second sentence in the first paragraph under (i) Efficient Energy Consumption is revised as follows:

These require USGBC LEED Gold Certification energy performance optimization features such as reducing building energy cost by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards and installing energy efficient appliances.

6. Page V-67, the second sentence in the first paragraph under (ii) Conflict with Plans for Renewable Energy or Energy Efficiency is revised as follows:

Alternative 2, as with the Project, would be designed to meet the USGBC LEED Gold Certification including energy performance optimization features, such as reducing building energy demand by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards.

7. Page V-85, the third sentence in the second to last paragraph is revised as follows:

Although the State and City have not established quantitative values for GHG emissions, in order to comply with policies and regulations adopted for the purpose of reducing or mitigating GHG emissions, Alternative 3, as with the Project, would incorporate ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1.

8. Page V-85, the first sentence in the last paragraph is revised as follows:

Alternative 3, as with the Project, with incorporation of ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1, would be consistent with applicable strategies outlined in CARB's Climate Change Scoping Plan, SCAG's 2016-2040 RTP/SCS, Sustainable City pLAn, and the City's Green Building Code.

9. The construction traffic noise analysis for Alternative 3 correctly indicates that off-site construction traffic noise would be "Similar to the Project", which were identified in Section IV.I, *Noise*, on page IV.I-76 of the Draft EIR as less than significant, with exception of temporary significant and unavoidable impacts on Yucca Street between Argyle Avenue and N. Gower Street. Table V-15, on page V-323, also indicates construction noise impacts under Alternative 3 would be significant and unavoidable. Page V-93, the fourth sentence in the first paragraph

is corrected as follows to indicate Alternative 3's construction noise impacts would be similar to the Project, which is stated as such in the Alternative 3 analysis:

Similar to the Project, maximum construction traffic would not result in significant noise levels (greater than 5 dBA L_{eq}) compared to existing traffic noise levels along any of the studied roadway segments, ~~and impacts would be less than significant with the exception of Yucca Street between Argyle Avenue and Gower Street.~~

10. Page V-107, the second sentence in the first paragraph under (i) Efficient Energy Consumption is revised as follows:

These require USGBC LEED Gold Certification energy performance optimization features such as reducing building energy cost by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards and installing energy efficient appliances.

11. Page V-108, the second sentence in the first paragraph under (ii) Conflict with Plans for Renewable Energy or Energy Efficiency is revised as follows:

Alternative 3, as with the Project, would be designed to meet the USGBC LEED Gold Certification including energy performance optimization features, such as reducing building energy demand by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards.

12. Page V-126, the third sentence in the last paragraph is revised as follows:

Although the State and City have not established quantitative values for GHG emissions, in order to comply with policies and regulations adopted for the purpose of reducing or mitigating GHG emissions, Alternative 3 4, as with the Project, would incorporate ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1.

13. Page V-127, the first sentence in the first full paragraph is revised as follows:

Alternative 4, as with the Project, with incorporation of ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1, would be consistent with applicable strategies outlined in CARB's Climate Change Scoping Plan, SCAG's 2016-2040 RTP/SCS, Sustainable City pLAN, and the City's Green Building Code.

14. Page V-127, the second to last sentence in the first full paragraph is revised as follows:

As such, Alternative 4 would not exceed the Central APC's employee threshold standard of ~~7.5~~ 7.6.

15. The construction traffic noise analysis for Alternative 4 correctly indicates that off-site construction traffic noise would be "Similar to the Project", which were identified in Section IV.I, *Noise*, on page IV.I-76 of the Draft EIR as less than

significant, with exception of temporary significant and unavoidable impacts on Yucca Street between Argyle Avenue and N. Gower Street. Table V-15, on page V-323, also indicates construction noise impacts under Alternative 4 would be significant and unavoidable. Page V-135, the third sentence from the last in the first paragraph is corrected as follows to indicate Alternative 4's construction noise impacts would be similar to the Project, which is stated as such in the Alternative 4 analysis:

Similar to the Project, maximum construction traffic would not result in significant noise levels (greater than 5 dBA L_{eq}) compared to existing traffic noise levels along any of the studied roadway segments, ~~and impacts would be less than significant with the exception of Yucca Street between Argyle Avenue and Gower Street.~~

16. Page V-149, the second sentence in the first paragraph under (i) Efficient Energy Consumption is revised as follows:

These require USGBC LEED Gold Certification energy performance optimization features such as reducing building energy cost by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards and installing energy efficient appliances.

17. Page V-150, the second sentence in the first paragraph under (ii) Conflict with Plans for Renewable Energy or Energy Efficiency is revised as follows:

Alternative 4, as with the Project, would be designed to meet the USGBC LEED Gold Certification including energy performance optimization features, such as reducing building energy demand by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards.

18. Page V-168, the third sentence in the second to last paragraph is revised as follows:

Although the State and City have not established quantitative values for GHG emissions, in order to comply with policies and regulations adopted for the purpose of reducing or mitigating GHG emissions, Alternative 5, as with the Project, would incorporate ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1.

19. Page V-168, the first sentence in the last paragraph is revised as follows:

Alternative 5, as with the Project, with incorporation of ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1, would be consistent with applicable strategies outlined in CARB's Climate Change Scoping Plan, SCAG's 2016-2040 RTP/SCS, Sustainable City pLAN, and the City's Green Building Code.

20. The construction traffic noise analysis for Alternative 5 correctly indicates that off-site construction traffic noise would be "Similar to the Project", which were

identified in Section IV.I, *Noise*, on page IV.I-76 of the Draft EIR as less than significant, with exception of temporary significant and unavoidable impacts on Yucca Street between Argyle Avenue and N. Gower Street. Table V-15, on page V-323, also indicates construction noise impacts under Alternative 5 would be significant and unavoidable. Page V-176, the last sentence in the last paragraph, which extends to the first paragraph on page V-177, is revised as follows to indicate Alternative 5's construction noise impacts would be similar to the Project, which is stated as such in the Alternative 5 analysis:

Similar to the Project, maximum construction traffic would not result in significant noise levels (greater than 5 dBA L_{eq}) compared to existing traffic noise levels along any of the studied roadway segments, ~~and impacts would be less than significant with the exception of Yucca Street between Argyle Avenue and Gower Street.~~

21. Page V-190, the second sentence in the last paragraph is revised as follows:

These require USGBC LEED Gold Certification energy performance optimization features such as reducing building energy cost by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards and installing energy efficient appliances.

22. Page V-191, the second sentence in the first paragraph under (ii) Conflict with Plans for Renewable Energy or Energy Efficiency is revised as follows:

Alternative 5, as with the Project, would be designed to meet the USGBC LEED Gold Certification including energy performance optimization features, such as reducing building energy demand by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards.

23. Page V-211, the third sentence in the second to last paragraph is revised as follows:

Although the State and City have not established quantitative values for GHG emissions, in order to comply with policies and regulations adopted for the purpose of reducing or mitigating GHG emissions, Alternative 6, as with the Project, would incorporate ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1.

24. Page V-211, the first sentence in the last paragraph is revised as follows:

Alternative 6, as with the Project, with incorporation of ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1, would be consistent with applicable strategies outlined in CARB's Climate Change Scoping Plan, SCAG's 2016-2040 RTP/SCS, Sustainable City pLAn, and the City's Green Building Code.

25. Page V-228, the second sentence in the first paragraph is revised as follows:

These require USGBC LEED Gold Certification energy performance optimization features such as reducing building energy cost by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards and installing energy efficient appliances.

26. Page V-228, the second sentence in the last paragraph is revised as follows:

Alternative 6, as with the Project, would be designed to meet the USGBC LEED Gold Certification including energy performance optimization features, such as reducing building energy demand by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards.

27. Page V-247, the third sentence in the first paragraph is revised as follows:

Although the State and City have not established quantitative values for GHG emissions, in order to comply with policies and regulations adopted for the purpose of reducing or mitigating GHG emissions, Alternative 7, as with the Project, would incorporate ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1.

28. Page V-247, the first sentence in the second paragraph is revised as follows:

Alternative 7, as with the Project, with incorporation of ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1, would be consistent with applicable strategies outlined in CARB's Climate Change Scoping Plan, SCAG's 2016-2040 RTP/SCS, Sustainable City pLAn, and the City's Green Building Code.

29. Page V-247, the second to last sentence in the second paragraph is revised as follows:

As such, Alternative 7 would not exceed the Central APC's employee threshold standard of ~~7.5~~ 7.6.

30. The construction traffic noise analysis for Alternative 7 correctly indicates that off-site construction traffic noise would be "Similar to the Project", which were identified in Section IV.I, *Noise*, on page IV.I-76 of the Draft EIR as less than significant, with exception of temporary significant and unavoidable impacts on Yucca Street between Argyle Avenue and N. Gower Street. Table V-15, on page V-323, also indicates construction noise impacts under Alternative 7 would be significant and unavoidable. Page V-255, the eighth sentence in the first paragraph is revised as follows to indicate Alternative 7's construction noise impacts would be similar to the Project, which is stated as such in the Alternative 7 analysis:

Similar to the Project, maximum construction traffic would not result in significant noise levels (greater than 5 dBA L_{eq}) compared to existing traffic noise levels along any of the

studied roadway segments, and impacts would be less than significant with the exception of Yucca Street between Argyle Avenue and Gower Street.

31. Page V-269, the second sentence in the first paragraph is revised as follows:

These require USGBC LEED Gold Certification energy performance optimization features such as reducing building energy cost by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards and installing energy efficient appliances.

32. Page V-270, the second sentence in the first paragraph is revised as follows:

Alternative 7, as with the Project, would be designed to meet the USGBC LEED Gold Certification including energy performance optimization features, such as reducing building energy demand by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards.

33. Page V-278, the shown row in Table V-13 is revised as follows:

West Site	35 stories, 469 feet	35 stories, 469 feet	48 stories, 209 <u>595</u> feet
-----------	----------------------	----------------------	--

34. Page V-282, the second sentence in the first paragraph under (a) Construction is revised as follows:

The maximum emissions under Alternative 8 would be similar to the Project for construction of the West Site first or construction of the East Site first because emission levels are based on a single day in which maximum construction activity would occur.

35. Page V-283, the second paragraph and a new paragraph are revised as follows:

At full buildout conditions, maximum NOx emissions would be 76 and 79 pounds per day for the Project and the Project with the East Site Hotel Option, respectively. The daily impact threshold for NOx is 55 pounds per day. Alternative 8 would have a similar land use intensity and result in more traffic than the Project and require a sizeable generator that, along with its collective NOx generating sources, are expected to be above 55 pounds per day. For Alternative 8, at full buildout conditions, maximum NOx emissions would be slightly greater than the Project since Alternative 8 would also require emergency generator capacity similar to the Project and because Alternative 8 results in greater daily vehicle trips as compared to the Project. Like the Project, the primary contributor to Alternative 8’s operational emissions is from emergency generator capacity. Thus, Alternative 8 would exceed 55 pounds per day, similar to the Project. Alternative 8 would implement the same Mitigation Measure AQ-MM-2 as the Project to reduce operational NOx levels to a less-than-significant level.

36. Page V-283, a new paragraph after the second paragraph is inserted as follows:

At interim buildout conditions and under the overlapping construction scenario with operations of either the West or East Site (whichever is built first) and overlapping construction of the other site, maximum NOx emissions would be 79 and 82 pounds per day for the Project and the Project with the East Site Hotel Option, respectively. The daily impact threshold for NOx is 55 pounds per day. Alternative 8 would have a similar land use intensity and require a sizeable generator that, along with its collective NOx generating sources, are expected to be above 55 pounds per day. For Alternative 8, at interim buildout conditions and under the overlapping construction scenario with operations of either the West or East Site (whichever is built first) and overlapping construction of the other site, maximum NOx emissions would be slightly greater than the Project because Alternative 8 results in greater daily vehicle trips as compared to the Project. However, as discussed above, like the Project, the primary contributor to Alternative 8's operational emissions is from emergency generator capacity. Alternative 8 would implement the same Mitigation Measures AQ-MM-1 to reduce construction-related emissions and AQ-MM-2 to reduce operational-related emissions as the Project to reduce interim buildout construction and operational NOx emission levels to a less-than-significant level.

37. Page V-284, the last sentence in the first paragraph under (i) Construction is revised as follows:

As Alternative 8 would have a similar scale of development (floor area) and a similar level of construction emissions as under the Project, impacts under Alternative 8 would be similar to the Project for construction of the West Site first or construction of the East Site first.

38. Page V-290, the first two paragraphs are revised as follows:

The construction and occupancy of the Project Site under Alternative 8, as with the Project, would increase GHG emissions over existing conditions. As with the Project, Alternative 8 would incorporate GHG reduction characteristics, features, and measures. Although the State and City have not established quantitative values for GHG emissions, in order to comply with policies and regulations adopted for the purpose of reducing or mitigating GHG emissions, Alternative 8, as with the Project, would incorporate ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1. Alternative 8 would result in increased traffic and higher mobile emissions, and, thus, maximum GHG operational emissions would be higher than the Project. The Project would result in 3,865 daily trips and 24,394 daily VMT and Alternative 8 would result in 5,336 daily trips and 35,989 daily VMT. With incorporation of applicable Project Design Features, GHG emission impacts under Alternative 8, as with the Project, would be less than significant. Due to its higher GHG emissions, impacts under Alternative 8 with respect to GHG emissions on the environment would be greater than the Project.

Alternative 8, as with the Project, with incorporation of ~~AQ-PDF-1, AQ-PDF-2~~ AQ-MM-1, AQ-MM-2 and GHG-PDF-1, would be consistent with applicable strategies outlined in

CARB's Climate Change Scoping Plan, SCAG's 2016-2040 RTP/SCS, Sustainable City pLAn, and the City's Green Building Code. As such, similar to the Project, impacts related to conflicts with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs would be less than significant under Alternative 8. As discussed under the Transportation subsection, below, Alternative 8 would result in a 4.5 household VMT per capita and a ~~4.7~~ 5.0 employee VMT per capita. The Project would result in 4.8 household per capita VMT and the Project with the East Site Hotel Option would result in a 4.7 household per capita VMT and 4.8 work VMT per employee. As such, Alternative 8 would not exceed the Central APC's household VMT threshold standard of 6.0 or the employee threshold standard of ~~7.5~~ 7.6. Additionally, Alternative 8's VMT would result in lower per resident GHG emissions than the Project. Alternative 8's employee VMT per capita of 5.0 would be higher than its resident VMT per capita of 4.5; however, it should be noted that office uses associated with Alternative 8 typically generate fewer trips and VMT on weekend days when many offices are closed, which may help to limit the overall annual VMT increase of Alternative 8 as compared to the Project. However, Alternative 8 with its lower household per capita VMT compared to the Project and its low work VMT per employee would meet the objectives of adopted policies and land use strategies to reduce GHGs through mixed-use development within the TPA to a higher extent than the Project, and thus, impacts related to GHG reduction policies would be less than the Project.

39. Page V-297, the last paragraph, which extends to the first paragraph on page V-298, is revised as follows:

Alternative 8 would require excavation for subterranean parking that would reach depths of 64 feet on the East Site and 60 feet on the West Site... Based on a conservative impact analysis, in which noise levels were calculated with all pieces of construction equipment operating simultaneously and located at the construction area nearest to the affected receptors, construction noise levels would exceed the applicable noise significance thresholds at several nearby noise sensitive receptors for construction of the West Site first or construction of the East Site first. Therefore, as with the Project, Alternative 8 would implement Mitigation Measures NOI-MM-1 to NOI-MM-3 to reduce construction noise impacts at off-site noise sensitive receptors to the extent technically feasible. However, as with the Project, with implementation of technically feasible mitigation, construction noise impacts at noise-sensitive receptors 1, 3, and 5 through 13 (eleven sites) would still exceed the significance threshold under Alternative 8 for construction of the West Site first or construction of the East Site first. Therefore, as with the Project, construction noise impacts associated with on-site noise sources would remain temporarily significant and unavoidable for Alternative 8. Similar to the Project, maximum construction traffic would not result in significant noise levels (greater than 5 dBA L_{eq}) compared to existing traffic noise levels along any of the studied roadway segments. As with the Project, construction noise levels associated with on-site noise sources would be significant and unavoidable under Alternative 8 for construction of the West Site first or construction of the East Site first. As Alternative 8 would result in a similar duration of construction activity, impacts related to construction noise would be similar to the Project.

40. The construction traffic noise analysis for Alternative 8 correctly indicates that off-site construction traffic noise would be “Similar to the Project”, which were identified in Section IV.I, *Noise* on page IV.I-76 of the Draft EIR as less than significant, with exception of temporary significant and unavoidable impacts on Yucca Street between Argyle Avenue and N. Gower Street. Table V-15, on page V-323, also indicates construction noise impacts under Alternative 8 would be significant and unavoidable. Page V-298, the fifth sentence in the first paragraph is revised as follows to indicate Alternative 8’s construction noise impacts would be similar to the Project, which is stated as such in the Alternative 8 analysis:

Similar to the Project, maximum construction traffic would not result in significant noise levels (greater than 5 dBA L_{eq}) compared to existing traffic noise levels along any of the studied roadway segments, with the exception of Yucca Street between Argyle Avenue and Gower Street.

41. Page V-299, the fifth sentence of the first paragraph under (a) Construction is revised as follows:

As with the Project, with implementation of Mitigation Measure ~~NOI-MM-8~~ NOI-MM-4 and compliance with LAMC Section 91.3307.1, vibration impacts associated with Alternative 8 would be reduced to less-than-significant levels for the Capitol Records and Gogerty Buildings.

42. Page V-306, the last sentence in the last paragraph, which extends to the first paragraph on page V-307, is revised as follows:

Alternative 8 would have a household VMT of 4.5 per capita and a work VMT of ~~4.7~~ 5.0 per employee.¹⁰⁷

43. Page V-307, the last paragraph in the first paragraph is revised as follows:

Alternative 8’s would have a lower comparative household and work VMT per capita rates ~~are lower than the Project’s compared to the Project and would have a low work VMT per capita.~~ , and a As such, impacts with respect to CEQA Guidelines Section 15064(b) are considered to be less than the Project.

44. Page V-310, the first sentence in the first paragraph under (ii) Water Supply is revised as follows:

~~Alternative 8 would increase demand on water supplies and infrastructure.~~ Alternative 8 would increase demand on water supplies and infrastructure.

45. Page V-311, the third paragraph under (iii) Solid Waste, which extends to the first paragraph on page V-312, and associated Footnote 111 are revised as follows:

During operation, Alternative 8's 1,849 employees would generate approximately 19,470 pounds of solid waste per day (based on 10.53 pounds per day per employee) or approximately 3,553 tons per year. After implementation of the City's 65-percent diversion rate, Alternative 8 would generate approximately ~~4,244~~ 1,955 tons per year (3.41 tpd) requiring landfill disposal per year. The Sunshine Canyon Landfill, the primary recipient of Class III solid waste from the City, has a maximum daily capacity of 12,100 tpd and a disposal rate of 6,765 tpd, indicating a residual daily capacity of 5,335 tpd. Alternative 8's addition of ~~3.99~~ 6.27 tpd¹¹¹ landfill disposal rate would represent ~~0.07~~ 0.12 percent of Sunshine Canyon's residual daily capacity, assuming diversion.

Footnote 111: Alternative 8's daily disposal in tons assumes that landfills operate six days per week; 52 weeks * 6 days = 312 days. Therefore, the daily disposal is calculated by $4,244 \frac{1,955}{312} \text{ tons} = 3.99 \frac{6.27}{312} \text{ tpd}$.

46. Page V-312, the second sentence in the last paragraph is revised as follows:

These require USGBC LEED Gold Certification energy performance optimization features such as reducing building energy cost by a minimum of 11.6 percent for new construction compared to the ~~2019~~ 2016 Title 24 Building Energy Efficiency Standards and installing energy efficient appliances.

47. Page V-314, the last sentence in the first paragraph under (3) Relationship to the Alternative to Project Objectives is revised as follows:

Because of its density of uses, design, open paseo, and building standards, and lower household VMT per capita (4.5) and work VMT per employee (~~4.7~~ 5.0), Alternative 8 would substantially meet all of the Project Objectives:

Chapter VI. Other CEQA Considerations

1. Page VI-14, the last paragraph is revised as follows:

CEQA Guidelines Section 15128 states that an EIR shall contain a brief statement indicating reasons that various possible significant effects of a project were determined not to be significant and not discussed in detail in the Draft EIR. Such a statement may be contained in an attached copy of an Initial Study. An Initial Study was prepared for the Project and is included in Appendix ~~A-1~~ A-2 of this Draft EIR. The Initial Study provides a detailed discussion of the potential environmental impact areas and the reasons that each topical area is or is not analyzed further in the Draft EIR. The City determined that the Project would result in less-than-significant or no impacts related to agricultural resources, biological resources, landslides, septic systems, flooding, habitat conservation plans, mineral resources, airstrips or airport proximity or plans, population or housing displacement, ~~schools,~~ and air traffic patterns. For further discussion of these issues and more detailed evaluation of potential impacts, refer to the Project's Initial Study, provided in Appendix ~~A-1~~ A-2 of this Draft EIR.

Appendices

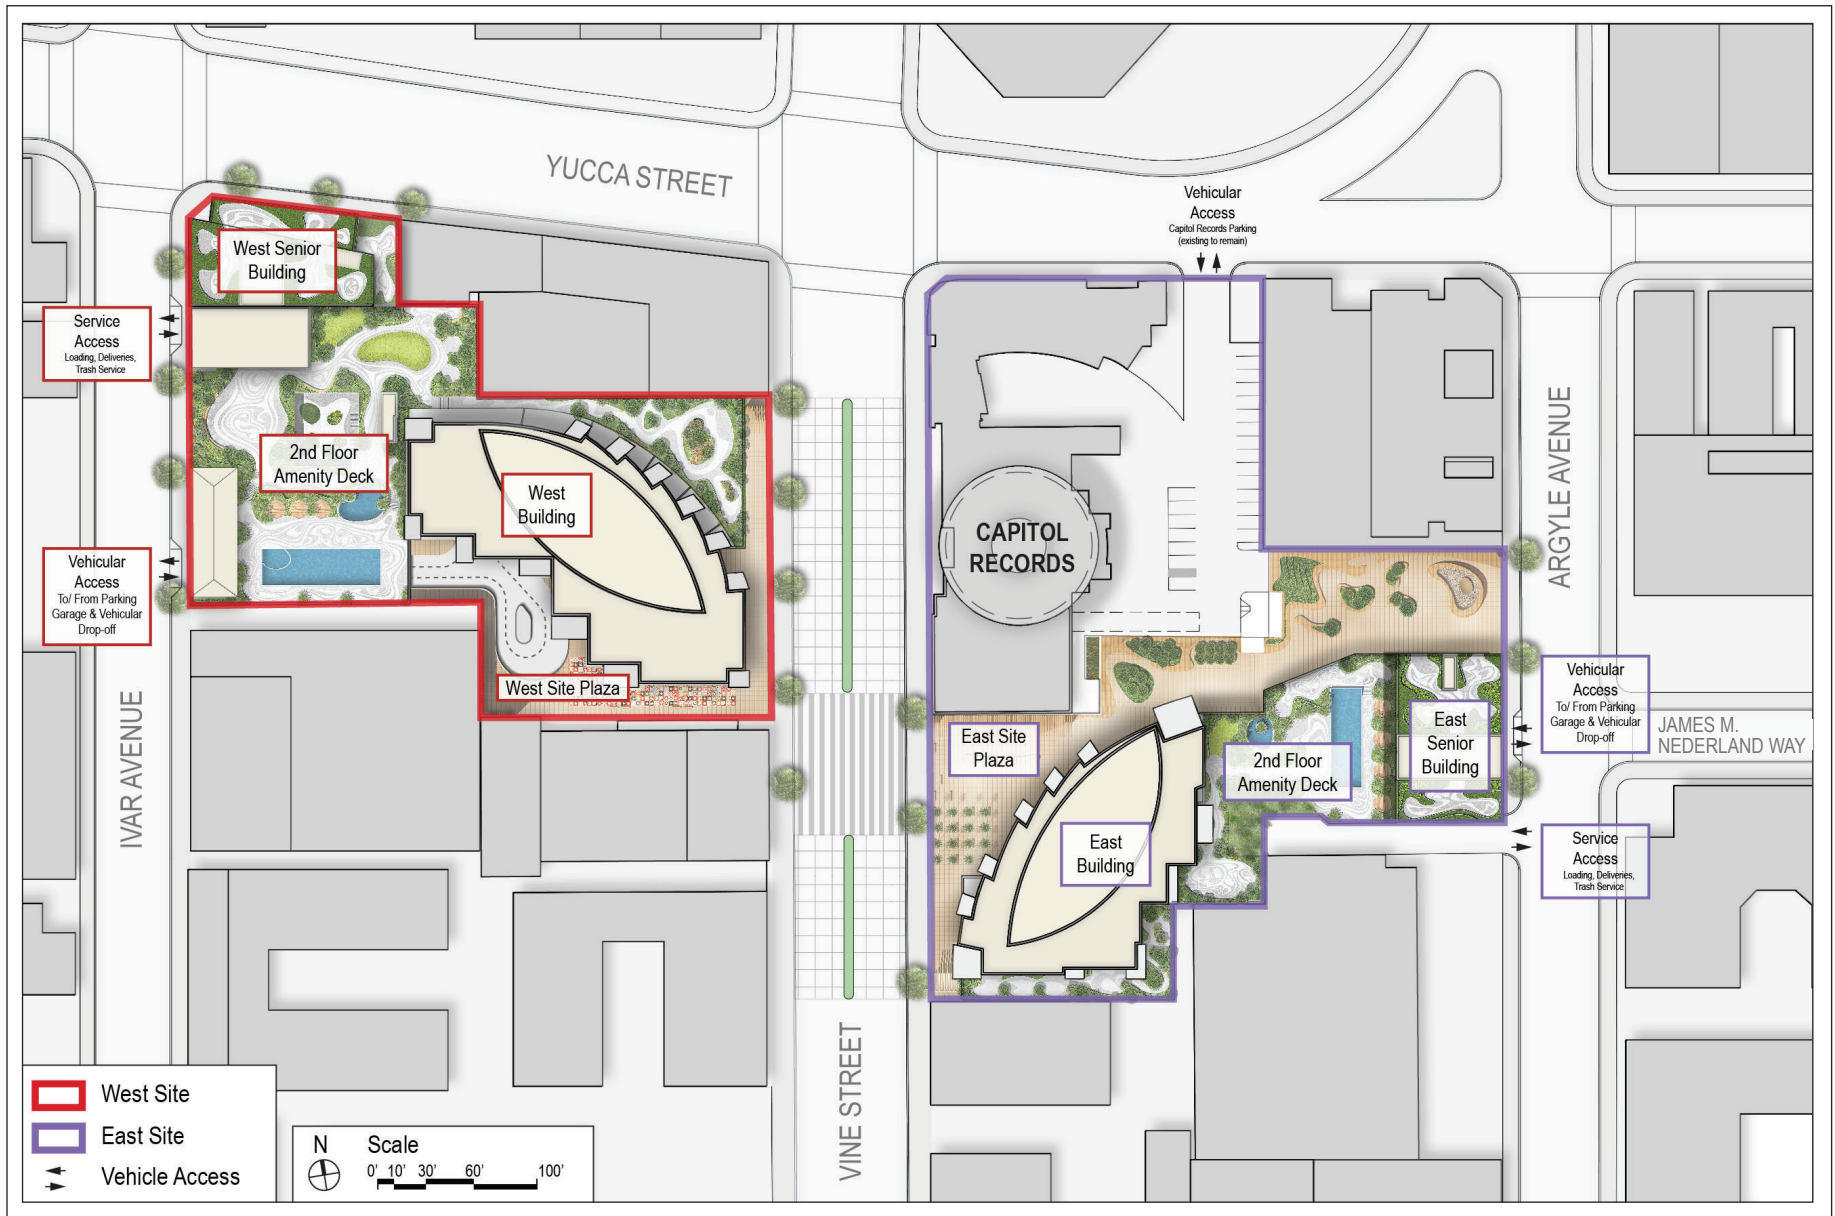

Appendix J, Land Use Plans and Policies: Project Consistency Tables

1. Table LU-4, *Consistency of the Project with Applicable Sections of the Hollywood Redevelopment Plan*, Page 20, the response to Policy 506.2.3, Regional Center Commercial Density, has been revised as follows: **No Conflict**. The proposed Project is requesting an increase from a base ~~6~~ 2:1 and 3:1 floor area ratio (FAR) to a 7:1 FAR. The Project is eligible for an FAR bonus ~~of up to 35 percent (8.1:1 FAR)~~ pursuant to Density Bonus Compliance Review under California Government Code Section 65915 and LAMC Section 12.22 ~~44.5.4~~ for providing at least 11 percent of the ~~total~~ residential units as Very Low Income households.

2. Table LU-4, *Consistency of the Project with Applicable Sections of the Hollywood Redevelopment Plan*, Page 23, the response to Policy 506.2.3, Regional Center Commercial Density, has been revised as follows: **No Conflict**. The proposed Project is requesting an increase from a base ~~6~~ 2:1 and 3:1 FAR to a 7:1 FAR. The Project is eligible for an FAR bonus ~~of up to 35 percent (8.1:1 FAR)~~ pursuant to Density Bonus Compliance Review under California Government Code Section 65915 and LAMC Section 12.22 ~~44.5.4 of the LAMG~~ for providing at least 11 percent of the ~~total~~ residential units as Very Low Income households. ~~Additionally, the Project proposes to remove the "D" Limitation, pursuant to Ordinance No. 165,659, through a proposed Zone Change and Height District Change for the Project Site.~~ Subject to approval of the requested discretionary action to allow an increase in floor area, the Project would be consistent with the FAR objectives of the Redevelopment Project. Review and approval of plans would be conducted by the Planning Department as further described in the analysis of plan provision 506.2.3. As described above, the Project would be substantially consistent with the objectives of the Hollywood Redevelopment Plan

Appendix N-1, Transportation Assessment

1. Page 5, Figure 2A is revised as follows:

Revised Figure 2A
 Site Plan

2. Page 3 of Appendix B, the first row is revised as follows:

<p><i>whether the project would result in impacts due to geometric design hazards or incompatible uses:</i></p> <p>1. <i>Is the project proposing new driveways, or introducing new vehicle access to the property from the public right-of-way?</i></p> <p>2. <i>Is the project proposing to, or required to make any voluntary or required, modifications to the way (i.e., street dedications, reconfigurations of curb line, etc.)?</i></p>	<p>1. No <u>Yes</u></p> <p>2. Yes</p>	<p>Yes, See Transportation Analysis Report Chapter 4</p>
---	--	--

3. In Appendix G, Transportation Assessment Guidelines Intersection Level of Service Worksheets, of the TA, the northbound right-turn overlap for the intersection of Argyle Avenue and the US-101 southbound on-ramp was removed from the CMA spreadsheets as the right-turn phasing was incorrect. The CMA spreadsheets for the future (2027 and 2040) without and with the Project have been updated to reflect this change. Based on the page numbering of the PDF that is provided on the Department of City Planning's website², pages 378, 389, 410, and 421 of Appendix G of the PDF are revised as follows:

² City of Los Angeles Department of City Planning, Hollywood Center Draft EIR, Appendix N-1, Transportation Assessment.

CHAPTER 4 - MITIGATION MONITORING PROGRAM

1. Introduction

This Mitigation Monitoring Program (MMP) has been prepared pursuant to Public Resources Code (PRC) Section 21081.6, which requires a Lead Agency to adopt a “reporting or monitoring program for changes to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment.” In addition, CEQA Guidelines Section 15097(a) requires that a public agency adopt a program for monitoring or reporting mitigation measures and project revisions, which it has required to mitigate or avoid significant environmental effects. This MMP has been prepared in compliance with the requirements of CEQA, PRC Section 21081.6 and CEQA Guidelines Section 15097.

The City of Los Angeles is the Lead Agency for the Project and, therefore, is responsible for administering and implementing the MMP. A public agency may delegate reporting or monitoring responsibilities to another public agency or to a private entity that accepts the delegation; however, until mitigation measures have been completed, the Lead Agency remains responsible for ensuring that implementation of the mitigation measures occurs in accordance with the program.

An Environmental Impact Report (EIR) has been prepared to address the potential environmental impacts of the Project. The evaluation of the Project’s impacts in the EIR takes into consideration the project design features (PDF) and applies mitigation measures (MM) needed to avoid or reduce potentially significant environmental impacts. This MMP is designed to monitor implementation of the PDFs and MMs identified for the Project.

2. Organization

As shown on the following pages, each identified project design feature and mitigation measure for the Project is listed and categorized by environmental impact area, with accompanying identification of the following:

- **Enforcement Agency:** the agency with the power to enforce the PDF or MM.
- **Monitoring Agency:** the agency to which reports involving feasibility, compliance, implementation, and development are made.
- **Monitoring Phase:** the phase of the Project during which the PDF or MM shall be monitored.
- **Monitoring Frequency:** the frequency at which the PDF or MM shall be monitored.

- **Action Indicating Compliance:** the action by which the Enforcement or Monitoring Agency indicates that compliance with the identified PDF or required MM has been implemented.

3. Administrative Procedures and Enforcement

This MMP shall be enforced throughout all phases of the Project. The Applicant shall be responsible for implementing each PDF and MM and shall be obligated to provide certification, as identified below, to the appropriate monitoring and enforcement agencies that each PDF and MM has been implemented. The Applicant shall maintain records demonstrating compliance with each PDF and MM. Such records shall be made available to the City upon request.

During the construction phase and prior to the issuance of building permits, the Applicant shall retain an independent Construction Monitor (either via the City or through a third-party consultant), approved by the Department of City Planning, who shall be responsible for monitoring implementation of PDFs and MMs during construction activities consistent with the monitoring phase and frequency set forth in this MMP.

The Construction Monitor shall also prepare documentation of the Applicant's compliance with the PDFs and MMs during construction every 90 days in a form satisfactory to the Department of City Planning. The documentation must be signed by the Applicant and Construction Monitor and be included as part of the Applicant's Compliance Report. The Construction Monitor shall be obligated to immediately report to the Enforcement Agency any non-compliance with the MMs and PDFs within two businesses days if the Applicant does not correct the non-compliance within a reasonable time of notification to the Applicant by the monitor or if the non-compliance is repeated. Such non-compliance shall be appropriately addressed by the Enforcement Agency.

4. Program Modification

After review and approval of the final MMP by the Lead Agency, minor changes and modifications to the MMP are permitted but can only be made subject to City approval. The Lead Agency, in conjunction with any appropriate agencies or departments, will determine the adequacy of any proposed change or modification. This flexibility is necessary in light of the nature of the MMP and the need to protect the environment. No changes will be permitted unless the MMP continues to satisfy the requirements of CEQA, as determined by the Lead Agency.

The Project shall be in substantial conformance with the PDFs and MMs contained in this MMP. The enforcing departments or agencies may determine substantial conformance with PDFs and MMs in the MMP in their reasonable discretion. If the department or agency cannot find substantial conformance, a PDF or MM may be modified or deleted as follows: the enforcing department or agency, or the decision maker for a subsequent discretionary Project-related approval finds that the modification or deletion complies with CEQA, including CEQA Guidelines Sections 15162 and 15164, which could include the

preparation of an addendum or subsequent environmental clearance, if necessary, to analyze the impacts from the modifications to or deletion of the PDFs or MMs. Any addendum or subsequent CEQA clearance shall explain why the PDF or MM is no longer needed, not feasible, or the other basis for modifying or deleting the PDF or MM, and that the modification will not result in a new significant impact consistent with the requirements of CEQA. Under this process, the modification or deletion of a PDF or MM shall not, in and of itself, require a modification to any Project discretionary approval unless the Director of Planning also finds that the change to the PDF or MM results in a substantial change to the Project or the non-environmental conditions of approval.

5. Mitigation Monitoring Program

a) Aesthetics

Project Design Features

AES-PDF-1: Construction Fencing. Temporary construction fencing will be placed along the periphery of the Project Site to screen construction activity for new buildings from view at the street level. A minimum eight-foot-high construction fence will be located along the perimeter of the active construction sites. Protective fencing or walls will be incorporated between and the south wall of the Capitol Records Building during demolition, excavation, and new building erection on the East Site. The Project Applicant will ensure through appropriate postings and daily visual inspections that no unauthorized materials are posted on any temporary construction barriers or temporary pedestrian walkways that are accessible/visible to the public and that such temporary barriers and walkways are maintained in a visually attractive manner (i.e., free of trash, graffiti, peeling postings and of uniform paint color or graphic treatment) throughout the construction period.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Construction
- **Monitoring Frequency:** Periodic field inspections during construction
- **Action Indicating Compliance:** Field inspection sign-off

AES-PDF-2: Screening of Utilities. Mechanical, electrical, and roof top equipment (including Heating, Ventilation, and Air Conditioning [HVAC] systems), as well as building appurtenances, will be integrated into the Project's architectural design (e.g., placed behind parapet walls) and be screened from view from public rights-of-way.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction; Construction
- **Monitoring Frequency:** Once at Project plan check; Once during field inspection

- **Action Indicating Compliance:** Plan approval and issuance of applicable building permit; Issuance of Certificate of Occupancy

AES-PDF-3: Glare. Glass used in building façades will be anti-reflective or treated with an anti-reflective coating in order to minimize glare (e.g., minimize the use of glass with mirror coatings).

- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction; Construction
- **Monitoring Frequency:** Once at Project plan check; Once during field inspection
- **Action Indicating Compliance:** Plan approval and issuance of applicable building permit; Issuance of Certificate of Occupancy

AES-PDF-4: Lighting. Construction and operational lighting will be shielded and directed downward (or on the specific on-site feature to be lit) in such a manner so as to avoid undue glare or light trespass onto adjacent uses.

- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction; Construction
- **Monitoring Frequency:** Once at Project plan check; Once during field inspection
- **Action Indicating Compliance:** Plan approval and issuance of applicable building permit; Issuance of Certificate of Occupancy

b) Air Quality

See Project Design Feature GHG-PDF-1 (Water Conservation Features) below.

Mitigation Measures

AQ-MM-1: Construction Equipment Features. The Applicant shall implement the following construction equipment features for equipment operating at the Project Site. These features shall be included in applicable bid documents, and successful contractor(s) must demonstrate the ability to supply such equipment. Construction features shall include the following:

- The Project shall utilize off-road diesel-powered construction equipment that meets or exceeds the California Air Resources Board (CARB) and U.S. Environmental Protection Agency (USEPA) Tier 4 Final off-road emissions

standards or equivalent for equipment rated at 50 horsepower (hp) or greater during Project construction where available within the Los Angeles region. Such equipment shall be outfitted with Best Available Control Technology (BACT), which means a CARB-certified Level 3 DPM or equivalent.

- Construction equipment, such as tower cranes, shall utilize electricity from power poles or alternative fuels (i.e., non-diesel) rather than diesel power generators and/or gasoline power generators. Pole power shall be made available for use for electric tools, equipment, lighting, etc. If stationary construction equipment, such as diesel- or gasoline-powered generators, must be operated continuously, such equipment shall be located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.
 - Contractors shall maintain and operate construction equipment so as to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications. The contractor shall keep documentation on-site demonstrating that the equipment has been maintained in accordance with the manufacturer's specifications. Tampering with construction equipment to increase horsepower or to defeat emission control devices shall be prohibited.
- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
 - **Monitoring Agency:** City of Los Angeles Department of Building and Safety; City of Los Angeles Department of City Planning
 - **Monitoring Phase:** Pre-construction; Construction
 - **Monitoring Frequency:** Once during Project plan check; Continuous field inspections during construction, with quarterly reporting
 - **Action Indicating Compliance:** Issuance of applicable building permit; Field inspection sign-off

AQ-MM-2: Emergency Generators. The Project representative shall schedule routine maintenance and testing of the emergency generators installed on the Project Site on different days. Prior to the installation of emergency generators, the Project representative shall supply documentation to the City that emergency generator testing by contractors, service providers, or maintenance crews shall be conducted in accordance with the specified requirements. The Project representative shall maintain records of emergency generator testing, including testing dates, which shall be made available to the City upon request.

- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction; Operation

- **Monitoring Frequency:** Once at Project plan check prior to issuance of grading permit; Periodically during operation and during routine maintenance and testing
- **Action Indicating Compliance:** Plan approval and issuance of applicable building permit; Field inspection signoff

c) Cultural Resources

Mitigation Measures

See Mitigation Measure NOI-MM-4 below.

CUL-MM-1: Prior to any disturbance to the Hollywood Walk of Fame, a City of Los Angeles designated Historic-Cultural Monument, the Applicant shall contact the Hollywood Chamber of Commerce/Hollywood Historic Trust (Chamber/Trust) directly via letter detailing the location of the Project Site, its potential impact on the Hollywood Walk of Fame, Project timeframe, list of affected stars and surrounding sidewalk area, proposed procedures for removal of stars, where and for how long the stars would be stored, how they would be secured, and other relevant details. The Chamber/Trust would reply via letter with the required procedures related to alterations to the Hollywood Walk of Fame and a list of contractors approved for such work. Additionally, the Chamber/Trust would request a formal in-person meeting between the Applicant, Chamber/Trust officials, and staff from the Office of Historic Resources and Department of Public Works Bureau of Engineering to discuss the process in greater depth. Written correspondence to the Chamber/Trust shall be sent to the address that follows: Hollywood Chamber of Commerce, 6255 Sunset Boulevard, Suite 150, Hollywood, CA 90028. Accepting that specific details for removal, storage and, replacement of affected stars and terrazzo shall be determined through coordination with the Chamber/Trust, the following general procedures shall be implemented:

- Photographic and documentary recordation of the location of each Hollywood Walk of Fame star potentially impacted by project construction shall be completed by a qualified architectural historian meeting the Secretary of the Interior's Professional Qualification Standards for Architectural History;
- Prior to any construction or demolition activities that have the potential to damage the sidewalk along Vine Street, each section of sidewalk containing a star that cannot be reasonably protected in place shall be cut and carefully removed [by a qualified restoration contractor] within its respective bronze-bordered square as specifically directed by Chamber/Trust procedures. Each affected star shall be promptly crated and stored, at a secured off-site location;
- Following completion of Project construction, reinstallation of each affected star at its original documented location shall occur within a newly poured, color-matched terrazzo sidewalk [by a qualified restoration contractor] with work completed to the satisfaction of the Chamber/Trust, the Office of Historic Resources, and the Department of Public Works Bureau of Engineering; and

- Excavation and construction activities in the vicinity of the Hollywood Walk of Fame and work conducted by the restoration contractor to remove, store, and replace affected areas of the Hollywood Walk of Fame, shall be monitored by a qualified historic preservation consultant meeting the Secretary of the Interior's Professional Qualification Standards for Architectural History and documented in a monitoring report that shall be provided to the City of Los Angeles, Office of Historic Resources, and the Chamber/Trust.
- **Enforcement Agency:** City of Los Angeles Department of City Planning, City of Los Angeles Office of Historic Resources; the Chamber/Trust; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning, City of Los Angeles Office of Historic Resources; City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction
- **Monitoring Frequency:** Prior to issuance of building permit
- **Action Indicating Compliance:** Submittal of compliance documentation to the City of Los Angeles Department of Building and Safety and subsequent issuance of applicable building permit

CUL-MM-2: Excavation and shoring have the potential to damage buildings in close proximity to the Project Site; therefore, the following procedures are required for shoring system design and monitoring of excavation, grading, and shoring activities are proposed:

- Excavation and shoring plans and calculations for temporary shoring walls shall be prepared by a California Registered Civil Engineer experienced in the design and construction of shoring systems and hired under the excavation subcontractor. The shoring systems shall be selected and designed in accordance with all current code requirements, industry best practices, and the recommendations of the Project Geotechnical Engineer. Maximum allowable lateral deflections for the Project Site are to be developed by the Project Geotechnical Engineer in consideration of adjacent structures, property, and public rights-of-way. These deflection limits shall be prepared in consideration of protecting adjacent historic resources. The shoring engineer shall produce a shoring design, incorporating tie-backs, soldier piles, walers, etc., that is of sufficient capacity and stiffness to meet or exceed the Project strength and deflection requirements. Calculations shall be prepared by the shoring engineer showing the anticipated lateral deflection of the shoring system and its components and demonstrating that these deflections are within the allowable limits. Where tie-back anchors shall extend across property lines or encroach into the public rights-of-way, appropriate notification and approval procedures shall be followed. The final excavation and shoring plans shall include all appropriate details, material specifications, testing and special inspection requirements and shall be reviewed by the Project Geotechnical Engineer for conformance with the design intent and submitted to LADBS for

review and approval during the Grading Permit application submission. The Project Geotechnical Engineer shall provide on-site observation during the excavation and shoring work.

- The general contractor shall hire a California Registered Professional Engineer or California Professional Land Surveyor to prepare an Adjacent Structures Construction Monitoring Plan, subject to review and approval by LADBS, prior to initiation of any excavation, grading, or shoring activities to ensure the protection of adjacent historic resources from damage due to settlement during construction and excavation. The Adjacent Structures Construction Monitoring Plan shall be carried out by a California Professional Land Surveyor and establish survey monuments and document and record through any necessary means, including video, photography, survey, etc. the initial positions of adjacent structures, sidewalks, buildings, utilities, facades, cracks, etc. to form a baseline for determining settlement or deformation. Upon installation of soldier piles, survey monuments shall be affixed to the tops of representative piles so that deflection can be measured. The shored excavation and adjacent structures, sidewalks, buildings, utilities, facades, cracks, etc. shall be visually inspected each day. Survey monuments shall be measured at critical stages of dewatering, excavation, shoring, and construction but shall not occur less frequently than once every 30 days. Reports shall be prepared by the California Professional Land Surveyor documenting the movement monitoring results.
 - Appropriate parties shall be notified immediately and corrective steps shall be identified and implemented if movement exceeds predetermined thresholds, calculated amounts, or if new cracks, distress, or other damage are observed in adjacent structures, sidewalks, buildings, utilities, façades, etc. In the event that settlement due to excavation or construction activity causes damage requiring repairs to the historic features of adjacent historic buildings, (specifically the Capitol Records Building, the Gogerty Building, Pantages Theatre, Avalon Hollywood, and 6316-24 Yucca Street/Art Deco Building storefront), that work shall be performed in consultation with a qualified preservation consultant and in accordance with the California Historical Building Code and the Secretary of the Interior's Standards, as appropriate.
 - Foundation systems are to be designed in accordance with all applicable loading requirements, including seismic, wind, settlement, and hydrostatic loads, as determined by the California Building Code and in accordance with the recommendations provided by the Project Geotechnical Engineer. Foundation systems are anticipated to consist of cast-in-place concrete mat foundations supported by cast-in-place concrete drilled shaft or auger cast piles. Driven piles shall not be used.
- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
 - **Monitoring Agency:** City of Los Angeles Department of Building and Safety
 - **Monitoring Phase:** Pre-construction

- **Monitoring Frequency:** At Project plan check prior to issuance of building permit
- **Action Indicating Compliance:** Submittal of compliance documentation to City of Los Angeles Department of Building and Safety and subsequent issuance of applicable building permit

CUL-MM-3: Prior to issuance of a grading permit and prior to the start of any ground-disturbing activity, the Applicant shall retain a qualified archaeologist who meets the Secretary of the Interior's Professional Qualifications Standards (Qualified Archaeologist) to oversee an archaeological monitor who shall be present during construction excavations, such as demolition, clearing/grubbing, grading, trenching, or any other construction excavation activity associated with the Project, including peripheral activities, such as sidewalk replacement, utilities work, and landscaping, which may occur adjacent to the Project Site. The frequency of monitoring shall be based on the rate of excavation and grading activities, the materials being excavated (younger sediments vs. older sediments), the depth of excavation, and, if found, the abundance and type of archaeological resources encountered. Full-time monitoring may be reduced to part-time inspections, or ceased entirely, if determined adequate by the Qualified Archaeologist. Prior to commencement of excavation activities, Archaeological Sensitivity Training shall be given for construction personnel. The training session shall be carried out by the Qualified Archaeologist and shall focus on how to identify archaeological resources that may be encountered during earthmoving activities and the procedures to be followed in such an event.

- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction
- **Monitoring Frequency:** Prior to issuance of a demolition or grading permit
- **Action Indicating Compliance:** Issuance of demolition or grading permit

CUL-MM-4: In the event that historic (e.g., bottles, foundations, refuse dumps/privies, railroads, etc.) or prehistoric (e.g., hearths, burials, stone tools, shell and faunal bone remains, etc.) archaeological resources are unearthed, ground-disturbing activities shall be halted or diverted away from the vicinity of the find so that the find can be evaluated. A 50-foot buffer within which construction activities shall not be allowed to continue shall be established by the Qualified Archaeologist around the find. Work shall be allowed to continue outside of the buffer area. All archaeological resources unearthed by Project construction activities shall be evaluated by the Qualified Archaeologist. If a resource is determined by the Qualified Archaeologist to constitute a "historical resource" pursuant to CEQA Guidelines Section 15064.5(a) or a "unique archaeological resource" pursuant to Public Resources Code Section 21083.2(g), the Qualified Archaeologist shall coordinate with the Applicant and the City to develop a formal treatment plan that would

serve to reduce impacts to the resources. The treatment plan established for the resources shall be in accordance with CEQA Guidelines Section 15064.5(f) for historical resources and Public Resources Code Sections 21083.2(b) for unique archaeological resources. Preservation in place (i.e., avoidance) is the preferred manner of treatment. If, in coordination with the City, it is determined that preservation in place is not feasible, appropriate treatment of the resource shall be developed by the Qualified Archaeologist in coordination with the City and may include implementation of archaeological data recovery excavations to remove the resource along with subsequent laboratory processing and analysis. Any archaeological material collected shall be curated at a public, non-profit institution with a research interest in the materials, if such an institution agrees to accept the material. If no institution accepts the archaeological material, they shall be donated to a local school, Tribe, or historical society in the area for educational purposes.

- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- Monitoring Phase: Construction
- **Monitoring Frequency:** At time of resource discovery, should it occur
- **Action Indicating Compliance:** Compliance report by Qualified Archaeologist

CUL-MM-5: Prior to the release of the grading bond, the Qualified Archaeologist shall prepare final report and appropriate California Department of Parks and Recreation Site Forms at the conclusion of archaeological monitoring. The report shall include a description of resources unearthed, if any, treatment of the resources, results of the artifact processing, analysis, and research, and evaluation of the resources with respect to the California Register and CEQA. The report and the Site Forms shall be submitted by the Applicant to the City, the South Central Coastal Information Center, and representatives of other appropriate or concerned agencies to signify the satisfactory completion of the development and required mitigation measures.

- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning
- Monitoring Phase: Construction
- **Monitoring Frequency:** Once, completion of grading/excavation activity
- **Action Indicating Compliance:** Compliance report by Qualified Archaeologist

d) Geology and Soils

Mitigation Measures

GEO-MM-1: A Qualified Paleontologist meeting the SVP Standards (Qualified Paleontologist) shall be retained prior to the approval of demolition or grading permits. The Qualified Paleontologist shall provide technical and compliance oversight of all work as it relates to paleontological resources, shall attend the Project kick-off meeting and Project progress meetings on a regular basis, and shall report to the Project Site in the event potential paleontological resources are encountered.

- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction; Construction
- **Monitoring Frequency:** Prior to issuance of demolition or grading permit; Periodic during construction activities
- **Action Indicating Compliance:** Issuance of demolition or grading permit; Compliance report by Qualified Paleontologist

GEO-MM-2: The Qualified Paleontologist shall conduct construction worker paleontological resources sensitivity training at the Project kick-off meeting prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.). In the event construction crews are phased, additional training shall be conducted for new construction personnel. The training session shall focus on the recognition of the types of paleontological resources that could be encountered within the Project Site and the procedures to be followed if they are found. Documentation shall be retained by the Qualified Paleontologist demonstrating that the appropriate construction personnel attended the training.

- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction
- **Monitoring Frequency:** Prior to issuance of demolition or grading permit
- **Action Indicating Compliance:** Issuance of demolition or grading permit

GEO-MM-3: Paleontological resources monitoring shall be performed by a qualified paleontological monitor (meeting the standards of the SVP, 2010) under the direction of the Qualified Paleontologist. Paleontological resources monitoring shall be conducted for all ground disturbing activities in previously undisturbed sediments which have high

sensitivity for encountering paleontological resources. Depending on the conditions encountered, full-time monitoring can be reduced to part-time inspections or ceased entirely if determined adequate by the Qualified Paleontologist. The Qualified Paleontologist shall spot check the excavation on an intermittent basis and recommend whether the depth of required monitoring needs to be revised based on his/her observations. Monitors shall have the authority to temporarily halt or divert work away from exposed fossils or potential fossils. Monitors shall prepare daily logs detailing the types of activities and soils observed and any discoveries. Any significant fossils collected during Project-related excavations shall be prepared to the point of identification and curated into an accredited repository with retrievable storage. The Qualified Paleontologist shall prepare a final monitoring and mitigation report for submittal to the City in order to document the results of the monitoring effort and any discoveries. If there are significant discoveries, fossil locality information and final disposition shall be included with the final report, which shall be submitted to the appropriate repository and the City.

- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Construction
- **Monitoring Frequency:** Periodic
- **Action Indicating Compliance:** Compliance report by Qualified Paleontologist

e) Greenhouse Gas Emissions

Project Design Features

See Project Design Feature WS-PDF-1 (Water Conservation Features) below.

GHG-PDF-1: Green Building Features. The Project will achieve the USGBC LEED Gold Certification and will be designed and operated to meet or exceed the applicable requirements of the State of California Green Building Standards Code and the City of Los Angeles Green Building Code. A summary of key green building and LEED measures are provided below:

- The Project will incorporate heat island reduction strategies for 50 percent of the Project Site hardscapes or provide 100 percent structured parking and incorporate heat island reduction strategies for the Project roof areas.
- The Project will promote alternatives to conventionally fueled automobiles by designating a minimum of 8 percent of on-site non-residential parking for carpool and/or alternative-fueled vehicles and shall pre-wire, or install conduit and panel capacity for a minimum of 30 percent of the Code-required parking spaces, with

10 percent of the Code-required spaces further improved with electric vehicle charging stations.

- The Project will optimize building energy performance with a 20 percent reduction from the LEED Version 4 (v4) baseline consistent with LEED requirements (equivalent to approximately 11.6 percent reduction from the 2016 Title 24 standards).
- The Project will reduce water consumption by 40 percent for indoor water and 100 percent for outdoor water from the LEED v4 usage baseline. The reductions would be achieved through potential strategies such as the installation of water efficient fixtures that exceed applicable standards and water efficient landscaping.
- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction; Construction; Operation
- **Monitoring Frequency:** Once at Project plan check prior to issuance of building permit; Once after completion of LEED Gold Certification commissioning activities
- **Action Indicating Compliance:** Plan approval and issuance of applicable building permit; Post-construction documentation that indicates the Project operates within the expected parameters to achieve the number of points required for LEED Gold Certification; Issuance of Certificate of Occupancy

f) Hazards and Hazardous Materials

See Project Design Feature TRAF-PDF-2 (Construction Traffic Management Plan) below.

Mitigation Measures

HAZ-MM-1: Soil Management Plan. The Project Applicant shall retain a qualified environmental consultant to prepare a Soils Management Plan (SMP), which shall be submitted to the Los Angeles Department of Building and Safety (LADBS) for review and approval prior to the commencement of excavation and grading activities. The SMP shall establish policy and requirements for the management and disposal of soils, as well as for any steel structures, including USTs, should they be encountered, during soil-disturbing activities performed at the Project Site (i.e., excavation, grading, trenching, utility installation or repair, and other human activities) that may disturb potentially contaminated soils. The SMP shall describe specific soil- and UST-handling controls required to comply with federal, state, and local, overseeing agencies; prevent unacceptable exposure to contaminated soils or vapors during construction; and prevent the improper disposal of contaminated soils or steel structures.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety

- **Monitoring Phase:** Pre-construction; Construction (during soil-disturbing activities)
- **Monitoring Frequency:** Once at Project plan check prior to issuance of grading permit; Ongoing with periodic field inspections during construction if impacted material is discovered
- **Action Indicating Compliance:** Issuance of grading permit; Field inspection signoff

g) Noise

Project Design Features

See Project Design Feature TRAF-PDF-2 (Construction Traffic Management Plan) below.

NOI-PDF-1: Impact Pile Driving and Blasting Prohibitions. The Project will not use or allow impact pile drivers and will not require or allow blasting during construction activities.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Construction
- **Monitoring Frequency:** Periodic field inspections
- **Action Indicating Compliance:** Field inspection sign-off

NOI-PDF-2: Construction Power Sources. Electricity from power poles, where power poles are available, and/or solar-powered generators rather than temporary diesel or gasoline generators will be used during construction. If diesel- or gasoline-powered generators are used, such equipment will be located at least 100 feet away from off-site sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible, and flexible sound control curtains will be placed around the equipment when in use.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Construction
- **Monitoring Frequency:** Periodic field inspections
- **Action Indicating Compliance:** Field inspection sign-off

NOI-PDF-3: Outdoor Performance Sound Restrictions. The Project will not require or allow operation of an amplified sound system in the outdoor plaza areas for performances, including the East Site Level 1 Performance Stage. Acoustic performances or ambient music speakers with prerecorded, low-level, background music on the East Site Level 1 Performance Stage will be limited to a sound level equivalent to 85 dBA measured at 25 feet from the performers. Compliance with this performance standard will be ensured through pre-performance noise tests/measurements for performances or

ambient music speakers with potential to exceed the sound level, along with any necessary adjustments to the location and nature of proposed performances or ambient music speakers. Ambient music speakers for use on the Amenity Decks (Level 2) on both the East Site and the West Site will be downward or inward facing and used for background music only.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Operation
- **Monitoring Frequency:** Ongoing during Project operation
- **Action Indicating Compliance:** Field inspection signoff

NOI-PDF-4: Emergency Generators. Emergency generators will be designed to meet the requirements of LAMC Chapter XI, Section 112.02. Section 112.02 of the LAMC requires that any mechanical system within any zone of the City not cause an increase in ambient noise levels on any other occupied property or if a condominium, apartment house, duplex, or attached business, within any adjoining unit to exceed the ambient noise level by more than 5 dBA.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction; Construction
- **Monitoring Frequency:** Once at Project plan check prior to building permit; Once during field inspection
- **Action Indicating Compliance:** Plan approval and issuance of applicable building permit; Field inspection signoff

Mitigation Measures

NOI-MM-1: Setback Distances and Boundary Noise Curtains. Noise and vibration construction equipment whose specific location on the Project Site may be flexible (e.g., compressors and generators) shall be located away from the nearest off-site sensitive land uses (at least 100 feet away), or natural and/or manmade barriers (e.g., intervening construction trailers) shall be used to screen propagation of noise from such equipment towards these land uses. Even with natural and/or manmade barriers, in no case shall fixed stationary equipment, stockpiling of construction materials, equipment warm-up areas, water tanks, and equipment storage areas be within 40 feet from the property line of off-site historic buildings. If manmade barriers are to be used, the contractor shall be required to use temporary construction noise barriers, such as sound deadening blankets or curtains, with a height up to 20 feet above ground that shall achieve a performance standard of a minimum 12-dBA insertion loss along the Project Site's boundary where significantly impacted noise-sensitive land uses are within 500 feet of the Project Site. The temporary construction noise barriers shall be installed on or around the Project Site

perimeter and/or along soldier piles that shall be drilled and cast in place during shoring activities. Open access points or gates leading to street frontages, including along Ivar Avenue, Vine Street, and Argyle Avenue, shall be permissible to allow for adequate and safe worker, vehicle, and equipment access to the construction area. The temporary construction noise barriers installed on or around the soldier piles shall remain in-place during ground disturbance activities until exterior vertical building construction commences, when the use of on-site noise-generating heavy-duty construction equipment is prevalent.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction; Construction
- **Monitoring Frequency:** Once prior to building permit; Once during field inspection
- **Action Indicating Compliance:** Plan approval and issuance of applicable building permit; Field inspection signoff

NOI-MM-2: Equipment Noise Shielding, Mufflers, and Stationary Curtains. The Project contractor shall use power construction equipment with factory-installed noise shielding and muffling devices. In addition, no impact pile driving shall be utilized; augured, or drilled piles are permitted. Flexible sound control curtains that achieve a performance standard of a minimum 12-dBA insertion loss with appropriate open access points or gates to allow for adequate and safe worker, vehicle, and equipment access shall be placed around all drilling apparatuses, drill rigs, stationary concrete pumps, stationary generators, and jackhammers when in use.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Construction
- **Monitoring Frequency:** Periodic field inspections
- **Action Indicating Compliance:** Field inspection sign-offs

NOI-MM-3: Construction Liaison. A construction liaison shall be provided to inform the nearby receptors 1, 3, and 5 through 13 when peak noise and vibration activities are scheduled to occur. Two weeks prior to the commencement of construction at the Project Site, notification shall be provided to these receptor properties that discloses the construction schedule, including the various types of activities and equipment that would be occurring throughout the duration of the construction period. The construction liaison shall coordinate with the owner/operator of the Pantages Theatre to minimize disruptions to performances during the performance times starting at 8:00 p.m., Tuesday through Saturday, and 2:00 p.m. on Saturday afternoon from Project construction noise and vibration near the Pantages Theater.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Construction
- **Monitoring Frequency:** Periodic field inspections
- **Action Indicating Compliance:** Field inspection sign-offs

NOI-MM-4: Vibration Monitoring. The Applicant shall perform structural vibration monitoring during Project construction as follows:

- a) Prior to start of construction, the Applicant shall retain the services of a licensed building inspector or structural engineer, or other qualified professional as approved by the City, to visit the following buildings, which are located either on-site or immediately adjacent to the Project Site, to inspect and document (video and/or photographic) the apparent physical condition of the building's readily-visible features. This includes both historic buildings and non-historic buildings in proximity to the Project Site. For the historic buildings listed below, inspection and documentation shall also be carried out by and in coordination with a qualified preservation consultant. The non-historic buildings are as follows:

- AMDA Vine Building
- Argyle House
- Single-story commercial building at 1718 N. Vine Street (if this building has been issue demolition permits or has already been demolished as part of Related Project No. 2, the provisions of this mitigation measure do not apply to this structure)

The historic buildings are as follows:

- Capitol Records Building (on-site)
- Gogerty Building (on-site)
- Pantages Theatre (off-site)
- Avalon Hollywood (off-site)
- 6316-24 Yucca Street/Art Deco Building Storefront (off-site)

- b) The Applicant shall retain the services of a qualified acoustical engineer and/or structural engineer to develop and implement a vibration monitoring program during the site demolition and grading/excavation, capable of documenting the construction-related ground vibration levels at the buildings listed above. The vibration monitoring systems shall be placed at receptor building façades closest to Project construction activity or placed at a representative location if a receptor building façade is not accessible and shall continuously measure (in vertical and horizontal directions) and store the peak particle velocity (PPV) in inch/second.

The systems shall also be programmed for two preset velocity levels: a warning level of 0.09 inch/second (PPV) for the off-site historic structures, 0.15 inch/second (PPV) for the single-story commercial building at 1718 N. Vine Street (not required if this building has been issued demolition permits or has already been demolished as part of Related Project No. 2), 0.25 inch/second (PPV) for the AMDA Vine Building, and 0.45 inch/second (PPV) for the Capitol Records Building, Gogerty Building, and the Argyle House and a regulatory level of 0.12 inch/second (PPV) for the off-site historic structures, 0.2 inch/second (PPV) for the single-story commercial building at 1718 N. Vine Street (not required if this building has been issued demolition permits or has already been demolished as part of Related Project No. 2), 0.30 inch/second (PPV) for the AMDA Vine Building, and 0.50 inch/second (PPV) for the Capitol Records Building, Gogerty Building, and the Argyle House. In cases where a receptor building façade is not accessible, the two preset velocity levels shall be programmed at equivalent levels based on distance and soil characteristics that affect vibration transmission over that distance. The systems shall also provide real-time alert when the vibration levels exceed the two preset levels. The noise and vibration monitoring program shall include a description of the monitoring equipment specifications, calibration certificates, exact monitoring locations (which shall be coordinated with the property owners for the buildings listed in “a.” above), and protocols for data collection, reporting, alerting, maintenance and calibration, and unplanned outage. Selected monitoring systems shall be capable of unmanned operation during periods of on-site Project construction activity, with internal storage and remote data download. Systems shall be capable of measuring the inch/second PPV in all three axes (vertical and two horizontal) simultaneously. The monitoring program shall specify the protocols for threshold exceedance, including, but not be limited to, which personnel are designated to receive alerts, how the alerts shall be sent (text message, email, etc.), and how the vibration event shall be documented and reported. The program shall include regular reporting no less frequently than weekly.

- c) The vibration monitoring program shall be submitted, for review and approval to the Department of Building and Safety, prior to initiating any construction activities.
- d) In the event the warning level (i.e., 0.09, 0.15, 0.25, and 0.45 inch/second [PPV], or equivalent levels) is triggered, the contractor shall identify the source of vibration generation and provide feasible steps to reduce the vibration level, including but not limited to staggering concurrent vibration-generating construction activities (if doing so would not pose a safety risk to personnel or damage risk to buildings or facilities) and utilizing lower vibratory techniques.
- e) In the event the regulatory level (i.e., 0.12, 0.20, 0.30, and 0.50 inch/second [PPV], or equivalent levels) is triggered, the contractor shall identify the source of vibration generation and implement feasible steps identified in Item “d” above to reduce the vibration level from construction activities to avoid or minimize damage

from construction activities in the vicinity of the building. The contractor shall visually inspect the building for any damage. Results of the inspection must be logged.

- f) In the event damage occurs to the historic features of historic buildings due to construction vibration, such features/materials shall be repaired in consultation with a qualified preservation consultant, and, if warranted, in a manner that meets the Secretary of the Interior's Standards.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction; Construction
- **Monitoring Frequency:** Once at Project plan check; Periodic field inspections; Prior to issuance of Certificate of Occupancy
- **Action Indicating Compliance:** Plan approval and issuance of applicable demolition or building permit; Issuance of Certificate of Occupancy; Field inspection sign-offs

h) Fire Protection

See Project Design Features TRAF-PDF-2 (Construction Traffic Management Plan) and TRAF-PDF-3 (Construction Worker Parking Plan) below.

i) Police Protection

Project Design Features

See Project Design Features TRAF-PDF-2 (Construction Traffic Management Plan) and TRAF-PDF-3 (Construction Worker Parking Plan) below.

POL-PDF-1: Security Features During Construction. Private security personnel will monitor vehicle and pedestrian access to the construction areas and patrol the Project Site, construction fencing with gated and locked entry will be installed around the perimeter of the construction site, and security lighting will be provided in and around the construction site.

- **Enforcement Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Construction
- **Monitoring Frequency:** Periodic field inspections
- **Action Indicating Compliance:** Field inspection sign-offs

POL-PDF-2: Security Features During Operation. During operation, the Project will incorporate a 24-hour/seven-day security program to ensure the safety of its residents, employees, patrons, and site visitors. The Project's security will include, but not be limited to, the following design features:

- a. Installing and utilizing a 24-hour security camera network throughout the underground and above-ground parking garages, the elevators, the common and amenity spaces, the lobby areas, and the rooftop and ground level outdoor open spaces. All security camera footage will be maintained for at least 30 days, and such footage will be provided to the LAPD, as needed.
 - b. Full-time security personnel. Duties of the security personnel will include, but would not be limited to, assisting residents and visitors with Project Site access, monitoring entrances and exits of buildings, and managing and monitoring fire/life/safety systems.
 - c. Staff training and building access/design to assist in crime prevention efforts and to reduce the demand for police protection services.
 - d. Controlled access to all housing units, hotel areas, and residential common open space areas through the use of key cards, site security and/or other means, as appropriate.
 - e. Maintenance of unrestricted access to commercial/restaurant uses, publicly accessible open space areas, and the paseo during business hours, with public access (except for authorized persons) prohibited after the businesses have closed via the use of gates, signage security patrols and/or other means determined appropriate.
 - f. Lighting of entryways, publicly accessible areas, and common building and open space areas associated with the housing units and hotel rooms for security purposes.
 - g. Regarding public events in the open space areas, following event completion and attendee dispersal, barricades to be placed on the stages, and regularly scheduled security patrols, as well as camera surveillance, to reduce the potential for undesirable activities within the publicly accessible open space.
- **Enforcement Agency:** City of Los Angeles Department of City Planning, City of Los Angeles Department of Building and Safety
 - **Monitoring Agency:** City of Los Angeles Department of City Planning, City of Los Angeles Department of Building and Safety
 - **Monitoring Phase:** Pre-construction; Construction
 - **Monitoring Frequency:** Once at Project plan check; Once prior to issuance of Certificate of Occupancy
 - **Action Indicating Compliance:** Plan approval and issuance of applicable building permit; Issuance of Certificate of Occupancy

j) Transportation

Project Design Features

TRAF-PDF-1: Transportation Demand Management (TDM) Program. The Applicant will implement a TDM Program aimed at discouraging single-occupancy vehicle trips and encouraging alternative modes of transportation, such as carpooling, taking transit, walking, and biking. The TDM Program will be subject to review and approval by the Los Angeles Department of City Planning and LADOT. The exact measures to be implemented will be determined when the Program is prepared, prior to issuance of a final certificate of occupancy for the Project. The strategies in the TDM Program will include, but are not necessarily limited to:

Parking

- Unbundle residential parking and price according to market rate
- Unbundle commercial parking coupled with pricing workplace parking and parking cash-out
- Contribute to LADOT Express Park program to upgrade local parking meter technology
- Daily parking discount for Metro Commuters

Transit

- Provide a location on-site at which to purchase Metro passes and display bus information
- Transit subsidies (available to residents and commercial employees) up to 50 percent of the cost of a monthly pass
- Provide parking spaces for monthly lease to non-resident Metro park-and-ride users
- Provide discounted daily parking to non-resident Metro transit pass holders
- Immediately adjacent Metro bus stop upgrades, which could include, but not limited to, street furniture, signage, and/or other transit-related information

Commute Trip Reductions

- Commute trip reduction program:
 - Rideshare (carpool/vanpool) matching and preferential parking
 - Guaranteed ride home (e.g., monthly Uber/Lyft/taxi reimbursement)
 - Encourage alternative work schedules and telecommuting for project residents
 - Business center/work center for residents working at home

Shared Mobility

- On-site car share
- Rideshare matching
- On-site bike share station with subsidized or free membership (residents, employees); on-site guest bike share service (hotel) (if/when public bike share comes to Hollywood)
- Coordination with LADOT Mobility Hub program

Bicycle Infrastructure

- Develop a bicycle amenities plan
- Bicycle parking (indoors and outdoors)
- Bike lockers, showers, and repair station
- Convenient access to on-site bicycle facilities (e.g., wayfinding, etc.)
- Contribution towards City's Bicycle Plan Trust Fund

Site Design

- Integrated pedestrian network within and adjacent to site (e.g., transit-, bike-, pedestrian-friendly)
- External and internal multimodal wayfinding signage

Education & Encouragement

- Transportation information center, kiosks and/or other on-site measures, such as providing a Tenant Welcome Package (i.e., all new residents receive information on available alternative modes and ways to access destinations)
- Tech-enabled mobility: incorporating commute planning, on-demand rideshare matching, shared-ride reservations, real-time traffic/transit information, push notifications about transportation choices, interactive transit screens, etc.
- Marketing and promotions (including digital gamification – participants can log trips for prizes, promotions, discounts for local merchants, incentives, etc.)

Management

- On-site TDM Program coordinator and administrative support
- Conduct user surveys
- Join future Hollywood Transportation Management Organization (TMO)

- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Transportation
- **Monitoring Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Transportation
- **Monitoring Phase:** Pre-construction; Construction; Operation
- **Monitoring Frequency:** Once prior to issuance of building permit; Periodic field inspections
- **Action Indicating Compliance:** Approval of Transportation Demand Management Program from the City of Los Angeles Department of City Planning and Los Angeles Department of Transportation prior to issuance of building permit; Issuance of Certificate of Occupancy; Field inspection sign-offs

TRAF-PDF-2: Construction Traffic Management Plan. Prior to the issuance of a building permit for the Project, a detailed Construction Management Plan (CMP), including street closure information, a detour plan, haul routes, and a staging plan, will be prepared and submitted to the City for review and approval. The CMP will formalize how construction will be carried out and identify specific actions that will be required to reduce effects on the surrounding community. The CMP will be based on the nature and timing of the specific construction activities and other projects in the vicinity of the Project Site. Construction management meetings with City Staff and other surrounding construction-related project representatives (i.e., construction contractors), whose projects will potentially be under construction at around the same time as the Project, will be conducted bimonthly, or as otherwise determined appropriate by City Staff. This coordination will ensure construction activities of the concurrent related projects and associated hauling activities are managed in collaboration with one another and the Project. The CMP will include, but not be limited to, the following elements as appropriate:

- As traffic lane, parking lane and/or sidewalk closures are anticipated, worksite traffic control plan(s), approved by the City of Los Angeles, will be developed and implemented to route vehicular traffic, bicyclists, and pedestrians around any such closures.
- Ensure that access will remain unobstructed for land uses in proximity to the Project Site during project construction.
- Coordinate with the City and emergency service providers to ensure adequate access, including emergency access, is maintained to the Project Site and neighboring businesses and residences. Emergency access points will be marked accordingly in consultation with LAFD, as necessary.
- Provide off-site truck staging in a legal area furnished by the construction truck contractor. Anticipated truck access to the Project Site will be off Ivar Avenue, Vine Street, and Argyle Avenue.

- Schedule deliveries and pick-ups of construction materials during non-peak travel periods to the extent possible and coordinate to reduce the potential of trucks waiting to load or unload for protracted periods.
- As parking lane and/or travel lane closures are anticipated, worksite traffic control plan(s), approved by the City of Los Angeles, should be implemented to route vehicular traffic, bicyclists, and pedestrians around any such closures.
- **Enforcement Agency:** City of Los Angeles Department of Transportation
- **Monitoring Agency:** City of Los Angeles Department of Transportation
- **Monitoring Phase:** Pre-construction; Construction
- **Monitoring Frequency:** Once prior to issuance of building permit; Periodic field inspections
- **Action Indicating Compliance:** Approval of Construction Traffic Management Plan from the Los Angeles Department of Transportation prior to issuance of building permit; Field inspection sign-offs

TRAF-PDF-3: Construction Worker Parking Plan. The Applicant will prepare a Construction Worker Parking Plan prior to commencement of construction to identify and enforce parking location requirements for construction workers. The Construction Worker Parking Plan will include, but not be limited to, the following elements as appropriate:

- During construction activities when construction worker parking cannot be accommodated on the Project Site, the plan will identify alternate parking location(s) for construction workers and the method of transportation to and from the Project Site (if beyond walking distance) for approval by the City 30 days prior to commencement of construction.
- Construction workers will not be permitted to park on street.
- All construction contractors will be provided with written information on where their workers and their subcontractors are permitted to park and provide clear consequences to violators for failure to follow these regulations.
- **Enforcement Agency:** City of Los Angeles Department of Transportation
- **Monitoring Agency:** City of Los Angeles Department of Transportation
- **Monitoring Phase:** Pre-construction; Construction
- **Monitoring Frequency:** Once prior to issuance of building permit; Periodic field inspections
- **Action Indicating Compliance:** Approval of Construction Worker Parking Plan from the Los Angeles Department of Transportation prior to issuance of building permit; Field inspection signoffs

k) Water Supply

Project Design Features

See Project Design Feature TRAF-PDF-2 (Construction Traffic Management Plan) above.

WS-PDF-1: Water Conservation Features. The Project will provide the following specific water efficiency features:

- ENERGY STAR Certified Residential Clothes Washers – Front-loading, capacity of 4.5 cubic feet, with Integrated Water Factor of 2.8.
- ENERGY STAR Certified Commercial Clothes Washers – Front-loading, capacity of 4.5 cubic feet, with Integrated Water Factor of 2.8.
- ENERGY STAR Certified Residential Dishwashers – Standard with 3.2 gallons/cycle.
- High-Efficiency Toilets (dual flush) with a flush volume of 0.8 gallons per flush for liquid waste and 1.28 gallons per flush for solid waste. Per Ordinance No. 180,822, Section 125,02, the toilets would have an effective flush volume of 0.96 gallons per flush.
- Install a meter on the pool make-up line so water use can be monitored and leaks can be identified and repaired.
- Landscaping – Approximately 52 percent of the total proposed landscaping is classified as low water use. Approximately 18 percent of the total proposed landscaping is classified as very low water use, which is considered drought-tolerant enough to require no irrigation by Model Water Efficient Landscape Ordinance.
- Leak Detection System for swimming pools and Jacuzzi.
- Overhead spray (8 percent) and drip irrigation (92 percent) for landscaped areas.
- Pool splash troughs around the perimeter that drain back into the pool.
- Proper Hydro-zoning/Zoned Irrigation.
- Reuse pool backwash water for irrigation.
- Water-Saving Pool Filter.
- Waterless urinals for commercial uses
- **Enforcement Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Agency:** City of Los Angeles Department of City Planning; City of Los Angeles Department of Building and Safety
- **Monitoring Phase:** Pre-construction; Construction; Operation

- **Monitoring Frequency:** Once at Project plan check prior to issuance of building permit; Once prior to issuance of final Certificate of Occupancy
- **Action Indicating Compliance:** Approval of plans and issuance of applicable building permit; Issuance of Final Certificate of Occupancy

I) Energy Conservation and Infrastructure

See Project Design Features GHG-PDF-1 (Green Building Features) and WS-PDF-1 (Water Conservation Features) above.
