Revisions to Applicant Estimates

Revisions to the applicant's emissions estimate provided in CalEEMod and in separate spreadsheets were made to address issues found with the applicant's estimates as follows:

CalEEMod Input Revisions/Additions:

- 1) Equipment was added to address missing water truck use and missing articulated trucks listed in the Applicant's construction equipment list.
- 2) Horsepower for certain equipment items were revised based on equipment types listed by the applicant in their equipment list or to fix issues with inappropriate CalEEMod default values that do not reflect the size of equipment needed for this large construction project.
- 3) Certain equipment that are too small for this type of project, such as the listed 16 horsepower dumper/tenders and 8 horsepower plate compactors, were removed and replaced if necessary with appropriately sized equipment that better matched the applicant's construction equipment list.
- 4) Watering mitigation was revised to reflect 2 times daily to match the mitigation measure requirements.
- 5) Off-road equipment was added to include expected regular road maintenance required for the project site's unpaved roads (dozer, grader, roller) that will be needed after rain events and periodically from normal use; as well as, slope stabilization work.
- 6) CalEEMod output files (annual, summer, winter) were edited to remove unnecessary information and improve the presentation and pagination.

Applicant Spreadsheet Revisions:

- 1) All applicant spreadsheets were revised to add appropriate level of input assumptions and reference detail, correct typos, and provide improved presentation quality.
- 2) Applicant helicopter spreadsheet revisions as follows:
 - a. Revised to assume KMAX helicopter rather than Huey helicopter (which is a very old helicopter not used for this type of work).
 - b. Revised the Lift/Take-Off (LTO) calculations to be based on number of LTOs to match emissions factor basis, with assumption of 8 LTOs per day.
- 3) Concrete batching spreadsheet was corrected to calculate based on cubic yards of concrete throughput per the emissions factor basis and to add the mixer loading emissions factor.

Additional Calculations:

- 1) Onsite Fugitive Dust. Calculations to address gaps in the CalEEMod model calculations were prepared, including the following:
 - a. For Construction.
 - i. On-site unpaved road dust calculations for onsite only vehicle trips. These trips include scraper travel, concrete truck trips, and soil movement dump truck/articulate truck trips.

b. For Operation

- i. On-site unpaved road dust calculations for expected normal operation trip requirements including daily trips for security/inspection and annual WTG maintenance events.
 - ii. Equipment activity based fugitive dust, dozer and grader, for unpaved road maintenance and slope stability maintenance activity which is expected to occur regularly after each large storm and otherwise as necessary.
- 2) Onsite Mobile Emissions. Onsite mobile vehicle use for normal inspection/security and annual WTG maintenance events are calculated.
- 3) GHG Indirect Emissions.
- a. Construction water use.
 - b. Operation indirect GHG emissions reduction due to renewable energy generation.

The specific assumptions and references for these additional calculations are listed with those calculations that are presented on the following emissions calculation sheets, presented after the emissions summary sheet and prior to the CalEEMod output files.

Onsite Unpaved Road Dust

Onsite Vehicle Travel Assumptions

- 1) On-site only trips are not included in the CalEEMod fugitive dust emissions estimates including:
 - a) Routine daily inspections.
 - b) Routine maintenance events, not including major upset work, specifically annual WTG maintenance events (2 days/year for each WTG) and road and slope maintenance that is assumed to be required regularly, up to 40 days per year.
 - c) Worst case daily assumption is one pickup (F150 class) traveling the entire WTG unpaved road route (15 miles) and two larger service vehicles (F350 class) going to a single WTG for routing maintenance (2 trips times 5 miles round trip).
 - d) Worst case annual assumption is one pickup (F150 class) traveling the entire WTG unpaved road route daily (15 miles) and two larger service vehicles (F350 class) going to a each WTG annually for routing maintenance two days each (120 trips times average of 2.5 average miles round trip).
 - e) The other wheeled maintenance equipment (grader/roller/dozer) have separate or insignificant emissions (roller).
 - f) Same emissions factor calculation (AP 42 Section 13.2.2) used with recalculated operation vehicle weights,
~~and silt content of 4 percent for maintained gravel roads.~~
 - g) Daily assumes no mitigation from rain events, annual emissions factor uses 40 days per year of rain to determine annual average emissions factor.

Assumptions:

- 1) CalEEMod does not include assessment of water use during construction.
- 2) Water use during construction will be substantial, so indirect GHG emissions from water use are calculated.
- 3) Water use estimate is based on applicant provided water truck trips with assumption of 4,000 gallons used per trip.
- 4) Estimate of CO₂e based on CalEEMod assumption of 0.041 Metric Tons of CO₂e per 1,000 gallons.

-------------------------	-------	----------------------

Operation

Assumptions

- 1) CalEEMod does not estimate the indirect reduction in GHG emissions from renewable energy generation.
- 2) The project will generate a large amount of renewable energy during a 30-year project lifetime.
- 3) The indirect GHG emissions reductions can be calculated in many ways, but a conservatively low approach assuming a lifetime average GHG emissions reduction rate is used.
- 4) The annual generation is 303,8000 MWh per the applicant.
- 5) PG&E has a system-wide 0.133 MTCO₂e/MWh emission rate in 2016. It is assumed that the future RPS requirements will mean the project life average is one-half of that rate (0.0665 MTCO₂e/MWh).
