Mr. Christos Hardt, Architectural Designer
MILLER ARCHITECTURE
1177 Idaho Street, Suite 200
Redlands, California 92374

Dear Mr. Hardt:

INTRODUCTION

Ganddini Group, Inc. is pleased to provide this focused noise analysis for the proposed SD Homes Redlands Apartments Project in the City of Redlands. The project site is located adjacent to Orange Avenue between Iowa Street and Alabama Street in the City of Redlands. A vicinity map showing the project location is provided on Figure 1.

To assist the reader with those terms unique to noise analysis, a list of acronyms and a glossary of terms have been provided in Appendix A and Appendix B, respectively.

PROJECT DESCRIPTION

The project proposes to develop the 21.84 gross acre (18.94 net acre) project site with 328 multi-family (low-rise) attached residential dwelling units and a 14,663 square foot clubhouse. The southern portion of the site will include a passive park area which will include shaded rest areas and trails. The proposed project is shown on Figure 2.

APPLICABLE STANDARDS

CITY OF REDLANDS GENERAL PLAN 2035[1]

Table 1 shows the City's noise level standards related to land use compatibility. According to this matrix, exterior noise levels of up to 60 CNEL are considered to be "clearly compatible" for multi-family residential uses. The policies that are applicable to the proposed project from the Noise section of the General Plan have been listed below:

Policies

Principles

7-P.41 Ensure that new development is compatible with the noise environment by continuing to use potential noise exposure as a criterion in land use planning.

[1] City of Redlands General Plan 2035, 7.5 Noise. December 2017.

Actions

7-A.135 Use the noise and land use compatibility matrix (see Table 1) and Future Noise Contours map (General Plan Figure 7-9) as criteria to determine the acceptability of a given land use, including the improvement/construction of streets, railroads, freeways, and highways. Do not permit new noise-sensitive uses—including schools, hospitals, places of worship, and homes—where noise levels are "normally unacceptable" or higher, if alternative locations are available for the uses in the City.

7-A.136 Require a noise analysis be conducted for all development proposals located where projected noise exposure would be other than "clearly" or "normally compatible" as specified in Table 1.

7-A.137 For all projects that have noise exposure levels that exceed the standards in Table 1, require site planning and architecture to incorporate noise-attenuating features. With mitigation, development should meet the allowable outdoor and indoor noise exposure standards in Table 2. When a building's openings to the exterior are required to be closed to meet the interior noise standard, mechanical ventilation shall be provided.

Measure U Policies

9.0e Use the criteria specified in Table 1 to assess the compatibility of proposed land uses with the projected noise environment, and apply the noise standards in Table 2, which prescribe interior and exterior noise standards in relation to specific land uses. Do not approve projects that would not comply with the standards in Tables 1 and 2.

9.0i Require construction of barriers to mitigate sound emissions where necessary or where feasible, and encourage use of walls and berms to protect residential or other noise sensitive land uses that are adjacent to major roads, commercial, or industrial areas.

9.0s Require mitigation to ensure that indoor noise levels for residential living spaces do not exceed 45 dB LDN/CNEL due to combined effect of all exterior noise sources.

9.0v Consider the following impacts as possibly "significant":

- An increase in exposure of 4 or more dB if the resulting noise level would exceed that described as clearly compatible for the affected land use, as established in Tables 1 and 2;
- Any increase of 6 dB or more, due to potential for adverse community response.

9.0w Limit hours of construction or demolition work where site-related noise is audible beyond the site boundary.

CITY OF REDLANDS MUNICIPAL CODE[2]

City of Redlands Municipal Code

Chapter 8.06 of the City's Municipal Code establishes the City's noise standards and regulations.

Section 8.06.070 Exterior Noise Limits.

[2] City of Redlands Municipal Code. September 2017.

A. The noise standards for categories of land uses identified below, unless otherwise specifically indicated, apply to all such property within a designated zone.

Maximum Permissible Sound Levels By Receiving Land Use		
Receiving Land Use Category	Time Period	Noise Level - dBA
Single-family residential districts	10:00 PM - 7:00 AM	50
	7:00 AM – 10:00 PM	60
Multi-family residential districts; public space; institutional	10:00 PM - 7:00 AM	50
	7:00 AM - 10:00 PM	60
Commercial	10:00 PM - 7:00 AM	60
	7:00 AM - 10:00 PM	65
Industrial	Anytime	75

B. No person shall operate, or cause to be operated, any source of sound at any location within the City or allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person which causes the noise level when measured on any other property to exceed:

1. The noise standard for that land use specified in the table above of this section for a cumulative period of more than thirty (30) minutes in any hour; or
2. The noise standard specified in the table above of this section plus five (5) dB for a cumulative period of more than fifteen (15) minutes in any hour; or
3. The noise standard specified in the table above of this section plus ten (10) dB for a cumulative period of more than five (5) minutes in any hour; or
4. The noise standard specified in the table above of this section plus fifteen (15) dB for a cumulative period of more than one minute in any hour; or
5. The noise standard specified in the table above of this section plus twenty (20) dB or the maximum measured ambient level, for any period of time.

C. If the measured ambient level exceeds the allowable noise exposure standard within any of the first four (4) noise limit categories above, the allowable noise exposure standard shall be adjusted in five (5) dB increments in each category as appropriate to encompass or reflect said ambient noise level. In the event the ambient noise level exceeds the fifth noise limit category, the maximum allowable noise level under this category shall be increased to reflect the maximum ambient noise level.

Section 8.06.080 Interior Noise Standards.

A. No person shall operate or cause to be operated any source of sound, or allow the creation of any noise, which causes the noise level when measured inside a neighboring receiving occupied building to exceed the following standards:

1. The noise standard for that land use specified in the table below for a cumulative period of more than five (5) minutes in any hour.
2. The noise standard for that land use specified in the table below plus five (5) dB for a cumulative period of more than one minute in any hour.
3. The noise standard for that land use specified in the table below plus ten (10) dB for the maximum measured ambient noise level for any period of time.

B. If the measured ambient level exceeds the allowable exterior noise exposure standard in 8.06.070 of this chapter, the allowable interior noise exposure level shall be adjusted in five (5) dB increments as appropriate to reflect the ambient noise level.

Maximum Permissible Interior Sound Levels by Receiving Land Use		
Receiving Land Use Category	Time Period	Noise Level - dBA
Single-family residential districts	Any time	45
Multi-family residential districts; institutional; hotels	Any time	45
Commercial	Any time	50
Industrial	Any time	60

Section 8.06.090 Noise Disturbances Prohibited.

The following acts, and the causing or permitting thereof, are declared to be in violation of the Noise Ordinance:

F. Construction And/Or Demolition: Operating or causing the operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between weekday hours of six o'clock (6:00) PM and seven o'clock (7:00) AM, including Saturdays or at any time on Sundays or holidays, such that the sound therefrom creates a noise disturbance across a residential or commercial real property line, except for emergency work by public service utilities, the City or another governmental entity. All mobile or stationary internal combustion engine powered equipment or machinery shall be equipped with exhaust and air intake silencers in proper working order, or suitable to meet the standards set forth herein.

G. Vibration: Operating or permitting the operation of any device that creates a vibration, which is above the vibration perception threshold of an individual at or beyond the property boundary of the source if on private property or at one hundred fifty feet (150') from the source if on a public space or public right of way. The City of Redlands Municipal Code, Section 8.06.020, defines the vibration perception threshold as 0.01 inches per second (in/sec) RMS. As such, this noise study uses the City of Redlands Municipal Code vibration perception threshold of 0.01 in/sec RMS to assess the potential vibration impacts due to Project construction. Structural damage would not occur at this level.

K. Noise Sensitive Zones: Creating or causing the creation of any sound within any noise sensitive zone, so as to exceed the specified land use noise standards set forth in 8.06.070A of this chapter and subsection 8.06.070B of this chapter, or so as to interfere with the functions of such activity or annoy the occupants in the activity, provided that conspicuous signs are displayed indicating the presence of the zone.

Section 8.06.120 Exemptions.

Construction Activity: This chapter shall not apply to noise sources associated with new construction, remodeling, rehabilitation or grading of any property provided such activities take place between the hours of seven o'clock (7:00) AM and six o'clock (6:00) PM on weekdays, including Saturdays, with no activities taking place at any time on Sundays or federal holidays. All motorized equipment used in such activity shall be equipped with functioning mufflers.

Further, all mobile or stationary internal combustion engine powered equipment or machinery shall be equipped with exhaust and air intake silencers in proper working order, or suitable to meet the standards set forth herein.

The Ordinance also prohibits the operation of any device that creates a vibration, which is above the vibration perception threshold of an individual at or beyond the property boundary of the source if on private property or at one hundred fifty feet (150') from the source if on a public space or public right-of-way.

EXISTING NOISE ENVIRONMENT

EXISTING LAND USES AND SENSITIVE RECEPTORS

The project site is bordered by Alabama Street and single-family detached residential dwelling units to the east; single-family detached residential dwelling units, vacant land, and Orange Avenue to the south; single-family detached residential dwelling units and Iowa Street to the west; and vacant land and single-family detached residential dwelling units to the north. There are several schools within a few miles of the project site.

The State of California defines sensitive receptors as those land uses that require serenity or are otherwise adversely affected by noise events or conditions. Schools, libraries, churches, hospitals, single and multi-family residential, including transient lodging, motels and hotel uses make up the majority of these areas.

Sensitive receptors that may be affected by project-generated noise include the single-family detached residential dwelling units located north, west, and south of the project site, and multi-family attached residential dwelling units located east of the project site.

AMBIENT NOISE MEASUREMENTS

In order to document the existing noise environment, an American National Standards Institute (ANSI Section SI4 1979, Type 1) Larson Davis model LxT sound level meter was used to document existing ambient noise levels. In order to document existing ambient noise levels in the project area, four (4) 10-minute daytime noise measurements were taken between 2:06 PM and 3:25 PM on March 23, 2018. Field worksheets and noise measurement output data are included in Appendix C.

As shown on Figure 3, the noise measurements were taken along the single-family detached residential dwelling units located to the south and west of the project site, and the multi-family attached residential dwelling units located to the east of the project site. Table 3 provides a summary of the short-term ambient noise data. Ambient noise levels measured between 56.6 and 66.3 dBA L_{eq} during the daytime (7:00 AM to 10:00 PM). Estimated ambient nighttime noise levels are anticipated to decrease by five dBA to between 51.6 and 61.3 dBA L_{eq} during nighttime hours. The dominant noise sources were from vehicles traveling along Alabama Street, Orange Avenue, and Iowa Street.

DISCUSSION AND RECOMMENDATIONS

CONSTRUCTION NOISE IMPACTS

Construction noise is considered a short-term impact and would be considered significant if construction activities are undertaken outside the allowable times as described by the City's Municipal Code Section 8.06.120 (G). Existing single-family detached residential dwelling unit located to the east, south, and west of the project site, and the multi-family attached residential dwelling units located to the east of the project site may be affected by short-term noise impacts associated with the transport of workers, the movement of

construction materials to and from the project site, ground clearing, excavation, grading, and building activities. Project generated construction noise will vary depending on the construction process, type of equipment involved, location of the construction site with respect to sensitive receptors, the schedule proposed to carry out each task (e.g., hours and days of the week) and the duration of the construction work. The Federal Highway Administration's Roadway Construction Noise Model (RCNM) was utilized to model worst-case construction and demolition noise levels (see Appendix D).

Demolition activities are expected to produce the highest sustained construction noise levels. Demolition is expected to include the use of a concrete saw, three excavators, and two dozers. Noise levels associated with equipment used during the demolition are shown in Table 4. A worst-case construction noise scenario assuming the above listed equipment was operating between 25 and 200 feet from the property line, assuming a use factor of 40 percent for each piece of equipment, unmitigated noise levels could reach 86.4 dBA L_{eq} and 89.6 dBA L_{max} at the property line, and the nearest sensitive receptors during demolition. These noise levels will vary throughout each workday as equipment are moved around the site. Grading activities will produce slightly lower noise levels but will last for a longer period of time.

Construction noise levels at receptors not immediately adjacent to the property line in the immediate vicinity include single and multiple-family residential land uses east of Alabama Street, a church south of the project site, medical offices southwest of the project site. Construction noise levels at these land uses as well as at schools located within approximately ½ mile of the project site are presented in Table 5. It is important to note that the listed noise levels due not take into account any attenuation provided by ground absorption, or by any existing buildings and/or walls. The sound level data in Table 5 shows that construction noise levels at properties not adjacent to the project site can be expected to reach up to 60.4 dBA L_{eq}, and that construction noise at other nearby land uses, including schools will not exceed 50.6 dBA L_{eq}. As listed in Table 3, existing measured ambient noise levels range between 56.6 dBA L_{eq} and 66.3 dBA L_{eq}.

As stated earlier, any construction activities that occur outside the allowable time as identified in Section 8.06.120 (G) of the City's Municipal Code would be considered significant. Further, as required in the City's Municipal Code, all motorized equipment used must be equipped with functioning mufflers. Noise reduction measures are provided below to minimize construction noise impacts. The impact is considered less than significant with compliance of hours of operation restrictions outlined in the Municipal Code and implementation of the mitigation measures (MM 1-5) listed below.

MM1 During all project site excavation and grading on-site, construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturer standards.

MM2 The contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the project site.

MM3 Equipment shall be shut off and not left to idle when not in use.

MM4 The contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise/vibration sources and sensitive receptors nearest the project site during all project construction.

MM5 Jackhammers, pneumatic equipment and all other portable stationary noise sources shall be shielded and noise shall be directed away from sensitive receptors.

VIBRATION IMPACTS

Potential for Damage

Vibration generated by construction activity has the potential to damage structures. This damage could be structural damage, such as cracking of floor slabs, foundations, columns, beams, or wells, or cosmetic architectural damage, such as cracked plaster, stucco, or tile.

Caltrans has produced a guidance manual for evaluating potential vibration impacts "Transportation- and Construction-Induced Vibration Guidance Manual" dated September 2013). The manual provides thresholds for potential impacts on human comfort and damage to buildings, as well as guidance for reducing potential vibration impacts and addressing vibration issues. The manual gathers data from multiple sources including the Federal Transit Administration (FTA). As shown in Table 7, 0.20 PPV is the threshold at which there is arisk to "architectural" damage to normal houses.

Vibration levels in the project area may be influenced by construction. Vibration impacts related to structural damage would generally be considered significant if it involves any construction-related or operations-related impacts in excess of 0.2 +inches per second (in/sec) PPV. Further, Section 8.06.090 (G) of the City's Municipal Code prohibits vibration which is above the vibration perception threshold of an individual at or beyond the property boundary of the source if on private property or at one hundred and fifty feet (150 feet) from the source if on a public space or public right-of-way.

Vibratory rollers and/or large bulldozers are the most vibratory pieces of equipment that may be utilized on the project site. As shown in Table 5, vibratory roller could generate up to 0.21 PPV at a distance of 25 feet; and operation of a large bulldozer (0.089 PPV) at a distance of 25 feet. Sensitive receptors in the vicinity of the project site are located adjacent to the south, east, west, and north of the project site. The only receptors that could possibly be affected by groundborne vibration are the homes located immediately adjacent to the project site if a vibrator roller is utilized within 25 feet of a structure or if a large bulldozer is utilized within 15 of a structure. Vibration calculations are provided in Appendix E. With incorporation of mitigation measure 6 listed below, impacts related to groundborne vibration would be less than significant.

MM6 The use of vibratory rollers is to be restricted within 25 feet of the existing structures and the use of large bulldozers is to be restricted within 15 feet of existing structures.

Annoyance

As shown in Table 2, groundborne vibration becomes readily perceptible at 0.8 PPV. A vibratory roller generates vibration levels of 0.8 PPV at a distance of 10 feet and a large bulldozer generates vibration levels of 0.8 PPV at a distance of 6 feet (See Appendix E). Vibratory equipment is not expected to be utilized within 10 feet of an existing structure. Impacts associated annoyance associated with groundborne vibration would be less than significant. Mitigation is not required.

TRAFFIC NOISE IMPACTS

Noise Impacts to Off-Site Receptors Due to Project Generated Trips

A worst-case project generated traffic noise level was modeled utilizing the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108. Traffic noise levels were calculated from the centerline of the roadway to the roadway right-of-way (ROW). The modeling is theoretical and does not take into account any existing barriers, structures, and/or topographical features that may further reduce noise levels. Therefore, the levels are shown for comparative purposes only to show the difference in with and without project conditions. Roadway input parameters including average daily traffic volumes (ADTs), speeds, and vehicle distribution data are shown in Table 7. Existing and Existing Plus Project FHWA worksheets are included in Appendix F. The potential off-

site noise impacts caused by an increase of traffic from operation of the proposed project on the nearby roadways were calculated for the following scenarios:

Existing Year (without Project): This scenario refers to existing year traffic noise conditions and is demonstrated in Table 7.

Existing Year (Plus Project): This scenario refers to existing year plus project traffic noise conditions and is also demonstrated in Table 7.

As shown in Table 8, modeled Existing traffic noise levels range between 62.98-75.63 dBA CNEL and the modeled Existing Plus Project traffic noise levels range between 63.35-75.66 dBA CNEL at the right-of-way of each modeled roadway segment. The City's General Plan 2035 identifies a potentially substantial increase as either an increase of four or more dB if the resulting noise level would exceed the clearly compatible standards as identified in Tables 1 and 2 or any increase of 6 dB.

Table 8 shows that all modeled roadway segments are anticipated to change the noise a nominal amount (approximately 0.01 to 1.5 dBA CNEL). Therefore, a change in noise level would not be audible at any sensitive receptors, including nearby schools, and would be considered less than significant. No mitigation is required.

Noise Impacts to the Proposed Project

As stated previously, the City of Redlands has identified noise levels of up to 60 CNEL as "clearly compatible" for multi-family attached residential uses (see Table 1). However, if exterior noise levels range between 60 and 75 CNEL, the City's guidelines recommend discouraging new residential development in that area; and if new construction or development does proceed, a detailed analysis of noise reduction requirements must be made and needed noise reduction features included in the design.

The project site is bordered by Orange Avenue, Alabama Street, and Iowa Street. The City of Redlands General Plan 2035 identifies Alabama Street as a Major Arterial roadway and Iowa Street and Orange Avenue as Collector roadways. Future noise levels associated with vehicular traffic traveling on these roadways were modeled using the SoundPLAN model. The Traffic Impact Analysis prepared for the proposed project projects approximately 19,900 average daily traffic volumes to the roadway segment of Alabama Street north of Orange Avenue; 16,400 average daily traffic volumes to the roadway segment of Alabama Street south of Orange Avenue; 3,500 average daily traffic volumes to the roadway segment of Iowa Street along the project site frontage; and 8,000 average daily traffic volumes to the roadway segment of Orange Avenue along the project site frontage. A speed of 30 miles per hour was utilized for modeling input for Orange Avenue and Iowa Street. The posted speed limit for Alabama Street in the vicinity of the project site is 45 miles per hour. SoundPLAN modeling data is included in Appendix G.

As shown on Figure 4, future exterior traffic noise levels at the proposed multi-family (low-rise) attached residential facades along Alabama Street, north of Orange Avenue, are expected to reach up to 68 CNEL at the 1st floor, 71 CNEL at the 2nd floor, and 71 CNEL at the 3rd floor. Windows facing or with a line of sight of Alabama Street, north of Orange Avenue, will need an STC rating of at least 29 to meet the interior noise standard of 45 CNEL.

Future exterior noise levels at the proposed multi-family (low-rise) attached residential facades along Alabama Street, south of Orange Avenue, are expected to reach up to 67 CNEL at the 1st floor, 69 CNEL at the 2nd floor, and 70 CNEL at the 3rd floor. Windows facing or with a line of sight of Alabama Street, north of Orange Avenue, will need an STC rating of at least 28 to meet the interior noise standard of 45 dBA CNEL.

Future exterior noise levels at building facades along Orange Avenue are expected to reach up to 60 CNEL

at the 1st floor, 62 CNEL at the 2nd floor, and 63 CNEL at the 3rd floor. For the proposed multi-family (low-rise) attached residential dwelling units located adjacent to Orange Avenue, windows facing or with a line of sight of Orange Street should have an STC rating of at least 28 to meet the interior noise standard of 45 dBA CNEL.

Future exterior noise levels at the proposed multi-family (low-rise) attached residential facades along Iowa Street are expected to reach up to 56 CNEL at the 1st floor, 55 CNEL at the 2nd floor, and 56 CNEL at the 3rd floor. Considering that typical construction provides approximately 20 dB of exterior to interior noise reduction, additional mitigation measures for the proposed multi-family (low-rise) attached residential facades facing Iowa Street are not necessary.

The City's exterior noise level standard for multiple family residential land uses (60 dBA CNEL) would apply to the outdoor active use areas proposed as part of the project, specifically, the recreation center and the pool area. As shown on Figure 4, future noise levels at these locations are expected to reach up to 55 dBA CNEL and would be consistent with the City's Land Use Compatibility criteria. No mitigation is necessary to reduce future noise levels at the active outdoor use areas.

The City's exterior noise level standard of 60 dBA CNEL does not apply to the proposed balconies and patios because they would not be served as exits from the dwelling units, rather, they would be enclosed with a low wall or railing which would prohibit exit from the dwelling. This guidance is contained in footnote 2 of Table 7-11 in the City of Redlands General Plan 2035 and also presented in Table 2 of this letter report. No mitigation would be required to reduce future noise levels at balconies or patios.

With the addition of windows with STC ratings presented below as mitigation measures, interior noise levels are expected to meet the State Building Code/City of Redlands standard of 45 CNEL.

MM6 Windows facing or with a line of sight of Alabama Street, north of Orange Avenue, will need an STC rating of at least 29 to meet the interior noise standard of 45 CNEL.

MM7 Windows facing or with a line of sight of Alabama Street, north of Orange Avenue, will need an STC rating of at least 28 to meet the interior noise standard of 45 dBA CNEL.

MM8 For the proposed multi-family (low-rise) attached residential dwelling units located adjacent to Orange Avenue, windows facing or with a line of sight of Orange Street should have an STC rating of at least 28 to meet the interior noise standard of 45 dBA CNEL.

OPERATIONAL NOISE IMPACTS

On-site noise sources associated with development of the proposed project will include typical noises associated with residential land uses, including vehicles starting and stopping, passenger loading and unloading; refuse trucks, occasional car alarm activation, landscape maintenance, kids playing. These instantaneous or short-term noise events would range between 55 and 70 dBA at 50 feet from the noise source. Noise associated with proposed park uses will include people talking and socializing along the proposed trails and at the shaded rest areas. Normal conversation is typically 65 dBA. These events and conversation, however, would not occur frequently enough or close enough to sensitive receptors to exceed City of Redlands stationary noise standards or result in a substantial increase in the ambient average (L_{eq}) noise levels, and would not result in significant impacts.

Mr. Christos Hardt, Architectural Designer
MILLER ARCHITECTURE
September 24, 2018 (Revised January 22, 2019, March 8, 2019 & May 22, 2019)

CONCLUSIONS

The noise impacts from the proposed SD Homes Redlands Apartments Project are anticipated to be consistent with applicable General Plan and Municipal Code standards.

It has been a pleasure for Ganddini Group, Inc. to service your needs on this project. Should you have any questions or if we can be of further assistance, please do not hesitate to call at (714) 795-3100.

Respectfully submitted,

Roma Stromberg, INCE/MS
Senior Noise Analyst

AGRICULTURE	Agriculture	A	A	A	A	A	A	A
Zone A: Clearly Compatible		Specified land use is satisfactory, based up the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.						
Zone B: Normally Compatible		New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements are made and needed noise insulation features in the design are determined. Conventional constuction, with closed windows and fresh air supply systems or air conditioning, will normally suffice.						
Zone C: Normally Incompatible		New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of noise reduction requirements must be made and needed noise reduction features included in the design.						
Zone D: Clearly Incompatible:		New construction or development should generally not be undertaken.

(2) Bold values are considered annoying to people.

Table 7
Typical Human Reaction and Effect on Buildings Due to Groundborne Vibration

Vibration Level Peak Particle Velocity (PPV)	Human Reaction	Effect on Buildings
0.006–0.019 in/sec	Threshold of perception, possibility of intrusion	Vibrations unlikely to cause damage of any type
0.08 in/sec	Vibrations readily perceptible	Recommended upper level of vibration to which ruins and ancient monuments should be subjected
0.10 in/sec	Level at which continuous vibration begins to annoy people	Virtually no risk of "architectural" (i.e., not structural) damage to normal buildings
0.20 in/sec	Vibrations annoying to people in buildings	Threshold at which there is a risk to "architectural" damage to normal dwelling – houses with plastered walls and ceilings
0.4–0.6 in/sec	Vibrations considered unpleasant by people subjected to continuous vibrations and unacceptable to some people walking on bridges	Vibrations at a greater level than normally expected from traffic, but would cause "architectural" damage and possibly minor structural damage

APPENDIX A

LIST OF ACRONYMS

TERMS	DEFINITIONS
ADT	Average Daily Traffic volume
ANSI	American National Standard Institute
APN	Assessor's Parcel Number
Caltrans	California Department of Transportation
Calveno	California Vehicle Noise
CEQA	California Environmental Quality Act
CFR	Code of Federal Regulations
CNEL	Community Noise Equivalent Level
D/E/N	Day/Evening/Night
dB	Decibel
dBA or dB(A)	Decibel "A-Weighted"
EIR	Environmental Impact Report
EPA	Environmental Protection Agency
FAA	Federal Aviation Administration
FHWA	Federal Highway Administration
FTA	Federal Transit Administration
Hz	Hertz
INCE	Institute of Noise Control Engineering
L_{02},L_{08},L_{50},L_{90}	A-weighted Noise Levels at 2 percent, 8 percent, 50 percent, and 90 percent, Respectively, of the time period
DNL	Day-Night Average Noise Level
$L_{eq(x)}$	Equivalent Noise Level for "x" period of Time
L_{max}	Maximum Level of Noise (measured using a sound level meter)
L_{min}	Minimum Level of Noise (measured using a sound level meter)
LOS C	Level of Service C
MPH	Miles Per Hour
NEPA	National Environmental Policy Act
OPR	California Governor's Office of Planning and Research
Peak Hour L_{eq}	Peak Hour Equivalent Sound Level
PPV	Peak Particle Velocity
RCNM	Road Construction Noise Model
RMS	Root Mean Square
SEL	Single Event Level or Sound Exposure Level
SPL	Sound Pressure Level
STC	Sound Transmission Class
VdB	Vibration Velocity Decibels

APPENDIX B

DEFINITIONS OF ACOUSTICAL TERMS

Term	Definition
Ambient Noise Level	The all-encompassing noise environment associated with a given environment, at a specified time, usually a composite of sound from many sources, at many directions, near and far, in which usually no particular sound is dominant.
A-Weighted Sound Level, dBA	The sound level obtained by use of A-weighting. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear.
CNEL	Community Noise Equivalent Level. CNEL is a weighted 24-hour noise level that is obtained by adding five decibels to sound levels in the evening (7:00 PM to 10:00 PM), and by adding ten decibels to sound levels at night (10:00 PM to 7:00 AM). This weighting accounts for the increased human sensitivity to noise during the evening and nighttime hours.
Decibel, dB	A logarithmic unit of noise level measurement that relates the energy of a noise source to that of a constant reference level; the number of decibels is 10 times the logarithm (to the base 10) of this ratio.
DNL, Ldn	Day Night Level. The DNL, or Ldn is a weighted 24-hour noise level that is obtained by adding ten decibels to sound levels at night (10:00 PM to 7:00 AM). This weighting accounts for the increased human sensitivity to noise during the nighttime hours.
Equivalent Continuous Noise Level, L_{eq}	A level of steady state sound that in a stated time period, and a stated location, has the same A-weighted sound energy as the time-varying sound.
Fast/Slow Meter Response	The fast and slow meter responses are different settings on a sound level meter. The fast response setting takes a measurement every 100 milliseconds, while a slow setting takes one every second.
Frequency, Hertz	In a function periodic in time, the number of times that the quantity repeats itself in one second (i.e., the number of cycles per second).
L_{02}, L_{08}, L_{50}, L_{90}	The A-weighted noise levels that are equaled or exceeded by a fluctuating sound level, 2 percent, 8 percent, 50 percent, and 90 percent of a stated time period, respectively.
L_{max}, L_{min}	L_{max} is the RMS (root mean squared) maximum level of a noise source or environment measured on a sound level meter, during a designated time interval, using fast meter response. L_{min} is the minimum level.
Offensive/ Offending/ Intrusive Noise	The noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of sound depends on its amplitude, duration, frequency, and time of occurrence, and tonal information content as well as the prevailing ambient noise level.
Root Mean Square (RMS)	A measure of the magnitude of a varying noise source quantity. The name derives from the calculation of the square root of the mean of the squares of the values. It can be calculated from either a series of lone values or a continuous varying function.

APPENDIX C

NOISE MONITORING FIELD WORKSHEETS

Noise Measurement
Field Data

Project Name: SD Homes Date: **23-Mar-18**

Project #: 18-0085

Noise Measurement #: NM1 **3099 LxT_Data131.xlsx** Technician: **Ian Edward Gallagher**

Nearest Address or Cross Street: **Alabama Street & Orange Avenue**

Site Description (Type of Existing Land Use and any other notable features) **Empty lot, grassy field. Surrounding, rural, farm style homes, cittrus groves, developing compact residemtial.**

Weather: **~30% cloudy, cumulus above and heavy rain clouds to the North, sunshine and blue sky between the clouds.** **Settings:** **SLOW** **FAST** (Circle one)

Temperature: 68 deg F **Wind: Calm - 3 mph** **Humidity: 47%** **Flat**

Start Time: **2:06 PM** **End Time:** **2:16 PM** **Run Time:** **10 minutes**

Leq:	64.6 **dB**	**Primary Noise Source:**	**Traffic noise from vehicles running along Alabama Street**
Lmax	80.3 **dB**		
L2	73.8 **dB**	**Secondary Noise Sources:**	**Overhead aircraft, propellor planes and higher altitude commercial jet aircraft**
L8	68.5 **dB**		**Bird song**
L25	63.9 **dB**		**Occasional dog bark from distant residence.**
L50	57.8 **dB**		

NOISE METER:	SoundTrack LxT Class 1 ;	**CALIBRATOR:**	Larson Davis CAL250 Acoustic Calibrator
MAKE:	Larson Davis	**MAKE:**	Larson Davis
MODEL:	LxT1	**MODEL:**	Cal250
SERIAL NUMBER:	3099	**SERIAL NUMBER:**	2723
FACTORY CALIBRATION DATE:	6/23/2017	**FACTORY CALIBRATION DATE:**	6/9/2017
FIELD CALIBRATION DATE:	3/23/2018

Concrete Saw	No	20		89.6	50	0
Excavator	No	40		80.7	50	0
Excavator	No	40		80.7	25	0
Dozer	No	40		81.7	100	0
Dozer	No	40		81.7	200	0

		Calculated (dBA)		Results
Equipment		*Lmax	Leq	
Concrete Saw		89.6	82.6	
Excavator		80.7	76.7	
Excavator		86.7	82.8	
Dozer		75.6	71.7	
Dozer		69.6	65.6	
	Total	**89.6**	**86.4**	

*Calculated Lmax is the Loudest value.

APPENDIX E

VIBRATION WORKSHEETS

GROUNDBORNE VIBRATION ANALYSIS

Project:	SD Homes	Date:	3/8/19
Source:	Vibratory Roller		
Scenario:	Unmitigated		
Location:	Project Site		
Address:			

PPV = PPVref(25/D)^n (in/sec)

INPUT

Equipment Type =	1	Vibratory Roller	INPUT SECTION IN GREEN
PPVref =	0.21	Reference PPV (in/sec) at 25 ft.	
D =	25.00	Distance from Equipment to Receiver (ft)	
n =	1.50	Vibration attenuation rate through the ground	

Note: Based on reference equations from Vibration Guidance Manual, California Department of Transportation, 2006, pgs 38-43.

RESULTS

PPV =	0.21	IN/SEC	OUTPUT IN BLUE

GROUNDBORNE VIBRATION ANALYSIS

Project:	SD Homes	Date:	3/8/19
Source:	Large Bulldozer		
Scenario:	Unmitigated		
Location:	Project Site		
Address:			

PPV = PPVref(25/D)^n (in/sec)

INPUT

Equipment = Type	2	Large Bulldozer	INPUT SECTION IN GREEN
PPVref =	0.089	Reference PPV (in/sec) at 25 ft.	
D =	15.00	Distance from Equipment to Receiver (ft)	
n =	1.50	Vibration attenuation rate through the ground	

Note: Based on reference equations from Vibration Guidance Manual, California Department of Transportation, 2006, pgs 38-43.

RESULTS

PPV =	0.2	IN/SEC	OUTPUT IN BLUE

GROUNDBORNE VIBRATION ANALYSIS

Project:	SD Homes	Date:	3/8/19
Source:	Vibratory Roller		
Scenario:	Unmitigated		
Location:	Project Site		
Address:			

PPV = PPVref(25/D)^n (in/sec)

INPUT

Equipment Type	1	Vibratory Roller	INPUT SECTION IN GREEN
PPVref =	0.21	Reference PPV (in/sec) at 25 ft.	
D =	10.00	Distance from Equipment to Receiver (ft)	
n =	1.50	Vibration attenuation rate through the ground	

Note: Based on reference equations from Vibration Guidance Manual, California Department of Transportation, 2006, pgs 38-43.

RESULTS

PPV =	0.8	IN/SEC	OUTPUT IN BLUE

GROUNDBORNE VIBRATION ANALYSIS

Project:	SD Homes	Date:	3/8/19
Source:	Large Bulldozer		
Scenario:	Unmitigated		
Location:	Project Site		
Address:			

PPV = PPVref(25/D)^n (in/sec)

INPUT

Equipment Type =	2	Large Bulldozer	INPUT SECTION IN GREEN
PPVref =	0.089	Reference PPV (in/sec) at 25 ft.	
D =	6.00	Distance from Equipment to Receiver (ft)	
n =	1.50	Vibration attenuation rate through the ground	

Note: Based on reference equations from Vibration Guidance Manual, California Department of Transportation, 2006, pgs 38-43.

RESULTS

PPV =	0.8	IN/SEC	OUTPUT IN BLUE
