

# CHAPTER 2 – RESPONSES TO COMMENTS

---

## 1. Introduction

Sections 21091(d) and 21092.5 of the Public Resources Code (PRC) and Section 15088(a) of the CEQA Guidelines govern the lead agency’s requirement to respond to comments provided on a Draft Environmental Impact Report (EIR). Section 15088(a) of the California Environmental Quality Act (CEQA) Guidelines states that “The lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. The Lead Agency shall respond to comments raising significant environmental issues that were received during the noticed comment period and any extensions and may respond to late comments.” In accordance with these requirements, this chapter provides responses to written comments on the Draft EIR, inclusive of four agency letters received during the public comment period and one agency letter received after the close of the public comment period.

**Table 2-1, *Comments Received in Response to the Draft EIR***, provides a list of the comment letters received by the City.

Subsection 2, *Topical Responses to Comments*, provides comprehensive responses to address multiple, similar comments that have been raised on key topics during the Draft EIR public review period. Where appropriate, references to the topical responses are provided within the individual responses to comments prepared in subsection 3, *Responses to Comments*, which is described below. The Topical Responses in this section include the following:

- Topical Response No. 1: Public Participation and Review
- Topical Response No. 2: Modifications to the Project Design
- Topical Response No. 3: Enforcement of Public Access
- Topical Response No. 4: Aesthetics
- Topical Response No. 5: Biological Resources/Trees
- Topical Response No. 6: Historic Resources
- Topical Response No. 7: Artificial Turf and Effects of Localized Heat and Health
- Topical Response No. 8: Noise: Construction and Operation Impacts
- Topical Response No. 9: Transportation and Parking During Construction and Operations
- Topical Response No. 10: Emergency Access
- Topical Response No. 11: Recreation: Golf and Tennis Facilities
- Topical Response No. 12: Related Projects: Adequacy of Cumulative Mobile Source Noise and Traffic Analyses
- Topical Response No. 13: Need for Project (Non-CEQA)

Subsection 3, *Responses to Comments*, below, presents the comment letters submitted during the public comment period for the Draft EIR. As indicated in Table 2-1, the comment letters are organized by agencies (AG), organizations (ORG), form letters (FORM), and individuals (IND). Each letter/correspondence is assigned a number and each comment that requires a response within a given letter/correspondence is also assigned a number. For example, the first agency letter below that provides comments is the letter from the City of Los Angeles Fire Department, and their correspondence is, therefore, designated Letter No. AG 1. The first comment received within Letter No. AG 1 is then labeled Comment No. AG 1-1. Each numbered comment is then followed by a corresponding numbered response, (i.e., Response No. AG 1-1). A copy of each comment letter is provided in Appendix A, Original Draft EIR Comment Letters, in this Final EIR.

As required by CEQA Guidelines Section 15088(c), the focus of the responses to comments is “the disposition of significant environmental issues raised.” Therefore, detailed responses are not provided to comments that do not relate to environmental issues. However, in some cases, additional information has been added for reference and clarity.

**TABLE 2-1  
COMMENTS RECEIVED IN RESPONSE TO THE DRAFT EIR**

## 2. Topical Responses to Comments

### a) Topical Response No. 1 – Public Participation and Review

#### (1) Introduction

This topical response is provided in response to comments received regarding the City's public review period. Numerous comments were received requesting that the public review period for the Draft Environmental Impact Report (EIR) be extended beyond 45 days to 90 days. Reasons for the public's requested extension included, but were not limited to, the fact that the public review period occurred during the COVID-19 pandemic, that the public review period coincided with the "tax" season, and the "large" volume of documentation associated with the Draft EIR, including its appendices.

#### (2) Discussion

With regard to public review of the Draft EIR, California Environmental Quality Act (CEQA) Guidelines Section 15105(a) specifies that the public review period for a Draft EIR should not be less than 30 days nor longer than 60 days except in unusual circumstances. When a draft EIR is submitted to the State Clearinghouse for review by state agencies, such as the Project's Draft EIR, the public review period shall not be less than 45 days, unless a shorter period, not less than 30 days, is approved by the State Clearinghouse.

The Department of City Planning determined that there were no unusual circumstances with respect to the Harvard-Westlake River Park Project Draft EIR that would warrant a comment period beyond the upper limit of 60 days, as set forth in the CEQA Guidelines.

Regarding release of the Draft EIR during "tax" season, the time of year including "tax" season does not constitute an unusual circumstance because it is an annual event that is not included in the Guidelines as cause for an extension. Additionally, the size of the Project's EIR does not constitute an unusual circumstance and the public circulation of the Draft EIR was consistent with the City's standard practice.

As stated in the Notice of Completion/Notice of Availability (NOC/NOA), the City's Department of City Planning recognized the unprecedented nature of COVID-19 and the restrictions it was causing. Having been identified as an essential City service, the Department of City Planning continued to work and respond to all inquiries pertaining to its ongoing efforts to process entitlement applications. As a result of the Mayor's "Safer at Home" Order issued on March 19, 2020, the Department of City Planning acknowledged that the usual methods for accessing project-related materials in-person might be limited. Nonetheless, the Department of City Planning was committed to ensuring that interested parties seeking information about the Project could retain access to the Draft EIR and the documents referenced in the Draft EIR. The Department of City

Planning was responsive and responded to public requests for Draft EIR information throughout the public review circulation period.

As the NOC/NOA clearly stated, the Draft EIR, the documents referenced in the Draft EIR, and the whole of the case file were available for public review online at the Department of City Planning's website and in-person at three City libraries and at Department of City Planning offices, and provided contact information for City staff should an interested party wish to purchase a copy of the Draft EIR and referenced documents, or to arrange additional accommodations. The City met all legal requirements for document access and availability. In addition, the City has released tens of Draft EIRs over the course of the COVID-19 pandemic with 45-day public review periods, therefore this instance does not present an unusual circumstance.

The original review period was increased to 47 days because the end of the 45-day public review fell on the weekend. While the City met all applicable CEQA requirements during the initial 47-day public review period, the City, in response to strong public interest in extending the Draft EIR's review and comment period, extended the public review period for an additional 15 days. Thus, the public review period occurred over a total of 62 calendar days from March 10, 2022 to May 10, 2022.

The California Environmental Quality Act (Public Resources Code Section 21000 *et seq.*) (CEQA) and the Guidelines for the California Environmental Quality Act (14 Cal. Code Regs. Section 15000 *et seq.*) (CEQA Guidelines) provide specific requirements with regard to the distribution and review of documents prepared as part of the EIR process, all of which the City has met or exceeded. An overview of these requirements and a discussion of how the City, in its role as Lead Agency for the Project, has met these requirements are provided below.

CEQA Guidelines Section 15085(a) requires that, upon completion of the Draft EIR, a Notice of Completion (NOC) be filed with the Office of Planning and Research (OPR). CEQA Guidelines Section 15087 requires that a Notice of Completion and Availability (NOC/NOA) of the Draft EIR be mailed to organizations and individuals that have requested such notice in writing, and that notice shall also be given by at least one of the following additional methods: (1) publication at least one time in the newspaper of general circulation in the area; (2) posting of notice by the public agency in the area where the project is to be located; or (3) direct mailing to owners and occupants contiguous to the parcel on which the project is located. CEQA Guidelines Section 15087(d) requires that the NOA shall also be posted in the Office of the County Clerk. CEQA Guidelines Section 15087(g) provides that lead agencies should furnish copies of the Draft EIR to the public library systems in the area of the project, and also provide a copy in the office of the lead agency, to make the Draft EIR available to the public. The City's compliance with these requirements is discussed in detail, below.

CEQA Guidelines Section 15086 includes the consultation requirements that the lead agency must fulfill during the comment period on the Draft EIR, such as consultation with

responsible agencies, trustee agencies, and any other agency that has jurisdiction by law over the Project. CEQA Guidelines Section 15086 also provides that the lead agency may consult with any person with expertise regarding any environmental impact involved, any member of the public who has filed a written request for notice; and any person identified by the applicant whom the applicant believes will be concerned about the project.

Consultation with the public was part of the Notice of Preparation (NOP), which included notification that a public scoping meeting would be held to further inform public agencies and other interested parties of the Project and to solicit input regarding the Draft EIR. The public scoping meeting was held on October 19, 2020, at 5:30 p.m., in an online format using the GoToWebinar platform. The meeting provided public agencies and interested parties the opportunity to view materials, ask questions, and provide written comments to the City regarding the scope and focus of the Draft EIR as described in the NOP and Initial Study. The presentation materials and other documentation from the scoping meeting were provided in Appendix A-3, Scoping Meeting Materials, of the Draft EIR.

When a Draft EIR is submitted to the State Clearinghouse for review by state agencies, the public review period shall not be less than 45 days, unless a shorter period, not less than 30 days, is approved by the State Clearinghouse.

In accordance with the requirements discussed above, once the Draft EIR was completed, the City, as the Lead Agency, filed a NOC with OPR, and copies of the Draft EIR were provided for distribution by the State Clearinghouse commencing the public review period on March 10, 2022, and ending on April 25, 2022, a period of 47 days (later extended by 15 days to 62 days). The City prepared and mailed the NOC/NOA requesting comments on the Draft EIR to responsible agencies, those agencies and individuals that commented on the NOP for the Initial Study, all property owners and tenants (including businesses) within a 500-foot radius of the Project Site, and any person or organization who had requested to be included on an interested parties list for the Project. The NOC/NOA included information on how to access the Draft EIR, including accessing the City's website.

An electronic copy on CD of the Draft EIR was also mailed to numerous appropriate agencies identified by the Los Angeles Department of City Planning. To further ensure that agencies received notice of the Draft EIR, the City e-mailed copies of the NOC/NOA to known agency contacts and/or general agency e-mail addresses, which also included a link to the Draft EIR on the City's website. A notice was also printed in the *Los Angeles Times* and posted at the County Clerk Office. With the newspaper notice, direct mailings to owners and occupants within a 500-foot radius of the Project Site, all parties who responded to the NOP, and to all persons and organizations on the Project's interested parties list including those who requested to receive notice, the City exceeded the noticing requirements set forth in CEQA Guidelines Section 15087.

Concerning the length of the public review of the Draft EIR, the initial public review period of 47 days, beginning on March 10, 2022, and ending on April 25, 2022, met CEQA's

requirement of 45 days pursuant to CEQA Guidelines Section 15105(a) for Draft EIRs submitted to the State Clearinghouse for public review by state agencies. Nonetheless, a Notice of Extension extending the public review period to May 10, 2022 was prepared by the City and distributed in a similar manner and to the same parties as completed for the NOC/NOA.

As explained in detail above, the City exceeded CEQA's requirements with regard to the distribution of documents for public review of documents in order to ensure that all interested agencies, organizations, and individuals were informed of and had the opportunity to comment on the Draft EIR for the Project. Regarding the Final EIR, pursuant to CEQA Guidelines Section 15088(b), the City, as the Lead Agency, will provide a written response to all public agency comments presented in this chapter of the Final EIR at least 10 days prior to certifying the Final EIR. In addition, the City will provide responses to comments submitted by organizations and individuals as included in this chapter in this Final EIR.

## b) Topical Response No. 2 – Modifications to the Project Design

### (1) Introduction

Modifications were made to the Project design in response to public and agency comments received on the Draft EIR. These include comments received from agencies such as the Los Angeles Department of Water and Power (LADWP) and the California Department of Fish and Wildlife (CDFW), as well as individuals and community organizations. Many of the comments submitted in response to the City’s circulation of the Draft EIR raised concerns regarding air quality, noise, and traffic impacts during construction activities. Also, numerous comments raised concerns about lighting, noise, and traffic during operation of the Project. With these concerns in mind, the Project Applicant, Harvard-Westlake School, has incorporated modifications to the Project design which have been formulated to accommodate these concerns, as discussed below. **Table 2-2, Summary of Project Design Modifications**, includes the design modifications that the School will implement as part of the Project. Generally, the Project design modifications include: a reduction in total seating, reduced number of light poles, building design (swimming pool area and gymnasium) changes, reduced number of parking spaces, reduced grading/excavation, changes to the stormwater capture and reuse system, and removal of water features. In addition, revisions to the Draft EIR with the Project design modifications are included in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR. Within Chapter 3, relevant figures from the Draft EIR have also been revised to illustrate the Project design modifications.

**TABLE 2-2  
SUMMARY OF PROJECT DESIGN MODIFICATIONS**

Category	Draft EIR Project Description	Project Design Modification
<b>Lights</b>		
Field A	6 poles at 70'	4 poles (2 poles on the East and 2 poles on the West) at 80'
Field B	3 poles (N) at 80', 3 poles (S) at 60/70/60' and 1 pole (E) at 60'	4 poles (2 poles on the South and 2 poles on the North) at 80'
Pool	2 poles (SW/SE) at 60', 5 poles (W) at 28', 4 poles (N) at 25', 3 poles (E) at 21'	4 poles (2 poles on the East and 2 poles on the West) at 55'
Tennis Courts	12 poles at 40'	10 poles at 40' (excludes 1 light mounted at 40' on pool pole)
<b>Swimming Pool</b>		
Bleacher Seats	348	214
Diving Boards	One 1-meter board, one 3-meter board	Diving boards and diving competitions removed from School activities

**TABLE 2-2  
SUMMARY OF PROJECT DESIGN MODIFICATIONS**

<b>Category</b>	<b>Draft EIR Project Description</b>	<b>Project Design Modification</b>
Noise Reduction Canopy	Located along the north, west, and south sides of the pool, maximum height of 30-feet.	Located on west side of pool above bleachers, maximum height, 14 feet, 6 inches
<b>Field A</b>		
Visitor Bleacher Seats	170	180 <sup>a</sup>
Home Bleacher Seats	318	362 <sup>a</sup>
<b>Field B</b>		
Bleacher Seats	255	109
<b>Tennis Courts</b>		
Bleacher Seats	100	84
<b>Gymnasium</b>		
Glass Curtain Wall	Facing north on 2 <sup>nd</sup> floor, and south on the 2 <sup>nd</sup> floor	Removed from 2 <sup>nd</sup> floor south elevation (now solid wall); Reduced window size on north elevation on the 2 <sup>nd</sup> floor
Bleacher Seats	1,026	1,056
Solar Panels	426 total: 338,000 kWh	379 total: 281,000 kWh
<b>Total Seating</b>		
Outdoor Bleacher Seating	1,191	949
Total Outdoor Bleacher and Gymnasium Seating	2,217	2,005
<b>Parking</b>		
Subterranean Garage	503 spaces	386 spaces
Surface Parking Lot	29 spaces	17 spaces
Total Parking	532 spaces	403 spaces
<b>Grading</b>		
Grading Cubic Yards	250,000	197,000
Grading Duration	7 months	5.5 months
Grading Truck trips (including both inbound and outbound trips)	35,714	28,142
Overall Construction Duration	30 months	30 months

<b>Water</b>		
Water Features	Three features west of gymnasium building	Removed from Project
Stormwater Capture and Reuse System	1-million gallon stormwater capture and reuse system for water from the Project Site and a 39-acre residential neighborhood north of the Project Site	Approximate 350,000 gallons stormwater capture and reuse system for water from the Project Site only

## NOTES:

<sup>a</sup> Seating Increase due to bleachers being converted from poured-in place concrete to a standard, prefabricated design.

SOURCE: ESA, 2023.

## (2) Discussion

### (a) Lighting

With regard to lighting, the Project design modifications would reduce the overall number of light poles on the Project Site within the two athletic fields, swimming pool, and tennis courts from 39 to 22 poles as follows:

- Field A, a reduction from six, 70-foot poles to four, 80-foot poles
- Field B, a reduction from seven poles that varied in height from 60 to 80 feet to four, 80-foot poles
- Swimming pool, a reduction from fourteen poles that varied in height from 21 to 60 feet to four, 55-foot poles<sup>1</sup>
- At the tennis courts, a reduction from twelve, 40-foot poles to ten, 40-foot poles<sup>2</sup>

A Supplemental Lighting Report Memorandum, included as Appendix B.1 of this Final EIR, provides the lighting levels around the Project Site with the Project design modifications. As analyzed therein, the footcandles of illumination produced by the sports lighting modification show a reduction from the original design, except at Receptor No.9 (4110 Whitsett Avenue) for which illumination was calculated to increase negligibly by a few hundredths of a footcandle (an amount that is not detectable by the human eye). All measurements remain far below the Los Angeles Municipal Code (LAMC) and River

<sup>1</sup> Two of the four poles in the pool area (i.e., the two poles on the eastern side of the pool) will have luminaires mounted such that they serve both the pool area and the adjacent tennis courts.

<sup>2</sup> The reduction of two poles at the tennis courts was accomplished by relocating those luminaires to nearby poles at the eastern side of the swimming pool.

Improvement Overlay (RIO) District<sup>3</sup> thresholds for illumination. Further, the modified sports lighting system continues to be an improvement over existing conditions which produce higher levels of off-site glare at adjacent residences and along the Zev Greenway given the imprecise optics and shallow orientation of the existing driving range and tennis court lights. Please refer to Topical Response No. 4 – Aesthetics, of this Final EIR, for a more detailed discussion of the modified lighting system. Also, refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, which includes updates to the lighting analysis in the Draft EIR to reflect the modified lighting system.

(b) *Swimming Pool Area*

With regard to noise and visual massing from the swimming pool area, the number of bleacher seats have been reduced from 348 to 214 seats, the noise reduction canopy has been reduced in size, and the diving boards and associated diving competitions have been eliminated (which standardizes the pool depth at eight feet rather than the eleven foot diving well that was originally required to support those activities). The reduction of the canopy would reduce the massing as viewed from off-site locations. However, since the redesigned canopy would be smaller than the previous design, it would not provide as much noise reduction as the prior, larger canopy. A Supplemental Noise Analysis, included as Appendix F of this Final EIR, provides the noise levels from the Project with the design modifications around the swimming pool area and composite noise levels (encompassing all activities and operation of the Project Site) at the adjacent off-site noise sensitive receptors. As analyzed therein, noise levels with the Project design modifications from the swimming pool area would be up to 3.5 dBA higher than analyzed in the Draft EIR (at one receptor location – R3<sup>4</sup>). As indicated in the Draft EIR, outside of a laboratory, a change of 3 dBA in ambient noise levels is considered to be a barely perceivable difference.<sup>5</sup> At 3.5 dBA, this increase would not be a substantial increase in the severity of impacts from the swimming pool area as analyzed in the Draft EIR. Moreover, composite noise levels that account for all Project Site activities with all the Project design modifications would be the same or lower at all of-site locations with the Project design modifications. Neither the Project with or without the design modifications would result in a significant noise impact based on the City's thresholds utilized in the Draft EIR. Please refer to Topical Response No. 8 – Noise: Construction and Operation Impacts, of this Final EIR, for a more detailed discussion of the noise levels associated with the Project design modifications in the swimming pool area. Also, refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, which includes updates to the noise analysis in the Draft EIR to reflect the swimming pool area with the Project's design modifications.

In addition, concerns regarding avian collisions were raised in public comments regarding the swimming pool buildings. Although the Project as evaluated in the Draft EIR would

<sup>3</sup> Zoning Information (ZI 2358), RIO Improvement Overlay District

<sup>4</sup> R3 = Single-family residential uses at the corner of Teesdale Avenue and Valley Spring Lane.

<sup>5</sup> Harvard-Westlake River Park Project Draft EIR, page IV.K-5, March 2022.

not result in any significant impacts to the movement of migratory birds or have a substantial adverse effect on any species identified as a candidate, sensitive, or special status species, the Project design modifications could potentially serve to further reduce potential avian collisions concerns. As shown on Figure II-13, Swimming Pool Elevations – East and West Views, as revised in Chapter 3 of this Final EIR, the glass within the pool area buildings would be limited to small glass areas with anodized aluminum metal and glass garage door.

(c) *Athletic Fields, Pool, and Tennis Court Bleacher Seating*

With regard to noise, the number of outdoor bleacher seats associated with the athletic fields, pool, and tennis courts would be revised as follows: Field A: 488 to 542 seats (10 additional seats on the east sideline and 44 additional seats on the west sideline); Field B: 255 to 109 seats; Pool: 348 seats to 214 seats; and tennis courts: 100 to 84. The total outdoor bleacher seating with the Project design modifications, including the swimming pool, athletic fields, and tennis courts, would be reduced from 1,191 to 949 seats, for a reduction of 242 outdoor seats. Because athletic activities could occur simultaneously on the Project Site, the noise analysis in the Draft EIR and Supplemental Noise Analysis conservatively analyzed noise from all Project Site athletic activities to determine whether noise impacts would occur. Furthermore, the Supplemental Noise Analysis reflects the Project with design modifications updated site plan (Figure II-6 in Chapter 3 of this Final EIR). For example, the modeled noise levels at the off-site receptor locations account for the modified pool area, which includes a reduced canopy that formerly provided additional noise attenuation across the Project Site. As analyzed in the Supplemental Noise Analysis, noise levels from the collective athletic activities under the Project with design modifications scenario would result in a maximum noise level increase of 1.1 dBA ( $L_{eq}$ ) at one off-site receptor (R3) compared to the Project without design modifications, which would not be a perceptible difference.<sup>6</sup> At well below 3 dBA, this increase would not be a perceptible change from the noise levels as analyzed in the Draft EIR. Moreover, as stated above, composite noise levels that account for all Project Site activities with all the Project design modifications would be the same or lower at all of-site locations with the Project design modifications. Again, neither the Project with or without the design modifications would result in a significant noise impact based on the thresholds utilized in the Draft EIR. Please refer to Topical Response No. 8 – Noise: Construction and Operation Impacts, of this Final EIR, for a more detailed discussion of the noise levels associated with the athletic activities under the Project with design modifications scenario. Also, refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, which includes updates to the noise analysis in the Draft EIR to reflect the modified bleacher seats.

<sup>6</sup> Based on a comparison of ambient plus Project noise levels in Table IV.K-12 and Table IV.K-13 in the Draft EIR to Table 2 and Table 3 in the Supplemental Noise Analysis, respectively.

*(d) Gymnasium*

The Project design modifications to the gymnasium would include increasing the indoor bleacher seating from 1,026 seats to 1,056 seats. As these seats are indoor and noise would be substantially contained to within the building, there would be no change to off-site noise levels from the small change in seating. Also, as discussed below, since the number of parking spaces has been reduced by 129 spaces and no off-site parking would be permitted for any event or use of the Project Site, the minor change in indoor seating with the reduced number of parking spaces would not result in increased traffic to/from the Project Site. That is, the Draft EIR analyzed noise levels with 532 spaces, and now with 403 spaces, visitors that could have parked at the Project Site with the additional 129 spaces, would now be required to shuttle to the Project Site. Thus, individual vehicle trips to/from the Project Site during events when the gymnasium may be at or near full capacity would be reduced. The Transportation Assessment (TA) prepared for the Project analyzed the circulation of three (3) shuttles during the periods of School use. Under the Project with design modifications, assuming that most of the event attendees would arrive at the Upper School campus around the same time, shuttles would be operated at the maximum capacity of 24 passengers at a time, resulting in 6 additional shuttle round trips (129 passengers divided by 24 passengers per shuttle trip) between the Project Site and the Upper School campus.

In addition, concerns regarding avian collisions were raised in public comments regarding the gymnasium. Although the Project as evaluated in the Draft EIR would not result in any significant impacts to the movement of migratory birds or have a substantial adverse effect on any species identified as a candidate, sensitive, or special status species, the Project design modifications could potentially serve to further reduce potential avian collisions concerns. The gymnasium will continue to rely in part on natural lighting, as part of the Project design modifications, and the majority of the building will continue to be covered by various metal louvers, porcelain tile and slate stone cladding. However, the window area of the south side (second floor) of the gymnasium (previously covered with metal louvers) has been removed from the Project design and will be converted to solid walls, and the window area of the north side of the gymnasium has been reduced in size. Note that on the inside of the gymnasium, a shade curtain would be installed and would typically be placed in its down position during athletic uses, which would also reduce light visible from the outside. The glass on the north side of gymnasium would be substantially obscured by a terrace area and HVAC systems, and the curtain on the inside of the gymnasium (when down). See updated Figure II-8, *Gymnasium Elevations – North and South Views*, and Figure II-25, *Rendering of the Southwestern Corner of the Gymnasium and Community Room*, as revised in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, for illustration of the modified gymnasium design.

Also, the number of solar panels on the gymnasium would be reduced from 426 to 379 panels. The reduction in solar panels was a design correction that still allows the Project to meet LAMC requirements, which were previously exceeded under the Project analyzed

in the Draft EIR. The reduction in the number of panels, made in order to provide serviceable pathways between banks of panels, would have no new or substantial increase in the severity of environmental effects under CEQA thresholds. Corrections have been made in Chapter 3 of this Final EIR to reflect the corrected number of solar panels and change in corresponding operational and energy and greenhouse gas (GHG) calculations. Corresponding modeling runs are included in Appendix K, Supplemental Greenhouse Gas and Energy Modeling Data, to this Final EIR.

(e) *Parking*

With regard to traffic and construction related air quality and noise, the Project design modifications would reduce the number of subterranean parking from 503 spaces to 386 spaces, and reduce the number of surface lot spaces from 29 to 17 spaces. Overall, the number of parking spaces would be reduced from 532 to 403, for a total reduction of 129 spaces. The reduced number of parking spaces would have the effect of reducing traffic along Moorpark Avenue, Whitsett Avenue, and Ventura Boulevard, to/from the Project Site since no off-site parking would be permitted by the Project. That is, visitors that could have parked at the Project Site with the additional 129 spaces, would now be required to shuttle to the Project Site during those occasions when the lot could reach capacity. Additionally, the reduced size of the subterranean parking structure would require less excavation as discussed below, which would result in a shorter duration of the construction excavation phase and a reduction in construction-related GHG emissions. Please refer to Topical Response No. 8 – Noise: Construction and Operation Impacts, of this Final EIR, for a more detailed discussion of the noise levels associated with the Project design modifications. Refer to Topical Response No. 9 - Transportation and Parking During Construction and Operations, for a discussion of the Project's proposed parking program with the Project design modifications. Also, refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, which includes updates to the Draft EIR to reflect the updated parking space numbers with the Project design modifications.

(f) *Grading*

With regard to traffic and construction related air quality and noise, as stated above, because of the reduced number of spaces, the footprint of the one level subterranean parking garage would be smaller. The modified subterranean parking structure would result in 53,000 cubic yards less of excavation compared to that analyzed as part of the Draft EIR. Thus, the overall amount of excavation would be reduced from 250,000 cubic yards to 197,000 cubic yards. This reduction in grading would reduce the number of haul truck trips from 35,714 trips to 28,142, a reduction of 7,572 truck trips<sup>7</sup>. This would reduce the excavation phase (with dirt hauling) from seven months to 5.5 months, although the overall construction schedule would still remain at approximately 30 months given

---

<sup>7</sup> The Project design modifications would result in a reduction in grading of 53,000 cubic yards. As each haul truck carries 14 cubic yards, that equates to a reduction of 3,786 trucks, or 7,572 truck trips.

overlapping construction phases. With the reduced grading, the duration of the Project's on-site and off-site significant and unavoidable construction noise impacts would be reduced as would construction-related GHG emissions. Please refer to Topical Response No. 8 – Noise: Construction and Operation Impacts, of this Final EIR, for a more detailed discussion of the noise levels associated with the Project design modifications. Refer to Topical Response No. 9 - Transportation and Parking During Construction and Operations, for a discussion of the Project's construction-related traffic impacts with the Project design modifications. Also, refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, which includes updates to the Draft EIR to reflect the reduced grading with the Project design modifications.

(g) *Water*

With regard to water supply, in consultation with the City and in accordance with Los Angeles City Charter Sections 671, 672, and 673, the Project's one-million-gallon stormwater capture and reuse system was reduced in size (down to approximately 350,000 gallons pending final design) and scale so as to capture and treat stormwater only from the Project Site, and not from the 39-acre residential neighborhood to the north. While the Draft EIR did acknowledge the benefits of capturing and treating runoff from the off-site area, this benefit was not quantified as part of the Draft EIR's analysis of the Project's hydrology, water quality, or water supply impacts. The Project would still similarly comply with all applicable water quality regulations as analyzed in the Draft EIR. All hydrology and water quality impacts from the Project would continue to be less than significant without the need for mitigation. Also, the Draft EIR's analysis of water supply did not take credit for water captured and reused by the on-site system, including captured water from off-site areas, so the analysis of water supply impacts does not change with the reduced capacity of the stormwater capture and reuse system. Moreover, although the Project's water demand would result in a less-than-significant impact on water supply, in an effort to support water conservation, all previously contemplated water features (such as recirculating streams and ponds west of the gymnasium building) within the Project Site have been removed. Refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, which includes updates to the Draft EIR to reflect the removal of the off-site water collection from the Project's capture and reuse system with the Project design modifications.

(h) *CEQA Implications*

CEQA anticipates circumstances where new information can be included in a Final EIR without recirculation of the Draft EIR if the new information is intended to clarify or amplify information in the Draft EIR and does not result in significant new or substantially increased environmental impacts. The proposed Project design modifications are intended to address public comments and generally have the effect of reducing environmental less-than-significant and significant and unavoidable impacts as analyzed in the Draft EIR and would not result in higher activity, new impacts, or substantial increases in the severity of impacts evaluated in the Draft EIR.

Overall, the Project modifications would reduce the duration of the Draft EIR’s significant and unavoidable construction noise impacts, and less-than-significant impacts related to light and glare, air emissions (with mitigation), GHGs, traffic, and water demand, while overall composite operational noise impacts would be similar to those identified in the Draft EIR. None of the modifications would result in an increase in any CEQA impacts identified in the Draft EIR. Because the Project modifications do not result in new or substantially increased severity of environmental effects over those identified in the Draft EIR, the Project’s design modifications would not require recirculation of the Draft EIR (refer to Chapter 1, *Introduction*, of this Final EIR, for additional details regarding recirculation criteria).

## c) Topical Response No. 3 – Enforcement of Public Access

### (1) Introduction

This topical response is provided in response to comments received on the Draft EIR regarding Harvard-Westlake's (School's) commitment to provide public access to the community of the Project Site, including whether the School will be required to provide public access and how the School or City will guarantee the public access.

### (2) Discussion

#### (a) *The Project was Specifically Designed to Incorporate Public Access*

The Draft EIR is clear that public access to the Project Site is an integral part of the Project. As described in Chapter II, *Project Description*, of the Draft EIR on pages II-2 and II-33 through II-35, the Project has been designed to provide daily, 7:00 a.m. to 9:00 p.m., public access to an approximately 0.75-mile landscaped pathway and other landscaped areas totaling 5.4 acres, and continued all day public use of the putting green and clubhouse/café. In addition, as shown in Table II-3, *Public Use Days and Hours*, on page II-34 of the Draft EIR, the public would have use of the tennis courts when courts are available, even if some of the courts are in use by the School. Public use of the tennis courts could be through walk-on play or through advanced reservations. With the tennis courts, the Project would provide a total of seven (7) acres of publicly accessible open space and recreation area. The gymnasium community room, gymnasium courts, and athletic fields would be available to preapproved groups when not in use by the School (preapproved groups are further described below). The swimming pool would be available for public use under approved swim programs because of certified lifeguarding requirements.

The public pedestrian pathway circumnavigating the Project Site would be available daily from 7:00 a.m. to 9:00 p.m. and would be accessed via gateways off Valley Spring Lane, Bellaire Avenue, and immediately north of LAFD Fire Station No. 78 along Whitsett Avenue. The public pedestrian pathway would be separated from School field activities by landscaped berms and fencing within the interior of the Site, to avoid conflation of public use of the athletic facilities when in use by the School. The public pathway would be extensively planted with native vegetation and trees and would comply with the Americans with Disability Act (ADA). The pathway would provide seating and would be available for any member of the public free of charge and without reservation, for dog walking, general exercise, and observation of the natural setting and biodiversity around the Project Site. The pathway would connect to an ADA-compliant pedestrian ramp that would provide access to the Zev Greenway.

With the exception of the tennis courts, other recreational facilities including the gymnasium, sports fields, and swimming pool would only be available during those

periods of the day when not in use by the School. The School's use would comprise a minor part of the day on weekdays, as discussed below. School use on Saturdays could take place intermittently, between 9:00 a.m. and 6:00 p.m., and are anticipated to be less frequent than weekday use. Concurrent public use of the Project Site on Saturdays would still be supported in the same manner as during school days. On Sundays, no School athletics uses would be permitted and the entire Project Site would be wholly available for public use. The tennis courts would be available to the public, even at times when some of the courts are in use by the School. In addition, the walking pathway and putting green are active uses that would be available to the public 7:00 a.m. to 9:00 p.m., seven days a week.

Harvard-Westlake students would primarily attend classes on the Upper School campus during the academic day and would generally not arrive at the Project Site until 3:00 p.m. The athletic fields, gymnasium, and tennis courts would therefore be fully available for public use from 7:00 a.m. until 2:30 p.m., equal to 7.5 hours each weekday (the half-hour differential between the cessation of public uses and the arrival of Harvard-Westlake students being necessary to provide sufficient time for the return of equipment, clean-up, and visitor egress). Based on the School's 2018-19 athletics calendar and the most conservative assumption that all School athletics activities would be scheduled at the Project Site (except for football games), approximately 50 percent of school days would not include outdoor athletic activities after 5:30 p.m. On such days, and providing the aforementioned 30 minutes of clean-up and egress time, public use could resume at 6:00 p.m. and continue until 8:00 p.m. when all outdoor activities would be required to cease (except for the tennis courts, which could be used until 9:00 p.m.). Reserved accordingly, public use on 50 percent of school days could total 9.5 hours out of the 14 hours that the Project Site's two multi-purpose fields and tennis courts would be open and operational. The Project's pool would be subject to more limited hours given the necessity of providing certified lifeguard supervision. The gymnasium basketball courts would be available to preapproved public groups by reservation (refer to discussion of preapproved public groups below). As described in Table II-3 of the Draft EIR, the pool would be available for members of approved swim programs daily from 7:00 a.m. to 9:00 a.m., or for periods of time after weekdays at 9:00 a.m., or on weekends, if the approved swim program provides dedicated, certified lifeguard supervision at the program's own expense (and assuming the pool is not in use by the School or other swim program).

The requirement for reservations would be a necessary component of coordinated public use in order to ensure that all participants are able to fully access the desired facility(ies) without unintended, simultaneous use by other individuals or groups. Given the layout of the athletic facilities and ability to move freely between the pool, athletic fields, and gymnasium, public use of those facilities would not be supported when they are in use by the School. As a result of public feedback and interest, however, public use of the tennis courts would be possible even if School tennis uses were underway on one or more of the eight courts (if the School were not using all of the courts).

In addition, in order to provide easier public access into the Project Site, the Project would provide off-site improvements to the segment of Valleyheart Drive, south of LAFD Fire Station 78, and portions of the Zev Greenway adjacent to the Project Site would have direct access to the walking pathway circumnavigating the Project Site. Furthermore, as described on page II-20 of the Draft EIR, the Project's gymnasium would include a ground-level community room available for public use by organizations through a reservation system. The community-accessible meeting space would be located along the southeastern corner of the building with the main entrance facing the Los Angeles River and be located adjacent to newly-landscaped areas, benches, other seating, and walking pathways. In addition to the community room, the Project's "River Room" would be located along the southwestern corner of the gymnasium building. While not directly reservable for general public use, the River Room would be used by Harvard-Westlake and preapproved environmental organizations to offer publicly-accessible classes, educational programming, nature walks, lectures, and cultural experiences relating to the role of the Los Angeles River in the City's evolution and those who have inhabited the area over time.

By providing a variety of accessible recreational opportunities, the Project would support the following: field, pool, and gym-based sports by pre-approved community groups or swim program members when not in use by the School; continued playing of tennis on eight courts; and regular access to approximately 5.4 acres (235,224 square feet) of passive open space, including the three-quarter mile long pedestrian pathway system described above. Several comments were received requesting clarity on what types of groups would be permitted to use the Project Site, and what the process for receiving pre-approval might entail. Based on information received from Harvard-Westlake, the pre-approval requirement for groups ensures that: a) the group is familiar with and abides by the conditions of Project Site usage (including, but not limited to, preferred driving routes, allowable hours of operation, and prohibition on parking in the neighborhood); b) the group or organization is able to provide appropriate supervision of its intended activities and participants; and c) the use of facilities can be managed in a way that best supports the aggregate, desired activity or program schedules of public groups across the Project Site. A group would consist of any organization or league that has a registration process for its own participants, provides trained staffing and/or coaching, provides supervision commensurate with its activities and number of participants, maintains liability insurance covering its participants, and has an executed/up-to-date agreement in place with the School. Group use of the tennis courts, such as for a tournament or tennis club, would be permissible as is individual use. With the exception of the walking pathway, putting green, café, and clubhouse, use of recreational facilities by entities other than the School would require a fee to help offset the cost of basic maintenance and security functions.

The Draft EIR lists among the Project Objectives that the Project would provide academic opportunities for science labs, outdoor classes, bird-watching, and other non-athletic school activities. Harvard-Westlake classes would be primarily held on the Upper School campus, and no classroom buildings are proposed as part of the Project. Since academic use of the Project Site is an important Project Objective, the Project Site would be used

for academic purposes. Academic use would be primarily conducted after regular school hours since students and teachers would need to travel from the Upper School campus to the Project Site. Because travel to the Project Site would reduce or interrupt the amount of regular school-hour instructional time (given the Upper School's fixed class periods), use of the Project Site for academic purposes prior to 3:00 p.m. on school days would be relatively infrequent. The academic use of the Project Site would not occupy any of the athletic recreational facilities and would not impede or conflict with any public use of the Project Site.

To facilitate public use of the Project Site, the Project would preserve the existing clubhouse structure and café to function as a visitor center, and the putting green would be preserved for public use. At the visitor center, members of the public would check in for tennis court reservations, use of the putting green, and for other information. The visitor center would be available for all reservation activities although an on-line reservation system would also be available to expedite visitor check-in and reservations. The clubhouse would also include an interpretive exhibit displaying the history of the property and its use as the Weddington Golf & Tennis facility. Additionally, the public would have access to Field A or the gymnasium for such activities as lectures, or community meetings, with outdoor events on Field A including such activities as "Movies in the Park," local concerts, or other performances (referred to in the Draft EIR as public special events). Public events would be scheduled so they do not occur concurrently with school events.

It should also be noted that under existing conditions the Project Site is composed of a private fee-only recreational golf and tennis facility, contains non-native and invasive species and large expanses of water-intensive grass, and has no connection to the Zev Greenway. In contrast, the Project would provide 5.4 acres of publicly-accessible open space that would be available without charge. The proposed landscape plan is consistent with the RIO District Ordinance guidelines and would replace many of the non-native and invasive species that had been previously introduced to the Project Site. As described on pages II-51 through II-52 of the Draft EIR, the primary goals of the Project's landscape design are to (i) create a dense tree canopy for natural habitat and learning opportunities, (ii) provide a high level of visual quality with respect to adjacent residential neighborhoods and public enjoyment, and (iii) create a diverse and pleasant outdoor setting for public use and relaxation. The landscaping would also enhance the connection between the Project Site and the adjacent Zev Greenway where currently no connection exists. In aggregate, the 240 trees to be removed would be replaced by 393 California native trees in addition to three understory planting zones throughout the Project Site, resulting in approximately 28,800 new shrubs and perennials located on the Project Site (refer to Figure IV.C-6, Planting Zone Plan, of the Draft EIR). All of these landscape features would enhance public enjoyment of the Project Site. (See also Topical Response No. 5 - Biological Resources, in this Final EIR, and Sections IV.C, *Biological Resources*, and IV.L.3, *Parks and Recreation*, pages IV.L.3-22 through IV.L.3-27, of the Draft EIR.)

Furthermore, the Project's commitment to public access is reflected in the Project Objectives set forth in Chapter II, *Project Description*, of the Draft EIR. Per Section 15124(b) of the CEQA Guidelines, "... The statement of objectives should include the underlying purpose of the project and may discuss the project benefits." Of the nine Project Objectives, three are solely dedicated to promoting public access:

- Project Objective 2: "Provide opportunities for shared use of a variety of types of recreational facilities and activities for the community."
- Project Objective 4: "Create new publicly-accessible open space with a broad array of recreational facilities in a safe and secure environment for the surrounding community and the public to use similar to a City-owned park, while also providing a community room, café, and indoor and outdoor areas for public gatherings, performances, and occasional special events."
- Project Objective 5: "Increase public access to and enhance the adjacent Los Angeles River and Zev Greenway through a network of publicly-accessible pathways, a new direct connection to the Zev Greenway, and a landscape plan that would restore native plant communities, create habitat for various species, and support the goals of the Los Angeles River Improvement Overlay District Ordinance, the Los Angeles River Revitalization Master Plan, and the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes."

(Page II-13 of the Draft EIR)

*(b) The Public Access and Shared Facilities Components of the Project Will be Secured Through the Project's Conditional Use Permit.*

As summarized above, the Project was clearly designed to permit and encourage public use of the open space and recreational facilities on the Project Site and to enhance the public's ability to access the Zev Greenway. Nonetheless, some commenters have expressed concern that once the Project is approved, the School will not maintain the Project's public access component, and that the City would have no enforcement mechanism to ensure that the open space and recreational facilities are accessible during the hours set forth in the Draft EIR.

However, these concerns are misplaced. As described on page II-8 of the Draft EIR, the Project Site is zoned A1, which is defined as an agricultural zone in the Los Angeles Municipal Code (LAMC), and a school use is permitted in the A1 zone with a conditional use permit (CUP) pursuant to LAMC Section 12.24. Accordingly, pursuant to LAMC Section 12.24 T, the School has requested a Vesting Conditional Use Permit to allow the operation of a private-school athletic and recreational campus in the A1 zone. (Page II-62, *Requested Permits and Approvals*, of the Draft EIR.) In general, if the City approves a CUP, it may impose conditions on a project. In the City of Los Angeles, the LAMC specifically allows the imposition of conditions that further the findings required for approval of a CUP (LAMC Section 12.24 F). The LAMC also requires that specific findings be made to support approval of the CUP, including a finding that "the project will

enhance the built environment in the surrounding neighborhood or will perform a function or provide a service that is essential or beneficial to the community, city, or region” (LAMC Section 12.24 E). In addition to providing school facilities, the Project would provide publicly accessible open space and shared use recreational facilities, features that substantially advance environmental sustainability as compared to existing conditions (such as a photovoltaic array to reduce energy demand, a landscape plan consisting entirely of native species, and a stormwater capture and reuse system). Although not a publicly owned park/recreational facility, the Project’s open space areas would nonetheless support many of the identified priorities and needs, including the need for walking pathways in the Project Site vicinity as identified by the Los Angeles Department of Recreation and Parks 2009 Citywide Community Needs Assessment. The Needs Assessment prioritizes recreation needs for the South San Fernando Valley as following: No. 1 - walking and biking trails, No. 2 - small neighborhood parks, No. 4 - nature trails, No. 8 - indoor gyms, No. 9 - outdoor tennis courts, No 12 - outdoor swimming pools, No. 13 - nature/environment centers, No. 19 - golf courses/driving ranges, No. 21 - youth soccer fields, and No. 25 - adult soccer fields.<sup>8</sup> Furthermore, the City may impose conditions that ensure the public access and shared use elements of the Project, including the hours that open space areas and pathways must be accessible to the public and the requirements for shared use of the recreational facilities. LAMC Section 12.24 F provides a mechanism for enforcement of such condition. Pursuant to LAMC Section 12.24 F:

**F. Conditions of Approval.** In approving a project, the decision-maker may impose conditions related to the interests addressed in the findings set forth in Subsection E. ...

The [Planning] Department shall have the authority to conduct inspections to verify compliance with any and all conditions imposed on any conditional use or other similar quasi-judicial approval granted pursuant to this section. Clearance, monitoring and inspection fees shall be paid by the business operator or property owner to the Department in accordance with the fee schedule in Section 19.01 of this Code. ...

If, upon inspection, the Department finds that the applicant has failed to comply with conditions of any conditional use or other similar quasi-judicial approval granted pursuant to this section, the Department shall give notice to the business operator or property owner to correct the specific deficiencies and the time in which to complete the correction. Evidence of compliance shall be submitted to the Department within the specified correction period. If the deficiencies are not corrected within the time

<sup>8</sup> City of Los Angeles Department of Recreation and Parks, 2009 Citywide Community Needs Assessment, Final Report, Figure 1.8.1a, *Prioritized Facility and Program Needs by Geographic Area*, page 54.

prescribed by the Department, revocation proceedings pursuant to Subsection Z. of this section may commence.

Furthermore, pursuant to LAMC Sections 12.24 Z and 12.24 AA, if the School fails to comply with the conditions of the CUP, the City can revoke, temporarily suspend, or impose further restrictions on the conditional use. In the event of a revocation, the Project would be subject to all the regulations of the A1 zone. Since the A1 zone does not permit a school use without a CUP, the School would not be able to continue operating the School facilities until, and unless, it receives a new CUP. Thus, at the City's discretion, potential conditions of approval could be imposed and the enforcement mechanism would ensure that the public access and shared use of recreational facilities would continue.

*(c) Project Design Modifications*

As discussed in Topical Response No. 2 – Modifications to the Project Design, design modifications relating to seating, lighting, building design (swimming pool area and gymnasium), parking, grading, storm water capture and reuse system, and water features were made to the Project in response to public and agency comments received on the Draft EIR. However, none of the design modifications affect public access to the Project Site and as such, the impact analysis and conclusions included in the Draft EIR are not affected by the Project design modifications.

**(3) Conclusion**

The above discusses the Project's (with or without design modifications) public access and shared facilities components that would be secured through the Project's conditional use permit. The discussion is provided for informational purposes. The Project's public access features were appropriately described in the Draft EIR. No new or additional analysis is required for this issue since the Project would not result in significant new or substantially increased environmental impacts evaluated in the Draft EIR.

## d) Topical Response No. 4 – Aesthetics

### (1) Introduction

This topical response is provided in response to comments received on the Draft EIR regarding the Project's aesthetics impacts. Commenters were primarily concerned that the heights of the field lights would impact views across the Project Site; the removal of trees would result in adverse scenic resources impacts; the scale of the gymnasium and overall Project would not be suitable for the Agricultural zoning of the Project Site or the scale of the neighborhood; and lighting for the Project's multipurpose athletic fields, tennis courts, and swimming pool would result in light and glare impacts. Based on the questions provided in Appendix G of the CEQA Guidelines, the Initial Study, included in Appendix A of the Draft EIR, determined that environmental issues related to views, scenic resources, and visual character would be less than significant and did not warrant further analysis in the Draft EIR. The Initial Study further determined that light and glare impacts would be potentially significant and would be further evaluated in the Draft EIR.

### (2) Discussion

As discussed above, the Initial Study determined that the Project would not result in potentially significant impacts regarding scenic vistas, scenic resources within a state scenic highway, or conflict with applicable zoning or other regulations governing scenic quality. Analyses of these issues are provided in the Initial Study, Section 4, *Environmental Impact Analysis*, Item I, *Aesthetics*. The Initial Study, which invited public comments, was circulated to the public for 30 days beginning September 30, 2020, and is included as Appendix A of the Draft EIR. The Initial Study findings are summarized below.

#### (a) Views

Under CEQA, impacts to views refer to blocked scenic vistas from public locations such as streets and parks. As evaluated in the Initial Study (see pages 57 and 58 of the Initial Study, contained in Appendix A of the Draft EIR), the proposed field light poles, ranging in height from 40 feet to 80 feet, would be partially visible from adjacent public streets. However, the field light poles would be broadly set back from each other and, due to their narrow structure, would not substantially block views of scenic vistas across the Project Site. Because of intervening trees, scenic vistas or long-range views of the background mountains are minimally visible in views across the Project Site, with some limited distant views present between trees, such as between the Mexican Fan palms on Valley Spring Lane. Moreover, the Project would not encroach into the public right-of-way and would not block public scenic vistas of the Hollywood Hills through south-facing street corridors. In addition, the Project's field lighting poles, at a maximum height of 80 feet, would be lower than many of the wooden poles that support the existing golf driving range netting and reach a height of approximately 90 feet. The Project's sports lighting poles would also have a diameter similar to the driving range netting poles. No community concerns were expressed regarding the existing 90-foot-high poles as being highly visible and

blocking existing views across the Project Site. Impacts related to views across the Project Site were determined to be less than significant. As such, the Project would not result in an environmental effect that would exceed CEQA threshold standards. This topic was recommended for no further evaluation in the Draft EIR.

(i) *Project Design Modifications*

With regard to scenic vistas, the Project design modifications include a reduced overall scale/massing of the swimming pool area due to the reduced size and height of the pool canopy. Because of this reduction at the swimming pool area, the Project's already less than significant impact regarding views to and across the Project Site from off-site vantages would be incrementally reduced, with impacts remaining less than significant, similar to that evaluated in the Initial Study.

Also, with regard to the field lights, the Project design modifications would reduce the overall number of light poles on the Project Site from within the two athletic fields, swimming pool and tennis courts from 39 to 22 poles, as described in Topical Response No. 2 – Modifications to the Project Design and as shown in the updated Figure II-27, Light and Signage Plan for the Project, in Chapter 3, *Revisions, Clarifications, and Corrections*, of this Final EIR. The height of the four light poles on each of Field A and Field B would all be 80 feet. The six light poles on Field A analyzed in the Draft EIR were up to 70 feet tall, and the seven light poles on Field B analyzed in the Draft EIR ranged from 60 to 80 feet tall. The Initial Study impact analysis and conclusions of views would remain unchanged with the Project design modifications since the Initial Study evaluated light poles up to 80 feet in height, and those poles that have increased in height would still be set away from each other and, due to their narrow structure, would not substantially block views of scenic vistas across the Project Site, similar to the Project without the design modifications. Also, the light poles with the Project design modifications would continue to be shorter than the existing 90-foot-high poles on the Project Site, and the total number of light poles under the Project with the design Modifications would be less than analyzed in the Draft EIR. For these reasons, the Initial Study's less than significant impacts regarding views would not change under the Project with design modifications.

(b) *Scenic Resources*

Significant impacts on scenic resources under CEQA refer to significant damage to natural resources such as trees and historic resources within a state scenic highway. As discussed in the Initial Study (see page 59 of the Initial Study, contained in Appendix A of the Draft EIR), the Project Site does not contain natural scenic resources, such as rock outcroppings or sizeable areas of native vegetation, nor is the Project Site within the view field of a state or local scenic highway.<sup>9</sup> The nearest eligible state scenic highway is along

---

<sup>9</sup> State of California, Department of Transportation, Officially Designated State Scenic Highways, <https://dot.ca.gov/programs/design/lap-landscape-architecture-and-community-livability/lap-liv-i-scenic-highways>, accessed September 1, 2020.

California State Route 1, approximately 10.44 miles west of the Project Site.<sup>10</sup> As such, development of the Project would not substantially damage scenic resources as the Project Site is not within a State Scenic Highway.

Nonetheless, commenters raised concerns about the removal and replacement of existing trees and the effects on the Project Site's scenic visual quality. It should be noted, however, that as discussed in the Initial Study, the Project would be designed to comply with the requirements of the City's Department of Public Works, Urban Forestry Division, which requires the replacement of street trees (trees within the street public right-of-way) on a 2:1 basis and approval by the Board of Public Works. Thus, the Project would not conflict with the tree replacement regulations. The Project has also been designed so that mature street trees would be retained along Bellaire Avenue, Whitsett Avenue, and the Zev Greenway. In addition, the Project would retain the majority of mature street trees along Valley Spring Lane with the exception of two smaller sections of trees along Valley Spring Lane. The areas of mature tree retention on Valley Spring Lane, Bellaire Avenue, Whitsett Avenue, and the Zev Greenway and tree removal along Valley Spring Lane, as well as the sections of tree removal on Valley Spring Lane, are illustrated in Section IV.C, *Biological Resources*, Figure IV.C-4, *Tree Removal Plan*, and Figure IV.C-5, *Tree Planting Plan*, on pages IV.C-36 and IV.C-37, respectively, of the Draft EIR. The removed trees on Valley Spring Lane would be replaced with fast growing Velvet Ash in 48-inch boxes to contribute to the screening of the Project Site from the public street. The Project's tree planting program would also comply with the *Los Angeles River Master Plan Landscaping Guidelines* with respect to recommended tree and shrub species within the River Implementation Overlay (RIO) District. Because the majority of street trees would remain, the few removed street trees would be replaced at a 2:1 ratio, and the Project's tree planting program over the entire Project Site would result in an overall increase of 153 trees beyond existing conditions (or a 36 percent increase), the Project's tree canopy would not result in a diminishment of tree resources. Refer to Topical Response No. 5 – Biological Resources/Trees, for additional discussion of the Project's tree replacement program and long-term effects to the tree canopy.

In addition, although the Project Site is not located within a state scenic highway, comments were received regarding the Project's effects on historical resources which contribute to the Project Site's scenic visual quality. As reflected in Chapter II, *Project Description*, of the Draft EIR, and in Section IV.D, *Cultural Resources*, page IV.D-30 and IV.D-31, Project Design Feature CUL-PDF-1: Rehabilitation Plan, the distinctive character-defining features of the Project Site as identified in the Historic-Cultural Monument (HCM) designation would be retained. Specifically, the Project Site would remain a private recreational facility open for public use in Studio City, and the character defining features of the HCM, specifically the clubhouse, putting green, golf ball-shaped light standards, and brick wall with weeping mortar, would all be retained such that the

---

<sup>10</sup> State of California, Department of Transportation, Officially Designated State Scenic Highways, <https://dot.ca.gov/programs/design/lap-landscape-architecture-and-community-livability/lap-liv-i-scenic-highways>, accessed September 1, 2020.

Project Site would retain its historic integrity and continue to convey its significance as a 1950s community recreational facility. The Project would maintain significant open space and mature landscaping and would not alter the Project Site in a manner that would significantly impact its historic character. See Topical Response No. 6 - Historic Resources, of this Final EIR for additional discussion of the Project's impacts to historical resources, including the Project's preservation of the historic-related character defining features.

(i) *Project Design Modifications*

With regard to scenic resources, the Project design modifications would not affect the Project tree removal and replacement program. Also, none of the design modifications directly or indirectly affect any of the Project Site's character-defining features. As the Project Site is not within a state scenic highway, the analysis of scenic resources impacts in the Initial Study would not change under the Project with design modifications.

(c) *Visual Quality*

As identified in the Initial Study, the Project is located within an urbanized area. As such, based on the CEQA Guidelines question, the Project does not require the evaluation of existing visual character or quality of public views of the Project Site and its surroundings. The CEQA threshold, however, requires that a Draft EIR evaluate a project's potential conflict with regulations that govern scenic quality (see page 57 of the Initial Study contained in Appendix A of the Draft EIR). As discussed on pages 59 through 60 of the Initial Study, the Project would not conflict with regulations that govern scenic quality including the requirements of the City's Department of Public Works, Urban Forestry Division, the RIO landscaping regulations, including the implementation of the Los Angeles River Master Plan Design Guidelines and Plant Palettes, and the individual design and community design and landscaping policies of the Sherman Oaks-Studio City-Toluca Lake-Cahuenga Community Plan (Community Plan) Design and Landscaping policies. This is further shown in the evaluations provided in Tables LU-1 through LU-6 in Appendix J of the Draft EIR regarding conflicts with land use plans, policies and regulations adopted for the purpose of avoiding or mitigating an environmental impact.

As discussed in the Initial Study, page 59, the Project would also not conflict with the individual design and community design and landscaping policies of the Community Plan. In accordance with Community Plan design policies, the vast majority of onsite parking would be located below grade to blend with the character of the Project Site. A smaller 29-space surface parking lot would be located in the southern sector of the Project Site, which would not be adjacent to or directly visible from the surrounding public streets. Decorative walls and landscaping would be used to screen the Project's uses from off-site residential uses. No building within the Project Site would exceed 30 feet in height. In accordance with the Community Plan Community Design and Landscaping policies, open space available to the public would maximize pedestrian accessibility, and circulation, open walkways, benches, and trees would maximize solar exposure and protection, and the Project would feature plant, tree, and shrub species consistent with

the *Los Angeles River Master Plan Landscaping Guidelines* consistent with RIO District regulations.

Although visual character is not evaluated in an urban area under CEQA thresholds, comments were received regarding the size of the gymnasium within the Project Site and neighborhood setting. The gymnasium would have a maximum height of 30 feet, consistent with the Property's A1-1XL-RIO zoning designation and, thus, is considered to be at a compatible scale given allowable heights and adjacent neighborhood structures. The gymnasium building would have a total floor area of 80,249 square feet in two above-grade and one below-grade level. The total floor area of the two levels above grade would be approximately 53,499 square feet and the building footprint would be approximately 26,750 square feet. The above-grade floor area and building footprint would not conflict with applicable and/or allowable City building requirements within the 17.2-acre Project Site. The gymnasium's proposed location, with its northwest corner (the nearest point to Valley Spring Lane) and 646 feet south of the curb line along Valley Spring Lane, would be set back far enough so as not to substantially disrupt southward views.

Comments were also received regarding the 30-foot height limitation on the Project Site under the existing zoning, and whether the limitation was adopted to regulate scenic quality. Because the gymnasium building and swimming pool canopy would not exceed 30 feet in height, the Initial Study determined that the Project would be in compliance with this height requirement. Although the Project is seeking the applicable entitlements for the field lights to allow heights in excess of 30 feet, these would not differ substantially in appearance from the existing 90-foot-high wooden poles supporting the netting for the golf driving range or existing utility poles in the area. Light poles in themselves would not be highly visually intrusive as shown in the elevations provided in Figure II-15, *Valley Spring Lane Elevations*; Figure II-16, *Valley Spring Lane and Whitsett Avenue Elevations*; Figure II-17, *Whitsett Avenue Elevations*; and Figure II-18, *Bellaire Avenue and Zev Yaroslavsky Greenway Elevations*. These figures illustrate the visible field light poles and show that the views are softened by the intervening rows of mature trees between the street and the on-site facilities. As such, the poles, in themselves, would not substantially contrast with the existing setting.

The Initial Study did, however, determine that the field lights had the potential for light and glare impacts and recommended further evaluation of light and glare in the Draft EIR (see below). While the City's intent in adopting the 30 foot height limitation in the early 1970's is not clear, it is not a CEQA issue. The agricultural A1 zone allows for buildings up to 45 feet in height, while the 1XL height district further restricts buildings to not more than 30 feet in height. The Project conforms to the total allowable building height as determined by the A1-1XL-RIO zone, and is requesting the applicable entitlements to address the heights requested for light poles and fences/walls on the Project Site.

For all the foregoing reasons, the Initial Study determined that the Project would not conflict with applicable zoning and other requirements governing scenic quality and, thus, recommended for no further evaluation of this topic in the Draft EIR.

(i) *Project Design Modifications*

With regard to visual quality, the Initial Study evaluated the Project's potential to conflict with existing zoning or other regulations that govern scenic quality. The Project design modifications would comply with applicable zoning and other regulations in a similar manner as the Project without design modifications. No changes to the Initial Study in this regard would occur with the Project design modifications and impacts would remain less than significant as evaluated in the Initial Study.

(d) *Light and Glare*

The Initial Study determined that the Project's exterior lighting, specifically field lights, pool lights, tennis court lights, and illuminated scoreboards, would have the potential to result in light and glare that could affect nighttime views in the area (see page 60 of the Initial Study, contained in Appendix A of the Draft EIR). As such, a detailed analysis of lighting impacts was included in Section IV.A, *Aesthetics*, of the Draft EIR.

The approach to determining lighting impacts was based, in part, on an assessment of existing lighting conditions, the identification of light sensitive receptors (land uses such as residences that are sensitive to nighttime lighting), and a comparison of the future lighting levels to the existing lighting levels at sensitive receptor locations. As discussed in Section IV.A of the Draft EIR, the lighting analysis was based on a Lighting Technical Report prepared by StudioK1, lighting specialists who conducted site-specific field testing to establish existing light levels/conditions and projected future level light/conditions based on the design of proposed lighting equipment and facilities (contained in Appendix B of the Draft EIR). The area's light sensitive receptors include the Zev Greenway and nearby off-site residential locations. Nearby residences are considered sensitive receptors in the evaluation of light and glare impacts since exterior light sources have the potential to disturb indoor residential activities (such as sleep) or outdoor recreation activities, such as the use of balconies and patios. The Zev Greenway is a sensitive receptor since it is subject to the RIO District's lighting limitations, which are intended to preserve the natural character of the river front. The RIO is a special use district that the City established in 2014 by Ordinance Nos. 183144 and 183145 to support implementation of the Los Angeles River Revitalization Plan, a long-term blueprint for a variety of comprehensive improvements intended to make the Los Angeles River a landmark and a catalyst for sustainability.

Based on the Lighting Technical Report's quantitative discussion of illuminance (light levels seen on an object or ambient, which are expressed in foot candles) and quantitative analysis of luminance (glare, which is expressed in candela per square meter or  $\text{cd}/\text{m}^2$ ), the Draft EIR focuses on whether the Project would cause or substantially increase adverse nighttime lighting effects on light sensitive receptors.

The existing conditions were surveyed from several locations surrounding the Project Site (i.e., the receptor locations) to gather a baseline and document any off-site areas currently affected by light or glare from the existing uses on the Project Site. The study locations

include 12 residential points along Whitsett Avenue, Valley Spring Lane, and Bellaire Avenue, as well as a 13th location on the Zev Greenway, which is the nearest point on the Zev Greenway to the Project Site and light sources. These locations are illustrated in Table 2, *Summary of Calculated Off-Site Lighting*, Figure 8, *Offsite Illuminance* (which pertains to ambient light levels) and Figure 9, *Offsite Luminance* (which pertains to glare levels) in Appendix B, Lighting Technical Study, of the Draft EIR. The effects of the Project on off-site illuminance are summarized in **Table IV.A-1, Summary of Calculated Off-Site Illuminance**, on page IV.A-17 of the Draft EIR. Table IV.A-1 in the Draft EIR includes those representative light sensitive receptor locations identified in Table 2 of the Lighting Technical Study.

The increases in illumination levels are not based on incremental changes to existing conditions, but on modeled calculations of illuminance levels from Project lighting (expressed in foot candles unit of measurement) at the sensitive receptor locations compared to regulatory standards.

Three analyses were prepared by StudioK1 for the Project's lighting evaluation, the first two of which are based on the computer calculations that were generated by Musco Lighting for the proposed sports lighting equipment. The Musco Lighting study utilizes photometry files, which define the amount of candela (light) emitted at any angle in a sphere around the fixture.

First among StudioK1's three analyses, the proposed sports field lighting fixtures were evaluated for off-site spill lighting illuminance at all surrounding properties to determine if the Project would produce two or more foot candles of light at any sensitive receptor, as per LAMC Section 93.0117(b). As per LAMC Section 13.17 F, compliance with the RIO District Ordinance was also evaluated against thresholds of 0.20 horizontal and vertical foot candle at the Project Site boundary and no greater than 0.01 horizontal foot candle 15 feet beyond the Project Site boundary.

Second, the proposed sports field lighting fixtures were evaluated for glare impacts (i.e., luminance) from the nearest, most impactful light fixture at all surrounding sensitive receptors outside the property line of the Project Site, per the requirements set forth in LAMC Section 13.17 F.

Finally, general hardscape lighting, building lighting, and sign lighting were evaluated using the California Energy Code (Energy Code) and the RIO District Ordinance. The RIO District Ordinance determines the type of lighting, intensity, and size that may be used on the Project Site between the athletic facilities and surface parking in order to avoid impacting neighboring properties and the Zev Greenway. Compliance with the Energy Code would limit the wattage, spill lighting, and operation of the lighting fixtures for pedestrian and vehicular circulation at the Project Site. These factors are all designed to provide neighbor-friendly lighting environments and reduce unnecessary energy use when sites are unoccupied or nonoperational. By also following the requirements of the RIO District Ordinance, the Project's sports lighting designs would eliminate the spill

lighting that currently crosses the Project Site's property line into the Zev Greenway and Los Angeles River areas.

The results of the analyses are provided on pages IV.A-13 through IV.A-21 in Section IV.A of the Draft EIR and in Appendix B of the Draft EIR. Figure II-27, *Light and Signage Plan*, for the Project is provided in Chapter II, *Project Description*, of the Draft EIR.

(i) *Illuminance (Light Levels)*

In Section IV.A of the Draft EIR, pages IV.A-13 to IV.A-15 describe in detail the Project's lighting program, including the number of light fixtures and poles, the locations and heights of poles, and the locations and sizes of illuminated scoreboards. Existing lighting conditions are described on pages IV.A-7 to IV.A-9 in the Draft EIR.

(a) Existing illuminance

The existing tennis court lighting is provided by eight 500-watt induction floodlights per court for a total of 128 fixtures. The existing 16 tennis courts are currently the brightest sources of light within the Project Site. The existing driving range at the Weddington Golf & Tennis facility is currently illuminated with six golf ball-shaped light standards that have five 1,000-watt floodlights each integrated into the golf ball-like head. There are four additional floodlights mounted to the north end of the driving range canopy, bringing the total number of driving range floodlights to 34. These floodlights are all aimed at 90-degrees from the ground so that the lighting is cast horizontally down the range at night toward the west and Bellaire Avenue. The floodlights feature a conical reflector to direct the light from each lamp onto the range, but no additional control features are used to reduce the glare or uplight. The underside of the driving range canopy has fluorescent striplights to provide illumination for golfers at the driving range stalls. Many of the existing lighting fixtures use legacy lamp sources, induction and metal halide, with internal fixture optics around the lamp to control the beam pattern. Due to the size of the lamps in the fixtures, controlling the light is less precise than a small point source, such as LED. In addition, existing fixtures are tilted upward to cast the lighting across the intended area to maximize their effectiveness. This further exposes the lights to the surrounding receptors and was the primary source of glare found during the field survey.

(b) Future Illuminance

The Project's lighting fixtures that would be utilized by the Project would be specifically designed with precise optics and integral shields to aid in controlling the light and preventing unwanted spill light, uplight, or glare. The Light Control Visor (shield) would be specifically engineered so that light from the fixture can reach the destination surface, in this case athletic fields, the pool, or tennis courts, while the edges of the visor block any high angles which would otherwise impact neighboring sites. The Project's lighting fixtures would be tilted downward toward the target which further enhances effectiveness of the shield.

Although the field lighting would contribute to an increase in ambient light compared to existing conditions on the Project Site itself (which is the intended result so that nighttime athletics uses can be conducted safely), these light sources would not be directed skyward or contribute to sky glow. Light increases (illuminance) from the Project would not result in a substantial change in the character of the ambient light and would produce a smaller area of sky glow as compared to existing conditions (refer to Section IV.A, *Aesthetics*, of the Draft EIR, page IV.A-16). This is illustrated in the Lighting Technical Report (Appendix B of the Draft EIR), by the extent of the contour lines in Figure 5, *Existing Off-Site Illuminance*, and Figure 8, *Off-Site Illuminance*, of the Lighting Technical Report. As shown in Figure 5, the existing illuminance extends beyond the Project Site boundary and to several lots deep within various areas of the adjacent residential uses. Figure 8 demonstrates illuminance with the development of the Project. When comparing Figure 8 to Figure 5, there is a discernible decrease in the radius and intensity of illuminance from the Project Site compared to existing conditions. The Project lighting shows far more control with only minimal spill beyond the Project Site boundary in a few areas. This comparison demonstrates the new lighting system would provide less intrusion into neighboring sites than the existing Project Site lighting. Further, the Project's outdoor lighting would be in use from dusk to no later than 8:00 p.m. daily (9:00 p.m. for the tennis courts). Field lights would not be used on a daily basis. Existing tennis court lights are kept on up to 10:00 p.m. and lighting for the driving range may extend to 11:00 p.m. Because of the lighting technology for the Project's field and tennis court lights, as well as the reduced hours in which outdoor lighting would be in use compared to existing conditions, the Project's overall off-site light and glare levels and duration would be less than under existing conditions.

The effects of the Project on off-site illuminance are summarized in Section IV.A, Table IV.A-1, *Summary of Calculated Off-Site Illuminance*, in the Draft EIR. As shown therein, light spill at the property line of all the residential properties surrounding the Project Site would be well within the LAMC Section 13.17 F maximum of 0.20 horizontal and vertical foot candles of light at the Project Site boundary, and no greater than 0.01 horizontal foot candle 15 feet beyond the Project Site. Table IV.A-1 shows that the Project's illuminance would have a range of 0.00 to 0.06 horizontal foot candles and 0.00 to 0.09 vertical foot candles. The golf ball-shaped light standards with 1,000 watt bulbs currently used to illuminate the driving range would be repurposed as area lighting for the courtyard adjacent to the clubhouse and tennis courts and replaced with bulbs not exceeding 50 watts.

(ii) *Luminance (Glare)*

Existing lamps on the Project Site are directly visible with no optical control, thus contributing to existing perceived glare. Glare is the light a user might perceive as the brightness or point intensity of a lighting fixture when directly viewed from a distance. Musco Lighting evaluated the glare produced by existing and proposed fixtures at any given point on and off the Project Site, including at twelve points within the adjacent residential neighborhood and, as a thirteenth point, the Zev Greenway (sensitive

receptors). Figure 9 (Off-Site Luminance) in the Lighting Technical Report (Appendix B of the Draft EIR) illustrates the 13 receptor sites and the calculated values in candela (directly visible light or glare) across the Project Site and the surrounding area. Each point on this grid reflects the maximum candela value for the fixture with the highest potential for glare at any given pole on the Project Site. The effects of the Project on off-site luminance are summarized in Table IV.A-2, *Summary of Calculated Off-Site Luminance*, on page IV.A-20 of the Draft EIR. As shown therein, the Project would result in reductions in glare at most of the off-site residences. For example, the values at 4068 Whitsett Avenue would be reduced from 3,500  $\text{cd}/\text{m}^2$  under existing conditions to approximately 5.8  $\text{cd}/\text{m}^2$  following Project construction. In other words, the new lighting system would produce substantially less candela, or glare, than the existing on-site lighting for twelve of the thirteen evaluated receptors. Modeled candela per square meter calculations ( $\text{cd}/\text{m}^2$ ) for one receptor (4202 Bellaire Avenue) would increase slightly compared to existing conditions, however, this minor increase would be 6.4  $\text{cd}/\text{m}^2$ , which is comparable to the brightness of a single candle flame (7.5  $\text{cd}/\text{m}^2$ ). Further, the modeled measurements do not take into consideration substantial intervening Project landscaping, which would result in a greater reduction in glare at all receptors. The conclusions for the receptor at 4202 Bellaire Avenue, for instance, would be reduced, if landscape were taken into consideration, given the substantial additional landscaping in proximity to Field B (refer to section IV.C, *Biological Resources*, Figure IV.C-5 - *Tree Planting Plan*).

### (iii) *Illuminated Scoreboards*

The Project would include illuminated scoreboards at the two playing fields and within the pool area. As described in page IV.A-18 and Appendix B of the Draft EIR, the Project would strategically layout the scoreboards so that no scoreboard directly faces an adjacent sensitive receptor. This layout of the scoreboards creates long distances to any directly facing receptor and steep oblique viewing angles to closer receptors adjacent to the fields. Due to either the long distance or steep viewing angle, the illumination effects of these signs would be nearly nonexistent at the sensitive receptors resulting in no exceedance of LAMC Section 14.4.4 E requirement, which limits light intensity from signage to no more than 3.0 foot candles above ambient lighting at residential property boundaries. Signs and sign lighting would be restricted by the Energy Code, which limits the allowable wattage for internally and externally illuminated signs. This applies to directional signs, message boards, as well as scoreboards, on the Project Site. Per Energy Code Section 140.8, internally illuminated signs are allowed up to 12 watts per square foot, while externally illuminated signs can use 2.3 watts per square foot of illuminated sign area. Signs must also comply with Energy Code Section 130.3, which requires photosensor controls to switch off signs during daylight conditions or have at least 65 percent dimming capabilities for signs illuminated both at night and day. In addition, any Electronic Message Center greater than 15kW would be required to reduce power by 30 percent in an energy event. These maximum allowable power restrictions for signs would keep the illumination to a minimum while maintaining functional viewing.

*(e) Project with Design Modifications*

As discussed in Topical Response No. 2 – Modifications to the Project Design, design modifications, including a change in the Project’s field lighting program, would be implemented for the Project based on public comments. Although light and glare impacts under the Project would be less than significant, lighting impacts would be further reduced at some receptor locations with the design modifications and a reduction in the number of light poles. The modified lighting program and effects of the design modifications are evaluated in detail in Appendix B.1, Supplemental Lighting Report Memorandum, and in Appendix B.2, Supplemental Lighting Report Appendix, of this Final EIR. As discussed therein the lighting program would be modified as follows:

- The Project’s three 70-foot field lights on the west sideline of Field A and three 70-foot-tall light poles on the east sideline of Field A (a total of six field lights at Field A) would be changed under the Project with design modifications to a total of four 80-foot-tall light poles on the east and west sidelines of the field (two on each sideline).
- The Project’s three 80-foot-tall field lights on the north side of Field B, one 60-foot-tall field light on the east side of Field B, two 60-foot-tall field lights on the south side of Field B, and one 70-foot-tall field light on the south side of Field B (a total of seven field lights at Field B) would be changed under the Project design modifications to two 80-foot-tall field lights on the north side of Field B, and two 80-foot-tall field lights on the south side of Field B (for a total of four field lights at Field B). The 60-foot-tall light pole on the east side of Field B and 70-foot-tall field light on the south side of Field B would be eliminated under the Project with design modifications.
- The Project’s 14 light poles located at the swimming pool with varying heights between 21 feet and 60 feet would be changed under the Project’s design modifications to four 55-foot-tall lights.<sup>11</sup>
- The Project’s twelve 40-foot-tall court lights located on all four sides of the tennis courts would be changed under the Project’s design modifications to a total ten court light poles at 40-feet-tall.<sup>12</sup>

The changes in field lights are illustrated in revised Figure II-27, *Light and Signage Plan for the Project*, in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. The total change in the number of light poles would be reduced from 39 poles under the Project to 22 poles under the Project with design modifications (a reduction of 17 poles).

<sup>11</sup> Two of the four poles in the pool area (i.e., the two poles on the eastern side of the pool) will have luminaires mounted such that they serve both the pool area and the adjacent tennis courts.

<sup>12</sup> The reduction of two poles at the tennis courts was accomplished by relocating those luminaires to nearby poles at the eastern side of the swimming pool.

As shown in Chapter 3 of this Final EIR, Table IV.A-1, Summary of Calculated Off-Site Illuminance, the calculated off-site illuminance (horizontal and vertical) would be well within the applicable LAMC thresholds. As shown therein, the footcandles of illumination produced by the sports lighting revision under the Project with design modifications show a reduction from the original design, except at receptor No. 9 (4110 Whitsett Avenue) for which illumination was calculated to increase negligibly by a few hundredths of a footcandle. All measurements remain far below the LAMC and RIO thresholds for illumination. Using the revised candela plot from Musco Lighting, a similar result for offsite glare, or candela per square meter ( $\text{cd}/\text{m}^2$ ), was observed.

Table IV.A-2, Summary of Calculated Off-site Luminance, as revised in Chapter 3 of this Final EIR, under the Project with design modifications, minor fluctuations in glare were calculated. Additionally, Table IV.A-2 shows that luminance levels would substantially decrease, except at one receptor location, under the Project with design modifications compared to existing luminance levels. Under the Project with design modifications, luminance levels would decrease at eight of the 13 analyzed receptor locations including luminance levels within the RIO District compared to the Project without the design modifications. The minor increases at the remaining six sensitive receptors would, as with the Project without the design modifications, continue to be substantially below existing luminance levels.

Under the Project with design modifications compared to the Project without design modifications, decreases in off-site luminance ranged from 0.3 to 9.7  $\text{cd}/\text{m}^2$  (the largest decrease being located at the property line adjacent to the Zev Greenway), while increases ranged from 0.1 to 2.0  $\text{cd}/\text{m}^2$ . All such increases are minor and generally comparable to the light produced by a single candle flame (7.5  $\text{cd}/\text{m}^2$ ). Under existing conditions, the existing lighting produces off-site glare as high as 3,700  $\text{cd}/\text{m}^2$  at adjacent residences and 4,375  $\text{cd}/\text{m}^2$  along the Zev Greenway given the imprecise optics and shallow orientation of the existing driving range and tennis court lights. In comparison, under the Project with design modifications, the maximum glare intensity would be 7.2  $\text{cd}/\text{m}^2$ , significantly decreasing the overall glare intensity, with the exception of one receptor location (4202 Bellaire Avenue).

The Project Site lighting conditions can also be viewed graphically via illuminance plots. As described in the Draft EIR's Lighting Report (Appendix B of the Draft EIR), existing lighting extends well beyond the Project Site boundary (Figure 5, Existing Off-Site Illuminance, in the Lighting Report). This simulation, for both existing and post-Project conditions, does not account for landscaping, changes in elevation, intervening structures, or geography of the Project Site that might reduce lighting views to some areas. The blue line (also referred to as isoline) included in the figure represents the extent of measurable lighting that is produced by sources on the existing Project Site. By contrast, the Project's field lighting system for the Project with design modifications is shown in Figure 8, Off-Site Illuminance, of the Supplemental Lighting Report Memorandum (Appendix B.1 of this Final EIR). Similar to the Project's original lighting layout, the revised design reflects tighter control of on-site light sources and yields a

significant reduction in off-site glare, reducing the lighting levels that the surrounding neighborhoods would experience. Therefore, similar to the Project without design modifications, the Project with design modifications would result in less than significant light and glare impacts.

### (3) Conclusion

Because of improvements in lighting technology, precision placement and angulation of source lights, as well as precise site planning, with the exception of a light level increase equivalent to one candle at one location (4202 Bellaire Avenue), the Project's lighting program, without design modifications, would reduce the Project Site's existing ambient light and glare conditions as compared to existing conditions. Note also that the modeled illuminance and luminance measurements do not take into account landscaping between the receptors and the Project Site. All light and glare levels under the Project without design modifications would be below regulatory standards. Therefore, the Project without design modifications would not create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

Similar to the Project lighting impacts analyzed in the Draft EIR, the Project's lighting program with design modifications would also reduce the existing ambient light and glare conditions with the exception of one receptor location (4202 Bellaire Avenue), similar to the Project without design modifications. All light and glare levels under the Project with design modifications would be below regulatory standards. Therefore, the Project with design modifications would not create a new source of substantial light or glare that would adversely affect day or nighttime views in the area. As such, the Project with the design modifications would not result in significant new or substantially increased environmental impacts as evaluated in the Draft EIR.

## e) Topical Response No. 5 – Biological Resources/ Trees

### (1) Introduction

This topical response addresses comments received on the Draft EIR regarding the Project's removal and replacement of trees from a biological resources perspective. The Draft EIR's evaluation of tree impacts from a biological resources perspective was included in Section IV.C, *Biological Resources*, and specifically assessed under Threshold (e), which, under Appendix G of the CEQA Guidelines, evaluates whether the Project would conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance. A Tree Report was prepared for the Project by Carlberg Associates to support preparation of the Draft EIR analysis of impacts to trees.<sup>13</sup> In addition, a number of public comments inquired about how the Project's tree removal and replacement program would affect long-term sequestration and the tree canopy. Thus, based on the Carbon Sequestration and Tree Canopy Study, included in Appendix C of this Final EIR, information on these issues is also included in this topical response for informational purposes.

Also, with regard to aesthetics impacts related to the Project's tree removal and replacement program, please refer to Topical Response No. 4 - Aesthetics, and the Project's Initial Study (included in Appendix A of the Draft EIR). As evaluated on pages 59 and 60 of the Initial Study, because the Project Site is located in an urbanized area, the analysis of visual character and quality under Threshold (c) evaluated whether the Project would conflict with applicable zoning and other regulations governing scenic quality. As analyzed therein, the Project would not conflict with any of the applicable plan and policies, including those pertaining to tree removal and replacement.

### (2) Discussion

#### (a) *City of Los Angeles Municipal Code – Protected Trees and Shrubs*

Native species of oak (*Quercus* sp., except scrub oak [*Q. dumosa*]), Southern California black walnut (*Juglans californica*), California bay laurel (*Umbellularia californica*) and western sycamore (*Platanus racemosa*) trees at least four inches in diameter (cumulative for multi-trunked trees) at 4.5 feet above the ground level at the base of the tree or diameter-at-breast height are protected in the City under Ordinance No. 177,404, which became effective April 23, 2006. On December 11, 2020, the City adopted Ordinance No. 186,873, extending protection status to two native shrub species, the Mexican Elderberry (*Sambucus mexicana*) and toyon (*Heteromeles arbutifolia*) shrubs, and amending

<sup>13</sup> Carlberg Associates, City of Los Angeles Tree Report Harvard-Westlake River Park Campus, October 2020. Appendix A of Appendix D, Biological Technical Report, of the Draft EIR.

provisions of Los Angeles Municipal Code (LAMC) Sections 12.21, 17.02, 17.05, 17.06, 17.51, 46.00, 46.01, 46.02, 46.03, 46.04, and 46.06.

LAMC Section 17.05 R prohibits, without a permit, the removal of any regulated protected tree, including “acts which inflict damage upon root systems or other parts of the tree...” and requires replacement of all regulated protected trees that are removed on at least a four-to-one basis with trees that are of a protected variety. Replacement trees must be at least 15 gallons or larger, measure one inch or more in diameter at a foot above the base, and measure at least seven feet in height from the base. The size and number of replacement trees shall approximate the value of the tree to be replaced. A protected tree shall only be replaced by other protected tree varieties and shall not be replaced by shrubs. Similarly, a protected shrub shall only be replaced by other protected shrub varieties and shall not be replaced by trees, to the extent feasible as determined by the Advisory Agency, Board of Public Works, or certified arborist. Further, when replacing more than two protected trees or shrubs, the permit at issue must be considered at a full public hearing of the Board of Public Works. The City also requires preparation of a report by a tree expert identifying protected on-site trees, impacts to trees related to grading and construction, and mitigation measures for impacts to protected trees. However, native trees that have been planted as part of a tree planting program are exempt from these ordinances and are not considered protected.

(b) *Existing Conditions*

As discussed on page II-1, in Chapter II, *Project Description*, of the Draft EIR, the area proposed for the Project consists of a 16.1-acre (701,428-square-foot) parcel, owned by the School (Property) located at 4047, 4141, and 4155 N. Whitsett Avenue and 12506, 12600, and 12630 W. Valley Spring Lane; and a 1.1-acre (47,916-square-foot) parcel the School leases from the Los Angeles County Flood Control District (Leased Property) (portion of Assessor Parcel Number [APN] 2375-018-903), which collectively comprise the 17.2-acre (749,344-square-foot) project site (Project Site). As discussed on page IV.C-13 of the Draft EIR, the Project Site (Property and Leased Property) and the off-site improvement areas (approximately 1.7 acres) combined together comprise the Biological Study Area, which is approximately 18.9 acres (refer to Figure IV.C-1, Plant Communities, on page IV.C-17 of the Draft EIR for an illustration of the Biological Study Area). The off-site improvement areas associated with the Project include improvements to the segment of Valleyheart Drive south of LAFD Fire Station 78, portions of the Zev Greenway adjacent to the Project Site, and an Americans with Disabilities Act (ADA)-compliant accessible pedestrian ramp leading to the Zev Greenway at Coldwater Canyon Avenue (Coldwater Canyon Avenue Riverwalk Path Ramp). The Biological Study Area is located in a developed urban area in the community of Studio City within the City of Los Angeles.

Although habitat within the Project Site is primarily non-native ornamental landscaping, it does support a large number of trees and some shrubs, though shrubs are minimal since the Project Site is predominantly comprised of maintained turf for the golf course and driving range. The Tree Report prepared for the Project evaluated a total of 421 trees, located both on the Project Site and off-site surrounding areas. Of the 421 trees

inventoried and evaluated, 258 trees are located on-site, and 163 trees are located off-site. The off-site trees include 87 trees surrounding the Project Site located in the public right-of-way and 76 trees located off-site within the Zev Greenway area.<sup>14</sup> The inventoried trees are generally concentrated along the western and northern boundaries of the Project Site and along the Los Angeles River, as well as scattered throughout the golf course. Non-native (and non-protected) tree species vary and include cedar, olive, palm, pine, and gum trees, among others. Mexican fan palms (*Washingtonia robusta*) (174), Aleppo pine (*Pinus halepensis*) (56), and blue gum eucalyptus (*Eucalyptus globulus*) (42) make up more than half of all the inventoried trees.<sup>15</sup> Mexican fan palms are considered invasive species by the California Invasive Plant Council and are listed in the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes as “plants that should never be planted along the river.”<sup>16,17</sup>

Land uses immediately surrounding the Project Site include residential neighborhoods to the north, west, and east and the Zev Greenway and the Los Angeles River to the south and southwest. This portion of the Los Angeles River is entirely channelized and does not support any vegetation within the channel. Some native vegetation is planted along the southwestern-facing slope north of the channel, which is part of a half-mile stretch of native habitat restored along the Zev Greenway.<sup>18</sup> There is also a row of mature western sycamore (*Platanus racemosa*) and ornamental African sumac (*Searsia lancea*) trees planted along the top of the southern bank of the Los Angeles River. The adjoining property to the southeast is LAFD Fire Station 78.

(i) *City-Protected and Non-Protected Significant Trees*

The City’s Protected Tree and Shrub Ordinance protects native tree and shrub species (i.e., western sycamores, indigenous oak species, California bay laurels, southern California black walnuts, Mexican elderberry, and toyon). None of the on-site private property trees are protected by the Protected Tree and Shrub Ordinance, and all trees planted on-site are ornamental, non-native trees. Trees located in public rights-of-way are generally protected regardless of species or size, and these total 87 off-site trees. As discussed on page IV.C-28, in Section IV.C, *Biological Resources*, of the Draft EIR, there are 30 young oak and sycamore trees and a number of native shrubs, including Mexican elderberry and toyon, in the off-site Zev Greenway area; however, these were planted (not naturally occurring) and are, therefore, not considered a protected tree or shrub since any tree planted or

<sup>14</sup> Carlberg Associates. City of Los Angeles Tree Report Harvard-Westlake River Park Campus, October 2020. Appendix A of Appendix D, *Biological Resources Technical Report*, of the Draft EIR.

<sup>15</sup> For plant and wildlife species, scientific names are only included with common names upon first mention. They are only referred to by common names thereafter.

<sup>16</sup> California Invasive Plant Council, The Cal-IPC Inventory, <https://www.cal-ipc.org/plants/inventory/>.2020, accessed December 10, 2020.

<sup>17</sup> Los Angeles County Public Works, Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes, January 2004, page 38.

<sup>18</sup> Community Conservation Solutions. The Zev Yaroslavsky L.A. River Greenway Trail, <https://www.conservationolutions.org/la-river/>, accessed November 18, 2020.

grown as part of a tree planting program is not protected under the City's Protected Tree and Shrub Ordinance.<sup>19</sup> As discussed in the Biological Resources Technical Report (Appendix D of the Draft EIR), there were no Mexican elderberry or toyon found within the Project Site. One significant, protected, off-site tree, a coast live oak, was identified, is located in the Zev Greenway and would be preserved by the Project.

All trees over eight inches in diameter-at-breast height, or located within the public right-of-way are "significant trees" according to the direction of the Department of City Planning. Based on their measured trunk diameters, 304 on- and off-site trees are considered significant, non-protected trees.

(c) *Project Improvements*

One of the Project Objectives is to "Implement a tree planting program that substantially increases the number of trees on the Project Site with native and River Improvement Overlay (RIO) compliant tree species, while removing invasive exotic and non-RIO compliant tree species."<sup>20</sup> In line with this objective, the Project's landscape design includes the planting of healthy trees that are consistent with the Los Angeles RIO District Ordinance<sup>21</sup> and the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes<sup>22</sup> (Landscaping Guidelines).

The Project's tree removal and tree replacement program is outlined in **Table 2-3, Tree Removal and Replacement Program**, which is the same as Table II-2, *Tree Removal and Replacement Program*, in Chapter II, *Project Description*, of the Draft EIR. As shown therein and discussed on page IV.C-29, in Section IV.C, *Biological Resources*, of the Draft EIR, 240 trees would be removed by the Project. The majority of the trees to be removed, 75 percent (179 trees), are non-RIO compliant (including 121 Mexican fan palms). Of the 240 trees to be removed, 209 are located on-site (Project Site), 31 trees (including 26 Mexican fan palms) are located off-site in the public right-of-way, and no trees would be removed within the Zev Greenway Area (off-site). The Project would increase the number of trees on-site from 258 to 383, a 49-percent increase. The Project would increase the number of off-site trees from 163 to 191, a 17-percent increase. Overall, the Project would plant 393 new trees, resulting in an overall net increase of 153 trees as compared to existing conditions (i.e., a 36 percent increase).

<sup>19</sup> LAMC Section 17.02, which states: "The definition [of protected species] shall not include any tree or shrub grown or held for sale by a licensed nursery, or trees planted or grown as part of a tree planting program."

<sup>20</sup> The "RIO" designation indicates a River Improvement Overlay (RIO) District related to the Project's location in proximity to the Los Angeles River. Zoning Information (ZI 2358), RIO Improvement Overlay District.

<sup>21</sup> City of Los Angeles, Zoning Information (Z.I) No. 2358 River Improvement Overlay District Ordinance Nos. 183144 and 183145, effective August 20, 2014, revised January 12, 2015.

*(d) Project Impacts*

As discussed on pages IV.C-49 to IV.C-56 of Section IV.C, *Biological Resources*, of the Draft EIR, the Project would not conflict with any local policies or ordinances protecting biological resources in the City's General Plan Framework Element, Conservation Element, Open Space Element, the Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan, or tree preservation ordinance.

*(i) RIO District Ordinance and the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes*

In addition to being consistent with the above plans, as discussed on pages IV.C-52 to IV.C-54, in Section IV.C, *Biological Resources*, of the Draft EIR, the Project is designed to be consistent with the RIO District Ordinance and the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes. Plant materials would consist entirely of native plants that have low to medium water demand. The Project's landscape design includes the maintenance and planting of healthy trees that are consistent with the RIO District Ordinance and Landscaping Guidelines; maintenance and enhancement of native habitat for wildlife; contribution to the environmental and ecological health of the City's watershed system; and increased public access to the Los Angeles River. The Project would remove invasive Mexican fan palms, which are not RIO District-compliant species. Section F.1, Development Guidelines, of the RIO District Ordinance (adopted August 2014 and codified in LAMC Section 13.17) requires 75 percent of a project's newly landscaped area to be planted with any combination of the following: native trees, plants and shrubs, or species defined as WatershedWise, or species listed in the Los Angeles County River Master Plan Landscaping Guidelines and Plant Palettes.. The Landscaping Guidelines, Design Guideline 7 (Plants That Should Never Be Planted along the River) states: "Mexican fan palms (*Washingtonia robusta*), may be attractive to the uneducated eye, but their aggressive domination of riverside landscapes displaces opportunities for

native plant species and the habitats they shape.” The Landscape Guidelines state that aggressive plant species shall not be allowed in new plantings and “only plant species included in the Landscape Guideline’s “Short List” or “Plant Community Lists” shall be allowed in plantings along the river.” The Mexican fan palm is not listed on the Landscape Guidelines’ lists of approved species.<sup>23</sup>

The Project’s landscape plan consists entirely of native trees, the vast majority of which would also be species sourced from the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes that would be planted in locations that promote the restoration of native plant communities along the Los Angeles River. As previously described, the Project would also result in a 36-percent net increase in trees for a total of 574 trees within the on-and off-site Project areas. Furthermore, the Project’s native landscaping would enhance the existing off-site native habitat along the Zev Greenway. The replacement trees would have a minimum 24-inch box size, though many would be sourced at larger sizes. Native species would include California sycamore, coast live oak, Engelmann oak (*Quercus engelmannii*), valley oak, velvet ash (*Fraxinus velutina*), toyon, and big berry manzanita (*Arctostaphylos glauca*) in the Project Site and white alder (*Alnus rhombifolia*), velvet ash, California sycamore, Mexican elderberry, California bay laurel, and toyon in the off-site improvement areas. The new RIO District-compliant trees would be planted in locations that promote the restoration of native plant communities along the Los Angeles River and create habitat and canopy cover for various species. Introduction of climate-appropriate planting in these areas would also provide shelter and food sources for bird and animal species around the Biological Study Area and the Los Angeles River. For these reasons, the Project would be consistent with the RIO District Ordinance and the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes.

(ii) *City-Protected and Non-Protected Significant Trees*

As stated above and on pages IV.C-54 to IV.C-56 in Section IV.C, *Biological Resources*, of the Draft EIR, of the 421 trees inventoried by Carlberg Associates, a total of 240 trees would be removed and replaced under the Project (except for four trees that would be removed that are deemed dead, and are, therefore, not subject to replacement requirements). Figure IV.C-4, Tree Removal Program, on page IV.C-36 of the Draft EIR illustrates the Project’s tree removal plan, and Figure IV.C-5, Tree Planting Plan, on page IV.C-37 illustrates the Project’s tree planting plan. No trees would be removed within the off-site Zev Greenway area. The Project would retain the eucalyptus trees along Valley Spring lane, the Aleppo and Canary Island pines along Bellaire Avenue, and the mature trees within the vicinity of the existing clubhouse, which would be retained. Approximately 50 percent (121 trees) of the 240 trees to be removed are Mexican fan palms and, in total, 75 percent (179 trees) are not RIO District-compliant and are considered invasive species. Other non-native (and non-protected) tree species that would be removed include cedar, olive, palm, pine, and gum trees, among others.

<sup>23</sup> County of Los Angeles, Los Angeles River Master Plan District Landscaping Guidelines and Plant Palettes, January 2004, page 38.

Existing Mexican fan palms removed as part of the Project's tree removal program would be replaced by other non-Mexican fan palm tree species, in compliance with the RIO District requirements that excludes this tree species from 75% of new tree plantings. As discussed on page IV.C-55 of the Draft EIR, the other 119 trees of the 240 trees to be removed are scattered throughout the Biological Study Area, mostly within the on-site area. Of the 119 trees, four trees (2 blue gum eucalyptus and 2 olives) are standing dead, and one native coast live oak,<sup>24</sup> a City-ordinance protected tree, is located off-site in the southeastern corner of the Zev Greenway area. This oak tree would likely require some measure of canopy pruning and root pruning to accommodate updates to the existing asphalt driveway that is located under the northern canopy of the tree.<sup>25</sup> Although the tree would be preserved, since the updates to the asphalt driveway could inflict damage to the root system, the Project's actions would be considered an encroachment and would still require a permit per the City's Protected Tree and Shrub Ordinance.<sup>26</sup> In the unlikely circumstance the coast live oak requires replacement, the Project would adhere to applicable replacement requirements in the City's Protected Tree and Shrub Ordinance. In addition to possible encroachment on this single native coast live oak tree, seven coast redwood trees within the Project Site on the golf course would be removed. Although coast redwood trees are native to California, they are not locally indigenous to Southern California and not City-protected trees and, therefore, are analyzed only as significant trees. As previously described, the City defines "significant trees" as trees with a trunk diameter of eight inches or greater at breast height or trees that are located within the public right-of-way. No other native trees would be removed or encroached upon. A detailed discussion of the tree assessment and arborist recommendations are contained in Appendix D of the Draft EIR.

Removed non-protected "significant" trees, including Mexican fan palm species, would be replaced at a 1:1 ratio, and removed street trees from the public right-of-way would be replaced at a 2:1 ratio, as required by the City's Department of Public Works, Urban Forestry Division. All replacement trees would be RIO-compliant. In aggregate, the Project would remove 240 trees and provide 393 California native replacement trees, which would exceed the minimum trees replacement requirement.

The removal of 209 significant on-site trees and 31 public street trees would result in potentially significant impacts. As such, the Project would implement Mitigation Measure BIO-MM-3, which has been updated in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, requiring that Harvard-Westlake School submit to the Department of City Planning and/or the City's Urban Forestry Division a landscape plan

<sup>24</sup> Coast live oak (*Quercus agrifolia*) is also referred to as California live oak in the City of Los Angeles Protected Tree and Shrub Ordinance; however, for purposes of this document, it is referred to as coast live oak.

<sup>25</sup> A protected tree permit under LAMC Section 17.05 would be required for any damage to the root system of this protected tree.

<sup>26</sup> If plans change and trees protected by the City's Tree Preservation and Protection Ordinance are proposed for removal, the City of Los Angeles will require mitigation tree plantings at a ratio of 4:1 and a Protected Tree Removal Permit will be required.

or tree plan depicting replacement of each “non-protected” significant tree removed at a minimum 1:1 ratio prior to issuance of a building permit. The actual mitigation requirement may be modified by the Department of City Planning dependent on their view of dead tree removals and removal of Mexican fan palms. As set forth in Mitigation Measure BIO-MM-3, the replacement tree locations and species shall be to the satisfaction of the Department of City Planning and/or the City’s Urban Forestry Division and in conformance with the landscape and planting guidelines in the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes. Furthermore, pursuant to this mitigation measure, replacement trees shall be planted in the Biological Study Area as shown on the Project’s landscape plan, as represented in Figure IV.5, Tree Planting Plan, and Figure IV.6, Planting Zone Plan, on pages IV.C-37 and IV.C-38, respectively, of the Draft EIR , and the removal of 31 public street trees shall require a tree removal permit approved by the Board of Public Works and mitigation plantings, which is typically a ratio of 2:1, to the satisfaction of the Urban Forestry Division of the Bureau of Street Services. Mitigation Measure BIO-MM-3 also requires that if any of the on-site, off-site, or public street trees die within three years, as a consequence of construction, they will be replaced. With incorporation of Mitigation Measure BIO-MM-3, the Project would mitigate impacts to City-protected and non-protected significant trees to a less-than-significant level.

(e) *Tree Canopy and Carbon Sequestration*

(i) *Tree Canopy*

A supplemental analysis of the Project’s tree canopy is provided within Appendix C, Carbon Sequestration and Tree Canopy Study, of this Final EIR. All existing trees were included in the calculation of canopy coverage in order to appropriately characterize current conditions on the Project Site. Similarly, existing trees that would be preserved by the Project were included in the calculation of the Project’s canopy coverage. As discussed in detail in Appendix C, pages 3 through 5 of the study, approximately 20 percent of the Project Site is currently covered by tree canopy. Absent development of the Project, that level will not significantly increase further given the relative maturity of existing trees. The Project’s canopy coverage will reach a similar level between Years five and 10 of operation (Year 5 the canopy coverage would be approximately 15 percent, Year 10 the canopy cover would be approximately 28 percent) (see Figure 10, Year 5 Canopy Coverage of Project Trees, and Figure 11, Year 10 Canopy Coverage of Project Trees, in the Carbon Sequestration and Tree Canopy Study).

Given the diverse range of species in the Project’s tree replacement program and their respective growth rates, tree maturation points vary from 10 to 50 years, with a weighted average of 25 years. At Year 25 of Project operation (following construction), 53 percent of the Project Site would be under canopy coverage, or approximately 2.5 times more coverage than existing conditions (see Figure 12, Year 25 Canopy Coverage of Project Trees, of the Carbon Sequestration and Tree Canopy Study). The Project’s favorable points of comparison are largely the result of the biological characteristics of the existing tree mix. Notably, the prevalence of Mexican fan palms on the Project Site, which are

comprised of fibrous strands, lack branches and extensive leaf systems, and provide nominal canopy coverage. Refer to the Carbon Sequestration and Tree Canopy Study in Appendix C of this Final EIR for additional details on the methodologies and modeling conducted to determine the Project's projected future tree canopy coverage on the Project Site.

(ii) *Carbon Sequestration*

The City received numerous public comments related to the Project's effects on carbon sequestration due to the removal of existing trees on-site. While there is not a Threshold of Significance in Appendix G of the CEQA Guidelines related to carbon sequestration, nonetheless, a supplemental analysis of the Project's carbon sequestration from trees is provided within Appendix C, Carbon Sequestration and Tree Canopy Study, of this Final EIR for informational purposes. Rates of carbon sequestration (measured as pounds of carbon dioxide [CO<sub>2</sub>]) were calculated by comparing the existing trees on the Project Site that are to be removed with the replacement trees that would be planted as part of the Project. Existing trees to remain under the Project were not included in the carbon sequestration analysis, as the carbon sequestration benefits from such trees would be included equally in the analysis of existing and Project conditions. As summarized on PDF pages three through five in the Carbon Sequestration and Tree Canopy Study, during Year 2 of Project operation, the annual CO<sub>2</sub> sequestration rate of the Project's replacement trees would be approximately equivalent to existing sequestration rates. Existing carbon sequestration for the trees to be removed by the Project is 44,633 pounds as shown in Figure 1, Annual Sequestration of Existing Trees and Palms, of the Carbon Sequestration and Tree Canopy Study (see PDF page 7 of 39 in Appendix C of this Final EIR).

Year 2 carbon sequestration rates for the Project's replacement trees would be 43,160 pounds, as shown in Figure 4, Year 2 Sequestration of Project Trees, of the Carbon Sequestration and Tree Canopy Study (PDF page 9 of 39 of Appendix C). After Year 2 of Project operation, the replacement trees would sequester CO<sub>2</sub> at increasingly greater rates than existing trees. Specifically, during Year 5 of Project operation, the replacement trees would sequester more than 73,000 pounds of CO<sub>2</sub> as shown in Figure 5, Year 5 Sequestration of Project Trees (see PDF page 10 of 39 of Appendix C). Sequestration would increase to 131,000 pounds in Year 10, as shown in Figure 6, Year 10 Sequestration of Project Trees, (see PDF page 10 of 39 of Appendix C). Over the lifetime of the Project's replacement trees, approximately 8.7 million pounds of CO<sub>2</sub> would be sequestered. In comparison, the existing trees to be removed would sequester 2.6 million pounds over their lifetime, if left in place.

As with the tree canopy, the Project's higher amount of carbon sequestration is the result of the biological characteristics of the existing tree mix, particularly the prevalence of Mexican fan palms. Mexican fan palms are comprised of fibrous strands and lack branches and extensive leaf systems that would, otherwise, support carbon sequestration. For example, a single mature Mexican fan palm (60-80' in height) is estimated to sequester 34 pounds of CO<sub>2</sub> per year. By contrast, a single Engelmann Oak

or Valley Oak in a 48" box size would sequester 100 pounds of CO<sub>2</sub> in the first year following planting, more than three times that of a mature Mexican fan palm. Refer to the Carbon Sequestration and Tree Canopy Study in Appendix C of this Final EIR for additional details on the methodologies, data sources, and modeling conducted to determine the Project's projected future carbon sequestration of the Project's replacement trees on the Project Site.

(f) *Project Design Modifications*

As discussed in Topical Response No. 2 – Modifications to the Project Design, design modifications relating to seating, lighting, building design (swimming pool area and gymnasium), parking, grading, storm water capture and reuse system, and water features were made to the Project in response to public and agency comments received on the Draft EIR. However, none of the design modifications directly or indirectly affect the Project's tree removal and replanting program. The overall number of trees being removed under the Project with design modifications will remain as analyzed in the Draft EIR. As such, the biological resources impact analysis and conclusions applicable to tree removal and replacement included in the Draft EIR is not affected by the Project design modifications.

(3) **Conclusion**

As discussed above, the Project would increase the number of trees on-site from 258 to 383 (a 49-percent increase). The number of off-site trees would increase from 163 to 191 (a 17-percent increase). In total, the Project would plant 393 new trees, resulting in an overall net increase of 153 trees beyond the 421 trees under existing conditions (or a 36 percent increase). The Project's tree removal and planting program would not conflict with applicable biological resources policies in the City's General Plan Framework Element, Conservation Element, Open Space Element, and the Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan. The tree removal and replacement program would be consistent with the RIO District Ordinance and the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes, as well as the LAMC tree protection requirements. With implementation of Mitigation Measure BIO-MM-3, potentially significant direct impacts to City-protected and non-protected significant trees would be reduced to a less-than-significant level. Thus, as discussed in Section IV.C, *Biological Resources*, of the Draft EIR, the Project with mitigation would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, and impacts would be less than significant.

The Project's tree replacement program would result in a greater canopy cover by Year 10 compared to existing conditions. The existing Project Site has a canopy cover of 20 percent. Existing trees are primarily mature and would not increase in canopy size. Under the Project's tree removal and replacement program, the canopy cover would be 15 percent by Year 5 and would increase to 28 percent by Year 10.

Existing carbon sequestration from the trees to be removed by the Project is 44,633 pounds. Year 2 carbon sequestration rates for the Project's replacement trees would be 43,160 pounds. After Year 2 of Project operation, the replacement trees would sequester CO<sub>2</sub> at increasingly greater rates than existing trees. Over the lifetime of the Project's replacement trees, approximately 8.7 million pounds of CO<sub>2</sub> would be sequestered. In comparison, the existing trees to be removed would sequester 2.6 million pounds over their lifetime, if left in place.

As discussed above, the biological resource impacts pertaining to the Project's tree removal and replacement program are appropriately addressed in the Draft EIR. Further, the Project with design modifications would not directly or indirectly affect the Project's tree removal and replanting program and as such, the impact analysis and conclusions included in the Draft EIR are not affected by the Project design modifications. As such, the Project with the design modifications would not result in significant new or substantially increased environmental impacts as evaluated in the Draft EIR.

## f) Topical Response No. 6 – Historic Resources

### (1) Introduction

This topical response addresses comments received on the Draft EIR concerning impacts to historical resources. Additionally, this topical response provides background information regarding the City’s designation in 2021 of the Project Site as a Historic-Cultural Monument (HCM), which identified the character-defining features of the Project Site that contribute to the HCM designation.

### (2) Discussion

#### (a) *City of Los Angeles Historic-Cultural Monument Designation*

In 2021, based on the findings of the Los Angeles Cultural Heritage Commission, the City Council designated the Project Site an HCM under the name “Studio City Golf and Tennis Club.” In the determination that the Project Site qualified as an HCM, the findings from the City Council noted:

Studio City Golf and Tennis Club “exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community” as an excellent example of a 1950s private recreational facility open for public use in Studio City (HCM Criterion 1).

Studio City Golf and Tennis Club “embodies the distinctive characteristics of a style, type, period, or method of construction,” including the clubhouse, golf ball light standards, putting green, and brick wall with weeping mortar surrounding the front lawn at the northeast edge of the property, as an excellent example of a 1950s community recreational facility (HCM Criterion 3).<sup>27</sup>

#### (b) *Identification of Character-Defining Features*

Character-defining features for the Project Site were formally determined by the City as part of the designation of the property as an HCM. The identification of character-defining features in the Draft EIR was based on substantial evidence, which included a detailed review of the development history of the Project Site, consideration of the National Park Service guidance for the evaluation of the significance of the golf course design, and evaluation of the association of the Project Site with post-World War II recreational uses in the San Fernando Valley.

<sup>27</sup> Studio City Golf and Tennis Club Historic-Cultural Monument Application, Council File: 21-0470, Revised Findings, as modified by PLUM Committee, September 14, 2021, adopted by City Council, September 29, 2021.

Page IV.D-33 of the Draft EIR specifically concluded the following:

“The overall effect of the Project is consistent with the historic character of the Project Site, and therefore complies with the Standards for Rehabilitation. As further described in the Historical Report, provided in Appendix E-1, of this Draft EIR, use of the Project Site for athletic and recreational purposes is consistent with its historic use; the historic character of the Project Site overall would be retained; the identified character-defining features would be retained and rehabilitated; and the proposed new construction would not destroy historic materials, features, and spatial relationships that characterize the Project Site. Accordingly, the Project would not result in a substantial adverse change in the significance of a historical resource, the Project Site would retain all of the identified character features and will retain sufficient historic integrity to remain eligible as an HCM, and the Project would not have a significant impact on the environment as defined by CEQA.”

This conclusion was based on the substantial evidence presented in the Historic Resources Technical Report (Historical Report) included as Appendix E-1 to the Draft EIR, which discusses all features of the Project Site, including those that were not designated by the City as character-defining features. For example, the Historical Report discusses on pages 46 through 48 the progression of alterations on the Project Site from 1955 through 2018. These alternations include a 1957 redesign; the realignment and shortening of some holes in 1973 and 2018; the reduction in width of the driving range in 1976 and 1980 to accommodate additional tennis courts, and the removal of four tennis courts in 2006 to accommodate the construction of the adjacent fire station. Because of these changes, the golf course was not included in the City’s HCM designation of the Project Site. (See photographs on page 48 of the Historical Report showing the difference in the golf course from its 1956 design to its 2019 layout, including additions of the tennis courts which started in 1973.)

Therefore, the analysis in the Draft EIR and the formal designation of the former Studio City Golf and Tennis Club, as adopted by the City Council, correctly identify the historical significance and character-defining features of the Project Site. The character-defining features are:

- Private recreational facility open for public use
- Clubhouse
- Golf ball [-shaped] light standards
- Putting green
- Brick wall with weeping mortar surrounding the front lawn at the northeast edge of the property<sup>28</sup>

---

<sup>28</sup> Studio City Golf and Tennis Club Historic-Cultural Monument Application, Council File: 21-0470, Revised Findings, as modified by the PLUM Committee, September 14, 2021, adopted by City Council, September 29, 2021.

As noted in Section IV.D, *Cultural Resources*, of the Draft EIR and the Historical Report, several historic resource evaluations of the Project Site were prepared prior to the environmental review for the Project. These include the 2012 Historic Resources Report<sup>29</sup> prepared by Architectural Resources Group for an earlier project proposed by Planning Associates Inc., and a recommendation of potential historic significance by SurveyLA in 2013. In addition, there were further opinions presented as part of the public hearing process for the 2021 HCM nomination. While these previous evaluations and opinions identify potential historic significance for the Project Site and the associated features, none of the prior analyses or professional opinions represent an official determination or designation of the Project Site as a historical resource. The features and use of the Project Site as a golf course are not considered character-defining features of the Project Site as determined by the City and it is the City's identification of the character-defining features of the Project Site, as well as the HCM designation, that appropriately provide the basis for the analysis in the Draft EIR. Therefore, the City appropriately reviewed all of the evidence, and determined the historical significance and character-defining features of the Project Site as identified in Section IV.D, *Cultural Resources*, of the Draft EIR and the Historical Report included as Appendix E-1 to the Draft EIR.

Furthermore, the Supplemental Historic Memorandum, prepared by Historic Resources Group in November 2022 (included in Appendix F of this Final EIR), further supports the cultural and historic resources impact analysis and conclusions in the Draft EIR. Specifically, with regard to the golf course, the golf course does not represent an important example of golf course design; it does not rise to the level of significance of other important examples of the type in California; and it has been extensively altered which has compromised its integrity of design. Therefore, the character defining features have been appropriately identified to recognize the use of the property as a publicly-accessible recreational facility, with the associated features of the clubhouse, golf ball-shaped light standards, putting green, and brick wall with weeping mortar.

(c) *Evaluation of Impacts and Project Design Features*

As noted in the Draft EIR and on pages 66-74 of the Historical Report included as Appendix E-1 to the Draft EIR, the Project has been evaluated for potential impacts to the City-identified character-defining features of the Project Site. As stated on pages IV.D-32 and IV.D-33 in Section IV.D, *Cultural Resources*, of the Draft EIR, the Project would not result in significant adverse impacts to historical resources on the Project Site. The Project would retain those features as identified by the City as character-defining, including maintaining the historic use of the Project Site as a recreational facility that is open for public use; the clubhouse; golf ball-shaped light standards; putting green; and brick wall with weeping mortar. Further, the Project has been designed to comply with the *Secretary of the Interior's Standards for Rehabilitation* (Standards) as required for a designated HCM.

---

<sup>29</sup> Architectural Resources Group, Weddington Golf & Tennis Club: Historic Resources Assessment Report, January 30, 2012.

According to guidance from the National Park Service, “a project meets the Standards when the overall effect of all work is consistent with the property’s historic character.”<sup>30</sup> Following implementation of the Project, the Studio City Golf and Tennis Club (now Weddington Golf & Tennis) would maintain its historic use and overall character as a recreational site. All of the character-defining features of the Project Site would be retained. The clubhouse would be rehabilitated and would retain its historic function as the primary entrance to the Project Site as the visitors’ center. New construction proposed for the Project Site would be low-scale and sited to be minimally visible from the surrounding neighborhood. The Project would maintain significant open space and mature landscaping and would not significantly increase the density on the Project Site in a manner that would impact its historic character. Overall, the Project is consistent with the Standards based on an evaluation of the overall effect of the proposed work in the context of the specific features that contribute to the Project Site’s significance as a 1950s recreational facility. Therefore, the Draft EIR correctly concludes that the Project would not result in a substantial adverse change to the significance of a historical resource on the Project Site.

Moreover, the Historical Report considered the golf course, and other non-designated features that the Project would replace, in analyzing whether the Project would potentially impact the character of the Project Site such that it would no longer be able to convey its significance. (See pages 67 through 74 of the Historical Report, which discusses compliance with Standards 1 through 10 and concludes, among other things, that removal of the golf course would not impact the historical association, character, materials, or spatial relationships that characterize the HCM). For example, in regard to Standard 1, the Historical Report concluded on page 68 that the Project would repurpose the existing private golf course for use as an athletic and recreational facility for Harvard-Westlake School and the public. Therefore, the Project proposes a compatible new use for the Project Site that is consistent with the historic character of the Studio City Golf and Tennis Club (now Weddington Golf & Tennis) as a post-World War II recreational facility. With the implementation of the Project, the Project Site would continue to be used for recreational purposes and would maintain its historic association as a recreational amenity for the community. Similarly, with regard to Standard 3, the Historical Report states on page 70 that the Project Site would remain a private recreational facility open for public use in Studio City and specifically discusses the features which would be demolished, concluding that the features that are proposed for removal, including the nine-hole golf course, would be replaced with compatible new recreational facilities. Therefore, the historic character of the Project Site would be retained and preserved following completion of the Project. The Historical Report reiterated on page 77 that the Project would retain all the character-defining features and replace the non-character-defining features with new recreational facilities that are consistent with the historic use. Therefore, the Historical Report concluded that the Project Site would retain all of the

---

<sup>30</sup> U.S. Department of the Interior, National Park Service, “Technical Preservation Services: Cumulative Effect and Historic Character,” <https://www.nps.gov/tps/standards/applying-rehabilitation/cumulative-effect.htm> (accessed February 2022).

identified character-defining features in the HCM designation as adopted by City Council in 2021 and would retain sufficient historic integrity to convey its significance as a post-World War II recreational facility.

As demonstrated above, the Historical Report did not just dismiss the golf course in its current altered state as unimportant to the determination of the Project's impact on the HCM. The Historical Report evaluated all aspects of the Project for the potential to impact the Project Site such that it would no longer convey its significance as a post-World War II recreational facility. This included discussion of the treatment of those features identified as character-defining, other extant site features and their relationship with the historic features on the Project Site, and the compatibility of the proposed new construction with the historic recreational use of the Project Site. For example, the Historical Report discussed on pages 68 through 69 the open space and mature trees on the Project Site and concluded that the Project would maintain significant open space on the Project Site, including ample greenspace and mature landscaping and trees. The Project would remove 240 of the 421 inventoried trees and add 393 new California native trees, resulting in a net increase of 153 trees beyond existing conditions. The Project would also maintain the existing eucalyptus along Valley Spring Lane, the Aleppo and Canary Island pines along Bellaire Avenue, and the mature trees within the vicinity of the existing clubhouse. While no specific trees were identified by the City as character-defining, the Historical Report determined that maintaining a large number of mature trees is consistent with the historic character and use of the Project Site; maintaining mature trees along the periphery of the Project Site would help to maintain the existing relationship between the Project Site and the surrounding neighborhood; and the tree planting program and retained trees in proximity to the clubhouse would be compatible with and support the historic character of the clubhouse. Thus, the Historical Report considered potential impacts to the Project Site overall, and the ability of the features to collectively convey the significance of the designated HCM following implementation of the Project.

Accordingly, the Draft EIR appropriately analyzed the impacts of the Project on the HCM, including the impact of features that were not specifically delineated as character-defining features, and provided substantial evidence to support the analysis.

The conclusions in the Draft EIR are based on the Project as designed, and the conclusion of no significant adverse impacts to historical resources is not contingent on the implementation of the Project Design Features (PDF) to reduce or minimize potential impacts. Because the Draft EIR evaluates the overall plan for the Project Site, the PDFs related to the treatment of historical resources on the Project Site are included to reflect the Applicant's commitment to recognizing the history of the Project Site. Further, they reflect standard measures undertaken during design development and permitting to ensure the appropriate treatment of designated HCMs as details are further refined. Therefore, the PDFs, including the retention of a historic preservation professional as part of the design team, the approval of specific details related to the relocation of the golf ball-shaped light standards, and the rehabilitation of the clubhouse, are part of the normal approval and implementation process for projects involving designated HCMs in the City.

The Draft EIR correctly states that the Project, as designed, would not result in significant adverse impacts to historical resources on the Project Site. Therefore, no mitigation measures or further action on the Draft EIR would be required.

*(d) Project Design Modifications*

As discussed in Topical Response No. 2 – Modifications to the Project Design, design modifications relating to seating, lighting, building design (swimming pool area and gymnasium), parking, grading, storm water capture and reuse system, and water features were made to the Project in response to public and agency comments received on the Draft EIR. However, none of the design modifications directly or indirectly affect any of the Project Site’s character-defining features and as such, the cultural resources/historic resources impact analysis and conclusions included in the Draft EIR are not affected by the Project design modifications.

**(3) Conclusion**

As discussed above, the historical resources impacts of the Project are appropriately addressed in the Draft EIR and Historical Report included as Appendix E-1 to the Draft EIR. Further, the Project with design modifications would not directly or indirectly affect any of the Project Site’s character-defining features and as such, the cultural resources/historic resources impact analysis and conclusions included in the Draft EIR are not affected by the Project design modifications. As such, the Project with the design modifications would not result in significant new or substantially increased environmental impacts as evaluated in the Draft EIR.

## **g) Topical Response No. 7 – Artificial Turf and Effects on Localized Heat and Health**

### **(1) Introduction**

This topical response addresses comments received on the Draft EIR concerning potential Project impacts, specifically those related to the use of artificial turf and associated impacts on localized heat effects and health. The information presented below is based on content provided in Section IV.H, *Hazards and Hazardous Materials*, of the Draft EIR, and the Summary of Artificial Turf Studies on Human Health Technical Memorandum, prepared by Environmental Science Associates (ESA) dated October 6, 2021, included as Appendix H-2, PDF pages 1671 to 1691 of Appendix H, to the Draft EIR. Additionally, Appendix E.1, Supplemental Artificial Turf Field Materials Analysis by Exponent (Exponent 2022) dated December 21, 2022, Appendix E.2, Supplemental Analysis of Artificial Turf Fields by Gradient (Gradient) dated December 18, 2022, Appendix E.3, Field Turf Testing Report by David Teter Consulting dated November 22, 2022, and Appendix E.4, Supplemental Artificial Turf Field Materials Analysis by Exponent (Exponent 2023) dated February 16, 2023, have been added to the Final EIR as additional studies in support of the analysis contained in the Draft EIR and were also used to present the information below. These four appendices provide analysis results for the turf materials that are proposed for use in the Project and an analysis of artificial turf topics such as per- and polyfluoroalkyl substances (PFAS), standards related to PFAS, metals, and studies performed on the safety of artificial turf.

### **(2) Discussion**

#### *(a) Health Effects from the Use of Artificial Turf*

##### *(i) Components of Artificial Turf and Potential Health Hazards*

As discussed in Section II, *Project Description*, of the Draft EIR the Project would include two athletic fields that feature porous synthetic grass that would substantially reduce water consumption for irrigation compared to the current golf course while providing a year-round playing surface for both Harvard-Westlake and the community's year-round athletic and recreational uses. Additionally, it would avoid the use of pesticides associated with the current golf course, and avoid the emission of greenhouse gases associated with regular mowing, maintenance, and disposal of the existing natural turf grass. Furthermore, artificial turf is a consumer product that is approved for public use by all applicable regulatory bodies in the United States and in California. The Project's incorporation of artificial turf fields, as a sustainable alternative to natural turf fields, is consistent with the manner and circumstances for which turf fields are regularly put to use in the City.

Studies of health effects from artificial turf are discussed on pages IV.H-33 through IV.H-44 in Section IV.H, *Hazards and Hazardous Materials*, of the Draft EIR, with a more

detailed discussion in Appendix H-2, PDF pages 1676 through 1688 in Appendix H, to the Draft EIR. As discussed on pages IV.H-31 through IV.H-33 of the Draft EIR, the artificial turf to be installed for the Project would consist of four components: fiber, infill, backing, and underlayment. Artificial turf-related concerns include exposure to metals, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), PFAS, and methicillin-resistant *Staphylococcus aureus* (MRSA).

(ii) *Concepts of Human Health Risk Evaluation*

A human health risk assessment (HHRA) is the process used to estimate the nature and probability of adverse effects in humans who may be exposed to chemicals (in this case, the chemicals in or on the artificial turf) which could pose a health risk. As discussed on page IV.H-29 of the Draft EIR, an HHRA provides a risk characterization, which includes the assessment of non-carcinogenic (non-cancer) and carcinogenic (cancer) risks to potential on-site receptors on the artificial turf fields. Potential exposure pathways for chemicals that are present on or in the artificial turf materials include breathing (i.e., inhalation exposure), skin contact with the material (i.e., dermal exposure), and/or ingestion of the material (i.e., ingestion exposure). According to the California Department of Toxic Substances Control (DTSC) and United States Food and Drug Administration, a compound is considered carcinogenic if it is above a dose level in which there are no measurable carcinogenic risks. Cancer risk is deemed negligible (“*de minimis*”) when the excess lifetime cancer risk is at or below  $1 \times 10^{-6}$  (1 additional case of cancer per 1,000,000 exposed persons).<sup>31,32</sup> Risk reduction is generally recommended when estimates exceed the maximum acceptable risk of  $1 \times 10^{-4}$  (1 additional case per 10,000 exposed persons or 100 additional cases per 1,000,000 exposed persons). To address potential additive non-cancer effects, the Hazard Index (HI) is used. An HI of less than 1.0 means that the maximum impacted sensitive receptor would be exposed to concentrations at a level in which adverse non-cancer health effects would not be known or expected to occur. A HI of greater than 1.0 indicates that adverse effects are possible, but it is not a measure of the probability of adverse effects.

(iii) *Artificial Turf HHRA Studies*

A new HHRA was not prepared for the Project because numerous HHRAs have been conducted on the potential toxicological effects of exposure to artificial turf. Available scientific studies describing the effects of artificial turf on human health include independent studies conducted by, or reviewed and approved by, government agencies as well as studies that utilize government agency analysis methodologies.<sup>33</sup> These

<sup>31</sup> DTSC, 2023. DTSC Toxicity Criteria Rule for Human Health Risk Assessments, Responses to Frequently Asked Questions, What does the Toxicity Rule do?. Available: DTSC Toxicity Criteria Rule for Human Health Risk Assessments | Department of Toxic Substances Control (ca.gov). Accessed January 2023.

<sup>32</sup> California Code of Federal Regulations Title 21, Chapter I, Subchapter E, Part 500, Section 200.82

<sup>33</sup> These studies all provide a more rigorous analysis using standard methods and practices including being peer reviewed.

studies assess inhalation, ingestion, and dermal contact exposure pathways and provide a risk characterization. A summary of these studies is included in Section IV.H.3.d) for Threshold (a) in Subsection (1)(c)(iii), *Artificial Turf Studies*, of the Draft EIR and are discussed in more depth in Appendix H-2, PDF pages 1676 through 1689 in Appendix H, to the Draft EIR. The potential for the Project's artificial turf to create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials was analyzed based on the findings of these independent studies and assessments.

#### (a) Inhalation Exposure Pathway HHRAs

The inhalation of vapors and particulates was discussed in several HHRAs, including for VOCs, SVOCs, and particulate matter (PM). These studies are summarized on pages IV.H-33 through IV.H-42 of the Draft EIR and PDF pages 1676 through 1687 of Appendix H to the Draft EIR, their results are presented in **Table 2-4**, *Summary of HHRA Findings from Studies of the Inhalation of Vapors and Particulate Matter Above Artificial Turf*, below.

Overall, the studies (as cited in Table 2-4) conclude that human health risks from playing on synthetic turf fields are minimal, even though low concentrations of some chemicals have been demonstrated to leach from the tire crumb or volatilize as vapor. The key findings of Table 2-4 indicate that cancer risks are below the *de minimis* level in all the studies, except for a few results which were only slightly above the *de minimis* level but were on the lower end of the acceptable risk range<sup>34</sup>. Chronic non-cancer risks were not elevated above an HI of 1, for acute or chronic risks in any of the studies<sup>35</sup>. As summarized in Table 2-4, outdoor synthetic turf fields would not result in vapors or particulate matter that would cause an exceedance of health-based risk threshold levels. Therefore, Project impacts related to health risks from vapor and particulate matter in the air space above an artificial turf field or in the spectator seating areas would be less than significant.

#### (b) Ingestion Exposure Pathway

Health effects related to the ingestion of crumb rubber material by users of artificial turf fields were discussed in several of the HHRAs. These studies are summarized on pages IV.H-33 through IV.H-41 and pages IV.H-42 through IV.H-43 of the Draft EIR and Appendix H-2, PDF pages 1676 through 1687 in Appendix H, to the Draft EIR, their results are presented in **Table 2-5**, *Summary of HHRA Findings from Studies of the Ingestion of Crumb Rubber Material in Artificial Turf*, below.

Overall, the studies (as cited in Table 2-5) conclude that human health risks from playing on synthetic turf fields are minimal, even though ingestion of artificial turf products can

<sup>34</sup> See Table 2-4: 2009 OEHHA Study, 2017 Gradient Study, 2009 New York State Study, 2010 Connecticut Study, and 2008 Bainbridge Island Evaluation.

<sup>35</sup> See Table 2-4: 2010 CalRecycle Study, 2017 Gradient Study, 2009 New York State Study, 2010 Connecticut Study, 2008 Bainbridge Island Evaluation.

occur. Cancer risks were below the *de minimis* level in all the studies, except one result that was only slightly above the *de minimis* level and was on the lower end of the acceptable risk range<sup>36</sup>. Chronic non-cancer risks were not elevated above a HI of 1, for acute or chronic risks in all studies<sup>37</sup>. Based on the results of the studies outlined in Table 2-5, Project health risk impacts related to ingestion of artificial turf products would be less than significant.

(c) Dermal Contact Exposure Pathway

Health effects related to dermal (i.e., skin) contact with crumb rubber material by users of artificial turf fields were analyzed in several of the HHRAs. These studies are summarized on pages IV.H-33 through IV.H-41 and page IV.H-44 of the Draft EIR and Appendix H-2, PDF pages 1676 through 1687 of Appendix H, to the Draft EIR. The results of these studies are presented in **Table 2-6, Summary of HHRA Findings from Studies of Dermal Contact with Crumb Rubber Material in Artificial Turf**, below.

Overall, the studies (as cited in Table 2-6) indicate that human health risks from playing on synthetic turf fields are minimal, even though dermal contact with artificial turf products can occur. Cancer risks were below the *de minimis* level in all the studies<sup>38</sup>. Chronic non-cancer risks were not elevated above an HI of 1, for acute or chronic risks in all studies<sup>39</sup>. The HHRAs found that dermal contact with surfaces comprised of recycled tires or crumb rubber would not cause skin sensitization in children, nor would contact with these surfaces be expected to elicit skin reactions in children already sensitized to latex. The studies concluded that none of the estimated cancer risks for dermal contact would cause an exceedance of health-based risk levels. Additionally, the 2017 Gradient study concluded that the multi-pathway risk assessment (child spectator/youth soccer player inhalation, ingestion, and dermal) for recycled rubber in synthetic turf fields indicated cancer risks and non-cancer hazards below *de minimis* limits. Therefore, Project health risk impacts related to dermal contact would be less than significant.

**TABLE 2-4**  
**SUMMARY OF HHRA FINDINGS FROM STUDIES OF THE INHALATION OF VAPORS AND PARTICULATE MATTER ABOVE ARTIFICIAL TURF**

Study	Material Studied	Contaminants	Users	Supporting Data	Findings
2009 OEHHA Study	Indoor artificial turf (3 stadiums, 10-18°C, 45-53% humidity) and crumb rubber	69 VOCs 22 polycyclic aromatic hydrocarbons (PAHs) 3 phthalates PM10 PM2.5	Soccer players ages 5 to 55	Highest concentrations detected were used by OEHHA to calculate the increased lifetime cancer risk from the 8 PAHs Indoor fields were used, which have a higher concentration of VOCs than outdoor fields.	<b>Cancer Risk</b> Benzene, formaldehyde, naphthalene, nitromethane, and styrene are above the <i>de minimis</i> level of 1 in 1,000,000, but they are on the low end of the acceptable range of 1 in 1,000,000 to 100 in 1,000,000
2010 CalRecycle Study	4 artificial turf athletic fields containing recycled crumb rubber (aged 8 months, 1 year, 2 years, and 5 years). Natural turf field analyzed for comparison	VOCs and PM2.5	15 to 18 year old youth soccer players	8 air samples collected over each artificial turf fields and natural turf. Detected VOC concentrations over artificial turf did not increase as the surface temperature increased (as much as 55°F over the course of the day).	Acute exposures to persons using these fields were below the health-based screening levels for those chemicals. Chronic exposures were all below health-based screening levels. For both the acute and chronic exposure scenarios, adverse health effects are unlikely to occur in persons using these fields. Sampling data of three artificial turf fields found similar concentrations of PM2.5 upwind of the fields as directly on the fields. Therefore, there is no public health concern related to PM or heavy metals associated with PM at artificial fields.
2017 Gradient Study	Recycled crumb rubber and indoor and outdoor artificial turf fields	Number of Chemicals Evaluated: 139 from the recycled rubber composition studies; 213 from the outdoor air studies; 172 from the indoor air studies.	Youth Outdoor Soccer Player (YOSP) 6-18 years Youth Indoor Soccer Player (YISP) 6-18 years Youth Composite Soccer Player (YCSP) 6-18 years Adult Spectator (AS) Child Spectator (CS)	Conducted a comprehensive literature review to identify studies containing information about the concentrations of chemicals in recycled rubber or air sampling data to be used in a risk assessment. Number of Studies with Data: 37 recycled rubber composition studies; 7 outdoor air studies; 2 indoor air studies. Number of Samples: 130 from the recycled rubber composition studies; 76 from the outdoor air studies; 17 from the indoor air studies.	<b>Cancer Risk and Non-Cancer Hazard by Pathway for Recycled Rubber Fields</b> All receptor cancer risks were below <i>de minimis</i> risk and all non-cancer risk had a HI < 1. The HI 1 for the CS was related to potential ingestion of cobalt in recycled rubber, but since it is below the acceptable hazard limit, it is unlikely to result in non-cancer effects.  <b>Cancer Risk and non-cancer hazard by pathway for natural soil fields</b> Some of the cancer risks were above the <i>de minimis</i> risk but were within the USEPA's target risk range of $1 \times 10^{-6}$ to $1 \times 10^{-4}$ and all non-cancer risk had a HI < 1, which is below the <i>de minimis</i> risk level. The cancer risk results for the natural soil field analysis indicate that cancer risks were consistent with (but slightly higher than) those from exposure to recycled rubber fields. Similarly, the non-cancer hazard index was consistent with (but generally lower than) those from exposure to natural soil fields.
2009 New York State Study	Laboratory analysis of crumb rubber material and air sampling at two artificial turf fields.	VOCs and SVOCs from off-gassing of crumb rubber samples and 23 metals. VOCs, SVOCs, PM from air sampling at artificial turf fields VOCs, SVOCs, and metals for water sampling. SVOCs for downgradient groundwater samples.	Users of the artificial turf fields.	Study focused on surface water and groundwater, air sampling at the surface of the fields, and elevated surface temperatures as indicators of the potential for heat-related illness at synthetic turf fields.	Potential non-cancer risks from target chemicals had a HI < 1. Potential cancer risks exceeded the target of 1 in 1,000,000 for four chemicals: benzene and three forms of pentadiene. All other chemicals were well below the target. However, the estimated risks of the on-field samples were similar to those for the upwind, background samples and could not be attributed to turf emissions.

**TABLE 2-4  
SUMMARY OF HHRA FINDINGS FROM STUDIES OF THE INHALATION OF VAPORS AND PARTICULATE MATTER ABOVE ARTIFICIAL TURF**

Study	Material Studied	Contaminants	Users	Supporting Data	Findings
2010 Connecticut Study	Off-gassing and leaching of chemicals in crumb rubber. Stormwater sampling of artificial turf fields and upwind background sampling. Air sampling at 5 fields during active play.	200 chemicals analyzed including VOCs, SVOCs, rubber related chemicals and PM10. 4 VOCs identified as associated with turf emissions: methyl isobutyl ketone, acetone, toluene, and ethylbenzene. 2 SVOCs were identified as above background levels: benzothiazole and butylated hydroxytoluene	Youth ages 6 – 18 and adults for indoor and outdoor field types Exposures 3 hrs/day, 4 days/wk, for 8 months/year	The Connecticut Department of Public Health analyzed a total of 27 chemicals.	The study concluded that the cancer risks were only slightly above <i>de minimis</i> levels of 1 in 1,000,000 for all scenarios evaluated, including children playing at the indoor facility, the scenario with the highest exposure. The calculated risks were reported to be within typical risk levels from ambient pollution sources and below target risks associated with many air toxics regulatory programs. Chronic non-cancer risks had an HI < 1; for acute risk, the hazard index was close to 1 for children playing at the indoor field.
2008 Bainbridge Island Evaluation	Review of Scientific Literature on crumb rubber materials	Acetaldehyde, arsenic, benzene, benzo(a)pyrene, bis(2-ethylhexyl)phthalate, methyl isobutyl ketone, carcinogenic PAHs, total PCBs, toluene, xylene, zinc	Youth ages 8-10 Teenagers 11-18	The youth (8 -10) scenario assumes 3 hours/day for 261 days/year, for 3 years. The teenage scenario assumes 3 hours/day for 261 days/year, for 7 years.	For both age groups, the assessment addressed health risks via dermal contact with tire crumb leachate, inhalation of VOCs, and ingestion of whole tire particles. None of the estimated cancer risks exceeded <i>de minimis</i> excess cancer risk of 1 in 1,000,000, and the non-cancer HI for each chemical was a maximum of 0.05, far below an HI of 1.

**TABLE 2-5  
SUMMARY OF HHRA FINDINGS FROM STUDIES OF THE INGESTION OF CRUMB RUBBER MATERIAL IN ARTIFICIAL TURF**

Study	Material Studied	Contaminants	Users	Supporting Data	Findings
2007 Integrated Waste Management Board (CalRecycle) Study	Outdoor playground and track surfaces constructed from recycled waste tires	One time ingestion of 10 grams of tire shreds 212 chemicals released by tire shreds in gastric digestion experiment	3-year old child – ingestion of tire shreds 1-12 years for playground use	Evaluation of toxicity due to ingestion of tire shreds based on existing literature (46 studies) Released chemicals from the gastric digestion simulation were compared to their health-based screening values. Hand-to-surface-to-mouth activity was tested by wipe sampling of playground surfaces. Zinc and four PAHs were measured at levels that were three times background.	Only zinc exceeded its health-based screening value. It is unlikely that a onetime ingestion of tire shreds would produce adverse health effects. Seven of the chemicals leaching in very small amounts from tire shreds in published studies were carcinogens, yielding a $1.2 \times 10^{-7}$ cancer risk for the one-time ingestion. This risk is well below the <i>de minimis</i> level of $1 \times 10^{-6}$ . Gastric digestion simulation suggested a low risk of noncancer acute health effects. Five chemicals were carcinogens. If the released chemicals were ingested as a onetime event and averaged over a lifetime, the cancer risk would be $3.7 \times 10^{-8}$ (3.7 in one hundred million), well below the <i>de minimis</i> risk level. One carcinogen, PAH chrysene, was found in the wipe sampling. Chrysene gave an increased cancer risk of 2.9 in one million, slightly above the <i>de minimis</i> risk level, but within the acceptable cancer risk range of 1 in one million to 100 in one million.
2017 Gradient Study	Recycled crumb rubber and indoor and outdoor artificial turf fields	For adults and youth older than 6 years of age an ingestion rate of 50 mg/day of recycled rubber particles was used.  For children spectating a soccer game, an ingestion rate of 100 mg/day was used.  It was assumed adult spectators would not ingest recycled rubber particles.	Youth Outdoor Soccer Player (YOSP) 6-18 years Youth Indoor Soccer Player (YISP) 6-18 years Youth Composite Soccer Player (YCSP) 6-18 years Adult Spectator (AS) Child Spectator (CS)	The ingestion rates used represent one-half of the upper-bound value for daily soil and dust ingestion and would likely overestimate the consumption of recycled rubber, because recycled rubber particles are generally larger than soil particles and only a limited amount of time each day is spent playing on these surfaces. Using one-half metals and PAHs contributed the most to the incidental ingestion and dermal contact risks and hazards.	<b>Cancer Risk and Non-Cancer Hazard by Pathway for Recycled Rubber Fields</b> All receptor cancer risks were below <i>de minimis</i> risk and all non-cancer risk had a HI < 1. The HI of 1 for the CS was related to potential ingestion of cobalt in recycled rubber, but since it is below the acceptable hazard limit, it is unlikely to result in non-cancer effects.  <b>Cancer Risk and Non-Cancer Hazard by Pathway for Natural Soil Fields</b> Some of the cancer risks were above the <i>de minimis</i> risk but were within the USEPA's target risk range of $1 \times 10^{-6}$ to $1 \times 10^{-4}$ and all non-cancer risk had an HI < 1. The cancer risk results for the natural soil field analysis were consistent with (but higher than) those from exposure to recycled rubber fields. Similarly, the non-cancer hazard results were consistent with (but generally lower than) those from exposure to natural soil fields.
2008 Bainbridge Island Evaluation	Review of Scientific Literature on crumb rubber materials	Incidental ingestion rate: Child 0.2 g/day Teenager 0.1 g/day	Child Teenager	Assumes the consumption of 0.2 g/day of the rubber granules by children (USEPA default value for soil ingestion). Because the consumption of the rubber granules is unlikely for all groups except very young children, the value used for teenagers is 0.1 g/day. These values are conservative and assume the consumption of 73 g/year of rubber by children, and 36.5 g/year are by teenagers.	For both age groups, the assessment addressed health risks via dermal contact with tire crumb leachate, inhalation of VOCs, and ingestion of whole tire particles. Despite the use of a highly conservative exposure model (assuming that children and teenagers playing on a sport team will use the turf fields 5 times a week for either 3 or 7 years), cancer risks resulting from incidental ingestion of tire crumb were all several orders of magnitudes below the USEPA risk threshold level of 1 in 1,000,000 and non-cancer risks were all less than 1.0.

**TABLE 2-6  
SUMMARY OF HHRA FINDINGS FROM STUDIES OF DERMAL CONTACT WITH CRUMB RUBBER MATERIAL IN ARTIFICIAL TURF**

Study	Material Studied	Contaminants	Users	Supporting Data	Findings
2007 Integrated Waste Management Board (CalRecycle) Study	Laboratory study where guinea pigs were exposed to pieces of playground surfaces made from recycled tires.	Styrene-butadiene rubber (SBR) Ethylene propylene diene monomer (EPDM) rubber Crumb rubber	3-year-old child – ingestion of tire shreds 1-12 years for playground use	Skin sensitization testing consisted of three 6-hour induction exposures; each exposure separated by one week from the preceding exposure. All test samples were applied to the animals' skin. Then, after an additional two weeks, the animals were challenged with the test sample for 6 hours and examined after 24 and 48 hours for signs of erythema (skin reddening).	85 guinea pigs were used for the testing. No animal showed a positive skin reaction following any of the three doses. A follow up study was done since the animals did not show a reaction. No animals showed a positive reaction in the follow up study either. Thus, the SBR tiles, SBR crumb and EPDM tiles were considered not to be contact skin sensitizers.  These results suggest that recycled tires (SBR) used in playground surfaces do not cause skin sensitization in children.
2017 Gradient Study	Recycled crumb rubber and indoor and outdoor artificial turf fields	Contact with recycled crumb rubber material	Youth Outdoor Soccer Player (YOSP) 6-18 years Youth Indoor Soccer Player (YISP) 6-18 years Youth Composite Soccer Player (YCSP) 6-18 years Adult Spectator (AS) Child Spectator (CS)	Dermal absorption values were obtained from the United States Environmental Protection Agency's (USEPA's) dermal risk assessment guidance for soil. For PAHs, an absolute value of 0.002 was used for PAHs in the main analysis. The dermal absorption fractions used for other substances in the risk assessment are 0.03 for arsenic; 0.13 for naphthalene; 0.14 for PCBs; and 0.1 for SVOCs.  Skin adherence factor values are not available for recycled rubber, so the USEPA's recommended activity-specific soil-to-skin adherence factors for children and adolescents was used to calculate dermal absorption for receptors exposed to recycled rubber. To assess mutagenic compounds, the soil-to-skin adherence factor of 0.04 mg/cm <sup>2</sup> for all age groups was used.  Metals and PAHs contributed the most to the incidental ingestion and dermal contact risks and hazards.	<b>Cancer Risk and Non-Cancer Hazard by Pathway for Recycled Rubber Fields</b> All receptor cancer risks were below <i>de minimis</i> risk and all non-cancer risk had an HI < 1. The HI of 1 for the CS was related to potential ingestion of cobalt in recycled rubber, but since it is below the acceptable hazard limit, it is unlikely to result in non-cancer effects.  <b>Cancer Risk and Non-Cancer Hazard by Pathway for Natural Soil Fields</b> Some of the cancer risks were above the <i>de minimis</i> risk but were within the USEPA's target risk range of 1 x 10 <sup>-6</sup> to 1 x 10 <sup>-4</sup> and all non-cancer risk had an HI < 1.  The cancer risk results for the natural soil field analysis indicate that cancer risks were consistent with (but higher than) those from exposure to recycled rubber fields. Similarly, the non-cancer hazard results for the recycled rubber exposure scenarios were consistent with (but generally lower than) those from exposure to natural soil fields.
2008 Bainbridge Island Evaluation	Review of Scientific Literature on crumb rubber materials	Dermal adherence factor Child 1 mg/cm <sup>2</sup> Teenager 1 mg/cm <sup>2</sup>	Child Teenager	Highly conservative – assumes 100% adherence and absorption of chemicals through skin. This value is likely to be much lower.	For both age groups, the assessment addressed health risks via dermal contact with tire crumb leachate, inhalation of VOCs, and ingestion of whole tire particles.  Despite the use of a highly conservative exposure model, cancer risks resulting from dermal contact of tire crumb were all several orders of magnitudes below the EPA risk threshold level of 1 in 1,000,000 and non-cancer risks were all less than 1.0.

Winward Environmental LLC, Initial Evaluation of Potential Human Health Risks Associated with Playing on Synthetic Turf Fields on Bainbridge Island, 2008.

(d) Exposure to Per- and Polyfluoroalkyl Substances (PFAS)

The synthetic turf carpet is made up of artificial grass blades formed through a molding and extrusion process, which utilizes low levels of a fluoropolymer processing aid that is considered a PFAS. These fluoropolymer materials are not used as the base material for the artificial grass blades, but instead, are used as an additive at parts per million (ppm) levels to prevent clogging of the extruding machines.

PFAS are a family of thousands of chemicals that vary widely in their chemical and physical properties, as well as their potential risks to human health and the environment.<sup>40</sup> PFAS impart oil, water, stain, and soil repellency, chemical and thermal stability, and friction reduction in a range of products, including consumer products such as carpets, clothing, furniture, outdoor equipment, cosmetic products, non-stick cookware, and food packaging. PFAS are regularly detected in drinking water, soil and groundwater, fire extinguishing foam, food (e.g., seafood), food packaging (e.g., paper food packaging like wrappers at fast food restaurants, microwave popcorn bags, pizza boxes), household products (e.g., clothes, carpeting, upholstery, non-stick cookware, paints, lubricants, boxed cake mixes), dust from household products, and personal care products (e.g., lotions, lipsticks, mascara, cleansers, nail polish, shaving cream, foundation, eyeliner, dental floss), and biosolids (soil amendments), as well as at manufacturing or chemical production facilities.<sup>41</sup> Small-molecule PFAS are of potential concern due to their widespread production and use, their ability to move and persist in the environment, and their ability to accumulate in the body over time.<sup>42</sup> The primary exposure route identified by the United States Environmental Protection Agency (USEPA) and State regulatory agencies is through consumption of PFAS in drinking water.

As stated earlier, PFAS refers to a group of thousands of manmade compounds containing carbon-fluorine bonds, some of which are associated with a risk of cancer or reproductive toxicity. The term PFAS is frequently used to describe a set of small perfluorinated alkyl surfactants, including perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS), two PFAS that have been the most extensively produced and used in a wide range of products to reduce surface tension and stabilize mixtures of insoluble substances, such as in soaps and detergents, paints, shampoos and conditioners, and adhesives. However, current definitions of the term “PFAS” include a far larger set of substances and materials and can be so broad as to include

<sup>42</sup> USEPA, 2022. Our Current Understanding of the Human Health and Environmental Risks of PFAS, March 16. Available: <https://www.epa.gov/pfas/our-current-understanding-human-health-and-environmental-risks-pfas>. Accessed June 2022.

fluoropolymers such as polytetrafluoroethylene (PTFE) and fluorinated ethylene propylene (FEP), which have significantly different physical and chemical properties compared to PFOS and PFOA.<sup>43</sup> These PFAS substances are all very different from one another from the perspective of chemistry, structure, and corresponding properties, which is why they are used for different purposes and in different ways. As a result, any discussion related to the presence of PFAS in a specific context, whether for performance, sourcing, environmental persistence, or health risk, must consider the specific chemistries that are present, not just the presence of “PFAS” generally, or the total amount of PFAS present.<sup>44</sup>

Two common and important categories of PFAS are small-molecule<sup>45</sup> surfactants (like PFOA and PFOS) and fluoropolymers (polymers containing a carbon-only polymer backbone with fluorine atoms directly attached to it).<sup>46</sup> While both of these types of PFAS contain poly- or perfluorinated carbon chains, their specific molecular characteristics differ in important ways. One of the features of a small molecule surfactant is its functional group (often a carboxylate, sulfonate, or similar anionic group), which allows it to interact with water-based substances and materials at that location and confers surfactant activity.<sup>47</sup> Fluoropolymers, in contrast, have far larger poly- or perfluorinated chain segments and do not include reactive functional groups. As a result, fluoropolymers do not act as surfactants, are considered immobile in the environment, and are stable under many chemical and environmental conditions.<sup>48</sup>

Certain applications of fluoropolymers that involve direct contact with humans and/or food are regulated by the FDA. For example, fluoropolymers are used in the development and production of pharmaceuticals because of several beneficial properties, including

<sup>44</sup> Exponent, 2022. External Memorandum to ESA from Sarah Parker, Ph.D., Managing Scientist, Exponent, December 21. Appendix E.1 to the Final EIR.

<sup>45</sup> The term “small molecule” is used to differentiate molecules with low molecular weights (for example, below 500 daltons) from larger molecules like polymers and proteins that have different properties and characteristics as a result of their size. The term is often used to distinguish molecules of different sizes in biological contexts because molecular size is one characteristic that influences the ability of a molecule to enter a cell. See, e.g., Li, Q., & Kang, C. (2020). Mechanisms of action for small molecules revealed by structural biology in drug discovery. *International Journal of Molecular Sciences*, 21(15), 5262.

<sup>46</sup> Note that other polymers that include fluorine atoms (such as polyethers and polymers with fluorinated side chains) are typically referred to as “fluorinated polymers,” and are not included in the definition of the term “fluoropolymer.” Buck, R. C., Franklin, J., Berger, U., Conder, J. M., Cousins, I. T., De Voigt, P., ... and van Leeuwen, S. P. (2011). Perfluoroalkyl and polyfluoroalkyl substances in the environment: terminology, classification, and origins. *Int. Env. Assess. and Management* 7(4), 513-541.

their chemical inertness, resistance to high temperatures, and ability to be easily cleaned.<sup>49</sup> Fluoropolymers have been approved in various forms for use in food contact applications and cookware since the 1960s, and have been described by the FDA as containing “a negligible amount of PFAS capable of migrating to food.”<sup>50</sup> Another important application of fluoropolymers is in medical devices such as permanent medical implants. At present, there is a 50+ year history of material and product testing (e.g., laboratory, animal and human studies of biocompatibility) and real world data associated with permanent implants and other medical devices that support the use of fluoropolymers in direct, long term contact with the body.<sup>51</sup> This helps illustrate the importance of separately assessing the benefits and risks associated with different types of PFAS: while EPA limits certain small-molecule PFAS (small molecule surfactants and, specifically, PFOA and PFOS) concentrations in drinking water in order to protect human health, FDA-approved fluoropolymer sutures and implants (among other devices) are intended for use within the human body to enhance human health.

Fluoropolymers are also used as additives in other materials. One additive application that is relevant to artificial turf products is the use of certain fluoropolymers, including polytetrafluoroethylene (PTFE) and polyvinylidene fluoride (PVDF), as processing aids in the formulation of artificial turf fibers.<sup>52</sup> These fluoropolymer processing aids are added to the polymer formulations at low levels, typically around 100-1000 parts per million (ppm), to facilitate processing and prevent certain types of processing issues (e.g., sharkskin or surface melt fracture) that may be encountered during the fiber-forming process.<sup>53</sup> The addition of processing aids influences the frictional properties of the manufactured fibers, which may reduce skin abrasion when a user’s skin slides along the surface of the turf.<sup>54</sup>

Like fluoropolymers more generally, the properties of these fluoropolymer processing aids are significantly different than those of small-molecule fluorosurfactants such as PFOA and PFOS. These processing aids are inert materials that are known to withstand the high melting temperatures and extrusion processes for plastic component formation

<sup>54</sup> Exponent, 2022. External Memorandum to ESA from Sarah Parker, Ph.D., Managing Scientist, Exponent, December 21. Appendix E.1 to the Final EIR.

without deterioration.<sup>55</sup> Like fluoropolymers for other food contact applications, specific examples of fluoropolymer processing aids have been approved for use in food contact and packaging by the FDA for decades, in part because processing aids are used at such small amounts that only “a negligible amount of PFAS is capable of migrating” from materials made with them.<sup>56</sup>

Because the characteristics of fluoropolymers are measurably different from those of fluorosurfactants (and other small-molecule PFAS), fluoropolymers are often considered to be distinct types of PFAS.<sup>57</sup> Polymers are generally considered lower risk because of molecular size, and this is also true for fluoropolymers (often >100,000 daltons<sup>58</sup>).<sup>59</sup> Concern is also reduced for inert substances like fluoropolymers, compared to substances with functional groups that interact with water, such as small molecule fluorosurfactants. Many studies have assessed fluoropolymers for risk in the context of medical devices and food contact; the Organization for Economic Cooperation and Development (OECD) designates “polymers of low concern,” as “those deemed to have insignificant environmental and human health impacts.”<sup>60,61</sup> As with any assessment, molecules are not interchangeable, but generally, studies have found fluoropolymers to be of low concern for PFAS exposure unless they contain certain amounts of residual fluorosurfactant(s) from the manufacturing process.<sup>62</sup>

In some instances, the detection of fluorine is cited as the sole basis for concluding that artificial turf fibers and backing materials contain PFAS.<sup>63</sup> However, fluorine is an element that may be present in many chemical forms, and the literature provides examples of numerous fluorine-containing substances that have been well characterized and described to offer acceptable and beneficial attributes (for example, fluoride in

toothpaste). Even if present as organic fluorine, not all fluorinated compounds will be considered PFAS according to different definitions. Additionally, within the group of compounds that may be considered PFAS, different compounds have different properties, which matters in the assessment of environmental risk of a product such as artificial turf.<sup>64</sup>

To investigate the potential linkage between the detected concentration of fluorine in artificial turf with the presence of specific PFAS, a recent study was conducted on plastic- and rubber-containing artificial turf fields in Stockholm, Sweden (Cambridge, 2022).<sup>65</sup> In this study, samples were subjected to total fluorine (TF), extractable organic fluorine (EOF) and targeted PFAS analysis. TF was observed in all 51 artificial turf samples (range: 16 – 313, 12 – 310, and 24 – 661 µg F/g in backing, filling, and blades, respectively),<sup>66</sup> while EOF and target PFAS occurred in less than 42 percent of all samples (less than 200 and less than 1 ng/g, respectively).<sup>67,68</sup> A subset of samples extracted with water confirmed the absence of fluorine. Moreover, application of the total oxidizable precursor assay revealed negligible perfluoroalkyl acid (PFAA) formation across all three sample types, indicating that the fluorinated substance(s) in artificial turf are not low molecular weight PFAA-precursors.<sup>69</sup> Collectively, these results point towards polymeric organofluorine (e.g., fluoroelastomer, polytetrafluoroethylene, polyvinylidene fluoride), consistent with patent literature.<sup>70</sup> The combination of poor extractability and recalcitrance towards advanced oxidation suggests that leaching and/or conversion to mobile perfluorinated alkyl acids is limited over the lifetime of an artificial turf and/or

following accidental ingestion of artificial turf components and that these compounds pose a negligible human health risk from dermal, inhalation, and ingestion exposure.<sup>71,72</sup>

Furthermore, it is useful to compare the levels of small molecule PFAS described in the above study to levels of specific PFAS that might be expected to be present in soil samples to evaluate the potential for increased health risk. A review article published in the *Remediation Journal* collected information on background and ambient levels of two predominant PFAS (i.e., PFOS and PFOA) in North America in both abiotic media (soil, sediment, surface water, and public drinking water supplies) and selected biotic media (human tissues, fish, and shellfish) that were not associated with a known point source of PFAS.<sup>73</sup> PFOS was detected in every soil sample taken in North America at concentrations between 0.018 – 2.55 µg/kg (PFOA was detected at 0.059 – 1.84 µg/kg), with much higher concentrations found in the eastern U.S. (greater than 0.184 µg/kg).<sup>74</sup> Widespread ambient soil and sediment concentrations were well below human health-protective thresholds for direct contact exposures.<sup>75</sup> Surface water, drinking water supply waters (representing a combination of groundwater and surface water), fish and shellfish tissue, and human serum levels ranged from less than to greater than available health-based threshold values.<sup>76</sup> In comparison, the Cambridge 2022 study found levels of targeted PFAS (which included PFOS and PFOA) at less than 1 ng/g, which is equivalent to 1 µg/kg, well within the range of PFOA and PFOS detected in these soil samples.<sup>77</sup>

Since these levels were well below the safe soil USEPA Regional Screening Levels (RSL) by two to three orders of magnitude, human health risk is negligible.<sup>78</sup>

In addition, the USEPA has proposed designating certain specified PFAS, namely PFOA and PFOS, under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), also known as Superfund<sup>79</sup>. The proposed designation of PFOA and PFOS as hazardous substances under CERCLA must undergo a formal public rulemaking process, which has not occurred. Nonetheless, it is not expected that the Project's use of artificial turf would be subject to the USEPA proposed designation under CERCLA, if promulgated, since the artificial turf itself would not contain PFAS and would not constitute a release or threatened releases of PFAS into the environment under CERCLA. Additionally, the PFAS testing performed on the FieldTurf sample indicated that PFOA, PFOS and GenX<sup>80</sup> were not detected above the laboratory reporting limits for both pre-TOP assay and post-TOP assay testing results<sup>81</sup>. Thus, these three PFAS would not present a public health concern with respect to the Project's proposed use of artificial turf.

(e) Metals and PFAS Testing Results of FieldTurf Artificial Turf

The Project proposes the use of FieldTurf, consisting of the Core Vertex 2.5 fiber<sup>82</sup> and Cryogenic Crumb Rubber<sup>83</sup>, as the artificial turf. The proposed FieldTurf Core Vertex 2.5 fiber was tested, for the Project, for the presence of PFAS and the proposed Cryogenic Crumb Rubber was tested for the presence of metals (Eurofins, 2022<sup>84</sup>). FieldTurf components have been evaluated on a few prior occasions for the presence of PFAS

<sup>84</sup> Eurofins Sacramento. 2022. "Analytical Report re: PFAS Product Testing." Report to David Teter Consulting. 320-90614-1. 38p., September 28.

(TRC Companies, Inc., 2022<sup>85</sup>, Teter, 2019<sup>86</sup>).<sup>87</sup> Results from a recent analytical sampling (TRC Companies, Inc., 2022) conducted on behalf of the City of Portsmouth, New Hampshire, indicated no detectable concentrations of PFAS in a sample of FieldTurf grass carpet analyzed using a modified version of a USEPA standardized method for detecting 70 specific PFAS.<sup>88</sup> After oxidative treatment, under the Total Oxidizer Precursor (TOP) assay method<sup>89</sup>, one sample exhibited very low level, trace concentrations of a limited number of PFAS at orders of magnitude lower than health-protective soil screening levels, indicating no significant risk from exposure to these compounds.<sup>90,91</sup> The TOP assay method post-oxidation analyses did not result in a significant increase of PFAAs, indicating that the materials do not contain a significant mass of precursor PFAS and that the artificial turf does not represent a significant human health risk. Similarly, concentrations of PFAS were below detectable limits in analytical testing conducted on 1-square-foot samples from six types of FieldTurf grass carpet using the standard method (Teter, 2019).<sup>92,93</sup>

Additional testing of artificial turf material that has been described in the news media has utilized test methods that evaluate fluorine content of a sample without identifying individual PFAS, including the total fluorine and total organic fluorine (TOF) methods. One such article was published August 3, 2022 in the E&E News publication Greenwire. The Greenwire article implies that “high levels of organic fluorine” detected during TOF testing of Portsmouth’s artificial turf demonstrates an environmental and health risk.<sup>94</sup> However,

because both the amount and nature of the substances present in the turf will influence the risks associated with the material, it is crucial to understand the identity of the PFAS that may be present in the materials when conducting a risk assessment.<sup>95</sup> For artificial turf materials, this is especially important because fluoropolymer processing aids used in artificial turf manufacturing are considered to be of low concern for PFAS exposure compared to other PFAS (such as perfluorooctanoic acid, “PFOA” or perfluorooctanesulfonate, “PFOS”) that could also contribute to the level of “organic fluorine” detected by the TOF method.<sup>96</sup> Further, with respect to potential degradation, the Greenwire article makes statements that are not supported by the peer-reviewed literature about two fluoropolymer materials that are used as additives in artificial turf manufacturing, polyvinylidene fluoride (PVDF) and poly(vinylidene fluoride-co-hexafluoropropylene) (PVDF-HFP). The Greenwire article does not cite a source for its assertion of fluoropolymer material degradation. The potential for how PVDF, PVDF-HFP, and other fluoropolymer materials are likely to break down under different conditions have been studied by multiple authors and data is available in the peer-reviewed scientific literature. The peer-reviewed literature demonstrates that PVDF materials are durable under typical environmental conditions.<sup>97</sup> Additionally, the Greenwire article confused two different guidance levels by comparing the concentration of PFOS found in the post-oxidation turf carpet sample (135 ppt) to EPA health advisories for PFOS in drinking water (20 ppq) instead of the PFOS soil screening level (130 ppb). In fact, the turf carpet’s post-oxidation PFOS level is three orders of magnitude lower than the soil screening level.<sup>98</sup>

In addition to the studies mentioned above related to the PFAS content of artificial turf materials, there have been dozens of regulatory and peer-reviewed studies that have evaluated exposure and risk related to artificial turf and recycled rubber infill in the past decade and all studies found that there is no evidence that the levels of chemicals in recycled rubber infill present a public health concern.<sup>99</sup> The most recent study, conducted by the Japanese National Institute of Health Sciences, conducted four studies of synthetic turf infill and concluded that risk related to the exposure to metals from synthetic turf rubber granule infill is low.<sup>100</sup>

As part of this Final EIR, and specifically for the Project, testing was performed on FieldTurf cryogenic crumb rubber for total California Assessment Manual (CAM 17)

metals and PFAS on the FieldTurf Core Vertex 2.5 Fiber product using the standard and TOP assay methods by Eurofins, a laboratory widely regarded as experienced in PFAS testing (Eurofins, 2022).<sup>101</sup> Since crumb rubber is made from recycled tires, certain metallic elements that are used in the manufacturing of tires are expected to be found in crumb rubber. Test results from a sample of the fresh crumb rubber proposed for use in the Project's artificial turf field, Cryogenic Rubber 14-30, demonstrate that levels of the tested metals are consistent with, or lower than, the levels of metals reported in published studies of other fresh crumb rubber (i.e., crumb rubber after grinding, and before use in an application like infill).<sup>102</sup> None of the metals detected in the crumb rubber sample exceeded USEPA Regional Screening Levels (RSLs) for unrestricted residential use.<sup>103</sup> The detected concentration of zinc in the crumb rubber was 14,000 ppm, which is an expected result as the concentration of zinc in crumb rubber typically ranges from 7,000 to 20,000 ppm, and does not affect any human health exposure aspects because the USEPA regional screening level for zinc in an unrestricted use scenario is 23,500 ppm (noncarcinogenic child) or 235,000 ppm (noncarcinogenic adult), assuming a hazard index of 1, which is more than 50 percent higher than the laboratory tests for the Project's turf formulation.<sup>104</sup>

As mentioned above, a fluoropolymer processing aid, which is considered a PFAS, is used in the extruding process of the artificial turf fibers. The FieldTurf Vertex CORE 2.5 fiber product, which is proposed for the Project, was analyzed for an extended list of 68 PFAS using USEPA Method 537 Modified, which is currently considered the most comprehensive testing approach for target compounds.<sup>105</sup> No listed molecular PFAS of concern were detected above the reporting limit in the pre-weathered sample.<sup>106</sup> The FieldTurf Core Vertex 2.5 fiber product was then subjected to the TOP assay method which uses both heat and an aggressive hydroxyl radical oxidation process to attempt to break down precursor compounds of PFAS into measurable perfluoroalkyl acids (PFAA). This method is more harsh than typical conditions that artificial turf would be subject to in

the outdoor environment.<sup>107</sup> Perflurorobutanoic acid (PFBA) and Perfluoro-2-methoxypropionic acid (MTP) were detected in the post-TOP assay sample at concentrations just above their respective reporting limits<sup>108</sup>, 1.7 ppb and 5.9 ppb, respectively.<sup>109</sup> However, PFBA was also detected in the method blank and both PFBA and MTP were detected in the laboratory control spike and/or laboratory control spike duplicate indicating contamination of the instrument or other interference that would overstate the detected concentration of PFBA and MTB in the tested artificial turf.<sup>110,111</sup> These analytical issues are unlikely to affect the validity of the results, although they likely resulted in overestimated post-TOP assay concentrations of PFBA and MTP.<sup>112</sup> While there are no regulatory screening levels for these two specific forms of PFAS detected in the FieldTurf samples after oxidation, the levels that were detected are significantly lower than proposed regulatory limits for PFAS content in products, and lower than residential soil screening levels for any form of PFAS issued by USEPA.<sup>113,114</sup> Therefore, PFAS compounds used to produce or that may be found in artificial turf or recycled rubber infill do not present a public health concern because they were not detected or only very small detectable concentrations of PFAS were found in the artificial turf proposed for the Project, all of which were at least an order of magnitude lower than health protective screening levels.<sup>115</sup> These results are provided in Appendix E.3 to this Final EIR. Appendices E.1 and E.2, to this Final EIR, are from experienced scientific firms that analyzed the test results and offered their professional opinion on PFAS.

## (f) Microplastics and Potential for PFAS Leaching

Regarding microplastics and the potential impacts of PFAS and microplastics entering surface water, although the Draft EIR does not call out a discussion of microplastics, the Draft EIR does discuss the health effects of crumb rubber, which are the microplastics in artificial turf that could migrate to surface waters. One comment received during the circulation of the Draft EIR refers to a 2016 report titled *Swedish sources and pathways for microplastics in the environment*. This report states that the “[m]ost important emissions for microplastics were found to be from road wear and abrasion of tyres.”<sup>116,117</sup> This report also mentions that rubber infill from artificial turf is the second largest source of microplastics, but it mentions many other sources of microplastics as well. Additionally, this report states “[h]owever, it is not necessarily the sources with the largest microplastic emissions that contribute the most to the microplastic loads in the sea.”<sup>118</sup> In fact, the report has no data for the quantity of microplastics that reach the sea from tire wear, artificial turfs, and many other sources.<sup>119</sup> The report further states “[m]icroplastics from both traffic and artificial turfs are likely to be transported to the sea mainly via stormwater, but since there is no available data on microplastics in stormwater it was not possible to determine to what extent these two sources contribute to the pool of marine microplastics.”<sup>120</sup> The same can be said for artificial turf, and the report authors indicate as a “knowledge gap” that “the study would be more complete with studies of actual spill of granulates.”<sup>121</sup> Since the report acknowledges incomplete data and lack of data concerning the amount of microplastics from artificial turf that are in the sea and its relative contribution compared to all sources of microplastics, the issue of artificial turf fields’ contribution to microplastics is unknown. Therefore, any analysis of the potential of microplastics which may migrate from the Project Site to the Los Angeles River would be speculative and, as such, not required by CEQA.

Regarding the comment that PFAS and other toxic chemicals will migrate with these microplastics and leach into surface waters or groundwater, while microplastics in the environment from artificial turf could potentially collect in stormwater drains and get mixed

with stormwater, no studies have yet to be conducted to quantify the movement of infill granules from artificial turf fields to the surrounding environment. Refer to Sections (2)(iii)(a), (2)(iii)(b), and (2)(iii)(c) of this Topical Response for an evaluation of studies and health risks that were conducted on crumb rubber infill that illustrate that health risks from microplastics would be less than significant. Refer to Section (2)(iii)(d) of this Topical Response for a discussion of why the fluoropolymers used in the extrusion process are considered immobile in the environment, stable under many chemical and environmental conditions,<sup>122</sup> and would not leach into surface water or groundwater.

A Tetra Tech Report (2021) conducted on behalf of the Martha's Vineyard Commission in Massachusetts performed a Synthetic Precipitation Leaching Procedure (SPLP) process<sup>123</sup> on the artificial turf samples which simulates leaching as it is a synthetic precipitation leaching procedure. The Tetra Tech Report stated<sup>124</sup> that the targeted PFAS compounds were not detected in the total PFAS analysis at concentrations above the reporting limits or the method detection limits (MDL).<sup>125</sup> Therefore, the targeted PFAS may be present in the synthetic turf components, but at concentrations below the MDLs achieved by the laboratory.<sup>126</sup> The SPLP assay resulted in detection of Perfluoroheptanoic acid (PFHpA), perfluorooctanoic acid (PFOA), perfluorobutanoic acid (PFBA) perfluoropentanoic acid (PFPeA), perfluorodecanesulfonic acid (PFDS), and perfluorohexanoic acid (PFHxA) in the samples of the synthetic turf components at concentrations lower than the MDLs achieved by the laboratory.<sup>127</sup> The detection of PFAS compounds in the samples of the synthetic turf components via SPLP PFAS

<sup>126</sup> Tetra Tech, 2021. Synthetic Turf and Laboratory Testing and Analysis Summary Report Martha Vineyard Regional High School Athletic Field Project, February 26. <https://files.cityofportsmouth.com/agendas/2021/citycouncil/cc101821-Attachment3.pdf>. Accessed December 2022.

<sup>127</sup> Tetra Tech, 2021. Synthetic Turf and Laboratory Testing and Analysis Summary Report Martha Vineyard Regional High School Athletic Field Project, February 26. <https://files.cityofportsmouth.com/agendas/2021/citycouncil/cc101821-Attachment3.pdf>. Accessed December 2022.

analysis, but not via total PFAS analysis, suggest that these products contain PFAS compounds that were not extractable via the analytical method utilized for total PFAS analysis (isotope dilution method) but were extractable by the more rigorous SPLP extraction process. The report concludes that the SPLP testing that was performed assessed the products in a manner that likely results in significantly more aggressive degradation (mechanical reduction of particle size and extraction via acidic solution) than the anticipated conditions during the life of the synthetic turf field.<sup>128</sup> Therefore, no significant risks can be identified based on available data.<sup>129</sup> Additionally, based on the current regulatory standards for PFAS in Massachusetts, there are no significant risks associated with the discharge of PFAS from the synthetic turf field into groundwater.<sup>130,131</sup>

Furthermore, refer to Section (2)(iii)(e) of this topical response for a discussion on the results of metals and PFAS testing performed for the Final EIR on FieldTurf artificial turf, the artificial turf proposed for the Project. TOP assay sampling results showed slightly elevated levels for two types of PFAS, but the types detected are not subject to concentration limits by any regulatory agency (unlike PFOS and PFOA), and the levels that were detected are significantly lower than proposed regulatory limits for those forms of PFAS that are restricted in use, as well as being lower than residential soil screening levels for any form of PFAS issued by the USEPA.<sup>132</sup> For the majority of metals detected, the concentrations were below, and in some cases far below, the environmental screening levels for residential soil issued by USEPA. Three metals (i.e., cobalt, arsenic, and chromium) were either above the soil screening levels or could not be directly compared against these levels.<sup>133</sup> However, these three metals were found to either be comparable in concentration to background levels typically found in California soil, and/or to leach from the crumb rubber at only low levels compared to concentrations considered

<sup>128</sup> Tetra Tech, 2021. Synthetic Turf and Laboratory Testing and Analysis Summary Report Martha Vineyard Regional High School Athletic Field Project, February 26. <https://files.cityofportsmouth.com/agendas/2021/citycouncil/cc101821-Attachment3.pdf>. Accessed December 2022.

<sup>129</sup> Tetra Tech, 2021. Synthetic Turf and Laboratory Testing and Analysis Summary Report Martha Vineyard Regional High School Athletic Field Project, February 26. <https://files.cityofportsmouth.com/agendas/2021/citycouncil/cc101821-Attachment3.pdf>. Accessed December 2022.

<sup>130</sup> Tetra Tech, 2021. Synthetic Turf and Laboratory Testing and Analysis Summary Report Martha Vineyard Regional High School Athletic Field Project, February 26. <https://files.cityofportsmouth.com/agendas/2021/citycouncil/cc101821-Attachment3.pdf>. Accessed December 2022.

<sup>131</sup> There was no surface water in proximity to the field, so they used the SPLP test to see if PFAS would leach into groundwater.

acceptable in drinking water.<sup>134</sup> Moreover, see Final EIR Appendices E.1, E.2, and E.3 which provide the FieldTurf testing results and peer analysis.

In summary, the concern for potential PFAS and other toxic chemicals leaching from microplastics in artificial turf is unsupported. SPLP testing degrades the artificial turf in a manner that likely results in significantly more aggressive deterioration (mechanical reduction of particle size and extraction via acidic solution) than the anticipated conditions during the life of the synthetic turf field.<sup>135</sup> TOP testing mimics the type of oxidative degradation that could take place during a product's lifetime of use.<sup>136</sup> The SPLP results for artificial turf samples, in the Tetra Tech Report and the TOP assay results for the artificial turf proposed for the Project, concluded that PFAS and other compounds in artificial turf or recycled rubber infill do not present a public health concern.<sup>137,138</sup> Additionally, the fluoropolymers expected to be present in artificial turf do not act as surfactants (the short-chain type of PFAS that have potential human health considerations and are subject to regulation), are considered immobile in the environment, and are stable under many chemical and environmental conditions.<sup>139</sup> Metals testing in the artificial turf proposed for the Project resulted in concentrations that were generally below screening levels.<sup>140</sup> The three metals above screening levels were comparable in concentration to background levels and/or are known to leach from crumb rubber at only low levels compared to concentrations considered acceptable in drinking water.<sup>141</sup> Therefore, there are no significant risks associated with the discharge of PFAS or other toxic chemicals from microplastics in an amount that would be harmful to groundwater or any receiving waters, such as the Los Angeles River.

(g) Exposure to *Staphylococcus aureus*

Regarding potential exposure to *Staphylococcus aureus* from contact with the artificial turf fields, the Centers for Disease Control and Prevention/Agency for Toxic Substances and Disease Registry and the USEPA, in collaboration with the Consumer Product Safety Commission (CPSC), has conducted a multi-agency research effort to characterize the constituents in crumb rubber, including bacteria. The study, released in July 2019, collected tire crumb rubber infill material from 40 artificial turf fields, indoor and outdoor, located across the United States.<sup>142</sup> The analysis found higher concentrations of total bacteria in outdoor fields relative to indoor fields, but a gene commonly associated with the human skin microbiome (i.e., *Staphylococcus aureus*) was detected more often in indoor fields than outdoor fields.<sup>143</sup> With respect to artificial turf and natural turf, the USEPA cites to a study in which researchers found 2 of 30 samples (7 percent) collected from synthetic turf were positive for a species of *Staphylococcus* compared to 6 of 12 samples (50 percent) collected from natural turf and concluded that the current generation of synthetic turf containing crumb rubber infill harbors fewer bacteria than natural turf.<sup>144</sup>

Another study conducted by The Pennsylvania State University, titled *A Survey for the Presence of Staphylococcus aureus in the Infill Media of Synthetic Turf*, sampled the total microbial population of several infilled artificial turf systems and determine if *Staphylococcus aureus* was present.<sup>145</sup> Infill material and fiber samples were collected from twenty fields. In addition, other surfaces from public areas, from an athletic training facility, and from natural turfgrass rootzones were also sampled. Each sample was analyzed for total organism populations and for the presence *Staphylococcus aureus*. There were generally lower numbers of total microbes present in the infill or fibers of the synthetic turf systems tested compared to natural turfgrass rootzones and *Staphylococcus aureus* was not found on any of the playing surfaces.

A further study was conducted by The Pennsylvania State University, titled *Human health issues on synthetic turf in the USA*,<sup>146</sup> which surveyed 20 infilled artificial turf fields to determine microbial population and test for the presence of *Staphylococcus aureus* bacteria. Surfaces other than athletic playing surfaces were also tested for the presence

<sup>146</sup> Serensits, T.J., A.S. McNitt, and D.M. Petrunak, Human health issues on synthetic turf in the USA, Proceedings of the Institution of Mechanical Engineers, Part P: Journal of Sports Engineering and Technology published online 13 June 2011.

of microbes and *Staphylococcus aureus*. *Staphylococcus aureus* colonies were not found to be present on any field; however, *Staphylococcus aureus* colonies were found on other tested surfaces that athletes commonly come into contact with, such as sports and weight equipment. Based on the findings of the survey, the study determined that concerns related to infilled synthetic turf harboring and providing a breeding ground for *Staphylococcus aureus* is unwarranted.

Based on these studies, Project health risk impacts related to exposure to *Staphylococcus aureus* on artificial turf would be less than significant.

(b) *Heat Effects from the Use of Artificial Turf*

For informational purposes only and not related to a significance criteria Appendix H, *Hazardous Materials Documentation*, PDF pages 1688 and 1689, of the Draft EIR provides a discussion of studies on heat effects from artificial turf. Milone & MacBroom, Inc., conducted a temperature evaluation study designed to measure the temperature rise of artificial turf materials under a number of environmental conditions.<sup>147</sup> Two fields within Connecticut constructed by FieldTurf in 2007 were selected for this study, one of which (Field F) is located in the northern portion of the state, while the other (Field G) is located in the southern portion of the state. The results of the study indicate that solar heating of the materials used in the construction of artificial turf playing surfaces does occur and is most pronounced in the polyethylene and polypropylene fibers used to replicate natural grass.

Maximum temperatures of approximately 156 degrees Fahrenheit (F) on the surface of the artificial grass fibers were noted when the fields were exposed to direct sunlight for a prolonged period of time. The corresponding ambient temperature was 102 degrees F and the air temperature at 2 feet and 5 feet above the artificial turf surface was 103 and 101 degrees F, respectively. The crumb rubber temperature at 1-inch depth was 111.5 degrees F. As a comparison, the temperatures at the natural turf location at this same time was 99 degrees F on the surface of the natural grass, 101 and 102 degrees F at 2 feet and 5 feet above the surface, respectively, and 86 degrees F at 1-inch depth. Rapid cooling of the fibers was noted if the sunlight was interrupted or filtered by clouds. Significant cooling was also noted if water was applied to the synthetic fibers in quantities as low as one ounce per square foot.<sup>148</sup> The elevated temperatures noted for the fibers generally resulted in a localized air temperature increase of less than 5 degrees during periods of calm to low winds. For artificial turf, the air temperatures above the surface decrease rapidly with increasing height.

---

<sup>147</sup> Milone & MacBroom, Inc., *Thermal Effects Associated with Crumb Rubber In-filled Synthetic Turf Athletic Fields*, December 2008.

<sup>148</sup> The proposed Project does not include the installation of irrigation systems for its artificial turf fields.

The New York State Department of Health report, *An Assessment of Chemical Leaching, Releases to Air and Temperature at Crumb-Rubber Infilled Synthetic Turf Fields*,<sup>149</sup> describes a temperature survey conducted to gain a better understanding of the surface temperature of artificial turf fields and the potential for field users to suffer from heat-related illness. For the two artificial turf fields in this study (Thomas Jefferson Field and John Mullaly Field), the center of the field as well as a shaded edge area were selected for measurements and both areas were comprised of green-colored synthetic grass. An additional center location was selected for one field consisting of white artificial turf. Field measurements were conducted in August (11 days) and September (6 days). The results of the temperature survey show higher surface temperatures for artificial turf fields as compared to the measurements obtained on nearby grass and sand surfaces. Surface temperatures for the Thomas Jefferson Field grass and sand showed that the average synthetic turf surface was 42 degrees F higher than the grass surface temperature and 40 degrees F higher than the sand surface temperature. Surface temperatures for the John Mullaly Field grass and sand showed that the average synthetic turf surface was 26 degrees F higher than the grass surface temperature and 35 degrees F higher than the sand surface temperature. The temperature survey found little difference for the indicators of heat stress between the synthetic turf, grass, and sand surfaces, on any given day. Although little difference between indicators of heat stress measurements was found, the synthetic turf surface temperatures were much higher and prolonged contact with the hotter surfaces may have the potential to create discomfort, cause thermal injury and contribute to heat-related illnesses. The report recommended that awareness of the potential for heat illness and how to recognize and prevent it should be raised among users and managers of athletic fields, athletic staff, coaches and parents.

Based on these studies there was little difference in the indicators of heat stress between the synthetic turf, grass, and sand surfaces, on any given day. However, since synthetic turf surface temperatures were much higher and prolonged contact with the hotter surfaces may have the potential to create discomfort, cause thermal injury and contribute to heat-related illnesses, anyone who uses the athletic fields should be made aware of the potential for heat illness and how to recognize and prevent heat illness. With proper notification and awareness, Project health risk impacts related to heat effects from artificial turf would be preventable.

(c) *Possible Disposal/Recycling Options for the Artificial Turf*

Although recycling options of artificial turf in the past have consisted primarily of repurposing field components, turf recycling plants do exist and more are being built in the U.S., Europe, and around the world. Two such artificial turf recycling companies are discussed below, both of which are anticipated to be available for Project use when the Project's artificial turf has reached its end-of-life (expected to be approximately eight years after installation). Since the only operating artificial turf recycling facility was in

Denmark at the time the Draft EIR was circulated, disposal was the option chosen for analysis in the Draft EIR, and as stated on page IV.H-45, compliance with applicable regulatory requirements would ensure that Project impacts related to disposal of artificial turf would be less than significant. If instead of disposal, recycling plants are operational and are able to take the Project's artificial turf, the components would be separated and then used as feedstock for new materials. If the Project was able to recycle the artificial turf, instead of disposing of it, hazardous material and waste-related impacts would be similar to or less than those analyzed for disposal in the Draft EIR.

Re-Match turf recycling has had a working plant in Herning, Denmark, since June 2016, which can process up to 800 tonnes/week of artificial turf, equal to almost four full-sized soccer fields.<sup>150</sup> In March 2022, the second Re-Match turf recycling factory was completed in the Netherlands, which will be able to recycle the equivalent of more than 250 soccer fields per year.<sup>151</sup> The Re-Match process is patented technology that offers an environmentally sustainable recycling process that uses no chemicals or water and generates no pollution.<sup>152</sup> The artificial turf is separated into clean, raw materials using their separation technology. The raw materials, sand, backing, rubber, and plastic fibers are sold and used in new production cycles, and even for new synthetic turf fields. Re-Match plans to build 24 Re-Match facilities worldwide, with the next two locations to come on-line located in Erstein, France, and Pennsylvania, USA.<sup>153</sup> No date was given for when these new locations would be operational.

Additionally, in September of 2022, a Netherlands company, TenCate Grass, announced the launch of an initiative for a first of its kind program in the U.S. to recycle end-of-life artificial turf. TenCate aims to remove 50 artificial turf fields and send them to California where they will be shredded. The shredded material will then be shipped to Texas for pre-processing after which it will be broken down to feedstock that can be used to create new turf and other products.<sup>154</sup> TenCate's goal is to "keep turf out of landfills and put it back

(d) *Project Design Modifications*

As discussed in Topical Response No. 2 – Modifications to the Project Design, design modifications relating to seating, lighting, building design (swimming pool area and gymnasium), parking, grading, stormwater capture and reuse system, and water features were made to the Project in response to public and agency comments received on the Draft EIR. However, none of the design modifications directly or indirectly involves the analyses related to artificial turf and its effects on health or localized heat effects and as such, the impact analysis and conclusions included in the Draft EIR are not affected by the Project design modifications.

## **h) Topical Response No. 8 – Noise: Construction and Operation Impacts**

### **(1) Introduction**

This topical response addresses comments received on the Draft EIR concerning potential noise and vibration impacts of the Project. Issues raised focused on ambient noise levels, Project construction noise and vibration impacts on sensitive receptors, construction vibration impacts on buildings, operational noise impacts on sensitive receptors, and mitigation measures proposed to reduce construction noise and vibration impacts. The information presented below for the Project is based on the content provided in Section IV.K, *Noise*, of the Draft EIR, and the Noise Technical Report for the Harvard-Westlake River Park Project, prepared by Acoustical Engineering Services, Inc. (AES) dated March 2022, which is included as Appendix K to the Draft EIR. The mobile source noise analysis was based on traffic data provided in the Harvard-Westlake River Park Project Transportation Assessment (TA), prepared by Fehr & Peers dated April 2021, which is included in Appendix M of the Draft EIR. This topical response also addresses the noise impacts associated with the Project design modifications described in Topical Response No. 2, Modifications to the Project Design. The analysis of noise impacts with the Project design modifications incorporates the noise impact findings of the Supplemental Noise Analysis included in Appendix F of this Final EIR.

### **(2) Discussion**

#### ***(a) Noise-Sensitive Receptor Locations***

Some land uses are considered more sensitive to noise than others due to the types of activities typically involved at the receptor location and the effect that noise can have on those activities and the persons engaged in them. The 2006 L.A. CEQA Thresholds Guide states that residences, schools (pre-school, elementary, middle, and high schools), motels and hotels, libraries, religious institutions, hospitals, nursing homes, auditoriums, concert halls, amphitheatres, playgrounds, and parks are generally more sensitive to noise than commercial and industrial land uses. Eight off-site locations were selected as noise-sensitive receptors for the purpose of evaluating Project impacts, which include Receptors R1 to R6 located within 500 feet of the Project Site, as well as Receptor R7 that is located beyond 500 feet from the Project Site and Receptor R8 located adjacent to the proposed Coldwater Canyon Avenue Riverwalk Path Ramp, as listed below:

1. Single-family residential uses on west side of Bellaire Avenue.
2. Single-family residential uses at the corner of Bellaire Avenue and Valley Spring Lane.
3. Single-family residential uses at the corner of Teesdale Avenue and Valley Spring Lane.
4. Single-family residential uses at the corner of Babcock Avenue and Valley Spring Lane.

5. Multi-family residential uses on the east side of Whitsett Avenue.
6. Multi-family residential uses on the east side of Whitsett Avenue. Church use on the east side of Whitsett Avenue near the intersection with Valleyheart Drive and directly across the street from existing Los Angeles Fire Station No. 78.
7. Single-family residential uses on Sunswept Drive.
8. Multi-family residential uses north of the proposed Coldwater Canyon Avenue Riverwalk Path Ramp. This receptor location was only evaluated for potential impacts from construction related to the proposed off-site improvements at the Coldwater Canyon Avenue Riverwalk Path.

All other noise-sensitive land uses regulated by the City are located at greater distances from the Project Site and would experience lower noise levels from potential sources of noise emanating from the Project Site due to distance loss. There are no pre-school, elementary, middle, or high schools within 500 feet of the Project Site.

Comments were raised regarding construction noise impacts to locations greater than 500 feet from the Project Site. As stated on page IV.K-35 of the Draft EIR, the 2006 L.A. CEQA Thresholds Guide identifies a distance of 500 feet as the screening criterion with respect to construction activities. The 500-foot distance model under the Thresholds Guide is consistent with industry standards and science related to the attenuation of sound over distance.<sup>157</sup> Therefore, receptors located greater than 500 feet from the Project Site typically would not need to be specifically evaluated and ambient noise levels at distances greater than 500 feet are not required. A distance-based screening criterion is appropriate because noise attenuates (reduces) with increasing distance from the noise source. As discussed on page IV.K-6 of the Draft EIR, noise levels from a construction site are attenuated at a rate between 6 dBA for acoustically “hard” sites and 7.5 dBA for “soft” sites for each doubling of distance from the reference measurement, as their energy is continuously spread out over a spherical surface (e.g., for hard surfaces, 80 dBA at 50 feet attenuates to 74 dBA at 100 feet, 68 dBA at 200 feet, etc.). Hard sites are those with a reflective surface between the source and the receiver, such as asphalt or concrete surfaces or smooth bodies of water. No excess ground attenuation is assumed for hard sites and the reduction in noise levels with distance (drop-off rate) is simply the geometric spreading of the noise from the source. Soft sites have an absorptive ground surface, such as soft dirt, grass, or scattered bushes and trees, which in addition to geometric spreading, provides an excess ground attenuation value of 1.5 dBA (per doubling distance). Additionally, intervening buildings and other structures that block the line-of-sight from the Project’s construction site to an off-site receptor location would also block noise levels by a minimum of 10 dBA. Thus, with distance attenuation of noise and the presence of intervening buildings and structures between the Project Site and off-site uses greater than 500 feet from the Project Site, construction noise impacts to locations

<sup>157</sup> California Department of *Transportation, Technical Noise Supplement to the Traffic Noise Analysis Protocol*, Section 2. 1, *Physics of Sound*, September 2013. According to this source, receptors that are located beyond 500 feet from a project area do not need to be considered for analysis unless there is a reasonable expectation that noise impacts would extend beyond that boundary.

greater than 500 feet from the Project Site would generally be less than those within 500 feet and were largely appropriately screened out for evaluation in accordance with the 2006 L.A. CEQA Thresholds Guide. The Draft EIR evaluates noise impacts at noise-sensitive receptor locations in all directions from the Project Site (i.e., to the north, east, west, and south). However, despite the noise-sensitive receptors to the south (location R7) being located more than 500 feet from the Project Site; they were nonetheless included in the analysis since they could have a line-of-sight to the Project Site and to provide a conservative, comprehensive analysis and evaluate noise impacts to the south of the Project Site.

(b) *Vibration-Sensitive Receptor Locations*

Typically, groundborne vibration generated by man-made activities (e.g., rail and roadway traffic, operation of mechanical equipment, and typical construction equipment) diminishes rapidly with distance from the vibration source. Project construction activities, such as construction equipment and jack hammering, would have the greatest effect on vibration sensitive land uses. With respect to potential structural damage, structures in close proximity to the Project Site are considered vibration sensitive receptors. Vibration sensitive receptors, with respect to structural damage, are located fronting the streets along Bellaire Avenue to the west, Valley Spring Lane to the north, and Whitsett Avenue to the east of the Project Site. The structures in the vicinity of the Project Site are Category I (Los Angeles Fire Department (LAFD) Fire Station 78), Category II (Multi-family residential buildings and church use on the east side of Whitsett Avenue, east of the Project Site), and Category III (Single-family residential buildings on the north side of Valley Spring Lane, north of the Project Site and single-family residential buildings west of Bellaire Avenue, west of the Project Site). Additionally, vibration was analyzed for construction of the Coldwater Canyon Avenue Riverwalk Path Ramp. The closest vibration sensitive receptor to the Coldwater Canyon Avenue Riverwalk Path Ramp is a Category III (multi-family residential use directly to the north along Coldwater Canyon Avenue) receptor. As discussed in Section IV.D, *Cultural Resources*, of the Draft EIR, the character defining features of the Project Site's historic resources as identified in the City of Los Angeles Historic-Cultural Monument (HCM) designation include the clubhouse, putting green, golf ball-shaped light standards, and brick wall with weeping mortar, which would be considered a Category IV structure (buildings extremely susceptible to vibration damage). See Table IV.K-1, *Construction Vibration Damage Criteria*, in Section IV.K, *Noise*, of the Draft EIR, for additional details on the building category uses to assess construction vibration damage.

With respect to human annoyance, off-site sensitive land uses include buildings in which vibration-sensitive equipment is used (e.g., hospitals, research, medical offices, and manufacturing); residential land uses and buildings where people normally sleep; schools; and churches. Industrial or commercial (including office) uses are not considered vibration-sensitive. All of the off-site sensitive receptors listed above in Subsection 2(a), *Noise-Sensitive Receptor Locations*, were analyzed for impacts related to vibration-related human annoyance.

(c) *Ambient Noise Levels*

Comments were raised on the Draft EIR questioning the adequacy of the ambient noise level measurements, whether they represent the ambient noise level for the area, and the dates and duration of the measurements. As discussed in Section IV.K, *Noise*, pages IV.K-20 through IV.K-25, the predominant existing noise source surrounding the Project Site is traffic noise from major roadways, such as Whitsett Avenue to the east and Ventura Boulevard to the south. Secondary noise sources include local roadway traffic, landscaping equipment, and other typical urban noise from residences. Other noise sources include general residential and commercial-related activities associated with trash collection activities, loading and unloading activities, and surface parking lots. The Project Site itself contains an existing surface parking lot that generates noise as vehicles enter and exit the parking lot, and as people open and close their vehicle doors and walk to and from their vehicles. Additionally, the onsite golf course, driving range, putting green, clubhouse, and 16 tennis courts generate noise from people utilizing these facilities.

As discussed above, eight off-site noise-sensitive receptor locations were identified to represent noise-sensitive uses within the Project area. The locations of the noise-sensitive receptors are listed in **Table 2-7, Summary of Ambient Noise Measurements at Noise Sensitive Receptors**, as Receptor Locations 1 through 8 with the approximate distances to the Project Site. Table 2-7 is the same table as Table IV.K-6, *Summary of Ambient Noise Measurements*, in the Draft EIR. Ambient noise levels were measured at all eight locations (R1 through R8). The measured environmental noise levels at R1 through R8 represent the current ambient noise levels in the vicinity of the Project Site and are used to establish the existing ambient noise level at the noise-sensitive receptors within the Project area.

As indicated in Table 2-7, the existing ambient noise levels at the receptor locations ranged from 50.5 dBA  $L_{eq}$  (at receptor location R1) to 69.5 dBA  $L_{eq}$  (at receptor location R5). Based on field observation and measured sound data, the current ambient noise environment in the vicinity of the Project Site is controlled primarily by vehicular traffic on local roadways, commercial uses, and other typical urban noise. The existing ambient noise environment at all measurement locations currently exceed the City's presumed daytime ambient noise standard of 50 dBA ( $L_{eq}$ ) for residential use as established in the Los Angeles Municipal Code (LAMC) Section 111.01(a) and 111.03 and other conditions in Section 111.02. As described on pages IV.K-14 and IV.K-15 of the Draft EIR, the LAMC identifies the location (at an adjacent property line and at a location appropriate for the particular noise source being measured) and length of the time period (at least 15 minutes  $L_{eq}$ ) for conducting ambient noise measurements as indicated below in the relevant sections from the LAMC.

**TABLE 2-7  
SUMMARY OF AMBIENT NOISE MEASUREMENTS**

Receptor Location	Approximate Distance to Project Site <sup>b</sup> (ft)	Measured Ambient Noise Levels (dBA) <sup>a</sup>	
		Daytime (10 a.m. to 12 p.m.) 15-min L <sub>eq</sub>	Evening (7 p.m. to 10 p.m.) 15-min L <sub>eq</sub>
R1: Single-family residential uses on west side of Bellaire Avenue, west of the Project Site.	60	50.5	52.6
R2: Single-family residential uses at the corner of Bellaire Avenue and Valley Spring Lane, north of the Project Site.	60	51.1	55.1
R3: Single-family residential uses at the corner of Teesdale Avenue and Valley Spring Lane, north of the Project Site.	60	53.0	54.7
R4: Single-family residential uses at the corner of Babcock Avenue and Valley Spring Lane, north of the Project Site.	60	63.5	58.5
R5: Multi-family residential uses on the east side of Whitsett Avenue, east of the Project Site.	90	69.5	64.6
R6: Multi-family residential uses and church use on the east side of Whitsett Avenue, east of the Project Site.	90	64.6	68.3
R7: Single-family residential uses on Sunswept Drive, south of the Project Site.	800	57.1	57.2
R8: Multi-family residential uses north of the proposed Coldwater Canyon Avenue Riverwalk Path Ramp <sup>c</sup>	1,100	53.8	N/A

<sup>a</sup> Detailed measured noise data, including hourly L<sub>eq</sub> levels, are included in Appendix K of the Draft EIR.

<sup>b</sup> Distances are estimated based on Google Earth map and are referenced to the nearest receptor property boundary, and not the building or dwelling itself.

<sup>c</sup> Receptor location R8 is evaluated for potential impacts from construction related to the proposed off-site improvements at the Coldwater Canyon Avenue Riverwalk Path.

SOURCE: AES, 2022; ESA 2022.

- LAMC Sections 111.01(a) and 111.03 define the ambient noise as the actual measured ambient noise level or the City's presumed ambient noise level, whichever is greater. The actual ambient noise level is the measured noise level averaged over a period of at least 15 minutes L<sub>eq</sub> at a location and time of day comparable to that during which the measurement is taken of the particular noise source being measured.

- LAMC Section 111.02 provides procedures and criteria for the measurement of the sound level of “offending” noise sources. In accordance with the LAMC, a noise level increase of 5 dBA over the existing average ambient noise level at an adjacent property line is considered a noise violation. To account for people’s increased tolerance for short-duration noise events, the Noise Regulation provides a 5-dBA allowance for noise occurring more than five but less than fifteen minutes in any one-hour period and an additional 5-dBA allowance (total of 10 dBA) for noise occurring five minutes or less in any one-hour period.

Therefore, consistent with LAMC procedures, the measured existing ambient noise levels were used in the Draft EIR as the baseline conditions for the purposes of determining Project impacts.

As shown in the monitoring data files provided in Appendix K of the Draft EIR, the ambient noise measurements were taken for a period of at least 15 minutes at the eight selected off-site locations on February 11, 2020 (receptor locations R1, R3, R4, R6 and R7), November 11, 2020 (receptor locations R2 and R5)<sup>158</sup>, and March 1, 2022 (receptor location R8).<sup>159</sup> The measurements for receptor locations R2 and R5 (conducted on November 11, 2020) were added after the ambient measurements for the initial five receptor locations were completed on February 11, 2020, in response to public comment received during the October 19, 2020 scoping meeting for the Project. The measurement for receptor location R8 (conducted on March 1, 2022) was used to evaluate the proposed Americans with Disabilities Act (ADA)-compliant off-site improvements at the Coldwater Avenue Riverwalk Path Ramp, located west of the Project Site at the junction of the Los Angeles River and Coldwater Canyon Avenue. The measurements taken before the City of Los Angeles “Safer at Home” order issued on March 19, 2020 represent typical ambient conditions. The measurements taken after the “Safer at Home” order are conservative (i.e., lower than a typical condition), given the lower traffic volume associated with the COVID-19 pandemic and, therefore, provide for a more environmentally protective analysis as the ambient baseline noise associated with passing traffic would be slightly lower due to reduced traffic volumes. Two 15-minute measurements were conducted at the off-site receptor locations (R1, R2, R4, R5, R6 and R7), with one taking place during daytime and hours (between 10:00 A.M. and 12:00 P.M.) and another during the evening hours (between 7:00 P.M. and 10:00 P.M.). A 15-minute measurement was conducted

---

<sup>158</sup> The measurements taken on February 11, 2020, and November 11, 2020, were conducted by AES, Inc. The existing ambient noise measurements for receptor locations R2 and R5 are conservative (i.e., lower than a typical condition), given the lower traffic volume associated with the COVID-19 pandemic and, therefore, lower ambient noise associated with passing traffic.

<sup>159</sup> The measurement taken on March 1, 2022 was conducted by ESA.

at the off-site receptor location R8 during daytime hours. In addition to the 15-minute noise measurements, a 24-hour measurement was taken at receptor location R3.<sup>160</sup>

The ambient noise measurement locations were selected because they are representative of the noise environment of the existing off-site noise-sensitive receptors. As previously mentioned, the predominant existing noise source surrounding the Project Site is traffic noise. All ambient noise measurement locations near the Project Site were placed along the nearby streets and the nearby noise-sensitive receptors; therefore, these locations were representative of the ambient noise levels surrounding the Project Site. Furthermore, as noted on page IV.K-35 of the Draft EIR, the 2006 L.A. CEQA Thresholds Guide identifies a distance of 500 feet as the screening criterion with respect to construction activities. Therefore, receptors located greater than 500 feet from the Project Site would not need to be specifically evaluated, and ambient noise levels at distances greater than 500 feet are not required. Thus, the locations and time period for the ambient noise level measurements comply with the LAMC specifications and provide adequate and representative ambient noise data measured in the Project area.

(d) *Construction Noise*

(i) *On-Site Construction Noise*

(a) *Construction Noise Modeling*

Comments were raised regarding the accuracy of the modeled construction noise levels in the Draft EIR. Section IV.K, *Noise*, of the Draft EIR presents a conservative analysis of construction noise by incorporating the following assumptions: (1) assuming all pieces of construction equipment anticipated to be used for the specific construction stages and construction activities would be in use simultaneously; (2) assuming that the noisiest equipment used during the various construction stages and construction activities would be located on the Project Site in the applicable construction work area for the construction activity at the closest distance to the sensitive receptor location (the model assumes a 25-foot spread between equipment pieces to provide realistic construction noise levels since multiple equipment pieces cannot occupy the same spaces); (3) estimating noise levels at the property line of each sensitive receptor location and without benefit of any intervening walls, landscaping, windows, or structures; and (4) assuming the more conservative attenuation rate of 6 dBA per doubling of distance for acoustically “hard”

<sup>160</sup> A 24-hour measurement was conducted at receptor location R3 to document the current ambient noise pattern (i.e., noise level fluctuations with respect to time of day/night) during the Project proposed operation hours in the vicinity of the Project Site. To provide an environmentally conservative analysis, the lowest measured hourly  $L_{eq}$  during the proposed operations hours was used as the existing ambient level. Receptor location R3 was selected as a standard representation since it is located adjacent to the Project Site, near the location of the Project’s proposed Field B, track and pool, and located midblock on Valley Spring Lane within a lower (more sensitive) noise environment.

sites (e.g., asphalt and concrete surfaces) instead of 7.5 dBA per doubling of distance for acoustically “soft” sites (e.g., soft dirt, grass or scattered bushes and trees).

Related to assumptions (1) and (2) in the prior paragraph, to present a conservative impact analysis, the estimated noise levels were calculated assuming all pieces of construction equipment are operating simultaneously and the loudest pieces are near the affected receptors. The noise model assumed the two noisiest pieces of construction equipment would operate in the construction area nearest to the affected receptors. Additional construction equipment, if applicable for each phase, was modeled in groups of two with incremental 25-foot spacing between each group, as construction equipment would typically be spread out across the Project Site (detailed calculations are provided in Appendix K of the Draft EIR). This is a conservative assumption because all equipment related to a construction phase is rarely used simultaneously. The spread between the equipment pieces (and proximity of the loudest pieces nearest to the sensitive receptor) reflects the loudest potential construction condition since construction equipment is typically mobile and physically spaced throughout a construction site for reasons of safety and physical constraints. Additionally, for the purposes of providing a conservative analysis, no noise reduction from trees was applied to the Project construction noise calculations.

Regarding the metric used to evaluate noise impacts, the 2006 L.A. CEQA Thresholds Guide Exhibit I.1-1 and I.1-2 (pages I.1-8 and I.1-9 of the Thresholds Guide) cites to construction noise levels from the United States Environmental Protection Agency (USEPA) research and documentation.<sup>161</sup> As noted on page 12 of the USEPA documentation, engine noise typically predominates, with exhaust noise usually being most significant. Other sources of noise from construction equipment include mechanical and hydraulic transmission and actuation systems, and cooling fans. According to the USEPA documentation, the typical operating cycles of construction equipment includes one or two minutes of full-power (and therefore full power noise levels) followed by three or four minutes at lower power. Given fluctuating engine power levels combined with the fact that construction equipment would be mobile throughout the Project Site, the time-averaged equivalent ( $L_{eq}$ ) noise level of construction equipment is the appropriate metric to use for construction noise analyses consistent with the analysis provided in the Draft EIR. The  $L_{max}$  or the maximum, instantaneous noise level experienced during a given moment in time is not appropriate since it assumes construction equipment is operating at full power for the entire construction period, which is not consistent with USEPA research which, as cited above, states that the majority of the noise cycle for construction equipment is at a lower engine power. Therefore, the noise analysis in the Draft EIR used the appropriate noise metric for evaluating impacts.

---

<sup>161</sup> USEPA, Noise from Construction Equipment and Operations, Building Equipment and Home Appliances, PB206717, 1971.

## (b) Construction Noise Impacts

The Draft EIR disclosed a conservative analysis of potential construction noise levels in order to avoid underestimating Project construction noise impacts. As concluded on page IV.K-40 of the Draft EIR, the Project would result in the generation of a temporary increase in ambient noise levels in the vicinity of the Project in excess of standards established by the City, and on-site construction noise impacts would be potentially significant. Potentially significant construction noise impacts would be lessened with implementation of feasible mitigation measures (see Draft EIR pages IV.K-59 and IV.K-60). Implementation of Mitigation Measures NOI-MM-1 (temporary noise barriers), NOI-MM-2 (locating the use of certain construction equipment away from the nearest sensitive uses), and NOI-MM-3 (noise shielding and muffling devices for construction equipment), as described on page IV.K-58 of the Draft EIR, would reduce the Project's on-site construction noise impacts at the off-site noise sensitive receptors, to the extent technically feasible.<sup>162</sup> Specifically, the construction noise levels would be reduced by a minimum of 15 dBA at receptor locations R1 through R4, 12 dBA at receptor locations R5 and R6, and 8 dBA at receptor location R7, which would reduce the construction noise impacts at receptor locations R4 through R7 to less-than-significant levels. However, the construction noise levels at receptor locations R1 through R3 would still exceed the 5-dBA significance threshold during certain months of construction when there would be multiple simultaneous construction activities and some equipment used near the periphery of the Project Site. Consequently, with implementation of technically feasible mitigation measures, construction noise impacts at noise-sensitive receptor locations R1 through R3 would still exceed the significance threshold temporarily during certain months of construction, when there would be multiple simultaneous construction activities and some equipment used near the periphery of the Project Site (see shaded values in Table IV.K-21, page IV.K-60 of the Draft EIR which represents the sensitive receptor locations and the months when significant impacts would occur). Construction noise levels would be lower than shown in Table IV.K-21 when equipment would be in use in the interior portions of the Project Site, with equipment noise reduced (attenuating) at a rate of at least 6 dBA per doubling of distance between the equipment and the sensitive receptor. The mitigated noise levels in Table IV.K-21 conservatively assumes that the noisiest equipment used during the various construction stages and construction activities would be located on the Project Site in the applicable construction work area for the construction activity at the closest distance to the sensitive receptor location. There are no other feasible mitigation measures that could be implemented to reduce the temporary noise impacts from on-site construction. Therefore, construction noise impacts associated with on-site noise sources would remain temporarily significant and unavoidable.

<sup>162</sup> Technical infeasibility shall mean that said noise limitations cannot be complied with despite the use of mufflers, shields, sound barriers, and/or other noise reduction devices or techniques during the operation of the equipment. LAMC Chapter XI, Art. 1, Section 112.05.

(ii) *Off-Site Improvements at Coldwater Canyon Avenue Construction Noise*

Off-site improvements at the Coldwater Canyon Avenue Riverwalk Path Ramp would result in a temporary increase in ambient noise levels in the vicinity of the improvement in excess of standards established by the City and off-site construction noise impacts would be potentially significant (Draft EIR page IV.K-42). Implementation of Mitigation Measure NOI-MM-3 would reduce the construction noise impacts from the off-site improvements at the Coldwater Canyon Avenue Riverwalk Path Ramp at the off-site noise sensitive receptor (receptor location R8), to the extent technically feasible.<sup>163</sup> Construction noise levels at the sensitive receptor location north of the Coldwater Canyon Avenue Riverwalk Path Ramp (receptor location R8) would still exceed the 5-dBA significance threshold, as noise barriers would not be effective given that the construction work would take place at a lower elevation than the sensitive receptors. The sensitive receptors would still have a direct line-of-sight to the Coldwater Canyon Avenue Riverwalk Path Ramp construction site and any benefits of a noise barrier would not occur. It is not feasible to install a construction noise barrier of sufficient height that would block the line-of-sight for receptor location R8 due to technical limitations including barrier foundation needs and wind load capacities. The construction work area is within 100 feet from the nearest off-site sensitive land uses. Thus, Mitigation Measures NOI-MM-1 and NOI-MM-2 are not technically feasible for construction of the off-site improvements at the Coldwater Canyon Avenue Riverwalk Path Ramp. Therefore, construction noise impacts associated with construction of the off-site improvements at the Coldwater Canyon Avenue Riverwalk Path Ramp would remain temporarily significant and unavoidable.

(iii) *Off-Site Construction Traffic Noise*

The analysis on page IV.K-43 of the Draft EIR concluded that off-site construction traffic noise would not result in the generation of a substantial temporary increase in ambient noise levels in the vicinity of the Project in excess of standards established by the City. As shown in Table IV.K-10, *Estimate of Off-Site Construction Traffic Noise Impacts*, on page IV.K-44 of the Draft EIR, construction truck traffic noise would be consistent with existing ambient noise levels. As such, off-site construction traffic noise impacts would be less than significant.

Comments were raised regarding the lack of discussion of construction staging and construction traffic noise from vehicles along haul routes. As stated on page II-61 in Chapter II, *Project Description*, of the Draft EIR, all construction staging of materials and equipment and worker parking would be confined to the Project Site. Construction haul routes would be identified as required by Project Design Feature TRAF-PDF-1: Construction Management Plan (CMP) (see Draft EIR page IV.M-26). The haul route for the Project is described on page IV.K-42 of the Draft EIR. The CMP would contain

<sup>163</sup> Technical infeasibility shall mean that said noise limitations cannot be complied with despite the use of mufflers, shields, sound barriers, and/or other noise reduction devices or techniques during the operation of the equipment. LAMC Chapter XI, Art. 1, Section 112.05.

information regarding any temporary short-term lane/street closures if required, a detour plan, haul routes, and a staging plan. This would ensure that construction activities of the concurrent and related projects<sup>164</sup> and associated hauling activities are managed in collaboration with one another and the Project. However, it is expected that inbound haul trucks would access the Project Site from the US-101, head southbound to Coldwater Canyon Avenue, eastbound on Moorpark Street, and southbound on Whitsett Avenue to access the Project Site. Outbound haul trucks would leave the Project Site and head southbound on Whitsett Avenue, westbound on Ventura boulevard, and northbound on Coldwater Canyon Avenue to reach the US-101. No additional staging or use of off-site areas is proposed. Construction traffic noise impacts were fully analyzed and disclosed in the Draft EIR, inclusive of the haul routes, and were summarized in Table IV.K-10 of the Draft EIR. The Project would not result in the generation of a substantial temporary increase in ambient noise levels in the vicinity of the Project in excess of standards established by the City, and off-site construction traffic noise impacts would be less than significant.

(e) *Construction Vibration*

(i) *Vibration Impact Criteria*

As discussed on pages IV.K-9 through IV.K-11 of the Draft EIR, the Federal Transit Administration's (FTA) published the Transit Noise and Vibration Impact Assessment Manual, which provides criteria for construction vibration damage and building and groundborne vibration impact criteria for general assessment. The FTA Manual also provides technical guidance for conducting noise and vibration environmental analyses, using a screening distance of 100 feet for highly vibration-sensitive buildings and 50 feet for lesser vibration-sensitive buildings including residential uses.<sup>165</sup> The screening levels recognize that vibrations caused by construction equipment diminish in strength with increasing distance from the construction equipment.<sup>166</sup> Buildings within the screening distance were included in the quantified analysis for vibration impacts.

Comments were raised regarding the criteria used to evaluate vibration impacts to buildings in the Project vicinity. As discussed in Section IV.K, *Noise*, of the Draft EIR, the vibration levels were calculated based on the FTA's *Transit Noise and Vibration Impact Assessment Manual*. As stated on page IV.K-28 of the Draft EIR, the City has not adopted criteria to assess vibration impacts during construction. Thus, for this Project, the City

<sup>164</sup> Related project includes the continued construction of The Shops at Sportsmen Landing for a conservative analysis even though that project has completed construction. For further information, see Topical Response No. 12 - Related Projects: Adequacy of the Cumulative Mobile Source Noise and Traffic Analyses.

<sup>165</sup> FTA, Transit Noise and Vibration Impact Assessment, Table 6-18, Screening Distances for Vibration Assessments, 2018, page 136.

<sup>166</sup> FTA, Transit Noise and Vibration Impact Assessment Manual, 2018, p. 182.

has determined to utilize the FTA's criteria for structural damage and human annoyance impact evaluations.

Regarding structural damage, the FTA has adopted vibration criteria that are commonly used to evaluate potential structural damage to buildings by building category from construction activities. Category I refers to reinforced-concrete, steel, or timber (no plaster) buildings. Category II refers to engineered concrete and masonry (no plaster) buildings. Category III refers to non-engineered timber and masonry buildings. Category IV refers to buildings extremely susceptible to vibration damage.

Regarding human annoyance, as stated on page IV.K-10 of the Draft EIR, FTA Category 1 are buildings where vibration would interfere with operations within the building, including vibration-sensitive research and manufacturing facilities, hospitals with vibration-sensitive equipment, and university research operations. Vibration-sensitive equipment includes, but is not limited to, electron microscopes, high-resolution lithographic equipment, and normal optical microscopes. Furthermore, the FTA specifically states that the criteria for Category 1 are based on levels that are acceptable for most moderately sensitive equipment, such as optical microscopes. Category 2 refers to all residential land uses and any buildings where people sleep, such as hotels and hospitals. Category 3 refers to institutional land uses with primarily daytime use, such as schools, churches, other institutions, and quiet offices, that do not have vibration-sensitive equipment but still have the potential for activity interference due to vibration.

(ii) *Vibration Impacts – On Site*

Comments were raised asserting that the modeled construction vibration levels in the Draft EIR were lowered to minimize impacts.

Section IV.K, *Noise*, of the Draft EIR presents a conservative impact analysis by assuming that vibration-generating equipment (i.e., a vibratory roller) may be in use at a very close distance to buildings. Since vibration-generating equipment may, at times, be used in close proximity to the buildings, the Draft EIR calculated maximum vibration levels and identified less than significant vibration impacts for off-site building damage based on these maximum vibration levels. As shown in Table IV.K-23 on page IV.K-64 of the Draft EIR, the estimated vibration levels at the buildings adjacent to the Project Site construction areas would be up to 0.16 inch/second PPV, which would not exceed the applicable significance thresholds for structural damage (i.e., 0.50 inch/second PPV, 0.30 inch/second PPV, or 0.20 inch/second PPV, depending on the FTA building category) at the buildings adjacent to the Project Site. The maximum vibration level at off-site buildings of up to 0.16 inch/second PPV is calculated based on vibration-generating equipment (i.e., a vibratory roller) in use at a very close distance of 30 feet to LAFD Fire Station 78 building to the south of the Project Site construction areas (based on a setback of 30 feet from its property lines relative to the Project Site construction areas). All other off-site buildings are located at greater distances from the Project Site construction areas and, therefore, would be subject to lower vibration levels than the less-than-significant

levels for building damage that would occur at the adjacent LAFD Fire Station 78. As such, vibration impacts related to structural damage would be less than significant.

The Draft EIR also considered potential vibration damage to on-site structures that would remain as part of the Project, including the existing clubhouse building, putting green and brick wall with weeping mortar located in the northeastern corner of the Project Site, which were conservatively analyzed as Category IV structures (buildings extremely susceptible to vibration damage) for potential structural damage impacts. Grading, utilities and trenching, and landscaping construction activities would occur in the vicinity of the clubhouse. Per Project Design Feature CUL-PDF-1, vibratory rollers would not be used within 40 feet of the clubhouse, putting green and low brick wall with weeping mortar. Also, large dozers (300 horsepower and greater) and caisson drills will not be used on the Project Site within 25 feet of the clubhouse, putting green and low brick wall with weeping mortar; loaded trucks will not be used on the Project Site within 20 feet of the clubhouse, putting green, and low brick wall with weeping mortar; and jackhammers will not be used on the Project Site within 12 feet of the clubhouse, putting green, and low brick wall with weeping mortar. Vibration levels at the above distances from the clubhouse, putting green, and brick wall with weeping mortar for the specified equipment would be up to approximately 0.11 inches per second PPV, which would not exceed the significance threshold of 0.12 inches per second PPV. Furthermore, as discussed in Chapter II, *Project Description*, the Project would rehabilitate the clubhouse as part of the Project to improve its usability and address deferred maintenance. The clubhouse would remain as part of the Project and function as a visitor center. Rehabilitation of the clubhouse that would occur as part of the Project would further improve the structural integrity of the building given its history of deferred maintenance. Therefore, the modeled construction vibration levels in the Draft EIR were not lowered to minimize impacts.

In addition, Table IV.K-24, *Construction Vibration Impacts – Human Annoyance*, on page IV.K-66 of the Draft EIR, presents the estimated vibration velocity levels due to construction equipment at the off-site vibration sensitive receptors relative to human annoyance vibration impact thresholds. As indicated in Table IV.K-24, the estimated vibration levels due to on-site construction equipment would be below the significance threshold for human annoyance at all off-site receptor locations.

### (iii) *Vibration Impacts – Off-Site Improvements*

With regard to off-site improvements associated with the Coldwater Canyon Avenue Riverwalk Path Ramp, the Project could potentially exceed applicable thresholds for human annoyance for sensitive receptors north of the Coldwater Canyon Avenue Riverwalk Path Ramp (receptor location R8). As indicated in Table IV.K-24, and discussed on pages IV.K-65 and IV.K-68 of the Draft EIR, vibration impacts regarding human annoyance at nearby sensitive receptors could exceed the significance thresholds (72 VdB at residential uses at receptor location R8). There are no feasible mitigation measures that could reduce human annoyance to a less than significant level, and the human annoyance construction-related vibration impact would be significant and unavoidable at receptor location R8.

(f) *Operational Noise*

(i) *On-Site Noise*

Comments were raised regarding concerns with the accuracy of noise level measurements associated with the Project's mechanical equipment, athletic activities, special events, and parking facilities. As explained in Section IV.K, *Noise*, of the Draft EIR and as clarified below, operational on-site noise impacts were evaluated based on conservative assumptions to provide maximum impacts and to avoid underestimating impacts, and were calculated appropriately.

(a) *Fixed Mechanical Equipment*

The Project would include new mechanical equipment (e.g., air ventilation equipment), which would be located at the roof level (e.g., gymnasium building and restrooms) and within the building structure (e.g., pool pump and underground parking). As shown in Table IV.K-11 on page IV.K-45 of the Draft EIR, estimated on-site mechanical equipment noise levels at the off-site receptor locations from the mechanical equipment would range from 43.2 dBA ( $L_{eq}$ ) at receptor location R2 to 55.1 dBA ( $L_{eq}$ ) at receptor location R5. Existing ambient noise levels range from 50.5 dBA ( $L_{eq}$ ) at receptor location R1 to 64.6 dBA ( $L_{eq}$ ) at receptor locations R5 and R6. Existing ambient plus Project noise levels would range from 51.3 dBA ( $L_{eq}$ ) at receptor location R1 to 65.1 dBA ( $L_{eq}$ ) at receptor location R5. All of the combined Existing Ambient plus Project noise level measurements are below the significance threshold of 5 dBA ( $L_{eq}$ ) above ambient noise levels at each receptor location. Therefore, impacts from mechanical equipment noise would be less than significant.

(b) *Athletic Activities*

The Project would include two outdoor athletic fields. Field A would be located along the eastern portion of the Project Site adjacent to Whitsett Avenue and set back from the eastern Project Site boundary by approximately 25 feet (eastern property line to the east side bleachers). Field B would be located in the northwestern corner of the Project in proximity to Valley Spring Lane and set back from the northern Project Site boundary by approximately 35 feet (northern property line to the north side bleachers). The swimming pool, located along the northern portion of the Project Site in proximity to Valley Spring Lane, would be set back from the northern Project Site boundary by approximately 95 feet and would be designed with a 30-foot overhead canopy above the swimming pool bleachers and pool buildings. As discussed in Chapter II, *Project Description* of the Draft EIR, page II-20, this overhead canopy, would be acoustically-treated with sound and echo-reduction materials designed to reduce the transfer and reverberation of noise from the pool to the surrounding area. The canopy would provide acoustic shielding for noise sensitive receptors located to the north, east, and west of the Project Site. In addition, eight tennis courts would be located at the northeastern portion of the Project Site. To get a conservative noise estimate, the Draft EIR assumed that both outdoor athletic fields, swimming pool, and tennis courts would be in use simultaneously. As discussed on page IV.K-46 and as shown in Table IV.K-12 of the Draft EIR, estimated noise levels from the

outdoor athletic activities would range from 52.0 dBA ( $L_{eq}$ ) at receptor location R2 to 64.7 dBA ( $L_{eq}$ ) at receptor location R5, which would be below the significance threshold of 5-dBA ( $L_{eq}$ ) increase above the ambient noise levels at each receptor location. In addition to the  $L_{eq}$  noise analysis (per the LAMC), noise impacts in terms of  $L_{10}$  impact noise metric were also evaluated representing the intermittent noise levels (e.g., cheering sound). The  $L_{10}$  metric is defined as the noise level exceeded 10 percent of a specified time period (e.g., 6 minutes in an hour). The community noise environment changes from moment to moment, requiring the noise exposure to be measured over periods of time to legitimately characterize a noise environment and to evaluate cumulative noise impacts. To account for people's increased tolerance for short-duration noise events, the Noise Regulations provide a 5-dBA allowance for a noise source that causes noise lasting more than 5 but less than 15 minutes in any one-hour period, and an additional 5-dBA allowance (for a total of 10 dBA) for a noise source that causes noise lasting 5 minutes or less in any one-hour period.

As discussed on page IV.K-46 and as shown in Table IV.K-13 of the Draft EIR, the estimated outdoor athletic activities noise levels (in terms of  $L_{10}$ ) at the off-site sensitive receptors would range from 58.1 dBA ( $L_{10}$ ) at receptor location R2 to 68.9 dBA ( $L_{10}$ ) at receptor location R5 which would be below the significance threshold of a 10-dBA increase above ambient noise levels at each receptor location (page IV.K-47 of the Draft EIR). Because the dBA in  $L_{10}$  would be below the significance threshold, impacts from athletic activities noise would be less than significant.

### (c) Special Events

The Project would include outdoor School-related and public special events, which would be held at Field A (or inside the gymnasium which, for the purposes of this Draft EIR, were not evaluated given that interior noise would not be heard at nearby sensitive receptor locations). School-related special events at Field A would include events, such as alumni reunions, parent receptions, school meetings, and parent association activities, which may reach up to 30 special events per year, 27 of which are conservatively assumed to have up to 500 people and three at 2,000 people. The outdoor public special events at Field A would be limited to a maximum of 500 persons, could not take place at the same time as School athletics uses, and would include activities such as "Movies in the Park."

Noise sources associated with special events typically include amplified sound systems and noise from people in attendance (voice and clapping). Per Project Design Feature NOI-PDF-2, the Project would include an amplified sound system for special events (e.g., movies or music) at the north end of Field A facing south to reduce off-site noise for residential uses that would not exceed 92 dBA ( $L_{eq-1hr}$ ) at a distance of 50 feet from the amplified speaker sound system. Noise levels of 75 dBA and 71 dBA ( $L_{eq}$ ) at a distance of 3.3 feet for males and females (speaking in loud voice), respectively, were assumed for the analysis. To represent a worst-case noise scenario, it was assumed that 100 percent of the people (half of which would be male and the other half female) would be talking and clapping at the same time. As discussed on page IV.K-49 and as shown in

Table IV.K-14 of the Draft EIR, the estimated noise levels from School-related special events would range from 49.6 dBA ( $L_{eq}$ ) at receptor location R2 to 67.3 dBA ( $L_{eq}$ ) at receptor location R6. The Project noise levels from School-related special events, in addition to ambient noise levels, would be below the significance threshold of 5 dBA ( $L_{eq}$ ). As discussed on page IV.K-49 and as shown in Table IV.K-15 of the Draft EIR, the estimated noise levels from public special events would range from 46.0 dBA ( $L_{eq}$ ) at receptor location R2 to 65.2 dBA ( $L_{eq}$ ) at receptor location R6. The Project's generated noise from public special events, in addition to the ambient noise levels, would be below the significance threshold of 5 dBA ( $L_{eq}$ ) at each receptor location. Therefore, impacts from special event noise would be less than significant.

(d) Parking Facilities

Parking for the Project would be provided in both a surface parking lot (29 parking spaces) and a below-grade parking structure (503 parking spaces). The above-ground surface parking would be located at the southeastern portion of the Project Site between the multi-purpose gymnasium and Field A, which would be mostly shielded to the off-site sensitive receptors. Sources of noise within the below-grade parking structure would primarily include vehicular movements and engine noise and vehicle door opening and closing. Noise generated within the underground parking structure would be effectively shielded from off-site sensitive receptor locations, as the structure would be fully enclosed on all sides. As discussed on page IV.K-50 and as shown in Table IV.K-16 of the Draft EIR, the estimated noise levels from the Project surface parking lot would be well below existing ambient noise levels and the significance threshold of 5 dBA ( $L_{eq}$ ) above ambient noise levels. Therefore, impacts from parking facilities would be less than significant.

(ii) Off-Site Traffic Noise

Comments were raised regarding the accuracy of the modeled operational traffic noise levels in the Draft EIR. As explained in the Draft EIR, the traffic noise impacts were evaluated by comparing the increase in noise levels under two scenarios to ensure that the analyses are accurate, comprehensive, and conservative (i.e., environmentally protective). The traffic noise analysis for the "existing without Project" condition compared to the "existing plus Project" condition does not take into account additional non-Project related traffic volumes from future year growth into the existing baseline values. This comparison is provided in Table IV.K-18 in the Draft EIR. The traffic noise analysis for the "future without Project" condition compared to the "future plus Project" condition takes into account additional non-Project related traffic volumes from future year growth into the future baseline values. This comparison is provided in Table IV.K-19 in the Draft EIR.

As discussed on page IV.K-52 of the Draft EIR for the "existing plus Project" condition, traffic from the Project during the 3-4 p.m. hour would result in a maximum noise increase of 0.1 dBA along Whitsett Avenue (between Valley Spring Lane and Ventura Boulevard), Coldwater Canyon Avenue (between Moorpark Street and Ventura Boulevard), Moorpark Street (between Coldwater Canyon Avenue and Whitsett Avenue), and Ventura Boulevard (between Coldwater Canyon Avenue and Whitsett Avenue). During the 5-6

p.m. hour, the Project-related traffic noise would result in an increase of 0.1 dBA along Moorpark Street (between Coldwater Canyon Avenue and Whitsett Avenue) and an increase of 0.2 dBA increase along Whitsett Avenue (between Valley Spring Lane and Ventura Boulevard), Coldwater Canyon Avenue (between Moorpark Street and Ventura Boulevard), and Ventura Boulevard (between Coldwater Canyon Avenue and Whitsett Avenue). Roadway segments along Valley Spring Lane between Bellaire Avenue and Whitsett Avenue and between Whitsett Avenue and Laurel Canyon Boulevard experience slight decreases in noise levels as a result of decreasing traffic volumes along the roadway segments under the “existing with Project” scenario based on the traffic modeling in the Project’s Transportation Assessment (Appendix M). Typically, a minimum 3-dBA change in the noise environment (increase and/or decrease) is considered as a threshold of human perception.

As discussed on page IV.K-54 of the Draft EIR, for the “future (2025) plus Project” condition, traffic noise from the Project during the 3-4 p.m. hour would result in an increase of 0.1 dBA along Whitsett Avenue (between Valley Spring Lane and Ventura Boulevard), Coldwater Canyon Avenue (between Moorpark Street and Ventura Boulevard), Moorpark Street (between Coldwater Canyon Avenue and Whitsett Avenue), and Ventura Boulevard (between Coldwater Canyon Avenue and Whitsett Avenue). During the 5-6 p.m. hour, the Project-related traffic noise would result in an increase of 0.1 dBA along Whitsett Avenue (between Valley Spring Lane and Ventura Boulevard) and Coldwater Canyon Avenue (between Moorpark Street and Ventura Boulevard) and an increase of 0.2 dBA along Ventura Boulevard, Coldwater Canyon Avenue (between Moorpark Street and Ventura Boulevard), and Ventura Boulevard (between Coldwater Canyon Avenue and Whitsett Avenue). The Project-related traffic with the Special Events under the “left turn allowed at Valleyheart Drive”<sup>167</sup> would result in an increase of 0.1 dBA along Whitsett Avenue (between Moorpark Street and Valley Spring Lane) and Moorpark Street (between Coldwater Canyon Avenue and Whitsett Avenue), 0.5 dBA along Coldwater Canyon Avenue (between Moorpark Street and Ventura Boulevard) and Ventura Boulevard (between Coldwater Canyon Avenue and Whitsett Avenue), and 0.6 dBA along Whitsett Avenue (between Valley Spring Lane and Ventura Boulevard). The Project-related traffic with the Special Events under the “left turn not allowed at Valleyheart Drive” would result in an increase of 0.6 dBA along Whitsett Avenue (between Valley Spring Lane and Ventura Boulevard), Coldwater Canyon Avenue (between Moorpark Street and Ventura Boulevard) and Ventura Boulevard (between Coldwater Canyon Avenue and Whitsett Avenue). The estimated noise increases, under all options, would be below the 5-dBA significance threshold. Project traffic noise impacts are fully evaluated in the Draft EIR under two scenarios (“existing plus Project”, and “future plus Project”), and, as such, the traffic noise impacts are not minimized or downplayed. Therefore, the Project would not result in the generation of a substantial permanent

<sup>167</sup> As the southern driveway into the Project’s below-grade parking structure would be for ingress only, the “left turn allowed at Valleyheart Drive” scenario models the potential turning movement of cars exiting the 29-space surface parking lot and the roundabout located immediately southeast of the gymnasium.

increase in ambient noise levels in the vicinity of the Project in excess of standards established by the City, and Project-related traffic noise increases would be less than significant. Furthermore, the analyses provide an accurate, comprehensive, and conservative (i.e., environmentally protective) disclosure of traffic noise impacts.

*(iii) Off-Site Improvements at Coldwater Canyon Avenue Riverwalk Path Ramp*

Noise from pedestrian use of the Coldwater Canyon Avenue Riverwalk Path Ramp was analyzed for 10 individuals (representing a group of people walking/jogging on the ramp) who would be using the Coldwater Canyon Avenue Riverwalk Path Ramp simultaneously at a given time. As discussed on page IV.K-51 and as shown in Table IV.K-17 of the Draft EIR, the estimated noise level from operation of the Coldwater Canyon Avenue Riverwalk Path Ramp is compared to the ambient noise level and significance threshold. Estimated noise levels from the Coldwater Canyon Avenue Riverwalk Path Ramp would be below the existing ambient noise levels and the significance threshold of 5 dBA ( $L_{eq}$ ) above ambient levels. Therefore, noise impacts from operation of the Coldwater Canyon Avenue Riverwalk Path Ramp would be less than significant.

*(iv) Composite Noise Level Impacts from Project Operations*

An evaluation of composite noise levels, including all Project-related noise sources plus existing ambient noise levels, was conducted to identify the potential maximum Project-related noise level increase that may occur at the noise-sensitive receptor locations. The overall sound environment at the sensitive receptors surrounding the Project Site would include contributions from each on-site and off-site (traffic) individual noise source associated with maximum daily operation of the Project (all athletic fields, tennis courts, and swimming pool with maximum noise at each location). Principal on-site noise sources associated with the Project would include mechanical equipment, athletic activities, parking facility, and noise from occasional special events, including from the amplified sound system. Combined noise levels from each operational noise source were estimated by logarithmically adding together the noise levels from all the operational noise sources at the maximum impacted noise-sensitive receptor locations, assuming simultaneous contribution of noise from each source. As discussed on page IV.K-56 and as shown Table IV.K-20 of the Draft EIR, the Project would result in a maximum increase of 0.7 dBA CNEL at receptor location R2 to 3.0 dBA CNEL at receptor location R7. The increases in noise levels due to Project operations at off-site receptor locations R1 through R4 and R7 would be below the 5-dBA CNEL significance threshold, and the estimated noise levels would fall within the conditionally acceptable (60 to 70 CNEL) land use category for residential. The estimated noise level increase at off-site receptor locations R5 and R6 would be below the 3-dBA CNEL significance threshold, and the estimated noise levels would fall within the normally unacceptable (70 to 75 CNEL) land use category for residential and the normally unacceptable (70 to 80 CNEL) land use

category for churches.<sup>168</sup> Therefore, the Project's operational composite noise impacts would be less than significant.

*(g) Operational Vibration*

As discussed on page IV.K-67 of the Draft EIR, Project operation would include typical commercial-grade stationary mechanical and electrical equipment, such as air handling units, condenser units, and exhaust fans, which would produce vibration at low levels that would not cause building damage or human annoyance vibration impacts to on- or off-site buildings or occupants. According to the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE), pumps or compressors generate groundborne vibration levels of 0.5 in/sec PPV at 1 foot.<sup>169</sup> Project mechanical equipment, including air handling units, condenser units, and exhaust fans, would be located within enclosed mechanical rooms on basement levels and building rooftops. Therefore, groundborne vibration from the operation of such mechanical equipment would not impact any of the off-site sensitive receptors. Due to the rapid attenuation characteristics of groundborne vibration and distance from the Project Site to receptors, there is no potential for operational impacts with respect to groundborne vibration. Therefore, vibration impacts from Project operations would be less than significant.

*(h) Cumulative Noise and Vibration*

*(i) Construction and Operational Traffic Noise*

Please refer to Topical Response No. 12 – Related Projects: Adequacy of Cumulative Mobile Source Noise and Traffic Analyses, for a discussion of construction and operational cumulative traffic/mobile source noise impacts. As discussed therein, given that it is possible that the Project and related projects could contribute to cumulative off-site construction traffic noise levels and could exceed a significance threshold with sufficiently high cumulative traffic levels, cumulative off-site construction traffic noise impacts would be temporarily significant and unavoidable. During operation, the estimated cumulative noise increases would be below the 5-dBA significance threshold. Therefore, the Project's contribution to off-site traffic noise during operation would not be cumulatively considerable, and off-site cumulative traffic noise impacts associated with Project operation would be less than significant.

<sup>168</sup> A different threshold for off-site receptor locations R5 and R6 is used since noise levels from existing traffic conditions correspond with the City's land use categorization of "normally unacceptable". Therefore, the Project would have an impact if it resulted in a 3 dBA CNEL increase, rather than the 5 dBA CNEL increase associated with the "normally acceptable" or "conditionally acceptable" categorizations per the City of Los Angeles Noise Element.

<sup>169</sup> America Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., Heating, Ventilating, and Air-Conditioning Applications, 1999.

(ii) *On-Site Construction Noise*

Cumulative construction noise impacts were discussed and analyzed on pages IV.K-69 and IV.K-72 of the Draft EIR. Related Project Nos. 1 through 5 are located within 1,000 feet of the Project Site, as listed below:

- Related Project No. 1 – 12833 Ventura Boulevard (Sportsmen’s Lodge – Addition of health club and restaurants to existing hotel)
- Related Project No. 2 – 12548 Ventura Boulevard (Retail/apartments/other)
- Related Project No. 3 – 12582 Ventura Boulevard (Other)
- Related Project No. 4 – 12544 Ventura Boulevard (Other)
- Related Project No. 5 – 12833 Ventura Boulevard (Sportsmen’s Lodge – Apartments, Restaurant)

Related Project Nos. 1 and 5 are located approximately 630 feet west of the Project Site and approximately 120 feet south of the nearest residential use to the proposed Coldwater Canyon Avenue Riverwalk Path Ramp location. While construction related to Related Project No. 1 was at or near completion at the time the Draft EIR was in preparation, the Draft EIR analysis conservatively evaluated this related project by assuming that construction of this related project could occur at the same time as the Project. Residences located at the corner of Valleyheart Drive and Bellaire Avenue (represented by receptor location R1) are located between the Project Site and the Related Project Nos. 1 and 5 and could therefore be exposed to construction noise from both the Project and the Related Project Nos. 1 and 5 (again, conservatively assuming that Related Project No. 1 was not already completed). The estimated Project construction noise level at receptor R1 would exceed the 5-dBA significance threshold and the construction related noise from Related Project Nos. 1 and 5 would contribute to the cumulative noise impacts.

Related Project Nos. 2, 3 and 4 are approximately 530 feet south of the Project Site. Exact construction schedules for these related projects are not known. Nonetheless, the Draft EIR conservatively assumed that construction of these related projects could occur at the same time as the Project. There are residences along Sunswept Drive (represented by receptor location R7), which could be exposed to the construction noise from both the Project and these related projects. These related projects are located approximately 150 to 400 feet from receptor location R7. The estimated Project construction noise level at receptor location R7 would result in a noise level of up to 61.3 dBA  $L_{eq}$  with implementation of mitigation measures, which would not exceed the significance threshold of 62.1 dBA  $L_{eq}$  (5-dBA over the ambient). However, since receptor location R7 along Sunswept Drive has a direct line-of-sight to Related Project Nos. 2, 3, and 4, construction-related noise from Related Project Nos. 2, 3, and 4 could contribute to significant cumulative noise impacts. For instance, if any one of Related Project Nos. 2, 3, or 4 contribute a noise level identical to the Project, the combined noise level would

be approximately 64.3 dBA  $L_{eq}$  given that two equal noise levels result in a 3-dBA increase when added together (i.e., 61.3 dBA + 61.3 dBA = 64.3 dBA).

Based on the above, there would be potential cumulative noise impacts at the nearby sensitive uses (receptor locations R1 and R7) in the event of concurrent construction activities with Related Project Nos. 1 through 5. Construction-related noise levels from the related projects would be intermittent and temporary, and it is anticipated that, as with the Project, the related projects would comply with the construction hours and other relevant provisions set forth in the LAMC. In addition, noise associated with cumulative construction activities would be reduced to the degree reasonably and technically feasible through proposed mitigation measures for each individual related project and compliance with locally adopted and enforced noise ordinances. The Project would implement Mitigation Measures NOI-MM-1, NOI-MM-2, and NOI-MM-3 to reduce construction noise impacts. However, the Draft EIR conservatively concluded that the Project's contribution to cumulative construction noise associated with on-site construction equipment would be cumulatively considerable and would represent a significant and unavoidable cumulative impact at receptor locations R1 and R7.

(iii) *Off-Site Improvements at Coldwater Canyon Avenue Riverwalk Path Ramp: Construction Equipment Noise*

Related Project Nos. 1 and 5 are located approximately 120 feet south of the nearest residential use to the proposed Coldwater Canyon Avenue Riverwalk Path Ramp location. While construction related to Related Project No. 1 was at or near completion at the time the Draft EIR was in preparation, the Draft EIR analysis conservatively evaluated this related project assuming that construction of this related project could occur at the same time as construction of the off-site improvements at the Coldwater Canyon Avenue Riverwalk Path Ramp. The residential uses in the vicinity of the Coldwater Canyon Avenue Riverwalk Path Ramp location could be exposed to construction noise from both the Coldwater Canyon Avenue Riverwalk Path Ramp and the Related Projects 1 and 5. The estimated Project construction noise level at receptor location R8 would exceed the 5-dBA significance threshold and the construction related noise from Related Project Nos. 1 and 5 would contribute to the cumulative noise impacts. There are no feasible mitigation measures to reduce the impact. As such, the Project would have a significant and unavoidable cumulative impact at receptor location R8.

(iv) *Construction Groundborne Vibration*

(a) *On-Site Construction Vibration - Cumulative*

Due to rapid attenuation characteristics of groundborne vibration, only related projects located adjacent to the same sensitive receptors would result in cumulatively considerable vibration impacts. None of the related projects are located adjacent to the sensitive receptors identified for the Project. Related Project Nos. 1 and 5 are approximately 630 feet west of the Project Site, and Related Project Nos. 2, 3, and 4 are approximately 530 feet south of the Project Site. There are residences along Sunswept

Drive (represented by receptor location R7), which could be exposed to the construction vibration from both the Project and these related projects. These related projects are located approximately 150 to 400 feet from the receptor location R7. At the distances described above, operation of vibratory construction equipment would not exceed structural damage or human annoyance thresholds. Other related projects are further away from the Project Site and sensitive receptors and would experience lower levels of vibration. Therefore, construction of the Project, when considered together with Related Project Nos. 1, 2, 3, 4, and 5 would not result in a cumulatively considerable contribution and would have a less-than-significant cumulative impact with regard to groundborne vibration (structural damage and human annoyance) at receptor locations R1 through R7.

(b) Off-Site Improvements at Coldwater Canyon Avenue Riverwalk Path Ramp: Construction Equipment Vibration

Related Project Nos. 1 and 5 are approximately 120 feet south of the nearest residential use to the proposed Coldwater Canyon Avenue Riverwalk Path Ramp location. At the distances described above, operation of vibratory construction equipment would not exceed structural damage thresholds. However, groundborne vibration exceeding the human annoyance threshold at receptor location R8 would occur as a result of construction of the proposed Coldwater Canyon Avenue Riverwalk Path Ramp, and Related Projects could contribute to the human annoyance vibration impact. Therefore, construction of the Project, when considered together with Related Project Nos. 1, 2, 3, 4, and 5 would not result in a cumulatively considerable contribution and would have a less-than-significant cumulative impact with regard to structural damage caused by groundborne vibration at receptor location R8. However, the Project would result in a cumulatively considerable contribution and would have a significant and unavoidable cumulative impact with regard to human annoyance from groundborne vibration at receptor location R8.

(v) *Operations Noise (On-Site and Off-Site Improvements at Coldwater Canyon Avenue Riverwalk Path Ramp)*

Cumulative operational noise impacts are discussed on pages IV.K-72 and IV.K-73 of the Draft EIR. As discussed therein, similar to the Project, each of the related projects that have been identified in the vicinity of the Project Site would also generate stationary-source and mobile-source noise due to ongoing day-to-day operations. Due to provisions set forth in the LAMC that limit stationary source noise from items such as rooftop mechanical equipment and amplified sound, noise levels would be less than significant at the property line for each related project. As analyzed above, noise impacts associated with the Project on-site operations would be less than significant. Therefore, based on the distance of the related projects from the Project Site and the operational noise levels associated with the Project, the Project's contribution to operational noise would not be cumulatively considerable, and cumulative noise impacts associated with operation of the Project (both on-site and the off-site improvements at Coldwater Canyon Avenue Riverwalk Path Ramp) and related projects would be less than significant.

(vi) *Operation Groundborne Vibration*

Cumulative operational groundborne vibration impacts are discussed on page IV.K-76 of the Draft EIR. As discussed therein, Related Project Nos. 1 and 5 are approximately 630 feet west of the Project Site and approximately 120 feet south of the nearest residential use to the proposed Coldwater Canyon Avenue Riverwalk Path Ramp location. Related Project Nos. 2, 3, and 4 are approximately 530 feet south of the Project Site and approximately 150 to 400 feet from the residences along Sunswept Drive (represented by receptor location R7). These residences could be exposed to the operational vibration from both the Project and these related projects. At the distances described above, operation of vibratory operational equipment would not exceed structural damage or human annoyance thresholds. Other related projects are further away from the Project Site and sensitive receptors and would experience lower levels of vibration. Due to the rapid attenuation characteristics of groundborne vibration and distance from each of the related projects to the Project Site, there is no potential for cumulative operational impacts with respect to groundborne vibration. Therefore, operation of the Project (both on-site and the off-site improvements at Coldwater Canyon Avenue Riverwalk Path Ramp), when considered together with Related Project Nos. 1, 2, 3, 4, and 5 would not result in a cumulatively considerable contribution and would have a less-than-significant cumulative impact with regard to groundborne vibration or human annoyance.

(i) *Project Design Modifications: Construction Noise and Vibration*

The Project's design modifications are discussed under Topical Response No. 2 – Modifications to the Project Design. As discussed therein, the Project design modifications reduce the Project's soil excavation from 250,000 cubic yards to 197,000 cubic yards of soil to be exported off-site. This reduction in grading would reduce the number of haul truck trips from 35,714 trips to 28,142, a reduction of 7,572 truck trips. This would reduce the excavation phase (with dirt hauling) from seven months to 5.5 months, although the overall construction schedule would still remain at approximately 30 months given overlapping construction phases. The daily maximum construction activity (and construction traffic) during excavation would not change. As such, while there would be a temporary corresponding reduction in construction noise and vibration from the reduced construction activity for approximately 1.5 months compared to the Project without the design modifications, the evaluations of impact significance (Project-level and cumulative) for the estimated construction noise and vibration levels as analyzed in the Draft EIR would not materially change, and the same significant and unavoidable construction-related noise and vibration impacts would occur. The Project design modifications do not affect the off-site improvements associated with the Coldwater Canyon Avenue Riverwalk Path Ramp and as such, do not affect the construction noise and vibration impact analyses associated with these off-site improvements.

(j) *Project Design Modifications: Operations*

(i) *Traffic and Parking*

As discussed in Topical Response No. 2 – Modifications to the Project Design, design modifications relating to seating, lighting, building design (swimming pool area and gymnasium), parking, grading, storm water capture and reuse system, and water features were made to the Project in response to public and agency comments received on the Draft EIR. As related to traffic and parking noise, the Project with design modifications would reduce subterranean parking from 503 spaces to 386 spaces and surface parking would be reduced from 29 spaces to 17 spaces. On most days throughout the year (non-Special Event days), traffic and parking spaces utilized on-site would be the same with or without the Project design modifications. However, the reduced number of parking spaces with the Project design modifications would have the effect of reducing traffic to/from the Project Site along Whitsett Avenue, Moorpark Avenue, and Ventura Boulevard since no off-site parking would be permitted by the Project. That is, visitors that could have parked at the Project Site with the additional 129 spaces, would now be required to shuttle to the Project Site from the School's Upper School campus during those occasions when the on-site parking reaches capacity. The circulation of the School's three shuttles would accommodate the additional passengers which could result from the Project design modifications. This modification would result in an increase of six additional round trip shuttle trips (or 12 individual trips to/from the Project Site) as compared to those analyzed in the Draft EIR. Assuming that most of the event attendees would arrive at the Upper School campus around the same time, shuttles would be operated at the maximum capacity of 24 passengers at a time. Compared to the Project without design modifications, which would result in a maximum 0.6 dBA noise level increase along Coldwater Canyon between Moorpark Street and Ventura Boulevard (see Table IV.K-18 on page IV.K-53 of the Draft EIR), the shift in traffic (vehicles or shuttles) to the Upper School campus along Coldwater Canyon would have a negligible effect on noise levels of less than approximately 1 dBA, well below the 5 dBA impact threshold. This would be an imperceptible change in noise levels under the Project with design modifications compared to the Project without design modifications, with the resulting noise levels being less than significant, similar to the impact conclusion in the Draft EIR. As shown in Table IV.K-20, *Composite Noise Impacts*, of the Draft EIR, the Project's traffic and parking noise levels are both below ambient noise levels. While the reduction in traffic and parking noise to noise sensitive receptors near the Project Site would be reduced under the Project with design modifications, any such reduction would represent a negligible change to the noise levels included for the Project in Table IV.K-20 of the Draft EIR with operational noise impacts remaining less than significant.

(ii) *Swimming Pool Area*

A Supplemental Noise Analysis, provided in Appendix F of this Final EIR, was prepared to analyze the operational noise impacts associated with the Project design modifications. The Project with design modifications would reduce the number of bleacher seats at the swimming pool from 348 to 214 seats. Also, in the swimming pool area, the Project design

modifications would also reduce the height and extent of the Project's 30-foot-high noise attenuation canopy to 14.5 feet high over just the western side of the pool bleachers, remove the diving facilities, and eliminate the School's proposed diving competition program.

Table 1, *Estimated Pool Operation Noise Levels – Updated Design*, in the Supplemental Noise Analysis (included as Appendix F of this Final EIR) includes a comparative analysis of the estimated noise levels included in the Draft EIR to the noise levels that would occur with the Project design modifications in terms of  $L_{eq}$  and  $L_{10}$  noise descriptors. These same swimming pool noise levels in terms of  $L_{eq}$  and  $L_{10}$  have been incorporated as corrections to Draft EIR Table IV.K-12, *Athletic Activities Noise Levels –  $L_{eq}$  Analysis*, and Table IV.K-13, *Athletic Activities Noise Levels –  $L_{10}$  Analysis*, in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR. As analyzed therein, noise levels with the Project design modifications from the swimming pool area would be up to 3.5 dBA  $L_{eq}$  (or 3.3 dBA  $L_{10}$ ) higher than analyzed in the Draft EIR (at one receptor location – R3<sup>170</sup>). Minor increases in noise  $L_{eq}$  levels from the pool area at receptor locations R6 and R7 would also occur at 1.5 and 1.7 dBA  $L_{eq}$  (or 1.1 and 1.4  $L_{10}$ ), respectively. As indicated in the Draft EIR, outside of a laboratory, a change of 3 dBA in ambient noise levels is considered to be a barely perceivable difference.<sup>171</sup> At 3.5 dBA, this increase would not be a substantial increase in the severity of impacts from the swimming pool area as analyzed in the Draft EIR. As analyzed on pages IV.K-45 and IV.K-46 of the Draft EIR, noise from the pool area would occur together with the Project Site's other athletic activities. Thus, the Draft EIR appropriately analyzed noise from the swimming pool together with all on-site athletic activities in Table IV.K-12 and Table IV.K-13. As shown in these updated tables in Chapter 3 of this Final EIR, and discussed in the Athletic Activities subsection below, the collective noise levels from the Project Site's athletic activities would remain below the  $L_{eq}$  and  $L_{10}$  noise impact thresholds in the Draft EIR, and impacts would remain less than significant. In addition, a minor decrease of 0.2 dBA  $L_{10}$  would occur at receptor location R2, while the  $L_{eq}$  noise level would remain the same (see Table IV.K-12 and IV.K-13 in Chapter 3 of this Final EIR). There would also be minor decreases in noise levels at receptor locations R1, R4, and R5 with a maximum reduction up to 2.2 dBA  $L_{10}$  (at receptor location R4) (see Table IV.K-13 in Chapter 3 of this Final EIR).

As discussed above, the noise level changes at the pool area only under the Project with design modifications would be no more than 3.5 dBA higher than the Project without design modifications at one receptor location, which would be just beyond a barely perceptible change compared to the Project without design modifications, and still below the City's noise impact thresholds when analyzed together with all of the Project Site's athletic activities. As such, there would be no substantial increase in the severity of

<sup>170</sup> R3 = Single-family residential uses at the corner of Teesdale Avenue and Valley Spring Lane.

<sup>171</sup> Harvard-Westlake River Park Project Draft EIR, page IV.K-5, March 2022.

impacts and impacts from outdoor athletic activities would remain less than significant, similar to the Project without design modifications.

(iii) *Athletic Activities*

The Project with design modifications would reduce the overall indoor and outdoor seating from 2,217 seats to a total of 2,005 seats. Total outdoor seating would be reduced from 1,191 bleacher seats to 949 bleacher seats, including the swimming pool area. Outdoor seating at Field A would increase from 488 to 542 seats, decrease at Field B from 255 to 109 seats, decrease at the swimming pool from 348 to 214 seats, and decrease at the tennis courts from 100 to 84 seats.

The Supplemental Noise Analysis, provided in Appendix F of this Final EIR, analyzed the operational noise impacts associated with the Project design modifications relating to all outdoor athletic activities combined, including the swimming pool area. The noise levels from all of the Project's athletic activities, including Field A, Field B, swimming pool, and tennis courts, in terms of  $L_{eq}$  and  $L_{10}$  are shown in Table 2, *Athletic Activities Noise Levels –  $L_{eq}$  Analysis (Updated Design)*, and Table 3, *Athletic Activities Noise Levels –  $L_{10}$  Analysis (Updated Design)*, in the Supplemental Noise analysis. The noise levels presented in Tables 2 and 3 in the Supplemental Noise Analysis have been incorporated as revisions to Draft EIR Table IV.K-12, *Athletic Activities Noise Levels –  $L_{eq}$  Analysis*, and Table IV.K-13, *Athletic Activities Noise Levels –  $L_{10}$  Analysis*, in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR.

The outdoor athletic activities noise levels (in terms of  $L_{eq}$ ) at the off-site sensitive receptors with the Project design modifications are shown in the updated Table IV.K-12. Compared to the Project without the design modifications, the maximum increase in ambient plus Project noise levels under the Project without design modifications would be 0.9 dBA at receptor location R3. Noise levels at receptor locations R1, R4 and R5 would decrease by 1 dBA or less, while noise levels at receptor locations R6 and R7 would increase by 0.3 dBA. As presented in the updated Table IV.K-12 in Chapter 3 of this Final EIR, the noise levels (in terms of  $L_{eq}$ ) from the outdoor athletic activities with the modified pool design would be below the significance threshold of 5 dBA ( $L_{eq}$ ) increase above the ambient noise levels at all receptors, similar to the Project without design modifications. As shown in Table IV.K-12 in Chapter 3 of this Final EIR, the Project with design modifications' increase in noise would range between 1.5 dBA and 4.1 dBA over ambient noise levels. Accordingly, the noise levels under the Project with design modifications would be between 0.9 and 3.5 dBA below the 5 dBA significant impact threshold.

The outdoor athletic activities noise levels (in terms of  $L_{10}$ ) at the off-site sensitive receptors with the Project design modifications are shown in the updated Table IV.K-13. Compared to the Project without the design modifications, the maximum increase in ambient plus Project noise levels under the Project without design modifications would be 1.1 dBA at receptor location R3. Noise levels at receptor locations R1, R4 and R5 would decrease by 0.7 dBA or less, while noise levels at receptor locations R6 and R7

would increase by 0.3 dBA or less. As indicated in the updated IV.K-13, the noise levels from the outdoor athletic activities would be below the significance threshold of a 10 dBA increase above ambient noise levels at all receptor locations, similar to the Project without the design modifications. As shown in Table IV.K-13 in Chapter 3 of this Final EIR, the Project with design modifications' increase in noise would range between 3.9 dBA and 8.4 dBA over ambient noise levels. Accordingly, the noise levels under the Project with design modifications would be between 1.6 and 6.1 dBA below the 10 dBA significant impact threshold.

As discussed above, the noise level changes under the Project with design modifications would be no more than 1.1 dBA higher than the Project at one receptor location, which would not be a perceptible change compared to the Project without design modifications, and still below the City's noise impact thresholds. As such, there would be no substantial increase in the severity of impacts and impacts from outdoor athletic activities would remain less than significant, similar to the Project without design modifications.

*(iv) Composite Noise Levels*

The Supplemental Noise Analysis, provided in Appendix F of this Final EIR, analyzed the composite operational noise impacts associated with the Project design modifications relating to all outdoor athletic activities combined, including the swimming pool area, as well as traffic, mechanical equipment, parking and special events. The composite noise levels from all of the Project's athletic activities, including Field A, Field B, swimming pool, and tennis courts, in terms of CNEL are shown in Table 4, Composite Noise Impacts (Updated Design), in the Supplemental Noise analysis. The noise levels presented in Table 4 in the Supplemental Noise Analysis have been incorporated as revisions to Draft EIR Table IV.K-20, Composite Noise, in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR. As analyzed therein, the Project with design modifications would result in noise level increases of 0.7 dBA CNEL at receptor location R2 to 3.0 dBA CNEL at receptor location R7, the same range of noise increases as the Project without the design modifications. The Project with design modifications would result in changed CNEL noise level increases at only 3 receptor locations. The CNEL noise level at R3 would increase from 1.0 to 1.2 dBA (a 0.2 dBA increase), while noise levels at R4 and R5 would decrease from 2.7 to 2.4 dBA and 1.8 to 1.7 dBA, respectively. As with the Project without design modifications, the increases in noise levels with the Project design modifications at off-site receptor locations R1 through R4, and R7 would be below the 5 dBA CNEL significance threshold and the estimated noise levels would fall within the conditionally acceptable (60 to 70 CNEL) land use category for residential. The estimated noise level increase at off-site receptor locations R5 and R6 would be below the 3 dBA CNEL significance threshold, as the estimated noise levels would fall within the normally unacceptable (70 to 75 CNEL) land use category for residential and the normally unacceptable (70 to 80 CNEL) land use category for churches.

As discussed above, the composite noise level changes under the Project would be no more than 0.2 dBA CNEL higher than the Project at one receptor location (R3), which

would not be a perceptible change compared to the Project without design modifications, and still below the City's noise impact thresholds. As such, there would be no substantial increase in the severity of impacts and composite noise impacts would remain less than significant, similar to the Project without design modifications.

### (3) Conclusion

As discussed above, the construction and operational noise and vibration impacts are appropriately addressed in the Draft EIR. Thus, no new or additional analysis is required for these issues. As discussed above, the Project with design modifications would not substantially increase the severity of noise or vibration impacts evaluated in the Draft EIR and the noise/vibration impact conclusions in the Draft EIR would remain unchanged.

## i) **Topical Response No. 9 – Transportation and Parking During Construction and Operations**

### (1) Introduction

This topical response primarily addresses comments received during the public circulation period for the Draft EIR related to transportation issues that are not required to be addressed under the California Environmental Quality Act (CEQA) and City of Los Angeles CEQA requirements. Such issues include parking, level of service (LOS), congestion, and delay on surrounding roadways. This topical response also addresses the methodology for calculating the Project's vehicle miles traveled (VMT), which is utilized for the CEQA-required transportation impact assessments included in the Draft EIR. Emergency access is evaluated as a CEQA-required issue in the Draft EIR, and is addressed in Topical Response No. 10 – Emergency Access. In addition, Topical Response No. 12 - Related Projects: Adequacy of Cumulative Mobile Source Noise and Traffic Analyses, provides a detailed discussion of cumulative transportation impacts. The analyses of CEQA-required transportation issues were evaluated in Section IV.M, *Transportation*, of the Draft EIR, with supporting data provided in Appendix M, Transportation Assessment, of the Draft EIR. The Transportation Assessment (TA) includes both CEQA and non-CEQA required analyses in compliance with the City of Los Angeles Department of Transportation's (LADOT) Transportation Assessment Guidelines (TAG) (July 2020).

### (2) Discussion

#### (a) *CEQA Versus Non-CEQA Transportation Analysis Requirements*

Pursuant to Senate Bill 743 (SB 743), the California Natural Resources Agency adopted the Office of Planning and Research's (OPR's) recommended vehicle miles traveled (VMT) guidelines on December 28, 2018. The guidelines resulted in changes to Section 15064.3 and Appendix G of the CEQA Guidelines that effectively removed automobile delay and associated LOS as the metric to evaluate transportation impacts pursuant to CEQA, and replaced it with VMT. Accordingly, pursuant to these changes, the City adopted VMT as a CEQA threshold to determine transportation impacts. Therefore, as further described below, the analysis of transportation impacts in Section IV.M, *Transportation*, of the Draft EIR was focused on VMT and other analyses required by Appendix G of the CEQA Guidelines. Transportation issues not required to be analyzed under CEQA are presented in Chapter 4 of the TA (Appendix M of the Draft EIR). As such, responses to comments on the non-CEQA issues are not required to be provided in this Final EIR, and are provided herein only for informational purposes independent of CEQA requirements.

(b) *CEQA Transportation Analysis Requirements*

As explained on page IV.M-4 in Section IV.M, *Transportation*, of the Draft EIR, SB 743 directed OPR to develop revisions to the CEQA Guidelines to establish new criteria for determining the significance of transportation impacts and define alternative metrics to the metrics used for traffic LOS. Subsequent related changes to CEQA requirements for transportation impact analyses included the elimination of automobile delay, LOS, and other similar measures of vehicular capacity or traffic congestion as a basis for determining significant impacts for land use projects and plans in California. The updates to the CEQA Guidelines establish VMT as the primary metric for evaluating a project's environmental impacts on the transportation system. These changes to the way transportation impacts are assessed under CEQA were made to help ensure new development projects are built in a way that promotes options that would result in Californians driving less, while also promoting the achievement of climate and environmental goals, health and safety for residents, increased quality of life, and economic growth by co-locating jobs, services, transit, and housing.

As presented on pages IV.M-4 and IV.M-5 in Section IV.M, *Transportation*, of the Draft EIR, and in accordance with the current CEQA Guidelines and the City's CEQA transportation thresholds, the Project would be considered to have a significant impact related to transportation if it would:

- Threshold (a): Conflict with a program, plan, ordinance, or policy addressing the circulation system including transit, roadway, bicycle, and pedestrian facilities.
- Threshold (b): Conflict or be inconsistent with CEQA Guidelines Section 15064.3, Subdivision (b).
- Threshold (c): Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
- Threshold (d): Result in inadequate emergency access.

The required VMT analysis under Threshold (b) considers two different uses for the Project as specified in the July 2020 LADOT TAG. First, the Project is classified as an education facility since it would be owned and operated by Harvard-Westlake School (School) and utilized by their students, employees, and authorized individuals and organizations in conjunction with their operation as a private high school. Per Section 2.2.4 of the July 2020 LADOT TAG, it is assumed that the Project would attract people (employees and visitors) from a broader area and not just the immediate vicinity. Second, the community use component (publicly-accessible walking pathways and recreational areas and facilities) of the Project would be classified as a community-serving recreational facility. Per LADOT, and as stated in the TA Memorandum of Understanding (MOU) provided as Appendix A to the TA (see Appendix M of the Draft EIR) and in the LADOT Transportation Assessment letter dated June 11, 2021 included in Appendix M of the Draft EIR, community-serving recreational facilities are exempt from VMT analysis. Community-serving recreational facilities usually draw people locally, rather than

regionally, and thus tend to reduce, not increase, VMT since visitors could go to a closer recreational facility rather than one that was further away. Therefore, the VMT calculation for the Project (consistent with CEQA Guidelines Section 15064.3) focuses on the Harvard-Westlake athletic activities as an educational facility.

Per Section 2.2.4 of the July 2020 LADOT TAG, the Project would result in a significant VMT impact if the Project is expected to result in a net increase in daily VMT. The Project's VMT was calculated by multiplying the estimated average number of daily trips by an average trip length for each group of users and took credit for existing VMT for existing Weddington Golf & Tennis users, which would be eliminated by the Project. As shown in Table IV.M-5, Project Net Total Daily VMT Estimate, on page IV.M-41 of the Draft EIR, the Project would result in an estimated net decrease of 2,098 daily VMT. Thus, VMT impacts would be less than significant.

The evaluation of the Project's transportation impacts with respect to any potential conflict with adopted transportation plans and policies, roadway hazards, and emergency access are evaluated on pages IV.M-27 through IV.M-46 in Section IV.M of the Draft EIR. As discussed therein, impacts related to applicable threshold standards were determined to be less than significant.

For an analysis of the Project's potential impact on emergency services, refer to Section IV.L.1, *Public Services – Fire Protection*, and Section IV.L.2, *Public Services – Police Protection*, of the Draft EIR as well as Topical Response No. 10 – Emergency Access, provided in this Final EIR.

(c) *Non-CEQA Transportation Analysis Requirements*

Several comments on the Draft EIR relate to parking, LOS, congestion, and delay on surrounding roadways during both construction and operation. Based on SB 743 and the City's TAG guidance, LOS, congestion, delay, and parking effects are no longer considered impacts on the environment and, therefore, such effects were not evaluated as CEQA impacts in the Draft EIR. As such, responses to comments on these issues are not required to be provided in this Final EIR, and are provided herein only for informational purposes independent of CEQA requirements.

The City, through the LADOT TAG, continues to require that transportation assessments analyze various non-CEQA transportation topics, such as pedestrian, bicycle and transit access, intersection operations, project access, construction period traffic effects, and residential street cut-through effects. The City's TAG also establishes various criteria for these analyses where corrective actions may be appropriate to address non-CEQA adverse effects. These issues are discussed in the non-CEQA portion (Chapter 4) of the TA prepared for the Project, which is included in Appendix M of the Draft EIR. The results of these analyses of non-CEQA topics and the proposed corrective actions identified in the TA would be addressed through potential Project conditions of approval.

*(d) Traffic Effects*

A number of comments on the Draft EIR raise concerns about the current level of traffic on Whitsett Avenue, the current level of congestion on nearby arterials, increases in traffic, increases in congestion, increases in traffic on residential neighborhood streets, and whether cumulative traffic issues with other large projects have been addressed. The issues related to these concerns are addressed in the subsections below and in Topical Response No. 12 - Related Projects: Adequacy of Cumulative Mobile Source Noise and Traffic Analyses. Note that pursuant to CEQA, the Project has no authority or responsibility to reduce or address existing traffic conditions on local roadways. Note also that future baseline increases on Whitsett Avenue without the Project, and, therefore, to which the Project would not contribute, are background conditions that are not considered to be the Project's impacts on the environment as those increases would occur without the Project.

*(i) Project Construction Traffic*

As discussed above, effects of the Project (including construction activities) on traffic LOS, congestion, and delay are not considered to be CEQA impacts and thus, are not required to be included in the Draft EIR. However, an analysis of the effects of Project construction on traffic was conducted in the TA as part of the "Non-CEQA" Transportation Assessment using the City's criteria for evaluating construction period effects, which require an evaluation of potential temporary traffic constraints (e.g., temporary lane closures), temporary loss of access (e.g., loss of vehicle, bicycle, or pedestrian access to nearby parcels), and temporary loss of bus stops or rerouting of bus lines. This evaluation is presented in Chapter 4 of the TA.

With regard to CEQA impacts, the Draft EIR analyzed the Project's construction activity impacts in regard to emergency access on page IV.M-44 in Section IV.M, *Transportation*, of the Draft EIR. As evaluated therein, the Project would not result in inadequate emergency access during construction. Please refer to Topical Response No. 10 – Emergency Access, which discusses emergency access during Project construction in further detail.

*(ii) Project Operations Traffic*

As discussed above, effects of the Project on traffic LOS, congestion, and delay are not considered to be CEQA impacts. Nonetheless, they are addressed in Chapter 4 of the TA (see Appendix M of the Draft EIR). As required by the LADOT TAG, this includes a quantitative analysis of the effects of the Project on intersection operations and driveway LOS, as well as on residential street traffic.

As discussed in Chapter 4 of the TA, this process consisted of conducting counts of existing traffic volumes at the study intersections and residential street segments, factoring the existing counts upwards to consider ambient traffic growth, estimating and adding traffic generated by other known related projects in the vicinity of the Project that were not constructed as of the time of the traffic counts (including both the commercial

project and the residential project at the Sportsmen's Lodge site), and estimating and adding traffic generated by the Project (including traffic generated by student shuttles, Harvard-Westlake athletic practices and games, employees, and community use of facilities on the Project Site). Two scenarios were evaluated: one representing a 90th percentile day<sup>172</sup> for all days of Harvard-Westlake use across a year (the Non-Event Scenario); and a second representing a day with a worst-case Special Event (500 attendees in single-occupant automobiles). The 500-attendee event is considered the worst-case Special Event from a traffic perspective because it would have an assumed average vehicle occupancy (AVO) of 1.0 and result in 500 vehicles, whereas attendees to the 2,000-attendee event would arrive via bus with an assumed AVO of 40, resulting in 50 vehicles. Further details regarding the methodologies used in this analysis can be found in the TA.

LADOT considers the Project's effects on operations to be constrained if the Project's traffic would contribute to unacceptable queuing on an Avenue or Boulevard (as designated in the Mobility Plan 2035) at project driveway(s) or would cause or substantially extend queuing at nearby signalized intersections. As evaluated in the TA, the Project would be considered to contribute to unacceptable or extended queuing if one of the following conditions is met after the addition of Project traffic:

1. Turn pocket capacity is exceeded and:
  - a. the projected peak hour intersection LOS is D and the turn lane queue increases by greater than 75 feet on any approach with the directional approach LOS at E or F, or
  - b. the projected peak hour intersection LOS is E or F and the turn lane queue increases by greater than 50 feet on any approach with the directional approach LOS at E or F.
2. Cross streets or alleys are blocked.
3. Gridlock congestion, which is defined as the condition where traffic queues between closely-spaced intersections and impedes the flow of traffic through upstream intersections.

Under the LADOT TAG, a local residential street would be considered excessively burdened if the new trips generated by the Project result in increases in average daily traffic (ADT) volumes as follows:

---

<sup>172</sup> Instead of the maximum day trip scenario, the analysis in the TA selected the 90th percentile total trips for each peak hour, as the 90th percentile would represent most days of the school year and exclude the exceptional days such as big rivalry game days that only occur on a handful of days a year.

<b>Projected ADT with Project (Final ADT)</b>	<b>Project-Related Increase in ADT</b>
1 to 999	120 or more
1,000 to 1,999	12% or more of final ADT
2,000 to 2,999	10% or more of final ADT
3,000 or more	8% or more of final ADT

As discussed in Chapter 4 of the TA, per the City’s criteria, no instances were found where the Project would cause or substantially contribute to unacceptable queuing at nearby study intersections under either the Harvard-Westlake athletic use (Non-Event) scenario or the worst-case Special Event scenario. At the Project’s north driveway, north-south through vehicles on Whitsett Avenue would be unimpeded and vehicles turning right to exit the Project driveway onto Whitsett Avenue would experience no worse than a LOS D (representing an average stopped delay of 25 to 35 seconds, acceptable for a stop-controlled movement) in the Non-Event scenario. Similarly, in the Non-Event scenario at the Whitsett Avenue and Valleyheart Drive intersection, north-south through vehicles on Whitsett Avenue would be unimpeded and vehicles turning from Valleyheart Drive to Whitsett Avenue would experience no worse than a LOS D. In the worst-case Special Event scenario, vehicles turning from the north driveway onto Whitsett Avenue may experience a LOS E (35 to 50 seconds of average delay) but vehicles turning from Valleyheart Drive onto Whitsett Avenue would experience a LOS F. However, this would primarily occur if all of the vehicles that are estimated to turn left from Valleyheart Drive to northbound Whitsett Avenue actually attempt to do so. In actuality, if conditions for a left-turn become this onerous, motorists will react and turn right instead, reducing the average delay. The corrective action suggested in the TA, prohibiting left turns from Valleyheart Drive to Whitsett Avenue on days with large Special Events, would further enforce this and would achieve LOS B. Since these large Special Events would be infrequent (and the methodology used to analyze the scenario assumes the worst-case AVO of 1.0), the TA suggests that to meet the corrective action, this could be accomplished by using traffic control officers as part of an event management plan to be developed with LADOT.

As discussed in Chapter 4, of the TA, per the City’s criteria, the Project would not create an excessive burden on any of the surrounding residential streets in either the Non-Event Scenario or the Special Event Scenario. That is, the City’s criteria for an impact to a residential street segment is the addition of 120 trips. As shown in Table 14 of the TA (PDF page 90 of 217 in Appendix M of the Draft EIR), none of the street segments analyzed in the TA would have 120 or more added trips from the Project during either the Non-Event or Special Event scenarios. The preferred driving route to access the Project Site would use local arterial roadways such as Coldwater Canyon Avenue, Moorpark Avenue, and Whitsett Avenue. The preferred driving route would be widely communicated to Project Site visitors (including Harvard-Westlake spectators, students, employees, and parents, visiting teams from other schools, and other public users of the Project Site)

through the School's website and reservation site. The School would maintain a progressive disciplinary system of enforcement for the preferred driving route, up to and including the loss of permission to park at the Project Site. As such, the majority of trips would use Whitsett Avenue to either Moorpark Street or Ventura Boulevard.

Cumulative traffic impacts are addressed in Topical Response No. 12 - Related Projects: Adequacy of Cumulative Mobile Source Noise and Traffic Analyses, in this Final EIR.

(e) *Parking Effects*

A number of comments on the Draft EIR raise concerns about the potential for parking spillover from the Project Site to residential streets in the surrounding neighborhood. While CEQA Guidelines Appendix G does not identify parking supply or the availability of parking as an environmental issue related to transportation impacts, the following discussions are provided for informational purposes in consideration of public comments inquiring about the Project's parking features.

(i) *Project Construction Parking*

Project Design Feature TRAF-PDF-1 described on page IV.M-26 in Section IV.M, *Transportation*, of the Draft EIR mandates that construction worker and equipment parking on the adjacent residential streets would be prohibited. As discussed in Chapter 4, *Mitigation Monitoring Program*, of this Final EIR, the mitigation monitoring program specifies that LADOT will serve as the monitoring and enforcement agency for the implementation of this PDF and requires the approval of the CMP prior to issuance of building permit, as well as periodic field inspections.

At 16.1 acres, the Project Site is sufficiently large to accommodate the construction worker and equipment parking on site. As discussed in Chapter 4 in the TA, the number of construction workers would vary throughout the construction period, with Phase 5 (architectural finishes) generating the highest number of employees: 140 workers on site per day on peak activity days. Even if all of these 140 employees were to be on site at the same time and assuming as a worst case that each employee drove to the site in a single-occupant vehicle, parking all of these vehicles would only require approximately five percent of the Project Site. Therefore, parking spillover would be controlled during Project construction and parking spillover to residential streets in the surrounding neighborhood would not occur.

(ii) *Project Operations Parking*

Project Design Feature TRAF-PDF-3 on page IV.M-27 in Section IV.M, *Transportation*, of the Draft EIR states the following:

**TRAF-PDF-3:** On days in which event attendance is expected to surpass 300 spectators, including parents and other spectators, students will not be permitted to drive to the Project Site and will be required to use the School's shuttle service. Shuttles will follow a prescribed driving route, travelling northbound on Coldwater

Canyon Avenue, turning right at Moorpark Street, and turning right onto Whitsett Avenue. Spectators will park on the Project Site, and tickets and parking passes will be required to enter the Project Site. Spectators without a parking pass will be directed to park on the School's Upper Campus and ride the School-provided shuttles to the Project Site. Parking in the neighborhood will not be permitted and will be enforced by security personnel.

A number of comments on the Draft EIR questioned the ability of Harvard-Westlake to enforce this PDF and to ensure that spectators do not park on residential streets. Concerns expressed included the viability of the proposed parking pass program, the inability of Harvard-Westlake security personnel to enforce rules on the public streets, signage, and congestion that may be caused by motorists who attempt to enter the Project Site without a parking pass.

To further clarify implementation of Project Design Feature TRAF-PDF-3, this PDF has been modified to include a Parking and Transportation Management Plan that would be employed by Harvard-Westlake School for all School-related athletic competitions or Special Events that are expected to draw more than 300 attendees. The Parking and Transportation Management Plan would include appropriate tools to manage and control traffic and parking for the competitions or events so that impacts to the surrounding areas are minimized. Potential measures would include, but are not limited to, a parking reservation system to manage attendance, off-site parking at the Harvard-Westlake Upper School campus, attendant-assisted parking, temporary increases in traffic management and parking personnel as needed, use of security personnel, signage, and other measures. See addition to Project Design Feature TRAF-PDF-3 in Chapter 3, *Revisions, Clarifications and Additions to the Draft EIR*, of this Final EIR. As noted in Chapter 3, the Parking and Transportation Management Plan would be submitted to LADOT for review and approval, and would be monitored for a minimum of three years with annual monitoring reports submitted to LADOT for review.

The use of a reservation system for participation in recreational activities and attendance at School-related or public events is discussed in Chapter II, *Project Description*, pages II-33 and II-34 of the Draft EIR. The implementation of a reservations program for public use of recreational facilities is to accommodate smoothly those who wish to use the School's facilities. Specifically, the requirement that groups or organizations be pre-approved ensures that the group or organization is able to provide appropriate supervision of its intended activities and participants, and that the group or organization is familiar with and abides by the conditions for use of the Project Site (including, but not limited to, preferred driving routes and the prohibition on parking in the neighborhood). Attendance at special events would also require reservations and parking passes to enter the Project Site. The reservation program would require communication and coordination between the School and attendees, including the use of assigned parking or access via the shuttle service from the Upper Campus. Security personnel would monitor "walk-ins" who may have parked within the off-site neighborhood and are not confirmed to be residents living in the neighborhood or arriving via public transportation. Such walk-ins

would be required to return to their vehicle and, if on-site parking is available return to park within the Project Site. It would be incumbent upon the School to communicate the protocol for use of facilities to attendees. Pedestrian access to the Project Site's athletic facilities would also be relegated to the pedestrian entrance located in proximity to Whitsett Avenue and Valley Spring Lane, which would facilitate pedestrian monitoring. The School's prohibition of off-site parking and the provided shuttle program would reduce the numbers of pedestrians less familiar with the area and would, thus, support pedestrian safety.

As discussed above, the School would implement a ticketing and parking pass reservation system to control the number of spectator or attendee vehicles allowed to park at the Project Site. Spectators or attendees receiving parking passes would be provided information regarding how to access the on-site parking garage. Once 300 parking reservations have been made, information would be provided to additional people reserving tickets that they will be required to park at the School's Upper School campus and be shuttled to the Project Site. Guests seeking to attend a School athletic competition or Special Event without a parking reservation would be denied access to the Project Site. Harvard-Westlake would inform other schools participating in athletic competitions and organizations planning special events of the rules regarding transportation and parking, including the ticketing and parking reservation system. These mechanisms would be enforced by Harvard-Westlake security, and violations could result in rescinding of permission to use the Project Site, temporarily or even permanently.

Regarding spectators or attendees who may attempt to enter the Project Site for an athletic event or special event without a parking pass, there is sufficient room within the Project Site to manage such motorists without causing congestion. For vehicles entering the northern driveway to the garage, security personnel would check for passes at the subterranean entry gate within the garage. If security determines that an entering vehicle does not have a parking pass, that vehicle would be quickly directed to a nearby location within the garage where security would then converse with the motorist, give them directions to exit the garage and travel to the Upper School campus, and then watch them actually exit the garage. For vehicles entering the garage from the southern driveway, security personnel would check for passes at the at-grade entrance to the garage. If security determines that an entering vehicle does not have a parking pass, that vehicle would be redirected to the roundabout and provided directions to the School's Upper School campus. Security personnel would watch the vehicle actually exit the roundabout back to Valleyheart Drive.

Regarding the ability of security personnel to enforce the on-street parking restriction, it is acknowledged that Harvard-Westlake has no authority to tell people what they can or cannot do in public places. Nevertheless, the Project Site is privately-owned and Harvard-Westlake can control access to its private property. If someone attempts to enter the Project Site for an athletic competition or special event, they would be stopped by security personnel. A good faith effort would be made by security personnel to determine where

the visitor has parked. If it is suspected that they parked in the neighborhood, they would be denied entrance. Such action is within the School's legal rights.

Regarding rideshare services, Harvard-Westlake would work with transportation network companies (TNCs), such as Uber and Lyft, to route TNC vehicles to the southern driveway and roundabout and to implement geofencing<sup>173</sup> along Whitsett Avenue.

(f) *Project with Design Modifications*

(i) *Construction Traffic*

The Project's design modifications are discussed under Topical Response No. 2 – Modifications to the Project Design. As discussed therein, the Project design modifications reduce the Project's soil excavation from 250,000 cubic yards to 197,000 cubic yards of soil to be exported off-site. This reduction in grading would reduce the number of haul truck trips from 35,714 trips to 28,142, a reduction of 7,572 truck trips.<sup>174</sup> This would reduce the excavation phase (with dirt hauling) from seven months to 5.5 months, although the overall construction schedule would still remain at approximately 30 months given overlapping construction phases. The daily maximum construction activity (or construction traffic) during excavation, upon which the comparison to the TA's non-CEQA evaluation factors are based, would not change. As such, aside from a shorter period of construction traffic during the excavation phase, the TA's evaluation of construction-related non-CEQA criteria related to potential temporary traffic constraints (e.g., temporary lane closures), temporary loss of access (e.g., loss of vehicle, bicycle, or pedestrian access to nearby parcels), and temporary loss of bus stops or rerouting of bus lines would not change with the Project's design modifications. The Project would implement the Project Design Feature TRAF-PDF-1 in the same manner with or without the Project design modifications.

(ii) *Operational Traffic*

As discussed under Topical Response No. 2 – Modifications to the Project Design, the Project's number of parking spaces would be reduced from 532 to 403, for a reduction of 129 spaces. The reduced number of parking spaces would have the effect of reducing traffic to/from the Project Site since no off-site parking would be permitted by the Project. That is, visitors that could have parked at the Project Site with the additional 129 spaces, would now be required to shuttle to the Project Site during those occasions when the on-site parking reaches capacity. The TA assumed circulation of three (3) shuttles between the Project Site and the Upper Campus. Under the Project with design modifications,

<sup>173</sup> Geofencing is a location-based technology service in which a mobile, desktop or cloud-based app or other software uses GPS, RFID (radio frequency identification), Wi-Fi or cellular data to trigger a pre-programmed action when a mobile device or RFID tag or mobile device enters or exits a virtual boundary set up around a geographical location, known as a geofence.

<sup>174</sup> The Project design modifications would result in a reduction in grading of 53,000 cubic yards. As each haul truck carries 14 cubic yards, that equates to a reduction of 3,786 trucks, or 7,572 truck trips.

assuming that most of the event attendees would arrive at the Upper School campus around the same time, shuttles would be operated at the maximum capacity of 24 passengers at a time, resulting in 6 additional shuttle round trips (129 passengers divided by 24 passengers per shuttle trip) between the Project Site and the Upper School campus over an approximate 1-hour period.

With regard to VMT, the Project as analyzed in the Draft EIR would result in a net decrease in VMT, and as such, VMT impacts would be less than significant. With the reduced traffic to/from the Project Site during larger events when the on-site parking may reach capacity, vehicle occupants that would have parked at the Project Site in the former 129 spaces would be shuttled from the Upper School campus. Per the TA, the majority of visitors to the Project Site would be exiting the US-101 freeway at Coldwater Canyon Avenue. From the Coldwater Canyon Avenue exit ramp, the distance to the Project Site via the preferred driving route is approximately the same as the distance to the Upper School campus. Since Harvard-Westlake students, other Harvard-Westlake visitors, and Special Event attendees all have the same average trip length to the Project Site as evaluated in the Draft EIR, the shift in parking from the Project Site to the Upper School campus for vehicles that could have parked at the Project Site without the Project design modifications would not substantially change the VMT for the Project. Since VMT is calculated based on average daily trips, under the Project with design modifications, the additional daily trip generation from the six (6) additional shuttle trips during special events when spread out over the course of the school year would be less than 1 trip per day and less than 1 daily VMT. The Project without design modifications has a total daily VMT of 3,932 daily VMT, thus, this incremental change in VMT would represent a fraction of one percent of the Project's daily VMT and would immaterially effect the daily VMT. Furthermore, noting that the Project would result in a net decrease of 2,098 daily VMT compared to existing conditions, the Project with design modifications would similarly result in a substantial decrease in VMT compared to existing conditions. As such, the same less than significant VMT impacts would occur for the Project with design modifications.

With regard to non-CEQA traffic impacts, the TA did include an analysis for informational purposes that analyzed the Project's effect on traffic conditions in 2025. Table 10 (PDF page 67 of 217 in Appendix M of the Draft EIR) of the TA included trip generation estimates for the Project, which included a maximum of 550 total (50 inbound and 500 outbound) trips during the 5-6 P.M. peak hour under the Special Events Scenario. Table 11 (PDF pages 75 and 76 of 217 in Appendix M of the Draft EIR) of the TA shows the levels of service (LOS) and vehicle queues for the study area intersections in 2025 (Project Opening Year) during non-events and Special Events. As shown in Table 11, per the City's criteria, no instances were found of the Project where its vehicle trips were projected to cause or substantially contribute to unacceptable queuing at nearby signalized intersections. As the Project with the design modifications would reduce the maximum outbound trips assigned to Whitsett Avenue, Moorpark Street, and Ventura Boulevard because of the reduced number of parking spaces, there would be a reduction in Project trips from the Project Site during the 5-6 P.M. peak hour Special Event scenario in Year 2025. Thus, there would generally be a minor decrease in traffic and queuing along these

roadways and serving intersections compared to that analyzed in the TA. Compared to the Project without design modifications, the additional vehicles parked at the Upper School campus could add up to 129 vehicle passenger trips leaving the Upper Campus school and six shuttle round trips (or 12 one-way trips to/from the Project Site) along Coldwater Canyon Avenue between the Upper School campus and Moorpark Street, including through the intersections of Coldwater Canyon Avenue/Ventura Boulevard and Coldwater Canyon Avenue/Moorpark Street. The addition of these trips would represent an incremental increase to peak hour existing traffic conditions compared to the Project without design modifications and would not substantially degrade intersection LOS at any of the study area intersections or trigger an operational issue based on the changes to queuing. Regardless, LOS outputs and queuing are non-CEQA issues that are not required to be analyzed in the Project's EIR.

Cumulative traffic impacts are addressed in Topical Response No. 12 - Related Projects: Adequacy of Cumulative Mobile Source Noise and Traffic Analyses, in this Final EIR.

*(iii) Parking*

During construction, while the Project design modifications would result in fewer overall haul truck trips, there would not be a substantial change in the number of on-site construction workers. Thus, the same parking features and analysis that was included in the Draft EIR for construction worker parking would apply to the Project with design modifications. As discussed above, there is adequate space on-site to accommodate all construction parking. As such, the Project design modifications would not have any effect on the construction parking.

The adequacy of parking for the Project is not considered a significant impact on the environment. As discussed under Topical Response No. 2 – Modifications to the Project Design, the Project's number of parking spaces would be reduced from 532 to 403, for a reduction of 129 spaces. With the reduced number of parking spaces, the Project would still prohibit off-site parking via implementation of Project Design Feature TRAF-PDF-3 and in the same manner as the Project without the modifications, as discussed above. The provided parking would be consistent with LAMC Section 12.21 A.4(e), which requires one parking space per five fixed seats for high schools, general assembly, and auditoriums. The Project with design modifications would provide a total of 2,005 seats. Divided by five, the required parking spaces would be 401 parking spaces. The requirement would be exceeded by two spaces under the Project with design modifications.

*(g) Traffic Signal at Whitsett Avenue and Valley Spring Lane Intersection*

Following circulation of the Draft EIR, the City installed a traffic signal at the intersection of Whitsett Avenue and Valley Spring Lane. The intersection of Whitsett Avenue and Valley Spring Lane was unsignalized at the time of publication of the Draft EIR. The Project's traffic consultant, Fehr & Peers, prepared a memorandum that documents the

implications to the findings of the Draft EIR for the Project resulting the City's recent installation of the traffic signal. The memorandum is included as Appendix L, Traffic Signal Memorandum, of this Final EIR.

The memorandum states the thresholds of significance for analyzing Project impacts and outlines how this change in intersection control type (i.e., a two-way stop-controlled intersection to a traffic signal) could affect the findings and conclusions of the TA in the Draft EIR. As concluded in the memorandum, the change in intersection control from unsignalized to signalized at the intersection of Whitsett Avenue and Valley Spring Lane does not affect the findings and conclusions identified in the Draft EIR (Section IV.M, *Transportation*) or the TA contained in Appendix M of the Draft EIR.

The change in intersection control from unsignalized to signalized at the intersection of Whitsett Avenue and Valley Spring Lane would not change the less-than-significant impact finding for the review for conflicts with plans, programs, ordinances, or policies. The VMT calculated for the Project would not be affected by the traffic signal. The traffic signal would not change the alignment of the adjacent roadways, the number or location of proposed pedestrian, bicycle, or vehicle accesses to the Project Site, or cause the Project to introduce other hazardous design features, nor would it effect freeway off-ramp safety. Also, the traffic signal would not affect emergency access for the Project construction phase nor for operational conditions.

Finally, the addition of the traffic signal would allow for pedestrian and bicycle crossings from the surrounding areas to the Project Site through the intersection in marked crosswalks, thus, enhancing pedestrian safety in the Project Site area.

### (3) Conclusion

As discussed above, the CEQA transportation impacts and the non-CEQA construction and operational traffic effects and parking components of the Project are appropriately addressed in the Draft EIR and/or the TA provided as Appendix M to the Draft EIR. Thus, no new or additional analysis is required for these issues. As discussed above, the Project with design modifications would not result in significant new or substantially increased environmental impacts as evaluated in the Draft EIR.

## j) Topical Response No. 10 – Emergency Access

### (1) Introduction

This topical response addresses comments received on the Draft EIR regarding emergency access and effects to operations at the adjacent Los Angeles Fire Department (LAFD) Fire Station 78. The purpose of the evaluation of fire protection services in Section IV.L.1, *Public Services – Fire Protection*, of the Draft EIR is to consider whether the Project would result in substantial adverse physical impacts associated with the provision of new or physically altered government facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for fire protection services. In addition, pages IV.M-44 to IV.M-46 in Section IV.M, *Transportation*, of the Draft EIR evaluated whether the Project would result in inadequate emergency access as required pursuant to Appendix G of the CEQA Guidelines.

### (2) Discussion

#### (a) Existing Conditions

As shown in Table IV.L.1-3, *Fire Stations Located in the Project Vicinity*, of the Draft EIR, LAFD Fire Station 78 at 4041 Whitsett Avenue is located nearest and adjacent to the Project Site. Per the City's ZIMAS website, LAFD Fire Station 78 is the first due fire station for the Project Site. The other four stations named by LAFD that would provide support for fire protection services to the Project Site are LAFD Fire Stations 108, 86, 102, and 97, located (by driving distance) approximately 2.5 miles south, 2.6 miles east, 2.9 miles north, and 2.9 miles southeast, respectively, of the Project Site. The closest fire station with an Engine Company is LAFD Fire Station 108, and the closest station with a Truck Company is LAFD Fire Station 78.

As discussed in Section IV.M, *Transportation*, page IV.M-18 of the Draft EIR, the primary driveway for LAFD Fire Station 78 is used for the departure of the larger fire trucks from the station bays. This driveway is located on Whitsett Avenue, north of Valleyheart Drive. The station also has two driveways on the north side of Valleyheart Drive. Of these two driveways, the westerly driveway is used for the return of the larger fire vehicles, which swing wide and use most of the Valleyheart Drive roadway to enter the fire station before proceeding to the bays in the station building. The easterly driveway to the fire station is used for the entry and departure of smaller vehicles, such as ambulances.

#### (b) Project Improvements

Vehicle parking for the Project would be provided at grade and in an underground parking area located on the eastern portion of the Project Site. Vehicles would enter the Project Site on Whitsett Avenue via the primary driveway located approximately 725 feet south of Valley Spring Lane (to the north of Field A) (referred to as north driveway) and via a secondary driveway at the western end of the existing paved portion of Valleyheart Drive

located just south of LAFD Fire Station 78 (referred to as south driveway). Both driveways would provide access to the proposed single-level underground parking structure. No new driveways would be installed along Valley Spring Lane or Bellaire Avenue. The Project would eliminate two existing potential conflict locations by removing the existing service driveway on Valley Spring Lane and the existing driveway egress to the north of LAFD Station 78. All emergency vehicles, including fire trucks/engines, could enter the Project Site via the south driveway and smaller emergency vehicles, such as ambulances and trucks, could also access the Project Site via the north driveway.

To minimize conflicts with emergency vehicles exiting LAFD Fire Station 78, a flashing red warning light(s) would be installed on the southern exit driveway within the Project Site at a location before vehicles reach Valleyheart Drive to hold back vehicles exiting the Project Site roundabout onto Valleyheart Drive. This warning light would be activated by a remote control button pressed by LAFD staff in the emergency vehicle when it is approaching Valleyheart Drive from Whitsett Avenue or exiting from one of the two LAFD driveways on Valleyheart Drive. This feature is identified as Project Design Feature TRAF-PDF-2 on page IV.M-28 in Section IV.M, *Transportation*, of this Draft EIR. The remote control is discussed in more detail below.

(c) *Project Impacts*

(i) *Construction*

The Project would include temporary construction activities (e.g., temporary lane closures, etc.) and generate construction traffic that could potentially affect emergency access to the Project Site and surroundings. The Project would not require construction activities that would take place within the right-of-way, which would necessitate temporary lane, alley, or street closures for more than a day at a time. Furthermore, emergency access would be maintained at all times as no road closures would be necessary. Although construction activities would not require full street closures (i.e., at least one travel lane would be open at all times in both directions) and most Project construction activities would be confined to the Project Site, the Project would implement a Construction Management Plan (CMP) (see Project Design Feature TRAF-PDF-1) to reduce the potential for traffic-related conflicts.

With implementation of Project Design Feature TRAF-PDF-1, the majority of construction-related traffic, including hauling activities and construction worker trips would occur outside the typical weekday commuter a.m. and p.m. peak periods. The Project would also employ temporary traffic controls, such as flag persons, to control traffic movement during temporary traffic flow disruptions. Traffic management personnel would be trained to assist in emergency response by restricting or controlling the movement of traffic that could interfere with emergency vehicle access. Appropriate construction traffic control measures (e.g., detour signage, delineators, etc.) would also be implemented, as necessary, to ensure emergency access to the Project Site and traffic flow are maintained on adjacent rights-of-way, as well as minimizing response times. Furthermore, pursuant to California Vehicle Code (CVC) Section 21806, the drivers of emergency vehicles are

able to avoid traffic by using sirens to clear a path of travel or by driving in the lanes of opposing traffic to respond to emergencies in a timely manner.

As discussed in Section IV.L.1, *Public Services – Fire Protection*, of the Draft EIR, with the short-term nature of the construction activities and with implementation of a CMP, the Project's construction activities would not result in the need for a new fire station or the expansion of an existing facility, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios. In addition, as discussed in Section IV.M, *Transportation*, of the Draft EIR, the Project would not result in inadequate emergency access during construction. Therefore, impacts regarding fire protection services and emergency access during Project construction would be less than significant.

(ii) *Operation*

As indicated above, LAFD Station 78 is located on the north side of Valleyheart Drive, which serves as access to the Project's southern, secondary driveway. As part of the Project design and per Project Design Feature TRAF-PDF-2, a flashing red warning light(s) would be installed on the southern exit driveway within the Project Site at a location before vehicles reach Valleyheart Drive to hold back vehicles exiting the Project Site roundabout onto Valleyheart Drive. The primary objective of the warning light is to assist the return of the fire trucks and other vehicles to the fire station via Valleyheart Drive, as the vehicle turning radii for some of the vehicles are large and require the width of the entire Valleyheart Drive roadway to maneuver. There are two LAFD driveways on the north side of Valleyheart Drive that may use this warning light – the eastern driveway is used for the departure and return of the smaller emergency apparatus and the western driveway is used for the return of the larger fire trucks.

The warning light would help to minimize conflicts between vehicles leaving the Project Site's 17 space surface parking lot and emergency vehicles leaving/returning to the station. Further, the warning light would minimize eastbound queues by vehicles leaving the Project Site along Valleyheart Drive at Whitsett Avenue when emergency vehicles need to access Valleyheart Drive. Although not required, the warning light could be activated by LAFD, at their discretion, during the initial stages of response mobilization, before LAFD vehicles actually depart, allowing any inbound or outbound vehicles at the Project Site to clear the LAFD driveways on Valleyheart Lane, effectively maintaining unfettered emergency vehicle access to the fire station. Also, the Project would include an at-grade security kiosk located near the roundabout with a security guard nearby to assist with traffic management when the warning light is activated. Additionally, the southern driveway for the subterranean parking garage would allow for vehicular entry only; all vehicles exiting from the subterranean parking garage would do so via the north driveway onto Whitsett Avenue, which would reduce vehicular traffic on Valleyheart Drive and potential conflicts with the LAFD Station 78 driveway on Whitsett Avenue (refer to Chapter II – *Project Description*, page II-53). Finally, the site plan for the Project would be reviewed by the LAFD prior to issuance of a building permit as part of standard

permitting and plan check requirements to ensure that all emergency vehicle safety requirements (including those related to emergency access) are met.

While Project Design Feature TRAF-PDF-2 does not require the emergency responders to use the remote controls, and the findings in the Draft EIR do not change if the remote controls are not used, it provides an option if emergency responders observe impediments from vehicles exiting the Project Site and choose to use the remote control. If they choose not to use the remote control in the event of an emergency, smaller apparatus and other emergency vehicles departing using the eastern LAFD driveway on Valleyheart Drive would still be able to employ the traditional method of sirens and horns to alert other drivers of their presence. Valleyheart Drive, with a right-variable roadway width of at least 26 feet, also provides enough roadway width for smaller LAFD emergency vehicles to maneuver around other vehicles on Valleyheart Drive as necessary. In regard to the return of larger fire trucks that need to swing wide on Valleyheart Drive to enter the western LAFD driveway, returning vehicles would not be responding to an emergency situation. If the emergency responders choose to not activate the remote control warning light, it is likely that they would simply have personnel hold traffic on Valleyheart Drive while the truck enters the driveway. Such a technique is commonly used at fire stations when, for example, returning apparatus needs to back into a fire station from a public street.

Regarding the design and capacity of Valleyheart Drive at the Project's roundabout, as stated on page II-53 of the Draft EIR, Section II, *Project Description*, of the Draft EIR, the roundabout is designed to accommodate passenger vehicles, shuttles, garbage trucks, as well as emergency vehicles. The capacity of the roundabout to accommodate turning fire trucks is illustrated in Figure 3-3, *Fire Truck (NCHRP Report Aerial Fire Truck) Autoturn*, in Chapter 3, *Revisions, Clarifications, and Corrections*, of this Final EIR. Figure 3-3, which is added to Appendix M, *Transportation Assessment*, of the Draft EIR, is intended to clarify the adequacy of the turnaround.

It is acknowledged that at certain times, such as at the end of a large interscholastic competition or following a School or community Special Event, the Project would temporarily increase traffic on surrounding roadways. However, the area surrounding the Project Site includes an established street system, consisting of freeways, primary and secondary arterials, and collector and local streets, which provide regional, sub-regional, and local access and circulation within the local Project vicinity. Based on the Project Site's location within a highly urbanized area of the City, the streets surrounding the Project Site were designed as standard streets in terms of pavement width and thickness, curb and gutter, and horizontal and vertical curvature. Therefore, the street system surrounding the Project Site is not considered substandard and would be able to adequately accommodate event vehicle trips and traffic. As mentioned below, none of the streets adjacent to the Project Site are a City-designated disaster route that would be impacted by event traffic.

Emergency response is routinely facilitated, particularly for high priority calls, through the use of sirens to clear a path of travel (including bypassing of signalized intersections), by driving in the lanes of opposing traffic pursuant to CVC Section 21806, and by deploying multiple station response. In addition, because of the grid pattern of the local street system and the proximity to multiple freeways, each of the fire stations that serves the Project Site have multiple routes available to respond to emergency calls at the Project Site.

Operation of the Project would not include the installation of barriers (e.g., perimeter fencing, fixed bollards, etc.) that could impede emergency vehicle access to the Project Site and the Project vicinity. Furthermore, the Project's driveways and internal circulation would be designed to incorporate all applicable City Building Code and Fire Code requirements regarding Project Site access, including requirements to provide adequate emergency vehicle access. Such features would help to ensure fire response times are not substantively increased.

Compliance with applicable Los Angeles Building Code and Fire Code requirements would be demonstrated as part of LAFD's fire/life safety plan review and LAFD's fire/life safety inspection for new construction projects, as set forth in Los Angeles Municipal Code (LAMC) Section 57.118, and which are required prior to the issuance of a building permit. As discussed in Section IV.L.1, *Public Services - Fire Protection*, of the Draft EIR, impacts on fire protection services from Project implementation would be less than significant. In addition, as discussed in Section IV.H, *Hazards and Hazardous Materials*, of the Draft EIR, none of the streets adjacent to the Project Site are a City-designated disaster route.

In response to the City's request for information from LAFD on the Project, the LAFD letter included in Appendix L-1 of the Draft EIR stated:

"The Los Angeles Fire Department continually evaluates fire station placement and overall Department services for the entire City, as well as specific areas. The development of this proposed project, along with other approved and planned projects in the immediate area, may result in the need for the following: 1. Increased staffing for existing facilities. (I.E., Paramedic Rescue Ambulance and EMT Rescue Ambulance resources.) 2. Additional fire protection facilities. 3. Relocation of present fire protection facilities."

The above statement is standard language in the LAFD responses to development projects. The LAFD letter also includes a number of listed recommendations pertaining to firefighting personnel and apparatus access. LAFD in their letter states that, "[t]he inclusion of the above listed recommendations, along with any additional recommendations made during later review of the proposed project will reduce the impacts to an acceptable level."

At this time, LAFD has not identified any plans for constructing a new station in the Project area as a result of the Project-specific or cumulative impacts in the service area. If LAFD determines that new facilities are necessary at some point in the future, such facilities (1) would occur where allowed under the designated land use, (2) would be expected to be located on parcels that are infill opportunities on lots that are typically between approximately 0.5 to 1 acre in size (similar to nearby Stations 78, 108, 86, 102 and 97), and (3) could qualify for a Categorical Exemption under CEQA Guidelines Section 15301 or 15332 or Mitigated Negative Declaration and would not be expected to result in significant impacts. Therefore, development of a station at this scale is unlikely to result in significant impacts and projects involving the construction or expansion of a fire station, if needed in the future, would be addressed independently pursuant to CEQA.

(d) *Project with Design Modifications*

As discussed in Topical Response No. 2 – Modifications to the Project Design, design modifications relating to seating, lighting, building design (swimming pool area and gymnasium), reduced parking, grading, storm water capture and reuse system, and water features were made to the Project in response to public and agency comments received on the Draft EIR. However, none of the design modifications directly or indirectly affect emergency access to the Project Site and as such, the impact analysis and conclusions included in the Draft EIR are not affected by the Project design modifications.

(3) **Conclusion**

Overall, despite the Project's periodic and temporary increase in localized traffic, the Project would not significantly impair the LAFD from responding in a timely manner to emergencies at the Project Site or the surrounding area. The Project would provide for emergency access into the Project Site and would not substantially interfere with emergency access in the surrounding neighborhood such that response times are substantively increased. The Project would also provide a warning light system to maintain adequate access for emergency vehicles to enter and return to the adjacent LAFD Fire Station 78 to ensure that interference with station operation would not occur. In addition, the inclusion of LAFD's applicable recommendations provided in their letter, dated February 20, 2021, along with LADOT's recommendations as presented on PDF pages 6 and 7 of 217 in Appendix M of the Draft EIR, along with any additional recommendations made during standard permitting and plan check requirements would further ensure adequate emergency access is provided by the Project. In conclusion, as discussed in Section IV.L.1, *Public Services – Fire Protection*, and Section IV.M, *Transportation*, and as summarized above, impacts to fire protection services, including operations at LAFD Fire Station 78, as well as emergency access associated with LAFD Fire Station 78, would be less than significant. Moreover, the analysis in Section IV.L.1 of the Draft EIR concluded that Project operation would not result in the need for a new fire station or the expansion of an existing facility, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection.

## k) Topical Response No. 11 – Recreation: Golf and Tennis Facilities

### (1) Introduction

This topical response addresses comments received on the Draft EIR regarding the effects of the removal of the existing private golf and tennis facilities on the local community. Also, comments were received that inquired about the public's ability to use the on-site recreation facilities, including at times when the on-site facilities may be in full or partial use by Harvard-Westlake School (School). In accordance with the thresholds contained in Appendix G of the CEQA Guidelines, the Draft EIR evaluated Project impacts on parks and recreational facilities and considers whether the Project would increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of these facilities would occur or be accelerated, and whether the Project includes recreational facilities or requires the construction or expansion of recreational facilities that might have an adverse physical effect on the environment. CEQA Guidelines Section 15131 specifically states that social effects of a project which do not cause a physical change to the environment "shall not be treated as significant effects." Therefore, the Draft EIR does not address the effects of the removal or relocation of recreational facilities on the expectations or preferences of recreationists, such as what time of day Project or alternate facilities might be available to the public. The development of the Project's recreational facilities that would be available for public use was a primary subject of the Draft EIR and addressed throughout the document. Draft EIR Section IV.L.3, *Parks and Recreation*, also evaluated the effects of the removal of the golf course and driving range and reduction in tennis facilities with respect to secondary impacts on off-site, existing public parks and recreational facilities.

### (2) Discussion

#### (a) Existing Recreational Facilities

As discussed in Chapter II, *Project Description*, and Section IV.L.3 of the Draft EIR, the School purchased the Weddington Golf & Tennis Club in 2017. The School has maintained operation in the interim and allows the public, for a fee as with the prior Weddington Golf & Tennis Club, to use the existing, nine-hole, 27-par golf course and 16 lighted tennis courts. Additional existing facilities include a putting green, a 25-stall driving range, and café. The hours of operation are from 7:00 a.m. to sunset daily for the golf course, 7:00 a.m. to 11:00 p.m. daily for the driving range, and 7:00 a.m. to 10:00 p.m. daily for the tennis courts.

The School's uses, following the acquisition, have consisted of tennis team practices and tournaments on a portion of the tennis courts and occasional use of the driving range and golf course by the School's golf teams and summer camp. The majority of tennis courts are used for lessons with paid instructors, and open courts are available to the public throughout the day. The current demand for the on-site tennis courts, on average, is 96 one-hour sessions per weekday and 78 one-hour sessions per weekend day. This

indicates that the courts are not used to maximum capacity at any period throughout a typical weekday or weekend as maximum capacity consists of 240 one-hour sessions per day (16 courts available for 15, one-hour sessions).

The golf course, which plays 911 yards, is generally available to walk in (non-reservation) golfers, and serves on average approximately 100 golfers per weekday. Demand increases during the weekends to approximately 150 golfers per day (individuals, not groups of golfers). Since the course is typically played in groups of two to four, with groups of four comprising most weekend rounds, this would represent 25 to 50 rounds per weekday, and 38 to 50 rounds per weekend day (note this demand, as discussed below, was high during the Covid lockdown of indoor recreational facilities). The existing use represents a fraction of the use of a typical nine-hole golf course, which is approximately 250 rounds per day (or 500 to 1,000 golfers per day assuming that each round at municipal courses is played by two to four golfers) based on usage data provided by the City of Los Angeles Department of Recreation and Park (RAP) municipal golf courses.<sup>175</sup> The practice/driving range serves approximately 185 golfers per weekday and 250 golfers per weekend day. Although not specifically surveyed, based on the range of existing golfers' zip codes maintained by the operator, it is estimated that the existing golfers come from areas throughout the San Fernando Valley and areas of west Los Angeles and Hollywood.

*(b) Other Golf and Tennis Facilities in the Region*

The Draft EIR includes a survey of the availability and capacity of other golf and tennis facilities in the region that could serve the Project Site's displaced tennis players during construction and operation, and the golfers displaced by the permanent removal of the Project Site's golf facilities (other than the putting green which would remain under the Project). Table IV.L.3-4 on pages IV.L.3-15 and IV.L.3-16 of the Draft EIR provided a list of tennis courts in the East San Fernando Valley available to the public and determined that 71 courts would be available to the existing users of the Project Site. In addition, based on existing players' zip codes, the Draft EIR determined that some players who use the Project Site's tennis facilities also reside in Hollywood, Burbank, Toluca Lake and areas within the west Los Angeles basin, and would have more convenient access to additional public tennis facilities in those communities, which are not listed in Table IV.L.3-4.

The Draft EIR also includes a survey of nine-hole golf courses in the region, which were listed in Table IV.L.3-5 on page IV.L.3-17 of the Draft EIR. The golf courses included courses operated by the RAP and private, nine-hole golf courses. Similar to Weddington Golf Course, all of the seven identified off-site courses were available to the public for a

<sup>175</sup> City of Los Angeles Department of Recreation and Parks, City of Los Angeles Golf Courses, Management Desk, telephone conversation, March 26, 2021; City of Los Angeles Department of Recreation and Parks, City of Los Angeles Golf Division, email from Rick Reinschmidt, Acting Golf Manager, rick.reinschmidt@lacity.org, April 5, 2021. See footnote Nos. 25 and 26 on page IV.L.2- 26 of the Draft EIR.

fee. A survey performed for the Draft EIR in March and April 2021 determined that same-day tee times were available for the Roosevelt Municipal Golf Course, the Los Feliz Municipal Golf Course, the Rancho Park Municipal Golf Course, the Penmar Municipal Golf Course, and the private Van Nuys Golf Course. The municipal golf courses were open to the public between 6:30 a.m. and 6:45 p.m. and were able to accommodate up to 250 rounds per day. The Van Nuys nine-hole golf course accommodates a maximum of 300 rounds of golf per day on a “first come, first served” basis and had daily availability. Regarding municipal courses, the RAP’s Reservation Desk described the Los Feliz Golf Course as being particularly light, with tee times available throughout the weekday and weekends. All of the golf courses remained open during Covid-19 restrictions and the survey would be conservative given that these facilities may have absorbed additional recreationists for which other recreational facilities were closed.

(c) *Analysis Methodology*

Because the Project would result in the removal of existing private, fee-only recreational facilities, including a nine-hole, 27-par golf course and driving range and eight of the existing 16 tennis courts, the Draft EIR evaluated the effects of shifting the Project Site’s current users to other existing facilities. The existing putting green would remain onsite as part of the Project. The analysis of impacts to parks and recreational facilities in the Draft EIR identifies the potential demand that would be generated by the Project and the potential for that additional demand to result in the deterioration of existing facilities or need for expansion of existing and/or construction of new off-site facilities. The Draft EIR analysis also considered the extent to which park and recreational facilities provided by the Project would fulfill the RAP’s goals and policies and reduce demand for existing, off-site facilities.

(d) *Effects of the Project on Off-Site Recreational Facilities*

The Project’s construction and operation would require the relocation of existing Project Site users. As discussed on pages IV.L.3-20 through IV.L.3-27 in Section IV.L.3 of the Draft EIR, relocated tennis players would have access to 71 free and fee-required public courts in the San Fernando Valley East Tennis League network. According to the RAP websites for fee-required tennis courts, certain courts, such as the Sherman Oaks Tennis Center and the Encino Balboa Tennis Center, require reservations. The lead times for reservations, as accessed on the RAP websites on February 11, 2021, were from less than one day to three days, which indicate the availability of open courts throughout a typical week. Based on existing players’ zip codes, demand from relocated players would be spread over a large area and would not focus entirely on the courts nearest the Project Site. Regarding public tennis courts that require reservations, the reservation system at off-site courts would control the hours and rate of use, reduce the overall wear and tear on the concrete courts, and ensure that usage would not exceed the design capacity of the affected facilities. Therefore, the use of off-site tennis courts would not require the provision of new or upgraded public tennis courts in order for RAP to maintain adequate service ratios.

Table IV.L.3-6, *Projected Capacity of Future, On-Site Tennis Courts*, on page IV.L.3-25 in Section IV.L.3, *Parks and Recreation*, of the Draft EIR, shows the existing demand of the sixteen onsite tennis courts and the projected future demand of the Project's eight tennis courts. Future demand is based on the existing public usage of the sixteen tennis courts, which does not include the School's existing usage of the courts. As shown in Table IV.L.3-6, the existing sixteen courts provide to the public, on average, 96 sessions during a single weekday (480 sessions per week) and 78 sessions during a weekend day (156 sessions per week), for a total weekly average of 636 sessions. The weekly sessions total in Table IV.3-6 has been corrected in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR, to reflect 636 weekly existing sessions. This session total only consists of public and teaching professional uses, and does not include School uses.

The Project would develop eight new tennis courts that could be used simultaneously by both the School and the public when not in full use by the School. The eight future tennis courts would have the capacity to accommodate at least 88 public sessions per weekday (440 sessions per week) and 112 public sessions per weekend day (224 sessions per week), for a total weekly capacity of 664 sessions. The weekly sessions total in Table IV.L.3-6 has been corrected in Chapter 3 of this Final EIR, to reflect a capacity of 664 weekly sessions. The table reflects the School's use of the tennis courts on weekdays between 3:00 p.m. and 6:00 p.m., which is a conservative assumption since the School would not use all eight courts every weekday during the year, particularly during summer months and School breaks. As shown in Table IV.L.3-6, in Chapter 3 of this Final EIR, there are on average 480 existing weekday and 156 weekend sessions, for a total of 636 existing weekly sessions. On weekends, there would be adequate capacity offered by the Project's eight courts to accommodate the same number of existing sessions, other than between the hours of 8:00 a.m. and 11:00 a.m. Although the weekday capacity would be eight sessions less than the existing average daily use, the weekend (per day) capacity would be 34 sessions more than the current average use. In addition, School-associated tennis activities would generally not occur on the weekends. Over a period of a week, the Project would accommodate 664 weekly sessions, which is greater than the current use of 636 weekly sessions, and as such would have adequate capacity to accommodate the existing average weekly sessions. However, as discussed on pages IV.L.3-20 and IV.L.3-25 in Section IV.L.3 of the Draft EIR, available capacity of the future onsite tennis courts could depend on the willingness of existing players to shift their preferred hours of use. Although this could cause inconvenience to some players, those who have preferred hours not available at the Project Site have other tennis court choices throughout the local area. The choice of some existing players to relocate to off-site courts would not increase demand at RAP facilities that would cause significant deterioration nor require the construction of new facilities.

The Project would also result in the relocation of approximately 100 weekday and 150 weekend daily golfers. Assuming golfers would seek out similar nine-hole, par-3 playing opportunities (a conservative assumption since some golfers may transition to using full, 18-hole golf courses), this would increase demand on the private Van Nuys nine-hole golf

course and the City's four nine-hole golf courses (e.g., Roosevelt Golf Course, Los Feliz Golf Course, Rancho Park, and Penmar Golf Course), and would increase demand on the region's driving ranges. As with the RAP's fee-required tennis facilities, golf course activity is generally conducted on a reserved tee-time basis. A survey of the websites of the nearby Van Nuys Golf Course and four municipal courses in the area determined that tee times are available daily. Although demand for golfing has increased during the COVID-19 pandemic because outdoor activities, such as golf, are permitted by Los Angeles County COVID-19 health guidelines while other types of recreational activity, such as indoor racquetball and basketball facilities, have been closed or open on a limited or intermittent basis, the City of Los Angeles Golf Courses Reservation Desk described the Los Feliz Golf Course as being light, typically reaching less than 80 percent of its 250-round per day capacity. This indicates that the Los Feliz Golf Course would have at least 50 unfilled, or available, rounds per day. The Rancho Park golf course was also described by the RAP's Reservation Desk as below capacity during weekdays but closer to capacity on weekends. As previously stated, the Project Site's golf course serves, on average, 100 individuals on each weekday and 150 individuals on each weekend day. In groups of two to four (standard practice for golf courses), this represents 25 to 50 rounds per weekday, and 38 to 50 rounds per weekend day (groups of four are encouraged on busier weekends at all golf courses). Because existing municipal golf courses have available capacity to accommodate the relocated golfers from the Project Site without exceeding the RAP's service ratio of 250 rounds per day for municipal courses (the daily round capacity of the Los Feliz and Rancho Park Golf Courses), the relocation of golfers would not increase demand at a level that would foreseeably require the provision of new or reconstructed public golf courses. As discussed on page IV.L-20 and IV.L.3-27 in Section IV.L.3 of the Draft EIR, the use of other, offsite courses could potentially inconvenience existing golfers but would not result in a significant impact with respect to CEQA thresholds.

(e) *Overall Onsite Public Recreational Opportunities*

As described in Section IV.L.3 of the Draft EIR, the Project would provide all-day public access to 5.4 acres of landscaped open space and a 0.75-mile pedestrian pathway which would provide direct access through the Project Site from Valley Spring Lane to the Zev Greenway. The open space and pathway would be open to the public daily from 7:00 a.m. to 9:00 p.m. Other public uses include the use of the community room in the gymnasium building in an area that lacks neighborhood park facilities. Other facilities, such as the multi-purpose athletic fields, swimming pool, gymnasium, and eight tennis courts, would be available for public use with reservations when not in use by the School. As described on page II-47 in Chapter II, *Project Description*, of the Draft EIR, most of the School's outdoor activities, including those at the athletic fields, would occur in the late afternoons and would end between the hours of 4:45 p.m. to 7:45 p.m., with approximately 50 percent of school days containing no outdoor athletic activities after 5:30 p.m. (based on the School's 2018-2019 athletics calendar). As shown by the estimated schedule of activity, School-sponsored athletic activities would occur for a limited number of hours, leaving recreational facilities available for public use the majority of the day. As discussed above, the availability of the onsite tennis courts could depend on the willingness of existing

players to shift their preferred hours of use. The hours and days of operation for public use of onsite facilities are outlined in Chapter II, Table II-3, *Public Use Days and Hours*, of the Draft EIR. Public use would also include the continued use of the clubhouse, café, and putting green. Please refer to Topical Response No. 3, *Enforcement of Public Access*, in this Final EIR which describes the public's guaranteed use of the Project Site.

Relocated golfers would increase demand on RAP's 9 hole par 3 golf courses, which have been shown to have available capacity to serve existing Weddington golfers, and would temporarily increase demand on off-site public tennis courts during construction. The Project, however, would be able to accommodate existing public demand for tennis courts during operation. Since the off-site golf courses would be able to accommodate relocated golfers and the Project would be capable of accommodating existing tennis players and provide other recreational facilities to the public within the Project Site during operation, the Draft EIR correctly determined that the Project would not increase demand at off-site golf or tennis facilities such that the substantial or accelerated physical deterioration of public park and recreational facilities would occur, or require the construction or expansion of recreational facilities that would have an adverse physical effect on the environment.

#### (f) *Project Design Modifications*

As discussed in Topical Response No. 2 – Modifications to the Project Design, design modifications relating to seating, lighting, building design (swimming pool area and gymnasium), parking, grading, stormwater capture and reuse system, and water features were made to the Project in response to comments received on the Draft EIR. However, none of the design modifications directly or indirectly affect the use or availability of the on-site recreation facilities by the public, including the tennis courts or pathways. As such, the recreational impact analysis and conclusions included in the Draft EIR are not affected by the Project design modifications.

### (3) Conclusion

Based on the discussions above and analysis included in the Draft EIR, the Project Site's current golfers would be accommodated at other golf facilities without exceeding their capacity. Tennis players who use the existing Project Site tennis courts could also be accommodated at other facilities during construction without exceeding their capacity. After completion of Project construction, tennis players would have access to the eight new onsite tennis courts. Furthermore, the proximity of the Project Site to the surrounding residential neighborhood and the provision of recreational opportunities and park uses that do not currently exist in the area, would reduce demand on other local park facilities (excluding public tennis and golf facilities). The Project's recreational facilities would reduce demand for off-site parks and recreational uses and meet the criterion of neighborhood park uses within walking distance of the surrounding neighborhood, as well as provide the highest priority recreational uses (walking paths) and high priority uses (gymnasium and swimming pool) identified in the RAP's Citywide Community Needs Assessment for the South San Fernando Valley geographic area. Therefore, the Project

would not cause the substantial or accelerated physical deterioration of public park and recreational facilities, and would not require the construction or expansion of recreational facilities that would have an adverse physical effect on the environment.

As discussed above, the recreational impacts of the Project are appropriately addressed in the Draft EIR. Further, the Project with design modifications would not directly or indirectly effect the use or availability of the on-site recreation facilities by the public and as such, the impact analysis and conclusions included in the Draft EIR are not affected by the Project design modifications. As such, the Project with the design modifications would not result in significant new or substantially increased environmental impacts as evaluated in the Draft EIR.

## **I) Topical Response No. 12 – Related Projects: Adequacy of Cumulative Mobile Source Noise and Traffic Analyses**

### **(1) Introduction**

This topical response addresses comments received on the Draft EIR concerning potential impacts of the Project and related projects and the adequacy of the cumulative mobile source (or traffic) noise and transportation/traffic impact analyses. The topical response also discusses the cumulative noise effects that would occur under the Project with the modified design. The information presented below pertaining to the related projects list is based on the content provided in Chapter III, *Environmental Setting*, of the Draft EIR. The cumulative traffic noise impact analysis was provided in Section IV.K, *Noise*, of the Draft EIR, which was supported by a noise technical report, prepared by Acoustical Engineering Services, Inc. dated March 2022, and included as Appendix K of the Draft EIR (entitled *Noise Technical Report – Harvard-Westlake River Park Project*). The mobile source noise analysis was based on traffic data included in the Harvard-Westlake River Park Project Transportation Assessment (TA), prepared by Fehr & Peers dated April 2021, which is included in Appendix M of the Draft EIR. The TA also served as the primary basis in preparing Section IV.M, *Transportation*, of the Draft EIR.

### **(2) Discussion**

#### **(a) Related Projects - CEQA Guidelines Section 15130**

As discussed on pages III-3 through III-5 in Chapter III of the Draft EIR, Section 15130 of the CEQA Guidelines requires that an EIR consider the environmental effects of a proposed project individually as well as cumulatively. As defined in CEQA Guidelines Section 15355, cumulative impacts refer to two or more individual effects, which, when considered together, are considerable or which compound or increase other environmental impacts.

As set forth in CEQA Guidelines Section 15130, the determination of cumulative impacts is generally a two-step process. The first step is to determine whether or not the combined effects from the project and related projects would result in a potentially significant cumulative impact. If the answer is no, then the EIR only briefly needs to indicate why the cumulative impact is not significant and is not discussed in further detail in the EIR. If the answer is yes, then the analysis proceeds to the second step, which is to determine whether the project's incremental effects are cumulatively considerable. CEQA Guidelines Section 15065(a)(3) defines "cumulatively considerable" to mean that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects. In accordance with CEQA Guidelines Section 15130(a)(3), a project's contribution is less than cumulatively considerable if the project is required to implement or fund its fair share of a mitigation measure or measures designed to alleviate

the cumulative impact. In addition, the lead agency is required to identify facts and analyses supporting its conclusion that the contribution will be rendered less than cumulatively considerable.

CEQA Guidelines Section 15130(b) further provides that the discussion of cumulative impacts reflect “the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great of detail as is provided for the effects attributable to the project alone.” Rather, the discussion is to “be guided by the standards of practicality and reasonableness, and should focus on the cumulative impact to which the identified other projects contribute.”

CEQA Guidelines Section 15130(b) states that complying with one of the following two protocols is necessary to provide an adequate discussion of significant cumulative impacts:

- (A) A list of past, present, and probable future projects producing related or cumulative impacts including, if necessary, those projects outside the control of the agency; or
- (B) A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency.

Cumulative study areas are defined based on an analysis of the geographical scope relevant to each particular environmental issue. Therefore, the cumulative study area for each individual environmental impact issue may vary. For example, a cumulative land use impact generally may only affect the compatibility of uses within the vicinity of the project site, while a cumulative air quality impact may affect the entire South Coast Air Basin. The specific boundaries and the projected growth within those boundaries for the cumulative study area of each environmental issue are identified in the applicable environmental issue section in Chapter IV, *Environmental Impact Analysis*, of the Draft EIR. For cumulative noise and transportation impacts, as applicable, a list of related projects was determined appropriate for analyzing cumulative impacts. Note that for cumulative VMT impacts under CEQA requirements, the VMT for the related projects is not applicable as the Project’s VMT impacts would be less than significant and consistent with the 2020-2045 RTP/SCS VMT reduction goals.

A list of proposed development projects in the area of the Project that could affect conditions in the Project area (e.g., by generating population increases requiring public services, increase in traffic, etc.) was prepared based on information obtained from the City of Los Angeles Department of Transportation (LADOT) and the Department of City

Planning. A total of five (5) potential related development projects were identified within the vicinity of the Project Site for inclusion in the cumulative impact analysis for the Draft EIR. These related projects are in varying stages of the approval/entitlement/development process and reflect the diverse range of land uses in the vicinity of the Project Site and the location of the Project Site in an urban, built-out environment. Specifically, the related projects comprise a variety of uses, including apartments, retail, restaurant and other mixed-use land uses. The list of five (5) identified related projects is provided in **Table III-1, Related Projects List**, of the Draft EIR, with the locations of each of the related projects presented in **Figure III-1, Related Projects Map**, of the Draft EIR.

According to the LADOT Transportation Assessment Guidelines (TAG), related projects are new development projects within a one-half mile radius of the Project Site plus one-quarter mile from the farthest outlying intersection. As part of the related projects, both development projects at the Sportsmen's Lodge were included. There are two separate Sportsmen's Lodge projects (No. 1 and No. 5) identified in the related projects list. The first (Related Project No. 1) is the replacement of the event/banquet facility with a shopping center with a gym (Equinox is the tenant) and various retail stores, which was approved in 2015, has already been built and is at or near full operation, with initial operations occurring in late 2021. The second (Related Project No. 5) is a more recent project, which would involve the demolition of a hotel and the construction of apartments and restaurant/retail uses that is currently undergoing its own discretionary City review process.

(b) *Cumulative Traffic Noise Analyses*

(i) *Cumulative Construction Traffic Noise*

As discussed on page IV.K-70 in Section IV.K, *Noise*, of the Draft EIR, Related Project No. 1, which was at or near completion at the time the Draft EIR was in preparation, was conservatively included in the Project's cumulative noise analysis. In other words, the analysis of cumulative construction traffic noise in the Draft EIR conservatively assumed that construction of all of the related projects, including Related Project No. 1, could occur at the same time as the Project. This is a conservative assumption because it assumes that the Sportsmen's Lodge projects (Related Projects Nos.1 and 5) could generate construction truck traffic at the same time as the Project and that these related projects, when added together with the Project, could generate an increase in cumulative construction traffic noise levels (even though, as indicated above, Related Project No. 1 opened in late 2021 and would therefore not have construction activities that would overlap with construction of the Project).

As shown in Table IV.K-10 of the Draft EIR, the Project would not result in any significant off-site construction noise impacts due to construction trips. The roadway in the vicinity of the Project Site that would have off-site construction noise levels from Project construction trucks closest to the significance threshold would be Whitsett Avenue (between Moorpark Street and Ventura Boulevard) during construction months 3-5, which

would have a maximum of up to 25 truck trips per hour<sup>176</sup> and would generate a noise level of approximately 64.0 dBA Leq (67.3 dBA when added to existing ambient noise), where the threshold of significance is 69.6 dBA Leq.

It is acknowledged on page IV.K-71 of the Draft EIR that if construction of the related projects would overlap with Project construction and construction trucks would utilize the same roadway network as the Project, cumulative off-site construction noise level increases could occur in the Project vicinity. For the purposes of the analysis, the number of construction trucks from related projects that would be needed to exceed the significance threshold was estimated to determine the potential for impacts. Based on the analysis, related projects contributing more than 38 truck trips per hour (i.e., a 150 percent increase from the Project's maximum anticipated number of hourly truck trips) would result in a cumulatively considerable contribution to off-site construction noise and impacts would be significant, assuming that the trucks from the related projects travel on the same roadway segments as the Project, including on Whitsett Avenue (between Moorpark Street and Ventura Boulevard). Related Project Nos. 2, 3, and 4 are on the order of one acre or less in size each and, therefore, would not be expected to generate a sizeable number of truck trips. These related projects would not cumulatively contribute 38 or more truck trips per hour due to the limited amount of construction activity on such small sites. However, as per the Draft EIR's assumption that all five (5) of the related projects, including the Sportsmen's Lodge projects (Related Projects Nos. 1 and 5, despite the start of operation for Related Project No. 1 in late 2021), could generate construction truck traffic at the same time as the Project, it is possible that truck traffic from multiple related projects could potentially overlap on some days with the Project and generate noise in excess of the significance threshold.

Regarding mitigation measures, as discussed on page IV.K-76 of the Draft EIR, residential land uses comprise the majority of existing sensitive uses in the Project Site vicinity that could be impacted by the temporary increase in construction traffic-generated noise levels. Installation of temporary sound barriers to mitigate vehicular noise would be inappropriate for residential land uses that face the roadway as it would be impractical and would create aesthetic and access concerns. Thus, there are no feasible mitigation measures that could be implemented to reduce the temporary cumulative off-site construction traffic noise impacts. Therefore, given that it is possible, albeit unlikely since Related Project No. 1 began partial operation in late 2021, that the Project and related projects could contribute to cumulative off-site construction traffic noise levels that could exceed a significance threshold, and that there are no feasible mitigation measures, cumulative off-site construction traffic noise impacts would be temporarily significant and unavoidable. The analysis of construction traffic noise impacts meets the applicable requirements of CEQA Guidelines Section 15130 and no further analysis is required.

---

<sup>176</sup> While the Project would generate up to 50 truck trips per hour (inbound plus outbound), Whitsett Avenue between Moorpark Street and Ventura Boulevard would have inbound truck trips north of the Project Site and outbound truck trips south of the Project Site. Therefore, no portion of Whitsett Avenue would have both inbound and outbound truck trips.

*(ii) Cumulative Operational Traffic Noise*

Cumulative operational traffic noise impacts are discussed on pages IV.K-73 and IV.K-74 of the Draft EIR. As discussed therein, the Project and related projects in the area would produce off-site traffic volumes that would generate roadway noise. Roadway noise levels were projected using the Federal Highway Administration's (FHWA) Traffic Noise Model (TNM) and the roadway traffic volumes provided in the TA for the Project. Cumulative noise impacts due to off-site traffic were analyzed by comparing the projected increase in traffic noise levels from "existing" conditions to "future plus project" conditions to the applicable significance criteria. The "future plus project" conditions include traffic volumes from future ambient growth, related projects, and the Project. The traffic volume data is provided in the TA, prepared by Fehr & Peers dated April 2021, which is included in Appendix M of the Draft EIR.

Comments were received regarding the traffic volume data for the existing conditions scenario, which does not include operational traffic from the Sportsmen's Lodge projects. The Sportsmen's Lodge shopping center with gym and retail uses was recently completed and began operation in late 2021 (Related Project No. 1). The Sportsmen's Lodge apartments and restaurant/retail uses are not yet entitled or constructed (Related Project No. 5). Although Related Project No. 1 may currently contribute to ambient noise levels, the modeling of noise levels associated with existing conditions without Related Project No. 1 reflected a lower existing condition. The level of cumulative impact is the relative change between existing and future conditions. By not including the modeled traffic volume from Related Project No. 1 to the existing conditions scenario, traffic from Related Project No. 1 was added to the traffic noise generated by the Project and other related projects. As such, the Draft EIR analysis results in a slightly conservative traffic noise assessment. Note that, because the decibel scale used for noise analysis is a logarithmic calculation, sound energy is logarithmically added together (modeled) to obtain a resultant combined noise level. Using a slightly lower traffic volume for the existing condition means that the Project's and Related Project's incremental contribution to traffic noise would result in a slightly greater incremental increase in the traffic noise level. However, the exclusion of the traffic volume from Related Project No. 1 for the existing conditions scenario has little reductive effect on the Project's impact analysis given the Project's negligible modeled impact. As shown in Table IV.K-18 on page IV.K-53 of the Draft EIR, the Project's incremental change in traffic noise from operation ranges from approximately -0.3 dBA Leq (a slight reduction) to 0.2 dBA Leq (a slight increase). Even if the traffic volume from Related Project No. 1 were to be included for the existing conditions scenario, the Project's incremental change in traffic noise would be on the order of a change in the tenth decimal place (i.e., a change of less than 1 dBA Leq). As stated on page IV.K-5 of the Draft EIR, a change of 3 dBA in ambient noise levels is considered to be a barely perceivable difference for human hearing. Thus, given that the Project's incremental change in traffic noise levels, with or without the traffic volume from Related Project No. 1, would be on the order of a change in the tenth decimal place, the Project would result in a change in traffic noise levels far less than the significance

threshold, as defined on page IV.K-27 of the Draft EIR. As such, as concluded in the Draft EIR, the Project would have a less than significant impact.

As stated above, the “future plus project” conditions include traffic volumes from future ambient growth, related projects (including the Sportsmen’s Lodge projects [Related Project No. 1 and Related Project No. 5]), and the Project. Table IV.K-25 on page IV.K-74 of the Draft EIR provides a summary of the cumulative off-site traffic noise analysis under the “future (2025) plus project” condition. With regard to the traffic-related noise levels generated by the “future plus project” conditions, the traffic under this scenario accounted for trips generated by all the related projects, including the Sportsmen’s Lodge projects, as well as inclusion of an ambient growth factor of 0.6 percent per year applied to adjust the baseline year traffic volumes to reflect the effects of regional growth and development. This adjustment was applied to the baseline year (2020) traffic volume data to reflect the effect of ambient growth by the year 2025. LADOT approved this methodology to reflect regional growth and development based on consideration of the City of Los Angeles’ traffic demand model as part of the approved Memorandum of Understanding (MOU) (included in Appendix A in the TA), which outlines the methodology and assumptions included as part of the TA. This approach and methodology is consistent with standard City practice for evaluating cumulative impacts.

As indicated in Table IV.K-25, cumulative traffic noise during the 3-4 p.m. hour would result in a maximum increase of 0.5 dBA along Coldwater Canyon Avenue (between Moorpark Street and Ventura Boulevard) and Ventura Boulevard (between Coldwater Canyon Avenue and Whitsett Avenue). Cumulative traffic noise increases at all other analyzed roadway segments would be less than 0.5 dBA. During the 5-6 p.m. hour, the cumulative traffic noise increase on a Special Event day would result in a maximum increase of 1.1 dBA occurring along Coldwater Canyon Avenue (between Moorpark Street and Ventura Boulevard) and Ventura Boulevard (between Coldwater Canyon Avenue and Whitsett Avenue). All other analyzed street segments would have a cumulative traffic noise increase of 1 dBA or lower. The estimated cumulative noise increases would be well below the 5-dBA significance threshold. Therefore, the Project’s contribution to off-site traffic noise would not be cumulatively considerable, and off-site cumulative traffic noise impacts associated with the Project would be less than significant.

Based on the above, the analysis of operational traffic noise impacts meets the applicable requirements of CEQA Guidelines Section 15130 and no further analysis is required.

### (c) *Cumulative Traffic Analyses*

Section IV.M, *Transportation*, of the Draft EIR, analyzed the potential Project impacts based on the TA, prepared by Fehr & Peers dated April 2021, which is included in Appendix M of the Draft EIR. The TA was prepared in accordance with the LADOT’s TAG adopted in July 2019 and updated in July 2020, and pursuant to an MOU approved by LADOT on June 3, 2020, documenting its assumptions and technical methodologies. The TAG sets forth the methodology for analyzing the CEQA Guideline’s Appendix G transportation thresholds, including the City’s adopted VMT thresholds and evaluation of consistency

with CEQA Guidelines Section 15064.3, subdivision (b). In accordance with SB 743 and Section 15064.3 (b), the State mandates that traffic congestion is not considered a CEQA impact. The LADOT MOU is included in Appendix A of the TA. LADOT reviewed the TA and provided an approval letter of the TA on June 11, 2021, which is included in Appendix M of the Draft EIR.

In accordance with the TAG, the CEQA-required analysis to be included within the Draft EIR section includes an assessment of whether the Project would result in: 1) potential conflicts with transportation-related plans, ordinances, or policies; 2) a substantial increase in vehicle miles traveled (VMT); or 3) increased hazards due to a geometric design feature or incompatible use. In addition, in accordance with Appendix G of the CEQA Guidelines, an assessment of whether the Project would result in inadequate emergency access is included. These required CEQA issues do not include traffic impacts from the Project or related projects related to levels of service (LOS), which in general terms, analyze traffic congestion at local intersections. These “non-CEQA” issues are discussed below.

The TAG also requires assessment of “non-CEQA” transportation issues, which include: 1) pedestrian, bicycle, and transit access; 2) project access, safety, and circulation; 3) construction traffic; and 4) residential street cut-through analysis. The analyses of these “non-CEQA” issues are included in the TA along with the aforementioned LOS analysis. However, since they are non-CEQA items, they are not analyzed in the Draft EIR unless they relate to the assessment of potential conflicts with transportation-related plans, ordinances, or policies mentioned above.

As part of the non-CEQA analyses, the TA did include an analysis of intersection LOS and queuing, which evaluated the Project’s traffic relative to signalized and unsignalized intersections in the local Project vicinity during the projected opening year (2025) of the Project. This analysis included traffic/trips generated by all the related projects, including both developments at the Sportsmen’s Lodge, as well as inclusion of an ambient growth factor of 0.6 percent per year applied to adjust the baseline year traffic volumes to reflect the effects of regional growth and development. As shown in Tables 11a and 11b on PDF pages 75 and 76 of 217, respectively, of the TA, per the City’s criteria, no instances were found where the Project was projected to cause or substantially contribute to unacceptable queuing at the study area intersections.

Also, LADOT approved the related projects list concurrently with the Project’s MOU in June 2020. It is common for related projects to be in varying stages of construction and/or phases of the City’s entitlement process at the time of a project’s MOU approval by LADOT. In June 2020, a definitive fully operational date for Related Project No. 1 would have been speculative nearly 1.5 years before operations commenced for Related Project No. 1. Thus, it would not have been reasonable to delay the Project’s TA due the status of Related Project No. 1. Related Project No. 1 was ultimately approved by LADOT in June 2021, with construction activities initiating in late 2021. Since Related Project No. 1 did not commence construction activity until late 2021, it was appropriately excluded from

the Baseline 2020 Year traffic conditions evaluated in the TA. However, traffic volumes from Related Project No. 1, as well as all the other related projects, were appropriately accounted for as part of the non-CEQA transportation analysis (i.e., level of service analysis) using City-approved methodologies in the TA for the Project's Opening Year 2025 buildout condition.

*(d) Project Design Modifications*

*(i) Cumulative Construction Traffic Noise*

The Project's design modifications are discussed under Topical Response No. 2 – Modifications to the Project Design. As discussed therein, due to the reduced footprint of the subterranean parking garage, the Project design modifications reduce the Project's soil excavation from 250,000 cubic yards to 197,000 cubic yards of soil to be exported off-site. This reduction in grading would reduce the total number of haul truck trips from 35,714 trips to 28,142, a reduction of 7,572 truck trips. This would reduce the excavation phase (with dirt hauling) from seven months to 5.5 months, although the overall construction schedule would still remain at approximately 30 months given overlapping construction phases. As explained in the Draft EIR on pages IV.K-34 and IV.K-35, noise impacts are analyzed based on the maximum daily activity.

While the Project design modifications would result in a reduction in the duration of the excavation activities, the daily maximum construction activity during excavation, upon which the comparison to traffic and noise standards are based, would not change. As such, since the maximum daily construction activity and mobile source noise would be the same as analyzed in the Draft EIR, the cumulative mobile source analysis and significant and unavoidable cumulative mobile source noise impact in the Draft EIR is not changed due to the Project design modifications. However, the duration of the cumulative off-site mobile source noise impacts related to excavation activities would be reduced.

*(ii) Cumulative Operational Traffic Noise*

As discussed under Topical Response No. 2 – Modifications to the Project Design, the Project design modifications would reduce the number of subterranean parking from 503 spaces to 386 spaces, and reduce the number of surface lot spaces from 29 to 17 spaces. Overall, the number of parking spaces would be reduced from 532 to 403, for a reduction of 129 spaces. The reduced number of parking spaces would have the effect of reducing traffic along Moorpark Street, Whitsett Avenue, and Ventura Boulevard, to/from the Project Site since no off-site parking would be permitted by the Project. That is, visitors that could have parked at the Project Site with the additional 129 spaces, would now be required to shuttle from the Upper School campus to the Project Site during those occasions when the on-site parking could reach capacity. The TA assumed circulation of three (3) shuttles between the Project Site and the Upper School campus. Under the Project with design modifications, assuming that most of the event attendees would arrive at the Upper School campus around the same time, shuttles would be operated at the maximum capacity of 24 passengers at a time, resulting in 6 additional shuttle round trips

(129 passengers divided by 24 passengers per shuttle trip) between the Project Site and the Upper School campus.

As indicated on page IV.K-73 of the Draft EIR, the Project and related projects in the area would produce off-site traffic volumes that would generate roadway noise. Table IV.K-25, *Cumulative Off-Site Roadway Traffic Noise Impacts*, on page IV.K-74 of the Draft EIR provides a summary of the cumulative off-site traffic noise analysis under the “future (2025) plus project” condition. As indicated in Table IV.K-25, the maximum cumulative traffic noise increase would be 1.1 dBA along Coldwater Canyon Avenue (between Moorpark Street and Ventura Boulevard) during the Future (2025) condition with the Project and during a Special Event, assuming Left-Turn out would not be allowed at Valleyheart Drive. This increase would be a less than significant impact. Any potential decrease in Project traffic along Moorpark Street, Whitsett Avenue, and Ventura Boulevard with the design modifications could incrementally reduce the cumulative traffic noise level increases identified in Table IV.K-25, which are all below 1.1 dBA and well below the 5-dBA significance threshold. Compared to the Project without design modifications, which would result in a maximum 0.6 dBA noise level increase along Coldwater Canyon between Moorpark Street and Ventura Boulevard (see Table IV.K-18 on page IV.K-53 of the Draft EIR), the shift in traffic (vehicles or shuttles) to the Upper School campus along Coldwater Canyon would have a negligible effect on noise levels of less than approximately 1 dBA. This would be an imperceptible change in noise levels under the Project with design modifications compared to the Project without design modifications. Accordingly, even with additional traffic on Coldwater Canyon south of Moorpark from vehicles/shuttles going to/from the Upper School campus, the resulting cumulative noise level increase would be less than approximately 1.7 dBA with the cumulative change in traffic noise levels being less than significant, similar to the impact conclusion in the Draft EIR.

### (iii) *Cumulative Operational Traffic*

As discussed above and under Topical Response No. 2 – Modifications to the Project Design, the number of parking spaces would be reduced from 532 to 403, for a reduction of 129 spaces. The reduced number of parking spaces would have the effect of reducing traffic to/from the Project Site since no off-site parking would be permitted by the Project. That is, visitors that could have parked at the Project Site with the additional 129 spaces, would now be required to shuttle from the Upper School campus to the Project Site during those occasions when the lot could reach capacity. The TA assumed circulation of three (3) shuttles between the Project Site and the Upper School campus. Under the Project with design modifications, assuming that most of the event attendees would arrive at the Upper School campus around the same time, shuttles would be operated at the maximum capacity of 24 passengers at a time, resulting in 6 additional shuttle round trips (129 passengers divided by 24 passengers per shuttle trip) between the Project Site and the Upper School campus.

Note that for cumulative VMT impacts under CEQA requirements, the VMT for the related projects is not applicable as the Project’s VMT impacts would be less than significant and

consistent with the 2020-2045 RTP/SCS VMT reduction goals. Pursuant to Section 2.2.4 of LADOT's TAG, cumulative VMT impacts are based upon consistency with the RTP/SCS. Therefore, a less than significant impact conclusion for the Project without and with design modifications, in combination with demonstrated consistency with the RTP/SCS, is sufficient to demonstrate that there is no cumulative VMT impact.

The TA did include a non-CEQA analysis for informational purposes that analyzed the Project's effect on traffic conditions in 2025 with the related projects considered. Table 10 (PDF page 67 of 217 in Appendix M of the Draft EIR) of the TA included trip generation estimates for the Project, which included a maximum of 550 total (50 inbound and 500 outbound) trips during the 5-6 P.M. peak hour under the Special Events Scenario. Table 11 (PDF pages 75 and 76 of 217 in Appendix M of the Draft EIR) of the TA shows the levels of service (LOS) and vehicle queues for the study area intersections in 2025 (Project Opening Year) during non-events and Special Events. As shown in Table 11, per the City's criteria, no instances were found of the Project where its vehicle trips were projected to cause or substantially contribute to unacceptable queuing at nearby signalized intersections.

As the Project with the design modifications would reduce the maximum outbound trips during a Special Events Scenario based on the reduced number of parking spaces, there would be a reduction in Project trips assigned to Whitsett Avenue, Moorpark Street, and Ventura Boulevard during the 5-6 P.M. peak hour Special Event scenario with the related projects in Year 2025. Thus, there would be a decrease in traffic and queuing from traffic along these roadway segments compared to that analyzed in the TA. Compared to the Project without design modifications, the additional vehicles parked at the Upper School campus could add up to 129 vehicle passenger trips leaving the Upper Campus school and six shuttle round trips (or 12 one-way trips to/from the Project Site) along Coldwater Canyon Avenue between the Upper School campus and Moorpark Street, including through the intersections of Coldwater Canyon Avenue/Ventura Boulevard and Coldwater Canyon Avenue/Moorpark Street. The addition of these trips would represent an incremental increase to peak hour existing traffic conditions compared to the Project without design modifications and would not substantially degrade intersection LOS at any of the study area intersections or trigger an operational issue based on the changes to queuing. Regardless, LOS outputs and queuing are non-CEQA issues that are not required to be analyzed in the Project's EIR.

### (3) Conclusion

As discussed above, both the cumulative mobile source (traffic) noise analysis in Section IV. K, *Noise*, in the Draft EIR, and the cumulative LOS analysis (a non-CEQA component) in the TA appropriately analyzed and included traffic generated by the related projects, including traffic generated by both related projects at the Sportsmen's Lodge. Thus, the respective analyses meet the applicable requirements of CEQA Guidelines Section 15130 for analyzing cumulative impacts and no new or additional analysis is required for these issues.

Modifications to the Project design as described in Topical Response No. 2 would not result in any new or significant off-site transportation or traffic noise impacts and therefore, would not contribute to a new significant impact or a substantial increase in the severity of cumulative impacts compared to the Project without the design modifications.

Refer to Topical Response No. 9 – Transportation and Parking During Construction and Operations, for further discussion on the Project’s transportation impacts.

## m) Topical Response No. 13 – Need for Project (Non-CEQA)

The City received comments that challenged the need for the Project; however, these comments do not represent a challenge to the sufficiency of the Draft EIR. An EIR is not intended or required to provide justification or demonstrate the need for a particular project, as the criteria by which a project's need might be evaluated is subject to significant variability and, often, subjective assessment. Rather, as required by CEQA, an EIR is intended to serve as an informational document to provide public agencies and the public with information about the potential effect(s) that a proposed project is likely to have on the environment, to list ways in which the significant effect(s) of such a project might be minimized, and to indicate alternatives to such a project. Notwithstanding the above, this topical response addresses comments related to the need for the Project for informational purposes.

Nine specific Project Objectives were identified in Chapter II, *Project Description*, on pages II-13 and II-14 of the Draft EIR. Primary among them is the construction of new athletic facilities for future generations of Harvard-Westlake students. The Draft EIR also states that “[t]he underlying purpose of the Project is to supplement the School’s athletic and recreational facilities, and provide Harvard-Westlake School a campus that can fulfill its educational mission and athletic principles now and in the future.” Objectives specifically include the development of a state-of-the-art indoor and outdoor athletic and recreational facility to support the School’s existing athletic programs and co-curricular activities; to provide opportunities for shared use of a variety of types of recreational facilities and activities for the community; and to provide opportunities for academic use of the Project Site through science labs and outdoor classes, bird watching, and other non-athletic school activities.

Though comments were received that the Project’s athletic facilities might replace those that already exist on the Upper School campus, the Project’s multipurpose fields, tennis courts, pool, and gymnasium would in fact supplement the School’s existing facilities, not replace them. Existing facilities are currently space-constrained, impinging on student participation, limiting the formation of new sports programs, capping the number of teams that can be supported within an existing sport, creating crowded and potentially unsafe practice conditions, reducing the possibility of intramural sports programs, and shifting athletic activities later into evening hours. The shortage has been derived from multiple factors over the years that increased program interest and scope and worsened constraints affecting available athletics spaces (e.g., spaces that are available fewer hours per day).

First, the number of existing athletics facilities at the Upper School campus are the same in 2022 as they were in the 1980s, despite changes that have significantly increased the number of students participating in athletics. Second, the overall desire of students to participate in sports, which has increased significantly since the 1991 merger that led to Harvard-Westlake. Since 2000, participation rates increased by 55 percent of students to

over 70 percent of students. The third factor stems from a California Interscholastic Federation (CIF) rule change that took effect in 2008 that allowed practices, conditioning, and competition for a single sport to take place year-round (the CIF governs sports programs for participating high schools). For many high schools with robust sports programs, the result of the rule change was that coaches immediately began to schedule conditioning and practice sessions during their team's non-competition season. Instead of two or three in-season teams coordinating use of a single facility during the same week, multiple out-of-season teams now needed to schedule space as well.

For Harvard-Westlake, the combination of these three factors have resulted in heightened stresses being placed on the School's longstanding and largely unchanged athletics facilities. As previously stated, the underlying purpose of the Project is to supplement the School's athletic and recreational facilities, and provide Harvard-Westlake School a campus that can fulfill its educational mission and athletic principles now and in the future, which can be implemented by an expansion of existing athletic and recreational facilities.

### 3. Responses to Comments

#### Comment Letter No. AG 1

Mathew Craig, Inspector II  
Los Angeles Fire Department  
Received April 11 and April 19, 2022

#### Comment No. AG 1-1

I received a notice of extension regarding this case. Please advise if you need anything from LAFD, I have recently taken over this process and do not know if you have received a response previously. I do not have a current request or proof of payment regarding a response request.

#### Response No. AG 1-1

*The below response was provided via e-mail by Kimberly Henry with the Department of City Planning on April 18, 2022.*

“Hi Inspector Craig,

We previously sent the LAFD Service Letter Request regarding this project, to LAFD (Captain Mittino at the time) on October 28, 2020, at the time that the Notice of Preparation was sent out for the Draft EIR. I then received LAFD's response on February 20, 2021. Therefore, as far as I know, I've received what we needed from LAFD for this project, unless you have additional comments on the project that you would like to provide.

I've attached the original Service Letter Request and the Response from LAFD that I received, for your reference. Please let me know if you need anything from me for this project, or if you'd like to provide any additional comments to us on the Project from LAFD.”

The comment explains that the commenter is new to the process and inquires whether anything is needed of the Los Angeles Fire Department (LAFD) at this time. This comment does not raise any issues with respect to the content and adequacy of the Draft EIR. Nonetheless, to clarify the comment, the Department of City Planning previously sent the LAFD Service Letter Request regarding this Project to then-LAFD Captain Mittino on October 28, 2020, at the time that the Notice of Preparation was sent out for the Draft EIR. The Department of City Planning then received LAFD's response on February 20, 2021. Therefore, the City has received what it needed from LAFD for this Project. However, if there are any additional comments on the Project that the LAFD would like to provide, those comments would be forwarded to the decision makers.

## **Comment No. AG 1-2**

*The below response was provided via e-mail by Matthew Craig with LAFD on April 19, 2022.*

“As long as there have been no major changes to the scope of this project our original response remains the same. thank you”

## **Response No. AG 1-2**

*The below response was provided via e-mail by Kimberly Henry with the Department of City Planning on April 20, 2022.*

“No, there have been no major changes to the scope of this project.

Thank you for confirming that LAFD's original response remains the same. Have a great rest of your week!”

The above response by the Department of City Planning re-affirm no changes are needed to LAFD's original public service letter. This comment does not raise any issues with respect to the content and adequacy of the Draft EIR. Thus, no further response is necessary.

## **Comment Letter No. AG 2**

Marshall Styers  
Environmental Specialist  
Environmental Planning and Assessment  
Los Angeles Department of Water and Power  
Received April 15 and April 19, 2022

### **Comment No. AG 2-1**

*The below e-mail was provided by LADWP on April 19, 2022.*

The Los Angeles Department of Water and Power (LADWP) is submitting a comment letter for the Harvard-Westlake Project. I have also attached the notification letter we received regarding the project for your reference. Please let me know if you have any questions, and thank you for the opportunity to provide comments on this project.

### **Response No. AG 2-1**

The comment indicates LADWP has provided a comment letter on the Project, which is addressed below in Response Nos. AG 2-2 to 2-7. This comment does not raise any issues with respect to the content and adequacy of the Draft EIR. Thus, no further response is necessary.

### **Comment No. AG 2-2**

*Comment Nos AG 2-2 to AG 2-7 were included in a letter dated April 15, 2022*

The Los Angeles Department of Water and Power (LADWP) appreciates the opportunity to provide comments on the Harvard-Westlake River Project (Project) Draft Environmental Impact Report. The mission of LADWP is to provide clean, reliable water and power to the City of Los Angeles. Based on our review of the Project Initial Study we respectfully submit the below comments.

### **Response No. AG 2-2**

The comment expresses appreciation for the opportunity to comment on the Project and describes LADWP's mission in providing clean, reliable water and energy to the City. The comment also introduces comments to be provided below but does not, in itself, comment on the adequacy or content of the Draft EIR. As such, no further response is necessary.

## Comment No. AG 2-3

### Comments:

#### Joint:

- 1) The City of Los Angeles, herein referred to as City, shall pertain to its employees, agents, consultants, contractors, officers, patrons, or invitees of the City, or by any other of the City's affiliated entities.
- 2) This response shall not be construed as an approval for any project.

## Response No. AG 2-3

The comment clarifies the definition and persons who are referred to as the City, but does not discuss the contents or adequacy of the Draft EIR. As such, no further response is necessary. However, as is requested in the comment letter, the LADWP's comments shall not be construed as an approval of the Project.

## Comment No. AG 2-4

### Water System:

#### IV. Environmental Impact Analysis I. Hydrology and Water Quality

1. The project description on page IV.I-28 indicates that the construction will require grading, excavation and dewatering activities below the historical groundwater level. These activities could potentially impact and/or deplete the San Fernando Basin's (SFB) groundwater supplies, a principle groundwater resource in the Upper Los Angeles River Area (ULARA). The City of Los Angeles (City) relies on groundwater from the SFB to supply its over four million customers. The City has prior and paramount pueblo water rights to the native ground waters rights, as well as the right to store and recapture water, as set forth in the judgment in *The City of Los Angeles v. City of San Fernando*, Los Angeles Superior Court Case No. 650079, dated January 26, 1979 (ULARA Judgment). To avoid impacting the City's rights, the project should incorporate the following:
  - a. Establish communication with the court appointed ULARA Watermaster, Richard C. Slade & Associates LLC, 14051 Burbank Boulevard, Suite 300, Sherman Oaks, CA 91401, Phone (818) 506-0418, <http://ularawatermaster.com/> and LADWP staff Mr. Manuel Aguilar at (213) 367-3465 or via email at [Manuel.Aguilar@ladwp.com](mailto:Manuel.Aguilar@ladwp.com). The ULARA Judgment requires safe yield operations for the SFB to ensure groundwater extractions over the long-term do not create a condition of overdraft. Basin management in SFB is achieved by collective efforts of a court-appointed Watermaster and an administrative committee consisting of representatives from the City's LADWP and other public water supply agencies.

- b. Install flow meters on extraction wells and report extractions to LADWP. Contact LADWP staff Mr. Manuel Aguilar at (213) 367-3465 or via email at Manuel.Aguilar@ladwp.com for information on how to report extractions.
- c. Compensate the City by annual payment for the loss incurred from groundwater extractions. Contact LADWP staff Mr. Manuel Aguilar at (213) 367-3465 or via email at Manuel.Aguilar@ladwp.com for more information.

## Response No. AG 2-4

The comment correctly indicates that Project construction will require grading, excavation and dewatering activities should groundwater be encountered. As stated on page IV.I-21 of the Draft EIR, groundwater was encountered within the soil borings cited in the Preliminary Geotechnical Report (Appendix G-1 of the Draft EIR) at varying depths between 24.5 and 49.5 feet below ground surface (bgs).<sup>1</sup> The historical highest groundwater is at ground surface.<sup>2</sup> Project construction requires excavation and grading of the Project Site to a maximum depth of approximately 21 feet. Thus, based on the soil boring information included in the Preliminary Geotechnical Report, groundwater would not be encountered. Nonetheless, based on the historical highest groundwater level, the Draft EIR conservatively concludes that temporary dewatering activities may be needed during excavation activities. As discussed on page IV.I-28 of the Draft EIR, the temporary dewatering would comply with all relevant National Pollutant Discharge Elimination System (NPDES) requirements related to construction and discharges from dewatering operations. If dewatering is required, the treatment and disposal of the dewatered water would occur in accordance with the requirements of LARWQCB's Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties.<sup>3</sup> Temporary construction-related dewatering impacts are analyzed on page IV.I-34 of the Draft EIR. As analyzed therein, the dewatered water would be disposed to the public storm drainage system under the LARWQCB permit and in accordance with NPDES requirements related to construction and discharges from dewatering operations. Dewatering during construction would not result in the substantial removal of groundwater that would reduce the local groundwater table. Further, dewatering would only occur temporarily during construction, if even necessary at all, and would not continue post-construction. That is, no long-term extraction affecting groundwater would occur. For these reasons, the Project would not be expected to impede sustainable groundwater management of the San Fernando Valley Groundwater Basin. Nonetheless, while no

<sup>1</sup> Geotechnologies, Inc., Geotechnical Engineering Investigation, Proposed Academic and Athletic Development, 4141 Whitsett Avenue, Studio City, CA. July 2, 2019 and revised July 20, 2020. Provided in Appendix G-1 of the Draft EIR.

<sup>2</sup> KPFF Consulting Engineers, Harvard-Westlake River Park Hydrology and Water Quality Report, February 2022, page 6. Provided in Appendix H of the Draft EIR.

<sup>3</sup> KPFF Consulting Engineers, Harvard-Westlake River Park Hydrology and Water Quality Report, 4141 Whitsett Avenue, Studio City, CA 91604, February 2022, page 15. Provided in Appendix I of this Draft EIR.

long-term extractions would occur, the School would contact the ULARA Watermaster and LADWP, as required by the ULARA Judgment, and install/implement necessary extraction equipment and reporting actions, along with payment of required fees, as determined appropriate through consultation between the School and LADWP, should dewatering activities be necessary to avoid impacting the City's rights.

### **Comment No. AG 2-5**

2. Beneficial reuse of dewatering discharge (as an alternative to discharging to the storm drain or sewer) on or off-site is encouraged as a conservation measure. In addition to water conservation, beneficial reuse may reduce or eliminate costs associated with storm drain and sewer permitting and monitoring. Common applications of Beneficial Reuse include, Landscape irrigation, Cooling tower make-up, and Construction (dust control, concrete mixing, soil compaction, etc.)

### **Response No. AG 2-5**

If dewatering is necessary during construction activity, such activities would be subject to compliance with the applicable regulatory requirements as discussed in Response No. AG 2-3 above. However, consistent with this comment, the Project contractor would use water collected during construction dewatering for dust control or soil compaction, as feasible, and consistent with applicable LARWQCB permit requirements.

### **Comment No. AG 2-6**

#### **Power System:**

- 1) The Project encompasses an area with various LADWP overhead and underground distribution lines. LADWP advises the City to coordinate overhead or underground electrical distribution conflicts through the following email address: [dwpps.coordination@ladwp.com](mailto:dwpps.coordination@ladwp.com).

### **Response No. AG 2-6**

The comment requests coordination with the LADWP regarding overhead and underground distribution lines. Consistent with this comment, the Project contractor would coordinate with LADWP regarding the locations and protection of any underground or overhead electrical distribution systems.

This comment does not raise any issues with respect to the content and adequacy of the Draft EIR. Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

### **Comment No. AG 2-7**

For any questions regarding the above comments, please contact Mr. Marshall Styers of my staff at (213) 367-3541 or [Marshall.Styers@ladwp.com](mailto:Marshall.Styers@ladwp.com).

## **Response No. AG 2-7**

The comment identifies the contact party at the LADWP regarding the comments on the Project. As the comment does address the adequacy or content of the Draft EIR, no further response is necessary.

## **Comment Letter No. AG 3**

Brandon Wilson, T.E., MPA  
Transportation Engineering Associate III (Acting)  
Valley Development Bureau  
Los Angeles Department of Transportation  
Received April 22, 2022

### **Comment No. AG 3-1**

LADOT concerns appear to have been thoroughly expressed and represented in the assessment letter provided for this project on June 10th and 11th, 2021. At this time, there are no further comments.

### **Response No. AG 3-1**

The comment states that the LADOT has no comments on the Draft EIR. LADOT's comments on the Project's transportation analysis were thoroughly expressed and represented in their assessment letter which was originally provided for the Project on June 10, 2021, however, LADOT provided an updated letter on June 11, 2021. A copy of LADOT's Assessment Letter for the TA is included in Appendix M of the Draft EIR. In their June 11, 2021 letter, LADOT indicated that the Project would not result in significant CEQA transportation-related impacts related to conflicts with plans, programs and policies addressing the circulation system; VMT; and hazardous design features. As such, no further response is necessary.

## **Comment Letter No. AG 4**

Erinn Wilson-Olgin  
Environmental Program Manager I  
South Coast Region  
State of California Department of Fish and Wildlife  
Received April 25, 2022

### **Comment No. AG 4-1**

The California Department of Fish and Wildlife (CDFW) has reviewed the Draft Environmental Impact Report (DEIR) for Harvard-Westlake River Park Project (Project) from the City of Los Angeles (City). Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

### **Response No. AG 4-1**

This comment acknowledges that the CDFW has reviewed the Draft EIR and expresses appreciation for the opportunity to provide comments and recommendations. This introductory comment does not address the adequacy of the Draft EIR, but is noted for the record. Specific comments regarding the Draft EIR are provided and responded to below and all comments will be forwarded to the decision-makers for review and consideration.

Subsequent to receiving this comment letter, the City of Los Angeles Department of City Planning met with CDFW staff and the Applicant via teleconference on May 20, 2022. At the meeting, the proposed Project components were discussed to provide clarity as to the potential Project effects relative to CDFW's comments, as noted below.

### **Comment No. AG 4-2**

#### **CDFW's Role**

CDFW is California's Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State [Fish & G. Code, §§ 711.7, subdivision (a) & 1802; Pub. Resources Code, § 21070; California Environmental Quality Act (CEQA) Guidelines, § 15386, subdivision (a)]. CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing

specifically on projects and related activities that have the potential to adversely affect state fish and wildlife resources.

### **Response No. AG 4-2**

This comment cites CDFW's position as a Trustee Agency for fish and wildlife resources with jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species. It also states that CDFW is charged by law to provide comments and recommendations specifically on projects that have the potential to adversely affect state fish and wildlife resources. This introductory comment does not address the adequacy of the Draft EIR but is noted for the record. Specific comments regarding the Draft EIR are provided and responded to below and all comments will be forwarded to the decision-makers for review and consideration.

### **Comment No. AG 4-3**

CDFW is also submitting comments as a Responsible Agency under CEQA (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code, including lake and streambed alteration regulatory authority (Fish & G. Code, § 1600 et seq.). Likewise, to the extent implementation of the Project as proposed may result in "take", as defined by State law, of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.), or CESA-listed rare plant pursuant to the Native Plant Protection Act (NPPA; Fish & G. Code, §1900 et seq.), CDFW recommends the Project proponent obtain appropriate authorization under the Fish and Game Code.

### **Response No. AG 4-3**

This comment cites CDFW's position as a Responsible Agency under CEQA, with regulatory authority in situations that could result in "take" of endangered species. Subsequent to receiving the CDFW comment letter, CDFW met with City staff and the Applicant, via teleconference on May 20, 2022, to clarify the project description; it was agreed during that discussion that CDFW is not a responsible agency because no species listed under the CESA would be impacted and no jurisdictional streambed or lake would be altered by the Project. This introductory comment does not address the adequacy of the Draft EIR but is noted for the record. Specific comments regarding the Draft EIR are provided and responded to below and all comments will be forwarded to the decision-makers for review and consideration.

### **Comment No. AG 4-4**

#### **Project Description and Summary**

**Objective:** The Harvard-Westlake River Park Project (Project) involves the redevelopment of the approximately 16.1-acre Weddington Golf & Tennis site and an

adjacent approximately 1.1-acre open space portion of property along the Los Angeles River leased from Los Angeles County. The collective 17.2-acre Project site will be developed for use as an athletic and recreational facility for the Harvard-Westlake School and for shared public use. The Project would remove the existing golf course, driving range, and tennis facility. The Project would then develop two athletic fields with bleacher seating; an 80,249-square-foot, two-story multi-purpose gymnasium; a 52-meter swimming pool with seating; eight tennis courts with seating; one level of below-grade parking; and a surface parking lot. The Project would include ancillary field buildings, three security kiosks, exterior light poles, walls/fencing, retention of the existing clubhouse structure, putting green, low brick retaining wall with weeping mortar, and golf ball-shaped light standards. The Project would remove 240 of the existing 421 trees and plant 393 new trees. The Project would include a 1-million-gallon stormwater capture and reuse system for water conservation and treatment purposes. The Project would also provide approximately 5.4 acres of publicly accessible open space and landscaped trails connecting to the adjacent Zev Yaroslavsky Los Angeles River Greenway (Zev Greenway). The Project would also provide on-site landscaped areas, water features, and recreational facilities. The Project involves off-site improvements to the Valleyheart Drive public right-of-way, portions of the Zev Greenway adjacent to the Project site, and an ADA compliant ramp to provide a pedestrian connection between the Zev Greenway and Coldwater Canyon Avenue northwest of the Project site. Project development would require excavation and grading of the Project site to a maximum depth of approximately 21 feet below grade and a net cut/fill volume of approximately 250,000 cubic yards.

## **Response No. AG 4-4**

The comment provides a summary description of the Project components. Please refer to Topical Response No. 2 - Modifications to the Project Design, which discusses design modifications made to the Project in response to public and agency comments received on the Draft EIR. In addition, corrections to the Draft EIR with the Project design modifications are included in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR. Within Chapter 3, relevant figures from the Draft EIR have also been revised to illustrate the Project design modifications. As part of the Project design modifications, the stormwater capture and reuse system would be reduced to approximately 350,000 gallons. The modifications to the Project design would reduce the total amount of Project grading from 250,000 cubic yards to 197,000 cubic yards due to a reduction in the size of the subterranean parking garage, which previously accommodated 503 spaces and now will have 386 spaces. Also, the Project's water features would be eliminated, with additional modifications relating to bleacher seating, lighting, building design (swimming pool area and gymnasium) and reduced parking. This comment does not address the adequacy of the Draft EIR but is noted for the record. Specific comments regarding the Draft EIR are provided and responded to below and all comments will be forwarded to the decision-makers for review and consideration.

## **Comment No. AG 4-5**

**Location:** The area proposed for the Project is owned by the Harvard-Westlake School located at 4047, 4141, and 4155 N. Whitsett Avenue and 12506, 12600, and 12630 W. Valley Spring Lane. The Project site consists of one parcel generally bounded by Bellaire Avenue to the west, Valley Spring Lane to the north, the Los Angeles River and Valleyheart Drive to the south, Whitsett Avenue to the east, and Los Angeles Fire Department Fire Station 78 to the southeast. The property leased from Los Angeles County is located between the Project site and the Los Angeles River.

## **Response No. AG 4-5**

The comment provides a summary description of the Project location. This introductory comment does not address the adequacy of the Draft EIR but is noted for the record. Specific comments regarding the Draft EIR are provided and responded to below and all comments will be forwarded to the decision-makers for review and consideration.

## **Comment No. AG 4-6**

### **Comments and Recommendations**

CDFW offers the comments and recommendations below to assist the City in adequately identifying, avoiding, and/or mitigating the Project's significant, or potentially significant, direct, and indirect impacts on fish and wildlife (biological) resources. Editorial comments or other suggestions are also included to improve the environmental document. CDFW recommends the measures or revisions below be included in a science-based monitoring program that contains adaptive management strategies as part of the Project's CEQA mitigation, monitoring and reporting program (Pub. Resources Code, § 21081.6; CEQA Guidelines, § 15097).

## **Response No. AG 4-6**

This is an introductory comment to the CDFW's comments and recommendations that are intended to assist the City in identifying, avoiding, or mitigating potentially significant, direct, and indirect impacts on fish and wildlife. This introductory comment does not address the adequacy of the Draft EIR but is noted for the record. Specific comments regarding the Draft EIR are provided and responded to below and all comments will be forwarded to the decision-makers for review and consideration.

## **Comment No. AG 4-7**

### **Specific Comments**

#### **Comment #1: Impacts from New Path Installation**

**Issue:** The Project proposes to install a trail along the Zev Greenway.

**Specific Impacts:** The DEIR states, “implementation of the Project would result in limited impacts from a proposed river connection (trail), river fence, and river overlook to 0.14 acre of recently restored California brittlebush scrub (16 percent of off-site sensitive natural community).” Elevated pedestrian usage is likely to create direct and indirect impacts to local wildlife species through the loss of potential habitat.

## Response No. AG 4-7

The comment contends that the Project’s potential to increase pedestrian usage of the Zev Greenway is likely to impact local wildlife through the loss of potential habitat. It must be clarified that the Project does not propose a trail along or within the Zev Greenway, which already has an existing trail. Rather, the Project proposes to install an ADA-compliant pedestrian ramp leading from the Project Site to the existing Zev Greenway trail, as mentioned on Page II-33 of the Draft EIR Project Description. Corrections have been made in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR, to revise the term “trail” to “ramp” as applicable in this regard. In addition, corrections have been made in Chapter 3 to change references from “trails” within the Project Site to “pathways.” The Draft EIR addressed biological resources impacts in Section IV.C, *Biological Resources*, with supporting data provided in Appendix D, Biological Resources Technical Report, of the Draft EIR. Specifically, impacts to California brittlebush were analyzed on pages IV.C-42 to IV.C-44. The current restored California brittlebush scrub was planted as part of improvements to the Zev Greenway that were completed approximately five years ago and with the specific intent of creating new pedestrian uses within the Zev Greenway. The proposed ADA-compliant pedestrian ramp would impact a 0.14 acre area of restored California brittlebush scrub, which will be planted in kind at a 1:1 ratio elsewhere on-site and adjacent to and along the Zev Greenway, in accordance with Mitigation Measure BIO-MM-2, and would therefore have a less than significant impact after mitigation. In addition, as stated in the Draft EIR on pages IV.C-43, the California brittlebush scrub occurs along a public trail, and the additional human activity, light, or noise would not have an adverse effect on this sensitive natural community since the plants would not be affected by subtle changes in Project light, noise, or human activity. Furthermore, the Project’s native landscaping, which would exclude invasive exotic plant species and would proactively remove Mexican fan palms, would help to enhance this sensitive natural community, as well as the surrounding area, by expanding the habitat, creating a greater native seed source, and providing a larger buffer from nonnative ornamental landscaping in the surrounding developed areas. The Project would result in additional trees and understory vegetation being added to the Zev Greenway, and the creation of new landscaped areas throughout the Project Site, including areas that are immediately adjacent to the Zev Greenway. As analyzed in the Draft EIR, biological resources impacts would be less than significant after mitigation, where applicable.

## Comment No. AG 4-8

**Why impacts would occur:** The area of influence that the trail has upon the surrounding habitat is being increased. An increase in use has potential to impact sensitive wildlife species and their habitat through a variety of ways:

- increased numbers of people and dogs using the trail
- loss of habitat due to erosion from footpaths
- increased noise levels
- increased trash or pet waste
- introduction of unnatural food sources via trash and trash receptacles
- introduction of invasive species from other sites

Outdoor recreation has the potential to disturb wildlife, resulting in energetic costs, impacts to animals' behavior and fitness, and avoidance of otherwise suitable habitat. These impacts may negatively affect wildlife's ability to persist in an area or cause potential mortality. Studies have shown that outdoor recreation is the second leading cause of the decline of federally threatened and endangered species on public lands (Losos et al. 1995) and fourth leading cause on all lands (Czech et al. 2000). As a result, natural resource managers are becoming increasingly concerned about impacts of recreation on wildlife (Knight and Gutzwiller 1995).

## Response No. AG 4-8

The comment contends that the Project will lead to increased trail usage that will impact sensitive wildlife species and their habitat. The restored California brittlebush scrub is limited to an isolated strip of restored native habitat along the Zev Greenway, which is an improved public trail along the northern edge of the Los Angeles River. The channelized Los Angeles River is located to the south of the Zev Greenway, and the surrounding vicinity is a highly urbanized area developed with residential and commercial land uses. Thus, wildlife that may occur within the Project Site are already adapted to urban areas and the activities associated with the current recreational uses, Zev Greenway trail use, and surrounding urbanization.

As stated on pages IV.C-32 through IV.C-33, in Section IV.C, *Biological Resources*, of the Draft EIR, under the heading Impact Analysis, there are no federally threatened and endangered species that will be impacted by the Project. The Project would avoid direct impact to Nevin's barberry (i.e., avoid trampling or removal of this plant), and the additional human activity, light, or noise would not have an adverse indirect effect on these species. Furthermore, the native landscaping proposed, which would exclude invasive exotic plant species, would help to enhance the natural community, as well as the surrounding area, by expanding the habitat, creating a greater native seed source, and providing a larger buffer from non-native ornamental landscaping in the surrounding developed areas. There is one special-status wildlife species, western yellow bat (species

of special concern) that has a moderate potential to occur; however, this species would be associated with the ornamental trees if it is found to occur on-site (i.e., not within the restored California brittlebush scrub), and mitigation (BIO-MM-1) is provided to reduce potentially significant direct impacts on this species as stated on page IV.C-42 of the Draft EIR.

### **Comment No. AG 4-9**

Recreational trails can fragment the habitat that they pass through. These negative impacts generally result from the expansion of the area of influence that a trail has on its surrounding open space. Trails can create artificial boundaries or areas of avoidance for wildlife as they bring outsiders into areas that would otherwise be unvisited. Along with these perceived outsiders, in this case pedestrians, comes a new set of perceived threats to local wildlife in the form of visual, auditory, and olfactory cues that remain along the trail well after recreational usage.

### **Response No. AG 4-9**

The comment contends that recreation trails can fragment habitat resulting in negative impacts. As stated in Response No. AG 4-8, the restored California brittlebush scrub is limited to an isolated strip of restored native habitat along the Zev Greenway, and wildlife that may occur within the Project Site are already adapted to urban areas and the activities associated with the current recreational uses, Zev Greenway trail use, and surrounding urbanization.

As discussed in Response No. AG 4-7, the Project does not propose a trail along or within the Zev Greenway, which already has an existing trail. Rather, the Project proposes to install an ADA-compliant pedestrian ramp leading from the Project Site to the existing Zev Greenway trail, as mentioned on Page II-33 of the Draft EIR Project Description. As such, the Project will not change the alignment of the Zev Greenway trail. The ramp would prevent people from walking through the vegetated areas on the side of the hill leading to the Zev Greenway. As discussed in Response No. ORG 4-13, the Project would implement BIO-PDF-3, whereby the school will make available to the Zev Greenway trail users educational materials and signage at the entrance to the ramp. The materials and signage will promote awareness that human activities, such as trail use, may impact or disturb wildlife use of open spaces. Educational materials and signage will explain how human activity impacts, inclusive of noise and odors, may have on natural habitats growing within the Zev Greenway, emphasizing the increased severity during breeding seasons.

The Project will install fencing along the edge of the Leased Property and ADA compliant railing along the Project's pedestrian ramp leading from the Project Site to the Zev Greenway to prevent people from trampling down the side of the hill through the California brittlebush scrub and other vegetated areas to the Zev Greenway trail. As designed, the fencing has spacing that would allow for local wildlife (e.g., smaller animals) to pass through while still providing a line-of-sight to the river. While this fencing was accounted

for in the Draft EIR impact analysis, Project Design Feature BIO-PDF-2 has been added to provide further details of the proposed Project fencing. Project Design Feature BIO-PDF-2 is included in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR. Lastly, Mitigation Measure BIO-MM-2 requires replacement of any removed California brittlebush scrub at a 1:1 ratio, with such replacement to occur adjacent to the Zev Greenway, thereby contributing to the habitat's restoration and integrity as a sensitive natural community.

Lastly, habitat fragmentation is the result of the existing condition, as the Zev Greenway is planted with native species and is located on a narrow strip of habitat between the existing urban area (including the Project Site) on the north and the Los Angeles River to the south. By contrast, the Project would install supplemental habitat that is suitable to local wildlife and consisting of native species, in contrast to the existing uses which largely consist of turfgrass and non-native, ornamental, and, in many cases, invasive species that offer little in the way of habitat or biological resources to wildlife that may exist in the area.

### **Comment No. AG 4-10**

If habitat is available, wildlife may move to areas farther from trails, beyond the areas of influence, to avoid recreation-related disturbance (Reed et al. 2019). However, the Los Angeles County leased area and Zev Greenway, is already small (1.1 acres) and is the only open space in the Project vicinity where wildlife might retreat to. With the addition of the trail, it reduces the opportunities for wildlife to retreat from nearby recreational users in an area with already little habitat available.

### **Response No. AG 4-10**

The comment contends that the Los Angeles County leased area and Zev Greenway are small and there is limited open space where wildlife might retreat to as a result of increased recreation-related disturbance. As stated in Response Nos. AG 4-8, wildlife that may occur within the Project Site are already adapted to urban areas and the activities associated with the current recreational uses, Zev Greenway trail use, and surrounding urbanization. In addition, the Zev Greenway was designed as a walking trail and is already used for recreational purposes. Lastly, the Project would result in very limited impacts to potential wildlife habitat, which will be planted in kind elsewhere along the Zev Greenway as depicted in Figure IV.C-6, *Planting Zone Plan*. Thus, there will be no net loss of habitat.

Further, it is clarified that as discussed in Responses No. AG 4-7 and AG 4-9, the Project does not propose a trail along or within the Zev Greenway, which already has an existing trail. A pedestrian ramp connecting the Project Site to the Zev Greenway would be provided by the Project. See Response No. AG 4-9 for a discussion of the fencing and Project Design Features BIO-PDF-2 and BIO-PDF-3, which will help to limit direct and indirect impacts to vegetation and wildlife in the hillside areas adjacent to the Zev Greenway trail.

## Comment No. AG 4-11

With increased recreational usage of trails through open spaces comes increased exposure of wildlife to humans. Habituated urban wildlife is less likely to avoid contact with humans, which may increase the probability of human-wildlife conflicts and of attraction to anthropogenic food sources; both are considered problematic in many urban areas (Whittaker and Knight 1998; George and Crooks 2006). Wildlife habituation to humans may also increase wildlife aggression toward humans, or render wildlife more vulnerable to predators, poaching, or roadkill (Whittaker and Knight 1998; George and Crooks 2006; Marzano and Dandy 2012). Furthermore, habituation of wildlife may impact their reproductive success. Habituation of adult individuals may also be associated with negative consequences for their offspring as habituation of adults does not necessarily lead to immediate habituation of juveniles (Reilly et al. 2017).

## Response No. AG 4-11

The comment contends that increased recreational usage of trails may increase the probability of human-wildlife conflicts. As stated in Response Nos. AG 4-9 and AG 4-10, the restored California brittlebush scrub is limited to an isolated strip of restored native habitat along the Zev Greenway, and wildlife that may occur within the Project Site are already adapted to urban areas and the activities associated with the current recreational uses, Zev Greenway trail use, and surrounding urbanization. The Biological Study Area supports limited potential live-in and marginal movement habitat for species on a local scale (i.e., some reptile, bird, and small mammal species, such as squirrels). Also, as discussed in Response No. AG 4-7, the Project does not propose a trail along or within the Zev Greenway, which already has an existing trail. Rather, the Project proposes to install an ADA-compliant pedestrian ramp leading from the Project Site to the Zev Greenway. Project operations would be similar in nature to existing conditions and species adapted to urban areas would be expected to persist on-site.

## Comment No. AG 4-12

**Evidence impacts would be significant:** Project activities and humans that may utilize the trail may negatively impact wildlife behaviors. Appropriate avoidance, minimization, and mitigations have not been included for the trail creation. Without avoidance, minimization, or mitigation measures, the Project may have a substantial adverse direct and cumulative effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by CDFW.

## Response No. AG 4-12

The comment contends that human use of the Project's trail may affect wildlife behavior. As discussed in Response No. AG 4-7, the Project does not propose a trail along or within the Zev Greenway, which already has an existing trail. The Project proposes to install an ADA-compliant pedestrian ramp leading from the Project Site to the Zev Greenway, as

mentioned on page II-33 of the Draft EIR Project Description. The ADA-compliant pedestrian ramp location was selected to avoid and minimize impacts to biological resources. The ADA-compliant pedestrian ramp leads to an existing trail along the Los Angeles River and does not introduce new human use of the Zev Greenway but enhances opportunities for existing use. As stated on page IV.C-32 in Section IV.C, *Biological Resources*, of the Draft EIR, there are no federally threatened and endangered species that will be impacted by the Project. The Project would avoid direct impact to Nevin's barberry (i.e., avoid trampling or removal of this plant), and the additional human activity, light, or noise would not have an adverse indirect effect on these species. Furthermore, the Project's native landscaping, which would exclude invasive exotic plant species, would help to enhance the natural community, as well as the surrounding area, by expanding the habitat, creating a greater native seed source, and providing a larger buffer from non-native ornamental landscaping in the surrounding developed areas. There is one special-status wildlife species, western yellow bat (species of special concern) that has a moderate potential to occur. No special-status species were observed during the site visits; however, this species would be associated with the ornamental trees if it is found to occur on-site (i.e., not within the restored California brittlebush scrub), and mitigation (BIO-MM-1) is provided to reduce potentially significant direct impacts on this species as stated on page IV.C-42.

### **Comment No. AG 4-13**

#### **Recommended Potentially Feasible Mitigation Measure(s):**

**Mitigation Measure #1:** Educational materials and signage should be made available to trail users to keep aware of the impacts that human disturbance brings to open spaces. People should be made aware of the impacts that they have on surrounding habitat (such as noise or smells), particularly during breeding seasons.

CDFW recommends the City install appropriate public information signage at trailheads to: 1) educate and inform the public about wildlife present in the area; 2) advise on proper use of the trail in a manner respectful to wildlife; and 3) provide local contact information to report injured or dead wildlife. Signage should be written in the language(s) understandable to all those likely to recreate and use the trails. Signage should not be made of materials harmful to wildlife such as spikes or glass. The City should provide a long-term maintenance plan to repair and replace the signs.

### **Response No. AG 4-13**

The comment recommends a mitigation measure relating to potential indirect impacts to special-status wildlife species for increased use of the Zev Greenway trail; however, the comments do not provide substantial evidence that the Project would create a significant impact that requires mitigation other than what is already included in the DEIR to address special-status bats. Furthermore, the Zev Greenway is not a part of the Project but is an existing recreational trail adjacent to the Project Site. Although the School has agreed to the maintenance of the Zev Greenway vegetation within the off-site portion of the Project,

the School does not have authority to manage operations (i.e., control or regulate usage) for the Zev Greenway. Although not required as a mitigation measure because there is no associated significant impact, the suggested measure for educational materials and signage will be incorporated into the project, on the Leased Property at the entrance to the Project's ADA-compliant pedestrian ramp, as a project design feature (PDF). The following PDF is added to increase the beneficial uses of the Zev Greenway as a natural open space area (see addition in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR).

**BIO-PDF-3:** Harvard-Westlake School will make available to the Zev Greenway trail users educational materials and signage at the entrance to the ADA-compliant pedestrian ramp located between the Project's gymnasium and the Zev Greenway. The materials and signage will promote awareness that human activities, such as trail use, may impact or disturb wildlife use of open spaces. Educational materials and signage will explain how human activity impacts, inclusive of noise and odors, may have on natural habitats growing within the Zev Greenway, emphasizing the increased severity during breeding seasons. The signage will be submitted for review by the City for compliance with any applicable regulations and will also: 1) educate and inform the public about wildlife present in the area; 2) advise on proper use of the ramp in a manner respectful to wildlife; and 3) provide local contact information to report injured or dead wildlife. Signage will be written in the language(s) understandable by residents in the local vicinity and to those most likely to use the ramp. Signage will be made of materials not harmful to wildlife, avoiding glass or the use of spikes.

## **Comment No. AG 4-14**

**Mitigation Measure #2:** Trash receptacles should be placed only at trailheads to avoid creating an unnatural food source that may attract nuisance wildlife and to minimize waste.

## **Response No. AG 4-14**

The comment recommends a mitigation measure. It is not associated with a specific impact, but it is assumed this recommended mitigation measure would mitigate indirect impacts to special-status wildlife species due to the increased use of the Zev Greenway trail; however, the comment does not provide substantial evidence that the Project would create a significant impact that requires mitigation other than what is already included in the DEIR to address special-status bats. Although not required as a mitigation measure because there is no associated significant impact, the City has included this suggested measure as a PDF to require that the school place a trash receptacle at the entrance to the Project's ADA-compliant pedestrian ramp located between the Project's gymnasium and the Zev Greenway. The following PDF is added to discourage potential conflicts

between wildlife and users of the Zev Greenway (see addition in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR).

**BIO-PDF-4:** As part of the Project's routine maintenance program, Harvard-Westlake School will place a trash receptacle at the entrance to the Project's ADA-compliant pedestrian ramp located between the Project's gymnasium and the Zev Greenway in order to avoid or minimize the potential to create an attractive nuisance of an unnatural food source for wildlife. The receptacle will be regularly maintained to avoid waste materials inadvertently entering the Zev Greenway area.

## Comment No. AG 4-15

### Comment #2: Impacts to Rivers

**Issue:** The DEIR proposes a 1-million-gallon underground stormwater capture and reuse system. The system will treat water that is collected on site as well as water collected from the 39-acre residential neighborhood to the north of the Project site.

**Specific impacts:** The Project has potential to result in the permanent impacts to stream function and biological diversity downstream of the Project.

## Response No. AG 4-15

The comment contends that the inclusion of an onsite water reclamation system might have permanent impacts to downstream stream function and biological resources, which is similarly stated in Comment No. AG 4-16. Refer to Response No. 4-16 for a discussion of impacts to downstream stream function and biological resources.

## Comment No. AG 4-16

**Why impacts would occur:** Project activities will potentially permanently alter the stormwater flow into the Los Angeles River, potentially impacting fish and wildlife resources downstream. According to the DEIR, "during rainfall events and with dry weather flows (such as residential landscape irrigation and car washing), water flows from this residential neighborhood to an inlet that directs water into the Los Angeles River." CDFW is concerned this could potentially reduce water availability in stream, which could be considered a significant impact to biological resources. Flow reductions, especially dry season flow, could impact beneficial uses directly or indirectly through habitat modifications. Diverting water from streams, such as Los Angeles River, during the dry season could reduce the availability and extent of shallow water sheet flow. The resulting sheet flows may allow phytoplankton (algae and cyanobacteria), microorganisms, and herbaceous vegetation to establish. The algae provide habitat and a food source for benthic invertebrates, a vital food source for wading birds. The diversion of water could potentially impact algae and benthic invertebrates, and eventually birds.

## Response No. AG 4-16

The comment contends that the inclusion of an onsite water reclamation system might have permanent impacts to downstream biological resources due to reduced flows. The Project as analyzed in the Draft EIR proposed to capture 1 million gallons of stormwater runoff from the Project Site and a 39-acre residential neighborhood to the north of the Project site, as discussed on page II-61, as well as on pages IV.I-18 and IV.I-34 of the Draft EIR. Stormwater and other urban runoff currently sheet flows from impervious surfaces such as City streets, directly into the Los Angeles River. It is estimated that the cistern could be filled within two hours during a regular storm event. Stormwater runoff in excess of 1 million gallons would continue to be treated, and subsequently released into the Los Angeles River.

The 17.2-acre Project Site and 39-acre offsite area totaling 56.2 acres is less than 0.01 percent of the entire Los Angeles River watershed,<sup>4</sup> and the 1 million gallons that the Project's reclamation system would collect are less than 1 percent of total flows into the Los Angeles River during an average rainfall event.<sup>5</sup> Further, as discussed in Response No. AG 4-17, diverting the urban runoff flow during the dry weather season from the Project Site and/or the adjacent 39-acre neighborhood would not have a significant impact on the Los Angeles River during the dry season. Consequently, as discussed between the City and CDFW during a meeting on May 20, 2022, there would be no potentially significant impact on downstream wildlife habitat or beneficial uses due to flow reductions.

As discussed above, the 1-million gallon stormwater capture and reuse system analyzed in the Draft EIR would not significantly impact downstream wildlife habitat or beneficial uses due to flow reductions in the Los Angeles River. Based on public and agency comments received on the Draft EIR, design modifications have been made to the Project as discussed in Topical Response No. 2 - Modifications to the Project Design. In addition, corrections to the Draft EIR with the Project design modifications are included in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR. As part of the Project design modifications, the stormwater capture and reuse system would be reduced to approximately 350,000 gallons. The reduction in the size of the system is because the Project would no longer capture and treat stormwater from the 39-acre off-site area, but rather only capture and treat stormwater from the 17.2 acre Project Site. Thus, water from the 39-acre off-site area would flow into the Los Angeles River as it does currently under existing conditions. Therefore, under the Project design modifications, the potential 650,000 additional gallons of stormwater that could have been stored on the Project Site during any given storm event, would flow into the Los Angeles River under the Project with design modifications as it does under existing conditions. Thus, because the Project with design modifications would maintain existing off-site

<sup>4</sup> The Los Angeles River watershed is 824 square miles in area (527,360 acres) [LA\_River\_Watershed.pdf (ca.gov)] and the Project Site 17.2 acres, which is 0.0033 percent of the total watershed area.

<sup>5</sup> KPFF Memo – CDFW Comments, dated August 18, 2022. Provided as Appendix J to the Final EIR.

stormwater flows to the Los Angeles River, the Project's already less than significant impacts regarding flow reductions to the Los Angeles River would be reduced. Overall, the same less than significant hydrology and water quality impact conclusions would occur with or without the Project design modifications. In addition, it is acknowledged that on-site flows are not currently treated before entering the Los Angeles River and contain potential contaminants such as hydrocarbons, metals, nutrients, organics and pesticides. Stormwater runoff would be treated through high efficiency on-site filtration systems as part of the Project design to improve water quality prior to entering the River, which would also have a benefit to downstream habitat and wading birds.

### **Comment No. AG 4-17**

*Seasonality:* During the dry season, typically April through September in southern California, the many concrete-lined channels are largely maintained by urban runoff and discharge from wastewater reclamation plants. Diverting water could be significant during the dry season and could either significantly reduce water flow or result in complete loss of water flow.

### **Response No. AG 4-17**

The comment contends that Project diversion of dry season stormwater flow could significantly reduce water flow. KPFF conducted a hydrological analysis to study the Project's potential impacts to the flow within the Los Angeles River. The results of the additional analysis is provided in a memo dated August 18, 2022 (KPFF Memo).<sup>6</sup> As discussed in the KPFF Memo, based on actual flow data from Los Angeles County for the Los Angeles River concrete channel between April 2021 and April 2022, the Average Dry Weather Flow is approximately 30 cubic feet per second (cfs). The primary source of existing flows to the Los Angeles River is from the discharge from wastewater reclamation plants, which the Project would not interrupt or abate whatsoever. Based on measured dry weather season rainfall data from September 2011 to June 2022, the average daily rain fall is approximately 0.0036 inches per day, which would equate to an Average Dry Weather Flow for the Project Site and the adjacent 39-acre neighborhood of 0.0075 (cfs). Diverting this runoff would result in 0.03% reduction of flow in the Los Angeles River. Because of the incremental decrease/change in flow, diverting the urban runoff flow during the dry weather season from the Project Site or the adjacent neighborhood would not have a significant impact on the Los Angeles River during the dry season.

In addition, as discussed in Response No. AG 4-16, the Project's stormwater capture and reuse system is being reduced to approximately 350,000 gallons under the Project with design modifications. The Project will no longer capture and treat stormwater from the 39-acre off-site area, but rather only capture and treat stormwater from the 17.2 acre Project Site. Thus, diverting water only from the Project Site would be less than a 0.03% reduction of flow in the Los Angeles River. As with the Project without design

---

<sup>6</sup> KPFF Memo – CDFW Comments, dated August 18, 2002. Provided as Appendix J to the Final EIR.

modifications, because of the incremental decrease/change in flow with the Project design modifications, diverting the urban runoff flow during the dry weather season from the Project Site would not have a significant impact on the Los Angeles River during the dry season.

### **Comment No. AG 4-18**

*Drought:* Since 2000, the longest duration of drought in California lasted between 2011 and 2019 (USGS 2021) and in southern California, between 2012 through 2016 (Los Angeles Almanac 2021). The 2017-2018 rainfall season was below normal and the driest for Los Angeles since 2006-2007 (Los Angeles Almanac 2021). Diverting water during a below-normal rainfall year may significantly reduce water flow or result in complete loss of water flow.

### **Response No. AG 4-18**

The comment contends that Project diversion of water during below-normal rainfall years may significantly impact water flow. According to the KPFF Memo, the highest flow rate measured adjacent to the Project Site was estimated at 3,200 cfs using the flow data for a rain event on December 30, 2021. Based on the Los Angeles County Hydrology Manual and rain gauge data, the measured storm event equates to a 2-year event or a mean storm. As reported in the KPFF Memo, the maximum flow diverted from the adjacent neighborhood to the north of the Project Site for this event and any rain event would be 25.97 cfs. The potential Project impact (as analyzed in the Draft EIR) would result in a less than 1 percent reduction in flow to the channel from the Project Site and adjacent neighborhood to the north of the Project Site during a rain event, which are, in turn, less than 1 percent of the Los Angeles River watershed area. Furthermore, as discussed in Response No. AG-16, the Project Site and 39-acre offsite area totaling 56.2 acres represent a small fraction of the total area within the Los Angeles River Watershed, therefore the Project's diversion of non-stormwater runoff (i.e., urban runoff), would represent a similar fraction of the urban runoff entering the Los Angeles River, and could not on its own result in the complete loss of water flow in the Los Angeles River. Therefore, Project impacts to the flow of water in the Los Angeles River, even during years of below-normal rainfall, would be less than significant.

As discussed in Response No. AG 4-16, the Projects stormwater capture and reuse system is being reduced to approximately 350,000 gallons under the Project with design modifications. The Project will no longer capture and treat stormwater from the 39-acre off-site area, but rather only capture and treat stormwater from the 17.2 acre Project Site. Thus, the 25.97 cfs maximum flow from the 39-acre off-site area would no longer be diverted from the Los Angeles River. Therefore, as with the Project without design modifications, because the amount of runoff diverted would represent a fraction of the urban runoff entering the Los Angeles River, the Project with design modifications' impacts to the flow of water in the Los Angeles River, even during years of below-normal rainfall, would be less than significant.

## Comment No. AG 4-19

Downstream and associated biological resources beyond the Project development footprint may also be impacted by Project-related releases of sediment or debris and altered watershed effects resulting from Project activities.

## Response No. AG 4-19

The comment contends downstream resources may be impacted by Project releases of sediment or debris and altered watershed effects. As discussed between the City and CDFW during a teleconference on May 20, 2022, the Project would not release sediment or debris from the Project Site into the Los Angeles River. The Project's Stormwater Pollution Prevention Plan (SWPPP) would implement best management practices during construction to prevent the release of sediment and debris into the Los Angeles River. The Project's required SWPPP compliance and implementation is explained on pages IV.I-6 to IV.I-7 of Section IV.I, *Hydrology and Water Quality*, of the Draft EIR. During operation, when the Project's cistern system is at capacity, water would be prevented from entering the cistern but would continue to pass through the filtration system. The filtration system would filter out sediment or debris materials. Following filtration, it would be redirected back to the curb face on Whittsett Avenue and ultimately discharged, having been cleaned and filtered, into the Los Angeles River. Further, as discussed in Responses No. AG 4-16 to AG 4-18, the Project would not substantively alter flows in the Los Angeles River and as such, would not alter or change the watershed in any significant manner, with the exception that water quality in the Los Angeles River would be improved by the Project.

Therefore, the Project would not impact downstream biological resources by release of sediment or debris and altered watershed effects.

## Comment No. AG 4-20

**Evidence impacts would be significant:** Changes to hydrology, both within the Project area and downstream, are reasonable potential direct and indirect physical changes in the environment. Said changes and their potential impacts on biological resources should be analyzed and disclosed in an environmental document. Adequate disclosure is necessary for CDFW to assist a lead agency in adequately identifying, avoiding, and/or mitigating a project's significant, or potentially significant, direct, and indirect impacts on biological resources.

## Response No. AG 4-20

The comment contends that Project changes to hydrology are physical changes to the environment resulting in potential impacts to biological resources. As discussed between the City and CDFW during a teleconference on May 20, 2022, the Project design for stormwater capture, treatment, and either onsite reuse or release to the Los Angeles River would not cause a significant impact to onsite or downstream biological resources.

Potential construction impacts would be minimized through the SWPPP implementation, which would prevent sediment and debris release, and non-stormwater surface runoff would be minimal, as analyzed in the Impact Analysis discussion in Section IV.I *Hydrology and Water Quality*, of the Draft EIR. Project operational impacts were determined to be less than significant without mitigation because post-Project conditions would result in improved surface water quality compared to existing conditions and there would not be a substantial reduction in downstream flows within the Los Angeles River. To note, revisions have been made to Section IV. I, *Hydrology and Water Quality*, of the Draft EIR, in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR to reflect the Project design modifications as discussed in Topical Response No. 2 - Modifications to the Project Design. The revisions do not result in any substantial increase in the severity of impacts or changes to the impact conclusions included in Section IV.I of the Draft EIR.

### **Comment No. AG 4-21**

Fish and Game Code section 1602 requires any person, State or local governmental agency, or public utility to notify CDFW prior to beginning any activity that may do one or more of the following:

- Divert or obstruct the natural flow of any river, stream, or lake;
- Change the bed, channel, or bank of any river, stream, or lake;
- Use material from any river, stream, or lake; or,
- Deposit or dispose of material into any river, stream, or lake.

### **Response No. AG 4-21**

The comment states that the Project must notify CDFW prior to Project implementation because the Project may divert the natural flow of a river. Subsequent to the close of the Draft EIR public comment period, City staff and the Applicant met with CDFW, via teleconference, on May 20, 2022 in order to provide CDFW with additional Project details related to the concerns raised in the comment letter. Because the Project would not divert flow from within, change bed or bank of, or use or deposit materials into a jurisdictional river, stream or lake, CDFW agreed that they would not be a responsible agency and that a lake or streambed alteration agreement would not be required under Fish and Game Code Section 1602. CDFW was satisfied that there would be no or minimal flows from the Project Site during the dry season and there would not be impacts to downstream biological resources.

### **Comment No. AG 4-22**

The Project may adversely affect the existing hydrology pattern of the Project site as well as downstream. This may occur through the alteration of flows to streams. In addition, impacts to biological resources off site, such as the Glendale Narrows, may occur. The Project may substantially adversely affect the existing stormwater flows into streams

through the alteration of drainages on site. It is unclear if these stormwater diversions would impact biological resources offsite because an investigation has not been made to determine so. Therefore, appropriate avoidance, minimization, and mitigations have not been determined. Inadequate investigation may result in the Project continuing to have a substantial adverse direct and cumulative effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by CDFW.

## Response No. AG 4-22

The comment contends that the Project may adversely affect the existing hydrological pattern of the Project area. See Response No. AG 4-18 which discusses the results of the KPFF hydrological analysis and indicates the Project would result in a less than 1 percent reduction in flow to the Los Angeles River during rain events, which is less than 1 percent of the Los Angeles River watershed area. The Glendale Narrows is located approximately seven miles downstream of the Project, which means the impact of the Project at this downstream location would be even less because additional tributaries to the Los Angeles River enter the main Los Angeles River channel and because additional discharges from wastewater treatment facilities contribute to flows at the Glendale Narrows. Given the minimal changes to flows in the Los Angeles River and improved water quality resulting from the Project as discussed in Responses Nos. AG 4-16 to AG 4-20, impacts to biological resources within the Los Angeles River would be less than significant. Also, as discussed in Response No. ORG 4-21, CDFW agreed via teleconference, on May 20, 2022, that a lake or streambed alteration agreement would not be required under Fish and Game Code Section 1602. CDFW was satisfied that there would be no or minimal flows from the Project Site during the dry season and there would not be impacts to downstream biological resources. Further, Section IV. I, *Hydrology and Water Quality*, of the Draft EIR, fully evaluated hydrology patterns in and around the Project Site with the Project. The analysis included in Section IV.I of the Draft EIR was largely based on the Hydrology and Water Quality Report (technical report) provided in Appendix I of the Draft EIR. The hydrology evaluation concluded that the existing hydrology pattern of the Project Site and surrounding area would not be affected in a manner that would result in significant hydrology impacts. All hydrology-related impacts would be less than significant as analyzed therein. Overall, the hydrological pattern of the of the Project site as well as downstream in the Los Angeles River would not be altered in a manner that would result in adverse impacts to biological resources. To note, revisions have been to Section IV. I, *Hydrology and Water Quality*, of the Draft EIR, in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR to reflect the Project design modifications as discussed in Topical Response No. 2 - Modifications to the Project Design. The revisions do not result in any substantial increase in the severity of impacts or changes to the impact conclusions included in Section IV.I of the Draft EIR.

## Comment No. AG 4-23

### Recommended Potentially Feasible Mitigation Measure(s):

**Mitigation Measure #1:** The Project may result in the alteration of streams. For any such activities, the Project applicant (or “entity”) must provide written notification to CDFW pursuant to section 1600 et seq. of the Fish and Game Code. Based on this notification and other information, CDFW determines whether a Lake and Streambed Alteration (LSA) Agreement with the applicant is required prior to conducting the proposed activities. Please visit CDFW’s Lake and Streambed Alteration Program webpage for information about LSA Notification and online submittal through the Environmental Permit Information Management System (EPIMS) Permitting Portal (CDFW 2021a).

## Response No. AG 4-23

The comment states that the Project must notify CDFW prior to Project implementation because the Project may divert the natural flow of a river and require a streambed alteration agreement. See Response No. AG 4-21 above for an explanation as to why the Project will not need to process a lake or streambed alteration agreement and that the recommended mitigation measure is not required because there is no significant impact to a lake, stream or river. There is no substantial evidence that the Project’s diversion of urban runoff would cause a significant impact to downstream river flows, as discussed in Response Nos. AG 4-20 and 4-22.

## Comment No. AG 4-24

**Mitigation Measure #2:** CDFW recommends the LSA Notification include a hydrology report to evaluate whether altering streams within the Project site may impact hydrologic activity within and downstream of the Project site. The hydrology report should also include an analysis to determine if Project activities will impact the current hydrologic regime or change the velocity of flows on site and downstream. The hydrology report should also determine if the Project will result in substantial changes to water availability downstream for biological resources in the Glendale Narrows. CDFW also requests a hydrological evaluation of any potential scour or erosion at the Project site and downstream due to a 100, 50, 25, 10, 5, and 2-year frequency storm event for existing and proposed conditions to determine how the Project activities may change the hydrology on site.

## Response No. AG 4-24

The comment contends that a hydrology report be included in a CDFW LSA Notification. A preliminary hydrological analysis was performed by KPFF to study the impacts of the Project to the Los Angeles River concrete channel, as well as any potential downstream impacts, and presented to CDFW during a teleconference meeting attended by CDFW, the City of Los Angeles Department of City Planning, and the Applicant on May 20, 2022. As discussed above, the KPFF Memo details the results of the hydrological analysis

discussed with CDFW and the City.<sup>7</sup> See Response No. AG 4-18 which discusses the results of the KPFF hydrological analysis and indicates the Project would result in a less than 1 percent reduction in flow to the Los Angeles River during rain events, which is less than 1 percent of the Los Angeles River watershed area. The reduction in flow percentage for the 100, 50, 25, 10 and 5-year rain events would be even less. The Glendale Narrows is located approximately seven miles downstream of the Project, which means the impact of the Project at this location would be even less because additional tributaries to the Los Angeles River enter the main Los Angeles River channel and because additional discharges from wastewater treatment facilities contribute to flows at the Glendale Narrows.

See Response No. AG 4-21 above for an explanation of why the Project would not need to process a lake or streambed alteration agreement and that the recommended mitigation measure is not required because there is no significant impact to a lake, stream or river.

### **Comment No. AG 4-25**

**Mitigation Measure #3:** CDFW recommends the Project implement Best Management Practices (BMPs) to prevent erosion and the discharge of sediment and pollutants into drainages during Project activities. CDFW recommends BMPs be monitored and repaired, if necessary, to ensure maximum erosion, sediment, and pollution control. The Project proponent should prohibit the use of erosion control materials potentially harmful to fish and wildlife species, such as mono-filament netting (erosion control matting) or similar material, within stream areas. All fiber rolls, straw wattles, and/or hay bales utilized within and adjacent to the Project site should be free of nonnative plant materials. Fiber rolls or erosion control mesh should be made of loose-weave mesh that is not fused at the intersections of the weave, such as jute, or coconut (coir) fiber, or other products without welded weaves. Non-welded weaves reduce entanglement risks to wildlife by allowing animals to push through the weave, which expands when spread.

### **Response No. AG 4-25**

The comment recommends that Project implement Best Management Practices to prevent erosion and the discharge of sediment. As discussed in Section IV.I, *Hydrology and Water Quality*, of the Draft EIR, the Project would be required to implement a SWPPP. The SWPPP documents the selection and implementation of BMPs to prevent discharges of water pollutants to surface or groundwater. The SWPPP also charges owners with stormwater quality management responsibilities. BMPs are determined at the Project's permit stage, at which time the CDFW would have input into specific BMPs. As discussed on pages IV.1-6 and I-7, BMPs would address erosion control, sediment control, wind control, tracking control, and waste management and materials control. Because the

---

<sup>7</sup> KPFF Memo – CDFW Comments, dated August 18, 2002. Provided as Appendix J to the Final EIR

SWPPP and BMPs are regulatory requirements that will be imposed, no new mitigation measures are necessary for inclusion in the Draft EIR.

### **Comment No. AG 4-26**

**Recommendation #1:** CDFW recommends the DEIR include an analysis of potential impacts on biological resources resulting from the proposed water diversion. At a minimum, the analysis should evaluate a study reach that includes the channel downstream from the Project site. The study reach should extend a minimum of one mile downstream or an appropriate distance determined by both a qualified biologist and hydrologist, whichever is greater. The analysis of the study reach should discuss changes in hydrology and hydraulics, including the following:

1. Under pre-project (i.e., baseline) conditions, the volume of water flow from both the Project area and study reach during a) the wet (November through March); b) the dry season (April through October); and c) above-average and below-average water year (i.e., wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year). The analysis should clearly define above-average or below-average rainfall year.
2. Under proposed Project conditions, the percent reduction in flow from both the Project area and study reach for a wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year.
3. A quantitative analysis comparing the flow from the Project area and other tributaries into the study reach, and their relative contribution to the hydrograph of the study reach.
4. A quantitative analysis of other potential stormwater diversion Projects along the Los Angeles River, both up and downstream, and their cumulative impact to the hydrograph of the study reach.
5. An analysis of potential Project-related changes to river hydraulics in both concrete-lined and soft-bottom reaches. This includes water depth (percent change), wetted perimeter (acres gained/lost), and velocity (percent change).

### **Response No. AG 4-26**

The comment recommends that the Project provide an analysis of potential impacts on biological resources resulting from the proposed water diversion. A hydrological analysis was performed as part of the KPFF Memo to study the potential impacts of the Project to the Los Angeles River concrete channel and any potential downstream impacts. City staff presented the findings contained in the KPFF Memo to CDFW staff during a teleconference meeting attended by CDFW, City of Los Angeles Department of City Planning, and the Applicant.<sup>8</sup> The KPFF Memo addressed the Project's potential impacts

<sup>8</sup> KPFF Memo – CDFW Comments, dated August 18, 2002. Provided as Appendix J to the Final EIR.

during the raining and dry season (Item No. 1). See Response No. AG 4-18, which discusses the results of the KPFF Memo. The KPFF Memo concluded that the Project would result in a less than 1 percent reduction in flow to the Los Angeles River during rain events, which is less than 1 percent of the Los Angeles River watershed area. As stated in Response ORG 4-24, the reduction in flow percentage for the 100, 50, 25, 10 and 5-year rain events would be even less. As discussed in Response No. AG 4-17, for the dry season, the Average Dry Weather Flow is approximately 30 cfs. Urban runoff would not produce this volume of flow, considering most of the urban runoff would come from irrigation overflow (e.g. sprinklers). The primary source of flow to the Los Angeles River during the dry season is from the discharge from wastewater reclamation plants, which the Project would not interrupt or abate whatsoever. For this reason, diverting the urban runoff flow during the dry weather season from the Project Site (or the adjacent neighborhood under the Project without design modifications) would not impact the Los Angeles River during the summer months. Thus, the analyzed scenarios in the KPFF Memo were sufficient to recognize the *de minimus* changes to flows in the L.A. River (Item No. 2), along with improved water quality resulting from the Project as discussed in Responses Nos. AG 4-16 to AG 4-20. Therefore, the Project would not result in significant adverse impacts to biological resources within the Los Angeles River. Other tributaries referenced in Item No. 3 of the comment were already accounted for in the flow data provided by the County, and incorporated in the flow analysis as part of the KPFF Memo. With regard to Item No. 4 of the comment, other potential stormwater diversion projects, if any, along the Los Angeles River would be evaluated for consistency with applicable City, State and federal stormwater runoff regulations to ensure a change in flows do not adversely impact biological resources in the Los Angeles River. Furthermore, the Los Angeles County 2020 Los Angeles River Master Plan Program EIR stated that “[f]urther urbanization in the greater Los Angeles region and implementation of transportation improvements and land use strategies would result in a continuing increase in stormwater runoff...”<sup>9</sup> As such, the L.A. River Master Plan acknowledges that future stormwater flows to the Los Angeles River are anticipated to increase over time. Based on the above and because of the *de minimus* changes to flows in the Los Angeles River and the Project’s beneficial effects regarding water quality, additional quantitative analysis of other potential stormwater diversion Projects along the Los Angeles River is not necessary. The Project’s contribution to any change in the hydrograph area would not be cumulatively considerable. Regarding Item No. 5 of the comment, Los Angeles River hydraulic changes are addressed in Responses No. AG 4-18, AG 4-24, and above herein this response. Water depth, wetted perimeter and velocity are not analyzed because the changes to these values would be less than 1 percent (0.8 percent for a 2-Year Event and even less for the 25y, 50y and 100y), and for the same reasons as discussed for Item No. 4 above, additional quantitative analyses of these subtopics are not necessary.

---

<sup>9</sup> 2020 Los Angeles River Mater Plan Program EIR, Los Angeles County Public Works, February 2021, p. 3.9-90.

## Comment No. AG 4-27

**Recommendation #2:** CDFW's issuance of an LSA Agreement for a Project that is subject to CEQA will require CEQA compliance actions by CDFW as a Responsible Agency. As a Responsible Agency, CDFW may consider the CEQA document from the City for the Project. To minimize additional requirements by CDFW pursuant to Fish and Game Code section 1600 *et seq.* and/or under CEQA, the CEQA document should fully identify the potential impacts to the stream or riparian resources and provide adequate avoidance, mitigation, monitoring, and reporting commitments for issuance of the LSA Agreement.

## Response No. AG 4-27

The comment contends that a CEQA analysis is required for the processing of an LSA Agreement. As discussed in Response No. AG 4-21 above, CDFW agreed during the May 20, 2022 meeting that a lake or streambed alteration agreement would not be required because the Project would not divert flow from within, change bed or bank of, or use or deposit materials into a jurisdictional lake, stream or river. The Project is not subject to the provisions of Fish and Game Code 1600 *et seq.* and would not result in significant impacts to stream or riparian resources as discussed in page IV.C-44 of the Draft EIR.

## Comment No. AG 4-28

To compensate for any on- and off-site impacts to wetlands or riparian resources, additional mitigation conditioned in any LSA Agreement may include the following: erosion and pollution control measures, avoidance of resources, protective measures for downstream resources, on- and/or off-site habitat creation, enhancement or restoration, and/or protection, and management of mitigation lands in perpetuity.

## Response No. AG 4-28

The comment contends that Project must provide mitigation for impacts to wetlands or riparian resources. See Response Nos. AG 4-21 and AG 4-27 above for an explanation of why the Project would not need to process a lake or streambed alteration agreement. Because the Project would not impact a lake, stream or river, there is no need for compensatory mitigation. Although compensatory mitigation would not be required, the Project would control erosion with the implementation of a SWPPP and would avoid impacts to jurisdictional resources.

## Comment No. AG 4-29

### Additional Comments and Recommendations

Phased Removal. CDFW recommends the City consider phased removal of trees (i.e., phased Project approach) in order to minimize impacts resulting from the temporal loss

of trees and to provide structurally diverse tree replacement habitat while mitigation for impacts to tree removal occurs.

### **Response No. AG 4-29**

The comment recommends that the Project implement a phased removal of trees. It should be noted that half of the tree removals are Mexican fan palms, which are considered an invasive species, provide minimal foraging or habitat opportunities for most animal species that might exist on the Project Site and in the vicinity of the Project, and are specifically identified by the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes under the heading “Plants That Should Never Be Planted Along The River”. The Project would preserve the majority of trees located toward the outer strata of the Project Site (away from primary construction areas) and the Project’s landscaping plan would result in the net increase of 153 trees (an approximately 36 percent increase). Please refer to Topical Response No. 5 – Biological Resources/Trees, for further information regarding the less than significant Project impacts on biological resources, including trees and wildlife habitat.

### **Comment No. AG 4-30**

Bats. CDFW recommends modifying BIO-MM-1 to include underlined language and remove language with strikethrough.

“Due to the presence of potentially suitable roosting habitat (ornamental trees) for special-status bat species (i.e., western yellow bat), Harvard-Westlake School shall demonstrate and guarantee to the satisfaction of the Los Angeles Department of City Planning that either of the following has been or shall be accomplished:

1. Tree removal activities shall be scheduled outside of the maternity roosting season (October 1 through February 28) to avoid potential impacts to special-status bat species.

2. Any construction or palm tree removal activities that occur during the maternity roosting season for special-status bat species (March 1 through September 30) shall require a qualified biologist experienced with bat roost biology to conduct a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) to determine whether special status bat species are roosting within trees that would be removed. The surveys shall be conducted at dusk and after nightfall by a biologist. If an active roost site is located during the pre-construction survey, the roost shall be avoided and Project activities shall be conducted as recommended by the biologist to avoid the area, which may include temporary postponement or provision of a suitable buffer established around the roost until roosting activities cease. Suitable buffers could include netting, canvas, or similar materials as recommended by the biologist. A report shall be submitted to the City with the results of the pre-construction or tree removal survey and any needed maternity roost avoidance actions. Depending on the survey results, a qualified bat specialist should discuss potentially significant effects of the Project on bats and include species specific mitigation measures to reduce impacts to below a level of

significance (CEQA Guidelines, § 15125). Surveys, reporting, and preparation of robust mitigation measures by a qualified bat specialist should be completed and submitted to the City prior to any Project-related ground-disturbing activities or vegetation removal at or near locations of roosting habitat for bats.

3. If bats are not detected, but the bat specialist determines that roosting bats may be present at any time of year and could roost in trees at a given location, during tree removal, trees should be pushed using heavy machinery prior to using a chainsaw to remove them. To ensure the optimum warning for any roosting bats that may still be present, trees should be pushed lightly two or three times, with a pause of approximately 30 seconds between each nudge to allow bats to become active. A period of at least 24 hours, and preferable 48 hours, should elapse prior to such operations to allow bats to escape”.

### **Response No. AG 4-30**

The comment recommends changes to Mitigation Measure BIO-MM-1. In coordination with CDFW, Mitigation Measure BIO-MM-1 on pages IV.C-42 to IV.C-43 of the Draft EIR has been revised to include additional requirements if a qualified bat specialist determines that special-status bats are present, or that bats are absent but trees to be removed are suitable bat roosting habitat. This update has been incorporated into Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR. Mitigation Measure BIO-MM-1 is modified below to reflect the acceptance of the CDFW recommendation.

BIO-MM-1: Due to the presence of potentially suitable roosting habitat (ornamental trees) for special-status bat species (i.e., western yellow bat), Harvard-Westlake School shall demonstrate and guarantee to the satisfaction of the Los Angeles Department of City Planning that either of the following has been or shall be accomplished:

1. Tree removal activities shall be scheduled outside of the maternity roosting season (October 1 through February 28) to avoid potential impacts to special-status bat species during breeding season.
2. Any construction or palm tree removal activities that occur during the maternity roosting season for special-status bat species (March 1 through September 30) shall require a qualified biologist experienced with bat roost biology to conduct a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) and night vision goggles for an emergence survey (for at least one-hour after sunset) to determine whether special status bat species are roosting within trees that would be removed. A qualified biologist is a biologist with specialized bat experience including the familiarity with bat roost biology (i.e., a professional biologist with a minimum of two years of bat survey experience, inclusive of acoustic survey experience). The surveys shall be conducted at dusk and after nightfall by a biologist. If an active roost site is

located during the pre-construction survey, the roost shall be avoided and Project activities shall be conducted as recommended by the biologist to avoid the area, which may include temporary postponement or provision of a suitable buffer established around the roost until roosting activities cease. ~~Suitable buffers could include netting, canvas, or similar materials as recommended by the biologist.~~ A report shall be submitted to the City with the results of the pre-construction or tree removal survey and any needed maternity roost avoidance actions, prior to any Project-related ground-disturbing activities or vegetation removal at or near locations of roosting habitat for bats. If special-status bats are detected during the survey, a qualified bat specialist shall prepare species specific mitigation measures to reduce or avoid impacts to each special-status species detected. Mitigation may include avoidance through postponing or temporarily halting construction until maternal roost use is completed, use of construction buffers of no less than 100-feet, or the installation of bat boxes in proximity to detected maternal roosts. Avoidance measures shall be based on site-specific factors to prevent roost disturbances; including but not limited to numbers and locations of bats, proposed construction activities, height and distance of bat roosts from proposed construction activities, the presence of visual and/or acoustic barriers between the roost and proposed activities, and the pre-existing level of human activities (e.g., ambient noise, potential movement, etc.) to which the bats may already tolerate.

3. If special-status bats are not detected, but the bat specialist nonetheless determines that roosting bats may be present at any time of year and could roost in trees at a given location, tree removal activities shall be initiated by pushing trees using heavy machinery prior to using a chainsaw to remove the tree. In order to provide the optimum warning to any roosting special-status bats that may be present, trees shall be pushed lightly two or three times, with an approximately 30-second pause between each nudge/push to allow bats to become active. A period of at least 24 hours shall elapse between such operations to allow special-status bats to escape the construction area.

### **Comment No. AG 4-31**

Nesting Birds. As currently written, the measures included in Section 2.a.2.a. California Department of Fish and Wildlife on pages IV.C-4 and IV.C-5 of the DEIR for nesting birds may not be enforceable as they are not listed as mitigation. CDFW recommends the measures be considered enforceable biological mitigation measures for the Project and be included as BIO-MM-4.

It should be noted that the temporary halt of Project activities within nesting buffers during nesting season does not constitute effective mitigation for the purposes of offsetting Project impacts associated with habitat loss. Additional mitigation would be necessary to compensate for the removal of nesting habitat within the Project site based on acreage of impact and vegetation composition. CDFW shall be consulted to determine proper mitigation for impacts to occupied habitat depending on the status of the bird species.

Mitigation ratios would increase with the occurrence a California Species of Special Concern and would further increase with the occurrence of a CESA-listed species.

### **Response No. AG 4-31**

The comment contends that Project protection for nesting birds may not be enforceable. As stated on pages IV.C-30 and IV.C-31, in Section IV.C, *Biological Resources*, of the Draft EIR, under the heading Project Design Features, the Project would implement Project Design Feature BIO-PDF-1 to protect nesting birds. This project design feature would be enforced by inclusion in the Project's Mitigation Monitoring Program (MMP) similar to a mitigation measure. In addition, there were no California Species of Special Concern (SSC) or CESA-listed species observed by biologists during several site visits to inventory existing biological resources and the project design feature is not designed to be applied only to such special-status avian species. Although no SSC species were observed, the Draft EIR concluded that western yellow bat, an SSC, has a moderate potential to roost within the Biological Study Area (Page IV.C-32 of the Draft EIR) for which Mitigation Measure BIO-MM-1 is required to reduce impacts to less than significant. The minor temporal loss of ornamental trees is not a substantial loss of habitat as the Project would replant more trees than would be removed, replacing lost nesting habitat for avian species.

### **Comment No. AG 4-32**

Data. CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. Accordingly, please report any special status species detected by completing and submitting CNDDDB Field Survey Forms (CDFW 2021b). This includes all documented occurrences of Nevin's barberry and other special status species. The City should ensure the data has been properly submitted, with all data fields applicable filled out, prior to Project ground-disturbing activities. The data entry should also list pending development as a threat and then update this occurrence after impacts have occurred. The City should provide CDFW with confirmation of data submittal.

### **Response No. AG 4-32**

The comment states that data related to special-status species should be reported to the CNDDDB, if such species are encountered. The City concurs with this statement. Upon certification of the Project EIR by the Lead Agency, data for special-status species that are maintained by the CNDDDB will be reported to CDFW using the appropriate format indicated in the comment.

Because this comment does not raise a substantive issue on the adequacy of the Draft EIR, no further response is necessary.

### **Comment No. AG 4-33**

Mitigation and Monitoring Reporting Plan. Per Public Resources Code section 21081.6(a)(1), CDFW has provided the City with a summary of our suggested mitigation measures and recommendations in the form of an attached Draft Mitigation and Monitoring Reporting Plan (MMRP; Attachment A). A final MMRP shall reflect results following additional plant and wildlife surveys and the Project's final on and/or off-site mitigation plans.

### **Response No. AG 4-33**

The comment reminds the Lead Agency that an MMRP is required for CEQA compliance. The City appreciates the CDFW-recommend MMRP. However, as explained in detail in Response to No. AG-36 below, the City, as Lead Agency, has prepared its own Mitigation Monitoring Program (MMP) as part of the Final EIR, as required under State CEQA Guidelines Section 15097, and which contains all recommended mitigation measures and required project design features. No additional plant or wildlife surveys are required for the City's decision makers to consider certification of the EIR.

### **Comment No. AG 4-34**

#### **Filing Fees**

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the City of Los Angeles and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required for the underlying Project approval to be operative, vested, and final (Cal. Code Regs., tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089).

### **Response No. AG 4-34**

The comment reminds the Lead Agency that CDFW environmental review fees are required at the time of Notice of Determination posting. This comment provides filing fee information and is noted for the record. Because the comment does/comments do not raise a substantive issue on the content of the Draft EIR, no further response is necessary.

### **Comment No. AG 4-35**

#### **Conclusion**

We appreciate the opportunity to comment on the Project to assist the City of Los Angeles in adequately analyzing and minimizing/mitigating impacts to biological resources. CDFW requests an opportunity to review and comment on any response that the City of Los Angeles has to our comments and to receive notification of any forthcoming hearing date(s) for the Project [CEQA Guidelines, § 15073(e)]. If you have any questions or

comments regarding this letter, please contact Felicia Silva, Environmental Scientist, at Felicia.Silva@wildlife.ca.gov or (562) 292-8105.

### Response No. AG 4-35

The comment thanks the Lead Agency for the opportunity to comment on the CEQA document. This expresses CDFW's opportunity to review and comment on the Draft EIR and provides contact information. The comment does not address the adequacy of the Draft EIR but is noted for the record and will be forwarded to the decision-makers for review and consideration.

### Comment No. AG 4-36

#### Attachment A: Draft Mitigation and Monitoring Reporting Plan

CDFW recommends the following language to be incorporated into a future environmental document for the Project. A final MMRP shall reflect results following additional plant and wildlife surveys and the Project's final on and/or off-site mitigation plans.

<b>Biological Resources (BIO)</b>			
<b>Mitigation Measure (MM) or Recommendation (REC)</b>		<b>Timing</b>	<b>Responsible Party</b>
<b>MM-BIO-1-Trail Installation</b>	Educational materials and signage shall be made available to trail users to keep aware of the impacts that human disturbance brings to open spaces. People shall be made aware of the impacts that they have on surrounding habitat (such as noise or smells), particularly during breeding seasons. CDFW recommends the City install appropriate public information signage at trailheads to: 1) educate and inform the public about wildlife present in the area; 2) advise on proper use of the trail in a manner respectful to wildlife; and 3) provide local contact information to report injured or dead wildlife. Signage shall be written in the language(s) understandable to all those likely to recreate and use the trails. Signage shall not be made of materials harmful to wildlife such as spikes or glass. The City should provide a long-term maintenance plan to repair and replace the signs.	Prior to Project construction and activities	City/Project Applicant
<b>MM-BIO-2-Trail Installation</b>	Trash receptacles shall be placed only at trailheads to avoid creating an unnatural food source that may attract nuisance wildlife and to minimize waste in core habitat areas.	Prior to Project construction and activities	City/Project Applicant

<b>Biological Resources (BIO)</b>			
<b>Mitigation Measure (MM) or Recommendation (REC)</b>		<b>Timing</b>	<b>Responsible Party</b>
<b>MM-BIO-3-LSA</b>	The Project may result in the alteration of streams. For any such activities, the Project applicant (or “entity”) must provide written notification to CDFW pursuant to section 1600 et seq. of the Fish and Game Code. Based on this notification and other information, CDFW determines whether a Lake and Streambed Alteration (LSA) Agreement with the applicant is required prior to conducting the proposed activities. Please visit CDFW’s <a href="#">Lake and Streambed Alteration Program</a> webpage for information about LSA Notification and online submittal through the Environmental Permit Information Management System (EPIMS) Permitting Portal (CDFW 2021a).	Prior to construction	Project Applicant
<b>MM-BIO-4-Hydrology Report</b>	The LSA Notification shall include a hydrology report to evaluate whether altering streams within the Project site may impact hydrologic activity within and downstream of the Project site. The hydrology report shall also include an analysis to determine if Project activities will impact the current hydrologic regime or change the velocity of flows on site and downstream. The hydrology report shall also determine if the Project will result in substantial changes to water availability downstream for biological resources in the Whittier Narrows. CDFW also requests a hydrological evaluation of any potential scour or erosion at the Project site and downstream due to a 100, 50, 25, 10, 5, and 2- year frequency storm event for existing and proposed conditions to determine how the Project activities may change the hydrology on site.	Prior to Construction	Project Applicant
<b>MM-BIO-5-BMPs</b>	The Project shall implement Best Management Practices (BMPs) to prevent erosion and the discharge of sediment and pollutants into drainages during Project activities. BMPs shall be monitored and repaired, if necessary, to ensure maximum erosion, sediment, and pollution control. The Project proponent shall prohibit the use of erosion control materials potentially harmful to fish and wildlife species,	Prior to Construction	Project Applicant

<b>Biological Resources (BIO)</b>			
<b>Mitigation Measure (MM) or Recommendation (REC)</b>		<b>Timing</b>	<b>Responsible Party</b>
	<p>such as mono-filament netting (erosion control matting) or similar material, within stream areas. All fiber rolls, straw wattles, and/or hay bales utilized within and adjacent to the Project site shall be free of nonnative plant materials. Fiber rolls or erosion control mesh shall be made of loose-weave mesh that is not fused at the intersections of the weave, such as jute, or coconut (coir) fiber, or other products without welded weaves. Non-welded weaves reduce entanglement risks to wildlife by allowing animals to push through the weave, which expands when spread.</p>		
<b>REC-1-Diversion Analysis</b>	<p>CDFW recommends the DEIR include an analysis of potential impacts on biological resources resulting from the proposed water diversion. At a minimum, the analysis should evaluate a study reach that includes the channel downstream from the Project site. The study reach should extend a minimum of one mile downstream or an appropriate distance determined by both a qualified biologist and hydrologist, whichever is greater. The analysis of the study reach should discuss changes in hydrology and hydraulics, including the following:</p> <ol style="list-style-type: none"> <li>1. Under pre-project (i.e., baseline) conditions, the volume of water flow from both the Project area and study reach during a) the wet (November through March); b) the dry season (April through October); and c) above-average and below-average water year (i.e., wet season/above-average water year, wet season/below-average water year, dry season/above-average water year, and dry season/below-average water year). The analysis should clearly define above-average or below-average rainfall year.</li> <li>2. Under proposed Project conditions, the percent reduction in flow from both the Project area and study reach for a wet season/above-average water year, wet season/below-average water year, dry season/above-average water year,</li> </ol>	Prior to Construction	Project Applicant

<b>Biological Resources (BIO)</b>			
<b>Mitigation Measure (MM) or Recommendation (REC)</b>		<b>Timing</b>	<b>Responsible Party</b>
	<p>and dry season/below-average water year.</p> <p>3. A quantitative analysis comparing the flow from the Project area and other tributaries into the study reach, and their relative contribution to the hydrograph of the study reach</p> <p>4. A quantitative analysis of other potential stormwater diversion Projects along the Los Angeles River, both up and downstream, and their cumulative impact to the hydrograph of the study reach.</p> <p>5. An analysis of potential Project-related changes to river hydraulics in both concrete-lined and soft-bottom reaches. This includes water depth (percent change), wetted perimeter (acres gained/lost), and velocity (percent change).</p>		
<b>REC-2-Phased Removal</b>	<p>CDFW recommends the City consider phased removal of trees (i.e., phased Project approach) in order to minimize impacts resulting from the temporal loss of trees and to provide structurally diverse tree replacement habitat while mitigation for impacts to tree removal occurs.</p>	Prior to Construction	Project Applicant
<b>REC-3-Bats</b>	<p>CDFW recommends modifying BIO-MM-1 to include underlined language and remove language with strikethrough.</p> <p>Due to the presence of potentially suitable roosting habitat (ornamental trees) for special-status bat species (i.e., western yellow bat), Harvard-Westlake School shall demonstrate and guarantee to the satisfaction of the Los Angeles Department of City Planning that either of the following has been or shall be accomplished:</p> <p>1. Tree removal activities shall be scheduled outside of the maternity roosting season (October 1 through February 28) to avoid potential impacts to special-status bat species.</p> <p>2. Any construction or palm tree removal activities that occur during the maternity roosting season for</p>	Prior to Construction	Project Applicant

<b>Biological Resources (BIO)</b>		
<b>Mitigation Measure (MM) or Recommendation (REC)</b>	<b>Timing</b>	<b>Responsible Party</b>
<p>special-status bat species (March 1 through September 30) shall require a qualified biologist experienced with bat roost biology to conduct a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) to determine whether special status bat species are roosting within trees that would be removed. The surveys shall be conducted at dusk and after nightfall by a biologist. If an active roost site is located during the pre-construction survey, the roost shall be avoided and Project activities shall be conducted as recommended by the biologist to avoid the area, which may include temporary postponement or provision of a suitable buffer established around the roost until roosting activities cease. Suitable buffers could include netting, canvas, or similar materials as recommended by the biologist. A report shall be submitted to the City with the results of the pre-construction or tree removal survey and any needed maternity roost avoidance actions. <u>Depending on the survey results, a qualified bat specialist should discuss potentially significant effects of the Project on bats and include species specific mitigation measures to reduce impacts to below a level of significance (CEQA Guidelines, § 15125). Surveys, reporting, and preparation of robust mitigation measures by a qualified bat specialist should be completed and submitted to the City prior to any Project-related ground-disturbing activities or vegetation removal at or near locations of roosting habitat for bats.</u></p> <p>3. <u>If bats are not detected, but the bat specialist determines that roosting bats may be present at any time of year and could roost in trees at a given location, during tree removal, trees should be pushed using heavy machinery prior to using a chainsaw</u></p>

<b>REC-4-Nesting Birds</b>	<p>As currently written, the measures included in Section 2.a.2.a. California Department of Fish and Wildlife on pages IV.C-4 and IV.C-5 of the DEIR for nesting birds may not be enforceable as they are not listed as mitigation. CDFW recommends the measures be considered enforceable biological mitigation measures for the Project and be included as BIO-MM-4.</p> <p>It shall be noted that the temporary halt of Project Activities within nesting buffers during nesting season does not constitute effective mitigation for the purposes of offsetting Project impacts associated with habitat loss. Additional mitigation would be necessary to compensate for the removal of nesting habitat within the Project site based on acreage of impact and vegetation composition. CDFW shall be consulted to determine proper mitigation for impacts to occupied habitat depending on the status of the bird species. Mitigation ratios would increase with the occurrence a California Species of Special Concern and would further increase with the occurrence of CESA-listed species.</p>	Prior to Project construction and activities	City/Project Applicant
<b>REC-5-Data</b>	<p>CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. The City shall ensure that all data concerning special status species within the Project site be submitted to the CNDDDB by completing</p>	Prior to Project construction and activities	City/Project Applicant

<b>Biological Resources (BIO)</b>			
<b>Mitigation Measure (MM) or Recommendation (REC)</b>		<b>Timing</b>	<b>Responsible Party</b>
	and submitting <a href="#">CNDDDB Field Survey Forms</a> . The City shall ensure the data has been properly submitted, with all data fields applicable filled out, prior to Project ground-disturbing activities. The data entry shall also list pending development as a threat and then update this occurrence after impacts have occurred. The City shall provide CDFW with confirmation of data submittal.		
REC-6-Mitigation and Monitoring Plan	Per Public Resources Code section 21081.6(a)(1), CDFW has provided the City with a summary of our suggested mitigation measures and recommendations in the form of an attached Draft Mitigation and Monitoring Reporting Plan (MMRP; Attachment A). A final MMRP shall reflect results following additional plant and wildlife surveys and the Project's final on and/or off-site mitigation plans.	Prior to approval of CEQA document	City/Project Applicant

## Response No. AG 4-36

The comment provides a list of recommended measures for consideration by the Lead Agency for incorporation into the CEQA documentation. The City thanks CDFW for the recommended draft MMRP. However, the City, as Lead Agency, has drafted a separate MMP because the CDFW-recommended draft MMRP for biological resources includes measures that are either not warranted or applicable or include recommendations that have not been fully incorporated by the City. In addition, the CDFW-recommended draft MMRP applies only to biological resources and does not include all of the EIR-recommended mitigation measures or the project design features that are included in the Lead Agency's MMP.

In particular, of the CDFW mitigation measures or recommendations, the following are either not adopted or do not apply due to the lack of significant impact: MM-BIO-3-LSA (Section 1602 of the Fish and Game Code does not apply), MM-BIO-4 Hydrology Report (already included in the Draft EIR), MM-BIO-5-BMPs (will be included in the Project SWPPP), REC-1-Diversion Analysis (analysis completed; see Response No. AG 4-26 above), REC-2-Phased Removal (to be considered during removal; however, about half of the trees to be removed are Mexican fan palms), REC-3-Bats (in part, some of the recommendation is incorporated), REC-4-Nesting Birds (remains a project design feature included in the Lead Agency MMP), REC-5-Data (special-status species data will be reported), REC-6-Mitigation and Monitoring Plan (incomplete, so not adopted). The

CDFW recommended measures MM-BIO-1-Trail Installation and MM-BIO-2-Trail Installation are adopted as project design features, as follows (see addition in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR).

**BIO-PDF-3** is added to increase the beneficial uses of the Zev Greenway as a natural open space area by promoting awareness that human activities, such as trail use, may impact or disturb wildlife use of open spaces.

**BIO-PDF-3:** Harvard-Westlake School will make available to the Zev Greenway trail users educational materials and signage at the entrance to the ADA-compliant pedestrian ramp located between the Project's gymnasium and the Zev Greenway. The materials and signage will promote awareness that human activities, such as trail use, may impact or disturb wildlife use of open spaces. Educational materials and signage will explain how human activity impacts, inclusive of noise and odors, may have on natural habitats growing within the Zev Greenway, emphasizing the increased severity during breeding seasons. The signage, acceptable to the City, will also: 1) educate and inform the public about wildlife present in the area; 2) advise on proper use of the ramp in a manner respectful to wildlife; and 3) provide local contact information to report injured or dead wildlife. Signage will be written in the language(s) understandable by residents in the local vicinity and to those most likely to use the ramp. Signage will be made of materials not harmful to wildlife, avoiding glass or the use of spikes.

**BIO-PDF-4** is added to discourage potential conflicts between wildlife and users of the Zev Greenway by avoiding or minimizing the potential to create an attractive nuisance of an unnatural food source for wildlife.

**BIO-PDF-4:** As part of the Project's routine maintenance program, Harvard-Westlake School will place a waste receptacle at the entrance to the Project's ADA-compliant pedestrian ramp located between the Project's gymnasium and the Zev Greenway in order to avoid or minimize the potential to create an attractive nuisance of an unnatural food source for wildlife. The receptacle will be regularly maintained to avoid waste materials inadvertently entering the Zev Greenway area.

## **Comment Letter No. AG 5**

Mashaal Majid

Planning Director

Office of Los Angeles City Councilmember Nithya Raman, 4th District

Received May 12, 2022

### **Comment No. AG 5-1**

I am reaching out on behalf of Councilmember Nithya Raman to share our thoughts for the proposed Harvard-Westlake River Project (Project) located at 4047, 4141, and 4155 Whitsett Avenue and 12506, 12600, and 12630 Valley Spring Lane at the former Weddington Golf & Tennis site. This site is now in Council District 4 after the 2020 City of Los Angeles redistricting process.

### **Response No. AG 5-1**

This comment introduces the purpose of the comment on behalf of Councilmember Nithya Raman. As the comment does not discuss the adequacy or content of the Draft EIR, no further response is necessary.

### **Comment No. AG 5-2**

It is our understanding that the site, which is currently occupied by a private nine-hole, 27-par golf course and tennis facility, was purchased by Harvard-Westlake School from the Weddington family in 2017 for the purpose of redesigning, building, and operating an athletic and recreational facility for the School's students, staff, and the general public. This sale and purchase took place after previous proposals for the 16-acre property by the Weddington family, such as one which included preservation of golfing and tennis on the site while adding housing units, failed to move forward.

### **Response No. AG 5-2**

This comment provides an accurate summary of historical information regarding the Project Site but does not address the adequacy or content of the Draft EIR. As such, no further response is necessary.

### **Comment No. AG 5-3**

As detailed in the Draft Environmental Impact Report (Draft EIR), this Project involves the redevelopment of the approximately 16.1-acre Weddington Golf & Tennis site and an adjacent approximately 1.1-acre portion of property along the Los Angeles River leased from Los Angeles County for use as an athletic and recreational facility for the Harvard-Westlake School and for shared public use.

### **Response No. AG 5-3**

This comment provides an accurate summary of information provided in Chapter II, *Project Description*, of the Draft EIR, but does not address the adequacy of the Draft EIR. As such, no further response is necessary.

### **Comment No. AG 5-4**

The Project would remove the existing golf course, driving range, and tennis facility to develop two athletic fields with bleacher seating, an 80,249-square-foot, two-story multi-purpose gymnasium with a maximum height of 30 feet, a 52-meter swimming pool with seating, eight tennis courts with seating, one level of below-grade parking and a surface parking lot. The Project would include ancillary field buildings, three security kiosks, exterior light poles, walls/fencing, and retention of the existing clubhouse structure, putting green, low brick retaining wall, and golf ball-shaped light standards. It would remove 240 of the existing 421 trees and plant 393 new trees, include a one million-gallon stormwater capture and reuse system for water conservation and treatment purposes, provide approximately 5.4 acres of publicly-accessible open space and landscaped trails connecting to the adjacent Zev Yaroslavsky Los Angeles River Greenway, and would incorporate on-site landscaped areas, water features, and recreational facilities. Lastly, the Project would provide off-site improvements to the Valleyheart Drive public right-of-way, portions of the Greenway, and an ADA compliant ramp to provide a pedestrian connection between the Greenway and Coldwater Canyon Avenue.

### **Response No. AG 5-4**

This comment provides a summary of components of the Project as provided in Chapter II, *Project Description*, of the Draft EIR. Please refer to Topical Response No. 2 - Modifications to the Project Design, which discusses design modifications made to the Project in response to public and agency comments received on the Draft EIR. In addition, corrections to the Draft EIR with the Project design modifications are included in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR. Within Chapter 3, relevant figures from the Draft EIR have also been revised to illustrate the Project design modifications. As part of the Project design modifications, the stormwater capture and reuse system would be reduced to approximately 350,000 gallons and the Project's water features would be eliminated, with additional modifications relating to bleacher seating, lighting, building design (swimming pool area and gymnasium), parking, and grading. As the comment does not discuss the adequacy or content of the Draft EIR, no further response is necessary.

### **Comment No. AG 5-5**

We want to ensure that community questions, concerns, feedback, and strategies related to potential environmental impacts and as shared in response to the Draft EIR are thoroughly assessed and adequately responded to in the Final EIR, including but not limited to: noise, traffic, circulation, active transportation access, habitat protection, public

access to the waterway and upkeep of the river park, public access to athletic and recreational facilities, light pollution, grading, construction (including for projects in close proximity to this site and on the same theoretical timelines pending city actions), the nature of on-site special events, shuttling services, water runoff, landscaping and canopy coverage, retainment of structures deemed historic per the Historic Cultural Monument designation, and neighborhood buffering and screening.

### **Response No. AG 5-5**

The comment requests that community questions, concerns, feedback, and strategies related to potential environmental impacts be thoroughly assessed and adequately responded to in the Final EIR. Regarding all the subject areas listed in the comment, the Final EIR addresses comments consistent with the requirements of CEQA Guidelines Section 15088, *Evaluation of and Response to Comments*, Subsection (a), which requires the lead agency to evaluate comments on environmental issues by preparing a written response to comments raising significant environmental issues. Per the CEQA Guidelines, the level of detail contained in a response may correspond to the level of detail provided in the comment (i.e., responses to general comments are allowed to be general). A general response may be appropriate when a comment does not contain or specifically refer to readily available information nor explain the relevance of evidence submitted with the comment. Section 15132 of the CEQA Guidelines, provides that the Final EIR may address comments either in verbatim or in summary. Although certain form letters with minor variations in presentation are addressed in the Final EIR as a unit, the Final EIR mostly addresses organization, agency, and individual comments verbatim. As the comment does not address the contents or adequacy of the Draft EIR, no further response is necessary.

### **Comment No. AG 5-6**

We understand that there will be more opportunities for community members to weigh in, including at a public hearing held by City Planning following publication of the Final EIR release, as well as at a future City Planning Commission meeting. We deeply appreciate and would like to commend the high level of robust engagement around this Project, and our office looks forward to continued conversations with residents, the Harvard-Westlake School, city departments and other public agencies, and additional stakeholders.

### **Response No. AG 5-6**

This comment indicates future opportunities for public input on the Project and acknowledges the high level of engagement by various stakeholders. This comment does not raise any issues with respect to the content and adequacy of the Draft EIR. Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

### **Comment No. AG 5-7**

Our office looks forward to the progression of the environmental review process as an opportunity to address all issues raised and will remain engaged to support a positive resolution for all affected stakeholders.

### **Response No. AG 5-7**

The comment expresses the Council Office's position that all issues raised would be addressed and that the Council Office will remain engaged to support a positive resolution for all affected stakeholders. This comment does not raise any issues with respect to the content and adequacy of the Draft EIR. Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

## **Comment Letter No. ORG 1**

Kim Tashman, President (ORG 1A and 1C)  
Save Weddington, Inc.  
Jamie T. Hall (ORG 1B)  
Channel Law Group LLP on behalf of Save Weddington, Inc.  
Received March 15, and May 10, 2022

### **Comment Letter No. ORG 1A, March 15, 2022 (Kim Tashman)**

#### **Comment No. ORG 1A-1**

Subject: Request extension for public comment review period of the DEIR (ENV-2020-1512-EIR)

Save Weddington, Inc. is a community based nonprofit corporation in Studio City. We are in receipt of the Draft Environmental Impact Report ENV-2020-1512-EIR Harvard-Westlake River Park Project. We request that the Planning Department agree to extend the comment period from 45 days to 90 days. It is important to our community and to other concerned stakeholders in the San Fernando Valley that enough time be permitted for a meaningful response to be made.

Unusual circumstances exist for making this request. This DEIR was released 17 months after the Notice of Preparation was posted. In addition, the DEIR's Environmental Impact Analysis section consists of 19 elements that must be reviewed and commented on by appropriate experts in their respective fields, the DEIR's Alternatives section consists of seven sections, and the overall document is thousands of pages long. Finally, the developers have unlimited funds and have had years to produce data supporting their desired outcomes. Developers are not required to include studies or data that do not support the proposed project. That job falls to the community and is not funded by public dollars.

CEQA Guidelines Section 15105 states that the comment period for a project like the current one should be 45 days, at a minimum, but should only be more than 60 days in unusual circumstances. Save Weddington believes that the proposed development is being presented during and with unusual circumstances.

A 90-day public comment period is not unusual. For the NBCUniversal Evolution Plan DEIR, a 90-day response was granted, given the scope and impact on the surrounding community. Such is the case with the plan proposed in the DEIR (ENV-2020-1512-EIR).

Save Weddington requests that the public comment period be extended to 90 days. We also request that you reply to this request as soon as possible.

## Response No. ORG 1A-1

The comment requests that the City extend the Project’s public review period to 90 days. CEQA Guidelines Section 15105(a) states: “The public review period for a draft EIR shall not be less than 30 days nor should it be longer than 60 days except under unusual circumstances. When a draft EIR is submitted to the State Clearinghouse for review by state agencies, the public review period shall not be less than 45 days, unless a shorter period, not less than 30 days, is approved by the State Clearinghouse.” When the Draft EIR was released for public review on March 10, 2022, the public review period was 47 days, to meet the required 45 day public review period when Draft EIRs are submitted to the State Clearinghouse for State agency review. The City then extended the public review period to be a total of 62 days, from March 10, 2022 to May 10, 2022. The City determined that public review conditions did not rise to an “unusual circumstance” and that public access to the Draft EIR was adequate during the 62-day review period. For additional details regarding the City’s determination to extend the Draft EIR comment period to 62 days, rather than the 90-day comment period granted to the NBC Universal Evolution Plan project, the commenter is referred to Topical Response No. 1 – Public Participation and Review. Topical Response No. 1 also includes a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation and access to the Draft EIR.

---

## **Comment Letter No. ORG 1B, May 10, 2022:**

### **Comment No. ORG 1B-1**

This firm represents “Save Weddington.” As detailed in this comment letter, the Draft Environmental Impact Report (“DEIR”) for the Harvard-Westlake River Park Project (“Project” or “proposed Project”)<sup>1</sup> is fatally flawed and must be revised and then recirculated for additional public comment and review.

<sup>1</sup> The DEIR is available at: <https://planning.lacity.org/development-services/eir/harvard-westlake-riverpark-project-0>

### **Response No. ORG 1B-1**

The comment introduces Channel Law Group, LLP as a representative of Save Weddington. The comment also makes a general statement that the Draft EIR is fatally flawed and that it must be revised and recirculated for further public review. The comment does not include specific examples of any shortcomings in the Draft EIR. The comment, however, is noted for the record and will be forwarded to the decision-makers for review and consideration.

### **Comment No. ORG 1B-2**

#### **Introduction**

The proposed Project involves substantial modification of a City of Los Angeles Historic-Cultural Monument (“HCM”), the Studio City Golf and Tennis Club (or Weddington Golf & Tennis Club). The proposed Project involves the demolition of the private nine-hole, 27-par golf course and tennis facility and the construction of athletic and recreation facilities to serve a private two-campus school, Harvard-Westlake School, with campuses located 1.2 and 4.25 driving miles from the Project site. Students would thus be required to access the new facilities via vehicles. The proposed Project would also allow for some public use of the site. The public would have access to approximately seven acres of walking paths and wooded areas. They would also have access, with a reservation, to the tennis courts and the putting green after checking-in at the clubhouse but would not be provided with direct access to the athletic facilities.

### **Response No. ORG 1B-2**

The comment claims the Project would involve substantial modification of a City of Los Angeles HCM, the Studio City Golf and Tennis Club (or Weddington Golf & Tennis Club). This assertion made in the comment is not supported by substantiated facts. The commenter is referred to Topical Response No. 6 – Historical Resources, which addresses direct and indirect impacts on historical resources resulting from the Project. Topical Response No. 6 identifies the Project Site’s HCM designation and its character-defining features (private recreational facility open for public use, the clubhouse, the golf

ball [-shaped] light standards, the putting green, and the brick wall with weeping mortar at the front lawn) that will be preserved and/or, as necessary, restored as part of the Project. Topical Response No. 6 also discusses Project Design Features that include a historic preservation professional as part of the design team and the approval of specific details related to the relocation of the golf ball-shaped light standards and rehabilitation of the clubhouse. As further concluded therein, the Project as designed would not result in significant adverse impacts to historical resources on the Project Site.

The comment indicates the public would have “some” public use of the site and cites examples of the Project’s public use features. As discussed in Chapter II, *Project Description*, page II-34 of the Draft EIR, the Project would be available for public use from 7:00 a.m. to 9:00 p.m. seven days a week. As further discussed in Chapter II, page II-47, most of the School’s outdoor activities would occur in the late afternoons (after academic hours at the Upper Campus and would end between the hours of 4:45 p.m. to 7:45 p.m. with approximately 50 percent of school days containing no outdoor athletic activities after 5:30 p.m. The majority of the school day would be open for public use of the Project Site. School uses on Saturdays would take place, at maximum, between 9:00 a.m. and 6:00 p.m., though concurrent public use would still be the supported in the same manner as during school days. On Sundays, no School athletics uses would be permitted and the entire Project Site would be wholly available for public uses. The Draft EIR defines public use of the gymnasium and both athletic fields to be “for pre-approved organizations” (refer to Chapter II, *Project Description*, page II-34). Please refer to Topical Response No. 3, Enforcement of Public Access, for additional public use information.

In addition, the 0.75-mile landscaped pedestrian pathway (with seating, shade, and direct access to the Zev Greenway from Valley Spring Lane), the putting green and the clubhouse/café would be open to the public all day, every day of the week and, collectively, comprise 5.4 acres of open space. Public use of the Project Site is further discussed in Topical Response No. 3 - Enforcement of Public Access. Because the comment does not raise a substantive issue on the content or adequacy of the Draft EIR, no further response is necessary.

### **Comment No. ORG 1B-3**

As detailed in the Notice of Completion and Availability (“NOC/NOA”)<sup>2</sup> for the proposed Project:

The Harvard-Westlake River Park Project (Project) involves the redevelopment of the approximately 16.1-acre (701,428 square foot) Weddington Golf & Tennis site, and an adjacent approximately 1.1-acre (47,916 square foot) portion of property along the Los Angeles River leased from Los Angeles County, collectively comprising an approximately 17.2-acre (749,344 square foot) project site (Project Site), for use as an athletic and recreational facility for the Harvard-Westlake School and for shared

public use. The Project would remove the existing golf course, driving range, and tennis facility to develop two athletic fields with bleacher seating, an 80,249-square-foot, two-story multi-purpose gymnasium with a maximum height of 30 feet, a 52-meter swimming pool with seating, eight tennis courts with seating, one level of below-grade parking and a surface parking lot. The Project would include ancillary field buildings, three security kiosks, exterior light poles, walls/fencing, and retention of the existing clubhouse structure, putting green, low brick retaining wall with weeping mortar, and golf ball-shaped light standards. The Project would remove 240 of the existing 421 trees and plant 393 new trees. The Project would include a one million-gallon stormwater capture and reuse system for water conservation and treatment purposes. The Project would also provide approximately 5.4 acres (235,224 square feet) of publicly-accessible open space and landscaped trails connecting to the adjacent Zev Yaroslavsky Los Angeles River Greenway (Zev Greenway) and would provide on-site landscaped areas, water features, and recreational facilities. The Project involves off-site improvements to the Valleyheart Drive public right-of-way, portions of the Zev Greenway adjacent to the Project Site, and an ADA compliant ramp to provide a pedestrian connection between the Zev Greenway and Coldwater Canyon Avenue northwest of the Project Site. Project development would require excavation and grading of the Project Site to a maximum depth of approximately 21 feet below grade and a net cut/fill volume of approximately 250,000 cubic yards.

<sup>2</sup> The NOC/NOA is available at:  
[https://planning.lacity.org/eir/HarvardWestlake\\_River\\_Park\\_Project/deir/Draft%20EIR%20Sections/DEIR\\_NOCA\\_Signed.pdf](https://planning.lacity.org/eir/HarvardWestlake_River_Park_Project/deir/Draft%20EIR%20Sections/DEIR_NOCA_Signed.pdf)

### **Response No. ORG 1B-3**

The comment reiterates the description of the Project from the Notice of Completion and Availability. No comments are made on the adequacy of the Draft EIR and, therefore, no further response is necessary.

### **Comment No. ORG 1B-4**

The proposed Project would include a below-grade parking structure located in the eastern portion of the Project Site, with approximately 503 automobile parking spaces. An additional 29 surface parking spaces would be provided at the Valleyheart Drive entrance to the parking structure, for a total of 532 spaces, as compared to the existing 89 surface parking spaces. This represents a net gain of 443 parking spaces associated with the proposed intensification of use.

## Response No. ORG 1B-4

The comment reiterates the description of the Project's on-site parking facilities from the Notice of Completion and Availability. Note that modifications to the Project design would reduce the capacity of the underground parking structure from 503 spaces to 386 spaces and the capacity of the above grade parking lot from 29 spaces to 17 spaces for a total of 403 spaces. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. No comments are made on the adequacy of the Draft EIR and, therefore, no further response is necessary.

## Comment No. ORG 1B-5

Seating for observing sports at facilities included as part of the proposed Project include: 488 bleacher seats for Field A seating; 255 seats for Field B seating; 1,026 retractable bleacher seats in the Gymnasium; 348 bleacher seats for the pool; and 100 seats for the tennis courts. This can be compared to the 532 parking spaces to be provided.

## Response No. ORG 1B-5

The comment reiterates the description of the Project's facilities and parking from the Notice of Completion and Availability. The comment also compares the number of seats to the number of parking spaces. The Project's proposed parking would meet applicable LAMC requirements. Refer to Topical Response No. 9 - Transportation and Parking During Construction and Operations, for a discussion of the Project's proposed parking program. As discussed in Topical Response No. 9, based on SB 743 and City of Los Angeles Department of Transportation's (LADOT) Transportation Assessment Guidelines (TAG), parking effects are no longer considered impacts on the environment and therefore such effects were not evaluated as CEQA impacts in the Draft EIR. As such, responses to comments on parking effects are not required to be provided in this Final EIR and are provided herein only for informational purposes independent of CEQA requirements. Note that modifications to the Project design would reduce the cumulative number of seats at the Project's athletics facilities from 2,217 to 2,005. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. Because the comment does not raise a substantive issue on the content or adequacy of the Draft EIR, no further response is necessary.

## Comment No. ORG 1B-6

During Project construction, according to page II-62 of the DEIR, demolition and site preparation activities would generate up to 252 daily haul trucks. During the grading and excavation phase up to 300 export haul trips would be generated between the hours of 8:00 a.m. and 4:00 p.m. This equates to a haul truck leaving the site more frequently than every 2 minutes, as well as a haul truck arriving at the site more frequently than every two minutes between these hours. Given that 250,000 cubic yards of earth would be exported,

and the standard capacity of a large dump truck of between 10 and 16 cubic yards,<sup>3</sup> this equates to between 25,000 and 15,625 two-way haul truck trips, or 31,250-50,000 one-way trips just for soil export, over the course of Project construction, or between 50,000 and 31,250 one-way haul trips,<sup>4</sup> without consideration of the fact that compacted soil expands in size once excavated.<sup>5</sup> The DEIR needs to disclose whether the soil excavation and removal quantities are bank cubic yards, loose cubic yard or compacted cubic yards and the analysis corrected accordingly. The DEIR Project Description fails to identify the length of key construction phases. Please provide a table indicating the length of each construction phases and the equipment to be used during each construction phase.

<sup>3</sup> <https://www.jdpower.com/cars/shopping-guides/how-many-cubic-yards-are-in-a-dump-truc>

<sup>4</sup> According to page IV.B-36 of the DEIR, the DEIR assumes 14 cubic yard soil capacity haul trucks for the grading/excavation phase. This equates to 17,858 two-way haul trips, or 35,714 one-way haul trips.

<sup>5</sup> See: <https://www.nationwideconsultingllc.com/excavation-and-compaction/>  
Swell and shrinkage are two important, and often misunderstood, terms. Consider the simple example of digging a 1.0 cubic yard hole with a shovel and then throwing the dirt into wheelbarrows. In the ground the 1.0 cubic yard of soil is in its virgin (or natural) state. Upon being shoveled into the wheelbarrows the soil is in a loose (or lower density) state and probably has a volume of 1.2 to 1.4 cubic yards. This process of soil increasing in volume from its virgin state to a loose state is called swell.

It does not appear that the soil export volumes in the DEIR account for swell and thus both earth quantities to be exported and haul trips have been underestimated resulting in an underestimate of impacts.

## Response No. ORG 1B-6

The comment makes various assertions regarding the exportation of soil and number of truck trips generated by this activity and requests a table detailing the length of each phase of construction. The Draft EIR provided the overall construction duration in Chapter II, *Project Description*, in subsection 5, *Anticipated Construction Schedule*. In addition, the Project's construction modeling assumptions, including phase lengths, construction equipment list and truck trips per phase were provided on PDF pages 8 through 18 of 437 of Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. Construction activity and the anticipated duration of each construction phase are summarized on PDF pages 82 through 84 of 217 in Appendix M, Transportation Assessment, to the Draft EIR. Subsequent to the development of the Transportation Assessment, which cites hours of grading and excavation activity as occurring from 8:00 a.m. to 4:00 p.m., the hours for excavation and grading activity have been revised from 9:00 a.m. to 3:00 p.m. Regarding daily haul trips, the Project would generate 300 one-way truck trips (150 trucks), with each truck accounting for one trip to the Project Site and one trip from the Project Site. As such, excavation and grading activities would generate approximately 150 outbound haul trucks per day, and 150 empty inbound haul trips per day. This clarifying information has been provided in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

As further stated in Section IV.B, *Air Quality*, of the Draft EIR, haul truck trip estimates were based on excavation volumes obtained from the Project's engineering

representative and 7 cubic yard capacity haul trucks for demolition and site preparation phase, and 14 cubic yard soil capacity haul trucks for the grading/excavation phase; cement truck trip estimates were based on the Project's engineering representative and 10 cubic yard concrete capacity concrete trucks. A bulking factor of 20 percent was used in the estimated 250,000 cubic yards of excavated materials. More specifically, there are two methods to account for bulking: 1) in the calculation of the total cubic yards of grading and 2) in the assumed capacity of individual haul trucks. Soil bulking for the Project was accounted for using the first of the two methods and is typically set at 15 percent. In order to provide a conservative analysis of Project impacts, a bulking factor of approximately 20 percent was used in order to arrive at the 250,000 estimated cubic yards of grading. Therefore, even with bulking, the export trips would be within the estimated number for Project construction activities. Furthermore, if soil hauling takes place over 8 hours, as stated in the comment, that means one export truck trip every 3 minutes and 10 seconds. However, as noted above, Project hauling would take place over 6 hours to allow for soil preparation during the morning and to ensure that trucks are able to arrive at the receiver destinations prior to those destinations closing. As soil hauling takes place over 6 hours (9:00 am to 3:00 pm), this would mean one truck every 2 minutes and 24 seconds. Please refer to Appendix C of the Draft EIR for details regarding the length of each construction phase, the type and number of equipment to be used during each construction phase, as well as the verified material amounts and number of truck trips required for exporting materials during Project construction. Note that modifications to the Project design would reduce the total amount of Project grading from 250,000 cubic yards to 197,000 cubic yards. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

### **Comment No. ORG 1B-7**

The Project Site is adjacent to residential neighborhoods to the north, east, and west. To the south it is adjacent to the Los Angeles River and the Zev Greenway along the Los Angeles River. To the south, it is also adjacent to Fire Station 78.

As noted in the NOC/NOA and the DEIR, the proposed Project would result in significant and unavoidable impacts related to Project-level and cumulative on-site and off-site construction noise, and Project-level and cumulative off-site construction vibration (human annoyance). According to the DEIR other potential impacts would be less than significant or mitigated to less-than-significant levels.

### **Response No. ORG 1B-7**

The comment correctly reiterates the conclusion of the Draft EIR that construction-related noise and vibration impacts would be significant unavoidable and other potential impacts would be less than significant or mitigated to less-than-significant levels. The comment, however, does not raise a substantive issue on the content or adequacy of the Draft EIR and, therefore, no further response is necessary.

## Comment No. ORG 1B-8

### 1.1 Inappropriate Consideration of Project Design Features in the Analysis

However, in making important judgements regarding the Project's potential for impacts, the DEIR impermissibly relies on Project Design Features ("PDFs") which are in fact mitigation measures designed to avoid or lessen Project impacts, as detailed more fully in **Section 3.0** of this comment letter. As noted on page II-61 of the DEIR's Project Description Chapter.<sup>6</sup>

#### h) Project Design Features

The above sections identify general characteristics of the Project upon which the analyses of this Draft EIR are based. In addition to these Project characteristics, Harvard-Westlake School proposes to implement a number of PDFs that specifically relate to environmental considerations. The PDFs will be included in the Mitigation Monitoring Program required in association with certification of the EIR. The PDFs are presented in the Executive Summary of the Draft EIR, as well as in individual topical sections of the Draft EIR, where applicable. **The PDFs are taken into account in the analysis of potential Project impacts** provided in Chapter IV, *Environmental Analysis*, of this Draft EIR. (Emphasis added.)

<sup>6</sup> The Project Description Chapter is available at: [https://planning.lacity.org/eir/Harvard-Westlake\\_River\\_Park\\_Project/deir/Draft%20EIR%20Sections/II.%20Project%20Description.pdf](https://planning.lacity.org/eir/Harvard-Westlake_River_Park_Project/deir/Draft%20EIR%20Sections/II.%20Project%20Description.pdf)

## Response No. ORG 1B-8

The comment states that the Draft EIR relied on Project Design Features (PDFs) which should have been mitigation measures. However, no specific PDFs are identified other than a reference to a more detailed discussion in Section 3.0 of the comment letter.

Nonetheless, as a general matter, the Project's PDFs are all appropriate components of the Project and not mitigation measures. As shown in the excerpt to the Draft EIR included in this comment, the Draft EIR analyzed the impacts of the Project with the PDFs as Project components incorporated into the Project. Pursuant to CEQA, mitigation measures are not part of the original project design, but instead are actions taken by the lead agency to reduce impacts to the environment resulting from the original project design. (CEQA Guidelines Sections 15126.4(a) and 15370.) Mitigation measures are identified by the lead agency while a project is undergoing environmental review, and not finalized until the end of the environmental review process, and are above-and-beyond existing laws, regulations, and requirements that would reduce environmental impacts. Moreover, CEQA encourages the incorporation of project elements that would reduce or avoid any potential significant impacts. Accordingly, most projects include avoidance and minimization measures or environmental commitments into the project design as part of the project description. The CEQA Guidelines also reference these types of features in

Section 15064(f)(2) and Section 15126.4(a)(1)(A). Examples of PDFs that may address environmental impacts include construction traffic management plans, transportation demand plans, use of energy efficient lighting, use of solar panels, and building standards in excess of the requirements of Title 24 of the California Building Code. These are not considered mitigation measures because they are part of the project that is undergoing environmental review. While the courts have recognized that it is often difficult to distinguish between the elements of a project and measures designed to mitigate the impacts of a project (see, e.g., *Lotus v. Department of Transportation* (2014) 223 Cal. App. 4<sup>th</sup> 645, 656 fn.8) (*Lotus*), the Project's PDFs are clearly integral to the Project even when they are incorporated in order to ensure that the Project is environmentally sensitive or to show the manner in which a regulatory requirement would be carried out.

Moreover, case law is clear that use of PDFs that do have the effect of avoiding or lessening a potential impact are not prohibited by CEQA so long as the characterization of the measure does not improperly interfere with identification of the potential environmental impact. As clarified by the same judge that wrote the opinion in the *Lotus* case, the court in *Mission Bay Alliance v. Office of Community Investment and Infrastructure* (2016) 6 Cal. App. 5<sup>th</sup> 160, 185, (*Mission Bay*), in reference to the objection of including a transportation management program element as part of the project rather than as a mitigation measure, stated that “[a]ny mischaracterization is significant, however, only if it precludes or obfuscates required disclosure of the project's environmental impacts and analysis of potential mitigation measures.”

The Draft EIR adequately discusses the PDFs and potential impacts and at no time utilizes PDFs to avoid discussion of the Project's potential impacts or appropriate mitigation measures. Rather than hiding the impacts, the purpose of the PDFs, or the mitigation measures, the Draft EIR sets them out in several places. Table ES-1, *Summary of Project Impacts, Project Design Features, and Mitigation Measures*, specifically lists the project's environmental impacts and lists which PDFs and mitigation measures are used to determine the Project's impacts (Draft EIR pages ES-15 through ES-25). Additionally, for easy reference to all the PDFs and mitigation measures without having to go through each environmental topic discussion, pages ES-26 through ES-31 sets forth each PDF while pages ES-31 through ES-35 sets forth each mitigation measure. These entries are followed by a full analysis of the Project's impacts and the incorporated PDFs and mitigation measures in Chapter IV, *Environmental Impact Analysis*, of the Draft EIR. The City further ensures that PDFs are enforceable components of the Project by including all the PDFs in the Mitigation Monitoring Program (MMP) (see Final EIR Chapter 4.0, *Mitigation Monitoring Program*).

See also, Response Nos. ORG 1B-24 through ORG 1B-35 below for responses to specifically questioned PDFs.

## Comment No. ORG 1B-9

As detailed on pages ES-26 to ES-31 of the DEIR's Executive Summary,<sup>7</sup> PDFs for the following issue areas were “take into account in the analysis of potential Project impacts.” This has resulted in an under-identification of impacts or failure to identify significant impacts for these issue areas:

- Biological Resources (nesting birds)
- Cultural Resources (rehabilitation plan, documentation requirements, interpretation requirement)
- Greenhouse Gas Emissions (solar voltaic system)
- Hazardous Materials (artificial turf formulation)
- Noise and Vibration (wall and canopy requirements, limitations on amplified sound system, construction time limitations)
- Police Services (security features during construction and operation).
- Transportation (Construction Management Plan, requirements for flashing red warning lights, restrictions on number of trips to the site and requirements for provision of School shuttle service during events)
- Utilities and Service Systems – Water Supply (artificial turf, capture and reuse system).

<sup>7</sup> The Executive Summary is available at:  
[https://planning.lacity.org/eir/HarvardWestlake\\_River\\_Park\\_Project/deir/Draft%20EIR%20Sections/01%20Executive%20Summary.pdf](https://planning.lacity.org/eir/HarvardWestlake_River_Park_Project/deir/Draft%20EIR%20Sections/01%20Executive%20Summary.pdf)

## Response No. ORG 1B-9

This comment references sections in Chapter IV, *Environmental Impact Analyses*, of the Draft EIR which include PDFs and alleges that the listed PDFs result in an underestimation or a failure to identify significant impacts. Refer to Response No. ORG 1B-8, which discusses and explains the rationale as to why the Project's PDFs are all appropriate components of the Project and not mitigation measures. The comment does not provide any evidence of an underestimation or failure to identify a significant impact. Therefore, no further response is necessary.

## Comment No. ORG 1B-10

### 1.2 Required Discretionary Approvals

As detailed in pages II-62 to II-63 of the Project Description, the discretionary entitlements, reviews, permits and approvals required to implement the proposed Project include, but are not necessarily limited to, the following:

- Pursuant to LAMC Section 12.24 T, a Vesting Conditional Use Permit to allow the operation of a private-school athletic and recreational campus in the A1 zone.
- Light Poles: Pursuant to LAMC Section 12.24 F, the following maximum heights for light poles ancillary to the athletic and recreational campus, in lieu of the 30-foot height limit otherwise required by LAMC Section 12.21.1 A.
  - Two 60-foot-tall light poles on the southeast and southwest sides of the pool facility.
  - Three 80-foot-tall light poles on the north side of Field B.
  - One 60-foot-tall light pole on the east side of Field B.
  - Two 60-foot-tall light poles on the south side of Field B.
  - One 70-foot-tall light pole on the south side of Field B.
  - Three 70-foot-tall light poles on the west sideline, and three 70-foot-tall light poles on the east sideline, of Field A.
  - Twelve 40-foot-tall light poles located on all four sides of the proposed tennis courts.
- Walls/Fences: Pursuant to 12.24 F, the following maximum heights for walls and fences ancillary to the athletic and recreational campus, in lieu of the 8-foot maximum height limitation for fences and walls in side yards and the 6-foot maximum height limitation for fences and walls in front yards, in the A1-1XL-RIO zone.
  - A maximum 10-foot-height wall along Whitsett Avenue.
  - A maximum 11-foot-height wall along Valley Spring Lane and Bellaire Avenue.
- Pursuant to LAMC Section 16.05, a Site Plan Review because the Project would result in an increase of more than 50,000 square feet of non-residential floor area.
- Execution of a rental agreement with the Los Angeles County Flood Control District for use of the Leased Property.

In addition, Harvard-Westlake School will submit requests related to the Project, which may include approvals and permits from various City and County departments, including the Department of Building and Safety, the County Flood Control District, Bureau of Street Services (Urban Forestry Division) and other City and County municipal agencies for Project construction activities, including but not limited to demolition, haul route, excavation, shoring, grading, foundation, temporary street closure, and building and

interior improvements and Department of Public Works approval for the removal of trees located on the public right-of-way. Harvard-Westlake School will also request a revocable permit to make certain improvements in the Valleyheart area. Other discretionary and ministerial permits and approvals that may be deemed necessary, including, but not limited to, temporary street closure permits, grading permits, excavation permits, foundation permits, building permits, Department of Public Works approval to remove non-protected trees from the Project Site, and sign permits.

## **Response No. ORG 1B-10**

The comment lists required discretionary approvals for the Project. Because this comment does not raise a substantive issue on the content or adequacy of the Draft EIR, no further response is necessary.

## **Comment No. ORG 1B-11**

### **1.3 CEQA Requirements for Recirculation of a DEIR**

As detailed in this comment letter, the DEIR is fatally flawed and must be corrected and recirculated. Section 15088.5 of California Environmental Quality Act (“CEQA”) Guidelines specifies when recirculation of an EIR is required prior to certification. CEQA Guidelines Section 15088.5 states in part:<sup>8</sup>

- (a) A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review under Section 15087 but before certification. As used in this section, the term “information” can include changes in the project or environmental setting as well as additional data or other information. New information added to an EIR is not “significant” unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project’s proponents have declined to implement. “Significant new information” requiring recirculation include, for example, a disclosure showing that:
- (1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
  - (2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
  - (3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the

environmental impacts of the project, but the project's proponents decline to adopt it.

- (4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. (*Mountain Lion Coalition v. Fish and Game Com.* (1989) 214 Cal.App.3d 1043).

<sup>8</sup> CEQA Guidelines Section 15088.5 specifies: A decision not to recirculate an EIR must be supported by substantial evidence in the administrative record.

## Response No. ORG 1B-11

The comment states that the Draft EIR must be recirculated and refers to the CEQA Guidelines Section 15088.5. However, the comment does not provide substantial evidence of significant new information showing that there is a new significant impact, an increase in the severity of an impact, an alternative that would lessen the impacts, or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, the comment does not demonstrate that recirculation of the Draft EIR is required.

## Comment No. ORG 1B-12

### 1.4 Organization of This Comment Letter

This comment letter details defects in the DEIR, its analysis and impact judgements. This comment letter is organized as follows:

- Section 2 addresses the DEIR's inadequate Project Description and resulting failure to conduct required analysis of Project and cumulative impacts.
- Section 3 addresses the DEIR's improper reliance on Project Design Features (PDFs) when making impact judgements resulting in an underestimate of impacts and a failure to identify significant impacts.
- Section 4 addresses the defects in some of the DEIR's impact analyses and resulting failure to identify a number of significant Project impacts and/or the DEIR's underestimate of impacts.
- Section 5 addresses the DEIR's use of improperly deferred mitigation measures or infeasible mitigation measures.
- Section 6 addresses the DEIR's inadequate mitigation.
- Section 7 addresses the DEIR's inadequate alternatives analysis.
- Section 8 addresses the DEIR inadequate cumulative and growth-inducing analysis.
- Section 9 concludes with the need for the DEIR to be revised and recirculated.

## Response No. ORG 1B-12

The comment sets forth the organization of the comment letter. Refer to Response Nos. ORG 1B-13 to ORG 1B-113 below for responses that address comments in Sections 2 through Section 9 of this letter. The comment, however, does not provide any information as to the content or adequacy of the Draft EIR and, therefore, no further response is necessary.

## Comment No. ORG 1B-13

### 2.0 INADEQUATE PROJECT DESCRIPTION AND ASSOCIATED FAILURE TO ANALYZED PROJECT AND CUMULATIVE IMPACTS

#### 2.1 Use of Project Facilities for Non-Harvard Westlake Events

DEIR pages II-47 to II-51 disclose the likely use of the Project facilities by Harvard Westlake. The DEIR represents the likely number and size of events, with 27 events of up to 500 people and three events of up to 2,000 per year. However, there is no mitigation measure to ensure that the assumptions used in the analysis are valid. The DEIR needs to include a mitigation measures limiting the size of events to no more than 27 events of up to 500 people per year, and no more than three events of up to 2,000 people per year, otherwise the DEIR underestimates Project and cumulative impacts. In addition, the analysis in the DEIR needs to represent the worst-case scenario.

## Response No. ORG 1B-13

The comment appears to assert that the Project Description is faulty because there are no mitigation measures to ensure that Harvard-Westlake does not have more large events than described in the Draft EIR thereby underestimating Project and cumulative impacts. Although the comment incorrectly titles these events as non-Harvard-Westlake events, the Draft EIR clearly states that the events discussed in the comment are “up to 30 school-related special events per year”. (Draft EIR at page II-50.) The following PDF will be added to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, and Chapter 4, *Mitigation Monitoring Program*, of this Final EIR.

NOI-PDF-4: Special Events. Harvard-Westlake will have no more than 30 school-related special events with the following limitations on attendance: no more than 27 special events per year of up to 500 people and no more than three (3) special events per year of up to 2,000 people.

However, even without the added PDF, the comment does not provide facts to support the contention that the Project Description is inadequate. The discussion of the types of school athletic, recreational and special events and non-school use of the Project Site is clearly set forth in Chapter II, *Project Description*, of the Draft EIR. The Project Description need only contain a general description and should not supply extensive

detail beyond that needed for evaluation and review of the environmental impacts (CEQA Guidelines Section 15124).

Chapter IV, *Environmental Impact Analysis*, of the Draft EIR evaluated the thirteen environmental subjects identified in the Initial Study, as supported by technical reports provided in the appendices to the Draft EIR. In order to reflect the most conservative potential environmental conditions, the evaluations are based on “worst case scenario” assumptions, as applicable. An example of the “worst case scenario” is the Draft EIR evaluation of operational noise impacts including a 500-person (maximum Harvard-Westlake School event and a 2,000-person “special event” (maximum public event) along with concurrent athletic activities, and the assumption that all “special event” attendees are simultaneously talking in a loud voice and clapping at the same time. Please see Section IV.K, *Noise*, pages IV.K-56 and IV.K-57 and Table IV.K-20, *Composite Noise Impacts*, of the Draft EIR, which shows that noise impacts under this “worst case scenario,” supported by detailed modeling as substantial evidence, were determined to be less than significant. Note that modifications to the Project would change the noise levels from on-site activities, however the composite noise levels would be the same or less as analyzed in the Draft EIR. See Topical Response No. 2 – Modifications to the Project Design, Topical Response No. 8: Noise Construction and Operation, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, which discuss the noise with the Project modifications.

This conservative approach for all applicable subjects was used to encompass the full extent of the Project’s potential environmental effects. However, from a transportation perspective, as discussed in Topical Response No. 9 - Transportation and Parking During Construction and Operations, the 500-attendee event is considered the worst-case Special Event from a traffic perspective because it would have an assumed average vehicle occupancy (AVO) of 1.0 and result in 500 vehicles, whereas attendees to the 2,000-attendee event would be required to arrive via bus with an assumed AVO of 40, resulting in 50 vehicles.

In addition, contrary to the implication in the comment, utilizing Harvard-Westlake’s past experience as to athletic, recreational and special event activities is the most logical metric to use to determine the foreseeable future use of the Project Site. This past experience, pre-Covid, is the only reliable indicator of the use of the facilities without resorting to speculation. As was reiterated in *Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal. App. 4th 342, 373, citing previous authority, “it has been held that an EIR is not required to engage in speculation in order to analyze a ‘worse-case scenario’”. Nothing in the comment demonstrates that the Draft EIR erred in relying on Harvard-Westlake’s experience and data in determining the use of the facilities for the reasonably foreseeable future.

Therefore, the comment provides no substantial evidence that the likely number of special events described in the Draft EIR would create a significant impact or a significant cumulative impact, or that the Draft EIR underestimates Project and cumulative impacts.

## Comment No. ORG 1B-14

The DEIR fails to disclose whether Harvard Westlake will rent or loan the facilities to other schools, non-profits, companies, local jurisdictions, or other groups for special events or regular use.

## Response No. ORG 1B-14

Public use of the Project Site is described in Chapter II, *Project Description*, of the Draft EIR. “As a primary objective of the Project, the School is committed to ensuring that members of the public would have access to the Project Site, as well as to the Zev Greenway and Los Angeles River environs, and to a broad array of recreational facilities, including substantial areas that are maintained and available without charge in the same fashion as a City-owned park.” (page II-33). The Draft EIR goes on to describe two categories of usage in Table II-3 (Public Use Days and Hours), beginning with the clubhouse, café, putting green, park areas, and gymnasium community room, all of which shall be made available, daily, for public use from 7:00 a.m. to 9:00 p.m. The second category of usage described in Table II-3 (Public Use Days and Hours) applies to the athletic facilities, which shall be made available to the public when not already in use by the School. Since the athletics facilities, except for the use of the tennis courts, would not be used concurrently by the School and public, a combined analysis of impacts resulting from simultaneous use of recreational facilities by the School and public, as suggested by the commenter, is not applicable. Further, while public use hours will exceed those of the School (students will generally not arrive on the Project Site before 3:00 p.m. on school days and 50 percent of school days contain no outdoor activities after 5:30 p.m. as described on page II-47 of the Project Description), the School’s use of the athletic facilities at a given point in time will involve a greater number of concurrent participants and spectators than public use. Therefore, in order to provide a conservative analysis of environmental impacts (i.e., “worst-case”), it is the School’s use of the recreational facilities under a maximum scenario, including School special events, that is the appropriate basis for evaluation.

Special events available to the public are described in Chapter II, *Project Description*, on page II-34 of the Draft EIR. As specified, up to five public community events would be permitted on the Project Site per year with a maximum attendance of 500 persons and limited to Field A or inside the gymnasium. Public community events would not be permitted to take place at the same time as School events. Given these restrictions, special events associated with the School represent a more conservative basis for impact evaluation, particularly since School special events (involving up to 500 participants for most events and up to 2,000 participants for three events per year) could take place at the same time as School recreational usage as analyzed in the Draft EIR.

If the Project were to be approved by the City, to ensure public use does not exceed that of the School, the City will impose a potential condition of approval generally stating that, “Public community events held at either the gymnasium or Field A would not exceed 500

persons or the number of parking spaces available on the Project Site, whichever is less. Public community events would be scheduled so they do not occur concurrently with school events.” This is consistent with the text included in Chapter II, *Project Description*, on page II-35 of the Draft EIR.

### **Comment No. ORG 1B-15**

Given that Alternative 4 is an alternative which does not allow for special events for the public, the implication is that the proposed Project does allow for outside special events. While the Project Description details the likely frequency and magnitude of use by Harvard Westlake, it is silent on use of the facilities by other groups. As a result, the potential for, and magnitude of, impacts is underestimated.

### **Response No. ORG 1B-15**

Chapter II, *Project Description*, pages II-34 and II-35 of the Draft EIR, discusses public events that could occur up to five times a year and have an attendance of over 100 people, and up to a maximum of 500 people. If the Project were to be approved by the City, the maximum use and operation of the Project would be limited by potential conditions of approval under the School/s Conditional Use Permit (CUP), which reflect the EIR’s Project Description and cannot be exceeded. As such, Draft EIR evaluations of project impacts reflect the maximum operation of the Project and do not underestimate impacts. Refer to response No. 1B-14 for additional discussion of the public use of the Project Site.

### **Comment No. ORG 1B-16**

For example, the DEIR relies on a PDF, TRAF-PDF-3, which prohibits parents, students and spectators from driving to the Project site when event attendance is expected to surpass 300 spectators, and instead requires use of the School’s shuttle service. Is this PDF feasible or would it be enforced if there is a non-school event with more than 300 persons? How would that be handled? If shuttle requirements do not apply to non-School events, then the DEIR underestimates project impacts and the DEIR must be revised and recirculated. If shuttle requirements do apply to non-School events, the DEIR needs to address impacts associated with additional trips to the two existing campuses by non-school users in order to access the Shuttle service, and the DEIR needs to be revised and recirculated to address these potential impacts.

### **Response No. ORG 1B-16**

As stated in Appendix M, Transportation Assessment, to the Draft EIR, shuttle use is mainly for the Harvard-Westlake athletic events and would not be used for non-school events (referred to as “community events” in the Draft EIR).

The Draft EIR addressed VMT impacts in Section IV.M, *Transportation*. The VMT associated with non-school events (i.e., community serving recreational facilities) were

exempt from the VMT analysis, per LADOT, as explained on page IV.M-22 of the Draft EIR.

PDF pages 56 through 76 of 217 in Appendix M of the Draft EIR evaluated Project access, safety, and circulation for various scenarios, including event days. In addition, PDF pages 78 through 81 provides a site access evaluation. The event scenario studied was the Special Event Scenario, which represents the trips associated with a Harvard-Westlake special event day, specifically a conference day. This scenario was selected as it was anticipated to generate the highest number of vehicle trips based on the attendance (up to 500 attendees), average vehicle occupancy (AVO) of 1.0, and the special event taking place concurrently with School athletics uses. Community events were not studied in the project access, safety, and circulation section of the TA, as these events are estimated to generate fewer vehicle trips than the Harvard-Westlake special event day, and would not be permitted to take place concurrently with athletic uses. Per the Draft EIR, there could be up to 5 community events per year with up to 500 attendees (refer to Response Nos. ORG 1B-13 and ORG 1B-15 which indicate that if the Project were to be approved by the City, a potential condition of approval consistent with the Draft EIR Project Description would limit public Special Event attendance to the lesser of 500 individuals or the number of parking spaces on the Project Site). The assumed AVO was 1.5, which would generate fewer vehicle trips than the Harvard-Westlake special event day. Even if the AVO for the community events were less than 1.5, the number of vehicle trips generated would not exceed the Special Events scenario that was studied. The community events would also only occur during the weekends or the summer, when the School is not in session, and they would not overlap with the typical days of Harvard-Westlake athletic activities.

### **Comment No. ORG 1B-17**

If Harvard Westlake does not intend to rent or provide the facilities to other groups for non-school events, then the DEIR needs to include a mitigation measure preventing Harvard Westlake for renting or loaning out the facilities for non-Harvard Westlake events and providing a penalty for violation of the mitigation. If Harvard Westlake does anticipate renting or loaning out the facilities, then the number and allowable size of such events needs to be both disclosed and analyzed in the DEIR and a mitigation measure limiting events to that assumed in the analysis needs to be required. Any impact judgements which rely on TRAF-PDF-3 would need to be revisited, which they need to be anyway due to the impermissible consideration of PDFs which [sic] making impact judgements. As currently written, the DEIR Project Description and analysis of event impacts is inadequate due to its failure to disclose and analyze the impacts of outside events, and the DEIR must be revised and recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4).

## Response No. ORG 1B-17

Special events that would be available to the public are described in Chapter II, *Project Description*, of the Draft EIR on pages II-34 and II-35. Up to five public community events may occur per year, limited to either Field A or the gymnasium, ending no later than 10:00 p.m., and with attendance of no more than 500 persons. Public community events will not take place at the same time as School events or athletic activities. If the Project were to be approved by the City, the City will impose a potential condition of approval to ensure that the event and attendance limits are not exceeded. Given these restrictions, special events associated with the School represent a more conservative basis for impact evaluation, particularly since School special events (involving up to 2,000 participants) could take place at the same time as School recreational usage as analyzed in the Draft EIR.

The Project Site would be used by the community, including by non-Harvard Westlake sports organizations. In the event that the community activities on-site are expected to exceed 300 participants, parking passes would be required. Parking passes would be issued for up to 400 vehicles, or as many parking spaces are available on-site, whichever is fewer. Parking off-site in the surrounding neighborhood would be prohibited. Organizations would be notified of such parking requirements and would be required to inform their participants, coaches, and spectators. These mechanisms would be enforced by Harvard-Westlake, and violations could result in the rescinding of permission to use the Project Site.

In addition, refer to Response No. ORG 1B-8, which discusses and explains the rationale as to why the Project's PDFs are all appropriate components of the Project and not mitigation measures.

Based on the above, the comment does not provide evidence that there is significant new information showing that there is a new significant impact, or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, revision and recirculation of the Draft EIR is not required.

## Comment No. ORG 1B-18

### 2.2 Excavation and Soil Removal

As noted on pages 11-61 to 62 of the Project Description Chapter, the project involves substantial excavation and soil removal:

Project development would disturb a majority of the Project Site (746,532 square feet)<sup>17</sup> and require excavation and grading of the Project Site to a maximum depth of approximately 21 feet for construction of the one-level subterranean parking structure, gymnasium basement, and proposed one-million-gallon stormwater capture and reuse system. Rough grading cut

volumes would be approximately 251,836 cubic yards (unadjusted), and the fill volume would be approximately 1,836 cubic yards (unadjusted), for a net cut/fill volume of approximately 250,000 cubic yards (unadjusted).<sup>18</sup> Because cut soils would exceed fill soils, export and disposal off-site would be required.

<sup>17</sup> *The total assumes all portions of the Project Site (i.e., 17.2 acres or 749,344 square feet) would be disturbed less the existing buildings on the Project Site (i.e., 2,700 square feet). Disturbed areas included in this total include Project improvements such as graded and excavated areas as well as minor disturbances such as minor landscaping upgrades to understory vegetation, replacement of poles, etc.*

<sup>18</sup> *“Unadjusted” cut and fill is a programmed estimate that does not account for minor shrinkage from compaction, swelling, or other factors that may require final manual adjustments to achieve finished gradients/ heights.*

It is therefore estimated that 250,000 cubic yards of soil will be removed from the site and, as noted in the DEIR, off-site disposal is required. However, the DEIR fails to identify the disposal site, or to address impacts to that site which would result from the dumping of 250,000 cubic yards of soil. The California Environmental Quality Act (“CEQA”) requires that both the direct and indirect impacts of a project be addressed in an EIR.<sup>9</sup> The EIR therefore needs to identify the soil disposal site(s) and to address impacts to those site areas which would result from the proposed Project.

<sup>9</sup> CEQA Guidelines Section 15064(d).

## Response No. ORG 1B-18

Section IV.O, *Utilities and Service Systems – Solid Waste*, of the Draft EIR discusses the disposal of the cut and fill soils and identifies the potential disposal sites. As stated on page IV.O.3-15 of the Draft EIR, “[t]he inert solid waste and soil would require disposal at the County’s only operating inert landfill, Azusa Land Reclamation, or at any of a number of State-permitted Inert Debris Engineered Fill Operations in the County, such as the Hanson Rock Quarry or United Rock Products in Irwindale.....In compliance with the requirements of SB 1374 and Waste Hauler Permit Program, Harvard-Westlake School would implement a construction waste management plan to recycle and/or salvage a minimum of 75 percent of non-hazardous demolition and construction debris.” In addition, the Draft EIR disclosed on page IV.O.3-16 that “[t]he remaining capacity of the Azusa Land Reclamation landfill is estimated at 47.07 million cubic yards (58.84 million tons) with a projected closure date of 2046. The Project’s construction-generated solid waste disposal after 75-percent diversion would represent 0.17 percent of the estimated remaining capacity at this particular County landfill, which does not take into consideration existing capacity at other sites within the County and out-of-county that could potentially accept Project C&D waste. Other facilities, such as Hanson Aggregates West, Inc and United Rock Products Pit #2 in Irwindale, accept up to 4,006 and 3,846 tons per day, respectively, of inert solid waste materials. Such facilities could also be utilized by the Project when disposing of C&D waste materials. As such, multiple facilities would be available to accommodate the C&D waste from the Project.” (footnotes omitted) Based

on this, the Draft EIR does identify disposal sites for the 250,000 cubic yards of soil that would be removed from the Project during construction. Furthermore, as concluded in the Draft EIR, Project construction would not generate solid waste in excess of State and local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals, and impacts would be less than significant (page IV.O.3-16 of the Draft EIR).

Section IV.B., *Air Quality*, Section IV.G., *Greenhouse Gas Emissions*, and Appendix C, Technical Appendix for Air Quality and Greenhouse Gas Emissions, of the Draft EIR also discusses impacts associated with the on-road vehicle exhaust emissions of criteria pollutants and greenhouse gas (GHG); fugitive dust emissions of PM10 and PM2.5 from haul trucks for demolition debris hauling, soil hauling, and supplies/material transport; and PM10 and PM2.5 emissions from tire wear, brake wear, and entrained road dust from haul trucks associated with the disposal of cut and fill soils. The emissions were calculated using a hauling distance that would cover the above-mentioned disposal sites. As seen in Table IV.B-8 and discussed on page IV.B-55 of the Draft EIR, regional Project air quality construction emissions, which include criteria pollutant emissions from haul trucks traveling to and from the disposal sites to the Project Site, would be mitigated to less than significant with the incorporation of Mitigation Measure AQ-MM-1. In addition, as presented in Table IV.G-6 on page IV.G-51 of the Draft EIR, the Project construction GHG emissions, which include GHG emissions from haul trucks traveling to and from the disposal sites to the Project Site, would be 430 metric tons per year amortized over 30 years. GHG impacts for the Project were shown to be less than significant, as discussed on pages IV. G-59 through IV.G-75 of the Draft EIR, the Project's consistency with applicable GHG reduction plans and policies demonstrate that the Project does not conflict with regulations and policies, and complies with or exceeds the regulations and reduction actions/strategies outlined in the Climate Change Scoping Plan, 2025-2045 RTP/SCS, the City's Green New Deal, and the Los Angeles Green Building Code. The Project would also have a less-than-significant impact with respect to the urban heat island effect. Therefore, Project-specific impacts with regard to GHG emissions would be less than significant. As demonstrated above, the Draft EIR does discuss and disclose Project impacts related to the disposal of 250,000 cubic yards of soil, including the emissions of criteria pollutants and GHG associated with haul trucks used for off-site disposal. Note that modifications to the Project design would reduce the total amount of Project grading from 250,000 cubic yards to 197,000 cubic yards. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

### **Comment No. ORG 1B-19**

While the DEIR discloses the following haul route for accessing the Project site, it is silent on the location of the disposal site(s) and on the haul routes and adjacent uses at the other end of the haul route. DEIR page II-62 indicates that the "inbound haul route would come from US-101, head southbound on Coldwater Canyon Avenue, eastbound on Moorpark Street, and southbound on Whitsett Avenue to access the Project Site" and that

the “outbound haul route would leave the Project Site and head southbound on Whitsett Avenue, westbound on Ventura Boulevard, and northbound on Coldwater Canyon Avenue to reach US-101.” Where will soil and construction material be hauled to? What are the adjacent uses and impacts to those uses associated with the proposed Project? The DEIR needs to disclose this.

### **Response No. ORG 1B-19**

Please see Response No. ORG 1B-18 for a detailed discussion of the potential disposal sites for the cut soil material from construction. As stated in the comment, the outbound haul route would leave the Project Site and head southbound on Whitsett Avenue, westbound on Ventura Boulevard, and northbound on Coldwater Canyon Avenue to reach US-101 where trucks would proceed to the disposal site. Additionally, TRAF-PDF-1, Construction Management Plan (CMP) would provide designated haul routes that would be approved by the City prior to the issuance of any demolition permit or building permit for the Project (page ES-30 of the Draft EIR). Refer to Response No. ORG 1B-18 for a list of disposal sites. Additionally, as discussed in Threshold (a) of Section IV.H, *Hazards and Hazardous Materials*, compliance with regulatory requirements for the routine transport or disposal of hazardous materials during demolition and construction of the Project would ensure that impacts to the public would be less than significant. In addition, the commenter is referred to Section IV.K, *Noise*, of the Draft EIR, for a discussion of impacts regarding mobile source noise from construction-related vehicles along the local roadway segments, including the haul routes. As analyzed therein, the Project would not result in the generation of a substantial temporary increase in ambient noise levels in the vicinity of the Project in excess of standards established by the City, and off-site construction traffic noise impacts would be less than significant.

### **Comment No. ORG 1B-20**

It is important to understand the sheer volume of soil to be exported from the site. One cubic yard is roughly the size of a washing machine. According to Los Angeles County Public Works, by way of comparison, the Rose Bowl in Pasadena would hold about 400,000 cubic yards.<sup>10</sup> It should be noted that “[a]t a modern capacity of 92,542, Rose Bowl Stadium is the 15<sup>th</sup>-largest stadium in the world, the 11<sup>th</sup>-largest stadium in the United States, and the 10<sup>th</sup> largest NCAA stadium.”<sup>11</sup>

The proposed Project thus involves the removal of enough soil to fill the Rose Bowl 62.5% full. This is an enormous quantity of earth to be removed. The DEIR must make this clear, identify the disposal site(s), justify and [sic] trip length assumptions associated with soil removal trips, specify the length of each phase of Project construction, analyze impacts associated with soil hauling and the disposal of this volume of soil at the disposal site, address cumulative impacts associated with soil hauling and disposal in combination with other past, present and reasonably foreseeable related projects involving substantial soil disposal such as debris basin sediment removal projects such as Big Tujunga,<sup>12</sup> Cogswell and San Gabriel,<sup>13</sup> Devil’s Gate,<sup>14</sup> Morris,<sup>15</sup> and Pacoima,<sup>16</sup> and address the impact of

this project on the availability of soil disposal sites for future public works and debris basin cleaning projects and thus the functioning of the area's debris basin and flood control system. Given the DEIR's failure to address these key issues, pursuant to CEQA Guidelines Section 15088.5(a)(2) and (4), the DEIR must be revised and recirculated.

<sup>16</sup> <https://dpw.lacounty.gov/lacfd/sediment/prj.aspx?prj=2>

## Response No. ORG 1B-20

The Project's construction modeling assumptions including phase lengths, construction equipment list and truck trips per phase were provided on pages PDF 8 through 18 of 437 of Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. In addition, as stated in Section IV.B, *Air Quality*, haul truck trip estimates were based on excavation volumes obtained from the Project's engineering representative and 7 cubic yard capacity haul trucks for the demolition and site preparation phase and 14 cubic yard soil capacity haul trucks for the grading/excavation phase; cement truck trip estimates were based on the Project's engineering representative and 10 cubic yard concrete capacity concrete trucks. Thus, the length of each construction phase and the equipment to be used during each construction phase, as well as the verified material amounts and number of truck trips required for exporting materials during Project construction were provided in the Draft EIR. As described in Response No. ORG 1B-6 regarding bulking of soils, a conservative bulking factor of 20 percent was assumed in order to arrive at the estimated 250,000 cubic yards of soil (in excess of the more typical 15 percent bulking factor). Note that modifications to the Project design would reduce the total amount of Project grading from 250,000 cubic yards to 197,000 cubic yards. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. Therefore, even with bulking, the export trips would be within the estimated number for Project construction activities. Project-level and cumulative air quality, energy, greenhouse gas, noise, and solid waste impacts related to the hauling of soil from the Project Site to the disposal site(s) were analyzed in Sections IV.B, *Air Quality*, IV.E, *Energy*, IV. G, *Greenhouse Gas Emissions*, IV. K, *Noise*, and Section IV.O, *Utilities and Service Systems – Solid Waste*, respectively.

As discussed in detail under Response No. ORG 1B-18 above, the Draft EIR identifies multiple disposal facilities with capacity to accommodate the C&D waste, including the 250,000 cubic yards of soil (revised to 197,000 cubic yards in this Final EIR), from the Project. Clean excavated soils are also sold to other construction sites throughout the region. The Draft EIR concluded that Project construction would not generate solid waste

in excess of state and local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals, and impacts would be less than significant (page IV.O.3-16 of the Draft EIR). Debris basin sediment removal projects such as Big Tujunga, Cogswell and San Gabriel, Devil's Gate, Morris, and Pacoima, and future public works and debris basin cleaning projects are not within the scope of the Draft EIR and, as such, are not evaluated therein.

Based on the above, the comment does not provide evidence that there is an increase in the severity of an impact or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, the revision and circulation of the Draft EIR is not necessary.

## **Comment No. ORG 1B-21**

### **3.0 IMPROPER RELIANCE ON PROJECT DESIGN FEATURES WHEN MAKING IMPACT JUDGEMENTS HAS RESULTED IN AN UNDER-IDENTIFICATION OF IMPACTS**

It is clear from the impact analyses in the DEIR, that the impact judgements in the DEIR are after-implementation-of-the-PDFs impacts. While several of the PDF are standard regulatory measures, or include components that are regulatory measures, the PDFs are, for the most part, clearly measures intended to mitigate, minimize or avoid Project impacts. The way the EIR has relied on PDFs in making impact judgements is contrary to the requirement that project impact significance determinations under CEQA be made without consideration of mitigation measures.

## **Response No. ORG 1B-21**

The comment states that some of the PDFs are improperly utilized to avoid Project impacts. The comment provides no identification of which PDFs are improper nor substantial evidence of the improper use of such PDFs. As such, no further response is necessary. Nonetheless, see Response No. ORG 1B-8 regarding the use of PDFs.

## **Comment No. ORG 1B-22**

The EIR for the proposed project thus understates Project impacts, by improperly relying on PDFs which are in fact mitigation measures, as a basis for concluding that Project impacts are less than significant. In *Lotus vs. Department of Transportation* (2014) 223 Cal.App.4th 645 (*Lotus*), the court found that an EIR violated CEQA by incorporating proposed mitigation measures into the description of the project, and then basing its conclusion of less-than-significant impacts in part on those mitigation measures. This is exactly what has been done in the EIR for the proposed Project. The court found that this improperly compressed the analysis of impacts and mitigation measures into a single issue.

## Response No. ORG 1B-22

The comment states that some unidentified PDFs are really mitigation measures that were improperly used to avoid analysis of Project impacts pursuant to the *Lotus* decision. The comment does not provide substantial evidence that any of the PDFs should in fact be mitigation measures nor any evidence that the Draft EIR did not properly utilize PDFs as permitted by the *Lotus* and *Mission Bay* decisions. In *Lotus* the court acknowledged that PDFs were proper when they were elements of the Project, such as the type of concrete to be used, but not when they were mitigation measures for reducing impacts, such as invasive plant removal (*Lotus* 223 Cal. App. 4<sup>th</sup> at p. 656 fn 8). However, the court found that the Department of Transportation (Caltrans) had failed to provide a standard for evaluating impacts on old growth trees and therefore failed to analyze potential impacts properly.

In *Mission Bay* (6 Cal. App. 5<sup>th</sup> at p. 184), the same court explained that the “CEQA Guidelines define a ‘project’ as including ‘the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment....’ (CEQA Guidelines, § 15378, subd. (a).) A mitigation measure, by contrast, involves ‘feasible changes in any or all activities involved in the project in order to substantially lessen or avoid significant effects on the environment....’ (CEQA Guidelines, § 15041, subd. (a).)” The court then differentiated the insufficient analysis of potential impacts in the *Lotus* case from the adequate analysis in the *Mission Bay* case even though the complaint was based on similar contentions of incorrectly characterizing project features rather than analyzing them as mitigation measures. As such, *Lotus* is only controlling in limited situations where the EIR compresses the analysis of impacts and mitigation measures into a signal issue (See *Lotus* 223 Cal. App. 4<sup>th</sup> at pp. 655-656.). The Project’s Draft EIR does not suffer from the same deficiencies as the *Lotus* case. Chapter IV, *Environmental Impact Analysis*, of the Draft EIR fully describes and analyzes the Project’s potential impacts and the use of PDFs and mitigation measures, and adequately analyzes Project impacts. Similar to the *Mission Bay* case, the Project’s Draft EIR contains no compression of analysis, failure to provide standards for evaluating impacts, or in any way ignores or obscures potential impacts and the comment provides no evidence that it does.

See also *Wollmer v. City of Berkeley*. (2011) 193 Cal. App. 4<sup>th</sup> 1329, which held that dedication of land to improve traffic was a proper component of the project and not a mitigation measure because it was a project element that assisted the city in dealing with an existing traffic condition rather than an element needed to mitigate a project impact. Therefore, PDFs which alleviate environmental concerns can be integral to the project or volunteered by the applicant as a project design feature to assist with an existing condition not caused by the project. In either case, and even when a PDF is mischaracterized, so long as the project’s impacts are fully disclosed and analyzed, there is no violation of CEQA.

## Comment No. ORG 1B-23

In *Lotus v. Dep't of Transp.* (2014) 223 Cal.App.4th 645 (*Lotus*), Caltrans was found to have certified an insufficient EIR based on its failure to properly evaluate the potential impacts of a highway project. The *Lotus* court found that Caltrans erred by:

. . . incorporating the proposed mitigation measures into its description of the project and then concluding that any potential impacts from the project will be less than significant. As the trial court held, the “avoidance, minimization and/or mitigation measures,” as they are characterized in the EIR, are not “part of the project.” They are mitigation measures designed to reduce or eliminate the damage to the redwoods anticipated from disturbing the structural root zone of the trees by excavation and placement of impermeable materials over the root zones. By compressing the analysis of impacts and mitigation measures into a single issue, the EIR disregards the requirements of CEQA. (*Lotus v. Dep't of Transp.*, *supra*, 223 Cal.App.4th at pp. 655–656, *emph. added*.)

The court ordered Caltrans’ certification of the EIR be set aside, finding:

[T]his shortcutting of CEQA requirements subverts the purposes of CEQA by omitting material necessary to informed decisionmaking and informed public participation. It precludes both identification of potential environmental consequences arising from the project and also thoughtful analysis of the sufficiency of measures to mitigate those consequences. The deficiency cannot be considered harmless. *Ibid*.

(*Id. at 658.*)

As documented in the succeeding discussion, the analysis of the proposed Project is fatally flawed because many of the PDFs are in fact mitigation measures. The EIR thus understates impacts in a way that is far more extreme than what happened in *Lotus*. Under CEQA, significance determinations must be made without consideration of avoidance, minimization, and/or mitigation measures. The EIR for the proposed Project has violated this precept and has thus understated and failed to identify impacts. The EIR is therefore fatally flawed and all of the impact determinations which rely on PDFs must be redone. This fatal flaw must be corrected and the EIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4)

## Response No. ORG 1B-23

The comment restates that some unidentified PDFs were impermissible. The comment does not provide substantial evidence that any of the PDFs were not appropriate Project elements nor that any of the deficiencies discussed in the *Lotus* decision are applicable to this Draft EIR. Additionally, the comment overstates the ruling in *Lotus*. As explained in Response No. ORG 1B-8 and No. ORG 1B-22, the court in *Lotus* did not state that all

PDFs that have the effect of avoiding or lessening a potential impact are impermissible. The court found that Caltrans had failed to include sufficient information and analysis on the Project's impacts. The court concluded that the mischaracterization of mitigation measures as part of the project compounded a significant omission in the EIR which was the failure to identify any standard of significance to impacts on the root systems of old growth redwood trees. (*Lotus*, 223 Cal. App. 4<sup>th</sup> at pp. 654–655.) The court explained that without such a standard, it was impossible to determine whether mitigation measures would be needed for any specific trees or whether more effective mitigation would be appropriate. Thus, the court held that “[s]imply stating that there will be no significant impacts because the project incorporates ‘special construction techniques’ [some of which were appropriate PDFs such as the type of concrete which would be used and others which were not project elements such as invasive plant removal] is not adequate or permissible.” (Id. at p. 656.) The comment fails to provide evidence that any of the Project's PDFs or the Draft EIR's impact analysis suffer from the same deficiencies as the Caltrans analysis and, as such, the comment fails to provide substantial evidence that the Draft EIR should be recirculated.

See Response Nos. ORG 1B-24 through 1B-35, below to comments on specific PDFs.

## **Comment No. ORG 1B-24**

### **3.1 Biological Resources**

The DEIR relies on Project Design Feature PDF-BIO-1 when concluding that impacts to nesting birds and conflicts with policies or ordinances protecting nesting birds would be Less Than Significant. PDF-BIO-1 states:

**PDF-BIO-1:** Prior to the issuance of any grading permit that would remove potentially suitable nesting habitat for raptors or songbirds, Harvard-Westlake School shall demonstrate and guarantee to the satisfaction of the Los Angeles Department of City Planning that either of the following have been or shall be accomplished:

1. Vegetation removal activities will be scheduled outside the nesting season (September 1 to February 14 for songbirds; September 1 to January 14 for raptors) to avoid potential impacts to nesting birds.
2. Any construction activities that occur during the nesting season (February 15 to August 31 for songbirds; January 15 to August 31 for raptors) will require that all suitable habitat be thoroughly surveyed for the presence of nesting birds by a qualified biologist experienced in avian nesting bird behavior before commencement of clearing. If any active nests are detected, a buffer of 300 feet around the nest (500 feet for raptors), or as determined appropriate by the biologist based on species and site-specific conditions, will be delineated, flagged, and avoided until the nesting cycle is complete. The buffer may be modified and/or other

recommendations proposed as determined appropriate by the biological monitor to minimize impacts.

The fact that this is a mitigation measures is highlighted by comparing the language of PDF-BIO-1 with the language of Mitigation Measures BIO-MM-1 which addresses potential bat roosting habitat, as follows:

**BIO-MM-1:** Due to the presence of potentially suitable roosting habitat (ornamental trees) for special-status bat species (i.e., western yellow bat), Harvard-Westlake School shall demonstrate and guarantee to the satisfaction of the Los Angeles Department of City Planning that either of the following has been or shall be accomplished:

1. Tree removal activities shall be scheduled outside of the maternity roosting season (October 1 through February 28) to avoid potential impacts to special-status bat species.
2. Any construction or palm tree removal activities that occur during the maternity roosting season for special-status bat species (March 1 through September 30) shall require a qualified biologist experienced with bat roost biology to conduct a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) to determine whether special-status bat species are roosting within trees that would be removed. The surveys shall be conducted at dusk and after nightfall by a biologist. If an active roost site is located during the pre- construction survey, the roost shall be avoided and Project activities shall be conducted as recommended by the biologist to avoid the area, which may include temporary postponement or provision of a suitable buffer established around the roost until roosting activities cease. Suitable buffers could include netting, canvas, or similar materials as recommended by the biologist. A report shall be submitted to the City with the results of the pre-construction or tree removal survey and any needed maternity roost avoidance actions.

## Response No. ORG 1B-24

The comment states that Project Design Feature BIO-PDF-1 should be a mitigation measure. The federal *Migratory Bird Act* (MBTA) and the *California Migratory Bird Act* provide protection to nesting migratory birds, the protection of which is largely defined under these Acts. The purpose of Project Design Feature BIO-PDF-1 is to set forth the specific manner in which the Project would comply with both the federal and the state migratory bird acts. Because of the regulatory nature of the Acts, the PDF is incorporated into the Project. The PDF is not equivalent to the protection of “special status” bats, which would be potentially impacted and mitigated under Mitigation Measure BIO-MM-1. The purpose of the mitigation measure is to reduce potential impacts to an identified on-site species, where specific protection measures are not established under state and federal laws, to less than significant levels.

The different treatment of birds and bats is justified because bird nests are protected by law while bat nests are not. Thus, as discussed above, Project Design Feature PDF-BIO-1 (revised to “BIO-PDF-1” as shown in Chapter 3, *Revisions, Clarifications to the Draft EIR*, of this Final EIR) simply reflects how the Project will comply with relevant regulations regarding protecting nesting birds while Mitigation Measure BIO-MM-1 properly sets forth a mitigation measure for nesting bats. The comment provides no substantial evidence that the use of the PDF avoids or compresses any analysis of potential impacts to nesting birds. As stated on pages IV.C-2 through IV.C-3 of the Draft EIR, all bird species that are native to the United States or its territories are protected by the federal MBTA from taking, capturing, killing, selling etc. (collectively “taking”). The MBTA does not prohibit the destruction of a bird nest but does prohibit the taking of the eggs or birds in the nest. Additionally, as stated on pages IV.C-4 through IV.C-5 of the Draft EIR, the California Department of Fish and Wildlife has developed measures to ensure avoidance of a taking. These measures were incorporated into the Project through the PDF. No such similar measures apply to bats. However, the Western yellow bat is considered by the California Department of Fish and Wildlife as a species of “special concern.” As explained on page IV.C-27 of the Draft EIR, while no Western yellow bats have been seen within the region of the Project Site since 1984 (as recorded in the 2020 California Natural Diversity Database [CNDDDB] search), there is a potential for roosting and foraging within the Biological Study area. A species of special concern has no legal status; however, they are treated as species requiring special consideration under CEQA. As such, even though there is only a possibility that the Western yellow bat may roost within the Project Site, a mitigation measure was designed, that is similar to the guidelines to ensure compliance with the legal requirements for birds, to ensure that bat nests would not be disturbed. Thus, the PDF for bird nests is appropriate since it sets forth the procedures for compliance with no take regulations while the mitigation measure for bats is necessary to ensure that the Western yellow bat nest is similarly protected.

### Comment No. ORG 1B-25

The DEIR clearly reached its conclusion that “indirect impacts from lighting, noise, and human activity during Project operation would not diminish long-term survival of nesting birds . . . and, therefore, would not be significant” by relying on BIO-PDF-1, as explained on DEIR pages IV-C-47 to 48:

Disturbing or destroying active nests is a violation of the MBTA. In addition, nests and eggs are protected under Fish and Wildlife Code Section 3503. As such direct impacts to breeding birds or roosting bats (e.g., through nest or roost removal) or indirect impacts (e.g., by noise causing abandonment of the nest or roost) would be a potentially significant impact as defined by the thresholds above. **Project Design Feature PDF-BIO-1**, which demonstrates compliance with regulatory requirements for nesting bird protection, and Mitigation Measure BIO-MM-1 **would reduce any direct impacts to nesting birds and roosting bat species to a less-than-significant level.**

PDF-BIO-1 is clearly a mitigation measure. The analyses regarding impacts to nesting birds and conflicts with policies or ordinances protecting nesting birds must be redone and the DEIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4).

## Response No. ORG 1B-25

The comment states that Project Design Feature BIO-PDF-1 should be a mitigation measure. However, the comment does not provide substantial evidence that the analysis in the Draft EIR did not sufficiently analyze the potential impact to nesting birds. As more fully explained in Response No. ORG 1B-8, so long as the EIR fully discloses the potential impacts, there is no CEQA concern with characterizing the project feature as a PDF. “Any mischaracterization [of a PDF] is significant, however, only if it precludes or obfuscates required disclosure of the project’s environmental impacts and analysis of potential mitigation measures.” (*Mission Bay*, 6 Cal. App. 5<sup>th</sup> at p.185.) The language cited in the comment shows that the Draft EIR did not attempt to hide the potential impact to nesting birds but instead called it out and explained that the PDF would ensure compliance with regulations protecting nesting birds. Moreover, a mitigation measure is only appropriate for mitigating a potentially significant impact (CEQA Guidelines Section 15126.4(a)(3).) Since the Project is required by law to comply with the MBTA and the Fish and Wildlife Code, there is no need for a mitigation measure, only a PDF that describes how the Project would comply with the applicable regulations since those regulations generally only provide guidance on how to avoid a take.

Here, as in the *Mission Bay* case, characterization of the procedure for compliance with regulatory measures as part of the Project and not as a mitigation measure did not, as the comment states, interfere with the identification of the potential impacts to migratory birds, the consequences of the Project, nor the analysis of measures to mitigate those consequences. Unlike the situation in *Lotus*, the environmental impacts of the Project on migratory species and native wildlife nursery sites are fully disclosed in the Draft EIR and the compliance with the PDF is secured by inclusion of the PDF in the MMP. See Draft EIR pages IV.C-27 and IV.C-47 through IV.C-48 regarding the analysis and disclosure of potential impacts on songbird and raptor nests and the MMP in Chapter 4.0, *Mitigation Monitoring Program*, of this Final EIR.

## Comment No. ORG 1B-26

### 3.2 Cultural Resources

The DEIR relies on Project Design Features CUL-PDF-1, CUL-PDF-2 and CUL-PDF-3 when concluding that impacts to historical resources would be Less Than Significant and that no mitigation is required. The DEIR also relies on CUL-PDF-1 and CUL-PDF-3 when concluding that impacts due to a conflict with any applicable land use plan, policy or regulation adopted for purposes of avoiding or mitigating an environmental effect will be Less Than Significant (without mitigation). These PDFs read as follows:

**CUL-PDF-1: Rehabilitation Plan.** A Rehabilitation Plan will be prepared as part of the Project to ensure appropriate treatment and protection of the identified character-defining features on the Project Site. This includes the appropriate treatment of the golf ball-shaped light standards during relocation, and documentation that the rehabilitation of the clubhouse, putting green, and low brick wall with weeping mortar complies with the Secretary of the Interiors Standards for Rehabilitation (the Standards). Standards compliance is required by the City of Los Angeles Cultural Heritage Ordinance for properties that are designated Historic Cultural Monuments (Los Angeles Administrative Code, Section 22.171.14). The Project team will include a historic architect or qualified historic preservation consultant who meets the Secretary of the Interior's Professional Standards in Architectural History or Historic Architecture. The Rehabilitation Plan will be submitted for review and approval by the Department of City Planning, Office of Historic Resources. At a minimum, the Rehabilitation Plan will address the following:

- Appropriate measures for the relocation of the golf ball-shaped light standards.
- Appropriate measures for protecting all identified character-defining features of the Project Site during construction activity. If necessary, a physical barrier (e.g., exclusion or cyclone fencing) will be erected to separate and protect the clubhouse, and other features as needed, during construction.
- Retention and appropriate treatment of the significant characteristics of the original Ranch-style architecture and the relationship of the clubhouse within the context of the Project Site overall and its relationship to other character defining features on the Project Site and in the surrounding neighborhood. This includes retaining the clubhouse in its historic location, and maintaining the significant features that have collectively served as the public face of the Project Site since the 1950s as identified in the Historical Report, including: the clubhouse's angled position facing Whitsett Avenue and Valley Spring Lane; the existing setback; the relationship of the clubhouse and the putting green; the mature trees; the golf ball-shaped light standards; and the low brick wall.
- Retention and rehabilitation of the distinctive features of the exterior of the clubhouse, including its original Ranch-style plan, massing, and original architectural details as identified in the Historical Report. The Project is not proposing significant additions to the clubhouse, or alterations to the building that would obscure or remove important exterior features.
- Retention and rehabilitation of the distinctive original features of the interior of the clubhouse as identified in the Historical Report.

**CUL-PDF-2: Documentation.** In order to memorialize the extant features of the Project Site prior to implementation of the Project, the Project Site will be documented according to Historic American Buildings Survey (HABS) Level III standards to include: sketch plan; a maximum of 40 photographs with large-format negatives that documents the Project Site overall and the relationship of the features on the Project Site, exterior and significant interior spaces of the clubhouse, and views of the associated putting green and low brick wall; and golf ball-shaped light standards; and short form historical report. The documentation will be reviewed and approved by the Department of City Planning, Office of Historic Resources. The documentation will be retained on-site, and digital copies will be offered to the following repositories: Los Angeles Public Library, Los Angeles Office of Historic Resources, and San Fernando Valley Historical Society.

**CUL-PDF-3: Interpretation.** Harvard-Westlake School will prepare interpretation of the history of the Project Site to be housed on-site. The interpretive program may be housed in the clubhouse and may include historic photographs or other ephemeral materials documenting the history of the Weddington family, the development of the San Fernando Valley, and the history of the Project Site as a postwar recreational facility. A digital copy of the interpretive materials will be provided to the Department of City Planning, Office of Historic Resources and may also be made available to interested parties.

These are clearly mitigation measures for historical resource impacts and are illustrative of the types of mitigation measures commonly used in EIRs when there is the potential for impacts to an historical resource. In fact, the effectiveness of both documentation and interpretive displays as historic resource mitigations has been addressed by the courts.<sup>17</sup>

<sup>17</sup> See: *Architectural Heritage Association v. County of Monterey* (19 Cal. Rptr. 3d 469 and *League for Protection v. City of Oakland*, 52 Cal.App.4th 896).

## Response No. ORG 1B-26

The comment states that mitigation measures for cultural resources should be mitigation measures instead of PDFs. The comment does not provide evidence that the analysis of the potential impacts and appropriate mitigation of those impacts is insufficient. See Response No. ORG 1B-8, Response No. ORG 1B-22, Response No. ORG 1B-23, and Response ORG 1B-25 for an explanation of why PDFs are appropriate even when they have the effect of lessening a potential environmental impact. Moreover, the cases cited in the comment are not applicable to the Project. Both cases involved the demolition of a potential historical resource and the need for an EIR to analyze the impacts of that demolition. In both cases the courts discuss potential mitigation measures for the demolition. However, the Project is not demolishing the cultural resources on the Project Site. The Project includes retention and rehabilitation of the character-defining features

of the Project Site and has prepared a Project EIR that fully analyzes that Project's impacts.

In fact, one of the Project Objectives is to “[r]etain and rehabilitate the existing clubhouse with café, associated putting green, low brick retaining wall, and golf ball-shaped light standards for public use and leisure to convey their historic value as character defining features of the Historic-Cultural Monument, the Studio City Golf and Tennis Club (now Weddington Golf & Tennis), as a post-World War II recreational facility and as an important local example of Ranch style architecture.” (See Project Description, pg. II-14)

Furthermore, Section IV.D, *Cultural Resources*, of the Draft EIR, provides a detailed description of the Project Site components including those character-defining features that were designated as a Historic-Cultural Monument (HCM) by the City in 2021. As explained on pages IV.D-31 through IV.D-34 of the Draft EIR, the distinctive character-defining features of the Project Site, as identified in the HCM designation, would be retained as part of the Project and rehabilitated in compliance with applicable regulations. Rather than hiding or ignoring potential impacts, the Draft EIR thoroughly discusses the HCM designated features and explains that they would be retained such that the Project Site would retain its historic integrity and continue to convey its significance as a 1950s community recreational facility. The PDFs are provided as part of the Project to set forth the procedures for compliance with the Secretary of the Interiors Standards for Rehabilitation. See also Appendix E-1 of the Draft EIR, Historical Resources Technical Report for 4141 N. Whitsett Avenue, Studio City, which describes how the use of the Project Site for athletic and recreational purposes is consistent with its historic use, how the historic character of the Project Site overall would be retained, and that the Project would retain all of the identified character-defining features and thus will retain sufficient historic integrity to remain eligible as an HCM. Therefore, the PDFs are appropriate Project components to ensure that the significance of the HCM is retained as required by law and not a mitigation measure for a potentially significant Project impact. Nonetheless, even if the PDFs are mischaracterized, which the City contends is not the case, the Draft EIR analysis combined with including the PDFs in the MMP resolve the issue. See also, Topical Response No. 6 – Historical Resources.

### **Comment No. ORG 1B-27**

The DEIR acknowledges on page IV.D-34 that these, essentially, mitigation measures were relied on when making historic-resource related impact judgements:

As described above, the Project would retain its significance as a 1950s community recreational facility, all of the identified character-defining features of the HCM, Studio City Golf and Tennis Club, **and it includes Project Design Features to ensure the significance of the HCM is retained, specifically PDF-CUL1, Rehabilitation Plan, PDF- CUL-2, Documentation, and PDF-CUL-3, Interpretation.** Accordingly, impacts on an historical resource as defined in CEQA Guidelines Section 15064.5 were

determined to be less than significant. Therefore, no mitigation measures are required. (Emphasis added).

Because the DEIR considered these PDFs when making a determination that historical resource impacts would be Less Than Significant without mitigation, the DEIR has failed to accurately classify historic resource impacts. (See also **Section 4.3** of this letter). The DEIR must be revised and recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4).

## **Response No. ORG 1B-27**

The comment states that the description of the purpose for Project Design Features PDF-CUL-1 through PDF-CUL-3 signifies that they are really mitigation measures. As more fully explained in Response No. ORG 1B-8 and Response No. ORG 1B-26, the Project's PDFs are properly characterized as Project components and not mitigation measures. However, even if the characterization were incorrect, the comment provides no evidence that the analysis of the Project's potential impacts is inadequate. As discussed in Response No. ORG 1B-26, the Draft EIR provides a full and complete description of the Project's impacts on cultural resources and compliance with the PDFs are secured by inclusion of the PDFs in the MMP (See Chapter 4.0, *Mitigation Monitoring Program*, of this Final EIR).

## **Comment No. ORG 1B-28**

### **3.3 Greenhouse Gas Emissions**

The DEIR relies on Project Design Feature GHG-PDF-1 when concluding that operational impacts on energy resources will be Less than Significant (without mitigation). It relies on GHG-PDF-1, along with WS-PDF-1 and WS-PDF-2 when concluding that conflicts with State or local plans for renewable energy or energy efficiency will be Less Than Significant (without mitigation). The DEIR also relies on GHG-PDF-1 when concluding that Greenhouse Gas emission impacts will be Less Than Significant (without mitigation) and when concluding that conflicts with any applicable plans, policies or regulations adopted for purposes of reducing the emissions of GHGs will be Less Than Significant (without mitigation). This PDF reads as follows:

**GHG-PDF-1: Solar Voltaic System.** The Project will be designed to include solar voltaic panels providing 339,000 kilo Watt-hours (kWh) per year<sup>6</sup> on the roof of the gymnasium that would reduce the amount of electricity demand from City utilities.

<sup>6</sup> The solar voltaic panel system would supply approximately 11.5 percent of the Project's energy demand. For complete list of assumptions refer to Appendix C of this Draft EIR.

This is clearly a Project-specific mitigation measure as illustrated by the discussion on DEIR page IV-G.58 to 59:

The Project's consistency with these applicable regulatory plans and policies to reduce GHG emissions, along with implementation of Project Design Features as discussed in this Draft EIR, **particularly Project Design Feature GHG-PDF-1 in Subsection IV.G.3.c), Project Design Features, would reduce the Project's GHG emissions by 21 percent** (or 32 percent on a net GHG emissions basis) compared to the Project without implementation of GHG reduction characteristics, features, and measures. In summary, the plan consistency analysis provided below under Threshold (b) demonstrates that the Project's design features would not conflict with regulations and policies and would comply with or exceed the regulations and reduction actions/strategies outlined in the Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City's Green New Deal, and the Los Angeles Green Building Code. **The Project's evaluation of consistency with the above plans is the primary basis for determining the significance of the Project's GHG-related impacts on the environment. Accordingly, as shown below in Threshold (b), since the Project would not conflict with applicable plans, regulations or goals, the Project would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.** (Emphasis added).

## Response No. ORG 1B-28

The comment states that the PDFs for GHG emissions and water supply should have been discussed as mitigation measures. For all the reasons described in the prior responses to this comment letter, the Draft EIR is not flawed in its use of PDFs which are Project elements, or its use of mitigation measures which are additional measures added after analysis of the Project with the PDFs integrated into the Project. See Response No. ORG 1B-8, Response No. ORG 1B-22, Response No. ORG 1B-23, Response No. ORG 1B-25 and Response No. ORG 1B-26.

Additionally, the types of Project elements contained in these mitigation measures are exactly the types which are typically included in EIRs as PDFs because they are an integral part of the design of the Project. For example, Project Design Feature GHG-PDF-1 cited above involves the Project feature of putting solar voltaic panels on the Project Site. This is similar to the *Lotus* case example of specifying the type of concrete that would be used for the project which would have environmental benefits such as minimizing impacts to tree roots. As stated by the court in *Lotus*, it would be "nonsensical" to require an analysis of the project with a different type of concrete and then find that Caltrans must use the type of concrete they intended to use all along in order to mitigate against a type of concrete they had no intention of using (*Lotus* 223 Cal. App. 4<sup>th</sup> at p. 656 fn 8.). Clearly Project Design Feature GHG-PDF-1 reflects a Project design element

and not a mitigation for any environmental impact caused by the Project. In fact, it is a Project design element that assists the State and City in dealing with an existing condition, extensive GHG in the region. The fact that this PDF helps the City make the finding that the Project does not conflict with applicable plans, regulations and goals does not turn the PDF into a mitigation measure. Project Design Feature GHG-PDF-1 is an integral part of the Project as designed by the School. As such, it is part of the whole of the Project and appropriately considered as a Project component in the analysis of the Project's potential impacts. To argue that the reduction in GHG emissions that results from this PDF is proof that the PDF is really a mitigation measure is as "nonsensical" as the example discussed in the *Lotus* case. Moreover, unlike the situation in *Lotus*, the environmental impacts of the Project on the environment are fully disclosed in the Draft EIR and the compliance with the PDF is secured by inclusion of the PDF in the MMP.

Note that modifications to the Project would reduce the total number of solar panels from 426 to 378, and reducing the electricity provided from 339,000 kWh to 281,000 kWh. The reduction in solar panels was a design correction that still allows the Project to meet LAMC requirements, which were previously exceeded under the Project analyzed in the Draft EIR. Bringing the Project into compliance with the Building Code would have no new or substantial increase in the severity of environmental effects under CEQA thresholds. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. The revisions in Chapter 3 of this Final EIR update Project Design Feature GHG-PDF-1 and include updated GHG and energy calculations based on the modified solar panels. Appendix K, Supplemental Greenhouse Gas and Energy Modeling Data, of this Final EIR includes the modeling results with the Project modifications. The updated calculations do not change the energy and GHG impact conclusions in the Draft EIR, and there would not be a substantial increase in the severity of impacts.

### **Comment No. ORG 1B-29**

GHG-PDF-1 is clearly a mitigation measure. The analyses regarding operational impacts on energy resources, conflicts with State or local plans for renewable energy or energy efficiency, Greenhouse Gas emission impacts, and conflicts with applicable plans, policies or regulations adopted for purposes of reducing the emissions of GHGs must be redone and the DEIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4).

### **Response No. ORG 1B-29**

This comment states that Project Design Feature GHG-PDF-1 (the solar voltaic system designed as part of the Project) is a mitigation measure and implies that it is not a proper Project Design Feature. Since the Draft EIR's evaluation of GHG impacts takes Project Design Feature GHG-PDF-1 into consideration, the comment's implication that the Draft EIR's evaluation of GHG emissions is invalid is not substantiated. The comment states that GHG impacts must be reevaluated (without consideration of Project Design Feature

GHG-PDF-1 as implied) and the Draft EIR must be recirculated. As evaluated in Section IV.G of Draft EIR, with the incorporation of Project Design Feature GHG-PDF-1 impacts with respect to Project operation on energy resources, consistency with State or local plans for renewable energy or energy efficiency, GHG emission impacts, and consistency with applicable plans, policies or regulations adopted for purposes of reducing the emissions would be less than significant. The comment does not support the implication that Project Design Feature GHG-PDF-1 is not an appropriate Project Design Feature, that it cannot be taken into consideration in the evaluation of GHG impacts, or that a reevaluation of the Project's GHGs without consideration of Project Design Feature GHG-PDF-1 is necessary. (See Response No. ORG 1B-8, Response No. ORG 1B-22, Response No. ORG 1B-23, Response No. ORG 1B-25 and Response No. ORG 1B-26 for further discussion regarding PDFs.) As such, no further response is necessary.

### **Comment No. ORG 1B-30**

#### **3.4 Hazards and Hazardous Materials**

The DEIR relies on Project Design Feature HAZ-PDF-1 when concluding that operational impacts associated with the routine transport, use or disposal of hazardous materials will be Less Than Significant (without mitigation). This PDF reads as follows:

**HAZ-PDF-1: Artificial Turf Formulation.** The artificial turf fiber, backing, and underlayment installed on the Project Site will not have a lead concentration level higher than 50 parts per million as determined using a testing protocol in accordance with U.S. Environmental Protection Agency Method 30508; U.S. Environmental Protection Agency Method 6010c or alternatively Method 6020A will be used to analyze digestate.

HAZ-PDF-1 is clearly a mitigation measure. The analyses regarding impacts associated with the routine transport, use or disposal of hazardous material must be redone and the DEIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4).

### **Response No. ORG 1B-30**

This comment states that Project Design Feature HAZ-PDF-1, which describes the artificial turf formulation to be used for the Project, should be analyzed as a mitigation measure. The comment conflates Project components with mitigation measures needed if those components were not integrated into the design of the Project. For all of the reasons previously stated in the responses to this comment letter, the Draft EIR is not flawed in its use of PDFs which are Project elements, or its use of mitigation measures which are additional measures added after analysis of the Project with the PDFs integrated into the Project. See Response No. ORG 1B-8, Response No. ORG 1B-22, Response No. ORG 1B-23, Response No. ORG 1B-25 and Response No. ORG 1B-26 for further discussion regarding PDFs. Having a PDF which states what type of artificial turf is to be used in the Project is a Project design feature no different than the type of

concrete to be used by Caltrans in the *Lotus* case. Unlike the situation in *Lotus*, the environmental impacts of the Project are fully disclosed in the Draft EIR and the compliance with the PDF is secured by inclusion of the PDF in the MMP (See Chapter 4.0, *Mitigation Monitoring Program*, of this Final EIR). Further, the comment provides no evidence that the analysis in the Draft EIR is incorrect, or that the Draft EIR should be recirculated. As such, no further response is necessary.

## Comment No. ORG 1B-31

### 3.5 Noise and Vibration

The DEIR relies on Project Design Feature NOI-PDF-3, along with mitigation measures NOI-MM-1, MM2 and MM3 when concluding that project construction will result in significant and unavoidable impacts associated with an increase in ambient noise levels. The DEIR relies on NOI-PDF-3 when concluding that construction vibration impacts will be Significant and Unavoidable and provides no mitigations for vibration impacts. The DEIR relies on NOI-PDF-1 and NOI-PDF-2 when concluding that operational noise impacts will be Less Than Significant (without mitigation). As noted on DEIR page IV-K-38 to 39:

The following project design features (PDF) **are proposed to reduce the noise impacts from Project operation** to the nearby sensitive receptors: (Emphasis added).

**NOI-PDF-1:** The Project will include sections of solid walls and an overhead canopy above the swimming pool that will reduce noise associated with the athletic activities to the adjacent residences, as follows:

- An 8- to 10-foot-high wall along portions of the northeastern and eastern sides of Field A.
- An 8- to 11-foot-high wall along portions of the western and northern sides of Field B.
- A 30-foot solid overhead canopy above the swimming pool bleachers and pool buildings.
- An 8-foot-high solid wall along the northern edge of the tennis courts.

**NOI-PDF-2:** The Project's amplified sound system for special events at Field A will be installed and designed using a line-array speaker system, so as to not exceed a maximum noise level of 92 dBA (Leq) at a distance of 50 feet from the amplified sound system. In addition, the stage for special events will be located at the north side of Field A, with the amplified sound system facing south in the opposite direction from the off-site sensitive uses to the north of Field A, which would reduce speaker noise at the nearest off-site sensitive uses to the north and east of Field A.

**NOI-PDF-3:** Project construction will be limited to Monday through Friday between 7:00 a.m. and 6:00 p.m.; and Saturdays between 8:00 and 6:00 p.m., which is within the allowable hours per Los Angeles Municipal Code Section 41.40.

NOI-PDF-1, NOI-PDF-2 and NOI-PDF-3 are clearly a mitigation measures. The analysis regarding operational noise impacts must be redone and the DEIR recirculated pursuant to pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4)

### **Response No. ORG 1B-31**

This comment states that PDFs related to minimizing noise from the Project should be analyzed as mitigation measures. The comment conflates Project components with mitigation measures needed if those components were not integrated into the design of the Project. For all the reasons previously stated in the responses to this comment letter, the Draft EIR is not flawed in its use of PDFs which are Project elements, or its use of mitigation measures which are additional measures added after analysis of the Project with the PDFs integrated into the Project. See Response No. ORG 1B-8, Response No. ORG. 1B-22, Response No. ORG 1B-23, Response No. ORG 1B-25 and Response No. ORG 1B-26 for further discussion of PDFs. Project Design Features NOI-PDF-1, NOI-PDF-2 and NOI-PDF-3 are all integral parts of the Project as designed by the School. As such, they are part of the whole of the Project and appropriately considered as a Project component in the analysis of the Project's potential noise impacts. Unlike the situation in *Lotus*, the environmental impacts of the Project are fully disclosed in the Draft EIR and the compliance with the PDFs is secured by inclusion of the PDFs in the MMP. Further, the comment provides no evidence that the analysis in the Draft EIR is incorrect, or that the Draft EIR should be recirculated. As such, the revision and recirculation of the Draft EIR is not necessary.

### **Comment No. ORG 1B-32**

#### **3.6 Police Services**

The DEIR relies on Project Design Features POL-PDF-1 along with TRAF-PDF-1 when concluding that Project construction impacts on police protection will be Less Than Significant (without mitigation). The DEIR relies on POL-PDF-2 when concluding that Project operational impacts on police protection services will be Less Than Significant (without mitigation). These PDFs read as follows:

**POL-PDF-1: Security Features During Construction.** During construction, on-site security measures will include security lighting and a construction security fence with gated and locked entry around active construction areas.

**POL-PDF-2: Security Features During Operation.** During operation, the Project will incorporate a security program to ensure the safety of its

students, employees, and spectators, as well as public users of the Project Site. The Project's security will include, but not be limited to, the following design features:

- Construction of three security kiosks: (1) a security kiosk constructed south of the tennis courts; (2) a security kiosk located in the underground parking structure; and, (3) a security kiosk located in proximity to the roundabout and at-grade parking.
- Security personnel would be present onsite 24 hours per day every day of the year, and range in numbers from two to as many as ten guards depending on the time of day and number of scheduled activities.
  - One security person would be stationed at the underground garage security kiosk throughout business hours. Patrols would be conducted at random during each guard's eight-hour shift.
  - Security patrols present north of the Project Site on Valley Spring Lane during events to enforce no neighborhood or other off-site parking or visitor drop-off.
  - Security guard placed at the pedestrian entrance on Whitsett Avenue during larger events (i.e., days on which the number of event/game attendees is expected to be 300 or more for any individual game, or concurrent games combined) to screen visitors for neighborhood parking and to return visitors to their car if inappropriately parked.
- Lighting would be provided along all pathways, around the Project's gymnasium building, in the surface parking area, and in entrance areas for security and wayfinding purposes. As required by LAMC Section 93.0117(b), exterior light sources would be designed such that they would not cause more than two foot-candles of lighting intensity or generate direct glare onto nearby sensitive uses (i.e., residential uses).
- North Hollywood Community Police Station would be provided with diagrams showing access to each portion of the Project Site.
- Installation of and monitoring of closed circuit television (CCTV) cameras.

As noted on DEIR page IV.L.2-16:

The Project Site would need to be secured during construction in order to avoid potential theft. Security lighting and fencing (refer to Project Design Feature POL-PDF-1), would be provided at the Project Site during construction, **thereby reducing the potential need for LAPD services.** (Emphasis added).

As noted on DEIR page IV.L.2-17:

As the Project would include fencing and security lighting, as part of Project Design Feature POL-PDF-1, no additional officers from LAPD would be needed to monitor the Project Site during construction outside of existing officers that already patrol the area.

As noted on DEIR page IV.L.2-18:

Moreover, the Project's increased operational demand for police protection services would be offset as the result of the security services that would be provided on the Project Site as part of Project Design Feature POL-PDF-2.

POL-PDF-1 and POL-PDF-2 are clearly a [sic] mitigation measures. The analysis regarding impacts police services during Project construction and operation must be redone to identify these as mitigation measures and the DEIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4)

### **Response No. ORG 1B-32**

This comment states that PDFs which have the effect of minimizing construction and operational impacts on police services should be analyzed as mitigation measures. The comment conflates Project components with mitigation measures needed if those components were not integrated into the design of the Project. For all the reasons previously stated in the responses to this comment letter, the Draft EIR is not flawed in its use of PDFs which are Project elements, or its use of mitigation measures which are additional measures added after analysis of the Project with the PDFs integrated into the Project. See Response No. ORG 1B-8, Response No. ORG. 1B-22, Response No. ORG 1B-23, Response No. ORG 1B-25 and Response No. ORG 1B-26 for further discussion regarding PDFs.

Project Design Features POL-PDF-1 and POL-PDF-2 and TRAF-PDF-1 are all integral parts of the Project as designed by the School. As such, they are part of the whole of the Project and appropriately considered as Project components in the analysis of the Project's potential impacts on police services. To argue that the reduction in the need for police services that would result from these PDFs is proof that the PDFs are really a mitigation measure is as "nonsensical" as the example discussed in the *Lotus* case. Unlike the situation in *Lotus*, the environmental impacts of the Project are fully disclosed in the Draft EIR and compliance with the PDFs is secured by inclusion of the PDFs in the MMP. Further, the comment provides no evidence that the analysis in the Draft EIR is incorrect, or that the Draft EIR should be recirculated. As such, the revision and recirculation of the Draft EIR is not necessary.

## Comment No. ORG 1B-33

### 3.7 Transportation

The DEIR relies on Project Design Feature TRAF-PDF-1 when concluding that Project impacts on fire protection services during construction will be Less Than Significant (without mitigation). The DEIR relies on TRAF-PDF-2 when concluding that Project impacts on fire protection services during operation will be Less Than Significant (without mitigation). The DEIR relies on Project Design Feature TRAF-PDF-1 along with POL-PDF-1 when concluding that Project construction impacts on police protection will be Less Than Significant (without mitigation). The DEIR relies on TRAF-PDF-3 when concluding that Project impacts due to a conflict with a program, plan, policy or ordinance addressing the circulation system will be Less Than Significant (without mitigation). The DEIR relies on PDF-TRAF-1 when concluding that Project emergency access impacts during construction will be Less Than Significant (without mitigation) and relies on PDF-TRAF-2 when concluding that Project emergency access issues during operation would be Less Than Significant (without mitigation). The DEIR also relies on TRAF-PDF-1 when concluding that Project construction impacts on water and wastewater infrastructure will be Less Than Significant (without mitigation). These PDFs read as follows:

**TRAF-PDF-1: Construction Management Plan.** Prior to the issuance of any demolition permit or building permit for the Project, a detailed Construction Management Plan (CMP), including street closure information, a detour plan, haul routes, and a staging plan, will be prepared and submitted to the City for review and approval. The CMP will formalize how construction will be carried out and identify specific actions that will be required to reduce effects on the surrounding community. The CMP will be based on the nature and timing of the specific construction activities and other projects in the vicinity of the Project Site. Construction management meetings with City Staff and other surrounding construction-related project representatives (i.e., construction contractors), whose projects will potentially be under construction at around the same time as the Project, will be conducted bimonthly, or as otherwise determined appropriate by City Staff. This coordination will ensure construction activities of the concurrent related projects and associated hauling activities are managed in collaboration with one another and the Project. The CMP will include, but not be limited to, the following elements as appropriate:

- As traffic lane, parking lane, and/or sidewalk closures are anticipated, worksite traffic control plan(s), approved by the City of Los Angeles, will be developed and implemented to route vehicular traffic, bicyclists, and pedestrians around any such closures.
- Ensure that access will remain unobstructed for land uses in proximity to the Project Site during project construction.

- Coordinate with the City and emergency service providers to ensure adequate access, including emergency access, is maintained to the Project Site and neighboring businesses and residences. Emergency access points will be marked accordingly in consultation with LAFD, as necessary.
- Schedule deliveries and pick-ups of construction materials during non-peak travel periods to the extent possible and coordinate to reduce the potential of trucks waiting to load or unload for protracted periods.
- Prohibit construction worker and equipment parking on the adjacent residential streets.

According to DEIR page IV.L.1-19:

. . . pursuant to Project Design Feature TRAF-PDF-1, the Project would implement a Construction Management Plan that would include measures to ensure emergency access to the Project Site and adjacent properties. **Project Design Feature TRAF-PDF-1 would minimize impacts to vehicular and other forms of circulation during construction.** (Emphasis added).

According to DEIR page IV.L.1-21:

Project construction activities could temporarily impact emergency access. However, with implementation of Project Design Feature TRAF-PDF-1 . . . construction of the Project would not result in the need for a new fire station or the expansion of an existing facility, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection services. Therefore, impacts to fire protection during Project construction would be less than significant.

Per DEIR page IV.L.2-17:

Accordingly, impacts to police protection services would be less than significant for the following reasons:

1. Emergency access would be maintained to the Project Site during construction through marked emergency access points approved by the LAPD (refer to Project Design Feature TRAF-PDF-1 in Section IV.M, Transportation, of this Draft EIR); . . .

TRAF-PDF-2 is similarly clearly designed to avoid or minimize impacts of Project traffic on Fire Station operation. TRAF-PDF-2 reads as follows:

**TRAF-PDF-2:** A flashing red warning light(s) will be installed on the southern exit driveway within the Project Site at a point located before

vehicles reach Valleyheart Drive that will hold back vehicles exiting the Project Site roundabout onto Valleyheart Drive. This warning light will be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting from one of the two LAFD driveways on Valleyheart Drive.

As noted on DEIR page II-53, the “south driveway” for the aboveground and underground parking areas would be “via a driveway at the paved portion of Valleyheart Drive located just south of LAFD Fire Station 78”. As explained on DEIR page II-53 to II-55:<sup>18</sup>

The southern driveway via Valleyheart Drive would lead to both the below-grade parking structure and to a drop-off/pick-up roundabout area at the southeast corner of the Project Site. The south driveway would only allow entry into the subterranean garage, and all exits from the garage would be via the north driveway off Whitsett Avenue. The roundabout has been designed to accommodate buses, shuttles, and automobiles. The roundabout would lead to a 29-space, short-term surface parking lot near the parking structure’s southern entrance. Rideshare vehicles would use the southern driveway (with roundabout) to access the surface parking lot...

**To minimize conflicts with emergency vehicles exiting LAFD Fire Station 78**, a flashing red warning light(s) would be installed on the southern exit driveway within the Project Site at a point located before vehicles reach Valleyheart Drive that will hold back vehicles exiting the Project Site roundabout onto Valleyheart Drive. This warning light would be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting from one of the two LAFD driveways on Valleyheart Drive. This feature is identified as Project Design Feature TRAF-PDF-2 in Section IV.M, Transportation, of this Draft EIR. (Emphasis added).

It is thus very clear that this PDF is a mitigation measure designed to address impacts of the proposed Project on Fire Station operations. By treating this mitigation measures [sic] as a PDF, the DEIR has failed to identify significant impacts to Fire Station operations that would result from Project operations. This must be corrected and the EIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4). (See also discussion in **Section 4.8** of this letter).

<sup>18</sup> See also page IV.L.1-25: As part of the Project design and per Project Design Feature TRAF-PDF-2, a flashing red warning light(s) will be installed on the southern exit driveway within the Project Site at a point located before vehicles reach Valleyheart Drive that will hold back vehicles exiting the Project Site roundabout onto Valleyheart Drive. This warning light will be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting one of the LAFD driveways on Valleyheart Drive. The warning light would allow for adequate emergency access by LAFD vehicles between Valleyheart

Drive and Whitsett Avenue by reducing conflicts between vehicles leaving the Project Site and emergency vehicles leaving/coming back to the station. Further, the warning light would minimize the eastbound queues by vehicles leaving the Project Site along Valleyheart Drive at Whitsett Avenue when emergency vehicles need to access Valleyheart Drive. With the warning light in operation, LAFD would be able to effectively maintain adequate emergency vehicle access to LAFD Fire Station 78. Further, the warning light would ensure emergency response times are not substantively increased.

### **Response No. ORG 1B-33**

This comment states that Project Design Features TRAF-PDF-1, TRAF-PDF-2, TRAF-PDF-3, which have the effect of minimizing construction and operational traffic impacts on police and fire services, should be analyzed as mitigation measures. The comment conflates Project components with mitigation measures needed if those components were not integrated into the design of the Project. For all the reasons previously stated in the responses to this comment letter, the Draft EIR is not flawed in its use of PDFs which are Project elements, or its use of mitigation measures which are additional measures added after analysis of the Project with the PDFs integrated into the Project. See Response No. ORG 1B-8, Response No. ORG. 1B-22, Response No. ORG 1B-23, Response No. ORG 1B-25 and Response No. ORG 1B-26 for further discussion of PDFs.

Project Design Features TRAF-PDF-1, TRAF-PDF-2 and TRAF-PDF-3 are all integral parts of the Project as designed by the School. As such, they are part of the whole of the Project and appropriately considered as a Project component in the analysis of the Project's potential impacts on police and fire services. To argue that the reduction in the need for police and fire services that would result from these PDFs is proof that the PDFs are really mitigation measures is as "nonsensical" as the example discussed in the *Lotus* case. Unlike the situation in *Lotus*, the environmental impacts of the Project are fully disclosed in the Draft EIR and the compliance with the PDF is secured by inclusion of the PDF in the MMP. Further, the comment provides no evidence that the analysis in the Draft EIR is incorrect, or that the Draft EIR should be recirculated. As such, the revision and recirculation of the Draft EIR is not necessary.

Nonetheless, see Topical Response No. 10 – Emergency Access, for a discussion of the Project's impacts on emergency access. As discussed in Topical Response No. 10, the Project's emergency access impacts were fully evaluated in Section IV.L.1, *Public Services – Fire Protection*, and Section IV.M, *Transportation*, of the Draft EIR. Despite the Project's periodic and temporary increase in localized traffic, the Project would not significantly impair the Los Angeles Fire Department (LAFD) from responding in a timely manner to emergencies at the Project Site or the surrounding area. The Project would provide for emergency access into the Project Site and would not substantially interfere with emergency access in the surrounding neighborhood such that response times are substantively increased. It would also provide a system to maintain adequate access for emergency vehicles to enter and return to the adjacent LAFD Fire Station 78 and, thus, would not interfere with the operation of that fire station or substantively increase response times. In conclusion, as discussed in Section IV.L.1, *Public Services – Fire Protection*, and Section IV.M, *Transportation*, impacts to fire protection services, including

operations at LAFD Fire Station 78, as well as emergency access associated with LAFD Fire Station 78, would be less than significant.

### **Comment No. ORG 1B-34**

TRAF-PDF-3 is also clearly designed to mitigate Project impacts. TRAF-PDF-3 reads as follows:

**TRAF-PDF-3:** On days in which event attendance is expected to surpass 300 spectators, including parents and other spectators, students will not be permitted to drive to the Project Site and will be required to use the School's shuttle service. Shuttles will follow a prescribed driving route, travelling northbound on Coldwater Canyon Avenue, turning right at Moorpark Street, and turning right onto Whitsett Avenue. Spectators will park on the Project Site, and tickets and parking passes will be required to enter the Project Site. Spectators without a parking pass will be directed to park on the School's Upper Campus and ride the School-provided shuttles to the Project Site. Parking in the neighborhood will not be permitted and will be enforced by security personnel.

TRAF-PDF-1, TRAF-PDF-2 and TRAF-PDF-3 are clearly mitigation measures designed to reduce or avoid impacts. The following impact determinations which rely on these PDF must be corrected and the DEIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and/or (4): impacts on fire protection services during construction; impacts on fire protection services during operation; construction impacts on police protection; impacts due to a conflict with a program, plan, policy or ordinance addressing the circulation system; Project emergency access impacts during construction; Project emergency access issues during operation; and Project construction impacts on water and wastewater infrastructure.

### **Response No. ORG 1B-34**

This comment states that Project Design Features TRAF-PDF-1, TRAF-PDF-2, and specifically TRAF-PDF-3, which have the effect of minimizing impacts on the adjacent fire station, should be analyzed as mitigation measures. The comment conflates Project components with mitigation measures needed if those components were not integrated into the design of the Project. See also Topical Response No. 10 - Emergency Access. As discussed in Topical Response No. 10, the Project's emergency access impacts were fully evaluated in Section IV.L.1, *Public Services – Fire Protection*, and Section IV.M, *Transportation*, of the Draft EIR. Despite the Project's periodic and temporary increase in localized traffic, the Project would not significantly impair the LAFD from responding in a timely manner to emergencies at the Project Site or the surrounding area. The Project would provide for emergency access into the Project Site and would not substantially interfere with emergency access in the surrounding neighborhood such that response times are substantively increased. It would also provide a system to maintain adequate access for emergency vehicles to enter and return to the adjacent LAFD Fire Station 78

and, thus, would not interfere with the operation of that fire station or substantively increase response times. In conclusion, as discussed in Section IV.L.1, *Public Services – Fire Protection*, and Section IV.M, *Transportation*, impacts to fire protection services, including operations at LAFD Fire Station 78, as well as emergency access associated with LAFD Fire Station 78, would be less than significant.

## Comment No. ORG 1B-35

### 3.7 Utilities and Service Systems – Water Supply

The DEIR relies on WS-PDF-1 and WS-PDF-2 along with GHG-PDF-1, when concluding that conflicts with State or local plans for renewable energy or energy efficiency will be Less Than Significant (without mitigation). The DEIR relies on WS-PDF-2 when concluding that the impact of Project operations on consistency with water quality standards and waste discharge requirements will be Less Than Significant (without mitigation). It also relies on WS-PDF-2 when concluding that operational impacts on groundwater supplies and recharge will be Less Than Significant (without mitigation). The DEIR relies on WS-PDF-1 and WS-PDF-2 when concluding that Project operational impacts on the water supply will be Less Than Significant without mitigation. These PDFs read as follows.

**WS-PDF-1: Artificial Turf.** The Project will use artificial turf on Fields A and B, which would serve to reduce water demand compared to natural grass.

**WS-PDF-2: Capture and Reuse System.** The Project would capture, treat, and store up to 1 million gallons of stormwater and other urban runoff at a time from the developed portions of the Project Site, as well as from an approximate 38.64-acre off-site drainage area to the north of the Project Site, through a stormwater Low Impact Development (LID) capture and reuse cistern system, which will then use the treated stormwater for irrigation or water features on the Project Site.

WS-PDF-1 and WS-PDF-2 are clearly measures designed to reduce Project water use and thus mitigation measures. The analyses regarding impacts to conflicts with State or local plans for renewable energy or energy efficiency, the impact of Project operations on consistency with water quality standards and waste discharge requirements, operational impacts on groundwater supplies and recharge, and Project operational impacts on the water supply need to be redone to identify the level of impact with and without these mitigation measures. (See also discussion in **Section 4.12**)

## Response No. ORG 1B-35

This comment states that Project Design Features WS-PDF-1 and WS-PDF-2 which have the effect of minimizing construction and operational impacts on water supply should be analyzed as mitigation measures. The comment conflates Project components with mitigation measures needed if those components were not integrated into the design of

the Project. For all the reasons previously stated in the responses to this comment letter, the Draft EIR is not flawed in its use of PDFs which are Project elements, or its use of mitigation measures which are additional measures added after analysis of the Project with the PDFs integrated into the Project. See Response No. ORG 1B-8, Response No. ORG 1B-22, Response No. ORG 1B-23, Response No. ORG 1B-25 and Response No. ORG 1B-26 for further discussion on PDFs.

Project Design Features WS-PDF-1, which specifies that the Project will only use artificial turf in the athletic fields, and WS-PDF-2, which sets forth the capture and reuse system which is designed to be in excess of what is required by the City's LID ordinance, are both integral parts of the Project as designed by the School. As such, they are part of the whole of the Project and appropriately considered as a Project component in the analysis of the Project's potential impacts on water supply. To argue that the reduction in the need for water use that would result from these PDFs is proof that the PDFs are really mitigation measures is as "nonsensical" as the example discussed in the *Lotus* case. Unlike the situation in *Lotus*, the environmental impacts of the Project are fully disclosed in the Draft EIR and the compliance with the PDF is secured by inclusion of the PDFs in the MMP. Further, the comment provides no evidence that the analysis in the Draft EIR is incorrect, or that the Draft EIR should be recirculated. As such, is the revision and recirculation of the Draft EIR is not necessary. Note that modifications to the Project design would eliminate the capture and reuse water from off-site areas. Project Design Feature WS-PDF-2 has been updated accordingly. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

## **Comment No. ORG 1B-36**

### **4.0 FAILURE TO IDENTIFY SIGNIFICANT PROJECT IMPACTS AND DEFECTS IN THE IMPACTS ANALYSES**

#### **4.1 Air Quality Analysis Underestimates Project Emissions**

As detailed in the letter from SWAPE included in Attachment 1, the DEIR underestimates and fails to adequately address the air quality impacts associated with the proposed Project. We therefore request detailed responses to the issues raised by SWAPE in their letter included in Attachment 1 to this letter, and that the analysis be corrected and that the DEIR be recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4). As detailed in the SWAPE letter, as quoted or paraphrased below:

- The off-road emissions calculated with CalEEMod, and the on-road emissions calculated outside of CalEEMod, each "do not represent the emissions that would occur every day during Project construction." As neither account for the entirety of the criteria air pollutants that would be generated during Project construction, the DEIR should have summed the off-road and on-road emissions estimates in order to accurately evaluate the Project's maximum daily construction-related emissions.

## Response No. ORG 1B-36

The comment claims the Draft EIR underestimates and fails to adequately address the air quality impacts associated with the Project based on the Draft EIR's calculations of construction on-road and off-road emissions. Construction on-road and off-road emissions are fully evaluated in Section IV.B, *Air Quality*, of the Draft EIR. Please refer to Draft EIR Section IV.B for a detailed evaluation of the calculations of construction on-road and off-road emissions. As concluded therein, impacts with respect to on-road and off-road emissions would be less than significant with implementation of the required mitigation measure. As stated on page IV.B-36 of the Draft EIR, emissions from off-road equipment and off-road vehicles were estimated through CalEEMod since CalEEMod is based on outputs from the CARB off-road emissions factor (OFFROAD), which is the emissions estimation model developed by CARB and used to calculate emissions from construction activities, including off-road vehicles. Worker trip, concrete truck, vendor truck and haul truck trip estimates were provided by the Project's construction representative. Emissions from worker trips, haul truck trips, concrete truck trips and vendor truck trips were estimated outside of CalEEMod using the CARB on-road vehicle emissions factor (EMFAC) model emissions factors because CalEEMod assumes that the number of heavy-duty trucks input into the model occurs across the entire length of the applicable construction phase. However, since the applicable construction phases would not have the same number of haul trucks, vendor trucks, and concrete trucks on-site every day within each particular phase, the emissions calculations performed outside of CalEEMod were able to account for the varying maximum numbers of daily haul truck and concrete truck trips within each of the demolition, site preparation, grading/excavation, and foundations/concrete pour, landscape and pool/canopy/building phases. These values were applied to the construction phasing assumptions used in the criteria pollutant analysis to generate criteria pollutant emissions values for each construction activity. The maximum daily emissions were estimated based on maximum construction activity conditions for heavy-duty off-road construction equipment and on-road mobile sources and do not represent the emissions that would occur every day during Project construction. The maximum daily emissions were compared to the SCAQMD daily regional thresholds of significance.

Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of construction activity, and prevailing weather conditions. The maximum daily Project emissions estimated in Table IV.B-6, *Estimated Maximum Regional Construction Emissions*, on page IV.B-52 of the Draft EIR, represent maximum construction activity conditions for heavy-duty off-road construction equipment and on-road mobile sources and do not represent the emissions that would occur every day during Project construction, which would be lower on construction days under typical or below average construction activity conditions. Thus, what is portrayed is a worst-case day for criteria pollutant emissions during Project construction, which accounts for the entirety of emissions for the worst-case day. As shown in Table IV.B-6, NO<sub>x</sub> emissions are over the significance threshold for overlapping phases of construction and require mitigation to reduce the potentially significant impact. Implementation of Mitigation

Measure AQ-MM-1: Construction Equipment Features (pages IV.B-54 through IV.B-55 of the Draft EIR) would reduce short-term NOx emissions to below the regional emission significance threshold for NOx. Therefore, short-term and temporary impacts related to regional NOx construction emissions would be less than significant with implementation of Mitigation Measure AQ-MM-1.

With regard to the SWAPE letter in Attachment 1, all comments have been responded to in Response Nos. ORG 1B-115 through 1B-137.

Based on the above, the comment does not provide evidence that there is significant new information showing that there is a new significant impact, or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, the revision and recirculation of the Draft EIR is not necessary.

### **Comment No. ORG 1B-37**

- When reviewing the Project's CalEEMod output files, provided in the Air Quality and Greenhouse Gas Report ("AQ & GHG Report") included Appendix C to the DEIR, SWAPE found that several model inputs were not consistent with information disclosed in the DEIR. As a result, the Project's construction and operational emissions are underestimated.

### **Response No. ORG 1B-37**

The comment incorrectly claims that several model inputs were not consistent with information disclosed in the DEIR and that, as a result, the Project's construction and operational emissions are underestimated. The issue of modeling inputs is fully explained in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. Please refer to Appendix C-1 for a detailed list of modeling inputs. As concluded in Section IV.B, *Air Quality*, of the Draft EIR, impacts with respect to the Project emissions would be less than significant with implementation of the required mitigation measures. Please refer to Response No. ORG 1B-38, below, for a detailed explanation of modeling input changes relating to the commenter's specific inquiries.

### **Comment No. ORG 1B-38**

- The DEIR's analysis is incorrect, as the size of the existing land uses to be removed from the Project site was overestimated in the Project's air modeling. By overestimating the area of the existing land use, the model overestimates the emissions associated with the existing land uses, resulting in an underestimation of the net change in operational emissions associated with the proposed Project.
- The air emissions modeling includes several changes to the default individual construction phase lengths which are not supported by substantial evidence. These unsubstantiated changes present an issue, as the construction

emissions are improperly spread out over a longer period of time for some phases. As a result, the model underestimates the peak daily emissions associated with some phases of construction and therefore cannot be relied upon to determine Project air quality impacts, or the lack thereof.

### **Response No. ORG 1B-38**

The comment incorrectly claims the Draft EIR's calculations of Project emissions are underestimated based on inputs related to existing land uses and changes to default construction phase lengths in the emissions modeling. Modeling inputs are fully explained in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. Specifically, please refer to Appendix C-1 for a detailed list of modeling inputs. Air emissions are also addressed in responses to the SWAPE letter in Response Nos. ORG 1B-126 through ORG 1B-130, below. As concluded in Section IV.B, *Air Quality*, of the Draft EIR, and in response to the SWAPE letter below, impacts with respect to the Project emissions would be less than significant with implementation of the required mitigation measures. Although not specified, the commenter appears to be referring to the land use used for the existing golf-related spaces. The existing golf course consists of 426,000-square feet as stated in Chapter II, *Project Description*, page II-3 of the Draft EIR. However, existing land uses as modeled in CalEEMod used 559,860.95 square feet, which the commenter says overestimated the land use by approximately 133,860-square feet in the model, thereby underestimating Project emissions (please refer to Response No. ORG 1B-118). However, this is incorrect. The Draft EIR Appendix C-1, PDF page 8 of 437, clearly shows that the golf-related space consists of the golf course, which is 426,000 square feet, and the driving range, which is 133,860.95 square feet. Thus, for the golf related recreational land use in the model, the golf course and driving range square footage were added together for a total of 559,860.95 square feet, which is the amount that was used in the CalEEMod run. As such, Project emissions are not underestimated.

As stated in Section IV.B 3.b)(5), *Construction Emissions Methodology*, page IV.B-36 of the Draft EIR, the input values used in this analysis were adjusted to be Project-specific based on equipment types and the construction schedule provided by Harvard-Westlake School, which provide an accurate Project-specific assessment of the Project's construction activities. Each phase will occur over different times, depending on what part of the Project Site will have construction. Thus, the longest period of work for each phase was used to model emissions for a conservative approach as it allows for the greatest overlap of construction phases. Therefore, daily peak emissions were not underestimated and the emissions estimates can be relied upon to determine Project impacts.

### **Comment No. ORG 1B-39**

- Review of the construction on-road emissions in the AQ & GHG Report demonstrates that only 82 vendor trips are included in the calculations (Appendix C, pp. 254). As such, the number of vendor trips required for Project

construction is reduced from the CalEEMod default value by 570 trips. However, the AQ & GHG Report fails to provide sufficient justification for this reduction. By including an unsubstantiated reduction in the number to vendor trips in the on-road emissions analysis, the DEIR underestimates the Project's mobile-source construction-related emissions and should not be relied upon to determine Project significance.

### **Response No. ORG 1B-39**

The comment incorrectly claims that the Draft EIR's calculations of Project emissions are underestimated based on vendor trip inputs. Modeling inputs are fully explained in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. Specifically, please refer to Appendix C-1 for a detailed list of modeling inputs. As concluded in Section IV.B, *Air Quality*, of the Draft EIR, impacts with respect to the Project emissions would be less than significant with implementation of the required mitigation measures. As stated in Section IV.B 3.b)(5), *Construction Emissions Methodology*, on page IV.B-36 of the Draft EIR, worker trip, concrete truck, vendor truck, and haul truck trip estimates were provided by the Project's construction representative. Thus, the input values used in this analysis were adjusted to be Project-specific. This also applies to trip rates for vendors, which are shown in detail in Appendix C-1. As stated, the changes to the default CalEEMod construction vendor trips were due to the Project-specific information provided by the School's construction representative. Thus, the Draft EIR provided sufficient justification for the number of vendor trucks visiting the site and the Project's mobile source construction related emissions are not underestimated and can be relied upon. In addition, Appendix C, PDF page 254 of 437 only displays a partial number of the construction phases and the construction mobile emissions that come from those phases, whereas to see all the construction phases and the vendor truck numbers assumed and the associated emissions, one would need to refer to PDF pages 254 through 269 of 437 for an accounting of the total vendor trucks assumed. The number of vendor trucks assumed across all construction phases is also displayed in the Project modeling assumptions on page 10.

### **Comment No. ORG 1B-40**

- The air quality analysis includes several construction-related mitigation measures without properly committing to their implementation. The model therefore underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance.

### **Response No. ORG 1B-40**

The comment incorrectly claims that the Draft EIR's calculations of Project emissions are underestimated based on improper implementation of the air quality mitigation measures. The Project is fully committed to implementing Mitigation Measure AQ-MM-1: Construction Equipment Features. This mitigation will be included in applicable bid documents and successful contractor(s) must demonstrate the ability to supply such

equipment (page IV.B-54). The implementation and enforcement requirements are outlined in Mitigation Measure AQ-MM-1 as follows:

- The Project shall utilize off-road diesel-powered construction equipment that meets or exceeds the California Air Resources Board (CARB) and United States Environmental Protection Agency (USEPA) Tier 4 Final off-road emissions standards or equivalent for equipment rated at 50 horsepower (hp) or greater during Project construction where available within the Los Angeles region. Such equipment shall be outfitted with Best Available Control Technology (BACT) which means a CARB certified Level 3 Diesel Particulate Filter or equivalent.
- During plan check, the Project's representative shall make available to the lead agency and South Coast Air Quality Management District (SCAQMD) a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that shall be used during any of the construction phases. The inventory shall include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each such unit's certified tier specification, best available control technology (BACT) documentation, and CARB or SCAQMD operating permit shall be maintained on-site at the time of mobilization of each applicable unit of equipment.
- During demolition, site preparation, and grading and excavation activities, the contractor shall provide notification and documentation that haul truck drivers have received training regarding idling limitations specified in Title 13 California Code of Regulations, Section 2485, and that haul trucks limit idling for loading activities to 5 minutes or less at any one location and unloading activities to ~~40~~ 5 minutes or less at any one location ~~per one-way truck trip~~.
- Contractors shall maintain and operate construction equipment so as to minimize exhaust emissions. All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications. The contractor shall keep documentation on-site demonstrating that the equipment has been maintained in accordance with the manufacturer's specifications. Tampering with construction equipment to increase horsepower or to defeat emission control devices shall be prohibited.
- Construction activities shall be discontinued during second-stage smog alerts. A record of any second-stage smog alerts and of discontinued construction activities as applicable shall be maintained by the Contractor on-site.

As evidenced, the Project fully enforces the implementation of Mitigation Measure AQ-MM-1 which will be included in the Project's MMP, which is included in Chapter 4.0, *Mitigation Monitoring Program*, of this Final EIR. Therefore, the Project's construction-related emissions are not underestimated and can be relied upon to determine Project significance.

Note that bullet point No. 3 in Mitigation Measure AQ-MM-1 was updated in Chapter 3 of this Final EIR to clarify the idling regulatory requirements that are applicable to the Project and assumed as part of the mitigated air quality emission analyzed in the Draft EIR.

## **Comment No. ORG 1B-41**

### **4.2 Inadequate Analysis of Biological Resources Impacts**

Scott Cashen, an environmental biologist with 29 years of professional experience in wildlife biology and natural resources management has reviewed the biological resource impact analysis contained the DEIR has found it deficient because:

## **Response No. ORG 1B-41**

The comment regarding the commenter's credentials is noted and will be provided to the decision-makers for their review and consideration. Because this comment does not raise a substantive issue on the content or adequacy of the Draft EIR, no further response is necessary.

## **Comment No. ORG 1B-42**

- The DEIR does not adequately disclose, analyze, or mitigate impacts to the western yellow bat (and potentially other special-status bat species).

## **Response No. ORG 1B-42**

This comment alleges that the analysis of impacts to special-status bat species is inadequate. As stated on pages IV.C-32 through IV.C-42, in Section IV.C, *Biological Resources*, of the Draft EIR, under the heading Candidate, Sensitive, or Special-Status Wildlife, only one special-status wildlife species, western yellow bat (species of special concern) has a moderate potential to occur on the Project Site. As discussed in the Draft EIR, construction of the Project could result in potentially significant direct impacts to this bat species if tree removal commences during the maternity roosting season (generally March 1 through September 30). Mitigation Measure BIO-MM-1 is provided to reduce potentially significant direct impacts on this species to a less than significant level. The comment does not contain facts to support the contention that the disclosure, analysis, or mitigation of impacts to special-status bat species are inadequate.

## **Comment No. ORG 1B-43**

- The DEIR fails to provide an accurate assessment of impacts to the California brittlebush scrub community (a sensitive natural community). In addition, the DEIR impermissibly defers critical components of the proposed mitigation.

## Response No. ORG 1B-43

The comment states that the Draft EIR fails to accurately assess impacts to the California brittlebush scrub community and that the mitigation measure is impermissibly deferred. As stated on pages IV.C-42 through IV.C-44, in Section IV.C, *Biological Resources*, of the Draft EIR, under the heading Sensitive Natural Communities, the Project would result in limited impacts from a proposed river connection (ramp), river fence, and river overlook to 0.14 acre of recently restored California brittlebush scrub (16 percent of off-site sensitive natural community). Although impacts would be limited, direct impacts to this sensitive natural community are considered to be potentially significant. Mitigation Measure BIO-MM-2 is provided to reduce potentially significant impacts to sensitive natural communities to a less than significant level. The comment does not contain facts to support the contention that the analysis of impacts on sensitive natural communities is inadequate.

As to the assertion that the mitigation measure is impermissibly deferred, it is clear from the wording of Mitigation Measure BIO-MM-2, that the measure includes detailed information on when a final landscape plan must be submitted (prior to issuance of a building permit), the amount of restoration required (replacement at 1:1), the location of restored habitat (clustered adjacent to and contiguous with the Zev Greenway), and species to be planted (compliant with the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes). In addition, Mitigation Measure BIO-MM-2 requires a five-year monitoring plan to ensure that the California brittlebrush scrub has been successfully restored. The Landscape Plan is based on the Project's final Site Plan, which must be reviewed and approved by the Building Department prior to finalization of the Landscape Plan. For the reasons cited above and the commitment to the restoration of the California brittlebush scrub in a specified location with plant species listed in an approved plan, Mitigation Measure BIO-MM-2 is neither impermissibly deferred nor inadequate to mitigate the impact on sensitive natural communities to a less-than-significant level.

## Comment No. ORG 1B-44

- The DEIR fails to disclose, analyze, or provide mitigation for the avian collision hazard associated with Project design features (large expanses of glass).

A copy of his findings are included as **Attachment 2** to this letter. We hereby request responses to all of his comments.

## Response No. ORG 1B-44

The comment states that the analysis on avian collision hazards associated with expanses of glass is inadequate. A response addressing avian collision hazards is provided below in Response No. ORG 1B-152. Please refer to Response No. 1B-152 which addresses this comment. Additionally, see Response Nos. ORG 1B-138 through ORG 1B-126a addressing Attachment 2.

## Comment No. ORG 1B-45

### Failure to Identify and Adequately Mitigate Impacts to the Western Yellow Bat

As noted on page IV.C-32 of the DEIR:

One special-status bat species, the western yellow bat (species of special concern), was considered to have moderate potential to roost and forage in the Biological Study Area. **Construction of the Project could result in potentially significant direct impacts to this bat species if tree removal commences during the maternity roosting season (generally March 1 through September 30).**

As noted on DEIR page IV.C-27:

The Biological Study Area supports a number of palm trees that would be suitable roosting habitat for this species. Additionally, the adjacent Los Angeles River may provide suitable foraging habitat above the river and near the southwestern boundary of the Biological Study Area. There is only one CNDDDB occurrence of this species within the region of the Biological Study Area, which was recorded in 1984 approximately 8.5 miles to the east in a developed area of Glendale.

This species roosts in trees, particularly palm trees, and forages over water and among trees. There are 174 Mexican fan palms on the Project Site. In fact, approximately one-half (51 percent) of the inventoried trees are Mexican fan palms according to DEIR page II-29. Of the 240 trees to be removed from the Project Site, 122 are Mexican fan palms. The proposed Project would thus result in the loss of 70 percent of the potential bat roosting habitat on the Project Site. The DEIR provides no analysis of this habitat loss. As noted by Mr. Cashen:

Because the loss of suitable roosting habitat is one of the primary threats to the western yellow bat population,<sup>19</sup> and because the DEIR does not incorporate compensatory mitigation, potentially significant impacts on the western yellow bat remain unmitigated.

Despite the potential for western yellow bats to occur on the Project Site, no surveys to assess the presence or absence of the species were conducted as part of the preparation of the DEIR. Instead, the DEIR assumes that Mitigation Measure BIO-MM-1, tree removal outside of the roosting season, or pre-construction surveys if tree removal occurs during the roosting season, is sufficient to mitigate impacts to this bat species. However, this assumes that displaced bats can easily relocate and that the only impacts are from tree removal during roosting season. This is belied by the relatively few colonies of this bat species in the Los Angeles area. The DEIR underestimates and fails to mitigate potential displacement impacts to these bats and the potential impact on the colony's survival.

<sup>19</sup> Ibid.

## Response No. ORG 1B-45

The comment states that analysis of the impact to and mitigation for the western yellow bat is inadequate for failure to survey the Project Site for this bat species, for removal of the palm trees where they could roost, and for failure to discuss displacement impacts. As discussed on pages II-29 and II-30 in Chapter II, Project Description, of the Draft EIR, approximately one-half (51 percent) of the inventoried trees are either Mexican fan palms (174) or blue gum eucalyptus (42), which are considered invasive species by the U.S. National Park Service and/or the California Invasive Plant Council. All invasive palms (i.e., the Mexican fan palm) removed as part of the Project would be replaced at a 1:1 minimum ratio with RIO-compliant trees and all other removed non-native trees would be replaced at a minimum 2:1 ratio with RIO-compliant trees.

Topical Response No.5 – Biological Resource/Trees discusses that the Project’s tree removal and replanting program was fully analyzed in the Draft EIR’s Section IV.C, *Biological Resources*. As discussed in Section IV.C and Chapter II, *Project Description*, of the Draft EIR, the Project would implement an extensive tree planting and landscaping program that would remove 240 of the existing 421 trees, located both on the Project Site and off-site surrounding areas (e.g., within portions of the public right-of-way), and plant 393 trees, resulting in a net increase of 153 trees (or 36 percent). As discussed in Section IV.C, *Biological Resources*, of the Draft EIR, and Topical Response No. 5, the Project with mitigation would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, and impacts would be less than significant.

Direct and indirect impacts to the western yellow bat were fully analyzed in Section IV.C, *Biological Resources*, of the Draft EIR. The impact analysis identified the need for Mitigation Measure BIO-MM-1, now modified upon recommendation of the California Department of Fish and Wildlife (CDFW), to ensure potentially significant construction-related impacts would be reduced to a less than significant level. Western yellow bats are typically found in desert regions of southwestern United States and their roosting habitat is often within the “skirt” of dead fronds of native or non-native palm trees. It is noted that the majority of the Mexican fan palms occurring within the Project Site have had their skirt of dead fronds removed during routine annual maintenance, limiting the potential for roosting of western yellow bats on the Project Site. ESA’s biologists surveyed the Project Site for wildlife, including bats, in November 2016, and the western yellow bat was not detected at that time. That survey was conducted by an individual with bat expertise. Similarly, the western yellow bat was not observed during the more recent ESA wildlife surveys undertaken for the current Project, which is acknowledged to be general in nature (i.e., for the purpose of broadly examining and inventorying onsite plant and animal species, including bats) and not focused exclusively on the potential existence of bats. There is only one CNDDDB occurrence record of this bat species within the vicinity of the Project Site, which was recorded in 1984 approximately 8.5 miles to the east in a developed area of Glendale. Closer in proximity to the Glendale record, bat surveys were conducted between April and November 2008 in Griffith Park, and the results of the

surveys found no individual of western yellow bat to be present.<sup>10</sup> During operation, as stated above, while the Project would remove invasive Mexican fan palms, the Project's native landscaping proposed would help to enhance the existing off-site native habitat, as well as the surrounding area, by expanding the habitat, creating a greater native seed source, and providing a larger buffer from non-native ornamental landscaping in the surrounding developed areas, which may benefit special-status bat species by providing enhanced foraging opportunities (Draft EIR page IV.C-35).

It is acknowledged that the loss of suitable roosting habitat is a threat to the western yellow bat species. As indicated above, that threat is primarily in desert areas within the species' largest recorded distribution and the Project Site is at the far periphery of the recorded range for the species. While the non-native Mexican fan palm trees provide potential roosting habitat, there is yet to be a confirmed observation of the species in close proximity to the Project Site. With the existing routine maintenance of the onsite palm trees and the removal of dead palm fronds, the potential for western yellow bat roosting habitat to occur is reduced. As such, the quality of the potential habitat onsite is marginal and is not considered to be able to support a substantial population of this species. In addition, not all palm trees would be eliminated in the Project area as clusters of the palm trees exist on the south side of the Los Angeles River and along Ventura Boulevard.

Based on the Draft EIR analysis included in Section IV.C, *Biological Resources*, the Draft EIR adequately analyzed impacts to the western yellow bat. Thus, while the comment claims the DEIR underestimates and fails to mitigate potential displacement impacts to these bats and the potential impact "on the colony's survival," the comment does not provide any substantial evidence to support these claims nor reference any recorded colony for this species in the vicinity of the Project Site. On the contrary, evidence supported by surveys and documented records indicate that the species is not present and there is no colony for the Project to impact survival. Nonetheless, because there is some potential for western yellow bat to occur, even if unlikely, Mitigation Measure BIO-MM-1 has been included to address impacts if a roosting colony were to be detected or observed.

Refer also to Response No. AG 4-30 for additional requirements recommended by CDFW that have been added to Mitigation Measure BIO-MM-1 on pages IV.C-43 to IV.C-44 of the Draft EIR. These additions have been made per coordination with CDFW to include additional requirements if a qualified bat specialist determines that special-status bats are present, or that bats are absent but trees to be removed may provide suitable bat roosting habitat. This update has been incorporated into Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR.

---

<sup>10</sup> Remington, S. and D.S. Cooper. 2009. Bat Survey of Griffith Park, Los Angeles, California, Draft Report. February 20, 2009.

## Comment No. ORG 1B-46

Furthermore, as noted by Mr. Cashen:

Direct impacts to the western yellow bat (and other bat species) are not limited to tree removal during the maternity roosting season. Some western yellow bats are year-round residents in southern California.<sup>20</sup> These bats may use trees at the Project site as day roosts, night roosts, or maternity roosts.<sup>21</sup> Consequently, western yellow bats may occur in trees (especially the palms) at the Project site at any time of day (or night), on any day of the year.

Yellow bats are deep sleepers.<sup>22</sup> Even when fully awake, they feel safe in palm fronds and generally will not flush at signs of danger.<sup>23</sup> As a result, yellow bats are frequently killed or injured when palm trees are felled.<sup>24</sup> Because bats are a prey species that has few behavioral defenses against predation, they rely on concealment (at roosts) to avoid predation by diurnal predators. Therefore, even if bats flush from a tree as it is being felled, most of these individuals are likely to die due to predation or exposure. The DEIR fails to analyze impacts to, or incorporate mitigation for, bats that may occupy trees at the Project site during the non-maternity season.

<sup>20</sup> Pierson ED, Rainey WE. 1998. Western yellow bat, *Lasiurus xanthinus*. In: Bolster BC, ed. Terrestrial Mammal Species of Special Concern in California. pp. 50 and 51

<sup>21</sup> Day roosts are used during the day for sleep and protection from predators and heat exposure. Night roosts are used at night to rest, digest food, conserve energy, and avoid predators. Maternity roosts are used to give birth and raise young.

<sup>24</sup> Ibid.

## Response No. ORG 1B-46

The comment states that impacts to the western yellow bat can occur outside of maternity roosting season. Refer to Response No. AG 4-30 for additional requirements that have been added to Mitigation Measure BIO-MM-1 on pages IV.C-43 to IV.C-44 of the Draft EIR that addresses the potential presence of western yellow bat. These additions have been made per coordination with CDFW to include additional requirements recommended by CDFW if a qualified bat specialist determines that special-status bats are present at any time of the year, or that bats are absent but trees to be removed may provide suitable bat roosting habitat. The added requirements will include nudging trees to provide ample warning and allowing bats to become active, which will provide them time to leave the trees on their own before any tree removal. These additions have been incorporated into Chapter 3.0, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR.

It should be noted that the citation in the comment for the Austin Bat Refuge is in reference to two bat species that do not occur in California.

### **Comment No. ORG 1B-47**

In addition, the DEIR fails to adequately analyze the impacts of Project construction and operational noise on the bats, as detailed by Mr. Cashen in his comments included in **Attachment 2**.

### **Response No. ORG 1B-47**

The comment states that the Draft EIR fails to analyze the impacts of construction and operation noise on the western yellow bat. As stated on pages IV.C-40 and IV.C-41, in Section IV.C, *Biological Resources*, under the heading Indirect Impacts, of the Draft EIR, there would be indirect impacts to special-status bat species from noise and human activities associated with Project construction; however, construction activities would be temporary on an intermittent basis, and potential on-site tree roosts would be removed during the initial construction phase if no active roosts are found, consistent with Mitigation Measure BIO-MM-1, which applies at any time of year. As such, indirect impacts would be avoided and the Project would not diminish the long-term survival of a special-status bat species; and, therefore, would be less than significant. For any potentially displaced individuals, there will still be clusters of the palm trees existing on the south side of the Los Angeles River and along Ventura Boulevard. Indirect impacts associated with a change in the on-site operational noise and human activities would be similar to existing conditions with the potential for more noise and human activities during sports events. If present on-site, the special-status bat species are already adapted to living in an urbanized setting and ambient noise and human activities associated with frequent use of the golf and tennis facilities on-site. Increases in noise and human activities would be concentrated around outdoor athletic activities within the fields, tennis courts, and swimming pool, which do not contain vegetation or have suitable roosting habitat for the special-status bats, and larger sporting events would be limited to specific hours, as well as limited in duration. Project construction and operation activities, including changes in the ambient levels of noise, would not result in significant indirect impacts to special-status, candidate, and/or sensitive bat species. As such, indirect impacts to special-status, candidate, and/or sensitive bat species would be less than significant.

### **Comment No. ORG 1B-48**

The potential for impacts to the western yellow bat remain significant and unmitigated and must be acknowledged as such in the DEIR. Pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4), the DEIR must be revised and recirculated.

### **Response No. ORG 1B-48**

The comment states that the impacts to the western yellow bat are significant and unmitigated. The Draft EIR addressed impacts to the western yellow bat in Section IV.C,

*Biological Resources*, with supporting data provided in Appendix D, Biological Resources Technical Report, of the Draft EIR. As analyzed therein, impacts to the western yellow bat would be less than significant after implementation of Mitigation Measure BIO-MM-1. Furthermore, as discussed above in Response No. ORG 1B-47, Mitigation Measure BIO-MM-1 has been modified to include additional requirements recommended by CDFW to address impacts to potential roosting bats. Refer to Response Nos. ORG 1B-44 to 1B-47 for additional discussions related to impacts to the western yellow bat.

Based on the above, the comment does not provide evidence that there is significant new information showing that there is a new significant impact, or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, the revision and recirculation of the Draft EIR is not necessary.

## **Comment No. ORG 1B-49**

### **Failure to Identify and Mitigate Impacts to the Brittlebrush Scrub Community**

As detailed by Mr. Cashen in his comments included in **Attachment 2**, the DEIR's analysis of impacts to the Brittlebrush Scrub Community is inaccurate and fails to identify a significant impact to this community:

The DEIR's rationale is flawed because it fails to recognize that the Project would not only increase human activity along the existing trail, but that it would also create a new trail that bisects the California brittlebrush scrub community, thereby increasing the proportion of that community that would be susceptible to trampling, weed invasion, and other adverse edge effects associated with fragmentation. In addition, because the proposed river connection trail would not provide the shortest route to the Zev Greenway trail, students and spectators are likely to create shortcuts (and other unauthorized trail routes) through the California brittlebrush scrub . . . This would cause further loss, degradation, and fragmentation of the sensitive natural community. The DEIR fails to incorporate mitigation for this potentially significant indirect impact.

## **Response No. ORG 1B-49**

The comment states that the increased use of the Project Site with existing and new trails would result in a significant impact. The Project does not propose a trail along or within the Zev Greenway, which already has an existing trail. Rather, the Project proposes to install an ADA-compliant pedestrian ramp leading from the Project Site to the existing Zev Greenway trail, as mentioned on Page II-33 of the Draft EIR Project Description. Corrections have been made in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR, to revise the term "trail" to "ramp" as applicable in this regard. The ramp location was designed to avoid and minimize impacts to biological resources. As stated on pages IV.C-43 through IV.C-45, in Section IV.C, *Biological*

*Resources*, of the Draft EIR under the heading Sensitive Natural Communities, the Project would result in limited impacts from a proposed river connection (ramp), river fence, and river overlook to 0.14 acre of recently restored California brittlebush scrub (16 percent of off-site sensitive natural community). Although impacts would be limited, direct impacts to this sensitive natural community are identified as potentially significant. Mitigation Measure BIO-MM-2 is provided to require replacement of California brittlebush scrub at an equivalent acreage to reduce potentially significant impacts on sensitive natural communities to a less-than-significant level.

As stated on page IV.C-43, the additional human activity, light, or noise would not have an adverse effect on this sensitive natural community since the plants would not be affected by the changes in Project light, noise, or human activity. Furthermore, the Project's native landscaping, which would exclude invasive exotic plant species and proactively remove Mexican fan palms, would help to enhance this sensitive natural community, as well as the surrounding area, by expanding the habitat, creating a greater native seed source, and providing a larger buffer from non-native ornamental landscaping in the surrounding developed areas (such as currently occurs through the rapid spread of Mexican fan palms). Thus, indirect Project construction and operation activities would not result in significant impacts to sensitive natural communities.

Also, the California brittlebush scrub is relatively dense in most areas and not easily traversable. Nevertheless, the Project will install fencing along the edge of the Leased Property to prevent people from trampling down the side of the hill through the California brittlebush scrub to the Zev Greenway trail, as well as along the sides of the new ADA-compliant pedestrian ramp that would lead from the Project Site to the Zev Greenway. As designed, the fencing has spacing that would allow for local wildlife (e.g., smaller animals) to pass through while still providing an appropriate aesthetic and line-of-sight to the river.

### **Comment No. ORG 1B-50**

In addition, the DEIR's analysis fails to account for impacts associated with the installation of 38 trees in the community and the impact of the associated loss of sunlight on this sensitive nature community. The DEIR has thus failed to identify and mitigate impacts to this community. The DEIR has also failed to demonstrate that the MM-BIO-2 for impacts to this community is feasible.

### **Response No. ORG 1B-50**

The comment states that loss of sunlight as a result of planting 38 trees would cause impacts to the California brittlebush scrub and that the Draft EIR fails to demonstrate that the mitigation measure for the California brittlebush scrub is feasible. As stated on page II-30, in Section II, *Project Description*, under the heading Open Space and Trees, of the Draft EIR, Table II-2 shows that the Zev Greenway, where the California brittlebush scrub is planted, already has 76 native trees, primarily coast live oak (*Quercus agrifolia*) and California sycamore (*Platanus racemosa*). These native trees create partial shade for the California brittlebush scrub, in which the dominant species *Encelia californica* is known to

grow and survive in part shade.<sup>11</sup> The California Native Plant Society provides the following description of California brittle bush - Ashy buckwheat scrub (*Encelia californica* - *Eriogonum cinereum* Shrubland Alliance) indicates that emergent trees such as coast live oak may be present within the scrub natural community.<sup>12</sup> As stated on page IV.C-19, in Section IV.C, *Biological Resources*, under the heading California Brittlebush Scrub, of the Draft EIR, native trees were already planted as a part of the restored California brittlebush scrub community. The replanted area is also shown in the tree photographs within Appendix A City of Los Angeles Tree Report of Appendix D Biological Resources Technical Report of the Draft EIR (PDF pages 314 through 341 of 394 in Appendix D of the Draft EIR). The planting of an additional 38 native trees, 1/3 of which are large shrubs to small trees, would not significantly impact the restored California brittlebush scrub community.

Planting of native scrub habitat has already been demonstrated as feasible within the area, as shown by the California brittlebush scrub community found along the Zev Greenway. The California brittlebush scrub was installed approximately five years ago, in a location that did not previously support this community subsequent to the channelization of the Los Angeles River. Natural communities may be a mix of more than one community, especially where the tree canopy of woodland habitats have not experienced a hot wildfire for many years. Lastly, the natural distribution of California brittlebush scrub substantially overlaps the distribution of coast live oak trees within southern California such that the species may co-exist.

Furthermore, Mitigation Measure BIO-MM-2 requires the replacement of sensitive natural community habitat to be planted in the 0.14-acre impact area (within the approximately 0.35-acre habitat area), clustered adjacent to and contiguous with the Zev Greenway. The locations and species must be to the satisfaction of the Department of City Planning and in conformance with the landscape and planting guidelines in the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes. Replacement sensitive natural community habitat areas would be planted on-site and shown on the Project's landscape plan. The restored sensitive natural community would be monitored for five years to verify that California brittlebush scrub has been successfully restored. Thus, the planning requirements and long-term monitoring included in Mitigation Measure BIO-MM-2 would ensure that the new California brittlebush scrub would survive over the long-term. The comment fails to provide evidence that this mitigation measure is not feasible nor explain why the commenter thinks it might not be feasible. As such, no further response is necessary.

## Comment No. ORG 1B-51

### Failure to Disclose, Analyze or Incorporate Mitigation for Avian Collisions

As detailed by Mr. Cashen in his comments included in **Attachment 2**:

The Project site and adjacent Los Angeles River corridor support at least 74 species of birds,<sup>25</sup> some of which are classified as special-status species.<sup>26</sup> . . . Collision with windows is second only to predation by domestic cats as an anthropogenic source of avian mortality.<sup>27</sup> . . . A poorly designed building can kill hundreds of birds per year.<sup>28</sup>

The proposed Project incorporates design variables known to cause high levels of avian mortality:

1. Buildings with reflective or transparent windows, large windows, or a high percentage of glass.
2. Buildings with windows located adjacent to extensive vegetation.

As noted by Mr. Cashen:

The American Bird Conservancy and New York City Audubon Society have developed bird-friendly design standards for new buildings.<sup>29</sup> Because the Project does not incorporate these (or comparable) design standards, the Project's impact on bird populations would be potentially significant.

<sup>25</sup> DEIR, Appendix B to Appendix D (Biological Resources Technical Report). <sup>29</sup> American Bird Conservancy and New York City Audubon Society. 2015. Bird-Friendly Building Design, 2nd Ed. Available at: [https://abcbirds.org/wp-content/uploads/2015/05/Bird-friendly-BuildingGuide\\_LINKS.pdf](https://abcbirds.org/wp-content/uploads/2015/05/Bird-friendly-BuildingGuide_LINKS.pdf).

## Response No. ORG 1B-51

The comment states that the analysis on impacts from avian collisions is inadequate. A response addressing avian collision hazards is provided below in Response No. ORG 1B-152. Please refer to Response No. 1B-152 which addresses this comment.

## Comment No. ORG 1B-52

The DEIR's analyses of impacts to bats, migratory and special-status birds, and the Brittlebrush community are deficient and, as a result, the DEIR has failed to identify significant biological resource impacts. Moreover, as detailed by Mr. Cashen, there are problems with the biological resource mitigations measures included in the DEIR which render them ineffective in mitigating impacts to a level considered Less Than Significant. The DEIR analysis must be corrected and that the DEIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4).

## Response No. ORG 1B-52

The comment states that the analysis of impacts to biological impacts is deficient. The comment regarding deficient analyses of specific biological resources is addressed in the Response Nos. ORG 1B-42 and ORG 1B-45 through ORG 1B-48 for bats; ORG 1B-44 and ORG 1B-51 for birds; and ORG 1B-49 and ORG 1B-50 for California brittlebush scrub. The comment does not present substantial evidence of significant new information showing that there is a new significant impact, an increase in the severity of an impact, an alternative that would lessen the impacts, or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, the revision and recirculation of the Draft EIR is not necessary.

## Comment No. ORG 1B-53

### 4.3 Failure to Identify Significant Historic Resource Impacts

The DEIR fails to accurately identify impacts to an historical resource, the Weddington Golf and Tennis Club (or "Studio City Golf and Tennis Club"), a historic resource which has been found to be both locally eligible for listing as a City Historic-Cultural Monument ("HCM"), and eligible for listing in the California Register of Historical Resources ("California Register").<sup>30</sup> The DEIR fails to identify impacts to the resource, first by inappropriately treating mitigation measures as Project Design Features, as discussed in **Section 3.2** of this letter, and secondly by inappropriately omitting some of the character-defining features of the Project property, which have been identified by historic resource consultants meeting the Secretary of the Interiors Professional Standards, so as to limit the identification of impacts. The DEIR on page IV-D-22 states that: "the clubhouse, putting green with brick wall, and golf ball-shaped light standards are identified as character-defining features that support its status as a Historic-Cultural Monument, as well as it being a private recreational facility open for public use." The DEIR limits the identified character-defining features so as to exclude important aspects of the property, such as the golf course, which will be demolished as part of the Project. It does this while acknowledging on DEIR page IV-D-22 that the "primary physical characteristics of the Project Site include a nine-hole golf course, a twenty-five-stall driving range, sixteen tennis courts, a tennis shack, a clubhouse, a putting green surrounded by a brick wall, and six golf ball-shaped light standards."

The omission of consideration of the Project’s impact to the golf course as a character defining-feature, as well as impacts to other additional character-defining features identified by historic resource experts, is not supported by substantial evidence, defies common sense, and has led to a DEIR which has failed to identify significant Project historic resource impacts. In omitting the golf course portion of the Project Site from the character-defining features, the DEIR ignores the expert opinions of the City’s own Office of Historic Resources staff, as well as multiple historic resource consultants. As a result, the DEIR must be corrected to identify a significant impact to an HCM and California Register eligible resource and recirculated for public review and comment pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4).

<sup>30</sup> See the 2012 Historic Resources Assessment Report prepared by Architectural Resources Group, Inc. Architects, Planners & Conservators, included in Attachment 3 and available at: [https://planning.lacity.org/odocument/5ae20992-41fd-4739-a6b0-66003878f981/CHC-2020-7764-HCM\\_\(4-15-21\).pdf](https://planning.lacity.org/odocument/5ae20992-41fd-4739-a6b0-66003878f981/CHC-2020-7764-HCM_(4-15-21).pdf).

## Response No. ORG 1B-53

The comment states that the analysis of historical resources is inadequate due to failure to include the golf course. See Topical Response No. 6 – Historical Resources. As discussed therein, the City determined the character-defining features of the Project Site based on a review of available evidence and an evaluation of the potential significance of the Project Site. The Project Site was designated a City HCM under the name Studio City Golf and Tennis Club in 2021. The character-defining features of the Project Site, as formally determined by the City, are:

- Private recreational facility open for public use
- Clubhouse
- Golf ball [-shaped] light standards
- Putting green
- Brick wall with weeping mortar surrounding the front lawn at the northeast edge of the property<sup>13</sup>

The commenter is incorrect that the Draft EIR “limits the identified character-defining features so as to exclude important aspects of the property, such as the golf course, which will be demolished as part of the Project.” Character-defining features of the Project Site were formally determined by the City during the nomination and designation of the Project Site as an HCM. This determination is based on substantial evidence including the development history of the Project Site, National Park Service guidance, and the association of the Project Site with post-World War II recreational uses in the San Fernando Valley. Therefore, the City appropriately identified the character-defining

<sup>13</sup> Studio City Golf and Tennis Club Historic-Cultural Monument Application, Council File: 21-0470, Revised Findings, as modified by the PLUM Committee, September 14, 2021, adopted by City Council, September 29, 2021.

features of the Project Site in the Draft EIR based on the analysis of the significance of the Project Site and the City Council's formal designation of the former Studio City Golf and Tennis Club.

The commenter's assertion that character-defining features of the Project Site were artificially "limited" is, therefore, incorrect. Character-defining features of the Project Site have been determined by the City based on substantial evidence of the history and significance of the Project Site, which is reflected in the features that have been formally identified as part of the HCM process. It is the City's identification of the character-defining features of the Project Site that appropriately provide the basis for the analysis in the Draft EIR.

The description of the Project Site referenced by the commenter (Draft EIR page IV-D-22) is intended to describe the Project Site's existing condition only. It is not a description of character-defining features associated with the historical resource, which are identified separately.

Based on the above, the comment does not provide substantial evidence that there is significant new information showing that there is a new significant impact, that there is an increase in the severity of an impact, or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, the request for the revision and recirculation of the Draft EIR is not necessary.

### **Comment No. ORG 1B-54**

On April 15, 2021 the Cultural Heritage Commission at its regular meeting<sup>31</sup> considered the designation of the Weddington Golf and Tennis Club as an Historic Cultural Monument. A copy of the Staff Report is included as **Attachment 3** to this comment letter.<sup>32</sup> The agenda packet includes:

1. Final Determination Staff Recommendation Report;
2. Commission/Staff Site Inspection Photos – February 25, 2021;
3. Categorical Exemption;
4. Under Consideration Staff Recommendation Report;
5. Historic-Cultural Monument Application;
6. 2012 Historic Resources Assessment Report prepared by Architectural Resources Group, Inc. ("ARG");
7. Supplemental Photos from the Applicant, received January 20, 2021; and,
8. Supplemental Photos from the Applicant, received February 25, 2021. As part of the hearing, testimony was provided by Jenna Snow, a historical resource consultant.<sup>33</sup>

Evidence that the golf course and several other features of the Project Site are character-defining features of the historic resource is provided by 2012 ARG report attached to this Cultural Heritage Commission Staff Report (see **Attachment 3** to this letter). This information needs to be included in the revised DEIR. As detailed below in the ARG report, which predates the property's HCM designation:<sup>34</sup>

## V. Evaluation of Eligibility

For CEQA purposes, a historical resource is a resource listed in, or determined to be eligible for listing in, the California Register of Historical Resources (CRHR) or a qualified local register (for further explanation of qualifying local registers, see IV. Regulations and Criteria of Evaluation). California properties formally determined eligible for or listed on the National Register of Historic Places are automatically listed on the CRHR. Weddington Golf and Tennis Club has not been previously listed on or determined eligible for the CRHR or the NRHP, nor has it been designated as a City of Los Angeles Historic-Cultural Monument.

For the purposes of this report, the Weddington Golf and Tennis Club was evaluated against the criteria of the California Register of Historical Resources, as is required by CEQA. It was not evaluated for national (National Register) or local (Los Angeles Historic-Cultural Monument) landmark eligibility.

### Significance Under the California Register

The Weddington Golf and Tennis Club appears to be eligible for the California Register of Historical Resources under the following criteria:

**Criterion 1.** It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States.

*The Weddington Golf & Tennis Club appears to be locally significant in the area of recreation and entertainment as a community recreation center. Specifically, the 9-hole golf course and driving range were constructed in the mid-1950s and developed over the next ten years to provide the growing Studio City community with a publicly-accessible facility where children and adults alike could learn and practice the sport. The clubhouse, course, and driving range were a community draw, particularly for many patrons at all levels of the entertainment industry. The course and driving range reflects the broad popularity of golf in the 1950s and 1960s, and how such recreational facilities were valuable amenities to serve the rapidly growing suburban population base in the San Fernando Valley during its most significant period of community development.*

**Criterion 3.** It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master, or possesses high artistic values.

*The Weddington Golf Course represents the essential characteristics of a local, community golf course in the mid-1950s. It has high associative value and it effectively communicates the features of such a facility. Its setting has high integrity, as do the component elements including the low- slung, Ranch style clubhouse (and its compatible, adjoining driving range shelter) that echo the preferred residential forms of the San Fernando Valley in that era, the golf course with its fairways lined in palm, eucalyptus, and pine trees, and associated features such as the golf ball-shaped light standards and putting green.*

### **Integrity**

The National Register Bulletin series provides guidance in regard to eligibility, integrity, period of significance and resource type.

Essentially, for a property to qualify as an historic resource it must represent a significant part of the history, architecture, archeology, engineering, or culture of an area, and it must have the characteristics that make it a good representative of properties associated with that aspect of the past (National Park Service, National Register Bulletin 15, 2002).

Bulletin 15 notes that an historic property derives its importance from its association with an important historic context and its retention of historic integrity of those features necessary to convey its significance. Insensitive modifications to an historic property can have a negative impact on that building's integrity. The evaluation of integrity is sometimes a subjective judgment, but it must always be grounded in an understanding of a property's physical features and their relation to its significance.

Integrity is based on significance: why, where, and when a property is important. Only after significance is fully established can you proceed to the issue of integrity. The steps in assessing integrity are:

- Define the essential [or character-defining] physical features that must be present for a property to represent its significance
- Determine whether the essential physical features are visible enough to convey their significance
- Determine whether the property needs to be compared with similar properties

- Determine, based on the significance and essential physical features, which aspects of integrity are particularly vital to the property being nominated and if they are present.

### **Character-Defining Features**

All properties change over time. It is not necessary for a property to retain all its historic physical features or characteristics. The property must retain, however, the essential physical features that enable it to convey its historic identity. The essential physical features are those features that define both why a property is significant (Applicable Criteria and Areas of Significance) and when it was significant (Periods of Significance.)

The character-defining features of the Weddington Golf and Tennis Club include:

- 9-hole golf course, composed of fairways, greens, and tees (5<sup>th</sup> & 6<sup>th</sup> holes altered).
- Park-like setting on the property created by extensive trees and open space.
- Clubhouse: including board-and-batten siding, shake roof with rectangular cut-outs at planters, brick fireplace and chimney, knotty-pine interior paneling, and lunch counter.
- Driving range (altered) with shed-roof canopy with shake roof.
- Putting green in front of clubhouse.
- Golf ball light standards.

### **Evaluation**

Within the concept of integrity, the National Register criteria recognize seven aspects or qualities that, in various combinations, define integrity. To retain historic integrity, a property must always possess several, and usually most, of the aspects: location, design, setting, materials, workmanship, feeling, and association. Ultimately, a property either does or does not have integrity. The following is a definition and analysis of each of the seven aspects of integrity in relation to this property.

**Location:** The place where the historic property was constructed or the place where the historic event occurred.

*The historic property remains in its original location. The property retains this aspect of integrity.*

**Design:** The combination of elements that create the form, plan, space, structure, and style of a property.

*The Weddington Golf and Tennis Club has been partially altered in terms of design. The northern portion retains its 1958 design in terms of golf course layout, location and design of the putting green and clubhouse. Alterations completed in 1974 to accommodate tennis courts required the realignment of two holes and the reduction in size (by nearly half) of the driving range. However, the alterations reflect the evolution of the property as a community recreation center. These alterations have the potential of becoming significant and, therefore, do not substantially subtract from the property's integrity of design.*

*A 1966 maintenance building was demolished, but it was located in a part of the property that was removed from the clubhouse and starting and ending points of the course and did not contribute to the historic design.*

*The more recent construction of the fire station at the southeast corner of the site is not associated with the property's historic significance as a community recreation center. However, its siting at the southeast corner of the property minimizes the impact of the new construction on the property's integrity of design as the golf course layout remained unaffected.*

**Setting:** The physical environment of a historic property.

*Unlike location, setting refers to the character of the place in which the property played a historic role. It involves how, not just where, the property is situated, and its relationship to surrounding features and open space. Examples of features that create setting are: topographic features, vegetation, simple manmade features, and relationships between buildings and other features or open spaces.*

*Weddington Golf and Tennis Club largely retains its integrity of setting. Setting is a particularly important aspect of integrity for this property, and refers both to the property's surroundings and the setting created within the property by the arrangement and integrity of its component parts, combining buildings, outdoor spaces and hardscape, and landscaped areas, all with a particular purpose that contributes to the recognition of the property type and the associated use. The clubhouse is the nexus of all of the golf-related uses on the property, including the putting green, the starting and ending points of the golf course, and the driving range. The setting of the property is defined not just by the functional interrelationships of elements, but also by the sense of open space created by the design and location of the golf course. The site is buffered from Ventura Blvd. by its location along the Los Angeles River channel, and along each of the boundaries (as well as within the site), mature trees act as windbreaks, visual buffers, and markers of open space within the neighborhood and on the property.*

*The southeast corner of the property has been disrupted by the construction of a new fire station; however, it is oriented away from the significant areas of the historic property's. Furthermore, the station removed maintenance structures that were secondary to the significance of the property and only partially removed the tennis elements of the property. (The tennis courts are not considered contributing features.) Therefore, the overall impact of the new construction has been limited.*

**Materials:** The physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

*The site retains its integrity of materials. This aspect of integrity refers mainly to building materials and to whether the original materials from the period of significance continue to compose the significant structures, objects, and hardscape of the grounds. The substantially unaltered clubhouse retains the characteristic materials of the interior and exterior, such as the board and batten siding, shingled roof, and knotty pine paneling. The concrete patios that lie between the driving range, clubhouse, and first and last holes also contribute to the setting and design of the property. The driving range shelter is also unaltered and composed of its original materials.*

**Workmanship:** The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.

*Workmanship is not a significant aspect of integrity for this property. Most of the building materials of the structures were mass produced and did not reflect either traditional building crafts or significant new materials or methods. Workmanship for this property is best exhibited in the superior maintenance of the fairways and greens. In this respect, the skilled craft of golf course maintenance reflects the property's workmanship and the Weddington Golf and Tennis Club retains its integrity of workmanship.*

**Feeling:** A property's expression of the aesthetic or historic sense of a particular period of time.

*As a result of retaining all material aspects of integrity, in whole or in part, Weddington Golf and Tennis Club retains its integrity of feeling.*

**Association:** The direct link between an important historic event or person and a historic property.

*As a result of retaining all material aspects of integrity, in whole or in part, Weddington Golf and Tennis Club retain its integrity of association.*

The ARG report thus found that the character-defining features of the Weddington Golf and Tennis Club include:

- 9-hole golf course, composed of fairways, greens, and tees (5<sup>th</sup> & 6<sup>th</sup> holes altered).
- Park-like setting on the property created by extensive trees and open space.
- Clubhouse: including board-and-batten siding, shake roof with rectangular cut-outs at planters, brick fireplace and chimney, knotty-pine interior paneling, and lunch counter.
- Driving range (altered) with shed-roof canopy with shake roof.
- Putting green in front of clubhouse.
- Golf ball light standards.

<sup>34</sup> See pages 27 to 31 of the ARG report included on PDF pages 172-176 of the Staff Report for the April 15, 2021 Cultural Heritage Commission meeting, included as Attachment 3 to this comment letter.

## Response No. ORG 1B-54

This comment largely includes direct text from subsection V, Evaluation of Eligibility, in the 2012 ARG report, which was attached to the referenced Cultural Heritage Commission Staff Report (see Attachment 3 to Comment Letter No. ORG 1B, dated May 10, 2022). The comment also provides a summary of what were evaluated to be the character-defining features of the Weddington Golf and Tennis Club from the 2012 ARG Report, including the golf course.

All evidence presented during the Cultural Heritage Commission meeting was reviewed, and ultimately the City did not concur with the recommendation that the golf course should be identified as a character-defining feature of the Project Site. Further, none of the prior analysis or professional opinions represent an official determination or designation of the Project Site as a historical resource. Therefore, the City reviewed all of the evidence, and determined the historical significance and character-defining features of the Project Site as identified in the Draft EIR. It is the City's identification of the character-defining features of the Project Site that appropriately provides the basis for the analysis in the Draft EIR. Challenging the prior determination of the City does not constitute evidence that the Draft

EIR is inadequate. As such, no further response is necessary. See also Topical Response No. 6 – Historical Resources.

## Comment No. ORG 1B-55

Evidence that the golf course is a character-defining feature of the historic resource was provided at the meeting of the Cultural Heritage Commission. In the Staff Report for the April 15, 2021 Hearing, the City’s historic resource staff recommended designation of the property as a City Historical Cultural Monument, finding that it met two of the City’s criteria.<sup>35</sup> The Staff Report reads in part:<sup>36</sup>

### FINDINGS

- Weddington Golf and Tennis Club “exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community” **as an excellent example of a 1950s private recreational facility and golf club in Studio City.**
- Weddington Golf and Tennis Club “embodies the distinctive characteristics of a style, type, period, or method of construction” **as an excellent example of a 1950s community golf course.**

### SUMMARY

Weddington Golf and Tennis Club is a private recreational facility located on a triangular lot bounded by Valley Spring Lane to the north, Whitsett Avenue to the east, Valleyheart Drive to the south, and Bellaire Avenue to the west in the Studio City neighborhood of Los Angeles. Sited on the former sheep ranch of San Fernando Valley pioneer Wilson C. Weddington, the golf course was built in 1955 when the Weddington family leased the property to actor and golf professional Joe Kirkwood, Jr. That year, architect William M. Bray (1905-1998) designed a golf shop and clubhouse in the Ranch architectural style that was erected by the Colonial Construction Company. The subject property was largely developed over the next ten years, with the addition of tennis courts in the 1970s, and the site now consists of a golf course, driving range, tennis courts, tennis clubhouse, and golf clubhouse. Operated by the McCallister family from 1958 until 2008, the subject property was called the Studio City Golf and Tennis Club. Since 2008, it has been called the Weddington Golf and Tennis Club.

Formed around 1927, Studio City was conceived as a combined studio, commercial development, and residential subdivision; however, the area remained largely rural until the 1950s. Similar to the rest of Southern California, the San Fernando Valley experienced a dramatic construction and population boom fueled by the increased demand for housing following World War II. Migration to the region was driven by a booming postwar

economy, led by the defense industry that provided thousands of new jobs in aviation. In the development of Studio City and surrounding areas, communities were designed and built to be complete neighborhoods, with schools, churches, shopping centers, and parks located within a close drive of residential streets. Neighborhoods were promoted for their balance of work and recreation opportunities, such as golf courses and tennis courts, that had previously been unavailable to the average middle-class citizen.

The subject property spans approximately 16 acres, and the primary entrance is oriented to the east facing Whitsett Avenue. Much of the property maintains a park-like setting with landscaping and more than 400 mature trees. Most of the trees were planted during or following the development off the golf course, but a row of Eucalyptus trees along Valley Spring Lane predates the course. Golf-related resources are located at the northeastern portion of the site and include a one-story clubhouse; a nine-hole, par three golf course; a 24-stand, 230-yard driving range; and a putting green. The clubhouse is of wood-frame construction with board and batten cladding and has a side-gabled roof with wood shingles and overhanging eaves. The structure sits at an angle facing the northeast corner of the site and is approached by a walkway from the parking lot to the south. The primary entrance is recessed beneath the overhang and consists of aluminum-frame glass doors with flanking full-height sidelites. Interior features include knotty pine paneling, wrought iron light fixtures, and a slab fireplace wall with variegated brick cladding. The interior includes a reception area, a coffee shop and a pro shop. The golf course loops around the property, partially encircling the driving range, and winds back to the clubhouse. A wood, shed-style canopy shelters the northern half of the stands within the driving range, and temporary awnings shelter those on the south end. Eight original light standards, designed in the form of a golf ball set atop a tee, line the fence along the Whitsett Avenue parking lot and provide light to the driving range.

The southeastern corner of the parcel is dedicated for tennis use and includes a small club structure and 16 concrete courts located in staggered rows. The club structure faces west toward the tennis courts and features board and batten cladding and a front-gabled roof with wood shingles. Fenestration consists of aluminum sliding windows, and the entrances consist of single doors with inset panels and a cross-timber detail. There is also a temporary maintenance structure east of the tennis courts at the southern property line, which consists of a fenced yard with a roof.

William M. Bray, architect of the golf clubhouse, practiced architecture in Southern California for over 60 years, with an office located in Encino. Aspects of Bray's residential designs were periodically featured in the Los Angeles Times throughout the 1950s and 1960s. Bray was responsible for

two of the residential designs for the Aladowney Homes subdivision in Downey (1951) and Brighton Hills in Montebello (1961), where he employed the popular Ranch architectural style. He also designed a retirement community in Palm Desert called “Palm City.” In 1994, Bray was awarded a lifetime achievement award from the San Fernando Valley chapter of the American Institute of Architects. His son and business partner, Roger W. Bray, continues the practice today as Bray Architects.

The subject property has experienced several alterations that include an addition to the clubhouse in 1962; the demolition of a maintenance building, construction of a new maintenance building and the construction of an enclosure at the driving range, creating 10 sheltered tees, in 1966; the construction of tennis courts, court fencing and a tennis shop in 1974; the installation of tennis court fencing in 1975; the installation of fencing with lights in 1976; and the demolition of four original tennis courts and a 1966 maintenance structure as part of the construction of a fire station in 2007 at the southern corner (land now owned by the City of Los Angeles). Other alterations noted during the Commission site inspection consist of the reconfiguration of the fifth and sixth holes, ninth tee, and a reduction in the size of the driving range from the original 1958 design.

SurveyLA, the citywide historic resources survey, identified the subject property as individually eligible for listing under the national, state, and local designation programs **as an excellent example of a 1950s private recreational facility/tennis club/golf course in Studio City**. The survey found that the property appears to meet the eligibility standards, but it noted that it was not fully visible from the public right-of-way.

## DISCUSSION

Weddington Golf and Tennis Club meets two of the Historic Cultural Monument criteria.

The subject property “exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community” **as an excellent example of a 1950s private recreational facility and golf club in Studio City**. The suburbanization of the middle class and the boom in home and automobile ownership during the 1950s and 1960s enabled larger populations to live near and access golf courses. The golf course and driving range were developed to provide the growing Studio City community with a publicly accessible facility where visitors of all ages could learn and practice the game of golf. Previously a sport reserved for elites, golf began to attract middle-class suburban players and enjoy popular appeal in the postwar period. The televising of golf tournaments greatly increased the sport’s profile and audience and contributed to its popularization. Facilities

like the subject property opened to the public to serve this growing demand for the sport. In addition, the subject property reflects the value of recreational amenities to the suburban population base in the San Fernando Valley during a significant period of growth.

Furthermore, the subject property “embodies the distinctive characteristics of a style, type, period, or method of construction” **as an excellent example of a 1950s community golf course. It retains many essential characteristics of the small, local community golf courses that became popular nationwide in the 1950s.** As open spaces were rapidly disappearing in light of the increased development of urban and suburban landscapes, the combination of greenery, open spaces, social outlets, and community recreation provided by golf courses were valued throughout the mid-20<sup>th</sup> century. **In addition, the golf course retains associative value with the post-World War II era in the San Fernando Valley: the golf ball-shaped lights are a form of programmatic architecture, a type of roadside attraction contemporaneous with the popularity of car culture, and the clubhouse reflects the Ranch architectural style, the preferred residential forms of the San Fernando Valley during that period.**

While the property has experienced some alterations, they are all related to its **evolution as a community golf course over time. As such, the subject property retains a high level of integrity of location, design, setting, materials, workmanship, feeling, and association to convey its significance.**

Separately, staff recommends that the subject property’s proposed monument name be changed to the “Studio City Golf and Tennis Club,” to reflect the original, historic name with which it was associated for 50 years. (Emphasis added)

<sup>35</sup> The Staff Report is signed by the Planning Director as well as: Ken Bernstein, AICP, Principal City Planning Office of Historic Resources; Shannon Ryan, Senior City Planner, Office of Historic Resources; Lambert M. Giessinger, Preservation Architect, Office of Historic Resources; and Melissa Jones, City Planning Associate, Office of Historic Resources.

<sup>36</sup> Final Determination Staff Recommendation Report, Page 3 -7.

## Response No. ORG 1B-55

The comment restates that the commenter disagrees with the City’s prior determination of the character-defining characteristics of the HCM. The commenter is correct that evidence as to whether or not the golf course is a character-defining feature was provided at the April 15, 2021 meeting of the Cultural Heritage Commission, as part of the discussion of the Project Site as a potential HCM. All evidence presented during the Cultural Heritage Commission meeting was reviewed, and ultimately the City did not

concur with the recommendation that the golf course should be identified as a character-defining feature of the Project Site. Further, none of the prior analysis or professional opinions represent an official determination or designation of the Project Site as a historical resource. Therefore, the City reviewed all of the evidence, and determined the historical significance and character-defining features of the Project Site as identified in the Draft EIR. It is the City's identification of the character-defining features of the Project Site that appropriately provides the basis for the analysis in the Draft EIR. Challenging the prior determination of the City does not constitute evidence that the Draft EIR is inadequate. As such, no further response is necessary. See also Topical Response No. 6 – Historical Resources.

### **Comment No. ORG 1B-56**

In addition, at the hearing, Jenna Snow, an historic resource consultant meeting the Secretary of the Interior's Professional Standards testified regarding the site's evolution and overall integrity, provided an evaluation of the Project Site as a designed historic landscape,<sup>37</sup> and listed the character-defining features of this "mid-20<sup>th</sup> Century recreational facility" as including the: "club house, putting green, golf ball light standards, lawn, tees, fairways, greens, concrete paths and other landscape details." She noted that: "To separate out the club house, putting green and golf ball light standards from the rest of the property would be artificially separating character-defining features that must be considered as an entire unit."<sup>38</sup>

Eric Van Breene, the Preservation Coordinator for the Los Angeles Conservancy also testified at the hearing stating:<sup>39</sup>

. . . speaking on behalf of the Los Angeles Conservancy, the nomination of Weddington golf course, the property is a cultural landscape developed during the mid-century period and embodies the distinct characteristics of the community golf course at that time. Weddington played a significant role in developing recreational sports for middle-class Angelenos in the San Fernando Valley during a period of suburban growth. The property retains a high degree of integrity with many of its original character defining features still intact.

These character defining features are not limited to the William and Bray design ranch clubhouse, but include fairways with mature plantings, tennis courts, and unique features such as programmatic golf ball light standards. Alterations discussed largely reflect continued use as a community golf course and do not negatively impact the properties eligibility as a historic cultural monument.

<sup>38</sup> Jenna Snow testimony 12:30 to 13:02 of the hearing available at: [https://planning.lacity.org/plndoc/Audio/CHC/2021/04-15-2021/08\\_CHC\\_2020\\_7767.mp3](https://planning.lacity.org/plndoc/Audio/CHC/2021/04-15-2021/08_CHC_2020_7767.mp3)

<sup>39</sup> Hearing testimony at 1:08:03-1:09:03

## Response No. ORG 1B-56

The comment reasserts that the commenter disagrees with the City’s prior determination of the character-defining features of the HCM. The commenter is correct that evidence as to whether or not the golf course is a character-defining feature was provided at the April 15, 2021 meeting of the Cultural Heritage Commission when reviewing the nomination of the Project Site as a potential HCM. However, none of the prior analysis or professional opinions represent an official determination or designation of the Project Site as a historical resource. Therefore, the City reviewed all of the evidence, and determined the historical significance and character-defining features of the Project Site as identified in the Draft EIR. It is the City’s identification of the character-defining features of the Project Site that appropriately provides the basis for the analysis in the Draft EIR. Challenging the prior determination of the City does not constitute evidence that the Draft EIR is inadequate. As such, no further response is necessary. See also Topical Response No, 6 – Historical Resources.

## Comment No. ORG 1B-57

The DEIR’s conclusions have also been reviewed by Architectural and Historic Consultant Kim Tashman who has a Master’s degree in Historic Preservation-Heritage Conservation from the University of Southern California. A copy of her comment letter on the DEIR is included as **Attachment 4** to this letter. We hereby request responses to Ms. Tashman comments. In her expert opinion:

[T]he analysis is defective because it fails to address the impacts of the project on all of the character-defining features of the site. Per my thesis research, and according to the 2012 Architectural Resources Group Historical Resources Assessment Report (ARG Report) regarding the site, Weddington Golf’s historic and character-defining features include: the 9-hole golf course, the clubhouse, the putting green located in front of the clubhouse, the driving range, the golf ball light standards, and the open green space and park-like setting of the site (including the extensive canopy of mature trees). These features are not adequately nor individually addressed in the DEIR. The DEIR arbitrarily limits its own list of “character defining features” to only the clubhouse, putting green, and golf ball light standards. . . Should the Project go forward as planned, these conveniently excluded historic elements will be either damaged or lost entirely – a significant impact on the site’s historic characteristics.

...

The historic nature of the course’s design is thoroughly documented in my thesis research attached. In removing these terms from the HCM, and ignoring the significance of the golf course itself in the DEIR, the DEIR is

deliberately downplaying or outright denying the historic quality of the course, relegating the defining features of the historic site as irrelevant. As such, the DEIR has failed to accurately assess the impact of the Project on the HCM, a California Register eligible resource, and the site's cultural and historic landscape. It has failed to identify significant and unmitigated impacts of the Project.

### **Response No. ORG 1B-57**

The comment restates that the commenter disagrees with the City's prior determination of the character-defining features of the HCM. The assertion that the golf course is a character-defining feature of the Project Site is the opinion of the commenter and is not part of any official determination or designation of the Project Site as a historical resource. The City reviewed all of the evidence related to the history of the Project Site, and determined the historical significance and character-defining features as identified in the Draft EIR. It is the City's identification of the character-defining features of the Project Site that appropriately provides the basis for the analysis in the Draft EIR. Challenging the prior determination of the City does not constitute evidence that the Draft EIR is inadequate. As such, no further response is necessary. See also Topical Response No, 6 – Historical Resources.

### **Comment No. ORG 1B-58**

The DEIR states that because the site will retain the historic clubhouse facility, putting green, and golf ball light standards, that there will be no significant cultural or historic losses to the site with the construction of the new facility. This is plainly inaccurate, given that one of the things that makes the site itself historic is the unique nine-hole golf course and driving range facilities, according to a number of experts.

It is only common sense that a significant impact to the historic resource would result from removing the golf course feature from a property, which the City's expert staff has found to historic as both: "as an excellent example of a 1950s private recreational facility and golf club in Studio City"; and "as an excellent example of a 1950s community golf course" which "retains many essential characteristics of the small, local community golf courses that became popular nationwide in the 1950s." Removing the golf course component and any other character-defining features would materially alter, in an adverse manner, those physical characteristics of the historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the local register and/or the California Register of Historical Resources. The Project, as proposed, would remove a number of key character-defining features, including the golf course. The Project would clearly result in significant adverse impacts to a historic resource which is both an HCM and eligible for listing in the California Register of Historical Resources. The DEIR must be revised and recirculated to acknowledge this significant Project impact on an historic resource.

## Response No. ORG 1B-58

See Topical Response No. 6 – Historical Resources. The commenter states that “one of the things that makes the site itself historic is the unique nine-hole golf course and driving facilities, according to a number of experts.” However, none of the prior analysis or professional opinions regarding the historic significance or character-defining features represent an official determination or designation of the Project Site as a historical resource. The analysis contained in the Draft EIR also noted several other nine-hole golf courses and driving facilities in the area. Therefore, the City reviewed all of the evidence, and determined the historical significance and character-defining features of the Project Site as identified in the Draft EIR. It is the City’s identification of the character-defining features of the Project Site that appropriately provide the basis for the analysis in the Draft EIR.

The commenter therefore incorrectly states that the Project “would remove a number of key character-defining features, including the golf course.” As identified in the Draft EIR, the Project would retain the character-defining features of the Project Site, including maintaining its historic use as a recreational facility that is open for public use; and retaining and rehabilitating the clubhouse, golf ball-shaped light standards, putting green, and brick wall with weeping mortar. The City Cultural Heritage Ordinance requires compliance with the Secretary of the Interior’s Standards (the “Standards”) for properties that are designated HCMs (Los Angeles Administrative Code, Section 22.171.14). According to guidance from the National Park Service, “a project meets the Standards when the overall effect of all work is consistent with the property’s historic character.”<sup>14</sup> Determination that a Project meets the Standards is based on the cumulative effect of all the proposed work in the context of the specific existing conditions. The Project has been Designed to comply with the Standards; see Topical Response No. 6 – Historical Resources, for further discussion of the Project’s compliance with the Standards. The Draft EIR finds that the Project overall is consistent with the Standards, based on an evaluation of the cumulative effect of the proposed work in the context of the specific features that contribute to the Project Site’s significance as a 1950s recreational facility. Therefore, the Draft EIR correctly identifies that the Project would not result in a substantial adverse change in the significance of a historical resource on the Project Site.

## Comment No. ORG 1B-59

The DEIR includes three PDF which are in fact typical historic resource mitigation measures. The DEIR authors have inappropriately considered these PDFs prior to making impact judgements. The three PDFs are: (1) requirements for a Rehabilitation Plan to ensure that rehabilitation of just the clubhouse, putting green, and low brick wall with weeping mortar complies with the Secretary of the Interiors Standards for Rehabilitation (Secretary’s Standards); (2) a requirement for preparation of Historic

---

<sup>14</sup> U.S. Department of the Interior, National Park Service, “Technical Preservation Services: Cumulative Effect and Historic Character,” <https://www.nps.gov/tps/standards/applying-rehabilitation/cumulative-effect.htm> (accessed February 2022).

American Buildings Survey (HABS) Level III documentation; and (3) a requirement for the preparation of an interpretation of the history of the Project Site to be housed on-site. However, even if the DEIR had correctly identified significant Project historic resource impacts, and these PDFs had been properly identified as mitigation measures, they would not be sufficient to fully mitigate Project historic resource impacts associated with the substantial proposed modification of the Project site. The requirement for treatment consistent with the Secretary's Standards only applies to three of the character-defining features of the Project Site. It therefore would not fully mitigate Project impacts. As noted by the court in *Architectural Heritage Association v. County of Monterey* (19 Cal. Rptr. 3d 469): "As drawing a chalk mark around a dead body is not mitigation, so archival documentation cannot normally reduce destruction of an historic resource to an insignificant level." The documentation PDF, even if it were a mitigation measure, thus would not fully mitigate Project impacts. The same is true of the requirement for an interpretive display (see *League for Protection v. City of Oakland*, 52 Cal.App.4th 896). As proposed, the Project would result in significant unmitigated Project impacts. The DEIR must be revised and recirculated for public review and comment pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4).

## **Response No. ORG 1B-59**

The comment contends that the PDFs included in Section IV.D, *Cultural Resources*, of the Draft EIR should have been mitigation measures and that these features do not fully mitigate Project impacts. As to the use of PDFs, see Response Nos. ORG 1B-8, ORG 1B-22, ORG 1B-23 (regarding the general use of PDFs), and ORG 1B-26 and ORG 1B-27 (regarding the specific PDFs for cultural resources).

See Topical Response No. 6 – Historical Resources. The Project as designed would comply with the Standards and would retain all of the character-defining features of the Studio City Golf and Tennis Club as identified by the City. Therefore, the Draft EIR correctly identifies that there would be no significant impacts to historical resources on the Project Site as a result of the Project, and no mitigation measures specific to historical resources are required. The PDFs referenced by the commenter were incorporated in recognition of the historic significance of the Project Site, and to reinforce the School's commitment to the history of the Project Site and understanding of City requirements regarding the typical design development and permitting process for designated HCMs. As to the assertion that the PDFs incorporated into the Project related to cultural resources should be analyzed as mitigation measures, see Response Nos. ORG 1B-26 and ORG B1-27 which explain that, (i) these are appropriate PDFs which ensure that the Project would not result in a substantial adverse change in the significance of a historical resource and (ii) the cases cited in the comment are not applicable to the Project. The comment also states that PDFs are insufficient to ensure that the Project would not have a significant impact on the cultural resources within the Project Site. This issue is fully analyzed in Section IV.D, *Cultural Resources*, pages IV.D-27 through IV.D-34 of the Draft EIR and in Appendix E-1, Historical Resources Technical Report for 4141 N. Whitsett Avenue, Studio City, pages 66 through 77 (PDF pages 70 through 81 of 176 of Appendix E). No substantial evidence is presented

in the comment to support the contention that the Draft EIR incorrectly concluded that the Project would not result in a significant impact to the character-defining features of the designated HCM.

Based on the above, the comment does not provide substantial evidence of significant new information showing that there is a new significant impact, of an increase in the severity of an impact, or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, the revision and recirculation of the Draft EIR is not necessary.

## **Comment No. ORG 1B-60**

### **4.4 Failure to Identify Significant Greenhouse Gas Impacts.**

The DEIR's analysis of Project Greenhouse Gas ("GHG") emissions underestimates Project GHG impacts for a number of reasons. First, the analysis fails to account for the GHG emissions from removing existing turf and soil from the site. This will both release sequestered carbon and result in the loss of turf-related carbon sequestration as existing turf is removed, disposed of and replaced with artificial turf.

Recent studies have shown that both home of [sic] golf course turf results in net carbon sequestration:

The Colorado Carbon Project, a collaborative effort among Colorado State University, the USDA and the Rocky Mountain Golf Course Superintendents Association and other entities, suggests that if the average fairway is 1.7 acres, then a single fairway will sequester .75 tons of carbon per year, which is equivalent of driving 6,500 miles with the average car. In addition, putting greens have the potential to sequester .40 tons of carbon per acre per year.

<sup>40</sup> <https://www.golfcourseindustry.com/article/gci-0310-golf-carbon-sequestration/>

## **Response No. ORG 1B-60**

The comment states that the analysis underestimates GHG impacts from the Project and did not account for the removal of the existing turf and soil from the Project Site. Section IV.G, *Greenhouse Gas Emissions*, addresses GHG emissions from the construction and operation of the Project, which includes the construction activities and equipment necessary to remove the existing turf. As analyzed, the Project would be consistent with applicable plans, policies, and regulations adopted to reduce GHG emissions and impacts would be less than significant. The loss of carbon sequestration due to the removal of the existing golf course and driving range was not calculated in the Draft EIR because it would be negligible. As stated in the CalEEMod user's guide, CalEEMod "assumes the IPCC active growing period of 20 years. Thereafter, the accumulation of carbon in biomass slows with age, and will be completely offset by losses

from clipping, pruning, and occasional death.”<sup>15</sup> Thus, an existing golf course with mature vegetation does not generate any substantial net carbon sequestration.

As stated in Chapter II, *Project Description*, of the Draft EIR, the Project would implement an extensive tree planting and landscaping program that would remove 240 of the existing 421 inventoried on- and off-site trees (four of which are deemed dead and, therefore, excluded from mitigation requirements), and plant 393 trees, resulting in a net increase of 153 trees beyond existing conditions (or a 36 percent increase); provide approximately 5.4 acres (235,224 square feet) of publicly-accessible open space and landscaped pedestrian pathways connecting via an ADA-compliant pedestrian ramp to the adjacent Zev Yaroslavsky Los Angeles River Greenway, and on-site landscaped areas. This new vegetation would be available as growing vegetation and contribute to a net increase in carbon sequestration. Although the Project results in vegetation removal, this loss would not be permanent due to the replanting of RIO-compliant and/or native trees once completed. Research by the University of Florida determined that highly maintained lawns sequester much less carbon than more natural areas requiring little maintenance and that lawn sequestered much less carbon than trees.<sup>16</sup> Additionally, the referenced article stated that if the average fairway is 1.7 acres, then a single fairway will sequester 0.75 tons of carbon per year, while one acre of trees will store 2.5 tons of carbon per year.<sup>17</sup> Thus, the Project would actually increase, not decrease, the carbon sequestration, resulting in a net increase in sequestration of CO<sub>2</sub> emissions. Reduced carbon sequestration through the installation of artificial turf would be offset by the net increase in overall RIO-compliant trees and the planting of native landscaping throughout the Project Site. Please also refer to Response No ORG 6A-1, which discusses how the Project would result in an increased tree canopy after nearly 10 years. Also, refer to Response No. 6B-2 which discusses the long-term carbon sequestration increase with the Project compared to existing conditions.

### **Comment No. ORG 1B-61**

Agricultural Research Service soil scientists have similarly found that golf course turf serves to sequester carbon:

Agricultural Research Service soil scientist Ronald F. Follett and Colorado State University researcher Yaling Qian have studied soil records from 16 Denver-area golf courses. Follett says they found that carbon sequestration in the soil under turf- grass occurred at a “significant rate that is comparable to the carbon sequestration rate reported from U.S. land that has been

<sup>15</sup> California Air Pollution Control Officers Association, California Emissions Estimator Model, User’s Guide, Appendix A, page 60, October 2017.

<sup>16</sup> Hostetler, M & Escobedo F., 2019. What Types of Urban Greenspace are Better for Carbon Dioxide Sequestration? University of Florida, Department of Wildlife Ecology and Conservation, UF/IFAS Extension. February 24. Available: <https://edis.ifas.ufl.edu/publication/UW324>, Accessed June 2022.

<sup>17</sup> Carbon Pirates, 2019. How much Carbon does on Tree absorb?, August 24. Available: <https://www.carbonpirates.com/blog/how-much-carbon-do-trees-absorb/>. Accessed June 2022.

placed in the Conservation Reserve Program.” That voluntary program, run by USDA’s Farm Service Agency, pays agricultural landowners to “establish long-term, resource-conserving covers on eligible farmland,” which helps trap carbon.

Follett explains that golf course managers generally keep excellent soil records; some of the records used for this research go back 45 years. The scientists found that carbon sequestration lasts for up to 31 years in fairways and 45 years in greens, after which the rates slow or become negligible.

<sup>41</sup> <https://agresearchmag.ars.usda.gov/AR/archive/2003/Jun/golf0603.pdf>

### **Response No. ORG 1B-61**

The comment restates that golf course turf sequesters carbon. However, as discussed in Response No. ORG 1B-60, the Project would result in a net increase of 153 trees beyond existing conditions (or a 36 percent increase) and would have a net environmentally beneficial effect on carbon sequestration. Regardless, according to the Follett citation offered by the commenter, carbon sequestration by the existing golf course and driving range would have “slow[ed] or become negligible” in the early 2000s (given that the course and range became operational in the late 1950s).

### **Comment No. ORG 1B-62**

The DEIR’s GHG analysis needs to account for the loss of carbon sequestration from the turf and the release of sequestered carbon as the removed turf rots. The DEIR’s GHG analysis also needs to account for carbon release from the large volume of soil to be removed from the Project Site. As noted by the United States Department of Agriculture’s Natural Resources Conservation Service:

It is also important to limit soil disturbance because research has shown that large amounts of carbon dioxide are released when the soil is disturbed. The greater the volume of soil disturbed, the greater the carbon lost from the soil.<sup>42</sup>

<sup>42</sup> <https://www.nrcs.usda.gov/wps/portal/nrcs/detail/pa/soils/health/?cid=nrcseprd1201408>

### **Response No. ORG 1B-62**

The comment restates the prior comments on carbon sequestration and states that carbon release from the removed turf must be analyzed, including as it rots following removal. See Response No. ORG 1B-60 for a detailed discussion of carbon sequestration for the Project. With regard to the referenced article, this is an article about farming soils (not urban parks) and managing humus (soil with high organic matter content) in soils by

managing carbon, which feeds soil organisms through the living roots of plants.<sup>18</sup> The article states that “[t]he below-ground part of the plant is probably more important than the above-ground part for increasing humus content. Therefore, it is important to have living roots in the soil year-round...”<sup>19</sup> As discussed in Response No. ORG 1B-60, the Project would result in a net increase of 153 trees beyond existing conditions (or a 36 percent increase) and would have a net environmentally beneficial effect on carbon sequestration. Please also refer to Response No ORG 6A-1, which discusses how the Project would result in an increased tree canopy after nearly 10 years. Also, refer to Response No. 6B-2 which discusses the long-term carbon sequestration increase with the Project compared to existing conditions. With respect to sequestered carbon as the removed turf rots, this source of carbon is not an anthropogenic (human-made) emission. According to the USEPA, “carbon dioxide is naturally present in the atmosphere as part of the Earth’s carbon cycle (the natural circulation of carbon among the atmosphere, oceans, soil, plants, and animals).”<sup>20</sup> CalEEMod recognizes that “the accumulation of carbon in biomass slows with age, and will be completely offset by losses from clipping, pruning, and occasional death.”<sup>21</sup> Thus, an existing golf course with mature vegetation does not generate any substantial net carbon sequestration. No additional analysis on carbon sequestration is required.

### **Comment No. ORG 1B-63**

The DEIR’s analysis has failed to account for the GHG impacts of turf and soil removal. The analysis also contains a number of errors as documented by the environmental consulting firm, SWAPE.

As detailed in the letter from SWAPE included in **Attachment 1**, and quoted or paraphrased herein, there are a number of problems with the GHG analysis in the DEIR. SWAPEs full comments need to be addressed in the responses to comments and revised DEIR.

### **Response No. ORG 1B-63**

The comment restates the contention that the GHG analysis is inadequate for failure to analyze impacts of turf and soil removal and from other unspecified errors. See Response Nos. ORG 1B-60 through ORG 1B-62 for a detailed discussion of why the analysis did not need to account for carbon sequestration for the Project. All comments in the SWAPE

letter, included as Attachment 1, have been responded to in Response Nos. ORG 1B-115 through 1B-137. However, the Draft EIR does not require revisions related to carbon sequestration as discussed in Response Nos. ORG 1B-60 through ORG 1B-62.

### **Comment No. ORG 1B-64**

According to SWAPE, the DEIR estimates that the Project would generate net annual greenhouse gas (“GHG”) emissions of 1,533- and 2,226-metric tons of carbon dioxide equivalents per year (“MT CO<sub>2</sub>e/year”) with and without GHG reduction measures, respectively (see p. IV.G-53, Table IV.G-7). However, the DEIR elects not to apply a quantitative GHG threshold. Instead, the DEIR concludes a less- than-significant GHG impact based on “the Project’s compliance with performance-based standards included in the regulations outlined in the applicable portions of CARB’s Climate Change Scoping Plan, the 2020-2045 Regional Transportation Plan/Sustainable Communities Plan (“RTP/SCS”), City’s Green New Deal, and the Los Angeles Green Building Code” (p. IV.G-40). However, the DEIR’s analysis, as well as the subsequent less-than-significant impact conclusion, is incorrect for five reasons:

- (1) The DEIR’s quantitative GHG analysis relies upon an incorrect and unsubstantiated air model;
- (2) The DEIR fails to indicate a potentially significant GHG impact;
- (3) The DEIR should incorporate PDFs as formal mitigation measures, not PDFs;
- (4) The DEIR fails to consider the performance-based standards under CARB’s Scoping Plan; and
- (5) The DEIR fails to consider the performance-based standards under SCAG’s RTP/SCS.

### **Response No. ORG 1B-64**

The comment states that the GHG analysis is defective due to the air model used, failure to include unspecified significant impacts, use of PDFs instead of mitigation measures, and not using performance-based standards. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. The modeling used for GHG emissions consists of the CalEEMod model, which was developed for the California Air Pollution Officers Association (CAPCOA) in collaboration with the California Air Districts<sup>22</sup>. The model uses regional data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) provided by the various California air districts to account for local requirements and condition and is considered to be an accurate and comprehensive tool for quantifying air quality and GHG impacts from land use projects throughout California by lead agencies. The CARB on-road vehicle

<sup>22</sup> SCAQMD website, <http://www.aqmd.gov/caleemod/home>. Accessed August 16, 2022.

emissions factor (EMFAC) model was used for mobile source emissions to account for variability in day-to-day construction vehicle miles traveled.

As discussed on page IV.G-38, In Section IV.G, *Greenhouse Gas Emissions*, under the heading Thresholds of Significance in the Draft EIR, CEQA Guidelines Section 15064.4 gives lead agencies the discretion to determine whether to assess those emissions quantitatively or qualitatively. Although GHG emissions were quantified for the Project, CARB, SCAQMD, and the City have not adopted quantitative project-level significance thresholds for GHG emissions that would be applicable to the Project. Therefore, in the absence of any adopted quantitative thresholds of general application, the City, as Lead Agency, has determined that the Project's GHG emissions would not be considerable and would not have a significant effect on the environment if the Project is found to be compliant with performance-based standards included in the regulations outlined in the applicable portions of CARB's Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City's Green New Deal, and the Los Angeles Green Building Code consistent with CEQA Guidelines Sections 15064.4(b)(2). Since the Project was not in conflict with these applicable regulatory plans to reduce GHG emissions, Project impacts are less than significant. In addition, support for this threshold is found in California Supreme Court case law, such as *Center for Biological Diversity et al. vs. California Department of Fish and Wildlife and Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 576.).

Table IV.G-7, *Estimated Operational Greenhouse Gas Emissions – Project*, on page IV.G-53 of the Draft EIR, provides the Project's estimated GHG emissions with and without implementation of GHG reduction characteristics, features, and measures. This comparison is provided to evaluate the Project's efficiency with respect to GHG emissions but is not the threshold of significance used for the impact analysis. The analysis assumes the Project without implementation of GHG reduction characteristics, features, and measures would incorporate the same land uses and building square footage as the Project. Furthermore, this analysis is consistent with the most current regulatory policies and GHG quantification methods; however, the scientific, regulatory environment regarding GHG reduction and CEQA approaches for GHG analysis are constantly evolving and would continue to do so into the future. Although the quantification of GHG emissions was not measured against a significance threshold because none have been adopted that are applicable to the Project, it nevertheless provides the extent to which the Project would increase GHG as compared to the existing environmental setting. In addition, as the Project does not result in a significant GHG impact based on the established qualitative threshold above, mitigation measures are not required and the GHG reduction characteristics, features, and measures are more appropriately assigned as PDFs.

For all the reasons described in the prior responses to this comment letter, the Draft EIR is not flawed in its use of PDFs which are Project elements, or its use of mitigation measures which are additional measures added after analysis of the Project with the PDFs integrated into the Project. See Response No. ORG 1B-28 for further discussion of the Draft EIR's use of PDFs as related to GHG emissions.

In addition, the compliance of the Project with performance-based standards under CARB's Scoping Plan and SCAG's RTP/SCS are discussed in Table 1, *Project Compliance with Applicable 2017 Climate Change Scoping Plan Actions and Strategies* and Table 2, *Comparison of Project Characteristics with Applicable SCAG 2016-2040 RTP/SCS and 2020-2045 RTP/SCS Actions and Strategies*, which are provided in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR (PDF pages 39 through 50 of 437). As explained in Tables 1 and 2, regarding the performance-based standards under CARB's Scoping Plan and SCAG's RTP/SCS, as required under SB 375, the CARB is required to update regional GHG emissions targets every 8 years, which have been updated in 2018. As part of the 2018 updates, the CARB adopted a passenger vehicle related GHG reduction of 19 percent per capita for 2035 for the SCAG region. The Project would be consistent with SB 375 as it would be an infill development with various transit options. In addition, the Project would implement a shuttle system between the School's Upper Campus and the Project Site whenever there are School activities underway at the Project Site. The local and regional bus line services and the implementation of the shuttle system would encourage efficient transportation and reduce VMT associated with the Project. In addition, although the Project is not required to provide any bicycle parking spaces per the LAMC, the Project would also provide up to 100 on-site bicycle parking spaces. The Project would provide spectators, visitors, students and employees with the ability to access nearby public transit and opportunities for walking and biking, which would facilitate a reduction in VMT and related vehicular GHG emissions. Evidence of the Project's less-than-significant impact is provided in Table IV.G-7 of the Draft EIR, where mobile source GHG emissions associated with the Project are reduced by approximately 31 percent compared to a project without implementation of GHG reduction characteristics, features, and measures. By locating the Project in an urban infill location, which is a GHG reduction strategy supported in the CARB 2017 Climate Change Scoping Plan, VMT from Project users would be reduced, which results in the 31 percent reduction in mobile source GHG emissions and, as shown in Table 2 (referenced above) would exceed the SCAG region-wide reduction goals in SB 375. As such, the Project would not conflict with the 2020-2045 RTP/SCS goal of reducing daily VMT per capita and providing local community serving uses in infill locations. Therefore, as discussed, the Project would comply with the performance-based standards under CARB's Scoping Plan and SCAG's RTP/SCS. Therefore, the analysis, as presented in the Draft EIR, provides correct and substantiated quantitative GHG analyses and modeling; provides correct and substantiated GHG impact determinations; appropriately incorporates PDFs; considers performance-based standards under CARB's Scoping Plan; and considers the performance-based standards under SCAG's RTP/SCS. Revisions to the Draft EIR are not required.

### **Comment No. ORG 1B-65**

As detailed in **Attachment 1**, in an effort to quantitatively evaluate the Project's GHG emissions, SWAPE compared the Project's GHG emissions, as estimated by the DEIR, to the SCAQMD 2035 service population ("SP") efficiency target of 3.0 MT CO<sub>2</sub>e/SP/year, which was calculated by applying a 40% reduction to the 2020 targets. When dividing the

Project's net annual GHG emissions, as estimated by the DEIR, by a SP of 100 people, SWAPE found that the Project would emit approximately 15.5 MT CO<sub>2</sub>e/SP/year. When applying this threshold, the Project's incorrect and unsubstantiated air model indicates a potentially significant GHG impact.

### **Response No. ORG 1B-65**

The comment states that the Draft EIR's quantitative GHG emissions analysis is incorrect. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. Please refer to Response No. ORG 1B-64 for a discussion on the appropriate use of the qualitative significance threshold where it was determined that the Project's GHG emissions would not be considerable and therefore would not have a significant effect on the environment if the Project is found to be compliant with performance-based standards included in the regulations outlined in the applicable portions of CARB's Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City's Green New Deal, and the Los Angeles Green Building Code, rather than any service population or quantitative threshold. In addition, please refer to Response No. ORG 1B-64 for a discussion on the validity and applicability of the CalEEMod model used to assess the Project's GHG emissions.

The calculation provided in the comment regarding a service population of 100 people and per service population GHG emissions is not meaningful and lacks any substantial evidence as to its applicability to the Project. It is not known how the commenter arrived at a service population of 100 people. It is presumed that the commenter is referencing information in Chapter 2, *Project Description*, of the Draft EIR, which states that "[o]n days in which high attendance events do take place (i.e., greater than 300 spectators and participants) there would be a maximum of approximately 100 employees." However, using a population of 100 people in a GHG calculation is faulty and problematic as it excludes other people that would be traveling to and from the Project Site and using the Project Site amenities including students, parents, and other visitors not affiliated with the School, but nonetheless included in the Project's calculation of GHG emissions. Similar comments were raised to the SCAQMD regarding the problematic nature of per service population thresholds and how such potential thresholds would be infeasible for many commercial projects that serve non-resident and non-employee customers.<sup>23</sup> The SCAQMD did not provide a formal response to the comment and, as has been previously discussed, the SCAQMD has never adopted nor formally recommended a quantitative GHG emissions threshold for land use development project, such as this Project. Given the faulty and problematic nature of per service population thresholds, the City has determined that a per service population threshold is not appropriate for this Project.

<sup>23</sup> SCAQMD, Greenhouse Gases (GHG), CEQA Significance Thresholds, GHG Meeting 15 Comment Letter. Available: [http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-\(ghg\)-ceqa-significance-thresholds/year-2008-2009/ghg-meeting-15/ghg-meeting-15-comment-letter.pdf?sfvrsn=2](http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/year-2008-2009/ghg-meeting-15/ghg-meeting-15-comment-letter.pdf?sfvrsn=2). Accessed June 2022.

All comments in the SWAPE letter, included as Attachment 1 to Comment Letter No. ORG 1B, dated May 10, 2022, have been responded to in Response Nos. ORG 1B-115 through 1B-137.

### **Comment No. ORG 1B-66**

Additionally, according to SWAPE, the CalEEMod output files demonstrates that the “Harvard Westlake – Operations” model includes a manual reduction to the default CO<sub>2</sub> intensity factor (Appendix C, pp. 279, 291, 388, 403). This unsubstantiated reduction presents an issue, as CalEEMod uses the CO<sub>2</sub> intensity factor to calculate the Project’s greenhouse gas (“GHG”) emissions associated with electricity use. Thus, by including an unsubstantiated reduction to the default CO<sub>2</sub> intensity factor, the model may underestimate the Project’s GHG emissions and should not be relied upon to determine Project significance.

### **Response No. ORG 1B-66**

This comment states that the modeling files for the Project include unsubstantiated reductions to the default factors. Contrary to the comment, the adjustment made to the CO<sub>2</sub> intensity factors in the CalEEMod modeling are justified. First, the CO<sub>2</sub> was adjusted based on the Los Angeles Department of Water and Power (LADWP) 2017 Power Strategic Long-Term Resource Plan in which LADWP provided a carbon dioxide equivalent (CO<sub>2</sub>) intensity value for the LADWP’s own generation power electricity of 834 lbs CO<sub>2</sub>/MWh which converts to 0.378 million tons (MT) CO<sub>2</sub>e/MWh for year 2016. Furthermore, the power content label for SCE for 2016, which was used to establish the baseline CO<sub>2</sub>e intensity value, states that the SCE power mix came from 29 percent renewable sources for year 2017, meaning the base CO<sub>2</sub> intensity value for electricity with no renewables would be 1,174.65 pounds (lbs) CO<sub>2</sub>/MWh. Therefore, using linear projection based on SB 100, renewable energy procurement requirements for retail sellers and local publicly owned electric utilities renewable procurement requirements of 44 percent of retail sales by December 31, 2024, 52 percent by December 31, 2027, and 60 percent by December 31, 2030, the projected 2025 renewables for year 2025 was 46.67 percent and would correspond to a CO<sub>2</sub> intensity factor of 626.48 lbs CO<sub>2</sub>/MWh.

For these reasons, the adjusted CO<sub>2</sub> intensity factors used to calculate the Project’s GHG emissions associated with electricity use are substantiated and accurately estimate the Project’s GHG emissions. Therefore, revisions to the Draft EIR are not required.

### **Comment No. ORG 1B-67**

Given the errors in the GHG analysis in the DEIR, the analysis and DEIR must be revised and recirculated for public review and comment pursuant to CEQA Guidelines Section 15088.5(a)(1), (2) and (4).

## Response No. ORG 1B-67

The comment restates that errors in the GHG analysis require revision and recirculation. The Draft EIR fully and accurately addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. Refer to Response Nos. ORG 1B-64 through 1B-66 for a discussion on the validity and applicability of the CalEEMod model used to assess the Project's GHG emissions; the appropriate use of the qualitative significance threshold where it was determined that the Project's GHG emissions would not be considerable, and therefore, would not have a significant effect on the environment if the Project is found to be compliant with performance-based standards included in the regulations outlined in the applicable portions of CARB's Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City's Green New Deal, and the Los Angeles Green Building Code, rather than any service population or quantitative threshold; the appropriateness in assigned GHG reduction characteristics, features, and measures as PDFs since the Project does not have significant GHG impacts; the compliance of the Project with the performance-based standards under CARB's Scoping Plan and SCAG's RTP/SCS; and substantiated the adjustments to the CO<sub>2</sub> intensity factors used to calculate the Project's GHG emissions associated with electricity use. Therefore, the analysis, as presented in the Draft EIR, provides correct and substantiated quantitative GHG analyses and modeling; provides correct and substantiated GHG impact determinations; appropriately incorporates PDFs; considers performance-based standards under CARB's Scoping Plan; and consider the performance-based standards under SCAG's RTP/SCS.

Based on the above, the comment does not provide substantial evidence of significant new information showing that there is a new significant impact, of an increase in the severity of an impact, or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, the revision and recirculation of the Draft EIR is not necessary.

## Comment No. ORG 1B-68

### **4.5 Deficiencies in the Discussion of Hazardous Materials, Health, Water Quality and Waste Management Impacts – Artificial Turf**

The analysis of the hazards posed by the proposed Project's artificial turf in the DEIR oversells the safety of such turf and fails to adequately disclose the health unknowns of artificial turf. The most pertinent concern, echoed by many scientists and advocates, is that researchers don't know much about the safety of artificial turf crumb rubber. In 2008 researchers from Robert Wood Johnson Medical School put it like this:

Neither systematic testing nor post-test evaluation has been performed on the composition and fate of either the turf or the filler. Is the crumb rubber contaminated with metals as it comes from ground up used tires that have been in contact with many road- ways and dirt surfaces; what is the surface

temperature of the artificial turf as the crumb rubber is black and will absorb more heat than a grass surface; how are the fields safely disposed of once they exceed their usable lifetime; and what happens to the rubber material that does not stay attached to the turf as it becomes mobilized and is released into the environment or becomes attached to the skin and clothing of the users? Numerous mothers have told us that this crumb rubber comes home with the child and is distributed around the house. Furthermore, there are now residential uses of turf with and without “in fill” marketed in many colors with unspecified coloring agents. Is the rubber and turf safe? (J. Expo. Sci. Environ. Epidemiol. 2008;18:533–4; doi:10/1038/jes.2008.56)

As noted in Journal of National Cancer Institute (JNCI), 2016, Vol. 108, No. 12:<sup>43</sup>

Griffin’s concern is that the way scientists have been testing the safety of artificial turf may not reflect the way some soccer players interact with the material. She has seen blood cancers mostly in soccer players who were goalkeepers. They dive into the turf, often breathing only inches away from it, and end up ingesting much more of the substance orally than the average player. That’s not the sort of interaction researchers tend to investigate.

Despite widespread adoption of the crumb rubber–filled synthetic turf (the U.S. has some 12,000 such fields now), no epidemiological studies have examined populations with experience playing [*sic*] on such fields. Nor have researchers conducted animal testing on rubber fill, in which mammals are directly exposed to the substance for long periods and researchers examine the effects.

Andrew Watterson, Ph.D., professor of health and director of the Centre for Public Health and Population Health Research at Scotland’s University of Stirling, has found cancer-causing chemicals in crumb samples from artificial soccer fields. He argues that the problem is just that so little is known about such a potentially dangerous substance.

“The surprising thing to me is that the health issues were not checked out much earlier—bearing in mind how long such pitches have been around and how many millions of people, especially children, use the surfaces worldwide—and we still don’t know what, if any, health risks there are from widely recognized carcinogenic substances used in crumb rubber and what uptake rather than simply exposure there is,” Watterson said. “It would have been in both government and industry interests to have sorted this [out] a long time ago.”

Tania Bush Isaksen, Ph.D., M.P.H., lecturer in the department of environmental and occupational health sciences at UW’s School of Public Health, is investigating cancer rates among athletes across Washington State. What she’s working on won’t tell whether artificial turf causes cancer, but “it’ll [tell] us if these rates are higher than we should expect.”

The Environmental Protection Agency, the Consumer Product Safety Commission, and the Center for Disease Control and Prevention also are studying the issue.

<sup>43</sup> Artificial Turf and Cancer Risk by Daniel Luzer available at starting on page 2: <https://academic.oup.com/jnci/article/108/12/djw311/2706944>

## Response No. ORG 1B-68

The comment states that the Draft EIR underestimates the impacts of the use of artificial turf. See Topical Response No. 7 – Artificial Turf and Effects on Localized Heat and Health. Topical Response No. 7 addresses the potential health-related and urban heat island effects due to the Project’s use of artificial turf fields. Also, please refer to Response Nos. ORG 8-5, ORG 8-6 and ORG 8-11 regarding testing of FieldTurf samples and additional information related to impacts associated with artificial turf. The Project would replace the existing Project Site uses with new athletic and recreational facilities, including outdoor athletic fields utilizing artificial grass as a sustainable alternative to turf grass, thereby reducing irrigation water demand, emissions, and avoiding the use of pesticides associated with the turf grass. Annually lawns consume nearly 3 trillion gallons of water a year, 200 million gallons of gas for mowing and 70 million pounds of pesticides in the U.S.<sup>24</sup>

In regard to the article about artificial turf crumb rubber, Section IV.H, *Hazards and Hazardous Materials*, and Appendix H-2, Artificial Turf Technical Memorandum, of the Draft EIR, included a detailed evaluation of potential health impacts related to use of crumb rubber and artificial turf. Based on the analysis, the Draft EIR determined that health-related impacts would be less than significant. Refer to Table IV.H-2 on page IV.H-41 of the Draft EIR, for a summary of the major findings from the health studies discussed in Appendix H-2, Artificial Turf Technical Memorandum, of the Draft EIR regarding the use of crumb rubber and artificial turf. Also, refer to Topical Response No. 7 for additional details regarding the Project’s health-related impacts associated with artificial turf.

With respect to the article mentioned by the commenter regarding coach Griffin and cancer in soccer players in Washington State, the Washington State Department of Health investigated this topic in a report titled *Investigation of Reported Cancer among Soccer Players in Washington State*<sup>25</sup>, which found “less cancer among the soccer players, select and premier players, and goalkeepers on the coach’s list than expected based on rates of cancer among Washington residents of the same ages. In addition, the currently available research on the health effects of artificial turf does not suggest that artificial turf presents

<sup>24</sup> Talbot, M., 2016. *More Sustainable (and Beautiful) Alternatives to a Grass Lawn*. Available: More Sustainable (and Beautiful) Alternatives to a Grass Lawn | NRDC. Accessed July 28, 2022.

<sup>25</sup> Washington State Department of Health, 2017. *Investigation of Reported Cancer among Soccer Players in Washington State*, April. Available: <https://doh.wa.gov/sites/default/files/legacy/Documents/Pubs//210-091.pdf?uid=62a24798bd6dc>. Accessed June 2022.

a significant public health risk. The Washington State Department of Health recommends that people who enjoy soccer continue to play irrespective of the type of field surface.”

Furthermore, a recent Dutch National Institute for Public Health and Environment, *Evaluation of health risk of playing sports on synthetic turf pitches with rubber granulate*<sup>26</sup>, concluded that no indications were found in the available literature of a link between playing sports on synthetic turf pitches with an infill of rubber granulate and the incidence of leukemia and lymphoma. A health risk assessment was conducted which concluded that for polycyclic aromatic hydrocarbons (PAHs), the additional cancer risk is 2.2-3.0 per million for someone who has been a goalkeeper from ages 7 to 50. This additional cancer risk is virtually negligible.<sup>27</sup>

Therefore, the analysis of the hazards posed by the proposed Project’s artificial turf, which contains crumb rubber, in the Draft EIR does not oversell the safety of such turf and adequately discloses the potential for health impacts from exposure to artificial turf materials.

### **Comment No. ORG 1B-69**

The USEPA is currently conducting research on recycled tire crumb used in artificial turf on playing fields. As noted by the EPA:<sup>44</sup>

Concerns have been raised by the public about the potential health risks from playing on synthetic turf fields in the U.S. containing tire crumb rubber. Studies to date have not shown an elevated health risk from playing on fields with tire crumb rubber, but the existing studies have been limited.

To help address these concerns, the Centers for Disease Control and Prevention/Agency for Toxic Substances and Disease Registry (CDC/ATSDR) and the U.S. Environmental Protection Agency (EPA), in collaboration with the Consumer Product Safety Commission (CPSC), launched a multi-agency research effort in February 2016.

This multi-agency research effort, known as the Federal Research Action Plan on Recycled Tire Crumb Used on Playing Fields and Playgrounds (FRAP), is focused on assessing potential human exposure, which includes conducting research activities to characterize the chemicals associated with tire crumb rubber and to identify the ways in which people may be exposed to those chemicals based on their activities on synthetic turf fields. Also, the FRAP includes characterizing emissions and bioaccessibility to differentiate what is present in the tire crumb rubber from what people may actually be exposed to from tire crumb rubber. . .

<sup>26</sup> National Institute for Public Health and the Environment *Ministry of Health, Welfare and Sport, 2017. Evaluation of health risk of playing sports on synthetic turf pitches with rubber granulate, Scientific background document*. Available: <https://www.rivm.nl/bibliotheek/rapporten/2017-0017.pdf>. Accessed June 2022.

<sup>27</sup> It is much smaller than the so-called maximum permissible risk ( $1 \times 10^{-4}$ ) and is slightly higher than the negligible risk ( $1 \times 10^{-6}$ , the *de minimis* risk).

The study has four parts:

- Literature Review/Gap Analysis (EPA and CDC/ATSDR)
- Recycled Tire Crumb Characterization (EPA and CDC/ATSDR)
- Exposure Characterization Study (EPA and CDC/ATSDR)
- Playground Study (Consumer Product Safety Commission)

<sup>44</sup> <https://www.epa.gov/chemical-research/federal-research-recycled-tire-crumb-used-playing-fields>

## Response No. ORG 1B-69

The comment does not raise any issues as to the adequacy of the Draft EIR and instead refers to concerns regarding recycled tire crumb rubber in artificial turf. Nonetheless, see Topical Response No. 7 – Artificial Turf and Effects on Localized Heat and Health. Topical Response No. 7 addresses the potential health-related effects due to the Project's use of artificial turf fields. The Project would replace the existing Project Site uses with new athletic and recreational facilities, including outdoor athletic fields utilizing artificial grass as a sustainable alternative to turf grass, thereby reducing irrigation water demand and avoiding the use of pesticides associated with the turf grass. Section IV.H, *Hazards and Hazardous Materials*, and Appendix H-2, Artificial Turf Technical Memorandum, of the Draft EIR, included a detailed evaluation of potential health impacts related to use of artificial turf. Based on the analysis, the Draft EIR determined that health-related impacts would be less than significant.

Additionally, Part one of the FRAP study, published in July 2019<sup>28</sup>, states that it is not a risk assessment and that its goal is to characterize potential human exposures to the substances associated with recycled tire crumb rubber used in synthetic fields. The report collected tire crumb rubber samples from nine tire recycling facilities and 40 synthetic turf fields, both indoors and outdoors, across the United States. Lab analyses were conducted to measure the physical, chemical, and microbiological characteristics of tire crumb rubber material. Results of the analysis indicate:<sup>29</sup>

- Emissions of most semi-volatile organic compounds (SVOCs) and many volatile organic compounds (VOCs) were low when tested at 25 degrees Celsius (77

<sup>28</sup> United States Environmental Protection Agency, 2019. Synthetic Turf Field Recycled Tire Crumb Rubber Research Under the Federal Research Action Plan, Final Report Part 1 – Tire Crumb Rubber Characterization Volume 1, July 25. Available: [https://www.epa.gov/sites/default/files/2019-08/documents/synthetic\\_turf\\_field\\_recycled\\_tire\\_crumb\\_rubber\\_research\\_under\\_the\\_federal\\_research\\_action\\_plan\\_final\\_report\\_part\\_1\\_volume\\_1.pdf](https://www.epa.gov/sites/default/files/2019-08/documents/synthetic_turf_field_recycled_tire_crumb_rubber_research_under_the_federal_research_action_plan_final_report_part_1_volume_1.pdf). Accessed June 2022.

<sup>29</sup> United States Environmental Protection Agency, 2019. Synthetic Turf Field Recycled Tire Crumb Rubber Research Under the Federal Research Action Plan, Final Report Part 1 – Tire Crumb Rubber Characterization Volume 1, July 25. Available: [https://www.epa.gov/sites/default/files/2019-08/documents/synthetic\\_turf\\_field\\_recycled\\_tire\\_crumb\\_rubber\\_research\\_under\\_the\\_federal\\_research\\_action\\_plan\\_final\\_report\\_part\\_1\\_volume\\_1.pdf](https://www.epa.gov/sites/default/files/2019-08/documents/synthetic_turf_field_recycled_tire_crumb_rubber_research_under_the_federal_research_action_plan_final_report_part_1_volume_1.pdf). Accessed June 2022.

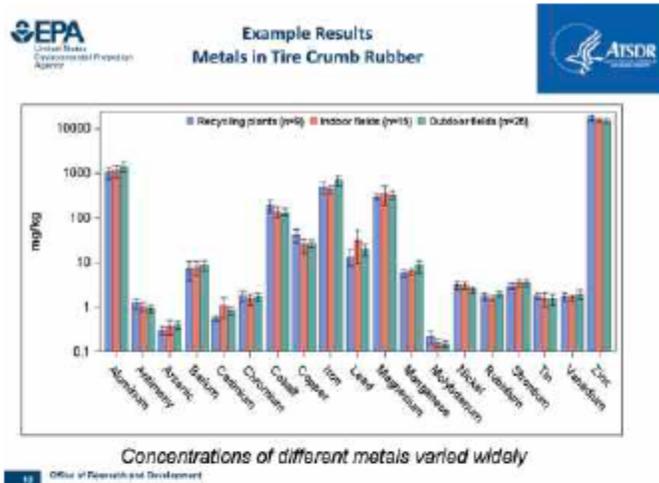

degrees Fahrenheit), while emissions were higher for some, but not all at 60 degrees Celsius (140 degrees Fahrenheit).

- The amount of metals released into simulated biological fluids was low, on average about 3 percent in gastric fluid and less than 1 percent in saliva and sweat plus sebum.
- The emissions and bioaccessibility measurements suggest that exposures to most chemicals may be relatively low, but exposure measurements are being conducted to confirm these results.
- Concentrations of many organic chemicals found in crumb rubber infill material vary with synthetic turf field age and type (i.e., indoor versus outdoor). In general, concentrations of many organic chemicals appeared to decrease with increasing field age, leading to lower concentrations of many organic chemicals over time, particularly for outdoor fields.
- Concentrations of many organic chemicals were higher for indoor fields compared to outdoor fields.
- Concentrations of metals were comparable between the crumb rubber samples collected at tire recycling plants and synthetic turf fields. A few chemicals [e.g., lead and bis(2-ethylhexyl) phthalate] had higher average concentrations in infill samples from synthetic turf fields than in tire crumb rubber samples collected at recycling plants. Additional research may be needed to better understand whether there are contributions of some chemicals at fields from sources other than the recycled tire crumb rubber.
- Emission measurements suggested that several VOCs, such as benzene and toluene, may be present primarily at the surface of the rubber particles; other VOCs, such as methyl isobutyl ketone and benzothiazole, appear more likely to be intrinsic to the tire crumb rubber material.

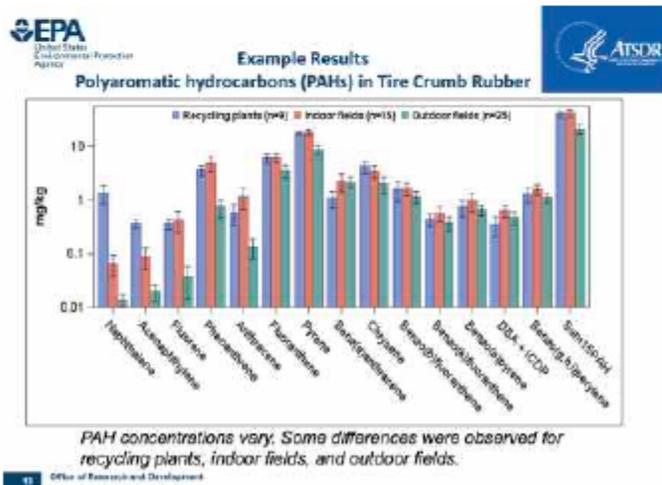

In conclusion, the FRAP report found that, as expected, a range of metals, organic chemicals, and bacteria was found to be associated with recycled crumb rubber. The results of the FRAP study were comparable to other studies characterizing tire crumb, such as those discussed in Section IV.H, under *Artificial Turf Studies*, pages IV.H-33 through IV.H-45, and Appendix H-2, *Artificial Turf Technical Memorandum*, of the Draft EIR. Further, the emissions of many organic chemicals into air were typically found to be below detection limits or test chamber background, and releases of metals into simulated biological fluids were very low (mean bioaccessibility values averaged about 3 percent in gastric fluid and less than 1 percent in saliva and sweat plus sebum). Together, these findings support the premise that while many chemicals are present in the recycled tire crumb rubber, exposure may be limited based on what is released into air or biological fluids. As further shown in Appendix E.3, *Field Turf Testing Report*, in the Final EIR, concentrations of metals in the crumb rubber were either 1) below the USEPA and/or State of California screening thresholds, or 2) exist in a form that would not leach into the surrounding environment (e.g., cobalt, arsenic, and chromium). This information supports the less-than-significant finding as described in detail in the Draft EIR.

### Comment No. ORG 1B-70

Only the Synthetic Turf Field Recycled Tire Crumb Rubber Characterization Research Final Report: Part 1 -Tire Crumb Rubber Characterization has been completed, to date.<sup>45</sup> The study found:

**FIGURE 1 – Concentration of Metals in Artificial Turf Crumb Rubber**  
 Source: [https://www.epa.gov/sites/default/files/2019-08/documents/tc\\_public\\_webinar\\_-\\_august\\_6\\_2019.pdf](https://www.epa.gov/sites/default/files/2019-08/documents/tc_public_webinar_-_august_6_2019.pdf)

**FIGURE 2 – PAH Concentrations in Artificial Turf Crumb Rubber**  
 Source: [https://www.epa.gov/sites/default/files/2019-08/documents/tc\\_public\\_webinar\\_-\\_august\\_6\\_2019.pdf](https://www.epa.gov/sites/default/files/2019-08/documents/tc_public_webinar_-_august_6_2019.pdf)

- Most of the target analytes among the 21 metals and 49 SVOCs, and several of the 31 target VOCs, were found in tire crumb rubber collected at fields across the U.S.
- Average concentrations ranged from <1 mg/kg for several metals and extractable SVOCs to up to 15,000 mg/kg for zinc.

- For most VOC and SVOC chemicals, air emissions were low at 25 °C and in many cases, not measurable above the detection limit or above background levels.
- At 60 °C, higher emissions were measured for some, but not all, VOCs and SVOCs.
- Every sample from the 40 fields was positive for total bacteria.
  - 42% had at least one sample with *Staphylococcus aureus*.
  - 70% had a least one positive sample for methicillin resistance.

<sup>45</sup> The report is available at: <https://www.epa.gov/chemical-research/federal-research-recycled-tire-crumbused-playing-fields>. A presentation on the report from an August 6, 2019 public webinar is available at: <https://www.epa.gov/chemical-research/public-webinar-part-1-tire-crumb-rubber-characterization> The webinar slides are available at: [https://www.epa.gov/sites/default/files/2019-08/documents/tc\\_public\\_webinar\\_-\\_august\\_6\\_2019.pdf](https://www.epa.gov/sites/default/files/2019-08/documents/tc_public_webinar_-_august_6_2019.pdf)

## Response No. ORG 1B-70

The comment does not raise any issues as to the adequacy of the Draft EIR and instead refers to a report regarding recycled tire crumb rubber in artificial turf. Nonetheless, refer to Response No. ORG 1B-69, above for a discussion of potential health-related effects due to the Project's use of artificial turf.

## Comment No. ORG 1B-71

Given that the proposed Project is in the San Fernando Valley, with it's [sic] high heats, the DEIR needs to address the potential for off-gassing of VOCs and SVOCs. This should be addressed as part of the Hazardous Material discussion, the air quality analysis and the needed health risk assessment.

## Response No. ORG 1B-71

The comment states that the potential for off-gassing VOCs and SVOCs should be discussed in the Draft EIR. A number of artificial turf studies that discussed the off-gassing of VOCs and SVOCs and the health risks associated with inhalation risks were reviewed and summarized in Section IV.H , under *Artificial Turf Studies* on pages IV.H-33 through IV.H-45 of the Draft EIR and Appendix H-2, *Artificial Turf Technical Memorandum*, of the Draft EIR. The information contained in these studies support the less-than-significant finding as described in detail in the Draft EIR. In addition, as discussed in Response No. ORG 1B-69, the FRAP report stated that for most VOC and SVOC target chemicals, air emissions were low at 25 degrees Celsius (77 degrees Fahrenheit) and in many cases, not measurable above the detection limit or above background levels. At 60 degrees Celsius (140 degrees Fahrenheit), higher emissions were measured for some, but not all, VOCs and SVOCs. Overall, methyl isobutyl ketone and benzothiazole had the highest emission factors among the target analytes in this

study.<sup>30</sup> Refer also to Topical Response No. 7 for additional detail regarding the Project's health-related impacts associated with artificial turf.

### **Comment No. ORG 1B-72**

The second phases of the EPA study, which will include a health risk assessment has yet to be completed. The EPA has yet to determine whether the health risks of artificial turf which includes crumb rubber are less than significant.

According to the Mount Sinai Children's Environmental Health Center:<sup>46</sup>

#### **What chemicals can be contained in the infill crumb rubber?**

Because infill crumb rubber is made from recycled tires and other recycled materials, it can contain a mixture of chemicals. These chemicals include rubber, polycyclic aromatic hydrocarbons (PAHs), volatile organic compounds (VOCs), and heavy metals (lead, zinc, iron, and manganese).<sup>1</sup>

#### **How can people be exposed to these chemicals?**

(1) Inhalation: Exposure to airborne chemicals was recently studied by Connecticut's Departments of Public Health and Environmental Protection, their Agricultural Experiment Station, and UCONN Division of Occupational and Environmental Medicine. They studied both indoor and outdoor turf fields. Results showed that each field had a different mixture of airborne chemicals. When the amount of airborne chemicals at outdoor turf fields was compared to background (non turf field) levels, they did not find a difference. However, there were more airborne chemicals (e.g. benzothiazole) in one indoor field as compared to outdoor fields.<sup>2</sup> This result supports the idea that chemicals remain in the air longer with decreased ventilation. Based on these measurements, the Connecticut Department of Health found that health risk from playing on turf fields (even indoors) was "...within typical risk levels in the community from ambient pollution sources and are below target risks associated with many air toxics regulatory programs."<sup>2</sup> However, one limitation of the Connecticut findings is that chemical measurements were taken on summer days when the temperature was below 90 degrees. They did not assess the potential for increased chemical release with hotter temperatures typical of summer heat waves.

<sup>30</sup> United States Environmental Protection Agency, 2019. Synthetic Turf Field Recycled Tire Crumb Rubber Research Under the Federal Research Action Plan, Final Report Part 1 – Tire Crumb Rubber Characterization Volume 1, July 25. Available: [https://www.epa.gov/sites/default/files/2019-08/documents/synthetic\\_turf\\_field\\_recycled\\_tire\\_crumb\\_rubber\\_research\\_under\\_the\\_federal\\_research\\_action\\_plan\\_final\\_report\\_part\\_1\\_volume\\_1.pdf](https://www.epa.gov/sites/default/files/2019-08/documents/synthetic_turf_field_recycled_tire_crumb_rubber_research_under_the_federal_research_action_plan_final_report_part_1_volume_1.pdf). Accessed June 2022.

(2) Ingestion: Pellet infills can stick to the hands and bodies of children playing on the fields. This can lead to ingestion in young children who often put hands and toys into their mouths.<sup>4</sup>

(3) Skin: Certain chemicals may be absorbed through direct skin contact. This is of greater concern in young children whose skin barrier is not as thick, or keratinized, as older individuals.<sup>4</sup>

<sup>46</sup> [https://icahn.mssm.edu/files/ISMMS/Assets/Research/PEHSU/ArtTurfFactSheet\\_2011.pdf](https://icahn.mssm.edu/files/ISMMS/Assets/Research/PEHSU/ArtTurfFactSheet_2011.pdf)

## Response No. ORG 1B-72

The comment does not raise any issues as to the adequacy of the Draft EIR and instead refers to an uncompleted study regarding potential health risks of artificial turf. The Project would replace the existing Project Site uses with new athletic and recreational facilities, including outdoor athletic fields utilizing artificial grass as a sustainable alternative to turf grass, thereby reducing irrigation water demand and avoiding the use of pesticides associated with the turf grass. Section IV.H, *Hazards and Hazardous Materials*, and Appendix H-2, Artificial Turf Technical Memorandum, of the Draft EIR, included a detailed evaluation of potential health impacts related to use of artificial turf. Based on the analysis, the Draft EIR determined that health-related impacts would be less than significant. Refer to Section (2)(a) in Topical Response No. 7 – Artificial Turf and Effects on Localized Heat and Health for additional detail regarding the human health-related risks, including human health risk assessments (HHRAs) conducted on crumb rubber material associated with dermal, inhalation, and ingestion contact with artificial turf.

HHRAs have been conducted on crumb rubber in artificial turf as outlined in the Section IV.H, *Hazards and Hazardous Materials*, and Appendix H-2, Artificial Turf Technical Memorandum, of the Draft EIR, which concluded that cancer risks for inhalation, ingestion, and dermal were primarily below the *de minimis* risk level ( $1 \times 10^{-6}$ ) and the few that were above this risk level were within the EPA's target risk range of  $1 \times 10^{-6}$  to  $1 \times 10^{-4}$ , mostly towards the lower end of this range. All non-cancer risks were below the Hazard Index of 1. One HHRA studied skin sensitization and the results suggest that crumb rubber used in artificial turf did not cause skin sensitization in children. As shown by these health risk assessments, impacts from crumb rubber are less than significant and the information supports the less-than-significant finding as described in detail in the Draft EIR.

## **Comment No. ORG 1B-73**

### **What are the health and environmental effects of chemical exposures related to infill rubber?**

Exposures to chemicals present in crumb rubber at very high levels, typical of animal or occupational studies, are known to cause birth defects, neurologic and developmental deficits, and some can even cause cancer.<sup>4</sup> These are higher exposures than would be found in infilled tire crumb. What is not yet known is the extent to which these chemicals actually enter the bodies of children playing on turf fields. Several studies have attempted to approximate exposure to concerning components of crumb rubber by using theoretical estimates of inhalation, ingestion, and dermal exposure; these studies found that exposure would in most cases be too small to have health effects.<sup>4</sup> A limitation of these studies is that exposure level is only theoretical. In addition, the long-term health effects of very small doses is still unknown.

Another concern is the extent to which chemicals may leach from the fields into the surrounding environment, soil and groundwater. The New York State Department of Environmental Conservation is investigating the impact of chemicals in rubber infill on groundwater and the environment. Results, as of May 2009, have not shown significant groundwater contamination, however, the study is still ongoing.<sup>8</sup> Lastly, the ability of infill-related chemical exposure to cause allergic reaction or irritation (skin or respiratory) has not yet been studied.

## **Response No. ORG 1B-73**

The comment does not raise any issues as to the adequacy of the Draft EIR and instead asks questions regarding potential health risks of artificial turf. As such, no further response is warranted. Nonetheless, refer to Response Nos. ORG 1B-68, ORG 1B-69, and ORG 1B-72, above.

## **Comment No. ORG 1B-74**

### **What are the proven hazards of turf fields?**

(1) Heat: It is unsafe for children to be playing on surfaces at extreme temperatures as they can develop heat-induced illnesses (eg. dehydration, heat stress, heat stroke, and heat burns).<sup>4</sup> Temperatures on artificial turf fields are elevated as compared to natural grass turf. At the University of Missouri's turf field, surface temperature reached 173°F and "head level" height temperature reached 138°F on a 98°F day.<sup>4</sup> Heat levels on artificial turf fields are slightly lower in areas shaded from sunlight.<sup>4</sup>

(2) “Turf burn” or friction abrasions: Athletes who fall on turf fields can get friction abrasions called “turf burns”, which should be cleaned with soap and water. However, injuries on turf fields are not increased with respect to injury rate or severity as compared with natural grass fields. <sup>3,5,6,7,9,10</sup>

## Response No. ORG 1B-74

The comment does not raise any issues as to the adequacy of the Draft EIR but claims there are proven risks to the use of artificial turf related to heat and turf burns. As to turf burns, the comment acknowledges that the injury rate and severity of turf burns are not increased as compared with natural grass fields. As to the issue of heat, see Topical Response No. 7 - Artificial Turf and Effects on Localized Heat and Health. Topical Response No. 7 addresses the potential health-related and urban heat island effects due to the Project's use of artificial turf fields. In addition, Section IV.H, *Hazards and Hazardous Materials*, and Appendix H-2, Artificial Turf Technical Memorandum, of the Draft EIR, included a detailed evaluation of potential health impacts related to use of artificial turf. Based on the analysis, the Draft EIR determined that health-related impacts would be less than significant.

As discussed in in Topical Response No. 7 and Appendix H-2 of the Draft EIR, the New York City Department of Health and Mental Hygiene<sup>31</sup> stated the average synthetic turf surface was 26 degrees Fahrenheit higher than the grass surface temperature and 35 degrees Fahrenheit higher than the sand surface temperature. However, the temperature survey found little difference for the indicators of heat stress between the synthetic turf, grass, and sand surfaces, on any given day. Although little difference between indicators of heat stress measurements was found, the synthetic turf surface temperatures were much higher and prolonged contact with the hotter surfaces may have the potential to create discomfort, cause thermal injury and contribute to heat-related illnesses. Thus, the report recommended that awareness of the potential for heat illness and how to recognize and prevent heat illness should be raised among users and managers of athletic fields, athletic staff, coaches and parents. Thus, with proper management of the use of the field, heat-related impacts were found to be less than significant in the Draft EIR. Regarding the comment that artificial turf fields contribute to an increase in localized temperatures, which could contribute to a broader urban island effect, a study conducted by Milone & MacBroom, Inc., a privately-owned, multidisciplinary consulting firm, conducted a temperature evaluation study designed to determine the temperature rise of artificial turf materials under a number of environmental conditions.<sup>32</sup> That study, which is described in more detail in Appendix H-2 of the Draft EIR, concluded that while artificial turf fields, and specifically the artificial fibers used to simulate blades of grass, do exhibit higher surface temperatures when exposed to sunlight for prolonged periods of time (as compared to natural turf), rapid cooling was observed if the sunlight was interrupted or filtered by clouds, and would therefore not continue to release heat into the evening in the same manner as sidewalks, parking lots, streets, and roofing.

## Comment No. ORG 1B-75

In addition, the possible presence of polyfluoroalkyl substances – known as PFAS chemicals (or forever chemicals) in artificial turf blades and backing is a concern. As noted by the organization Public Employees for Environmental Responsibility (PEER):<sup>47</sup>

In September, the Ecology Center, working with PEER, found elemental fluorine in artificial turf blades, suggesting that PFAS is an ingredient in the carpet grass fibers or a byproduct of the manufacturing process. It also found specific PFAS chemicals in discarded turf backing and an adjacent wetland. Per- and polyfluoroalkyl substances (PFAS), often referred to as “forever chemicals,” do not break down in the environment and bioaccumulate in the food chain. Human exposures to PFAS are associated with cancer, birth defects, and other impairments. On October 14, 2019, the Synthetic Turf Council put out a statement that did not deny the presence of PFAS but nonetheless blasted the groups’ “inaccurate, non-verified report using questionable test methods.” Yet, it is hard for industry to dispute that:

- Two specific PFAS substances were found in backing of two different turf samples: one had 6:2 FTSA, the other had PFOA from samples taken by three PhD scientists who collected samples using proper lab protocols;
- Shaw Industries, one of the companies that produced the turf that tested positive for elemental fluorine, admits, “These chemicals are commonly used by synthetic turf manufacturers as a non-stick agent.... We are exploring alternatives with our technical teams and suppliers but have not yet identified a substitute that provides the non-stick properties required for manufacturing synthetic turf.” (emphasis added); and
- ACTGlobal also concedes it uses a “fluoroelastomer process aid” (likely a PFAS) in the manufacture of synthetic grass.

Significantly, the groups can only test for 36 PFAS because widespread claims of “confidential business information” prevent release of data about hundreds of other PFAS compounds. “We are asking manufacturers to fully disclose all PFAS chemistry used, including fluoropolymers and any other fluorinated processing aids used in the production of turfgrass fibers and backing,” said Jeff Gearhart of the Ecology Center. “Industry continues to claim this chemistry is proprietary, however, the public has a right to know.”

Two big concerns about PFAS in the turf blades and backing is the direct chemical exposure to children, and the potential for PFAS to leach off the fields into groundwater, surface water and eventually, drinking water.

<sup>47</sup> <https://peer.org/industry-in-a-dither-about-pfas-in-synthetic-turf>

## Response No. ORG 1B-75

The comment does not raise any issues as to the adequacy of the Draft EIR but suggests the possible presence of polyfluoroalkyl substances in artificial turf. Nonetheless, see Section (2)(a)(iii)(d) in Topical Response No. 7 - Artificial Turf and Effects on Localized Heat and Health, and Section IV.H, *Hazards and Hazardous Materials* and Appendix H-2, Artificial Turf Technical Memorandum, of the Draft EIR for discussions regarding the human health-related risks from Per- and Polyfluoroalkyl Substances (PFAS) in artificial turf, which the Draft EIR found to be less than significant based on HHRAs conducted on compounds in artificial turf, including PFAS. As discussed in Topical Response No. 7 – Artificial Turf and Effects on Localized Heat and Health, several laboratory tests of FieldTurf samples (including a 2022 test conducted by Eurofins on the product to be used in the Project) did not detect PFAS above the test method’s reporting limit. Further, all results were below the screening levels for any form of PFAS issued by the USEPA and as proposed by the state of California. Also, please refer to Appendix E-3, Field Turf Testing Report, of this Final EIR.

PFAS are a family of thousands of chemicals that vary widely in their chemical and physical properties, as well as their potential risks to human health and the environment.<sup>33</sup> PFAS impart oil, water, stain, and soil repellency, chemical and thermal stability, and friction reduction in a range of products, including consumer products such as carpets, clothing, furniture, outdoor equipment, cosmetic products, non-stick cookware, and food packaging. PFAS can be found in drinking water, soil and water, fire extinguishing foam, manufacturing or chemical production facilities, food, food packaging, household products and dust, personal care products, and biosolids.<sup>34</sup> They are of concern due their widespread production and use, as well as their ability to move and persist in the environment and that they can accumulate in the body over time, primarily through exposure from drinking water.<sup>35</sup> The primary exposure route that the USEPA and state regulatory agencies have identified is through consumption of PFAS in contaminated drinking water. Based on research studies and what is known about the chemical composition of PFAS, dermal (skin) exposure to PFAS containing materials is not significant and thus poses a negligible human health risk. Similarly, due to the high water solubility of PFAS and low volatility, these compounds pose a negligible health risk via the inhalation exposure pathway.

<sup>35</sup> EPA, 2022. Our Current Understanding of the Human Health and Environmental Risks of PFAS, March 16. Available: <https://www.epa.gov/pfas/our-current-understanding-human-health-and-environmental-risks-pfas>. Accessed June 2022.

Artificial turf has been in the news recently for PFAS following the sampling and analysis of discarded turf. Two papers, the Boston Globe<sup>36</sup> and The Intercept<sup>37</sup> ran articles in October 2019 that said two nonprofit environmental groups, Ecology Center and Public Employees for Environmental Responsibility (PEER), tested an abandoned pile of artificial turf and found that PFAS showed up in samples. The concentrations found in the turf samples contained 190 parts per trillion (ppt) and 10 ppt in water samples. Although these articles have brought out concern about PFAS in artificial turf, there are points of contention with the sources. The newspaper articles did not, nor did the interest groups that did the sampling, specify the precautions taken in the field to avoid contamination of samples as there are many materials that contain PFAS used in sampling including gloves, clothing, sampling items, containers, notebooks, makeup, perfumes, etc.<sup>38</sup> Additionally, there is no certified method for analyzing PFAS concentrations in materials other than a USEPA method for analyzing PFAS in drinking water. Since synthetic turf samples and not drinking water were sampled, the methods used for analysis were likely not certified leading to questionable results.<sup>39</sup> Additionally, the Boston Globe article noted that an additional eight samples were analyzed for total fluorine and assumed that total fluorine is an indication that PFAS is present.<sup>40</sup> However, this method can be biased by the presence of many non-PFAS compounds that also contain fluorine. For example, some anionic surfactants applied to the field drain may contain fluorine. Many consumer products also contain fluorine such as toothpaste,

mouthwash and household cleaners. The presence of fluorine, therefore, does not necessarily indicate PFAS compounds are present.<sup>41, 42, 43</sup>

A review article, in *Remediation Journal*, collected information on background and ambient levels of two predominant PFAS, perfluorooctane sulfonate (PFOS) and perfluorooctanoate (PFOA), in North America in both abiotic media (soil, sediment, surface water, and public drinking water supplies) and selected biotic media (human tissues, fish, and shellfish) with no known point source of PFAS.<sup>44</sup> The range of concentrations for PFOS, which was detected in every soil sample taken in North America, was 0.018 - 2.55 µg/kg (range of PFOA was 0.059 – 1.84 µg/kg). Concentrations in the eastern U.S. are much higher (>0.184 µg/kg).<sup>45</sup> Thus, a concentration of 0.19 µg/kg PFOS, which is what was measured in the abandoned artificial turf (Boston Globe and *The Intercept* articles), in a swatch of used turf falls into this uncontaminated concentration range which would be considered “clean”.<sup>46</sup> Widespread ambient soil and sediment concentrations were noted but were well below human health-protective thresholds for direct contact exposures.<sup>47</sup> Surface water, drinking water supply waters (representing a combination of groundwater and surface water), fish and shellfish tissue, and human serum levels ranged from less than to greater than available health-based

threshold values.<sup>48</sup> Since these levels were well below the safe soil RSL by two to three orders of magnitude, human health risk is negligible.<sup>49</sup>

Furthermore, according to a recent study of plastic- and rubber-containing artificial turf fields in Stockholm, Sweden,<sup>50</sup> samples were subjected to total fluorine (TF), extractable organic fluorine (EOF) and target PFAS analysis. TF was observed in all 51 artificial turf samples (range: 16 - 313, 12 - 310, and 24 - 661 µg F/g in backing, filling, and blades, respectively)<sup>51</sup>, while EOF and target PFAS occurred in <42 percent of all samples (<200 and <1 ng/g, respectively).<sup>52,53</sup> A subset of samples extracted with water confirmed the absence of fluoride. Moreover, application of the total oxidizable precursor assay revealed negligible perfluoroalkyl acid (PFAA) formation across all three sample types, indicating that the fluorinated substance(s) in artificial turf are not low molecular weight PFAA-precursors.<sup>54</sup> Collectively, these results point towards polymeric organofluorine (e.g. fluoroelastomer, polytetrafluoroethylene, polyvinylidene fluoride), consistent with patent literature.<sup>55</sup> The combination of poor extractability and recalcitrance towards advanced oxidation suggests that leaching and/or conversion to mobile PFAAs is unlikely over the

lifetime of artificial turf and/or following accidental ingestion of artificial turf components.<sup>56</sup> Thus, the fluorine in artificial turf does not pose an imminent risk to users.<sup>57</sup>

As discussed above, although PFAS was found in one sampling of artificial turf, levels were orders of magnitude below safe soil RSLs and as the studies have shown PFAS levels are found in background soil and water samples and ambient samples taken in North America at levels of less than to greater than health based levels. Additionally, the above cited articles suggest that the PFAS in artificial turf does not pose an imminent risk to users based on the level of PFAS and/or fluorine found in the artificial turf samples and that PFAS in artificial turf is unlikely to leach or convert to mobile PFAAs which could affect surface water and groundwater.

### Comment No. ORG 1B-76

The DEIR needs to disclose the unknowns regarding the potential health risks of artificial turf. Given the unknowns, impact should be classified as potentially significant.

It should also be noted in the DEIR that PEER has filed a complaint with the Federal Trade Commission (“FTC”) alleging that artificial turf manufacturer claims that artificial turf is recyclable are false and that recycling is not possible due to the difficulty of separating component parts.<sup>48</sup> The complaint states that artificial turf fields last eight to ten years<sup>49</sup> and that there are currently no facilities in the United States that can recycle artificial turf.<sup>50</sup> The DEIR, therefore, also needs to disclose and address the solid waste impacts associated with the use of artificial turf.

## Response No. ORG 1B-76

The comment states that the Draft EIR must disclose the unknowns regarding potential health impacts related to the use and disposal of artificial turf, and must also disclose and address the solid waste impact associated with the use of artificial turf since a complaint has been filed with the FTC alleging that it is not recyclable. Section IV.H, *Hazards and Hazardous Materials*, of the Draft EIR, included a detailed evaluation of the disposal of artificial turf and disclosed information that is known and unknown based on the cited studies in the Draft EIR and its Appendices, in Topical Response No. 7 - Artificial Turf and Effects on Localized Heat and Health, and within the Responses to Comment Letter No. ORG 1B. For example, Draft EIR Appendix H-2 provides detailed discussion of health risk impacts and discloses the compounds analyzed in the various cited studies including those that are known or not known to cause specified health risk impacts. The State CEQA Guidelines prohibit lead agencies from engaging in speculation or conjecture (State CEQA Guidelines Section 15145); therefore, the Draft EIR refrains from engaging in speculation or conjecture on the impacts from unknown factors.

As stated on page IV.H-45 of the Draft EIR, used turf would be disposed of in accordance with hazardous waste standards in 22 CCR 66261.20 et seq., and would have to demonstrate that none of the CCR Title 22 metal concentrations exceed California Total Threshold Limit Concentrations (TTLC), which are used to classify a hazardous waste, except for zinc. Additionally, the infill materials would have to be analyzed for soluble metals and demonstrate that none exceed the Soluble Limit Threshold Concentration for disposal. Although zinc levels could exceed the TTLC, disposal of the turf consistent with the management of used tires would ensure disposal as a non-hazardous material in accordance with CCR Title 22. In addition to compliance with applicable regulations, artificial turf consists of materials that can be recycled at the end of its useful life, or repurposed. A pilot program known as the TenCate Turf Recycling Solutions, established in 2022, aims to receive old turf from California, separate the materials or shred the materials at a Southern California facility, and send the plastics by railcar to an International Sustainability and Carbon Certification (ISCC) PLUS certified advanced recycling facility in Baytown, Texas.<sup>58</sup> Other recycling options are available in the western United States with stated recycling rates of 97 percent or higher of artificial turf materials including sand and rubber products.<sup>59</sup> Compliance with applicable regulatory requirements would ensure that Project impacts related to disposal of artificial turf would be less than significant. In addition, as Harvard Westlake School intends to recycle the artificial turf, Section IV.O.3, *Solid Waste*, of the Draft EIR appropriately did not assume annual operational solid waste disposal impacts associated with the artificial turf, which may be disposed of approximately every 8+ years. Further, even if the selected recycling facility did have some nominal portion of the turf that was not recyclable, it can be reasonably expected the facility would be permitted to dispose of any materials in

---

<sup>58</sup> TenCate Turf Recycling Solutions, <https://turfrecycling.us/>. Accessed November 11, 2022.

<sup>59</sup> Artificial Grass Recyclers, Recycling, <https://artificialgrassrecyclers.com/recycling-turf/>. Accessed November 11, 2022.

accordance with applicable regulatory requirements at a disposal facility with remaining capacity. As discussed on page IV.O.3-18 in Section IV.O. 3 of the Draft EIR, per the County of Los Angeles Countywide Integrated Waste Management Plan (CoIWMP) 2019 Annual Report, future disposal needs over the next 15-year planning horizon (2034) would be adequately met through the use of in-County and out-of-County facilities through a number of strategies that would be carried out over the years. It should also be noted that with annual reviews of demand and capacity in each subsequent Annual Report, the 15-year planning horizon provides sufficient lead time for the County to address any future shortfalls in landfill capacity. Thus, there would not be substantial increase in the severity of operational solid waste impacts analyzed in the Draft EIR.

## **Comment No. ORG 1B-77**

### **4.6 Inadequate Health Risk Assessment and Failure to Identify Significant Health Risks**

As detailed in the SWAPE letter included as Attachment 1 to the letter and quoted or paraphrased below, the DEIR concludes that the Project would have a less than-significant health risk impact without conducting a quantified construction or operational health risk analysis (“HRA”) (p. IV.B-61 – IV.B-62). The DEIR’s evaluation of the Project’s potential health risk impacts, as well as the subsequent less-than-significant impact conclusion, is incorrect and the analysis is insufficient for three reasons:

First, this qualitative as opposed to quantitative approach is inconsistent with CEQA’s requirement to make “a reasonable effort to substantively connect a project’s air quality impacts to likely health consequences.”<sup>51</sup> The Project will generate a substantial number of Project-related trips both during construction and operation. For example, during construction 250,000 cubic yards of soil must be removed from the Project Site. The DEIR needs to quantitatively evaluate health risks both in the vicinity of the Project Site, along the haul route, and in the vicinity of the soil disposal site.

<sup>51</sup> “Sierra Club v. County of Fresno.” Supreme Court of California, December 2018, available at: <https://ceqaportal.org/decisions/1907/Sierra%20Club%20v.%20County%20of%20Fresno.pdf>

## **Response No. ORG 1B-77**

The commenter maintains that the EIR should have included both a construction and operational health risk assessment (HRA) of the Project’s toxic air contaminant (TAC) emissions. Pages IV.B-61 through IV.B-63 of the Draft EIR analyze and disclose the potential for the Project to cause adverse health impacts from exposure to TACs from the Project’s construction and operational emissions consistent with CEQA Guidelines Section 15126.2(a). As discussed therein, the Draft EIR correctly concludes that construction and operational TAC impacts would be less than significant (see Response No. ORG 1B-79 below). Although a quantitative HRA for the Project is not required for the reasons discussed in Response No. ORG 1B-79, in order to provide information that

further supports the Draft EIR's less than significant finding with respect to TAC emissions, a quantitative HRA has been prepared. As discussed in further detail in Response to Comment No. ORG 1B-79, the results of the quantitative HRA demonstrate that the health risks from TAC emissions from Project construction would not exceed the SCAQMD significance threshold. This HRA further confirms the Draft EIR's less than significant impact finding with respect to TAC emissions.

All comments in the SWAPE letter, included as Attachment 1, have been responded to in Response Nos. ORG 1B-115 through 1B-137.

Note that modifications to the Project design would reduce the total amount of Project grading from 250,000 cubic yards to 197,000 cubic yards. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

### **Comment No. ORG 1B-78**

Second, the analysis is inconsistent with guidance from the Office of Environmental Health Hazard Assessment (“OEHHA”), the organization responsible for providing guidance on conducting Health Risk Assessments (“HRAs”) in California. OEHHA released its most recent *Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments* in February 2015. Specifically, OEHHA recommends that all short-term projects lasting at least 2 months assess cancer risks and that exposure from projects lasting more than 6 months should be evaluated for the duration of the project.<sup>52</sup> Thus, as the Project's anticipated construction duration exceeds the 2-month and 6-month requirements set forth by OEHHA, construction of the Project meets the threshold warranting a quantified HRA under OEHHA guidance and should be evaluated for the entire 30-month construction duration.

<sup>52</sup> “Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments.” OEHHA, February 2015, available at: <https://oehha.ca.gov/media/downloads/crn/2015guidancemanual.pdf>, p. 8-18.

### **Response No. ORG 1B-78**

The comment states that the Draft EIR is inconsistent with guidance from the Office of Environmental Health Hazard Assessment (OEHHA) regarding HRAs. The OEHHA 2015 Guidance Manual, the most recent version, was developed by OEHHA, in conjunction with the CARB, for use in implementing the Air Toxics “Hot Spots” Program. The Air Toxics “Hot Spots” Program requires stationary sources (e.g., power generation facilities, refineries, and chemical plants) to report the types and quantities of certain substances routinely released into the air. The intent in developing the 2015 Guidance Manual was to provide health risk assessment procedures for use in the Air Toxics Hot Spots Program or for the permitting of new or modified stationary sources. The Project is not a “Hot Spots”

Program project but rather involves the construction and operation of a School's athletic facilities and open space.

The guidance states:

*The local air pollution control districts sometimes use the risk assessment guidelines for the Hot Spots program in permitting decisions for short-term projects such as construction or waste site remediation. Frequently, the issue of how to address cancer risks from short-term projects arises. Cancer potency factors are based on animal lifetime studies or worker studies where there is long-term exposure to the carcinogenic agent. There is considerable uncertainty in trying to evaluate the cancer risk from projects that will only last a small fraction of a lifetime. (Page 8-17)*

While OEHHA provides limited guidance on how to conduct HRAs for short-term projects, it acknowledges the “considerable uncertainty” in evaluating cancer risk over short-term durations. In addition, the guidance document does not identify short-term projects or non-stationary source projects that warrant the preparation of a HRA or recommend the preparation of HRAs for short-term construction projects or non-stationary source projects, such as the Project. Therefore, the most relevant HRA guidance for short-term construction was used, and the results are not underestimated.

### **Comment No. ORG 1B-79**

Third, by claiming a less than significant impact without conducting a quantified construction or operational HRA for nearby, existing sensitive receptors, the DEIR fails to compare the Project's excess cancer risk to the SCAQMD's specific numeric threshold of 10 in one million.<sup>53</sup> Thus, in accordance with the most relevant guidance, an assessment of the health risk posed to nearby, existing receptors as a result of Project construction and operation should be conducted.

The DEIR needs to be revised to include the required quantitative Health Risk Assessment. The DEIR must then be revised and recirculated for public review and comment pursuant to CEQA Guidelines Section 15088.5(a)(4).

<sup>53</sup> “South Coast AQMD Air Quality Significance Thresholds.” SCAQMD, April 2019, available at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf>.

### **Response No. ORG 1B-79**

The commenter maintains that the EIR should have included both a construction and operational HRA of Project's TAC emissions. Pages IV.B-61 through IV.B-63 of the Draft EIR analyze and disclose the potential for the Project to cause adverse health impacts from exposure to TACs from the Project's construction and operational emissions

consistent with CEQA Guidelines Section 15126.2(a). As discussed therein, with respect to Project construction, the Project would be consistent with applicable SCAQMD Air Quality Management Plan strategies intended to reduce emissions from construction equipment and activities, which include the use of cleaner construction equipment. The Project would comply with regulatory mandates including CARB Air Toxic Control Measure (ATCM) that limits idling to no more than five minutes at a location, and the CARB In-Use Off-Road Diesel Vehicle Regulation for the use of cleaner construction equipment. As a result, the impacts from TACs during construction would be less than significant. Consistent with and supportive of the goals of these regulatory mandates to minimize emissions and exposure to emissions, the Project would include emissions controls agreed upon by the City and the School that would be fully enforceable by the City, as per Mitigation Measure AQ-MM-1. While this mitigation measure is intended to reduce the Project's construction criteria pollutant emissions, it would also have the beneficial effect of reducing TACs, including diesel particulate matter (DPM.) emissions, from Project construction equipment.

Implementation of Mitigation Measure AQ-MM-1 would result in the reduction of DPM. exhaust emissions from the Project's construction equipment by over approximately 65 percent as compared to the fleet average emissions for construction equipment and vehicles. Please refer to Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR regarding emissions from the unmitigated localized construction emissions presented on PDF pages 60 through 64 of 437 and mitigated localized construction emissions presented on PDF pages 65 through 69 of 437. As shown therein, on-site construction emissions of PM<sub>2.5</sub>, which are highly correlated to DPM emissions, would be minimized to less than 1 pound per day with incorporation of Mitigation Measure AQ-MM-1. Furthermore, the Project would comply with the CARB ATCM that limits diesel powered equipment and vehicle idling to no more than 5 minutes at a location and the CARB In-Use Off-Road Diesel Vehicle Regulation. Compliance with these standards would substantially minimize emissions of TACs during construction. Note that bullet point No. 3 in Mitigation Measure AQ-MM-1 was updated in Chapter 3 of this Final EIR to clarify the idling regulatory requirements that are applicable to the Project and assumed as part of the mitigated air quality emission analyzed in the Draft EIR.

Furthermore, as disclosed in the Draft EIR on pages IV.B-32 and IV.B-61, health effects from TACs for sensitive residential receptors are described in terms of individual cancer risk based on a long-term resident exposure duration (i.e., resident lifetime or 70-year). Given the temporary and short-term construction schedule (approximately 30 months), the Project would not result in a long-term (i.e., lifetime or 70-year) exposure as a result of Project construction. Although a quantitative HRA for the Project is not required for the reasons discussed above, in order to provide information that further supports the Draft EIR's less than significant finding with respect to TAC emissions, a quantitative HRA has been performed. Consistent with the discussion on pages IV.B-61 of Section IV.B, *Air Quality*, of the Draft EIR, the findings of the HRA show that the Project, with incorporation of Mitigation Measure AQ-MM-1, would result in cancer risk below 10 in one million for the maximum impacted air quality-sensitive receptors, which would be located directly

across the street to the Project Site. Other receptors would result in lower air pollutant health risk impacts from the Project due to atmospheric dispersion effects. The results of the refined AERMOD dispersion modeling provides further substantial evidence that TAC emissions from construction activities would not expose sensitive receptors to substantial TAC concentrations. The results of the quantitative health risk modeling are provided in Appendix I of this Final EIR.

As discussed on pages IV.B-62 and IV.B-63 of the Draft EIR, the Project does not include the installation of industrial-sized stationary sources of TAC emissions; therefore, potential long-term operational impacts associated with the release of TACs would be minimal, regulated, and controlled, and would not exceed the SCAQMD thresholds of significance. As such, the Draft EIR addressed human health in the air quality analysis, and no additional analysis is required. The SCAQMD has published and adopted the Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning, which provides recommendations regarding the siting of new sensitive land uses near potential sources of air toxic emissions (e.g., freeways, distribution centers, rail yards, ports, refineries, chrome plating facilities, dry cleaners, and gasoline dispensing facilities). The Project would not include any of these uses; therefore, an operational HRA is neither required nor necessary.

Additionally, with respect to operational health risks, see Topical Response No. 7 – Artificial Turf and Effects on Localized Heat and Health. Topical Response No. 7 addresses the potential health-related and urban heat island effects due to the Project's use of artificial turf fields. The Project would replace the existing Project Site uses with new athletic and recreational facilities, including outdoor athletic fields utilizing artificial grass as a sustainable alternative to turf grass, thereby reducing irrigation water demand and avoiding the use of pesticides associated with the turf grass. Section IV.H, *Hazards and Hazardous Materials*, and Appendix H-2, Artificial Turf Technical Memorandum, of the Draft EIR, included a detailed evaluation of potential health impacts related to use of artificial turf. Based on the analysis, the Draft EIR determined that health-related impacts from inhalation, ingestion, and dermal contact, and heat related would be less than significant. Refer to Topical Response No. 7 for additional detail regarding the Project's health-related impacts associated with artificial turf.

Based on the above, the comment does not provide substantial evidence that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, the revision and recirculation of the Draft EIR is not necessary.

## **Comment No. ORG 1B-80**

### **4.7 Lack of an Adequate Cumulative Noise Assessment**

The DEIR needs to address the potential of the proposed Project in combination with cumulative noise sources such as increasing aviation noise in the Project area, to result in cumulative noise impacts. As explained by Studio City for Quite Skies:<sup>54</sup>

NextGen is the Federal Aviation Administration's new satellite GPS system for guiding aircraft. It is being implemented all over the country. It creates concentrated flight paths supposedly to promote efficiency and save money for the airlines but it has not achieved its goal (according to the Inspector General) and has been a complete failure inspiring lawsuits nationwide. . .

### **How is it different from the previous system?**

The FAA formerly used a radar system that dispersed flights in six-mile wide paths. With NextGen, the FAA has compressed these paths into narrow, undeviating half-mile corridors - massively increasing noise and pollution for those living under them. Previously, jets departing Hollywood Burbank Airport were dispersed over a six-mile area, sharing the burden of noise across the East San Fernando Valley. Since NextGen, however, flight paths have been narrowed to a half-mile wide area, at dramatically lower altitudes, and were shifted south directly above our once-tranquil hillside suburb, including the protected, 4(f)-designated wilderness of the Santa Monica Mountains. This High Fire Severity Zone was never studied as part of Metroplex and residents were never given notice of the change. Studio City is now subjected to almost 200 low and loud jets per day from Burbank, expected to increase by 15% per year - with an all-new Expanded Burbank Terminal coming in 2024. This is on top of some 80-100 flights per day from Van Nuys Airport - also increasing.

### **How does all this affect Studio City, Sherman Oaks and Encino?**

Control towers and airlines gradually rolled out NextGen in Southern California ("The Southern California Metroplex") in November, 2016 and officially in March, 2017. See evidence of November 2016 rollout [HERE](#). At Burbank Airport, Air Traffic Control began vectoring flights far south of the 101 Freeway in anticipation of the FAA creating two new departure procedures, named SLAPP TWO and OROSZ THREE. Since the Task Force recessed in May 2020, FAA has added multiple new operations over our community in addition to just departures. We now receive simultaneous arrivals and departures from both BUR and VNY, when prior to the Task Force, we received arrivals only on "wind days," and instead of departures.

### **What are the two New Proposed Procedures?**

FAA has proposed TWO NEW BURBANK DEPARTURE PROCEDURES (SLAPP TWO and OROSZ THREE) which will create GPS-guided waypoints over Colfax/Ventura (near Carpenter Community Charter Elementary School) and at Hollyline, south of Valley Vista (near The Buckley School). These will serve to legitimize and make permanent flight paths that are already destroying our quality of life - while extending the air noise misery to Sherman Oaks and Encino. These procedures were

proposed without an Environmental Assessment or any consultation with affected communities. Studio City has suffered a devastating increase in airplane noise since the introduction of NextGen.

The DEIR needs to address the cumulative noise impact of the proposed Project in combination with the related cumulative noise impact resulting from past, present and reasonably foreseeable changes in Burbank Airport operations.

<sup>54</sup> <https://www.studiocityforquietskies.com/copy-of-about>

## **Response No. ORG 1B-80**

The comment states that the Draft EIR needs to address the flight patterns for the Hollywood Burbank Airport as a cumulative noise impact. As discussed under Threshold (c) of Section IV.K, *Noise*, of the Draft EIR, the Project is not located within two miles of a public airport or private airstrip and is not within the boundaries of an airport land use plan. Therefore, the Project would have no impact and would not expose people residing or working in the Project Site area to excessive noise levels from aircraft. Accordingly, the Project would, therefore, not contribute to any cumulative noise impacts related to airports.

## **Comment No. ORG 1B-81**

### **4.8 Public Services – Failure to Identify Significant Impacts to Fire Station Operations During Construction and Operation and on Emergency Access**

As noted on DEIR page II-53, the “south driveway” for the aboveground and underground parking areas would be “via a driveway at the paved portion of Valleyheart Drive located just south of LAFD Fire Station 78”. **Figure 3** shows the proximity of this driveway to the Fire Station. **Figures 4 and 5** shown the configuration of the Fire Station and its driveways.

**FIGURE 3 – Location of South Driveway and Dropoff Area in Relation to Fire Station No. 78**

Source: DEIR Figure II-6 – The number 2 indicates vehicular entry, the number 5 indicates a vehicular gate

**FIGURE 4 – Aerial View of Fire Station 78**

Source: Google Earth

**FIGURE 5 – View of Fire Station 78 from Valleyhart – Eastern Driveway**  
Source: Google Earth

## Construction

DEIR page II-62 indicates that the “inbound haul route would come from US-101, head southbound on Coldwater Canyon Avenue, eastbound on Moorpark Street, and southbound on Whitsett Avenue to access the Project Site” and that the “outbound haul route would leave the Project Site and head southbound on Whitsett Avenue, westbound on Ventura Boulevard, and northbound on Coldwater Canyon Avenue to reach US-101.”

As noted on page IV-M-18 of the DEIR: With regard to LAFD Fire Station 78 emergency access, **the station’s main driveway used for the departure of the larger fire trucks from the station bays is located on Whitsett Avenue**, north of Valleyheart Drive. The station also has two driveways on the north side of Valleyheart Drive. Of these two driveways, the westerly driveway is used for the return of the larger fire vehicles, which swing wide and use most of the Valleyheart Drive roadway to enter the fire station before proceeding to the bays. The easterly driveway to the fire station is used for the entry and departure of smaller vehicles, such as ambulances. (Emphasis added).

DEIR page IV.M-44 concludes without providing any evidence that:

emergency access would be maintained at all times as no road closures would be necessary. However, while construction activities would not require full street closures (i.e., at least one travel lane would be open at all times) and most Project construction activities would be confined to the Project Site, the Project would still implement a CMP (see Project Design Feature TRAF-PDF-1). Because of the short-term nature of the construction activities and with implementation of a CMP, the Project’s construction activities would not require a new, or significantly interfere with an existing, risk management, emergency response, or evacuation plan. The Project would not result in inadequate emergency access during construction.

Given the volume of construction truck traffic associated with the project, the fact that the construction haul route will use Whitsett, the fact the DEIR admits that some travel lanes may be closed during construction, the location of Fire Station 78 and its driveways, and the fact that the DEIR relies on Project Design Feature TRAF-PDF-1 (a Construction Management Plan), the specifics of which have not been disclosed, the conclusion that impacts to emergency response during construction will be less than significant are not supported by substantial evidence. There has been no demonstration that the Construction Management Plan will fully mitigate emergency access and response impacts during construction or that such mitigation is really feasible. The potential for significant emergency response impacts during construction remains.

### **Response No. ORG 1B-81**

The comment states that the analysis of impacts regarding emergency response is inadequate. Impacts on emergency response during construction were fully evaluated in Section IV.M, *Transportation*, of the Draft EIR. The commenter is referred to Topical Response No. 10 – Emergency Access, for a discussion of Project construction and operations at LAFD Fire Station 78. As discussed therein, the Project would employ temporary traffic controls, such as flag persons, to control traffic movement during temporary traffic flow disruptions. Traffic management personnel would be trained to assist in emergency response by restricting or controlling the movement of traffic that could interfere with emergency vehicle access. During operation, as part of the Project design and per Project Design Feature TRAF-PDF-2, a flashing red warning light(s) will be installed on the southern exit driveway within the Project Site to hold back vehicles exiting the Project Site roundabout onto Valleyheart Drive. The warning light would assist the return of the fire trucks and other vehicles to the fire station via Valleyheart Drive and could be activated by LAFD during the initial stages of response mobilization, allowing any inbound or outbound vehicles at the Project Site to clear the LAFD driveways, effectively maintaining unfettered emergency vehicle access to the fire station.

Project Design Feature TRAF-PDF-1 on page IV.M-26 of the Draft EIR describes the basic requirements that the Construction Management Plan (CMP) will be required to achieve. The CMP will be reviewed, approved, and monitored by LADOT to ensure that the plan will adequately address any transportation impacts during construction.

### **Comment No. ORG 1B-82**

#### **Operation**

As previously discussed in **Section 3.7**, the DEIR impermissibly relies on a Project Design Feature, TRAF-PDF-2, the installation of a flashing warning light installed on the southern exit driveway as the mechanism for ensuring that vehicles existing the Project Site will not conflict with emergency vehicles entering and existing Fire Station 78 site and POL-PDF-2, the existence of security kiosks, when making impact judgements.

The DEIR concludes on page IV.M-45 that:

The warning light would allow for adequate emergency access by LAFD vehicles between Valleyheart Drive and Whitsett Avenue by reducing conflicts between vehicles leaving the Project Site and emergency vehicles leaving/coming back to the station. Further, the warning light would minimize the eastbound queues by vehicles leaving the Project Site along Valleyheart Drive at Whitsett Avenue when emergency vehicles need to access Valleyheart Drive. With the warning light in operation, LAFD would be able to effectively maintain adequate emergency vehicle access to the fire station. Also, the Project would include an at-grade security kiosk located near the roundabout, thereby placing a security guard nearby to assist with traffic management when the warning light is activated. . . .

**Based on the above, Project impacts with respect to emergency access would be less than significant.**

The DEIR has thus failed to identify a significant emergency access impact, by relying on PDFs which are clearly mitigation measures when conducting the analysis. Given that the DEIR has failed to identify a significant impact, by relying on PDFs which are in fact clearly mitigation measures, recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(1).

## **Response No. ORG 1B-82**

The comment restates that Project Design Feature TRAF-PDF-2, which has the effect of minimizing impacts on the emergency access to the adjacent fire station, should be included as a mitigation measure. The comment conflates Project components with mitigation measures needed if those components were not integrated into the design of the Project. For all the reasons previously stated in the responses to this comment letter, the Draft EIR is not flawed in its use of PDFs which are Project elements, or its use of mitigation measures which are additional measures added after analysis of the Project with the PDFs integrated into the Project. See Response No. ORG 1B-8, Response No. ORG 1B-22, Response No. ORG 1B-23, Response No. ORG 1B-25 and Response No. ORG 1B-26 for further discussion of PDFs.

Project Design Feature TRAF-PDF-2 is an integral part of the Project as designed by the School. As such, it is part of the whole of the Project and appropriately considered as a Project component in the analysis of the Project's potential impacts on fire services and emergency access. The comment, however, implies that having a design element which ensures that the Project avoids conflicts with the fire station is proof that the PDF is really a mitigation measure. Even if this analysis were logical, unlike the situation in *Lotus*, the environmental impacts of the Project are fully disclosed in the Draft EIR and the compliance with the PDF is secured by inclusion of the PDF in the MMP. See Section IV.M, *Transportation*, and Appendix M, *Transportation Assessment*, to the Draft EIR, which thoroughly discuss the transportation consequences of the Project. The Draft EIR

does not mask the emergency access concerns presented by the Project. The Draft EIR acknowledges that at certain times, such as the end of large interscholastic competition, the Project could temporarily increase traffic (Draft EIR at page IV.L.1-24). It also explains that LAFD Fire Station 78 is located on Valleyheart Drive, which provides access for the Project's southern driveway. The Draft EIR further explains that to ensure that access to the fire station would not be impacted by any increase in traffic, the Project was designed with Project Design Feature TRAF-PDF-2 which provides a system to ensure emergency access for the fire station. The exact elements of that design and what it would accomplish is thoroughly discussed on pages IV.L.1-25 through IV.L.1-26 and IV.M-44 through IV.M-45 of the Draft EIR. Therefore, the Draft EIR's discussion of emergency access is not diminished by including this design feature as a PDF rather than a mitigation measure. See also, Topical Response No. 10 – Emergency Access, which summarizes impact findings related to emergency access associated with LAFD Fire Station 78. As discussed in Topical Response No. 10, the Project's emergency access impacts were fully evaluated in Section IV.L.1, *Public Services – Fire Protection*, and Section IV.M, *Transportation*, of the Draft EIR. Despite the Project's periodic and temporary increase in localized traffic, the Project would not significantly impair the LAFD from responding in a timely manner to emergencies at the Project Site or the surrounding area. The Project would provide for emergency access into the Project Site and would not substantially interfere with emergency access in the surrounding neighborhood such that response times are substantively increased. It would also provide a system to maintain adequate access for emergency vehicles to enter and return to the adjacent LAFD Fire Station 78 and, thus, would not interfere with the operation of that fire station or substantively increase response times. In conclusion, as discussed in Section IV.L.1, *Public Services – Fire Protection*, and Section IV.M, *Transportation*, impacts to fire protection services, including operations at LAFD Fire Station 78, as well as emergency access associated with LAFD Fire Station 78, would be less than significant.

### **Comment No. ORG 1B-83**

The Traffic Analysis included as Appendix M to the DEIR identifies, on page 62, two mitigation measures for Project access issues at the south Project driveway:

#### **Potential Corrective Actions**

After identifying the Project related access constraint at the south driveway on Whitsett Avenue during the Special Event Scenario, the following corrective action was identified to minimize the access constraints:

- On Special Event Days, prohibit left turns out of the south driveway and force all exiting vehicles to turn right onto Whitsett Avenue. This can be employed using traffic control officers (TCOs) as part of an event management plan to be developed with LADOT. This change would improve the projected LOS at the southern driveway from LOS F to LOS

B and would reduce the projected queue length from 150 feet to 25 feet, as shown in **Table 12A** and **Table 12B**.

- To minimize effects on access for LAFD vehicles on Valleyheart Drive, implement a warning light that would hold back vehicles exiting the Project turnaround onto Valleyheart Drive when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting from one of the two LAFD driveways on Valleyheart Drive. This warning light would be activated by a button pressed by LAFD staff in the emergency vehicles.

While the second of these needed mitigations has been included as Project Design Feature (TRAF-PDF-2), the left-turn restriction has not been required as a mitigation measure. In the absence of this mitigation, significant Project impacts remain and the DEIR needs to be recirculated to acknowledge these impacts.

### **Response No. ORG 1B-83**

The comment incorrectly states that the Transportation Assessment, Appendix M of the Draft EIR, required imposition of two mitigation measures. In fact, the measures discussed in the Transportation Assessment, PDF page 81 of 217 in Appendix M to the Draft EIR, and cited in the comment, are only listed as potential corrective actions to minimize access constraints and not required to mitigate any potentially significant CEQA impact. As noted in the comment, the warning light has been included in Project Design Feature TRAF-PDF-2.

The left-turn prohibition on Special Event Days would be included in an event Parking and Traffic Management Plan, as described in Topical Response No. 9 – Transportation and Parking During Construction and Operations. As discussed therein, Project Design Feature TRAF-PDF-3 has been modified to include a Parking and Transportation Management Plan that would be employed by Harvard-Westlake School for all athletic competitions or Special Events that are expected to draw more than 300 concurrent attendees. This update has been incorporated into Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR.

Moreover, the comment fails to provide any evidence that exclusion of the potential corrective action causes the Project's impact to be significant. A mitigation measure is only needed to minimize significant adverse impacts (CEQA Guidelines Section 15126.4). Since the Transportation Assessment did not recommend this corrective action to lessen a significant impact, the Draft EIR is not deficient and recirculation is not required.

### **Comment No. ORG 1B-84**

In addition, the analysis on pages IV.M-44 to 45 of the DEIR and PDFs only addresses traffic exiting the Project Site via the driveway adjacent to Fire Station 78. No analysis has been provided in the DEIR of the potential of vehicles, turning onto Valleyhart [*sic*] in

the vicinity of Fire Station 78 from Whitsett to enter the Project Site for drop-off or parking purposes, to interfere with the operation of the Fire Station.<sup>55</sup> The DEIR needs to address both left and right-turn movements onto Valleyhart [*sic*] from Whitsett into the south Project driveway. If exiting vehicles will result in impacts to Fire Station operations, so too will entering vehicles. This impact has not been identified in the DEIR. Recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(1) and (4). Please also see and address all of the comments by Aperture, included in Attachment 5 to this letter. Aperture is a forensic engineering firm and has identified defects in the DEIR's analysis.<sup>56</sup>

<sup>55</sup> See for example

<sup>56</sup> See <https://www.aperturellc.com> or <https://wexco.net> Apertures services include: accident reconstruction, animation & graphics, biomechanics, construction defect and premises liability analyses.

## Response No. ORG 1B-84

The comment states that Draft EIR fails to address vehicles entering the Project Site at Valleyheart Drive, in the vicinity of LAFD Fire Station 78, thus requiring revision and recirculation of the Draft EIR. PDF pages 80 and 81 of 217 of Appendix M , Transportation Assessment, to the Draft EIR addresses the passenger loading at the on-site turnaround off of Valleyheart Drive. The turnaround at the western edge of Valleyheart Drive would be used exclusively for drop-off and pick-up activities (i.e., shuttles, transportation network company [TNC] vehicles). The available storage capacity in the turnaround was found to be sufficient for the estimated queuing on special event days, which is the worst-case, highest trip generating event anticipated at the Project Site. Since the storage capacity is sufficient to contain the vehicular queue at the turnaround, queue spillback from the turnaround onto Valleyheart Drive would not occur and thus would not interfere with LAFD Fire Station 78 operations on Valleyheart Drive.

Further, refer to Response No. ORG 1B-81 and Topical Response No. 10 – Emergency Access, for a discussion of effects to operation at LAFD Fire Station 78, including those associated with construction activities.

The comment does not provide substantial evidence of significant new information showing that there is a new significant impact, an increase in the severity of an impact, or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, the revision and recirculation of the Draft EIR is not necessary.

The responses to the comments by Aperture in Attachment 5 are addressed in the Responses to Comment Nos. ORG 1B-170 through 1B-196 below.

## Comment No. ORG 1B-85

Furthermore, the Traffic Analysis needs to be redone since the trip assignment used makes no sense given that one of the Harvard-Westlake schools that would use the facilities is located on Coldwater Canyon Boulevard and the other is located west of Coldwater Canyon. As shown in **Figure 6**, which reproduces Figure 8A from the Traffic Analysis in DEIR Appendix M, the Traffic Analysis assumes that 60 percent of Harvard-Westlake visitors to the site would arrive from the eastbound 101 freeway and 20 percent would be coming from east of Whitsett. The same trip distribution was also used for Harvard-Westlake employees (see Appendix M, Figure 8C). The trip distribution used in the analysis therefore makes no sense and is likely to underestimate right turns onto Valleyheart from Whitsett after vehicles pass Fire Station 78. Furthermore, a separate trip distribution and analysis needs to be provided for non-Harvard-Westlake events at the Project Site. The analysis of potential impacts from Project vehicular movements needs to be completely redone and the DEIR recirculated for public review and comment pursuant to CEQA Guidelines Section 15088.5(a)(4).

**FIGURE 6 – Trip Distribution Assumptions for Harvard-Westlake Visitors and Employees Used in the Traffic Analysis**

Source: Figure 8A from the Traffic Analysis in DEIR Appendix M

## Response No. ORG 1B-85

The comment states that the Transportation Assessment's trip assignment figures are not adequate. As explained in pages 53 through 63 (PDF pages 71 through 81 of 217) of Appendix M, Transportation Assessment, to the Draft EIR, Figures 8A through 8C, Trip Distribution Map, on pages 50 through 52 (PDF pages 68 to 70 of 217) and Table 10, Trip

Generation Estimate, on page 49 (PDF page 67 of 217) represent the trip generation and distribution of the following groups: Harvard-Westlake students traveling to the Project Site for practice or a game, Harvard-Westlake coaches, visiting team athletes and coaches, spectators, and visitors to the Harvard-Westlake campus, which includes the visiting team athletes and coaches, as well as spectators. This trip distribution was developed based on zip code data provided by Harvard-Westlake School of the number of Harvard-Westlake student households in each zip code, as this would be representative of the origin and/or destination of the groups indicated above.

Zip code data for employees was analyzed to obtain the average trip length to the Project Site, as well as trip distribution. The average trip length was found to be slightly longer than the trip length for the Harvard-Westlake “Other” category (i.e., the groups listed in the paragraph above), but the distribution of the trips to the streets and intersections in the vicinity of the Project Site was found to be the same, due to the majority of trips of both categories using the US-101.

The Harvard-Westlake student athletes arriving from the Upper School to the Project Site or from the Middle School to the Project Site (via the existing intercampus shuttle that carries Middle School athletes to the Upper School) are not included in this trip distribution and were considered separately. The Middle School students that would participate in sports at the Project Site are currently already bused from the Middle School to the Upper School campus for these sports, along with other Middle School students who use transportation to the Upper School campus at the end of the academic day (such as for after-school clubs and meeting up with the student’s older sibling(s)). Therefore, these students are considered to already be at the Upper School and, in terms of trip distribution, are included with the other Upper School students riding the shuttle to the Project Site (students from the Middle School are, except in very rare circumstances, not of legal driving age). Regarding non-Harvard-Westlake events (community events), these events are exempt as community uses for VMT analysis, but were analyzed for project access, safety, and circulation in Appendix M to the Draft EIR. Therefore, the trip generation and distribution utilized in the Transportation Assessment for the Project is valid.

### **Comment No. ORG 1B-86**

Given that impacts are underestimated, recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(2). Due to both the failure to identify an impact and the underestimate of impacts recirculation of the DEIR is also required pursuant to CEQA Guidelines Section 15088.5(a)(4).

### **Response No. ORG 1B-86**

The comment contends that revision and recirculation of the Draft EIR is required due to underestimation of impacts related to transportation. Refer to Response Nos. ORG 1B-81 through ORG 1B-85. Based on the above, the comment does not present substantial evidence that the Draft EIR is fundamentally flawed to support a contention that the Draft

EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, the recirculation of the Draft EIR is not necessary.

## **Comment No. ORG 1B-87**

### **4.9 Traffic – Failure to Identify Pedestrian and Vehicular Safety Impacts**

Please also see and address the comments by Aperture regarding pedestrian and vehicular safety, included in **Attachment 5** to this letter.

## **Response No. ORG 1B-87**

The responses to the comments by Aperture in Attachment 5 are addressed in the Responses to Comment Nos. ORG 1B-170 through 1B-196 later in this document.

## **Comment No. ORG 1B-88**

### **4.10 Traffic – Inadequate Analysis of Construction Impacts to Freeway Safety and Off-Ramp Queuing**

DEIR pages IV.M-41 to IV.M-44 include an analysis of the impacts of Project operations on local and freeway safety, including the operation of the US-101 Southbound Off-ramp to Coldwater Canyon Avenue during the peak afternoon hour. This analysis largely consists of a narrative unsupported by quantitative data or analysis. It is therefore not supported by substantial evidence.

Furthermore, no such analysis is provided of the impacts of Project construction-related activities on local and freeway safety. The proposed Project will generate an enormous amount of truck traffic during construction, more than one inbound and one outbound truck trip every two minutes. As required by CEQA, the DEIR needs to address construction, as well as operational impacts of the Project on local roadway and freeway safety and the operation of the freeway ramps. A quantitative analysis of the impact of truck traffic, with truck traffic converted to passenger car equivalents as appropriate, needs to be included in the DEIR, otherwise, based on the sheer volume of truck traffic, there is the clear potential for significant unmitigated truck-related impacts to the safety and operation of the freeway and freeway ramps at both ends of the haul routes. Given that truck traffic will be generated during both the a.m. and p.m. peak period, both periods need to be addressed in the analysis.

## **Response No. ORG 1B-89**

The comment states that the analysis of Project impacts on local and freeway safety is inadequate. While the discussion of impacts of Project operations on freeway safety is qualitatively described on page IV.M-43 of the Draft EIR, the quantitative analysis supporting this discussion and conducted in accordance with LADOT guidance is included on pages 28 through 31 (PDF pages 46 through 49 of 217) of Appendix M,

Transportation Assessment , to the Draft EIR. An analysis of potential construction-period impacts on the transportation system conducted in accordance with the requirements of LADOT's Transportation Assessment Guidelines is presented on page 69 (PDF page 87 of 217) of Appendix M to the Draft EIR.

## Comment No. ORG 1B-90

### 4.11 Traffic –Failure to Identify Significant Neighborhood Impacts

The proposed project includes 532 parking spaces to serve the 80,249 square foot, two-story gymnasium with basement, playing fields, courts and clubhouse with 10-seat café. DEIR Table II-6 shows the calculation of required parking per LAMC Section 12.21 A4 as 444 spaces and is based on the number of fixed seats associated with the gymnasium, tennis courts, Field A, Field B and Pool. While LAMC Section 12.21 A4 (e)<sup>57</sup> does provide for calculating parking requirements based on fixed seats as follows, this has been inappropriately applied to the gymnasium portion of the Project:

(e) **For Auditoriums.** There shall be at least one automobile parking space for each five seats contained within any theatre, church, high school, college or university auditorium, or general auditorium, stadium or other similar place of assembly. Where there are no fixed seats in the auditorium or place of assembly, there shall be one parking space for each 35 square feet of floor area (exclusive of stage) contained therein.

However, LAMC Section 12.21 A4 (c)(2) specifies:

(2) **Health Clubs:** There shall be at least one automobile parking space for each 100 square feet of floor area in the building being utilized for a health club, athletic club, bath house, **gymnasium**, dance studio, dance hall, or any similar establishment, which operates as a private facility or offers the use of the premises and equipment to the general public for physical exercise, dance or sports activities. This provision does not include such a facility located in a building which is accessory to an elementary school, junior high school or senior high school as defined in Section 12.03 of this article or any other institution of learning under the jurisdiction of the State Department of Education. This provision does not include such a facility located within an office building of at least 50,000 square feet or more of gross floor area, or located within the Downtown Business District parking exception area described in Paragraph (i) of this subdivision.

The gymnasium does not qualify as accessory to a school, since it is not located on the same lot as the school.<sup>58</sup> Parking requirements for the gymnasium should therefore have been calculated based on square footage. Given the 80,249 square foot size of the gymnasium, 802 parking spaces would be required for this portion of the proposed Project.<sup>59</sup> In total 1,041 parking spaces would thus be required for the Project. The Project is thus severely under-parked and it is therefore likely that event parking will spill over into

nearby neighborhoods, particularly given that DEIR page II-50 acknowledges that school events will include attendance by up to 2,000 persons:

In addition to the school athletic and recreational activities described above, the Project Site could be used for up to 30 school-related special events per year, 27 of which are conservatively assumed to have up to 500 people and three with 2,000 people. These special events would include a maximum of 15 weekday events, 10 Saturday events and 5 Sunday events. Special events are defined as any non-athletic, non-recreational or non-regular academic activity involving more than 100 persons.

<sup>57</sup> See: [https://codelibrary.amlegal.com/codes/los\\_angeles/latest/lapz/0-0-0-5183](https://codelibrary.amlegal.com/codes/los_angeles/latest/lapz/0-0-0-5183)

<sup>58</sup> See LAMC definition of accessory use at: [https://codelibrary.amlegal.com/codes/los\\_angeles/latest/lapz/0-0-0-886#JD\\_12.03](https://codelibrary.amlegal.com/codes/los_angeles/latest/lapz/0-0-0-886#JD_12.03)

<sup>59</sup> It should be noted that parking requirements are typically established based on studies of trip generation associated with different uses.

## Response No. ORG 1B-90

The comment states that the parking requirements for the Project were not correctly determined. Contrary to the contention in the comment, the parking needs for the Project's gymnasium are more akin to an auditorium than a health club because the activities on-site are generally controlled by the School. In this case, the gymnasium would be considered as accessory to the school, as the Project would primarily serve Harvard-Westlake students from the Upper School campus. The gymnasium would not be operated as a typical health club open to the public upon simple remittance of health club dues. Further, LAMC Section 12.21 A.4(e) requires one parking space per five fixed seats for stadiums, high schools, colleges, and general assembly, as well as for auditoriums. A 5:1 seat:parking ratio is consistent with how the City has evaluated other school-constructed gymnasiums throughout the City and, therefore, a 1 seat per 100 square foot is inappropriately applied in this comment. As discussed in Chapter II, *Project Description*, of the Draft EIR, students would be bused to the Project Site from the Upper Campus for typical after-school activities. The capacity for spectators for Harvard-Westlake athletic events and for public use by pre-approved organizations would be limited by the seating capacity of the gymnasium.

Appendix M, Transportation Assessment, to the Draft EIR evaluated the Project access, safety and circulation associated with the Special Event Scenario, which represents the trips associated with a Harvard-Westlake special event day, specifically a conference day. This scenario was selected as it was anticipated to generate the highest number of vehicle trips based on the attendance (up to 500 attendees) and average vehicle occupancy (AVO of 1). This would result in a maximum of 500 vehicles parking on-site, which is a conservative estimate since some conference attendees would likely use a TNC service like Lyft or Uber and would not require parking on-site. 500 vehicles would be accommodated on-site and would not result in spillover onto neighborhood streets. There would be events with up to 2,000 attendees, but those events would require busing to the

Project Site from either the Upper School or the Middle School with an AVO of 40, and thus would not result in a higher vehicle trip generation compared to the special event day scenario of 500 attendees with an AVO of 1. Please refer to Response to Comment No. 1B-13 regarding the addition of Project Design Feature NOI-PDF-4 which limits the maximum attendance at school-related Special.

### **Comment No. ORG 1B-91**

According to DEIR page II-56:

By providing more parking spaces than required by the LAMC, the School would accommodate the parking needs of its students, employees, and visitors on-site, to ensure they do not park in the surrounding community. Off-site parking for the Project Site's users would be prohibited through the following measures:

- Security patrols present north of the Project Site on Valley Spring Lane during events to enforce no neighborhood or other off-site parking.
- Security guard placed at the pedestrian entrance on Whitsett Avenue to screen visitors for neighborhood parking and to return visitors to their car if inappropriately parked.
- On days in which event attendance is expected to surpass 300 spectators, tickets and parking passes would be required for visitors to enter the Project Site. This includes single events or combined events. For reference, attendance reached this level fewer than ten times during Harvard-Westlake School's 2018- 2019 school year and is anticipated to be similarly infrequent at the Project Site. On ticketed days, visitors without parking passes would be directed to the upper school campus on Coldwater Canyon Avenue to utilize the shuttle service to the Project Site.
- Three shuttles are anticipated to transfer students, coaches, and visitors between the campus and the Project Site between 2:30 p.m. to the end of the day's latest activity. Shuttles would have an estimated rider capacity of 24 and service is anticipated every 5 to 10 minutes. Ingress and egress at the Project Site would be at the south driveway drop-off roundabout, at Valleyheart Drive, just west of the LAFD Fire Station 78.

Requirements for use of a Shuttle and parking passes is required by TRAF-PDF3, which is clearly intended as a mitigation measures for potential impacts. POL-PDF-2 specifies the provision of the specified security personnel, and is clearly intended as a mitigation measure for potential impacts. The DEIR has therefore failed to identify significant pre-mitigation neighborhood impacts.

## Response No. ORG 1B-91

The comment restates the contention that PDFs related to transportation should have been analyzed as mitigation measures. Refer to Response Nos. ORG 1B-32 and ORG 1B-33, which address the adequacy of Project Design Feature TRAF-PDF-3 and POL-PDF-2 as PDFs, and not mitigation measures.

Project Design Feature TRAF-PDF-3 is legitimately a PDF rather than a mitigation measure since it has been the intention of Harvard-Westlake to require shuttling from the Upper Campus from early planning for the Project to the present. Project Design Feature POL-PDF-2 is legitimately a PDF rather than a mitigation measure since provision of on-site security personnel is a necessity to ensure the safety of students, employees, spectators, and public users of the Project Site and has also been an element of the Project from early planning to the present. As such, these features are appropriately included as PDFs.

## Comment No. ORG 1B-92

The DEIR silent [sic] on the number of frequencies of non-school special events that will be permitted at the Project Site and how parking for such events will be controlled. In the absence of a mitigation measure prohibiting non-school special events, assumptions about the frequency of large events that will occur at the site are not supported by substantial evidence, and impacts associated with special events has been underestimated. Both the impact analysis and DEIR's Project Description are silent on how non-school special event traffic will be managed.

## Response No. ORG 1B-92

The comment states that non-school events are inadequately analyzed and that the number of non-school special events is not disclosed. As discussed in Chapter II, *Project Description*, page II-34 of the Draft EIR, there would be up to five special events per year for the public. Refer to Response Nos. ORG 1B-14 to ORG 1B-17 for information pertaining to the transportation analysis for non-school events (community events).

The commenter is also referred to Topical Response No. 9 – Transportation and Parking During Construction and Operations, for a discussion of mechanisms to manage traffic and parking on event days. As discussed therein, per the City's criteria, the Project is not expected to create an excessive burden on any of the surrounding residential streets in either the Non-Event Scenario or the Special Event Scenario. The preferred driving route to access the Project Site would use local arterial roadways such as Coldwater Canyon Avenue, Moorpark Avenue, and Whitsett Avenue, the preferred driving route would be widely communicated to Project Site visitors. Further, Project Design Feature TRAF-PDF-3 has been modified to include a Parking and Transportation Management Plan that will be employed by Harvard-Westlake School for all School-related athletic competitions or Special Events that are expected to draw more than 300 concurrent attendees. The

Parking and Transportation Management Plan will include appropriate tools to manage and control traffic and parking for the competitions or events so that impacts to the surrounding areas are minimized.

### **Comment No. ORG 1B-93**

The DEIR fails to adequately analyze the impact of visitors to the Project Site seeking parking on nearby streets and neighborhoods and its impact on both neighborhoods and roadway operations and the operation of Fire Station 78. The DEIR similarly fails to adequately analyze the impact noise generation associated with visitors and special events. Given that impacts are underestimated, recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(1) and (2).

### **Response No. ORG 1B-93**

The comment states that the Draft EIR fails to adequately analyze the impacts related to visitor parking on streets, roadway operations, LAFD Fire Station 78, and noise associated with visitors and special events. As shown in Table II-6, *Required Parking Per LAMC Section 12.21 A.4*, on page II-56 in Chapter II, *Project Description*, of the Draft EIR, the Project is providing an appropriate number of parking spaces as required by the LAMC to ensure that there is sufficient parking on-site and that spillover would not occur onto neighborhood streets. Furthermore, Project Design Feature TRAF-PDF-3 requires that, on days in which event attendance is expected to surpass 300 concurrent spectators, tickets and parking passes would be required for visitors to enter the Project Site and that visitors without parking passes would be directed to the Upper School campus on Coldwater Canyon Avenue to utilize the shuttle service to the Project Site.

To prevent visitors from driving through and parking in the surrounding residential neighborhood, visitors would have the use of the subterranean garage. The provision of parking passes would be part of the reservation program for games or other use of recreational facilities by the public. For larger events that would exceed the capacity of the parking structure, visitors would be shuttled from either of the two Harvard-Westlake campuses. For public community events, parking passes would be required in the event that community participants are expected to exceed 300 people. Parking passes would be issued for up to 400 vehicles, or as many parking spaces are available on-site, whichever is fewer. Parking off-site in the surrounding neighborhood would be prohibited. Organizations would be notified of such parking requirements and would be required to inform their participants, coaches, and spectators. These mechanisms would be enforced by Harvard-Westlake, and violations could result in rescinding of the public's permission to use the Project Site.

The commenter is referred to Response No. ORG 1B-92 above and Topical Response No. 9 – Transportation and Parking During Construction and Operations, for a discussion of mechanisms to manage traffic on event days.

Further, as discussed in pages IV.K-46 and IV.K-49 of Section IV.K, *Noise*, of the Draft EIR, and shown in Tables IV.K-14, *School Related Special Events Noise Levels*, and IV.K-15, *Public Special Events Noise Levels*, of the Draft EIR, the range of public or special events activities (including the use of amplified sound), singularly or in combination, would not exceed CEQA threshold levels for noise. The comment that noise levels associated with visitors and special events are not adequately analyzed is not substantiated by fact and no further response is necessary.

Based on the above, the comment does not present substantial evidence of significant new information showing that there is a new significant impact, an increase in the severity of an impact, or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, recirculation of the Draft EIR is not necessary.

## **Comment No. ORG 1B-94**

### **4.11 Inadequate Traffic, Public Facility and Recreational Impacts Due to Displaced Users Analyses**

The DEIR fails to cite any source for the golf course and driving range usage figures provided on DEIR page IV.L.3-14 or to indicate what year and month(s) these figures are for. The DEIR should provide the source of the figures. The DEIR should also provide data showing how monthly usage rates have changed since Harvard-Westlake bought the property.

The DEIR needs to provide multiple-year, monthly data, regarding the use of golf and tennis facilities in the region, not just the limited data provided on page IV.L3-17 to 19. The DEIR indicates that golf and tennis reservations data are from surveys for February and March of 2021. However, there is no indication that these months are typical of historic patterns use pattern. Conclusions regarding the impact of displaced users on other facilities are thus not supported by substantial evidence. The DEIR's VMT analysis needs to account for the additional miles traveled by displaced site users that will have to travel a greater distance to access golf and tennis facilities.

## **Response No. ORG 1B-94**

The comment states that the Draft EIR failed to cite source(s) for data regarding golf course and driving range usage, and failed to analyze the impacts related to displaced users of the current Project Site facilities. The data cited on page IV.L.3-14 in Section IV.L.3, *Parks and Recreation*, of the Draft EIR is based on existing conditions at the Project Site, which is currently occupied by a "for-fee" golf and tennis facility. Harvard-Westlake School is the current property owner and operator of the Project Site. The former Project Site owner/ operator operated the facility for more than a decade prior to Harvard-Westlake School's ownership. Accordingly, Harvard-Westlake School is the source of all existing conditions information, such as the number and type of existing facilities, existing floor areas, acreages for the Project Site and the leased parcels,

existing operations, and other existing features. A clarification has been added to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, indicating that existing condition information was provided by Harvard-Westlake School as the facility operator. The data provided by Harvard-Westlake School was current at the time of the preparation of the Draft EIR in 2021. Data cited for off-site facilities was sourced from websites and operators of the facilities, which is primarily the City of Los Angeles Department of Recreation and Parks. These sources are referenced and dated in footnotes provided in the section. As shown in the footnotes, contact dates are primarily in early 2021.

The study area for tennis facilities is focused on the eastern and south San Fernando Valley, which reflect existing user zip codes and existing locations of individuals who would be most likely relocated to other recreational facilities. The evaluated study area for golf facilities was broader than tennis since, according to the Department of Recreation and Parks, golfers often travel greater distances to municipal courses. This means that the existing location of users who use the Project Site's tennis and golf facilities already derive from throughout the region. In addition, according to the Department of Recreation and Parks, use of outdoor recreational facilities, such as tennis courts and golf courses, during the Covid outbreak skewed higher than typical usage because outdoor recreational use continued to be available and replaced other indoor recreational activity that was not available during the outbreak and subsequent lockdown. In this regard, the data provided by the School during the Covid outbreak was conservative and, as such, multiple-year, monthly data to show a historic use pattern is not necessary. This is discussed on page IV.L.3-17 of the Draft EIR. Regarding lengths of vehicle trips, the City of Los Angeles Department of Transportation VMT calculator ascribes the evaluations of trip length to per capita residents and employees. The analysis of VMT in the Draft EIR is correctly based on VMT calculator requirements for the defined recreational use of the Project Site.

The comment provides no evidence that the figures used in the Draft EIR were inaccurate or improper for use in the analysis of the Project's potential impacts. As such, no further analysis is necessary.

### **Comment No. ORG 1B-95**

The DEIR fails to provide substantial evidence to support its conclusions regarding the lack of recreational facility impacts resulting from the Project. The DEIR provides insufficient data to demonstrate that conclusions are based on data which is representative of historic patterns of site usage both before and after Harvard-Westlake purchased the property and at the other facilities in the region. Monthly data for multiple years is required to support the conclusions in the DEIR. The potential for significant impacts remains.

## Response No. ORG 1B-95

The comment states that the Draft EIR fails to provide substantial evidence that the Project's impacts related to recreational facilities would be less than significant. Section IV.L.3, *Parks and Recreation*, of the Draft EIR accurately depicts the use of the Project Site under current conditions and compares the anticipated relocation of users as well as accommodation of users on-site, to existing conditions as required for the CEQA analysis. Harvard-Westlake School has continued the use of the Project Site that existed prior the School's purchase of the Project Site in 2017. This includes public access to 16 tennis courts per current demand, use of the golf course, use of the clubhouse, use of the driving range, and use of the putting green. The replacement of users who visited the site prior to 2017 would not be pertinent to the CEQA analysis. For instance, if a site once-developed with a large-scale dairy farm were razed and remained vacant for several years, CEQA would require that a future project would be compared to the vacant condition of the Project Site, not to the historic use.

## Comment No. ORG 1B-96

### 4.12 Failure to Identify Significant Cumulative Water Supply Impacts

According to page IV.O.1-28 of the DEIR, after improperly accounting for the water use reductions resulting from WS-PDF-1 (artificial turf) and WS-PDF-2 (capture and reuse system), which are in fact mitigation measures, the DEIR calculates Project water use as follows:

Depending on rainfall frequency and volume, a minimum of one-third of the Project's total annual irrigation demand is expected to be provided by the Project's 1-million-gallon stormwater capture and reuse system. Thus, with Project Design Feature WS-PDF-2, the Project's irrigation demand would be reduced, at minimum, to 6,064 gpd or 6.8 afy; and, the Project's overall water demand would be reduced to 36,885 gpd or 41.31 afy.

...

As indicated in Table IV.O.1-8, the Project would result in a total domestic water demand of 30,821 gpd or 34.52 afy, and a landscape/irrigation demand of 9,051 gpd or 10.13 afy. In total, the Project's overall water demand would be 39,872 gpd or 44.65 afy. The Project, as conservatively analyzed and as further explained below, would result in a net increase of 6,993 gpd or 7.82 afy compared to existing conditions.

The DEIR then goes on to concluded on page IV.O.1-31 that:

As discussed in LADWP's 2020 UWMP and summarized in Tables IV.O.1-4 to IV.O.1-7, above, LADWP expects to have available water supplies during average year, single dry year, multiple dry years and drought

condition scenarios. Assuming the conservative analysis included in Table IV.O.1-8 with a Project water demand of 44.65 afy or a net increase of 7.82 afy above existing conditions, the Project's water demand increase would be well within the City's total increase of 69,200 afy in water demand from 2025 to 2045.<sup>39</sup> With its current water supplies, planned future water conservation and planned future water supplies, LADWP has available supplies to meet all demands under all three hydrologic scenarios (average, single dry, and multiple dry years) through the 25-year planning period covered by the 2020 UWMP. In addition, as shown in Table IV.O.1-7, LADWP would have available water supplies to meet water demand under drought conditions in 2025.

However, the DEIR has failed to account for an important cumulative project which will result in water demand in excess of that analyzed in the 2020 UWMP. That cumulative project is the City's 2021-2029 Housing Element and associated up-zoning of the City.

### **Response No. ORG 1B-96**

The comment states that the Draft EIR improperly accounted for reductions in water use resulting from the incorporation of Project Design Features WS-PDF-1 and WS-PDF-2 and failed to include the City's 2021-2029 Housing Element and associated zoning as a related project for the cumulative analysis. On the first issue, see Response No. ORG 1B-35.

On the second issue, CEQA requires that a project analyze the cumulative effects of potentially significant adverse impacts as specified in CEQA Guidelines Section 15130. Pursuant to Section 15130, the Draft EIR determined the list of related projects within a reasonable geographic area to be discussed in the cumulative analysis of the environmental topics covered in the Draft EIR. (Draft EIR pages III-3 through III-5 and Figure III-1, *Related Projects Map*.) The Draft EIR analyzed the cumulative impact on water supplies due to the demand from the Project, the related projects, and the cumulative increase in population and housing growth combined. As discussed on pages IV.O.1-33 through IV.O.1-35 of the Draft EIR, the analysis shows that the Project's contribution to a cumulative impact to the water supply would not be cumulatively considerable. As explained in that analysis, the water demand for projects that are consistent with the allowable land uses, building area, and density contained in the General Plan, which includes the Housing Element, were taken into account in the planned growth of the City by the LADWP in their 2020 Urban Water Management Plan (2020 UWMP). The 2020 UWMP concludes that the LADWP will have sufficient water supply to reliably provide water to its customers through the year 2045, based on the growth projections in SCAG's 2020-2045 RTP/SCS. Although the 2021-2029 Housing Element Update was adopted after the 2020 UWMP, the analysis is still correct since the Housing Element Update EIR determined that the cumulative demand was within the projections of the 2020 UWMP as explained below.

The 2021-2029 Housing Element was adopted by the Los Angeles City Council on November 24, 2021. The 2021-2029 Housing Element was only adopted after certification of an EIR (ENV-2020-6762-EIR; State Clearinghouse Number: 2021010130) (Housing Element EIR) which analyzed project and cumulative impacts to the City's water supply. The Housing Element EIR included the geographic area of the entire City, approximately 467 square miles. Section 4.16.2, Water Supply and Facilities, pages 4.16-27 through 4.16-55, of the Housing Element EIR, analyzed cumulative water demand and supply and concluded that the City would have sufficient water supplies to serve the build out of the City's Regional Housing Needs Assessment (RHNA) under the Housing Element during normal, dry and multiple dry years and, as such, the impacts to water supply with full build out of the Housing Element would be less than significant (Housing Element EIR at page 4.16-48.)

In the analysis of cumulative impacts, the Housing Element EIR determined that the City would have sufficient water for both the Housing Element and other Citywide project water demand. "Total water demand projected by the LADWP 2020 UWMP accounts for growth within its jurisdictional boundaries, which is based on SCAG's demographic data and the 2020-2045 RTP/SCS, which would include the cumulative projects as well as the growth being accommodated by the Housing Element Update. The LADWP is projected to supply 693,200 afy, which would accommodate the citywide estimated water demand of 597,000 afy with implementation of the Housing Element Update. Per the 2020 UWMP, based on current water supplies, planned future water conservation and planned future water supplies, LADWP will be able to reliably provide water to meet the demands of the City for the 25-year planning horizon identified in the 2020 UWMP, including the planning period of the Housing Element Update through the year 2029. Therefore, cumulative development would not result in a cumulatively significant impact with respect to water supply." (Housing Element EIR page 4.16-73.) This conclusion is consistent with the analysis in the Draft EIR and demonstrates that the City can accommodate the Project, the related projects, and the 2021-2029 Housing Element build out.

Additionally, while the Draft EIR does not list the 2021-2029 Housing Element as a related project, it is not required to do so. CEQA Guidelines Section 1530(b) only requires one of two protocols for discussion of cumulative impacts (i) a list of projects, or (ii) a summary of projections contained in an adopted local, regional, or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. The Housing Element of the City's General Plan is an adopted local plan and therefore is classified under option two of the protocols. The City chose to prepare the cumulative analysis using option one and created a list of nearby planned projects. An EIR is not required to utilize both protocols; therefore the Draft EIR for the Project was not required to also analyze the contribution of the Housing Elements projections.

Moreover, the Draft EIR is not flawed because the water demand projections are appropriately based on the Project's and the Related Project's projected water needs to determine the cumulative impact of the Project's water demand. (See Table IV.O.1-9, *Estimated Cumulative Demand*, Draft EIR page IV.O.1-34.) The Draft EIR then compares

the cumulative total against the total water availability pursuant to the 2020 UWMP as projected through 2045. Since the Housing Element EIR found that the 2020 UWMP projected water supply would be sufficient for both build out of the RHNA and projected Citywide demand, the Draft EIR's reliance on the 2020 UWMP was sufficient to account for any growth caused by full build out of the RHNA housing goals.

Accordingly, the assertion that the Draft EIR failed to take the Housing Element's projected increase in water demand into account is not correct.

### **Comment No. ORG 1B-97**

The Notice of Preparation for the EIR for the proposed Project was issued September 30, 2020, after the City received its Regional Housing Needs Assessment (RHNA) housing production targets for the 2021-2029 period, yet the analysis of Project water use impacts fails to address this important related impacts cumulative project. The additional demand, which arises from housing production targets and associated up-zoning goals established after adoption of the 2020 Urban Water Management Plan (UWMP), is not accounted for in the current 2020 UWMP (see 2020 UWMP Exhibit 1C and 1D on UWMP page 1-6).<sup>60</sup>

<sup>60</sup> The 2020 UWMP is available at:

<https://www.ladwp.com/cs/groups/ladwp/documents/pdf/mdaw/nzyy/~edisp/opladwpccb762836.pdf>

### **Response No. ORG 1B-97**

This comment restates that the Draft EIR's cumulative analysis of impacts on water supply failed to assess water supply in light of the RHNA. See Response No. ORG 1B-96 which explains that the Housing Element EIR did take into account cumulative water demand from full RNHA build out, as well as the City's other projected water needs. and concluded that the water demand projected by LADWP's 2020 UWMP would be sufficient to meet the water demands of the City to serve the build out of the RHNA and other projected citywide growth. Therefore, while the 2020 UWMP was adopted prior to adoption of the 2021-2029 Housing Element, it projected sufficient growth to accommodate the RHNA build out, the Project, and the related projects. The Project Draft EIR, therefore, adequately analyzed the cumulative water demands through reliance on the 2020 UWMP. Moreover, the cumulative analysis in the Draft EIR does analyze total water demand including the cumulative demand from the Project, the related projects, and projected City population and housing growth (see Draft EIR, pages IV.0.1-32 through IV.0.1-35.)

### **Comment No. ORG 1B-98**

As detailed in the City's 2021-2029 draft Housing Element and the Housing Element DEIR, the draft Housing Element would result in the significant up-zoning of land within the City. "In accordance with SCAG's RHNA Allocation Plan, adopted in March 2020, the City's 2021-2029 Housing Element must accommodate a total of **456,643 units**, of which 184,721 units must be affordable to lower income households (Very Low and Low)." <sup>61</sup>

This can be compared to its RHNA allocation of 82,002 units for the prior eight-year cycle. In January of 2020, the City had a total of 1,496,453 housing units according to the California Department of Finance (DOF).<sup>62</sup> The RHNA allocation thus requires a 30% increase in the City's total housing stock in just eight years.

In addition to meeting its RHNA allocation, the City's 2021-2029 Housing Element includes a 15% buffer of additional housing units, resulting in a total housing production goal and associated rezoning to provide for 486,379 units additional housing units from 2021 to 2029.<sup>63</sup> These additional units substantially exceed the year 2030 housing unit assumptions in the UWMP. As shown in **Table 1**, this will result in water demand in excess of supply unless significant on-going water conservation is implemented. However, as noted in a recent Los Angeles Times article:<sup>64</sup> "Between July — when Newsom urged Californians to slash water use by 15% — and February, statewide cumulative water savings have amounted to just 5.8% relative to a 2020 baseline." (See **Attachment 6**). To date, even during a drought, water conservation has failed to meet targets.

## Response No. ORG 1B-98

This comment states that 2020 UWMP does not adequately account for the growth in demand that would result from full build out of the RHNA. As such, the comment is

challenging the accuracy of the Housing Element EIR which found that the City would have sufficient water supplies to meet the demand generated by build out of the RHNA under the Housing Element and other City needs pursuant to the growth projections of the 2020-2045 RTP/SCS (Housing Element EIR at page 4.15-48). See also Response No. ORG 1B-96. Pursuant to CEQA Guidelines Section 15112, the statute of limitations for challenging the Housing Element EIR has expired. Since this comment challenges the conclusions of a different EIR from that prepared for the Project, no further response is necessary.

### **Comment No. ORG 1B-99**

The analysis of Project water supply impacts in the DEIR is inaccurate because it fails to address the amount of cumulative growth planned for and encouraged by the City in its 2021-2029 Housing Element, which is in excess of that addressed in the UWMP. As shown in **Table X**, with achievement of Housing Element targets, water demand in the City will exceed supply even in average years, unless substantial water conservation measures are undertaken. The Project's additional water demand of 7.82 afy compared to existing conditions, even after implementation of the PDFs which are in fact mitigation measures, would thus represent a significant cumulative water supply impact which has not been acknowledged in the DEIR, as it would contribute to pre-conservation demand in excess of supply in average years in a State which has to-date only managed to achieve water conservation level which are well below the UWMP's water conservation scenario. Given the City is experiencing substantial drought conditions, which will persist for an unknown period of time, this cumulative impact may be even greater. The DEIR has failed to identify a significant cumulative water supply impact resulting from the Project. Recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(1) and (2).

### **Response No. ORG 1B-99**

This comment restates that the Draft EIR fails to include the increase in water demand that could be generated from the Housing Element Update in the cumulative analysis. See Response No. ORG 1B-96 through Response No. ORG 1B-98.

### **Comment No. ORG 1B-100**

#### **5.0 IMPROPER DEFERRAL OF ANALYSIS OR MITIGATION AND INFEASIBLE MITIGATION MEASURES**

The following mitigation measures demonstrate that the City has improperly deferred analysis of potential project impacts. They also constitute examples of improper deferral of mitigation.

**HAZ-MM-1: Soil Management Plan.** Prior to the issuance of grading permits, Harvard- Westlake School shall retain a qualified environmental consultant to prepare a Soils Management Plan (SMP), which shall be

submitted to the Los Angeles Department of Building and Safety (LADBS) and Los Angeles Regional Water Quality Control Board (LARWQCB), as necessary, for review and approval. The SMP shall specify soil testing parameters and sampling frequency for areas within the golf course and near the location of the 500-gallon UST removed from the Project Site in 1995. Sampling, testing, and analysis shall be conducted in accordance with appropriate California and local guidelines [e.g., Department of Toxic Substances Control (DTSC), California Environmental Protection Agency (CalEPA), and LARWQCB]. Any soils qualifying as hazardous waste and/or soils that include concentrations of chemicals that exceed applicable State Office of Environmental Health Hazard Assessment (OEHHA) California Human Health Screening Levels (CHHSL), shall be subject to site-specific soil removal, treatment, and disposal measures included in the SMP to comply with applicable federal, State, and local overseeing agencies requirements to prevent unacceptable exposure of hazardous materials to construction workers, the environment or the public from contaminated soils or soil vapors during construction. The SMP shall also include, but is not limited to, protocols that address the following: screening measures for soil exhibiting impacts, stockpile management, vapor suppression and dust control, surface and groundwater protection, soil stockpile sampling, and exporting of contaminated soils. Upon completion of construction-related soil disturbing activities, Harvard-Westlake School shall obtain a closure letter(s) or No Further Action (NFA) letter from the LADBS, DTSC, LARWQCB, and/or other local or State agencies, as applicable, which states that no further soils testing or remediation is required on the Project Site, including near the former 500-gallon UST that was removed from the Project 72 Site in 1995 just south of the tennis courts near the adjacent LAFD site boundary. The closure letter and/or NFA letter(s) shall at a minimum address the on-site area, including the previously removed 500-gallon UST.

**HAZ-MM-2: Health and Safety Plan (HASP):** Harvard-Westlake School shall commission a HASP to be prepared in compliance with Occupational Safety and Health Administration (OSHA) Safety and Health Standards (29 CFR 1910.120) and Cal/OSHA requirements (8 CCR, General Industry Safety Orders and California Labor Code, Division 5, Part 1, Sections 6300-6719) and submitted for review and approval by the LADBS. The HASP would address, as appropriate, safety requirements that would serve to avoid significant impacts or risks to workers or the public in the event that contaminated soils or elevated levels of subsurface vapors are encountered during grading and excavation. The general contractor shall be responsible for health and safety concerns not related to contaminated soils or soil vapors, such as those associated with standard construction operations (e.g., excavation stability, stockpile placement, heavy equipment operation, etc.).

## Response No. ORG 1B-100

This comment states that Mitigation Measures HAZ-MM-1 and HAZ-MM-2 demonstrate that the City has improperly deferred analysis of potential project impacts and includes deferred mitigation. The comment provides no substantial evidence that a Project impact related to hazards and hazardous materials has not been analyzed in the Draft EIR. Section IV.H, *Hazards and Hazardous Material*, thoroughly discusses the Project's potential hazards and hazardous materials impacts that could occur during Project construction and operation, as well as its incremental contribution to cumulative impacts. (See also Appendix H-1, Phase I Hazardous Materials Environmental Site Assessment, of the Draft EIR.) As to the need for this particular mitigation measure, as stated on pages IV.H-46 through IV.H-49 in Section IV.H, *Hazards and Hazardous Materials*, of the Draft EIR, given the long term use of the Project Site as a golf course, the pesticides used in a golf course, and the fact that an underground storage tank was removed in 1995 under the supervision of the LAFD, but a No Further Action letter was not located, the Draft EIR conservatively included a soils management plan as a mitigation measure to ensure that there is no potential for exposure. Thus, the mitigation measure is not a deferral of an analysis of a potential impact; the Draft EIR acknowledges that there may be an impact, however low the risk, and, therefore, requires a plan to deal with it. Based on this conservative analysis, Mitigation Measures HAZ-MM-1 and HAZ-MM-2 were developed to ensure that neither the construction nor operation activities of the Project would result in exposure to hazardous materials. Moreover, Mitigation Measure HAZ-MM-1 and HAZ-MM-2 do not constitute the deferral of mitigation measures. Rather, these measures set forth exactly what the soils management plan and HASP must contain, who must approve them, what regulations must be complied with, and what performance criteria are required in case contaminated soils or soil vapors are encountered. The courts have held that such a measure is permissible. (See, e.g. *Oakland Heritage Alliance v. City of Oakland* (2011) 195 Cal.App.4th 884.)

## Comment No. ORG 1B-101

In addition, HAZ-MM-1 needs to be revised to specify that Harvard-Westlake School shall obtain a closure letter(s) or No Further Action (NFA) letter from the LADBS, DTSC, LARWQCB, and/or other local or State agencies, as applicable, which states that no further soils testing or remediation is required on the Project Site, and that documentation shall be obtained prior to the issuance of any demolition, grading, site preparation and construction permits.

## Response No. ORG 1B-101

The comment states that Mitigation Measure HAZ-MM-1 should include a requirement to obtain a No Further Action letter. A closure letter is already required under Mitigation Measure HAZ-MM-1 on page IV.H-48, of the Draft EIR. Mitigation Measure HAZ-MM-1 includes the following statement: "Upon completion of construction-related soil disturbing activities, Harvard-Westlake School shall obtain a closure letter(s) or No Further Action

(NFA) letter from the LADBS, DTSC, LARWQCB, and/or other local or State agencies, as applicable, which states that no further soils testing or remediation is required on the Project Site, including near the former 500-gallon UST that was removed from the Project Site in 1995 just south of the tennis courts near the adjacent LAFD site boundary. The closure letter and/or NFA letter(s) shall at a minimum address the on-site area, including the previously removed 500-gallon UST.” No further response to this comment is necessary.

### **Comment No. ORG 1B-102**

Please also see and address comments from Mr. Cashen included in Attachment 2 regarding improperly deferred and potentially infeasible Biological Resource mitigation measures. Recirculation of the DEIR is required pursuant to CEQA Guidelines Section 15088.5(a)(1) and (2).

### **Response No. ORG 1B-102**

The comment requests that the City address Mr. Cashen’s comments pertaining to improperly deferred and potentially infeasible Biological Resource mitigation measures contained in Attachment 2 to Comment Letter No ORG 1B, dated May 10, 2022. Mr. Cashen’s comments are included and addressed in Comment and Response Nos. ORG 1B-138 through ORG 1B-162, below. Note that the statement in Comment No. ORG 1B-102 regarding “improperly deferred and potentially infeasible Biological Resource mitigation measures” is not demonstrated in either the comments above or in Mr. Cashen’s comments below. That is, the comment and the attachment contain no facts to substantiate the letter’s allegations regarding deferment or infeasibility of the mitigation measures. As such, no further response is necessary.

### **Comment No. ORG 1B-103**

#### **6.0 INADEQUATE MITIGATION**

The DEIR fails to include feasible mitigation measures to ensure Project operation consistent with assumptions used in the DEIR’s impact analysis, such as number and size of both Harvard-Westlake and non-Harvard-Westlake events. The DEIR thus includes inadequate mitigation.

### **Response No. ORG 1B-103**

The comment states that the Draft EIR fails to include unspecified mitigation measures to ensure that there are no significant operational impacts. The comment contains no evidence of any potentially significant operational impacts including impacts due to the number or size of School and non-School events. The Project’s maximum operation would not exceed the number of events and types of activities listed in Chapter II, *Project Description*, of the Draft EIR, and evaluated throughout the Draft EIR. The listed activities represent the maximum use of the Project Site and cannot be exceeded under the

potential conditions of approval that would be required for the proposed CUP. As such, the Draft EIR evaluates the maximum activity that would occur on the Project Site, including the number and size of all events. No further mitigation beyond the mitigation measures provided in the Draft EIR would be required.

## **Comment No. ORG 1B-104**

### **7.0 INADEQUATE ALTERNATIVES ANALYSIS**

#### **7.1 Impact Reducing Alternatives**

As noted on DEIR page V-4:

As described above, according to State CEQA Guidelines Section 15126.6(a) the purpose of analyzing project alternatives is to identify alternatives that "...would avoid or substantially lessen any of the significant effects of the project..."

The alternatives included in the DEIR fail to appropriately do this because the DEIR analysis fails to identify a number of significant Project impacts, as explained in Sections 3 and 4 of this letter. As noted on DEIR page V-4:

As shown in Chapter IV, Environmental Analyses, of this Draft EIR, the Project would not have significant long-term impacts due to Project operations that would require consideration of alternatives that would reduce such impacts.

The DEIR has thus inappropriately limited its definition of alternatives to those which would reduce only the construction noise and vibration impacts of the Project. The definition in the DEIR of alternatives is thus based on the faulty premise that the DEIR only needs to address two significant unmitigated construction-related impacts. Once the DEIR is corrected to appropriately identify a number of operational impacts, additional alternatives to address these impacts should be defined and added to the DEIR. This should include the addition of an alternative that would address the significant unmitigated historical resource impacts of the proposed Project.

## **Response No. ORG 1B-104**

The comment states that the Draft EIR impermissibly limited the number of alternatives based on failure to include alternatives to address alleged operation impacts. Under CEQA Section 15126.6(a), an EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project. An EIR is not required to consider alternatives which are infeasible. As determined by the City, the only significant and unavoidable impacts of the Project are construction-related noise and vibration impacts. A significant contributor to the Project's

noise and vibration impacts is the excavation and soil hauling required for the subterranean garage and stormwater capture and reuse system. With the exception of Alternative 4, the Project alternatives would eliminate the subterranean garage and stormwater capture and reuse system, reduce overall on-site construction activity and intensity, and, thus, reduce on-site noise and vibration impacts compared to the Project. However, similar to the Project, Alternatives 2 through 4 would install an ADA-compliant pedestrian ramp leading to the Zev Greenway at Coldwater Canyon Avenue (the Coldwater Canyon Avenue Riverwalk Path Ramp). In addition, Alternative 4, which would eliminate all public use of the Project Site, which would substantially reduce daily use and activity at the Project Site (as described in the table notes of Table IV.O.3.-3 on page IV.O.3-17 in Section IV.O.3, *Utilities and Service Systems – Solid Waste* of the Draft EIR, an estimated 82 percent of Project Site usage would be derived from public users and not the School). The selection of Alternatives also includes those that would meet the underlying purpose of the Project, which is to supplement the School's athletic and recreational facilities, and provide Harvard-Westlake School a campus that can fulfill its educational mission and athletic principles. The statement in the comment that the definition in the Draft EIR of alternatives is “based on the faulty premise that the Draft EIR only needs to address two significant unmitigated construction-related impacts” and that “once the DEIR is corrected to appropriately identify a number of operational impacts, additional alternatives to address these impacts should be defined and added to the DEIR” including “an alternative that would address the significant unmitigated historical resource impacts,” is not based on substantial evidence presented in this comment letter or in the evaluation in Section IV.D. *Cultural Resources*, of the Draft EIR. As further evaluated in Topical Response No. 6 – Historical Resources, the Project Site's historical cultural monument (HCM) designation requires the preservation and/or restoration of the Project Site's City-designated character-defining features (private recreational facility open for public use, the clubhouse, the golf ball [-shaped] light standards, the putting green, and the brick wall with weeping mortar at the front lawn) that will be preserved and/or, as necessary, restored. As concluded in Section IV.D, *Cultural Resources*, of the Draft EIR and in Topical Response No. 6, the Project as designed would not result in significant adverse impacts to historical resources on the Project Site. Because the alternatives evaluated in the Draft EIR would reduce the Project's construction noise and vibration impacts (albeit the impacts would still remain significant and unavoidable), reduce many of the Project's less than significant impacts (acknowledging a few impacts may be greater than the Project's) while largely achieving most of the Project's basic objectives either fully, substantially or partially, the selection of alternatives is consistent with CEQA Guidelines. As the comment provides no evidence to support its assertions, no further response is necessary.

## Comment No. ORG 1B-105

### 7.2 Alternatives Considered and Rejected - Alternative Project Site Designs/Reduced Development Intensity

In Section 4 of Chapter V, the DEIR artificially rejects this alternative suggested in NOP comments as failing to meet five of the Project objectives. (See DEIR pages V-7 to V-8). However, the argument is disingenuous as no serious attempt has been made to design an alternative which would retain more of the character-defining features of the historic resource. The DEIR needs to include a serious alternative which retains more of the character-defining features of the historic resource and which address some of the other construction and operational impacts of the Project as discussed in **Section 4** of this letter.

## Response No. ORG 1B-105

The comment states that the City has improperly rejected alternatives which would retain more of character-defining features of the historical resource. An EIR does not need to consider every possible alternative (Guidelines Section 15126.6(a)). The alternatives selected for analysis should be those which attain most of the basic objectives of the project but would avoid or substantially lessen any of the project's significant effects. (Id.) As thoroughly analyzed in Appendix E-1, Historic Resources Technical Report, and Section IV.D, *Cultural Resources*, of the Draft EIR, the Project would not result in significant impacts to historical resources. As explained on in pages IV.D-31 through IV.D-33 in Section IV.D of the Draft EIR, the distinct character-defining features of the Project Site as identified in the HCM designation would be retained. As such, the Project would not result in a substantial adverse change in the significance of a historical resources and, therefore, no inclusion of an alternative to retain more of the character-defining features is required. Moreover, as explained on page V-7 and V-8 in Chapter V, *Alternatives*, of the Draft EIR, the alternatives rejected were rejected because they failed to meet most of the Project objectives. The comment neither describes which alternative design should have been included nor provides substantial evidence that the Project would result in a significant impact to the historical resource. See also, Topical Response No. 6 – Historical Resources, which summarizes direct and indirect impacts on historical resources and Response No. ORG 1B-26 which further discusses the Project's retention of the Project Site's character-defining features.

## Comment No. ORG 1B-106

### 7.3 Alternative Sites

The DEIR should be revised to include consideration of an alternative where the proposed facilities are constructed on the Los Angeles Valley College (LAVC) campus for joint use by Harvard-Westlake and LAVC. Under this alternative, limited improvements could be made to the Project Site to meet non-academic Project objectives and the facility could be maintained for public use, thus meeting objectives 3, 4, 5, 6, and 9 at the Tennis Club site and the remaining objectives at the LAVC site.

## Response No. ORG 1B-106

The comment suggests that an alternative site for the Project be evaluated. CEQA does not require an EIR to analyze any specific number of alternatives. Pursuant to CEQA Guidelines Section 15126.6(a), “[a]n EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation. There is no ironclad rule governing the nature or the scope of the alternatives to be discussed other than the rule of reason. [citations omitted]” Chapter V, *Alternatives*, of the Draft EIR, provides a reasonable range of alternatives and explains the reasons for selecting those alternatives and rejecting others. The comment contains no facts to substantiate the contention that the range of alternatives analyzed were impermissibly limited.

As explained on page V-6 of the Draft EIR, no alternative sites are available which would meet the Project objectives and result in lessened impacts. Moreover, Harvard-Westlake owns the Project Site and cannot acquire an existing public school site.

Additionally, the comment provides no evidence that the LAVC is available, suitable, nor that use of that site would avoid or substantially lessen any of the Project’s significant impacts.

## Comment No. ORG 1B-107

### 8.0 **INADEQUATE CUMMULATIVE AND GROWTH-INDUCTING IMPACT ANALYSIS**

#### 8.1 Inadequate Related Project’s List

CEQA Guidelines Section 15130(b) specifies that:

The following elements are necessary to an adequate discussion of significant cumulative impacts:

- (1) Either:
- (A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency, or
  - (B) A summary of projections contained in an adopted local, regional or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency.

The City has opted to use a related projects lists as the basis of the cumulative impact analysis in the DEIR. As noted on DEIR page III-4, under CEQA:

Cumulative study areas are defined based on an analysis of the geographical scope relevant to each particular environmental issue. Therefore, the cumulative study area for each individual environmental impact issue may vary. For example, a cumulative land use impact generally may only affect the compatibility of uses within the vicinity of the project site, while a cumulative air quality impact may affect the entire South Coast Air Basin. The specific boundaries and the projected growth within those boundaries for the cumulative study area of each environmental issue are identified in the applicable environmental issue section in *Chapter IV, Environmental Impact Analysis*, of this Draft EIR.

## **Response No. ORG 1B-107**

The comment cites the Draft EIR's explanation of application of the CEQA Guidelines for the discussion of cumulative impacts. The comment contains no evidence to support the allegation that the Draft EIR's related project list is inadequate. For environmental impact reports, the Los Angeles Department of City Planning derives the list of related projects according to a geographic radius of one-half mile of the Project Site plus one-quarter mile from the farthest outlying intersection in accordance with LADOT Transportation Assessment Guidelines (TAG). The study area radius is common for project EIRs throughout the City. The Project Site is unique in that, unlike most urban areas in the City of Los Angeles, relatively little new development is occurring or anticipated within its surrounding geographic area. In addition, the relatively small study area under the TAG provides an accurate picture of cumulative impacts in that projects within a closer physical radius are more apt to result in cumulative impacts throughout most environmental issue

areas. It is correct that cumulative effects can be variable and that cumulative emissions within the established geographic study area, or a broader geographic area, are able to affect the air quality of the South Coast Air Basin. For this reason, the Draft EIR evaluates the Project's impacts with respect to regional plans, such as LADWP's 2020 UWMP and SCAQMD's Air Quality Management Plans (AQMPs), which are based on the long-term projected buildout of the of region. As such, the Draft EIR provides local and regional evaluations of the Project and related projects, as necessary. However, establishing specific related projects based on a geographically-defined study area provides that no individual projects are unfairly credited with greater or fewer cumulative impacts than other development projects throughout the region.

### **Comment No. ORG 1B-108**

A list of proposed development projects in the area of the Project that could affect conditions in the Project area (e.g., by generating population increases requiring public services) was prepared based on information obtained primarily from LADOT and the City of Los Angeles Department of City Planning (DCP). A total of five (5) potential related development projects have been identified within the vicinity of the Project Site for inclusion in the cumulative impact analysis for this EIR

As noted on DEIR page IV.A-21:

All of the related projects are located within a 0.5-mile section of Ventura Boulevard, between 12544 and 12833 Ventura Boulevard. All of the related projects sites are zoned C-1.5 (Limited Commercial) and are currently developed with commercial uses.

This list of five related projects formed the basis of the cumulative impact analysis of: aesthetics (light and glare), geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, noise, public services (police, fire and parks and recreation), transportation, tribal cultural resources, and wastewater generation. Only two of the five related projects were considered when assessing cumulative biological resource impacts and the analysis of cumulative historic resource impacts. Only the analyses of cumulative energy impacts, cumulative water supply impacts, and soil waste considered a wider geographic area.

### **Response No. ORG 1B-108**

The comment appears to assert that the Draft EIR's analysis of the related projects was not adequate due to the geographic limitations of the individual environmental topics analyzed. The study area for the related projects is based on the LADOT's TAG procedures and representative of a common radius in the City's EIRs. The comment provides no evidence to substantiate the claim that the list of related projects and cumulative analysis are inadequate. Pages IV.B-64 through IV.B-67 in Section IV.B, *Air Quality*; pages IV.C-57 and IV.C-58 in Section IV.C, *Biological Resources*; pages IV.D-

37 through IV.D-39 in Section IV.D, *Cultural Resources*, and pages IV.G-75 through IV.G-78 in Section IV.G, *Greenhouse Gas Emissions*, of the Draft EIR describe all of the five related projects and conditions on those sites pertinent to biological and historical resources. The Draft EIR evaluates the regional environmental effects related to energy, water supply and solid waste from projects within the Study Area, and is not required to evaluate the impacts of all development occurring within an undefined broader geographic area, or throughout the City, the County, or the State. Moreover, it is not uncommon to have situations where a related project would have no effect or a *de minimus* effect on biological and/or historical resources. For instance, three of the five related project sites do not contain any biological or historical resources. As such, the respective related projects would not be specifically evaluated regarding biological or historical resources.

### Comment No. ORG 1B-109

The analyses of cumulative impacts in the DEIR, for most issue areas is thus based on an artificially constrained list of related projects, leading to an underestimate of the potential of the project in combination with related projects to result in significant cumulative impacts. The DEIR, in each of the issue area analyses, has failed to justify this artificially constrained definition of related projects. CEQA Guidelines Section 15130 specifies:

(a) . . .

- (1) As defined in Section 15355, a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing **related impacts**.” (Emphasis added).

(b) . . .

- (2) When utilizing a list, as suggested in paragraph (1) of subdivision (b), factors to consider when determining whether to include a related project should include the nature of each environmental resource being examined, the location of the project and its type. Location may be important, for example, when water quality impacts are at issue since projects outside the watershed would probably not contribute to a cumulative effect. Project type may be important, for example, when the impact is specialized, such as a particular air pollutant or mode of traffic.
- (3) Lead agencies should define the geographic scope of the area affected by the cumulative effect and **provide a reasonable explanation for the geographic limitation** used. (Emphasis added).

## Response No. ORG 1B-109

This comment states that the Draft EIR's cumulative impacts analysis improperly constrained the list of related projects. The comment contains no evidence that any relevant projects were omitted nor facts to show that the radius determined to be appropriate by LADOT and the City of Los Angeles Department of City Planning was insufficient. Contrary to the implication in the comment, the Draft EIR does explain how it determined the appropriate geographic area. As explained on page III-5 in Chapter III, *Environmental Setting*, of the Draft EIR, "[a] list of proposed development projects in the area of the Project that could affect conditions in the Project area (e.g., by generating population increases requiring public services) was prepared based on information obtained primarily from LADOT and the City of Los Angeles Department of City Planning. According to the LADOT Transportation Assessment Guidelines (TAG), related projects are new development within a one-half mile radius of the Project Site plus one-quarter mile from the farthest outlying intersection." The methodology used to establish the related projects radius is consistent with guidelines and EIRs regularly evaluated for other projects throughout the City. The comment provides no facts to show that this standard City radius for determining the appropriate list of related projects is not adequate. As such, no further response is necessary.

## Comment No. ORG 1B-110

The DEIR and City have failed to comply with CEQA Guidelines Section 15130(b)(2). The DEIR inappropriately constrains the related projects considered in the cumulative impact analyses by both geography and use type, rather than by related impacts, resulting in an underestimate of cumulative impacts. The cumulative impacts analysis is thus fatally flawed and must be redone and the DEIR recirculated pursuant to CEQA Guidelines Section 15088.5(a)(2) and (4).

## Response No. ORG 1B-110

The comment states that the Draft EIR fails to comply with CEQA Guidelines Section 15130(b)(2) by constraining the list of related projects by geography and use type. As to the basis for determining the geographic boundaries, see Response No. ORG 1B-109. Regarding the alleged constraint by use type, the comment does not include an explanation of what use constraint is imposed by the Draft EIR. The list of related projects is based on the City's standard practice of including any known new projects within the area established by the TAG to be the area where cumulative impacts may occur. As stated in the Draft EIR, for some of the environmental topic analysis the potential for a cumulative impact goes beyond the immediate area of the Project and, therefore, the analysis for that topic goes beyond the listed related projects (Page III-4 in Chapter III, *Environmental Setting*, of the Draft EIR at). There is no restriction on type of use of related projects in the Draft EIR analysis.

Based on the above, the comment does not provide substantial evidence that there is an increase in the severity of a cumulative impact or that the Draft EIR is fundamentally

flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. . As such, revision and recirculation of the Draft EIR is not necessary.

## **Comment No. ORG 1B-111**

### **8.2 Failure to Include Important Cumulative Projects**

As discussed in **Section 4.12** of this letter, the DEIR needs to include as a cumulative project, the City's Housing Element targets and associated up-zoning requirements. This cumulative project will result in important related cumulative impacts on infrastructure demand and services as well as traffic and thus roadway operations in the project area. It also needs to included projects involving the substantial related disposal of soil as discussed in Section 1 of this letter. The failure to include projects related by impact in the analysis has led to an underestimate of cumulative impacts.

## **Response No. ORG 1B-111**

The comment restates that the City's Housing Element should have been listed as a related project. See Response No. ORG 1B-96. The Draft EIR is not required to list an adopted plan as a related project. As explained in Response No. ORG 1B-96, CEQA Guidelines Section 1530(b) only requires one of two protocols for discussion of cumulative impacts (i) a list of projects, or (ii) a summary of projections contained in an adopted local, regional, or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. The Housing Element of the City's General Plan is an adopted local plan and, therefore, is classified under option two of the protocols. The City chose to prepare the cumulative analysis using option one and created a list of nearby planned projects. An EIR is not required to utilize both protocols; therefore, the Draft EIR for the Project was not required to also analyze the contribution of the Housing Elements projections.

Moreover, the Housing Element EIR contains a cumulative analysis for each environmental topic it analyzed. As shown throughout the Housing Element EIR, in determining the cumulative impacts, the Housing Element EIR included projected growth and accommodation of the increased housing due to the Housing Element's housing goals. For example, (and without listing all the examples), the Housing Element EIR contains the following type of language for all its cumulative analysis: Section 4.2, page 4.2-64, states that cumulative air quality impacts "would include any reasonably anticipated development in [South Coast Air Basin] for regional air quality impacts, as well as housing development accommodated under the Housing Element Update..."; Section 4.10, page 4.10-52, states that cumulative noise and vibration impacts could occur "if such impacts from development projects under the Housing Element Update combine with similar impacts of other development (e.g., nonresidential, past residential) projects throughout the geographic extent of analysis, which is defined as the City of Los Angeles"; and Section 4.16.2, page 4.16-72 states that cumulative water supply impacts could occur "if such impacts to utilities and service systems from development projects under the

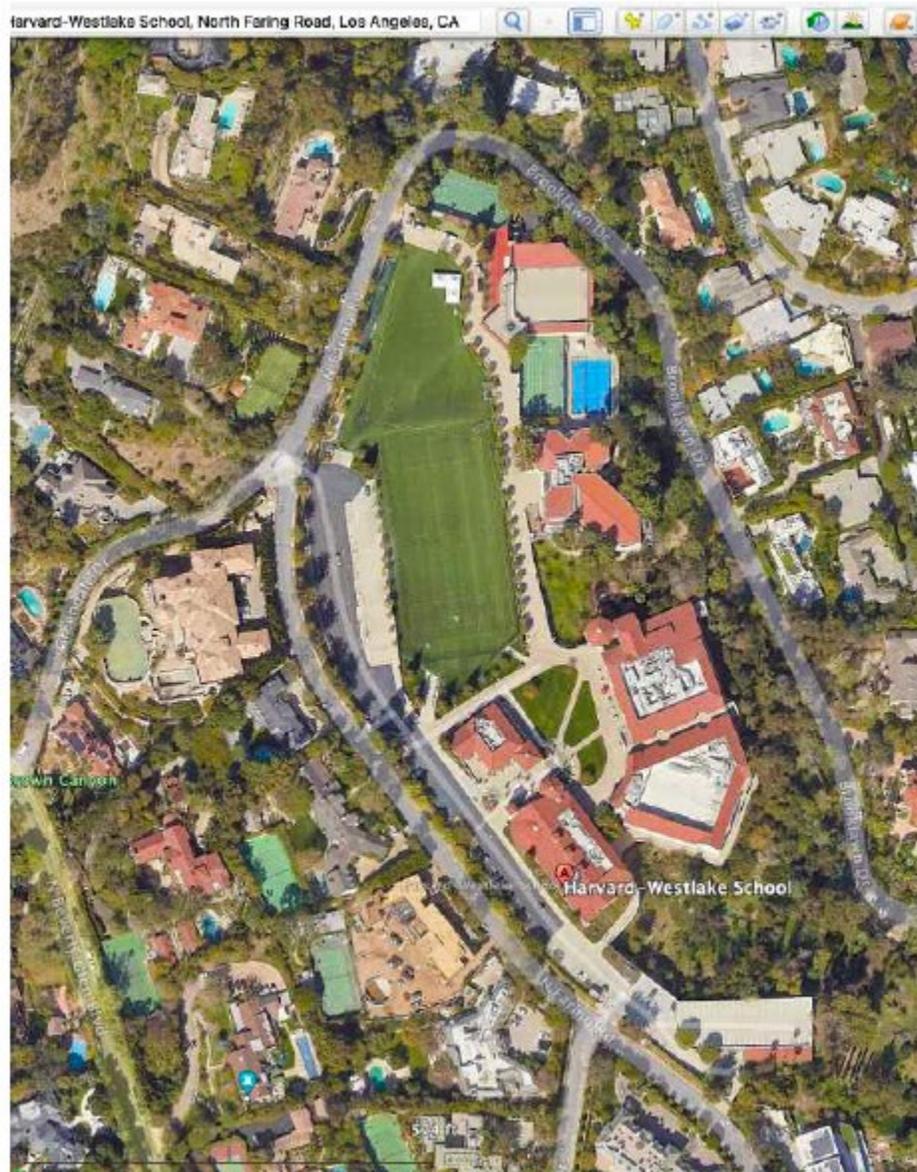

Housing Element Update combine with similar impacts to utilities and service systems of other development projects throughout the geographic extent of analysis, which is defined as the City of Los Angeles". As such, the Housing Element EIR has already discussed the cumulative impact of anticipated housing growth under the Housing Element and Citywide projected growth for each environmental topic. Thus, no discussion of the Housing Element is required in the Draft EIR. The comment also states that the Draft EIR needs to include projects involving the substantial related disposal of soil as discussed in Section 1 of this letter (which referenced the Big Tujunga, Cogswell and San Gabriel, Devil's Gate, Morris, and Pacoima, and future public works and debris basin cleaning projects). The cited projects are outside the scope of the Draft EIR (see also Response No. ORG 1B-20). The Draft EIR correctly concluded that Project construction would not generate solid waste in excess of state and local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals, and impacts would be less than significant (page IV.O.3-16 of the Draft EIR).

## **Comment No. ORG 1B-112**

### **8.3 Failure to Address Reasonably Foreseeable Future Development on the Two Harvard-Westlake Campuses**

The DEIR fails to identify or adequately address the cumulative and growth-inducing impacts of the proposed Project associated with the transfer of athletic facilities and uses from the two Harvard-Westlake campuses to the Project Site. The proposed Project would free up space on the two existing Harvard [sic]-Westlake campuses currently used for playing fields and other athletic facilities, thus freeing up land that would allow for expansion of academic facilities and thus enrollment expansion on the two campuses. As shown in **Figures 7 and 8**, elimination of athletic fields at the two campuses would free up substantial land area for campus program expansion. The proposed Project would thus be growth-inducing. The DEIR's cumulative impact analysis and growth-inducing impact analyses needs to address the potential of the proposed Project to lead to enrollment expansion and new construction at the two existing campuses, as a result of the transfer of athletic activities to the Project Site. This additional development is a reasonably foreseeable consequence of the proposed Project.

**FIGURE 8 – Harvard-Westlake North Faring Road Campus Showing Share of Campus Occupied by Athletic Facilities**

Source: Google Earth

## Response No. ORG 1B-112

The comment states that the Draft EIR is flawed for failing to discuss the cumulative and growth inducing impacts of the Project related to the potential for expansion of uses at the existing Harvard-Westlake campuses. As to the sufficiency of the cumulative analysis, see Response Nos. ORG 1B- 96, ORG 1B-97, ORG 1B-109, ORG 1B-110 and ORG 1B-111. The potential for growth inducing impacts of the Project is adequately analyzed in Chapter VI, *Other CEQA Considerations*, of the Draft EIR. As stated on pages VI-9 through VI-10, the Project would serve the School's existing need for recreational

facilities for which space is not available at the School's Upper Campus. The Project's primary objective, as stated on page II-13 of the Draft EIR, is to "supplement the School's athletic and recreational facilities." The commenter's assertion that the Project would allow Harvard-Westlake to increase Upper School campus academic facilities or increase student population is speculation. Please refer to Topical Response No. 13 - Need for the Project. As discussed therein, the need for the Project is to serve existing demand for recreational facilities for athletic programs to meet the requirements of the CIF rule change and other growth factors that heighten stress on the School's longstanding athletics facilities. No changes in the existing on-campus facilities, which would continue to be used for the School's physical education program, are anticipated. Please refer to Topical Response No. 13 for a more detailed discussion of the need for the Project as well as existing on-campus recreational facilities. The comment contains no substantial evidence to support the speculative comments. As was reiterated in *Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal. App. 4th 342, 373, citing previous authority, an EIR is not required to engage in speculation. See also, Topical Response No. 13 – Need for the Project (Non-CEQA), which discusses the current constrained conditions at the School demonstrating that the Project would not be growth inducing at the existing campuses.

### **Comment No. ORG 1B-113**

#### **9.0 CONCLUSION**

In this comment letter and its attachments, we have provided substantial evidence regarding defects in the DEIR. In addition to our comments, as part of the response to comments, the City needs to provide detailed response to the comments provided by subject-matter experts contained in Attachments 1, 2, 4 and 5 to this letter. As documented herein, the DEIR fails to identify a number of significant impacts as well as underestimates impacts. The DEIR needs to be corrected and these issues addressed and the recirculated pursuant to CEQA Guidelines Section 15088.5(a)(1) and (2).

### **Response No. ORG 1B-113**

The comment restates the contention that the Draft EIR's analysis is flawed, requests that the City respond to the comments in the attachments to the comment letter, and concludes that recirculation is required. The responses to the assertions contained in the Comment Letter No ORG 1B, dated May 10, 2022, are included in Response Nos. ORG 1B-1 through ORG 1B-112. The responses to the assertions contained in the attachments to the comment letter are included in Response Nos. ORG 1B-115 through ORG 1B-197. As stated in those responses, the comment letter, including the attachments, do not provide substantial evidence that the Draft EIR's analysis is deficient or, in some cases, raise a substantive issue on the content or adequacy of the Draft EIR.

Based on the above, the comment does not provide substantial evidence of significant new information showing that there is a new significant impact, an increase in the severity of an impact, or that the Draft EIR is fundamentally flawed to support a contention that

the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. . As such, revision and recirculation of the Draft EIR is not necessary.

The comment is a list of attachments for Letter ORG 1B. Responses to these attachments are provided below in Response Nos. ORG 1B-115 through ORG 1B-197.

### **Comment No. ORG 1B-115**

#### **ATTACHMENT 1 (Swape Consultants)**

We have reviewed the March 2022 Draft Environmental Impact Report (“DEIR”) for the Harvard-Westlake River Park Project (“Project”) located in the City of Los Angeles (“City”). The Project proposes to demolish an existing 799-square-foot (“SF”) tennis facility, 426,000-SF golf course, and 2,300-SF driving range, as well as construct an 80,249-SF gym, a 52-meter swimming pool, and 532 parking spaces on the 17.2-acre site.

Our review concludes that the DEIR fails to adequately evaluate the Project’s air quality, health risk, and greenhouse gas impacts. As a result, emissions and health risk impacts associated with construction and operation of the proposed Project are underestimated and inadequately addressed. An updated EIR should be prepared to adequately assess and mitigate the potential air quality, health risk, and greenhouse gas impacts that the project may have on the surrounding environment.

### **Response No. ORG 1B-115**

The comment contains an introductory statement regarding the description of the Project and a summary of the conclusions of the commenter. Because the comment does not provide any facts to support the conclusions that the Draft EIR’s air quality, health risk, or

greenhouse gas impacts are flawed, no further response is necessary. See Response Nos. ORG 1B-116 through ORG 1B-137 for responses to the commenter's specific contentions.

## **Comment No. ORG 1B-116**

### **Air Quality**

#### **Incorrect Analysis of Construction-Related Criteria Air Pollutant Emissions**

Regarding the DEIR's analysis of the Project's construction-related criteria air pollutant emissions, the Air Quality/Greenhouse Gas Emissions Technical Documentation ("AQ & GHG Report"), provided as Appendix C to the DEIR, states:

"Emissions from off-road equipment and off-road vehicles were estimated through CalEEMod [...] Emissions from worker trips, haul truck trips, concrete truck trips and vendor truck trips were estimated outside of CalEEMod to account for the ARB on-road vehicle emissions factor EMFAC2017 (EMFAC) model because it has not yet been incorporated in the current version of CalEEMod [...] Emissions from haul trucks, vendor trucks and concrete trucks were also estimated outside of CalEEMod using EMFAC emission factors for haul, vendor and concrete trucks because CalEEMod assumes that the number of heavy-duty trucks input into the model occurs across the entire length of the applicable construction phases" (p. 2).

As demonstrated above, emissions associated with off-road equipment and vehicles during Project construction were calculated with the California Emissions Estimator Model ("CalEEMod"), while emissions associated with on-road vehicles during Project construction were calculated outside of CalEEMod. Furthermore, the AQ & GHG Report states:

"The maximum daily emissions estimated based on maximum construction activity conditions for heavy-duty off-road construction equipment and onroad mobile sources and do not represent the emissions that would occur every day during Project construction" (p. 3).

As demonstrated above, the AQ & GHG Report acknowledges that the off-road emissions calculated with CalEEMod, and the on-road emissions calculated outside of CalEEMod, each "do not represent the emissions that would occur every day during Project construction." As neither account for the entirety of the criteria air pollutants that would be generated during Project construction, the DEIR should have summed the off-road and on-road emissions estimates in order to accurately evaluate the Project's maximum daily construction-related emissions. Specifically, the Project's mitigated off-road and on-road construction-related emissions, as estimated by the DEIR, are respectively presented below.

Off-Road Emissions (Appendix C, pp. 75, 120):

Mitigated Construction

**2.1 Overall Construction (Maximum Daily Emission)**

**Mitigated Construction**

	ROG	NOx	CO	SO2	Fugitive PM10	Exhaust PM10	PM10 Total	Fugitive PM2.5	Exhaust PM2.5	PM2.5 Total

On-Road Emissions (Appendix C, pp. 65):

However, upon review of the DEIR’s construction-related emissions summary, it appears that the DEIR fails to include the off-road emissions estimates calculated with CalEEMod (see excerpt below) (p. IV.B- 55, Table IV.B-8):

SCAQMD Regional Significance Threshold	75	100	550	150	150	55
Exceeds Threshold?	No	No	No	No	No	No

The DEIR’s construction-related emissions summary, as displayed above, appears to be incorrect for two reasons. First, the overlapping phase estimates in the emissions summary are identical to the on-road construction-related emissions (Appendix C, pp. 65). Thus, the DEIR’s analysis of the Project’s construction-related emissions fails to include the estimates calculated by CalEEMod or account for emissions generated by off-road construction equipment. Second, the maximum daily emissions presented in the emissions summary are underestimated and inconsistent with the on-road peak daily

emissions (Appendix C, pp. 65). As such, the DEIR underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance.

### **Response No. ORG 1B-116**

The comment states that the Draft EIR underestimates the Project's construction related emissions due to the failure to account for emissions generated by off-road construction equipment and daily emissions inconsistency with the on-road peak daily emissions. The comment also mischaracterizes a quotation from Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR.

The Draft EIR does not underestimate the Project's construction related emissions and, contrary to the assertions made by the commenter, the emissions generated by off-road construction equipment and on-road vehicles are summed together when assessing maximum daily emissions and associated impacts. As discussed on page IV.B-36 in Section IV.B, *Air Quality*, of the Draft EIR, emissions from worker trips, haul truck trips, concrete truck trips and vendor truck trips were estimated using EMFAC2017. Emissions from haul trucks, vendor trucks, and concrete trucks were also estimated outside of CalEEMod using EMFAC2017 emission factors for haul, vendor and concrete trucks because CalEEMod assumes that the number of heavy-duty trucks input into the model occurs across the entire length of the applicable construction phases. However, since the applicable construction phases would not have the same number of haul trucks, vendor trucks, and concrete trucks on-site every day within each particular phase, the emissions calculations performed outside of CalEEMod are able to account for the varying maximum numbers of daily haul truck and concrete truck trips within each of the demolition, site preparation, grading/excavation, and foundations/concrete pour, landscape and pool/canopy/building phases. The EMFAC2017 mobile emission factors are used to calculate on-road construction mobile emissions, as shown on pages 254 through 269 of 437 of Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. The EMFAC2017 mobile sources emission factors are used for the calculations on both PDF pages 65 and 66 of 437 in Appendix C-1, which is why they are the same. As stated in Section IV.B, *Air Quality*, the maximum daily emissions were estimated based on maximum construction activity conditions for heavy-duty off-road construction equipment and on-road mobile sources accounting for the overlap of individual construction phases; therefore, the estimated maximum daily emissions include these potential overlaps by combining the relevant construction phase emissions based on the construction schedule based on information provided by Harvard-Westlake School. These maximum daily emissions, accounting for maximum construction activity conditions for heavy-duty off-road construction equipment and on-road mobile sources accounting for the overlap of individual construction phases, are presented in Tables IV.B-6 and Table IV.B-8 in Section IV.B, *Air Quality* of the Draft EIR. Further, the construction emissions are presented in more detail in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, including presenting the heavy-duty off-road construction equipment and on-road mobile sources for individual

phases, on PDF pages 60 through 64 of 437 for unmitigated construction emissions, and PDF pages 65 through 69 of 437 for mitigated construction emissions.

Regarding on-road peak daily emissions, the commenter is incorrect that off-road emissions are not accounted for because the commenter is referencing an unmitigated CalEEMod modeling run for off-road equipment and referencing a mitigated summary worksheet (Appendix C, pages 75 of 437 and 120 of 437). It is apparent that the commenter is referencing an unmitigated CalEEMod modeling run because the emissions in Section 2.1 of the CalEEMod modeling run are the same for both “unmitigated” and “mitigated” tables, which indicates no mitigation has been applied in the modeling run. The appropriate reference would be to Appendix C, PDF pages 166 of 437 and 213 of 437, which show substantially reduced emissions due to implementation of mitigation measures within these referenced CalEEMod modeling runs. As discussed above, with respect to mitigated impacts, the appropriately mitigated emissions from off-road and on-road sources are accounted for when evaluating the maximum mitigated daily emission impacts.

The comment also mischaracterizes a quotation from Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. The comment is mistaken in purporting that the quotation means that off-road and on-road emissions do not occur on the same day. The quotation is actually saying that the analysis evaluates maximum daily emissions from both off-road and on-road emissions in order to determine maximum daily air quality impacts, maintaining a conservative analysis for the purpose of the Draft EIR, but that the maximum daily emission levels produced using this conservative approach do not represent emissions levels that would occur every day of Project construction.

Therefore, the construction-related emissions summaries in Section IV.B, *Air Quality* and Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation are not underestimated and provide substantial evidence to determine the Project’s impacts.

## **Comment No. ORG 1B-117**

### **Unsubstantiated Input Parameters Used to Estimate Project Emissions**

The DEIR’s operational air quality analysis relies on emissions calculated with CalEEMod.2016.3.2 (p. IV.B-35).<sup>1</sup> CalEEMod provides recommended default values based on site-specific information, such as land use type, meteorological data, total lot acreage, project type and typical equipment associated with project type. If more specific project information is known, the user can change the default values and input project-specific values, but the California Environmental Quality Act (“CEQA”) requires that such changes be justified by substantial evidence. Once all of the values are inputted into the model, the Project’s construction and operational emissions are calculated, and “output files” are generated. These output files disclose to the reader what parameters are utilized in calculating the Project’s air pollutant emissions and make known which default values are changed as well as provide justification for the values selected.

When reviewing the Project's CalEEMod output files, provided in the AQ & GHG Report as Appendix C to the DEIR, we found that several model inputs were not consistent with information disclosed in the DEIR. As a result, the Project's construction and operational emissions are underestimated. As a result, an updated EIR should be prepared to include an updated air quality analysis that adequately evaluates the impacts that construction and operation of the Project will have on local and regional air quality.

<sup>1</sup> "CalEEMod Version 2016.3.2." California Air Pollution Control Officers Association (CAPCOA), November 2017, available at: <http://www.aqmd.gov/caleemod/archive/download-version-2016-3-2>.

## **Response No. ORG 1B-117**

This comment states that there are inconsistent and/or unsubstantiated input parameters to estimate Project air quality and GHG emissions. However, the comment does not state specific inputs that were inconsistent or unsubstantiated. As described on pages IV.B-36 through IV.B-43 in Section IV.B, *Air Quality*, of the Draft EIR, and on pages IV.G-40 to IV.G-50 in Section IV.G, *Greenhouse Gas Emissions*, of the Draft EIR, the assumptions used for air quality and GHG emissions modeling and emissions estimates for the Project were based on Project-specific inputs based on information provided by Harvard-Westlake School, the Project's engineering and construction representatives, and CalEEMod modeling software (Version 2016.3.2) default inputs. In addition, the detailed list of construction and operational inputs used in the modeling with source documentation is presented on PDF pages 7 through 18 of 437 in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation. Thus, the Project's air quality analysis uses substantiated and consistent (as applicable) inputs and adequately evaluates the impacts that construction and operation of the Project would have on local and regional air quality.

## **Comment No. ORG 1B-118**

### **Overestimated Existing Land Use Size**

Review of the DEIR demonstrates that the operational emissions associated with the existing land uses are subtracted from the operational emissions associated with the proposed land uses in order to determine the significance of the Project's air quality impact (see excerpt below) (p. IV.B-53, Table IV.B-7).

**TABLE IV.B-7

<sup>a</sup> Totals may not add up exactly due to rounding in the modeling calculations. Detailed emissions calculations are provided in Appendix C of this Draft EIR.

<sup>b</sup> Area source VOC emissions are primarily emitted by consumer product usage as estimated in CalEEMod.

SOURCE: ESA, 2021.

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area
General Office Building	0.80	1000sqft	0.05	799.00
Other Non-Asphalt Surfaces	128.00	1000sqft	2.94	128,000.00
Parking Lot	89.00	Space	0.88	38,400.00
City Park	1.10	Acre	1.10	47,916.00
Golf Course	11.78	Acre	11.78	<b>559,860.96</b>

However, the DEIR’s analysis is incorrect, as the size of the existing land uses to be removed from the Project site was overestimated in the Project’s air modeling. Specifically, review of the CalEEMod output files demonstrates that the “Harvard Westlake - Existing” model includes 559,860-SF of golf course area (see excerpt below) (Appendix C, pp. 301, 309, 419).

This is inaccurate, as the DEIR indicates that the existing golf course consists of only 426,000-SF (p. II-3). As such, the land use size is overestimated by approximately 133,860-SF in the model.<sup>2</sup>

This overestimation presents an issue, as the land use size feature is used throughout CalEEMod to determine default variable and emission factors that go into the model’s calculations. The square footage of a land use is used for certain calculations such as determining the wall space to be painted (i.e., VOC emissions from architectural coatings) and volume that is heated or cooled (i.e., energy impacts).<sup>3</sup> By overestimating the area of the existing land use, the model overestimates the emissions associated with the

existing land uses, resulting in an underestimation of the net change in operational emissions associated with the proposed Project. As a result, the model should not be relied upon to determine Project significance.

**Unsubstantiated Changes to Individual Construction Phase Lengths**

Review of the CalEEMod output files demonstrates that the “Harvard Westlake - Construction” model includes several changes to the default individual construction phase lengths (see excerpt below) (Appendix C, pp. 71, 116, 163, 210, 323).

Table Name	Column Name	Default Value	New Value
tblConstructionPhase	NumDays	20.00	310.00
tblConstructionPhase	NumDays	300.00	312.00
tblConstructionPhase	NumDays	300.00	446.00
tblConstructionPhase	NumDays	300.00	392.00
tblConstructionPhase	NumDays	300.00	365.00
tblConstructionPhase	NumDays	20.00	53.00
tblConstructionPhase	NumDays	30.00	181.00
tblConstructionPhase	NumDays	20.00	28.00
tblConstructionPhase	NumDays	10.00	27.00
tblConstructionPhase	NumDays	10.00	26.00

As a result of these changes, the model includes the following construction schedule (see excerpt below) (Appendix C, pp. 76, 121, 167, 171, 214, 328):

Phase Number	Phase Name	Phase Type	Start Date	End Date	Num Days Week	Num Days
1	Site Preparation-1	Site Preparation	6/30/2022	7/31/2022	6	27
2	Demolition	Demolition	7/1/2022	8/31/2022	6	53
3	Grading	Grading	8/1/2022	2/27/2023	6	181
4	Foundations	Building Construction	12/2/2022	11/30/2023	6	312
5	Utilities	Trenching	2/2/2023	4/5/2024	6	368
6	Building Construction	Building Construction	5/1/2023	10/1/2024	6	446
7	Site Preparation-2	Site Preparation	9/1/2023	9/30/2023	6	26
8	Landscape	Building Construction	10/2/2023	12/31/2024	6	392
9	Pool Area	Building Construction	11/2/2023	12/31/2024	6	365
10	Architectural Coating	Architectural Coating	1/2/2024	12/27/2024	6	310
11	Paving	Paving	11/1/2024	12/3/2024	6	28

As you can see from the excerpts above, the “Site Preparation-1” phase is increased by 170% from the default value of 10 to 27 days; the “Demolition” phase is increased by 77%, from the default value of 30 to 53 days; the “Grading” phase is increased by 503%,

from the default value of 30 to 181 days; the “Foundations” phase is increased by 4%, from the default value of 300 to 312 days; the “Building Construction” phase is increased by 49%, from the default value of 300 to 446 days; the “Site Preparation-2” phase is increased by 160%, from the default value of 10 to 26 days; the “Landscape” phase is increased by 31%, from the default value of 300 to 392 days; the “Pool Area” phase is increased by 22%, from the default value of 300 to 365 days; the “Architectural Coating” phase is increased by 1,450%, from the default value of 20 to 310 days; and the “Paving” phase is increased by 40%, from the default value of 20 to 28 days.

<sup>2</sup> Calculated: 559,860-SF – 426,000-SF = 133,860-SF

## Response No. ORG 1B-118

The comment contends that the emissions analysis overestimated the size of the existing uses which would be removed and failed to justify the length of construction. As discussed on page, II-3 in Chapter II, *Project Description*, of the Draft EIR, the existing uses include a “nine-hole, 27-par golf course (with Frisbee golf), comprising approximately 426,000 square feet, a 25-stall driving range with a 2,300-square-foot golf canopy...”, where the 25-stall driving range is separate from the nine-hole, 27-par golf course (with frisbee golf). As presented on PDF page 8 of 437 in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, the 25-stall driving range was estimated to be approximately 133,860 square feet and together with the nine-hole golf course were modeled combined as approximately 559,860 square feet. Therefore, the area of the existing land use and emissions associated with the existing land uses were correctly estimated, resulting in an accurate estimation of the net change in operational emissions associated with the proposed Project. As a result, the modeling conducted for the Draft EIR constitutes substantial evidence that can appropriately be relied upon to determine the Project’s impacts.

As stated on page 9 of the CalEEMod user guide, “The user may override the defaults to input more accurate, project-specific information as appropriate.”<sup>60</sup> As discussed on page IV.B-36 in Section IV.B, *Air Quality*, of the Draft EIR, the construction schedule used in modeling was based on information provided by Harvard-Westlake School and MATT Construction, the School’s construction representative and general contractor with expert knowledge in construction projects, including estimating equipment, phasing, and scheduling of construction projects. Therefore, the changes in construction phase length

<sup>60</sup> CAPCOA, CalEEMod User’s Guide, page 9, November 2017. Available: [https://www.aqmd.gov/docs/default-source/caleemod/01\\_user-39-s-guide2016-3-2\\_15november2017.pdf?sfvrsn=4](https://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4)

and duration in the modeling inputs to match the Project construction schedule provided by Harvard-Westlake School is substantiated. The provided schedule would be more accurate based on duration estimates received from the Schools construction representative for the specific Project, as compared to the CalEEMod default schedule for all types of projects. Therefore, the construction schedule provided by Harvard-Westlake School and used in the modeling as documented on page 10 in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, to the Draft EIR is more accurate than the CalEEMod default schedule in estimating the Project's construction air quality impacts. Thus, the DEIR provides substantial evidence to support the revised individual construction phase lengths and construction duration.

### **Comment No. ORG 1B-119**

As previously mentioned, the CalEEMod User's Guide requires any changes to model defaults be justified.<sup>4</sup> According to the "User Entered Comments & Non-Default Data" table, the justification provided for these changes is:

"see construction assumptions" (Appendix C, pp. 71, 116, 163, 210, 323).

Furthermore, regarding the Project's anticipated construction duration, the DEIR states:

"Construction of the Project is anticipated to begin in the third quarter of 2022 pending Project consideration and approval, and is estimated to be completed in the fourth quarter of 2025 with construction occurring for approximately two and a half years (approximately 30 months)" (II-61).

However, while the DEIR indicates an overall construction duration of 30 month, the DEIR fails to mention or justify the individual construction phase lengths. This is incorrect, as according to the CalEEMod User's Guide:

"CalEEMod was also designed to allow the user to change the defaults to reflect site- or project specific information, when available, provided that the information is supported by substantial evidence as required by CEQA."<sup>5</sup>

Here, as the DEIR only justifies the total construction duration of 30 months, the DEIR fails to provide substantial evidence to support the revised individual construction phase lengths. As such, we cannot verify the changes.

### **Response No. ORG 1B-119**

The comment contends that changes to the default CalEEMod model were unsubstantiated. Please see Response No. ORG 1B-118 for a discussion of the analysis and the changes that were made to the CalEEMod default construction phase lengths and durations in the modeling inputs in order to match the Project-specific construction schedule provided by Harvard-Westlake School, consistent with the CalEEMod User's Guide, which were in turn received by the School from its construction representative.

## Comment No. ORG 1B-120

These unsubstantiated changes present an issue, as the construction emissions are improperly spread out over a longer period of time for some phases, but not for others. According to the CalEEMod User's Guide, each construction phase is associated with different emissions activities (see excerpt below).<sup>6</sup>

**Demolition** involves moving buildings or structures.

**Site Preparation** involves clearing vegetation (grubbing and tree/stump removal) and removing stones and other unwanted material or debris prior to grading.

**Grading** involves the cut and fill of land to ensure that the proper base and slope is created for the foundation.

**Building Construction** involves the construction of the foundation, structures and buildings.

**Architectural Coating** involves the application of coatings to both the interior and exterior of buildings or structures, the painting of parking lot or parking garage striping, associated signage and curbs, and the painting of walls or other components such as stair railings inside parking structures.

**Paving** involves the laying of concrete or asphalt such as in parking lots, roads, driveways, or sidewalks.

Thus, by disproportionately altering and extending some of the individual construction phase lengths without proper justification, the model assumes there are a greater number of days to complete the construction activities required by the prolonged phases. As such, there will be less construction activities required per day and, consequently, less pollutants emitted per day. As a result, the model may underestimate the peak daily emissions associated with some phases of construction and should not be relied upon to determine Project significance.

<sup>6</sup> "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, available at: <https://www.aqmd.gov/caleemod/user-s-guide>, p. 32.

## Response No. ORG 1B-120

The comment states that unsubstantiated changes to the default construction schedule underestimates the construction related emission impacts. Please see Response No. ORG 1B-118 for a discussion of the analysis and the changes that were made to the CalEEMod default construction phase lengths and durations in the modeling inputs in order to match the Project-specific construction schedule provided by Harvard-Westlake School and its construction representative, consistent with the CalEEMod User's Guide.

## Comment No. ORG 1B-121

### Unsubstantiated Number of Vendor Trips

Review of the CalEEMod output files demonstrates that the “Harvard Westlake - Construction” model includes several reductions to the number of vendor trips (see excerpt below) (Appendix C, pp. 74, 119, 165, 212, 326).

Table Name	Column Name	Default Value	New Value
tblTripsAndVMT	VendorTripNumber	163.00	0.00
tblTripsAndVMT	VendorTripNumber	163.00	0.00
tblTripsAndVMT	VendorTripNumber	163.00	0.00
tblTripsAndVMT	VendorTripNumber	163.00	0.00

As you can see in the excerpt above, the number of vendor trips is reduced from the default value of 652- to 0-trips. As previously mentioned, the CalEEMod User’s Guide requires any changes to model defaults be justified.<sup>7</sup> According to the “User Entered Comments & Non-Default Data” table, the justification provided for these changes is:

“construction mobile emissions calculated outside of CalEEMo.d”  
(Appendix C, pp. 71, 116, 163, 210, 323).

While we understand mobile-source construction-related emissions are calculated outside of CalEEMod, the number of vendor trips remains unsubstantiated. Review of the construction on-road emissions in the AQ & GHG Report demonstrates that only 82 vendor trips are included in the calculations (Appendix C, pp. 254). As such, the number of vendor trips required for Project construction is reduced from the CalEEMod default value by 570 trips. However, the AQ & GHG Report fails to provide sufficient justification for this reduction and therefore, we are unable to verify the number of vendor trips is accurate.

The unsubstantiated number of vendor trips presents an issue, as CalEEMod uses the vendor and worker trip numbers to estimate the construction-related emissions associated with on-road vehicles.<sup>8</sup> By including an unsubstantiated number to vendor trips in the on-road emissions analysis, the DEIR may underestimate the Project’s mobile-source construction-related emissions and should not be relied upon to determine Project significance.

<sup>7</sup> “CalEEMod User’s Guide.” California Air Pollution Control Officers Association (CAPCOA), May 2021, available at: <https://www.aqmd.gov/caleemod/user-s-guide>, p. 1, 14.

<sup>8</sup> “CalEEMod User’s Guide.” California Air Pollution Control Officers Association (CAPCOA), May 2021, available at: <https://www.aqmd.gov/caleemod/user-s-guide>, p. 35

## Response No. ORG 1B-121

The comment states that unsubstantiated changes from the default inputs to vendor trips underestimates the construction related emissions impacts. As stated on page 9 of the CalEEMod User Guide, “The user may override the defaults to input more accurate, project-specific information as appropriate.”<sup>61</sup> As discussed on page IV.B-36 in Section IV. B, *Air Quality*, of the Draft EIR, worker trip, concrete truck, vendor truck and haul truck trip estimates are based on Project-specific construction information. Therefore, the changes to the default construction vendor trip numbers in the modeling inputs were made to match the provided Project construction information and allows for the modeling to be more representative of the actual anticipated number of vendor trips that would be required for Project construction as compared to the CalEEMod default number of vendor trips. Therefore, the construction vendor trip numbers provided by Harvard-Westlake School and used in modeling as documented on page 10 in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR provides for a more accurate analysis than the CalEEMod default vendor trips in estimating the Project’s construction air quality impacts. As such, the Draft EIR provides substantial evidence to support the revised individual construction phase lengths and construction duration.

## Comment No. ORG 1B-122

### Incorrect CO<sub>2</sub> Intensity Factors

Review of the CalEEMod output files demonstrates that the “Harvard Westlake - Operations” model includes a manual reduction to the default CO<sub>2</sub> intensity factor (see excerpt below) (Appendix C, pp. 279, 291, 388, 403).

Table Name	Column Name	Default Value	New Value
tblProjectCharacteristics	CO2IntensityFactor	1227.89	626.48

As previously mentioned, the CalEEMod User’s Guide requires any changes to model defaults be justified.<sup>9</sup> According to the “User Entered Comments & Non-Default Data” table, the justification provided for the change is:

“CO<sub>2</sub> intensity factor linearly adjusted to account for SB100 RPS by year 2025” (Appendix C, pp. 278, 289, 386).

<sup>61</sup> CAPCOA, CalEEMod User’s Guide, page 9, November 2017. Available: [https://www.aqmd.gov/docs/default-source/caleemod/01\\_user-39-s-guide2016-3-2\\_15november2017.pdf?sfvrsn=4](https://www.aqmd.gov/docs/default-source/caleemod/01_user-39-s-guide2016-3-2_15november2017.pdf?sfvrsn=4)

Furthermore, regarding the California’s Renewables Portfolio Standard (“RPS”), the DEIR states:

“Emission factors for GHGs due to electrical generation to serve the demands of the existing Project Site were obtained from the LADWP 2017 Power Strategic Long-Term Resource Plan, which accounts for the generation mix using renewable and non-renewable sources.<sup>109</sup> Approximately 34 percent of LADWP’s 2019 electricity purchases were from renewable sources, which is similar to the 32 percent Statewide percentage of electricity purchases from renewable sources.<sup>110</sup> LADWP would provide an increasing percentage from renewable sources in compliance with the RPS with 50 percent by 2025, 55 percent by 2030, and 65 percent by 2036. [...] Based on LADWP future projections for the Project opening year of 2025, an estimated emission factor of 626.48 lbs CO<sub>2</sub>/MWh for electricity was calculated using LADWP projections from existing plans for compliance with the RPS (i.e., SB 100) and future projected energy supply resources” (p. IV.G-46)

However, these changes remain unsupported for two reasons. First, the LADWP 2017 Power Strategic Long-Term Resource Plan, which is the source provided for the revised CO<sub>2</sub> intensity factor, appears to be unavailable. Second, simply because the State has renewable energy goals, such as 50% renewable energy by 2025, does not ensure that these goals will be achieved locally on the Project site or by the Project’s specific utility company. As such, the CO<sub>2</sub> intensity factor should be based on currently achieved power mixes, rather than future estimates based on statewide targets. As a result, we cannot verify the revised value.

This unsubstantiated reduction presents an issue, as CalEEMod uses the CO<sub>2</sub> intensity factor to calculate the Project’s greenhouse gas (“GHG”) emissions associated with electricity use.<sup>10</sup> Thus, by including an unsubstantiated reduction to the default CO<sub>2</sub> intensity factor, the model may underestimate the Project’s GHG emissions and should not be relied upon to determine Project significance.

<sup>9</sup> “CalEEMod User’s Guide.” California Air Pollution Control Officers Association (CAPCOA), May 2021, available at: <https://www.aqmd.gov/caleemod/user-s-guide>, p. 35.

<sup>10</sup> “CalEEMod User’s Guide.” California Air Pollution Control Officers Association (CAPCOA), May 2021, available at: <https://www.aqmd.gov/caleemod/user-s-guide>, p. 19.

## Response No. ORG 1B-122

The comment states that the unsubstantiated changes from the CO<sub>2</sub> defaults underestimates the GHG emissions. Refer to Response No. ORG 1B-66 for a discussion of the adjusted CO<sub>2</sub> intensity factors used to calculate the Project’s GHG emissions associated with electricity use. As discussed therein, the adjusted CO<sub>2</sub> intensity factors are substantiated and are appropriately relied upon to estimate the Project’s GHG emissions. In addition, the LADWP 2017 Power Strategic Long-Term Resource Plan is

available in the link provided.<sup>62</sup> Furthermore, SB 100 does not set RPS “goals” but rather establishes RPS “requirements” that regulatorily mandate 44 percent by 2024, 52 percent by 2027, and 60 percent by 2030, and that CARB should plan for 100 percent eligible renewable energy resources and zero-carbon resources by 2045.<sup>63</sup> Therefore, the use of future regulatorily-mandated RPS requirements for future CO<sub>2</sub> intensity of the electric supply is appropriate and provides a more accurate analysis of future expected GHG emissions.

## Comment No. ORG 1B-123

### Incorrect Application of Construction-Related Mitigation Measures

Review of the CalEEMod output files demonstrates that the “Harvard Westlake - Construction” model includes the following construction-related mitigation measures (see excerpt below) (Appendix A, pp. 73, 110, 140):

#### 3.1 Mitigation Measures Construction

- Use Soil Stabilizer
- Water Exposed Area
- Reduce Vehicle Speed on Unpaved Roads

As previously mentioned, the CalEEMod User’s Guide requires any changes to model defaults be justified.<sup>11</sup> However, the “User Entered Comments & Non-Default Data” table fails to provide a justification for these changes. Furthermore, regarding Project compliance with fugitive dust regulations, the DEIR states:

“Rule 403 – Fugitive Dust: This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the project property line, restricts the net P.M.10 emissions to less than 50 micrograms per cubic meter (µg/m<sup>3</sup>) and restricts the tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Best available control measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers and/or ceasing all activities. Finally, a contingency plan may be required if so determined by the USEPA” (p. IV.B-16).

<sup>62</sup> LADWP, 2017 Final Power Strategic Long-Term Resource Plan, December 2017. Available: [https://www.ladwp.com/ladwp/faces/wcnav\\_externalId/a-p-doc?\\_adf.ctrl-state=1cwrvmmyrn\\_4&\\_afLoop=1227158160253547](https://www.ladwp.com/ladwp/faces/wcnav_externalId/a-p-doc?_adf.ctrl-state=1cwrvmmyrn_4&_afLoop=1227158160253547).

<sup>63</sup> California Legislative Information, *SB-100 California Renewables Portfolio Standard Program: Emissions of Greenhouse Gases*. Available: [https://leginfo.ca.gov/faces/billTextClient.xhtml?bill\\_id=201720180SB100](https://leginfo.ca.gov/faces/billTextClient.xhtml?bill_id=201720180SB100)

However, the inclusion of the above-mentioned construction-related mitigation measures remain unsupported for three reasons.

First, the inclusion of the construction-related mitigation measures, based on the Project's compliance with SCAQMD Rule 403, is unsupported. According to the Association of Environmental Professionals ("AEP") CEQA Portal Topic Paper on mitigation measures.

"By definition, mitigation measures are not part of the original project design. Rather, mitigation measures are actions taken by the lead agency to reduce impacts to the environment resulting from the original project design. Mitigation measures are identified by the lead agency after the project has undergone environmental review and are above-and-beyond existing laws, regulations, and requirements that would reduce environmental impacts."<sup>12</sup>

As you can see in the excerpt above, mitigation measures "are not part of the original project design" and are intended to go "above-and-beyond" existing regulatory requirements. As such, the inclusion of these measures, based solely on SCAQMD Rule 403, is unsubstantiated.

<sup>11</sup> "CalEEMod User's Guide." California Air Pollution Control Officers Association (CAPCOA), May 2021, available at: <https://www.aqmd.gov/caleemod/user-s-guide>, p. 1, 14.

<sup>12</sup> "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, available at: <https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf>, p. 5.

## Response No. ORG 1B-123

The comment states that the modeling for the Project includes incorrect application of construction-related mitigation measures. Compliance with SCAQMD Rule 403 and Rule 1466 is a requirement of every construction project within SCAQMD's jurisdiction. Therefore, the reduction of fugitive dust emissions based on compliance with Rule 403 and Rule 1466 (which is, by default, not included by CalEEMod in the unmitigated default calculation) is justified because the use of "mitigation" for dust suppression is actually a function of the unmitigated scenario. The use of "mitigation measures" (which is the vernacular used as part of CalEEMod's program and is separate and distinct from the inclusion of a project's mitigation measures in an EIR as per CEQA) to comply with Rule 403 and Rule 1466 does not indicate that compliance with Rule 403 and Rule 1466 would be a mitigation measure needed to mitigate impacts. It is simply using a built-in function of the program to accurately estimate fugitive dust emissions from construction activities. This is a common practice within the industry, and therefore, compliance with Rule 403 and Rule 1466 are not considered a mitigation measure.

As CalEEMod defaults for watering is a minimum of three times daily for the SCAQMD area, watering three times daily would be the minimum required to meet the Rule 403 requirements for dust suppression from grading/soil disturbance. In addition, as noted in Rule 1466, the speed limit of 15 mph is required for excavating and grading activities to minimize the amount of off-site fugitive dust emissions containing TACs by reducing

particulate emissions in the ambient air as a result of earth-moving activities. As such, the application of this measure to the Project scenario accurately reflects the unmitigated Project emissions of fugitive dust.

The soil stabilizer “mitigation measure” was selected to provide it as an option for compliance with Rule 403 in conjunction with and/or separate from watering. Thus, there is reasonable justification provided to substantiate the use of soil stabilizer in the CalEEMod construction modeling to accurately estimate the Project’s dust emissions during the site preparation and grading phases, and the Project’s overall construction-related emissions, which can be relied upon to determine the significance of air quality impacts. However, the effect of applying both a soil stabilizer and watering are not additive, partially additive, or multiplicative, as modeling performed without the soil stabilizer “mitigation measure”, while watering and reduced speed are applied results in the same fugitive dust emissions as when all three measures including the soil stabilizer, watering and reduced speeds are applied. The construction CalEEMod runs that show that the fugitive dust emissions results would not change are provided as Appendix H to this Final EIR. Thus, applying soil stabilizers in the modeling does not change the Project’s maximum PM10 or PM2.5 impacts, and the impacts would be less than significant as presented in the Draft EIR. Therefore, the analysis provided in the Draft EIR is supported by substantial evidence.

### **Comment No. ORG 1B-124**

Second, according to the above-mentioned AEP report:

“While not ‘mitigation’, a good practice is to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP). Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, it is easy for someone not involved in the original environmental process to approve a change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact.”<sup>13</sup>

As you can see in the excerpt above, project design features (“PDFs”) that are not formally included as mitigation measures may be eliminated from the Project’s design altogether. Thus, as the above-mentioned construction-related measures are not formally included as mitigation measures, we cannot guarantee that they would be implemented, monitored, and enforced on the Project site.

<sup>13</sup> “CEQA Portal Topic Paper Mitigation Measures.” AEP, February 2020, available at: <https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf>, p. 6.

## Response No. ORG 1B-124

The comment states that construction-related measures, including PDFs, should be included as mitigation measures to ensure that they are enforced. Compliance with SCAQMD Rule 403 and Rule 1466 is a requirement of every construction project within SCAQMD's jurisdiction. Therefore, the reduction of fugitive dust emissions based on compliance with Rule 403 and Rule 1466 (which is, by default, not included by CalEEMod in the unmitigated default calculation) is justified because the use of "mitigation" for dust suppression is actually a function of the unmitigated scenario. The use of "mitigation measures" (which is the vernacular used as part of CalEEMod program and is separate and distinct from the inclusion of a project's mitigation measures in an EIR as per CEQA) to comply with Rule 403 and Rule 1466 does not indicate that compliance with Rule 403 and Rule 1466 would be a mitigation measure needed to mitigate impacts. It is simply using a built-in function of the program to accurately estimate fugitive dust emissions from construction activities. This is a common practice within the industry, and therefore, compliance with Rule 403 and Rule 1466 are not considered a mitigation measure.

Additionally, while compliance with regulatory measures are neither PDFs nor mitigation measures for CEQA analysis, the PDFs in the Draft EIR are enforceable by the City as they are included in the Mitigation Monitoring Program. See Chapter 4.0, *Mitigation Monitoring Program*, of this Final EIR.

## Comment No. ORG 1B-125

Third, simply because the DEIR references SCAQMD Rule 403 does not justify the inclusion of the above-mentioned construction-related mitigation measures in the model. Specifically, according to SCAQMD Rule 403, Projects can either water unpaved roads 3 times per day, water unpaved roads 1 time per day and limit vehicle speeds to 15 mph or apply a chemical stabilizer (see excerpt below).<sup>14</sup>

Table 2 (Continued)

FUGITIVE DUST SOURCE CATEGORY	CONTROL ACTIONS
Unpaved Roads	(4a) Water all roads used for any vehicular traffic at least once per every two hours of active operations [3 times per normal 8 hour work day]; OR (4b) Water all roads used for any vehicular traffic once daily and restrict vehicle speeds to 15 miles per hour; OR (4c) Apply a chemical stabilizer to all unpaved road surfaces in sufficient quantity and frequency to maintain a stabilized surface.

As you can see in the above excerpt, to simply comply with SCAQMD Rule 403, the Project may either water unpaved roads 3 times per day, water unpaved roads 1 time per day and limit vehicle speeds to 15 mph, or apply a chemical stabilizer. Thus, the "Use

Soil Stabilizer,” “Water Exposed Area,” and “Reduce Vehicle Speed on Unpaved Roads” measures are not all explicitly required by SCAQMD Rule 403, and should therefore not be included in the model. By incorrectly including several construction-related mitigation measures without properly committing to their implementation, the model may underestimate the Project’s construction-related emissions and should not be relied upon to determine Project significance.

<sup>14</sup> “RULE 403. FUGITIVE DUST.” SCAQMD, June 2005, available at: <http://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-403.pdf>, p. 403-21, Table 2.

## **Response No. ORG 1B-125**

The comment contends that the Draft EIR underestimated Project-related construction emissions by not committing the Project to one of the specific mitigation measures contained in SCAQMD Rule 403. The soil stabilizer “mitigation measure” was selected to provide it as an option for compliance with Rule 403 in conjunction with and/or separate from watering. Thus, there is reasonable justification provided to substantiate the use of soil stabilizer used in the CalEEMod construction modeling to accurately estimate the Project’s dust emissions during the site preparation and grading phases, and the Project’s overall construction-related emissions, which can be relied upon to determine the significance of air quality impacts. However, the effect of applying both a soil stabilizer and watering are not additive, partially additive, or multiplicative, as modeling performed without the soil stabilizer “mitigation measure”, while watering and reduced speed are applied results in the same fugitive dust emissions as when all three measures including the soil stabilizer, watering and reduced speeds are applied. The construction CalEEMod runs that show that the fugitive dust emissions results would not change are provided as Appendix H to this Final EIR.

## **Comment No. ORG 1B-126**

### **Diesel Particulate Matter Health Risk Emissions Inadequately Evaluated**

The DEIR concludes that the Project would have a less-than-significant health risk impact without conducting a quantified construction or operational health risk analysis (“HRA”) (p. IV.B-61 – IV.B-62). Regarding the health risk impacts associated with Project construction, the DEIR states:

“Temporary TAC emissions associated with DP.M. emissions from heavy construction equipment would occur during the construction phase of the Project. According to OEHHA and the SCAQMD Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis, 96 health effects from TACs are described in terms of individual cancer risk based on a lifetime (i.e., 70- year) resident exposure duration. Given the temporary construction schedule (approximately 30 months), the Project would not result in a long-term (i.e., lifetime or 70-year) exposure as a result of Project construction” (p. IV.B-61)

As demonstrated above, the DEIR concludes that the Project would result in a less-than-significant construction-related health risk impact because the temporary construction schedule would not result in long-term toxic air contaminant (“TAC”) emissions. Furthermore, regarding the health risk impacts associated with Project operation, the DEIR states:

“As a result, toxic or carcinogenic air pollutants are not expected to occur in any substantial amounts in conjunction with operation of the proposed land uses within the Project Site. Based on the uses expected on the Project Site, operation of the Project would not expose sensitive receptors to substantial TAC concentrations, and operational impacts would be less than significant” (p. IV.B-62).

As demonstrated above, the DEIR concludes that the Project would result in a less-than-significant operational health risk impact because the proposed land uses are not expected to generate substantial TAC emissions. However, the DEIR’s evaluation of the Project’s potential health risk impacts, as well as the subsequent less-than-significant impact conclusion, is incorrect for three reasons.

First, by failing to prepare a quantified construction and operational HRA, the Project is inconsistent with CEQA’s requirement to make “a reasonable effort to substantively connect a project’s air quality impacts to likely health consequences.”<sup>15</sup> This poses a problem, as construction of the Project would produce diesel particulate matter (“DP.M.”) emissions through the exhaust stacks of construction equipment over a duration of approximately 30 months (p. II-61). Furthermore, operation of the Project is expected to generate an estimated 3,932 total daily vehicle miles travelled (“VMT”), which would produce additional exhaust emissions and continue to expose nearby, existing sensitive receptors to DP.M. emissions during Project operation (p. IV.M-40). However, the DEIR fails to evaluate the TAC emissions associated with Project construction and operation, or indicate the concentrations at which such pollutants would trigger adverse health effects. Thus, without making a reasonable effort to connect the Project’s TAC emissions to the potential health risks posed to nearby receptors, the DEIR is inconsistent with CEQA’s requirement to correlate Project-generated emissions with potential adverse impacts on human health.

<sup>15</sup> “Sierra Club v. County of Fresno.” Supreme Court of California, December 2018, available at: <https://ceqaportal.org/decisions/1907/Sierra%20Club%20v.%20County%20of%20Fresno.pdf>. Duration. Furthermore, OEHHA recommends that an exposure duration of 30 years should be used to estimate the individual cancer risk at the maximally exposed individual resident (“MEIR”).<sup>18</sup> While the DEIR fails to provide the expected lifetime of the proposed Project, we can reasonably assume that the Project would operate for at least 30 years, if not more. Therefore, operation of the Project also exceeds the 2-month and 6-month requirements set forth by OEHHA, and should be evaluated for the entire 30- year residential exposure duration as indicated by OEHHA guidance. These recommendations reflect the most recent state health risk policies, and as such, an updated EIR should be prepared to include an analysis of health risk impacts posed to nearby sensitive receptors from Project-generated DP.M. emissions.

## Response No. ORG 1B-126

The commenter maintains that the EIR should have included both a construction and operational HRA of the Project's TAC emissions. As stated on pages IV.B-42 through IV.B-43 in Section IV.B, *Air Quality*, of the Draft EIR, the City is not required to conduct a quantified HRA for recreational and athletic facility projects, such as the Project, as the applicable standards and guidance that are available are intended for evaluation of health risks associated with stationary long-term sources of TAC emissions. Rather than being a stationary source of TAC emissions, the Project's emissions are largely from mobile sources, and, while the Project would generate localized TAC emissions primarily during construction, the associated activities and exposures would be short- rather than long-term.

Further, the OEHHA developed the Air Toxics Hot Spots Program Guidance Manual for the Preparation of Risk Assessments (Guidance Manual),<sup>64</sup> in conjunction with CARB, for use in implementing the Air Toxics "Hot Spots" Program (Health and Safety Code Section 44360 et. seq.). The Air Toxics "Hot Spots" Program requires stationary sources to report the types and quantities of certain substances routinely released into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, to identify facilities having localized impacts, to ascertain health risks, to notify nearby residents of significant risks, and to reduce those significant risks to acceptable levels. The intent in developing the Guidance Manual was to provide HRA procedures for use in the Air Toxics Hot Spots Program or for the permitting of new or modified stationary sources.

Although the HRA guidelines are intended for assessment of long-term stationary sources, in relation to assessment of health risk due to short-term construction, the Guidance Manual states:

*"The local air pollution control districts sometimes use the risk assessment guidelines for the Hot Spots program in permitting decisions for short-term projects such as construction or waste site remediation. Frequently, the issue of how to address cancer risks from short-term projects arises. Cancer potency factors are based on animal lifetime studies or worker studies where there is long-term exposure to the carcinogenic agent. There is considerable uncertainty in trying to evaluate the cancer risk from projects that will only last a small fraction of a lifetime."*<sup>65</sup>

The Project is not a "Hot Spots" Program project but rather involves the construction and operation of a school athletic and recreational facility and publicly-accessible recreational uses. The OEHHA Guidance Manual applies to stationary source operations which have no applicability to athletic and recreational projects, such as the Project. While OEHHA provides limited guidance on how to conduct HRAs for short-term projects, it makes it clear there is

<sup>64</sup> Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program, Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments, February 2015.

<sup>65</sup> Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program, Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments, February 2015, page 8-17.

“considerable uncertainty” in evaluating cancer risk over short-term durations. In addition, the Guidance Manual does not identify short-term projects or non-stationary source projects that warrant the preparation of an HRA or recommend the preparation of HRAs for short-term construction projects or non-stationary source projects, such as the Project.

In addition to OEHHA highlighting the considerable uncertainty in meaningfully evaluating short term exposures to TACs, with respect to construction emissions, the SCAQMD states that it “currently does not have guidance on construction Health Risk Assessments.”<sup>66</sup> Furthermore, in comments presented to the SCAQMD Governing Board<sup>67</sup> relating to TAC exposures associated with Rules 1401, 1401.1, 1402 and 212 revisions, with regard to the use of the OEHHA Guidance Manual for projects subject to CEQA, SCAQMD staff reported that:

*The Proposed Amended Rules are separate from the CEQA significance thresholds. Per the Response to Comments Staff Report PAR 1401, 1401.1, 1402, and 212 A—(8 June 2015), SCAQMD staff is currently evaluating how to implement the Revised OEHHA Guidelines under CEQA. The SCAQMD staff will evaluate a variety of options on how to evaluate health risks under the Revised OEHHA Guidelines under CEQA. The SCAQMD staff will conduct public workshops to gather input before bringing recommendations to the Governing Board.*

To date, the SCAQMD has not conducted public workshops nor developed policy relating to the applicability of applying the Guidance Manual for projects prepared by other public/lead agencies subject to CEQA, for short-term construction emissions, or for recreational and athletic facility projects, such as the Project. Therefore, as stated on pages IV.B-42 through IV.B-43 in Section IV.B, *Air Quality*, of the Draft EIR, in light of the considerable uncertainty and lack of accepted guidance for assessing short-term construction emissions from OEHHA and SCAQMD, the City does not require that a quantified HRA be prepared for the Project for the purposes of CEQA compliance.

While a quantified HRA is not required to be conducted, for informational purposes only, a quantitative construction HRA has been prepared, included as Appendix I to this Final EIR. The results of the HRA, which was performed through a refined modeling approach

<sup>66</sup> South Coast Air Quality Management District, Final Environmental Assessment for: Proposed Amended Rule 307.1 – Alternative Fees for Air Toxics Emissions Inventory; Proposed Amended Rule 1401 – New Source Review of Toxic Air Contaminants; Proposed Amended Rule 1402 – Control of Toxic Air Contaminants from Existing Sources; SCAQMD Public Notification Procedures for Facilities Under the Air Toxics “Hot Spots” Information and Assessment Act (AB 2588) and Rule 1402; and, SCAQMD Guidelines for Participating in the Rule 1402 Voluntary Risk, page 2-23, September 2016. The SCAQMD only applies the revised OEHHA Guidelines for operational impacts at stationary industrial source facilities that are in the AB 2588 Air Toxics Hot Spots program, which does not apply to the Project.

<sup>67</sup> SCAQMD, Board Meeting, Agenda No. 28, Proposed Amended Rules 1401 – New Source Review of Toxic Air Contaminants, 1401.1 – Requirements for New and Relocated Facilities Near Schools, Rule 1402 – Control of Toxic Air Contaminants from Existing Sources, and 212 – Standards for Approving Permits and Issuing Public Notice, June 5, 2015.

using the USEPA/AMS Regulatory Model (AERMOD), show that the Project would result in cancer risk below 10 in one million for the maximum impacted residential receptors. The maximum non-cancer impacts for the Project would be below a hazard index of 1.0. The results of this refined AERMOD dispersion modeling provides further substantial evidence that TAC emissions from construction activities would not expose sensitive receptors to substantial TAC concentrations. Thus, although this analysis is provided for informational purposes only, it demonstrates that construction activities under the Project would not expose sensitive receptors to substantial TAC concentrations and supports the information and conclusions presented on pages IV.B-61 through IV.B-63 of the Draft EIR.

In addition, as stated on page IV.B-62 in Section IV.B, *Air Quality*, of the Draft EIR, the SCAQMD recommends that operational health risk assessments be conducted for substantial sources of operational DP.M. (e.g., truck stops and warehouse distribution facilities that generate more than 100 trucks per day or more than 40 trucks with operating transport refrigeration units) and has provided guidance for analyzing mobile source diesel emissions. The Project would not include any truck stop or warehouse distribution uses, and, as such, operations would generate only minor amounts of diesel emissions from mobile sources, such as delivery trucks and occasional maintenance. Further, the potential for significant increased health risk impacts associated with the inhalation of vapors and particulate matter in the air space above the artificial turf field, the accidental ingestion of artificial turf products, or dermal contact with artificial turf products are evaluated in Section IV.H, *Hazards and Hazardous Materials*, with additional detail provided in Appendix H-2 of the Draft EIR. As analyzed therein, Project impacts related to the inhalation of vapors and particulates associated with the use of artificial turf, ingestion of artificial turf products, and dermal contact with artificial turf products would be less than significant because evidence does not support a conclusion of a significant increase in health risks. As a result, toxic or carcinogenic air pollutants are not expected to occur in any substantial amounts in conjunction with operation of the proposed land uses within the Project Site. Based on the uses expected on the Project Site, operation of the Project would not expose sensitive receptors to substantial TAC concentrations, and operational impacts would be less than significant. Thus, the findings as described on pages IV.B-61 through IV.B-63 of the Draft EIR that the potential for the Project to cause adverse health impacts from exposure to TACs from the Project's construction and operational emissions consistent with CEQA Guidelines Section 15126.2(a) is less than significant remains unchanged as is further substantiated by the quantitative HRA. No additional analysis is required.

### **Comment No. ORG 1B-127**

Second, the Office of Environmental Health Hazard Assessment ("OEHHA"), the organization responsible for providing guidance on conducting HRAs in California, released its most recent Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments in February 2015. This guidance document describes the types of projects that warrant the preparation of an HRA. Specifically, OEHHA

recommends that all short-term projects lasting at least 2 months assess cancer risks.<sup>16</sup> Furthermore, according to OEHHA:

“Exposure from projects lasting more than 6 months should be evaluated for the duration of the project. In all cases, for assessing risk to residential receptors, the exposure should be assumed to start in the third trimester to allow for the use of the ASFs (OEHHA, 2009).”<sup>17</sup>

Thus, as the Project’s anticipated construction duration exceeds the 2-month and 6-month requirements set forth by OEHHA, construction of the Project meets the threshold warranting a quantified HRA under OEHHA guidance and should be evaluated for the entire 30-month construction duration. Furthermore, OEHHA recommends that an exposure duration of 30 years should be used to estimate the individual cancer risk at the maximally exposed individual resident (“MEIR”).<sup>18</sup> While the DEIR fails to provide the expected lifetime of the proposed Project, we can reasonably assume that the Project would operate for at least 30 years, if not more. Therefore, operation of the Project also exceeds the 2-month and 6-month requirements set forth by OEHHA, and should be evaluated for the entire 30- year residential exposure duration as indicated by OEHHA guidance. These recommendations reflect the most recent state health risk policies, and as such, an updated EIR should be prepared to include an analysis of health risk impacts posed to nearby sensitive receptors from Project-generated DP.M. emissions.

<sup>16</sup> “Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments.” OEHHA, February 2015, available at: <https://oehha.ca.gov/media/downloads/crn/2015guidancemanual.pdf>, p. 8-18.

<sup>17</sup> “Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments.” OEHHA, February 2015, available at: <https://oehha.ca.gov/media/downloads/crn/2015guidancemanual.pdf>, p. 8-18.

<sup>18</sup> “Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments.” OEHHA, February 2015, available at: <https://oehha.ca.gov/media/downloads/crn/2015guidancemanual.pdf>, p. 2-4.

## Response No. ORG 1B-127

The comment restates that a health risk assessment is required for Project construction and operation. Refer to Response Nos. ORG 1B-77 through ORG 1B-79 and ORG 1B-126.

## Comment No. ORG 1B-128

Third, by claiming a less than significant impact without conducting a quantified construction or operational HRA for nearby, existing sensitive receptors, the DEIR fails to compare the Project’s excess cancer risk to the SCAQMD’s specific numeric threshold of 10 in one million.<sup>19</sup> Thus, in accordance with the most relevant guidance, an assessment of the health risk posed to nearby, existing receptors as a result of Project construction and operation should be conducted.

<sup>19</sup> “South Coast AQMD Air Quality Significance Thresholds.” SCAQMD, April 2019, available at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf>.

## Response No. ORG 1B-128

The comment restates the need for a health risk assessment to assess the Project's cancer risks. Refer to Response No. ORG 1B-126.

## Comment No. ORG 1B-129

### Greenhouse Gas

#### Failure to Adequately Evaluate Greenhouse Gas Impacts

The DEIR estimates that the Project would generate net annual greenhouse gas ("GHG") emissions of 1,533- and 2,226-metric tons of carbon dioxide equivalents per year ("MT CO<sub>2</sub>e/year") with and without GHG reduction measures, respectively (see excerpt below) (p. IV.G-53, Table IV.G-7).

**TABLE IV.G-7  
ESTIMATED OPERATIONAL GREENHOUSE GAS EMISSIONS – PROJECT**

Emissions Sources	CO <sub>2</sub> e at Buildout Year (2025) (Metric Tons per Year) <sup>a</sup>	
	Project with implementation of GHG reduction characteristics, features, and measures	Project without implementation of GHG reduction characteristics, features, and measures
<b>Project Operational</b>		
Mobile Sources <sup>b</sup> (Includes VMT associated from both the Project and Community Use)	1,420	1,865
Area	<1	<1
Electricity	693	972
Natural Gas	93	94
Water and Wastewater Treatment	64	73
Solid Waste	19	19
Construction (Amortized)	430	430
Project Subtotal	2,719	3,452
Existing Site (refer to Table IV.G-5)	1,186	1,186
<b>Net Total (Project minus Existing)</b>	<b>1,533</b>	<b>2,266</b>

<sup>a</sup> Totals may not add up exactly due to rounding in the modeling calculations.

<sup>b</sup> As discussed in subsection IV.G.3.b) *Methodology*, while the community use component of the Project, which is classified as a community-serving recreational facility, is exempt from VMT analysis per LADOT's *Transportation Assessment Guidelines*, the emissions associated with VMT from the community use component of the Project were accounted for in the Project's operational emissions for the purposes of this GHG analysis, including from typical weekday community use. The Project's GHG analysis also accounted for annual VMT from occasional community use events that could occur during the year, including five Community Events with approximately 500 attendees per event. Factoring in these various uses, estimated operational GHGs associated with community uses account for more than two-thirds of the Project total. Refer to VMT data in Appendix C and Appendix M of this Draft EIR.

SOURCE: ESA, 2021.

However, the DEIR elects not to apply a quantitative GHG threshold. Instead, the DEIR concludes a less-than-significant GHG impact based on “the Project’s compliance with performance-based standards included in the regulations outlined in the applicable portions of CARB’s Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City’s Green New Deal, and the Los Angeles Green Building Code” (p. IV.G-40). However, the DEIR’s analysis, as well as the subsequent less-than-significant impact conclusion, is incorrect for five reasons:

- (1) The DEIR’s quantitative GHG analysis relies upon an incorrect and unsubstantiated air model;
- (2) The DEIR fails to indicate a potentially significant GHG impact;
- (3) The DEIR should incorporate PDFs as formal mitigation measures;
- (4) The DEIR fails to consider the performance-based standards under CARB’s Scoping Plan; and
- (5) The DEIR fails to consider the performance-based standards under SCAG’s RTP/SCS

### **Response No. ORG 1B-129**

The comment states that the GHG analysis is defective due to the air model use, failure to include unspecified significant impacts, use of PDFs instead of mitigation measures, and not using performance-based standards. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. Please refer to Response No. ORG 1B-64 for a discussion on the validity and applicability of the CalEEMod model used to assess the Project’s GHG emissions; the appropriate use of the qualitative significance threshold where it was determined that the Project’s GHG emissions would not be considerable and therefore would not have a significant effect on the environment if the Project is found to be compliant with performance-based standards included in the regulations outlined in the applicable portions of CARB’s Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City’s Green New Deal, and the Los Angeles Green Building Code, rather than any service population or quantitative threshold; the appropriateness in assigned GHG reduction characteristics, features, and measures as PDFs since the Project does not have significant GHG impacts; and the compliance of the Project with the performance-based standards under CARB’s Scoping Plan and SCAG’s RTP/SCS.

Additionally, see Response No. ORG 1B-28 regarding use of PDFs in the GHG analysis.

## Comment No. ORG 1B-130

### 1) Incorrect and Unsubstantiated Quantitative Analysis of Emissions

As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 1,533- and 2,226-MT CO<sub>2</sub>e/year with and without GHG reduction measures, respectively (p. IV.G-53, Table IV.G-7). However, the DEIR's quantitative GHG analysis is unsubstantiated. As previously discussed, when we reviewed the Project's CalEEMod output files, provided in the AQ & GHG Report as Appendix C to the DEIR, we found that several of the values inputted into the model are not consistent with information disclosed in the DEIR. As a result, the model underestimates the Project's emissions, and the DEIR's quantitative GHG analysis should not be relied upon to determine Project significance. An updated EIR should be prepared that adequately assesses the potential GHG impacts that construction and operation of the proposed Project may have on the surrounding environment.

## Response No. ORG 1B-130

This comment states that there are inconsistent and/or unsubstantiated input parameters to estimate Project GHG emissions; however, the comment does not state specific inputs that were inconsistent or unsubstantiated. As described on pages IV.G-40 to IV.G-50 in Section IV.G, *Greenhouse Gas Emissions*, of the Draft EIR, the assumptions used for the air quality and GHG emissions modeling and emissions estimates for the Project were based on Project-specific information provided by Harvard-Westlake School, the Project's engineering and construction representatives, and CalEEMod modeling software (Version 2016.3.2) default inputs. In addition, the detailed list of construction and operational inputs used in the modeling with source documentation is presented on pages PDF pages 7 through 20 of 437 in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation. As a result, the model accurately estimates the Project's GHG emissions. Thus, the Project's GHG analysis uses substantiated and consistent (as applicable) inputs and adequately evaluates the impacts that construction and operation of the Project would have regarding GHG emissions. Further, as discussed on page IV.G-38, in Section IV.G, *Greenhouse Gas Emissions*, under the heading Thresholds of Significance in the Draft EIR, CEQA Guidelines Section 15064.4 gives lead agencies the discretion to determine whether to assess those emissions quantitatively or qualitatively. Although GHG emissions were quantified for the Project, CARB, SCAQMD, and the City have not adopted quantitative project-level significance thresholds for GHG emissions that would be applicable to the Project. Therefore, in the absence of any adopted quantitative thresholds of general application, the City, as Lead Agency, has determined that the Project's GHG emissions would not be considerable and would not have a significant effect on the environment if the Project is found to be compliant with performance-based standards included in the regulations outlined in the applicable portions of CARB's Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City's Green New Deal, and the Los Angeles Green Building Code. Since the Project was not in conflict with these applicable regulatory plans to reduce GHG emissions, Project impacts are less

than significant. In addition, support for this threshold is found in California Supreme Court case law, such as *Center for Biological Diversity et al. vs. California Department of Fish and Wildlife* and *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 576.).

## Comment No. ORG 1B-131

### 2) Failure to Identify a Potentially Significant GHG Impact

In an effort to quantitatively evaluate the Project's GHG emissions, we compared the Project's GHG emissions, as estimated by the DEIR, to the SCAQMD 2035 service population efficiency target of 3.0 MT CO<sub>2</sub>e/SP/year, which was calculated by applying a 40% reduction to the 2020 targets.<sup>20</sup> When applying this threshold, the Project's incorrect and unsubstantiated air model indicates a potentially significant GHG impact.

As previously stated, the DEIR estimates that the Project would generate net annual GHG emissions of 1,533 MT CO<sub>2</sub>e/year with GHG reduction measures (p. IV.G-53, Table IV.G-7). According to CAPCOA's CEQA & Climate Change report, a service population ("SP") is defined as "the sum of the number of residents and the number of jobs supported by the project."<sup>21</sup> According to the DEIR, the Project would employ a maximum of 100 people during operation (p. II-51). As the Project does not include any residential land uses, we estimate a SP of 100 people.<sup>22</sup> When dividing the Project's net annual GHG emissions, as estimated by the DEIR, by a SP of 100 people, we find that the Project would emit approximately 15.5 MT CO<sub>2</sub>e/SP/year (see table below).<sup>23</sup>

DEIR Greenhouse Gas Emissions	
Annual Emissions (MT CO <sub>2</sub> e/year)	1,553
Service Population	100
Service Population Efficiency (MT CO <sub>2</sub> e/SP/year)	15.5
SCAQMD 2035 Threshold	3.0
Exceeds?	Yes

As demonstrated above, the Project's service population efficiency value, as estimated by the DEIR's net annual GHG emission estimates and SP, exceeds the SCAQMD 2035 efficiency target of 3.0 MT CO<sub>2</sub>e/SP/year, indicating a potentially significant impact not previously identified or addressed by the DEIR. As a result, the DEIR's less-than-significant GHG impact conclusion should not be relied upon. An updated EIR should be prepared, including an updated GHG analysis and incorporating additional mitigation measures to reduce the Project's GHG emissions to less-than-significant levels.

- <sup>20</sup> “Minutes for the GHG CEQA Significance Threshold Stakeholder Working Group #15.” SCAQMD, September 2010, available at: [http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-\(ghg\)-ceqasignificance-thresholds/year-2008-2009/ghg-meeting-15/ghg-meeting-15-minutes.pdf](http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqasignificance-thresholds/year-2008-2009/ghg-meeting-15/ghg-meeting-15-minutes.pdf), p. 2
- <sup>21</sup> “CEQA & Climate Change.” CAPCOA, January 2008, available at: <http://www.capcoa.org/wpcontent/uploads/2012/03/CAPCOA-White-Paper.pdf>, p. 71-72.
- <sup>22</sup> Calculated: 100 employees + 0 residents = 100 total SP.
- <sup>23</sup> Calculated: (1,553 MT CO<sub>2</sub>e/year) / (100 service population) = (15.5 MT CO<sub>2</sub>e/SP/year).

## Response No. ORG 1B-131

The comment contends that use of a quantitative analysis discloses that the Project would have a significant impact related to GHG emissions. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. Please refer to Response Nos. ORG 1B-64, ORG 1B-65, and ORG 1B-130 for a discussion on the appropriate use of the qualitative significance threshold where the City determined that the Project’s GHG emissions would not be considerable and therefore would not have a significant effect on the environment if the Project is found to be compliant with performance-based standards included in the regulations outlined in the applicable portions of CARB’s Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City’s Green New Deal, and the Los Angeles Green Building Code, rather than any service population or quantitative threshold.

The calculation provided in the comment regarding a service population of 100 people and a per service population GHG emissions is not meaningful and lacks any substantial evidence as to its applicability to the Project. It is not known how the commenter arrived at a service population of 100 people. It is presumed that the commenter is referencing information in Chapter 2, *Project Description*, of the Draft EIR, which states that “On days in which high attendance events do take place (i.e., greater than 300 spectators and participants) there would be a maximum of approximately 100 employees.” However, using a population of 100 people in a GHG calculation is faulty and problematic as it excludes other people that would be traveling to and from the Project Site and using the Project Site amenities including students, parents, and other visitors not affiliated with the School, but nonetheless included in the Project’s calculation of GHG emissions. Similar comments were raised to the SCAQMD regarding the problematic nature of per service population thresholds and how such potential thresholds would be infeasible for many commercial projects that serve non-resident and non-employee customers.<sup>68</sup> The SCAQMD did not provide a formal response to the comment and, as has been previously discussed, the SCAQMD has never adopted nor formally recommended a quantitative GHG emissions threshold for land use development projects, such as this Project. Given

<sup>68</sup> SCAQMD, Greenhouse Gases (GHG), CEQA Significance Thresholds, GHG Meeting 15 Comment Letter. Available: . Accessed June 2022.

the faulty and problematic nature of per service population thresholds, the City has determined that a per service population threshold is not appropriate for this Project.

## **Comment No. ORG 1B-132**

### **3) Project Design Features Should Be Incorporated as Mitigation Measures**

As previously mentioned, the DEIR relies upon the Project's consistency with the CARB's Scoping Plan, SCAG's RTP/SCS, the City's Green New Deal, and the Los Angeles Green Building Code (IV.G-40). Furthermore, consistent with the emissions reductions strategies within the above-mentioned plans and policies, the DEIR includes the following Project Design Feature ("PDF"):

"GHG-PDF-1: Solar Voltaic System. The Project will be designed to include solar voltaic panels providing 339,000 kilo Watt-hours (kWh) per year on the roof of the gymnasium that would reduce the amount of electricity demand from City utilities" (p. IV.G-50).

However, we recommend that the DEIR incorporates this PDF as a formal mitigation measure. According to the AEP CEQA Portal Topic Paper on Mitigation Measures:

"While not "mitigation", a good practice is to include those project design feature(s) that address environmental impacts in the mitigation monitoring and reporting program (MMRP). Often the MMRP is all that accompanies building and construction plans through the permit process. If the design features are not listed as important to addressing an environmental impact, it is easy for someone not involved in the original environmental process to approve a change to the project that could eliminate one or more of the design features without understanding the resulting environmental impact."<sup>24</sup>

As demonstrated above, PDFs that are not formally included as mitigation measures may be eliminated from the Project's design altogether. Thus, as the solar voltaic system is not formally included as a mitigation measure, we cannot guarantee that it would be implemented, monitored, and enforced on the Project site. As such, until the PDF is included as a mitigation measure, the Project's GHG analysis should not be relied upon to determine Project significance.

<sup>24</sup> "CEQA Portal Topic Paper Mitigation Measures." AEP, February 2020, available at: <https://ceqaportal.org/tp/CEQA%20Mitigation%202020.pdf>, p. 6.

## **Response No. ORG 1B-132**

The comment recommends that Project Design Feature GHG-PDF-1 be changed to a mitigation measure in order to ensure that it would be included in the MMP and not eliminated from the Project's design. All Project PDFs are included in the MMP. This

City practice is consistent with the topic paper cited in the comment which does not state that PDFs should be changed to mitigation measures but rather than PDFs should be included in the MMP. Since GHG impacts would be less than significant, there is no purpose or nexus for including a mitigation measure. Therefore, the commenter's concern is already addressed. See, Chapter 4, *Mitigation Monitoring Program*, in this Final EIR.

### Comment No. ORG 1B-133

#### 4) Failure to Consider Performance-based Standards Under CARB's 2017 Scoping Plan

As previously discussed, the DEIR concludes that the Project would be consistent with CARB's 2017 Climate Change Scoping Plan (p. IV.G-40). However, this is incorrect, as the DEIR fails to consider performance-based measures proposed by CARB.

##### *i. Passenger & Light Duty VMT Per Capita Benchmarks per SB 375*

In reaching the State's long-term GHG emission reduction goals, CARB's 2017 Scoping Plan explicitly cites to SB 375 and the VMT reductions anticipated under the implementation of Sustainable Community Strategies.<sup>25</sup> CARB has identified the population and daily VMT from passenger autos and light-duty vehicles at the state and county level for each year between 2010 to 2050 under a "baseline scenario" that includes "current projections of VMT included in the existing Regional Transportation Plans/Sustainable Communities Strategies (RTP/SCSs) adopted by the State's 18 Metropolitan Planning Organizations (MPOs) pursuant to SB 375 as of 2015."<sup>26</sup> By dividing the projected daily VMT by the population, we calculated the daily VMT per capita for each year at the state and county level for 2010 (baseline year), 2025 (Project operational year), and 2030 (target years under SB 32) (see table below).

2017 Scoping Plan Daily VMT Per Capita						
Year	Los Angeles County			State		
	Population	LDV VMT Baseline	VMT Per Capita	Population	LDV VMT Baseline	VMT Per Capita
2010	9,838,771	216,979,221.64	22.05	37,335,085	836,463,980.46	22.40
2025	10,671,800	217,340,094.90	20.37	42,326,397	929,443,512.65	21.96
2030	10,868,614	215,539,586.12	19.83	43,939,250	957,178,153.19	21.78

As the DEIR fails to evaluate the Project's consistency with the CARB 2017 Scoping Plan performance-based daily VMT per capita projections, the DEIR's claim that the proposed Project would not conflict with the CARB 2017 Scoping Plan is unsupported. An updated EIR should be prepared for the proposed Project to provide additional information and analysis to conclude less-than-significant GHG impacts.

<sup>25</sup> "California's 2017 Climate Change Scoping Plan." CARB, November 2017, available at: [https://ww3.arb.ca.gov/cc/scopingplan/scoping\\_plan\\_2017.pdf](https://ww3.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf), p. 25, 98, 101-103.

<sup>26</sup> “Supporting Calculations for 2017 Scoping Plan-Identified VMT Reductions,” Excel Sheet “Readme.” CARB, January 2019, available at: [https://ww2.arb.ca.gov/sites/default/files/2019-01/sp\\_mss\\_vmt\\_calculations\\_jan19\\_0.xlsx](https://ww2.arb.ca.gov/sites/default/files/2019-01/sp_mss_vmt_calculations_jan19_0.xlsx).

## **Response No. ORG 1B-133**

The comment states that the Draft EIR is flawed for failure to consider performance-based standards under CARB’s 2017 Scoping Plan illustrated in Comment No. ORG 1B-133. The 2017 CARB Scoping Plan provides generalized VMT per capita standards that have been refined for specific areas of the City of Los Angeles by the LADOT’s 2020 City of Los Angeles VMT Calculation Documentation. The City’s VMT Calculator is consistent with the purposes of the CARB Scoping Plan and SB 375. Refer to Response No. ORG 1B-64 for a discussion of the substantial evidence provided in the Draft EIR supporting the determination that the Project would not conflict with the SB 375, CARB’s 2017 Scoping Plan and 2020-2045 RTP/SCS goals of reducing daily VMT per capita, providing local community-serving uses at infill locations, and not conflicting with CARB’s 2017 Scoping Plan and 2020-2045 RTP/SCS’s performance-based standards. Therefore, the GHG emissions analysis in the Draft EIR appropriately concludes less-than-significant GHG emission impacts.

## **Comment No. ORG 1B-134**

### **5) Failure to Consider Performance-based Standards under SCAG’s RTP/SCS**

As previously discussed, the DEIR concludes that the Project would be consistent with SCAG’s RTP/SCS (p. IV.G-40). However, the DEIR fails to consider whether or not the Project meets any of the specific performance-based goals underlying SCAG’s RTP/SCS and SB 375, such as: i) per capita GHG emission targets, or ii) daily vehicles miles traveled (“VMT”) per capita benchmarks.

#### **i. SB 375 Per Capita GHG Emission Goals**

SB 375 was signed into law in September 2008 to enhance the state’s ability to reach AB 32 goals by directing CARB to develop regional 2020 and 2035 GHG emission reduction targets for passenger vehicles (autos and light-duty trucks). In March 2018, CARB adopted updated regional targets requiring a 19 percent decrease in VMT for the SCAG region by 2035. This goal is reflected in SCAG’s 2020 RTP/SCS Program Environmental Impact Report (“PEIR”), in which the 2020 RTP/SCS PEIR updates the per capita emissions to 18.8 lbs/day in 2035 (see excerpt below).<sup>27</sup>

**Table 3.8-10**  
**SB 375 Analysis**

	2005 (Baseline)	2020 (Plan)	2035 (Plan)
Resident population (per 1,000)	17,161	19,194	21,110
CO2 emissions (per 1,000 tons)	204.0 <sup>a/</sup>	204.5 <sup>b/</sup>	198.6 <sup>b/</sup>
Per capita emissions (pounds/day)	23.8	21.3	18.8
% difference from Plan (2020) to Baseline (2005)			-8%
% difference from Plan (2035) to Baseline (2005)			-19% <sup>c/</sup>

*<http://www.scag.ca.gov/committees/CommitteeDocLibrary/jointRCPC110515fullagn.pdf>*

As the DEIR fails to evaluate the Project's consistency with the SCAG's per capita emissions, the DEIR's claim that the proposed Project would not conflict with SCAG's RTP/SCS is unsupported. An updated EIR should be prepared for the proposed Project to provide additional information and analysis to conclude less-than-significant GHG impacts.

<sup>27</sup> "Connect SoCal Certified Final Program Environmental Impact Report." SCAG, May 2020, available at: [https://scag.ca.gov/sites/main/files/file-attachments/fpeir\\_connectsocial\\_complete.pdf?1607981618](https://scag.ca.gov/sites/main/files/file-attachments/fpeir_connectsocial_complete.pdf?1607981618), p. 3.8-74.

## Response No. ORG 1B-134

The comment states that the Draft EIR is flawed for failure to consider performance-based standards under the 2020-2045 RTP/SCS. However, the comment misinterprets the data presented in Table 3.8-10, *SB 375 Analysis*. The table is not prescribing a performance-based standard of a specific per capita emissions goal for every individual project under Connect SoCal, but is rather presenting the expected per capita emissions reductions in year 2020 and 2035 as compared to the 2005 baseline through implementation of all the projects that could occur over the lifetime of the 2020 Connect SoCal Plan. Therefore, it is not stating that individual projects need to meet an 18.8 pounds per day per capita emissions level to be consistent with the 2020 Connect SoCal plan. Furthermore, as previously stated, Response No. ORG 1B-64 provides a discussion of the substantial evidence provided in the Draft EIR supporting the determination that the Project would not conflict with SB 375, CARB's 2017 Scoping Plan and 2020-2045 RTP/SCS goals of reducing daily VMT per capita, providing local community serving uses at infill locations, and not conflicting with CARB's 2017 Scoping Plan and 2020-2045 RTP/SCS's performance-based standards. Therefore, the GHG emissions analysis in the Draft EIR appropriately concludes less-than-significant GHG emission impacts.

## Comment No. ORG 1B-135

### ii. SB 375 RTP/SCS Daily VMT Per Capita Target

Under the SCAG's 2020 RTP/SCS, daily VMT per capita in the SCAG region should decrease from 23.2 VMT in 2016 to 20.7 VMT by 2045.<sup>28</sup> Daily VMT per capita in Los Angeles County should decrease from 22.2 to 19.2 VMT during that same period.<sup>29</sup> Here, however, the DEIR fails to consider any of the above-mentioned performance-based VMT targets. As the DEIR fails to evaluate the Project's consistency with the SCAG's performance-based daily VMT per capita projections, the DEIR's claim that the proposed Project would not conflict with SCAG's RTP/SCS is unsupported. An updated EIR should be prepared for the proposed Project to provide additional information and analysis to conclude less-than-significant GHG impacts.

<sup>28</sup> "Connect SoCal." SCAG, September 2020, available at: [https://scag.ca.gov/sites/main/files/fileattachments/0903fconnectsocial-plan\\_0.pdf?1606001176](https://scag.ca.gov/sites/main/files/fileattachments/0903fconnectsocial-plan_0.pdf?1606001176), pp. 138.

<sup>29</sup> "Connect SoCal." SCAG, September 2020, available at: [https://scag.ca.gov/sites/main/files/fileattachments/0903fconnectsocial-plan\\_0.pdf?1606001176](https://scag.ca.gov/sites/main/files/fileattachments/0903fconnectsocial-plan_0.pdf?1606001176), pp. 138.

## Response No. ORG 1B-135

The comment states that the Draft EIR is flawed for failure to evaluate performance-based VMT targets. Refer to Response No. ORG 1B-64 for a discussion of the substantial evidence provided in the Draft EIR supporting the determination that the Project would not conflict with SB 375, CARB's 2017 Scoping Plan and 2020-2045 RTP/SCS goals of reducing daily VMT per capita, providing local community serving uses at infill locations, and not conflicting with CARB's 2017 Scoping Plan and 2020-2045 RTP/SCS's performance-based standards. As noted under Response No. ORG-133, the 2017 CARB Scoping Plan's VMT per capita standards have been refined for specific areas of the City of Los Angeles by the LADOT's 2020 City of Los Angeles VMT Calculation Documentation. The City's VMT Calculator is consistent with the purposes of the CARB Scoping Plan and SB 375. Therefore, the GHG emissions analysis in the Draft EIR appropriately concludes less-than-significant GHG emission impacts.

## Comment No. ORG 1B-136

### Feasible Mitigation Measures Available to Reduce Emissions

Our analysis demonstrates that the Project would result in a potentially significant GHG impact that should be mitigated further. As such, in an effort to reduce the Project's emissions, we identified several mitigation measures that are applicable to the proposed Project. Therefore, to reduce the Project's emissions, we recommend consideration of SCAG's 2020 RTP/SCS PEIR's Greenhouse Gas Project Level Mitigation Measures ("P.M.M-GHG-1"), as described below:<sup>30</sup>

<b>SCAG RTP/SCS 2020-2045</b>	
<b>Greenhouse Gas Project Level Mitigation Measures – PMM-GHG-1</b>	
<p>In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the <i>State CEQA Guidelines</i>, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency:</p>	
b)	Reduce emissions resulting from projects through implementation of project features, project design, or other measures, such as those described in Appendix F of the State CEQA Guidelines.
c)	Include off-site measures to mitigate a project’s emissions.
d)	<p>Measures that consider incorporation of Best Available Control Technology (BACT) during design, construction and operation of projects to minimize GHG emissions, including but not limited to:</p> <ol style="list-style-type: none"> <li>i. Use energy and fuel-efficient vehicles and equipment;</li> <li>ii. Deployment of zero- and/or near zero emission technologies;</li> <li>iii. Use lighting systems that are energy efficient, such as LED technology;</li> <li>iv. Use the minimum feasible amount of GHG-emitting construction materials;</li> <li>v. Use cement blended with the maximum feasible amount of flash or other materials that reduce GHG emissions from cement production;</li> <li>vi. Incorporate design measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse;</li> <li>vii. Incorporate design measures to reduce energy consumption and increase use of renewable energy;</li> <li>viii. Incorporate design measures to reduce water consumption;</li> <li>ix. Use lighter-colored pavement where feasible;</li> <li>x. Recycle construction debris to maximum extent feasible;</li> <li>xi. Plant shade trees in or near construction projects where feasible; and</li> <li>xii. Solicit bids that include concepts listed above.</li> </ol>
e)	<p>Measures that encourage transit use, carpooling, bike-share and car-share programs, active transportation, and parking strategies, including, but not limited to the following:</p> <ol style="list-style-type: none"> <li>i. Promote transit-active transportation coordinated strategies;</li> <li>ii. Increase bicycle carrying capacity on transit and rail vehicles;</li> <li>iii. Improve or increase access to transit;</li> <li>iv. Increase access to common goods and services, such as groceries, schools, and day care;</li> <li>v. Incorporate affordable housing into the project;</li> <li>vi. Incorporate the neighborhood electric vehicle network;</li> <li>vii. Orient the project toward transit, bicycle and pedestrian facilities;</li> <li>viii. Improve pedestrian or bicycle networks, or transit service;</li> <li>ix. Provide traffic calming measures;</li> <li>x. Provide bicycle parking;</li> <li>xi. Limit or eliminate park supply;</li> <li>xii. Unbundle parking costs;</li> </ol>

4.0-23; See also: “Certified Final Connect SoCal Program Environmental Impact Report.” Southern California Association of Governments (SCAG), May 2020, available at: <https://scag.ca.gov/peir>.

<ul style="list-style-type: none"> <li>xiii. Provide parking cash-out programs;</li> <li>xiv. Implement or provide access to commute reduction program;</li> </ul>
f) Incorporate bicycle and pedestrian facilities into project designs, maintaining these facilities, and providing amenities incentivizing their use; and planning for and building local bicycle projects that connect with the regional network;
g) Improving transit access to rail and bus routes by incentives for construction and transit facilities within developments, and/or providing dedicated shuttle service to transit stations; and
<p>h) Adopting employer trip reduction measures to reduce employee trips such as vanpool and carpool programs, providing end-of-trip facilities, and telecommuting programs including but not limited to measures that:</p> <ul style="list-style-type: none"> <li>i. Provide car-sharing, bike sharing, and ride-sharing programs;</li> <li>ii. Provide transit passes;</li> <li>iii. Shift single occupancy vehicle trips to carpooling or vanpooling, for example providing ride-matching services;</li> <li>iv. Provide incentives or subsidies that increase that use of modes other than single-occupancy vehicle;</li> <li>v. Provide on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, and showers and locker rooms;</li> <li>vi. Provide employee transportation coordinators at employment sites;</li> <li>vii. Provide a guaranteed ride home service to users of non-auto modes.</li> </ul>
i) Designate a percentage of parking spaces for ride-sharing vehicles or high-occupancy vehicles, and provide adequate passenger loading and unloading for those vehicles;
<p>j) Land use siting and design measures that reduce GHG emissions, including:</p> <ul style="list-style-type: none"> <li>i. Developing on infill and brownfields sites;</li> <li>ii. Building compact and mixed-use developments near transit;</li> <li>iii. Retaining on-site mature trees and vegetation, and planting new canopy trees;</li> <li>iv. Measures that increase vehicle efficiency, encourage use of zero and low emissions vehicles, or reduce the carbon content of fuels, including constructing or encouraging construction of electric vehicle charging stations or neighborhood electric vehicle networks, or charging for electric bicycles; and</li> <li>v. Measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse.</li> </ul>
k) Consult the SCAG Environmental Justice Toolbox for potential measures to address impacts to low-income and/or minority communities. The measures provided above are also intended to be applied in low income and minority communities as applicable and feasible.
l) Require at least five percent of all vehicle parking spaces include electric vehicle charging stations, or at a minimum, require the appropriate infrastructure to facilitate sufficient electric charging for passenger vehicles and trucks to plug-in.
<p>m) Encourage telecommuting and alternative work schedules, such as:</p> <ul style="list-style-type: none"> <li>i. Staggered starting times</li> <li>ii. Flexible schedules</li> <li>iii. Compressed work weeks</li> </ul>
<p>n) Implement commute trip reduction marketing, such as:</p> <ul style="list-style-type: none"> <li>i. New employee orientation of trip reduction and alternative mode options</li> <li>ii. Event promotions</li> <li>iii. Publications</li> </ul>
o) Implement preferential parking permit program
p) Implement school pool and bus programs

## q) Price workplace parking, such as:

- i. Explicitly charging for parking for its employees;
- ii. Implementing above market rate pricing;
- iii. Validating parking only for invited guests;
- iv. Not providing employee parking and transportation allowances; and
- v. Educating employees about available alternatives.

These measures offer a cost-effective, feasible way to incorporate lower-emitting design features into the proposed Project, which subsequently, reduce emissions released during Project construction and operation. An updated EIR should be prepared to include all feasible mitigation measures, as well as include an updated GHG analysis to ensure that the necessary mitigation measures are implemented to reduce emissions to below thresholds. The EIR should also demonstrate a commitment to the implementation of these measures prior to Project approval, to ensure that the Project's significant emissions are reduced to the maximum extent possible.

<sup>30</sup> "4.0 Mitigation Measures." Connect SoCal Program Environmental Impact Report Addendum #1, September 2020, available at: [https://scag.ca.gov/sites/main/files/fileattachments/fpeir\\_connectsocial\\_addendum\\_4\\_mitigationmeasures.pdf?1606004420](https://scag.ca.gov/sites/main/files/fileattachments/fpeir_connectsocial_addendum_4_mitigationmeasures.pdf?1606004420), p. 4.0-2 – 4.0-10; 4.0-19.

## Response No. ORG 1B-136

The comment states that additional mitigation measures are needed to reduce the alleged significant GHG emissions. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. Please refer to Response No. ORG 1B-64 for a discussion on the appropriate use of the qualitative significance threshold where it was determined that the Project's GHG emissions would not be considerable and therefore would not have a significant effect on the environment if the Project is found to be compliant with performance-based standards included in the regulations outlined in the applicable portions of CARB's Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City's Green New Deal, and the Los Angeles Green Building Code. As the Project's GHG impacts would be less than significant, no mitigation measures are required.

## Comment No. ORG 1B-137

### Disclaimer

SWAPE has received limited discovery regarding this project. Additional information may become available in the future; thus, we retain the right to revise or amend this report when additional information becomes available. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar

circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the scope of work, work methodologies and protocols, site conditions, analytical testing results, and findings presented. This report reflects efforts which were limited to information that was reasonably accessible at the time of the work, and may contain informational gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties.

### **Response No. ORG 1B-137**

The comment expresses the right to revise or amend the provided report at a future time and submits the caveat that the comments may contain information gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties. The comments are noted and made part of the Final EIR record. However, since the comment does not discuss the adequacy of the Draft EIR, no further response is necessary.

#### **Attachment 2 (Scott Cashen, Independent Biological Resources Consultant)**

#### **Subject: Comments on the Draft Environmental Impact Report for the Harvard-Westlake River Park Project**

This letter contains my comments on the Draft Environmental Impact Report (“DEIR”) prepared by the City of Los Angeles (“City”) for the Harvard-Westlake River Park Project (“Project”). The Project Applicant, Harvard-Westlake School (“Applicant”) proposes construction and operation of an athletic and recreational facility on a 16.1-acre parcel

owned by the Applicant, and a 1.1-acre parcel leased from the Los Angeles County Flood Control District, in the community of Studio City. Although the majority of the Project site is currently occupied by a private golf course and tennis facility, some components of the Project extend into the Zev Yaroslavsky Los Angeles River Greenway (“Zev Greenway”).

### **Response No. ORG 1B-138**

The comment briefly summarizes the Project Site but does not discuss the adequacies or content of the Draft EIR. The comment is noted and included herein for the record but no further response is necessary.

### **Comment No. ORG 1B-139**

I am an environmental biologist with 29 years of professional experience in wildlife biology and natural resources management. I have served as a biological resources expert for over 150 projects in California. My experience and scope of work in this regard has included assisting various clients with evaluations of biological resource issues; preparation and peer review of environmental compliance documents prepared pursuant to the California Environmental Quality Act (“CEQA”) and the National Environmental Policy Act (“NEPA”); and preparation of written comments that address deficiencies with CEQA and NEPA documents. My work has included written and oral testimony for the California Energy Commission, California Public Utilities Commission, and Federal courts. My educational background includes a B.S. in Resource Management from the University of California at Berkeley, and a M.S. in Wildlife and Fisheries Science from the Pennsylvania State University. A copy of my curriculum vitae is attached hereto.

### **Response No. ORG 1B-129**

The comment briefly summarizes the commenter’s professional background but does not discuss the adequacies or content of the Draft EIR. The comment is noted and forwarded to the Project decision-makers for their consideration. Therefore, no further response is necessary.

### **Comment No. ORG 1B-140**

The comments herein are based on my review of the environmental documents prepared for the Project, a review of scientific literature pertaining to biological resources known to occur in the Project area, consultations with other biological resource experts, and the knowledge and experience I have acquired during my 29-year career in the field of natural resources management.

## Response No. ORG 1B-140

The comment introduces the commenter’s position in reviewing the Biological Resources section of the Draft EIR but does not discuss the adequacies or content of the Draft EIR. The comment is noted and forwarded to the Project decision-makers for their consideration. Therefore, no further response is necessary.

## Comment No. ORG 1B-141

### ENVIRONMENTAL SETTING

#### The DEIR Fails to Establish the Environmental Setting with Respect to the Western Yellow Bat

The western yellow bat (*Lasiurus xanthinus*) is a California Species of Special Concern that appears to roost exclusively in the skirts of palm trees located near open water or wetlands.<sup>1</sup> The photographs provided in the tree report prepared by the Applicant’s arborist depict numerous palms at the Project site with skirts suitable for roosting bats.<sup>2</sup> According to the DEIR:

“Western yellow bat has moderate potential to roost and forage in the Biological Study Area. The Biological Study Area supports a number of palm trees that would be suitable roosting habitat for this species. Additionally, the adjacent Los Angeles River may provide suitable foraging habitat above the river and near the southwestern boundary of the Biological Study Area.”<sup>3</sup>

Although the DEIR acknowledges there is potential for western yellow bats to occur at the Project site, there was no effort to determine presence, abundance, and distribution of the species at the site, nor were there any attempts to determine how many of the site’s 174 palm trees contain bat roosts.

<sup>1</sup> Pierson ED, Rainey WE. 1998. Western yellow bat, *Lasiurus xanthinus*. In: Bolster BC, ed. Terrestrial Mammal Species of Special Concern in California. pp. 50 and 51. See also Marty J, Unnasch R. 2015. Western Yellow Bat (*Lasiurus xanthinus*) (WYBA) Basic Conceptual Ecological Model for the Lower Colorado River. Submitted to the Bureau of Reclamation, Boulder City, Nevada, by Sound Science, LLC, Boise, Idaho.

<sup>2</sup> DEIR, Appendix A (Arborist Report) to Appendix D (Biological Resources Technical Report).

<sup>3</sup> DEIR, p. IV.C-27.

## Response No. ORG 1B-141

The comment states that no effort was made to document the presence or absence of the western yellow bat on the Project Site. ESA previously surveyed the Project Site for wildlife, including bats, in November 2016 for a different project and the western yellow bat was not detected at that time. That survey was conducted by an individual with bat expertise. Similarly, the western yellow bat was not observed during the more recent ESA wildlife surveys undertaken for the current project, which is acknowledged to be general

in nature (i.e., for the purpose of broadly examining and inventorying onsite plant and animal species, including bats) and not focused exclusively on bats. Because these surveys were not exhaustive, which is not required by CEQA, the EIR assessed the potential for this species to occur, which is a moderate potential to roost within palm trees retaining the dried and dead fronds, and explicitly recommends Mitigation Measure BIO-MM-1, with the knowledge that the species may be present and, if present, needs protection prior to construction.

As stated in Comment No. ORG 1B-46, some western yellow bats are year-round residents in southern California. Therefore, if present, western yellow bat would be detected by a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) to determine whether special status bat species are roosting within trees that would be removed, as outlined in Mitigation Measure BIO-MM-1 on pages IV.C-42 to IV.C-43 in Section IV.C, *Biological Resources*, of the Draft EIR.

Additionally, as stated in Response No. ORG 1B-45, there is only one CNDDDB occurrence record of this bat species within the vicinity of the Project Site, which was recorded in 1984 approximately 8.5 miles to the east in a developed area of Glendale. Closer in proximity to the Glendale record, bat surveys were conducted between April and November 2008 in Griffith Park, and the results of the surveys found no individual of western yellow bat to be present. Nonetheless, in coordination with CDFW, Mitigation Measure BIO-MM-1 on pages IV.C-42 to IV.C-43 of the Draft EIR has been revised to include additional requirements if a qualified bat specialist determines that special-status bats are present, or that bats are absent but trees to be removed are suitable bat roosting habitat. This update has been incorporated into Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, in this Final EIR.

### **Comment No. ORG 1B-142**

The DEIR's failure to establish the environmental setting (with respect to bats) precludes informed decision making and public participation because it precludes understanding of the severity of the Project's impacts on the western yellow bat population. For example, without data on the number of active bat roosts at the Project site, the public (and City) have no idea whether the Project would affect 1 yellow bat, 100 yellow bats, or no yellow bats. This lack of information not only has implications on the public's ability to understand the Project's impacts, but also the City's ability to effectively evaluate the significance threshold used in the DEIR (i.e., "[w]ould the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species..."). Whereas loss of one active bat roost from the Project site would not have a substantial adverse effect on the western yellow bat population, the loss of 50 active roosts (for example) would have severe, and potentially unmitigable impacts on the population. To properly disclose, analyze, and mitigate the Project's impacts on bats, the City must conduct surveys to determine the presence, abundance, and distribution of active roosts at the site, and these data must be released to the public in a recirculated DEIR.

## Response No. ORG 1B-142

The comment contends that a survey of the Project Site to determine the presence, abundance, and distribution of active roosts is required in order to properly analyze impacts to the western yellow bats and that the Draft EIR should be recirculated with this information. See Response Nos. ORG 1B-45 and ORG 1B-141 for a discussion of the potential for the western yellow bat to be present on the Project Site. Additionally, the comment does not provide substantial evidence of significant new information showing that there is a new significant impact, an increase in the severity of an impact, or that the Draft EIR is fundamentally flawed to support a contention that the Draft EIR is required to be recirculated pursuant to CEQA Guidelines Section 15088.5. As such, recirculation of the Draft EIR is not necessary.

## Comment No. ORG 1B-143

### PROJECT IMPACTS

#### The DEIR Fails to Adequately Disclose and Analyze Project Impacts to the Western Yellow Bat

##### Direct Impacts

The DEIR's analysis of direct impacts to the western yellow bat is limited to the statement that: "[c]onstruction of the Project could result in potentially significant direct impacts to this bat species if tree removal commences during the maternity roosting season (generally March 1 through September 30)."<sup>4</sup>

Direct impacts to the western yellow bat (and other bat species) are not limited tree removal during the maternity roosting season. Some western yellow bats are year-round residents in southern California.<sup>5</sup> These bats may use trees at the Project site as day roosts, night roosts, or maternity roosts.<sup>6</sup> Consequently, western yellow bats may occur in trees (especially the palms) at the Project site at any time of day (or night), on any day of the year.

Yellow bats are deep sleepers.<sup>7</sup> Even when fully awake, they feel safe in palm fronds and generally will not flush at signs of danger.<sup>8</sup> As a result, yellow bats are frequently killed or injured when palm trees are felled.<sup>9</sup> Because bats are a prey species that has few behavioral defenses against predation, they rely on concealment (at roosts) to avoid predation by diurnal predators. Therefore, even if bats flush from a tree as it is being felled, most of these individuals are likely to die due to predation or exposure. The DEIR fails to analyze impacts to, or incorporate mitigation for, bats that may occupy trees at the Project site during the non-maternity season.

<sup>4</sup> DEIR, p. IV.C-32.

<sup>5</sup> Pierson ED, Rainey WE. 1998. Western yellow bat, *Lasiurus xanthinus*. In: Bolster BC, ed. Terrestrial Mammal Species of Special Concern in California. pp. 50 and 51.

- <sup>6</sup> Day roosts are used during the day for sleep and protection from predators and heat exposure. Night roosts are used at night to rest, digest food, conserve energy, and avoid predators. Maternity roosts are used to give birth and raise young
- <sup>7</sup> Austin Bat Refuge. 2021. Palm Trees [webpage]. Available at: [https://austinbatrefuge.org/palm trees](https://austinbatrefuge.org/palm-trees). (Accessed 6 May 2022).
- <sup>8</sup> Ibid. See also Tatarian G. 2018. Conserving California's Bats Through Environmental Review and Permitting. CDFW Conservation Lecture Series Archive. Available at: <https://wildlifrr.ca.gov/Conservation/Lecdtures/Archive#ACEApr12> (Accessed 6 May 2022).
- <sup>9</sup> Ibid.

### **Response No. ORG 1B-143**

The comment states that the analysis on the western yellow bat is inadequate for failure to consider potential impacts beyond the maternity roosting season. See Response Nos. ORG 1B-45 through 1B-48 and 1B-142.

### **Comment No. ORG 1B-144**

The Project entails removing 121 of the Mexican fan palms that occur at the Project site. This represents a substantial number of potential roosts for the western yellow bat. Incredibly, the DEIR provides no analysis of this habitat loss. Because the loss of suitable roosting habitat is one of the primary threats to the western yellow bat population,<sup>10</sup> and because the DEIR does not incorporate compensatory mitigation, potentially significant impacts on the western yellow bat remain unmitigated.

<sup>10</sup> Ibid

### **Response No. ORG 1B-144**

The comment contends that removal of Mexican fan palms will result in a loss of habitat for the western yellow bat. See Response No. ORG 1B-45.

### **Comment No. ORG 1B-145**

#### Indirect Impacts

According to the DEIR:

“There would also be additional indirect impacts to special-status bat species from noise and human activities associated with Project construction; however, construction activities would be temporary on an intermittent basis, and potential on-site tree roosts would be removed during the initial construction phase if no active roosts are found. As such, impacts would not diminish the long-term survival of a special-status bat species and, therefore, would be less than significant.”<sup>11</sup>

A fundamental flaw with the DEIR's analysis is that it fails to discuss how noise and human activities associated with construction would impact bats at the Project site. For example,

the DEIR does not identify whether construction activities would affect vital rates (e.g., survival and recruitment), behavior (e.g., roost attendance, sleep and torpor, movement patterns), habitat use, predator-prey relationships, or other variables that may influence the bat population. This precludes the public's ability to validate the DEIR's conclusion that Project impacts "would not diminish the long-term survival of a special-status bat species and, therefore, would be less than significant."

<sup>11</sup> DEIR, pp. IV.C-40 and -41.

## **Response No. ORG 1B-145**

The comment contends that indirect impacts from noise and human activities are not adequately addressed in the Draft EIR. Refer to Response No. ORG 1B-47.

## **Comment No. ORG 1B-146**

The DEIR provides two reasons for its determination that Project impacts to special-status bats would be less than significant. The DEIR's first reason is that construction activities would be "temporary." Project construction activities would occur for approximately two and a half years,<sup>12</sup> which would encompass two or three reproductive cycles of the bat population (bats reproduce only once per year). Bats have low reproductive rates, high juvenile mortality, and long generational turnover.<sup>13</sup> Consequently, any reduction in reproductive output (or success) can have a substantial impact on viability of the bat population. Indeed, it can take a colony (population) many years to recover from activities that cause mortality or even temporary reduced fecundity (i.e., the ability to produce offspring).<sup>14</sup> Therefore, although a 2.5-year impact might be temporary from a human perspective, it is not "temporary" from the bat's perspective.

<sup>12</sup> DEIR, p. II-61.

<sup>13</sup> Western Bat Working Group. 2005 [update]. Species account for the western yellow bat. Available at: <https://wbwg.org/western-bat-species/> (Accessed 6 May 2022).

<sup>14</sup> Johnston D, Tatarian G, Pierson E. 2004. California Bat Mitigation Techniques, Solutions, and Effectiveness. Report to California Department of Transportation, Sacramento, California. Project Number 2394-01.

## **Response No. ORG 1B-146**

The comment contends that the construction period is not temporary from a bat's perspective and therefore the determination of less-than-significant construction impacts is flawed. Refer to Response Nos. ORG 1B-45, ORG 1B-46 and ORG 1B-47. It is acknowledged that Mexican fan palms, the suitable habitat for western yellow bat (though the last recorded occurrence of this bat species in the CNDDDB database was in 1984 and approximately 8.5 miles to the east), are currently present and many will be removed with Project implementation (i.e., construction). However, if the species is present, any bats may use the clusters of palm trees that exist on the south side of the Los Angeles River and along Ventura Boulevard. Mitigation Measure BIO-MM-1 is designed and included in order to avoid direct impacts to this species.

## **Comment No. ORG 1B-147**

The DEIR's second reason is that potential roosts would be removed during the initial construction phase. This reason is both confusing and illogical. First, the rationale is confusing because the Project does not involve removal of all potential roosts (e.g., 181 trees would remain, of which 53 are Mexican fan palms).<sup>15</sup> Therefore, removing potential roosts (trees) during the initial construction phase does not eliminate the potential for significant indirect impacts to bats. Second, the rationale is illogical because removing potential roosts would generate a different type of indirect impact to bats. Specifically, removing roosts would eliminate a habitat element essential to survival and reproduction. If replacement roosts are not available, the loss of roosts from the Project site would eliminate the reproductive potential of all individuals that are displaced from the Project site. As a result, and contrary to the DEIR's assertion, removing roosts from the Project site would reduce the potential for "long-term survival," especially for an organism that is already exposed to numerous threats (e.g., habitat loss, pesticides, and wind turbine strikes, among others).

<sup>15</sup> DEIR, pp. IV.C-54 and -55.

## **Response No. ORG 1B-147**

The comment contends that removal of roosts would reduce the potential for the long-term survival of the western yellow bat. Refer to Response Nos. ORG 1B-45, ORG 1B-46 and ORG 1B-47. To clarify, potential on-site tree roosts would be removed during the initial construction phase if no active maternity bat roosts are found, as determined by the pre-construction survey required by Mitigation Measure BIO-MM-1, and consequently, there would be no breeding bats within areas closest to the Project Site that may be indirectly impacted by noise and human activities associated with the Project construction because trees determined to remain would also be surveyed for the presence or absence of active bat roosts. However, the Project will not remove all Mexican fan palms, and if the species is present, any non-breeding bats that remain in the Project area will either be tolerant of the construction noise levels or may relocate to use clusters of palm trees existing on the south side of the Los Angeles River and along Ventura Boulevard, which are further away from the Project construction.

## **Comment No. ORG 1B-148**

### **The DEIR Fails to Provide an Accurate Assessment of Impacts to the California Brittlebush Scrub Community (A Sensitive Natural Community)**

In 2017, the Zev Greenway was restored to native coastal sage scrub habitat along a majority of the Project Site's southern boundary. The restored habitat includes a diverse mix of native species (although some non-native species remain). Because California brittlebush (*Encelia californica*) is the dominant species in the restoration area, it was classified as California brittlebush scrub, which is a sensitive natural community in the State of California.<sup>16</sup>

The DEIR states that the proposed river connection trail, river fence, and river overlook would directly impact 0.14 acres of California brittlebush scrub. However, according to the DEIR, the Project would not have significant indirect impacts on the California brittlebush scrub community because: (a) it occurs along an existing public trail (i.e., the Zev Greenway trail), and (b) “plants would not be affected by subtle changes in Project light, noise, or human activity.”<sup>17</sup> The DEIR’s rationale is flawed because it fails to recognize that the Project would not only increase human activity along the existing trail, but that it would also create a new trail that bisects the California brittlebush scrub community, thereby increasing the proportion of that community that would be susceptible to trampling, weed invasion, and other adverse edge effects associated with fragmentation. In addition, because the proposed river connection trail would not provide the shortest route to the Zev Greenway trail, students and spectators are likely to create shortcuts (and other unauthorized trail routes) through the California brittlebush scrub, as depicted in Figure 1 (below). This would cause further loss, degradation, and fragmentation of the sensitive natural community. The DEIR fails to incorporate mitigation for this potentially significant indirect impact.

<sup>16</sup> DEIR, p. IV.C-19.

<sup>17</sup> DEIR, p. IV.C-43

## Response No. ORG 1B-148

The comment contends that the existing and proposed recreational trails and shortcuts to the Zev Greenway would cause habitat loss, degradation, and fragmentation. As stated in Response ORG 1B-49 above, the restoration of California brittlebush scrub is limited to an isolated strip of restored native habitat along the Zev Greenway. The Project’s ADA-compliant pedestrian ramp between the Project Site and the Zev Greenway was designed to avoid and minimize impacts to biological resources. As stated on pages IV.C-42 and IV.C-44, in Section IV.C, *Biological Resources*, of the Draft EIR under the heading Sensitive Natural Communities, the Project would result in limited impacts from the ramp connection, river fence, and river overlook to 0.14 acre of recently restored California brittlebush scrub (16 percent of off-site sensitive natural community). Although impacts would be limited, direct impacts to this sensitive natural community are identified as potentially significant. Mitigation Measure BIO-MM-2 is provided to require replacement of California brittlebush scrub at an equivalent acreage to reduce potentially significant impacts on sensitive natural communities to a less-than-significant level. Furthermore, as discussed in Section IV.C, *Biological Resources*, under the heading Impact Analysis, of the Draft EIR, the native landscaping proposed, which would exclude invasive exotic plant species, would help to enhance the natural community, as well as the surrounding area, by expanding the habitat, creating a greater native seed source, and providing a larger buffer from non-native ornamental landscaping in the surrounding developed areas.

As stated on page IV.C-43, the additional human activity would not have an adverse effect on this sensitive natural community since the plants would not be affected by the changes

in human activity. The California brittlebush scrub is relatively dense in most areas and not easily traversable and, therefore, unlikely to be utilized as a short pathway to the Zev Greenway. Nevertheless, although unlikely to occur, the Project will install fencing along the edge of the Leased Property and along the Project's ADA-compliant pedestrian ramp leading from the Project Site to the Zev Greenway to prevent people from trampling down the side of the hill through the California brittlebush scrub to the Zev Greenway trail. While this fencing was accounted for in the Draft EIR impact analysis, Project Design Feature BIO-PDF-2 has been added to provide further details of the proposed Project fencing. Project Design Feature BIO-PDF-2 is included in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR. Lastly, Mitigation Measure BIO-MM-2 requires replacement of any removed California brittlebush scrub at a 1:1 ratio, with such replacement to occur adjacent to the Zev Greenway, thereby contributing to the habitat's restoration and integrity as a sensitive natural community. Therefore, the indirect impacts of the Project would not cause further loss, degradation, and fragmentation of the California brittlebush scrub.

### Comment No. ORG 1B-149

The Project includes installation of 38 trees in the California brittlebush scrub community along the Zev Greenway.<sup>18</sup> As these trees mature, they will substantially decrease the amount of sunlight reaching plants in the shrub layer. This is important because California brittlebush, coast goldenbush, Nevin's barberry (an endangered species), and most of the other plant species that occur along the Zev Greenway are adapted to full sun (or part shade),<sup>19</sup> and thus are unlikely to persist in the shady conditions created by the Project's trees. The DEIR fails to analyze this potentially significant indirect impact on the California brittlebush scrub community and the two Nevin's barberry plants that occur therein.

<sup>18</sup> DEIR, Figure IV.C-5.

<sup>19</sup> California Native Plant Society. 2022. Calscape [website]. Available at: <https://Calscape.org>. (Accessed 4 May 2022). See also California Native Plant Society. 2022. A Manual of California Vegetation, Online Edition. Available at: <https://vegetation.cnps.org/> (Accessed 4 May 2022).

**Figure 1.** Unauthorized trail shortcuts (yellow lines) that are likely to be created through the California brittlebush scrub community following Project development.

## Response No. ORG 1B-149

The comment contends that the increase in trees will create shade that would be detrimental to shrubs. As stated on page II-30, in Section II, *Project Description*, under the heading Open Space and Trees, of the Draft EIR, all replacement trees would be RIO-compliant. The proposed tree species would be either native trees or species sourced from the Los Angeles River Master Plan Plant Landscaping Guidelines and Plant Palettes.<sup>69</sup> As stated on page IV.C-19, in Section IV.C, *Biological Resources*, under the heading California Brittlebush Scrub, of the Draft EIR, native trees were already planted as a part of the restored California brittlebush scrub community. This is also shown in the tree photographs provided on pages 228 through 256 (PDF pages 314 through 341 of 394) of the City of Los Angeles Tree Report – Harvard-Westlake River Park Campus Appendix D, Biological Resources Technical Report, of the Draft EIR.

Planting of native scrub habitat has already been successful within the area, as shown by the California brittlebush scrub community found along the Zev Greenway. However, the comment contends that the increase in planted trees would create shade to the detriment of the shrubs, including Nevin’s barberry. As stated on page IV.C-31, in Section IV.C, *Biological Resources*, under the heading Analysis of Impacts, of the Draft EIR, the Project would avoid impacts to Nevin’s barberry by retaining the two cultivated individual plants and avoiding trampling of the plants. As described in Response No. ORG 1B-50, the California brittlebush scrub would not be significantly impacted by planting of additional native trees because the plants can grow in part shade as well as full sun and there are already trees planted in the existing restored native community. Like California brittlebush, Nevin’s barberry also grows in either part shade or full sun and would not be adversely impacted by the addition of more tree canopies.<sup>70</sup>

Furthermore, Mitigation Measure BIO-MM-2 requires the replacement of sensitive natural community habitat to be planted clustered adjacent to and contiguous with the Zev Greenway. The locations and species must be to the satisfaction of the Department of City Planning and in conformance with the landscape and planting guidelines in the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes. Replacement sensitive natural community habitat areas would be planted on-site and shown on the Project’s landscape plan. The restored sensitive natural community would be monitored for five years to verify that California brittlebush scrub has been successfully restored. Thus, the planning requirements and long-term monitoring included in Mitigation Measure BIO-MM-2 would ensure that the new California brittlebush scrub would survive over the long-term, as it needs to be self-sustaining at the end of the five-year monitoring period.

## Comment No. ORG 1B-150

### The DEIR Fails to Disclose, Analyze, or Incorporate Mitigation for Avian Collisions

The Project site and adjacent Los Angeles River corridor support at least 74 species of birds,<sup>20</sup> some of which are classified as special-status species.<sup>21</sup> These include summer residents, winter residents, year-round residents, and birds that move through the Project area during migration.

Collision with windows is second only to predation by domestic cats as an anthropogenic source of avian mortality.<sup>22</sup> Klem (2009) estimated over one billion birds are killed each year due to collisions with clear and reflective sheet glass in the U.S. alone.<sup>23,24</sup> The visual system of birds is simply not capable of perceiving glass as a physical obstacle.<sup>25</sup> Casualties occur from head trauma after leaving a perch from as little as one meter away in an attempt to reach habitat seen through, or reflected in, clear and tinted panes.<sup>26</sup> Glass windows kill birds in urban, suburban, and rural settings.<sup>27</sup> There is no window size, building structure, time of day, season of year, or weather conditions during which birds elude the lethal hazards of glass.<sup>28</sup>

Scientists have determined that bird mortality caused by collisions with structures is “biologically significant”<sup>29</sup> and that avian mortality from window collisions is contributing to population declines of special-status species and birds in general.<sup>30</sup> As a result, several cities (e.g., San Francisco, New York) have adopted standards for “bird-safe” buildings.

## Response No. ORG 1B-150

This comment regarding avian collisions is noted and will be provided to the decision-makers for their review and consideration. Because this comment does not raise a substantive issue on the adequacy of the Draft EIR, no further response is necessary.

## Comment No. ORG 1B-151

### Causal Factors of Avian Collisions

There are two factors that cause birds to collide with human-built structures. The first is the lighting of structures at night, which “traps” and disorients many species of nocturnal migrants, making them vulnerable to collision with obstructions.<sup>31</sup> Those birds that are not killed outright by impact with lit windows are disoriented by the light and continue to fly around the light source, often to the point of exhaustion (which often leads to death).<sup>32</sup>

The second factor is the presence of architectural glass (e.g., windows), which birds in flight either cannot detect, or misinterpret.<sup>33</sup> Almost every type of architectural glass under the right conditions reflects the sky, clouds, or nearby trees and vegetation.<sup>34</sup> Glass that reflects the environment presents birds with the appearance of safe routes, shelter, and possibly food ahead. When birds try to fly to the reflected habitat, they hit the glass.

The bulk of bird deaths result when lone, confused birds mistake glass for a safe flight path.<sup>35</sup> During migration, birds make stops to rest and refuel. After landing, these birds make short, low flights near dawn, searching for feeding areas.<sup>36</sup> Thus, they are susceptible to collisions as they ascend, descend, and search for the resources needed to continue their migratory journey. Consequently, night-migrating songbirds<sup>37</sup>—already imperiled by habitat loss and other environmental stressors—face a dual risk, threatened both by illuminated buildings when they fly at night and by daytime glass collisions as they seek food and shelter.<sup>38</sup>

## Response No. ORG 1B-151

This comment regarding factors causing avian collisions is noted and will be provided to the decision-makers for their review and consideration. Because this comment does not raise a substantive issue on the adequacy of the Draft EIR, no further response is necessary.

## Comment No. ORG 1B-152

### Project-Specific Hazards

A poorly designed building can kill hundreds of birds per year.<sup>39</sup> A few variables in particular have proven to be especially lethal to birds. As described below, the proposed Project incorporates design variables known to cause high levels of avian mortality: 1. Buildings with reflective or transparent windows, large windows, or a high percentage of glass.

Birds have been reported to strike two general types of windows: (1) transparent windows, which appear invisible to birds and (2) reflective windows, which mirror the facing habitat.<sup>40</sup> In addition, studies have shown that buildings with large windows or a high percentage of glass kill a disproportionately high number of birds.<sup>41</sup>

The proposed Project would have transparent and reflective windows.<sup>42</sup> All of the Project's buildings would have large windows (or panes of glass).<sup>43</sup> In addition, the proposed gymnasium and swimming pool buildings would contain a high percentage of glass. Indeed, one of the sustainability features touted in the DEIR is: “[n]atural light to be harvested for the main spaces in the gymnasium building using large expanses of glass and skylights...”<sup>44</sup>

The threat large expanses of glass pose to birds is exacerbated when windows are installed on opposite sides of a building directly across from one another or at a corner, because birds perceive an unobstructed passageway and fly towards the glass with no awareness of an obstacle.<sup>45</sup> The proposed gymnasium and pool buildings would possess this “design trap.”

## Response No. ORG 1B-152

This comment states that the Project’s windows would create an impact on avian species due to collisions. As shown on Figure II-8, *Gymnasium Elevations – North and South Views*, and Figure II-25, *Rendering of the Southwestern Corner of the Gymnasium and Community Room*, in the Draft EIR, while the gymnasium would include glass areas with the building design, the building would feature a wide variety of design elements, including the use of various metal louvers, porcelain tile and slate stone cladding such the glass surfaces on the northern variation would largely be “broken up” such that no continuous unobstructed glass area would exceed approximately 14-feet in height. Also, the southern elevation would have large areas of metal louvers with a printed finish such that no sizeable areas of unobstructive glass would be visible. Similarly, as shown in Figure II-13, *Swimming Pool Elevations – East and West Views*, of the Draft EIR, the design of the pool area buildings and canopy would feature a variety of materials, finishes and columns that also break up the glass areas such that no continuous unobstructed glass area would exceed approximately 14-feet in height. While the commenter provides examples of causal factors of avian collision, the comment offers no substantial evidence that the Project’s use of glass would result in any CEQA impact. Further, the comment states that, “The threat large expanses of glass pose to birds is exacerbated when windows are installed on opposite sides of a building directly across from one another or at a corner, because birds perceive an unobstructed passageway and fly towards the glass with no awareness of an obstacle.”<sup>45</sup> (footnote omitted) The proposed gymnasium and pool buildings would possess this “design trap.”” This assertion is not correct. The south elevation of the gymnasium is almost entirely covered by metal lovers and other solid building materials. Also, the lower levels of the swimming pool building would provide no sizeable areas of unobstructed views through glass within the building. The pool canopy would feature painted steel columns, kynar metal finish panels, and glass windows with anodized aluminum material, which collectively would not provide large, expansive glass areas with unobstructed views through the canopy. Accordingly, while it is acknowledged that avian collisions could occur on any building with reflective glass features (such as a residence with windows), there is no evidence in the comment that any potential avian collisions with the Project’s buildings would substantially interfere with

the movement of migratory birds or have a substantial adverse effect on any species identified as a candidate, sensitive, or special status species.

Nonetheless, as shown on Figure II-8, *Gymnasium Elevations – North and South Views*, and Figure II-25, *Rendering of the Southwestern Corner of the Gymnasium and Community Room*, as revised in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, although the gymnasium will use natural lighting, as part of the Project design modifications the majority of the building would continue to be covered by various metal louvers, porcelain tile and slate stone cladding. In addition, and partly as a response to the comments received on the Draft EIR, the window area of the south side of the gymnasium has been removed from the scope of the Project and will be converted to solid walls, and the window area of the north side of the gymnasium has been reduced in size. On the inside of the gymnasium, the curtain would be down during athletic uses, which would also reduce light visible from the outside. The glass on the north side of gymnasium would be substantially obscured by terrace area and HVAC features, and the curtain on the inside (when down). These changes are discussed in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. Also, as shown on Figure II-13, *Swimming Pool Elevations – East and West Views*, as revised in Chapter 3 of this Final EIR, the glass within the pool area buildings would also be limited to small glass areas with anodized aluminum metal and glass garage door.

### **Comment No. ORG-1B-153**

#### 2. Buildings with windows located adjacent to extensive vegetation.

Several studies have provided evidence that buildings with windows adjacent to extensive vegetation kill numerous birds.<sup>46</sup> Buildings that have windows at lower stories (below 60 feet) are the most dangerous because those windows are at or below canopy height and are more likely to reflect trees and other landscape features that attract birds.<sup>47</sup> In suburban areas, buildings with these features have been documented to kill an average of 30 birds per year (per building).<sup>48</sup> This combination may be even more lethal in urban areas. Studies of Manhattan structures with large swaths of windows adjacent to large open spaces have recorded well over 100 collisions per year (per structure).<sup>49</sup>

The proposed Project includes installation of large expanses of glass near ground level and adjacent to vegetation attractive to birds.<sup>50</sup> This would create a significant collision hazard to birds.

The American Bird Conservancy and New York City Audubon Society have developed bird-friendly design standards for new buildings.<sup>51</sup> Because the Project does not incorporate these (or comparable) design standards, the Project's impact on bird populations would be potentially significant.

## Response No. ORG 1B-153

The comment contends that the Project contains large expanses of glass adjacent to vegetation, which could lead to avian collisions. Refer to Response No. ORG 1B-152 for a discussion of the use of glass on Project buildings.

## Comment No. ORG 1B-154

### MITIGATION ISSUES

#### BIO-MM-1 (Special-Status Bats)

BIO-MM-1 requires the Applicant to implement either of the following measures:

- 1) "Tree removal activities shall be scheduled outside of the maternity roosting season (October 1 through February 28) to avoid potential impacts to special-status bat species."
- 2) "Any construction or palm tree removal activities that occur during the maternity roosting season for special-status bat species (March 1 through September 30) shall require a qualified biologist experienced with bat roost biology to conduct a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) to determine whether special-status bat species are roosting within trees that would be removed. The surveys shall be conducted at dusk and after nightfall by a biologist. If an active roost site is located during the pre-construction survey, the roost shall be avoided and Project activities shall be conducted as recommended by the biologist to avoid the area, which may include temporary postponement or provision of a suitable buffer established around the roost until roosting activities cease. Suitable buffers could include netting, canvas, or similar materials as recommended by the biologist. A report shall be submitted to

the City with the results of the pre-construction or tree removal survey and any needed maternity roost avoidance actions.”

As discussed previously, tree removal outside of the maternity roosting season would avoid direct impacts to bats that use the trees for maternity purposes, but it would not avoid direct impacts to bats that use the trees as day roosts.<sup>52</sup>

There are several reasons why the second approach (i.e., pre-construction survey and buffer) would not reduce potentially significant direct impacts on bats. First, the measure applies only to roosts occupied by special-status bats, thus providing no protection to maternity roosts occupied by other bat species. An impact to a maternity roost of any bat species would constitute a significant impact because it would “impede the use of native wildlife nursery sites” (i.e., CEQA significance threshold “d”).<sup>53</sup>

<sup>52</sup> Presumably trees would be felled only during the daytime.

<sup>53</sup> See DEIR, p. IV.C-29.

## Response No. ORG 1B-154

The comment states that Mitigation Measure BIO-MM-1 is insufficient to protect the western yellow bat during non-nesting periods and that the Draft EIR should have considered protection for other bat species. Although at least some individuals or populations of western yellow bat may be migratory, as stated in Comment No. ORG 1B-46, some western yellow bats are year-round residents in southern California.<sup>71</sup> Therefore, if present, western yellow bats would be detected by a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) to determine whether special status bat species are roosting within trees that would be removed, as outlined in Mitigation Measure BIO-MM-1 on pages IV.C-41 to IV.C-42 of the Draft EIR.

Pre-construction surveys for special-status bat species would encompass the only potential suitable bat habitat that occurs on-site and would therefore encompass any other common bat species that could be present. As common bat species, like special-status bat species, have marginally suitable maternity roosts on the Project Site, typically the onsite trees, the selective removal of some of the trees would not impede the use of the Project Site as native wildlife nursery site because most of the perimeter trees would remain. The Project would also plant more trees than would be removed, continuing to provide potential native wildlife nursery sites.

Additionally, as stated in Response No. ORG 1B-45, in coordination with CDFW, Mitigation Measure BIO-MM-1 on pages IV.C-41 to IV.C-42 of the Draft EIR has been revised to include additional requirements if a qualified bat specialist determines that

<sup>71</sup> Pierson ED, Rainey WE. 1998. Western yellow bat, *Lasiurus xanthinus*. In: Bolster BC, ed. Terrestrial Mammal Species of Special Concern in California. pp. 50 and 51.  
<https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=84523&inline>.

special-status bats are present, or that bats are absent but trees to be removed are suitable bat roosting habitat. This update has been incorporated into Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, in this Final EIR.

### **Comment No. ORG 1B-155**

Second, although bat detectors can be relatively effective in detecting bat activity, they do not identify roost locations. Furthermore, even when appropriate techniques are implemented (i.e., visually monitoring palm trees at emergence time), it is difficult to locate roosts occupied by western yellow bats.<sup>54</sup> As a result, the pre-construction survey methods required under BIO-MM-1 would not provide reliable information on yellow bat roosts that may be impacted by the Project. This issue is compounded by the DEIR's failure to establish standards for the "qualified biologist" that would conduct the survey.

<sup>54</sup> Western Bat Working Group. 2005 [update]. Species account for the western yellow bat. Available at: <http://wbwg.org/western-bat-species> (Accessed 6 May 2022).

### **Response No. ORG 1B-155**

The comment contends that Mitigation Measure BIO-MM-1 is inadequate to detect the roost locations of the western yellow bat. As stated in Response No. ORG 1B-45, in addition to a pre-construction (or pre-tree removal) survey using sonic bat detectors (e.g., Anabat or Sonobat), additional requirements recommended by CDFW have been added to Mitigation Measure BIO-MM-1, including the requirement for a qualified bat specialist to conduct the bat survey. If a qualified bat specialist determines that special-status bats are present, or that bats are absent but trees to be removed are suitable bat roosting habitat, then roost tree nudging prior to palm tree removal will be required to passively encourage any bats to leave the area.

A qualified biologist is a biologist with specialized bat experience including the familiarity with bat roost biology (i.e., a professional biologist with a minimum of two years of bat survey experience, inclusive of acoustic survey experience. This language, as well as the additional requirements recommended by CDFW, have been added to Mitigation Measure BIO-MM-1 as reflected in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, in this Final EIR.

### **Comment No. ORG 1B-156**

Third, BIO-MM-1 lacks the specificity needed to ensure reliable data on presence of bats in areas that would be impacted by the Project. Bat detection probabilities during acoustic surveys at a given site are known to vary depending on a range of factors, including weather conditions, sampling duration, number of observers/detectors deployed, and sensitivity/directionality of detector types.<sup>55</sup> BIO-MM-1 fails to address these variables. Importantly, the single pre-construction survey proposed in BIO-MM-1 would not be sufficient to conclude absence of bat roosts. For example, Froidevaux and others (2020) found that a minimum of three and four acoustic surveys are required to be 95% confident

that a building does not host a roost of *Pipistrellus* species and *Plecotus* species, respectively.<sup>56</sup>

<sup>55</sup> Froidevaux JSP, Boughey KL, Hawkins CL, Jones G, Collins J. 2020. Evaluating survey methods for bat roost detection in ecological impact assessment. *Animal Conservation* 23(5) 597-606.

<sup>56</sup> Ibid.

## Response No. ORG 1B-156

The comment states that a single survey is insufficient to determine the presence of bats. As stated in Response No. ORG 1B-45, in addition to a pre-construction (or pre-tree removal) survey using sonic bat detectors (e.g., Anabat or Sonobat), additional requirements recommended by CDFW have been added to Mitigation Measure BIO-MM-1 if a qualified bat specialist determines that special-status bats are present, or that bats are absent but trees to be removed are suitable bat roosting habitat.

CDFW is the wildlife agency responsible for classifying western yellow bat as a species of special concern, and Mitigation Measure BIO-MM-1 was revised based on their recommended language. Please refer to Comment Letter No. AG 4, Response No. AG 4-30.

## Comment No. ORG 1B-157

Fourth, the DEIR fails to explain how “netting, canvas, or similar materials” could be used to create a buffer around a maternity roost. To the contrary, these materials are used to exclude bats from their roosts—not to protect active roosts from construction activities. Furthermore, bat biologists recommend against netting because it is known to trap (or entangle) bats and birds.<sup>57</sup> Consequently, the DEIR must disclose and analyze potentially significant impacts caused by implementation of BIO-MM-1 if netting might be installed at the Project site.

<sup>57</sup> Johnston D, Tatarian G, Pierson E. 2004. California Bat Mitigation Techniques, Solutions, and Effectiveness. Report to California Department of Transportation, Sacramento, California. Project Number 2394-01.

## Response No. ORG 1B-157

The comment contends that use of netting or similar material described in Mitigation Measure BIO-MM-1 would not protect active roosts and are not recommended by bat biologists. Mitigation Measure BIO-MM-1 on pages IV.C-41 to IV.C-42 of the Draft EIR has been revised to remove the statement “Suitable buffers could include netting, canvas, or similar materials as recommended by the biologist.” The removal of the use of netting, canvas, or similar materials to establish a buffer around a bat maternity roost is consistent with current mitigation techniques for bat protection, as the comment contends. This update has been incorporated into Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, in this Final EIR.

**Comment No. ORG 1B-158**

Fifth, the DEIR does not identify what would be considered a “suitable buffer,” nor does it establish performance standards [sic] BIO-MM-1. Furthermore, although BIO-MM-1 requires a report that documents “any needed maternity roost avoidance actions,” it does not require monitoring to evaluate the efficacy of those actions. As a result, the DEIR provides no assurances that BIO-MM-1 would be successful in preventing significant impacts to bats.

**Response No. ORG 1B-158**

The comment contends that Mitigation Measure BIO-MM-1 is inadequate because it does not define a suitable buffer or include performance standards. As stated in Mitigation Measure BIO-MM-1, a suitable buffer would be determined by the qualified bat biologist, and would depend on the bat biologist’s best professional opinion based on site-specific factors to conservatively prevent roost disturbances, including but not limited to the numbers and locations of bats, proposed construction activities, height and distance of bats from proposed activities, the presence of visual and/or acoustic barriers between the roost and proposed activities, and the existing level of pre-project human activities (e.g., ambient noise, potential movement, etc.) to which the bats may already be acclimated. Mitigation Measure BIO-MM-1 has been modified to include these considerations and included in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, in this Final EIR.

**Comment No. ORG 1B-159**

BIO-MM-2 states:

“Prior to issuance of a building permit, Harvard-Westlake School shall submit to the Department of City Planning a landscape plan or mitigation plan depicting replacement of an equivalent acreage of California brittlebush scrub removed at a 1:1 ratio. The sensitive natural community does not need to be dominated only by California brittlebush, but this species shall be prevalent within the community, and the native scrub mix proposed shall use similar species as used for the Zev Greenway restoration habitat. The replacement of sensitive natural community habitat shall be planted clustered adjacent to and contiguous with the Zev Greenway, and the locations and species shall be to the satisfaction of the Department of City Planning and in conformance with the landscape and planting guidelines in the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes. Replacement sensitive natural community habitat areas shall be planted on-site and shall be shown on the Project’s landscape plan. The restored sensitive natural community shall be monitored for five years to verify that California brittlebush scrub has been successfully restored.”

There are several problems with BIO-MM-2. First, the DEIR fails to demonstrate it would be feasible to create 0.14 acres of replacement habitat on-site and adjacent to the Zev Greenway. Most of the habitat adjacent to the Zev Greenway already consists of California brittlebush scrub (and therefore does not qualify as a potential mitigation site).<sup>58</sup> Although there are small patches of “Disturbed” and “Ornamental” vegetation along the Greenway near the Project’s southwestern boundary, it is unclear whether there would be 0.14 acres “on-site” that could be restored to California brittlebush scrub, especially given the Applicant’s plan to plant trees in that area.<sup>59</sup>

<sup>58</sup> DEIR, Figure IV.C-3.

<sup>59</sup> DEIR, Figure IV.C-5

### **Response No. ORG 1B-159**

The comment contends that Mitigation Measure BIO-MM-2 is not feasible because it is unclear whether there would be sufficient space onsite to plant the restoration habitat. As stated in Mitigation Measure BIO-MM-2 on page IV.C-44, in Section IV.C, *Biological Resources*, under the heading Mitigation Measures, of the Draft EIR, the Project would plant replacement plantings adjacent to and contiguous with the Zev Greenway. Figure IV.C-6, *Planting Zone Plan*, of the Draft EIR, illustrates the planting zone areas within the Project Site, as well as areas adjacent to and contiguous with the Zev Greenway. As shown in Figures IV.C-1 and IV.C-2 California brittlebrush scrub is located along the Zev Greenway, approximately 0.14 acres of which would be impacted by the Project’s connector ramp to the Zev Greenway. Under Mitigation Measure BIO-MM-2, the area depicted in Zone C in Figure IV.C-6, would be available for restoration that could accommodate the California brittlebush. The restoration area, comprising approximately 0.35 acres that is either owned or leased by Harvard-Westlake, is sufficient to implement Mitigation Measure BIO-MM-2.

### **Comment No. ORG 1B-160**

Second, the DEIR does not establish performance standards for BIO-MM-2, nor does it identify the variables that would be evaluated to determine whether the California brittlebush scrub had been “successfully restored.” As a result, the DEIR lacks assurances that BIO-MM-2 would be effective in mitigating the Project’s impacts to less-than-significant levels.

### **Response No. ORG 1B-160**

The comment contends that Mitigation Measure BIO-MM-2 is inadequate because it does not include performance standards. Planting of native scrub habitat has already been demonstrated as successful within the area, as shown by the California brittlebush scrub community found along the Zev Greenway, which did not occur in this location five or more years ago. As stated in Mitigation Measure BIO-MM-2 on page IV.C-44, in Section IV.C, *Biological Resources*, under the heading Mitigation Measures, of the Draft EIR, the locations and species of the replacement habitat would be to the satisfaction of the

Department of City Planning and in conformance with the landscape and planting guidelines in the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes. Replacement sensitive natural community habitat areas would be planted on-site and shown on the Project's landscape plan, as the intent of the mitigation measure is to ensure that the sensitive natural community that may be impacted by the Project is returned to the existing area. The restored sensitive natural community would be monitored for five years to verify that California brittlebush scrub has been successfully restored, as demonstrated by the survival of the plantings documented on the approved landscape plan. Thus, the Department of City Planning would determine if the California brittlebush scrub has been "successfully restored" by assessing the survival of the plantings at the end of the five years of monitoring. This would identify any dead or dying plants that would need to be replaced. Mitigation Measure BIO-MM-2 has been updated to state that, "...The restored sensitive natural community shall be monitored for five years to verify that California brittlebush scrub has been successfully restored with the survival of the plants depicted in the approved landscape plan at the conclusion of the five years of monitoring." This update is included in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

### **Comment No. ORG 1B-161**

Third, BIO-MM-2 fails to incorporate a mechanism that would ensure the compensation habitat is maintained (and properly managed) in perpetuity. That is, there is not mechanism that would prevent the Applicant from removing the compensation habitat upon termination of the five-year monitoring period.

### **Response No. ORG 1B-161**

The comment states that Mitigation Measure BIO-MM-2 does not ensure that the compensatory habitat for impacts to California brittlebush scrub would be maintained in perpetuity. The Project would plant replacement plantings of California brittlebush scrub adjacent to and contiguous with the Zev Greenway. The School does not own the Zev Greenway and would require County and City approval of a discretionary action in order to modify the Zev Greenway natural plant communities, such as the communities included as part of the Project. While a conservation easement or other method to protect the replacement plantings is not required because the landscape plan must be prepared in conformance with the Los Angeles River Master Plan Landscaping Guidelines, the five-year monitoring period requires the School to demonstrate the success of the compensation mitigation to the satisfaction of the City. The five-year monitoring period is sufficient to document survival for short-lived native shrubs such as California brittlebush. Any future discretionary projects that may propose modifications to these areas would be subject to environmental review by the Department of City Planning similar to this Project. However, minor landscape changes, such as may be required for maintenance purposes, would not require environmental review.

**Comment No. ORG 1B-162**

For these reasons, BIO-MM-2 does not ensure the Project's impacts to California brittlebush scrub would be mitigated to less-than-significant levels.

**Response No. ORG 1B-162**

The comment restates that Mitigation Measure BIO-MM-2 does not ensure that impacts would be reduced to less-than-significant levels, but does not include additional facts to support the contention. Responses to the prior comments on impacts to California brittlebush scrub are provided above in Response Nos. ORG 1B-49, 1B-50, and ORG 1B-159 through ORG 1B-161. Based on the above, the comment presents no evidence to support a contention that Mitigation Measure BIO-MM-2 does not ensure the Project's impacts to California brittlebush scrub would be mitigated to less-than-significant levels.

**Comment No. ORG 1B 162a**

CV for Mr. Cashsen included in the comment attachment.

**Response No. ORG 1B 162a**

The CV does not include any comments on the Draft EIR and no response is necessary.

However, they do not include comments on the Draft EIR. Refer to Appendix A of this Final EIR for copies of these attachments.*

**Comment No. ORG 1B-164**

**Attachment 4 (Kim Tashman, Architectural & Historical Consulting)**

The following reflects my professional comments and opinion with regards to the Draft Environmental Impact Report (DEIR) for the Harvard-Westlake River Park Project (Case Number ENV2020-1512-EIR), based on the information about the project available as of March, 2022.

## **Response No. ORG 1B-164**

This is an introductory comment regarding Kim Tashman's comments and opinions on the Draft EIR. The comment, however, does not discuss the adequacy of the Draft EIR and no further response is necessary.

## **Comment No. ORG 1B-165**

I hold a Master's degree in Historic Preservation-Heritage Conservation from the University of Southern California, and work as an architectural and historic preservationist. I wrote my Master's thesis on the historical and cultural aspects and value of the Weddington Golf site and its landscape. Based on this experience, and in my expert opinion, the Cultural Resources Impact Analysis in the DEIR is inadequate for the following reasons:

First, the analysis is defective because it fails to address the impacts of the project on all of the character-defining features of the site. Per my thesis research, and according to the 2012 Architectural Resources Group Historical Resources Assessment Report (ARG Report) regarding the site, Weddington Golf's historic and character-defining features include: the 9-hole golf course, the clubhouse, the putting green located in front of the clubhouse, the driving range, the golf ball light standards, and the open green space and park-like setting of the site (including the extensive canopy of mature trees). These features are not adequately nor individually addressed in the DEIR. The DEIR arbitrarily limits its own list of "character defining features" to only the clubhouse, putting green, and golf ball light standards. The DEIR's Cultural Resources analysis states that because the site will retain these limited features, there will not be significant cultural or historic losses. But this limited list is inaccurate, and contradicts their own statement on DEIR page IV-D-22 that the "primary physical characteristics" of the site include both the nine-hole golf course and the driving range. This more detailed list of character defining features is also supported by the ARG Report, which is referenced throughout the DEIR. Should the Project go forward as planned, these conveniently excluded historic elements will be either damaged or lost entirely – a significant impact on the site's historic characteristics.

## **Response No. ORG 1B-165**

See Topical Response No. 6 – Historical Resources. The assertion that the golf course is a character-defining feature of the Project Site is the opinion of the commenter and is not part of any official determination or designation of the Project Site as a historical resource. The City, in a separate action on the designation of the Project Site as an HCM conducted in 2021, reviewed all of the evidence related to the history of the Project Site, and determined the historical significance and character-defining features as identified in the Draft EIR. It is the City's identification of the character-defining features of the Project Site that appropriately provides the basis for the analysis in the Draft EIR. Moreover, the comment conflates the term "primary physical characteristics" of the Project Site (Draft EIR page IV.D-22) with the "character-defining features" of the HCM which are clearly

differentiated from the Project Site's other physical characteristics on pages IV.D-23 and IV.D-24 of the Draft EIR.

### **Comment No. ORG 1B-166**

Furthermore, the DEIR has completely failed to reference the existing lawsuit filed by Save Weddington Inc. against the City of Los Angeles (Superior Court of California, County of Los Angeles Case Number: 21STCP04158) regarding the last-minute removal of historically and culturally significant terms from final HCM determination. The essential defining terms "golf club" and "golf course" were improperly removed at the last minute during the final vote for the nomination. This was done without any evidence, as is required by law, as to why these essential historical and cultural terms were to be removed. This needs to be addressed and responded to in the DEIR, as once the case is settled it may alter the mitigation measures required to sustain the historic nature of the site. The removal of these terms is suspect, given how convenient their removal is for the developer's desired outcome for the site. Ignoring, or outright invalidating, the historic nature of the golf course's landscape only serves to benefit the developer's interests.

### **Response No. ORG 1B-166**

See Topical Response No. 6 – Historical Resources. The assertion that the golf course is a character-defining feature of the Project Site is the opinion of the commenter and is not part of any official determination or designation of the Project Site as a historical resource. Based on an application that the commenter submitted to the City to designate the Project Site a historical monument, the City reviewed all of the evidence related to the history of the Project Site, and determined the historical significance and character-defining features as identified in the Draft EIR. It is the City's identification of the character-defining features of the Project Site that appropriately provides the basis for the analysis in the Draft EIR. The fact that the commenter has filed a lawsuit<sup>72</sup> challenging the City's determination is not relevant to the analysis and conclusions of the Draft EIR.

### **Comment No. ORG 1B-167**

Moreover, the DEIR is incorrect when it states on page IV-D-39 that "[c]umulative impacts to historic resources...were determined to be less than significant...and no mitigation measures are required." Once the lawsuit is settled, it is likely that numerous mitigation measures will be required in order to protect the golf course and driving range from significant damage to their historic character.

### **Response No. ORG 1B-167**

See Topical Response No. 6 – Historical Resources. The comment indicates that the lawsuit challenging the City's findings for the Project Site's HCR status would change the

---

<sup>72</sup> See *Save Weddington Inc. v. City of Los Angeles* (Los Angeles Superior Court Case No. 21STCP04158; filed Dec. 22, 2021)

evaluation of historic resources in the Draft EIR. The comments states this would change the Draft EIR's cumulative historic analysis and the conclusion in the Draft EIR that the golf course is not a character-defining historic feature. The assertion that the golf course is a character-defining feature of the Project Site is the opinion of the commenter and is not part of any official determination or designation of the Project Site as a historical resource or, to date, the conclusion of a resolved lawsuit. The City reviewed all of the evidence related to the history of the Project Site, and determined the historical significance and character-defining features as identified in the Draft EIR. It is the City's identification of the character-defining features of the Project Site that appropriately provides the basis for the analysis in the Draft EIR. The commenter's opinion, which is not based on fact, that once the lawsuit is "settled" additional mitigation measures will be required does not question the adequacy of the Draft EIR, and no additional response is necessary.

### **Comment No. ORG 1B-168**

The historic nature of the course's design is thoroughly documented in my thesis research attached. In removing these terms from the HCM, and ignoring the significance of the golf course itself in the DEIR, the DEIR is deliberately downplaying or outright denying the historic quality of the course, relegating the defining features of the historic site as irrelevant. As such, the DEIR has failed to accurately assess the impact of the Project on the HCM, a California Register eligible resource, and the site's cultural and historic landscape. It has failed to identify significant and unmitigated impacts of the Project.

If you have any questions regarding the content of this document, please contact me using the information below.

### **Response No. ORG 1B-168**

See Topical Response No. 6 – Historical Resources. The assertion that the golf course is a character-defining feature of the Project Site is the opinion of the commenter and is not part of any official determination or designation of the Project Site as a historical resource. The City reviewed all of the evidence related to the history of the Project Site, and determined the historical significance and character-defining features as identified in the Draft EIR. It is the City's identification of the character-defining features of the Project Site that appropriately provides the basis for the analysis in the Draft EIR.

*Ms. Tashman Master's Thesis is provided as an attachment her comments. Refer to Appendix A of this Final EIR for copies of these attachments.*

## Response No. ORG 1B-169

Ms. Tashman Master's Thesis is provided as an attachment to her comments. However, the thesis does not include comments on the Draft EIR. Refer to Appendix A of this Final EIR for copies of these attachments.

## Comment No. ORG 1B-170

### Attachment 5 (Aperture DEIR Report Review – Commentary)

The following are intended to serve as comments regarding WEXCO's observations of the Draft Environmental Impact Report (DEIR) relative to the Harvard-Westlake River Park Project, as of March, 2022, based on the information available to date.

The format of this document is: 1) an excerpt of the DEIR including page/section number, 2) WEXCO's Relevant Summary of the DEIR provision, 3) WEXCO's comment as to the DEIR proposal. This report does not include all of our observations and opinions and is subject to enhancement or changes as additional data is received.

## Response No. ORG 1B-170

The comment introduces WEXCO's comments on the Draft EIR and describes the format of the forthcoming comments. The comment, in itself, does not comment on the Draft EIR and no further response is necessary.

## Comment No. ORG 1B-171

### Opening Statement

Per Section IV H Hazards and Hazardous Materials of the DEIR there are a series of Thresholds of Significance that characterize a significant impacts [sic] related to hazards and hazardous materials if the project would:

- (a) Create a significant hazard to the public or the environment ...

We believe there are significant hazards and / or safety concerns (not limited to hazardous materials) associated with the proposed project not limited to the items listed below.

### 1. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-53):

Vehicle parking would be provided in aboveground and underground parking areas located on the eastern portion of the Project Site. Vehicles would enter the Project Site on Whitsett Avenue via a driveway located several hundred feet south of Valley Spring Lane (to the north of Field A) (referred to as north driveway) and **via a driveway at the paved portion of Valleyheart Drive located just south of LAFD Fire Station 78 (referred to as south driveway)**. Both driveways would provide access to the proposed

single-level underground parking structure, as described below. **No new driveways would be installed** along Valley Spring Lane or Bellaire Avenue, and the existing service driveway on Valley Spring Lane would be removed, thus eliminating an existing potential conflict location.

**Relevant Summary:**

The roadway serving the Fire Station 78 at Valleyheart Drive is proposed to also be utilized by Harvard Westlake patrons and employees.

**WEXCO Commentary:**

**The elimination of the relatively exclusive use of the Valleyheart Drive serving the Fire Station is Unsafe**

The south driveway and Valleyheart Drive should not be shared with Harvard Westlake in the event of a fire, or earthquake, or other emergency situation or calamity that would require the Firefighters to use the south driveway and Valleyheart. If the Valleyheart Drive has a line of vehicles entering the proposed facility, that traffic would severely impact the emergency services personnel, vehicles and equipment from ingress and egress.

The proposed south driveway plan will hinder emergency services ability to timely egress which can slow response time and be life threatening.

**Response No. ORG 1B-171**

The comment states that joint use of a public street by the Project and LAFD Fire Station 78 would be hazardous or unsafe. It is common for stations and the general public to share the use of public streets. The commenter is referred to Topical Response No. 10 – Emergency Access, for a discussion of the Project’s effects to operations at LAFD Fire Station 78, including those associated with use of Valleyheart Drive.

**Comment No. ORG 1B-172**

**To the extent that pedestrian access, in/out of the Proposed Facility via the proposed South Driveway to cross or impede Emergency Services access is also unsafe.**

There should be no encumbrances to the Fire Station and Emergency Services personnel and vehicles and equipment at the proposed South Driveway.

According to the LAFD Statistics, for LAFD Station 78, the Operational Response Time for Emergency Medical Services (EMS) is currently 7 mins 11 sec. For Advanced Life Support (ALS) LAFD Station 78 response time is currently 6 mins 18 secs. For Structure Fires, the response time is 5 mins 24 secs.

Per Vehicle Code 22500, it is unlawful to Stop, Stand or Park within 15 feet of the driveway entrance to a fire station.

Per the California Fire Code and / or Ca. Vehicle Code the minimum clear width of fire access roads is 20 feet.

## **Response No. ORG 1B-172**

The comment speculates that pedestrian traffic on public streets near LAFD Fire Station 78 would be hazardous or unsafe. There is no reason to believe that pedestrians who may use the public sidewalks along Whitsett Avenue or Valleyheart Drive or the crosswalk at the intersection of Whitsett Avenue and Valleyheart Drive would not obey standard protocols of moving out of the way of emergency vehicles, nor that motorists would not obey Vehicle Code Section 22500.

Valleyheart Drive is approximately 33 feet in width, which is sufficient to provide 20 feet of clear width.

The commenter is also referred to Topical Response No. 10 – Emergency Access, for a discussion of the Project’s effects to operations at the LAFD Fire Station 78, including those associated with use of Valleyheart Drive.

## **Comment No. ORG 1B-173**

### **2. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Pages II-53-54).**

**The south driveway would only allow entry into the subterranean garage, and all exits from the garage would be via the north driveway off Whitsett Avenue.**

**The roundabout has been designed to accommodate buses, shuttles, and automobiles. The roundabout would lead to a 29-space, short-term surface parking lot near the parking structure’s southern entrance.**

**Rideshare vehicles would use the southern driveway (with roundabout) to access the surface parking lot.**

**Visitors that are not affiliated with the School would be informed about preferred driving routes and neighborhood parking prohibitions via signage, the School’s website, through the online athletic facility reservation system (i.e., tennis court reservation system), and information made available at the security kiosks.**

### **Relevant Summary:**

*The Southern Driveway and Valleyheart Drive will serve numerous types of traffic. Signage will be placed to direct visitors about preferred driving routes and parking prohibitions.*

**WEXCO Commentary:**

**The north driveway will be congested given that the south driveway is slated for ingress only.**

Traffic on Whitsett will be impacted by having a single exit point for a 500+ vehicle parking lot discharging onto Whitsett from the proposed north driveway. Traffic congestion is a safety hazard. It is also a safety hazard in the proximity of the Fire Station 78. Is there a controlled intersection planned for that north driveway? With a traffic signal? Will vehicles exiting the North driveway be allowed to turn left (north) onto Whitsett from the driveway?

**There is no indication that the proposed internal roundabout would accommodate emergency vehicles. It is unclear how the 29-Parking Space vehicles on the surface lot will exit the proposed facility, since the North Driveway is for subterranean parking lot exit only.**

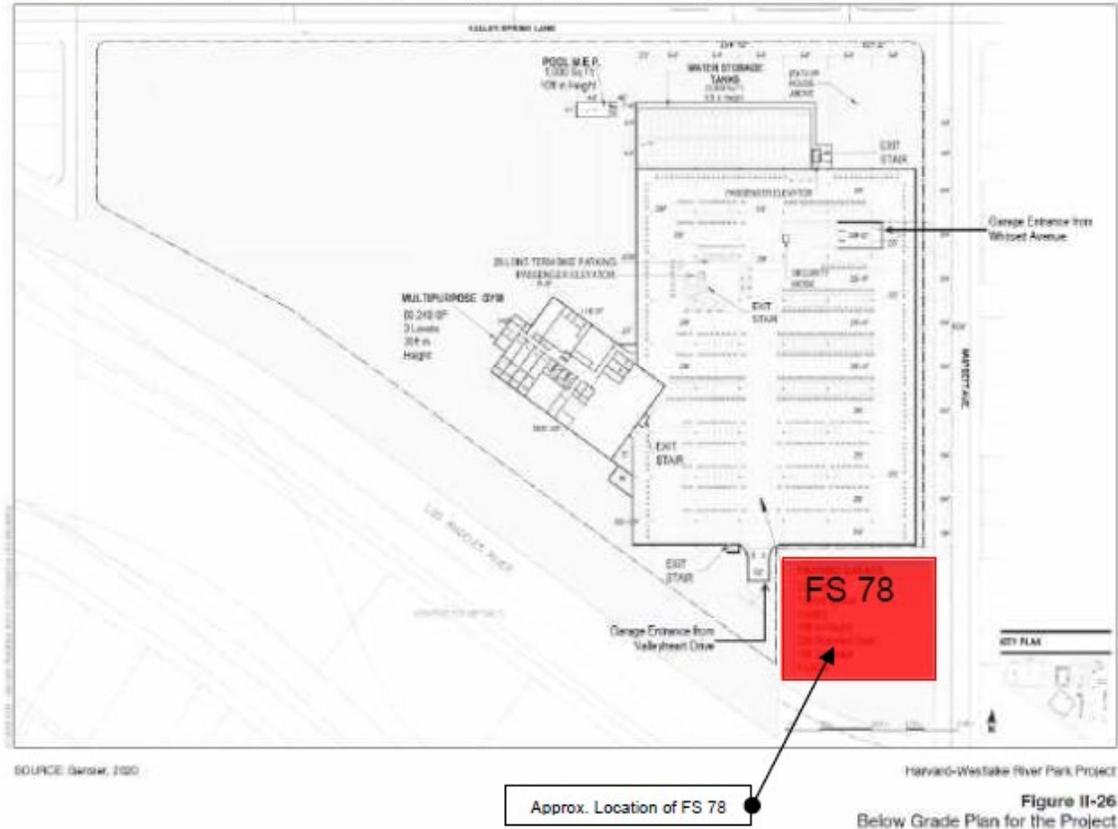

**Allowing Rideshare service Only into the Southern Driveway will cause confusion and a safety hazard. And, the confusion will further complicate the south driveway relative to the Fire Station 78 access/egress.**

**Visitors not familiar with the specialized proposed parking arrangements having to rely on specialized signs without fair warning will cause confusion and safety hazards.**

There does not seem to be a plan to provide motorists enough lead time for motorists to assess the signs. That lack of lead time will force motorists to make snap decisions in using the North or South Driveway Entrance. There would need to be advanced signage along the roadway to accommodate motorists for proper specialized driveway entrance selection.

3. **DEIR, Figure II-26**

*Indicates location of subterranean parking garage. (See below)*

**Response No. ORG 1B-173**

The comment states that the Project’s parking and circulation components will cause congestion and confusion resulting in hazardous or unsafe conditions. Regarding the north driveway, vehicles would be limited to right-turns-in and right-turns out via provision of a triangular island on the driveway itself which will render left-turns infeasible. Exiting vehicles will be controlled by a stop sign. Regarding congestion at the north driveway, the exiting queue length is estimated to be approximately 25 feet (1 vehicle) on non-event days and 275 feet (11 vehicles) on special event days. This queue would occur on the Project Site within the subterranean parking garage and would not affect traffic on Whittsett Avenue. This analysis is shown on Table 12B (page 61 or PDF page 79 of 217) in Appendix M, Transportation Assessment, of the Draft EIR.

Regarding the design and capacity of the roundabout, as stated on page II-53 of the Draft EIR, Section II, *Project Description*, of the Draft EIR, the roundabout is designed to accommodate passenger vehicles, shuttles, garbage trucks, as well as emergency vehicles. The capacity of the roundabout to accommodate turning fire trucks is illustrated in Figure M-3, Fire Truck (NCHRP Report Aerial Fire Truck) Autoturn, in Chapter 3,

*Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. Figure M-3, which is added to Appendix M, Transportation Assessment, of the Draft EIR, is intended to clarify the adequacy of the turnaround and to supplement the discussion provided in Topical Response No. 10 - Emergency Response. As shown in Figure M-3, the fire engine would be accommodated by the proposed roadway.

Regarding the 29-space surface parking lot, vehicles parked in this lot will exit the facility via the roundabout/south driveway to Valleyheart Drive as stated on page II-53 in Chapter II, *Project Description*, of the Draft EIR. Note that modifications to the Project design would reduce the size of the surface parking lot from 29 spaces to 17 spaces. See Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

Regarding rideshare service restricted to only use the south driveway, Harvard-Westlake will work with transportation network companies (TNCs such as Uber and Lyft) to have the Project's address route TNC vehicles to the southern driveway and roundabout and to implement geofencing along Whitsett Avenue.

The commenter is referred to Topical Response No. 9 – Transportation and Parking During Construction and Operations, for a discussion of mechanisms to manage traffic on event days.

## **Comment No. ORG 1B-174**

### **WEXCO Commentary:**

**The proposed Below Grade Plan – does not indicate the Proximity of the Fire Station 78 and does not indicate the shared roadway (Valleyheart Drive) with Fire Station 78.**

The figure II-26 should provide more information so that the impacts to the Fire Station driveway is revealed.

## Response No. ORG 1B-174

The comment requests more information regarding the proximity of LAFD Fire Station 78. Chapter II, *Project Description*, Figure II-6, *Harvard-Westlake Athletic and Recreational Facilities Conceptual Site Plan*, on page II-16 of the Draft EIR clearly shows the Project's driveways, the location and naming of Valleyheart Drive, and the location of LAFD Fire Station 78. The Project Description, page II-53 describes the Project's access as thus: "Vehicles would enter the Project Site on Whitsett Avenue via a driveway located several hundred feet south of Valley Spring Lane (to the north of Field A) (referred to as north driveway) and via a driveway at the paved portion of Valleyheart Drive located just south of LAFD Fire Station 78 (referred to as south driveway). Both driveways would provide access to the proposed single-level underground parking structure, as described below." On page II-55 of the Project Description, the Draft EIR states: "To minimize conflicts with

emergency vehicles exiting LAFD Fire Station 78, a flashing red warning light(s) would be installed on the southern exit driveway within the Project Site at a point located before vehicles reach Valleyheart Drive that will hold back vehicles exiting the Project Site roundabout onto Valleyheart Drive. This warning light would be activated by a remote control button pressed by LAFD staff when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting from one of the two LAFD driveways on Valleyheart Drive. This light feature is identified as Project Design Feature TRAF-PDF-2 in Section IV.M, *Transportation*, of this Draft EIR.” Specific access in and around LAFD Fire Station 78 is discussed in more detail in Sections IV.L.1, *Fire Protection*, Emergency Access, page IV.L.1-16, and IV.M, *Transportation*, Emergency Access, page IV.M-18. Both of these sections describe the access for the fire station as such: “With regard to LAFD Fire Station 78 emergency access, the station’s main driveway used for the departure of the larger fire trucks from the station bays is located on Whitsett Avenue, north of Valleyheart Drive. The station also has two driveways on the north side of Valleyheart Drive. Of these two driveways, the westerly driveway is used for the return of the larger fire vehicles, which swing wide and use most of the Valleyheart Drive roadway to enter the fire station before proceeding to the bays. The easterly driveway to the fire station is used for the entry and departure of smaller vehicles, such as ambulances.”

The emergency access discussions in the Draft EIR and Figure II-6 (the Conceptual Site Plan) provide driveway information, the role of Valleyheart Drive for incoming fire vehicles and Project access. The Draft EIR also provides information regarding potential conflicts at Valleyheart Drive with returning fire vehicles and provides, as part of the Project, a PDF to include a stop light to be operated by the LAFD. With the information provided in the Draft EIR, including the Conceptual Site Plan, any potential impacts to LAFD Fire Station 78 are fully explained and addressed.

## **Comment No. ORG 1B-175**

### **4. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-55):**

**To minimize conflicts with emergency vehicles exiting LAFD Fire Station 78, a flashing red warning light(s) would be installed on the southern exit driveway within the Project Site** at a point located before vehicles reach Valleyheart Drive **that will hold back vehicles** exiting the Project Site roundabout onto Valleyheart Drive. This warning light would be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching Valleyheart Drive from Whitsett Avenue or exiting from one of the two LAFD driveways on Valleyheart Drive. This feature is identified as Project Design Feature TRAF-PDF-2 in Section IV.M, *Transportation*, of this Draft EIR.

### **Relevant Summary:**

A Flashing warning light will be added to alert Harvard Westlake patrons inside the proposed facility to “hold back”.

**WEXCO Commentary:****The warning light will not serve traffic on Whitsett or Valleyheart.**

**It was indicated in the DEIR that the south driveway was only an entrance to the proposed facility. Why would a flashing light be needed inside the facility at the South driveway if it is only an entrance?**

**Response No. ORG 1B-175**

The comment questions the purpose of the flashing light at the southern Project driveway. The south driveway would be used to exit the roundabout. The intent of the warning light at the southern exit driveway, paired with the adjacent security kiosk, is to control vehicles exiting the roundabout and from the 29-space surface parking lot to ensure that vehicles do not exit the roundabout when an emergency vehicle is accessing Valleyheart Drive to or from LAFD Fire Station 78. Note that modifications to the Project design would reduce the size of the surface parking lot from 29 spaces to 17 spaces. See Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. See Response No. ORG 1B-192 explaining that fire trucks and engines do not use Valleyheart Drive for departure in an emergency situation. Rather, only lighter-duty fire vehicles, such as ambulances, use LAFD Fire Station 78's eastern driveway on Valleyheart Drive for ingress and egress. Because the comment does not provide any evidence that raises a substantive issue on the adequacy of the Draft EIR, no further response is warranted.

**Comment No. ORG 1B-176****5. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-55):**

On days in which attendance is expected to surpass 300 spectators, tickets and parking passes would be required to enter the Project Site. **Spectators without a parking pass would be directed to park on the Upper School campus** and ride the School-provided shuttles to the Project Site. **Parking in the neighborhood would not be permitted and would be enforced by security personnel**, as discussed above.

**Relevant Summary:**

*If spectators do not have a parking pass they will be directed to turn around and park at the Harvard Westlake Campus (that already has limited parking and has overflow onto neighboring streets). (All Harvard Westlake related) parking will be enforced by Harvard Westlake security.*

**WEXCO Commentary:**

**This scenario of re-directing motorists from the proposed facility to the HW Upper campus further complicates the traffic in proximity to Fire Station 78.**

**Response No. ORG 1B-176**

The comment states that re-directing motorists to the Upper Campus would complicate traffic in proximity to LAFD Fire Station 78. The comment does not raise a substantive issue on the content or adequacy of the Draft EIR. However, the commenter is referred to Topical Response No. 10 – Emergency Access, for a discussion of effects to operations at LAFD Fire Station 78 and to Topical Response No. 9 – Transportation and Parking During Construction and Operations, for a discussion of how parking restrictions on event days would be enforced. Additionally, re-directing motorists who do not have a parking pass on days when such a pass is needed would not impact LAFD Fire Station 78 operations as the redirected motorists would be required to exit the subterranean parking garage from the northern driveway, located approximately 500 feet north of the LAFD Fire Station 78 driveway on Whitsett. By comparison, existing golf and tennis users must exit the Project Site from a driveway that is located less than 150 feet from the LAFD Fire Station 78 driveway. Furthermore, the majority of visitors would have reservations for specific activities or events, which would include parking passes. Spectators for larger events (greater than available parking) would be informed that all visitors with vehicles would require parking passes, with information as to the alternative of Upper School campus parking and shuttling. Because of the information and coordination provided through the reservation program, the number of vehicle trips caused by visitors without parking passes is anticipated to be low and would not generate a traffic congestion issue of its own.

**Comment No. ORG 1B-177**

**The Harvard Westlake Security agent has no authority to enforce the Vehicle Code or Parking Enforcement – this will further complicate the traffic conditions when spectators that are redirected to HW Upper Campus about 1 mile away – will have the option to park in the neighborhood.**

Harvard Westlake “enforcing” the neighborhood parking rules is unreliable and not lawful.

***It should be noted that the existing facility (Tennis Courts, Driving Range, Club House/Pro Shop, Snack Shop and 9-hole Pitch and Putt Golf Course has 89 parking stalls with two exits on Whitsett. The proposed project includes 532 parking stalls (that reflects nearly a 600% increase in capacity) than what currently exists. It is unclear how this substantial (6x) increase in vehicle parking and traffic can be achieved safely with only one exit (the North Driveway).***

***The proposed project forecasts 2,217 “fixed” seating (there is always seats that can be brought in too). This increase in patronage and traffic for this neighborhood and the proximate Fire Station is excessive.***

### **Response No. ORG 1B-177**

The comment states that increased traffic generated by the Project will impact the neighborhood and LAFD Fire Station 78 and that the School would have no authority to enforce parking restrictions. The commenter is referred to Topical Response No. 9 – Transportation and Parking During Construction and Operations, for a discussion of how on-site and off-site parking restrictions would be enforced.

The vehicle delay and queue lengths at the driveways were studied in Appendix M, Transportation Assessment, to the Draft EIR. The exiting queue length at the north driveway is estimated to be approximately 25 feet (1 vehicle) on non-event days and 275 feet (11 vehicles) on special event days. This queue would occur on the Project Site, within the subterranean parking garage, and would not affect traffic on Whitsett Avenue.

### **Comment No. ORG 1B-178**

#### **6. DEIR, II. Project Description, 4. Description of the Project, d) Access, Circulation and Parking (2) Vehicle Parking (Page II-56):**

**Three shuttles are anticipated to transfer students, coaches, and visitors between the campus and the Project Site between 2:30 p.m. to the end of the day’s latest activity. Shuttles would have an estimated rider capacity of 24 and service is anticipated every 5 to 10 minutes. Ingress and egress at the Project Site would be at the south driveway drop-off roundabout, at Valleyheart Drive, just west of the LAFD Fire Station 78.**

#### **Relevant Summary:**

HW Shuttles will be used to transport patrons to and from the proposed site every 5 to 10 minutes in proximity to the LAFD Station 78.

#### **WEXCO Commentary:**

***The HW Shuttles are yet additional sources (amongst multiple sources) of traffic that further complicates the congestion and frequency of traffic in proximity to Fire Station 78.***

***It should be noted in this analysis that years of construction of the proposed project will severely impact traffic along Whitsett, and the feeder streets and neighborhood including the LAFD Station 78.***

## Response No. ORG 1B-178

The comment states that shuttle bus traffic and construction activities will impact streets and LAFD Fire Station 78. Vehicle trips generated by Harvard-Westlake shuttle buses were considered in the transportation analyses provided in the Section IV.M, *Transportation*, of the Draft EIR. The Project's total trip generation, including shuttles are illustrated in Section IV.M, Table IV.M-5, *Project Net Total Daily VMT Estimate*, on page IV.M-41 of the Draft EIR and in Appendix A (PDF page 42 of 217) to Appendix M, Transportation Assessment, to the Draft EIR. As shown in Table IV.M-5, the shuttles would generate 58 average daily trips having a one-way trip length of 1.5 miles and result in a daily VMT of 87. The Project's total daily VMT would be 3,032. The existing daily VMT is 6,030. As such, the Project would result in a negative VMT of 2,035 compared to existing conditions and would not result in significant traffic impacts under the CEQA Guidelines Section 15064.3 criterion.

Regarding construction traffic, evaluation criteria include potential temporary traffic constraints (e.g., temporary lane closures), temporary loss of access (e.g., loss of vehicle, bicycle, or pedestrian access to nearby parcels), and temporary loss of bus stops or rerouting of bus lines. The Project would not require construction activities that would take place within the right-of-way which would necessitate temporary lane, alley, or partial street closures for more than a day at a time. In addition to traffic control measures included within the Project's Construction Management Plan (CMP), as required by Project Design Feature TRAF-PDF-1 the mitigation monitoring program provides that LADOT will serve as the monitoring and enforcement agency for the implementation of Project Design Feature TRAF-PDF-1 requiring approval of the CMP prior to issuance of building permit and periodic field inspections. With implementation of Project Design Feature TRAF-PDF-1, construction traffic was determined to be less than significant.

The commenter is referred to Topical Response No. 10 – Emergency Access, for a discussion of effects to operations at LAFD Fire Station 78, by vehicular traffic including shuttles. As also discussed in Topical Response No. 10, during construction, the Project would employ temporary traffic controls, such as flag persons, to control traffic movement during temporary traffic flow disruptions. Traffic management personnel would be trained to assist in emergency response by restricting or controlling the movement of traffic that could interfere with emergency vehicle access.

The comment does not contain substantial evidence that supports the contention that congestion in the Project area would increase as a result of Project construction and operation, or that Project traffic would create hazardous or unsafe conditions. As such, no further response is necessary.

## Comment No. ORG 1B-179

### 7. DEIR, IV. M. Transportation 3. Project Impacts, (f) Vision Zero (Page M 35):

Vision Zero is a plan that **strives to eliminate traffic-related deaths** in Los Angeles by 2025 through strategies, such as modifying streets to better serve vulnerable road users. Projects located in the HIN should make improvements or fund them. **The Project's frontages are not along streets in the Vision Zero network.** The Project frontages are not along streets that are on the HIN, and, therefore, the **Project would not preclude or conflict** with the implementation of future Vision Zero projects in on the HIN.

#### Relevant Summary:

HW claims the project frontages do not enter the Vision Zero network, therefore the project would not conflict with Vision Zero.

#### WEXCO Commentary:

**In LADOT's High Injury Network (HIN), Ventura Blvd from Coldwater Canyon Ave to Carpenter Ave is identified as a street with one of the City's highest incidences of severe and fatal injury collisions. Although the DEIR claims "The Project Site's frontages are not along streets that are part of the HIN," shouldn't the HIN be taken into account for all aspects of the project, including:**

- 1) construction haul routes (which are planning to utilize Ventura Blvd between Whitsett Ave and Coldwater Canyon Ave),
- 2) prescribed student and visitor trip routes (from the Project Site back to the upper campus would entail heading southbound on Whitsett Ave, turning right and heading westbound on Ventura Blvd, and turning left on Coldwater Canyon Ave),
- 3) and daily, cumulative traffic impacts.

## Response No. ORG 1B-179

The comment questions whether the Draft EIR should include analysis of the High Injury Network (HIN) due to construction haul routes and student and visitor trips that could utilize HIN streets. The City of Los Angeles TAG states that projects located along the HIN should identify countermeasures to enhance safety at the project site and consider avoiding or minimizing the number of driveways along the HIN. As stated on page IV.M-35 in Section IV.M, *Transportation*, of the Draft EIR, the Project Site's frontages are not along streets that are part of the HIN. Furthermore, the Project would not preclude the City's ability to implement safety countermeasures along any of the streets in the area.

## Comment No. ORG 1B-180

### 8. DEIR, IV. M. Transportation 3. Project Impacts, (e) LADOT Manual of Policies and Procedures (Page M 34-35):

MPP 321 states that on arterial highways, such as Whitsett Avenue, serving lots with frontages greater than 250 feet driveways should not be placed within 150 feet of the adjacent street. The Project proposes two driveways. The north driveway on Whitsett Avenue is more than 150 feet away from the closest intersection at Valley Spring Lane to the north. The south driveway on Valleyheart Drive that leads to Whitsett Avenue is more than 150 feet away from the closest intersection at Ventura Court to the south. MPP 321 also allows up to two driveways for up to 400 feet of frontage. The Project proposes two driveways and therefore does not propose more driveways than allowed by MPP 321.

#### WEXCO Commentary:

*The proposed driveways do not comply with the City's applicable requirements, as the north driveway is proposed to be 39 feet wide and the south driveway is proposed to be 33 feet wide.*

*Additionally, the south driveway is the extension of a public street, Valleyheart Drive, which is currently 33 feet wide. The Project is not consistent with the recommendation in the MPP Section 321.*

## Response No. ORG 1B-180

The comment contends that the Project is not consistent with the MPP's recommended driveway width. MPP Section 321 recommends, but does not require, that two-way driveways for commercial/industrial/multi-family residential developments be no wider than 30 feet in width. As stated on page IV.M-35, in Section IV. M, *Transportation*, of the Draft EIR, the inconsistency of the Project with the recommendation in MPP Section 321 would not result in increased circulation, pedestrian and vehicular conflicts since the Project is reducing the number of driveways, a triangular island would be provided on the north driveway configured to restrict turns into and out of the driveway to right-turns only, and the south driveway would be the extension of a public street, which is currently 33 feet wide.

## Comment No. ORG 1B-181

### 9. DEIR, IV. M. Transportation 3. Project Impacts, Threshold (d) (Page M 44-45):

#### (a) Construction

**The Project would include temporary construction activities (e.g., temporary lane closures, etc.) and generate construction traffic that could potentially affect emergency access to the Project Site and surroundings. As stated in the TA, the**

Project would not require construction activities that would take place within the right-of-way, which would necessitate temporary lane, alley, or street closures for more than a day at a time. Furthermore, emergency access would be maintained at all times as no road closures would be necessary. However, while construction activities would not require full street closures (i.e., at least one travel lane would be open at all times) and most Project construction activities would be confined to the Project Site, the Project would still implement a CMP (see Project Design Feature TRAF-PDF-1). Because of the short-term nature of the construction activities and with implementation of a CMP, the Project's construction activities would not require a new, or significantly interfere with an existing, risk management, emergency response, or evacuation plan. **The Project would not result in inadequate emergency access during construction.**

(b) Operation

**Operation of the Project would not include the installation of barriers (e.g., perimeter fencing, fixed bollards, etc.) that could impede emergency vehicle access to the Project Site and in the Project vicinity.** Drivers of emergency vehicles normally have a variety of options for avoiding traffic, such as using sirens to clear a path of travel or driving in the lanes of opposing traffic. As discussed in Section IV.L.1, Fire Protection, **impacts to these services from Project implementation would be less than significant.** In addition, as discussed in Section IV.H, Hazards and Hazardous Materials, none of the streets adjacent to the Project Site are a City-designated disaster route.

...the Project would not result in inadequate emergency access.

**WEXCO Commentary:**

**The document addresses that “the Project would not result in inadequate emergency access.” But, it does not specifically address the impacts to the Public. The above does not consider the effects of the construction in such close proximity to the LAFD Station 78 relative to the need of the Public. We are of the opinion that the proposed project would result in inadequate emergency egress to serve the General Public.**

**We disagree that the construction activities will be “less than significant” relative to Traffic and Emergency Services from LAFD Station 78.**

**Response No. ORG 1B-181**

The comment explains that the commenter disagrees with the Draft EIR's determination that construction activities impacts on emergency access would be less than significant. However, the comment does not provide substantial evidence to support the contention that the determination is incorrect. The commenter is referred to Topical Response No. 10 – Emergency Access, for a discussion of effects to operation at LAFD Fire Station 78, including those associated with construction activities.

## Comment No. ORG 1B-182

### 10. DEIR, IV. M. Transportation 3. Project Impacts, Threshold (b) (Page M 40-41):

See Table IV M-5 Project Net Total Daily VMT (Vehicle Miles Traveled) Estimate

... No mitigation measures were required or included, and the impact level remains less than significant.

#### WEXCO Commentary:

**If the data in the DEIR is correct, the proposed project reflects a decrease in the VMT in the area from 6,000 Daily VMT (Existing Use) to 4,000 Daily VMT (but, only as it pertains to HW inbound miles).**

**However, if the Daily VMT included outbound miles the proposed project would be greater than the existing use (i.e. 8,000 Daily VMT). Therefore the subject proposed project VMT will be increased.**

**We would like to see the source of the data relative to the existing use data. It is hard to believe that the existing facility (with 89 parking stalls) generates more VMT than the proposed sports facility with 532 parking stalls and numerous Shuttles and other vehicles (Deliveries, Rideshare, etc).**

## Response No. ORG 1B-182

The comment requests information on the VMT calculations. However, the comment contains no substantial evidence that the VMT calculations are not correct. Table IV.M-5, *Project Net Total Daily VMT Estimate*, in Section IV.M, *Transportation*, of the Draft EIR shows the total daily VMT that would be generated by the Project and the net total daily VMT associated with the Project, which is the additional VMT that would be generated by the Project relative to existing operations. Given that the Harvard-Westlake student athletes are already at the Harvard-Westlake Upper School campus, the VMT associated with the travel of the students returning home from the Project Site is not included in the total daily VMT since this trip already occurs under existing conditions. However, the average daily trip generation in Table IV.M-5 of the Draft EIR for the other population groups like those on the Harvard-Westlake shuttles, the Harvard-Westlake Other category (coaches, visiting schools, spectators), employees, and trips associated with Harvard-Westlake special events, includes both inbound and outbound trips. Therefore, the total daily VMT already includes outbound trips, and the statement in the comment that the daily VMT should be 8,000 VMT is incorrect.

In addition, the VMT associated with non-school events (i.e., community serving recreational facilities) were exempt from the VMT analysis, per guidance from LADOT, as explained on page IV.M-22 of the Draft EIR.

The existing ingress and egress data for the Weddington Golf & Tennis driveways is provided in Figure M-2, *Existing Driveway Data*, in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

### **Comment No. ORG 1B-183**

#### **11. DEIR, IV. Appendix L. Public Service Provider Correspondence, Section L-1 Los Angeles Fire Department Correspondence, Fire Protection:**

The Los Angeles Fire Department continually evaluates fire station placement and overall Department services for the entire City, as well as specific areas. The **development of this proposed project, along with other approved and planned projects in the immediate area, may result in the need for the following:**

- 1. Increased staffing for existing facilities. (i.e., Paramedic Rescue Ambulance and EMT Rescue Ambulance resources.)**
- 2. Additional fire protection facilities.**
- 3. Relocation of present fire protection facilities.**

#### **WEXCO Commentary:**

**We agree.**

### **Response No. ORG 1B-183**

The comment expresses support for the excerpted language from the Draft EIR but does not raise any issues with respect to the content or adequacy of the Draft EIR. As discussed in Section IV.L.1, *Fire Protection*, the threshold standard for impacts pertaining to fire protection services is based on increased demand for fire services that would require expanded or new fire services facilities, the construction of which would result in potentially significant impacts. The LAFD has not indicated in their response to information for the Draft EIR and in its review of the Draft EIR that the Project would increase demand to the extent that new facilities would be required. As discussed in Section IV.L.1, *Fire Protection*, page IV.L.1-26, “the Project would provide a system to maintain adequate access for emergency vehicles to enter and return to the adjacent LAFD Fire Station 78 and, thus, would not interfere with the operation of that fire station or substantively increase response times.” Since the operation of the Project would not substantively increase response times, or impair the overall operation of the fire station, the development of new or expansion of existing fire facilities would not be required. It is also noted that fire stations in highly urbanized areas frequently deal with potential emergency vehicle/street vehicle conflicts. These conflicts are reduced by the use of sirens and other means for emergency vehicles to exert priority rights on the roadway and at driveway entrances.

Based on the above, Project operation would not result in the need for a new fire station or the expansion of an existing facility, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection.

## **Comment No. ORG 1B-184**

### **12. DEIR IV. V. Alternatives**

(5) maximizes public safety through 24-hour, seven-day a week on-site security, monitored points of entry, and enforcement of a prohibition on off-site parking.

#### **WEXCO Commentary:**

**We disagree. On-Site security has no authority to prohibit or enforce off-site parking.**

## **Response No. ORG 1B-184**

The comment expresses disagreement with the excerpted Draft EIR language but does not raise any issues with respect to the content or adequacy of the Draft EIR. The commenter is referred to Topical Response No. 9 – Transportation and Parking During Construction and Operations, for a discussion of how on-site and off-site parking restrictions would be enforced.

## **Comment No. ORG 1B-185**

### **13. DEIR, IV. V. Alternatives H. Hazards and Hazardous Materials (Page V-47):**

As the Project would require grading and excavation of the Project Site, including a net cut/fill volume of approximately **250,000 cubic yards** (unadjusted), these grading activities could result in the exposure of construction works to hazardous conditions associated with contaminated soils or soil vapor. **As such, the Project could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving hazardous materials as a result of contaminated soils, and impacts would be potentially significant.**

#### **WEXCO Commentary:**

**Upon excavation, undisturbed soil may emit pollutants, contaminants, and particulate matter to the detriment of public health and safety (e.g., Valley Fever) that can compromise those with respiratory conditions.**

**The DEIR does not indicate any Swell Calculation of the Export soils.**

**Swell of compacted soil -as it is being excavated and placed into dump / haul trucks -is commonly estimated to be between 20%-25%. The amount of anticipated haulage of Export is misleading.**

**In other words, the Proposed excavation amount of 250,000 Cubic Yards of compacted earth materials will increase in size by 20%-25% as it is distributed from the earth to the dump trucks; thereby increasing the amount of haulage of earth materials from the 250,000 CY to 310,000 CY (i.e. 22.5% Swell Factor).**

**The DEIR does not indicate the weights of various construction elements that will impact the Roads and Infrastructure**

WEXCO has not seen, in the DEIR, any calculations as to the weight of:

1) Imported soils to the Site.

2) Imported Concrete to the Site.

*The DEIR does not indicate the number of Concrete Trucks per day during the Project,*

*The DEIR does not indicate the amount (in Cubic Yardage - CY) of concrete for the proposed project.*

3) Imported Steel and Reinforcing Steel to the Site.

4) Heavy Equipment transported to/from the site

5) .... and other substantive Construction Equipment and Materials

**Response No. ORG 1B-185**

The comment states that soils could contain contaminants and states that the Draft EIR does not indicate any swell calculation of exported soil or contain information regarding the weights of various construction elements. Section IV.H, *Hazardous Materials*, of the Draft EIR evaluates the potential for contamination in on-site soils and provides mitigation measures that would reduce these hazards to less than significant levels. Required mitigation measures include the following: HAZ-MM-1: Soil Management Plan and HAZ-MM-2: Health and Safety Plan (HASP). These mitigation measures are enforceable through the Project's MMP included in Chapter 4.0 of this Final EIR.

Regarding the potential for Valley Fever due to exposure to dust during construction, the fungus causing Valley Fever is commonly found in areas of the Antelope Valley portion of Los Angeles County, although it can be found in other areas according to the Los Angeles County Department of Public Health. The Project is not located in the Antelope Valley portion of Los Angeles County and thus is not located in an area where it is

expected to be common. Further, according to a study published in the Journal of the American Medical Association, in 1994, an outbreak of Valley Fever occurred in Simi Valley in Ventura County due to large dust clouds generated by landslides associated with the Northridge earthquake. Grading associated with the Project would not cause landslides and would not result in fugitive dust emissions on the level and scale of the 1994 Northridge earthquake. As discussed on pages IV.B-47, IV.B-52, IV.B-56 and IV.B-58 in Section IV.B. *Air Quality*, of the Draft EIR, Project construction would be compliant with SCAQMD Rule 403, which requires that soil be stabilized by watering the unpaved portions of the Project Site three times a day. The use of water is an accepted environmentally-safe dust control agent. The Project would also suspend construction activities on unpaved surfaces when wind speeds exceed 25 mph. In addition, soil migration off-site would be mitigated by installing wheel shaker device to remove soil from tires and vehicle undercarriages as they exit the Project Site, which would minimize the potential for transport of the Valley Fever spores, if present in the soil.

The effect of hauling on public roadways is not a CEQA issue and, as such, the CEQA Guidelines do not include pertinent threshold standards. However, the weight of truck loads is regulated by Caltrans, which establishes maximum loads for types of streets and highways. Under the LADOT approved Construction Management Plan (CMP) and haul route, haul trucks would leave the Project Site by way of Whitsett Avenue, an arterial street which has a higher bearing capacity than, for instance, the surrounding neighborhood/local streets. With compliance with the approved haul route and CMP in accordance with LADOT requirements, construction hauling would not adversely impact the area's arterial streets and highways.

Volumes of exported materials are discussed in Chapter II, *Project Description*, and the hauling of export materials is discussed in Sections IV.B, *Air Quality*; IV.E, *Energy*, IV.M, *Transportation*; and IV.O.3, *Solid Waste*, of the Draft EIR. As described on page II-62 in Chapter II, *Project Description*, of the Draft EIR, rough grading cut volumes would be approximately 251,836 cubic yards (unadjusted), and the fill volume would be approximately 1,836 cubic yards (unadjusted), for a net cut/fill volume of approximately 250,000 cubic yards (unadjusted). As discussed under Response No. ORG 1B-6, above, a bulking factor of 20 percent was used in the estimated 250,000 cubic yards of excavated materials. As explained in Footnote 18 in Chapter II, "unadjusted" cut and fill is a programmed estimate that does not account for minor shrinkage from compaction, swelling, or other factors that may require final manual adjustments to achieve finished gradients/ heights. Note that modifications to the Project design would reduce the total amount of Project grading from 250,000 cubic yards to 197,000 cubic yards. See Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

The Draft EIR also states that the excavated volumes are an estimate and may be subject to either swelling or shrinkage. Under CEQA, hauling is evaluated relative to emissions associated with maximum daily truck trips, landfill capacity, or handling of hazardous materials. Regarding land fill capacity, clean soils are marketable and would be almost entirely recycled and, thus, not adversely impact landfills. From a geotechnical

standpoint, the existing site-soils may also be re-utilized and recompacted for the creation of a compacted fill pad.

Regarding air emissions, regional air emissions from diesel trucks are based on a daily maximum activity which, based on the capacity of the Project Site to accommodate haul trucks within the prescribe hauling hours, would be the same for every maximum day. The maximum daily emissions generation would be the same whether the hauling phase were shortened or lengthened due to shrinkage or swelling of export materials. CEQA does not provide a threshold related to the weight of trucks on streets. However, state and local ordinances establish maximum weights depending on the category of street with which the hauler must comply.

As discussed in Section IV.B, *Air Quality*, of the Draft EIR, the Project must comply with CARB requirements to minimize short-term emissions from on-road and off-road diesel equipment and with SCAQMD's regulations, such as Rule 403 for controlling fugitive dust.

Mitigation Measure AQ-MM-1, Construction Equipment Features, requires that during demolition, site preparation, and grading and excavation activities, the contractor must provide notification and documentation that haul truck drivers have received training regarding idling limitations specified in Title 13 California Code of Regulations, Section 2485, and that haul trucks limit idling for loading and unloading activities to 5 minutes or less at any one location and unloading activities to 5 minutes or less at any one location. Mitigation Measure AQ-MM-1 was updated in Chapter 3 of this Final EIR to clarify these idling regulatory requirements that are applicable to the Project and assumed as part of the mitigated air quality emission analyzed in the Draft EIR. Project Design Feature TRAF-PDF-1 requires the development of a CMP, prior to the issuance of any demolition permit or building permit for the Project. The CMP will formalize how construction will be carried out and identify specific actions that will be required to reduce effects on the surrounding community. The CMP will be based on the nature and timing of the specific construction activities and other projects in the vicinity of the Project Site.

With compliance with existing regulations, PDFs, and mitigation measures, the Project would not result in a reasonably foreseeable upset and accident involving hazardous materials or adversely impact roadways. As such, the Draft EIR provides substantial evidence that the Project would not result in a potentially significant impact to the public or the environment as a result of hauling exported materials. The comment does not provide any evidence that contradicts the analysis in the Draft EIR.

## **Comment No. ORG 1B-186**

### **14. Additional Points:**

1. Even if there is a median on Whitsett to prevent left-hand turns, when there are special events with visitors/cars exceeding the 500+ parking spaces, it is likely that people will park on the east side of Whitsett Ave and then either walk around the

block to the nearest cross-street (with currently no crosswalk) or dart across Whitsett (east to west).

### **Response No. ORG 1B-186**

The comment speculates that people will park on the street and either use a street intersection or jaywalk to reach the Project Site. This speculation does not raise any issues with respect to the content or adequacy of the Draft EIR. The commenter is referred to Topical Response No. 9 – Transportation and Parking During Construction and Operations, for a discussion of how on-site and off-site parking restrictions would be enforced.

In addition, as indicated in Topical Response No. 9 – Transportation and Parking During Construction and Operations, following circulation of the Draft EIR, the City installed a traffic signal at the intersection of Whitsett Avenue and Valley Spring Lane. The intersection of Whitsett Avenue and Valley Spring Lane was unsignalized at the time of publication of the Draft EIR. The addition of the traffic signal would allow for pedestrian and bicycle crossings from the surrounding areas to the Project Site through the intersection in marked crosswalks, thus, enhancing pedestrian safety in the Project Site area.

### **Comment No. ORG 1B-187**

2. Even if there are no street parking along Valley Spring Lane, what is to stop patrons from finding other nearby street parking? What safety ramifications were accounted for in the DEIR for the increased pedestrian travel along the surrounding streets that feed into the proposed project?

### **Response No. ORG 1B-187**

The comment requests information on safety ramifications of potential increased pedestrian travel along the street in the Project area but does not any issues with respect to the adequacy of the Draft EIR. The commenter is referred to Topical Response No. 9 – Transportation and Parking During Construction and Operations, for a discussion of how off-site parking restrictions would be enforced and how such restrictions would reduce pedestrian travel from off-site parking prohibited by the School. In addition, as indicated in Topical Response No. 9, following circulation of the Draft EIR, the City installed a traffic signal at the intersection of Whitsett Avenue and Valley Spring Lane. The intersection of Whitsett Avenue and Valley Spring Lane was unsignalized at the time of publication of the Draft EIR. The addition of the traffic signal would allow for pedestrian and bicycle crossings from the surrounding areas to the Project Site through the intersection in marked crosswalks, thus, enhancing pedestrian safety in the Project Site area.

**Comment No. ORG 1B-188**

3. Motorists heading northbound on Whitsett Avenue from Ventura Boulevard to the proposed project – where vehicles can't turn left into the project's north driveway – it is foreseeable that these northbound motorists will likely make a U-turn at the intersection of Whitsett Ave. and Valley Spring Lane to be able to enter the North Driveway. The DEIR does not seem to take that scenario into account.

**Response No. ORG 1B-188**

The comment speculates that motorists may make a U-turn at the intersection of Whitsett Avenue and Valley Spring Lane to enter the Project's north driveway but does not raise any issues with respect to the content or adequacy of the Draft EIR. The preferred driving route to access the Project Site and avoid neighboring residential streets would be communicated to Project Site visitors (refer to page II-53 of Chapter II, *Project Description*). As therein discussed, the preferred driving route would direct motorists to approach the Project Site on southbound Whitsett Avenue from Moorpark Avenue. For everyday users of the Project Site, those heading northbound on Whitsett Avenue would know to turn left at Valleyheart Drive and enter the Project's southern driveway. For those who do not regularly visit the Project Site, such as visitors on a special event day, the appropriate information would be distributed in advance and signage would be placed. It is noted that existing Project Site conditions permit an unassisted left-turn into the Project Site's only vehicular entry and no preferred driving routes are posted or otherwise communicated to visitors. The commenter is also referred to Topical Response No. 9 – Transportation and Parking During Construction and Operations, for a discussion of how traffic and parking on event days would be managed on event days.

**Comment No. ORG 1B-189**

4. The methane gas emitted from the installation of artificial turf, along with the urban heat island effect are significant health (odor and or fumes) and safety (heat) impacts to occupants and the public.

**Response No. ORG 1B-189**

The comment states that artificial turf can result in health and safety impacts to the occupants and the public. See Topical Response No. 7 - Artificial Turf and Effects on Localized Heat and Health. Topical Response No. 7 addresses the potential health-related and urban heat island effects due to the Project's use of artificial turf fields. The Project would replace the existing Project Site uses with new athletic and recreational facilities, including outdoor athletic fields utilizing artificial grass as a sustainable alternative to turf grass, thereby reducing irrigation water demand and avoiding the use of pesticides associated with the turf grass. Section IV.H, *Hazards and Hazardous Materials*, and Appendix H-2, Artificial Turf Technical Memorandum, of the Draft EIR, included a detailed evaluation of potential health impacts related to use of artificial turf. Based on the

analysis, the Draft EIR determined that health-related impacts from inhalation, ingestion, and dermal contact, and heat related would be less than significant.

In addition, pages IV.G-72 through IV.G-74 in Section IV. G, *Greenhouse Gas Emissions*, of the Draft EIR, included an analysis of urban heat island effects from Project implementation. As analyzed therein, the Project's artificial turf would not substantially contribute to an increase in the urban heat island effect for the area. Refer to Topical Response No. 7 for additional detail regarding the Project's heat island-related impacts associated with artificial turf.

### **Comment No. ORG 1B-190**

5. Significant light and noise pollution. Cumulative noise pollution (Crowds, Vehicles, Event generated sounds, Emergency Vehicles from LAFD Station 78 – coupled with the jet-noise impacts from Burbank and Van Nuys airports - is significant.

### **Response No. ORG 1B-190**

The comment states that the Project's light and cumulative noise impacts would be significant. As described on pages IV.K-56 and IV.K-57 in Section IV.K, *Noise*, of the Draft EIR and Table IV.K-20, *Composite Noise Impacts*, of the Draft EIR, the Project's contribution to operational noise resulting from mechanical equipment, athletic activities, special events, parking facilities, off-site improvements at Coldwater Canyon Avenue Riverwalk Path Ramp, and off-site traffic noise would all be less than significant. The composite (combined) noise levels of all operational components would also be less than significant, even under a "worst-case" scenario in which all of the athletic facilities are being used simultaneously along with a concurrent School special event. Therefore, the Project's contribution to operational noise would not be cumulatively considerable and cumulative impacts would be less than significant.

In addition, the Project is not located within two miles of a public airport or private airstrip and is not within the boundaries of an airport land use plan. Therefore, the Project would have no impact with respect to air traffic noise levels and would not expose people residing or working in the Project Site area to excessive noise levels from aircraft. Therefore, the Project would not contribute to any cumulative noise impacts related to airports.

Light and noise generated by emergency vehicles from LAFD Station 78 are existing conditions that would not be a "related project" under the CEQA definition, nor would these existing conditions be considered to contribute to cumulative light and noise impacts. With respect to warning devices on emergency vehicles, which include sirens (emergency vehicle sirens typically come equipped with a public address system), such noise is exempt from the City's Noise Ordinance in Chapter XI, Articles 1, 2, and 4. Specifically, LAMC Section 111.01(j) states that warning devices on emergency vehicles are not regulated as sound-amplifying equipment. LAMC Section 112.04 exempts

powered equipment and operations specifically mentioned and referenced in the City's Noise Ordinance. Section 114.04 exempts warning devices regulated in Article 1 of Chapter 5 of Division 12 of the California Vehicle Code, commencing at Section 27000, which allows authorized emergency vehicles to be equipped with and use sirens. According to the California Code of Regulations, Title 13, Section 1028, the on-axis sound level for a Class A siren is required to be a minimum of 120 dBA measured directly in front of the siren at a distance of approximately 10 feet.<sup>73</sup> At 50 degrees off-axis, the sound level for a Class A siren is required to be a minimum 113 dBA at a distance of approximately 10 feet. Class B sirens are allowed to be 5 dBA less than Class A sirens. The difference between Class A and Class B sirens is the allowable mounting locations on authorized emergency vehicles.<sup>74</sup> At distances of 25 and 50 feet, which are typical distances used for a roadside noise receptor, the 50 degrees off-axis sound level for a Class A siren would be a minimum of approximately 105 dBA and 99 dBA, respectively. The primary purpose of sirens on emergency vehicles is to generate a sound level that is louder than the ambient noise level to effectively alert the public of an approaching emergency vehicle, and in particular, is intended to alert drivers in cars with windows closed, music playing, and/or passengers conversing. The use of sirens in connection with emergency responses would generate a high level of sound along the response routes; however, siren noise would be occasional and short-lived. Sirens would be used in-transit for a very short duration in the vicinity of the Project Site. The noise level of emergency vehicle sirens are well above typical noise levels in the ambient environment and noise levels that would be generated by the Project, such that, due to the logarithmic decibel scale, the Project's noise would not result in an additive noise level increase to emergency vehicle siren noise (i.e., siren noise is at a purposefully elevated level that it would completely mask Project-related noise). Therefore, the Project would not result in a cumulative noise impact from emergency vehicle sirens.

As evaluated in Section IV.A, *Aesthetics*, of the Draft EIR, light and glare impacts would not exceed existing ambient light and glare levels in the off-site area or exceed RIO standards within the Project Site. In addition, the Project's lighting program has been revised to reduce the number of field and tennis court lights. The Supplemental Lighting Report Memorandum is attached as Appendix B to this Final EIR and, as further evaluated in Topical Response No. 4 - Aesthetics, the reduction in lighting would further reduce the Project's light and glare levels. Consistent with the analysis in Section IV.A, light and glare impacts would be less than significant, and as such, would not contribute to cumulative light and glare impacts. Please refer to the specific changes in the number and heights

<sup>73</sup> California Code of Regulations, Title 13, Division 2, Chapter 4, Article 8, Section 1028, [https://govt.westlaw.com/calregs/Document/I0EC464A0D46911DE8879F88E8B0DAAAE?viewType=FullText&originationContext=documenttoc&transitionType=CategoryPageItem&contextData=\(sc.Default\)](https://govt.westlaw.com/calregs/Document/I0EC464A0D46911DE8879F88E8B0DAAAE?viewType=FullText&originationContext=documenttoc&transitionType=CategoryPageItem&contextData=(sc.Default)). <sup>74</sup> California Code of Regulations, Title 13, Division 2, Chapter 4, Article 8, Section 1029, [https://govt.westlaw.com/calregs/Document/IA2353020FA6111DE8C6E96BC63A3F6F5?viewType=FullText&originationContext=documenttoc&transitionType=CategoryPageItem&contextData=\(sc.Default\)](https://govt.westlaw.com/calregs/Document/IA2353020FA6111DE8C6E96BC63A3F6F5?viewType=FullText&originationContext=documenttoc&transitionType=CategoryPageItem&contextData=(sc.Default))

of lights provided in in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

### **Comment No. ORG 1B-191**

Over 40 stadium-lights that are 40' or over in height (many of which are 80' tall) are slated to be added. The DEIR does not seem to account for the glare and light pollution generated by the proposed project.

### **Response No. ORG 1B-191**

The comment states that the Draft EIR does not account for the light and glare impacts of the Project's lights. As evaluated in Section IV.A, *Aesthetics*, of the Draft EIR, light and glare impacts would not exceed existing ambient light and glare levels in the off-site area or exceed RIO standards within the Project Site. In addition, the Project's lighting program has been revised to reduce the number of field and tennis court lights. The revised Lighting Study is attached as Appendix B to this Final EIR and, as further evaluated in Topical Response No. 4 - *Aesthetics*, the reduction in lighting would further reduce the Project's light and glare levels. Consistent with the analysis in Section IV.A, light and glare impacts would be less than significant, and as such, would not contribute to cumulative light and glare impacts. Please refer to the specific changes in the number and heights of lights provided in in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

### **Comment No. ORG 1B-192**

6. Per IV. Environmental Impact Analysis; L.1 Public Services – Fire Protection... As noted herein but worth repeating. As part of the Project design and per Project Design Feature TRAF-PDF-2, a flashing red warning light is proposed to be installed at the Project-facing side of the southern exit driveway within the Project Site at a point located before vehicles reach Valleyheart Drive that purports to “hold back” vehicles exiting the Project Site onto Valleyheart Drive. This warning light is proposed to be activated by a remote control button pressed by LAFD staff in the emergency vehicle when an emergency vehicle is approaching / or departing Valleyheart Drive / Whitsett Avenue or exiting one of the LAFD driveways on Valleyheart Drive. The warning light will purportedly reduce conflicts between vehicles leaving (but not entering) the Project Site and emergency vehicles leaving/coming back to the station. Also, the Project would include an at-grade security kiosk located near the roundabout, thereby placing a security guard nearby to assist with traffic management when the warning light is activated.

***The proposed red flashing light solution is not nearly enough... More and other options are needed to address the impacts to the Public Safety relative to the impacts of the construction and proposed project to the LAFD Station 78.***

**The DEIR even suggests that LAFD Station 78 may need to be RELOCATED resulting from the proposed project** (see Section L-1 Los Angeles Fire Department Correspondence, Fire Protection)

***LAFD Fire Station was built in 2004 – it would be a tremendous burden to now (because of the proposed project) resort to relocating an 18 year-old LAFD Station 78.***

**Manual operated safety systems, such as those proposed, are subject to human error.**

## **Response No. ORG 1B-192**

The comment states that Project Design Feature TRAF-PDF-2 is inadequate to address impacts to public safety on LAFD Fire Station 78 and suggests that LAFD Fire Station 78 may need to be moved to ensure safety. The commenter is referred to Topical Response No. 10 – Emergency Access, for a discussion of the Project’s effects to operations at LAFD Fire Station 78.

As discussed in on page IV.L.1-28 Section IV.L.1, *Fire Protection*, of the Draft EIR, the letter received by the LAFD in response to ESA’s request for information in the preparation of the Draft EIR, stated that the development of the Project and related projects in the immediate area may result in the need for increased staffing for existing facilities, additional fire protection facilities, and relocation of present fire protection facilities. The comment letter, which is provided in Appendix L.1 of the Draft EIR is the standard language (form letter) used by the LAFD in the request for information for all EIRs for projects throughout the City of Los Angeles and is not specific to LAFD Fire Station 78. Note also that, on page IV.L.1-28, the Draft EIR states: “However, as previously discussed, the LAFD continuously evaluates fire station placement and overall service capabilities as part of its obligation to provide fire services throughout the City. Currently, the LAFD has no plans to expand or construct new facilities to service the Project Site vicinity.”

Regarding emergency access, the main driveway for LAFD Fire Station 78 used for the departure of fire trucks during all fire emergencies, or emergencies requiring the use of a fire truck, is located on Whitsett Avenue at the north side of the station building. Fire trucks and engines do not use Valleyheart Drive for departure in an emergency situation. The south side of the station has two driveways to Valleyheart Drive. The western such driveway is only used for returning heavy fire equipment (e.g., fire truck), allowing the truck to pull back into the fire station bay and be ready to exit directly onto Whitsett. The eastern such driveway is used for the ingress and egress of lighter-duty fire equipment, such as ambulances. The manual switch for the red light would only be operated by LAFD personnel. The switch would signal vehicles departing the Project Site to hold back when fire trucks are returning to the station and have need to turn wide on Valleyheart Drive in order to enter the fire station, or for smaller emergency vehicles entering and exiting the eastern fire station driveway on Valleyheart Drive. The manual switch is only

a secondary cautionary measure since vehicles leaving the Project Site, and returning fire trucks, which enter the fire station slowly would be in full view of each other. No additional devices to reduce conflict between returning fire trucks and exiting cars would be required. In addition, Valleyheart Drive is two lanes and, if not for the wide-turning fire trucks and engines, would not result in a conflict in two-way use. Since the Project would not affect emergency vehicles leaving the station, it would not result in a public safety hazard.

### **Comment No. ORG 1B-193**

7. In addition to the excessive stadium lighting issue (see item No. 5 above) the existing street lighting on Whitsett Ave. is particularly not suitable for the increased pedestrian traffic that would be generated by the proposed project. Potential mitigation of this hazard would be to eliminate events or day-time only usage of the site.

### **Response No. ORG 1B-193**

The comment states that existing street lighting on Whitsett Avenue is not suitable for increased pedestrian traffic generated by the Project. All City regulations regarding field and pedestrian lighting will be followed. Because this comment does not raise a substantive issue on the adequacy of the Draft EIR, no further response is necessary.

### **Comment No. ORG 1B-194**

8. Given the proximity of the proposed tennis courts to Valley Spring, not only will there be noise pollution from the tennis players but also a risk of errant tennis balls entering the roadway. There is a potential for errant sports related equipment to enter Whitsett from Field A as well.

### **Response No. ORG 1B-194**

The comment states that noise from the tennis courts would increase noise pollution and that there could be errant tennis balls or other sports equipment from Field A entering the roadway. The comment contains no evidence to support the characterization of Project noise or hazards from errant tennis balls. Noise from the tennis courts was evaluated in Section IV.K, *Noise*, of the Draft EIR. As discussed on pages IV.K-27 and IV.K-28, and IV.K-45 through IV.K-49, Table IV.K-12, *Athletic Activities Noise Levels*, Leq Analysis, and Table IV.K-13, *Athletic Activities Noise Levels, L10 Analysis*, activities at the tennis courts would not exceed the significance threshold for operational noise. In addition, the Project Site currently has 16 courts along Whitsett Avenue that are open until 10:00 P.M. daily, compared to the Project which would have 8 courts closing at 9:00 P.M. daily. The potential for errant tennis balls has not been described as an environmental hazard under existing conditions, even though existing tennis courts are proximate to Whitsett Avenue which, according to Mobility Plan 2035, is considered a Major Highway Class II. In

addition, fencing along the Project Site's Valley Spring Lane and Whitsett Avenue frontages would reduce the potential for sports equipment to be lost in these streets.

## Comment No. ORG 1B-195

### **9. Liquefaction issue and the proposed construction of the subterranean garage, and sports facilities at the southern edge of the property near the LA River channel wall:**

Prior to the construction of LAFD Station 78 that was built in 2008, the Geotechnical Engineering Division (GED) commissioned URS Corporation (URS) to perform subsurface exploration at the site and laboratory testing of samples collected from the site.

The URS 2004 report Conclusions and Recommendations section states:

“Liquefaction-induced settlements and lateral spreading were evaluated for the proposed Fire Station #78. For a design seismic event with a probability of occurrence of 10% in 50 years (PGA=0.53g), we estimate that liquefaction-induced settlements would be about 2 inches. For such an event, **lateral spreading would produce ground displacements of up to 8 inches in a zone extending about 125 feet behind the channel wall**, with displacements being greatest immediately behind the wall. Attenuating with increasing distance from the wall, horizontal ground displacements are expected to approach zero at the edge of the 125-foot wide zone affected by lateral spreading. With the proposed building footprint being located just outside this zone, the building foundations are not subjected to shaking-induced lateral spreading”

“Because the site is underlain by loose soils to depths of up to 15 feet, and **because there is a potential for liquefaction-induced settlements from saturated loose sands at depth, we recommend that the building be supported on piles**. In addition to supporting the building loads, **the piles will have to be designed to accommodate negative skin friction caused by liquefaction-induced settlement** of the loose sands at depth.”

The subject DEIR recommends a mat foundation system (not piles), but what remains unclear is how close the proposed planned development is to the LA River channel wall and if any development (including underground) is within that 125 feet zone from the northern wall of the River channel.

According to the URS 2004 report, anything within the 125-foot zone, which would also be “40 feet north of the northern right of way of Valleyheart Drive” would be “susceptible to distress as the result of lateral movement.” ***It appears that the proposed improvements would be susceptible to distress and therefore unsafe for occupants and the general public given the proximity of the***

**proposed project to a vital storm drain system (LA River). This aspect of the proposed project does not appear to have been thoroughly analyzed.**

**Response No. ORG 1B-195**

The comment states that Project facilities could be susceptible to liquefaction and therefore unsafe and that the Draft EIR does not thoroughly analyze this issue. The Draft EIR addresses liquefaction and other geotechnical issues in Section IV.F, *Geology and Soils*, and in Appendix G-1, Preliminary Geotechnical Report, of the Draft EIR. In addition to the analysis in Appendix G-1, pages IV.F-13 and IV.F-14 and IV.F-23 through IV.F-25 of the Draft EIR discuss the potential for liquefaction at the Project Site and the preliminary recommendations for construction to reduce the potential seismically-induced liquefaction. Regarding liquefaction in general, the area of weakness or failure during liquefaction or lateral spread occurs along a “free face.” During lateral spread, blocks of mostly intact, surficial soil displace downslope or toward a free face along a shear zone (the point of ground failure) that has formed within the liquefied sediment. At the Project Site, the free face would correspond to the embankment of the Los Angeles River.

According to established understanding of liquefaction, when saturated cohesionless sediments and soils reach a specific level of movement, the soils lose resistance and begin to collapse. The force at which this would occur at the Project Site is estimated to be  $N1\ 60$  (values greater than 15). Under this criterion, significant displacement is not likely for earthquakes with a magnitude (MW) of less than 8.0.

According to the USGS, the modal predominant MW for the Project Site is 6.9, which is substantially less than 8.0 under which ground failure is anticipated. In addition, the potentially liquefiable layer consists of a stratified layer that is variable and discontinuous throughout the Project Site. Because of the discontinuous and variable stratification with differing depths of soils and bedrock layers, ground failure would not occur uniformly or extensively throughout the Project Site. Based on these considerations, the potential for lateral spreading and liquefaction is considered to be remote for the Project Site.

Additionally, the upper 15 feet strata within the footprint of the proposed structures (gymnasium and subterranean parking garage) will not be subject to lateral spreading, as this would be removed for the construction of the subterranean component or would be completely removed and recompacted for at-grade structures pursuant to the Preliminary Geotechnical Report, as modified, if at all, by the Final Geotechnical Report required by the City. Thus, the structures are not considered subject to distress due to lateral spreading. Based on all of the above, the Draft EIR appropriately concluded that the Project would not exacerbate conditions related to seismic-related ground failure, including liquefaction, and that the risk of loss, injury or death including seismic-related ground failure, including liquefaction, would be less than significant.

### **Comment No. ORG 1B-196**

If you have any questions with the content of this document, please contact the undersigned at (310) 306-3877. This report is subject to further amendments subsequent to receipt of any new additional documents.

### **Response No. ORG 1B-196**

The comment provides basic contact information and states that the report is subject to further amendments. However, no additional amendments have been received by the City subsequent to the closing of the EIR review period on May 10, 2022. The comment does not discuss the adequacy of the Draft EIR. As such, no further response is necessary.

### **Comment No. ORG 1B-197**

#### **Attachment 6 (Los Angeles Times Article)**

### **Response No. ORG 1B-197**

A Los Angeles Times article is provided as an attachment. However, the article does not include comments on the Draft EIR. Refer to Appendix A of this Final EIR for a copy of this article.

## **Comment Letter No. ORG 1C**

Kim Tashman, President  
Save Weddington  
Received May 10, 2022

### **Comment No. ORG 1C-1**

Save Weddington is a neighborhood non-profit group whose mission is to preserve and protect the last 16 acres of unprotected green open space along the Los Angeles River in the San Fernando Valley at Weddington Golf & Tennis as recreational space available for public use and enjoyment.

Save Weddington submits the following comments on the proposed Project. In addition, we are submitting as part of this letter two independent expert reports: air quality/greenhouse gases and safety.

We are also attaching a copy of our online petition, wherein nearly 14,000 citizens voice both their support for the preservation of the entire 16-acre Weddington Golf & Tennis parcel and concern over the proposed Project's negative impact to precious green open space.

The Draft Environmental Impact Report (DEIR) does not consider the impact of providing so many exceptions and variances to City building codes and limits for this Project, nor the precedential effect that approval of this Project would have on future development.

We continue to have serious concerns about the negative impact of this Project in regards to Aesthetics, Air Quality, Biological Resources, Construction and Operational Noise, Land Use Compatibility, Lighting, Safety, and Traffic hazards created by the Project.

Finally, please note that more than 14,000 community members have signed a petition supporting the preservation of the 16-acre Weddington property in its entirety. The community urges you to reject the DEIR's inaccurate and incomplete picture of potential environmental impacts, as well as deny approval of the required Condition Use Permit and certification of the DEIR.

Thank you for your time and consideration of this most important matter.

### **Response No. ORG 1C-1**

The comment introduces Save Weddington as a non-profit group whose mission is to preserve the 16-acre Weddington Golf and Tennis site. In addition to general concerns on the impacts evaluated in the Draft EIR, the comment references two attached reports, an air quality/greenhouse gas report and a safety report. The comment also references a 14,000-signature online petition which supports preservation of the entire Weddington Golf and Tennis facility. To note, the petition included as an attachment to this letter is in opposition to the ramp at Coldwater Canyon connecting to the Zev Greenway, and

includes far less than 14,000 signatures. The petition opposing the ramp is provided as an attachment to the original letter (Letter 1C) in Appendix A of this Final EIR. The comment contends that the Draft EIR does not consider the impact of the Project’s requested permits and approvals. The comment further expresses concern regarding impacts related to Aesthetics, Air Quality, Biological Resources, Construction and Operational Noise, Land Use Compatibility, Lighting, Safety, and Traffic hazards.

As this is an introductory comment that does not contain substantial evidence regarding the adequacy of the Draft EIR, no further response is necessary. However, this comment is noted for the record and will be forwarded to the decision-makers for their review and consideration.

The comment is a table of contents related to issues raised in the comment letter. This comment does not raise any issues with respect to the content or adequacy of the Draft EIR. Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

## Comment No. ORG 1C-3

### 1. Air Quality and Air Pollution Impacts (Excavation, Construction, and Operational)

A report was performed by Soil/Water/Air Protection Enterprise (SWAPE) regarding the Project's air quality, health risk, and greenhouse gas (GHG) impacts (Attachment 1). The SWAPE report finds that "the DEIR underestimates the Project's construction-related emissions and should not be relied upon to determine Project significance." The report also finds that "several model inputs were not consistent with information disclosed in the DEIR." These include overestimated existing land use size, unsubstantiated changes to individual construction phase lengths, unsubstantiated numbers of vendor trips, incorrect CO2 intensity factors, and incorrect application of construction-related mitigation measures. In addition, the report finds that diesel particulate matter health risk emissions were inadequately evaluated with no quantified construction or operational health risk analysis (HRA). The report also finds that the DEIR fails to adequately evaluate GHG impacts (e.g., incorrect and unsubstantiated quantitative analysis of emissions, failure to identify a potentially significant GHG impact, project design features should be incorporated as mitigation measures, failure to consider performance-based standards under CARB's 2017 scoping plan, and failure to consider performance-based standards under SCAG's RTP/SCS). Additional considerations and recommendations for inclusion in a recirculated DEIR (RDEIR) can be found in the SWAPE report (Attachment 1).

## Response No. ORG 1C-3

This comment raises concerns regarding the air quality analysis based on issues identified in the SWAPE Report, including underestimation of the Project's construction-related emissions, incorrect model inputs, and incorrect application of mitigation measures in the Draft EIR. Refer to Response Nos. ORG 1B-36 through ORG 1B-40 which address these concerns.

The comment states that diesel particulate matter health risk emissions were inadequately evaluated with no quantified construction or operational health risk analysis (HRA). Please refer to Response Nos. ORG 1B-77 to ORG 1B-79 which address this concern.

The comment states that the Draft EIR fails to adequately evaluate GHG impacts (e.g., incorrect and unsubstantiated quantitative analysis of emissions, failure to identify a potentially significant GHG impact, project design features should be incorporated as

mitigation measures, failure to consider performance-based standards under CARB's 2017 scoping plan, and failure to consider performance-based standards under SCAG's RTP/SCS). Please refer to Response Nos. ORG 1B-129 to ORG 1B-134 which address this concern.

In addition, all issues identified in the SWAPE Report, which is also provided as Attachment 1 to Comment Letter No. ORG 1B, have been previously responded to in Response Nos. ORG 1B-115 through ORG 1B-137.

As discussed in the responses to comments listed above, none of the issues raised in this comment are supported by substantial evidence demonstrating that the Draft EIR is inadequate as all potential air quality and greenhouse gas emissions impacts have been properly analyzed and disclosed in the Draft EIR. Therefore, a recirculated Draft EIR to address concerns raised in this comment is not necessary.

## **Comment No. ORG 1C-4**

### **2. Noise Pollution Impacts (Construction and Operational)**

Excess noise, like that proposed as part of the Project is widely-known to have adverse health impacts in humans, including increased blood pressure and is associated with an increased risk of developing cardiovascular disease, hypertension, stress, sleep disturbances, among other adverse effects. Noise also has adverse impacts on wildlife (e.g., communication interference for songbirds, prey species becoming distracted, etc.) and the DEIR fails to analyze how these impacts to wildlife from increased noise may be reduced to a non-significant level. The DEIR fails to acknowledge these impacts of noise on human or animal health and consider them when determining mitigation measures. A recirculated DEIR (RDEIR) must include this information.

### **Response No. ORG 1C-4**

The comment expresses the concern that the Project's noise impacts would have adverse human health and wildlife effects. Please refer to Response Nos. ORG 7A-109, ORG 7A-110, ORG 7A-114, and ORG 7A-115 which address the human health concerns listed in the comment.

With regard to noise impacts on wildlife, as discussed in Section IV.C, *Biological Resources*, of the Draft EIR, the Project's indirect impacts to wildlife species from noise generated by construction and operation of the Project would be less than significant. See pages IV.C-40, IV.C-41 for a discussion of indirect noise impacts to sensitive wildlife species, and IV.C-48 for a discussion of such impacts to wildlife movement and nesting birds. As stated therein, indirect impacts associated with a change in the on-site operational noise and human activities would be similar to existing conditions with the potential for more noise and human activities during sports events. If present on-site, wildlife species are already adapted to living in an urbanized setting and ambient noise and human activities associated with frequent use of the golf and tennis facilities on-site, nearby

single-family and multi-family residences, and the dense commercial corridor located less than 500 feet away on Ventura Boulevard. Increases in noise and human activities would be concentrated around outdoor athletic activities within the fields, tennis courts, and swimming pool, which do not contain vegetation or have suitable roosting habitat for the special-status bats, and larger sporting events would be limited to specific hours, as well as limited in duration. A change in the on-site operational noise levels and associated human activities would be low and would not diminish the chances for long-term survival or significantly impact wildlife species.

Based on the above, a recirculated Draft EIR to address concerns raised in this comment is not necessary.

### **Comment No. ORG 1C-5**

The DEIR does offer a sound study, but one that merely predicts Project noise generated will be similar to other sport venues, but not how drastically the noise level will increase from what it is now in this residential neighborhood, with some homes as close as 45 feet away.

The DEIR is incomplete as it also fails to accurately identify what noise impacts are avoidable. Several proposals to avoid or minimize construction and operational noise pollution impacts exist (e.g., type of public address (PA) system used, speaker locations, etc.). However, the DEIR does not provide adequate data regarding:

- No public address (PA) system
- No games or scrimmages
- No spectators

### **Response No. ORG 1C-5**

The comment expresses concern that the Project's Noise Study did not adequately analyze impacts to the adjacent residential uses and the increase to existing ambient noise levels. Contrary to the comment, the noise analysis analyzed the Project's construction and operational noise levels based on ambient noise measurements conducted around the Project Site, including at the adjacent residential uses. The noise level differences between the existing ambient levels and the Project noise levels were identified and included in Section IV.K, *Noise*, of the Draft EIR. The Project's use of an amplified sound system is included in Project Design Feature NOI-PDF-2 on page IV.K-39 of the Draft EIR. Also, the analysis of operational noise impacts included athletic activities, with spectators, is discussed on pages IV.K-27 and IV.K-28 of the Draft EIR. Acceptable noise levels from athletic activities are shown in Figure IV.K-2, *Guidelines for Compatible Land Use*, on page IV.K-12 of the Draft EIR. Furthermore, Table IV.K-20, *Composite Noise Impacts*, on page IV.K-57 of the Draft EIR includes composite noise levels from all maximum daily activities occurring on the Project Site. The commenter is referred to Topical Response No. 8 – Noise: Construction and Operation Impacts, for

additional discussion of the Project's construction and operational noise impacts. In addition, please refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, and Topical Response No. 2 – Modifications to the Project Design, of the Final EIR which describes the changes to the seating capacity and the size of the pool canopy, and Topical Response No. 8 – Noise: Construction and Operation Impacts, of the Final EIR which provides updates to the Project's noise levels due to design modifications. As discussed in Topical Response No. 8 and shown in the Supplemental Noise Analysis included in Appendix F of this Final EIR, the design modifications would not create significant new noise impacts associated with the parking and traffic, use of athletic fields, use of the swimming pool, combined use of all athletic facilities, or composite operational noise. Therefore, similar to the Project without design modifications, the Project with design modifications would result in less than significant operational noise impacts. As the Draft EIR appropriately concluded that the Project would not result in any significant noise impacts from Project operation, mitigation steps, such as those referenced by the commenter, some of which would prohibit the use of the Project Site for School athletic activities, are not necessary.

### **Comment No. ORG 1C-6**

The community is extremely unconvinced that the Applicant will be able to preserve the tranquility (and related noise levels) of the existing site, as was pledged by Councilmember Krekorian in his 2017 letter announcing the Applicant's purchase of the Project Site (Attachment 2). More specifically, the letter indicated that "the school has also acknowledged that it will respect the community's desires by maintaining the tranquility of the property." The Project's proposed components are simply not in compliance with this notion that was promised to the community. Transitioning from a site that is predominantly comprised of a 9-hole golf course to a private school sports complex that offers different, louder sports (e.g., football, soccer, lacrosse, swimming) will not be able to satisfy the commitment of the Applicant conveyed by Councilmember Krekorian.

### **Response No. ORG 1C-6**

This comment references a public update from Councilmember Paul Krekorian and describes the commenter's perceived opinions of the community regarding the intention of the School in the development of the Project Site. This comment is unrelated to the environmental review for the Project and does not raise any issues with respect to the content or adequacy of the Draft EIR. Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

### **Comment No. ORG 1C-7**

In fact, the issue of noise and noise mitigation on the Applicant's existing upper school campus was raised during the Applicant's previous proposed failed development plan (ENV-2013-0150- EIR). A study at the Applicant's upper school campus by Veneklasen Associates found that even though the Applicant was attempting to expand its facilities, which would obviously add to the cumulative noise impact, the Applicant did not even

comply with its existing Conditional Use Permit (CUP), with its current field generating noise in excess of the LAMC and Noise Ordinance (Attachment 3). What is to say this won't happen again at the Project's proposed facilities? In a recirculated DEIR (RDEIR), the Lead Agency must study this occurrence in greater detail before the potential approval or issuance of a CUP.

### **Response No. ORG 1C-7**

The comment expresses the belief that noise levels at the School's existing Upper School campus field have exceeded LAMC noise standards, and that the same conditions would occur at the Project Site. The existing physical conditions at the Upper School campus are not applicable to the Project or Project Site. Noise levels will be enforced by site-specific CUP conditions at the Project Site. As such, a recirculated Draft EIR to address concerns raised in this comment is not necessary.

### **Comment No. ORG 1C-8**

Finally, cumulative noise impacts must include jet noise from altered Federal Aviation Administration (FAA) flight paths and flights that originate from Hollywood Burbank Airport. Numerous lawsuits have been filed and resolution of this issue is ongoing. The Project site is also very close to the Santa Monica Mountains and Foothills, where jet noise is amplified by canyons and hillsides.

### **Response No. ORG 1C-8**

This comment states that aircraft noise should be accounted for in the cumulative noise impact analysis. With regard to (cumulative) noise impacts for jet noise, as stated on page IV.K-69, of the Draft EIR, the nearest airport is the Hollywood Burbank Airport (BUR), located approximately 4.5 miles northeast of the Project Site. Additionally, the Project Site is not located within two miles of a public airport or private airstrip and is not within the boundaries of an airport land use plan and, therefore, would not expose people residing or working in the Project Site area to excessive noise levels for a project within the vicinity of a public use airport or private airstrip. Furthermore, ambient noise measurements were taken as part of the noise analysis in the Draft EIR. The aircraft noise from relocated flight paths from BUR and Van Nuys Airport (VNY) were included in the existing conditions noise measurements. Thus, the existing airports' jet noise was included as part of the ambient noise in the Project vicinity. Intermittent aircraft noise is common throughout the City; however, such temporary noise instances would not materially change the cumulative noise impact analysis as aircraft noise is already included within the existing baseline conditions. Furthermore, the Project would not exacerbate any existing noise issues that the community may have with airport noise; therefore, no additional analysis of the existing noise sources is required by CEQA.

## Comment No. ORG 1C-9

### 3. Lighting and Light Pollution Impacts

Lighting impacts as a result of the Project will be noticeable and significant for the entire community. A majority of the existing Weddington Golf & Tennis site (the 9-hole golf course) is not lit past sundown at night and an increase in illumination of any magnitude will be severe and significant. A lighted gymnasium, two lighted fields, and eight lighted tennis courts, among other lighted Project components, where there is now almost complete darkness will be a significant shock to both the local community and wildlife.

### Response No. ORG 1C-9

The commenter states that the Project's lighting impacts would be significant compared to existing conditions. See Topical Response No. 4 – Aesthetics, regarding the impact of the Project's field lights and other outdoor lighting on surrounding land uses. As evaluated in the Draft EIR, the Project's new lighting system would provide less light intrusion into neighboring sites than the existing Project Site lighting. Further, the Project's outdoor lighting would be in use from dusk to no later than 8:00 p.m. daily (9:00 p.m. for the tennis courts). Field lights would not be used on a daily basis. Existing tennis court lights are kept on up to 10:00 p.m. and lighting for the driving range may extend to 11:00 p.m. Because of the lighting technology for the Project's field and tennis court lights, as well as the reduced hours in which outdoor lighting would be in use compared to existing conditions, the Project's overall off-site light and glare levels and duration would be less than under existing conditions.

In addition, please refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, and Topical Response No. 2 - Modifications to the Project Design, which provides updates to the Project's light poles. The Project's lighting program has been revised to reduce the number of field, pool and tennis court lights. A Supplemental Lighting Report Memorandum analyzing the modified lighting program is attached as Appendix B to this Final EIR. As further discussed in Topical Response No. 4 – Aesthetics, similar to the Project's original lighting layout, the revised design reflects tighter control of on-site light sources and yields a significant reduction in off-site glare, reducing the lighting impacts that the surrounding neighborhoods would experience. Therefore, similar to the Project without design modifications, the Project with design modifications would result in less than significant light and glare impacts.

In addition, Section IV.C, *Biological Resources*, pages IV.C-32, IV.C-40 and IV.C-41 of the Draft EIR provided a detailed discussion of the impact of the Project's light levels on wildlife. As evaluated therein, on-site light and glare levels would not adversely impact wildlife.

**Comment No. ORG 1C-10**

Lighting impacts will impact the Western Yellow Bat, among other species. The DEIR reads, “If present on-site, the special-status bat species are already adapted to living in an urbanized setting with the existing night lighting on-site, as well as from the adjacent residential and commercial areas and traffic along roads.” This statement negates the fact that the bats are not currently faced with human activity on the golf course past nightfall. So, the bats may be accustomed to surrounding neighborhood streetlights and car headlights, but they are not used to any light emanating from light poles on the golf course, like those that are being proposed in the Project.

**Response No. ORG 1C-10**

This comment raises concerns about lighting impacts to bats, among other species, from Project lighting. Please refer to Response No.ORG 10-5 which addresses this concern. As discussed therein, indirect impacts from Project lighting during Project operation would not diminish long-term survival of roosting bat species and, therefore, would not be significant.

**Comment No. ORG 1C-11**

The DEIR admits that “the illumination of the new Project site would produce more footcandles on the athletic facilities than the lighting of the existing Weddington Golf & Tennis facility” and “this would make the Project site’s surfaces more prominent at night than the previous facility, as the athletic fields will be brighter.” This is absolutely true, given the fact that there is no light whatsoever on a large portion of the Project site as a 9-hole golf course. Furthermore, the Project proposes security lighting, which indicates there will be some level of light on the Project site 24 hours a day, which is in stark contrast to the existing Weddington Golf & Tennis site. Finally, variances for 80 foot light poles cannot be approved without significant detrimental impacts to the surrounding community and therefore, any of the Project’s proposed light poles must remain at the same height of existing light poles at Weddington Golf & Tennis.

The DEIR then continues to explain that because the target plane would be at ground level, which is perpendicular to views from tested receptor locations, views of the illuminated surfaces would be limited. However, it is mentioned that “the residential neighborhood on the hill above Ventura Boulevard has a more direct view of the facilities, unobstructed by landscape or architecture, from which to observe the “glow” of the Project site.” Many of these community members already experience the “glow” from Ventura Boulevard and would consider additional “glow” from the proposed Project to be a cumulative significant impact.

**Response No. ORG 1C-11**

The comment expresses concern that light impacts would increase over existing conditions. The comment also cites excerpts from the Project’s Lighting Report in

Appendix B of the Draft EIR, but does not provide the prior or following corresponding text which provide context to the quoted statements on page 34 of the Lighting Report (PDF page 36 of 46 in Appendix B of the Draft EIR). The general analysis discussed in the Lighting Report indicates that the light focused on the fields may be brighter, but the Project's lighting program would reduce the lighting effects being experienced at the adjacent properties. The commenter is referred to Topical Response No. 4 – Aesthetics, for a discussion regarding operational light and glare impacts, including the conditions that would require lights and outdoor activities cease no later than 8:00 p.m. (9:00 p.m. for the tennis courts), as compared to existing uses which, daily, extend until 11:00 p.m. Also, as discussed in Topical Response No. 4, the Project's lighting program would reduce the Project Site's existing ambient light and glare conditions as compared to existing conditions. Thus, there would not be additional "glow" from the Project Site, in fact, there would be a reduced extent and duration of visible light or "glow" compared to existing conditions.

In addition, refer to Response No. ORG 1C-9 which discusses the design modifications related to the Project's lighting program. Similar to the Project without design modifications, the Project with design modifications would result in less than significant light and glare impacts.

### **Comment No. ORG 1C-12**

In a July 15, 2019 Los Angeles Times article titled "Harvard-Westlake Releases First Draft for New Athletic Facilities on 16-Acre Site in Studio City,"<sup>1</sup> a Harvard-Westlake School spokesperson said that the Project "is entirely about increasing the capacity of our athletic facilities so we can get kids home earlier." If that is still a primary goal of the School with the Project, no lights on the Project site would compel practices and activities to end earlier so that students can leave school and arrive home earlier. Therefore, we believe there should be no more light than that which presently exists on the Project site.

<sup>1</sup> Available at: <https://www.latimes.com/sports/highschool/varsity-times/la-sp-vti-harvard-westlake-athletic-facilities-20190715-story.html>

### **Response No. ORG 1C-12**

The comment states that there should be no more light than that which presently exists on the Project Site. Refer to Response No. ORG 1C-11, which indicates the Project's lighting program would reduce the Project Site's existing ambient light and glare conditions as compared to existing conditions.

### **Comment No. ORG 1C-13**

The DEIR analysis also does not take into consideration the reflectivity of turf, which has been shown to be about 55% when light is shown directly downwards on turf. However, with slightly different light positioning (60° angle), only 12% of the light is reflected upward. This reflection creates light spillover and glare conditions around the Project site that will

be bright enough to affect both human and animal health. Research has shown that in regions with high light pollution, both humans and other animals experience a suppression of the melatonin hormone, which impacts circadian rhythms. There also appears to be a correlation to outdoor lighting and cancer rates in humans. In birds, specifically, increased illumination can change bird behavior such that normal singing times are altered.

### **Response No. ORG 1C-13**

The comment expresses concern over reflected light from the turf field and the effects that this light pollution would have on human and animal health. The statistics about turf light reflection in this comment are not supported by any substantive facts. It is noted, however, that reflected light (shine) was a characteristic of the first generations of synthetic grass (i.e., Astro turf). The former Astro turf had broader and more continuous surface areas to reflect light. However, because of yarn engineering currently implemented in the production of artificial turf, contemporary synthetic grass minimizes light reflection by using thin blades that produce very little, if any, shine from any angle, even under intense sun conditions. Furthermore, the blades are often extruded in a corrugated design, with a series of parallel concaves, which also serve to lower reflectivity levels. By minimizing surface areas on each blade, reflection is minimal.<sup>75</sup>

Moreover, as discussed in Topical Response No. 4 – Aesthetics, the Project’s lighting program would reduce the Project Site’s existing ambient light and glare conditions as compared to existing conditions. The Project’s outdoor lighting would be in use from dusk to no later than 8:00 p.m. daily (9:00 p.m. for the tennis courts). Field lights would not be used on a daily basis. In comparison, the existing tennis court lights are kept on up to 10:00 p.m. and lighting for the driving range may extend to 11:00 p.m. It is also noted that views and line of sight between the residential neighborhood along Valley Spring Lane of the turf fields would largely be blocked by landscaping, walls, fencing, and trees along the Project Site’s north edges. As such, high light pollution is not expected to occur as a result of the Project. See also Response Nos. ORG 1C-9 and ORG 1C-10 which address lighting impacts to birds/wildlife.

### **Comment No. ORG 1C-14**

Finally, although we would have commented on lighting designs, including photometric calculation reports, plot maps, and cut sheets, the DEIR Appendix B. Lighting Report does not seem to include the Appendix 2 that was referenced in the Appendix B. Lighting Report. A recirculated DEIR (RDEIR) needs to include all materials (including all appendices of appendices).

<sup>75</sup> D.A. Devitt, M.H. Young, M. Baghzouz and B.M. Bird, *Journal of Turfgrass and Sports Surfaces Science, Vol. 83, Surface Temperatures, Heat Loading, and Spectral Reflectance of Artificial Turfgrass* (2007).

## Response No. ORG 1C-14

The comment correctly indicates that Appendix 2 of the Studio K1 Lighting Report (Appendix B) was not provided in the Draft EIR. Appendix 2 includes materials such as datasheets on contemplated light fixtures components and lighting modeling sheets. However, similar light fixture information was included in Section 8 of the Lighting Report and Figures 8 and 9 of the Lighting Report illustrate the composite lighting levels resulting from the Project, which are the basis of the Draft EIR lighting impact conclusions. As such, the technical materials in Appendix 2 do not add “significant” new information in that: 1) the materials included in Appendix 2 do not change the figures, analysis or conclusions in the Draft EIR; 2) the Project’s composite lighting levels were illustrated and discussed in the Draft EIR, which allowed the public meaningful opportunity to review and comment upon the effects of the Project; and 3) no new or substantial increase in the severity of impacts would occur from this information. For these reasons, recirculation of the Draft EIR is not necessary. However, for clarification, Appendix 2 of the Studio K1 Lighting Report has been included as Appendix B.3 of this Final EIR. Appendix B.2 of this Final EIR includes appendices to the Supplemental Lighting Report, which reflects lighting associated with the Project with design modifications.

## Comment No. ORG 1C-15

### 4. Traffic Impacts and Calculations

The DEIR is defective because the baseline condition was never measured, but rather, modeled using pre-COVID data. All other calculations stem from that original modeled baseline. This is a serious problem and therefore, these calculations need to be nullified, since they would not take into account any changes in traffic patterns, populations, usage, or developments during the period from April 2019 to the present.

In addition, in the DEIR, historical Los Angeles Department of Transportation (LADOT) traffic counts from 2017 were used for Intersections 4 (Coldwater Canyon Avenue and Moorpark Street) and 5 (Coldwater Canyon Avenue and Ventura Boulevard). However, these counts in 2017 would have been analyzing traffic flows before construction for the Sportsman's Landing development began (2019) or was completed (2021), which severely compromises additional analyses. A recirculated DEIR (RDEIR) must perform traffic analyses using accurate baseline data, as well as data that incorporate the significant impact of cumulative projects on local traffic.

## Response No. ORG 1C-15

The comment expresses the concern that the traffic counts do not represent actual baseline conditions. The methodology to establish the 2020 baseline conditions was reviewed and approved by LADOT, which confirmed the calculations were appropriate for use in the Project’s Transportation Assessment. The methodology for the traffic counts is discussed on pages 28 (PDF page 56 of 217), 42 (PDF page 60 of 217) and 43 (PDF page 61 of 217) of the Transportation Assessment included in Appendix M of the

Draft EIR. As explained therein, traffic counts were collected in April 2019 at three study area intersections at the time. For the other two study area intersections that were not counted at that time, it was appropriate to use measured counts from 2017 with an added ambient growth factor at two intersections since counts in 2020 would not reflect actual conditions due to the COVID-19 pandemic, which resulted in a significant decrease in typical traffic conditions. In addition, refer to Topical Response No. 12, Related Projects: Adequacy of Cumulative Mobile Source Noise and Traffic Analyses, for additional discussion on the adequacy of the cumulative traffic analyses, which conservatively analyzed traffic impacts in consideration of the related projects at Sportsmen's Lodge.

The commenter is also referred to Topical Response No. 9 – Transportation and Parking During Construction and Operations, for additional discussion of transportation-related impacts included in the Draft EIR.

Based on the above, a recirculated Draft EIR to address concerns raised in this comment is not necessary.

### **Comment No. ORG 1C-16**

The DEIR is inadequate because the Applicant's proposed Project would result in a conflict, since it would "preclude the City from implementing adopted transportation-related programs, plans and policies" as it related to Los Angeles' Green New Deal Sustainability pLAN. The pLAN calls for the "redu[ction of] Vehicle Miles Traveled (VMT) per capita by at least 13% by 2025; 39% by 2035; and 45% by 2050."<sup>2</sup> The Applicant's proposed private school sports complex would increase the existing parking space capacity by nearly 600% (from 89 existing spaces to 532 proposed spaces). The increased capacity for parking would inherently encourage VMT at a time when the Green New Deal Sustainability pLAN calls for reducing reliance on single-occupancy vehicle use and trips. More specifically, the pLAN calls for "increas[ing] the percentage of all trips made by walking, biking, micro-mobility / matched rides or transit to at least 35% by 2025; 50% by 2035; and maintain at least 50% by 2050."<sup>2</sup>

<sup>2</sup> Available at: [https://plan.lamayor.org/sites/default/files/pLAN\\_2019\\_final.pdf](https://plan.lamayor.org/sites/default/files/pLAN_2019_final.pdf)

### **Response No. ORG 1C-16**

The comment expresses that the Project would conflict with City plans to reduce VMT and decrease single-occupancy vehicle use. The commenter states the Project's proposed vehicle parking spaces would contribute to these conflicts. The number of parking spaces does not have direct correlation to whether the Project would result in an increase or decrease in VMT compared to existing conditions. VMT impacts in the Project's Transportation Assessment and Draft EIR were analyzed per the City's Los Angeles Department of Transportation's (LADOT) Transportation Assessment Guidelines (TAG), which establish the guidelines and methodology for assessing transportation impacts for development projects based on the updated CEQA Guidelines from the State of California. As analyzed on pages IV.M-40 and IV.M-41, in Section IV.M,

*Transportation*, of the Draft EIR, the Project would result in a net decrease in VMT compared to existing conditions, according to the City's approved methodology.

Also, a discussion of the Project consistency with the City's Green New Deal is provided on pages IV.G-70 and IV.G-71, in Section IV.G, *Greenhouse Gas Emissions*, of the Draft EIR, with supporting documentation in Appendix C-1, Air Quality and Greenhouse Gas Technical Documentation. Table 3 in Appendix C-1 provides a detailed analysis of the Project's potential to conflict with the targets set forth in the Green New Deal. As analyzed therein, the Project would not conflict with any applicable targets of the Green New Deal.

Moreover, the Project's parking structure upper capacity would only be needed for larger, onsite events, and would not be reached during typical day-to-day operations. See also Response No. ORG 1C-18 for a detailed discussion of the frequency when the parking structure is in use at the upper limit of its capacity. The commenter is also referred to Topical Response No. 9 – Transportation and Parking During Construction and Operations, in this Final EIR for a discussion of the Project's parking impacts.

As discussed in Topical Response No. 9, with the Project design modifications (presented in Topical Response No. 2 – Modifications to the Project Design), the Project's number of parking spaces would be reduced from 532 to 403, for a reduction of 129 spaces. With the reduced traffic to/from the Project Site during larger events when the on-site parking may reach capacity, vehicle occupants that would have parked at the Project Site in the former 129 spaces would be shuttled from the Upper School campus. Since Harvard-Westlake students, other Harvard-Westlake visitors, and Special Event attendees all have the same average trip length to the Project Site as evaluated in the Draft EIR, the shift in parking from the Project Site to the Upper School campus for vehicles that could have parked at the Project Site without the modifications would not substantially change the VMT for the Project. As such, the same less than significant VMT impacts would occur for the Project with design modifications.

### **Comment No. ORG 1C-17**

The DEIR is inconclusive, as it lacks in providing full and current transportation support data. The community use component of the Project or community-serving recreational facilities are exempt from vehicle mile traveled (VMT) analysis. It does not make sense why the VMT analysis only focuses on "the educational facility portion of the Project" or "on the Harvard-Westlake athletic activities use, as an educational facility." With the Applicant eager to supposedly increase public access to the Project site, it remains unclear why DEIR VMT analysis would not include visitors from the general public. Unfortunately, it appears that the DEIR is using miles driven by "community" participants as an "impact write off." The community truly believes this Project, and especially the transportation and traffic impacts, needs to be examined with a holistic lens.

## Response No. ORG 1C-17

The comment expresses that the Draft EIR is inconclusive regarding transportation support data. The commenter is referred to Topical Response No. 9 – Transportation and Parking During Construction and Operations, regarding the methodology for calculating VMT, including VMT associated with community serving recreational facilities.

## Comment No. ORG 1C-18

The Project calls for a total of 532 parking spaces, 88 more than legally required. Alternatives must focus on decreasing the number of parking spaces at the Project site. According to the United States Department of Transportation 2017 National Household Travel Survey, the average number of miles driven by Americans peaked in the 1990s and as of 2017, dipped below 2001 mileage levels.<sup>3</sup> This phenomenon, coupled with a decreased individual car ownership preference among millennials (who are the nation's largest living adult generation),<sup>4</sup> indicates that future development planning should place less emphasis on accommodating visitors' individual cars with designated parking spaces. With the construction of a 532-space parking structure, which represents a roughly 600% increase over the number of spaces currently on site, the proposed Harvard-Westlake project substantially increases visitors' reliance on cars, a concept steeped in the past, not the future.

## Response No. ORG 1C-18

The comment contends that the Project should include an Alternative that would reduce the number of parking spaces. The issue of traffic and parking is discussed in Topical Response No. 9 - Transportation and Parking During Construction and Operations, in this Final EIR. As evaluated therein, impacts with respect to transportation and traffic would be less than significant and no mitigation measures are required. Please refer to Chapter II, *Project Description*, page II-48 indicating that there are historically fewer than 400 spectators for 90 percent of interscholastic games. Though these instances are relatively infrequent, LAMC nonetheless requires the provision of school parking spaces in proportion to the number of fixed seats (including bleachers), regardless of how often such capacities are actually utilized.

Note that current updates to the Project would reduce the overall number of seats provided by the Project from 2,217 seats to 1,989 seats, which is a reduction of 228 seats. The changes to seating include: 1) pool area bleacher seats reduced from 348 to 216; 2) Field B bleacher seats reduced from 255 to 106; 3) Field A bleacher seats increased from 488 to 541; 5) gymnasium seats increased from 1,026 to 1,056; and 6) tennis bleacher seats reduced from 100 to 70. Also, the overall parking capacity has been reduced from 532 spaces to 403 spaces, which is only 2 more spaces than required by the LAMC parking requirements. The number of parking spaces is based on the number of seats.

Specifically, the parking capacity of the underground structure has been reduced from 503 spaces to 386 spaces and the capacity of the above grade surface parking lot has been reduced from 29 spaces to 17 spaces. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, which provides these Project updates.

Because parking is not a CEQA impact and no significant impacts occur as a result of operational parking, the Draft EIR is not required to analyze an alternative with reduced parking spaces. For additional discussion of the Project’s adequacy of alternatives in the Draft EIR, refer to Response Nos. ORG 1B-105, ORG 1B-106 and ORG 7A-146 to ORG 7A-176.

## **Comment No. ORG 1C-19**

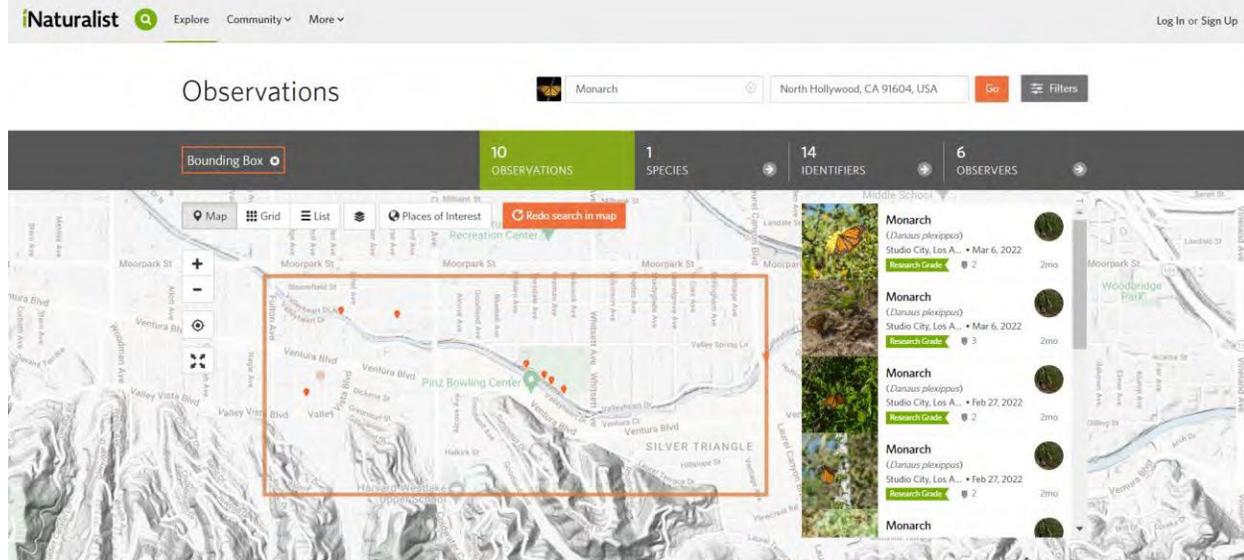

### **5. Biological Resources and Destruction of “Desirable Open Space”**

#### ***Specific Animal Species***

The DEIR is incomplete, as there remains an underestimation of the value the parcel of green open space at Weddington Golf & Tennis provides to various species. For example, the DEIR flora and fauna inventory lists two bird species (Allen’s Hummingbird and Rufous Hummingbird) that appear on the watchlist of Partners in Flight, a network of organizations focused on landbird conservation. This watchlist identifies species that are of highest conservation concern at the continental scale.<sup>5</sup> In addition to the two listed in the RDEIR [sic] inventory, according to eBird, a citizen science database, two other bird species (Oak Titmouse and Band-Tailed Pigeon) have been cited at Weddington Golf & Tennis and/or along the Los Angeles River between Whitsett Avenue and Coldwater Canyon Avenue.<sup>6</sup> All four species mentioned above are listed on the Partners in Flight watchlist due to “population declines and moderate to high threats.”<sup>5</sup> According to eBird, Weddington Golf & Tennis is one of the most biologically diverse parcels of green open space on the Valley floor between the Sepulveda Basin and Universal Studios.<sup>6</sup> In addition, the DEIR lists the potential occurrence for monarch butterflies (one species listed on the California Department of Fish and Wildlife (CDFW) Special Animals List) to be “none.” However, according to an iNaturalist search, monarchs have been identified in the Zev Greenway, immediately adjacent to the Biological Study Area. There even seems to be a grouping of sightings along the Zev Greenway.

<sup>5</sup> Available at: <https://partnersinflight.org/wp-content/uploads/2017/03/SPECIES-OF-CONT-CONCERN-from-pif-continental-plan-final-spread-2.pdf>

<sup>6</sup> Available at: <https://ebird.org/hotspot/L6684917>

## Response No. ORG 1C-19

The comment is concerned that the Draft EIR's analysis of biological resources is inadequate. The Draft EIR evaluated impacts to biological resources in Section IV.C, *Biological Resources*, of the Draft EIR with supporting data provided in Appendix D, Biological Resources Technical Report, of the Draft EIR. As analyzed therein, biological resources impacts would be less than significant with mitigation, where applicable. The analysis of impacts to biological resources is based on the thresholds of significance consistent with Appendix G of the CEQA Guidelines. With regard to animal species, Threshold (a) requires an assessment of impacts to any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service (see pages IV.C-28 and IV.C-29 of the Draft EIR). As part of the biological resources assessment, biologists conducted field surveys and records searches of all applicable databases, which are discussed on pages 15 and 16 (PDF pages 23 and 24 of 394 of Appendix D of the Draft EIR) of the Biological Resources Technical Report. Appendix D of the Biological Resources Technical Report evaluates the potential for special status species to occur on the Project site in consideration of the habitat on the Project site. Only rufous hummingbird is considered a special-status species, as this species is included on the CDFW Special Animals list. Although the oak titmouse is on the Los Angeles County Bird Watchlist (Los Angeles County Sensitive Bird Species Working Group 2009), the other three species are not considered to be special-status species, as none are included in the CDFW Special Animals list and eBird lists both oak titmouse and Allen's hummingbird bird as "Least Concern" in conservation status and band-tailed pigeon has no conservation status listing at all. Regardless, if these species occur on-site or have the potential to occur, they would utilize the ornamental landscaping habitat on-site and limited native habitat off-site, both of which will still occur and may be enhanced (i.e., with more native plant species) with the Project. Thus, impacts to these species would be less than significant and no mitigation would be required. Further, Project Design Feature BIO-

PDF-1 requires a pre-construction survey for any vegetation removal that may occur in nesting season that may have the potential to impact nesting birds. Based on the field surveys and records search results, only one special-status bat species, the western yellow bat (species of special concern), was considered to have moderate potential to roost and forage in the Biological Study Area. With regard to monarch butterflies, the report indicates that although the Project Site supports eucalyptus trees, the trees are too widely spaced to provide sufficient shelter. The Biological Study Area is approximately 10.5 miles to the northeast of the coast. The majority of monarch butterfly winter roosts recorded on California Natural Diversity Database (CNDDDB) are within 5 miles of the coastline. Thus, the Project Site does not include sufficient habitat for wintering monarch butterfly roost sites. Further, the field survey of the Project Site by biologists did not identify the presence of any monarch butterflies.

### **Comment No. ORG 1C-20**

Also, importantly, monarchs typically follow the same migration route of their ancestors, so a presence of some may indicate more are around or there are more who use the general area in their migration patterns.<sup>7,8</sup> Additional analysis and inventories must be performed in a recirculated DEIR (RDEIR).

<sup>7</sup> Available at: [https://www.fs.fed.us/wildflowers/pollinators/Monarch\\_Butterfly/documents/Conservation\\_Management\\_MonarchButterflies.pdf](https://www.fs.fed.us/wildflowers/pollinators/Monarch_Butterfly/documents/Conservation_Management_MonarchButterflies.pdf)

<sup>8</sup> Available at: [https://www.fs.fed.us/wildflowers/pollinators/Monarch\\_Butterfly/migration/](https://www.fs.fed.us/wildflowers/pollinators/Monarch_Butterfly/migration/)

### **Response No. ORG 1C-20**

The comment expresses concern regarding the effects of the Project on monarch butterflies. Refer to Response No. ORG 1C-19 for a discussion of monarch butterflies. Based on the referenced response, a recirculated Draft EIR to address concerns raised in this comment is not necessary.

### **Comment No. ORG 1C-21**

The types of trees that are used by species like birds and bats matter and this information is absent from the DEIR. Although the DEIR emphasizes the non-native nature of the existing, mature tree canopy, it is critical that the habitat value of these trees is understood. The DEIR states that the “Biological Study Area supports some potential nesting and foraging habitat for migratory birds and raptors.” Additionally, the DEIR flora and fauna inventory lists several raptors that were “observed in the Biological Study Area” or “in the off-site portion of the Biological Study Area along Zev Greenway,” including Cooper’s Hawks, Red-Tailed Hawks, and Red-Shouldered Hawks. According to the Los Angeles Raptor Study 2021 Final Report,<sup>9</sup> for a variety of reasons, raptors prefer and utilize pine and eucalyptus trees for nesting, even though they are non-native species.

The report reads, “Looking at nest tree and substrate type (Tables 3c – 3d), as in prior years, (non- native) pines (*Pinus* spp.) were the most common nest tree used in 2021 (99

of 266 observed nests; 37%), followed by gums (*Eucalyptus* spp.) and related species (n = 54), Shamel ash (*Fraxinus uhdei*) with 30 nests, sycamores with 22 nests, and figs (*Ficus* spp.) with 19 nests ... As noted in 2020, the low usage rate of native trees must correlate strongly with availability, as native trees are almost non-existent as street trees (except for sycamores), and large specimens of most native trees (e.g., coast live oak) are largely restricted to patches of open space like the eastern Santa Monica Mountains, and sparingly elsewhere ... As we wrote in 2019, by virtue of their abundance across the urban and suburban landscape of the study area, pines and eucalyptus “accounted for a relatively large proportion of our local nests, highlighting the importance of the very large, non- native trees in and around the park, many of which have matured – and are now the tallest trees around – since they were planted decades ago. While non-native, they clearly provide excellent nesting opportunities to the local raptor community, and have essentially outpaced native substrates locally, perhaps enabling native raptors to continue using the habitats.”<sup>9</sup>

The DEIR claim that “a significant number of native replacement trees (a 36-percent increase as compared to existing conditions)” would enable “species adapted to urban areas ... to persist on- site” underestimates the importance of the existing, mature urban tree canopy. For instance, the Western Yellow Bat (*Lasiurus Xanthinus*) prefers the Mexican Fan Palm, as evidenced by the United States Department of Interior, Bureau of Reclamation, Lower Colorado River Multi- Species Conservation Program Report on the Western Yellow Bat (WYBA).<sup>10</sup> The 2015 report states, “In a study of bat roost site habitat conducted at the LCR, WYBA were documented to use Mexican fan palms (*Washingtonia robusta*) almost exclusively and did not exhibit roost switching behavior.”<sup>10</sup> Therefore, while non-native, the Mexican fan palms serve an important function for this California Department of Fish and Wildlife (CDFW) species of special concern. Additionally, the DEIR states that the Project would remove the majority of Mexican fan palms, and therefore, potential habitat, leaving only 53 from the original count of 174. The DEIR is incomplete, since it greatly underestimates the impact of the removal of this many trees of the same species, which is suitable potential habitat for the Western Yellow Bat.

<sup>9</sup> Available at: <https://friendsofgriffithpark.org/wp-content/uploads/2021/09/FoGP-Raptors-2021F.pdf>

<sup>10</sup> Available at: [https://www.lcrmscp.gov/reports/2015/g06\\_wyba\\_cem\\_2015.pdf](https://www.lcrmscp.gov/reports/2015/g06_wyba_cem_2015.pdf)

## Response No. ORG 1C-21

The comment expresses concern regarding the impact of tree removal and replacement on nesting birds and bats. Refer to Response No. ORG 14A-15 for a discussion of impacts to common wildlife and nesting birds, including raptors. In addition, refer to Response Nos. ORG 1B-45 and 1B-48, which addresses impacts specific to the western yellow bat, including impacts due to the proposed removal of the Mexican fan palms.

## Comment No. ORG 1C-22

### *Urban Tree Canopy*

The DEIR is defective, as it fails to describe the importance of preserving existing, mature urban tree canopy and the time lag in benefits provided by proposed plantlings versus existing trees. The 2016 Los Angeles County Tree Canopy Assessment (conducted by TreePeople, SavATree, The Center for Urban Resilience at Loyola Marymount University, The Spatial Analysis Laboratory at the University of Vermont's Rubenstein School of the Environment and Natural Resources, Dr. Dexter Locke, United States Forest Service, and CalFire) mentions this goal explicitly when the report says, "keeping the trees you have is more efficient than removing and replacing them."<sup>11</sup> [sic]

The report goes on to state, "Preserving existing tree canopy is critical. The ecosystem services provided by trees are directly related to the amount of canopy they provide. When trees are removed and replaced, there is not only a size difference in the canopy provided by the new tree compared with the mature tree; there is also a time lag of reduced benefits until the new tree can grow to the size of the mature tree. Keeping the trees you have is more efficient than removing and replacing them."<sup>11</sup>

A recirculated DEIR (RDEIR) must include calculations that determine exactly how long it will take for the Applicant's proposed plans (tree removal and tree planting) to equal the benefits provided by the existing, mature urban tree canopy. The community cannot afford to wait for a definitive answer on how long it will take for the proposed urban tree canopy to match the benefits of the existing canopy.

<sup>11</sup> Available at: [https://digitalcommons.lmu.edu/cgi/viewcontent.cgi?article=1005&context=cures\\_reports](https://digitalcommons.lmu.edu/cgi/viewcontent.cgi?article=1005&context=cures_reports)

## Response No. ORG 1C-22

The comment expresses concern over the reduction in the existing tree canopy. The commenter is referred to Topical Response No. 5 – Biological Resources/Trees, for a discussion of the removal and replacement of trees and anticipated restoration of the tree canopy. For additional discussion of impacts related to carbon sequestration and tree canopy, refer to Response No. ORG 6A-1 and ORG 1B-60. A Carbon Sequestration and Canopy Study (November 2022) by ESA has been included in Appendix C of this Final EIR. As discussed in Topical Response No. 5, the Project's tree replacement program would result in a greater canopy cover by Year 10 compared to existing conditions. The existing Project Site has a canopy cover of 20 percent. Existing trees are primarily mature and would not increase in canopy size. Under the Project's tree removal and replacement program, the canopy cover would be 15 percent by Year 5 and would increase to 28 percent by Year 10.

Based on the referenced responses and Carbon Sequestration and Tree Canopy Study, a recirculated Draft EIR to address concerns raised in this comment is not necessary.

## Comment No. ORG 1C-23

It is widely understood that Los Angeles' urban tree canopy is not equitably distributed. According to the TreePeople Los Angeles County Tree Canopy Map Viewer, tree canopy occupies 42.4% of land in Studio City (ZIP code 91604), which is 24.4% higher than the LA County average (18.0%).<sup>12</sup> The Studio City neighborhood is extremely fortunate to have a sizeable urban tree canopy. However, as a result, the local community is at risk of losing significant portions of its existing tree canopy due to irresponsible development projects, like the one currently proposed by the Applicant. Community members are opposed to the removal of such a large chunk of mature tree canopy - regardless of the species.

An Environmental Cost-Benefit Analysis for the existing, mature urban tree canopy at Weddington Golf & Tennis was performed by Angelenos For Trees, a community group uniting Los Angeles neighborhoods to preserve and regenerate its rapidly shrinking tree canopy (Attachment 4). The Angelenos For Trees report describes various economic appraisals of tree canopy at Weddington Golf & Tennis, as well as calculates several critical measures that help quantify the benefits of the existing tree canopy. Notable findings include:

- Yearly estimate of carbon dioxide (CO<sub>2</sub>) sequestration is \$1,584.14.
- Yearly estimate of carbon dioxide (CO<sub>2</sub>) sequestration is 67,439.56 lbs.
- Yearly estimate of storm water mitigation is \$413.32.
- Yearly estimate of storm water runoff avoided is 46,330.26 gals.
- Yearly estimate of storm water rainfall intercepted is 312,555.20 gals.
- Yearly estimate of air pollution removal is \$2,412.25.
- Yearly estimate of air pollution carbon monoxide removal is 237.83 oz.
- Yearly estimate of air pollution ozone removal is 6,027.37 oz.
- Yearly estimate of air pollution nitrogen dioxide is 1,469.45 oz.
- Yearly estimate of air pollution sulfur dioxide is 104.49 oz.
- Yearly estimate of air pollution (fine particles or particulate matter) is 63.00 oz.
- Estimate of carbon dioxide (CO<sub>2</sub>) stored to date is \$35,281.18.
- Estimate of carbon dioxide (CO<sub>2</sub>) stored to date is 1,520,466.02 lbs.

According to the performed Environmental Cost-Benefit Analysis, the 240 trees slated to be removed as part of the Project sequester a total of 898,772.54 lbs of carbon dioxide (CO<sub>2</sub>) (Attachment 4). This figure is immense, but not surprising, as mature trees serve as excellent storers of carbon. However, the DEIR fails to perform such an analysis or describe how the removal of these trees and the release of nearly one million pounds of carbon dioxide (CO<sub>2</sub>) will impact the local community. The DEIR is also inadequate

because it fails to examine relocating existing tree canopy, which has been done in other development projects, including The Village at Westfield Topanga.

<sup>12</sup> Available at: <https://www.treepeople.org/los-angeles-county-tree-canopy-map-viewer/>

### **Response No. ORG 1C-23**

The comment expresses concern over the reduction in the existing tree canopy and cites an analysis of the existing tree canopy at Weddington Golf & Tennis, as well as the canopy on the adjacent right-of-way and the Zev Greenway, performed by Angelenos For Trees. Refer to Response Nos. ORG 6B-1 through 6B-8 which provide responses to the comments in the Angelenos For Trees comment letter.

### **Comment No. ORG 1C-24**

The Project also calls for the installation of a pedestrian ramp leading to the Zev Greenway at Coldwater Canyon Avenue. Although the DEIR states that “the Project Site (Property and County Leased Property) and the off-site improvement areas comprise the Biological Study Area,” Appendix D. Biological Resources Technical Report fails to include a cluster of what appears to be three significant pine trees. A recirculated DEIR (RDEIR) must include these resources if they are designated in the Project’s Biological Study Area.

### **Response No. ORG 1C-24**

The commenter correctly indicates that the three pines near the Coldwater Canyon Avenue Riverwalk Path Ramp were not included in the Biological Resources Technical Report. The area which includes these trees is identified as an “ornamental” plant community. The final design of the ramp structure would avoid these trees, thus, retaining the trees in their current location. This clarification has also been made in Mitigation Measure BIO-MM-3 in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. Because these trees would be retained, the tree removal, replacement requirements, and analysis in the Draft EIR remain correct. Based on the above, a recirculated Draft EIR to address concerns raised in this comment is not necessary.

### **Comment No. ORG 1C-25**

The DEIR proposes that non-protected “significant” trees would be replaced at a 1:1 ratio with RIO District-compliant trees and public street trees from the right-of-way would be replaced at a 2:1 ratio. The DEIR claims that these ratios would result in the 240 removed trees being replaced by 393 trees (which would exceed the minimum required) for a total of 574 in the Biological Study Area. However, in its current configuration, the Project cannot accommodate the proposed tree planting program. As it stands now, much of the Project site’s natural, green open space is slated to be paved over to erect a gymnasium, two artificial turf fields, an Olympic-size swimming pool, and eight new tennis courts. The

remaining area is inadequate to plant 393 trees, except, perhaps, in ways that would be ecologically and arboriculturally inappropriate.

Developers often use these planting ratios as a means to an unjustified end, not recognizing that we cannot add more trees to less space to plant our way out of the emergency our City faces and specific sites must be designed properly to support these plantings. For example, according to Environmental Protection Agency reports, “Big trees require large volumes of soil and aboveground and belowground space to grow... A large-sized tree (16 inches DBH) needs at least 1,000 cubic feet of uncompacted soil. A tree’s ability to establish, grow to its full potential, and remain healthy is largely dependent upon soil volume.”<sup>13,14</sup> Plans for compacting soil in various locations across the Project site also adds to the unrealistic and nonviable proposal of planting 393 trees and ensuring they reach maturity. A recirculated DEIR (RDEIR) must calculate the carrying capacity of what remaining open space land is available (factoring planning for tree height, spread, and root growth) and determine what the exact number of trees at maturity will be, so community members can have a better understanding of what they could expect long-term before the removal of any significant portion of our existing mature, urban tree canopy is allowed to commence.

<sup>13</sup> Available at: <https://www.epa.gov/sites/default/files/2015-11/documents/stormwater2streettrees.pdf>

<sup>14</sup> Available at: [https://www.epa.gov/sites/default/files/2016-11/documents/final\\_stormwater\\_trees\\_technical\\_memo\\_508.pdf](https://www.epa.gov/sites/default/files/2016-11/documents/final_stormwater_trees_technical_memo_508.pdf)

## Response No. ORG 1C-25

The comment expresses concern over the long-term ability of the Project Site to support the Project’s proposed tree replacement and planting program. The comment cites general design parameters for street trees from various EPA documents. The commenter’s assertion that the Project Site cannot accommodate the proposed tree planting program is merely speculation without substantial evidence to support the contention. Further, EPA’s recommendations are general parameters, as stated on page 6 of EPA’s “Stormwater to Street Trees” document referenced in the comment, “And although no universal standard for soil volume requirements for expected mature tree size exists in arboriculture, it is generally accepted that a large-sized tree (16 inches diameter at breast height) needs at least 1,000 cubic feet of uncompacted soil (Figure 2).” While the EPA’s recommendations are acknowledged, the Project’s tree planting program was appropriately designed by qualified professional landscape architects who provided the necessary Project-specific spacing based on the specific types and quantities of trees proposed in consideration of their root and canopy growth.

As shown on Figure IV.C-4, Tree Removal Plan, of the Draft EIR, the Project Site currently supports clusters of trees of varying sizes throughout the Project Site, along the right-of way of Valley Spring Lane, and along the Zev Greenway. Figure IV.C-5, Tree Planting Plan, of the Draft EIR illustrates the Project’s tree planting program, with tree canopies shown, proposed at the Project Site. The trees would be dispersed throughout the Project Site to allow adequate spacing for the trees to mature and thrive. Per Mitigation Measure

BIO-MM-3, the replacement tree locations and species shall be to the satisfaction of the Department of City Planning and in conformance with the landscape and planting guidelines in the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes. For all the reasons summarized above, the Project's tree planting program is sufficient to meet the necessary tree replacement requirements by the City. No further studies referenced in the comment are necessary. Thus, a recirculated Draft EIR to calculate the carrying capacity of what remaining open space land is available (factoring planning for tree height, spread, and root growth) and determine the exact number of trees at maturity is not needed.

## **Comment No. ORG 1C-26**

### **6. Geotechnical, Grading, and Soil Excavation Impacts**

The DEIR is flawed, as it fails to disclose the specific proximity of the proposed Project development to the northern wall of the Los Angeles River channel. A 2004 geotechnical report states that "proposed structures within 125 feet of the northern wall of the river channel, corresponding to approximately 40 feet north of the northern right of way of Valleyheart Drive, will be susceptible to distress as the result of lateral movement that could occur as the result of seismic shaking" (Attachment 5). Based on anticipated liquefaction-induced settlement, analyses of the Project site from 2004 (Attachment 5) and 2019 (DEIR Appendix G. Geotechnical and Paleontological Resources Documentation) also recommend that proposed structures be supported on piles or a mat foundation system. Therefore, more detailed information on what type of development is planned in this sensitive zone of potential lateral spreading (within 125 feet of the northern wall of the Los Angeles River channel) is required in a recirculated DEIR (RDEIR).

## **Response No. ORG 1C-26**

This comment raises the same environmental concerns included in Comment No. ORG 1B-195. Please refer to Response No. ORG 1B-195, which provides a detailed analysis of the Project's seismic risk and the use of appropriate foundation measures. As further discussed therein, the Draft EIR appropriately concluded that the Project would not exacerbate conditions related to seismic-related ground failure, including lateral spreading in proximity the river. As concluded therein and in Draft EIR Section, IV.F, *Geology and Soils*, the hat the risk of loss, injury or death including seismic-related ground failure, including lateral spreading, would be less than significant. The recirculation of the Draft EIR to address concerns raised in this comment is not necessary.

## **Comment No. ORG 1C-27**

According to the Aperture report (Attachment 6), the DEIR does not include any swell calculation of the export soils. As a result of soil swell, "the proposed excavation of 250,000 cubic yards of compacted earth materials will increase in size by 20%-25%," resulting in a more accurate haulage amount estimate of 310,000 cubic yards. While the initial figure of 250,000 cubic yards could be considered large, the 310,000 cubic yards

estimate is even more astounding. For reference, 250,000 cubic yards is about five times as big as the United States Capitol Rotunda and about seven-and-a-half times as big as the Lincoln Memorial Reflecting Pool. The larger, more accurate estimate of 310,000 cubic yards is about six-and-a-half times as big as the United States Capitol Rotunda and about nine-and-a-half times as big as the Lincoln Memorial Reflecting Pool. This more accurate estimate affects other DEIR subjects, including haul truck trips. While the DEIR indicates a total of 35,714 haul truck trips are required for export of 250,000 cubic yards of excavated materials, how many more truck trips would be required for 310,000 cubic yards of soil?

Additionally, the DEIR defers analysis of mitigation for haul routes, as the haul routes are not clearly delineated. The community needs to know the identified receptor site for the excavated materials, as haul trucks don't simply appear or disappear at the US-101 Freeway off-ramp/on-ramp at Coldwater Canyon Avenue. Since the community will be put at risk by the emissions caused by the enormous excavation and hauling associated with this Project, the public deserves to know what the true amount of soil excavation and true number of haul truck trips will be. Clearly, soil excavation and truck trips have been underestimated and a recirculated DEIR (RDEIR) should include more accurate information by incorporating the swell effect into grading export and truck trip calculations, as well as provide complete haul routes.

### **Response No. ORG 1C-27**

This comment raises concerns regarding the amount of soil excavation and associated haul trips from the Project's construction activities. The comment also states that information regarding the haul routes and disposal locations for excavated materials should be provided to the public. The commenter is referred to Response Nos. ORG 1B-19 and ORG 1B-185 which address these concerns. As discussed therein, the Draft EIR appropriately analyzed impacts associated with excavation activities and soil hauling.

Also, as discussed in Response No. 1C-18, updates to the Project would reduce the parking capacity of the underground structure from 503 spaces to 386 spaces. With this reduction, the amount of grading would be reduced from 250,000 cubic yards to 197,000 cubic yards, a reduction of approximately 53,000 cubic yards. This reduction in grading would reduce the duration of grading from approximately 7 months to 5.5 months, and reduce the number of grading haul truck trips from 35,714 trips to 28,142 trips. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, which provides these Project updates.

Based on the above, a recirculated Draft EIR to address concerns raised in this comment is not necessary.

## Comment No. ORG 1C-28

### 7. Hazards and Hazardous Materials

Although the DEIR describes potential inhalation, ingestion, or contact hazards related to artificial turf, there is limited discussion regarding Per- and polyfluorinated alkyl substances (PFAS) or “forever chemicals.” Artificial turf compliance to the California Department of Public Health’s lead content is listed as 50 parts per million (ppm) or less. However, there is no mention of allowable content of PFAS. The California Office of Environmental Health Hazard Assessment recently proposed new limits to regulate PFAS because they do not break down in the environment. The State’s goal would limit two of the most notorious PFAS compounds: 1) Perfluorooctanoic acid (PFOA) to 7 parts per quadrillion and 2) Perfluorooctanesulfonic acid (PFOS) to 1 part per trillion.<sup>15</sup> The State’s current response level is 10 and 40 parts per trillion for PFOA and PFOS, respectively.<sup>16</sup> The DEIR fails to disclose mitigation or adherence strategies once these fields are no longer in compliance with the State’s crackdown on these “forever chemicals.”

Artificial turf fields also leach microplastics into the soil and groundwater. Since the artificial turf field is permeable and the planned rainwater capture cistern is located nearby Field A, PFAS may contaminate the planned 1-million gallon stormwater capture and reuse system that is expected to provide a minimum of one-third of the Project’s total annual irrigation demand. Also, considering the potential for runoff from both of the Project’s proposed artificial turf fields into the Los Angeles River, which flows to the Pacific Ocean, filtration systems that are equipped to and aimed at removing PFAS are necessary. Various options exist and technologies recommended by the Environmental Protection Agency (EPA) include granular activated carbon absorption, ion exchange resins, and high-pressure membranes.<sup>17</sup>

Some of the most well-known artificial turf manufacturers are AstroTurf, FieldTurf, MatrixTurf, and SporTurf. These manufacturers often claim that their various turf products do not contain PFAS. But, these claims are often based on industry laboratory testing and independent testing is always required to verify such claims. For example, AstroTurf claims its Rhino Blend 46 does not contain PFAS<sup>18</sup> and FieldTurf pledged that its Revolution 360 product does not contain PFAS.<sup>19</sup> However, citizens had samples of FieldTurf’s Revolution 360 independently tested and the results did show that several types of PFAS were found in surface water adjacent to a newly-constructed artificial turf field at a local high school and other cases have produced similar findings.<sup>19</sup> As a result, despite claims from industry representatives that no PFAS are present in its products, use of artificial turf must be prohibited, for the safety of all in our community, including the Applicant’s own students.

Finally, a recirculated DEIR (RDEIR) must contain a contingency management plan for the filtration and storage of these “forever chemicals,” as they cannot ever truly be disposed of or destroyed and must be properly contained and stored.

<sup>15</sup> Available at: <https://oehha.ca.gov/sites/default/files/media/downloads/crnrr/pfoapfosphgdraft061021.pdf>

<sup>19</sup> Available at: <https://files.cityofportsmouth.com/agendas/2021/citycouncil/cc101821cp.pdf>

## **Response No. ORG 1C-28**

The comment expresses concern regarding the presence of PFAS in the proposed artificial turf. The commenter is referred to Topical Response No. 7 - Artificial Turf and Effects on Localized Heat and Health, and Response No. ORG 1B-75 which address potential hazards associated with artificial turf and PFAS. As discussed therein, the presence of PFAS in artificial turf would not create substantial adverse effects to users of the turf fields, the public, or the environment. Based on the above, a recirculated Draft EIR to address concerns raised in this comment is not necessary.

## **Comment No. ORG 1C-29**

Other hazards of artificial turf include greenhouse gases emitted in its production, transportation, and processing. Artificial turf hazards also include crumb rubber, which, according to the DEIR, “may also emit trace to low levels of volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) (including PAHs and phthalates) into the air, depending on outdoor air temperatures. PAHs and phthalates refers groups of compounds, some of which have been identified by OEHHA as compounds known to have a risk of causing cancer or reproductive toxicity, such as chrysene, naphthalene, and di(2-ethylhexyl)phthalate (DEHP).”

## **Response No. ORG 1C-29**

The comment expresses concern over hazards related greenhouse gases emitted in the production, transportation, and processing of artificial turf. Any GHG emissions associated with the production of artificial turf are not part of the Project. Artificial turf manufacturers are required obtain necessary permits and comply with applicable regulations, as applicable to the production location. In addition, the comment refers to concerns regarding the presence of VOCs and other organic compounds in the proposed artificial turf. These concerns are addressed in Topical Response No. 7 - Artificial Turf and Effects on Localized Heat and Health and Response Nos. ORG 1B-68, ORG 1B-69, ORG 1B-71, and ORG 1B-72. As discussed therein, the Draft EIR adequately discloses the potential for health and environmental impacts from exposure to artificial turf materials and use/productions of such materials.

### **Comment No. ORG 1C-30**

The DEIR also only includes limited discussion regarding the contribution of artificial turf on the urban heat island effect. On warm, sunny days, artificial turf fields become dangerously hot, often forcing the postponement of athletic practice or contests due to the possibility of heat-related injuries. Surface temperatures can be significantly higher on artificial turf than natural turf. Finally, although the Applicant has informed the community that its newer technology turf will minimize the significance of these issues, according to a study in *The Journal of Sports Engineering and Technology* titled “Comparison of Surface Temperatures of Different Synthetic Turf Systems and Natural Grass: Have Advances in Synthetic Turf Technology Made a Difference,”<sup>20</sup> any kind of artificial turf (newer technologies or not) will cause higher temperatures for the local climate.

<sup>20</sup> Available at: <http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.848.8800&rep=rep1&type=pdf>

### **Response No. ORG 1C-30**

The comment expresses concern regarding the urban heat island effect of the proposed artificial turf. This concern is addressed in Topical Response No. 7 – Artificial Turf and Effects on Localized Heat and Health.

### **Comment No. ORG 1C-31**

The DEIR also fails to discuss or analyze the fact that although artificial turf may reduce irrigated water, water will be required to cool the turf for use at certain times of the year. In fact, a recent study in the *Journal of Irrigation and Drainage Engineering* titled “Water Requirements for Cooling Artificial Turf”<sup>21</sup> describes a mathematical model that was developed based on the heat balance equation to determine heat dissipation from artificial turf-based fields with comparison of the predicted values to experimental data. The report reads, “This model indicates that the amount of water required to maintain Artificial Turf (AT) temperatures at levels comparable to irrigated Natural Turf (NT) over a 24-hr period exceeds the water requirements of bermudagrass NT in the same environment.”<sup>21</sup> While the study was conducted in New Mexico, which has been classified as having an arid climate zone, according to the Thornthwaite climate classification system, Los Angeles is semiarid and mesothermal. Moreover, subject experts have considered Los Angeles's climate to be semi-arid Mediterranean.<sup>22</sup> Additional research also reveals that the cooling effect of water being applied to artificial turf only lasts for less than one hour and “in order to provide a cool, playable surface, irrigation amounts for artificial turf are greater than for natural warmseason turf.”<sup>23</sup> In conclusion, if the use of water to irrigate natural turf is comparable to the amount of water required to cool artificial turf, DEIR claims touting artificial turf as a water-saving measure to reduce irrigation water demand must be re-considered. This information must be examined further in a recirculated DEIR (RDEIR) and re-calculated in the Water Supply section of the RDEIR.

<sup>21</sup> Available at: <https://ascelibrary.org/doi/epdf/10.1061/%28ASCE%29IR.1943-4774.0001506>

<sup>22</sup> Available at: <https://laist.com/news/is-los-angeles-a-desert>

<sup>23</sup> Available at: [https://www.researchgate.net/profile/Ahmed-Kanaan/publication/327540438\\_Quantifying\\_Water\\_Required\\_to\\_Cool\\_Artificial\\_Turf/links/5b947486299bf147392bafcf/Quantifying-Water-Required-to-Cool-Artificial-Turf.pdf](https://www.researchgate.net/profile/Ahmed-Kanaan/publication/327540438_Quantifying_Water_Required_to_Cool_Artificial_Turf/links/5b947486299bf147392bafcf/Quantifying-Water-Required-to-Cool-Artificial-Turf.pdf)

## Response No. ORG 1C-31

The comment states that water demand needed to cool artificial turf was not accounted for in the Draft EIR's water supply analysis. No irrigation lines will be run to the turf fields. Thus, irrigation water will not be used to lower the temperature of the fields. Accordingly, the water demand calculations included in Section IV.O.1 – *Utilities and Service Systems – Water Supply*, of the Draft EIR are correct. Also, refer to Response No. ORG 8-7 regarding use of water to irrigate turf. The experiment in the use of water to cool artificial turf in New Mexico was an experiment to measure the amount of water that would be needed to maintain surface temperatures of these infill fields at levels similar to natural turf grass areas. As stated in the article referenced by the commenter, in many cases irrigating synthetic fields is not necessary. Additionally, the article states that newer in-fill materials have lessened the issue of heat gain on fields. As such, irrigating to cool the surface is not particularly effective. Because additional impacts related to water demand are not anticipated, a recirculated Draft EIR to address concerns raised in this comment is not necessary.

## Comment No. ORG 1C-32

Although there is one peer-review article cited in the DEIR Hazards and Hazardous Materials section, the study was conducted by scientists at the Gradient corporation, an industry consulting firm.<sup>24</sup> Additionally, no author hailed from a neutral academic institution. In fact, towards the end of the article, under the funding disclosure section, the study says that the lead corresponding author, Michael K. Peterson, “was retained as a scientific advisor by the Recycled Rubber Council from 2015 to May 2017. Gradient has been involved in many projects related to recycled rubber for a variety of entities, including school districts, health districts, synthetic turf manufacturers, rubber recyclers, and trade associations.” If peer-reviewed studies are going to be referenced, they should be truly non-partisan and include authors from a range of institutions, including universities, health systems, or academic medical centers. Although many researchers often interact with industry in some fashion, the inclusion of authors from academic institutions helps provide rigor that may be lacking when academicians are not included in studies.

<sup>24</sup> Available at: <https://www.sciencedirect.com/science/article/abs/pii/S0013935117303936>

## Response No. ORG 1C-32

The comment expresses concern that a neutral study from an academic institution was not consulted in the preparation of the hazards report regarding artificial turf. This comment does not raise any issues with respect to the adequacy of the Draft EIR.

Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

However, contrary to the assertion in the comment, Section IV.H, *Hazards and Hazardous Materials* of the Draft EIR was based on a wide variety of scientific studies. A summary of scientific studies on artificial turf regarding potential effects on human health, prepared by ESA in October 2021, is included in Appendix H-2 of the Draft EIR. As shown in Topical Response No. 7 - Artificial Turf and Effects on Localized Heat and Health, Table 1, background studies include those authored by the State of California Office of Environmental Health Assessment (OEHHA), CalRecycle, New York State Study, and Connecticut Department of Public Health. These governmental studies, for example, are deemed to be neutral studies on artificial turf.

### **Comment No. ORG 1C-33**

The DEIR completely omits analysis of artificial turf-related athlete injuries. Findings from the following peer-reviewed studies are intended to provide the Lead Agency with helpful information on this topic that is absent from the DEIR. According to a study of National Football League (NFL) athletes published in *The American Journal of Sports Medicine* titled “Higher Rates of Lower Extremity Injury on Synthetic Turf Compared With Natural Turf Among National Football League Athletes,”<sup>25</sup> “play on synthetic turf resulted in a 16% increase in lower extremity injuries per play than that on natural turf” and “synthetic turf surfaces have a causal impact on lower extremity injury.” According to a study of National Collegiate Athletic Association American (NCAA) football players published in *The American Journal of Sports Medicine* titled “Incidence of Knee Injuries on Artificial Turf Versus Natural Grass in National Collegiate Athletic Association American Football: 2004-2005 Through 2013-2014 Seasons,”<sup>26</sup> “athletes participating in competitions on artificial turf experienced posterior cruciate ligament (PCL) injuries at 2.94 times the rate as those playing on grass,” “injury rates for PCL tears were significantly increased during competitions played on artificial turf as compared with natural grass,” and “lower NCAA divisions (II and III) also showed higher rates of ACL injuries during competitions on artificial turf versus natural grass.” According to a study of NCAA football players published in *The American Journal of Sports Medicine* titled “Incidence and Risk Factors for Injuries to the Anterior Cruciate Ligament in National Collegiate Athletic Association Football: Data From the 2004-2005 Through 2008-2009 National Collegiate Athletic Association Injury Surveillance System,”<sup>27</sup> “the rate of anterior cruciate ligament (ACL) injury on artificial surfaces is 1.39 times higher than the injury rate on grass surfaces.” According to a study of NCAA football players published in *The Knee* titled “The Effect of Playing Surface on the Incidence of ACL Injuries in National Collegiate Athletic Association American Football,”<sup>28</sup> “the rate of ACL injury on artificial surfaces is 1.39 times higher than the injury rate on grass surfaces” and “non-contact injuries occurred more frequently on artificial turf surfaces (44.29%) than on natural grass (36.12%).” According to a study of major league soccer players published in *The American Journal of Sports Medicine* titled “Injury Surveillance in Major League Soccer: A 4-Year Comparison of Injury on Natural Grass Versus Artificial Turf Field,”<sup>29</sup> “within injury subgroups, overall

ankle injury, Achilles injury, and ankle fracture were found to have a statistically higher incidence on artificial turf” and “within individual injury categories, a higher rate of ankle injury was found on artificial turf.” According to a retrospective cohort study of high school athletes published in *Current Orthopaedic Practice* titled “Injury Incidence is Higher on Artificial Turf Compared with Natural Grass in High School Athletes: A Retrospective Cohort Study,”<sup>30</sup> “athletes were 58% more likely to sustain injuries on artificial turf than natural grass,” “lower extremity, torso, and upper extremity injuries were significantly more likely to occur on artificial turf,” and “football, girls soccer, boys soccer, and rugby had higher injury incidences on artificial turf.” The DEIR underestimates the significance of this hazard. In light of studies showing extensive athlete injury risks while playing sports that are proposed to be played on the Project site, a recirculated DEIR (RDEIR) must address how the safety of student athletes and the general public will be assured when using artificial turf.

The DEIR also completely omits analysis of athlete perceptions of artificial turf safety. The following peer-reviewed studies and letters from players unions provide clarification and additional context. According to a study of professional soccer players published in the *Journal of Applied Statistics* titled “Elite Players’ Perceptions of Football Playing Surfaces: A Mixed Effects Ordinal Logistic Regression Model of Players’ Perceptions,”<sup>31</sup> “the majority of players expressed a strong preference for the use of Natural Turf pitches over alternatives such as Artificial Turf.” According to a study of professional soccer players published in *BMC Sports Science, Medicine and Rehabilitation* titled “The Perceptions of Professional Soccer Players on the Risk of Injury From Competition and Training on Natural Grass and 3rd Generation Artificial Turf,”<sup>32</sup> “players believed that playing and training on artificial turf (FT) increased the risk of sustaining a non- contact injury,” “the players identified three surface related risk factors on FT, which they related to injuries and greater recovery times: 1) Greater surface stiffness 2) Greater surface friction 3) Larger metabolic cost to playing on artificial grounds,” and “overall, 94% of the players chose FT as the surface most likely to increase the risk of sustaining an injury.”

The President of the National Football League Players Association (NFLPA), the union representing the players of the National Football League, cited years of higher rates of injury on artificial turf versus natural turf when advocating that “NFL clubs should proactively change all field surfaces to natural,” “our occupation is dangerous enough, and the increased rate of lower extremity injuries linked to the field surface we are forced to play on is unacceptable,” and “the NFLPA is advocating for teams to convert artificial practice and game fields to natural grass fields.”<sup>33</sup> Furthermore, the United States National Soccer Team Players Association (USNSTPA), the players union for members of the United States men’s national soccer team, “is opposed to playing any game on sod placed atop artificial surfaces.”<sup>34</sup>

## Response No. ORG 1C-33

The comment expresses the concern that the use of artificial turf would increase the incidence of athletic injuries. The references to this effect are acknowledged. Athletic injuries, however, are not treated as significant effects on the environment under CEQA and, therefore, are not evaluated in the Draft EIR. This comment does not raise any issues with respect to the adequacy of the Draft EIR. Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

## Comment No. ORG 1C-34

The DEIR is inaccurate when it states that, “in addition to compliance with applicable disposal regulations, artificial turf consists of material that can be recycled at the end of its useful life” misrepresents the truth and requires additional context. In fact, a consultant report for CalRecycle (Attachment 7) and investigative journalism<sup>35</sup> have proven that the recycling options are extremely limited or virtually non-existent. The consultant’s report was commissioned by (under contract to) CalRecycle, part of the State of California Environmental Protection Agency (EPA), for its consideration. The report indicates that most of the State’s crumb-rubber fields are going to the dump. The report states “it appears that in practice landfill disposal is by far the most common method for managing field components after removal, and no complete examples of an actual recycling project for the components of a removed field in California were identified.” The report also found that “markets for recycled crumb rubber infill are extremely limited” (Attachment 7). Therefore, a life-cycle assessment for artificial turf and a contingency management plan for the disposal of artificial turf must be presented in a recirculated DEIR (RDEIR).

<sup>35</sup> Available at: <https://www.theatlantic.com/science/archive/2019/12/artificial-turf-fields-are-piling-no-recycling-fix/603874/>

## Response No. ORG 1C-34

The comment expresses the concern that recycling options for artificial turf material/crumb rubber are extremely limited and states that a life-cycle assessment for artificial turf and a contingency management plan for the disposal of artificial turf must be presented in a recirculated DEIR. The commenter is referred to Response No. 7A-36 for a discussion of recycling related to artificial turf. Since artificial turf has potential recyclable uses and because a market, although limited, exists, the evaluation in the Draft

EIR appropriately discloses the fact that the material is recyclable. It is also noted that a large percentage of all types of recyclable materials are deposited in landfills due to varying market conditions. However, such materials are deemed to be recyclable.

Based on the above, a life-cycle assessment for artificial turf and a contingency management plan for the disposal of artificial turf is not required in a recirculated DEIR.

## **Comment No. ORG 1C-35**

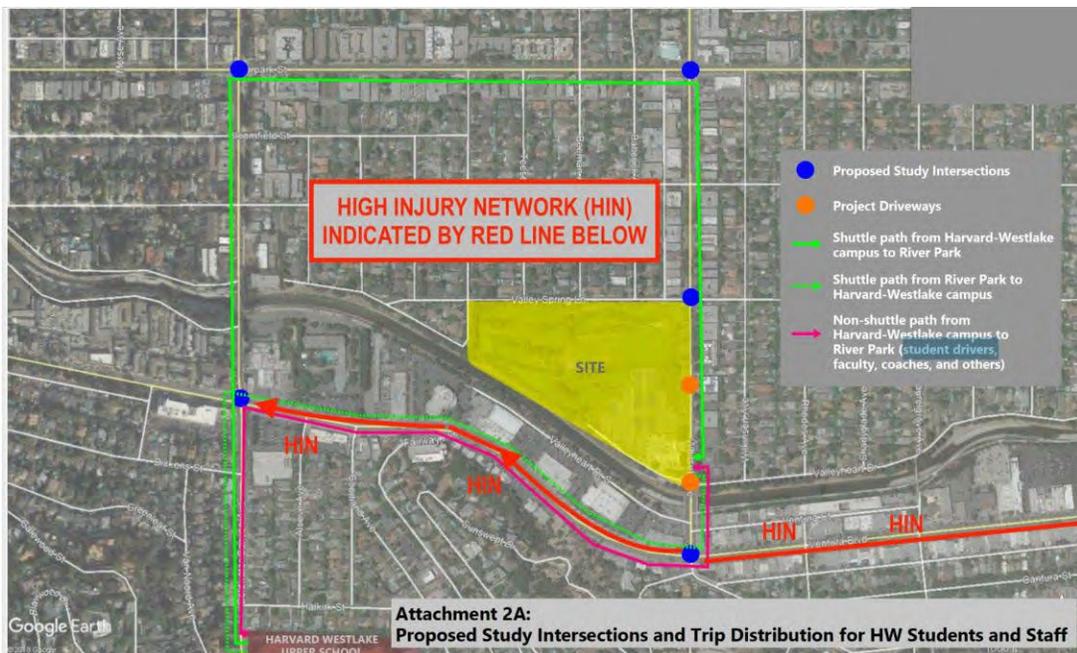

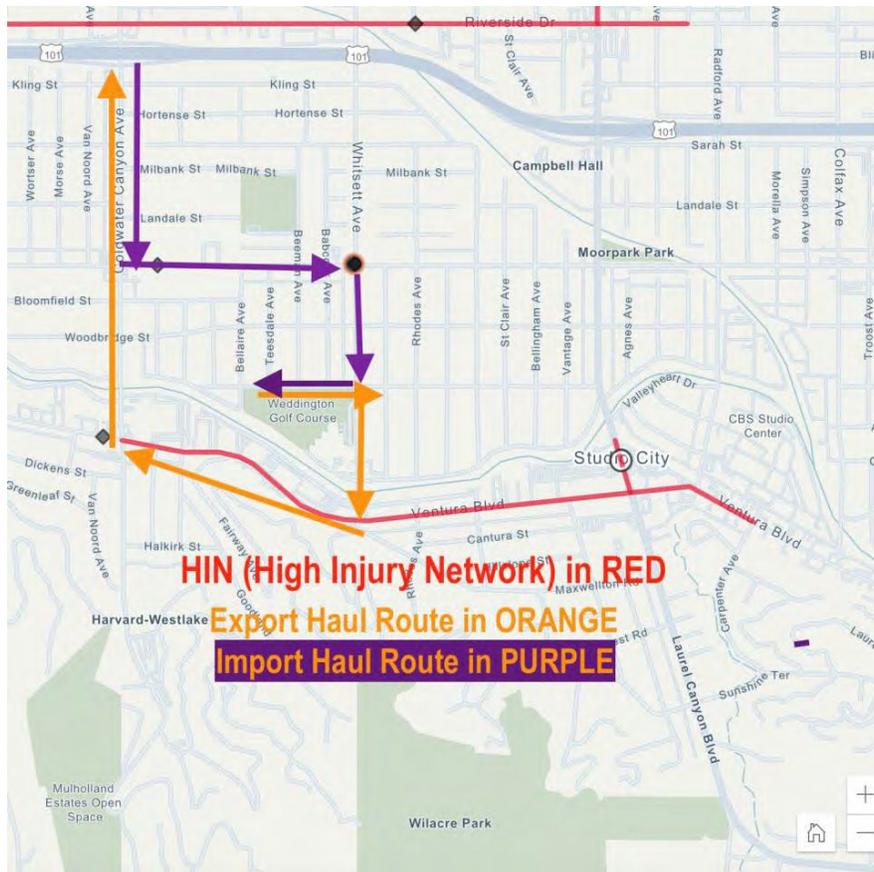

### **8. Safety Impacts**

A report (Attachment 6) performed by Aperture (formerly WEXCO) regarding the Project's safety impacts is included. The Aperture report raises a number of concerning topics, many of which relate to ensuring the safe ingress and egress for emergency services personnel and vehicles at the Los Angeles Fire Department (LAFD) Station 78. First off, the report states that eliminating the Fire Station's relatively exclusive use of Valleyheart Drive and allowing vehicle and pedestrian traffic on Valleyheart Drive to access the Project site and the south driveway is unsafe. It is crucial to note that residents living south of Ventura Boulevard are located in a Very High Fire Hazard Severity Zone (VHFHSZ). Any impacts to emergency services personnel and vehicle response times stemming from the proposed Project may pose a significant threat to the entire Santa Monica Mountains, as any fire in this VHFHSZ can quickly become uncontrolled and spread rapidly.

The report also states that for Project Design Feature TRAF-PDF-2, "the proposed red flashing light solution is not nearly enough" and "manual systems such as those proposed are subject to human error." In light of the fact that the DEIR raises the possibility that increased staffing for existing facilities, additional fire protection facilities, or that relocation of the existing LAFD Station 78 may be needed, "more and other options are needed to address the impacts to the Public Safety relative to the impacts of the construction and proposed project to the LAFD Station 78" (Attachment 6).

In addition, the Aperture report (Attachment 6) asks the Lead Agency if a controlled intersection with a traffic signal is being planned for the north driveway, as this is the only exit point for all 503 underground parking spaces. The report also clarifies that although parking in the neighborhood would not be permitted, the Applicant's security guards do not have the authority to enforce the Vehicle Code or Parking Enforcement, so the proposed enforcement is not truly enforceable. Additionally, the report suggests that all aspects of the Project (construction haul routes, planned student and visitor trip routes, and daily, cumulative traffic impacts) should be examined in light of the Los Angeles Department of Transportation (LADOT)'s High Injury Network (HIN), which designates Ventura Boulevard between Coldwater Canyon Avenue and Carpenter Avenue as a street with one of the City's highest incidences of severe and fatal injury collisions.

Please refer to the two maps below, the first of which illustrates the construction haul routes in the context of the HIN and the second of which illustrates planned student and visitor trip routes in the context of the HIN.

## **Response No. ORG 1C-35**

The comment summarizes the concerns raised by the Aperture report which was also attached to Letter ORG 1B, as well as 1C. The responses to the comments by Aperture are addressed in Response Nos. ORG 1B-171 through 1B-195. In addition, the commenter is referred to Response Nos. ORG 1B-81 through ORG 1B-84, which address emergency access to LAFD Fire Station 78. Note that current revisions to the Project would reduce the capacity of the underground structure from 503 spaces to 386 spaces and the capacity of the above grade parking lot from 29 spaces to 17 spaces for a total of 403 spaces. See Topical Response No. 2 – Modifications to the Project Design and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

In addition, as indicated in Topical Response No. 9 – Transportation and Parking During Construction and Operations, following circulation of the Draft EIR, the City installed a traffic signal at the intersection of Whitsett Avenue and Valley Spring Lane. The intersection of Whitsett Avenue and Valley Spring Lane was unsignalized at the time of publication of the Draft EIR. The addition of the traffic signal would allow for pedestrian and bicycle crossings from the surrounding areas to the Project Site through the intersection in marked crosswalks, thus, enhancing pedestrian safety in the Project Site area.

## **Comment No. ORG 1C-36**

The Aperture report also raises the possibility of errant sports-related equipment entering roads, like Valley Spring Lane (from the proposed tennis courts) and Whitsett Avenue (from the proposed Field A). Golf balls are found on Valley Spring Lane and Whitsett Avenue now, so it is likely sports-related objects will enter these streets, which could be dangerous (Attachment 7).

## **Response No. ORG 1C-36**

This comment raises the same concerns included in Comment No. ORG 1B-194. As discussed in Response No. ORG 1B-194, the Project Site currently has 16 courts along Whitsett Avenue that are open until 10:00 P.M. daily, compared to the Project which would have 8 courts closing at 9:00 P.M. daily. The potential for errant tennis balls has not been described as an environmental hazard under existing conditions, even though existing tennis courts are proximate to Whitsett Avenue which, according to Mobility Plan 2035, is considered a Major Highway Class II. In addition, fencing along the Project Site's Valley Spring Lane and Whitsett Avenue frontages would reduce the potential for sports equipment to be lost in these streets.

## **Comment No. ORG 1C-37**

Speaking of dangerous roads, the Aperture report suggests that when there are special events, "it is likely that people will park on the east side of Whitsett Avenue and either walk around the block to the nearest cross-street (with currently no crosswalk) or dart

across Whitsett (east to west).” In addition, the street lighting on Whitsett Avenue is not particularly suitable for the increased pedestrian traffic that would be generated by the proposed project (Attachment 7). Potential mitigations proposed would be to eliminate events and allow day-time only usage of the Project site.

### **Response No. ORG 1C-37**

This comment raises the same concerns included in Comment Nos. ORG 1B-186 and 1B-193. As discussed in Response Nos. ORG 1B-186 and ORG 1B-193, these concerns do not raise any issues with respect to the content or adequacy of the Draft EIR and the Project would comply with applicable City lighting regulations. Please also refer to Topical Response No. 4 – Aesthetics, for a discussion of Project lighting and Topical Response No. 9 – Transportation and Parking During Construction and Operations, for a discussion of the enforcement of on- and off-site parking restrictions.

In addition, as indicated in Topical Response No. 9 – Transportation and Parking During Construction and Operations, following circulation of the Draft EIR, the City installed a traffic signal at the intersection of Whitsett Avenue and Valley Spring Lane. The intersection of Whitsett Avenue and Valley Spring Lane was unsignalized at the time of publication of the Draft EIR. The addition of the traffic signal would allow for pedestrian and bicycle crossings from the surrounding areas to the Project Site through the intersection in marked crosswalks, thus, enhancing pedestrian safety in the Project Site area.

### **Comment No. ORG 1C-38**

The DEIR is inadequate because by not including a comprehensive Health Risk Assessment, it has alarmingly failed to consider the health risks to nearby residents (many of which are seniors and children) from construction-related toxics and the cumulative toxic air contaminant (TAC) emissions that include operational emissions. Again, as the Project site is uniquely situated within a residential neighborhood, with some homes as close as 45 feet away, the DEIR must comprehensively analyze all risks to ensure the community’s health and safety. We encourage the Lead Agency to insist on the use of AERMOD to characterize increased health risks of exposures to TACs. A recirculated DEIR (RDEIR) must demonstrate that the Lead Agency considers it a priority to protect public health by including a comprehensive Health Risk Assessment to definitely determine which of the Project’s many impacts are truly significant.

### **Response No. ORG 1C-38**

The comment states that a health risk assessment is required for Project construction and operation. Refer to Response Nos. ORG 1B-77 to 1B-79 and ORG 1B-126, which address this concern.

## Comment No. ORG 1C-39

### 9. Recreation Impacts

The DEIR is inadequate because it fails to explain how different sports offer different opportunities and challenges for different athletes or users. Replacing the current multi-generational sports of golf and tennis with team sports (basketball, football, lacrosse, etc.) that require schedules, practices, and uniforms will dramatically reduce public access for people of all ages and instead, cater to a much smaller demographic of school-aged participants. The DEIR is also defective, since in many instances, it uses “as the crow flies” as a measure, instead of actual measurements.

The assumption in the DEIR that people using the par 3 golf course at Weddington Golf & Tennis will "migrate" to larger, 18-hole courses fails to take into account that seniors and younger children will be excluded by either age or stamina to utilize much larger courses. Also, the increased cost and travel involved will also deprive many of opportunity and access.

## Response No. ORG 1C-39

The comment states that the Draft EIR fails to explain how different sports offer different opportunities and challenges compared to existing conditions. This comment is not related to a CEQA impact. Recreational impacts are analyzed based on the thresholds of significance in Appendix G of the CEQA Guidelines as shown on page IV.L.3-19 of the Draft EIR, and are generally determined in consideration of adverse physical impacts to the environment. The commenter is referred to Topical Response No. 11 – Recreation: Golf and Tennis Facilities, for a detailed discussion of the Project’s impacts related to recreational facilities, including golf, as applicable to the Appendix G thresholds.

In addition, refer to Topical Response No. 3 - Enforcement of Public Access, in this Final EIR for additional details regarding public access and use of the Project Site, and a discussion of the School’s commitments to public access and shared use of recreational facilities as set forth in the Draft EIR.

The term “as the crow flies” is used with specific dimensions and is an accepted term to indicate that the measure is a straight line between the origin and destination locations.

Lastly, the analysis of golf course and driving range availability in the Draft EIR does not presume any use at all of full length, 18-hole golf courses, contrary to the commenter’s assertion. Stated conversely, the ability of golfers to reserve tee times at other courses was based exclusively on nine-hole, par-27 courses under the assumption that “golfers would seek out similar nine-hole playing opportunities.” (pages IV.L.3-21 and IV.L.3-22 in Section IV L.3, *Public Services – Parks and Recreation*, of the Draft EIR)

## Comment No. ORG 1C-40

The proposed reduction of publicly-available tennis courts (from 16 to 8) will restrict the ability of Southern California community members to learn and play tennis. Since the early 1970s, Weddington's courts have served as a teaching hub, with pros offering instruction to beginners and experienced players, alike. Approximately 100,000 Angelenos of all backgrounds and from across the San Fernando Valley and City of Los Angeles (according to a survey in the DEIR, tennis players at Weddington are widely distributed and originate from 74 regional ZIP codes) use Weddington Golf & Tennis each year. If the proposed development is approved (for the primary benefit of approximately 800 Harvard-Westlake School students), tens of thousands of community members will be forced to relocate to continue playing tennis or may simply stop playing tennis altogether. We urge City Planning to consider this question: Is privatizing spaces that have been open to the public for nearly 70 years, for the limited use of a select few, really in the best interest of the City and its residents?

Although the DEIR lists alternate "tennis courts in the East San Fernando Valley available to the public," the average number of courts at those facilities is less than five, which fails to account for the fact that associations and leagues cannot utilize so few courts at these facilities. A greater number of courts for tournaments, like the 16 at Weddington, is needed for association and league use (Attachment 8, Attachment 9). More importantly, City facilities do not permit the block reservations utilized by pros, associations, and leagues as are currently allowed at Weddington.

The DEIR claims the proposed Project would be able to continue to host league matches "as under existing conditions"; however, this is false. Associations and leagues need, on average, greater than 4 courts per facility at a time for tournaments. And, they are already starved for courts (Attachment 9). How could the proposed Project continue to host associations when only eight courts are being proposed and historical precedent reveals a single organization cannot book all the courts at once? (Some courts need to remain available for non-association/league public use).

In addition, there is only a tepid acknowledgement in the DEIR that "the reduction in tennis courts from 16 to 8 available to the public and hours of use during weekdays and Saturdays when the courts would be used by the School, indicates that some tennis players would either need to conduct their tennis activities at other times of the day or other days when there is ample court availability, than under existing conditions, or relocate to other tennis facilities in the area." The Project will result in the displacement of thousands of tennis players, much to the detriment of the community.

The DEIR Table IV.L.3-6's comparison between existing average use versus future project capacity is extremely misleading and requires clarification in a recirculated DEIR (RDEIR). The table is not comparing apples to apples. If it was, it would be comparing existing capacity to future capacity. Instead, it is comparing existing average use to future

capacity. Of course, it is obvious that capacity and opportunity for play would be greater with the existing 16 courts versus the proposed 8 courts.

### **Response No. ORG 1C-40**

The comment states that the Project's proposed reduction of publicly-available tennis courts (from 16 to 8) will restrict the ability of Southern California community members to learn and play tennis. Please refer to Topical Response No. 11 - Recreation: Golf and Tennis Facilities, regarding public use of the Project's tennis courts and the capacity of the future courts to accommodate the same number of sessions for the public, including tournament play, as under existing conditions. For additional discussion of the availability of the tennis courts to meet public and organizational needs, including tournaments, refer to Response Nos. ORG 15-6 to ORG 15-8. As discussed within these responses, the Project's eight (8) tennis courts could accommodate the existing average number of weekly tennis sessions. However, it is acknowledged that, as discussed on pages IV.L.3-20 and IV.L.3-25 in Section IV.L.3 of the Draft EIR, available capacity of the future onsite tennis courts could depend on the willingness of existing players to shift their preferred hours of use. Although this could cause inconvenience to some players, those who have preferred hours not available at the Project Site have other tennis court choices throughout the local area. The choice of some existing players to relocate to off-site courts would not increase demand at off-site tennis facilities that would cause significant deterioration nor require the construction of new facilities.

### **Comment No. ORG 1C-41**

Finally, in the DEIR, there are multiple disclaimers and pre-conditions for use of the proposed project's facilities, including access to facilities "when not in use by School," "for pre-approved Studio City-based organizations," and "for pre-approved swim program members." These limitations are in stark contrast to the publicly available amenities at Weddington Golf & Tennis, which have always been open to all community members without restrictions of any kind at any time.

### **Response No. ORG 1C-41**

The comment speculates that the requirements for use of the tennis courts would make it difficult for the commenter's organization to use the facilities and states that there are currently no restrictions on their use of the tennis courts. This assertion does not present any facts to support a contention that the Draft EIR's analysis of Project impacts to recreational facilities is inadequate; therefore, no further response is necessary. Nonetheless, see Response No. ORG 15-8 which indicates that the Project would have adequate capacity to accommodate the current weekly number of tennis court sessions as the existing Weddington Golf & Tennis facility. In addition, refer to Topical Response No. 3 – Enforcement of Public Access, for additional details regarding public access, the rationale and mechanism by which public groups may be pre-approved, and use of the Project Site, including tennis facility use, and a discussion of the School's commitments to public access and shared use of recreational facilities as set forth in the Draft EIR.

## Comment No. ORG 1C-42

### 10. Cultural Resources

The DEIR is defective because it fails to address the impacts of the Project on a character-defining feature of the Project site (the golf course) and fails to identify significant Project-related historic resource impacts.

First, the DEIR Historic Resources Technical Report Figure 3 fails to identify the Weddington Golf & Tennis facility or Project site as a Designated Historic-Cultural Monument or SurveyLA Identified Historic Resource. The figure needs to clearly identify if the Project site is a Designated Historic-Cultural Monument or SurveyLA Identified Historic Resources.

The DEIR also fails to reference the existing lawsuit filed against the City of Los Angeles (Superior Court of California, County of Los Angeles Case Number: 21STCP04158) regarding the suspicious, last-minute removal (without evidence, as required by law) of historically and culturally significant terms from the final Historic-Cultural Monument (HCM) designation determination. The essential defining terms “golf club” and “golf course” were improperly removed at the last minute during the final vote for the designation. The revised findings inappropriately limit the scope of the HCM designation and do not honor the full history, heritage, culture, and experience of Weddington Golf & Tennis. We are also gravely concerned about any precedent this may set for Los Angeles preservation moving forward.

The DEIR asserts that “the Project would not result in a substantial adverse change in the significance of a historical resource” because “the Project site would remain a private recreational facility open for public use in Studio City, and the character defining features of the HCM, specifically the clubhouse, putting green, golf ball-shaped light standards, and brick wall with weeping mortar, would all be retained such that the Project Site would retain its historic integrity and continue to convey its significance as a 1950s community recreational facility.” However, this rationale would need to be revised if the City is instructed to correct its oversight and amend its HCM designation for Weddington Golf & Tennis.

The DEIR underestimates the historic quality of the entire Weddington Golf & Tennis subject property, relegating the value of historic resources to only the putting green, clubhouse, and golf ball light standards. It is likely that numerous mitigation measures will be required to protect the golf course and driving range from significant, irreparable damage to their historic nature. As a result, the DEIR cannot accurately assess the Project site’s historic and cultural landscape until the scope of character-defining features is revised. Future City Planning analyses need to be delayed until more definitive mitigation measures for historic preservation are identified.

## Response No. ORG 1C-42

The comment contends that the Draft EIR is defective because it fails to address the impacts of the Project on what the commenter perceives as a character-defining feature of the Project site (the golf course and driving range) and fails to identify significant Project-related historical resource impacts. The comment raises concerns related to the Project Site's HCM designation, a lawsuit filed against the City regarding the HCM designation, and potential for mitigation measures from a future lawsuit. The commenter is referred to Response Nos. ORG 1B-165 to ORG 1B-168 which address concerns related to cultural resources impacts raised in this comment.

## Comment No. ORG 1C-43

### 11. Land Use Compatibility/Impacts to Open Space Land

Only after receiving numerous zone variances and a Conditional Use Permit (CUP), would the Project be compatible with the current A1-1XL-RIO zone. Although there is brief mention that the Biological Study Area “may facilitate wildlife movement between these two areas that support higher quality resources for wildlife” (referring to Griffith Park/Bette Davis Picnic Area and Sepulveda Dam) and “could serve as patch habitat along the river and provide some habitat value to urban-adapted wildlife species and may support live-in and movement habitat for species on a local scale,” more information is needed in a recirculated DEIR (RDEIR) to describe the importance of so-called “habitat patches.” This is needed, especially in light of research that has shown that preserving smaller isolated patches is more beneficial than contiguous tracts.<sup>36</sup>

Also, please refer to the two renderings below, both of which illustrate just how intrusive the Project components would be in a largely residential neighborhood.

<sup>36</sup> Available at: <https://www.pnas.org/doi/epdf/10.1073/pnas.1813051115>

## Response No. ORG 1C-43

This comment expresses concerns about the approvals being requested for the Project. The Project Site is zoned A1-1XL-RIO. The “A1” zone, which allows one-family dwellings, parks, golf courses, and farming among other uses, and also permits a school use with a

conditional use permit.<sup>76</sup> LAMC Section 12.24.T.3(b) explicitly permits schools and school-related facilities within an agricultural (A) zone and in all residential (R) zones under a conditional use permit (CUP). Most private schools in the City operate under a CUP (public schools are not subject to the City's zoning code). Therefore, the Project's application for a CUP to operate its athletic and recreational facilities is not an unusual circumstance that indicates a conflict with the Project Site's existing zoning or the City's Zoning Code.

The comment also expresses concerns regarding wildlife movement and provides renderings to illustrate "how intrusive the Project components would be in a largely residential neighborhood." These renderings are provided as a reflection of the commenter's opinion on the compatibility of the Project with the neighboring residential uses, as well as support for the commenter's concern regarding habitat connectivity and wildlife corridors.

As stated on page IV.C-45 under the heading of *Wildlife Movement and Corridors* of the DEIR, it is acknowledged that the Biological Study Area supports limited potential live-in and marginal movement habitat for species on a local scale (i.e., some reptile, bird, and small mammal species, such as squirrels) but does not facilitate wildlife movement for species on a regional scale and is not identified as a regionally important dispersal or seasonal migration corridor. Thus, although not a regional wildlife movement corridor, the Draft EIR recognizes that local movement and live-in habitat occurs on-site, albeit limited. For a more in-depth discussion of the *Wildlife Movement and Corridors* analysis, see Appendix D of the Draft EIR, Biological Resources Documentation, which includes the Biological Resources Technical Report prepared by ESA that describes the rationale for characterizing the Biological Study Area as having limited potential live-in and marginal movement habitat for species on a local scale (e.g., surrounding existing development, lack of native food sources, non-native ornamental trees, area subjected to frequent human disturbance due to operation of the golf course and tennis center; pages 27 to 28 [PDF pages 35 to 36 of 394]).

## **Comment No. ORG 1C-44**

### ***Story Poles and Transparency of Project's Scale***

In an effort to make the Project known to the community-at-large, including all motorists who travel along Whitsett Avenue, and all residents included in our Sherman Oaks - Studio City - Toluca Lake - Cahuenga Pass Community Plan, Save Weddington requests the erection of story poles. These markers are regularly used in other municipalities to make the public aware of the scale and scope of a proposed development project. There is also precedent for the use of story poles in Harvard-Westlake's previously proposed failed development plan (ENV-2013-0150- EIR), which was also supported by the local Studio City Neighborhood Council (SCNC) and the Studio City Residents Association

---

<sup>76</sup> Los Angeles Municipal Code (LAMC) Section 12.05.A (A1 Zone defined uses).

(SCRA). The Lead Agency, along with Councilmember Raman, should require the Applicant to erect story poles that visually demonstrate all components of the Project. The story pole demonstration must be erected as soon as possible to alert citizens of what might happen to this irreplaceable green open space if the Project is permitted to move forward.

### **Response No. ORG 1C-44**

The comment requests that the School hire a professional company to install “story poles.” The proposed “story poles” could be requested at the discretion of the Project’s decision makers but are not a part of the Project evaluated in the Draft EIR, nor are they required by or related to any impacts evaluated in the Draft EIR. The comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is necessary.

### **Comment No. ORG 1C-45**

#### **12. Study Area and Alternative Sites**

In a re-circulated DEIR (RDEIR), the Study Area radius for including sensitive receptors and identifying potential alternative sites must be expanded. Although it remains unclear from which exact point of the 16-acre Weddington Golf & Tennis site the 0.5 mile radius emanates from, regardless, the Study Area Radius must be expanded due to the many concerns this Project raises for the immediate neighborhood around the Weddington Golf & Tennis site, as well as the greater Studio City community. The DEIR uses differing Study Area radii, with a 0.5 mile radius being used in some instances and a 1 mile radius being used in others, as evidenced in Figure 3 of the Historic Resources Technical Report. [See Figure 3 in the original comment letter included Appendix A of this Draft EIR].

As the Study Area radius for many projects is arbitrarily decided, we propose utilizing an established, relevant distance. For example, this may include the distance between the two existing Harvard-Westlake School campuses (since the Project is being considered a third campus) or, at the very least, the distance between the upper school campus and the Project site or between the Project site and the US-101 Highway at the Coldwater Canyon Avenue on-ramp/off-ramp (which is the origination point in the preliminary projected haul route in the DEIR). The shortest route (which utilizes Coldwater Canyon) between the Applicant’s two existing campuses [(700 North Faring Road, Los Angeles, CA 90077) and (3700 Coldwater Canyon Avenue, Studio City, CA 91604)] has a distance of 6.5 miles. The distance between the upper school campus and Weddington Golf & Tennis utilizing the Applicant’s prescribed transportation route is 1.3 miles. The distance between the Project site and the US-101 Highway at the Coldwater Canyon on- ramp/off-ramp is 1.2 miles.

## Response No. ORG 1C-45

The comment requests an increase in the size of the Project Study Area. The comment does not support the request for an expanded study area with pertinent information or facts. It is unclear what study area the comment is referring to as the Draft EIR's analysis of environmental impact category is determined by the potential impact, consistent with CEQA and the Department of City Planning's practice. For example, while the Cultural Resources Technical Study, Appendix C, of the Draft EIR, researched resources within one mile of the Project Site, the Air Quality analysis covers the South Coast Air Quality basin, and the Noise analysis includes a discussion of off-site construction traffic noise, which includes the truck haul route. If this comment is related to the list of related projects in Chapter 3, *Environmental Setting*, of the Draft EIR, a consideration of the list of related projects is included as part of the cumulative analyses provided for each environmental impact category analyzed in the Draft EIR. As discussed on page III-4 of the Draft EIR, CEQA Guidelines Section 15130(b) provides that the discussion of cumulative impacts reflect "the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great of detail as is provided for the effects attributable to the project alone." Rather, the discussion is to "be guided by the standards of practicality and reasonableness, and should focus on the cumulative impact to which the identified other projects contribute." Cumulative study areas are defined based on an analysis of the geographical scope relevant to each particular environmental issue. Therefore, the cumulative study area for each individual environmental impact issue may vary. For example, a cumulative land use impact generally may only affect the compatibility of uses within the vicinity of the project site, while a cumulative air quality impact may affect the entire South Coast Air Basin. The specific boundaries and the projected growth within those boundaries for the cumulative study area of each environmental issue are identified in the applicable environmental impact category section in Chapter IV, *Environmental Impact Analysis*, of this Draft EIR.

The Project's related project's list is determined by the LADOT according to procedures set forth in the LADOT's TAG. According to the TAG, the Draft EIR Study Area for major projects in the City of Los Angeles is based on a one-half mile radius of the Project Site plus one-quarter mile from the farthest outlying intersection.

Further, the concern in the comment that an increase in the Study Area would increase environmental impacts to sensitive receptors does not reasonably reflect CEQA analysis procedures. Under CEQA analysis procedures, impacts to the nearest sensitive receptors typically result in the worst-case or conservative scenario with respect to CEQA impact thresholds. The worst-case scenarios are more likely to reveal a project's most severe and most likely environmental impacts. As evaluated in detail in the Draft EIR, the Project would result in significant and unavoidable impacts related to construction noise and vibration. More distant receptors beyond those evaluated in the Draft EIR would experience decreased or no impacts compared to those evaluated and disclosed in the Draft EIR. All other potential impacts identified for evaluation in the Draft EIR were either determined to be less than significant or were mitigated to less-than-significant levels.

Under CEQA, adverse impacts to one receptor or exceedance of one threshold identifies a significant impact that must be mitigated as feasible. The Draft EIR complies with all CEQA procedural requirements in this regard. An increase in the study area (or list of related projects) would not substantially increase or result in new Project-level or cumulative environmental impacts, nor change the findings of the Draft EIR.

### **Comment No. ORG 1C-46**

The DEIR is woefully inadequate in its production of alternatives to the Project. There is no evidence of true effort made to identify viable alternatives. Additionally, none of the four alternatives to the Project listed in the DEIR are good-faith attempts to incorporate the community's true concerns. The alternatives listed are extremes and do not represent the Applicant's ability to truly value the community's concerns and compromise with a Project plan that would be supported by both the Applicant and the greater Studio City, San Fernando Valley, and Los Angeles community.

Although the DEIR claims that "in order for the Project to satisfy the Project Objectives, a property would need to be of sufficient size to accommodate two playing fields, tennis courts, a pool, all with respective bleachers, and a gymnasium that would provide for recreational practice and instruction, as well as allow for competitive meets with available spectator seating and adequate onsite parking to preclude off-site parking." If the athletics-related Project Objective that is being referenced is to "develop a state-of-the-art indoor and outdoor athletic and recreational facility to support the School's existing athletic programs and co-curricular activities, including basketball, soccer, football, track and field, tennis, swim, water polo, volleyball, fencing, weight training, dance, yoga, physical fitness, and wrestling programs," wouldn't the Applicant's existing facilities suffice and allow for this Project Objective to be met?

The DEIR inadequately explains the need for the Applicant's Project Objectives and inadequately describes why an additional campus is required, considering the fact that the Applicant's current campuses already meet stated Project Objectives. The Applicant can also refer to and consult with three other similar, nearby schools (Campbell Hall, Notre Dame High School, and The Buckley School) that all operate fewer athletic facilities for roughly the same number of students.

As described above, considering the fact that, excluding the Project site, the Applicant already has two athletic fields, two swimming pools, two gymnasiums, two sports performance centers, two baseball/softball fields, and eight tennis courts, it seems like the Applicant has enough facilities to satisfy the Project Objective in question.

### **Response No. ORG 1C-46**

This comment expresses concerns regarding the adequacy of the alternatives analyzed in the Draft EIR and questions the need for the Project in consideration of the School's existing Upper Campus school facilities. For detailed discussions of the Project's adequacy of alternatives and Project objectives in the Draft EIR, refer to Response Nos.

ORG 1B-104, 1B-105, ORG 1B-106 and ORG 7A-146 to ORG 7A-176. Please also refer to Topical Response No. 13 - Need for Project (Non-CEQA), for a discussion of the existing, space-constrained athletic and recreational facilities on the School's Upper School campus.

### **Comment No. ORG 1C-47**

An alternative that was rejected from further analysis was the use of natural turf fields instead of the Project's artificial turf fields. The DEIR claims that "this alternative was considered to result in a much higher water demand than the Project"; however, mathematical modeling has shown that the use of water to irrigate natural turf is comparable to the amount of water required to cool artificial turf."<sup>21</sup>[sic] Therefore, a recirculated DEIR (RDEIR) must examine this alternative.

<sup>37</sup> Available at: <https://auduboninternational.org/acsp-for-golf/>

### **Response No. ORG 1C-47**

The comment states that the use of natural turf fields instead of the Project's artificial turf fields was rejected from further analysis as an alternative. The fact is that no irrigation lines will be run to the artificial turf fields and, furthermore, the School's existing artificial turf field on its Upper School campus is not irrigated. Thus, irrigation water will not be used on the artificial turf fields. Moreover, pursuant to CEQA Guidelines Section, 15126.6, an EIR need not consider all possible alternatives, only a range of reasonable alternatives that seek to lessen the Project's significant impacts. As fully discussed in the Draft EIR, the Project's significant impacts would only occur during construction activities. Accordingly, the suggested alternative is not warranted. Thus, a recirculated Draft EIR to address concerns raised in this comment is not necessary.

### **Comment No. ORG 1C-48**

While all of the alternatives in the DEIR are insufficient, Alternative 3 is particularly shocking because of the proposed placement of a 239 parking space parking lot in the northwest corner of the Project site - less than 45 feet away from a residential neighborhood with single family homes. This alternative is also in direct contradiction with the Applicant's stated commitment to preserving the "the community's desires by maintaining the tranquility of the property," which was stated in Councilmember Krekorian's 2017 letter to the community (Attachment 2). Of note, the "No Project/No Build" alternative is considered the overall environmentally superior alternative.

### **Response No. ORG 1C-48**

The comment asserts that all the Project Alternatives are insufficient and that, in particular, Alternative 3 would not preserve the community's desire to maintain the tranquility of the Project Site. The comment does not contain facts which support the assertion that the alternatives analysis in the Draft EIR is inadequate. Moreover, the

selection of Alternative 3 is based on CEQA Section 15126.6, which is to feasibly attain most of the objectives of the Project while avoiding or reducing any of the significant effects of the Project. Alternative 3 was selected to reduce the Project's significant and unavoidable excavation and grading noise impacts. The community's desire that the privately-owned Project Site maintain the tranquility of the property is not an impact on the environment which must be analyzed in an EIR nor is the term well-defined in the comment. For the purpose of the Draft EIR, the standard for evaluating project impacts is the goal of reducing or maintaining environmental impacts at less than significant levels. The evaluation of alternatives is to compare the alternatives to the Project and to determine if the alternative would reduce significant impacts or potentially result in secondary effects.

### **Comment No. ORG 1C-49**

Several recommendations for alternatives are described below, each of which City Planning must seriously consider in lieu of the Project.

- The Applicant could partake in a land swap with Los Angeles Valley College (LAVC). The Applicant could build everything that is currently included in the current Project plans and Weddington Golf & Tennis would become part of the City of Los Angeles Department of Recreation and Parks and be open to the public in perpetuity. Also, there is already precedent for Harvard-Westlake School sharing facilities with LAVC, as the School refurbished the eight Tribull Tennis Courts at LAVC and has previously used these facilities for its tennis operations. If the land swap is pursued and completed, the Applicant would not take a beloved asset away from the community, but rather, provide for the community by improving the facilities at LAVC.
  - Improvements to the current golf course could be pursued, such as using recycled water, changing turf types, reducing the amount of fertilizer and pesticides used, pursuing regenerative practices, and receiving designation in the Audubon Cooperative Sanctuary Program for Golf Courses.<sup>37</sup> Due to its existing, mature urban tree canopy, Weddington Golf & Tennis is home to many species, but with Audubon's guidelines and assistance, could become a leader in the movement to balance biological needs with recreational desires by enhancing wildlife and habitat management, enhancing water conservation and water quality management, and reducing chemical use.
  - Although the Applicant has claimed that the Project site, in its current use, is no longer financially viable, the Applicant's 990 Tax Returns (which are available to the public, as the School has non-profit status) refute this claim. The Weddington Golf & Tennis facility has been extremely busy over the last few years and the facility generates sufficient income to cover the operation of the facility, which again, is described in the Applicant's 990 Tax Returns.

## Response No. ORG 1C-49

The comment suggests an alternative be considered which involves a land swap with LAVC, while providing improvements to the existing Weddington Golf and Tennis facility. The comment also makes unsubstantiated reference to the financial viability of the existing Weddington Golf and Tennis facility. The commenter is referred to Response No. ORG 1B-106 which addresses LAVC as an alternative site.

Regarding alternatives that would require the School to remodel or otherwise upgrade or improve the existing facilities on the Project Site, not only are such alternatives not required by CEQA but the City cannot compel the School to continue operation of the current uses. Specifically, the Property was purchased by the School in 2017 and the School is under no obligation to continue current operation. The School has indicated a willingness to do so, however, while the Project undergoes environmental review by the City. Also, please refer to Topical Response No. 13 - Need for Project (Non-CEQA), which discusses why the continuation of Weddington Golf & Tennis facility would not be feasible.

## Comment No. ORG 1C-50

- The Applicant could partake in a land swap next to its current baseball and softball facilities (O'Malley Family Field and Encino-Sherman Oaks Softball Facility at Encino Franklin Fields) on City-owned land at Balboa Park. The Applicant could maintain its baseball and softball fields and build some or all of its proposed Project on directly-adjacent land. However, as proponents of true green open space, we would advocate for the new Project site to preserve as much permeable parkland as possible. Then, Weddington Golf & Tennis would become part of the City of Los Angeles Department of Recreation and Parks and be open to the public in perpetuity.

## Response No. ORG 1C-50

The comment suggests a land swap next to its current baseball and softball facilities (O'Malley Family Field and Encino-Sherman Oaks Softball Facility at Encino Franklin Fields) on City-owned land at Balboa Park as an Alternative to the Project. The alternative site included in this comment would not satisfy the Project Objectives. The reasons that alternative sites were considered and rejected is provided in Section V, *Alternatives*, page V-6, of the Draft EIR. In addition to a site with the size to accommodate the Project Objectives, the other criteria for the Project include proximity to the existing Harvard-Westlake's Upper School campus on Coldwater Canyon Avenue and a site with level topography to allow for the development of the contemplated recreational facilities. Proximity is a criteria factor because of the need for daily commuting from the Upper School campus, as it relates to higher daily vehicle miles. As concluded in Section V, no other location with adequate acreage and topography exists within proximity to the Upper School campus.

Balboa Park is also located within an urban area surrounded by residential land uses and would not reduce the significant and unavoidable impacts of the Project. While the School's golf team may use this site, this site is located approximately 7.0 miles from the Upper School campus and additional shuttles for additional student use would result in greater VMT impacts than the Project Site, located approximately 1.5 miles from the Upper School campus.

### **Comment No. ORG 1C-51**

- The Applicant could scale down the Project to focus on the southern part of the property, thus reducing many of the most egregious impacts to the community and preserving a significant portion of the property for its historic use (golf and tennis) for a wide demographic. The Applicant could use their current surface level parking lots to build another gymnasium and utilize underground parking. Then, the Applicant could reduce the number of proposed Project fields to one (the smaller field) on the Project site, since the Applicant already has a field and track stadium on its upper school campus. Any way a potential Project is configured, it would cause significant impacts to community members (either to the immediate north, immediate west, east of Whitsett Avenue, or south of Ventura Boulevard). Therefore, the Project must be rejected for the benefit of all community members.

### **Response No. ORG 1C-51**

The comment suggests that the Project would result in egregious impacts in the northern part of the Project Site. This statement and further statements that the Project would result in significant operational impacts are inconsistent with the findings of the Draft EIR and are not supported by facts. Because the statement does not provide any evidence to refute the findings of the Draft EIR, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

### **Comment No. ORG 1C-52**

- No additional parking at the Project site (retaining the existing lot), with students and visitors utilizing shuttle bus services or parking at the Studio City public parking lot (12225 Ventura Boulevard Studio City, CA 91604) and walking a short distance to the Project site.

### **Response No. ORG 1C-52**

The comment suggests an alternative that would retain the existing parking lot and eliminate the Project's parking program. It is assumed that the commenter is suggesting this as an alternative to eliminate impacts to the single-family residential neighborhood immediately north of the Project Site. See Topical Response No. 9 - Transportation and Parking During Construction and Operations, for a discussion of the Project's traffic impacts and parking. As discussed therein, all parking for the Project would be provided on-site. No off-site parking would be permitted. As such, the evaluation or implementation of this

recommended alternative is not necessary. Because the statement does not provide any evidence to refute the findings of the Draft EIR, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

### **Comment No. ORG 1C-53**

- Reduction in Project's proposed 532 parking spaces, 88 more than legally required. Alternatives should focus on decreasing the number of parking spaces at the Project site, as the concept of reliance on cars is steeped in the past, not the future.

### **Response No. ORG 1C-53**

The comment suggests that alternatives should focus on reducing the number of parking spaces. This comment does not raise any issues with respect to the adequacy of the Draft EIR. Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

The commenter is also referred to Response No. ORG 1C-46 which discusses the adequacy of the Draft EIR's alternatives analysis.

In addition, in consideration of public comments inquiring about the Project's parking features, modifications to the Project design would reduce the capacity of the underground parking structure from 503 spaces to 386 spaces and the capacity of the above grade parking lot from 29 spaces to 17 spaces for a total of 403 spaces. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, which discuss and reflect these changes to the Project design.

### **Comment No. ORG 1C-54**

- Re-location of tennis courts and/or pool on top of the gymnasium, thus enabling the retention of more green open space that the community is requesting. The preservation of more open space would inherently serve as a mitigation measure, reducing aesthetic, noise, and excavation disturbances, etc. One specific recommendation that community members have proposed is preserving the strip of land on the northern edge of the Project site along Valley Spring Lane from Bellaire Avenue to Whitsett Ave (golf course 9th hole, 2nd hole, and 3rd hole tee), which would provide a buffer between the residential neighborhood and the Project. The retention of more open space acreage to form a truly contiguous green space park might then finally justify the Applicant's Project site name of "River Park."

### **Response No. ORG 1C-54**

The comment suggests relocating athletic facilities to the roof of the gymnasium building. Since the Project would not result in any significant operational impacts, the evaluation of

an alternative that provides additional open space is not necessary from a CEQA perspective. The site plan does include a trail and landscaping along the northern Project Site edge between Valley Spring Avenue and the Project's recreational facilities, with setbacks of up to 100 feet as compared to the City-required 25 feet along Valley Spring Lane.

This comment does not raise any issues with respect to the adequacy of the Draft EIR. Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

### **Comment No. ORG 1C-55**

Any way a potential Project is configured, it would cause significant impacts to community members (either to the immediate north, immediate west, east of Whitsett Avenue, or south of Ventura Boulevard). Therefore, the Project must be rejected for the benefit of all community members.

### **Response No. ORG 1C-55**

The comment states that any way the Project could be configured, other than status quo preservation of golf and tennis, would cause significant impacts to community members and must be rejected. This comment, however, does not provide evidence of significant impacts consistent with the analyses in the Draft EIR. As discussed therein, the Project would potentially result in significant noise and vibration impacts associated with the Project's construction activities. However, operational impacts would all be less than significant with mitigation (as applicable).

This comment is noted for the record and will be forwarded to the decision-makers for their review and consideration.

### **Comment No. ORG 1C-56**

## **13. Discretionary Actions/Entitlements That Negatively Affect Local Community**

The DEIR is inadequate since the requested entitlements will not mitigate significant environmental impacts. Since said entitlements fail to address the negative impacts, they must not be granted. Save Weddington is extremely concerned about the numerous, far-reaching entitlements that the Applicant seeks as part of its proposed development project, including:

- Pursuant to LAMC Section 12.24, a Vesting Conditional Use Permit (CUP) to allow the operation of a private school athletic and recreational campus in the A1 zone.
- Two (2) 50-foot light poles on the east and west side of the pool facility (in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with "XL" signifying an "Extra Limited Height District").

- Three (3) 60-foot light poles on the north side of Field B (in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with “XL” signifying an “Extra Limited Height District”).
- One (1) 50-foot light pole on the west side, and one (1) 50-foot light pole on the east side, of Field B ((in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with “XL” signifying an “Extra Limited Height District”).
- Three (3) 80-foot light poles on the south side of Field B (in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with “XL” signifying an “Extra Limited Height District”).
- Three (3) 60-foot light poles on the west side, and three (3) 60-foot light poles on the east side, of Field A (in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with “XL” signifying an “Extra Limited Height District”).
- Twelve (12) 50-foot light poles located on all four sides of the proposed tennis courts (in lieu of the LAMC Section 12.21.A-1 required 30-foot maximum height limitation for buildings or structures in the A1-1XL-RIO zone, with “XL” signifying an “Extra Limited Height District”).
- 10-foot privacy walls along Whitsett Ave (in lieu of the 8-foot maximum height limitation for fences and walls in side yards and the 6-foot maximum height limitation for fences and walls in front yards in the A1-1XL-RIO zone).
- 11-foot privacy walls along Valley Spring Lane and Bellaire Ave (in lieu of the 8-foot maximum height limitation for fences and walls in side yards and the 6-foot maximum height limitation for fences and walls in front yards in the A1-1XL-RIO zone).

### **Response No. ORG 1C-56**

The comment states that the Draft EIR is inadequate because the Project’s requested permits and approvals would not mitigate impacts. The purpose of the permits and approvals is to establish key construction and operational requirements for the Project under a CUP. These are not intended as mitigation measures. The approvals being sought in themselves would not result in significant environmental impacts.

### **Comment No. ORG 1C-57**

The Conditional Use Permit (CUP) required for Project operations should not be granted, since, per LAMC Section 12.24, the following conditions are not satisfied:

- that the Project will enhance the built environment in the surrounding neighborhood or will perform a function or provide a service that is essential or beneficial to the community, city, or region;

- that the Project's location, size, height, operations and other significant features will be compatible with and will not adversely affect or further degrade adjacent properties, the surrounding neighborhood, or the public health, welfare, and safety; and
- that the Project substantially conforms with the purpose, intent and provisions of the General Plan, the applicable community plan, and any applicable specific plan.

### **Response No. ORG 1C-57**

The comment states the CUP for the Project should not be granted and cites conditions which are not satisfied. Similar issues are raised in Comment No. ORG 9-22. As discussed in detail in Response No. ORG 9-22, the Draft EIR concluded after detailed analysis that the Project would not result in significant operational impacts; degrade the community with respect to location, size, height, operations and other significant features that would impact public health, welfare, and safety; and that it would not conflict with the objectives of the General Plan or Community Plan. As such, the Project would meet the requirements (findings) required for the granting of a CUP for school-related uses.

### **Comment No. ORG 1C-58**

The DEIR is inadequate because it fails to address the continued expansion efforts by the Applicant. Based on past precedent of the Applicant's proposed expansion initiatives, Save Weddington requests (a) presentation, circulation, and certification of a long-term Harvard- Westlake School master strategic plan; (b) that the Project may only operate using a comprehensive Conditional Use Permit (CUP) that covers all three Harvard-Westlake School campuses; and (c) a 25-year building moratorium. During the Applicant's previous proposed failed development plan (ENV-2013-0150-EIR), it was explained that "Despite receiving permits based on enrollment at much lower numbers than the Applicant currently has, the Applicant has continued to increase enrollment since 1992, and alleges that they are not subject to an enrollment cap. Obviously, should the Project go forward, the Applicant must be held to an enforceable and clear enrollment cap at the current level of enrollment" (Attachment 3). Save Weddington agrees with the sentiment outlined by Save Coldwater Canyon!. Thus far, the Applicant has not linked the proposed Project to other plans for construction at either of its two other campuses. If the Applicant is discovered to be developing in a piecemeal manner, this would amount to unlawful segmentation: without a plan, segmentation is not permissible. In fact, it is illegal to divide a project with potentially significant impacts into smaller components so that when reviewed separately, the smaller components are not likely to represent significant impacts (Court Street Development Project, LLC v Utica Urban Renewal Agency; Sandora v City of New York). In various instances through the DEIR, the Project is referred to as the "Harvard-Westlake River Park Campus." The DEIR proposes the construction of Project facilities not only for athletics, but for educational opportunities, as well - even going so far to explain that, for example, inside the proposed gymnasium, there would be "flex-meeting spaces for ... students to do homework." Clearly, the proposed athletic and educational operational uses are connected and intertwined. If the

Project is approved and the site does indeed serve as a third campus, a comprehensive CUP would be needed to prevent continual shifting of operations and the Applicant must operate its three campuses under that single CUP.

### **Response No. ORG 1C-58**

The comment states that the Draft EIR is inadequate because it does not evaluate any future, potential expansion by the School. The comment further requests preparation of a Master Plan, a CUP covering all three of the Schools' campuses, and a 25-year building moratorium. This comment does not address the adequacy of the Draft EIR and, as such, no further response is necessary.

Nonetheless, LAMC Sec.12.24.T.3(b) permits schools and school-related facilities within an agricultural (A) zone under a Vesting Conditional Use Permit (CUP). A CUP is attached to a specific property and not to off-site facilities using the property. No changes are anticipated at the Harvard Westlake Middle or Upper Campuses as a result of the Project and, further, the CUP can limit the use of the Project Site as specifically described in the Draft EIR. The Project is intended in part for Harvard-Westlake students to meet and join in a range of simultaneous athletic and recreational activities and intramural sports during a prescribed time-frame primarily after school hours. The Project is also intended as a facility that can be used by the public in accordance with the objectives of the Project cited in Chapter II, *Project Description*, of the Draft EIR. The CUP, if approved, would allow the Project as described in the Draft EIR, along with any corrections/additions, included in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. With conditions of approval that establish the specific use of the Project, the Project would not lead to additional activities at the existing campuses that would result in the expansion or change in operations or growth that would result in potential environmental impacts not identified in the Draft EIR. As such, there is no purpose, or legal justification, for the Department of City Planning to require a Master Plan, agreement to any moratoriums, or preparation of detailed transportation demand management (TDM) plans for the Project Site and both campuses. It is also noted that TDM applies to reductions in commuting vehicle trips through various measures, such as carpooling, shuttling, and use of transit. The comment does not demonstrate that the proposed CUP would not adequately limit or define the range of activities and use of the Project Site. In addition, the range of activities at the Project Site does not indicate any necessary or implied changes in existing activities at the Upper School and Middle School campuses that would require a moratorium on growth or need to be addressed in the Draft EIR. Under existing conditions, students from the Middle School already commute after school to the Upper School campus for sports activities. This activity would not change, except that these students would likely carpool with older students or take School-provided shuttles to the Project Site from the Upper School campus. Large events also currently take place at the Upper School campus that require on-site parking (see Chapter II, *Project Description*, Table II-48, Harvard-Westlake School Athletic Program, which, outlines the School's 2018-19 school year). The comment does not provide any substantiated evidence to show how the Project would cause changes in the operation

and activity at the Middle or Upper campuses, or “shifting” of operations that would require the severe measures set forth in the recommendation.

## **Comment No. ORG 1C-59**

### **14. Community Views of Harvard-Westlake School and its Proposed Project**

In light of the numerous concerns the proposed Project raises, community members do not understand why the Applicant is pursuing this Project. In short, many in the community believe that this Project is excessive. As has been brought to our knowledge, if the proposed Project is permitted to proceed, Harvard-Westlake School (across both existing campuses with a student body of roughly 1,600 students) would be the only private school within the Los Angeles Unified School District (LAUSD) to have or utilize four athletic fields, three swimming pools, three gymnasiums, three sports performance centers, two baseball/softball fields, and eight tennis courts spread across five sites (including the middle school, upper school, and proposed “River Park” campuses).

According to the Applicant’s website, Harvard-Westlake School athletics facilities (with locations and descriptions) include:<sup>38</sup>

- Sprague Athletic Field (Middle school campus; Sprague Field is used to host middle school football, field hockey, lacrosse, soccer, and softball games.)
- The Marshall Center Gymnasium (Middle school campus; The gym hosts basketball and volleyball games as well as wrestling meets.)
- The Marshall Center Sports Performance Facility (Middle school campus; The sports performance facility is used for middle school PE and ninth grade sports performance training.)
- Marshall Center Swimming Pool (Middle school campus; The pool hosts PE classes and middle school swim practices and meets.)
- Taper Gymnasium (Upper school campus; The Taper Gymnasium is located on Harvard- Westlake’s upper school campus. Festooned with league, CIF-Southern Section, State and National Championship banners, its walls tell of the storied Wolverine athletic program. Taper Gym is home of the Wolverine basketball and volleyball programs.)
- Ted Slavin Field (Upper school campus; Ted Slavin Field is located on the upper school campus. Built in 2003, it features an NFL-caliber Field Turf surface and a synthetic track. It is the proud home of Wolverine football, soccer, track and field, lacrosse, and field hockey. Many of our student athletes who have graced the Ted Slavin field have gone on to professional, Olympic, and collegiate success in their chosen sports.)
- Copses Family Pool (Upper school campus; Located on Harvard-Westlake's upper school campus, the Copses Family Pool is a 50-meter pool manufactured by Myrtha Pools of Mantua, Italy. The stainless-steel pool features a surge tank underneath the pool deck to keep the water level, which reduces water resistance

for swimmers. The facility also includes a pool house and bleachers. The Copses Pool is home to the Wolverine swimming and water polo teams.)

- Upper School Sports Performance Center (Upper school campus; The Sports Performance Center provides our student athletes with the movement and mental tools to realize their highest skill potential. Multidisciplinary training methods and physically prepare our student athletes for the rigors of competition and increase their resilience. Our positive- coaching atmosphere is designed to instill a championship attitude and educate our student athletes so they can navigate their lifelong journey toward health and fitness.)
- O'Malley Family Field (Off-campus; 17301 Oxnard St., Encino 91316. The recently renovated O'Malley Family Field is Harvard-Westlake's state-of-the-art baseball complex, featuring professional grade turf, drainage and irrigation systems, dugouts, bullpens, clubhouse, and a covered hitting facility behind the right-field fence. O'Malley Family Field is located in Encino, off of Louise Avenue and Oxnard Streets, next to Balboa Park. Please park only in the O'Malley Family Field parking lot located on the left just after you turn onto Oxnard Street. No parking is allowed on Oxnard Street or on any street in the adjacent neighborhood.)
- Encino-Sherman Oaks Softball Facility at Encino Franklin Fields (Off-campus; Softball is played on Field 6 at 17301 Oxnard Street, Encino, CA 91316.)
- Tribull Tennis Courts at Los Angeles Valley College (Off-campus; The Tribull Tennis Courts are located at 6290 Fulton Avenue, Valley Glen, CA 91401. Take the 101 freeway, exit Coldwater Canyon. North on Coldwater, left on Burbank. Courts are at Ethel and Burbank.)
- Weddington Golf & Tennis (Off-campus; 4141 Whitsett Ave, Studio City, CA 91604. Weddington Golf Course is a 9 hole, par 27 course that plays 1088 yards from the back tees. Weddington Golf also has a 25 stall driving range, a putting green and a chipping practice area. The Weddington Tennis Court facility features 16 lighted tennis courts. The facility is on Whitsett Ave. between Ventura Blvd. and the 101 Freeway.)

At a time when our City and Country is attempting to rectify decades and centuries-long patterns of spatial inequality, including the unequal distribution of resources and opportunities, it's shocking that the Applicant would look to build a \$100 million sports complex for a select few of its own when hundreds of thousands of students across Los Angeles are lacking the most basic tools needed to succeed. Harvard-Westlake School may be able to afford anything it wants, but the rest of us cannot afford its reckless decisions.

Based on our community outreach, not only do we hear that the overwhelming majority of community members are in opposition to this Project, but a majority of Harvard-Westlake School students do not support the Project either. In a poll conducted by Harvard-Westlake School's newspaper, The Chronicle, just 41% of survey respondents said they were in favor of the School's plan to build the "River Park" project.<sup>39</sup> So, if both the community and Harvard-Westlake students are against the Project, who is the Project

for and why is it needed at all? A question many community members have been asking for years now is: "What is Harvard-Westlake School - an educator or developer?"

<sup>38</sup> Available at: <https://www.hw.com/athletics/Facilities-Locations>

<sup>39</sup> Available at: <https://hwchronicle.com/57585/uncategorized/weapons-of-mass-construction/>

## **Response No. ORG 1C-59**

The comment questions the purpose of the Project given the School's access to existing recreational facilities. The need for the Project is described in detail in Topical Response No. 13 - Need for Project (Non-CEQA). Please refer to Topical Response No. 13. In addition, refer to Response Nos. ORG 7A-18 through ORG 7A-22, which further discuss the Project in relation to the School's existing facilities.

## **Comment No. ORG 1C-60**

Another question from the community that remains unanswered is whether or not this Project site will be (a) utilized for any kind of 2028 Olympic Games activities, (b) utilized by colleges, or (c) rented out by professional sports teams or leagues. In accordance with the requirements of the Conditional Use Permit (CUP), the Project site must not host activities beyond high-school athletic levels or non-professional athletic use.

## **Response No. ORG 1C-60**

The comment requests information regarding the users of the Project Site. Refer to Response No. IND 143-1 which addresses these questions. The comment also states that in accordance with the requirements of the Conditional Use Permit (CUP), the Project site must not host activities beyond high-school athletic levels or non-professional athletic use. However, a CUP has not been issued for the Project as the Project has not yet gone before the City Planning Commission, as the initial decision-making body for the Project. The commenter is referred to Chapter II, Project Description, which described the public use of the Project Site (see pages II-33 to II-35) and School operations at the Project Site (see pages II-47 to II-51).

## **Comment No. ORG 1C-61**

The community also recognizes the proposed Project for what it is - an appropriation of green open space available for public use. Community members also recognize that the so-called "River Park" is not a continuous acreage "park," but rather cobbled-together bits and pieces on the perimeter of the Project.

The DEIR is insufficient in its explanation of its proposed reservation and payment system for public access to the Project site and security protocols that will be followed to permit members of the public to utilize facilities on-site. More specifications are needed in a recirculated DEIR (RDEIR). The DEIR is also inadequate in its explanation of phrases pertaining to public use and access. For example, the Applicant has made vague

commitments to public access with pre- condition phrases like “when not in use by School,” “for pre-approved Studio City-based organizations,” and “for pre-approved swim program members” appearing in the DEIR. These unclearly defined terms need to be clarified and the community must receive this information, especially since the Applicant continually mentions it will offer public use of the Project site. However, with nearly 100,000 Angelenos utilizing the Weddington Golf & Tennis facility each year, the community stands to lose access to the Project site, due to the regulations and conditions described above. Although the DEIR briefly mentions non-athletic special events, a recirculated DEIR (RDEIR) must clarify intentions for any other special event use (e.g., Olympic Games or third-party athletic events), as well as terms, commitments, and conditions for public use.

### **Response No. ORG 1C-61**

The comment expresses that the Project is the appropriation of green open space available for public use. The comment further expresses that the open space pedestrian pathway through the property is “cobbled together” and that the Draft EIR does not adequately describe the reservation system for continued public access. The Project Site is a private property owned by the School and currently used by the public at the discretion of the owner. The open space would be heavily landscaped and offer a continuous path through the site connecting to the Zev Greenway. The reservation system for public use of the Project’s recreational facilities is discussed in Chapter II, *Project Description*, of the Draft EIR (see pages II-34 and II-53). The purpose of the reservation system is to ensure availability of facilities (as with the existing tennis courts) and a safe and enjoyable experience for families and other users. The Draft EIR is clear that the use of the pathways across approximately 5.4 acres of the Project Site, café, putting green, and clubhouse will be open and available all day without reservations. The tennis courts will be open to the public all day via a reservation system (in much the same fashion as operation of the existing tennis courts, or the City’s own municipal courts). Reservations will also be made on a website. The Draft EIR is clear that the School will use the athletic facilities primarily during after School hours and, when any courts are not in use by the School during this time period, they would be available to the public. The use of other recreational facilities, including the gymnasium, pool, and fields will be available to approved community groups to ensure use by families, school clubs, and other public groups for which they are intended. The commenter is referred to Topical Response No. 11 – Recreation: Golf and Tennis Facilities, for additional clarification of the use of recreational facilities by the public. Also, refer to Topical Response No. 3 - Enforcement of Public Access, in this Final EIR for additional details regarding public access and use of the Project Site, and a discussion of the School’s commitments to public access and shared use of recreational facilities as set forth in the Draft EIR.

## **Comment No. ORG 1C-62**

### **Dismissal of Community Needs and Desires**

The Project design package prepared by Gensler Architects dated March 5, 2019 (Attachment 10) was completed in March 2019, before any meetings were held for community feedback. The March 2019 Project design is identical to the version that was eventually submitted to the Department of City Planning in March 2020. The Applicant consistently states that it made changes to the Project design based on input from the community. However, this is false. In fact, there were zero changes made to the Project from its March 2019 design to the March 2020 iteration that was submitted. In essence, no changes were made to address any of the community's many concerns that were voiced during outreach meetings.

### **Response No. ORG 1C-62**

The comment states that the Project plans were not changed to reflect community concerns. The site plan presented in Chapter II, *Project Description*, Figure II-6, of the Draft EIR is the subject of the Draft EIR evaluation. The Draft EIR figures are what Harvard-Westlake School has provided to the City as their proposal to be analyzed in the Draft EIR.

This comment does not raise any issues with respect to the content or adequacy of the Draft EIR. Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

## **Comment No. ORG 1C-63**

Similar to the Applicant's dismissal of concerns regarding the Project site, petitioners in the community have also raised their opposed [sic] the installation of a ramp off of Coldwater Canyon Avenue onto the Zev Greenway to the City and the Applicant (Attachment 11). However, proposed Project plans do not incorporate community members' concerns. Petitioners claim that the proposed ramp is not needed, since the City's goal of promoting Los Angeles River connectivity has already been satisfied with a connecting path between Coldwater Canyon Avenue and Whitsett Avenue (ramps at both ends) on the south side of the Los Angeles River. Anyone wanting to access the River from Coldwater Canyon Avenue can easily utilize the ramp on the south side. Furthermore, petitioners claim that the proposed ramp is not an added benefit, since, on the north side, there are already existing entrance ramps on either side of the Project site.

### **Response No. ORG 1C-63**

The comment states that petitioners in the community have expressed opposition to the installation of an ADA-compliant ramp from Coldwater to the Zev Greenway. This comment does not raise any issues with respect to the content or adequacy of the Draft

EIR. Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

### **Comment No. ORG 1C-64**

In a July 15, 2019 Los Angeles Times article titled “Harvard-Westlake Releases First Draft for New Athletic Facilities on 16-Acre Site in Studio City,” a spokesperson for the Applicant said, “This is entirely about increasing the capacity of our athletic facilities so we can get kids home earlier.”<sup>1</sup> This demonstrates what the community has known all along: the Project has never been designed for the benefit of the community and if approved, will not be constructed or operated for the benefit of the community.

### **Response No. ORG 1C-64**

The comment states that the Project was designed for the purpose of serving the School and not the public. This comment does not raise any issues with respect to the content or adequacy of the Draft EIR. Therefore, it is noted for the record and will be forwarded to the decision-makers for their review and consideration. However, the commenter is referred to Topical Response No. 3 - Enforcement of Public Access, in this Final EIR for details regarding public access and use of the Project Site and any potential conditions of approval that would ensure the School maintains its commitments to public access and shared use of recreational facilities as set forth in the Draft EIR. The quotation offered by the commenter is entirely consistent with the Project Objectives described in Chapter II, *Project Description*, of the Draft EIR as “The underlying purpose of the Project is to supplement the School’s athletic and recreational facilities, and provide Harvard-Westlake School a campus that can fulfill its educational mission and athletic principles now and in the future.”

### **Comment No. ORG 1C-65**

In conclusion, we believe that the DEIR is defective, the proposed Project is terribly flawed, and the Lead Agency should deny approval of the required Conditional Use Permit and certification of the DEIR. We urge the Lead Agency to recirculate the DEIR to properly address the critical errors and omissions that were raised in this letter. We appreciate your careful review of our comments on this Project as our community collectively works to preserve and protect this precious, publicly accessible true green open space for future generations.

### **Response No. ORG 1C-65**

The conclusory comment expresses the concern that the Draft EIR is defective and that the Lead Agency should deny approval of the Project. As discussed in Response Nos. ORG 1C-1 through ORG 1C-64, no evidence in comments indicate the need for a recirculated Draft EIR.

This comment is noted for the record and will be forwarded to the decision-makers for their review and consideration.

**Comment No. ORG 1C-77**

11. Community Petition re: River Ramp

**Response No. ORG 1C-77**

Attachment 11 includes a petition showing public opposition to the Coldwater Canyon ADA-compliant ramp to the Zev Greenway. The petition does not include comments on the Draft EIR, but it is noted for the record and will be forwarded to the decision-makers for their review and consideration.

## Comment Letter No. ORG 2

Beth Dymond, President

Studio City Residents Association

Letter A received March 14

Letter B received April 15

Letter C received March 17 from Barry Johnson, Vice-President, Studio City Residents Association

*Also see Comment Letter No. ORG 7 prepared by Chatten-Brown, Carstsens & Minter on behalf of the Studio City Residents Organization and Save the River Open Space*

### Letter A, March 14, 2022

#### Comment No. ORG 2A-1

The Studio City Residents Association (SCRA) is in receipt of the Draft Environmental Impact Report and request the Planning Department agree to extend the comment period. Unusual circumstances exist for making this request. It is of great importance to our members and to other concerned stakeholders in Studio City that enough time be permitted for a meaningful response to be made.

#### Response No. ORG 2A-1

The comment states that additional time for review of the Draft EIR is required due to unusual circumstances. CEQA Guidelines Section 15105(a) states: “The public review period for a draft EIR shall not be less than 30 days nor should it be longer than 60 days except under unusual circumstances.” The City extended the review period to 62 days from March 10, 2022 to May 10, 2022. The City determined that public review conditions did not rise to an “unusual circumstance” in providing for access to the Draft EIR. The length of the Project’s EIR does not constitute an unusual circumstance. For additional details regarding the City’s determination to extend the Draft EIR comment period to 62 days, the commenter is referred to Topical Response No. 1 – Public Participation and Review, which includes a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with the Draft EIR.

#### Comment No. ORG 2A-2

This DEIR came after 17 months of preparation by the applicant. The EIR consists in part of, #IV Environmental Impact Analysis consists of 19 elements that must be reviewed and commented on by the appropriate experts in their field: #V Alternatives consists of Seven elements: #VI Other CEQA Considerations: List of Figures: 38 elements and many others which amount to 6,500 pages.

## Response No. ORG 2A-2

This comment implies that the length of the Draft EIR warrants the extension of the comment period. The length of the Project's EIR does not constitute an unusual circumstance. The City determined that there were no unusual circumstances with respect to the scale or content of the Harvard-Westlake River Park Project Draft EIR that would warrant a comment period beyond the upper limit of 60 days set forth in the CEQA Guidelines. Refer to Response No. 2A-1 and Topical Response No. 1 – Public Participation and Review, which discusses the CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with the Draft EIR.

## Comment No. ORG 2A-3

CEQA Guidelines section 15105 states the comment period for a project such as this should be a minimum of 45 days, but should only be more than 60 days in unusual circumstances. The SCRA argues that this development presents unusual circumstances based on the foregoing and the impact on the Stakeholders over broad areas of the San Fernando Valley.

## Response No. ORG 2A-3

The comment states that additional time for review of the Draft EIR is required due to unusual circumstances and the impact on the stakeholders over broad areas of the San Fernando Valley. Refer to Response No. 2A-1 and Topical Response No. 1 – Public Participation and Review, which discusses the CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with the Draft EIR.

## Comment No. ORG 2A-4

A 90 day comment period is not unusual. On the DEIR for the NBCUniversal Evolution Plan, a 90 days response was granted given scope and the impact on the surrounding community. Such is the case here. SCRA therefore requests that the comment period be extended to 90 days.

## Response No. ORG 2A-4

The comment states that a 90-day comment period is not unusual. While the commenter refers to the NBC Universal Evolution Plan, 90 day public review periods are not common, except to address unusual circumstances. The NBC Universal Evolution Plan EIR is not comparable to the Harvard-Westlake River Park EIR. The NBC Universal Evolution Plan involved the development of 391 acres in the City of Los Angeles plus a 76-acre annexation from the County of Los Angeles. In addition to the massive size of the project, the NBC Universal Evolution Plan project contained a multi-jurisdictional component. The City deemed the scale of the Evolution Plan and the involvement of two jurisdictions to

be an unusual circumstance at the time of the release of the NBC Universal Evolution Plan Draft EIR in 2010. The scale of the Harvard-Westlake River Park Project, at 17.2 acres, does not rise to the same level of complexity. Refer to Topical Response No. 1 – Public Participation and Review, for additional details of the CEQA public participation requirements in association with the Draft EIR.

## **Letter B, April 15, 2022**

### **Comment No. ORG 2B-1**

Has Harvard Westlake filed form CP7768 listing the special events that will take place at the Harvard Westlake River Park. This information was omitted on their application however special events was checked. Please let me know as soon as possible and if CP7768 has been filed please attach a copy.

### **Response No. ORG 2A-2**

The comment questions whether form CP-7768 was filed with the Project and states that Form CP-7768 Form was omitted from the Harvard-Westlake application. The comment does not address the adequacy or contents of the Draft EIR and, as such, no further response is warranted. However, form CP-7768 was filed by Harvard-Westlake at the time the Project case(s) were originally filed with the Department of City Planning.

*Note: A copy of the completed form was e-mailed to the commenter by the City on April 21, 2022.*

## **Letter C, March 17, 2022**

### **Comment No. ORG 2C-1**

In regards to the request for a total of 90 days for the public review of the Harvard-Westlake DEIR, please see the last paragraph of Councilmember Krekorian's letter to you in the attachment below from October 30, 2020.

Also, this link [https://planning.lacity.org/eir/NBC\\_UnivPlan/FEIR/files/0.%20TOC.pdf](https://planning.lacity.org/eir/NBC_UnivPlan/FEIR/files/0.%20TOC.pdf) shows the front page of the NBC Universal Evolution Plan (ENV-2007-0254-EIR) which was actually prepared by the Los Angeles City Planning Department even though the land was a combination of City and County. Councilmember LaBonge and Councilmember Krekorian asked for and got an extension for a total of 90 days for public comment on what was another huge document. Councilmember Krekorian said in his letter, "... I will be requesting an extended public comment period to ensure that my constituents have ample time to review and respond to the report."

In my view, adding only 15 days to your 45 days does not meet the definition of "extended" as Councilmember Krekorian requested for his constituents... plus the "constituents" that were promised are still here, even though we have a different Councilmember due to Redistricting.

Between the link and attachment, there is precedence for a 90 day review period for public response to the Harvard-Westlake DEIR..

### **Response No. ORG 2C-1**

The comment requests a 90 day review period for the Draft EIR. The comment also includes a copy of Councilmember Krekorian's letter to the City as an attachment dated October 30, 2020. The attachment is not a comment letter on the Draft EIR, but rather a comment on the NOP. The commenter is referred to Topical Response No. 1 – Public Participation and Review, which addresses the Project's Draft EIR circulation period.

## **Comment Letter No. ORG 3**

Peter Warda, Senior Legislative Affairs Manager  
Victor Berrellez, VICA Chair  
Stuart Waldman, VICA President  
Valley Industry & Commerce Association  
Received March 15, 2022

### **Comment No. ORG 3-1**

Please find attached VICA's letter of support for ENV-2020-1512-EIR.

### **Response No. ORG 3-1**

The comment instructs that a letter of support is attached. The comment does not discuss the adequacy of the Draft EIR and, therefore, no further response is needed.

### **Comment No. ORG 3-2**

The Valley Industry and Commerce Association (VICA) supports the Harvard-Westlake River Park project, which will offer athletic and recreational opportunities to Harvard-Westlake students and the Studio City community.

### **Response No. ORG 3-2**

The comment describes VICA's support of the Project for offering athletic and recreational opportunities to Harvard-Westlake students and the Studio City community. The comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is necessary.

### **Comment No. ORG 3-3**

Harvard-Westlake understands the Weddington Golf & Tennis property has a long history in Studio City. Therefore, the development of the Harvard-Westlake River Park campus will be guided by key design principles and commitments, which will ensure that the Weddington Golf & Tennis site remains open and green.

### **Response No. ORG 3-3**

The comment acknowledges the Project's design principles and commitments. In this regard, the Project would include the design features, including open space, landscaping, tree replacement consistent with the River Improvement Overlay (RIO) District Ordinance, and sustainability features discussed in Chapter II, *Project Description*, of the Draft EIR. The comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is necessary.

**Comment No. ORG 3-4**

The draft site plan for the Harvard-Westlake River Park calls for the development of two athletic fields, a fifty-meter swimming pool, eight tennis courts, and a gymnasium. Above ground, the plan also features a walking/jogging track around the entire perimeter of the site and a network of public plazas, water features, wooded areas, and other natural spaces that together comprise a publicly accessible six-acre River Park. The plan also includes one of the largest privately funded stormwater capture and treatment systems in Los Angeles, a testament to Harvard-Westlake's commitment to developing an environmentally responsible project.

**Response No. ORG 3-4**

The comment correctly describes components of the Project as discussed in Chapter II, *Project Description*, of the Draft EIR. The comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is necessary.

**Comment No. ORG 3-5**

Harvard-Westlake has conducted and will continue to conduct outreach to the broader Studio City community. Feedback from home and business owners, as well as from community stakeholder groups will be used to guide the plans submitted to the City of Los Angeles.

**Response No. ORG 3-5**

The comment discusses the School's past and continued outreach to the Community, and use of feedback from the community and other stakeholders to guide its plans. The comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is necessary.

**Comment No. ORG 3-6**

For these reasons, VICA supports the Harvard-Westlake River Park project and urge you to support this forward-thinking project as well.

**Response No. ORG 3-6**

The comment describes VICA's support of the Project and urging of support. The comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is necessary.

## **Comment Letter No. ORG 4**

Tammy Scher, board Chair  
Sherman Oaks Chamber of Commerce  
Letter A received March 16, 2022  
Letter B received April 30, 2022

### **Letter A, March 16, 2022**

#### **Comment No. ORG 4A-1**

Due to the size of the DEIR which is over 6000 pages and its importance and impact on the community. Can you please request planning to allow for a 90-day extension of time so that we all have a chance to review and comment on the environmental impact of this project?

#### **Response No. ORG 4A-1**

The comment states that additional time for review of the Draft EIR is required due to the size of the Draft EIR and impact on the community. CEQA Guidelines Section 15105(a) states: "The public review period for a draft EIR shall not be less than 30 days nor should it be longer than 60 days except under unusual circumstances." The City extended the review period to 62 days from March 10, 2022 to May 10, 2022. The length of the Project's EIR does not constitute an unusual circumstance. The City determined that public review conditions did not rise to an "unusual circumstance" in providing for access to the Draft EIR. For additional details regarding the City's determination to extend the Draft EIR comment period to 62 days, the commenter is referred to Topical Response No. 1 – Public Participation and Review, which includes a discussion of CEQA public participation requirements and steps undertaken by the City to facilitate public participation in association with the Draft EIR.

### **Letter B, April 30, 2022**

#### **Comment No. ORG 4B-1**

I am writing in opposition to Harvard Westlake's destruction of Weddington Golf and Tennis.

#### **Response No. ORG 4B-1**

The comment stating opposition is noted. However, the comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is necessary.

**Comment No. ORG 4B-2**

This huge project will degrade the integrity and character of Studio City and will be detrimental to the quality of life, property values, and access to recreational open space.

**Response No. ORG 4B-2**

This comment expresses the commenter's opinion that the Project will degrade the integrity and character of Studio City and will be detrimental to the quality of life, property values, and access to recreational open space. Refer to Response No. Form 3-3 which addresses this comment.

**Comment No. ORG 4B-3**

The studies included in the recently released DEIR paid for by Harvard Westlake, do not adequately address the most serious impacts including, but not limited to; traffic, noise, construction, and climate. The mandatory "alternative plans" suggested are disingenuous and lacking in a realistic effort to offer alternate sites or plans.

**Response No. ORG 4B-3**

This comment expresses the opinion that the Project's technical studies do not adequately address the most serious impacts including, but not limited to; traffic, noise, construction, and climate. Also, the comment states that the Project's mandatory "alternative plans" suggested are disingenuous and lacking in a realistic effort to offer alternate sites or plans. This is assumed to refer to the alternatives presented in Chapter 5, *Alternatives*, of the Draft EIR. While the comment contains no facts to support the contention that the Draft EIR's analysis is inadequate, refer to Response No. Form 3-4 which addresses this comment.

**Comment No. ORG 4B-4**

This property is zoned agricultural/open space and requires "special entitlements" and a "conditional use permit". Both would need your approval to be granted. You are the only councilmember who has a master's degree in urban planning. It is arguable that you know more about this subject than any other councilmember. Please use your unique skills to speak for over 100,000 Angelenos who enjoy this beloved facility annual and deny permission to build this project.

**Response No. ORG 4B-4**

This comment states that the property is zoned agricultural/open space and requires "special entitlements" and a "conditional use permit." The comment requests the local councilmember to deny permission to build this project. While the comment contains no facts to support its contention that the Draft EIR is inadequate, refer to Response No. Form 3-5 which addresses this comment.

## **Comment Letter No. ORG 5**

Todd Pimentel, HOA President  
Whitsett Green Homeowners Association  
Received March 31, 2022

### **Comment No. ORG 5-1**

We are in receipt and our HOA of 40+ residents located directly across the street of the project have reviewed the mail communication about the EIR.

### **Response No. ORG 5-1**

The comment describes the location of the Whitsett Green HOA and states that Draft EIR Materials were received. The comment does not discuss the adequacy of the Draft EIR and, therefore, no further response is necessary.

### **Comment No. ORG 5-2**

I've carefully reviewed the report and we cannot locate our comments we supplied to the City of LA earlier in Fall of 2020.

### **Response No. ORG 5-2**

The comment states that the commenter cannot locate responses to earlier comments made regarding the Project. Comments sent to the City in Fall of 2020 would have been in response to the Initial Study and would not be incorporated into the Draft EIR. However, the comments received on the Initial Study and Scoping Meeting, if applicable to CEQA concerns, are taken into account in the preparation of the Draft EIR and are summarized in the *Executive Summary, Subsection 2, Issues Raised During Notice of Preparation Process*, pages ES-3 through ES-6 of the Draft EIR. However, the comment does not discuss the adequacy of the Draft EIR and, therefore, no further response is necessary.

### **Comment No. ORG 5-3**

We are still very concerned about the location of the underground parking entrance, that now includes a turn-lane directly across from our property. After careful review of the traffic studies, these were all done during COVID and do not reflect actual traffic, speed or other traffic patterns as of today.

### **Response No. ORG 5-3**

The comment expresses concern about the location of the underground parking entrance, which includes a turn-lane directly across from the commenter's or the Association members' property and also contends that the traffic studies are inadequate because they are not reflective of non-COVID traffic conditions. The north driveway into the parking garage would include a median island configured to restrict turns into and out of the

driveway to right-turns only, which would enhance safety by minimizing conflicts with pedestrians and vehicles at this location. The final design of the driveway would be subject to review and approval by the Los Angeles Department of Transportation (LADOT) to ensure it complies with all applicable City regulations.

See Topical Response No. 9 - Transportation and Parking During Construction and Operations. As discussed in Topical Response No. 9, the Project's construction and operation transportation/traffic impacts were fully evaluated in Section IV.M, *Transportation*, of the Draft EIR. Section IV.M, *Transportation*, of the Draft EIR determined that all CEQA-required transportation impacts would be less than significant without mitigation. Refer also to Topical Response No. 9 for a discussion of the Project's proposed parking program.

Note that modifications to the Project design would reduce the capacity of the underground parking structure from 503 spaces to 386 spaces and the capacity of the above grade parking lot from 29 spaces to 17 spaces for a total of 403 spaces. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. The provided parking would be consistent with LAMC Section 12.21 A.4(e), which requires one parking space per five fixed seats for stadiums, high schools, colleges, general assembly, and auditoriums. The Project with design modifications would provide a total of 2,005 seats. Divided by five, the required parking spaces would be 401 parking spaces. The requirement would be exceeded by the Project with design modifications by two spaces.

.As stated on PDF page 60 of 217 of the Transportation Assessment for the Harvard-Westlake River Park Project <sup>77</sup> provided as Appendix M to the Draft EIR, intersection turning movement counts were obtained for the traffic study area and LOS was calculated to determine Year 2020 baseline conditions. Appendix F of the TA includes count sheets. New weekday PM peak period turning movement counts were collected in April 2019 at the three study intersections along Whitsett Avenue (Study Intersections 3, 4, and 5). Turning movement counts were not collected at the two study intersections along Coldwater Canyon Avenue (Study Intersections 1 and 2) at this time. Due to the COVID-19 pandemic and the shelter in-place orders from the Governor and County, along with a memo released by LADOT in April 2020, turning movements counts could not be collected at these intersections in 2020 since they would not reflect typical conditions. Therefore, historical LADOT counts from 2017 were used for the two intersections along Coldwater Canyon Avenue, and an ambient growth factor of 0.6 percent per year was applied to adjust the traffic volumes to reflect baseline year 2020. Accordingly, traffic counts did reflect non-COVID-19 traffic conditions, contrary to the comment's assertion.

In addition, refer to Topical Response No. 12 - Related Projects: Adequacy of Cumulative Mobile Source Noise and Traffic Analyses. As discussed therein, the cumulative LOS

<sup>77</sup> Fehr & Peers, Transportation Assessment – Harvard-Westlake River Park Project for Assessor Parcel Numbers 2375-018-020 and portion of APN 2375-018-903 Los Angeles River Parcel 276,4141 Whitsett Avenue, Studio City, CA 91604, April 2021.

analysis (a non-CEQA component) appropriately analyzed and included traffic generated by the related projects.

### **Comment No. ORG 5-4**

We would like this addressed and re-evaluated to a different location in the public review/comment period. Example - the underground entrance is done more south on Whitsett with less residential impact or usage of the Valleyheart entrance on the West Side area.

### **Response No. ORG 5-4**

The comment expresses an interest in the relocation of the Project's Whitsett Avenue driveway. The comment, however, does not provide factual evidence to support the need to relocate the driveway or that refutes the information provided in the Draft EIR. As discussed in Response No. ORG 5-3, the Project's transportation-related impacts would be less than significant. As such, the alternative entrance along Whitsett Avenue is not necessary.

### **Comment No. ORG 5-5**

Please advise any next steps we need to take to have this go on record during the public hearing period -- now extended to mid-May.

### **Response No. ORG 5-5**

The comment requests information on how to ensure that the comments are included in the public record. All of the comments received on the Draft EIR, during the Draft EIR comment period of March 10, 2022 through May 10, 2022, are incorporated into this Final EIR and will be provided to decision-makers for review and consideration. The comment does not raise any issues with respect to the content and adequacy of the Draft EIR. As such, no further response is necessary.

## Comment Letter No. ORG 6A

Jacky Surber, Co-Founder  
 Angelenos for Trees  
 Received April 25, 2022

### Comment No. ORG 6A-1

For the Draft EIR: <https://youtu.be/5dxmr-zsfhE>

*This is video from the Angelenos for Trees organization. The video expresses opposition to the Project's removal of trees, especially, large, mature trees which they claim would result in a 57 percent canopy decline. The organization states a tree canopy cover in the San Fernando Valley of at least 40 percent is needed to combat impacts of climate change and the urban heat island effect. The video states the 1:1 or 2:1 replacement ratio is not a metric that increases urban tree canopies and the removal of existing mature trees would result in a net loss of for over 30 years.*

### Response No. ORG 6A-1

This comment, in the form of a video, expresses that the Project's tree removal would result in loss of tree canopy that is needed to combat impacts of climate change and the urban heat island effect. Further, the comment states the 1:1 or 2:1 replacement ratio is not a metric that increases urban tree canopies and the removal of existing mature trees would result in a net loss for over 30 years. The comment does not provide factual evidence to show that the Project's tree replacement ratio (particularly with the replacement of existing, invasive Mexican fan palms with native trees) would result in net loss of tree canopy over 30 years or any deficiency in the analysis of biological resources in the Draft EIR. Nonetheless, a discussion of impacts with respect to trees is provided below.

A supplemental analysis of the Project's tree canopy is provided within Appendix C, Carbon Sequestration and Tree Canopy Study, of this Final EIR. All existing trees were included in the calculation of canopy coverage in order to appropriately characterize current conditions on the Project Site. Similarly, existing trees that would be preserved by the Project were included in the calculation of the Project's canopy coverage. As discussed in detail in Appendix C, PDF pages 4 through 6 of 39, approximately 20 percent of the Project Site is currently covered by tree canopy. Absent development of the Project, that level will not significantly increase further given the relative maturity of existing trees.

The Project's canopy coverage will reach a similar level between Years 5 and 10 of operation (Year 5 the canopy coverage would be approximately 15 percent, Year 10 the canopy cover would be approximately 28 percent) (see Figure 10, Year 5 Canopy Coverage of Project Trees, and Figure 11, Year 10 Canopy Coverage of Project Trees, in the Carbon Sequestration and Tree Canopy Study).

As described in Section IV, *Biological Resources*, of the Draft EIR, the Project's replacement trees will be sourced in box sizes ranging from 36 to 48 inches. Given the diverse range of species in the Project's tree replacement program and their respective growth rates, tree maturation points vary from 10 to 50 years, with a weighted average of 25 years. At Year 25 of Project operation (following construction), 53 percent of the Project Site would be under canopy coverage, or approximately 2.5 times more coverage than existing conditions (see Figure 12, Year 25 Canopy Coverage of Project Trees, of the Carbon Sequestration and Tree Canopy Study). The Project's favorable points of comparison are largely the result of the relatively poor biological characteristics of the existing tree mix. Notably, the prevalence of Mexican fan palms on the Project Site, which are comprised of fibrous strands, lack branches and extensive leaf systems, and provide nominal canopy coverage. Refer to the Carbon Sequestration and Tree Canopy Study in Appendix C of this Final EIR for additional details on the methodologies and modeling conducted to determine the Project's projected future tree canopy coverage on the Project Site.

See Topical Response No. 5 – Biological Resources/Trees, for additional discussion of impacts to on-site trees. As discussed in Topical Response No. 5, the Project's tree removal and replanting program was fully analyzed in the Draft EIR's Section IV.C, *Biological Resources*, of the Draft EIR. As discussed in Section IV.C and Chapter II, *Project Description*, of the Draft EIR, the Project would implement an extensive tree planting and landscaping program that would remove 240 of the existing 421 trees, located both on the Project Site and off-site in surrounding areas (e.g., within portions of the public right-of-way), and plant 393 trees, resulting in a net increase of 153 trees (or 36 percent). The Project would result in a total of 574 trees within the on- and off-site Project areas (see Section IV.C, Figure IV.C-5, *Tree Planting Plan*, of the Draft EIR). The Project's landscaping program is consistent with the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes and consists entirely of native trees that would require significantly less water as compared to the ornamental, and in many cases invasive, species that currently exist on the Project Site.

Existing RIO-compliant trees along the Zev Greenway would remain, non-RIO-compliant trees (such as fan palms) would be removed from the Property, and a RIO-compliant planting program would be implemented along the Project and Zev Greenway interface (see Figures IV.C-4 and IV.C-5 of the Draft EIR), thereby adding to the visual landscape and providing increased habitat and foraging opportunities for wildlife.<sup>78</sup>

As discussed in Section IV.C, *Biological Resources*, of the Draft EIR, and Topical Response No. 5 – Biological Resources/Trees, the Project with mitigation would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, and impacts would be less than significant.

---

<sup>78</sup> The "RIO" designation indicates a River Improvement Overlay (RIO) District<sup>78</sup> related to the Project's location in proximity to the Los Angeles River.

As discussed in Topical Response No. 2 – Modifications to the Project Design, design modifications relating to seating, lighting, building design (swimming pool area and gymnasium), parking, grading, storm water capture and reuse system, and water features were made to the Project in response to public and agency comments received on the Draft EIR. However, none of the design modifications directly or indirectly affect the Project's tree removal and replanting program, or the Project's tree canopy. As such, the biological resources impact analysis and conclusions as applicable to trees removal and replacement included in the Draft EIR is not affected by the Project design modifications.

In addition, with regard to urban heat island effects, please see Topical Response No. 7 - Artificial Turf and Effects on Localized Heat and Health. Topical Response No. 7 addresses the potential health-related and urban heat island effects due to the Project's use of artificial turf fields.

Also, refer to Responses Nos. ORG 7A-57 and 7A-67 for additional discussion of the Draft EIR's evaluation of heat island effects .

In addition, the Draft EIR addressed greenhouse gas emissions (GHG) impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. For additional discussion of the Project's impacts with respect to climate change, refer to Response No. 7A-47.

See also Response Nos. ORG 6B-2 to ORG 6B-8 which addresses written comments provided by the Angelenos for Trees organization, including comments related to carbon sequestration.

## **Comment Letter No. ORG 6B**

Jeanne McConnell, Co-Founder  
Angelenos For Trees  
Community Forest Advisory Committee  
Received May 10, 2022

### **Comment No. ORG 6B-1**

Attached is Angelenos for Trees comments to the DEIR for Studio City Golf and Tennis. Please let me know if you have any questions or comments.

### **Response No. ORG 6B-1**

The comment provides information that the Angelenos for Trees comments are attached. The comment does not discuss the content or adequacy of the Draft EIR and no further response is necessary.

### **Comment No. ORG 6B-2**

Angelenos for Trees is submitting this response in conjunction with the DEIR prepared for the Harvard Westlake River Park Project ("HW Project").

Currently, at the proposed HW Project - Harvard Westlake is proposing to remove 240 trees which is over a 50% loss in the property tree canopy cover. Most of these trees are mature and according to the Davey Services iTree environmental services calculator have provided over 898,773 pounds of carbon sequestration services to date.<sup>1</sup> A copy of the full report of the data obtained from the environmental services calculator is attached to this letter. The city is using iTree to conduct its street tree inventory.

Taking out significant 70-year-old mature trees and replacing them with saplings (even if they are natives) that will need an additional 20-30 years of growth to provide these types of environmental benefits is a failure to recognize the value of mature trees and the ecosystems they support now.

We determined over a span of 10 years 390,794 pounds of carbon sequestration services will be lost. It will take at least 10 years until a sapling in a 46" inch box will start sequestering carbon at all.

<sup>1</sup> Angeleno for Trees input each tree into the tree environmental services calculator to obtain these numbers.

### **Response No. ORG 6B-2**

The comment states that the removal of existing mature trees would adversely affect carbon sequestration rates at the Project Site. A supplemental analysis of the Project's carbon sequestration from trees is provided within Appendix C, Carbon Sequestration

and Tree Canopy Study, of this Final EIR. Rates of carbon sequestration (measured as pounds of carbon dioxide [CO<sub>2</sub>]) were calculated by comparing the existing trees on the Project Site that are to be removed with the replacement trees that would be planted as part of the Project. Existing trees to remain under the Project were not included in the carbon sequestration analysis, as the carbon sequestration benefits from such trees would be equal under existing and Project conditions. As summarized on PDF pages 4 through 6 of 39 in the Carbon Sequestration and Tree Canopy Study, during Year 2 of Project operation, the annual CO<sub>2</sub> sequestration rate of the Project's replacement trees would be approximately equivalent to existing sequestration rates. Existing carbon sequestration for the trees to be removed by the Project is 44,633 pounds as shown in Figure 1, Annual Sequestration of Existing Trees and Palms, of the Carbon Sequestration and Tree Canopy Study (see PDF page 7 of 39 of Appendix C).

Year 2 carbon sequestration rates for the Project's replacement trees would be 43,160 pounds, as shown in Figure 4, Year 2 Sequestration of Project Trees, of the Carbon Sequestration and Tree Canopy Study (PDF page 9 of 39 of Appendix C). After Year 2 of Project operation, the replacement trees would sequester CO<sub>2</sub> at increasingly greater rates than existing trees (existing trees to be removed sequester 44,633 pounds). Specifically, during Year 5 of Project operation, the replacement trees would sequester more than 73,000 pounds of CO<sub>2</sub> as shown in Figure 5, Year 5 Sequestration of Project Trees (see PDF page 10 of 39 of Appendix C). Sequestration would increase to 131,000 pounds in Year 10, as shown in Figure 6, Year 10 Sequestration of Project Trees, (see PDF page 10 of 39 of Appendix C). Over the lifetime of the Project's replacement trees, approximately 8.7 million pounds of CO<sub>2</sub> would be sequestered. In comparison, the existing trees to be removed would sequester 2.6 million pounds over their lifetime, if left in place. Final EIR Appendix C, Figures 1 and 2 provide lists of existing individual tree species and the sequestration capacities of the individual species. Final EIR Appendix C, Figures 3 through 7 provide lists of the replacement and retained trees and the sequestration capacities of the individual species, which show Year 1, Year 2, Year 5, Year 10, and Lifetime sequestration of Project trees respectively.

As with the tree canopy, the Project's higher amount of carbon sequestration is the result of the relatively poor biological characteristics of the existing tree mix, particularly the prevalence of Mexican fan palms. Mexican fan palms are comprised of fibrous strands and lack branches and extensive leaf systems that would, otherwise, support carbon sequestration. For example, a single mature Mexican fan palm (60-80' in height) is estimated to sequester 34 pounds of CO<sub>2</sub> per year. By contrast, a single Engelmann Oak or Valley Oak in a 48" box size would sequester 100 pounds of CO<sub>2</sub> in the first year alone following planting, more than three times that of a mature Mexican fan palm. Refer to the Carbon Sequestration and Tree Canopy Study in Appendix C of this Final EIR for additional details on the methodologies, data sources, and modeling conducted to determine the Project's projected future carbon sequestration of the Project's replacement trees on the Project Site.

Refer to Topical Response No. 5 – Biological Resources/Trees, in this Final EIR, for additional details regarding the Project’s tree removal and replacement program.

Also, as discussed in Topical Response No. 2 – Modifications to the Project Design, design modifications relating to seating, lighting, building design (swimming pool area and gymnasium), parking, grading, storm water capture and reuse system, and water features were made to the Project in response to public and agency comments received on the Draft EIR. However, none of the design modifications directly or indirectly affect the Project’s tree removal and replanting program or the Project’s carbon sequestration from the tree replacement program. As such, the biological resources impact analysis and conclusions as applicable to trees removal and replacement included in the Draft EIR is not affected by the Project design modifications.

In addition, refer to Response Nos. 6A-1 which discusses the Project’s tree canopy. As discussed therein, the Project’s canopy coverage will reach a similar level as existing conditions between Years 5 and 10 of operation, with subsequent years having a greater canopy coverage than under existing conditions.

### **Comment No. ORG 6B-3**

The effects of human - caused global warming are happening now. The latest IPCC (Intergovernmental Panel on Climate Change) report shows greenhouse gas emissions continue to rise, and current plans to address climate change are not ambitious enough and will worsen in the decades to come. It is common in large development projects in Los Angeles for the developer to remove the majority of the trees at a location. In this case on the site property (not the right of way or other adjacent locations), Harvard Westlake is removing over 80% of the trees. Harvard Westlake is essentially clear cutting the property for its development project.

### **Response No. ORG 6B-3**

The comment states that GHG emissions continue to rise and that current plans are not ambitious enough to address climate change impacts. The comment also expresses concern regarding the Project’s tree removal. Please refer to Topical Response No. 5 – Biological Resources/Trees, and Response No. ORG 6A-1 for a discussion of impacts to trees and the Project’s tree replacement program.

In addition, the Draft EIR addressed greenhouse gas emissions (GHG) impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, the Project’s GHG impacts would be less than significant. For additional discussion of the Project’s impacts with respect to climate change, refer to Response No. 7A-47.

### **Comment No. ORG 6B-4**

New trees require a lot of support (water and otherwise) and have been shown in a field study conducted by the US Forest Service in a Mediterranean climate, like Los Angeles, to experience a 15% failure rate within 1 year that rose to 40% just 5 years later.

Planting replacement trees 1:1 will result in a net loss of carbon sequestration, a loss of storm water mitigation and will result in a net loss of existing canopy coverage at that one particular location and fails to take into account the loss of canopy coverage over the last 10 years by adjacent properties (including Sportsman Lodge, Sunkist development, and Grant High School).

### **Response No. ORG 6B-4**

The comment indicates that the Project's tree planting program would result in a net loss of carbon sequestration and tree canopy, as well as a loss of stormwater mitigation. Regarding carbon sequestration, please refer to Response No. ORG 6B-2, which indicates the Project would result in a long-term net increase in carbon sequestration. In addition, refer to Response No. 6A-1 which discusses the Project's tree canopy. As discussed therein, the Project's canopy coverage will reach a similar level as existing conditions between Years 5 and 10 of operation, with subsequent years having a greater canopy coverage than under existing conditions. As such, because the Project would result in long-term increases in tree canopy coverage and carbon sequestration, it would not contribute to a cumulative loss of tree canopy coverage with the adjacent properties and/or projects referenced in this comment.

It is further noted that the replacement species would be compliant with the RIO District Ordinance and would be either drought-resistant native trees or species sourced from the Los Angeles River Master Plan Plant Landscaping Guidelines and Plant Palettes. The RIO District Ordinance and the Los Angeles River Master Plan Plant Landscaping Guidelines and Plant Palettes which are specifically committed to planting drought resistant species in proximity to the Los Angeles River. With the Project's increase in drought-resistant tree species and reduction in existing invasive (non-native) tree species, the Project would result in a per species reduction in water demand. In addition, the Project's stormwater capture and reuse system would comply with all applicable regulations pertaining to stormwater treatment.

Furthermore, Mitigation Measure BIO-MM-3 has been supplemented to include monitoring requirements of replacement trees over a period of three years to ensure their survival. If any of the on-site, off-site, or public street trees die within three years, as a consequence of construction, they will be replaced. See Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, for the update Mitigation Measure BIO-MM-3.

## Comment No. ORG 6B-5

In 2019, Cy Carlberg, Harvard Westlake's consulting arborist, who was also paid to consult at the Grant High School project, pointed out in her report for LAUSD the proposed removal of healthy mature Redwoods, which are not native to Southern California could be subject to drought and die off in future years, therefore justifying the removal of these beloved trees from the high school. Removing a tree because it could be subject to drought and replacing it with a tree that requires more water than an existing mature tree makes no sense. Although what she said is not necessarily wrong as to its location the fact is these trees were healthy and showed no sign of stress. This argument is separated from reality and failed to recognize that we don't live in laboratory with only one species. It is similar to the current argument for the HW Project that the replacement of the slated mature trees with native saplings is a more "ecological beneficial project". This is also not necessarily wrong (without understanding the context) - however, the fact is that these trees slated for removal are over 70 years old, are healthy and are providing valuable environmental services now. Those replacement saplings will take at least 20 years to provide similar benefits. The idea that is okay to remove all mature trees in Los Angeles that are providing environmental benefits now and replacing them with native trees is ridiculous and self-defeating. Yes, as trees die, we should replace them with native species but to remove them prematurely is an environmental and ecological disaster.

## Response No. ORG 6B-5

The comment states that the Project's tree removal program would take 20 years to result in benefits (presuming benefits are carbon sequestration and the tree canopy coverage). Regarding carbon sequestration, please refer to Response No. ORG 6B-2, which indicates the Project would result in a long-term net increase in carbon sequestration. In addition, refer to Response Nos. 6A-1 which discusses the Project's tree canopy. As discussed therein, the Project's canopy coverage will reach a similar level as existing conditions between Years 5 and 10 of operation, with subsequent years having a greater canopy coverage than under existing conditions.

The comment also states the "premature" removal of mature trees would result in an ecological disaster. However, this statement is not supported by specific evidence and is based on the opinion of the commenter. As discussed above, the Project would result in increases to the tree canopy and carbon sequestration over the long-term. Moreover, as discussed in Section IV.C, *Biological Resources*, of the Draft EIR and Topical Response No. 5 – Biological Resources/Trees, of this Final EIR, the removal of non-native species such as the Mexican fan palms (*Washingtonia robusta*) would be ecologically beneficial since they are considered invasive species by the California Invasive Plant Council and are listed in the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes as "plants that should never be planted along the river."

## **Comment No. ORG 6B-6**

This may be an isolated development project, but the impacts are far reaching to the entire San Fernando Valley and Los Angeles. We all breathe the same air and experience the increased heat. Air and temperature are not limited to a parcel - on a tax map. The mature trees are part of an urban ecosystem that helps reduce temperatures, sequester carbon, promote biodiversity, reduce storm water runoff, and clean the air. UCLA, USC, and Tree People have identified the San Fernando Valley to be uniquely susceptible to climate change. Los Angeles has the worst air quality in the nation, and City is already experiencing a spike in heat related deaths due to the increased heat of climate change and the urban heat island effect.

Ironically, instead of using the existing natural resources of permeable turf and trees already in place at the proposed HW Project, Harvard Westlake is looking to replicate the Army Corp of Engineers project of paving the LA River in the 1930s. The paving of the LA River, which was once the location of verdant wetlands, is now universally recognized as an over-engineered error due to the misunderstanding of the ecological impacts of isolating one part of the ecosystem rather than looking at the whole ecosystem.

Impermeable artificial turf is replacing existing permeable grass. The turf emits carbon dioxide and methane, provides no ecological benefit, and will negatively impact the ecosystem of birds, insects, and other endemic species native to Southern California. Removing 240 trees results in a loss of carbon sequestration benefits and Harvard Westlake's proposed installation of a built storm water management system is an over engineered solution to problem that doesn't exist because the mature trees at the location are already providing 312,555 gallons of rainfall interception and 46,330 gallons of run off avoidance per year. Removing the 240 trees will result in a more than a 50% net decrease of runoff avoidance equal to 26,267 gallons and more than a 50% decrease of 176,336 gallons.

## **Response No. ORG 6B-6**

The comment states that the Project's artificial turf would be impermeable and replace permeable grass. This statement is incorrect, as the artificial turf would be pervious to rainfall and other surface water. Also, the artificial turf would reduce water demand compared to the requirements of the golf course sod or natural turf sod. The comment states the artificial turf would emit carbon dioxide and methane, provide no ecological benefit, and will negatively impact the ecosystem of birds, insects, and other endemic species native to Southern California. See Topical Response No. 7 - Artificial Turf and Effects on Localized Heat and Health. Topical Response No. 7 addresses the potential health-related and urban heat island effects due to the Project's use of artificial turf fields. Regarding carbon sequestration, please refer to Response No. ORG 6B-2, which indicates the Project would result in a long-term net increase in carbon sequestration.

Please refer to Topical Response No. 5 – Biological Resources/Trees, for a discussion of impacts to trees and the Project's tree replacement program. The commenter is also

referred to Section IV.C, *Biological Resources*, of the Draft EIR, with supporting data provided in Appendix D, Biological Resources Technical Report, of the Draft EIR. As analyzed therein, biological resources impacts would be less than significant with mitigation, where applicable.

With regard to the Project's capture and reuse system as analyzed in the Draft EIR, the 1-million gallon system as evaluated would capture and treat water from the Project Site as well as from a 39-acre off-site area to the north of the Project Site. As discussed in Topical Response No. 2 – Modifications to the Project Design, the Project's 1-million-gallon stormwater capture and reuse system was reduced in size (down to approximately 350,000 gallons pending final design) and scale so as to capture and treat stormwater only from the Project Site, and not from the 39-acre residential neighborhood to the north. The Project would still similarly comply with all applicable water quality regulations as analyzed in the Draft EIR (see section IV.I, *Hydrology and Water Quality*, of the Draft EIR). All hydrology and water quality from the Project would continue to be less than significant without the need for mitigation. Refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, which includes updates to the Draft EIR to reflect the removal of the off-site water collection from the Project's capture and reuse system with the Project design modifications.

### **Comment No. ORG 6B-7**

Los Angeles in its many policies, including the green new deal, and the city's respected academic institutions all recognize the need for open green space, a healthy ecosystem, shade, and clean air. Although the proposed built environment of the HW Project could be considered "open" it is not open green permeable space and fails to take advantage of existing ecological science that will benefit the growth of our natural environment, provide shade, and clean our air. Angelenos for Trees, recommends that Harvard Westlake, maintain the space in its current configuration, introduce native species, including trees, over time, consistent with the current science relative to habitats and ecosystems and increase the tree canopy to support a healthy ecosystem. Such a project could operate as a lab for field biology projects while still providing tennis and golf as activities for its students and the community.

### **Response No. ORG 6B-7**

The comment recommends that Harvard-Westlake maintain the space in its current configuration, introduce native species, including trees, over time, consistent with the current science relative to habitats and ecosystems and increase the tree canopy to support a healthy ecosystem. The comment does not provide any evidence that the Project would not support or contribute to a healthy ecosystem. As discussed in Response Nos. 6A-1 and 6B-2, the Project would result in long-term net increases in tree canopy and carbon sequestration, respectively.

Please refer to Topical Response No. 5 – Biological Resources/Trees, and Response No. ORG 6A-1 for a discussion of impacts to trees and the Project's tree replacement

program. The commenter is also referred to Section IV.C, *Biological Resources*, of the Draft EIR, with supporting data provided in Appendix D, Biological Resources Technical Report, of the Draft EIR. As analyzed therein, biological resources impacts would be less than significant with mitigation, where applicable. It is noted that the Project would replace existing exotic plant/tree species with native and drought tolerant species, which would be beneficial to the ecosystem.

While the comment does not provide any evidence that the Project would not support or contribute to a healthy ecosystem, the commenter's recommendation that Harvard-Westlake maintain the space in its current configuration, introduce native species, including trees, over time, is noted for the record and similar to all comments received will be forwarded to the decision-makers for their review and consideration.

### **Environmental Cost-Benefit Analysis for Existing, Mature Urban Tree Canopy at Weddington Golf & Tennis**

#### **Methodology and Additional Information**

This report utilizes the i-Tree National Tree Benefits Calculator software, which was developed in partnership with the United States Department of Agriculture (USDA) Forest Service. Tree health ratings differed between the Biological Resources Technical Report and i-Tree, so for calculation purposes, the following describes the labeling methods employed. Ratings from the Biological Resources Technical Report of "A," "B," "C," "D," and "F" were assigned in i-Tree as "Excellent," "Good," "Fair," "Poor," and "Dead," respectively.

In instances where the species were not inventoried in i-Tree, experts were consulted and similar inventoried species were substituted and utilized. These cases can be found on the calculation spreadsheet. Average DBH measurements utilized for the Mexican fan palm (*Washingtonia robusta*) and Windmill palm (*Trachycarpus fortunei*) species relied on USDA data and were 14.1 DBH and 9 DBH, respectively. 4 Spanish daggers (*Yucca gloriosa*) were excluded from analysis due to inconclusive DBH measurements.

#### **Results**

- Yearly estimate of carbon dioxide (CO<sub>2</sub>) sequestration is \$1,584.14.
- Yearly estimate of carbon dioxide (CO<sub>2</sub>) sequestration is 67,439.56 lbs.
- Yearly estimate of storm water mitigation is \$413.32.
- Yearly estimate of storm water runoff avoided is 46,330.26 gals.
- Yearly estimate of storm water rainfall intercepted is 312,555.20 gals.
- Yearly estimate of air pollution removal is \$2,412.25.

- Yearly estimate of air pollution carbon monoxide removal is 237.83 oz.
- Yearly estimate of air pollution ozone removal is 6,027.37 oz.
- Yearly estimate of air pollution nitrogen dioxide is 1,469.45 oz.
- Yearly estimate of air pollution sulfur dioxide is 104.49 oz.
- Yearly estimate of air pollution (fine particles or particulate matter) is 63.00 oz.
- Estimate of carbon dioxide (CO<sub>2</sub>) stored to date is \$35,281.18.
- Estimate of carbon dioxide (CO<sub>2</sub>) stored to date is 1,520,466.02 lbs.

## Response No. ORG 6B-8

The comment shows the results of an i-Tree National Tree Benefits Calculator software carbon sequestration analysis of existing conditions. As shown in the comment, the commenter estimated total existing carbon sequestration as 67,439.56 lbs. The commenter erroneously calculated and cited carbon sequestration for the entire Project Site, even though the Project would preserve approximately half of the existing trees.

Appendix C, Carbon Sequestration and Tree Canopy Study, also used i-Tree software consisting of the web-based CO<sub>2</sub> sequestration calculator known as “i-Tree Design” and the software interface “i-Tree Eco” in the evaluation of existing trees and palms to be removed. Appendix C, Figure 1, Annual Sequestration of Trees and Palms to be Removed, tabulates only the trees to be removed by the Project according to species. The Project’s removal of 240 of 421 existing trees represents 57 percent of removal of total trees. Forty-three percent of existing trees would remain. Figure 1 shows annual sequestration of the trees to be removed by the Project as 44,633 lbs. (or the 57 percent to be removed). The annual sequestration of the trees to be removed represents 33.8 percent of the existing carbon sequestration of 67,439.56 lbs cited in the comment. Since 57 percent of trees would be removed, the existing sequestration for trees to be removed in Appendix C represents a higher existing sequestration and more conservative analysis (a greater potential loss) compared to that calculated in the comment. That is, as explained above, that the comment overstates any potential impact since its calculations are based on removal of a significant number of trees which will remain onsite under the Project.

Respective tables showing carbon sequestration per species for the Project are provided in Figures 3 through 7 in Appendix C. Per the Carbon Sequestration and Tree Canopy Study, data comparisons with i-Tree software conservatively assumed that existing trees would continue to annually sequester the same level of carbon dioxide in the future as they do today. Existing trees to be removed, no matter their state of health were rated as “excellent” to provide a conservative data base for existing conditions. The “excellent” health condition for existing trees in the analysis was also used for the Project’s replacement trees. This would be appropriate in the analysis since the proposed native trees would all be supplied by reputable tree nurseries that comply with the nursery industry standard. Further assumptions applied to the carbon sequestration model include the tree inventory from the Carlberg Associates’ October 2020 Tree Report.

Although existing trees to be removed by the Project were all assumed to be in “excellent” health condition for the purpose of the study, the Carlberg Associates Tree Report identified a wide range of health grades (including several trees that were deemed dead, and more than half of all trees to be removed were assigned health grades of C or lower,

excluding Mexican fan palms). Notably, the Mexican fan palms on the Project Site are the only group of trees that were consistently assessed with health grades of “A.” Please refer to Final EIR Appendix C for a more detailed discussion of carbon sequestration and the full Carlsberg Associates Tree Report. Note also that by year 2, the annual carbon dioxide sequestration rate of the Project’s replacement trees would be 43,160 pounds (almost enough to make up for the sequestration from the removed trees) and that by year 5 replacement trees would sequester more than 73,000 pounds of carbon dioxide, which would surpass the sequestration rate from existing conditions.

## **Comment Letter No. ORG 7**

Amy Minter

Sunjana Supekar

Chatten-Brown, Carstens & Minter

On behalf of Save LA River Open Space and the Studio City Residents Association

Letter A received May 10, 2022

Letter B received May 11, 2022

Letter C received April 22, 2022

### **Letter A – May 10, 2022**

#### **Comment No. ORG 7A-1**

On behalf of the Studio City Residents Association (SCRA) and Save LA River Open Space (SLAROS), we provide the following comments on the draft environmental impact report (DEIR) for the proposed Harvard-Westlake River Park Project. SCRA is an all-volunteer membership organization that advocates for and enhances the quality of life in Studio City. The SCRA's volunteers educate our members and create a platform for the interests, concerns and passions regarding the Studio City community. SCRA consists of more than 2,100 members in the community surrounding the proposed Harvard-Westlake River Park Project (the "Project") on what is now the site of Weddington Golf & Tennis. SLAROS is a non-profit volunteer organization working with SCRA in their commitment to protect the last remaining 16 acres of unprotected open space along the Los Angeles River in the San Fernando Valley.

#### **Response No. ORG 7A-1**

The comment introduces Chatten-Brown, Carstens & Minter as representing the SCRA and SLAROS in responding to the Draft EIR. The comment discusses the purpose and membership of the SCRA and describes the role of SLAROS. This introductory comment does not address the adequacy of the Draft EIR and no further response is necessary.

#### **Comment No. ORG 7A-2**

SCRA and SLAROS have serious concerns regarding the density and intensity of development proposed as part of Harvard-Westlake's Project, as well as the limited public access to the recreational facilities on the Project site. The Harvard-Westlake School ("School") has proposed to cram two large sports fields with artificial turf and a 50-meter swimming pool, with hundreds of bleacher seats and 70- to 80-foot-tall lighting and LED scoreboards, a two-story, 80,249-square-foot multi-purpose gymnasium and a 500-space subterranean parking garage on the site after eliminating the existing popular golf course and driving range and the hundreds of mature trees located on the Project site. This Project would have significant adverse impacts that are not fully disclosed in the DEIR due to the elimination of the scenic trees that provide important biological resources, the increase in intensity of use increasing traffic, air quality and greenhouse gas impacts, the

change in hydrologic conditions on the site, the failure to comply with requirements the California Environmental Quality Act (CEQA) imposes on the treatment of Tribal Cultural Resources, lack of consistency with land use plan policies and programs, loss of public recreational access, and potential public health impacts. The DEIR fails to include fully enforceable mitigation measures for many of these impacts, in clear violation of CEQA's requirements.

### **Response No. ORG 7A-2**

The comment asserts that that the Project would result in potentially significant impacts that are not disclosed in the Draft EIR but does not provide any factual support for this claim. The comment is primarily an introduction for the commenter's further discussion below. According to the comment, the Project would have significant adverse impacts that are not fully disclosed in the Draft EIR due to the elimination of scenic trees that provide important biological resources; increase in intensity of use increasing traffic, air quality and greenhouse gas impacts; change in hydrologic conditions on the site; failure to comply with requirements of CEQA regarding the treatment of Tribal Cultural Resources; inconsistency with land use plan policies and programs; loss of public recreational access; potential public health impacts; and failure to provide enforceable mitigation measures. No specific examples are provided in this paragraph to support the claims and no further response to this comment is necessary. However, it is noted that the Project's prior 503-space subterranean garage has been reduced to 386 subterranean spaces and the lighting program has been revised to reduce the number of field and tennis court lights. These changes are incorporated into Chapter 3 of this Final EIR. The issues brought up in the letter are addressed under the Responses below.

### **Comment No. ORG 7A-3**

The DEIR fails to provide an adequate project description, particularly with regard to the Project's public accessibility, intensity of School use of the site and special uses of the site. The DEIR also fails to disclose the reasonably foreseeable activities that will be spurred on Harvard-Westlake's Coldwater Canyon Campus by making the extensive athletic facilities located there obsolete.

### **Response No. ORG 7A-3**

This comment asserts that the Project description is inadequate with regard to public accessibility, intensity of School use of the Project Site, special uses and impacts on the existing School athletic facilities. CEQA Guidelines Section 15124 specifically states that the project description "should not supply extensive detail beyond that needed for evaluation and review of the environmental impact". Section 15124(c) states that the project description shall contain "[a] general description of the project's technical, economic, and environmental characteristics".

The Project's public accessibility and intensity of School and special event use of the Project Site are adequately discussed in the Draft EIR. Chapter II, *Project Description*,

Subsection 4(a)(2), *Public Use of the Project Site*, pages II-33 through II-35, of the Draft EIR provides a schedule of hours when the Project Site would be available for public use as well as the types of uses available on site to the public. Subsection 4(b)(1), pages II-47 through II-51, *Athletic and Recreational Activity and Special Events*, of the Draft EIR discusses the athletic and sports program anticipated by the School, the maximum scenario for the hours of the day throughout the year in which the School would be using athletic facilities, and the frequency and attendance anticipated for special events. As described therein, most of the School's outdoor events, including those at the athletic fields, would occur in the late afternoons and would end between the hours of 4:45 p.m. to 7:45 p.m., with approximately 50 percent of school days containing no outdoor athletic activities after 5:30 p.m. Public access and use of facilities would be available prior to late afternoons during school days when not in use by the School. The details contained in Chapter II are more than sufficient to satisfy the requirements of CEQA Guidelines Section 15124 and to allow the commenter to evaluate and review any potential environmental impacts of the Project. However, for further clarification of public access and use of the Project Site, please refer to the cited subsections of the Draft EIR and Topical Response No. 3 – Enforcement of Public Access.

The comment asserts that the Draft EIR fails to include Project impacts at the School's Upper School campus "spurred" by the Project. The comment contains no facts to support the allegation that the facilities on the Coldwater Canyon campus (Upper School) would be rendered obsolete or any facts to support an allegation that there would be any change to the Upper School campus as a result of the Project. The School's objective, which is unrelated to the Project, is to maintain physical education and athletic facilities at the Upper School campus for academic purposes as under existing conditions. As related to unknown future changes, CEQA does not require an EIR to engage in speculation. As was reiterated in *Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal. App. 4th 342, 373, citing previous authority, an EIR is "not required to engage in speculation in order to analyze a 'worse-case scenario'".

Additionally, the assumption in the comment is incorrect. The Upper School campus recreational facilities are still needed for School use given significant student interest in recreation and interscholastic sports; the myriad of physical, emotional, and psychological benefits that are associated with recreation and sports; and limitations experienced by the School and its students on a daily basis from inadequate and overscheduled existing athletics facilities on the Upper School campus. The underlying objectives of the Project are expressed in Chapter II, *Project Description*, pages II-13 and II-14, of the Draft EIR, and framed by the primary purpose of the Project to "supplement the School's athletic and recreational facilities, and provide Harvard-Westlake School a campus that can fulfill its educational mission and athletic principles now and in the future", which contrasts with the comment's implication that the Project is a pretext to new programs and activities being developed at the Upper School campus. Also, please see Topical Response No. 13 – Need for Project (Non-CEQA). As discussed in Topical Response No. 13, the Weddington Golf & Tennis parcel was purchased by Harvard-Westlake School in December 2017, and the School has continued its operation primarily for public golf and

tennis uses. However, the current Weddington Golf & Tennis is not consistent with the School's educational mission or financially sustainable.

### **Comment No. ORG 7A-4**

Further, the DEIR's analysis of less impactful alternatives is based on improperly narrow project objectives and fails to include a reasonable range of alternatives that would reduce the Project's many significant impacts.

### **Response No. ORG 7A-4**

The comment asserts that the alternatives analysis is inadequate because the Project Objectives are too narrow and the range of alternatives is insufficient. The comment contains no facts to support this contention. Chapter II, *Project Description*, pages II-13 through II-14 of the Draft EIR contain a list of nine Project Objectives in addition to the underlying purpose of supplementing the School's existing recreational facilities. The scope of the Objectives range from fulfilling school needs to providing for public recreational opportunity to incorporating environmentally sustainable features. As such, the Project Objectives are reasonable, provide the public with access and recreational opportunities to private property, and do not limit the range of alternatives for the decisionmakers to consider. CEQA Guidelines 15126.6(a) only requires an EIR to evaluate a reasonable range alternatives. There is no requirement that all possible alternatives be considered. In determining which alternatives to evaluate, the lead agency is governed by a "rule of reason"; needing "only those alternatives necessary to permit a reasoned choice" (CEQA Guidelines Section 15126.6(f)). Please refer to Response Nos. ORG 1B-104 through 1B-106 above, regarding the selection of alternatives. As explained therein, the selection of alternatives is consistent with CEQA Guidelines because the alternatives evaluated in the Draft EIR would reduce the Project's construction noise and vibration impacts (albeit impacts would remain significant and unavoidable), reduce many of the Project's less than significant impacts (acknowledging a few impacts may be greater than the Project's) while largely achieving most of the Project's basic objectives either fully, substantially or partially.

    - 2. The Alternatives Contained in the DEIR Are Designed to Fail ..... 59
  - D. CEQA’s Substantive Mandate Requires Adoption of Feasible Alternatives and Mitigation Measures..... 60
- VII. Conclusion ..... 6

## Response No. ORG 7A-5

The table of contents provided in the comment outlines the specific environmental concerns described in Comment Nos. ORG 7A-6 through ORG 7A-200, below. These specific concerns are addressed by the City in Response Nos. ORG 7A-6 through 7A-200. Note also that Comment No. ORG 7A-5 does not include any supporting evidence for the claims of the listed headings and subheadings and as such no further response is necessary.

## Comment No. ORG 7A-6

### I. History of the Project Site

In the early 1970's, the Project site was down-zoned from residential to its current agricultural (A-1) zoning pursuant to an agreement among Weddington, Studio City Golf Course, Inc., and the City of Los Angeles and County of Los Angeles to permanently maintain the Project site as recreational open space. Consistent with that agreement, the Project site is designated as open space, with a specific golf course designation, on the Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan—the applicable land use element of the City's General Plan.

For more than 60 years, the Project site has been open to the public as the Studio City<sup>1</sup> Golf & Tennis, a recreational facility consisting of a 9-hole golf course, driving range, putting green, 16 tennis courts,<sup>2</sup> and club house. The site includes numerous mature trees, providing rare green and open space in the otherwise heavily developed San Fernando Valley, is extraordinarily well-operated and maintained, and is used by tens of thousands of residents from throughout both the City and the Greater Los Angeles region. The tennis facilities are home to the teams from several high schools and tennis leagues, including the Los Angeles Tennis Association.

<sup>1</sup> The facility has also been identified as the Weddington Golf & Tennis Center.

<sup>2</sup> Four tennis courts were previously removed to allow for construction of Los Angeles Fire Department Station 78.

## Response No. ORG 7A-6

The comment summarizes the history of the Project Site but inaccurately depicts the character of any agreement between the former owners and the City. In discussion with Matt Becker (descendent of Guy Weddington, the original operator of the property), the Property was downzoned from the original residential zone to reduce tax liability prior to Proposition 13 and to be consistent with the zoning of similar golf course properties in the region. According to Mr. Becker, prior to the downzoning, the Property was not financially sustainable given the tax liability and was intended to revert to the original residential zone after a certain number of years in order to allow for more profitable residential

development opportunities.<sup>79</sup> In addition, the original Weddington Golf & Tennis facility operators attempted to entitle and/or sell the site for the development of multi-family homes and, when that proposal did not succeed, the operator sold the site with the understanding that the School intended to develop it for the School's purposes. There was no documentation on the part of the City or the original operator that supported maintaining open space at the Project Site. The School has continued the operation of golf and tennis operations in the interim since its purchase of the Project Site in 2017 as a commitment to the public with the understanding that the Project Site would be reused for the School's athletic and recreational program. It is also the intent of the School to provide public access to these facilities (see Topical Response No. 3 - Enforcement of Public Access). As also discussed in Section IV.L.3, *Parks and Recreation*, of the Draft EIR, the east San Fernando Valley has tennis resources to absorb relocated current tennis uses of the Project Site to the extent that the temporary relocation would not exceed the CEQA Parks and Recreation threshold in which relocation would require the expansion or construction of new public facilities. The comment, however, does not discuss the adequacy of the Draft EIR and, therefore, no further response is necessary.

### **Comment No. ORG 7A-7**

In September 2021, the Los Angeles City Council designated the Studio City Golf & Tennis Center as an Historic Cultural Monument. This designation was based on the fact that the site “exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community” as an excellent example of a 1950s private recreational facility and golf club in Studio City. The facility also “embodies the distinctive characteristics of a style, type, period, or method of construction” as an excellent example of a 1950s community golf course. (See [https://planning.lacity.org/odocument/5ae20992-41fd-4739-a6b0-66003878f981/CHC-2020-7764-HCM\\_\(4-15-21\).pdf](https://planning.lacity.org/odocument/5ae20992-41fd-4739-a6b0-66003878f981/CHC-2020-7764-HCM_(4-15-21).pdf), incorporated by reference.) There was overwhelming community support for this designation, with commentors identifying the importance of the publicly available recreational facility, the facility's long-standing inclusivity and the importance of the open space the site provides.

### **Response No. ORG 7A-7**

The statement that the site “exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community” is based on the Cultural Heritage Commission's language in its recommendation to the City Council that the Project Site be designated as a Historic Cultural Monument. The comment, however, does not address the adequacy of the Draft EIR, but rather appears to conflate the Cultural Heritage Commission's recommendation and the City Council's designation of the Project Site as a Historic Cultural Monument since it mischaracterizes the final

<sup>79</sup> Conversation between Harvard-Westlake School and Matt Becker on June 6, 2022. In the conversation, Matt Becker expressed that he would be willing to testify to his understanding that the Property would revert to its original residential zone. Mr. Becker also stated that the price paid for the Fire Station site by the City through an imminent domain action demonstrated the City's acknowledgement of the value of the property as a potential residential use.

findings of the City Council. Nonetheless, as explained in Topical Response No. 6 – Historical Resources, the Project would comply with the City Council’s designation of the Project Site as a Historic Cultural Monument (HCM). The HCM designation is evaluated in Section IV.D, *Cultural Resources*, of the Draft EIR. As described therein, the Project Site was designated a Historic-Cultural Monument in 2021 under the name “Studio City Golf and Tennis Club.” According to the designation as adopted by the City Council, identified character-defining features include:

- Private recreational facility open for public use
- Clubhouse
- Golf ball [-shaped] light standards
- Putting green
- Brick wall with weeping mortar surrounding the front lawn at the northeast edge of the property

The City of Los Angeles Cultural Heritage Ordinance requires compliance with the Secretary of the Interior’s Standards for Rehabilitation (the Standards) for properties that are designated HCMs (Los Angeles Administrative Code, Section 22.171.14).

As discussed in Chapter II, *Project Description*, of the Draft EIR, and in Project Design Feature CUL-PDF-1: Rehabilitation Plan, the distinctive character-defining features of the Project Site as identified in the HCM designation would be retained. Specifically, the Project Site would remain a private recreational facility open for public use in Studio City, and the character defining features of the HCM, specifically the clubhouse, putting green, golf ball-shaped light standards, and brick wall with weeping mortar, would all be retained such that the Project Site would retain its historic integrity and continue to convey its significance as a 1950s community recreational facility. The putting green and brick wall would be retained in place in their original configuration. The golf ball-shaped light standards would be retained and relocated to the northeastern portion of the Project Site, in proximity to the clubhouse and putting green. Following their relocation on the Project Site, the golf ball-shaped light standards would remain visible from the public right-of-way and would continue to collectively convey their programmatic association with the history of the Project Site.

The clubhouse would be retained, adaptively re-used as a visitors’ center, and rehabilitated according to the Standards, as required by the City of Los Angeles Cultural Heritage Ordinance for properties that are designated HCMs. The Project would maintain the significant characteristics of the clubhouse’s original Ranch-style architecture, and the historic relationship of the building with the overall Project Site and the surrounding neighborhood. This includes retaining the clubhouse in its historic location and maintaining the significant features of the clubhouse that have collectively served as the public face of the Project Site since the 1950s, including: the clubhouse’s angled position facing Whitsett Avenue and Valley Spring Lane; the existing setback; the relationship of the clubhouse, the putting green, and the low brick wall; and the mature trees in this

portion of the Project Site. The clubhouse, golf ball-shaped light standards, putting green, and brick wall comprise the primary features of the Project Site that have historically been visible from the public right-of-way. The Project Site would, therefore, retain much of its historic outward appearance. The Project Site would maintain the same relationship with the surrounding neighborhood as it did historically when it was established as a recreational facility to serve the growing population in the San Fernando Valley after World War II.

### **Comment No. ORG 7A-8**

Not only is the Project site an important historic resource that includes public recreational facilities and one of the few remaining open space areas in the San Fernando Valley, it is also unique due to its strategic location adjacent to the Los Angeles River. The Project site is a critical location as a key connection in the regional network of parks, trails and natural lands that comprise the 51-mile Los Angeles River Greenway. The site has significant value as the last remaining unprotected undeveloped open space along the Los Angeles River. Large financial investments have been made at all levels of government and years of planning have gone into efforts to revitalize the Los Angeles River and lands adjacent to it. The Zev Yaroslavsky Los Angeles River Greenway Trail (“Zev Greenway”) was completed on County property adjacent to the Project site in 2017. The Zev Greenway is a half-mile walking path that brings back native habitat to the River’s edge and reincorporates the River into this urban San Fernando Valley neighborhood. The trail is popular with walkers and joggers, and those needing natural respite. Beautifully designed artistic gates and interpretive panels tell the story of the natural function of the River and the native people who once centered their lives around it.

### **Response No. ORG 7A-8**

The comment does not challenge the adequacy of the Draft EIR, and as such no further response is necessary. Nonetheless, the Project recognizes the importance of the adjacent Zev Greenway, a link in the Los Angeles River Greenway. Even though the Zev Greenway is immediately adjacent to the entire southern border of the privately-owned Project Site property, visitors to Weddington Golf & Tennis are not currently able to access the Zev Greenway or Los Angeles River environs from the Project Site, despite the proximity. As a primary objective of the Project, the School is committed to ensuring that members of the public would have access to and through the Project Site, as well as to the Zev Greenway and to a broad array of recreational facilities, including substantial areas that are maintained and available without charge in the same fashion as a City-owned park. The Project offers a three-quarter mile, publicly accessible walking path through the Project Site and would provide a ramp from the walking path to the Zev Greenway. The Project would also install an ADA-compliant accessible pedestrian ramp leading to the Zev Greenway at Coldwater Canyon Avenue (Coldwater Canyon Avenue Riverwalk Path Ramp) to allow for greater public access to the Greenway, open public access within the Project Site to the Greenway, replace less desirable tree species along the Greenway with RIO-approved trees, and restore habitat along the Greenway adjacent

to the Project Site to native species. One of the primary Project Objectives is to support the goals of the Los Angeles River Improvement Overlay District Ordinance, the Los Angeles River Revitalization Master Plan, and the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes (see Chapter II, Project Description, page II-30). As discussed in Section IV.C, *Biological Resources*, page IV.C-20, of the Draft EIR, disturbed areas consist of dirt areas that lack vegetation or previously disturbed by human activity include areas within the Zev Greenway and Coldwater Canyon Avenue Riverwalk Path Ramp area that are generally devoid of vegetation. The Project would provide for restoration of these areas, and under Mitigation Measure BIO-MM-2, discussed on page IV.C-44 of the Draft EIR, would replace sensitive natural community habitat adjacent to and contiguous with the Zev Greenway. As such, the Project would not conflict with the presumed objectives of the comment.

### **Comment No. ORG 7A-9**

A senior housing project was previously proposed for the Project site between approximately 2007 and 2014. The surrounding community opposed the privatization and development of this site. The previous development project did not move forward. However, before any individuals interested in preserving the Project site as public recreational facilities could make an offer on the Project site, the public was informed that Harvard-Westlake had purchased the site for private school use. The community similarly opposes the privatization of the Studio City Golf & Tennis Center site to be paved over with buildings, structures, and artificial turf to allow it to be converted to mainly private use as the athletic campus for an exclusive private school.

### **Response No. ORG 7A-9**

The comment does not address the adequacy of the Draft EIR and instead seems to be challenging the private property ownership rights of the School since it mischaracterizes the existing uses as being public uses and the School's uses as privatization of the existing uses; as such, no further response is necessary. Nonetheless, to clarify the existing property rights and on-site uses, it is noted that the Project Site under the former Weddington Golf & Tennis facility was privately owned and that no public access was allowed to the site without payment for tennis or golf services. In fact, the Property has been privately owned since the late 1800s, having remained under the ownership of the Weddington/Becker families until Harvard-Westlake purchased it in late 2017. The comment also mischaracterizes the future public use of the Project. Please refer to Chapter II, *Project Description*, page II-13, Objective 4, of the Draft EIR, which states a primary objective of the Project is to "create new publicly-accessible open space with a broad array of recreational facilities in a safe and secure environment for the surrounding community and the public to use similar to a City-owned park, while also providing a community room, café, and indoor and outdoor areas for public gatherings, performances, and occasional special events." As further discussed in Section IV.L.3, *Parks and Recreation*, of the Draft EIR, the surrounding community has a shortage of public parks

within walking distance. A purpose of the Project is to supplement recreational facilities and provide park-type services to this community.

Regarding the statement that the site would be “paved over”, please refer to the discussion of the Project’s open space and trees in Chapter II on pages II-28 through II-31, of the Draft EIR and landscape program in Chapter II, pages II-51 and II-52, of the Draft EIR, for discussions of new planting programs and tree replacement programs. Topical Response No. 5 – Biological Resources/Trees, further describes the replacement of trees. Please also refer to Response No. ORG 6A-1, which discusses how the Project would result in an increased tree canopy after nearly 10 years. Also, refer to Response No. 6B-2 which discusses the long-term carbon sequestration increase with the Project compared to existing conditions. As discussed therein, there would be an increase in greater carbon sequestration and Project Site shading from the Project’s landscaping program. The Project would implement an extensive tree planting and landscaping program that would remove 240 (the majority of which are invasive species, more than half of which are not taxonomically trees, and that the Los Angeles River Master Plan Landscaping Guidelines and Plant Palettes lists under the heading “Plants That Should Never Be Planted Along The River”) of the existing 421 trees, located both on the Project Site and off-site surrounding areas (e.g., within portions of the public right-of-way), and plant 393 RIO-compliant trees, resulting in a net increase of 153 trees (or 36 percent increase). The Project’s tree planting and landscaping program with native species does not support the characterization of the Project as “paving over” of the Project Site but rather shows that the Project would enhance the Project Site with more trees and native plantings than currently exist.

## **Comment No. ORG 7A-10**

### **II. The DEIR Contains an Inadequate Project Description.**

Every EIR must set forth a project description that is sufficient to allow an adequate evaluation and review of the project’s environmental impacts. (CEQA Guidelines § 15124.) “An accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR.” (*County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 192 93; accord *San Joaquin Raptor/Wildlife Reserve Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 730.) “[O]nly through an accurate view of the project may the public and interested parties and public agencies balance the proposed project's benefits against its environmental cost, consider appropriate mitigation measures, assess the advantages of terminating the proposal and properly weigh other alternatives.” (*City of Santee v. County of San Diego* (1989) 214 Cal.App.3d 1438, 1454.).

## **Response No. ORG 7A-10**

This comment sets forth the law on the adequacy of project descriptions. It contains no facts to support the contention that the Project description is inadequate. Nonetheless, see Response No. ORG 7A-3 regarding the adequacy of the Project description.

## **Comment No. ORG 7A-11**

Here, there are several aspects of the Project for which the DEIR fails to provide adequate information to fully assess the Project's impacts. Of overarching concern for SCRA and SLAROS, as well as the community as a whole, is the public accessibility of the Project site. The Project site is currently publicly accessible at all times the site is open, prior to sunset for the golf course and prior to 10 p.m. for the driving range and tennis courts. The Project applicant has claimed to the community that the Project site will remain publicly accessible for recreational uses in response to concerns that the site will now become mainly a private school recreational facility instead of a public recreational facility.

## **Response No. ORG 7A-11**

This comment, which asserts that the Project description is inadequate because it does not address the current permissible, for a fee, uses of the Project Site. These same concerns are raised in Comment No. 7A-2. Refer to Response No. 7A-2 for a response to these concerns.

## **Comment No. ORG 7A-12**

The DEIR claims the site will have 5.4 acres of publicly available open space from 7 a.m. to 9 p.m. (DEIR p. II-2.) However, a review of the Project site plan shows the publicly accessible area is mainly just the landscaping around the new Harvard-Westlake school athletic facilities and the walking paths between those facilities. The Project site is so crowded with school facilities, very little space is left for the public. It is also unclear whether they are including County property in this calculation. The overstatement of the public open space is misleading.

## **Response No. ORG 7A-12**

The comment asserts that the Draft EIR includes a misleading analysis of the public open space that the Project would provide. However, the comment itself mischaracterizes the public path and does not demonstrate that the Draft EIR misrepresents the proposed open space. The Project Description as presented in the Draft EIR would be enforced through the Conditional Use Permit (CUP) Standard Conditions and is not merely a "claim." As discussed in Chapter II, *Project Description*, of the Draft EIR and shown in Figure II-6, *Harvard-Westlake Athletic and Recreational Facilities Conceptual Site Plan*, of the Draft EIR, the Project would provide for public use consisting of approximately 5.4 acres of permanent open space that incorporates a 0.75-mile landscaped walking path. The walking path connects to the adjacent Zev Greenway by a ramp at the property line. The publicly accessible walking paths would be separated from the athletic facilities and would be accessed through four outer pedestrian gates from Valley Spring Lane. The separation would allow all-day public access, even when athletic facilities are in use by the School. The 0.75-mile landscaped walking pathway is not intended as merely a link between athletic facilities but, as discussed on page II-33 of the Draft EIR, would be created to circumnavigate the perimeter of the Project Site, provide opportunities for

cardiovascular exercise, and include shaded areas and bench seating for the public for relaxation, bird watching, dog walking, and general enjoyment of the natural environment as well as meet the objectives of RAP's Citywide Community Needs Assessment for the South San Fernando Valley geographic area (which lists walking paths as the highest priority recreational use in the area). The publicly accessible pathway and landscaped areas would connect with the Zev Greenway via a new ADA-compliant pedestrian ramp alongside the multipurpose gymnasium and would allow visitors to stroll throughout and around the Project Site, whereas under current conditions the Project Site is entirely closed to such uses with fencing that in some cases extends to the curblin. The public would also be provided all day access to the putting green, the café, and the clubhouse (see Table II-3, *Public Use Days and Hours*). Also, in addition to the 5.4 acres, with the tennis courts, the public would have access to 7 acres (304,920 sf) within the Project Site.

### **Comment No. ORG 7A-13**

The DEIR also includes a table of anticipated public use for the athletic facilities on the Project site. The tennis courts, gym (with the exception of a token community room), the swimming pool and athletic fields are claimed to be available whenever “not in use by the school” and only for pre-approved organizations and programs. (DEIR p. II-34.) This eliminates individual use and use by any groups that are not pre-approved. No qualification for pre-approval have been disclosed. The DEIR project description fails to provide adequate information regarding public availability of the facilities and what portions of the public Harvard-Westlake would approve for access. Moreover, there is heavy weekend usage of the Project site anticipated by Harvard-Westlake, which is the time of heaviest recreational use of the current site. The significant reduction in public recreational uses must be disclosed.

### **Response No. ORG 7A-13**

The comment asserts that the Draft EIR is inadequate due to lack of specificity of the conditions of public use and also seems to assert that the public would have reduced access to recreational facilities compared to the current uses of the private facilities. However, the comment does not provide substantial evidence to support the contention that the Project would result in a significant reduction in recreational opportunities for the public nor the contention that the Draft EIR lacks required specificity. (See Response No. ORG 7A-3 above regarding the adequacy of project descriptions.) Public use of the Project Site is thoroughly discussed in the Draft EIR. Additionally, three of the nine Project Objectives relate to the provision of open space accessible to the public and a broad array of recreational facilities in a safe and secure environment for the surrounding community and the public to use similar to a City-owned park (see Chapter II, *Project Description*, Objectives 2, 4, and 5, page II-13 of the Draft EIR). The Draft EIR also states that public access is a “primary objective” of the Project and that “the School is committed to ensuring that members of the public would have access to the Project Site, as well as to the Zev Greenway, to the Los Angeles River environs, and to a broad array of recreational facilities, including substantial areas that are maintained and available without charge in

the same fashion as a City-owned park “ (Chapter II, page II-33). As discussed in Section IV.L.3, *Parks and Recreation*, pages IV.L.3-5, IV.L.3-10, and Table IV.L.3-2, *Distances of Recreational Facilities from the Project Site*, of the Draft EIR, the surrounding neighborhood has minimal access to public park facilities within walking distance. The use of a “pre-approved” status and “reservations” for public use of recreational facilities is to accommodate smoothly those who wish to use the School’s facilities (including the gymnasium), to ensure that the Project serves the community and to enhance safety for individuals and families. Specifically, the requirement that groups or organizations be pre-approved ensures that the group or organization is able to provide appropriate supervision of its intended activities and participants and that the group or organization is familiar with and abides by the conditions of Project Site usage (including, but not limited to, preferred driving routes and the prohibition on parking in the neighborhood), and that the use of facilities can be managed in a way that best supports the aggregate, desired activity schedule of public groups and organizations across the Project Site (such as might be the case if a group or organization requires a certain number of continuing opportunities per week in order for the program to thrive). For these same reasons, individual use of some facilities (i.e., gymnasium community room and courts, pool, athletic fields) would not be permitted, with use limited to pre-approved organizations. For further clarification of public access and use of the Project Site, please refer to Topical Response No. 3 – Enforcement of Public Access.

The School’s use of the Project Site’s athletic facilities would typically not begin until approximately 3:00 p.m. on school days (given that students would be in class prior to then), allowing the Project Site to be used by the public from 7:00 a.m. to 2:30 p.m., providing 30 minutes for return of equipment and egress. Once School uses begin at approximately 3:00 p.m. on school days, the Draft EIR assumed the most conservative scenario that all athletics activities would take place simultaneously at the Project Site, except for football games. Based on 2018-19 school year activities, the last full year prior to COVID-19 when athletic activities were temporarily truncated, approximately 50 percent of school days would contain no outdoor activities after 5:30 p.m. (Chapter II – *Project Description*, page II-47). On those days, out of the 7:00 a.m. to 8:00 p.m. maximum outdoor operating hours, public uses of the two fields could comprise up to ten hours as compared to School uses of three hours. Hours of public access to the pool are more limited, consisting of weekday access between 7:00 a.m. and 9:00 a.m., given the need to provide certified lifeguard supervision. In addition, the Project would offer a greater range of recreational uses than the existing golf and tennis uses, in conformance with the Department of Recreation and Parks’ (RAP’s) Citywide Community Needs Assessment for the South San Fernando Valley geographic area, which lists walking paths as the highest priority recreational use and gymnasium and swimming pool as high priority uses. The Project, with a three-quarter mile landscaped walking path, gymnasium, and swimming pool (though with access limits for lifeguarding), would more closely meet the RAP’s identified recreation needs for the community compared to a tennis and golf club. The use of the School’s facilities following implementation of the Project, unlike the existing golf and tennis uses, would not be established with the intended result of

generating a financial profit. Also please refer to Topical Response No. 3 - Enforcement of Public Access, for further clarification of public use.

### **Comment No. ORG 7A-14**

Further, any approval for this Project must be conditioned upon clear requirements regarding availability of public use for the facilities. As set forth, the project description contains nothing more than estimates of the frequency of use based on previous use of existing facilities. But, the DEIR fails to address whether the frequency of athletic uses would increase with the development of these expansive facilities. Would more athletic games, including tournaments, be scheduled at Harvard-Westlake with the new facilities? Would new athletic teams be formed? It seems clear there would be an expansion beyond existing uses if the school will be significantly expanding its athletic facilities.

### **Response No. ORG 7A-14**

The comment requests that limitations be placed on the use of the Project Site facilities. The request is based on speculative questions that are not supported by facts. An EIR is not required to engage in speculation. (*Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal. App. 4th 342, 373.) Moreover, the Project description is detailed and sufficient to allow evaluation and review of the Project's potential environmental impacts. The discussion of the types of School athletic, recreational and special events and non-school use of the Project Site is clearly set forth in Chapter II, *Project Description*, of the Draft EIR, including as part of the first listed Project Objective "to support the School's existing athletic programs and co-curricular activities" (refer to page II-13). The Project Description need only contain a general description and should not supply extensive detail beyond that needed for evaluation and review of the environmental impacts. (CEQA Guidelines Section 15124.) See also Response No. ORG 7A-3 regarding use of the Project facilities.

Please also refer to Topical Response No. 3 - Enforcement of Public Access, for additional details regarding public access and use of the Project Site, and a discussion of the School's commitment to public access and shared use of recreational facilities as set forth in the Draft EIR.

### **Comment No. ORG 7A-15**

The DEIR discloses for the first time that the Project site will be used not only as a sports facility for Harvard-Westlake School, but also for academic uses, including science labs, meetings and classes. The DEIR fails to provide adequate information regarding these uses such as the frequency and where they would be located on the Project site. Since public use is halted when facilities are in use by the School, to adequately assess public accessibility, this information must be provided. The DEIR implies that prior to 3 p.m., more of the site would be publicly accessible. But, with the inclusion of academic classes on the Project site, Harvard-Westlake's use of the facilities could stretch throughout the entire day. The frequency of such use must also be disclosed because it could

significantly increase the intensity of use of the site. The vague reference to using the Project site for classes fails to provide a complete project description. Harvard-Westlake must also disclose any further anticipated expansion of use of the site. It appears it may anticipate turning the site into a full-time school campus and not just an after school athletic facility.

### **Response No. ORG 7A-15**

The comment contends that the Draft EIR should contain more information about the uses of the Project Site by the School. The Draft EIR specifies that athletic and recreational activities relating to Harvard-Westlake students would generally not begin until 3:00 p.m. after the academic day (Chapter II, *Project Description*, page II-47). Incidental, non-athletic School activities, such as those described by the commenter, would not begin before 9:00 a.m. and would involve fewer than 100 participants at a time (except for School special events, which are described on page II-50 of the Draft EIR). Academic uses include science labs, bird watching, meetings, and classes and would not occupy any of the athletic facilities. As there would not be any use of the athletic facilities by the incidental, non-athletic School activities, public use of those facilities would be unimpacted. Regarding the potential for increased intensity of site usage, which would only result if School academic and athletic uses were to overlap, academic classes are not generally held after 3:00 p.m. when athletic activities begin. A primary reason for the separation between the academic day and post-school, extracurricular activities (including athletics) is that over two-thirds of Harvard-Westlake students on the Upper School campus participate in sports, as described in Topical Response No. 13 – Need for Project (Non-CEQA). This participation makes it infeasible to conduct classes later in the afternoon hours. Nonetheless, any such afternoon academic uses, if they were to occur, would be subject to the same potential conditions of approval including, but not limited to, restrictions on hours of operation, provision of shuttles between the Upper School campus and Project Site, prohibition on parking in the neighborhood, and prohibition for student parking on the Project Site when cumulative attendance for activities across the Project Site is anticipated to be in excess of 300 participants.

There is no intention by the School to turn the Project Site into an academic campus. In addition, any change in use compared to the Project Description would be precluded by the terms of the CUP. The CUP, which is based on the Project as an athletic and recreational facility with guaranteed public access, would not allow expansion in the use of the Project as approved. Students' primary academic programs would take place at the Upper School campus.

### **Comment No. ORG 7A-16**

The DEIR also claims there may be up to 30 "special events" at the Project site per year. As with the level of Harvard-Westlake athletic activities at the Project site, the DEIR is not proposing any conditions of approval to limit the use to levels described in the Project description. Without such conditions, the use could be significantly higher than disclosed. Further, Harvard-Westlake has failed to provide the City with adequate information

regarding the special events. The Project application failed to include any description of these events or their frequency, despite this information being required in the application.

### **Response No. ORG 7A-16**

The comment asserts that conditions must be imposed to ensure the limit of use of the Project Site as described in the Project description. The proposed CUP for the Project is based on the description of the Project and the number of activities and events set forth in Chapter II, *Project Description*, of the Draft EIR. It is noted that the events listed in the Draft EIR are based on a conservative scenario (see page II-48). The potential conditions of approval under the CUP establish the maximum use of the Project, which is enforced by the City of Los Angeles. Specific special events, as well as the specific number of special events, is not known since the parameters for such activities would only be understood after the establishment of any potential conditions of approval. However, the School would comply with decision-makers' approvals regarding the maximum number and scale of events discussed in Chapter II of the Draft EIR. See also, Response No. ORG 1B-13 above regarding the addition of a Project Design Feature (NOI-PDF-4), in addition to the conditions of the CUP, to ensure the parameters of activities and events on the Project Site.

### **Comment No. ORG 7A-17**

Finally, when previously proposing construction of a new athletic field on the Harvard-Westlake Coldwater Canyon Campus, the School repeatedly cited the need for additional parking for students. This Project would provide over 500 parking spaces. The DEIR fails to disclose whether these parking spaces could be used by students attending school at the Harvard-Westlake campus, with shuttles to the campus, to make up for what the school has previously considered a significant deficit in student parking.

### **Response No. ORG 7A-17**

The comment refers to a prior project at the Upper School campus that was voluntarily withdrawn from City consideration by the School and contends that the Draft EIR does not contain sufficient information on student use of the Project Site parking. While the Draft EIR does not specifically state that students would not be permitted to park on the Project Site at the start of the academic day and be shuttled to the Upper School campus for classes, it is clear that such use would not be applicable given repeated reference to shuttles being provided between the Upper School campus and the Project Site between 2:30 p.m. and lasting until the day's final activity on the Project Site (refer to pages II-55 and II-56), with no reference to the provision of regularly-operating shuttles prior to 2:30 p.m. to shuttle the students from the Project Site to their classes on the Upper School campus. As the use of the Project Site for general, daytime student parking is not part of the Project, it would be prohibited as a potential condition of approval under any approved CUP. As further explained in Response No. ORG 7A-15 above, the CUP would prohibit student parking on the Project Site when the cumulative number of spectators across the

Project Site, including parents and other spectators, is anticipated to be in excess of 300 participants.

Note that modifications to the Project design would reduce the capacity of the underground parking structure from 503 spaces to 386 spaces and the capacity of the above grade parking lot from 29 spaces to 17 spaces for a total of 403 spaces. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

## **Comment No. ORG 7A-18**

### **III. The DEIR Improperly Segments the Relocation of Athletic Facilities from Expansion of Uses on Harvard-Westlake Campus.**

CEQA requires analysis of “the whole of an action,” including activities that are a reasonably foreseeable consequence of a project, and prohibits evading comprehensive CEQA analysis by splitting projects into separate pieces. (CEQA Guidelines § 15378; *Bozung v. LAFCO*. (1975) 13 Cal.3d 263, 283-84; *Orinda Assn v. Board of Supervisors* (1986) 182 Cal.App.3d 1145, 1171.) The City must “construe the project broadly to capture the whole of the action and its environmental impacts.” (*Save Berkeley’s Neighborhoods v. Regents of University of California* (2020) 51 Cal.App.5th 226, 239.) All phases must be considered together for environmental review. (*Natural Resources Defense Council, Inc. v. City of Los Angeles* (2002) 103 Cal.App.4th 268, 284.).

## **Response No. ORG 7A-18**

The comment cites CEQA provisions and case law but does not provide any facts to support the contention that the Draft EIR improperly segments the Project. The Draft EIR evaluates the combined activities of all facilities, including public use, as a single project. Since the comment does not specify, or demonstrate with statements of fact, the manner in which the commenter deems the whole of the Project to be segmented or evaluation in the Draft EIR to be incomplete, no further response is necessary.

## **Comment No. ORG 7A-19**

The Harvard-Westlake Coldwater Canyon Campus already contains a number of athletic facilities, including:

- Tapper Gymnasium
- Ted Slavin Field, with sports field and synthetic track
- “50-meter pool manufactured by Myrtha Pools of Mantua, Italy”
- Large Sports Performance Center with weight room and full-size dry cleaning and laundry facility

(Attachment A, H-W Map; <https://www.hw.com/athletics/Facilities-Locations>, incorporated by reference.).

### **Response No. ORG 7A-19**

The comment lists some of the facilities available at the Upper School campus, but does not address the adequacy of the Draft EIR or provide any facts to support any contention that the Project facilities will replace existing facilities. See Topical Response No. 13 - Need for the Project (Non-CEQA).

### **Comment No. ORG 7A-20**

When Harvard-Westlake previously proposed an expansion of athletic facilities adjacent to its existing campus, only one new sports field was identified as necessary. No additional gyms, pools or other athletic uses were identified as being required. Harvard-Westlake has failed to provide information regarding the necessity of all components that have been included as overly narrow project Objectives. (See Section VI.A, below.) Instead of providing only required additional facilities, Harvard-Westlake's goal appears to be creating an entirely new large campus where all School athletics, and some School academics, will be located.

### **Response No. ORG 7A-20**

The comment refers to a prior project contemplated by the School and appears to disagree with the School's current needs assessment and proposed uses for the Project Site. As such, the comment does not address the adequacy of the Draft EIR for the Project. As to the commenter's assertion that a prior EIR on a different project site did not include the same range of recreational facilities of this Project, the prior EIR analysis for the previously-proposed project did not reflect the full needs of the Harvard-Westlake School because that project was constrained by the available space at the property located across Coldwater Canyon Avenue from the Upper School campus (located on a hillside and less than half the size of the Project Site). As such, the prior EIR did not, and could not, have anticipated and articulated the range of potential possibilities and facilities solutions that a different property location might have enabled. Please refer to Topical Response No. 13 – Need for Project (Non-CEQA), for additional detail regarding the manner in which the Project has been designed to meet the School's current needs.

### **Comment No. ORG 7A-21**

The School has failed to identify a need for three large athletic fields, three gyms and two large pools, which is what would result from a combination of proposed new facilities and the currently existing facilities on the Harvard-Westlake campus. It is reasonably foreseeable that the athletic facilities currently existing on the campus will no longer be used if Harvard-Westlake creates an entirely new athletic facilities campus. Harvard-Westlake must disclose any potential plans to replace existing on campus athletic facilities with new or expanded uses.

## Response No. ORG 7A-21

The comment asserts that the Draft EIR fails to identify the need for the combination of the existing facilities currently on the campus and the new facilities proposed by the Project, and fails to disclose any replacement or expansion plans for the Upper School campus. The comment also suggests that uses on the Upper School campus may be expanded by the development of this Project. An EIR is not required to identify the need for a project, it is only required to provide sufficient information to allow the public and decision makers to determine if the project would cause any environmental impacts and identify project objectives for analysis of potential project alternatives. Nonetheless, the Draft EIR for the Project does include some discussion of the need for the Project. As stated on pages VI-9 through VI-10 in Chapter VI, *Other CEQA Considerations*, of the Draft EIR, the Project would serve the School's existing need for recreational facilities for which space is not available at the Upper School campus. The Project's primary objective, as stated on page II-13 in Chapter II, *Project Description*, of the Draft EIR, is to "supplement the School's athletic and recreational facilities." It is not a project intended to increase the use of the facilities at the Upper School campus. The commenter's assertion that the Project would allow Harvard-Westlake to increase the use of its existing recreational facilities is merely speculation without substantial evidence to support the contention. As was reiterated in *Napa Citizens for Honest Government v. Napa County Board of Supervisors* (2001) 91 Cal. App. 4th 342, 373, citing previous authority, an EIR is not required to engage in speculation. See also Topical Response No. 13 – Need for the Project (Non-CEQA), which discusses the current constrained conditions at the School demonstrating that the Project would not be growth-inducing at the Upper School campus, and provides additional detail regarding the manner in which the Project has been designed to meet the School's current needs.

## Comment No. ORG 7A-22

The California Supreme Court rejected a similar attempt at project segmentation in *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 393–395.) There, the agency claimed future uses at a university building did not need to be assessed in environmental review because it had "not yet formally approved any particular use" for the future phase. (*Id.* at 394.) The Court found that even though the specifics of the future phase had not yet been determined, there was adequate information to include that phase in the environmental review, either as a phase of the current project or as a cumulatively considerable future project. (*Id.* at 395.) The same requirement applies here. Harvard-Westlake must disclose its plans for future use of the on-campus athletic facilities that would become obsolete or unnecessary if the Project is developed as proposed. Failure to do so violates CEQA's important public disclosure principle. (*Laurel Heights I, supra*, 47 Cal.3d 376, 394.).

## Response No. ORG 7A-22

The comment asserts that the Draft EIR is required to disclose its plans for the future use of the Upper School campus' athletic facilities, basing this contention on the unsupported statement that the Project would make the existing School athletic facilities obsolete or unnecessary. As is clear from the Draft EIR, the Project is intended to supplement, not replace, the existing athletic facilities at the School. As stated on page II-13 in Chapter II, *Project Description*, of the Draft EIR, “[t]he underlying purpose of the Project is to *supplement* the School’s athletic and recreational facilities” (emphasis added). See Topical Response No. 13 - Need for the Project (Non-CEQA). Topical Response No. 13 explains why the School needs recreational facilities in addition to those that already exist at the Upper School campus. Also, unlike the case cited in the comment, there is no evidence presented in the comment that demonstrates that new facilities are planned for the Upper School campus or that the existing athletic facilities are contemplated to be used for a non-recreational purpose. Furthermore, the evidence presented in the Draft EIR and this Final EIR indicates that the athletic facilities on the Upper School campus would continue to be used for recreational purposes. See Response No. ORG 7A-21 regarding the EIR not being required to engage in speculation.

Since no new development is anticipated at the Upper School campus, this facility is not included as part of the Project. Thus, the Project Description and the Draft EIR evaluations are not “segmented” because the Project would not affect the existing or future use of the Upper School campus and because there are no plans to change the athletic facilities, or anything else, located on the Upper School campus.

## Comment No. ORG 7A-23

### IV. The DEIR Improperly Relies on Project Design Features and Proposed Conditions to Mitigate Impacts Without Analysis or Enforceability.

Throughout, the DEIR improperly relies upon so-called Project Design Features (PDFs) and claims that conditions will be placed on the Project in an attempt to reduce many of the Project’s impact without the required analysis of the impacts or the measures relied upon to mitigate them.

## Response No. ORG 7A-23

The comment asserts that PDFs were improperly used to reduce Project impacts. The assertions made in the comment are not supported by substantiated facts and, thus, no further response is necessary. Nonetheless, see Response Nos. ORG IB-8, 1B-22, and IB-23 above, regarding use of PDFs, which explain how the Draft EIR does not attempt to reduce any of Project’s impacts but rather fully analyzes them as part of the Project and includes the PDFs in the Mitigation Monitoring Program (MMP) to ensure compliance. As explained in Response No. ORG 1B-8, the Draft EIR analyzed the impacts of the Project with the PDFs as Project components incorporated into the Project. Pursuant to CEQA, mitigation measures are not part of the original project design, but instead are

actions taken by the lead agency to reduce impacts to the environment resulting from the original project design (CEQA Guidelines Sections 15126.4(a) and 15370). Mitigation measures are identified by the lead agency while a project is undergoing environmental review, and not finalized until the end of the environmental review process, and are above-and-beyond existing laws, regulations, and requirements that would reduce environmental impacts. Moreover, CEQA encourages the incorporation of project elements that would reduce or avoid any potential significant impacts. The Project's PDFs are clearly integral to the Project even when they are incorporated in order to ensure that the Project is environmentally sensitive or to show the manner in which a regulatory requirement would be carried out. The Draft EIR adequately discusses the PDFs and potential impacts and at no time utilizes PDFs to avoid discussion of the Project's potential impacts or appropriate mitigation measures. Rather than hiding potential impacts, or avoiding discussion of mitigation measures through the use of PDFs, these issues are clearly analyzed in the Draft EIR which sets out the PDFs and mitigation measures in several places including Table ES-1, Summary of Project Impacts, Project Design Features, and Mitigation Measures, on pages ES-15 through ES-25. These entries are followed by a full analysis of the Project's impacts and the incorporated PDFs and mitigation measures in Chapter IV, *Environmental Impact Analysis*, of the Draft EIR.

Similarly, conditions of a CUP do not hide any Project impacts but are used to ensure compliance with the Project characteristics that are set forth and fully analyzed in the Draft EIR. For example, see Response No. ORG 1B-15 above regarding the maximum use and operation of the Project which would be limited by the School's CUP potential conditions of approval which will reflect the EIR's Project Description and cannot be exceeded.

### **Comment No. ORG 7A-24**

The majority of these PDFs and conditions appear to be mitigation measures that the Project applicant and City have failed to incorporate into the Project's Mitigation Monitoring and Reporting Program (MMRP). When a Project incorporates mitigation measures, CEQA requires that those mitigation measures be "fully enforceable through permit conditions, agreements, or other measures." (Pub. Resources Code § 21081.6(b).) As mere PDFs that will not necessarily be incorporated into Project approvals, conditions, and the MMRP, the PDFs are not properly enforceable by the City or third parties and cannot be relied upon for any reductions in Project impacts. CEQA's mitigation requirements exist for a reason. "The purpose of these requirements is to ensure that feasible mitigation measures will actually be implemented as a condition of development, and not merely adopted and then neglected or disregarded." (*Federation of Hillside & Canyon v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261; *Katzeff v. California Dept. of Forestry and Fire Protection* (2010) 181 Cal.App.4th 601, 612; *Lincoln Place Tenants Assn v. City of Los Angeles* (2005) 130 Cal.App.4th 1491.).

## Response No. ORG 7A-24

This comment asserts that the Project's PDFs should be mitigation measures so that they can be incorporated into the MMP. The Project's PDFs are all incorporated into the MMP (See, Chapter 4, *Mitigation Monitoring Program*, of this Final EIR). With incorporation into the MMP, all PDFs are fully enforceable. The comment does not provide evidence to demonstrate that mitigation measures would have greater enforceability than PDF's and, therefore, no further response is necessary.

## Comment No. ORG 7A-25

The heavy reliance on Project PDFs and the future imposition of conditions also improperly compresses the DEIR's disclosure and analysis functions. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655-656.) A "mitigation measure cannot be used as a device to avoid disclosing project impacts." (*San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 663-664.) Here, the DEIR claims that the PDFs are part of the Project itself and fail to assess the impacts of the Project without these PDFs. Recent Court of Appeal decisions disapprove of this practice:

A 'mitigation measure' is a suggestion or change that would reduce or minimize significant adverse impacts on the environment caused by the project as proposed." (*Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 445, 66 Cal.Rptr.3d 120.) *A mitigation measure is not part of the project.* (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 656 & fn. 8, 167 Cal.Rptr.3d 382.) Thus, it is questionable whether these measures even qualify as mitigation measures.

(*Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 17 Cal.App.5th 413, 433, emphasis added.) An EIR cannot incorporate "the proposed mitigation measures into its description of the project and then conclude [] that any potential impacts from the project will be less than significant." (*Lotus, supra*, 223 Cal.App.4th 645, 655-657.) The DEIR's shortcut is "not merely a harmless procedural failing...[it] subverts the purposes of CEQA by omitting material necessary to informed decisionmaking and informed public participation." (*Id.* at 658.)

## Response No. ORG 7A-25

The comment reasserts that the Project's PDFs and conditions should have been discussed as mitigation measures and that failure to do so resulted in the Draft EIR improperly compressing the analysis of Project impacts. The comment does not state what PDFs were improperly applied to the Project nor what conditions the commenter is contending should have been analyzed as mitigation measures. As such, the assertions made in the comment are not supported by substantiated facts and, thus, further response is not necessary. Nonetheless, see Response No. ORG 1B-8, which explains that the Project's PDFs are all appropriate components of the Project and not mitigation

measures; Response No. ORG 1B-22, which explains why the analysis did not understate impacts or fail to discuss Project impacts; Response No. ORG 1B-23, which explains why the Project's Draft EIR does not suffer from the same deficiencies discussed in the Lotus case; and Response No. ORG 7A-23, which explains the use of potential conditions of approval to ensure compliance with Project characteristics and not for the purpose of mitigating a potentially significant impact.

## **Comment No. ORG 7A-26**

### **V. The DEIR Fails to Adequately Analyze the Project's Impacts.**

#### **A. The DEIR Fails to Adequately Disclose and Mitigate Aesthetic Impacts.**

##### **1. The DEIR Fails to Analyze Impacts to Scenic Quality of the Site.**

As a matter of law, the EIR must comprehensively address the significant aesthetic effect of the Project. (See *Quail Botanical Gardens Foundation, Inc. v. City of Encinitas (1994) 29 Cal.App.4th 1597.*) Existing public views of the open and expansive Project site, with numerous trees and greenspace forming a scenic vista, would be adversely altered by the Project. The Project would remove approximately 240 trees, many of which are located in the publicly visible public right-of-way. During the lengthy construction period, the site would be almost entirely denuded. The Project would also install walls and fencing around the site that block the existing views of greenspace and trees. The DEIR fails to include any analysis of these aesthetic impacts, claiming the Project is located in an urbanized area but failing to recognize that this site provides an important respite from the urbanization.

## **Response No. ORG 7A-26**

The comment asserts that the Draft EIR did not analyze all the Project's impacts related to aesthetics. The Initial Study for the Draft EIR, attached to the Draft EIR as Appendix A, provided a detailed evaluation of effects of the Project relative to (a) scenic vistas, (b) scenic resources, (c) scenic character, and (d) light and glare. Under the Initial Study, any issue that has the potential to exceed CEQA threshold standards is deferred for further evaluation in the Draft EIR. Based on CEQA threshold standards, the evaluation of the Project's impacts on scenic vistas, scenic resources, and scenic character were determined in the Initial Study to be less than significant. Few panoramic views are available across the Project Site and, as such, further analysis was not deferred to the Draft EIR. The Project Site is not located within the view field of a State Scenic Highway and would not impact scenic resources within a State Scenic Highway. Regarding Aesthetics Threshold (c), scenic quality, CEQA requires that a project located in an urbanized area should not conflict with applicable zoning and other regulations governing scenic quality. Under CEQA, for projects within an urban area, the visual character of a temporary construction site or the compatibility or conflict of a development with the existing setting is not evaluated in an EIR. The Project, which is located within an urban area, would be designed to comply with the requirements of the City's Department of

Public Works, Urban Forestry Division, which requires the replacement of street trees (trees within the street right-of-way) on a 2:1 basis and approval by the Board of Public Works. In addition, the Project would be designed to comply with RIO landscaping regulations, including the implementation of the Los Angeles River Master Plan Design Guidelines and Plant Palettes (Guidelines). The Guidelines establish setbacks, plant density, and the use of indigenous species. In addition, the Project would not conflict with the individual design and community design and landscaping policies of the Sherman Oaks-Studio City-Toluca Lake-Cahuenga Community Plan (Community Plan). In accordance with Community Plan design policies, the parking structure would be located below grade to blend with the character of the Project Site. Surface parking would be located at the rear of the Project Site. Decorative walls and landscaping would be used to screen the Project's uses from residential uses. No building within the Project Site would exceed 30 feet in height, as permitted at the Project Site, and trash would be located in enclosed areas. The Project's light poles would be visible; however, as narrow stationary features, these would not block scenic vistas across the Project Site and would be lower than many of the wooden poles that support the existing golf driving range netting that reaches a height of approximately 90 feet. In accordance with the Community Plan Community Design and Landscaping policies, open space available to the public would maximize pedestrian accessibility and circulation; open walkways, benches and trees would maximize solar exposure or protection; and the Project would feature appropriate plant and hardscape materials. As such, because the Project would not conflict with plans and policies adopted to regulate scenic quality, scenic quality impacts were deemed less than significant and excluded from further evaluation in the Draft EIR. The Initial Study, however, determined that impacts associated with light and glare were potentially significant and, as such, this issue was evaluated in detail in Section IV.A, *Aesthetics*, of the Draft EIR.

### **Comment No. ORG 7A-27**

Additionally, the DEIR fails to disclose that the Project would conflict with applicable zoning regulations intended to protect scenic quality. As discussed in Section V.G, addressing land use impacts, the Project includes numerous light poles that are 70 to 80 feet tall, making them at least 40 feet taller the allowable height on the Project site, and significantly taller than any other existing or planned structures. This height limit is intended to protect the scenic quality of this Los Angeles River-adjacent site that is currently in open space. The Project's lack of compliance with this regulation could result in adverse aesthetic impacts not evaluated in the DEIR.

### **Response No. ORG 7A-27**

The comment asserts that the Project's sports lighting system would conflict with applicable zoning regulations intended to protect scenic quality. Zoning regulations, such as building heights, are adopted to provide consistency in neighborhood development or to restrict development intensity. Height regulations, whether for buildings, fences, or poles, could be related to scenic quality but are not adopted for that exclusive purpose.

Although the zoning regulation would apply to light poles, it is not determined that the zoning regulations were adopted to regulate scenic quality in relation to these features. The Initial Study determined that the light poles would not block views and that the Project would be substantially consistent with City policies specifically related to protecting scenic quality, such as tree replacement, provision of open space, provision of landscaping, and River Improvement Overlay (RIO) District regulations. It is noted, however, that the RIO does have specific lighting level standards that have been and are currently exceeded by the existing tennis court use. The Project's sports lighting poles are described in Chapter II, *Project Description*, Table IV-1, Summary of Major Project Components, Figure II-27, Light and Signage Plan, and on pages II-57 through II-59 and page II-62 of the Draft EIR. As further discussed in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR the number of field lights and other outdoor lighting fixtures has been reduced compared to the lighting program outlined in the Draft EIR. Although light and glare impacts would be less than significant under the Project as defined in the Draft EIR, the lighting radius would be further reduced under the lighting program described in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, and Topical Response No. 4, Aesthetics. As discussed in the Draft EIR, the Project would request a permit and approval for the proposed lighting poles pursuant to LAMC Section 12.24 F, in lieu of the 30-foot height limit otherwise required by LAMC Section 12.21.1. The height limit exception would bring the Project into compliance with a residential zoning designation. Furthermore, the lights associated with the poles would reduce existing on-site aesthetic conditions related to light and glare as evaluated in Section IV.A, *Aesthetics*, of the Draft EIR and in Topical Response No. 4 – Aesthetics, and would be lower in height than many of the wooden poles that support the existing golf driving range netting. The latter, existing poles reach a height of approximately 90 feet. The Project's light and glare impacts from the light poles would not exceed RIO District standards. As discussed in the Initial Study, because of shielding by trees along Valley Spring Lane, Bellaire Avenue, and Whitsett Avenue, the Project's light poles would not result in significant impacts associated with scenic vistas, scenic resources, or scenic quality. The former Weddington Golf & Tennis facility is not an open space but a private property that has been operating for decades in non-compliance with RIO District standards and which can only be used by the public for a fee. The comment does not demonstrate with facts that the Project would result in significant aesthetic impacts not disclosed in the Draft EIR.

### **Comment No. ORG 7A-28**

The Project is also inconsistent with the designation of the site as open space with a golf course. (Attachment B, Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan Land Use Map.) The Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan includes Policy 5-1.1 "Encourage the retention of passive and visual open space which provides a balance to the urban development of the Plan Area" and requires open space areas be protected from the encroachment of more intense uses. The DEIR fails to disclose that the Project would conflict with the Community Plan's designation of the site as visual open space to balance the surrounding urban

development. Instead, the Project includes significant development on the site and an encroachment of more intense uses by Harvard-Westlake.

## **Response No. ORG 7A-28**

The comment asserts that the Project would not be consistent with the “Golf Course/Open Space” designation of the Community Plan. It is noted that under CEQA, the Draft EIR does not need to demonstrate consistency with a plan but to provide a comparison of a project to plan policies to determine if a project would result in a conflict with a plan policy that would result in a significant environmental impact. The Project is compared to policies of the Community Plan in Table LU-5, *Consistency of the Project with Applicable Policies of the Sherman Oaks-Studio City-Toluca Lake-Cahuenga Pass Community Plan*, in Appendix J of the Draft EIR; a summary of the comparison is provided in Section IV.J, *Land Use and Planning*, of the Draft EIR. The City does not consider the Project’s land use designation in itself to be pertinent to CEQA land use thresholds. CEQA land use thresholds apply only to policies that are adopted to avoid or mitigate an environmental effect. As such, the land use designation of the Community Plan is not evaluated in the Draft EIR. However, as discussed in Table LU-5, the Project would not conflict with the Community Plan’s policies to avoid or mitigate an environmental effect. For example, in relation to Policy 5-1.1, the Project would increase existing open space resources available for free public use and access compared to existing conditions, in which all facilities are part of a private golf and tennis facility and only available for a fee. In relation to Policy 5-1.2, the Project would promote active parkland by accommodating public use of the athletic fields, tennis courts, pool, and gymnasium facilities and by integrating landscaped public open space on the Project Site with accessibility to the adjacent Zev Greenway. Usability by the public and breadth of athletic, recreational, outdoor, and environmental uses would be expanded. Please refer to the evaluation of Policies 4.1, 4.1.1, 4-1.2, 5.1, 5-1.1, 5-1.2, 5.1-3, and Actions 3 through 9 regarding the provision of park and recreational facilities within the Community Plan area as provided in Appendix J of the Draft EIR.

The Project would provide substantial open space in the form of walking paths, playing fields and other recreational facilities that would characterize a public park. Within the Project Site, approximately 5.4 acres would be landscaped and separate from athletic facilities so it would be accessible to the public at all times during the day and direct access to the Zev Greenway and Los Angeles River overview would be provided. The existing site to which the Community Plan’s designation applies is a private site, which is only accessible to the public with payment of a fee. In that respect, the Project would increase public access and open space use of the Project Site compared to existing conditions. The comment does not demonstrate with fact that the Project would conflict with applicable plan policies or that the Draft EIR would exceed CEQA land use thresholds.

## Comment No. ORG 7A-29

The DEIR fails to provide comparative visual renderings and simulations for the site and surrounding area with and without the Project. This prevents the public and decisionmakers from assessing the visual impacts of the Project. Additionally, the renderings of the Project contained in the DEIR's project description section rely on misleading angles, mainly within the site or from middle of the River, not surrounding residences or the Zev Greenway, and not with the small replacement trees that would need years to grow to the size of existing mature trees.

## Response No. ORG 7A-29

The comment asserts that the Draft EIR does not provide adequate visual renderings. Existing conditions and renderings of future conditions are provided in Chapter II, *Project Description*, Figures II-15 through II-25, of the Draft EIR. Figures II-15 to II-18, II-23 and II-25 have been updated in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, which include updates to light pole heights and numbers, and gymnasium building design (Figure II-25). These figures are accurate depictions of existing and future conditions since the view field of the Project Site from the adjacent public streets would be dominated by existing (to remain) mature trees along Bellaire Avenue, Valley Spring Lane, and Whitsett Avenue. Contrary to the assertion that the renderings are not from the surrounding residences or Zev Greenway, Figure II-20, *Rendering – View of Project Site Entrance at Whitsett Avenue*, depicts the Project from the sidewalk at residences across Whitsett Avenue, Figure II-21, *Rendering – View of Project Site from Whitsett Avenue at Valley Spring Lane*, depicts the Project from the sidewalk across the street at that corner, and Figure II-22, *Rendering – View of Project Site from Valley Spring Lane*, depicts the Project from the sidewalk in front of residences along Valley Spring Lane. The views of the Project Site and Zev Yaroslavsky Greenway from the south (Figure IV-24, *Rendering – View of the Project Site and Zev Greenway from the Southwest*), depicts the Project Site as it would appear from the south side of the River and not from within the River. As further shown in Section IV.C, *Biological Resources*, Figure IV.C-4, *Tree Removal Plan*, and Figure IV.C-5, *Tree Planting Plan*, of the Draft EIR and discussed in Topical Response No. 4, *Biological Resources/Trees*, trees would primarily be removed from the central portion of the Project Site. The existing mature trees along Zev Greenway, Bellaire Avenue, and Whitsett Avenue would remain. The majority of mature street trees along Valley Spring Lane frontage would remain, except for groups of trees generally located northerly of the swimming pool and the eastern end of Field B. A number of the existing mature trees south of the removed trees on Valley Spring Lane would remain and screen on-site facilities from views from the public street. The replacement trees on Valley Spring Lane would be planted with fast growing Velvet Ash in 48-inch boxes (between the street and mature trees to be retained within the Project Site) to contribute to the screening of the Project Site. Because the majority of street trees would remain and those that would be removed would be replaced at a 2:1 ratio, the removal of trees would not cause the visual character of the Project Site to adversely change as viewed from off-site locations. The great majority of replacement

trees would be in 48-inch boxes with 3 to 7 years of growth prior to installation, with an average height of 12 to 15 feet, and would be located primarily at the interior and south edge of the Project Site. Although the replacement trees would reach maturity quickly, these trees would not be as visible from the surrounding residential neighborhood as the retained mature trees along the street edges. Since the renderings and tree replacement program are shown in the Draft EIR, the comment does not demonstrate that the Draft EIR fails to adequately depict the visual character of the future Project Site.

## **Comment No. ORG 7A-30**

### **2. The DEIR Fails to Adequately Disclose Night Lighting Impacts.**

The Project includes significantly more night lighting sources than currently exist on the Project site. Existing lighting on the Project site is limited to the eastern portion of the site. This lighting is buffered by the many mature trees on the site. Additionally, the lighting from the tennis courts is shielded from the Greenway in part by the Fire Station building. The new lighting would include 70- and 80-foot-tall polls [sic] for both fields and the pool area, plus LED screens. This significantly expands the height and number of lighting sources on the Project site. It also expands night lighting to the western portion of the site and even includes the installation of field lighting directly adjacent to the Greenway. (Compare DEIR App. B p. 15 (existing lighting locations) with p. 8 (proposed lighting locations for Project)).

## **Response No. ORG 7A-30**

The comment asserts that the Draft EIR does not adequately disclose night lighting impacts. Light levels for the existing Project Site are based on the evaluation of the types and locations of lighting and glare levels. As discussed on PDF page 39 of 46 of the Lighting Technical Report contained in Appendix B of the Draft EIR, the Project's lighting model does not take into account any shielding of lighting by trees or objects, and concludes that not only would the Project's sports lighting design meet or exceed applicable lighting standards but also that it would generally improve offsite spillover and glare as compared to existing conditions. Please see Topical Response No. 4 – Aesthetics, and Response to Comment No. ORG 7A-31, below, for a discussion regarding the effects of the Project's lighting program compared to existing conditions. In addition, please refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, and Topical Response No. 2 - Modifications to the Project Design, which provides updates to the Project's light poles. The Project's lighting program has been revised to reduce the number of field and tennis court lights. The Supplemental Lighting Report Memorandum is attached as Appendix B to this Final EIR and, as further evaluated in Topical Response No. 4 – Aesthetics, the reduction in lighting would further reduce the Project's light and glare levels.

## Comment No. ORG 7A-31

The DEIR claims no PDFs or mitigation measures are required for night lighting impacts, relying on the Project applicant's claim that they will install and maintain a certain type of lighting and shielding. This claim is unenforceable mitigation and as such is improper under CEQA. Moreover, to the extent the DEIR relies on the future installation of trees as a source of night lighting mitigation, that shielding will not be provided for many years. The Project is removing hundreds of mature trees and will replace them with much smaller trees. It will take years for the replacement trees to provide any shielding and they may never reach a height that would be able to shield lighting from the extremely tall athletic field lighting.

## Response No. ORG 7A-31

The comment asserts that the Draft EIR provides no enforcement of lighting types or levels through PDFs or mitigation measures to ensure that the light and shielding system described in the Draft EIR would be installed. The lighting facilities, as described and evaluated in the Lighting Technical Report by StudioK1 in Appendix B of the Draft EIR, are part of the Project Description, and would be incorporated into the potential conditions of approval for the CUP. Also, please see Section IV.A, *Aesthetics*, of the Draft EIR regarding light and glare as well as Topical Response No. 4 – Aesthetics. As discussed on page IV.A-12 of the Draft EIR: “The Project’s modeled sports lighting levels included in the Lighting Report did not account for the landscape conditions occurring between the Project Site and the Zev Greenway changes in elevation, the preservation of most of the existing trees along the Project Site’s property lines, or the addition of significant new landscaping to be undertaken as part of the Project. The numerous trees and dense landscaping along the property line in proximity to the Zev Greenway would likely block the line-of-sight between the light source and the Zev Greenway trail, with a similar effect at the residential neighborhoods immediately to the west, north, and east of the Project Site. As such, these conditions would work to shield the Project lighting and lower the foot candle levels at the property line beyond those included in the Lighting Report. As such, the Lighting Technical Report represents a conservative analysis of Project impacts.” Therefore, since the existing conditions were not factored into the Project’s prospective lighting analysis, the level of reduction from shielding features such as existing or future trees is not described in the Draft EIR. As further discussed in Topical Response No. 4, the types of fixtures to be implemented by the Project would reduce light and glare impacts on off-site areas, including residential neighborhoods and the Zev Greenway where levels are currently in excess of RIO District threshold standards. At no off-site locations would ambient light or glare levels exceed applicable RIO District, LAMC, or CEQA threshold standards. In addition, hours of operation for athletic facilities would cease no later than 8:00 or 9:00 p.m. compared to existing lighting of the tennis courts which currently occurs until 10:00 p.m. and existing lighting of the golf driving range which occurs until 11:00 p.m. In addition, please refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, and Topical Response No. 2 - Modifications to the Project Design, which provides updates to the Project’s light poles.

The Project's lighting program has been revised to reduce the number of field and tennis court lights. The Supplemental Lighting Report Memorandum is attached as Appendix B to this Final EIR and, as further evaluated in Topical Response No. 4 – Aesthetics, the reduction in lighting would further reduce the Project's light and glare levels. The comment does not demonstrate through substantiated fact that additional mitigation measures or PDFs would be required to further reduce the modeled future light levels.

## **Comment No. ORG 7A-32**

### **B. The DEIR Fails to Analyze and Disclose Air Quality and Hazards Impacts and Mitigation Measures.**

#### **1. The DEIR Must Acknowledge the Project's Location in an Area of Extreme Nonattainment.**

The South Coast Air Basin, where the Project is located, is in extreme nonattainment for the federal ozone National Ambient Air Quality Standards (NAAQS). While the DEIR states the attainment status on page IV.B-21, the reader is given no information as to why the Basin fails to meet the federal ozone standard. Nor does the DEIR explain what "extreme" nonattainment means (it is the very worst category, with the highest ozone concentrations in the air contemplated by the Clean Air Act; 42 U.S.C. § 7511(a)), or as to how severe the ozone pollution problem is in the Basin. U.S. EPA's Green Book states that only two areas in the nation are so heavily polluted as to be in "extreme" nonattainment for ozone, namely Los Angeles-South Coast Basin, and the San Joaquin Valley. (<https://www3.epa.gov/airquality/greenbook/jnc.html>, incorporated by reference.) The omission is so glaring as to make the document misleading on this point.

## **Response No. ORG 7A-32**

The comment claims that the Draft EIR does not describe the meaning of "extreme" nonattainment or why the South Coast Air Basin currently receives such designation. The Draft EIR presented the air basin's attainment status in Table IV.B-2, *South Coast Air Basin Attainment Standards (Los Angeles County)*, page IV.B-21. As shown in the table, the South Coast Air Basin is in non-attainment, extreme, for ozone. As designated in the USEPA Green Book, non-attainment is any area that does not meet (or that contributes to ambient air quality in a nearby area that does not meet) the national primary or secondary ambient air quality standard for a NAAQS. The 8-hour ozone classification of extreme means the area has a design value of 0.163 ppm and above. As presented in the South Coast 8-Hour Ozone Sip Update<sup>80</sup> ozone levels have declined by nearly a third since 1997 due primarily through state and district programs primarily aimed at reducing Nox emissions. Nox emissions in the South Coast have been reduced by almost 70 percent since the USEPA set the ozone standard in 1997. Table IV.B-7, *Estimated Maximum Regional Operational Emissions – Project (Pounds per Day)*, page IV.B-53,

<sup>80</sup> CARB, 2019. *Staff Report South Coast 8-Hour Ozone SIP Update*. Available: South Coast 8-Hour Ozone SIP Update (ca.gov). Accessed June 2022.

shows that Project operational emissions, including ozone precursors, do not exceed the significance threshold, resulting in a less than significant impact. As such, although the Draft EIR did not define extreme non-attainment, the pertinent information required by CEQA was presented, cited to, and available to decision-makers and the public. Therefore, the Draft EIR is not misleading in its analysis of the Project's air quality impacts.

### **Comment No. ORG 7A-33**

A true picture of the severity of ozone pollution in the South Coast Air Basin is presented in the prestigious State of the Air Report, which is issued annually by the American Lung Association. A copy of the excerpts of the Report for 2022 is attached to these comments for the record. It lists the Los Angeles-Long Beach metropolitan area as the most-polluted for ozone in the nation (Attachment C – State of the Air Report, p. 17). None of this information made it into the EIR, but the decision makers and the public are entitled to, and need to, know it.

### **Response No. ORG 7A-33**

The comment claims that the Draft EIR does not include a discussion of severe ozone pollution. The Draft EIR does, in fact, provide a discussion on the potential health effects of criteria air pollutants, including ozone on pages IV.B-3 – IV.B-7, as well as the air monitoring information reported by the SCAQMD for the region in Table IV.B-3 on pages IV.B-24 – IV.B-25. The SCAQMD provides this information, which includes the maximum concentrations of pollutants sampled and how many days that pollutant was over the standard, to inform the public on the state of the air quality in the region; thus, it provides a reasonable level of information to the public and the decision-makers. The comment highlights the American Lung Association *State of the Air Report* and suggests that the content of that report be included in the Final EIR. In response, page IV.B-26 of the Draft EIR has been revised. This *State of the Air Report* states that Los Angeles has the worst ozone pollution in the nation, as it has for all but one of the 23 years tracked by the *State of the Air* report. As discussed in Response No. ORG 7A-32, the region is designated as extreme non-attainment for ozone and, as such, that Los Angeles experiences ozone pollution is a known fact and not new information. However, information regarding this report will be included in the Final EIR. The information below from the American Lung Association *State of the Air Report* is included in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, in this Final EIR.

“The American Lung Association publishes an annual State of the Air report. The State of the Air 2022<sup>81</sup> report ranked Los Angeles County the 16<sup>th</sup> most polluted County in the US for daily p.m. and annual p.m., driven in large part by the increasing number and size of wildfires. Los Angeles County ranked 3<sup>rd</sup> as most polluted County in the US from

<sup>81</sup> American Lung Association, 2022. *State of the Air 2022*. Available: <https://www.lung.org/getmedia/74b3d3d3-88d1-4335-95d8-c4e47d0282c1/sota-2022.pdf>. Accessed June 2022.

ozone. However, Los Angeles County experienced fewer bad air days on average from 2018 – 2020 versus 2017–2019.”

## **Comment No. ORG 7A-34**

### **2. Air Quality Analysis is Based on Faulty VMT Assumptions.**

This Project, as proposed, is a project that will have shuttles running continuous trips five days a week. (DEIR, p. II-55.) Harvard-Westlake has made no commitment to run 100% electric shuttles, so these shuttles will necessarily emit criteria pollutants. As we have explained in Section J.2, the Project’s VMT analysis is based on unsupported assumptions and omissions. (Attachment D, Expert Comments from Tom Brohard.) The Air Quality analysis utilizes these faulty assumptions. For instance, the estimated mobile source emissions are dependent on the VMT analysis (DEIR, Appendix C, p. 13; IV.B-38.). The DEIR must correct these assumptions and be recirculated with the corrected air quality analysis.

## **Response No. ORG 7A-34**

The comment claims that the emissions analysis is based on incorrect VMT projections and other unspecified assumptions and omissions. As shown on page 276 of the Air Quality/Greenhouse Gas Emissions Technical Documentation for the Project, which was provided as Appendix C-1 to the Draft EIR, the shuttle VMT was accounted for in the VMT generated by the Project. As presented (beginning) on page IV.B-38 of Section IV.B, *Air Quality*, of the Draft EIR, the CARB on-road vehicle emissions factor (EMFAC) model was run in the emissions mode (also referred to as the “Burden” mode) and used to generate Air District-specific vehicle fleet emission factors in units of grams or metric tons per mile which account for gas, diesel, compressed natural gas, and electric vehicles. These emission factors were then applied to the daily VMT to obtain daily mobile source emissions. Therefore, the criteria pollutant emissions from the shuttles was accounted for in the Project’s operational mobile emissions estimates and assumed no emissions reduction from the use of hybrid or electric shuttles. Thus, the air quality analysis is correct and fully analyzes Project impacts relating to air quality.

## **Comment No. ORG 7A-35**

### **3. The DEIR Understates the Project’s Air Quality and Hazards Impacts Relating to Artificial Turf.**

Given the Project’s location in an air basin already burdened with significant air pollution, the Project must take every available precaution to avoid contributing to air pollution and hazards. This goal cannot be achieved with the Project’s use of artificial turf.

A component of artificial turf is crumb rubber, which contains contaminants of potential concern, including criteria pollutants such as particulate matter and VOCs. (DEIR, p. IV.H-31 to -32.) The DEIR states that the turf will need to be replaced every eight years, at

which point the replaced turf will need to be disposed. (DEIR, p. IV.H- 45.) The DEIR states that “In addition to compliance with applicable disposal regulations, artificial turf consists of material that can be recycled at the end of its useful life. **Compliance with applicable regulatory requirements would ensure that Project impacts related to disposal of artificial turf would be less than significant.**” (DEIR, p. IV.H-45.).

### **Response No. ORG 7A-35**

This comment claims that the Draft EIR understates the Project’s Air Quality and Hazards impacts related to artificial turf. However, the comment is a summary of the contaminants in artificial turf and disposal of artificial turf as discussed in the Draft EIR and does not address the adequacy of the Draft EIR. Therefore, no further response is necessary.

### **Comment No. ORG 7A-36**

But the DEIR provides no evidence that such recycling and safe disposal is even possible, and in fact substantial evidence demonstrates it is not possible. On February 28, 2022, Public Employees for Environmental Responsibility (PEER) filed a complaint with the Federal Trade Commission against turf manufacturers for false advertising, because “[t]here are no turf recycling plants in the U.S.,” “[u]sed turf is not being exported to the two known recycling plants in Europe” and “[a]rtificial turf is extremely difficult and expensive to recycle since all the different plastics, rubber, and other materials used must be separated from each other.” (**Attachment E** – PEER, March 7, 2022, “False Artificial Turf Recycling Claims Ripped,” <https://peer.org/false-artificial-turf-recycling-claims-ripped/>.) In 2019, a CEO of a turf recycling company admitted that turf recycling is not possible, and even the Synthetic Turf Council has stated that it is not possible at the point of removal. (**Attachment F** – PEER, January 30, 2020, “Artificial Turf’s Big Lie: Old Fields Not Recycled,” <https://peer.org/artificial-turfs-big-lie-old-fields-not-recycled/>.)

### **Response No. ORG 7A-36**

The comment claims that the Draft EIR does not provide evidence that recycling or safe disposal is possible. In this regard it is noted that artificial turf is difficult to recycle because it is made up of mixed polymers, which make up the turf, grass, and infill components. The different polymers must be separated from one another before they can be recycled and it is difficult to separate the infill components from the turf.<sup>82</sup> Although there are no recycling plants for artificial turf in the United States, a Netherlands company, TenCate Grass, announced the launch of an initiative, in September 2022, for a first of its kind program in the U.S. to recycle end-of-life artificial turf. As discussed in greater detail in Topical Response No. 7 – Artificial Turf and its Effects on Localized Heat and Health, TenCate aims to send artificial turf fields to California where they will be shredded. The shredded material will then be shipped to Texas for pre-processing and finally it will be

<sup>82</sup> ArtificialGreens.org, 2018. Can Artificial Grass be Recycled? Available: Can Artificial Grass be Recycled? - ArtificialGreens.org. Accessed July 28, 2022.

used to create new turf and other products.<sup>83</sup> TenCate’s goal is to “keep turf out of landfills and put it back to use”.<sup>84</sup> Once the pilot program is complete, TenCate plans to expand the initiative across the U.S.

The Draft EIR analyzes the disposal of hazardous turf and not the recycling of it. As evidenced, Section IV.H, *Hazards and Hazardous Materials* of the Draft EIR, included a detailed evaluation of the disposal of artificial turf, and simply identified that recycling of certain components of artificial turf is possible. As stated on page IV.H-45 of the Draft EIR, used turf would be disposed of in accordance with hazardous waste standards in 22 CCR 66261.20 et seq., and would have to demonstrate that none of the CCR Title 22 metals concentrations exceed California Total Threshold Limit Concentrations (TTLIC), which are used to classify a hazardous waste, except for zinc. Compliance with applicable regulatory requirements would ensure that Project impacts related to disposal of artificial turf would be less than significant. The assertion that the Draft EIR does not provide adequate evidence is not substantiated by fact.

### **Comment No. ORG 7A-37**

The DEIR does not disclose the amount of artificial turf the Project will use as far as we have been able to ascertain, but generating artificial turf waste every eight years that cannot be recycled will likely have significant air quality and hazardous impacts.

### **Response No. ORG 7A-37**

The comment asserts that the Draft EIR does not provide the total amount of artificial turf needed for the two fields and that recycling of turf would result in significant air quality and hazards impacts. As shown in Chapter II, *Project Description*, Table II-1 of the Draft EIR, Field A would be 1.87 acres. The turf areas for Fields A and B would be the same. The additional acreage shown for Field B (a total of 3.34 acres) in Table II would also include the running track comprising 1.47 acres that would not be covered by turf. The information regarding the acreage of the running track and total acreage of Field B is incorporated into Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. The combined fields would be 1.87 acres x 2, for a total of 3.74 acres. As such, the Project would require a total of 3.74 acres of artificial turf. Please see Response No. ORG 7A-36 above, which states that compliance with applicable regulatory requirements would ensure that Project impacts related to disposal of artificial turf would be less than significant.

<sup>83</sup> Carolina Recycling Association, 2022. TenCate Grass launches synthetic turf recycling program, September 20. TenCate Grass launches synthetic turf recycling program – Carolina Recycling Association (cra-recycle.org). Accessed December 2022.

<sup>84</sup> Sportsfield Management, 2022. TenCate Grass Launches Synthetic Turf Recycling Program in the U.S., September 29. TenCate Grass launches synthetic turf recycling program (sportsfieldmanagementonline.com), Accessed December 2022.

## Comment No. ORG 7A-38

### 4. The DEIR Fails to Analyze and Adopt All Feasible Mitigation Measures.

According to CalEnviroScreen, the Project Site ranks in the 70<sup>th</sup> percentile for pollution burden and 75<sup>th</sup> for ozone (Census Tract 6037143500). Nox emissions are a precursor to forming ozone. Thus, it is imperative that the Project reduce and avoid Nox emissions at any cost.

Despite this, the Project will have significant Nox emissions during its extended 2.5- year construction period. The DEIR must analyze and adopt all feasible mitigation measures to reduce Nox and other criteria pollutant emissions. These mitigation measures include:

- Prohibiting gas- or diesel-powered construction or maintenance equipment (e.g., leafblowers). Using electric equipment.
- Requiring all Project development to be all electric with no plumbing whatsoever for natural gas. Accordingly, no gas-powered water heaters, or any other gas-powered appliance shall be allowed.
- Including photovoltaic solar panels and batteries in the project design to provide the maximum amount of the Project’s commercial needs, but in no event, less than 90 percent.
- Actually constructing enough electric vehicle charging stations in the project design to provide charging capacity adequate to service all anticipated vehicles to the Project site, not solely providing some of the infrastructure for “future” stations.
- Including electric heat pumps in the project design to provide air and water heating and cooling.
- Requiring that the shuttles running from the Harvard-Westlake Upper School Campus to the Project site are 100% electric and mandating as an enforceable mitigation measure that use of such shuttles is required.
- Providing free transit passes to students, faculty, parents, and anyone who may utilize the Project.
- Providing a free shuttle to and from the nearest Metro Rail stations.
- Prohibiting vehicle idling.

These measures will also have co-benefits—all of them will reduce GHG emissions, and many of them will reduce the Project’s significant unmitigated noise impacts.

## Response No. ORG 7A-38

In crafting mitigation measures, the mandate of Public Resources Code section 21002 was considered, which provides, in part, that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available

which would substantially lessen the significant effects of such projects. The Project would incorporate a mitigation measure to substantially reduce Nox emissions to a less-than-significant level.

As detailed in Section IV.B, *Air Quality*, of the Draft EIR and prior to the incorporation of mitigation measures, the Project's construction Nox emissions would exceed the SCAQMD significance threshold for all the overlapping phases as shown in Table IV.B-6, *Estimated Maximum Regional Construction Emissions (Pounds per Day)*, on page IV.B-52 of the Draft EIR, resulting in potentially significant impacts. However, with implementation of Mitigation Measure AQ-MM-1: Construction Equipment Features, Nox emissions would be reduced to below the SCAQMD significance threshold as shown in Table IV.B-8, *Estimated Maximum Mitigated Regional Construction Emissions (Pounds per Day)*, on page IV.B-56 of the Draft EIR. Maximum Nox emissions would be reduced from 190.1 pounds per day to 85.9 pounds per day after mitigation. Since the mitigation measure would result in less-than-significant impacts, further mitigation is not required. I comment does not provide any facts to support the need for the additional mitigation measures, or facts that demonstrate the effectiveness of the proposed measures. Instead of reasoned analysis, the list merely represents the commenter's arbitrary selection of features which are not required by CEQA or regulatory mandates. Note that bullet point No. 3 in Mitigation Measure AQ-MM-1 was updated in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR to clarify the idling regulatory requirements that are applicable to the Project and assumed as part of the mitigated air quality emission analyzed in the Draft EIR.

## **Comment No. ORG 7A-39**

### **C. The DEIR Fails to Adequately Analyze and Mitigation the Project's Biological Impacts.**

#### **1. The DEIR's Assessment of Impacts Due to Tree Removal is Inadequate.**

The Project would have direct construction impacts on special-status birds and bats, raptors, and migratory birds that include the potential to disturb the lifecycle of avian species and migratory birds from damaging vegetation, affecting foraging, roosting, and nesting areas and disturbance of nesting, roosting, and foraging due to construction noise and vibration and night lighting. These temporary impacts must be addressed and mitigated, but were not.

The DEIR fails to acknowledge the long-term significant impacts to migratory birds and bat species that would result from the removal of approximately 250 mature trees currently at the Project site. The DEIR focuses on the replacement of these trees with native species, underestimating the habitat currently relied upon by birds and bats that will be lost for the years of construction and many years it will take for the replacement trees to reach a similar size.

Additionally, the DEIR does not address the cumulative loss of trees at both the Project site and for the Sportsmen's Lodge project located just over the River from the Project site. The Sportsmen's Lodge project has removed approximately 90 mature trees, adding to the cumulative loss of trees for species to rely upon in this area.

### **Response No. ORG 7A-39**

See Topical Response No. 5 – Biological Resource/Trees. As discussed in Topical Response No. 5, the Project's tree removal and replanting program was fully analyzed in the Draft EIR's Section IV.C, *Biological Resources*, of the Draft EIR. As discussed in Section IV.C and Chapter II, *Project Description*, of the Draft EIR, the Project would implement an extensive tree planting and landscaping program that would remove 240 of the existing 421 trees, located both on the Project Site and off-site surrounding areas (e.g., within portions of the public right-of-way), and plant 393 trees, resulting in a net increase of 153 trees (or 36 percent), an increase in tree canopy on the Project Site, and a greater capacity for carbon sequestration. As discussed in Section IV.C, *Biological Resources*, of the Draft EIR, and Topical Response No. 5, with implementation of mitigation, the Project would not conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, and impacts would be less than significant.

It should be noted that half of the tree removals are Mexican fan palms, and that the Project would preserve the vast majority of trees located toward the outer strata of the site (away from primary construction areas). As stated on pages IV.C-31 through IV.C-42, in Section IV.C, *Biological Resources*, under the heading Candidate, Sensitive, or Special-Status Wildlife, of the Draft EIR, there are no federally threatened and endangered wildlife species with potential to occur on-site. There is one special-status wildlife species, the western yellow bat (species of special concern), that has a moderate potential to occur, and mitigation is provided to reduce potentially significant direct impacts on this species as stated on page IV.C-42. Such mitigation was provided even though ESA's biologists previously surveyed the Project Site for wildlife, including bats, in November 2016 for a different project and the western yellow bat was not detected at that time.<sup>85</sup> That survey was conducted by an individual with bat expertise. Similarly, the western yellow bat was not observed during the more recent ESA wildlife surveys undertaken for the current Project, which is acknowledged to be general in nature (i.e., for the purpose of broadly examining and inventorying onsite plant and animal species, including bats) and not focused exclusively on the potential existence of bats. There is only one CNDDDB occurrence record of this bat species within the vicinity of the Project Site, which was recorded in 1984 approximately 8.5 miles to the east in a developed area of Glendale. Closer in proximity to the Glendale record, bat surveys were conducted between April and November 2008 in Griffith Park, and the results of the surveys found

<sup>85</sup> ESA, Biological Resources Technical Report, January 2022, provided in Appendix D of the Draft EIR.

no individual of western yellow bat to be present.<sup>86</sup> Also, please refer to Response No. AG 4-30 and Response Nos. ORG 1B-45 through ORG 1B-48 for additional information pertinent to impacts on bats.

As stated on pages IV.C-48 to IV.C-49, in Section IV.C, *Biological Resources*, under the heading Migratory Species and Native Wildlife Nursery Sites (beginning on page IV.C-47), of the Draft EIR, indirect impacts to nesting birds and roosting bats during construction and tree removal may result in behavioral changes and could cause unsuccessful breeding opportunities. However, construction activities would be temporary on an intermittent basis, and Project Design Feature PDF-BIO-1, which demonstrates compliance with regulatory requirements for nesting bird protection, and Mitigation Measure BIO-MM-1 would reduce any direct impacts to nesting birds and roosting bat species to a less-than-significant level.

The Project would result in a net increase of 153 trees (or 36 percent). As stated on pages IV.C-57 to IV.C-58, in Section IV.C, *Biological Resources*, under the heading Cumulative Impacts, of the Draft EIR, related projects would be required to comply with applicable regulatory requirements, such as the MBTA, and, to implement mitigation measures to address significant impacts under CEQA regarding migratory bird species, native wildlife nursery sites, and significant trees. The Project's contribution to cumulative impacts would not be cumulatively considerable when considered with the impacts of the related projects. As such, with incorporation of the Project's PDF and mitigation measures, cumulative impacts on biological resources would be less than significant.

## **Comment No. ORG 7A-40**

### **2. The DEIR's Analysis of Impacts to Bat Species from Tree Removal and Nighttime Lighting is Inadequate.**

The large number of mature trees on the Project site coupled with its adjacency to the Los Angeles River provide good bat roosting and foraging habitat in an area surrounded by dense urbanization. The DEIR admits that the Project site could provide habitat to the special status Western yellow bat, but fails to provide mitigation to address this impact. Moreover, the DEIR fails to include an adequate survey of bat species at the Project site. The day time site visit conducted in November (reconnaissance biological survey) was not adequate to provide evidence of bat occupancy of the Project site. (DEIR IV-C.13.) Nocturnal surveys with acoustic recordings for bats coupled with night vision observations should have been done between May and August to detect bats that may have maternity roosts in the trees. Additional bat species are likely to use the Project site and adjacent Zev Greenway, including those that are species of special concern. For example, the draft EIR prepared for the Los Angeles River Master Plan Update established that the Pallid

<sup>86</sup> Remington, S. and D.S. Cooper. 2009. Bat Survey of Griffith Park, Los Angeles, California, Draft Report. February 20, 2009.

bat, a species of special concern, was observed along the Los Angeles River in the vicinity of the Project site. (Attachment G, LARUMP pp. 3.3-11 and Fig 2-4.)

## Response No. ORG 7A-40

The comment contends that the Draft EIR's analysis of impacts to bat species due to tree removal is inadequate. As discussed in the Draft EIR, although at least some individuals or populations of western yellow bat may be migratory, some western yellow bats are year-round residents in southern California.<sup>87</sup> Therefore, if present, western yellow bat would be detected by a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) to determine whether special status bat species are roosting within trees that would be removed, as outlined in Mitigation Measure BIO-MM-1 on pages IV.C-41 to IV.C-42 of the Draft EIR. Western yellow bat is typically found in desert regions of southwestern United States and their roosting habitat is often within the "skirt" of dead fronds of native or non-native palm trees. It is noted that the majority of the Mexican fan palms occurring within the Project Site have had their skirt of dead fronds removed during routine annual maintenance, limiting the potential for roosting of western yellow bat on the Project Site.

In coordination with CDFW, Mitigation Measure BIO-MM-1 on pages IV.C-41 to IV.C-42 of the Draft EIR has been revised to include additional requirements if a qualified bat specialist determines that special-status bats are present, or that bats are absent but trees to be removed are suitable bat roosting habitat. This update has been incorporated into Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, in this Final EIR.

**BIO-MM-1:** Due to the presence of potentially suitable roosting habitat (ornamental trees) for special-status bat species (i.e., western yellow bat), Harvard-Westlake School shall demonstrate and guarantee to the satisfaction of the Los Angeles Department of City Planning that either of the following has been or shall be accomplished:

1. Tree removal activities shall be scheduled outside of the maternity roosting season (October 1 through February 28) to avoid potential impacts to special-status bat species during breeding season.
2. Any construction or palm tree removal activities that occur during the maternity roosting season for special-status bat species (March 1 through September 30) shall require a qualified biologist experienced with bat roost biology to conduct a pre-construction (or pre-tree removal) survey, using sonic bat detectors (e.g., Anabat or Sonobat) and night vision goggles for an emergence survey (for at least

<sup>87</sup> Pierson ED, Rainey WE. 1998. Western yellow bat, *Lasiurus xanthinus*. In: Bolster BC, ed. Terrestrial Mammal Species of Special Concern in California. pp. 50 and 51.  
<https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=84523&inline>.

one-hour after sunset) to determine whether special status bat species are roosting within trees that would be removed. A qualified biologist is a biologist with specialized bat experience including the familiarity with bat roost biology (i.e., a professional biologist with a minimum of two years of bat survey experience, inclusive of acoustic survey experience). The surveys shall be conducted at dusk and after nightfall by a biologist. If an active roost site is located during the pre-construction survey, the roost shall be avoided and Project activities shall be conducted as recommended by the biologist to avoid the area, which may include temporary postponement or provision of a suitable buffer established around the roost until roosting activities cease. Suitable buffers could include netting, canvas, or similar materials as recommended by the biologist. A report shall be submitted to the City with the results of the pre-construction or tree removal survey and any needed maternity roost avoidance actions: prior to any Project-related ground-disturbing activities or vegetation removal at or near locations of roosting habitat for bats. If special-status bats are detected during the survey, a qualified bat specialist shall prepare species specific mitigation measures to reduce or avoid impacts to each special-status species detected. Mitigation may include avoidance through postponing or temporarily halting construction until maternal roost use is completed, use of construction buffers of no less than 100-feet, or the installation of bat boxes in proximity to detected maternal roosts. Avoidance measures shall be based on site-specific factors to prevent roost disturbances; including but not limited to numbers and locations of bats, proposed construction activities, height and distance of bat roosts from proposed construction activities, the presence of visual and/or acoustic barriers between the roost and proposed activities, and the pre-existing level of human activities (e.g., ambient noise, potential movement, etc.) to which the bats may already tolerate.

3. If special-status bats are not detected, but the bat specialist determines that roosting bats may be present at any time of year and could roost in trees at a given location, tree removal activities will be initiated by pushing trees using heavy machinery prior to using a chainsaw to remove the tree. In order to provide the optimum warning to any roosting special-status bats that may be present, trees shall be pushed lightly two or three times, with an approximately 30-second pause between each nudge/push to allow bats to become active. A period of at least 24 hours shall elapse between such operations to allow special-status bats to escape the construction area.

As stated in Appendix D, Biological Resources Technical Report, Appendix D Special-Status Wildlife Species on PDF page 393 of 394, pallid bat is not expected to occur within the Biological Study Area since it does not support suitable roosting habitat due to the high level of human disturbance and development, and native habitats for foraging are absent. Pallid bat prefers rocky outcrops, cliffs, crevices, trees (e.g., deciduous trees in riparian areas) with access to open habitats for foraging. Although the Zev Greenway provides some scattered deciduous trees, they are not dense enough to comprise a

riparian community; therefore, this species is not expected to occur and would not be impacted by the Project.

### **Comment No. ORG 7A-41**

The DEIR does not assess best lighting practices for bat species, instead just claiming that the use of directed LED lighting will reduce impacts, failing to consider color temperature for lighting. “Best practices for lighting for bat species include avoiding green and red lights, as these interfere with migration patterns. White lighting tends to attract prey species and increase foraging. Lighting adjacent to wildlife areas should be limited to an upper limit of 3,000 on the Kelvin color temperature scale and shielded to prevent light from entering the wildlife area.” (Attachment H, LARUMP DPEIR p. 3.3-127.)

### **Response No. ORG 7A-41**

The comment asserts that the Draft EIR did not adequately address the best lighting practices for bat species. As stated on page IV.C-35 through IV.C-41, in Section IV.C, *Biological Resources*, of the Draft EIR, under the heading Indirect Impacts, lighting associated with construction would be limited to night lighting for security purposes if warranted, which would be similar to existing conditions. During the Project’s operation, lighting would allow the use of outdoor recreational facilities and other passive recreational spaces beyond sunset, extending the usable hours of the facility, especially during the winter months. Exterior lighting would be comprised of lighting for outdoor athletic events and activities during the evening hours and low-level lighting along pathways, around the gymnasium building, in the surface parking area, and in entrance areas for security and wayfinding purposes. In addition, lighting to accent signage and landscaping elements would be installed in limited areas of the Biological Study Area. Field lights, and those for the pool and tennis court areas, would utilize LED technology, timer controls, and shields directed only to the use intended to be illuminated to prevent spillover and glare and, as with all other exterior lighting, would be designed to comply with LAMC and RIO District Ordinance requirements.

Under existing conditions, lighting on-site includes six golf ball-shaped light standards and four additional canopy-mounted floodlights for the driving range and 128 tennis court lights that are turned on daily at sunset and remain on for up to 30 minutes following the closing of the driving range (at 11:00 p.m.) and tennis courts (at 10:00 p.m.) in order to allow for cleaning and maintenance at the end of the day. The tennis court lights generate the highest luminance values from the Project Site and are located in close proximity to the Zev Greenway and the Los Angeles River. The existing fixtures on the Project Site have no integral shielding and a more generic optical pattern common to floodlighting. In comparison, the Draft EIR described that the Project would include 45 total light poles that range between 21 feet and 80 feet in height. As part of the Project, the tennis courts would be placed further from the Zev Greenway to the northern portion of the Project Site. Some of the Field B lighting would be adjacent to the Zev Greenway in the southwestern portion of the Biological Study Area. Although the tennis and field light fixtures would

range in height from 40 to 80 feet, these fixtures would be internal to the Project Site and screened from most direct proximate views by intervening trees, landscaping, walls/fencing, and other features. The lighting fixtures are specifically designed with precise optics and integral shields to aid in controlling the light and preventing unwanted spill light, uplight, or glare. The new lighting system is generally expected to produce one-quarter ( $\frac{1}{4}$ ) or less candela, or glare, than the existing lighting.<sup>88</sup>

Monday through Friday outdoor activities would cease by 8:00 p.m. during the school year and by 6:00 p.m. during the summer (except for the tennis courts which would remain open for public uses until 9:00 p.m.). Saturday outdoor activities would cease by 6:00 p.m. (as previously noted, except for public usage of the tennis courts), and except for up to 10 Saturdays per year when outdoor athletic activities may take place up until 8:00 p.m. Lighting for outdoor athletic activities would be shut off after those times, or earlier if there are no activities taking place, except for low-level lighting for security and wayfinding purposes or lighting to accent signage and landscaping elements. Thus, the duration of lighting would be shorter than existing conditions every day of the year. The Zev Greenway does not have dedicated lighting for nighttime use. The Zev Greenway trail, which is immediately adjacent to the Los Angeles River, does have views to lighting on-site and receives filtered light through the trees between the trail and the existing golf and tennis facilities.<sup>89</sup>

Based on the lighting analysis, which calculated the spill light from the sports lighting on-site and beyond to neighboring properties, the results indicate that along the property line at the Los Angeles River, incremental lighting levels would be at or below 0.2 foot candle at the property line and at or below 0.01 foot candle fifteen feet past the property line, which is consistent with RIO District Ordinance lighting requirements. Additionally, the final aiming process of the lighting equipment is a controlled process by which the field engineers work to manually adjust the fixtures and reduce off-site light levels. This aiming process allows for miniscule changes to be made, which reduces off-site lighting while not affecting the target illumination. Finally, the Project would further reduce lighting effects by planting additional new trees which would create a natural barrier between the new lighting and the Zev Greenway.<sup>90</sup> In compliance with the RIO District Ordinance, the lighting designs would limit or eliminate the spill lighting that would cross the Project's property line into the Zev Greenway and cause unwanted nighttime illumination or glare on the Los Angeles River area. Although the Biological Study Area is currently not subject to the highest levels of nighttime illumination found within busy commercial areas nearby, there is already ample existing lighting. Street lighting and residential building lighting comprises most of the lighting sources on the immediate bounding streets, vehicle headlights and illuminated

---

<sup>88</sup> StudioK1. *Harvard-Westlake River Park Project, Study City, CA. Lighting Technical Report*. Studio City, CA, October 2021. Provided in Appendix B of the Draft EIR.

<sup>89</sup> StudioK1. *Harvard-Westlake River Park Project, Study City, CA. Lighting Technical Report*. Studio City, CA, October 2021. The Lighting Technical Report is provided in Appendix B of the Draft EIR.

<sup>90</sup> StudioK1. *Harvard-Westlake River Park Project, Study City, CA. Lighting Technical Report*. Studio City, CA, October 2021. The Lighting Technical Report is provided in Appendix B of the Draft EIR.

signage also contribute to the nighttime environment.<sup>91</sup> So although portions of the Biological Study Area would have experience small amounts of light spill during hours of outdoor athletic activities, such lighting would be precisely controlled and result in substantially less off-site illumination and glare as compared to existing conditions. Outside of the field lighting, other areas of the Biological Study Area would have conditions similar to or less than the existing conditions. Furthermore, it is anticipated that School-related practices and game competition would occur in the afternoons and early evenings and would end between the hours of 4:45 p.m. to 7:45 p.m., with approximately 50 percent of school days containing no outdoor athletic activities after 5:30 p.m. Indoor activities in the gymnasium would end no later than 9:30 p.m., though indoor activities would generally cease by 7:30 p.m. Thus, field lights and building lights would be shut off each night and the duration of lighting would be shorter every day of the year than existing conditions except for low-level lighting, as described above, for security and wayfinding purposes or lighting to accent signage and landscaping elements. If present on-site, the special-status bat species are already adapted to living in an urbanized setting with the existing night lighting on-site, as well as from the adjacent residential and commercial areas and traffic along roads.<sup>92</sup> Portions of the Biological Study Area that would have an increase in lighting during hours of outdoor athletic activities would be focused on fields and tennis courts, which do not contain roosting habitat for special-status bats. Additional lighting, tightly focused on the fields and tennis courts, also has the potential to attract more insects on which bat species forage, which could be a benefit. All lighting would be white lighting, which as the comment states will likely attract prey species and increase foraging opportunities for wildlife that may exist in the Project area.

Sports lighting would be 5,700 Kelvin, and lighting for buildings and fixtures are specified at 3,500 Kelvin. However, all lighting fixtures would be outside of the RIO zone and controlled (shielded) such that spillover would not exceed 0.01 foot candle in the RIO area. By comparison, existing lighting consists of various lights, that include tennis courts lights (the area currently nearest the RIO area) and parking lot lights that are at least 5,000 Kelvin. The flood lights at the driving range and the golf ball-shaped light standards are also up to 4,000 Kelvin. Also, as mentioned above, the existing fixtures on the Project Site have no integral shielding. With shielding, the Project would not substantially increase existing lighting conditions relative to wildlife within the RIO zone.

In addition, please refer to Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, and Topical Response No. 2 - Modifications to the Project Design, which provides updates to the Project's light poles. As evaluated in Section IV.A, *Aesthetics*, of the Draft EIR, light and glare impacts would not exceed existing ambient light and glare levels in the off-site area or exceed RIO standards within the Project Site. The Project's lighting program has been revised to reduce the number of field and tennis

---

<sup>91</sup> StudioK1. *Harvard-Westlake River Park Project, Study City, CA. Lighting Technical Report*. Studio City, CA. October 2021. The Lighting Technical Report is provided in Appendix B of the Draft EIR.

<sup>92</sup> ESA, Biological Resources Technical Report, January 2022, page 60 (PDF page 68 of 394) provided in Appendix D of the Draft EIR.

court lights. The Supplemental Lighting Report Memorandum is attached as Appendix B to this Final EIR and, as further evaluated in Topical Response No. 4 – Aesthetics, the reduction in lighting would further reduce the Project’s light and glare levels. Consistent with the analysis in Section IV.A. light and glare impacts would be less than significant.

### **Comment No. ORG 7A-42**

The DEIR also fails to adequately address the night lighting impacts on species that currently use the Project site and adjacent Zev Greenway, particularly those that use the site nocturnally. The Project extends night lighting to the entire Project site, whereas it is currently limited to the eastern portion of the site. The new lighting is significantly taller than the existing lighting. The DEIR claims replacement trees would reduce impacts of these new lighting sources, but the athletic field light poles would greatly exceed the height of the replacement trees for many years.

### **Response No. ORG 7A-42**

The comment asserts that the Draft EIR did not adequately assess light impacts on species that currently use the Project Site and adjacent Zev Greenway. The Project would retain a majority of mature street trees, including all of the street trees along Bellaire Avenue and nearly all along Whitsett Avenue, and also retain mature trees along Valley Spring Lane. The taller field lights would exceed the heights of some, but not all, trees (see Figures II-15 to Figure II-19 showing the elevations along the Project perimeter). Figures II-15 to II-18 have been updated in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, which include updates to light pole heights and numbers. However, the existing and proposed trees would soften the views of the poles. In addition, the fixtures would be shielded and directed downward so that the light sources (luminance) are not directed at off-site locations. The appearance of lighting from adjacent streets would be less than under existing conditions in which existing tennis court flood lights, driving range flood lights, and parking lot lights are unshielded. Further, as stated on page IV.C-41, in Section IV.C, *Biological Resources*, of the Draft EIR, under Indirect Impacts (beginning on page IV.C-35), field lights and building lights would be shut off each night and the duration of lighting would be shorter every day of the year compared to existing conditions except for low-level lighting for security and wayfinding purposes or lighting to accent signage and landscaping elements. Contrary to the assertion contained in the comment that the Project would extend lighting beyond existing conditions, Figures 5 and 8 of the Lighting Report (Appendix B of the Draft EIR) demonstrate that the extent and intensity of off-site illuminance would be reduced with Project implementation.

As stated in Appendix D, Biological Resources Technical Report, of the Draft EIR, on PDF page 61 of 394 under the heading 6.3.1.2 Special-Status Wildlife Species, common and non-indigenous wildlife species are likely adapted to human presence and are expected to persist in the area following Project completion. Thus, impacts would not be expected to reduce the general wildlife populations below self-sustaining levels within the region. Regardless, impacts to common and non-indigenous wildlife species do not meet the

CEQA significance threshold, as they do not constitute candidate, sensitive, or special-status wildlife species. Therefore, no mitigation measures are required for impacts to common and non-indigenous wildlife species.

Additionally, as stated on page IV.C-47, in Section IV.C, *Biological Resources*, under the heading Migratory Species and Native Wildlife Nursery Sites, of the Draft EIR, although portions of the Biological Study Area would have an increase in lighting during hours of outdoor athletic activities, the lighting would be focused on fields and tennis courts, which do not contain vegetation or have suitable habitat for nesting bird and roosting bat species. Such lighting would be precisely-controlled and result in substantially less off-site illumination and glare as compared to existing conditions. Additional lighting, particularly given the tightly controlled and focused nature of the Project's lighting, also has the potential to attract more insects on which bat species forage, which could be a benefit. Outside of the field lighting, other areas of the Biological Study Area would have lighting conditions similar to or less than the existing condition. Field lights and building lights would be shut off each night and the duration of lighting would be shorter every day of the year than existing conditions except for low-level lighting for security and wayfinding purposes or lighting to accent signage and landscaping elements. If present onsite, the nesting bird and roosting bat species are already adapted to living in an urbanized setting with the existing night floodlighting on-site, as well as from the adjacent residential and commercial areas and traffic along roads. Thus, indirect impacts from lighting during Project operation would not diminish long-term survival of nesting birds or roosting bat species and, therefore, would not be significant.

### **Comment No. ORG 7A-43**

Further, currently, only the eastern portion of the Project site is used at nighttime and there are limited noise impacts from the use of the tennis courts and driving range. The Project would open the entire site up to night time use and would significantly expand the number of persons on the site in the evenings, as well as the noise associated with activities on the site. Night time athletic games and meets, with hundreds of spectators, would generate increased noise levels on areas of the site that previously enjoyed tranquility for bird, bat and other species on the site and on the Zev Greenway. This increased human intrusion, along with the increased use of lighting and removal of mature trees will have major impacts on the ability of the Project site to support wildlife. The spillover noise and light and increased human presence at night will also negatively impact species that rely on the adjacent Greenway in the evening and nighttime.

### **Response No. ORG 7A-43**

The comment expresses the concern that outdoor activities would increase nighttime noise and light levels, that the Project would permit human intrusion in portions of the Project Site not currently used in the nighttime, and that the Project's removal of mature trees would adversely impact native species. The Project would end activities earlier than under existing conditions, in which the existing tennis court is open and illuminated until

10:00 p.m. and the driving range is open and illuminated until 11:00 p.m. Under the Project outdoor activities at all facilities, except the tennis courts, would end by 8:00 p.m. and the tennis courts will close at 9:00 p.m. Also, as discussed in detail in Topical Response No. 8 - Noise: Construction and Operation Impacts, outdoor recreational activity and special events would not exceed noise threshold levels of 5 dBA.

As further discussed on pages VI.C-40 through IV.C-41 of the Draft EIR, increased noise and human activity would not have a significant impact on special-status bat species since, if any are present on the Project Site, they would be adapted to living in an urbanized setting and, therefore, the Project would not diminish their chances for long term survival. Moreover, while the same would be true of common and non-indigence wildlife species which may be utilizing the Project Site, such species do not meet the CEQA significance threshold and, therefore, are not required to be analyzed in an EIR.

As discussed in Section IV.A, *Aesthetics* (Light and Glare) of the Draft EIR, the Project's lighting program would reduce ambient light and glare, including effects on adjacent neighborhoods. As shown in the Draft EIR and in the Lighting Technical Report (Appendix B of the Draft EIR) and in Figures 5 and 8 of the Supplemental Lighting report Memorandum (provided in Appendix B of this Final EIR), both the lighting program evaluated in the Draft EIR and under the revised lighting program would decrease illuminance around the Project Site. As shown in a comparison of Figure 5 (existing illuminance radius) and Figure 8 (future illuminance radius), the Project would discernably decrease the extent and intensity of illuminance from the Project Site compared to existing conditions. As further discussed in Topical Response No. 4 – Aesthetics, the Project would turn off field lights no later than 8:00 p.m. and tennis court lights no later than 9:00 p.m. As such, not only will light impacts be less under the Project, the duration of lighting would be less than under existing conditions. See also Response Nos. ORG 7A-41 and ORG 7A-42, regarding lighting impacts on special-status wildlife species (bats), as well as the Zev Greenway.

As to the impact of removal of some mature trees from the Project Site on wildlife, Project impacts on biological species was fully discussed in Section IV.C, *Biological Resources*, of the Draft EIR. As discussed in Section IV.C and Chapter II, *Project Description*, of the Draft EIR, the Project would implement an extensive tree planting and landscaping program that would remove 240 of the existing 421 trees, located both on the Project Site and off-site surrounding areas (e.g., within portions of the public right-of-way), and plant 393 trees, resulting in a net increase of 153 trees (or 36 percent). As further and discussed in Topical Response No. 5, *Biological Resources/Trees*, trees would primarily be removed from the central portion of the Project Site. The existing mature trees along Zev Greenway, Bellaire Avenue, and Whitsett Avenue would remain. The majority of mature street trees along Valley Spring Lane frontage would remain, except for groups of trees generally located northerly of the swimming pool and the eastern end of Field B. A number of the existing mature trees south of the removed trees on Valley Spring Lane would also remain. The great majority of replacement trees would be in 48-inch boxes with 3 to 7 years of growth prior to installation, with an average height of 12 to 15 feet. As such, the

Project would create additional foliage for use by all wildlife species. Also, as discussed on page IV.C-42 of the Draft EIR, with the implementation of Mitigation Measure BIO-MM-1 to avoid maternity roosting season and to avoid direct impacts to active roosts, impacts on special-status wildlife species would be less than significant. In addition, see Topical Response No. 2 - Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

## **Comment No. ORG 7A-44**

### **3. The DEIR Fails to Include Tree Removal Mitigation Recommended by CDFW and Relies on Mitigation That is Not Fully Enforceable.**

The DEIR fails to address mitigation set forth by the California Department of Fish and Wildlife (CDFW). CDFW provided scoping comments on the Project identifying the need to phase the tree removal during construction to reduce impacts. The DEIR fails to do so.

Mitigation measure BIO-MM-3 also fails to be fully enforceable. This measure provides for “replacement of each ‘non-protected’ significant tree removed at a minimum 1:1 ratio,” but that goes on to state that the “actual mitigation requirement may be modified by the Department of City Planning.” (DEIR IV.C-56.) This measure is not fully enforceable for several reasons. First, the DEIR does not define “significant tree.” Thus, there is not an objective standard set for determining which trees will need to be replaced. (*Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5<sup>th</sup> 467, 520 [mitigation is improperly deferred if it does not rely on objective standards].) The DEIR does not disclose how many replacement trees will actual [sic] be required for the Project.

## **Response No. ORG 7A-44**

The comment contends that the Draft EIR fails to address mitigation set forth by the CDFW and relies on information that is not fully enforceable. Refer to Response No. AG 4-29 which addresses CDFW’s comments on tree removal.

The comment asserts that Mitigation Measure BIO-MM-3 is not fully enforceable and that the Draft EIR does not disclose the number of replacement trees required for the Project. The comment also contends that the Draft EIR fails to define “significant tree”, which is incorrect. Page IV.C-28 of the Draft EIR describes both protected and significant trees and states that any trees that are not protected trees and have a diameter-at-breast height (DBH) of over eight inches are significant trees: “All the other trees over eight inches in DBH (on-site and off-site), 304 trees, were considered to be non-protected significant trees per direction of the Department of City Planning.” The contention that the mitigation measure is not enforceable because the Department of City Planning can change the ratio of replacement of unprotected trees is also incorrect. Under Mitigation Measure BIO-MM-3, the Department of City Planning cannot modify the replacement ratio but may only modify the total number of trees needing to be replaced based on the City’s determination of any dead specimens. Replacement is not required for trees determined to be dead. Total replacement in accordance with the required ratio would still be required. While

Mitigation Measure BIO-MM-3 requires the submission of a landscape plan prior to issuance of a building permit, which must be approved by the Department of City Planning, the mitigation measure contains parameters of what must be in the plan and the required replacement ratio as set forth in the measure and in the Los Angeles River Master Plan Landscaping Guidelines. Chapter II, *Project Description*, pages II-29 and II-30 of the Draft EIR, described the number of replacement trees. As discussed therein, “All invasive palms (i.e., the Mexican fan palm) removed would be replaced at a 1:1 minimum ratio with RIO-compliant trees and all other removed non-native trees would be replaced at a minimum 2:1 ratio with RIO-compliant trees. Street trees (trees within the public right-of-way) would also be replaced at a 2:1 ratio, as required by the City’s Department of Public Works, Urban Forestry Division.” In aggregate, the 240 removed trees would be replaced by 393 RIO-compliant trees, which exceeds the minimum number of trees required for replacement. The Draft EIR (page II-29) further states: “The majority of the trees to be removed, 75 percent (179 trees), are non-RIO compliant (including 121 Mexican fan palms).” The Project’s removal of 121 Mexican fan palms would require a replacement of 121 trees (at a 1:1 replacement ratio), while the remaining 119 removed trees would require a replacement of 238 trees (at a 2:1 replacement ratio), for a total replacement requirement of 359 trees. The Project would exceed this number by planting 393 replacement trees.

### **Comment No. ORG 7A-45**

Additionally, it is improper that this mitigation measure could be changed in the future outside of the environmental review process, in violation of the public participation goals of CEQA. (Pub. Resources Code § 21000.) Delegation of mitigation measure development to a post-approval process by lead agency staff has been found to be inadequate. (*Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4<sup>th</sup> 777, 793-94.)

### **Response No. ORG 7A-45**

The comment asserts that Mitigation Measure BIO-MM-3 is not fully enforceable and appears to contend that it is an impermissible delegation of the measure to the future. Please refer to Response No. ORG 7A-44. The Draft EIR identifies the impact to be mitigated by Mitigation Measure BIO-MM-3. The Draft EIR also sets forth specific parameters for Mitigation Measure BIO-MM-3, including the provision of defined materials and a time limitation for implementation prior to the issuance of a building permit. The plan check by the Department of Building and Safety prior to issuing a building permit ensures that the landscaped plan and other Project materials comply with the requirements of the Mitigation Monitoring Program (Chapter 4 of this Final EIR), the Conditional Use Permit (CUP) as approved by the City, and other applicable regulations. The preliminary materials required to implement the mitigation measure are presented in Figure IV.C-5, *Tree Removal Plan*; Figure IV.C-6, *Tree Planting Plan*; and Figure IV.C-7, *Planting Zone Plan*, of the Draft EIR. These materials are part of the Project and would be part of the Certified Draft EIR and would, thus, provide the basis for any future

approved landscape plans. All mitigation measures are implemented subsequent to Project approval and implemented at a development phase defined in the Mitigation Monitoring Program (MMP). Because Mitigation Measure BIO-MM-3 must be implemented prior to the issuance of a building permit, and since the parameters of the landscape plans are clearly delineated in the Draft EIR, the mitigation is not a post approval measure. Thus, since the mitigation measure contains specific parameters, the comment fails to provide facts to substantiate that the measure is deferred, or improperly delegated, or that the public is denied the opportunity to comment on the measure.

### **Comment No. ORG 7A-46**

Further, the DEIR also again improperly relies on PDFs instead of mitigation measures to reduce the impacts to nesting raptors and songbirds. This fails to adequately disclose, evaluate efficacy and ensure enforceability of the measures. (Section IV.).

### **Response No. ORG 7A-46**

The comment asserts that using a PDF to protect nesting raptors and songbirds was improper. Project Design Feature PDF-BIO-1 simply reflects how the Project would comply with relevant regulations regarding protecting nesting raptors and songbirds. The comment provides no substantial evidence that the use of the PDF avoids any analysis of potential impacts to nesting birds. As stated on pages IV.C-2 through IV.C-3 of the Draft EIR, all bird species that are native to the United States or its territories are protected by the federal Migratory Bird Treaty Act (MBTA) from taking, capturing, killing, selling etc. (collectively “taking”). The MBTA does not prohibit the destruction of a bird nest but does prohibit the taking of the eggs or birds in the nest. Additionally, as stated on pages IV.C-4 through IV.C-5 of the Draft EIR, the California Department of Fish and Wildlife (CDFW) has developed measures to ensure avoidance of a taking. These measures were incorporated into the Project through the PDF. Moreover, this PDF is incorporated into the MMP and therefore fully enforceable (see Chapter 4, *Mitigation Monitoring Program*, of this Final EIR.) See Response No. ORG 1B-8 above regarding use of PDFs being standard and permissible in an EIR analysis.

### **Comment No. ORG 7A-47**

#### **D. The DEIR Fails to Analyze and Disclose the Project’s GHG Impacts and Mitigation**

##### **1. The DEIR’s Analysis of GHG Impacts Must Reflect the Reality of the Climate Crisis.**

Public agencies must “stay in step with evolving scientific knowledge and state regulatory schemes.” (*Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5<sup>th</sup> 497, 504; accord CEQA Guidelines § 15064.4.) The Intergovernmental Panel on Climate Change has recently identified that greenhouse gas (“GHG”) emissions **must peak** by 2025 in order to limit the global temperature increase to 1.5 degree Celsius.

(Attachment I, Excerpts Intergovernmental Panel on Climate Change Report.) In order to do so, all sectors must utilize deep emissions reductions. As the Project is expected to begin operation in 2025, all Project activities must align with a decrease in GHG emissions. Any increase in GHG emissions will subvert this goal. The Project will increase GHG emissions relative to baseline; thus, the DEIR must disclose this as a significant impact.

## Response No. ORG 7A-47

The comment contends that the Draft EIR's analysis of GHG conflicts with the Intergovernmental Panel on Climate Change's opinion that GHG emissions must peak by 2025 in order to limit the global temperature increase to 1.5 degree Celsius. The Intergovernmental Panel on Climate Change is the United Nations body for assessing the science related to climate change. Its findings are not part of the recognized regulatory framework that the City and/or CEQA require projects to comply with. As described in Section IV.G, *Greenhouse Gas Emissions*, in subsection d) (1), *Impact Analysis*, on page IV.G-50 of the Draft EIR, compliance with a GHG emissions reduction plan renders a project's impact less than significant. In support of the consistency analysis which describes the Project's compliance with or exceedance of performance-based standards included in the regulations and policies outlined in the applicable portions of the Climate Change Scoping Plan, the 2020-2045 RTP/SCS, the City's Green New Deal, and the Los Angeles Green Building Code, quantitative calculations are provided in Section IV.G. The Project would generate an incremental contribution to and a cumulative increase in GHG emissions. Further, when considering only the Project's emissions, Table IV.G-7, *Estimated Operational Greenhouse Gas Emissions – Project*, page IV.G-53 of the Draft EIR, shows that the Project's operational emissions of 2,719 MTCO<sub>2e</sub> would be generated primarily by mobile sources and secondarily by energy (electricity and natural gas) and in 2025 would be approximately 21 percent below the emissions that would be generated by the Project without implementation of GHG reduction characteristics, features, and measures (i.e., based on the quantitative reduction, including those associated with Project Design Feature GHG-PDF-1). On a net GHG emissions basis (i.e., subtracting the existing site GHG emissions), the Project's net operational emissions of 1,533 MTCO<sub>2e</sub> in 2025 would be approximately 32 percent below the net emissions that would be generated by the Project without implementation of GHG reduction characteristics, features, and measures (i.e., based on the quantitative reduction, including those associated with Project Design Feature GHG-PDF-1). Thus, the analysis provided in the Draft EIR quantitatively demonstrates the efficiency of the Project GHG reduction measures as set forth in the applicable GHG reduction plans and policies and that the Project would result in a GHG-efficient development resulting in lower GHG emissions in 2025 than would be achieved without implemented GHG reduction measures. Moreover, as discussed under Threshold (b), page IV.G-59 of the Draft EIR, the Project would not conflict with the Climate Change Scoping Plan, the 2020-2045 RTP/SCS, the City's Green New Deal, and the Los Angeles Green Building Code. The Project's consistency with these applicable regulatory plans and policies to reduce GHG emissions, along with implementation of PDFs, particularly Project Design Feature GHG-

PDF-1 in Subsection IV.G.3.c), *Project Design Features*, would reduce the Project's GHG emissions by 21 percent (or 32 percent on a net GHG emissions basis) compared to the Project without implementation of GHG reduction characteristics, features, and measures. Thus, the Project would not generate GHG emissions that would have a significant effect on the environment, nor would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs.

Note that modifications to the Project would reduce the total number of solar panels from 426 to 378, and reducing the electricity provided from 339,000 kWh to 281,000 kWh. The reduction in solar panels was a design correction that still allows the Project to meet LAMC requirements, which were previously exceeded under the Project analyzed in the Draft EIR. Bringing the Project into compliance with the Building Code would have no new or substantial increase in the severity of environmental effects under CEQA thresholds. See Topical Response No. 2 – Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. The revisions in Chapter 3 of this Final EIR update Project Design Feature GHG-PDF-1 and include updated GHG and energy calculations based on the modified solar panels. Appendix K, Supplemental Greenhouse Gas and Energy Modeling Data, of this Final EIR includes the modeling results with the Project modifications. The updated calculations do not change the energy and GHG impact conclusions in the Draft EIR, nor would there be a substantial increase in the severity of impacts.

## Comment No. ORG 7A-48

### 2. The DEIR Fails to Evaluate its Adopted Threshold of Significance, and Fails to Support its Conclusion that the Project will Have No Significant GHG Impacts.

The DEIR states that:

In accordance with Appendix G of the CEQA Guidelines, a project would have a significant impact related to GHGs if it would:

Threshold (a): Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; **or**

Threshold (b): Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs.

(DEIR, p.IV.G-36, emphasis added.)

The DEIR thus adopts **two** thresholds of significance for GHG impacts. In evaluating Threshold (a), whether the Project generates GHG emissions directly or indirectly that may have a significant impact on the environment, the DEIR concedes that the Project would generate an increase of GHG emissions over baseline. (DEIR, p. IV.G- 58.) However, the DEIR declines to evaluate whether **this increase** would have a significant

impact on the environment, instead stating that due to the Project's purported consistency with applicable GHG reduction plans as evaluated in Threshold (b), the Project would not generate significant GHG emissions as defined in Threshold (a). (DEIR, pp. IV.G-58 to 59.).

## Response No. ORG 7A-48

The comment contends that the Draft EIR fails to address the adopted thresholds of significance for GHG impacts and fails to include facts to support the contention that the Project's GHG emission impacts would be less than significant. The Draft EIR addressed the Project's GHG emissions in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. CEQA Guidelines 15064.7(a) states that "[a] threshold of significance is an identifiable, quantitative, qualitative, or performance level of a particular environmental effect, noncompliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant." Although GHG emissions can be quantified, CARB, SCAQMD, and the City have not adopted quantitative project-level significance thresholds for GHG emissions that would be applicable to the Project.

The California Natural Resources Agency (CNRA) has also clarified that the Guidelines focus on the effects of GHG emissions as cumulative impacts, and that they should be analyzed in the context of CEQA's requirements for cumulative impact analysis (see CEQA Guidelines Section 15064(h)).<sup>93</sup> Per CEQA Guidelines Section 15064(h)(3), a project's incremental contribution to a cumulative impact can be found not cumulatively considerable if the project would comply with an approved plan or mitigation program that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area of the project.<sup>94</sup> To qualify, such a plan or program must be specified in law or adopted by the public agency with jurisdiction over the affected resources through a public review process to implement, interpret, or make specific the law enforced or administered by the public agency.<sup>95</sup> Examples of such programs include a "water quality control plan, air quality attainment or maintenance plan, integrated waste management plan, habitat conservation plan, natural community conservation plan, [and] plans or regulations for the reduction of greenhouse gas emissions."<sup>96</sup> Thus, CEQA Guidelines Section 15064(h)(3) allows a lead agency to make a finding of non-significance for GHG emissions if a project complies with a program and/or other regulatory schemes to reduce GHG emissions. Therefore, in the absence of any adopted

<sup>93</sup> See generally California Natural Resources Agency, Final Statement of Reasons for Regulatory Action, December 2009, pages 11-13, 14, and 16; see also Letter from Cynthia Bryant, Director of the Office of Planning and Research to Mike Chrisman, Secretary for Natural Resources, April 13, 2009.

<sup>94</sup> CCR, Title 14, Section 15064(h)(3).

<sup>95</sup> CCR, Title 14, Section 15064(h)(3).

<sup>96</sup> CCR, Title 14, Section 15064(h)(3).

quantitative threshold, the significance of the Project's GHG emissions is evaluated consistent with CEQA Guidelines Section 15064.4(b)(2) by considering whether the Project complies with applicable plans, policies, regulations, and requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. Using that evaluative methodology, the Draft EIR included substantial evidence that supported the appropriate conclusion that the Project's impacts on GHGs would be less than significant.

### **Comment No. ORG 7A-49**

This is an impermissible omission. The DEIR must actually evaluate the significance of the Project's increase in GHG emissions with respect to Threshold (a). CEQA Guidelines section 15064.4, subdivision (a) requires lead agencies to "make a good-faith effort, **based to the extent possible** on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project." The DEIR states that the Project's GHG emissions would exceed baseline (DEIR, p. IV.G-53), but makes no attempt to show whether such an increase would be significant. Instead, the DEIR states "even a very large individual project would not generate enough GHG emissions on its own to significantly influence global climate change." (DEIR, IV.G-58.) This is not only a severely retrograde position that fails to acknowledge the ongoing climate emergency and the urgency for immediate GHG reductions, but it also contrary to the CEQA Guidelines, which state "A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions." (CEQA Guidelines § 15064.4, subd. (b).)

### **Response No. ORG 7A-49**

The comment asserts that the Draft EIR impermissibly failed to discuss or calculate the estimate amount of GHG emissions. As discussed in Section IV.G, pages IV.G-39 and IV.G-76 of the Draft EIR, per CEQA Guidelines Section 15064(h)(3), a project's incremental contribution to a cumulative impact can be found not cumulatively considerable if the project would comply with an approved plan or mitigation program that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area of the project. Please also see Response No. ORG 7A-48, above, and Response No. ORG 7A-50, below.

### **Comment No. ORG 7A-50**

While compliance with GHG reduction plans is but one factor in determining the significance of GHG impacts (upon a showing of substantial evidence supporting such compliance), the CEQA Guidelines also specify that agencies should consider:

- (1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;

(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.

(CEQA Guidelines § 15064.4, subd. (b)(1) & (b)(2).) Accordingly, as Threshold (a) would address both of these factors, the DEIR must actually consider whether the Project's increase in emissions is significant. The failure to do so is an omission of necessary analysis that renders the EIR deficient. (Friant Ranch, supra, 6 Cal.5th 502, 514-15.)

## Response No. ORG 7A-50

The comment asserts that the Draft EIR's GHG emissions analysis is inadequate for failure to address whether the Project's GHG emissions would exceed thresholds of significance. The Draft EIR addressed GHG emission impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. As indicated on page IV.G-38, in Section IV.G, *Greenhouse Gas Emissions*, under the heading Thresholds of Significance in the Draft EIR, CEQA Guidelines Section 15064.4 gives lead agencies the discretion to determine whether to assess those emissions quantitatively or qualitatively. If a qualitative analysis is used, in addition to quantification, this section recommends certain qualitative factors that may be used in the determination of significance (i.e., extent to which the project may increase or reduce GHG emissions compared to the existing environment; whether the project exceeds an applicable significance threshold; and extent to which the project complies with regulations or requirements adopted to implement a reduction or mitigation of GHGs). CEQA Guidelines Section 15064.4 does not establish a threshold of significance; rather, lead agencies are granted discretion to establish significance thresholds for their respective jurisdictions, including looking to thresholds developed by other public agencies, or suggested by other experts, such as the California Air Pollution Control Officers Association (CAPCOA), so long as any threshold chosen is supported by substantial evidence (see CEQA Guidelines Section 15064.7I). Although GHG emissions were quantified for the Project, CARB, SCAQMD, and the City have not adopted quantitative project-level significance thresholds for GHG emissions that would be applicable to the Project.

Table IV.G-7, *Estimated Operational Greenhouse Gas Emissions – Project*, on page IV.G-53 of the Draft EIR, provides the Project's estimated GHG emissions with and without implementation of GHG reduction characteristics, features, and measures. This comparison is provided to evaluate the Project's efficiency with respect to GHG emissions but is not the threshold of significance used for impact analysis. The analysis assumes the Project without implementation of GHG reduction characteristics, features, and measures would incorporate the same land uses and building square footage as the Project. Furthermore, this analysis is consistent with the most current regulatory policies and GHG quantification methods; however, the scientific, regulatory environment regarding GHG reduction and CEQA approaches for GHG analysis are constantly evolving and will continue to do so into the future. Although the quantification of GHG

emissions was not measured against a significance threshold because none have been adopted that are applicable to the Project, it nevertheless provides the extent to which the Project would increase GHG emissions as compared to the existing environmental setting.

Furthermore, the CEQA Guidelines focus on the effects of GHG emissions as cumulative impacts, and that they should be analyzed in the context of CEQA's requirements for cumulative impact analysis (see CEQA Guidelines Section 15064(h)).<sup>97</sup> Per CEQA Guidelines Section 15064(h)(3), a project's incremental contribution to a cumulative impact can be found not cumulatively considerable if the project would comply with an approved plan or mitigation program that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area of the project.<sup>98</sup> To qualify, such a plan or program must be specified in law or adopted by the public agency with jurisdiction over the affected resources through a public review process to implement, interpret, or make specific the law enforced or administered by the public agency.<sup>99</sup> Examples of such programs include a "water quality control plan, air quality attainment or maintenance plan, integrated waste management plan, habitat conservation plan, natural community conservation plan, [and] plans or regulations for the reduction of greenhouse gas emissions."<sup>100</sup> Thus, CEQA Guidelines Section 15064(h)(3) allows a lead agency to make a finding of non-significance for GHG emissions if a project complies with a program and/or other regulatory schemes to reduce GHG emissions.

Therefore, in the absence of any adopted quantitative threshold, the significance of the Project's GHG emissions were evaluated consistent with CEQA Guidelines Section 15064.4(b)(2) by considering whether the Project complies with applicable plans, policies, regulations and requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. Since the Project was not in conflict with these applicable regulatory plans to reduce GHG emissions, Project impacts are less than significant.

Also, refer to Response No. ORG 7A-47, which discusses the Project design modifications and updated GHG and energy calculations in Chapter 3 of this Final EIR. As stated therein, the updated calculations do not change the energy and GHG impact conclusions in the Draft EIR, nor would there be a substantial increase in the severity of impacts.

---

<sup>97</sup> See generally California Natural Resources Agency, Final Statement of Reasons for Regulatory Action, December 2009, pages 11-13, 14, and 16; see also Letter from Cynthia Bryant, Director of the Office of Planning and Research to Mike Chrisman, Secretary for Natural Resources, April 13, 2009.

<sup>98</sup> CCR, Title 14, Section 15064(h)(3).

<sup>99</sup> CCR, Title 14, Section 15064(h)(3).

<sup>100</sup> CCR, Title 14, Section 15064(h)(3).

## Comment No. ORG 7A-51

Further, the CEQA Guidelines state that compliance with statewide GHG reduction goals may be considered “provided that substantial evidence supports the agency’s analysis of ***how those goals or strategies address the project’s incremental contribution to climate change and its conclusion that the project’s incremental contribution is not cumulatively considerable.***” (CEQA Guidelines § 15064.4, subd. (b)(3), emphasis added.) The DEIR has not provided such substantial evidence. In the DEIR and its Appendix C, the DEIR claims that the Project’s purported consistency with various state, regional, and local GHG reduction programs justify its increase in GHG emissions, but this so-called consistency is based on several unfounded conclusions.

For example, the DEIR claims consistency with numerous statewide and regional policies that do not govern individual developments like the Project. The DEIR claims credit for emissions reductions resulting from policies such as the Renewable Portfolio Standard applicable to energy sellers, LEV and ZEV regulations applicable to vehicle manufacturers (DEIR, Appendix C, p. 18), Low Carbon Fuel Standard reductions applicable to fuel suppliers (*Id.*, p. 22), Cap-and-Trade applicable to regulated entities (*Id.*, p. 23), numerous SCAG policies applying to local jurisdictions (*Id.*, pp. 25-29), among others. None of these policies apply to the Project, and all would be in place regardless of whether the Project were developed or not.

## Response No. ORG 7A-51

The comment asserts that the Draft EIR’s determination of consistency with applicable goals and policies related to GHG emissions is not supported adequately. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant because the Project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions. In Appendix C-1 of the Draft EIR, Section 2, Air Quality and Greenhouse Gas Emissions Methodology, Table 1, Project Compliance with Applicable 2017 Climate Change Scoping Plan Actions and Strategies, PDF pages 38 through 45 of 437, and Table 2, Comparison of Project Characteristics with Applicable SCAG 2016-2040 RTP/SCS and 2020-2045 RTP/SCS Actions and Strategies, PDF pages 46 through 51 of 437, discuss why the Project would not conflict with these applicable plans, policies, regulations and requirements. Consistency with plans adopted to implement GHG reductions is the required threshold standard under CEQA Guidelines Appendix G in the evaluation of GHF emissions (see Response No. ORG 7A-50 for a more detailed discussion of the significance threshold that the City, as Lead Agency, has determined to use for this Project). Although many adopted policies do not apply directly to the Project, the Project must not conflict with these policies to result in less than significant impacts. Thus, the Draft EIR discusses compliance with these plans by determining whether the Project would not conflict with any of them.

In addition to the evaluation of the Project's consistency with plans, policies, and regulations adopted for the purpose of reducing and/or mitigating GHG emissions, for informational purposes, the analysis also calculates the amount of GHG emissions that would be attributable to the Project. The primary purpose of quantifying the Project's GHG emissions is to satisfy CEQA Guidelines Section 15064.4(a), which requires a good-faith effort by the lead agency to describe and calculate emissions. The Draft EIR modeled GHG emissions with and without the regulatory changes to determine if there would be a reduction in the Project's incremental contribution of GHG emissions as a result of compliance with regulations and requirements adopted to implement plans for the reduction or mitigation of GHG emissions.

Also, refer to Response No. ORG 7A-47, which discusses the Project design modifications and updated GHG and energy calculations in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. As stated therein, the updated calculations do not change the energy and GHG impact conclusions in the Draft EIR, nor would there be a substantial increase in the severity of impacts.

### **Comment No. ORG 7A-52**

Further, even if the DEIR could validly assess comparison of the Project with these policies, agencies are required to "substantiate" their assumptions that the reductions specified in these policies "can also serve as the criterion for an individual land use project." (*Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 62 Cal4th 204, 228.) The DEIR has not done so here.

### **Response No. ORG 7A-52**

The comment asserts that the Draft EIR's GHG analysis does not adequately substantiate the project's compliance with Statewide GHG reduction goals. The comment is similar in content and expresses the same concerns as in Comment No. ORG 7A-51. Please refer to Response No. ORG 7A-51, which concludes that –the Draft EIR modeled GHG emissions with and without regulatory changes to determine if there would be a reduction in the Project's incremental contribution of GHG emissions as a result of compliance with regulations and requirements adopted to implement plans for the reduction or mitigation of GHG emissions and, therefore, substantiated the Draft EIR's analysis and conclusions.

Also, refer to Response No. ORG 7A-47, which discusses the Project design modifications and updated GHG and energy calculations in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR. As stated therein, the updated calculations do not change the energy and GHG impact conclusions in the Draft EIR, nor would there be a substantial increase in the severity of impacts.

### **Comment No. ORG 7A-53**

The DEIR also inadequately supports its claims that other Project features demonstrate its consistency with GHG reduction plans. The DEIR Appendix C states in a conclusory

manner that the Project would comply with SB 350 by meeting the requirements of Title 24, Part 6 and the Green Building Code. (DEIR, Appendix C, p.18.) A bare assertion of compliance with these regulatory schemes is insufficient to demonstrate that the Project would have no significant impacts. (Cf. *Californians for Alternatives to Toxics v. Department of Food & Agriculture* (2005) 136 Cal.App<sup>4</sup>th 1, 16.)

### **Response No. ORG 7A-53**

The comment asserts that the Draft EIR cannot rely on compliance with regulatory requirements to conclude that the Project would not be in conflict with applicable GHG emission policies. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. Appendix C-1, Section 2, Air Quality and Greenhouse Gas Emissions Methodology, Table 1, Project Compliance with Applicable 2017 Climate Change Scoping Plan Actions and Strategies, PDF pages 38 – 45 of 437, discusses the Project’s compliance with SB 350 and SB 100 because compliance with GHG reduction plans is the GHG significance threshold chosen for Project (see Response No. ORG 7A-50 for a more detailed discussion of the significance threshold that the City, as Lead Agency, has determined to use for this Project). Although these policies do not apply directly to the Project, the Project must not conflict with these policies to incur less than significant impacts. Thus, the Draft EIR discusses compliance with these plans through an analysis demonstrating that the Project would not be in conflict with these plans.

As discussed in Appendix C-1 and Section IV.G 3.d)Threshold (b)(1)(a)(i), page IV.G-60 of the Draft EIR, while this action does not directly apply to individual projects, the Project complies with the RPS program (SB 350 and SB 100) inasmuch as its electricity is provided by LADWP, which is in compliance with the RPS program. Thus, the Project would be supplied with electricity via renewable sources at increasing rates over time reducing the Project’s electricity-related GHG emissions as required by SB 350 and SB 100. As required under SB 350, doubling of the energy efficiency savings from final end uses of retail customers by 2030 would primarily rely on the existing suite of building energy efficiency standards under CCR Title 24, Part 6 and utility-sponsored programs such as rebates for high-efficiency appliances, heating, ventilation, and air conditioning (HVAC) systems, and insulation. Thus, since the Project would not conflict with Title 24 Standards as required by law, it would comply with SB 350 and would not conflict with and is consistent with these policies to reduce GHG emissions.

### **Comment No. ORG 7A-54**

The DEIR also claims consistency with regulations intended to reduce mobile source pollution and implement SB 375 by stating that the Project would introduce shuttles that will “reduce” VMT. (DEIR, Appendix C, pp. 20-21.) As we have stated elsewhere, the Project inaccurately estimates VMT, and so this assertion is unfounded. (Section V.J.2.)

Additionally, the DEIR fails to acknowledge that the almost daily running of shuttles continuously in the afternoon/evening is a GHG-intense activity.

### **Response No. ORG 7A-54**

The comment asserts that the Draft EIR inaccurately determined VMT for the Project and, therefore, could not state that the shuttle system would reduce VMT and thereby reduce GHG emissions. The evaluation of the Project's VMT is consistent with City of Los Angeles VMT Calculator User Guide. Regarding the Draft EIR's VMT evaluation, please refer to Response No. ORG 7A-125, which addresses the data source of the existing use credit, and to Response No. ORG 7A-126, which addresses the trips associated with the clubhouse and the putting green, as well as the use of February and September data from 2019. Note also that the shuttle emissions are taken into account in the Project's GHG emissions as evidenced in Appendix C-1, 1.b, Operational Modeling Outputs, of the Draft EIR, as discussed further in Response No. ORG 7A-34.

The Draft EIR addressed GIG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. Draft EIR Appendix C-1, Section 2, Air Quality and Greenhouse Gas Emissions Methodology, Table 1, Project Compliance with Applicable 2017 Climate Change Scoping Plan Actions and Strategies, PDF pages 38 – 45 of 437, discusses the Project's compliance with SB 375. As discussed on PDF page 41 of 437 of Appendix C-1 of the Draft EIR, SB 375 requires SCAG to direct the development of the RTP/SCS for the region which calls for reducing vehicle trips and VMTs and encouraging alternative modes of transportation. The Project supports these initiatives by its location in an urban infill location with nearby access to public transportation within 0.25 miles of the Project Site. The Project also supports the reduction of VMTs by providing a shuttle between the Upper School campus and the Project Site whenever there are school activities at the site. Additionally, the Project without design modifications would designate a minimum of 8 percent of on-site parking for carpool and/or alternative-fueled vehicles (33 spaces), install the conduit and panel capacity to accommodate future electric vehicle charging stations into a minimum of 30 percent of the parking spaces (160 spaces), and provide 10 percent of the parking spaces with electric vehicle charging stations (54 spaces). The Project design modifications discussed in Topical Response No. 2 - Modifications to the Project Design, would reduce the number of parking spaces from 532 to 403 spaces. However, the same number of carpool/alternative fueled vehicle spaces, conduits/panels to accommodate future electric vehicle charging stations, parking spaces with electric vehicle charging station would remain. These measures would reduce vehicle trips and VMTs. Thus, the Project would comply and not conflict with applicable 2020-2045 RTP/SCS actions and strategies to reduce GHG emissions. As evidenced, the Project would contribute to a reduction in mobile source emissions beyond the sole provision of shuttles.

## Comment No. ORG 7A-55

The DEIR also claims that the Project's inclusion of "conduit and panel capacity" for "future electric vehicle charging stations" demonstrates its consistency with regulations relating to reducing mobile source pollution (DEIR, Appendix C, p. 20), SCAG RTP/SCS policies regarding encouragement of EV usage and fleet conversion (*Id.*, pp. 25, 29), and City Green New Deal policies to include EVs/ZEVs (*Id.*, p. 32.) This "future" Project feature is speculative, and not enforceable as a mitigation measure (see Section IV), and thus does not support the DEIR's conclusion of no significant GHG impacts.

## Response No. ORG 7A-55

The comment asserts that the Draft EIR impermissibly concluded that the provision of conduit for future vehicle charging stations, which would encourage EV usage, demonstrated compliance with the SCAG RTP/SCS and that such future charging stations are unenforceable mitigation measures. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. Appendix C-1, Section 2, Air Quality and Greenhouse Gas Emissions Methodology, Table 1, Project Compliance with Applicable 2017 Climate Change Scoping Plan Actions and Strategies, pages 17 – 24 of the Draft EIR, discusses the Project's compliance with SB 375. Please refer to Response No. ORG 7A-54 for a discussion on the Project's inclusion of conduits and panels and electric vehicle charging stations and how they comply and do not conflict with SB 375. Also, with regard to the SCAG RTP/SCS policies referenced in the comment pertaining to EV usage and fleet conversion (Appendix C, PDF pages 46 and 50 of 437, of the Draft EIR), these actions/policies apply to local jurisdictions (e.g., the City) and/or SCAG, and not specifically to the Project. The Project would not interfere with the City's or SCAG's ability to encourage the use of alternative-fueled vehicles through various policies and programs. However, as discussed on page 29 of Appendix C-1 (Appendix C PDF page 50 of 437, of the Draft EIR), the Project would support SCAG "Clean Vehicle Technology Actions and Strategies" as it would encourage the use of alternative fueled vehicles, for the same reasons as discussed below under goals related to the City's Green New Deal.

Regarding the City of Los Angeles Green New Deal, Table 3, Comparison of Project Characteristics to Applicable City of Los Angeles Green New Deal GHG Emissions Goals and Actions, in Appendix C-1 of the Draft EIR, states that the Zero Emission Vehicles percentage applies to the City and not individual projects. However, the Project would designate a minimum of 43 spaces for carpool and/or alternatively fueled vehicles, install conduit and panels in approximately 160 spaces for future electric vehicle charging stations, and install 33 spaces with electric vehicle charging spaces. As discussed in Response No. 7A-54, the same number of carpool/alternative fueled vehicle spaces, conduits/panels to accommodate future electric vehicle charging stations, parking spaces with electric vehicle charging station would remain under the Project design modifications

discussed in Topical Response No. 2 - Modifications to the Project Design. This supports the ZEV initiative by encouraging carpools or the use of electric vehicles, providing electric vehicle charging stations to those that drive electric vehicles, and providing the ability to convert more parking spaces to electric vehicle charging stations in the future as more cars become electric if the initiative is successful. This “future” project feature is not speculative as the conduit and panels would be installed prior to the opening of the Project in compliance with the City’s New Green Deal requirements. The City’s New Green Deal anticipates that the required provision of conduits and panels in new construction projects would meet future electric vehicle demand and, as such, these features would accommodate but would not cause, themselves, the use of electric vehicles. Given that these features would comply with applicable regulatory framework as well as support the SM 375 strategies for ZEV use, the Draft EIR appropriately concluded that the Project would have less than significant impacts related to GHG emission, and, therefore, no mitigation measures are necessary. As such, these features are not appropriately described as a mitigation measure, but rather are part of the Project design. Thus, as part of the Project design, the City would ensure that this measure is complete prior to issuance of building permit.

### **Comment No. ORG 7A-56**

The DEIR states that it would designate a minimum of 33 parking spaces for carpools or alternative-fueled vehicles. (DEIR, Appendix C, p. 20.) While certainly a laudable and worthy feature to include, this feature does not support the EIR’s conclusion that the Project will have no significant GHG impacts because such designations are simply unenforceable.

### **Response No. ORG 7A-56**

The comment asserts that the Project’s parking design, which includes 44 parking spaces designated for carpools or alternative-fueled vehicles, is not enforceable and therefore cannot be relied upon for the conclusion that the Project would have no significant GHG impacts. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. Please refer to Response Nos. ORG 7A-54 and ORG 7A-55 for a discussion on the Project’s inclusion of conduits and panels and electric vehicle charging stations and how they comply and do not conflict with SB 375. Additionally, the inclusion of a minimum of 33 parking spaces for carpools or alternative-fueled vehicles is supportive of SB 375 and the City’s Green New Deal. As discussed in Response NO. 7A-54, the same number of carpool/alternative fueled vehicle spaces, conduits/panels to accommodate future electric vehicle charging stations, parking spaces with electric vehicle charging station would remain under the Project design modifications discussed in Topical Response No. 2 - Modifications to the Project Design. This is not a mitigation measure; rather it is part of the Project design and would be enforceable by the City before a Permit to Operate is issued. As stated above, compliance with approved plans and

policies is the significance threshold. Since the Project would not conflict with such plans and policies, Project GHG impacts would be less than significant.

### **Comment No. ORG 7A-57**

Finally, the DEIR states that the Project's removal of 240 trees somehow supports the City Green New Deal's requirement to reduce the urban heat island effect, simply because the Project would replace a greater number of trees. (DEIR, Appendix C, p. 33.) This wrongfully assumes that the replacement trees, once planted, would immediately perform the same GHG-reducing and heat-reducing functions that the existing trees performed. The DEIR provides no evidence to justify this assumption.

For these reasons, the EIR's conclusion that the Project will have no significant GHG impacts is both unsupported and omits information necessary to informed decisionmaking.

### **Response No. ORG 7A-57**

The comment asserts that the Draft EIR does not provide evidence to justify its conclusion regarding reducing the urban heat island effect. The comment is incorrect in the assertion that the only benefit of the Project relied upon in the Draft EIR to reduce urban heat island effect would be the replacement of trees that would be removed. Furthermore, the comment asserts that the Draft EIR states or assumes that the replacement trees, once planted, would immediately perform the same GHG-reducing and heat-reducing functions of the existing trees. This assumption is not stated in any appendix or section of the Draft EIR. The Project would include solar voltaic panels on the gymnasium building roofs which would reduce heat adsorption for the buildings. Additionally, the open space areas and landscaping throughout the Project Site would also reduce the heat island effect from the impervious surfaces on site. As stated on page IV.G-74 of Section IV.G, *Greenhouse Gas Emissions*, of the Draft EIR, the Project would implement an extensive tree and landscaping program that would remove 240 of the existing 421 inventoried on- and off-site trees (four which are deemed dead and, therefore, excluded from mitigation requirements), and plant 393 trees resulting in a net increase of 153 trees beyond existing conditions (or a 36 percent increase). As described on page IV.G-74, according to the USEPA, trees help reduce urban heat island effects by shading building and ground surfaces, deflecting radiation from the sun, and releasing moisture into the atmosphere, which results in cooling through evapotranspiration.<sup>101</sup> The increase in trees would help offset some of the highly-localized surface temperature warming effects from the proposed outdoor athletic fields utilizing artificial grass through increased Project Site-wide tree shading, deflection of solar radiation, and evapotranspiration compared to existing conditions. Therefore, the net replacement trees in combination with other GHG reduction features would perform GHG-reducing and

<sup>101</sup> U.S. Environmental Protection Agency, Reduce Urban Heat Island Effect, November 2, 2020, <https://www.epa.gov/green-infrastructure/reduce-urban-heat-island-effect>, accessed December 1, 2020.

heat-reducing functions that the existing trees performed. Refer to Appendix C, Supplemental Carbon Sequestration and Canopy Study, of this Final EIR.

## **Comment No. ORG 7A-58**

### **3. The DEIR Improperly Compresses GHG Impacts and Mitigation.**

As we have pointed out in other sections, the DEIR improperly compresses analysis of GHG impacts and mitigation, in violation of CEQA. (*Lotus, supra*, 223 Cal.App.4<sup>th</sup> 645, 656.) This error is fatal to the DEIR, because it precludes meaningful analysis and mitigation of the Project's GHG impacts, precludes analysis of the potential impacts imposed by mitigation measures (CEQA Guidelines § 15126.4, subd. (a)(1)(D)), and prevents a Statement of Overriding Considerations to be adopted if necessary.

## **Response No. ORG 7A-58**

The comment asserts that the Draft EIR improperly compresses analysis of GHG impacts and mitigations for GHG emissions. Please refer to Response No. ORG 7A-59 for a discussion on the how the Draft EIR adequately addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. Please refer to Response Nos. ORG 1B-8, ORG 1B-22 and ORG 7A-23 above for a discussion on how the Draft EIR properly analyzes the Project with PDFs as part of the Project; how the Draft EIR neither compresses, hides nor avoids discussion of potential impacts; and why the Draft EIR does not suffer from the deficiencies identified in the *Lotus* decision. As explained therein, the Draft EIR analyzed the impacts of the Project with the PDFs as Project components incorporated into the Project. Pursuant to CEQA, mitigation measures are not part of the original project design, but instead are actions taken by the lead agency to reduce impacts to the environment resulting from the original project design. (CEQA Guidelines Sections 15126.4(a) and 15370.) Chapter IV, *Environmental Impact Analysis*, of the Draft EIR fully describes and analyzes the Project's potential impacts and the use of PDFs and mitigation measures. The Project's Draft EIR contains no compression of analysis, failure to provide standards for evaluating impacts, or in any way ignores or obscures potential impacts and the comment provides no evidence that it does.

## **Comment No. ORG 7A-59**

The DEIR improperly compresses the analysis by declaring the Project's consistency with relevant GHG reduction plans through the implementation of "GHG reduction characteristics, features, and measures." (DEIR, p. IV.G-54.) The DEIR, however, does not properly analyze the significance of the Project's impacts without imposing such GHG reduction features. Instead, the DEIR makes a misleading comparison by comparing the Project's GHG impacts without any of these reduction features, to the Project with the GHG reduction features, and presenting the difference in GHG emissions to show the Project as proposed with the GHG reduction features is superior. (*Ibid.*) This is a

strawman comparison, however, as there is no evidence to suggest that a version of the Project without these features is being proposed. Thus, the comparison to a hypothetical version of the Project without these features is misleading.

## Response No. ORG 7A-59

The comment asserts that the Draft EIR does not properly analyze GHG impacts. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. As indicated on page IV.G-38, in Section IV.G, *Greenhouse Gas Emissions*, under the heading Thresholds of Significance in the Draft EIR, CEQA Guidelines Section 15064.4 gives lead agencies the discretion to determine whether to assess those emissions quantitatively or qualitatively. Although GHG emissions were quantified for the Project, CARB, SCAQMD, and the City have not adopted quantitative project-level significance thresholds for GHG emissions that would be applicable to the Project. Therefore, in the absence of any adopted quantitative thresholds of general application, the City, as Lead Agency, has determined that the Project's GHG emissions would not be considerable and would not have a significant effect on the environment if the Project is found to be compliant with performance-based standards included in the regulations outlined in the applicable portions of CARB's Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City's Green New Deal, and the Los Angeles Green Building Code consistent with CEQA Guidelines Sections 15064.4(b)(2). Since the Project was not in conflict with these applicable regulatory plans to reduce GHG emissions, Project impacts are less than significant. In addition, support for this threshold is found in California Supreme Court case law, such as *Center for Biological Diversity et al. vs. California Department of Fish and Wildlife* and *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 576.).

Table IV.G-7, *Estimated Operational Greenhouse Gas Emissions – Project*, on page IV.G-53 of the Draft EIR, provides the Project's estimated GHG emissions with and without implementation of GHG reduction characteristics, features, and measures. This comparison is provided to evaluate the Project's efficiency with respect to GHG emissions but is not the threshold of significance used for impact analysis. The analysis assumes the Project without implementation of GHG reduction characteristics, features, and measures would incorporate the same land uses and building square footage as the Project. Furthermore, this analysis is consistent with the most current regulatory policies and GHG quantification methods; however, the scientific, regulatory environment regarding GHG reduction and CEQA approaches for GHG analysis are constantly evolving and would continue to do so into the future. Although the quantification of GHG emissions was not measured against a significance threshold because none have been adopted that are applicable to the Project, it nevertheless provides the extent to which the Project would increase GHG emissions as compared to the existing environmental setting. In addition, as the Project does not result in a significant GHG impact based on the established qualitative threshold above, mitigation measures are not required and the

GHG reduction characteristics, features, and measures are more appropriately assigned as PDFs. The comment does not provide supporting evidence to show that the Draft EIR improperly evaluated GHG emissions. See also, Response No. ORG 7A-58 above.

### **Comment No. ORG 7A-60**

Further, the “GHG reduction” features do not even show that the Project would have less than significant GHG impacts. One of the features, a solar voltaic system on the gymnasium roof, is an unenforceable PDF that does not reflect a commitment by the Applicant. We have objected to the DEIR’s reliance on such PDFs above in Section IV. Further, the solar panels are expected to supply only 11.5% of the Project’s energy demand. (DEIR, p. IV.G-50.) The solar voltaic system thus is far from offsetting the Project’s GHG impacts.

### **Response No. ORG 7A-60**

The comment asserts that the GHG reduction features are not adequately analyzed and are unenforceable. As noted under Response No. ORG 7A-59, above, the Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. Project Design Feature GHG-PDF-1: Solar Voltaic System can be found on page IV.G-50 of the Draft EIR, and states that the Project would be designed to include solar voltaic panels on the roof of the gymnasium. With the revised solar panel configuration described in Topical Response No. 2 - Modifications to the Project Design, and Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR, the Project would meet LAMC requirements and would provide 281,000 kWh per year (which is approximately 10.2 percent of the Project’s energy demand) to reduce the electricity demand from City utilities. The reduction in the number of panels, made in order to provide serviceable pathways between banks of panels, would have no new or substantial increase in the severity of environmental effects under CEQA thresholds. PDFs which are part of the Project design are a commitment of the applicant and are enforceable through permits as well as the MMP contained in Chapter 4 of this Final EIR. The solar voltaic system was not designed with the sole intent to offset the Project’s GHG emissions, but rather to lessen reliance on City utilities. However, it will reduce GHG emissions as it is renewable energy and was accounted for in the quantification of the Project’s GHG emissions, which have been updated in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR based on the design correction.

### **Comment No. ORG 7A-61**

The DEIR also claims, as a GHG reduction feature, GHG reductions as a result of state requirements to reduce the carbon intensity of the energy supplied by the LADWP. (DEIR, p. IV.G-54.) These reductions do not reflect on the Project’s impacts because they are dependent on whether LADWP meets its RPS requirements, and not within the control of

the Project developer. GHG mitigation measures must be additional; that is, reducing emissions beyond what would otherwise occur (*Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5<sup>th</sup> 467, 518) and GHG mitigation is illusory unless it provides additionality. CEQA prohibits illusory mitigation. (*Federation of Hillside & Canyon Assn. v. City of Los Angeles* (2000) 83 Cal.App.4<sup>th</sup> 1252, 1261; *Katzeff v. California Dept. of Forestry and Fire Protection* (2010) 181 Cal.App.4<sup>th</sup> 601, 612; *Lincoln Place Tenants Assn v. City of Los Angeles* (2005) 130 Cal.App.4<sup>th</sup> 1491, 1508.) As defined by California’s Cap-and-Trade program, a GHG offset must “exceed any [GHG] reductions or removals that would otherwise occur in a conservative business-as-usual scenario.” (17 Cal. Code Regs., § 95802, subd. (a).) Thus, a GHG mitigation measure must create GHG reductions beyond those that would occur without its implementation. It must also be “real, permanent, quantifiable, verifiable, and enforceable.” (Health & Safety Code § 38562, subd. (d)(1).) The DEIR has not shown that its GHG reduction features are additional to what would normally occur.

## Response No. ORG 7A-61

The comment claims that a GHG mitigation measure is required to further reduce GHG emissions and that the Project’s compliance with regulatory requirements was improperly attributed as a mitigation measure. The contention is incorrect and the cases cited in the comment are not applicable since the Project’s GHG reduction features are not mitigation measures. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant and, as such, no mitigation measures were required. As stated on page IV.G-51 of the Draft EIR, Project GHG emissions include reductions from the Los Angeles Green Building Code and the State’s CalGreen Code/Title 24 Building Energy Efficiency requirements applicable to the Project.

Furthermore, as stated on page IV.G-55 of the Draft EIR, the total net Project emissions in Table IV.G-7 do not reflect the fact that Project operational-related GHG emissions would likely be lower as the Project would provide additional sustainability features (see Section IV.O.1, *Utilities and Service Systems – Water Supply*, of the Draft EIR) that would help to reduce the Project’s outdoor water demand and reduce associated GHG emissions from water supply, conveyance, distribution and treatment. These water-saving features were conservatively not accounted for in the quantitative GHG emissions analysis. Additionally, total net Project GHG emissions do not account for declining GHG emissions in future years as emissions reduction plans, policies, and regulations at the state, local and regional levels (including the RTP/SCS and Climate Change Scoping Plan) are achieved and as the State’s Cap-and-Trade program continues to be implemented. Emissions related to electricity would decline as utility providers meet their RPS obligations to provide renewable electricity sources to meet the future RPS obligations of 60 percent by December 31, 2030, and 100 percent by December 31, 2045. Additionally, emissions related to mobile sources would also decline as older vehicles are replaced with newer vehicles meeting stricter emissions standards. The Project did not

take reductions from future regulations, past 2025, that would reduce GHG emissions, so actual Project GHG emissions would be lower than those presented in Table IV.G-7 of the Draft EIR. As discussed on pages IV.G-55 through IV.G-56 of the Draft EIR, the Project GHG emissions analysis did not take into account reductions in GHG emissions from the RPS regulations beyond 2025. Therefore, it is not a mitigation measure that is unenforced or out of control of the Project, since those emissions reductions are not included in the Project GHG emissions estimate. Additionally, please refer to Response Nos. ORG 1B-8, ORG 1B-22, and ORG 7A-23 above for a discussion on the Draft EIR's appropriate disclosure and analysis of PDFs rather than mitigation measures when the impact reduction strategy is part of the Project's design features.

### **Comment No. ORG 7A-62**

Finally, the DEIR assumes GHG reductions based on the Project's purported VMT reductions. As noted in Section V.J.2, the DEIR's analysis of VMT is flawed, and does not account for all VMT. Thus, the DEIR's assumed GHG reductions are flawed as well.

### **Response No. ORG 7A-62**

The comment asserts that both the Draft EIR's VMT analysis is flawed and that the Draft EIR does not account for all VMT. This statement is not substantiated by any facts. As stated on pages IV.G-43 and IV.G-44 of Section IV.G, *Greenhouse Gas Emissions*, of the Draft EIR, mobile emissions were estimated based on emission factors from EMFAC along with VMT values taken from the Transportation Assessment (TA), and used to estimate on-road mobile source GHG emissions.<sup>102</sup> As discussed in Section IV.M., *Transportation*, of the Draft EIR, the Project's daily VMT was estimated for the different users that would utilize the Project, which include Harvard-Westlake School students, visiting teams, spectators, and employees. In addition, while the community use component of the Project, which is classified as a community-serving recreational facility, is exempt from VMT analysis per the Los Angeles Department of Transportation's (LADOT) *Transportation Assessment Guidelines*,<sup>103</sup> the emissions associated with VMT from the community use component of the Project were accounted for in the Project's operational emissions for the purposes of the Project's GHG analysis. The Project's GHG analysis also accounted for annual VMT from community use events that could occur during the year, including five community Special Events with approximately 500 attendees per event. In addition to the VMT generated by the students, visiting teams, spectators, and employees, the GHG emissions from VMT generated by occasional Harvard-Westlake Special Events that would occur during the academic year at the Project Site were included in the annual VMT, including 27 smaller School Special Events with approximately 500 attendees per event, and three larger School Special Events with

<sup>102</sup> Fehr & Peers, Transportation Assessment – Harvard-Westlake River Park Project for Assessor Parcel Numbers 2375-018-020 and portion of APN 2375-018-903 Los Angeles River Parcel 276,4141 Whitsett Avenue, Studio City, CA 91604, April 2021. Provided in Appendix M of this Draft EIR.

<sup>103</sup> Los Angeles Department of Transportation, Transportation Assessment Guidelines, July 2020.

approximately 2,000 attendees per event.<sup>104</sup> Finally, the net total annual VMT takes credit for the existing annual VMT associated with the existing Weddington Golf & Tennis that would no longer occur with implementation of the Project. The Project would generate an estimated total of 3,958,345 annual VMT. When taking into account the existing uses which will be eliminated, the Project would generate an estimated net increase of 1,757,395 annual VMT (of which, more than two-thirds is attributable to community uses of the Project Site).<sup>105</sup> Refer to VMT data in Appendix C and Appendix M of the Draft EIR. The Project's emissions were calculated for Project buildout in 2025. Therefore, all possible VMT from the Project were accounted for in Section IV.G, *Greenhouse Gas Emissions*, of the Draft EIR.

### **Comment No. ORG 7A-63**

The DEIR improperly compressed the analysis of Project impacts and spurious design features meant to mitigate GHG emissions. In doing so, it failed CEQA's mandate as an informational document. To correct this fatal flaw, the DEIR should analyze the impacts of the proposed Project first separately to assess the significance of impacts. Then, the DEIR should apply all feasible mitigation measures to reduce Project impacts.

### **Response No. ORG 7A-63**

The comment makes several unsupported claims that the Draft EIR improperly compressed the analysis of Project impacts, provided "spurious" design features, and failed CEQA requirements to provide an informational document. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. Please also refer to Response Nos. ORG 7A-53 through ORG 7A-57 and Response Nos. ORG 7A-60 through 7A-62, above, for a discussion on how the Draft EIR adequately addressed GHG emission impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. Please also refer to Response No. 1B-8 regarding the appropriate application of PDFs.

## Comment No. ORG 7A-64

### 4. The DEIR Relies on an Unsupported 30-Year Amortization Timeline.

The DEIR fails to disclose the total amount of GHGs expected to be emitted over the life of the Project. Instead, the DEIR relies on the assumption that the Project will have a lifespan of 30 years, and amortizes the construction emissions of the Project over that assumed lifespan. (DEIR, p. IV.G-43.) This lifespan is unsupported by substantial evidence. The DEIR understates the Project's GHG emissions by understating the useful life of the Project. The DEIR cites to a draft guidance document prepared by the South Coast Air Quality Management District (SCAQMD) staff in 2008 for consideration by the SCAQMD Board ("Board"), discussing proposed Draft SCAQMD Guidance for setting significance thresholds under CEQA for GHG emissions. (Attachment J, December 2008 Board Summary.) This was the occasion when the SCAQMD adopted the 10,000 metric tons per year of GHG emissions significance threshold for industrial projects. (Attachment J, p. 2.) However, no significance threshold, and no useful lifespan were adopted for commercial uses such as the Project site. The Board declined to recommend a lifespan for commercial uses. Thus, insofar as the Project includes commercial activities, a lifespan of 30 years should not be used as an assumption in the EIR.<sup>3</sup>

<sup>3</sup> A recent Superior Court decision in San Diego County noting that SCAQMD has not adopted a 30-year lifespan for residential/commercial projects is attached to these comments. (Attachment K [Decision in EHL v. County of San Diego], p. 3.)

## Response No. ORG 7A-64

The comment asserts that the Draft EIR fails to disclose the total amount of GHGs expected to be emitted over the life of the Project. In this regard, please see Response No. ORG 7A-65 for a detailed discussion on why construction-related GHG emissions were amortized over 30 years of project operations in order to include these emissions as part of the project's total annualized operational emissions as recommended by the SCAQMD (page IV.G-51 of the Draft EIR) and why the Draft EIR evaluated the Project's GHG emission impacts on an annual basis for the buildout year 2025 in Table IV.G-7 on page IV.G-53 of the Draft EIR. The buildout year would have the highest GHG emissions of all operational years because as stated in the Draft EIR, Project operational emissions takes into account actions and mandates already approved and expected to be in force by Project buildout (page IV.G-44 of the Draft EIR). As stricter emission regulations take effect in subsequent years, especially for mobile and energy emissions, Project GHG emissions would be less than that of the buildout year. Because the Draft EIR does not purport to assume a 30-year lifetime for the Project, nor does it report 30 years' of GHG emissions, the claims in the comment are unsupported by fact.

## Comment No. ORG 7A-65

It is simply not the case, as a matter of law, that SCAQMD requires that the residential and commercial portions of the Project be presumed to have a lifespan of only 30 years.

Even if it wished to, the SCAQMD does not have approval authority over those portions of the Project, and could not impose or enforce a 30-year limit to the Project's life. Nor does the DEIR indicate that the Project will accept as a condition of approval that it will cease to operate after 30 years, even if the City proposed to impose one. No practical or legally binding 30-year limitation on the Project's life exists. Hence, the EIR should calculate insofar as possible what the GHG emissions of the Project will be after 30 years and for as long as the Project can reasonably be expected to remain in operation. These emissions must be publicly disclosed, and must be mitigated to the extent feasible. (Pub. Resources Code §§ 21002, 21081(a).)

## **Response No. ORG 7A-65**

The comment contends that it was improper to calculate the Project's GHG emissions assuming a 30-year lifespan. However, the comment reflects a misunderstanding of the evaluation of GHG emissions in the Draft EIR, which are addressed in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant. The EIR did not use the term "lifespan" in the analysis in the Draft EIR, the analysis stated that "as recommended by the SCAQMD, construction-related GHG emissions were amortized over a 30-year project lifetime in order to include these emissions as part of a project's annualized lifetime total emissions" (page IV.G-51 of the Draft EIR). As stated on page IV.G-51, in accordance with SCAQMD guidance, GHG emissions from construction have been amortized (i.e., averaged annually) over the "lifetime" of the Project. The SCAQMD defines the lifetime of a project as 30 years for industrial projects for the sole purpose of amortizing one-time construction period emissions to be added to annual operational emissions and compared to the annual emissions threshold adopted by the SCAQMD. Stationary source operational permits issued by the SCAQMD do not impose or enforce a 30-year limit to the lifespan of industrial projects. Further, if the analyses were to assume a "lifespan" in excess of 30 years, as the comment suggests, the effect would actually be to lower the Project's annualized GHG emissions as the construction-related emissions are recognized over a longer time period.

In accordance with CEQA Guidelines section 15064.7, the City considered "...thresholds of significance previously adopted or recommended by other public agencies or recommended by experts...". The International Energy Agency (IEA), of which the United States is a member country, in its informational paper entitled *Energy Efficiency Requirements in Building Codes, Energy Efficiency Policies for New Buildings* (March 2008), recommends calculating energy savings and the associated costs over a building's lifetime of 30 years (see pages 35, 36, 41, 67, 70, 76, and 80 of IEA's informational paper), including for residential projects (see page 70 of IEA's informational paper). The IEA's recommendation does not imply a building's useable lifespan is only 30 years. The paper further notes the following:

*Occurring at 30-40 year intervals during a building’s lifespan, major renovations or refurbishment aim to repair and replace parts of a building, such as windows and installed equipment following decades of use and in the context of new technology and demands for functionality.*

Since the major sources of GHGs from buildings is energy consumption, the IEA’s recommendation that calculations of energy efficiency and consumption be based on a 30-year building or project “lifespan” is consistent with the calculation methodology used in the Draft EIR.

The Draft EIR evaluated the Project’s GHG emission impacts on an annual basis for the buildout year 2025 in Table IV.G-7 on page IV.G-53 of the Draft EIR. The Draft EIR does not purport to assume a 30-year lifetime for the Project, nor does it report 30 years’ of GHG emissions. For the reasons stated above, the commenter’s assertion that the Draft EIR failed to accurately report all Project emissions of GHG and that it imposes a 30-year limit to the Project’s life is incorrect. The Draft EIR presents the maximum annual GHG emissions that the Project would emit, since Project GHG emissions would be lower in the following years as regulations to reduce GHGs, which were not accounted for in the Project’s GHG emissions calculations, take effect. Additionally, GHG emissions calculations are only provided as support for the consistency analysis (DEIR page VI.G-50). Refer to Response No. ORG 7A-47, above, regarding the adequacy of the consistency analysis for determining potential impacts related to GHG emissions. Thus, the Draft EIR publicly disclosed GHG emissions to the extent feasible, and since Project GHG impacts were less than significant, no mitigation is required.

## **Comment No. ORG 7A-66**

### **5. The DEIR Understates the Project’s Urban Heat Island Effect.**

The DEIR understates the Project’s impacts with respect to the urban heat island effect. As the DEIR’s Appendix C-2 states, the urban heat island effect describes higher temperatures in urban environments, due to a greater concentration of heat-absorptive surfaces, heat generating activities, and less vegetation than in rural environments. (Draft EIR, Appendix C-2, pp. 1-2.) The urban heat island effect is important because it contributes to increased concentrations of heat, which leads to numerous deleterious health impacts. (Attachment L, Declaration of Dr. Futernick with supporting studies).

## **Response No. ORG 7A-66**

The comment contends that the Draft EIR understates the Project’s impacts with respect to the urban heat island effect. However, it provides no facts to support this contention. Specific issues raised by the commenter regarding the urban heat island effect are addressed in Response Nos. ORG 7A-67 through ORG 7A-68.

## Comment No. ORG 7A-67

The DEIR concludes that because the Project's artificial turf would undergo rapid cooling during the nighttime, it would not retain heat overnight and thus not contribute to the urban heat island effect. This represents a significant gap in the analysis, as the DEIR fails to explain how a lack of nighttime heat absorption would relate to the public health outcomes due to increased heat. The DEIR explains that the urban heat island effect is more pronounced at night, but does not assert that the **outcomes** of the effect are more pronounced at night. Thus, the DEIR's conclusion is unsupported.

## Response No. ORG 7A-67

The comment contends that the Draft EIR evaluation of the contribution of artificial turf to "heat island effect" is inadequate for failure to discuss how nighttime heat absorption would relate to public health outcomes. See Topical Response No. 7 – Artificial Turf and Effects on Localized Heat and Health, regarding the potential health-related and urban heat island effects due to the Project's use of artificial turf fields. The Project would replace the existing Project Site uses with new athletic and recreational facilities, including outdoor athletic fields utilizing artificial grass as a sustainable alternative to turf grass, thereby reducing irrigation water demand and avoiding the use of pesticides associated with the turf grass. Section IV.H, *Hazards and Hazardous Materials*, and Appendix H-2, Artificial Turf Technical Memorandum, of the Draft EIR, includes a detailed evaluation of potential health impacts related to use of artificial turf. Based on the analysis, the Draft EIR determined that health-related impacts would be less than significant. Refer to Table IV.H-2 of the Draft EIR for a summary of the major findings from the health studies discussed in Section IV.H regarding the use of artificial turf.

In addition, Section IV. G, *Greenhouse Gas Emissions*, of the Draft EIR, included an analysis of urban heat island effects from Project implementation. As analyzed therein, the Project's artificial turf would not substantially contribute to an increase in the urban heat island effect for the area.

As stated in Appendix C-2, Urban Heat Island, and Section IV.G 3.d)(3), *Urban Heat Effect*, based on the studies discussed in these sections, surface temperatures of artificial turf are higher compared to natural turf due to solar heating and is most pronounced in the polyethylene and polypropylene fibers used to replicate natural grass. Air temperatures at 2 and 5 feet above artificial turf were measured to be generally equivalent to the measured ambient air temperature, indicating the lack of stored heat within the fibers and combined mass of the artificial turf components that could even theoretically contribute to an urban heat island. As further evidence, rapid cooling of the artificial turf fibers was noted if the sunlight was interrupted or filtered by clouds with observed data indicating a cooling of 40 to 50 degrees fahrenheit over a 10-minute period when there was observed cloud cover. The Project Site is located in an already developed urban area with an asphalt roadway grid, and near commercial parking lots and commercial and residential buildings, which are general urban features that are known to contribute to the

urban heat island effect. However, as shown in Figure 1 of Appendix C-2 and Figure IV.G-2, of Section IV.G, of the Draft EIR, the urban area in which the Project Site is located is rated with the lowest Urban Heat Island Index (UHII) score of 0 to 10 degree-hours per day (Celsius scale) – equivalent to an average temperature difference between rural and urban in that area of approximately 0 to 0.75 degrees Fahrenheit. Thus, the Project’s artificial turf would not substantially contribute to an increase in the urban heat island effect for the area given that the totality of the urbanized development in the area already yields the lowest UHII score and that artificial turf does not store heat in the same manner and to the same extent as known contributors to urban heat islands.

Furthermore, the urban heat island effect is most pronounced during the nighttime because the strong influence of the urban heat island on nighttime temperatures limits the ability of people to cool down and recover before the heat of the next day. In general, daytime temperatures in urban areas are on average 1 to 6 degrees Fahrenheit higher than in rural areas, while nighttime temperatures can be as much as 22 degrees Fahrenheit higher as the heat is gradually released from buildings and pavement.<sup>106</sup> However, as stated previously, artificial turf fibers undergo rapid cooling if sunlight is interrupted or filtered by clouds. Thus, unlike buildings and pavement that retain daytime heat and gradually release heat during the nighttime hours, artificial turf fibers would undergo rapid cooling as the sun sets and would not contribute substantially to nighttime heating. Finally, consideration of the urban heat island effect conservatively did not account for the Project’s substantial landscaping program, including the planting of 393 new trees (a 36 percent increase over existing conditions), which would result in a greater percentage of the Project Site to be shaded by tree canopy beginning between years five and ten of Project operation as compared to existing conditions (refer to the Carbon Sequestration and Canopy Study, November 2022, in Appendix C of this Final EIR). Thus, as supported by the evidence discussed in the Draft EIR and in this Final EIR, the Project would have a less than significant impact with respect to the urban heat island effect.

## **Comment No. ORG 7A-68**

### **6. The EIR Fails to Include All Feasible Mitigation Measures**

Due to its errors in failing to analyze and disclose the Project’s significant GHG impacts, the DEIR fails to impose any GHG mitigation measures, even though the Project will increase GHG emissions.

## **Response No. ORG 7A-68**

The comment reasserts that the Draft EIR fails to analyze and disclose the Project’s significant GHG impacts and fails to impose mitigation measures. The comment’s unsupported claim that the Draft EIR fails to analyze and disclose the Project’s significant

<sup>106</sup> CalEPA, Understanding the Urban Heat Island Index. Available: <https://calepa.ca.gov/climate/urban-heat-island-index-for-california/understanding-the-urban-heat-island-index/>. Accessed June 2022.

GHG impacts and impose mitigation measures is incorrect. The Draft EIR addressed GHG impacts in Section IV.G, *Greenhouse Gas Emissions*, with supporting data provided in Appendix C-1, Air Quality/Greenhouse Gas Emissions Technical Documentation, of the Draft EIR. As analyzed therein, GHG impacts would be less than significant and, as such, no mitigation measures would be required.

### **Comment No. ORG 7A-69**

Lead agencies are required to analyze all feasible mitigation measures. (*King & Gardiner Farms v. County of Kern* (2020) 45 Cal.App.5th 814, 869.) The City must implement numerous GHG mitigation measures to mitigate the significant GHG impacts of the Project. These include:

- Requiring all Project development to be all electric with no plumbing whatsoever for natural gas. Accordingly, no gas-powered water heaters, or any other gas-powered appliance shall be allowed.
- Including photovoltaic solar panels and batteries in the project design to provide the maximum amount of the Project's commercial needs, but in no event, less than 90 percent. The estimated contribution of 11.5% of the Project's energy demand from GHG-PDF-1 is insufficient. (DEIR, p. IV.G-50.)
- Actually constructing enough electric vehicle charging stations in the project design to provide charging capacity adequate to service all anticipated vehicles to the Project site, not solely providing some of the infrastructure for "future" stations (DEIR, p. IV.G-61).
- Including electric heat pumps in the project design to provide air and water heating and cooling.
- Prohibiting gas-powered landscape maintenance equipment.
- Requiring that the shuttles running from the Harvard-Westlake Upper Campus to the Project site are 100% electric and mandating as an enforceable mitigation measure that use of such shuttles is required.
- Providing free transit passes to students, faculty, parents, and anyone who may utilize the Project.
- Providing a free shuttle to and from the nearest Metro Rail stations for events.
- Prohibiting vehicle idling.

### **Response No. ORG 7A-69**

The comment provides a list of measures that contribute to reductions in GHG Emissions. As discussed under Response No. ORG 7A-50, above, CEQA Guidelines Section 15064.4 gives lead agencies the discretion to determine whether to assess GHG emissions quantitatively or qualitatively. The City has not adopted quantitative project-level significance thresholds for GHG emissions that would be applicable to the Project. As Lead Agency, the City has determined that the Project's GHG emissions would not be

considerable and would not have a significant effect on the environment if the Project is found to be compliant with performance-based standards included in the regulations outlined in the applicable portions of CARB's Climate Change Scoping Plan, the 2020-2045 RTP/SCS, City's Green New Deal, and the Los Angeles Green Building Code consistent with CEQA Guidelines Sections 15064.4(b)(2). Since the Project would not conflict with these applicable regulatory plans to reduce GHG emissions, Project impacts are less than significant. In addition, Table IV.G-7, *Estimated Operational Greenhouse Gas Emissions – Project*, on page IV.G-53 of the Draft EIR, provides the Project's estimated GHG emissions with and without implementation of GHG reduction characteristics, features, and measures. This analysis is consistent with the most current regulatory policies and GHG quantification methods. Therefore, as the Project does not result in a significant Greenhouse Gas impact based on the established qualitative threshold discussed above, mitigation measures are not required and the GHG reduction characteristics, features, and measures are more appropriately assigned as Project Design Features as discussed in Section IV.G, *Greenhouse Gas Emissions*.

Thus, consistent with CEQA Guidelines Section 15162.4(a)(3) which states that mitigation measures are "not required for effects which are not found to be significant", the Draft EIR concluded that no mitigation measures were necessary (pages IV.G-59, IV.G-74 and IV.G-78). The comment does not provide any facts to support the need for the list of mitigation measures or the effectiveness of the proposed measures. Instead of a reasoned analysis, the list merely represents the commenter's arbitrary selection of features which are not required by CEQA or regulatory mandates. Please also refer to Response No. 7A-38 regarding the implementation of arbitrary, unmeasurable, and unnecessary mitigation measures.

Also, refer to Response No. ORG 7A-47, which discusses the Project design modifications and updated GHG and energy calculations in Chapter 3 of this Final EIR. As stated therein, the updated calculations do not change the energy and GHG impact conclusions in the Draft EIR, nor would there be a substantial increase in the severity of impacts.

## **Comment No. ORG 7A-70**

### **E. The DEIR Fails to Provide Enforceable Mitigation for Geotechnical Impacts.**

The Project would require a massive amount of grading; as admitted by the DEIR approximately 250,000 cubic yards of material would need to be excavated and exported from the Project site. There are significant hazards to the adjacent Los Angeles River and surrounding community associated with this high level of site excavation, taking place over a number of years. Additionally, this level of excavation is required in part due to the fill and clayey, expansive soils that make up the existing conditions of the Project site.

## Response No. ORG 7A-70

The comment claims unspecified and unsubstantiated hazards to which the Los Angeles River and surrounding community would be subject as a result of Project grading and excavation. As described in the Project's Geotechnical Report (Appendix G-1 of the Draft EIR), the more clayey, wetter and/or expansive materials should be exported (excavated and removed). The Geotechnical Report also recommends that the soils to be utilized for the preparation of a compacted fill pad are well blended to reduce their overall expansion index and moisture.<sup>107</sup> The removal or mixing of soils in compliance with the Geotechnical Report's recommendations would be required under the Building Code and would eliminate any potential hazard. Because compliance with the Geotechnical Report is a regulatory requirement, no additional mitigation is required. The potential environmental impacts of excavation would result from hauling and are discussed on PDF pages 82 to 87 of the Transportation Assessment, included in Appendix M of the Draft EIR, and evaluated in the Draft EIR. Excavation would occur over a period of 5.5 months (not a "number of years" as the comment claims) in Phase 3 of construction (see the clarification regarding the excavation phase in Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR). The potential for contaminated soils is discussed (not "admitted") in Section IV.H, *Hazards and Hazardous Materials*, of the Draft EIR. As described in Chapter II, *Project Description*, of the Draft EIR, rough grading cut volumes would be approximately 251,836 cubic yards (unadjusted), and the fill volume would be approximately 1,836 cubic yards (unadjusted), for a net cut/fill volume of approximately 250,000 cubic yards (unadjusted). A bulking factor of 20 percent was used in the estimated 250,000 cubic yards of excavated materials. It is noted that, with changes in the excavation of the subterranean garage, the total excavation has been reduced to 190,000 cubic yards (unadjusted). The change is described in Topical Response No. 2 – Modifications to the Project Design, and has been incorporated into Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR.

Under CEQA, hauling is evaluated relative to emissions associated with maximum daily truck trips, landfill capacity, or handling of hazardous materials. Under Mitigation Measure HAZ-MM-1, in Section IV.H of the Draft EIR, a Soils Management Plan (SMP) would be submitted to the Los Angeles Department of Building and Safety (LADBS) and Los Angeles Regional Water Quality Control Board (LARWQCB), as necessary, for review and approval. The SMP would specify soil testing parameters and sampling in accordance with appropriate California and local guidelines [e.g., Department of Toxic Substances Control (DTSC), California Environmental Protection Agency (CalEPA), and LARWQCB)]. Any soils qualifying as hazardous waste and/or soils that include concentrations of chemicals that exceed applicable State Office of Environmental Health Hazard Assessment (OEHHA) California Human Health Screening Levels (CHHSL), would be subject to site-specific soil removal, treatment, and specific disposal measures included in the SMP to comply with applicable federal, State, and local overseeing

<sup>107</sup> Geotechnologies Inc., Geotechnical Engineering Investigation, page 20 (PDF page 36 of 299 in Appendix G-1), provided in Appendix G-1 of the Draft EIR.

agencies requirements to prevent unacceptable exposure of hazardous materials to construction workers, the environment or the public from contaminated soils or soil vapors during construction or hauling. The SMP shall also include, but is not limited to, protocols that address the following: screening measures for soil exhibiting impacts, stockpile management, vapor suppression and dust control, surface and groundwater protection, soil stockpile sampling, and exporting procedures for contaminated soils. With the implementation of the SMP, Section IV.H of the Draft EIR correctly concluded that potential impacts to the Los Angeles River and surrounding community due to exposure to contaminated soils would be less than significant.

### **Comment No. ORG 7A-71**

However, the DEIR improperly relies on imposition of future conditions and proposed Project design to mitigate these potentially significant geotechnical impacts. The DEIR assumes an undisclosed stormwater pollution prevention plan (SWPPP) would eliminate hazards associated with blowing soils and runoff during excavation. As set forth in Section IV, the DEIR's reliance on this future condition, without including it as a mitigation measure, fails to adequately disclose the Project's impacts, fails to assess the adequacy of the measures to mitigate impacts and fails to provide fully enforceable mitigation as required by CEQA.

### **Response No. ORG 7A-71**

The comment claims that the Project's SWPPP should be enforced as a mitigation measure. The SWPPP, however, is a regulation mandated by the State and the City for any construction site greater than one acre and is discussed at length in Section IV.I, *Hydrology and Water Quality*, pages IV.I-6 and IV.I-7, IV.I-27 through IV.I-29, IV.I-36 and IV.I-37, and IV.I-43 of the Draft EIR. The SWPPP is required to implement Best Management Practices (BMPs), which are determined by the Department of Building and Safety upon review of final development plans. Page IV.I-7 of the Draft EIR provides a list of specific BMPs that are anticipated to be implemented and which include BMPs for erosion control, sediment control, wind erosion, tracking, non-stormwater management, and waste management. As a code-mandated regulatory feature for Project development, the SWPPP is not a mitigation measure. In addition, future specific BMPs imposed by the regulatory agency are based on accurate, detailed, and approved grading and construction design during review of building plans and, as regulatory features, are not a deferral of mitigation.

### **Comment No. ORG 7A-72**

The geotechnical report found that to reduce the potential seismically-induced liquefaction, the existing upper soils be removed and recompacted for support of the proposed structures. The DEIR's assumption that fill and expansive clay materials will be removed before construction, without including it as a required mitigation measure, similarly fails to fully disclose impacts and provide fully enforceable mitigation.

## Response No. ORG 7A-72

The comment claims that the geotechnical procedures to address potential liquefaction should be incorporated into the Draft EIR as mitigation measures. Mitigation measures to address liquefaction are not required since procedures to address all geological issues are mandated by existing regulations. LAMC Section 91.1803 (which incorporates by reference the California Building Code (CBC) Section 1803) requires that geology investigations must be performed for all development sites and investigations must be conducted by a registered geologist or geotechnical engineer in accordance with code-mandated procedures. The final geology or geotechnical report must be reviewed and approved by the LADBS. Under Section 91.1803, all builders must comply with the recommendations of the geologist or geotechnical engineer provided in a geological or geotechnical report, as approved by the public agency at the time of building permit review. The Building Code requires the following 1) Review and approval of detailed plans prior to issuance of any permit; 2) That building plans include the recommendations contained in their geotechnical reports; and 3) All recommendations contained in the geotechnical report that are more restrictive than LADBS' approval be incorporated into the plans, with such plans submitted to plan check prior to permit issuance. The LAMC also requires on-site inspections to ensure compliance with the approved report. Because procedures related to grading and excavation are codified and highly regulated by the City, such measures, such as the removal of potentially expansive soils prior to construction are not mitigation measures but compliance with enforceable regulations.

## Comment No. ORG 7A-73

### F. The DEIR Fails to Adequately Disclose and Mitigate Hydrological and Water Quality Impacts.

#### 1. The DEIR Fails to Include Fully Enforceable Mitigation Measures.

The DEIR again improperly relies on PDFs, including to-be developed BMPs and the development of a stormwater capture and reuse system to mitigate hydrological and water quality impacts associated with the Project. These are mitigation measures, and as set forth above, must be treated as such in the DEIR to adequately disclose impacts, evaluate efficacy, and ensure enforceability. (Section IV.)

## Response No. ORG 7A-73

The comment asserts that the Draft EIR impermissibly uses a PDF regarding the Project's stormwater capture and reuse system, asserting instead that the feature should have been a mitigation measure. Section IV.O.1, *Water Supply*, of the Draft EIR, thoroughly discusses the Project's impacts related to water supply and includes Project Design Feature WS-PDF-2, which includes a capture and reuse system to capture, treat, and store stormwater and other urban runoff through a stormwater Low Impact Development (LID) capture and reuse cistern system, which will then use the treated stormwater for irrigation on the Project Site. As described on pages IV.O.1-28 through

IV.O.1-31 of the Draft EIR, the Project design for this system would be required to comply with the LID Ordinance and the BMPs contained in that ordinance. Therefore, there is no uncertainty about the design and implementation of the system. As stated on page IV.O.1-24, “In order to maintain the conservative nature of the analysis, the Project’s irrigation water demand does not account for implementation of Project Design Feature WS-PDF-2.” Therefore, the water supply analysis was not dependent on the capture and reuse system. The capture and reuse system has been reduced in size based on direction from the City for the Project to not provide treatment of stormwater from the off-site drainage area, but rather to capture, treat and reuse only on-site stormwater. This requirement from the City has resulted in a revision to Project Design Feature WS-PDF-2 to remove reference to the 38.64-acre off-site drainage area, which is discussed in Topical Response No. 2 – Modifications to the Project Design, and reflected in Chapter 3, *Revisions, Clarifications and Corrections to the Draft EIR*, of this Final EIR.

Additionally, Section IV.I, *Hydrology and Water Quality*, of the Draft EIR, fully analyzes the Project’s hydrology impacts. PDFs which alleviate environmental concerns can be integral to the project or volunteered by the applicant as a PDF to assist with an existing condition not caused by the project. In either case, and even when a PDF is mischaracterized, so long as the project’s impacts are fully disclosed and analyzed, there is no violation of CEQA. See Response No. ORG 1B-22 regarding use of PDFs for both integral project features and features that assist with an existing condition rather than an element needed to mitigate a project impact. Since both Sections IV.I and IV.O.1 of the Draft EIR fully explain the hydrology and water quality issues related to this Project, the Draft EIR adequately analyzes the environmental impacts of the Project. Additionally, this PDF, and all PDFs presented in the Draft EIR, would be incorporated into the MMP. All mitigation measures and PDFs incorporated into the MMP are equally enforceable.

## **Comment No. ORG 7A-74**

### **2. The DEIR Fails to Provide Adequate Information Regarding Groundwater Infiltration.**

The DEIR claims that the Project would have a less than significant impact on groundwater, but fails to provide evidence adequate to support a claim there is no groundwater infiltration currently happening on the Project site. The DEIR geotechnical report found groundwater starting at depths of approximately 25 feet. (DEIR p. IV.F-10.) Thus, there is clearly infiltration currently occurring on the Project site. The DEIR includes an assumption that the groundwater discovered is perched and would not recharge groundwater basins, but not provide evidentiary support for that assumption.

## **Response No. ORG 7A-74**

The comment claims that the Draft EIR provides no evidence to support the finding that groundwater infiltration (meaning infiltration into a groundwater table) currently occurs on the Project Site. As discussed in Appendix G-1, Geotechnical Engineering Investigation, page 47 and page 20 of Appendix I, Hydrology and Water Quality Report, of the Draft

EIR, the Project Site is underlain by impervious rock and clay layers, as shown in the existing perched groundwater conditions in which groundwater is trapped between impervious layers and does not move into a groundwater table. According to the geotechnical report, reviewed and accepted by the LADBS, groundwater was encountered below the Project Site at depths between 24½ and 49½ feet below grade. The determination that groundwater is perched was made by the registered geotechnical engineer who prepared the geotechnical report (Appendix G-1 of the Draft EIR) and is based on his professional understanding of the underlying compacted clays, rock formations and other geologic conditions, including the variation of depths to the perched groundwater. Because it is understood that the underlying clay soils and bedrock layers are relatively impervious, the perched water would not recharge other groundwater sources because it cannot move between the impervious layers. The depth of encountered groundwater indicates that groundwater is not close to the surface and would not likely seep into any future development above the highest water level. The Los Angeles Building Code provides regulatory protections for all subterranean structures, which would ensure that seepage would not damage the Project's underground parking structure or gymnasium basement. The geotechnical engineer's understanding of subsurface materials as presented in the Draft EIR is sufficient to support the assumption regarding existing perched groundwater conditions and the conclusion in the Draft EIR that infiltration into the area's groundwater table does not occur. The Draft EIR, thus, supports the conclusion that impacts related to groundwater recharge would be less than significant.

In addition, the Project's geotechnical study was peer-reviewed by Byer Geotechnical, Inc. August 17, 2022, who further concurred with the findings that infiltration at this site is not feasible. The Byer Geotechnical peer review of the Project's geotechnical study is included as Appendix G of this Final EIR. Based on the determination that infiltration is not feasible based on the site conditions, tier two (Capture and Use) was considered for the Project.

### **Comment No. ORG 7A-75**

The Project would eliminate all existing groundwater infiltration at the Project site. The DEIR fails to provide an assessment of current infiltration rates on the Project site. Without this information, the DEIR cannot adequately assess the Project's impacts on groundwater recharge. As such, the DEIR fails as an informational document. (Sierra Club v. County of Fresno (2018) 6 Cal.5th 502, 517A-18.)

Groundwater infiltration is the top priority use for stormwater for the City of Los Angeles. The Project's elimination of any existing groundwater recharge would be a significant adverse impact that must be disclosed and mitigated. Further, the DEIR fails to provide adequate evidence to claim future groundwater infiltration for the Project is infeasible.

## Response No. ORG 7A-75

The comment makes the unsupported and incorrect assumption that the Project would eliminate all existing groundwater infiltration, an assumption that would only be proved valid if the entire Project Site were rendered impermeable. The comment that the Draft EIR also fails to provide adequate evidence that future groundwater infiltration (meaning infiltration into a groundwater table) is infeasible is also incorrect. Please refer to Response No. 7A-74, above. The Hydrology and Water Quality Report provided in Appendix I of the Draft EIR, and summarized in Section IV.1, *Hydrology and Water Quality*, of the Draft EIR, evaluates groundwater hydrology. According to the Hydrology and Water Quality Report, page 20 (PDF page 25 of 142 of the Appendix I, of the Draft EIR), the Project Site's impervious area would increase from 30 to 59 percent at Project buildout. As such, the Project would reduce but not eliminate water infiltration at the Project Site. The Hydrology report also reports the findings of the Geotechnical Engineering Investigation that, because of existing perched groundwater conditions, the Project Site does not currently contribute to the recharge of the region's groundwater table. As such, a continuation of existing conditions would not be useful in meeting the LADWP's groundwater storage program. The surface water capture and reuse system proposed by the Project would capture storm runoff from the Project Site. The water capture and reuse system would, then, use the treated stormwater for irrigation on the Project Site. All excess water would ultimately flow to the Los Angeles River. The water that enters the river would ultimately contribute to the LADWP's water storage plan. Please refer Chapter 3, *Revisions, Clarifications, and Corrections to the Draft EIR*, of this Final EIR which includes revisions to Section IV.1, *Hydrology and Water Quality*, page IV.1-30 of the Draft EIR and Table IV.1-2, Proposed Drainage Conditions During 85th Percentile Storm Event, regarding groundwater hydrology. Table IV.1-2 illustrates the volumetric flow rates generated by an 85th percentile storm event and a summary of post-Project imperviousness conditions for the Project Site (Area A). The analysis in the Draft EIR fully discloses the Project's hydrological effects and supports the conclusions regarding groundwater recharge and infeasibility of infiltration (to a regional groundwater table).

## Comment No. ORG 7A-76

### 3. The DEIR Fails to Address Water Quality Impacts Associated with Artificial Turf.

The DEIR fails to address the potential water quality impacts associated with the installation of massive amounts of artificial turf as part of the proposed Project. Artificial turf contains toxic fire retardants, UV inhibitors, plasticizers and PFAS. PFAS (Persistent Accumulative Mobil Hazardous) are called forever toxic chemicals. (See <https://www.environmentalpollutioncenters.org/news/artificial-turfgrass-contains-toxic-pfas/>, incorporated by reference; <https://pfasproject.com/2019/10/09/toxic-pfas-chemicals-found-in-artificial-turf/>, incorporated by reference.) Studies have found that these chemicals shed in the rain, sun and over time. Artificial turf sheds 600 lbs. of plastic bits per year along with PFAS and this plastic and chemicals do not biodegrade.

## Response No. ORG 7A-76

The comment asserts that the Draft EIR fails to address the potential water quality impacts of artificial turf, including its potential to contain chemicals, plastic, and Per- and Polyfluoroalkyl Substances (PFAS).

PFAS are a family of thousands of chemicals that vary widely in their chemical and physical properties, as well as their potential risks to human health and the environment.<sup>108</sup> PFAS impart oil, water, stain, and soil repellency, chemical and thermal stability, and friction reduction in a range of products, including consumer products such as carpets, clothing, furniture, outdoor equipment, cosmetic products, non-stick cookware, and food packaging. PFAS can be found in drinking water, soil and water, fire extinguishing foam, manufacturing or chemical production facilities, food, food packaging, household products and dust, personal care products, and biosolids.<sup>109</sup> They are of concern due their widespread production and use, as well as their ability to move and persist in the environment and that they can accumulate in the body over time, primarily through exposure from drinking water.<sup>110</sup> More specifically, the primary exposure route that the USEPA and state regulatory agencies have identified is through consumption of PFAS in contaminated drinking water.

Artificial turf has periodically been in the news for PFAS following the sampling and analysis of discarded turf. Two papers, the Boston Globe<sup>111</sup> and The Intercept,<sup>112</sup> ran articles in October 2019 that said two nonprofit environmental groups, Ecology Center and Public Employees for Environmental Responsibility (PEER), tested an abandoned pile of artificial turf and found that PFAS showed up in samples. The concentrations found in the turf samples contained 190 parts per trillion (ppt) and 10 ppt in water samples.<sup>113</sup> Although these articles have brought out concern about PFAS in artificial turf, there are problems with the sources. The newspaper articles did not, nor did the interest groups

<sup>113</sup> Abel, D., 2019. Boston Globe Article, Toxic chemicals are found in blades of artificial turf, October 9. Available: <https://www.bostonglobe.com/metro/2019/10/09/toxic-chemicals-found-blades-artificial-turf/1mlVxXjzCAqRahwgXtfy6K/story.html#:~:text=Public%20health%20advocates%20have%20long,cadmium%2C%20and%20other%20known%20carcinogens..> Accessed June 2022.

that did the sampling, specify the precautions taken in the field to avoid contamination of samples as there are many materials that contain PFAS used in sampling including gloves, clothing, sampling items, containers, notebooks, makeup, perfumes, etc.<sup>114</sup> Additionally, there is no certified method for analyzing PFAS concentrations in materials other than a US EPA method for analyzing PFAS in drinking water. Since synthetic turf samples and not drinking water were sampled, the methods used for analysis were likely not certified and lead to questionable results.<sup>115</sup> Additionally, the Boston Globe article noted that an additional eight samples were analyzed for total fluorine and assumed that total fluorine is an indication that PFAS is present.<sup>116</sup> However, this method can be biased by the presence of many non-PFAS compounds that also contain fluorine. For example, some anionic surfactants applied to the field drain<sup>117</sup> may contain fluorine. Many consumer products also contain fluorine such as toothpaste, mouthwash and household cleaners. The presence of fluorine, therefore, does not necessarily indicate PFAS compounds are present in artificial turf.<sup>118</sup> Based on research studies and what is known about the chemical composition of PFAS, dermal (skin) exposure to PFAS containing materials is not significant and thus poses a negligible human health risk.<sup>119</sup> Similarly, based on the high water solubility of PFAS and low volatility, these compounds pose a negligible health risk via the inhalation exposure pathway.<sup>120</sup>

A review article in Remediation Journal collected information on background and ambient levels of two predominant PFAS, perfluorooctane sulfonate (PFOS) and perfluorooctanoate (PFOA), in North America in both abiotic media (soil, sediment, surface water, and public drinking water supplies) and selected biotic media (human

Accessed June 2022.

tissues, fish, and shellfish) with no known point source of PFAS.<sup>121</sup> The range of concentrations for PFOS, which was detected in every soil sample taken in North America, was 0.018 - 2.55 µg/kg (range of PFOA was 0.059 – 1.84 µg/kg), with much higher concentrations in the eastern U.S. (>0.184 µg/kg).<sup>122</sup> Thus, a concentration of 0.19 µg/kg PFOS, which is what was measured in the abandoned artificial turf (Boston Globe and The Intercept articles) falls into this uncontaminated concentration range which would be considered “clean”.<sup>123</sup> Widespread ambient soil and sediment concentrations were noted but were well below human health-protective thresholds for direct contact exposures.<sup>124</sup> Surface water, drinking water supply waters (representing a combination of groundwater and surface water), fish and shellfish tissue, and human serum levels ranged from less than to greater than available health-based threshold values.<sup>125</sup> Since these levels were well below the safe soil RSL by two to three orders of magnitude, human health risk is negligible.<sup>126</sup>

Furthermore, according to a recent study of plastic- and rubber-containing artificial turf fields in Stockholm, Sweden,<sup>127</sup> samples were subjected to total fluorine (TF), extractable organic fluorine (EOF) and target PFAS analysis. TF was observed in all 51 artificial surf samples (range: 16 - 313, 12 - 310, and 24 - 661 µg/g in backing, filling, and blades, respectively)<sup>128</sup>, while EOF and target PFAS occurred in <42% of all samples (<200 and

<sup>128</sup> 1 µg/g = 1 mg/kg = 1 ppm

<1 ng/g, respectively).<sup>129,130</sup> A subset of samples extracted with water confirmed the absence of fluoride. Moreover, application of the total oxidizable precursor assay revealed negligible perfluoroalkyl acid (PFAA) formation across all three sample types, indicating that the fluorinated substance(s) in artificial turf are not low molecular weight PFAA-precursors.<sup>131</sup> Collectively, these results point towards polymeric organofluorine (e.g. fluoroelastomer, polytetrafluoroethylene, polyvinylidene fluoride), consistent with patent literature.<sup>132</sup> The combination of poor extractability and recalcitrance towards advanced oxidation suggests that the fluorine in artificial turf does not pose an imminent risk to users.<sup>133</sup>

As discussed above in the Boston Globe and Intercept articles, although PFAS were found in one sampling of artificial turf, levels were orders of magnitude below safe soil RSLs and as the studies have shown that PFAS levels are found in background and ambient samples taken in North America. Additionally, the Remediation Journal article and Stockholm Sweden study suggest that artificial turf does not pose a risk to users based on the level of PFAS and/or fluorine found in the artificial turf samples, and therefore support the conclusions of the Draft EIR that artificial turf would not result in public health hazards or adverse water quality conditions.

Regarding microplastics in the environment, please see Response No. ORG 8-12. Regarding leaching of PGAS to surface water or groundwater, please see Response No. ORG 8-5.

Additional information is provided in Topical Response No. 7 - Artificial Turf and Effects on Localized Heat and Health, that support the conclusions of the Draft EIR regarding the less than significant effects of artificial turf on localized heat and health. Section IV.H, *Hazards and Hazardous Materials*, and Appendix H-2, Artificial Turf Memo, of the Draft EIR, also included a detailed evaluation of potential health impacts related to use of artificial turf. Based on the analysis, the Draft EIR determined that health-related impacts

would be less than significant. Refer to Section (2)(ii) of Topical Response No. 7 for additional detail regarding the human health-related risks from PFAS in artificial turf, which the Draft EIR found to be less than significant based on HHRA's conducted on compounds in artificial turf, including PFAS. Refer to Topical Response No. 7 Section (2)(iii)(e) for a discussion on the results of metals and PFAS testing performed for the Final EIR on FieldTurf artificial turf, which is the artificial turf proposed for the Project. Moreover, see Final EIR Appendices B.1, B.2, and B.3 which provide the FieldTurf testing results and analysis and more detailed discussions on PFAS in artificial turf.

### **Comment No. ORG 7A-77**

The DEIR improperly failed to evaluate the potentially significant water quality impacts associated with the use of artificial turf.

### **Response No. ORG 7A-77**

As with Comment No. ORG 7A-76, this comment asserts that the Draft EIR failed to evaluate water quality impacts of artificial turf. Artificial turf anticipated for use at the Project Site would be permeable and would have no impact on surface runoff, infiltration, or other hydrological effects. Section IV.O.1, *Water Supply*, of the Draft EIR describes the impact of artificial turf on reduction in water demand. Regarding water quality, all surface runoff from the Project Site would be captured and cleaned by the Project's stormwater capture and reuse system. This system is anticipated to capture particles and other undissolved contaminants in surface water across the Project Site. As such, it is not anticipated that the artificial turf, and other Project Site uses, would adversely contribute to on-site or off-site water quality contamination and that the conclusions of the Draft EIR with respect to water quality are correct.

### **Comment No. ORG 7A-78**

#### **G. The DEIR Fails to Disclose Inconsistencies with Applicable Land Use Plans.**

CEQA requires the EIR to discuss any inconsistencies between the proposed project and applicable land use plans. (CEQA Guidelines §15125, subd. (d).) Specifically, Appendix G of the CEQA Guidelines provides that a project would have a significant impact related to land use if it would "cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of mitigating an environmental effect." Under the City's 2006 L.A. CEQA Thresholds Guide, a project has a significant impact on land use if it is:

- Inconsistent with the adopted land use/density designation in the Community Plan, redevelopment plan or specific plan for the site;
- Inconsistent with the adopted designation of the General Plan and Community Plan; or

- Inconsistent with other adopted environmental goals or policies contained in other applicable plans.

As proposed, the Project is inconsistent with several applicable land use policies and regulations, including the City’s General Plan, the Los Angeles River Revitalization Plan, and other policies intended to protect wildlife and habitat. The Project further proposes light poles up to 40 feet in excess of the 30-foot height limit and 11-foot-tall fences not otherwise permitted. The Project is also inconsistent with the applicable zoning in that school uses are not permitted without a CUP and in the Project’s failure to incorporate community gardening. These are significant environmental impacts that must be disclosed, analyzed, and mitigated before the City may consider the Project further. (*Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 783-4, 32 Cal.Rptr.3d 177.).

## Response No. ORG 7A-78

The comment asserts that the Draft EIR fails to disclose inconsistency with applicable land use plans. However, the listed items in the comment are not thresholds for the determination of land use impacts and the comment does not provide substantial evidence to show that the Project would conflict with applicable land use plans. As discussed in Section IV.J, *Land Use and Planning*, page IV.J-16 of the Draft EIR, in accordance with Appendix G of the CEQA Guidelines, a project would have a significant impact related to land use and planning if it would:

- Threshold (a): Physically divide an established community; or
- Threshold (b): Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

The applicable threshold in the determination of land use impacts is whether the Project would cause a significant impact due to a conflict with land use policies adopted for the purpose of avoiding or mitigating and environmental effect. As explained on page IV.J-16 of the Draft EIR, the City’s 2006 L.A. CEQA Thresholds Guide criteria which are cited in the comment are only used “as appropriate” to assist in answering the Appendix G threshold questions. Although these criteria are useful to the analysis of the Appendix G thresholds, not all land use policies are adopted for the purpose of avoiding or mitigating and environmental effect and, therefore, are not relevant to an analysis of whether the Project would conflict with land use plans, policies or regulations intended to eliminate or mitigate an environmental effect. As such, the Draft EIR is not required to discuss all land use plans, policies and regulations and failure to discuss land use plans that are not applicable to the Appendix G thresholds does not constitute a deficiency in the analysis.

With regard to the specific examples given in the comment to support the contention that the Draft EIR fails to disclose all land use impacts, there are no facts presented which support the initial threshold question of whether the plan, policy or regulation was enacted

to avoid or mitigate an environmental effect nor to support a contention that the Draft EIR fails to disclose and mitigate significant impacts. For example, the comment's assertion that the Project would be in conflict with the General Plan and the Los Angeles River Revitalization Plan appears to reflect the commenter's disagreement with the analysis contained in Section IV.J, *Land Use and Planning*, and the Land Use Tables included in Appendix J of the Draft EIR rather than provide facts to support the contention. Moreover, some of the examples cited in the comment are fully analyzed in the applicable Chapter IV, *Environmental Impact Analysis*, section of the Draft EIR. The comment claims that some features of the Project, including light poles up to 80 feet in height and 11-foot-tall fences are not permitted by the existing zoning designation, and that a school use in an A-1 (Agricultural) zone, would result in significant land use impacts. However, the appropriate standard of analysis in an EIR for determining a conflict with the zoning regulation is first to consider whether the regulation was enacted for the purpose of avoiding or mitigating an environmental effect and, secondly, whether the conflict would or would not result in a significant environmental impact. If the zoning regulation was adopted to avoid or mitigate an environmental impact, and the analysis determines that the conflict would not result in a significant environmental impact, then the Project would not result in a significant land use impact. Regarding the light poles and fencing, as discussed in Response No. ORG 7A-26, above, based on CEQA threshold standards, the impact of the Project (including light poles and fencing) with respect to scenic vistas, scenic resources, and scenic character, were determined in the Initial Study, included in Appendix A of the Draft EIR, to be less than significant. The Project's light poles would be visible; however, as narrow stationary features, these would not block scenic vistas across the Project Site and would be lower than many of the wooden poles that support the existing golf driving range netting that reach a height of approximately 90 feet. It is also noted, under existing conditions, that the entire southern boundary of the Leased Property along the golf course holes (a horizontal distance of over 600 feet), contains a series of support poles and netting that reach heights up to 30 feet. Primarily, because of the mature on-site trees, few panoramic views are available across the Project Site and, as such, further analysis was not warranted. As stated on pages 57 through 60 of the Initial Study, the Project would have a less than significant impact on scenic vistas for all the reasons discussed therein, some of which are summarized above, and would have no impact on a scenic resources within a State Scenic Highway as the Project Site is not located within the view field of a State Scenic Highway. Regarding Aesthetics Threshold (c), scenic quality, CEQA requires the determination of whether a project located in an urbanized area conflicts with applicable zoning and other regulations governing scenic quality. That analysis is included on pages 59 through 60 of the Initial Study, which concludes that the Project would not conflict with applicable regulations governing scenic quality for the reasons set forth therein including, but not limited to: the Project would be designed to comply with the requirements of the City's Department of Public Works, Urban Forestry Division, which requires the replacement of street trees on a 2:1 basis and approval by the Board of Public Works; the Project would be designed to comply with RIO landscaping regulations, including the implementation of the Los Angeles River Master Plan Design Guidelines and Plant Palettes which establish setbacks, plant density, and the use of indigenous species; and, the Project would not conflict with the

individual design and community design and landscaping policies of the Community Plan, such as locating the parking structure below grade with surface parking located at the rear of the Project Site, using decorative walls and landscaping to screen the Project's uses from residential uses, including public open space which would maximize pedestrian accessibility and circulation, and featuring appropriate plant and hardscape materials. Regarding community gardening within an A-1 zone, community gardening is permitted but not required, and no applicant for a project within the A-1 zone is compelled to analyze or incorporate community gardening. In addition, LAMC Section 12.24.T.3(b) permits schools and school-related facilities within an A-1 zone and in all residential (R) zones under a CUP. Although the comment makes a point of the need for a CUP, it is the LAUSD's standard practice to locate public schools within walking distance of students' homes in residential zones under a CUP. The purpose of the A-1 zoning designation is not to mitigate or avoid an environmental impact that would be anticipated by a project and, as such, was not evaluated in Section IV.J, *Land Use and Planning*, of the Draft EIR. As to the claim that the Project is inconsistent with several applicable land use policies and regulations, intended to protect wildlife and habitat, please refer to Section IV.C, *Biological Resources*, which shows that with implementation of Project Design Feature PDF-BIO-1 and Mitigation Measures MM-BIO-1 through MM-BIO-3 (i.e., avoidance of nesting and roosting seasons or pre-construction surveys for special-status species, replacing impacted California brittlebush scrub, avoidance of nesting and roosting seasons or pre-construction surveys for native wildlife nursery sites, and replacement of "non-protected" significant and street trees), Project impacts to wildlife and habitat would be less than significant and, as such, the Project would not conflict with respective plan policies.

Additionally, contrary to assertions in the comment, the Draft EIR, on pages IV.J-18 through IV.J-30 and in Appendix J, does identify and analyze whether the Project would conflict with applicable land use plans, policies and regulations including the 2020-2045 RTP/SCS, the General Plan's Framework Element, Open Space Element, and Conservation Element, the Community Plan, the Los Angeles River Revitalization Master Plan, the Los Angeles River Improvement Overlay District Ordinance, and the LAMC, including disclosure that that the Project is seeking several zoning actions related to the height of the light poles, walls and fences all as permitted by the LAMC. As such, the Draft EIR neither fails to disclose all impacts related to land use plans, policies and regulations, nor fails to include required mitigation measures.

### **Comment No. ORG 7A-79**

The Project site is zoned OS (Open Space) and A1 (Agricultural), more specifically, A1-1XL-RIO. (DEIR p. II-8.) Schools are permitted in A1 zones only with a conditional use permit. The "1XL" denotes a height restriction of 30 feet and a floor area ratio (FAR) of 3:1. The site is also subject to the River Improvement Overlay (RIO) District, due to its proximity to the Los Angeles River. Since the Project would be adjacent to the River, the site is considered in the RIO District's "inner core." Uses in the RIO district should support the Los Angeles River Revitalization Master Plan. Although the Project is located within

an Urban Agriculture Incentive Zone, intended to encourage community gardens, the Project does not propose any garden or garden-related uses.

## Response No. ORG 7A-79
