

Section 6.0 | Responses to Comments

6.1 INTRODUCTION

Section 15088(a) of the CEQA Guidelines states that the “lead agency shall evaluate comments on environmental issues received from persons who reviewed the Draft EIR and shall prepare a written response. The Lead Agency shall respond to comments that were received during the noticed comment period and any extensions and may respond to late comments.” This section of the Final EIR provides a list of persons, organizations, and public agencies that commented on the Draft EIR, along with responses of the Lead Agency to significant environmental points raised in the review and consultation process.

The Draft EIR was submitted to the State Clearinghouse Office of Planning and Research and circulated for public review from October 17, 2022 to January 17, 2023.

This Section 6.0, Responses to Comments, includes: Section 6.1, Introduction, Section 6.2, Topical Responses, and Section 6.3, Responses to Comments, which includes responses to all comments received on the Draft EIR during the Draft EIR public review period.¹ In addition, verbal comments made at the virtual February 8, 2023, public hearing were deemed timely submitted for the purposes of the Draft EIR comment period and are responded to in this Section 6.0.²

In accordance with Section 15088(c) of CEQA, reasoned, factual responses have been provided to all comments received during the Draft EIR public review period, with a particular emphasis on significant environmental issues. The comments and responses are organized as follows: state agencies (“S”), local agencies (“L”), groups and organizations (“GO”), individuals (“P”), and verbal and written comments received during the four Draft EIR public hearings (“PH”). All comments and responses to comments are included in this Final EIR and will be considered by the Metro Board prior to certification of this EIR and in any approval of the proposed Project.

Each comment letter, email, voicemail, and public hearing verbal or written comment, have been assigned a number in addition to a letter corresponding to the categories described above. The body of each comment letter, email, voicemail, and public hearing verbal or written comment, has been separated into individual comments, which also have been numbered. This results in a tiered numbering system, whereby the first comment in, for example, Comment Letter GO1 is depicted as Comment GO1-1, and so on. Copies of each comment letter, email, voicemail, and public hearing written comment, are provided in Appendix C, Public Comments on the Draft EIR, of this Final EIR. Copies of the transcripts of each verbal comment received during public hearings, are provided in Appendix B, Public Hearing Transcripts, of this Final EIR. All of the comments received are listed in Table 6-1 below, which provides a list of those parties that provided written comments on the Draft EIR during the public review period. Refer to Section 3.0, Project Description, for revisions to the proposed Project, and Section 5.0, Corrections and Additions, for specific additions and corrections to the Draft EIR made in the Final EIR.

¹ Certain Topical Responses in Section 6.2 and responses to comments in Section 6.3 include footnotes citing to or discussing reference materials. The reference materials are available on the proposed Project’s SB 44 website. Two documents, the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment* and the Parking Study, are referenced frequently throughout Section 6.3, Responses to Comments, but are not provided in footnotes because of the frequency with which they are cited. These documents were prepared by Fehr & Peers and are available on the proposed Project’s SB 44 website.

² As discussed in Topical Response A, SB 44, in light of the disruptions at the January 12, 2023, public hearing, Metro provided a fourth public hearing by way of a virtual public hearing held on February 8, 2023, after the public review period closed on January 17, 2023.

Table 6-1: Comments from Public Agencies, Groups, Organizations, and Individuals

Letter	Name (title)	Organization/Address	Date of Letter
State Agencies (S)			
S1	Erinn Wilson-Olgin, Environmental Program Manager I, South Coast Region; Felicia Silva, Environmental Scientist	California Department of Fish and Wildlife (CDFW) South Coast, Region 5 Habitat Conversation Planning Program 3030 Old Ranch Parkway, Suite 400 Seal Beach, CA 90740	January 14, 2023

6.2 TOPICAL RESPONSES

TOPICAL RESPONSE A

SB 44

Comments on the Draft EIR address the proposed Project’s consistency with Senate Bill (“SB”) 44. Comments regarding SB 44 do not raise substantive issues on the content of the Draft EIR and therefore no response is required pursuant to CEQA. Nevertheless, this topical response provides an overview of SB 44’s standards and how the proposed Project is consistent with them for informational purposes.

As discussed in Section 1.4.3, Senate Bill 44, of Section 1.0, Introduction, of the Draft EIR, SB 44 added Section 21168.6.9 to the Public Resources Code to provide for streamlined judicial review for “environmental leadership transit projects.” To qualify for SB 44’s streamlined judicial review process, a project must be an “environmental leadership transit project,” defined as a “fixed guideway” that (i) operates at zero emissions; (ii) reduces GHG emissions in the project’s corridor “as defined in the applicable environmental document over the useful life of the project, without using offsets”; (iii) reduces 30 million vehicle miles traveled in the project’s corridor “as defined in the applicable environmental document over the useful life of the project”; (iv) is consistent with the applicable sustainable communities strategy and regional transportation plan; and (v) incorporates sustainable infrastructure practices.¹

The proposed Project meets each of these standards.

Fixed Guideway

SB 44 states that “fixed guideway” “has the same meaning as defined in Section 5302 of Title 49 of the United States Code.”² Section 5302 of Title 49 of the United States Code includes definitions related to the Federal Transit Administration’s (“FTA”) public transportation programs and policies, including Fixed Guideway Capital Investment Grants (“Section 5309 Grant Program”). Section 5302 defines “fixed guideway” as follows.

The term “fixed guideway” means a public transportation facility—

- (A) using and occupying a separate right-of-way for the exclusive use of public transportation;
- (B) using rail;
- (C) using a fixed catenary system;
- (D) for a passenger ferry system; or
- (E) for a bus rapid transit system.³

¹ California Public Resources Code. 2022. Section 21168.6.9.

² California Public Resources Code. 2022. Section 21168.6.9(a)(2).

³ United States Code. Title 49, Section 5302(7).

Therefore, in order to qualify as a “fixed guideway,” a project must be “public transportation” meeting the statute’s prescribed categories. An expanded discussion of this definition, along with the proposed Project’s consistency with this definition, is provided below.

The Proposed Project Would Operate Daily for Public Service and Is Therefore Public Transportation

As a threshold matter, the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times.

Under Federal law, “[t]he term ‘public transportation’— (A) means regular, continuing shared-ride surface transportation services that are open to the general public or open to a segment of the general public defined by age, disability, or low income; and (B) does not include— (i) intercity passenger rail transportation provided by the entity described in chapter 243 (or a successor to such entity); (ii) intercity bus service; (iii) charter bus service; (iv) school bus service; (v) sightseeing service; (vi) courtesy shuttle service for patrons of one or more specific establishments; or (vii) intra-terminal or intra-facility shuttle services.”⁴

The proposed Project meets this definition because it will be operated at regular, scheduled operating hours and will be open to the general public. As discussed in Section 2.01, Project Overview, of Section 2.0, Project Description, of the Draft EIR:

[The] proposed Project would provide an aerial rapid transit (ART) option for visitors to Dodger Stadium, while also providing access between the Dodger Stadium property, the surrounding communities, including Chinatown, Mission Junction, Elysian Park, and Solano Canyon, and the Los Angeles State Historic Park, to the regional transit system accessible at [Los Angeles Union Station (LAUS)]. . . . The proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Accordingly, the proposed Project would be open to the general public. While there may be some limited circumstances where priority boarding will be given to Dodger ticketholders, the proposed Project will never close to the general public when operating. Further, while the proposed Project may “vary the number of cabins in service and speed throughout the day, based on demand,” just as Metro trains and buses do, the proposed Project will operate under a pre-determined, regular operating hour schedule. Therefore, the proposed Project meets the relevant definition of public transportation for whether it is a “fixed guideway” under Federal law.

In addition, as discussed on page 2-8 in Subsection 2.3.7, Purpose and Need, of the Draft EIR,

[T]he proposed Project would improve mobility and accessibility for the region by providing a daily, high capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. The proposed Project would include a mobility hub at Chinatown/State Park Station. . . [and a] mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park and the surrounding communities.

⁴ United States Code, Title 49, Section 5302(15).

The Proposed Project, as an Aerial Tramway, Is a Fixed Guideway, Consistent with FTA Precedent

The FTA deems “aerial tramways” to be a “fixed guideway.” The proposed Project is an aerial tramway. Therefore, the proposed Project is a “fixed guideway” under SB 44.

In 2004, the FTA described the Section 5309 Grant Program in the federal register and explicitly recognized that aerial tramways are included within the definition of “fixed guideway”:

A “fixed guideway” refers to any transit service that uses exclusive or controlled rights-of-way or rails, entirely or in part. **The term includes** heavy rail, commuter rail, light rail, monorail, trolleybus, **aerial tramway**, inclined plane, cable car, automated guideway transit, ferryboats, that portion of motor bus service operated on exclusive or controlled rights-of-way, and high-occupancy-vehicle (HOV) lanes.⁵

Thus, the FTA considers aerial tramways fixed guideways for the purposes of the definition in Section 5302. Based on the plain language of Section 5302, aerial tramways fall under subpart (A), “using and occupying a separate right-of-way for the exclusive use of public transportation” and subpart (C), “using a fixed catenary system.”

The Proposed Project Would Be Zero Emissions

As described on page 1-4, in Section 1.0, Introduction, of the Draft EIR, under SB 44, the environmental leadership transit project must operate at zero emissions. As discussed on page 1-5, in Section 1.0, Introduction, of the Draft EIR, the proposed Project will operate at zero emissions. The proposed Project guideway is powered by electricity. The electrical power for the proposed Project would be supplied by the City of Los Angeles Department of Water and Power (LADWP) through the utility’s Green Power Program, pursuant to GHG-PDF-A. Battery storage backup will be installed at each station, tower, and the non-passenger junction. Enrollment in LADWP’s Green Power Program and battery back up will reduce GHG emissions and improve air quality. Accordingly, the primary electricity usage associated with the proposed Project guideway would come from renewable resources and result in zero GHG and criteria pollutant emissions, satisfying the requirement to operate at zero emissions. Refer to Section 3.03, Air Quality, and Section 3.08, Greenhouse Gas Emissions, of the Draft EIR which provide additional details on the operational characteristics of the proposed Project that result in zero GHG and criteria pollutant emissions.

The Proposed Project Would Reduce GHG Emissions in the Project’s Corridor

As discussed on page 1-5, in Section 1.0, Introduction, of the Draft EIR, under SB 44, projects under two miles in length must reduce emissions by no less than 50,000 metric tons directly in the corridor of the project defined in the applicable environmental document. The proposed Project, which is less than two miles in length, would reduce emissions by no less than 50,000 metric tons of GHG emissions directly in the Project’s corridor as defined within the EIR over the useful life of the proposed Project, without using offsets. The proposed Project would reduce GHG emissions by 3,493 metric tons of carbon dioxide

⁵ FTA Fiscal Year 2005 Apportionments, Allocations and Program Information, 69 FR 78209-78210 <https://www.govinfo.gov/content/pkg/FR-2004-12-29/pdf/04-28408.pdf> (accessed September 20, 2023).

equivalent per year (MT CO₂e/year) in the buildout year of 2026 and by 6,277 MT CO₂e/year in the horizon year of 2042. Based on an interpolation for the years between 2026 and 2042, and holding the reduction constant after 2042 until 2056, the lifetime emissions of the proposed Project over its useful life (30 years based on SCAQMD's guidance for GHG significance thresholds) would be a reduction of greater than 50,000 metric tons of GHGs at 166,653 MT CO₂e. Therefore, the proposed Project, as a 1.2-mile fixed guideway system, would reduce 50,000 metric tons of GHG emissions in the Project's corridor, satisfying the requirements of Public Resources Code section 21168.6.9(a)(1)(B). Refer to Section 3.08, Greenhouse Gas Emissions, of the Draft EIR, which provides additional details on the proposed Project's expected GHG emissions reductions.

The Proposed Project Would Reduce VMT by at Least 30 Million

As discussed on pages 1-5 and 1-6, in Section 1.0, Introduction of the Draft EIR, the proposed Project would reduce "no less than 30,000,000 vehicle miles traveled in the corridor of the project defined in the applicable environmental document over the useful life of the project," satisfying SB 44's requirement to do so. As detailed in Table 3.17-6 in Section 3.17, Transportation, of the Draft EIR, the proposed Project is forecast to reduce annual VMT by 2,434,000 in the proposed Project's first operational year in 2026, increasing as ridership increases to an annual VMT reduction of 5,067,000 in 2042.

Using the 2026 reduction figures alone, the proposed Project would therefore achieve a minimum of 30,000,000 VMT reduced in approximately 12.3 years. Based on an interpolation for the years between 2026 and 2042, and holding the reduction constant after 2042 until 2056, the lifetime VMT reduction of the proposed Project over its useful life (30 years based on SCAQMD's guidance for GHG significance thresholds) would be a reduction of greater than 30,000,000 VMT at 129,629,500 VMT saved, substantially more VMT saved than is required under Public Resources Code section 21168.6.9(1)(C).

The Proposed Project Is Consistent with the RTP/SCS

As discussed on pages 1-6 through 1-8, in Section 1.0, Introduction, of the Draft EIR, the proposed Project satisfies SB 44's requirement to be consistent with the applicable sustainable communities strategy and alternative planning strategy and the applicable regional transportation plan under Public Resources Code sections 21168.6.9(a)(1)(D) and 21168.6.9(a)(1)(E), respectively. In September 2020, the Southern California Association of Governments approved and fully adopted the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), called Connect SoCal, the applicable sustainable communities strategy and regional transportation plan for the proposed Project. The plan outlines ten main goals, each of which the proposed Project is consistent with. Refer to the table on pages 1-6 to 1-7 in Section 1.0 Introduction, of the Draft EIR for a more detailed discussion of the proposed Project's consistency with these goals.

The proposed Project would provide improved mobility, accessibility, reliability and travel choices for people traveling in Los Angeles to a major event destination (Dodger Stadium), as well as provide improved transit service to adjacent communities. The proposed Project would reduce GHG emissions by reducing VMT. Accordingly, the proposed Project would be consistent with goals in Connect SoCal and is, thus, consistent with the applicable sustainable communities strategy and regional transportation plan, satisfying Public Resources Code sections 21168.6.9(a)(1)(D) and 21168.6.9(a)(1)(E).

The Proposed Project Incorporates Sustainable Infrastructure Practices

As discussed on pages 1-8 and 1-9, in Section 1.0, Introduction, of the Draft EIR, SB 44 requires the Project Sponsor to demonstrate “how it has incorporated sustainable infrastructure practices to achieve sustainability, resiliency, and climate change mitigation and adaptation goals in the project, including principles, frameworks, or guidelines as recommended by one or more of the following: (i) [t]he sustainability, resiliency, and climate change policies and standards of the American Society of Civil Engineers[;] (ii) [t]he Envision Rating System of the Institute for Sustainable Infrastructure; [or] (iii) [t]he Leadership in Energy and Environment Design (LEED) rating system of the United States Green Building Council” (USGBC).

The proposed Project is an innovative and sustainable transit system that provides a sustainable, high-capacity, zero emission aerial rapid transit option for visitors to Dodger Stadium, while also providing access between Dodger Stadium, the surrounding communities, and the regional transit system accessible at LAUS. Aerial rapid transit technology is quiet, minimizing noise and vibration, and the proposed Project would reduce VMT and congestion, leading to reduced GHG emissions and improved air quality.

The proposed Project has been reviewed against the policies and standards of the Envision Rating System of the Institute for Sustainable Infrastructure, as well as USGBC’s LEED for Building Design and Construction and has incorporated sustainability features based on these rating systems. Refer to pages 2-48 through 2-50 in Section 2.0, Project Description of the Draft EIR, for a detailed discussion of the proposed Project’s sustainability features.

Accordingly, pursuant to Public Resources Code section 21168.6.9(a)(1)(F), the proposed Project would incorporate sustainable infrastructure practices to achieve sustainability, resiliency, and climate change mitigation and adaptation goals in the Project, including USGBC’s LEED rating system and the Envision Rating System of the Institute for Sustainable Infrastructure’s policies and standards.

Metro Held All Required Public Meetings for SB 44

SB 44 requires that during the public review period for the Draft EIR, the lead agency hold one “informational workshop to inform the public of the key analyses and conclusions [of the Draft EIR]” within 10 calendar days after the release of the Draft EIR (Pub. Res. Code § 21168.6.9(e)(1)(C)(ii)(3)), and one “public hearing to receive testimony on the [Draft EIR]” within 10 calendar days before the close of the public review period. (*Id.*, § 21168.6.9(e)(1)(C)(ii)(4).)

The Draft EIR was released on October 17, 2022, for a 60-day public review period ending on December 16, 2022. On November 15, 2022, Metro, as the lead agency, extended the public review period an additional 30 days for a 90-day public review period ending on January 17, 2023. During this 90-day public review period, Metro held two informational workshops and three public hearings. In light of disruptions at the third public hearing, Metro provided a fourth public hearing by way of a virtual public hearing held after the close of the public review period to provide an additional opportunity for attendees to provide verbal testimony. Verbal comments made at this fourth public hearing were deemed timely submitted for purposes of the Draft EIR public review period.

Metro Held Two Informational Workshops – SB 44 Requires Only One

While SB 44 only requires one informational workshop within 10 calendar days after the release of the Draft EIR, Metro held two informational workshops – one virtual, and one in-person – to “inform the public of the key analyses and conclusions of the [Draft EIR],” within 10 calendar days of the release of the Draft EIR. (Pub. Res. Code § 21168.6.9(e)(1)(C)(ii)(3).)

The Draft EIR was released on October 17, 2022. The first informational workshop was a virtual informational workshop held on Saturday, October 22, 2022, from 10 am – 12 pm, via Zoom webinar. The second informational workshop was an in-person informational meeting held on Tuesday, October 25, 2022, from 5 pm – 7 pm at Los Angeles Union Station’s Ticket Concourse. Both informational workshops were, therefore, held “within 10 calendar days after the release of the Draft EIR,” satisfying and exceeding the requirement of SB 44.

SB 44 requires that the informational workshop “inform the public of the key analyses and conclusions of [the Draft EIR].” (Pub. Res. Code § 21168.6.9(e)(1)(C)(ii)(3).)

The format of the virtual informational workshop was a presentation of the proposed Project, including the Draft EIR’s key analyses and conclusions, followed by a question and answer session during which attendees could ask questions using the Zoom Q&A feature. Interpretation in Spanish, Mandarin, and Cantonese was provided in separate channels and slides were made available to attendees in English, Spanish, Chinese (Simplified) and Chinese (Traditional) on the lead agency’s website. Written interpretation of questions typed into Zoom’s chat and Q&A features was also available for any questions received in Chinese (Simplified), Chinese (Traditional), and Spanish. Closed-captioning was also provided for accessibility pursuant to the requirements of the Americans with Disabilities Act (ADA). The virtual informational workshop was staffed by Metro, the Draft EIR preparer’s staff, subject matter experts, and the proposed Project team, who answered attendee questions on the Draft EIR key analyses and conclusions.

The format of the in-person informational workshop was an open house, consistent with Metro’s standard practice, during which attendees could be informed of the proposed Project’s key analyses and conclusions and could learn how to comment on the Draft EIR. Spanish, Mandarin, and Cantonese Interpreters were provided to assist attendees in need of interpretation. Printed materials providing additional information about the Draft EIR’s key analyses and conclusions were provided in English, Spanish, Chinese (Simplified) and Chinese (Traditional). Twelve stations with large, printed boards providing additional information about the subject matter of each station, were set up throughout the Los Angeles Union Station Ticket Concourse, with ten stations focused on specific subject matter areas of the Draft EIR and their key analyses and conclusions, one station dedicated to information on aerial rapid transit technology, and one station with a video presentation of the proposed Project. Attendees could walk around to each station and ask questions to subject-matter experts about the proposed Project. Each station also included printed materials, including the presentation of the Draft EIR’s key analyses and conclusions from the virtual informational workshop, that attendees could review and/or take with them. A hard copy of the Draft EIR was also available at the Summary of Impacts station for attendees to review during the informational workshop. The meeting was staffed by Metro and Draft EIR preparer staff,

subject matter experts, and the proposed Project team, who answered questions from attendees on the Draft EIR key analyses and conclusions.

Metro Held Four Public Hearings – SB 44 Requires Only One

While SB 44 only requires one public hearing to be held within 10 calendar days before the close of the public comment period, Metro held four public hearings to receive testimony on the Draft EIR. (Pub. Res. Code § 21168.6.9(e)(1)(C)(ii)(4).) Metro held three public hearings during the Draft EIR public review period – two in-person and one virtual, and one virtual public hearing immediately following the close of the public review period. The first two public hearings were held within 10 days of the original close of the public review period, which would have been December 16, 2022. After Metro, on November 15, 2022, extended the public review period an additional 30 days for a 90-day public review period ending on January 17, 2023, a third public hearing was added for January 12, 2023, within 10 calendar days of the new close of the public review period. One public hearing was therefore held “within 10 calendar days before the close of the public review period,” satisfying the requirement of SB 44. In light of the disruptions at the January 12, 2023, public hearing, Metro provided a fourth public hearing by way of a virtual public hearing held on February 8, 2023. Verbal comments made at the virtual February 8, 2023 public hearing were deemed timely submitted for the purposes of the Draft EIR public review period.

The first public hearing was an in-person public hearing held on December 10, 2022, from 10:00 am to 12:00 pm, at Los Angeles Union Station’s Ticket Concourse. The second public hearing was a virtual public hearing held on December 13, 2022, from 5:00 pm to 7:00 pm, via Zoom webinar. The third public hearing was an in-person public hearing held on January 12, 2023, from 5:00 pm to 7:00 pm, at Cathedral High School’s Gymnasium, and within 10 calendar days before the close of the public comment period on January 17, 2023. Because there were disruptions at the January 12, 2023, in-person public hearing, Metro held a fourth public hearing after the close of the public review period on February 8, 2023 via Zoom webinar to provide an additional opportunity for attendees to provide verbal testimony. The fourth public hearing was a virtual public hearing held on February 8, 2023, from 5:00 pm to 8:00 pm, via Zoom webinar.

SB 44 requires that the lead agency hold the “public hearing to receive testimony on the draft environmental impact report.” (Pub. Res. Code § 21168.6.9(e)(1)(C)(ii)(4).) Each of the four public hearings provided an opportunity for Metro to receive testimony on the Draft EIR in compliance with SB 44. While not required by SB 44 for the public hearings, project materials and information were also made available at the public hearings, as it was at the informational workshops, in order to inform the public of the key analyses and conclusions of the Draft EIR.

The format of the two in-person public hearings was a public comment opportunity where Metro received verbal and written testimony on the Draft EIR from attendees, as well as an open house, consistent with Metro’s standard practice, during which attendees could be informed of the proposed Project’s key analyses and conclusions. Spanish, Mandarin, and Cantonese Interpreters were provided to assist attendees in need of interpretation, and printed materials providing additional information about the Draft EIR’s key analyses and conclusions were provided in English, Spanish, Chinese (Simplified) and Chinese (Traditional). During the January 12, 2023, in-person public hearing, interpretation was also provided in Taishanese, in addition to Spanish, Mandarin, and Cantonese. Twelve stations with large,

printed boards providing additional information about the subject matter of each station, were set up throughout the venue, with ten stations focused on specific subject matter areas of the Draft EIR and their key analyses and conclusions, one station dedicated to information on aerial rapid transit technology, and one station with a video presentation of the proposed Project. Attendees could walk around to each station and ask questions to subject-matter experts about the proposed Project. Each station also included printed materials, including the presentation of the Draft EIR's key analyses and conclusions from the virtual public hearing, that attendees could review and/or take with them. A hard copy of the Draft EIR was also available at the Summary of Impacts station for attendees to review during the public hearing. In addition to the open house, Metro received testimony on the Draft EIR, in writing on forms provided by Metro, or verbally to the two court reporters who were set up at a "comment station." Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). The public hearings were staffed by Metro and Draft EIR preparer staff, subject matter experts, and the proposed Project team, who answered questions from attendees on the Draft EIR key analyses and conclusions.

The format of the first virtual public hearing held on December 13, 2022, was a presentation of the proposed Project, including the Draft EIR's key analyses and conclusions, followed by a public comment session where Metro received verbal testimony on the Draft EIR from attendees, which was recorded and subsequently transcribed by a court reporter.⁶ Interpretation in Spanish, Mandarin, and Cantonese was provided in separate channels and slides were made available to attendees in English, Spanish, Chinese (Simplified) and Chinese (Traditional) on the lead agency's website. Verbal testimony made in Spanish, Cantonese, or Mandarin was translated to English, and court reporters subsequently recorded the English translation. Closed-captioning was also provided for ADA accessibility. The meeting was staffed by Metro and Draft EIR preparer staff, who gave the presentation and moderated the public comment session.

The format of the second virtual public hearing held on February 8, 2023, as a continuation of the January 12, 2023, public hearing to allow an additional opportunity for attendees to provide verbal testimony due to disruptions at the January 12, 2023, public hearing, was a public comment session where Metro received verbal testimony on the Draft EIR from attendees, which was recorded and subsequently transcribed by a court reporter. Verbal testimony made in Spanish, Cantonese, Mandarin, and Taishanese, was translated to English, and court reporters subsequently recorded the English translation. Closed-captioning was also provided for ADA accessibility. The meeting was staffed by Metro and Draft EIR preparer staff, who moderated the public comment session.

⁶ Transcripts of the public comments during the virtual public hearings are included in Appendix B, Public Hearing Transcripts, of the Final EIR.

TOPICAL RESPONSE B**Ridership Model; Queuing at Stations and Pre-game and Post-game Transportation**

Comments on the Draft EIR raise issues related to the passenger arrival and queuing at the proposed Project's Alameda Station and Chinatown/State Park Station during the pre-Dodger game/event at Dodger Stadium and passenger departure and queuing during post-Dodger game/event at the Dodger Stadium Station. Comments also raise issues related to the proposed Project's coordination with planned improvements at Los Angeles Union Station ("LAUS"), including the planned LAUS Forecourt.

As described in Section 3.17, Transportation, of the Draft EIR, for purposes of the Draft EIR, the transportation analysis included the analyses required by Appendix G of the CEQA Guidelines and the City of Los Angeles Transportation Assessment Guidelines (TAG). Pedestrian queues are not required to be analyzed under CEQA or the TAG. As such, this topical response is provided only for informational purposes. While not required for transportation, as discussed in Section 3.13, Noise, of the Draft EIR, estimates of passengers at stations were used for data input to evaluate operational noise.

Ridership Model

Given the uniqueness of a gondola as a mode of transportation, a model specifically tailored to games and events at Dodger Stadium was developed to estimate ridership of the proposed Project, and the results of this model were used to project ridership and associated potential operational effects including queuing. As detailed in Ridership Model Development, included in Appendix N, Transportation Appendices, of the Draft EIR, the model is based on the statistical relationship between cost and travel time, using data from a variety of sources including mode choice surveys for Angelenos traveling to sporting events in Downtown Los Angeles, travel time and cost to Dodger Stadium and LAUS for driving and transit, parking costs, value of time, mode of access intercept surveys of Dodger Stadium Express riders, and many other data. Many of the underlying factors that would influence pre-game/event and post-game/event travel conditions and ridership are built into the ridership model developed for the proposed Project based on extensive data sources and assumptions validated by data. As shown in Table 1 in Ridership Model Development, included in Appendix N, Transportation Appendices, of the Draft EIR, these data sources include zip codes of residence from Dodgers 2019 ticket sales, GIS ESRI's "Routable Network" to calculate travel times by car between zip codes and Dodger Stadium and between zip codes and LAUS, Metro and Metrolink timetables for travel times by transit, values of time extrapolated from U.S. DOT data, driving costs per mile estimated using vehicle miles per gallon data from the California Air Resources Board, actual parking costs for both Dodger Stadium and transit stations, and actual transit fares from Metro and Metrolink. The ridership model was calibrated by comparing the ridership estimated by the model for existing conditions to actual Dodger Stadium Express ridership counts and was then used to forecast future ridership.

As detailed on page 3.17-40 in Section 3.17, Transportation, of the Draft EIR, the ridership model estimated that 6,000 attendees would ride the proposed Project in 2026 per game/event and 10,000 attendees would ride the proposed Project in 2042 per game/event, reaching the estimated capacity of the system.

As noted on page 3.17-40 of the Draft EIR, for both pre-game/event and post-game/event, it was estimated that approximately 85 percent of the riders would board/deboard the proposed Project at the Alameda Station and 15 percent would board/deboard at the Chinatown/State Park Station based on Dodger ticket sales data by zip code and proximity of zip codes to the Metro L Line (Gold).

Pre-game Transportation

Queue Formation and Management

Ridership Projection

As stated above, there would be an estimated 6,000 pre-game/event riders for the proposed Project in 2026 and 10,000 pre-game/event riders in 2042. Given the assumption that 85 percent of riders would board at Alameda Station, there would be 5,100 riders in 2026 and 8,500 riders in 2042 at the Alameda Station. The remaining 900 riders in 2026 and 1,500 riders in 2042 would board at Chinatown/State Park Station.

Alameda Station

As discussed in Section 2.0, Project Description, of the Draft EIR, the Alameda Station would be located on Alameda Street adjacent to the planned LAUS Forecourt and Placita de Dolores at El Pueblo. There would be two access locations for the Alameda Station – the planned LAUS Forecourt to the east of Alameda Street and the proposed new pedestrian plaza at El Pueblo north of Placita de Dolores to the west of Alameda Street. It was assumed that approximately 70 percent of passengers would arrive from the planned LAUS Forecourt, due to its connection to the regional transit system at LAUS, and the remaining 30 percent of passengers would arrive from the proposed new pedestrian plaza at El Pueblo. Vertical circulation elements (i.e., elevators, escalators, stairs) for pedestrian access, which would also serve as queuing areas at the station, would be introduced at-grade from the planned LAUS Forecourt and the new pedestrian plaza at El Pueblo.

The queues would be managed by efficient vertical circulation and by staff at the station. For the vertical circulation, there would be three escalators connecting the ground floor to the boarding platform from the planned LAUS Forecourt, and of those three, two would serve the peak direction (up in the pre-game/event period and down in the post-game/event period). From the new pedestrian plaza at El Pueblo, one escalator would operate in each direction. In addition, stairs and elevators would be available on both sides of the station. The station's boarding platform would have a queueing capacity of 300 passengers. The management of queues by staff could also be enhanced when needed, at busy times and to address specific circumstances if needs arise, such as directing passengers into specific locations for queuing.

Due to the nature of queue formation, the pre-game/event passenger queues at the Alameda Station in 2026 are estimated to be largely contained on the platform and only minimally extend out into the planned LAUS Forecourt. Queueing is not expected to occur into the new pedestrian plaza at El Pueblo since the majority of riders are expected to board from the planned LAUS Forecourt.

More active queue management would become more frequently needed at the Alameda Station as ridership increases toward the 2042 ridership projection of 10,000 riders. As indicated on page 3.13-52,

in Section 3.13, Noise, of the Draft EIR, the maximum queue on a Dodger Game Day scenario in 2042 was estimated to be 603 people at the Alameda Station. Of these 603 people, approximately 300 would be inside Alameda Station on the boarding platform, and the remaining 303 people would be queueing outside of the Station, within the planned LAUS Forecourt. Unlike existing bus and rail transit service with headways between six minutes or much longer (e.g., over an hour in some cases), the queue line for the proposed Project would constantly be moving due to the 23 second headways of the proposed Project. Based on the maximum queue length of 603 people and an hourly departure rate of 5,000 people per hour, a person at the end of the line would wait for an estimated maximum of seven minutes, before boarding the gondola cabin. Others would wait shorter durations.

The Draft EIR concluded that the Dodger Stadium Express's (DSE) slower travel time to/from Dodger Stadium as compared to the proposed Project and the additional transfer time for riders to walk between Union Station and the maintenance facility would render the proposed Project substantially more competitive with driving time than the current DSE (see Draft EIR, pp. 4-63, 4-71). After a game, travel times on the DSE from Dodger Stadium to LAUS ranged from approximately 18 minutes to 49 minutes, compared with the estimated seven-minute travel time on the proposed Project. With the substantial travel time savings of the proposed Project compared with the Dodger Stadium Express, the wait time and travel time combined represent an improved condition for those choosing to use the proposed Project compared with existing conditions.

In addition, timed tickets would be employed to manage the arrival of passengers on expected large turnout days. On large turnout days, game or event attendees planning on riding the proposed Project would be required to reserve a ticket for a specific time slot in advance. This would spread out the passenger arrivals and assist with queue management. Timed tickets are regularly employed at locations such as museums, particularly on busy days like weekends and holidays, to manage crowds and queuing.

Chinatown/State Park Station

As discussed in Section 2.0, Project Description, of the Draft EIR, the Chinatown/State Park Station would be located adjacent to Spring Street in the southernmost portion of the Los Angeles State Historic Park. As discussed above, approximately 15 percent of proposed Project riders to Dodger Stadium (900 passengers in 2026 and 1,500 passengers in 2042) are expected to board the system before a game or event at the Stadium at the Chinatown/State Park Station.

Access to the Chinatown/State Park Station boarding platform would be from the mezzanine level via elevators and stairs. Comprised of three levels, elevators and stairs from the ground level would lead up to a mezzanine level, and ramps for the queuing area would lead up to a boarding platform. The mezzanine level would allow for internal circulation within the station and would also provide additional queueing space within the station.

Given that the boarding demand would be less than at the Alameda Station (15 percent of total ridership at the Chinatown/State Park Station versus 85 percent at the Alameda Station) and the larger queueing capacity at the Chinatown/State Park Station due to the ability to accommodate a mezzanine level in the

station's design,⁷ the queue is expected to be fully accommodated within the Chinatown/State Park Station and is not anticipated to extend outside of the station.

In addition to serving Dodger games and events at Dodger Stadium, the proposed Project would also serve events at the Los Angeles State Historic Park. As described on page 3.17-26, in Section 3.17, Transportation, in the Draft EIR, the analysis assumed a 10 percent capture rate for rides between LAUS and the Los Angeles State Historic Park for an average sized event (ranging from craft fairs drawing 6,000 to 8,000 people per event to evening concerts drawing 12,000 to 20,000 people per event, averaging 11,200 people per event), meaning that 10 percent of the attendees would ride the proposed Project. Queues for events at the Los Angeles State Historic Park would also be accommodated within the Chinatown/State Park Station and are not anticipated to extend outside the station since the station will have queuing capacity on both the mezzanine and boarding levels. In addition, riders seeking to utilize transit from the Chinatown/State Park Station to LAUS also have the choice of using the Metro L Line (Gold) Station, which will benefit from the proposed Project's proposed pedestrian access enhancements, which could include pedestrian improvements between Metro's L Line (Gold) Station and Chinatown/State Park Station consistent with the Connect US Action Plan, which proposes hardscape and landscape improvements, shade structures, and potential seating.

Post-game Transportation

Queue Formation and Management

As discussed in Section 2.0, Project Description, of the Draft EIR, the Dodger Stadium Station would be located in the southeast portion of the Dodger Stadium property near the Downtown Gate. The boarding platform and the passenger queueing area would be at-grade.

Certain Draft EIR comments suggest that post-game/event ridership on the proposed Project would be less than pre-game ridership due to factors such as the relatively longer queues to board compared to pre-game/event, and the more limited operation of the regional transit system at LAUS in the post-game period after evening games and events (see response to operation of the regional transit system comment in the Post-Game Transit System section below). The ridership modeling for the proposed Project took this into account and incorporated the expected drop in post-game ridership compared to pre-game that is seen today for the Dodger Stadium Express. As discussed in Section 3.17, Transportation, of the Draft EIR, based on data from the 2019 season, the post-game ridership for Dodger Stadium Express ranged from being similar to pre-game ridership (weekend games), or up to approximately 8 percent less than the pre-game ridership (weekday evening games) due to factors such as attendees arriving to weekday evening games from different work locations but traveling home together.

Based on current behaviors, game attendees gradually start leaving the game around 30 minutes before the end of the game. While most people would leave the stadium at the end of the game, given the crowd in the stadium and the distances from the various seating locations in the stadium, it would naturally take people seated the furthest away from the Dodger Stadium Station more time to walk to the station, much

⁷ A mezzanine level was included in the design of the Chinatown/State Park Station to allow access to both sides of the platform while minimizing the vertical circulation footprint at ground level in the Los Angeles State Historic Park. The Alameda Station does not include a mezzanine because it provides access to both sides of the boarding platform via vertical circulation from the planned LAUS Forecourt on the east and the proposed new pedestrian plaza at El Pueblo on the west.

like how it is currently for passengers riding the Dodger Stadium Express. In addition, gondola passengers who would rather not join the line immediately to board the proposed Project in the post-game period could visit some of the entertainment amenities at the stadium, including at the Centerfield Plaza.

Regarding the queue waiting time, Dodger Stadium Express riders today wait in queues to board the service. As discussed below, the queues to board, loading times, and travel times for the Dodger Stadium Express are significantly longer and more variable as compared to the proposed Project. The post-game/event queue for the proposed Project would be constantly moving as cabins would depart every 23 seconds. This is in contrast to the Dodger Stadium Express, which has much longer gaps in bus departures (from a minimum of 3 minutes to a maximum of 19 minutes spacing between bus departures based on 2023 season observations further described below) leading to static queues that build substantially over time as departure frequency is substantially less frequent than the proposed Project.

In order to quantify the existing service time needed to transport Dodger Stadium Express riders, Fehr & Peers observed four post-game time periods during the 2023 season. These games were selected to reflect the mix of game times, days, and opponents. As noted below, the service time from the first bus departure to the last bus departure was nearly 2 hours, with the last bus departing up to 90 minutes after the end of the game. The amount of time between the end of each game and the departure of the last bus varied, with the June 15th and June 16th games both going into extra innings. Additionally, the June 16 game had a post-game drone show. While the Dodger Stadium Express has the capacity to carry approximately 1/5th of the riders of the proposed Project, its service time needed to load all riders is equivalent to that of the proposed Project in 2042, and longer than the needed service time for the proposed Project's 2026 opening year ridership estimate.

- Sunday, June 4, 2023 (Yankees) — 1 hour 50 minute service time; 1 hour 30 minutes post-game
- Thursday June 15, 2023 (White Sox) — 1 hour 54 minute service time; 49 minutes post game (game ended in 11th inning)
- Friday, June 16, 2023 (Giants) — 2 hour 27 minute service time; 52 minutes post game (game ended in 11th inning)
- Saturday, June 24, 2023 (Astros) — 1 hour 15 minutes service time; 1 hour 15 minutes post-game

As noted above, the minimum observed time for a bus to load and depart was approximately 3 minutes, using both the rear and front door. This performance was achieved when the waiting passenger queue exceeded the capacity of buses, and therefore passengers were immediately ready to board. Observed maximum passenger loads for buses under these loading conditions was approximately 65-75 passengers.

As detailed in Topical Response J, Gondola Design and Operations, the proposed Project's 3S cabins typically carry between 30 to 40 passengers each, depending on the exact configuration of seating and cabin amenities selected. Assuming a capacity of 35 passengers per cabin, the proposed Project would carry up to approximately 5,000 pphpd. Therefore, the proposed Project can load an equivalent number of passengers in 2-3 cabins as one Dodger Stadium Express bus. However, as detailed in Topical Response J, multiple cabins would load simultaneously at slower speeds, but would be spaced every 23 seconds, therefore serving the same passenger demand as a Dodger Stadium Express bus in 46-69 seconds (2-3 cabins x 23 second headways) compared with at best 3 minutes for Dodger Stadium Express.

Once all Dodger Stadium Express buses in operation depart for LAUS, headways spaced out due to traffic congestion and overall run time between Dodger Stadium and LAUS. The longest time between bus departures was observed to be 19 minutes. During this 19 minute time period, the passenger queue either remained static, or grew as additional riders entered the queue following their exit from Dodger Stadium.

In contrast, within the same approximately 1/3 of an hour between Dodger Stadium Express departures at its longest headway, the proposed Project could serve approximately 1,667 passengers on average ($5,000/3=1,667$), which is approximately 90 percent ($1,667/1,840$) of the average 2019 season one-way passenger load of 1,840 carried by the Union Station Dodger Stadium Express in total for an entire game.

The observed length of the Dodger Stadium Express post-game passenger queues was substantial. For example, the longest queues observed at the Yankees game on June 4 and the Astros game on June 24 ranged from 400 to 775 feet (the lines for the two extra-inning games were not as long since the extra innings stretched out the departures), with passengers typically standing two to four persons abreast.

These observations indicate that riders are willing to wait for substantial periods of time after a game to board the Dodger Stadium Express, despite its slower travel time and long waits between buses, supporting the concept that riders would also be willing to wait after a game to board the proposed Project with its improved level of service. An additional indicator that Dodger fans have a willingness to wait for transit following a game is that fact that the Golden State Gate C cleared before the last Dodger Stadium Express bus departed at each of the games observed.

While the proposed Project would substantially improve the service level and reduce passenger queueing compared with the Dodger Stadium Express, queueing to ride post-event transit systems is a common phenomenon at athletic events, concerts, and other events and most large stadia and arenas. As noted above, attendants would be available to assist with management of queueing as needed.

Proposed Project Versus Other Modes

Certain Draft EIR comments suggest that passengers of the proposed Project may prefer to leave Dodger Stadium in other modes, such as the Dodger Stadium Express, rideshare, or even walking, due to the queues to board the proposed Project.

Dodger Stadium Express

As detailed on page 4-63, in Section 4.0, Alternatives, of the Draft EIR, the travel times for the Dodger Stadium Express ranged from approximately 18 minutes to 49 minutes post-game (which occurred on opening day), based on data for the 2019 season. Excluding the opening day travel time outlier, the post-game travel ranged from approximately 18 minutes to 24 minutes. These travel times are three to seven times the seven-minute travel time on the proposed Project, plus the longer loading time for the Dodger Stadium Express buses compared to the proposed Project cabins. In addition to the longer travel time, the Dodger Stadium Express travel times are more variable than the fixed seven-minute travel time for the proposed Project. In addition, the travel time for the proposed Project is not affected by factors such as congestion leaving the stadium, the congestion in the streets, and unexpected delays such as collisions and road closures the way that Dodger Stadium Express is today.

More information on the Dodger Stadium Express alternative can be found in the discussion of the Transportation Systems Management Alternative in Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options.

Rideshare/Transportation Network Company

As shown on page 28 of the Ridership Model Development, in Appendix N, Transportation Appendices, of the Draft EIR, data from the 2019 season indicated a Transportation Network Company (TNC) average share of 5 percent of game attendees at Dodger Stadium. This 5 percent share of game attendees on TNCs is included in the 2026 and 2042 forecast of game attendees leaving Dodger Stadium. Based on 2019 season data, TNC vehicle counts are higher for pre-game conditions compared with post-game conditions, likely due to an increase in average vehicle occupancy (AVO) post-game, as some game attendees may arrive separately (e.g., from different places of work), but depart together. This pattern is expected to continue with the proposed Project, since TNC access to the proposed Project is expected to be similar to Dodger Stadium. As described on page 3.17-28 of the Draft EIR, post-game TNC vehicle counts collected at Dodger Stadium are lower than pre-game TNC vehicle counts, indicating that TNCs are fuller post-game than pre-game, potentially because groups whose members travel to the game separately from two different origins may leave the game together, whether in a TNC or a private vehicle. These travel patterns are taken into account in the VMT analysis of the proposed Project.

Walking

While there are some game attendees who currently choose to walk to and from Dodger Stadium, the walk would take approximately five to eight times as long as the ride on proposed Project, and the path would be on a steep downward grade that does not meet Americans with Disabilities Act Accessibility Guidelines, and would be challenging for children, seniors, or people with limited physical mobility. The walk times for an average walker would take approximately 25 minutes from the proposed location of the proposed Dodger Stadium Station to the Metro L Line (Gold) Station and 35 minutes to LAUS, compared to the three-minute ride to the Chinatown/State Park Station (over eight times faster) and the seven-minute ride to the Alameda Station (over five times faster) on the proposed Project. Walking is not expected to substantially increase post-game as a result of the proposed Project. A project alternative, the Pedestrian Enhancement Alternative, with widened and improved sidewalks with enhanced safety features, and an escalator up the hill to Dodger Stadium, was considered but dismissed due to limitations on travel time and grade. More information on this project alternative can be found in discussion of the Pedestrian Enhancement Alternative in Section 5.0, Corrections and Additions, of this Final EIR.

Post-Game Transit System at Los Angeles Union Station

Draft EIR comments acknowledged the reduced operation of the regional transit system at LAUS in the late evening upon arriving to LAUS after riding the proposed Project after a game or event at Dodger Stadium. The limited operation of the regional transit system in the evening is a condition faced by riders of the Dodger Stadium Express today. Based on 2019 season data, there is an approximate 8 percent reduction in post-game riders of the Dodger Stadium Express on weekday evenings compared to pre-game. The proposed Project model assumed this same reduction for the post-game ridership estimates for the proposed Project. To be conservative, the full reduction of post-game ridership is assumed to shift

to TNCs, which are estimated to generate more VMT than private vehicle trips due to the VMT generated by the driver traveling to the pick-up location at Dodger Stadium.

The specific future transit network for buses and service hour and service frequency for buses and trains, cannot be fully known since Metro, Metrolink, and municipal transit operators adjust their bus routes and service hours frequency approximately every six months. Metro’s goal as an agency is to continue to expand and improve the service provided on the regional transit network. As stated on page 3.17-4, in Section 3.17, Transportation, of the Draft EIR, Metro presented the vision to improve transit infrastructure and service in the 2020 Long Range Transportation Plan.⁸ There are several planned and funded rail and bus rapid transit projects expected to open between 2023 and 2042, including the Downtown Regional Connector (which opened in June 2023), the Purple Line Extension to West Los Angeles, the West Santa Ana Branch, the completion of the K (Crenshaw) Line, the Gold Line Foothill Extension Phase 2B, and others. In January 2023, Metrolink was awarded nearly \$107 million of state funds to implement improvements to the regional rail system. The NextGen Bus Plan, a major restructuring of bus routes which Metro adopted in 2020, has a goal to “improve and expand midday, evening and weekend service, creating an all-day, 7-day-a-week service.”⁹

The Project Sponsor would coordinate potential improvements to late night service with Metro, Metrolink, and other transit service providers.

Coordination with Metro on the Planned LAUS Forecourt

Comments suggest the potential for the proposed Project and passenger queueing to interfere with other proposed plans for the planned LAUS Forecourt.

As described in Section 2.0, Project Description, of the Draft EIR, Metro’s LAUS Forecourt and Esplanade Improvements Project (“Forecourt and Esplanade Project”) is currently being developed in coordination with the City of Los Angeles, and would include repurposing the existing northwestern parking lot at LAUS into a pedestrian forecourt and gathering space, as well as pedestrian and bicycle enhancements along Alameda Street and Los Angeles Street.

As described on page 5-42 in Section 5.0, Other CEQA Considerations, of the Draft EIR, the West Santa Ana Branch Transit Corridor Project (“WSAB Project”) involves the construction of a new light rail transit line between Downtown Los Angeles and Artesia. On January 27, 2022, the Metro Board selected a Locally Preferred Alternative for the initial opening segment between the proposed Pioneer Station and the A Line Slauson Station. The ultimate terminus would be at Union Station, with two alternatives, either within the planned LAUS Forecourt or behind the Metropolitan Water District building.

As discussed in Section 2.0, Project Description, of the Draft EIR, the Alameda Station location is compatible with Metro’s existing plans at LAUS, including the Forecourt and Esplanade Project.

The Forecourt and Esplanade Project would repurpose the existing northwestern LAUS parking lot into a new civic space with sustainability features. The proposed Project, as well as other projects like the WSAB Project, have proposed plans that could have access within the planned LAUS Forecourt. The current plans

⁸ Los Angeles County Metropolitan Transportation Authority, 2020 Long Range Transportation Plan (2020).

⁹ Los Angeles County Metropolitan Transportation Authority, NexGen Bus Plan (2020).

for WSAB reflect a subterranean station with a portal within the Forecourt, which would have vertical circulation that would meet at the same general proposed location as the vertical circulation for the proposed Project. The Project Sponsor has coordinated with Metro on the design and placement of the proposed Project's Alameda Station and its vertical circulation, and the planned LAUS Forecourt design would reflect the presence of the proposed Project's Alameda Station. Since the planned LAUS Forecourt has not yet been designed or funded, the ultimate design of the Forecourt would take into consideration the other projects such as the proposed Project and the WSAB Project. The proposed Project would not preclude the other planned activities and projects in this area.

TOPICAL RESPONSE C

Project Features

Comments on the Draft EIR requested additional information as to how the proposed Project would take into account the current needs of the surrounding communities, including economic barriers and social challenges with access to transit, and provide an opportunity to local community stakeholders to have a decision-making role in how to showcase the surrounding art and culture, including utilizing local artists. In addition to the potential to alleviate existing congestion and associated air pollution in the Project area, which includes communities disproportionately burdened by multiple sources of air pollution, the proposed Project seeks to provide a number of features to enhance and provide additional benefit to the surrounding community, including but not limited to the following:

- Sustainability features at the stations, towers, and junction and open space enhancements at the Los Angeles State Historic Park
- Community Access Plan to allow local residents and employees of businesses close to the proposed Project to ride the gondola using their Metro fare at no additional cost
- Pedestrian access enhancements along the proposed Project alignment, including landscape and hardscape improvements, shade structures, and potential seating
- Access to the Los Angeles State Historic Park and Elysian Park
- Mobility hubs at Chinatown/State Park Station and Dodger Stadium Station
- Wayfinding signage adjacent to and throughout the proposed Project alignment
- Utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture and history
- Design of the proposed Project components inspired by adjacent neighborhood culture and history
- Interpretation Plan to identify unique ways to use the proposed Project to provide additional interpretation of the adjacent neighborhood culture and history, particularly aimed at a diverse visitor community
- Marketing plans to help promote the adjacent business areas, while honoring the rich history and cultural significance of each area
- Business and Community Support Program during construction
- Partnerships with local businesses and nonprofits along the proposed Project alignment
- Commitment to a goal of utilizing at least 35 percent MBE/WBE/DBE/SBE/DVBE/LGBTQ-owned businesses¹⁰ during the proposed Project's construction phase

The Project Sponsor will convene stakeholder groups to ensure adequate vetting and consensus around community features of the proposed Project.

¹⁰ MBE/WBE/DBE/SBE/DVBE/LGBTQ refers to minority business enterprises (MBE), women business enterprises (WBE), disadvantaged business enterprises (DBE), small business enterprise (SBE), disabled veteran business enterprises (DVBE), and LGBTQ-owned businesses.

Sustainability Features and Open Space Enhancements

As discussed in Section 2.7.9, Sustainability Features, of the Draft EIR, the proposed Project would include several sustainability features, including the installation of landscaping at the Alameda Station, Alpine Tower, Chinatown/State Park Station, Stadium Tower and Dodger Stadium Station, which would include drought tolerant landscape features and low water use irrigation strategies. The station, junction, and tower hardscape materials would also be selected to reduce Solar Reflective Index values to minimize the heat island effect. At the Chinatown/State Park Station, shade structures and potential seating would be included. The proposed Project would also provide open space enhancements at the Los Angeles State Historic Park and along the pedestrian pathway connecting Dodger Stadium Station and Dodger Stadium.

Community Access Plan

The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the proposed Community Access Plan. The graphic below demonstrates the geographic area for the Community Access Plan applicability. Moreover, under the Community Access Plan, transfers to and from the Metro regional transit system and the proposed Project would be free. The Community Access Plan would honor Metro's numerous discount fare programs for a variety of needs (i.e., senior fares, student fares, etc.). Residents and employees of businesses located within the communities adjacent to the proposed Project alignment would only pay the rate they pay to ride the Metro system to the proposed Project. The proposed Project would also be free to ride for anyone with a ticket to a Dodger game.

Pedestrian Access Enhancements

As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access

enhancements and first/last mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. The overall purpose of the proposed Project is to provide a direct transit connection between LAUS and the Dodger Stadium property via an aerial gondola system and improve connectivity for the surrounding communities by linking to the Los Angeles State Historic Park, Elysian Park, and the neighborhoods along the proposed alignment and the region's rapidly growing regional transit system at LAUS, as well as the businesses at El Pueblo and downtown Chinatown. The proposed Project would also provide new connections to and between currently underserved neighborhoods and uses along the proposed alignment, including El Pueblo, Chinatown, Mission Junction, the Los Angeles State Historic Park, Elysian Park, and Solano Canyon.

To facilitate this transportation connectivity, the proposed Project would include pedestrian access enhancements including pedestrian improvements between Metro's L Line (Gold) Station and Chinatown/State Park Station consistent with the Connect US Action Plan, shade structures, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge, discussed in greater detail below. The proposed Project would also include pedestrian enhancements and drought tolerant landscaping and open space enhancements, including at the Alameda Triangle, the Los Angeles State Historic Park, and along the pedestrian pathway connecting Dodger Stadium Station and Dodger Stadium, and improved access to Los Angeles State Historic Park and Elysian Park. Implementation of the proposed Project's Alameda Tower would include reuse and integration of the existing pavers located at the Alameda Triangle, and both the Alameda Tower and Alpine Tower will provide additional hardscape and landscape updates around the tower bases.

Access to Parks

The proposed Project would provide daily transit service to visitors of the Los Angeles State Historic Park and Elysian Park. The Los Angeles State Historic Park hosts various events throughout the year including craft markets, concerts, movie nights, and festivals. These events attract visitors from the surrounding local communities and throughout the region who can access the park from the proposed Project. While not proposed as part of the Project, the Draft EIR includes an analysis of the State Park's proposed bike and pedestrian bridge as part of Design and Use Option E. The bridge would provide important connections for students at Cathedral High School, and between the park and the Chinatown, Savoy, and Solano Canyon neighborhoods to support convenient access for the community. The analysis serves to provide environmental clearance for the bike and pedestrian bridge as a benefit to the Los Angeles State Historic Park, as while the bike and pedestrian bridge was mentioned in the Los Angeles State Historic Park General Plan and studied in the State Park's Bridge Feasibility Study, the bike and pedestrian bridge was never environmentally cleared. Access to Elysian Park, the City's second largest park, comprising 575 acres, would be provided through a mobility hub at the Dodger Stadium Station, where passengers would be able to access a suite of first/last mile multi-modal options.

Mobility Hubs

The proposed Project would include mobility hubs at Chinatown/State Park Station and Dodger Stadium Station where passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program.

Wayfinding Signage

The proposed Project would include multilingual signage to support wayfinding for transit passengers, including information about transit connections and other important information to facilitate transit usage, as well as directional and pedestrian signage adjacent to and throughout the proposed Project as necessary to facilitate access and safety, which would be illuminated in conformance with all applicable requirements of the Los Angeles Municipal Code. This wayfinding signage would help to promote connectivity between destinations including El Pueblo, Chinatown, Los Angeles State Historic Park, Elysian Park, and Dodger Stadium.

Utilization of Local Artists to Reflect the Unique Neighborhood Culture and History

As discussed in Section 2.0, Project Description, of the Draft EIR, each station could provide an opportunity for site-specific artwork commissioned from artists from the surrounding community, that is reflective of the unique neighborhood culture. The proposed Project has also committed to one “Art Cabin” that could feature artwork commissioned from local artists. Refer to page 106 of the Lighting Study attached to Appendix C, Visual Impact Assessment, of the Draft EIR, for a conceptual, illustrative rendering of the “Art Cabin.” As discussed in Section 3.01, Aesthetics, of the Draft EIR, Metro’s public art policy mandates that art be displayed throughout Metro’s transportation network in order to activate and enliven public spaces that otherwise serve a functional purpose. While not subject to the requirements of the public art policy, the proposed Project would expand the number of opportunities where local artists can display their work, consistent with the public art policy. As discussed in Topical Response M, Comparable Systems, of the Final EIR, the “Mexicable” system in Mexico City, Mexico, has galvanized the creation of public art, with as many as 52 works of street art and sculptures surrounding the system’s alignment. The Mexicable enabled collaborations with numerous local and international artists to design public art that now line the system’s alignment to be viewed by passengers and local residents. Similar to the Mexicable, the proposed Project could also identify additional sites for commissioned murals or art installations along the proposed Project alignment.

The proposed Project would create numerous opportunities to collaborate with and showcase local artists, including convening stakeholder groups to coordinate on issues including utilization of local artists and identification of sites along the proposed Project alignment to showcase the work of local artists.

The Design of Proposed Project Components Would Be Inspired by Adjacent Neighborhood Culture and History

Each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area, and which would be discussed with identified stakeholder groups. As discussed in Section 2.0, Project Description, and Appendix C, Visual Impact Assessment, of the Draft EIR, the proposed Project would not adhere to a fixed, Procrustean¹¹ design across the entire system, but each individual component would be designed to weave seamlessly into the surrounding urban fabric and the characteristics of the surrounding neighborhoods, and the colors and material finishes of each station and junction would be chosen to be complementary to each of their respective sites. As stated in Section 2.0, Project Description, of the Draft EIR, the proposed architectural design employs a simple barrel vault form,

¹¹ “Procrustean” design refers to design that is designed to produce conformity.

which utilizes a hollow structural steel section structure and metal panel assembly to allow the introduction of custom perforation patterns that take cues from the immediate neighborhood culture, while also providing a visual lightness to the form. Likewise, the neutral light-tone grey of each tower would be intended to conform with the surrounding urban environment and will not provide a highly metallic or mirrored finish to minimize glare. Further, as discussed in Appendix C, Visual Impact Assessment, of the Draft EIR, the proposed Project would be consistent with the goals of the City of Los Angeles' General Plan Framework Element regarding urban form and design and would support the Silver Lake – Echo Park – Elysian Valley Community Plan's aim to "provide color, lighting, and surface texture accents and complementary building materials to building walls and facades, consistent with architectural themes of the neighborhood." Moreover, the proposed Project would support the goals and objectives of the City's General Plan Framework to "improve the quality of the public realm through Project design, which would promote accessibility via improved pedestrian pathways that would be complementary and appropriate to the character of the existing buildings in the surrounding area," and the Central City North Community Plan's objective to "enhance the appearance of commercial districts," by selecting color, lighting, surface texture accents, and building materials to complement the architectural themes of each individual neighborhood.

Interpretation Plan

The Project Sponsor would convene stakeholder groups to identify unique ways to use the proposed Project to provide additional interpretation of the adjacent neighborhood culture and history, particularly aimed at a diverse visitor community. The goal of this interpretation plan is to develop a program that would provide all riders with an engaging and informative experience that would enhance their understanding and appreciation of the culture and history of the adjacent neighborhoods, including El Pueblo, Chinatown, Mission Junction, the Los Angeles State Historic Park, the Dodger Stadium property and its history as it relates to Chavez Ravine, and Elysian Park.

Business and Community Support Program During Construction

During construction of the proposed Project, the Project Sponsor would create a Business and Community Support Program to assist local businesses financially affected by construction activities.

The Business and Community Support Program would provide assistance to local businesses, including advertising support in a local or regional newspaper and on social media, and funding for temporary signage and advertising during construction to help businesses where access has been affected due to construction activity. The Program would also provide notice of the schedule for planned construction activities, lane closure schedules and information, and any required short-term modifications to property access, as well as access plans that ensure that all businesses are provided with adequate access during construction. The proposed Project would also implement its Construction Traffic Management Plan, as discussed in Section 3.17, Transportation, and as shown in Appendix B, Construction Assumptions, of the Draft EIR, that would include detours and ensure that emergency access is maintained throughout all construction activities. Materials shall be provided in English, Spanish, Chinese (Traditional), and Chinese (Simplified). This Program would also provide notice to property owners regarding utility relocations, which as discussed in Section 3.19, Utilities and Service System, of the Draft EIR would be implemented pursuant to the proposed Project's Utility Relocation Plan in coordination with the Los Angeles

Department of Water and Power and with the utility companies to minimize impacts to services during construction. In addition, this Program would provide methods by which residents and business owners can convey their concerns about construction activities and the effectiveness of measures during the construction period so activities can be modified to reduce adverse effects.

Partnerships with Local Businesses

The proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including MBEs, WBEs, DBEs, SBEs, DVBE, and LBGTQ-owned businesses. In addition to providing accessible and affordable mobility options for these businesses' employees, the proposed Project would create economic opportunities for potential partnerships with these businesses. As discussed in Appendix A, Scoping Report, of the Draft EIR, the proposed Project's team engaged in extensive outreach to local businesses and institutions to listen to and learn from the local community in order to pursue equitable outcomes.

As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses within the impacted communities of El Pueblo, Chinatown, Solano Canyon, Victor Heights, and Mission Junction, while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors, and represents an opportunity to increase pedestrian traffic along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to El Pueblo, Chinatown and other areas along the proposed Project alignment, which, consequently, adds revenues to these businesses in the communities the proposed Project hopes to serve. For example, as discussed in the Parking Study, the proposed Project could implement business to business partnerships with local businesses to pre-sell bundled packages that include patronage at the local business, as well as off-street parking, and a ticket to ride the proposed Project.

As discussed in Section 5.0, Other CEQA Considerations, of the Draft EIR, the locations of the proposed Project's Alameda Station and Chinatown/State Park Station optimize pedestrian access, driving customers to local businesses. The proposed Alameda Station would provide pedestrian access to the planned LAUS Forecourt and El Pueblo, enhancing access to El Pueblo and promoting and further attracting visitors to Olvera Street. The proposed Project, in addition to helping to promote and provide added connectivity to the Chinatown area, also would locate its Chinatown/State Park Station within a 3-minute walk to/from Metro's L Line (Gold) Chinatown Station as a way to drive additional foot traffic to Chinatown and provide direct access to the Los Angeles State Historic Park. The proposed Project would provide area residents and businesses with transit access to local businesses and institutions. The proposed Project could partner, for example, with the Chinese American Museum, the Italian American Museum, Chinatown businesses, and Olvera Street Merchants to help in addressing visitor, educational, and customer access to these businesses and institutions.

Partnerships with local businesses and nonprofits could also include an overall marketing plan on how best to market the 'gondola' to the benefit of the region; this may include additional monies for specific marketing of identified areas along the proposed Project alignment, in addition to grant-based assistance for anti-displacement strategies.

The Project Sponsor is in the process of and will continue convening stakeholder groups to coordinate on partnerships with local businesses.

The Project Sponsor’s Commitment to Utilizing MBE/WBE/DBE/SBE/DVBE/LGBTQ-owned Businesses During Construction

The Project Sponsor has committed to a goal of 35 percent utilization of MBEs, WBEs, DBEs, SBEs, DVBEs, and LGBTQ-owned businesses during the proposed Project’s construction phase.

TOPICAL RESPONSE D**Metro Is The Proper Lead Agency For The Proposed Project As The Region’s Transportation Authority; Metro Named And Consulted With The Applicable Responsible Agencies**

Comments on the Draft EIR address the role of Metro as CEQA lead agency for the proposed Project. Comments suggest that the City of Los Angeles (“City”) should serve as the lead agency due to the discretionary approvals required for the proposed Project from the City and other factors. Under CEQA and as the region’s transportation authority, Metro is properly designated as lead agency for the proposed Project. Metro owns Los Angeles Union Station (“LAUS”), Southern California’s primary transportation hub, which provides local and regional access via multiple modes of transport and service providers including Metro, Metrolink, Amtrak, and municipal and private bus operators. The proposed Project would commence adjacent to LAUS and would operate daily, providing a high-capacity aerial rapid transit connection between the regional transit system accessible at LAUS and the Dodger Stadium property and the surrounding communities, including Chinatown, Mission Junction, the Los Angeles State Historic Park, and Elysian Park.

Comments on the Draft EIR also suggest that Metro did not properly name responsible agencies, and failed to properly consult with all such agencies. However, Metro identified, provided notice, and consulted with responsible agencies in full compliance with CEQA. Responsible agencies for the proposed Project were identified as the California Department of Transportation (“Caltrans”), the California Department of Parks and Recreation (“State Parks”), the California Division of Occupational Safety and Health (“Cal/OSHA”), and the City.

Metro Is the Appropriate Lead Agency as the Region’s Transportation Authority and the Agency With Primary Responsibility for Supervising, Carrying Out, or Approving the Proposed Project

Metro is appropriately designated as lead agency under CEQA for the proposed Project’s environmental review because Metro has “the greatest responsibility for supervising or approving the project as a whole.”¹²

Under CEQA, lead agency “means the public agency which has the principal responsibility for carrying out or approving a project which may have a significant effect upon the environment” and in ensuring overall compliance with CEQA.¹³ In the case of a project to be carried out by a nongovernmental person or entity, as is the case for the proposed Project, the lead agency “shall be the public agency with the greatest responsibility for supervising or approving the project as a whole.”¹⁴

As the agency tasked with planning, operating, and coordinating funding for the Los Angeles Region’s transportation system, Metro is the appropriate lead agency for the proposed Project. Under the County Transportation Commissions Act, the State Legislature provided Metro with broad authority over public

¹² CEQA Guidelines Section 15051[b].

¹³ California Public Resources Code Section 21067; CEQA Guidelines Section 15367.

¹⁴ CEQA Guidelines Section 15051(b) [emphasis added].

transportation planning and coordination for the Los Angeles region.¹⁵ This Act declares that Metro shall aim to “achieve the operation of a coordinated and integrated transportation system which will reduce automobile usage and dependency, reduce the consumption of scarce and expensive energy fuels, and reduce the levels of automobile-related air pollution.”¹⁶ Metro is authorized to “[d]o **any and all things** necessary to carry out” these purposes.¹⁷ As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide an aerial rapid transit option for visitors to Dodger Stadium, while also providing access between the Dodger Stadium property, the surrounding communities, including Chinatown, Mission Junction, Elysian Park, and Solano Canyon, and the Los Angeles State Historic Park, to the regional transit system accessible at LAUS. Accordingly, the proposed Project is consistent with Metro’s statutory purpose.

Consistent with Metro’s statutory purpose to operate an integrated transportation system that reduces automobile usage, and as discussed in Section 2.10, Required Permits and Approvals, in Section 2.0, Project Description, of the Draft EIR, Metro is tasked with considering approval of the proposed Project’s plans for design, construction, and implementation under Public Utilities Code section 130252,¹⁸ as well as with consideration of the written approvals to operate the proposed Project, including an easement or other agreement or approval to authorize construction and operation of the project within a portion of LAUS pursuant to Public Utilities Code section 130521 and Civil Code section 801, and an encroachment permit. These potential approvals are consistent with the State Legislature’s grant of authority to issue approvals for transportation projects to Metro. Metro’s approvals are necessary for the proposed Project to operate.

The proposed Project would become a part of the regional transportation system that state law tasks Metro with overseeing. If the proposed Project is approved, Metro would have the primary responsibility for implementing the proposed Project as part of this regional transportation system, consistent with Metro’s statutory purpose. Therefore, Metro is the appropriate lead agency for the proposed Project. However, some commenters claim that because the City has approval authority over more discretionary approvals than Metro, the City is the appropriate lead agency.

Under CEQA, where two or more public agencies meet the criteria for acting as lead agency under CEQA Guidelines section 15051(b), the agency that acts first will normally serve as lead agency.¹⁹ Here, consistent with Metro’s statutory purpose and responsibility for implementing the proposed Project, Metro will act first to review and consider certification of the proposed Project’s Final EIR, as well as to consider the approval of the proposed Project’s plans for design, construction, and implementation. Metro elected to serve as lead agency, and the City has not disputed this designation and has cooperated as a responsible agency. CEQA provides for the state to settle lead agency disputes under CEQA Guidelines section 15053. The state shall designate a lead agency based on the criteria in CEQA Guidelines section 15051, as well as the capacity of the agency to adequately fulfill the requirements of CEQA. CEQA Guidelines section 15051 also notes that where two or more public agencies have a “substantial claim” to

¹⁵ Public Utilities Code. 1976. Section 130000, et seq.

¹⁶ Id., § 130001(b).

¹⁷ Id., § 130105(f) [emphasis added]; see also id., at §§ 130050, 130050.2, 130051.13, 130051.14, 30001(a).

¹⁸ Public Utilities Code section 130252 provides that “All plans proposed for the design, construction, and implementation of public mass transit systems or projects” are to be submitted for Metro for potential approval.

¹⁹ CEQA Guidelines Section 15051(c).

serve as lead agency, the agencies may designate one agency as lead agency by agreement.²⁰ Neither the state designation or agency agreement designation process was invoked because the agencies involved in the proposed Project agreed that Metro was the appropriate lead agency.

Responsible Agencies

Under CEQA, a responsible agency is “a public agency, other than the lead agency, which has responsibility for carrying out or approving a project.”²¹ In other words, responsible agencies are agencies, other than the lead agency, that have some discretionary authority for carrying out or approving a project.²² While the lead agency is responsible for considering all environmental impacts of the project before approving it, a responsible agency has a more specific charge: to consider only those aspects of a project that are within an area of expertise of the agency or that are required to be carried out or approved by the agency.²³ The responsible agency has authority to mitigate or avoid the environmental effects of only those parts of the project which the responsible agency is called upon to carry out or approve.²⁴ Similarly, a responsible agency may disapprove a project in order to avoid only those environmental effects of the part of the project that the responsible agency would carry out or approve.²⁵

Responsible Agencies Were Properly Identified and Properly Notified of the Preparation and Completion of the Draft EIR

The responsible agencies for the proposed Project are identified in Section 2.10, Required Permits and Approvals, in Section 2.0, Project Description, of the Draft EIR, and were identified as Caltrans, State Parks, Cal/OSHA, and the City. Contrary to a commenter’s claim, the California Public Utilities Commission (“CPUC”) has no discretionary approval authority related to the proposed Project. As discussed above, pursuant to the County Transportation Commissions Act, the State Legislature granted Metro the authority to approve and consider transit projects within Los Angeles County.

As reflected in Appendix A, Scoping Report, of the Draft EIR, and Appendix A, Public Outreach Report, of this Final EIR, the four responsible agencies were given proper notice of preparation of the Draft EIR and notice of completion of the Draft EIR, including being provided with copies of the Draft EIR and an opportunity to comment, as CEQA requires.²⁶

Metro Engaged in Consultation with Responsible Agencies Early in the CEQA Process and Continues Such Consultation

Under CEQA, responsible agencies are encouraged to consult with the lead agency.

As discussed in Section 8.0, List of Preparers, of the Draft EIR, Metro engaged in required consultation with all responsible agencies during the process of preparing the Draft EIR for the proposed Project, in compliance with CEQA. This consultation process included meetings with Metro and the responsible agencies to discuss the scope and content of the environmental information that Metro would include in

²⁰ CEQA Guidelines Section 15051(d).

²¹ California Public Resources Code Section 21069.

²² CEQA Guidelines Section 15381.

²³ See California Public Resources Code Sections 21104, 21153(c), 21069.

²⁴ CEQA Guidelines Sections 15041, 15096(g)(1).

²⁵ CEQA Guidelines Section 15042.

the Draft EIR,²⁷ additional consultation with the City and State Parks as Draft EIR preparers, and receiving comments from these responsible agencies on the Draft EIR.²⁸ This consultation process will continue throughout the course of the environmental review process. Consultation helps ensure that the EIR includes the necessary analysis regarding environmental effects within a responsible agency's jurisdiction to allow that agency to rely on the EIR, if ultimately certified, when considering the necessary approvals for the project that fall under its regulatory authority. If Metro certifies the Final EIR, each responsible agency will then conduct its own discretionary review process for the Project approvals for which it is responsible.²⁹

TOPICAL RESPONSE E

The Proposed Project Will Not Displace Housing or Prevent Planned Housing

Comments on the Draft EIR address the proposed Project's location near existing and planned housing.³⁰ This topical response provides an overview of the proposed Project's consistency with existing and planned and proposed housing in the vicinity of the proposed Project.

The Proposed Project Will Not Displace Any Housing

As discussed in Section 3.14, Population and Housing, of the Draft EIR, no displacement of existing residences or housing would occur in connection with construction or operation of the proposed Project, which would operate primarily over the public ROW and publicly owned property. The proposed Project is intended to accommodate existing and future transportation needs of the area's population. As discussed on page 3.14-14, in Section 3.14, Population and Housing, of the Draft EIR, "the proposed Project area is being developed with various mixed-use developments," including various "planned or recently constructed high-density developments." The proposed Project would support the City's goals of providing transit near residential development. Further, as discussed in Section 2.0, Project Description, of the Draft EIR, one of the proposed Project's objectives is to "maximize the use of ROW, and publicly owned property and minimize aerial rights requirements over private properties, taking into account existing and future adjacent land uses." The proposed Project was designed in accordance with this objective. As discussed in Section 2.5.1, Proposed Project Alignment, of the Draft EIR, the "proposed Project alignment was chosen as it maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties, taking into account existing and future adjacent land uses."

Section 2.0, Project Description, and Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR provide an overview of the proposed Project alignment, showing the portions of the proposed alignment over public ROW and publicly owned property and the portions over private property. As shown in Section 2.0 and Appendix Q, the proposed Project alignment maximizes the use of the public ROW and publicly owned property, minimizing aerial rights required over private properties (including both existing and future adjacent land uses). Figure 2-8: Proposed Alignment Over Public ROW/Publicly-Owned Property and Private Property, in Section 2.0, Project Description, of the Draft EIR, shows the minimal amount of private property where aerial rights may be required for the proposed Project.

As discussed in Section 2.0, Project Description, and Section 3.14, Population and Housing, of the Draft EIR, the proposed Project would increase connectivity in downtown Los Angeles by providing direct linkages to major residential, employment, recreational, and tourist destinations, such as Los Angeles Union Station (LAUS), El Pueblo/Olvera Street, Chinatown, Los Angeles State Historic Park, Dodger Stadium, and Elysian Park. Residents in existing and planned housing in the Project area would be connected to parks and recreational opportunities, including the Los Angeles State Historic Park and Elysian Park, the City's second-largest park. In addition, as discussed in Section 3.14, Population and Housing, of the Draft EIR,

³⁰ To the extent comments concern impacts to existing housing, the Draft EIR fully analyzed and considered the proposed Project's potential impacts to existing housing projects as part of the baseline physical conditions by which a lead agency determines whether an impact is significant, i.e., the environmental setting. (CEQA Guidelines § 15125; see also Draft EIR Sections 2.0, 3.01, 3.02, 3.03, 3.04, 3.05, 3.06, 3.07, 3.08, 3.09, 3.10, 3.12, 3.13, 3.14, 3.15, 3.16, 3.17, 3.18, 3.19, 3.20.)

approximately 25 percent of the residents in the Project Study Area utilize either public transportation or walking for commuting to work. Implementation of the proposed Project would provide additional access and mobility by providing a transit option to/from LAUS and Chinatown and other employment areas in downtown Los Angeles that would avoid congested local roadways and provide a transit option to Dodger Stadium on game days and for special events that would bypass typical vehicle traffic. As discussed in Section 5.0, Other CEQA Considerations, of the Draft EIR, given that the area in the City where the proposed Project alignment is located is densely urbanized and there are existing planned developments for the area, the proposed Project would be a benefit for existing and planned uses in the area as an additional transit option. Therefore, the proposed Project would not displace housing, but would provide a benefit to existing residents in the area.

Consistent with the Project Objectives, the Proposed Project Was Designed In Consideration of Planned or Anticipated Housing Projects, Including the Restorative Justice Master Plan and Hope Village Project

Commenters suggest that the proposed Project would be inconsistent with the Restorative Justice Village Master Plan. In 2021, County of Los Angeles Supervisor Hilda Solis introduced a motion to create a Master Plan for housing services in the vicinity of the Men’s Central Jail, called the “Restorative Justice Village Master Plan.”³¹ Supervisor Solis’ motion references Homeboy Industries’ plans to expand its campus, via a partnership with the City to offer transitional housing and daycare and to increase capacity to offer programs and job opportunities to formerly incarcerated and previously gang-involved community members. The motion specifically discusses Homeboy Industries’ anticipated transitional housing project at 903 North Main Street, described below. The “Hope Village Project,”³² is intended to serve a mix of unhoused and formerly incarcerated residents, integrating and connecting the Men’s Central Jail, LA’s Care First Village, Homeboy Industries, and The California Endowment’s Center for Healthy Communities Campus.³³ The Restorative Justice Master Plan and Hope Village Project are intended to “tie together all nearby development,” including other City and County partnerships.³⁴

Based on publicly available information from KFA Architecture and Urbanize Los Angeles, Homeboy Industries intends a five-story 36,000 square-foot transitional housing building with 157 residential units at the southeast corner of Alameda and Alpine Streets on 903 North Main Street.^{35, 36} According to KFA Architects’ (the Homeboy Industries project’s architect) website, the housing buildings would offer “support for the Homeboy population with dorm style apartments and supportive housing. The first phase

³¹ Revised Motion by Supervisor Hilda L. Solis for Restorative Justice Village Master Plan (January 26, 2021), available at <https://file.lacounty.gov/SDSInter/bos/supdocs/153341.pdf> (accessed September 20, 2023).

³² The Restorative Justice Master Plan and Hope Village Project are often described interchangeably, sharing common projects and goals. For instance, Homeboy Industries’ architect KFA Architecture refers to the Homeboy Industries housing development project as “one component of a new ‘Restorative Justice Village’ planned for Chinatown,” whereas Homeboy Industries’ website describes this same project as the “Hope Village.” (See KFA Los Angeles, Homeboy Industries Campus, <https://kfalosangeles.com/project/homeboy-industries-campus> (accessed September 20, 2023); Homeboy Industries, Campus Expansion and Transitional Housing, available at <https://homeboyindustries.org/hiltonfoundation/initiatives> (accessed September 20, 2023). Little detail as to the location and uses of the Restorative Justice Master Plan and Hope Village Project components are publicly available.

³³ Assemblywoman Wendy Carrillo, Assemblywoman Wendy Carrillo Announces \$5 Million in California State Budget Funds for Hope Village Project (Nov. 1, 2022), <https://a52.asmdc.org/press-releases/20221101-assemblywoman-wendy-carrillo-announces-5-million-california-state-budget> (accessed September 20, 2023).

³⁴ Revised Motion by Supervisor Hilda L. Solis for Restorative Justice Village Master Plan (January 26, 2021), available at <https://file.lacounty.gov/SDSInter/bos/supdocs/153341.pdf> (accessed September 20, 2023).

³⁵ KFA Los Angeles, Homeboy Industries Campus, <https://kfalosangeles.com/project/homeboy-industries-campus> (accessed September 20, 2023).

³⁶ Urbanize Los Angeles, Homeboy Industries expands into affordable housing (Oct. 8, 2021), <https://la.urbanize.city/post/homeboy-industries-expands-affordable-housing> (accessed September 20, 2023).

will also provide stacked parking, a gym, a mechanic’s garage and outdoor recreational space . . . The new housing and accompanying structures wrap around a site which also fronts the intersection of Main and Vignes Streets.”³⁷ The housing would be located on 903 North Main Street.

While little detail as to the location and uses of the Restorative Justice Master Plan and Hope Village Project components was publicly available, the Draft EIR considered proposed development projects in the vicinity of the proposed Project, using public information to the extent it was available. Table 5-1: Related Projects, in Section 5.0, Other CEQA Considerations, of the Draft EIR, lists 46 related land use development projects considered in the Draft EIR’s analysis that are either approved or proposed, including Restorative Justice Master Plan and Hope Village projects, such as the interim housing facility at 1060 North Vignes Street (Related Project 34) and the 903 North Main Street proposed housing project (Related Project 43). The proposed Project would support the goals of the Restorative Justice Master Plan and Hope Village Project by offering an additional transit option in the area, enhancing connectivity in Downtown Los Angeles, by providing direct linkages to major residential, employment, and tourist destinations.

Accordingly, the Draft EIR considered and analyzed the proposed Project’s consistency and potential impacts to all of the approved or proposed/anticipated housing projects along the proposed Project alignment, inclusive of the Restorative Justice Village Master Plan and Hope Village projects. Further, due to the minimal private property where aerial rights may be required for the proposed Project, other future housing or development projects may be similarly constructed.

The Project Does Not Impact Homeboy Industries’ Housing Project

The proposed Project would not impair or impact either Homeboy Industries’ current operations or their future housing development and expanded operations, or otherwise impact or impair Homeboy Industries’ ability to deliver housing in response to the City and County’s State of Emergency declarations regarding the homeless crisis. The proposed Alpine Tower is sited on 901 North Main Street and Homeboy Industries’ housing project is located on 903 North Main Street.

In addition to the proposed Project’s Alpine Tower not being physically located on the site of Homeboy Industries’ anticipated housing project, the minimal aerial rights required for the proposed Project do not conflict with or impact the Homeboy Industries housing project.

The Alpine Tower’s Location Considered and Avoided the 903 North Main Street Homeboy Housing Project

The Alpine Tower and Homebody Industries’ housing project would be on separate parcels – the proposed location of the Alpine Tower is on 901 North Main Street, which is located across Alpine Street from the 903 North Main Street parcel where Homeboy Industries presumably intends to locate its anticipated housing project, as shown on the image below.

³⁷ KFA Los Angeles, Homeboy Industries Campus, <https://kfalosangeles.com/project/homeboy-industries-campus> (accessed September 20, 2023).

As discussed in Section 2.0, Project Description, of the Draft EIR, one of the proposed Project’s objectives is to “maximize the use of ROW, and publicly owned property and minimize aerial rights requirements over private properties, taking into account existing and future adjacent land uses,” and the proposed Project was designed in accordance with this objective. Further, as discussed on page 2-22 in Section 2.0, Project Description, of the Draft EIR, “[i]n the process of selecting tower locations, the proposed Project . . . considers the proposed Project’s relationship to existing adjacent and potential future land uses.”

The Project’s Alpine Tower would have a footprint of approximately 1,030 square feet on the northeast corner of Alameda Street and Alpine Street, adjacent to the Metro L Line (Gold) on 901 North Main Street, as shown in Figure 2-14: Proposed Alpine Tower Location, in Section 2.0, Project Description, of the Draft EIR. This proposed tower is located across Alpine Street from Homeboy Industries’ anticipated housing project on 903 North Main Street, as further depicted on the image above.

The Homeboy Industries Housing Project Was Considered a Related Project in the Draft EIR

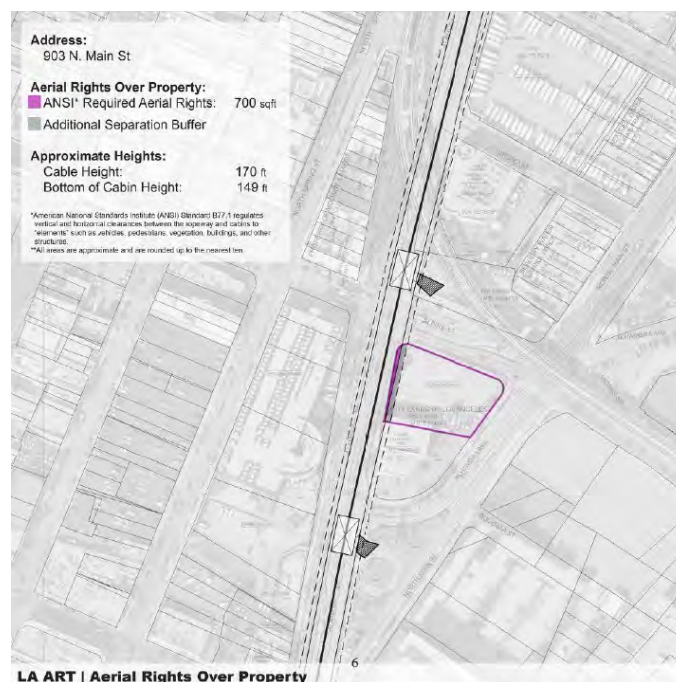

Table 5-1: Related Projects, in Section 5.0, Other CEQA Considerations, of the Draft EIR, lists Homeboy Industries' 157-dwelling unit anticipated housing development at 903 North Main Street as related project number 43. Figure 3.13-5: Noise Sensitive Receptors Map, in Section 3.13, Noise, of the Draft EIR, also lists Homeboy Industries' anticipated housing project as Noise Sensitive Receptor number 5, "Future Residential Development," and Vibration Sensitive Receptor number 11. Section 3.03, Air Quality, of the Draft EIR, and Appendix D, Air Quality/HRA Technical Report, of the Draft EIR, also identify Homeboy Industries' anticipated housing project as a sensitive receptor for the purposes of the Air Quality analysis and Health Risk Assessment. Accordingly, the Draft EIR considered Homeboy Industries' housing project in its analysis as one of the 46 related projects and as a sensitive receptor for the purposes of the air quality and noise and vibration analysis.

Aerial Rights Over 903 North Main Street

The proposed Project's minimal aerial rights requirement over 903 North Main Street would not interfere with Homeboy Industries' anticipated housing project.

As discussed in Section 2.4.6, Aerial Clearance, of the Draft EIR, the proposed Project will comply with industry standards for the design and operation of ropeways and cabins, including ANSI B77.1, regulating vertical and horizontal clearances between the ropeway and cabins to elements such as vehicles, pedestrians, vegetation, buildings, and other structures. As shown in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR, the proposed Project would require certain aerial rights over the edge of the property, which could be occupied in the future by Homeboy Industries' anticipated housing project in order to meet the industry standard clearance requirement.

The following image was included in Appendix Q of the Draft EIR:

The proposed Project is anticipated to require approximately 700 square feet of ANSI required aerial rights over 903 North Main Street, plus an Additional Separation Buffer.³⁸ Based on the publicly available information, Homeboy Industries' anticipated housing project at this location would be five stories. Based on the publicly available renderings on KFA Architect's website, Homeboy Industries' housing project appears to be Type III or Type V construction over a podium and appears to be approximately 70 feet high, and would be unlikely to exceed approximately 85 feet, which is the typical maximum height for Type III or Type V construction. ANSI B77.1 requires a vertical clearance of at least five feet over buildings. The proposed Project was designed to ensure that this clearance is met, as the bottom of the cabins would be 149 feet above ground and the cable would be 170 feet above ground. Accordingly, there would not be a conflict between Homeboy Industries' anticipated housing project and the required aerial clearances for the proposed Project. The proposed Project would substantially exceed the required aerial clearances from Homeboy Industries' anticipated housing project and would not impact either its construction or operation. The following segment of the proposed alignment's profile between Alameda Tower and Alpine Tower illustrates the proposed Project's relationship to Homeboy Industries' anticipated housing project, significantly exceeding the required clearances based on the publicly available information regarding Homeboy Industries' housing project.

LA ART | Segment of Proposed Alignment Profile with Homeboy Industries' Proposed Future Development at 903 North Main Street
SCALE: 3/16"=1' | 4/13/2023

Development of Housing Is Constrained on the Portion of 901 North Main Where Alpine Tower Is Located Due to the Proximity to the Metro L Line (Gold) Tracks

The proposed Alpine Tower would occupy approximately 1,030 square feet of 901 North Main Street on the northeast corner of Alameda Street and Alpine Street, adjacent to the Metro L Line (Gold). The proposed Alpine Tower is located on a triangular portion of 901 North Main Street between the Metro L

³⁸ Section 3.4.6, Aerial Clearance, of Section 3.0, Project Description, of the Final EIR details the proposed Project's Additional Separation Buffer.

Line (Gold) tracks and Alameda and Alpine Streets, this property was previously analyzed by the City of Los Angeles' City Administrative Officer, describing it as unsuitable for housing.³⁹ Based on publicly available information there is no housing proposed for this specific location, which is west of the Metro L Line (Gold) tracks on 901 North Main Street. The area east of the Metro L Line (Gold) tracks on 901 North Main Street would not be impacted by the proposed Alpine Tower.

The City of Los Angeles is currently in the process of transferring the City owned property at 901 and 903 North Main Street to Friends of Homeboy, LLC, on behalf of Homeboy Industries, pursuant to the City's Affordable Housing Opportunity Site program utilizing City owned properties that have been designated as surplus under the Surplus Land Act.⁴⁰ The City of Los Angeles' City Administrative Officer published a report on the proposed property transfer, determining that while 903 North Main Street was an appropriate site for affordable housing, "potential uses of [901 North Main Street] may be restricted to supplemental commercial uses related to affordable housing and services," due to the elevated Metro L Line (Gold) facilities. Specifically, the City recognized that the 901 North Main Street "site is bisected by overhead tracks, which are protected by an easement to" Metro and therefore "the Metro tracks will affect the ability to develop on the site."⁴¹

According to the City's Zone Information and Map Access System (ZIMAS), development and construction projects on 901 North Main Street must consult with Metro pursuant to Metro's Adjacent Development Review process to ensure safety and avoid conflicts related to transit services and operations. The process applies to work within 100 feet from Metro right-of-way, which affects most or all of the 901 North Main Street property.⁴² Metro's Adjacent Development Handbook⁴³ requires that building appurtenances and landscaping must be a minimum of 10 feet from Metro's overhead catenary system and support structures. If a transmission power feeder cable is present, a 20-foot setback from the overhead catenary system and support structures is required.

Compliance with Metro's requirements for construction design in locations adjacent to Metro's systems further restricts the ability for development on the portion of 901 North Main Street between the Metro L Line (Gold) tracks and Alameda and Alpine Street. Metro's Adjacent Construction Design Manual⁴⁴ incorporates all Federal, State, and internal Metro requirements for adjacent construction. Under these requirements, Metro must review and approve each part of the project's design to determine the effect of the proposed project on the Metro existing structures and its transit operations. Similar to Metro's Adjacent Development Handbook, the Design Manual requires that "[a]ll developments adjacent to Metro At-Grade Stations, Aerial Stations or Track Guideways shall provide a minimum 5 foot setback from the Metro and developer's shared property line to the outside face of the proposed structure at

³⁹ March 29, 2019, Letter from Richard H. Llewellyn, Jr., City Administrative Officer, to Los Angeles City Council regarding Recommendations for Proposed Transfer of 901 and 903 Main Street, Los Angeles, CA 90012, available at https://clkrep.lacity.org/onlinedocs/2018/18-0930_rpt_CAO_03-29-2019.pdf#page=3 (accessed September 20, 2023).

⁴⁰ Ibid.

⁴¹ *Id.*, pp. 2-3.

⁴² The 903 North Main Street property is also located within this area, according to ZIMAS.

⁴³ Los Angeles County Metropolitan Transportation Authority, Metro Adjacent Development Handbook (2021), <https://www.dropbox.com/s/3cddvf2og5jo5v6/2021-Adjacent-Development-Review-Handbook.pdf?dl=0> (accessed September 20, 2023).

⁴⁴ Los Angeles County Metropolitan Transportation Authority, Metro Design Criteria and Standards Adjacent Construction Design Manual (2018), <https://www.dropbox.com/s/c02lkxuvphbah1/2018-Adjacent-Construction-Design-Manual.pdf?dl=0> (accessed September 20, 2023).

Metro or the developer’s property for maintenance to be performed or installed from the zone created by this setback[.].”⁴⁵

These restrictions constrain the development potential for the portion of 901 North Main Street between the Metro L Line (Gold) tracks and Alameda and Alpine Streets where the Alpine Tower is proposed. Indeed, according to publicly available information,⁴⁶ Homeboy Industries is not proposing housing on 901 North Main Street. Homeboy Industries would still be able to develop the remainder of the 901 North Main Street property to the east of the Metro L Line (Gold) tracks with commercial and related uses to support its anticipated housing project and services at 903 North Main Street.

The Alpine Tower supports zero-emission transit in an area where approximately 25 percent of the residents utilize either public transportation or walking for commuting to work. This additional transit option would benefit existing and future residents in the proposed Project area. Moreover, the Project Sponsor has reached out to Homeboy Industries to express its desire to collaborate with Homeboy Industries to support Homeboy’s housing project, such as the potential to provide a symbiotic use at the base of the Alpine Tower, including potential Homeboy Industries signage, shade structures, seating, hardscape and landscape enhancements and other pedestrian enhancements.

The Proposed Project Does Not Impede The California Endowment’s Anticipated Hope Village Project

Subsequent to the release of the Draft EIR, The California Endowment published its Annual Report 2023⁴⁷ with additional information regarding the Hope Village, which anticipates offering housing, community, and health services to formerly incarcerated, unhoused, and economically disadvantaged residents.

A graphic in the Annual Report 2023 depicts the Alameda Triangle, a City ROW between Alameda Street, North Main Street, and Alhambra Avenue, as “RECREATIONAL SPACES.”

The following graphic from the Annual Report 2023 depicts the recreational spaces.

⁴⁵ Ibid.

⁴⁶ See, e.g., KFA Los Angeles, Homeboy Industries Campus, <https://kfalosangeles.com/project/homeboy-industries-campus> (accessed September 20, 2023).

⁴⁷ The California Endowment, Annual Report 2023 (2023), <https://www.calendow.org/annual-report> (accessed September 20, 2023).

As detailed in Section 2.0, Project Description, of the Draft EIR, the proposed Project proposes to locate the Alameda Tower in the northwest corner of the Alameda Triangle. The Alameda Tower base would be 900 square feet. Refer to Figure 2-12: Proposed Alameda Tower Location, of the Draft EIR, for the location of the Alameda Tower. Implementation of Alameda Tower would include reuse and integration of the existing pavers located at the Alameda Triangle, as well as landscape and hardscape updates to the Alameda Triangle.

The proposed Project would not impair or impact The California Endowment’s potential use of the Alameda Triangle for recreational spaces. As noted, the Alameda Tower base would be located in 900 square feet of the approximately 22,000 square foot Alameda Triangle. The following graphic depicts the Alameda Triangle, including space for both the Alameda Tower and potential recreational spaces based on the graphic in the Annual Report 2023.

The proposed Project’s Alameda Tower would not impede The California Endowment’s potential use of the Alameda Triangle for recreational spaces.

Further, the proposed Project alignment travels along Alameda Street, and, as shown in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR, does not require any aerial rights over the properties that The California Endowment anticipates building its housing or community and health services. Accordingly, the proposed Project would not impede The California Endowment’s anticipated housing, community and health services, or recreational spaces, based on the available information.

Pursuant to CEQA Guidelines sections 15125 and 15130, the Draft EIR should consider conditions as they exist at the time the notice of preparation is published, and include a cumulative impacts analysis of past, present, and probable future projects. The notice of preparation for the proposed Project was published

on October 1, 2020. As of October 2023, The California Endowment has yet to file an application for the anticipated Hope Village project, and therefore the project need not be treated as a present or probable future project for the purposes of environmental review. Further, The California Endowment has not publicly released any further details other than those outlined above in its Annual Report 2023. CEQA does not require speculation as to potential related impacts, and therefore no additional analysis is required.⁴⁸) Any potential impacts regarding proximity of the proposed Project have been addressed with respect to the adjacent The California Endowment building, which was included as a sensitive receptor for the purposes of the Draft EIR’s analysis. The proposed housing and community services are located further away from the Alameda Tower site than The California Endowment, so potential impacts are expected to be less.

Surplus Land Act

Comments regarding the Surplus Land Act do not raise substantive issues on the content of the Draft EIR and therefore no response is warranted pursuant to CEQA. Regardless, the proposed Project will comply with all State laws, including the Surplus Land Act.⁴⁹

The Surplus Land Act requires local agencies to declare land as either “surplus land” or “exempt surplus land,” as supported by written findings before the local agency may take any action to dispose of the land consistent with an agency’s policies or procedures.⁵⁰ The SLA and related Guidelines published by the California Department of Housing and Community Development (HCD) ⁵¹ set forth procedures applicable to the disposition of surplus land or exempt surplus land.

Metro and the City will exercise their independent judgment regarding the disposing of any Metro or City-owned land that may be necessary for the proposed Project, which may require compliance with the Surplus Land Act, and will act in conformance with the law, including seeking guidance from HCD as reasonably necessary to ensure compliance with the SLA.⁵² Compliance with the Surplus Land Act, should it apply, is separate and distinct from the CEQA environmental process and the purpose of environmental review.

Gentrification and Displacement

The proposed Project will not exacerbate gentrification or result in displacement of residents in the surrounding neighborhoods and is consistent with Metro’s considerations regarding gentrification and displacement. Metro recognizes that gentrification is “a process of neighborhood change in a historically disinvested neighborhood . . . by means of real estate investment,” including the “changes that happen when new, higher-income residents move in,” including potential displacement of existing residents.⁵³ As discussed in Section 3.14, Population and Housing, of the Draft EIR, no displacement of existing residences or housing would occur in connection with construction or operation of the proposed Project, which

⁴⁸ CEQA Guidelines Section 15145.

⁴⁹ California Government Code. 2009. Section 54220 et seq.

⁵⁰ California Government Code. 2009. Section 54221(b)(1).

⁵¹ https://www.hcd.ca.gov/community-development/docs/sla_guidelines_final.pdf.

⁵² As noted above, the City owned property where Alpine Tower would be located has already been deemed surplus and is in the process of being transferred to Friends of Homeboy, LLC, on behalf of Homeboy Industries, pursuant to the City’s Affordable Housing Opportunity Site program.

⁵³ <https://www.metro.net/about/gentrification-displacement/>.

would operate primarily over the public ROW. Further, the proposed Project does not include any new housing and is a first-mile/last transit connection to Dodger Stadium for existing residents, workers, park users, and visitors to Los Angeles.

As discussed in Section 3.14, Population and Housing, of the Draft EIR, the proposed Project would increase connectivity in downtown Los Angeles by providing direct linkages to major residential, employment, and tourist destinations, such as LAUS, El Pueblo/Olvera Street, Chinatown, Los Angeles State Historic Park, Dodger Stadium, and Elysian Park. The Project Study Area includes a population of which approximately 25 percent of the residents in the Project Study Area utilize either public transportation or walking for commuting to work. The proposed Project would enhance community connectivity for existing residents by providing direct linkages to major residential, employment, and tourist destinations, including to the second largest public parks and recreation area in Los Angeles—Elysian Park. Further, the proposed Project is located adjacent to existing transit stops at LAUS and the Metro L Line (Gold) Chinatown Station; any gentrification due to the construction of a transit facility would have already resulted due to these existing transit options. No gentrification or displacement would result from the construction of Dodger Stadium Station, which would be located on the Dodger Stadium property in a portion of the existing parking lot for the Stadium.

Consistent with Metro’s plans regarding gentrification and displacement, the proposed Project would “support and strengthen opportunities for small and local businesses, and preserve and enhance communities’ cultural assets.” The proposed Project’s partnerships and benefits to local businesses and opportunities to showcase local artists, as well as the immediate neighborhood culture’s influence on the proposed Project’s design is discussed in Topical Response C, Project Features.

The Project Will Not Take Funding from Housing Projects

Commenters suggest that funding for the proposed Project will be diverted from funding for housing projects. Section 4.0, Costs and Financing, of this Final EIR, discusses potential funding for the proposed Project. No funding benchmarked for housing projects or development will be used to fund or finance the proposed Project.

TOPICAL RESPONSE F

Los Angeles State Historic Park

Comments on the Draft EIR suggest California Department of Parks and Recreation’s (“State Parks”) does not have the authority to grant the necessary approvals for the proposed Project’s use of Los Angeles State Historic Park (“LASHP” or “Park”). As detailed in this topical response, State Parks has the authority to grant the necessary approvals for the proposed Project. State Parks will undertake its own review of the proposed Project when the Project Sponsor seeks approvals for its use of LASHP from State Parks.

Because comments regarding State Parks’ authority to grant the necessary approvals for the proposed Project’s use of LASHP do not raise substantive issues on the content of the Draft EIR, no further response is required by CEQA. Nevertheless, this topical response provides information regarding State Parks’ authority to grant the necessary approvals for the proposed Project’s use of LASHP.

California Department of Parks and Recreation’s Authority to Permit Project

State Parks Has Authority to Grant Project Approvals

As discussed in Section 2.10, Required Permits and Approvals, of the Draft EIR, approvals determined necessary by State Parks for the proposed Project’s use of LASHP could include, but are not necessarily limited to:

- a. Pursuant to Government Code section 14666, an easement and/or aerial easement, to construct and operate the Project within/over the Los Angeles State Historic Park.
- b. Pursuant to Public Resources Code section 5003.17, a lease or other agreement, to construct and operate the Project within/over the Los Angeles State Historic Park.
- c. Pursuant to Public Resources Code section 5003 and Government Code section 14666, a right of entry, to construct the Project within/over the Los Angeles State Historic Park.
- d. Pursuant to Public Resources Code section 5002.2, an amendment to the Los Angeles State Historic Park General Plan.

Title to real property owned by State Parks is vested in the name of the State of California.

State Parks’ transfer of real property interests through lease or easement requires the review and approval of Department of General Services (“DGS”) per Government Code section 11005.2.⁵⁴

Right-of-Entry Permits

Under State Parks’ general authority, State Parks “may establish rules and regulations not inconsistent with law for the government and administration of the property under its jurisdiction. The department may expend all moneys of the department, from whatever source derived, for the care, protection, supervision, extension, and improvement or development of the property under its jurisdiction.”⁵⁵ Within this authority, State Parks can issue Right-of-Entry Permits.

⁵⁴ California Government Code. 2019. Section 11005.2.

⁵⁵ California Public Resources Code.1983. Section 5003.

Right-of-Entry Permits, issued at the District level and reviewed by State Parks' Acquisition and Real Property Services Division, are for a short-duration use of state park property. A Right-of-Entry Permit is a revocable, short-term permit. Therefore, they are not considered an encumbrance in the same way as an easement or lease.

Leases and Easements

Other real property transactions such as the granting of an easement to a private party not performing a public service or entering into leases for any use may be carried out by DGS, as applicable, on behalf of State Parks with State Parks' approval, if the transactions meet certain statutory requirements.

Public Resources Code section 5003.17 authorizes and provides, among other things, that State Parks may lease for a term not exceeding ten years, for any use at fair market value, all or a portion of any parcel of the State Park System if the State Parks Director finds that the use would be compatible with the use of the real property as a unit and with the sound management and conservation of resources within the unit. Leases beyond ten years are allowed if the proposed lease is provided to the Joint Legislative Budget Committee along with "sufficient documentation to enable the joint legislative budget committee to determine whether the lease conforms to the requirements of [state law] and to evaluate fully all terms upon which the lease is proposed to be let, including the amount of the rent and other revenues that may be generated under the lease."⁵⁶ () Thus, prior to entering into a lease for the proposed Project, the State Park Director would ensure that the proposed Project pays fair market value⁵⁷ and that the use is compatible with (1) the use of LASHP as a unit and (2) the sound management and conservation of resources within LASHP.

State law provides two provisions related to easements on State Parks property: Public Resources Code section 5012 and Government Code section 14666. Only Government Code section 14666 is potentially applicable to the proposed Project.

Commenters assert that Public Resources Code section 5012 precludes State Parks from issuing the required approvals. Section 5012 authorizes State Parks to grant permits and easements to public agencies for utilities and public roads and to grant other utility easements or to perform a public service, upon application by the proper authorities. However, as the private Project Sponsor is not a public agency, this provision is not applicable.

Instead, real property transactions such as a sale of property, granting of an easement, or an acquisition of real property may be carried out by DGS on behalf of the State Parks with State Parks' approval, if the transactions meet statutory requirements.

Government Code section 14666 states: "With the approval of the state agency concerned, the [DGS] director may grant and convey in the name of the state, easements and rights-of-way across real property belonging to the state not used for highway rights-of-way or high-speed rail rights-of-way, for those purposes and upon that consideration and subject to those conditions, limitations, restrictions, and reservations as the director deems are in the interest of the state."⁵⁸ Thus, with the approval of State

⁵⁶ California Public Resources Code. 2017. Section 5003.17(d).

⁵⁷ Paying fair market value would ensure that the proposed Project does not receive a "gift" from the State or any of its political subdivisions in compliance with Article XVI, Section 6 of the California Constitution.

⁵⁸ California Government Code. 2014. Section 14666.

Parks, the DGS director may grant required easements and rights-of-way across LASHP for the proposed Project.

State Parks’ Considerations When Granting Approvals

Commenters raise several provisions of the Public Resources Code that provide directives to State Parks on how it should manage the State Park System.⁵⁹ State Parks will assess the proposed Project against its statutory authorities when the Project Sponsor seeks its approvals for use of LASHP from State Parks in the future. That said, as discussed in the Section 3.16, Parks and Recreational Facilities, and Section 3.11, Land Use and Planning, of the Draft EIR, the proposed Project would be consistent with the goals and guidelines of the LASHP General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation.

Section 5001 is the Legislative findings section of the Public Resources Code regarding the State Park System. It provides the broad declaration that state parks “deserve to be preserved and managed for the benefit and inspiration of all state residents and visitors to the state parks.”⁶⁰ As discussed in Section 3.11, Land Use and Planning, of the Draft EIR, the proposed Project is consistent with this goal by providing enhanced access and facilities so that even more residents and visitors can enjoy LASHP. As discussed in Table 3.11-1, Project Consistency with Applicable Los Angeles State Historic Park General Plan Policies, in the Draft EIR, the proposed Project

would provide a connection from the Los Angeles State Historic Park to other local transit lines along the proposed Project alignment and the regional transit system accessible at [Los Angeles Union Station]. Specifically, the Chinatown/State Park Station would provide transit access to the Los Angeles State Historic Park and to nearby neighborhoods and land uses, including Chinatown, Elysian Park, Solano Canyon, and the Mission Junction neighborhood, which includes the William Mead Homes public housing complex, and the Los Angeles River. The Chinatown/State Park Station would also include a mobility hub where passengers would be able to access a suite of first and last mile multi-modal options, such as a bike share program.

Public Resources Code section 5001.2 states that “[t]he director shall promote and regulate the use of the state park system in a manner that conserves the scenery, natural and historic resources, and wildlife in the individual units of the system for the enjoyment of future generations.”⁶¹ As discussed in Section 3.01, Aesthetics, Section 3.04, Biological Resources, and Section 3.05 Cultural Resources, of the Draft EIR, there are no significant and unavoidable impacts to aesthetics, biological resources, or cultural resources, related to the proposed Project’s use of the LASHP and the proposed Project will enhance the enjoyment of LASHP by providing increased access and visitor use facilities. See also Appendix H.2, Supplemental KOPs in Response to Comments, and Appendix G, Supplemental Biological Resources Report, of the Final EIR, and Appendix C, Visual Impact Assessment, Appendix E, Biological Resources Assessment, Appendix F, Archaeological and Paleontological Resources Assessment, and Appendix G, Historical Resources Technical Report, of the Draft EIR.

⁵⁹ See, e.g., California Public Resources Code Sections 5001, 5001.2, 5019.53, and 5019.59.

⁶⁰ California Public Resources Code. 2016. Section 5001.

⁶¹ California Public Resources Code. 2016. Section 5001.2.

As discussed in Section 3.11.3, Land Use and Planning, of the Draft EIR, Public Resources Code section 5019.59 permits facilities in historical units of the State Park system related to the safety, comfort, and enjoyment of the visitors, “such as access, parking, water, sanitation, interpretation, and picnicking.”⁶² The use of the term “such as” denotes that the list of allowable facilities is not exhaustive. But, in any event, it explicitly provides that facilities related to access are those types of facilities that are permitted. Commenters opine on the use of the word “required” in section 5019.59, arguing that because the proposed Project is not “required” to provide access, it is not an allowable use. However, the plain text of the section makes clear that the word “required” is describing the general types of uses that are allowed, such as access, and not describing every individual facility. If read as the commenters suggest, then no facilities would ever be allowed because no individual facility is “required.” Nothing in section 5019.59 would prohibit State Parks from issuing the necessary approvals for the proposed Project.

Section 5019.53 states that “[i]mprovements undertaken within state parks shall be for the purpose of making the areas available for public enjoyment and education in a manner consistent with the preservation of natural, scenic, cultural, and ecological values for present and future generations.”⁶³ The proposed Project will enhance LASHP by providing greater access, providing approximately 740 square feet of concessions, 770 square feet of restrooms, and a 220 square foot covered breezeway connecting the concessions and restrooms, providing a mobility hub where passengers would be able to access a suite of first and last mile multi-modal options, such as a bike share program. Pedestrian access improvements could include pedestrian improvements between Metro’s L Line (Gold) Station and Chinatown/State Park Station consistent with the Connect US Action Plan, including hardscape and landscape improvements, shade structures, and potential seating. These improvements could help to bring awareness of LASHP to thousands of people each year. Nothing in section 5019.53 would prohibit State Parks from issuing the necessary approvals for the proposed Project.

Provisions Cited By Commenters Allegedly Prohibiting State Parks From Granting Approvals Are Not Applicable

Commenters suggest certain other provisions of the Public Resources Code prohibit State Parks from granting the necessary approvals for the proposed Project’s use of LASHP. Commenters misconstrue those provisions of law.

Public Resources Code section 5003.5 provides State Parks with authority to “provide means of ingress to and egress from all state parks in order to provide ready access thereto by the public and to provide means of ingress and egress to highways and roads across state parks from lands separated from such highways and roads by state parks. . . .”⁶⁴ As a threshold matter, the proposed Project is not seeking to provide means of ingress and egress to highways and roads across state parks from lands separated from such highways and roads by state parks. Thus, State Parks does not need to “determine whether any reasonable access exists outside the boundaries of the park, or could be economically constructed.” Indeed, the only provision of Public Resources Code section 5003.5 that arguably applies to the proposed Project is the general authority provided to State Parks to “provide means of ingress to and egress from all state parks in order to provide ready access thereto by the public.” Because the proposed Project will

⁶² California Public Resources Code. 2001. Section 5019.59.

⁶³ California Public Resources Code. 2001. Section 5019.53.

⁶⁴ California Public Resources Code. 1959. Section 5003.5.

be providing a means of ingress to and egress from LASHP, section 5003.5 allows State Parks to authorize the proposed Project.

As discussed above, Public Resources Code section 5012 is also inapplicable to the proposed Project. Section 5012 permits State Parks to grant easements and permits for certain public utility and other public uses (e.g., roads, bicycle and pedestrian trails, etc.). However, this section does not prohibit other authorized types of easements, permits, and leases that are expressly permitted by other statutory grants as discussed above.

Commenters assert that the prohibition in Public Resources Code section 5001.65 on “commercial exploitation of resources in units of the state park system” categorically prohibits State Parks from issuing the required approvals for the proposed Project. This reading of section 5001.65 is incorrect. The State Legislature did not define “commercial exploitation” in section 5001.65, but the exceptions noted therein for oil or gas directional drilling, commercial fishing, taking of mineral specimens for recreational purposes from state beaches, state recreation areas, or state vehicular recreation areas indicate examples of commercial exploitation. Unlike some commenters’ assertion that section 5001.65 acts as a prohibition on all commercial *use* of the state park system, it is clear that the Legislature was focused on the commercial exploitation of tangible resources like minerals and biological resources that can be extracted from certain state lands.

Commenters’ broad reading of section 5001.65 would render moot various State Parks laws and regulations that explicitly allow commercial uses of the state park system with permits.⁶⁵ Indeed, commenters’ interpretation would prohibit the many commercial events (e.g., music festivals and farmers markets) that regularly occur at LASHP each year. (See, e.g., Draft EIR, § 5.5.2, Special Events at the Los Angeles State Historic Park [noting the LASHP hosts large events with up to 25,000 people and smaller monthly events of 500 to 5,000 people, including concerts, movie screenings, and festivals].)

As one commenter correctly notes, the Public Park Preservation Act is not applicable to the approvals that the proposed Project will seek from State Parks. The Public Park Preservation Act requires public entities which are acquiring public parkland to pay or transfer to the legislative body operating the park sufficient compensation or land to replace the park land that is being acquired. The Project Sponsor, which is not a public entity, is not seeking to “acquire” any real property that is public parkland for the proposed Project. Instead, the Project Sponsor is seeking land use approvals from State Parks to permit the proposed Project to use a portion of LASHP. Thus, the Public Park Preservation Act does not impose any requirements on the proposed Project and, as such, does not provide any informational value.

LASHP General Plan Amendment

As discussed in Section 3.11, Land Use and Planning, of the Draft EIR, the proposed Project’s Chinatown/State Park Station would be consistent with the goals and guidelines of the LASHP General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect.

⁶⁵ See, e.g., California Public Resources Code Section 5080.03 [permitting State Parks to enter concessions contracts with corporations] and 14 Cal. Code Regs. § 4316 [allowing commercial filming with a permit].

State Parks has determined that the proposed Project would be inconsistent with the LASHP General Plan because the identified land uses in the General Plan's Preferred Park Concept Elements did not contemplate a transit station like the proposed Project's Chinatown/State Park Station. State Parks considers this inconsistency a potentially significant impact. Therefore, Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain an amendment to the Los Angeles State Historic Park General Plan ("LASHP General Plan Amendment"). The LASHP General Plan Amendment proposes to amend the Preferred Park Concept Elements to include a "Transit" land use to allow for the proposed Project's use, as well as to address the state historic park classification as defined in Public Resources Code section 5019.59, which permits facilities for the comfort and enjoyment of the visitors, such as access. No other inconsistencies with LASHP General Plan policies were identified during the analysis, and therefore no other mitigation measures are required.

The LASHP General Plan Amendment, including any actions to address the state historic park classification as defined in Public Resources Code section 5019.59, is subject to the review and approval by the State Park and Recreation Commission, which retains its independent authority related to the proposed Project under Public Resources Code section 21174. Because the EIR analyzes all direct and indirect physical impacts to the environment associated with the permits and approvals outlined in Section 2.10, Required Permits and Approvals, of the Draft EIR, including the LASHP General Plan Amendment, the State Park and Recreation Commission will be able to rely on the EIR to support its discretionary action as a Responsible Agency pursuant to CEQA.

Consistency with the Transportation Theme of the Park

Metro and the Project Sponsor acknowledge the decades of planning and organizing that the community undertook to create a world-class park in the center of Los Angeles. This planning resulted in "a strong consensus around a vision for the Cornfield site incorporating four central themes: cultural-historical, including the role of water in the development of the region; connectivity; recreation; and transportation."⁶⁶

The LASHP General Plan identifies transportation as a "primary theme" of the park, recognizing the site's long history of transportation uses. The General Plan states: "The movement of people and products has enabled Los Angeles to become the megalopolis it is today. The Park site has been a route of transportation and commerce throughout its history. Located within bustling transportation and river corridors, the Park provides a place to reflect on the commercial and industrial activities that have shaped the city."⁶⁷

This transportation theme has been central to LASHP planning. The Cornfield State Park Advisory Committee was directed by Senate Bill 1177 to prioritize a list of recommendations for both interim and permanent land uses and facilities at the LASHP site. In April 2003, the Advisory Committee presented a recommendations report, "A Unified Vision for Cornfield State Park," to the State Parks Director, outlining a long-term vision and essential themes for park development, which included transportation.

⁶⁶ Cornfield State Park Advisory Committee. 2003. Recommendations Report. Available at: <https://www.parks.ca.gov/pages/21491/files/RecommendationsReport.pdf> (accessed August 2023).

⁶⁷ California State Department of Parks and Recreation 2005. Los Angeles State Historic Park General Plan and Final Environmental Impact Report. Available at: <https://lstatehistoricpark.org/wp-content/uploads/2021/07/LASHP-General-Plan.pdf> (accessed September 2023).

The Unified Vision for Cornfield State Park discussed the importance of transportation as a key theme of the park and how State Parks could incorporate this history into its planning for LASHP:

Transportation has long been prominently associated with the Cornfield site, from the railroads and trolleys in the recent past to the Gold Line currently under construction and the freeways that criss-cross the neighboring communities. ***Design could both recognize this history and embrace environmentally-friendly transportation systems within the Cornfield, its adjacent communities and all nearby cultural and recreational points of interest.***

Because pedestrian access has some limitations, shuttle buses, historic trolleys, and bike paths as well as walking paths should provide the basis for a “heritage trail” connecting other park or destination sites. The park could address the unique historical transportation linkages of the site through use, for example, of the rail cars from the age of steam and diesel at Traveltown, which would move back and forth as a linkage between the parks.

To address the traffic calming issue, park planning should also recognize safe passages to surrounding communities and pedestrian linkages, particularly in routing the commuter bikeway from the Valley into Union Station. ***Transportation within the park, whether pedestrian, equestrian, bicycle, transit, parking or national historical trails, should link up with systems outside the park.*** Transportation systems must be integral to park and recreation uses and designed in a manner consistent with retaining, to the maximum extent possible, land available for other park purposes.⁶⁸

Thus, while a transit use is not included in the Preferred Park Concept of the General Plan, “environmentally-friendly transportation systems within” the park that “link up with systems outside the park,” are consistent with the Park’s planning documents.

In summarizing the Park’s “unit classification,” the LASHP General Plan states:

This park’s historical significance transcends its historic uses and existing resources and is also linked to its role at the origin of Los Angeles’ meteoric rise from remote frontier community to 21st Century urban megalopolis and international economic power. Its association with the first public works project (*zanja madre*) and early agriculture, its donation to the Southern Pacific Railroad as enticement to bring the transcontinental link to Los Angeles in the 1870s, and its role as a pioneer and catalyst for the City and region’s unprecedented commercial, industrial, and social growth make it a unique place for tracing Los Angeles’ cultural history from its origins to today.⁶⁹

As a safe, zero emissions, environmentally-friendly, and high-capacity transit option which operates daily to link the Dodger Stadium property, Elysian Park, and the neighborhoods along the proposed alignment to the region’s rapidly growing regional transit system at LAUS, the proposed Project advances this

historical transportation theme while simultaneously providing the community a 21st century transportation option. In addition, the Chinatown/State Park Station would also include passenger amenities, including approximately 740 square feet of concessions, 770 square feet of restrooms, and a 220 square foot covered breezeway connecting the concessions and restrooms. The Chinatown/State Park Station would also include a mobility hub where passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program. Pedestrian access enhancements could include pedestrian improvements between Metro’s L Line (Gold) Station and the Chinatown/State Park Station consistent with the Connect US Action Plan, including hardscape and landscape improvements, shade structures, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge. The Chinatown/State Park Station would provide passenger access to Chinatown, LASHP, and to nearby neighborhoods and land uses, including the Mission Junction neighborhood, which includes the William Mead Homes public housing complex. Refer to Topical Response C, Project Features, for a discussion of the proposed Project’s features to enhance and provide additional benefits to LASHP and the surrounding communities.

Additionally, to honor and connect to the Park’s history even further, the Project Sponsor has committed to work with State Parks to develop an “Interpretation Plan” to identify unique ways to use the proposed Project to provide additional interpretation at the park, particularly aimed at a diverse visitor community. The Interpretation Plan would be a strategic document that outlines the key elements required to design and implement interpretation programs associated with the proposed Project. The goal of this plan is to develop a program that will provide all visitors with an engaging and informative experience that will enhance their understanding and appreciation of LASHP’s culture and history. The Interpretation Plan will include a detailed description of the history and significance of LASHP and will assess the existing interpretive resources within the Park. Based on this analysis, the Interpretation Plan will outline the overarching goals and objectives of the interpretation program, as well as the key themes and messages that will be conveyed to visitors.

The Interpretation Plan would also include a detailed description of the interpretive media and methods that will be used to deliver these messages effectively. This may include signage, exhibits, audiovisual presentations, guided tours, and other interactive experiences.

Overall, the Interpretation Plan will help ensure that the proposed Project is a benefit to LASHP by providing visitors with an engaging and informative experience that deepens their understanding and appreciation of LASHP’s culture and history with regard to the history of transportation within and around Los Angeles. And while the proposed Project deepens the Park’s connection to its transportation theme, it has been designed to avoid impacts to the other themes—recreation, cultural-historic, and connectivity—by careful siting and collaboration with State Parks. The Park will remain a green space to gather for small (family picnics and quiet walks) and large functions (community programming and festivals) alike.

LASHP General Plan EIR Mitigation Measure

Some commenters claim that the proposed Project is “disregarding” or “modifying” an adopted mitigation measure in the LASHP General Plan EIR. The referenced mitigation measure (Aes-1) requires State Parks

to review potential aesthetic quality impacts associated with new facilities and implement design practices that reduce those facilities' overall negative aesthetic effect.

The proposed Project does not “disregard” or “modify” this mitigation measure, which applies to State Parks' actions and does not apply to the proposed Project.

But, in any event, the Project Sponsor has been working cooperatively with State Parks to avoid or minimize impacts, including aesthetic impacts to LASHP, thus helping State Parks meet its obligations pursuant to this mitigation measure.

Indeed, in response to LASHP stakeholders' comments on the proposed Project's Notice of Preparation and discussions with State Parks, the following design considerations have been incorporated into the proposed Project to minimize the aesthetic effect of the proposed Project on LASHP:

- Unlike the Spring Street Alignment Alternative, studied in Section 4.0, Alternatives, of the Draft EIR, where cables and cabins associated with the proposed Project would be visible over the middle of the Park, the proposed Project alignment crosses over the westernmost edge of the LASHP, parallel to an existing access road and overhead utility lines on North Broadway, and adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system to reduce visual and operational impacts to LASHP.⁷⁰
- Also, unlike the Spring Street Alignment Alternative, where there would be a station in the middle of LASHP, the Chinatown/State Park Station would be located adjacent to Spring Street in the southernmost portion of the Los Angeles State Historic Park. The southern portion of the station would be located on City ROW, while the northern portion of the station would be integrated into the southern boundary of the Los Angeles State Historic Park. Any impacted trees will be relocated or replaced in coordination with State Parks. The location of the Chinatown/State Park Station also avoids adjacent private properties while maintaining transit access to surrounding communities within a half mile walkshed to transit, including the LASHP, Chinatown, Mission Junction including William Mead Homes, Los Angeles River, and North Broadway.
- The Project Sponsor worked with State Parks to select the site for the Chinatown/State Park Station to improve and balance pedestrian flow into the park, and to determine what other improvements would further enhance the visitor experience.
- To soften the visual effect of the Chinatown/State Park Station on LASHP, the size and scale of the station were reduced.
- The Draft EIR provides support for the future Los Angeles State Historic Park pedestrian bridge, the potential for which was analyzed in the LASHP General Plan and Final EIR. While the pedestrian bridge is not proposed as part of the proposed Project, the Draft EIR includes an

⁷⁰ The Notice of Preparation (“NOP”) for the proposed Project included two alternative alignments, for providing transit service adjacent to (the Broadway Alternative), and flying over (the Spring Street Alternative) the LASHP. Several comments on the NOP requested an intermediate station closer to Chinatown to bring business into the commercial area and to offer another travel mode choice so as to alleviate parking problems in the area, rather than the intermediate station proposed under the Broadway Alternative (now the “Broadway Station Alignment Alternative”). And a majority of commenters expressed a preference for the proposed Project alignment over the Spring Street Alternative (now the “Spring Street Alignment Alternative”), to avoid flying over the middle of the LASHP. (See Appendix A, Scoping Report, of the Draft EIR, Attachment F, for copies of written comments submitted during the public scoping period, and a verbatim transcript of comments received during the scoping meeting).

analysis of the pedestrian bridge for the LASHP as Design and Use Option E. The pedestrian bridge could provide much needed access to LASHP for neighborhoods at the park’s northern boundary.

- Project lighting would include low-level lighting for security and wayfinding purposes. Exterior lighting would be shielded or directed toward the areas to be lit to limit spillover onto adjacent properties and off-site uses, and would meet all applicable Los Angeles Municipal Code lighting standards.
- Chinatown/State Park station would include the installation of landscaping and hardscaping, including integration of, rather than removing, the existing historic granite pavers into the design.
- All utilities for the proposed Project will be underground.

Spring Street Alignment Alternative

Proposed Project Alignment

The proposed Project’s aesthetic impacts were evaluated in Section 3.01, Aesthetics, of the Draft EIR, supported by a comprehensive Visual Impact Assessment included in Appendix C of the Draft EIR. The Aesthetics Section of the Draft EIR and Visual Impact Assessment each specifically addressed and disclosed potential impacts on existing viewsheds and changes in the visual environment from within the LASHP. The Draft EIR concluded that the proposed Project would result in less than significant impacts to aesthetics and visual resources.

TOPICAL RESPONSE G**No Improper Project Segmentation: The Proposed Project is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property**

Comments on the Draft EIR suggest that the proposed Project was improperly segmented or “piecemealed” from a larger development project at the Dodger Stadium property. The purpose of the proposed Project is to create a permanent transit connection from the region’s transportation hub at Los Angeles Union Station (“LAUS”) to the Dodger Stadium property via an aerial gondola system. The City of Los Angeles has approved the Dodger Stadium property only for the Major League Baseball stadium and ancillary uses and structures as set forth in the Conditional Use Permit (“CUP”) for the Dodger Stadium property, including transit, and no other purposes. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. No improper segmentation has occurred and the independent utility of the proposed aerial gondola project -- the first permanent transit connection to one of the region’s most visited venues – has been well established.

The Proposed Project Addresses the Need for a Permanent Transit Connection to Dodger Stadium for Dodger Games and Special Events at the Dodger Stadium Property

As described in Section 2.0, Project Description, of the Draft EIR, the proposed Project would connect LAUS, the region’s transportation hub, to the Dodger Stadium property via an aerial gondola system. The construction on the Dodger Stadium property for the proposed Project is limited to project components and related improvements, such as pedestrian circulation facilities, proposed in connection with the aerial gondola system. The proposed Project would provide the first permanent transit link to Dodger Stadium.

As discussed in Section 2.0, Project Description, of the Draft EIR, Dodger Stadium is one of the region’s most visited venues; the average attendance at a Dodger game was approximately 49,000 for the 2019 season. The vast majority of visitors drive their personal vehicles to access the venue. As the third oldest continually used ballpark in Major League Baseball, Dodger Stadium has hosted more than 147 million fans since its opening in 1962. In 2022, over 3.7 million visitors attended Dodger games. Annual attendance has surpassed 3 million visitors in 9 of the last 11 years (excluding 2020 and 2021 where attendance was limited due to the pandemic).⁷¹ Dodger Stadium is the largest MLB stadium in terms of capacity, with approximately 56,000 seats. In addition to MLB games, other special events are hosted at Dodger Stadium throughout the year. As discussed in Section 2.3.7, Purpose and Need, in Section 2.0, Project Description, of the Draft EIR, Dodger Stadium is one of the region’s most visited venues, with approximately 100 baseball games and other events each year. However, there are no permanent transit connections to the venue. Other high-capacity venues in the region are directly accessible by public transit.⁷² As such, the proposed Project addresses the increased need for Dodger Stadium to obtain a

⁷¹ See Dodger Blue, Dodgers Attendance During 2022 Extended MLB Leading Streak (Oct. 7, 2022), <https://dodgerblue.com/dodgers-attendance-during-2022-season-extended-mlb-leading-streak/2022/10/07> (accessed September 20, 2023).

⁷² As discussed in Section 2.3.7, Purpose and Need, in Section 2.0, Project Description, of the Draft EIR, other high-capacity venues in the region include the Crypto.com Arena, which hosts the Los Angeles Lakers and Los Angeles Clippers professional basketball teams and Los Angeles Kings professional hockey team; the Los Angeles Memorial Coliseum, which hosted the Los Angeles Rams professional football team between 2016 and 2019 and hosts the University of Southern California collegiate athletic events; and the BMO Stadium, home to the

permanent transit connection. Given the capacity of the system, approximately 20 percent of fans attending a Dodger game could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. In addition, the proposed Project would provide new connections to and between currently underserved neighborhoods and uses along the proposed alignment, including Chinatown, Mission Junction, the Los Angeles State Historic Park, Elysian Park, and Solano Canyon.

Accordingly, the proposed Project has a clearly defined transportation purpose and independent utility through its ability to address a regional need to provide a permanent transit connection to Dodger Stadium, while also providing new connections to neighborhoods along the proposed alignment to the region’s rapidly growing regional transit system.

Overview of Improper Segmentation of a Project Under CEQA

CEQA requires a public agency to consider “the effects, both individual and collective, of all activities involved in a project.”⁷³ The CEQA Guidelines explain that “project” refers to the “whole of an action, which has the potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect change in the environment.”⁷⁴ The Guidelines further state that “[w]here an individual project is a necessary precedent for action on a larger project, or commits the lead agency to a larger project, with significant environmental effect, an EIR must address itself to the scope of the larger project.”⁷⁵ However, analysis of a larger project is not required without evidence that a larger project exists or that there is an intention to proceed with a larger, more grandiose project in the future.

The proposed Project has independent utility to connect LAUS to Dodger Stadium for games and event days, as well as providing an additional transit option in areas that are currently underserved. Accordingly, the proposed Project serves its own distinct purpose to connect the region’s transportation hub to one of the region’s most visited venues, serving the needs of existing stadium event attendees as well as the surrounding communities. A lead agency is not required to analyze a broader scheme or otherwise attribute a motive to an applicant based on speculation from commenters regarding a potential future action. Evaluation of future environmental effects should wait for the decisions that could cause those effects.

There is no proposal for development of, nor is there any commitment to develop, the property surrounding Dodger Stadium, through plans, or financing. The proposed Project is not a necessary precedent for an action or larger project, and has not committed Metro or any other agency to any future action related to a larger project. The proposed Project is solely comprised of an aerial gondola system connecting LAUS to Dodger Stadium and associated improvements. Accordingly, the Draft EIR did not engage in improper piecemealing in its analysis of the proposed Project.

Los Angeles Football Club (LAFC). These venues are accessible directly by public transit, including the Metro A Line (Blue) and E Line (Expo). Additionally, the new SoFi Stadium in Inglewood, which began hosting the Los Angeles Rams and Los Angeles Chargers professional football teams in 2020, will be accessible via a planned people mover connecting the future Metro Crenshaw/LAX line station to the stadium.

⁷³ California Public Resources Code, 1970, Section 21002.1(d).

⁷⁴ CEQA Guidelines, Section 15378(a).

⁷⁵ CEQA Guidelines, Section 15165.

The Dodger Stadium Property Is Approved Only for Dodger Stadium and Ancillary Uses and Structures, and Restrictive Designations and Zoning Are Not Consistent With the Uses Speculated by Commenters

The proposed Project does not include or request environmental clearance for any actions required to enable development beyond the Stadium Tower and Dodger Stadium Station and other aerial rapid transit system components on the Dodger Stadium property. As discussed in Section 3.11, Land Use and Planning, of the Draft EIR, on August 4, 1960, the City of Los Angeles approved a CUP for the Dodger Stadium property, which allows the operation of the 56,000-seat capacity Major League Baseball stadium and various ancillary uses and structures, as set forth in the CUP for the Dodger Stadium property. In addition, CUP Condition 4 provides for collaboration “in devising mass transportation service to the Stadium site which will be sufficiently efficient to encourage patronage thereof and thus reduce the number of private automobiles driven to the Stadium events.”

The zoning for the Dodger Stadium property is A1-1XL (Agriculture), allowing for agricultural uses with an Extra Limited Height of two stories or 30 feet. The City of Los Angeles Municipal Code (“LAMC”) only allows for single-family dwellings, parks or playgrounds, golf courses, farming, the keeping of livestock, or “any other similar uses or enterprises customarily carried on in the field of general agriculture and not obnoxious or detrimental to the public welfare.”⁷⁶ The Dodger Stadium property is designated as Open Space under the City of Los Angeles General Plan and Silver Lake-Echo Park-Elysian Valley Community Plan.

The Project Sponsor may seek a Plan Approval under the existing CUP to allow for the Stadium Tower and Dodger Stadium Station, including an exception from the site’s 1XL (Extra Limited Height) district designation for the proposed Stadium Tower and Dodger Stadium Station, which would exceed the 1XL district designation limits. In addition, the Project Sponsor is seeking to create a Specific Plan along the proposed Project alignment pursuant to LAMC section 11.5.7 to provide for consistent application of Project design standards, limitations, and operational measures. As noted above, CUP Condition 4 provides for collaboration “in devising mass transportation service to the Stadium site which will be sufficiently efficient to encourage patronage thereof and thus reduce the number of private automobiles driven to the Stadium events.” As such, with approval of the amendments to the zoning code and/or the Plan Approval, development of the Stadium Tower and Dodger Stadium Station would not conflict with the applicable LAMC requirements at the time of proposed Project implementation. The proposed Project does not request any other amendments or exceptions to the Dodger Stadium Property’s zoning.

The purported “future” development that commenters suggest is contemplated at Dodger Stadium, such as office, retail, hotel, and residential buildings, would require additional City designations and zoning, permits and approvals, including potentially, environmental review, that are not contemplated or analyzed in the Draft EIR because no such development is proposed.

⁷⁶ City of Los Angeles. 2010. Los Angeles Municipal Code Section 12.05. Available at: https://codelibrary.amlegal.com/codes/los_angeles/latest/lapz/0-0-0-1578 (accessed August 2023).

“Next 50” Project From 2008

Comments on the Draft EIR refer to Dodger Stadium-related uses and structures proposed in 2008, over 15 years ago, by former Los Angeles Dodgers owner Frank McCourt, referred to as the “Next 50” Project. The City issued a Notice of Preparation for the Dodger Stadium: The Next 50 Years Project in 2008.⁷⁷ The then-proposed Next 50 Project sought to “provide new fan and cultural amenities, improve the ease of pedestrian circulation around the Stadium, and create a destination for fans to gather at Dodger Stadium.” Proposed improvements included a grand entry to Dodger Stadium, including a plaza and promenade; a Dodger museum, dining, retail, and ticketing enhancements, and Dodger offices; a “Green Necklace,” comprised of an outdoor concourse with landscaping and pedestrian circulation around the Stadium; a landscaped plaza, converted from the existing surface parking area; and parking improvements. The Next 50 Project did not proceed after 2008, and the current owners of the Los Angeles Dodgers purchased the team and Dodger Stadium in 2012. Accordingly, the Next 50 Project is not required to be included as a related project in the Draft EIR or analyzed as part of the proposed Project in Draft EIR.

The current Los Angeles Dodgers owners obtained an approval from the City of Los Angeles in 2019 for the Dodger Stadium Centerfield Project,⁷⁸ which included a new front door to Dodger Stadium – the Centerfield Plaza; new concession and retail areas; new landscaping and pedestrian circulation around the Stadium perimeter; and upgraded circulation throughout the Stadium to improve overall accessibility, security, and ease of movement. The Dodger Stadium Centerfield Project was completed in 2020 prior to the issuance of the Notice of Preparation for the proposed Project. Accordingly, the Dodger Stadium Centerfield Project was not required to be included as a related Project in the Draft EIR or analyzed as part of the proposed Project in the Draft EIR.

As noted above, and as discussed in Section 3.11, Land Use and Planning, of the Draft EIR, the Dodger Stadium property is subject to a CUP, which allows the operation of the 56,000-seat capacity Major League Baseball stadium and various ancillary uses and structures as set forth in the CUP, including the improvements in the Dodger Stadium Centerfield Project. Such ancillary uses and structures are consistent with fan amenities at many Major League Baseball stadiums.

Dodger Stadium CC&Rs From 2012

Comments on the Draft EIR state that the Declaration of Covenants, Conditions, Restrictions and Easement for Chavez Ravine (“CC&Rs”) demonstrate that the proposed Project was “piecemealed” from a larger development project at the Dodger Stadium property. This is not true.

Covenants, Conditions, and Restrictions are legally binding and officially recorded documents frequently used to address the rights and obligations of adjacent property owners. The purpose of the CC&Rs, which were recorded on May 1, 2012, was to address the rights and obligations of the owner of Dodger Stadium and the owner of the parking areas surrounding the Stadium, including most notably as to the Los Angeles Dodgers use of the parking areas as parking for Dodger Stadium attendees. The adoption of the CC&Rs over a decade ago does not constitute a currently proposed development project at the Dodger Stadium property; rather, as is customary, the CC&Rs provide regulations and standards to maintain the existing

⁷⁷ See City of Los Angeles Notice of Preparation for Dodger Stadium: The Next 50 Years, issued on June 16, 2008 (ENV-2008-1659-EIR).

⁷⁸ Dodger Stadium Centerfield Project (City of Los Angeles Council File 19-1096; CPC-1999-0157-PAD-PAS).

stadium uses, including parking, if approvals are sought for additional improvements by the owner of the parking areas. No such development is proposed and no environmental analysis is required of the speculations of commenters. The CC&Rs establish procedures in connection with the rights and obligations of the owner of Dodger Stadium and the owner of the parking areas surrounding the Stadium.

Moreover, similar to the Dodger Stadium CUP provision regarding collaboration for mass transportation service to the Dodger Stadium property, the CC&Rs include a provision for the owner of Dodger Stadium and the owner of the parking areas to cooperate in connection with a proposal for mass transportation to the Dodger Stadium property, which would allow for easier and more efficient public access.

Commenters have also pointed out a provision of the CC&Rs providing that in connection with mass transportation to the Dodger Stadium property, the required number of 16,500 parking spaces established by the Dodger Stadium CUP and the CC&Rs could be reduced. However, the proposed Project is not seeking any reduction of parking spaces below the required number of 16,500 parking spaces. As described in Section 3.11, Land Use and Planning, of the Draft EIR, there are currently a total of 18,889 parking spaces on the Dodger Stadium property, and the proposed Project would remove approximately 194 parking spaces for the Dodger Stadium Station and its pedestrian connection to Dodger Stadium, along with associated hardscape and landscape improvements. Therefore, the proposed Project's transit improvements on the Dodger Stadium property are consistent with both the Dodger Stadium CUP and the CC&Rs.

TOPICAL RESPONSE H**The Draft EIR Considered an Appropriate Range of Alternatives and Design Options**

Comments on the Draft EIR address the range of alternatives studied in the Draft EIR. Commenters state that the Draft EIR failed to consider a reasonable range of alternatives. The Draft EIR considered a range of reasonable alternatives to the proposed Project in compliance with CEQA and the CEQA Guidelines.

Comments on the Draft EIR also address the Transportation Systems Management (“TSM”) Alternative for an enhanced Dodger Stadium Express. Commenters state that the study of the TSM Alternative must be revised and that the TSM Alternative should be pursued instead of the proposed Project. The TSM Alternative is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Commenters also suggest that the TSM Alternative should have considered electrification of the TSM Alternative buses, or considered expanding bus service from other locations in order to bolster the TSM Alternative’s potential benefits. Regardless of whether the shuttle buses would be electrified, the operational issues associated with substantially expanding the Dodger Stadium Express service would remain. Further, improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. Moreover, the TSM Alternative is not a permanent transit connection as bus routes and operations are frequently modified and/or eliminated due to fiscal and ridership issues.

Comments on the Draft EIR also suggest that the inclusion of Design and Use Options render the Project Description unstable. To the contrary, the proposed Project is described consistently throughout the entire Draft EIR, clearly identifying the proposed Project’s potential environmental impacts. In turn, Section 6.0, Design and Use Options, of the Draft EIR, includes design and use options responsive to public comments and stakeholder feedback and describes how environmental impacts from implementation of each design and use option would differ from the proposed Project’s potential environmental impacts described in the Project Description and analyzed in Section 3.0, Environmental Analysis, of the Draft EIR, with respect to the particular project component variation. The design and use options provide flexibility for decision makers to potentially adopt one or more minor variations to the components of the proposed Project should the decisionmaker determine such a minor variation is desirable as part of the proposed Project.

The Draft EIR Considered a Range of Reasonable Alternatives

Public Resources Code sections 21001(g), 21002.1(a), and 21061 require that an EIR identify alternatives to a proposed project. CEQA Guidelines section 15126.6(a) expands on the statute by stating that an EIR must include a “reasonable range” of alternatives to the project “which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project.” Likewise, CEQA Guidelines section 15126.6(f)(2)(A) further clarifies that an EIR is not required

to analyze alternatives that would not eliminate or substantially reduce significant adverse effects. An agency's selection and consideration of alternatives is governed by a "rule of reason."⁷⁹ An agency need not consider "every conceivable alternative" and may determine how many is a reasonable range.⁸⁰

Alternatives Analyzed in the Draft EIR

The alternatives analyzed in the Draft EIR, which are the No Project Alternative, the Spring Street Alignment Alternative, and the Transportation Systems Management ("TSM") Alternative, represent a reasonable range of potentially feasible alternatives that could reduce one or more significant impacts of the proposed Project. As presented in the Draft EIR, two project alternatives, as well as a "No Project" alternative, were described and compared with each other (including a comparison of major characteristics and significant environmental effects of each alternative) and with the proposed Project. Table 4-1, Alternatives Conformance with Objectives, and Table 4-3, Alternative Impact Comparison, in Section 4.0, Alternatives, of the Draft EIR, provide a comparison of the proposed Project, the proposed Project alternatives' impacts, and the proposed Project alternatives' ability to meet the Project Objectives.

The Draft EIR considers a reasonable range of alternatives that can feasibly accomplish most of the basic Project Objectives and could avoid or substantially lessen one or more of the significant effects. Alternatives that would impede, to some degree, the attainment of the Project Objectives, or would be more costly, also were considered. As required by CEQA, the alternatives analysis in Section 4.0, Alternatives, of the Draft EIR, included evaluation of the No Project Alternative in order to determine the consequences of not implementing the proposed Project.⁸¹ CEQA also requires that an EIR identify the "environmentally superior alternative" from the range of reasonable alternatives that are evaluated; if the "environmentally superior alternative" is the "No Project" alternative, the EIR must identify an "environmentally superior alternative" among the other alternatives. The Draft EIR adequately identifies and analyzes a reasonable range of alternatives in full compliance with CEQA's requirements.

As discussed in Section 4.2, Alternatives Development Process, of Section 4.0, Alternatives, of the Draft EIR, pursuant to CEQA Guidelines section 15126.6(d), discussion of each alternative presented in the Draft EIR was intended to "allow meaningful evaluation, analysis, and comparison with the proposed project," and each alternative was "evaluated in sufficient detail to determine the overall environmental impacts would be less than, similar to, or greater than the corresponding impacts of the proposed Project" and was "evaluated to determine whether the proposed Project objectives . . . would be mostly attained by the alternative pursuant to CEQA Guidelines Section 15126.6(c)." Evaluation of each of the alternatives included a description of the alternative, the environmental impacts of the alternative before and after implementation of reasonable mitigation measures for each environmental topic area, and the environmental impacts of each alternative as compared to the proposed Project, followed by a general discussion of the extent to which the underlying purpose and project objectives are obtained by the alternative.

⁷⁹ CEQA Guidelines, Section 15126.6(a); see also id., Section 13053.5(a).

⁸⁰ Id., Section 15126.6(a).

⁸¹ See CEQA Guidelines Section 15126.6(e).

Alternatives Considered but Dismissed from Detailed Analysis

In compliance with CEQA Guidelines section 15126.6(c), Section 4.2.1, Alternatives Considered but Dismissed from Detailed Analysis, in Section 4.0, Alternatives, of the Draft EIR, identifies alternatives that the Lead Agency considered but dismissed as infeasible during the scoping process, providing the reasons underlying this determination. Among the factors that may be used to eliminate alternatives from detailed consideration in the EIR are:

- i. Failure to meet most of the basic project objectives,
- ii. Infeasibility, or
- iii. Inability to avoid significant environmental impacts.⁸²

Section 15126.6(f)(1) of the CEQA Guidelines states that “among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries, and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (or the site is already owned by the proponent).” None of these factors establish a fixed limit on the scope of reasonable alternatives or a particular number that the Draft EIR was required to analyze.

Section 4.2.1, Alternatives Considered but Dismissed from Detailed Analysis, in Section 4.0, Alternatives, of the Draft EIR, considered five potential alternatives, including alignment and station location alternatives and direct alignment alternatives. In accordance with CEQA Guidelines section 15126.6(f)(2), the Draft EIR declined to carry forward an analysis of the alternative locations studied in the direct alignment alternatives, as such alternatives failed to avoid significant environmental impacts and otherwise would not meet the Project Objectives, and the Project Sponsor would likely be unable to reasonably acquire, control, or otherwise have access to alternative sites required for the direct alignment alternatives. Among the failure to meet other Project Objectives, the direct alignment alternatives would not maximize the use of public ROW and publicly owned properties while minimizing use of aerial rights over private properties. As discussed on pages 4-10 to 4-15 of Section 4.0, Alternatives, of the Draft EIR, the two alignment and station location alternatives were not carried forward for a more detailed analysis because they failed to avoid significant environmental impacts and otherwise would not meet the Project Objectives.

No Project Alternative

Pursuant to CEQA Guidelines section 15126.6(e), pages 4-18 to 4-25 in Section 4.0, Alternatives, of the Draft EIR, provide an analysis of a “No Project Alternative,” in order to provide a comparison between the environmental impacts of implementing the proposed Project in contrast to those resulting from not approving, or denying, the proposed Project. The No Project Alternative would avoid potentially significant impacts to all environmental considerations and would have no impact, as the proposed Project would not occur, and the environment would remain in its existing condition. However, environmental benefits through the proposed Project’s ability to reduce vehicle miles, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel, and to

⁸² CEQA Guidelines, Section 15126.6(c).

implement LID source control and BMPs to minimize water runoff and water pollution would not be realized. The No Project Alternative would be unable to meet any of the Project Objectives, as summarized in Table 4-1, Project Objective Conformance, in Section 4.0, Alternatives, of the Draft EIR.

Spring Street Alignment Alternative

Similar to the proposed Project, the Spring Street Alignment Alternative would provide an aerial rapid transit option for visitors to Dodger Stadium, while also providing access between Dodger Stadium, the surrounding communities, and the regional transit system accessible at LAUS. The Spring Street Alignment Alternative would include three stations, a non-passenger junction, and four cable-supporting towers at various locations along the alignment. The Spring Street Alignment Alternative would include the following components in common with the proposed Project: Alameda Station, Alameda Tower, Alpine Tower, Stadium Tower, and Dodger Stadium Station. In addition to these components, the Spring Street Alignment Alternative would also include the following components that would be unique to this alternative: Spring Street Junction, State Historic Park Station, and Bishops Tower. A detailed description and impacts analyses of the Spring Street Alignment Alternative's proposed alignment are provided in Section 4.2.2.2, Spring Street Alignment Alternative, of Section 4.0, Alternatives, of the Draft EIR.

Although the Spring Street Alignment Alternative would be consistent with the Project Objectives, it would require a larger footprint than the proposed Project within the Los Angeles State Historic Park. The proposed Project's Chinatown/State Park Station location was chosen over the other potential locations, including State Historic Park Station location as part of the Spring Street Alignment Alternative, because it would minimize the proposed Project's potential footprint within the Los Angeles State Historic Park while maintaining transit access to the park and surrounding communities and is closer to the Metro L Line (Gold) Station. As such, the Spring Street Alignment Alternative would not meet the following objective to the same extent as the proposed Project, and therefore, is considered to be only partially consistent with Objective 11 to "Minimize the Project's environmental footprint through the integration of sustainability and environmentally-friendly design features into the materials, construction, operations, and maintenance of the proposed Project."

As discussed in Section 4.0, Alternatives, of the Draft EIR, the Spring Street Alignment Alternative could result in additional sources of light and glare and shading due to the additional proposed Project components, although impacts would be less than significant. In addition, although the State Historic Park Station would be at a location not previously analyzed, this station would have similar levels of construction as the proposed Project. Potential environmental impacts of the Spring Street Alignment Alternative would generally be similar to the proposed Project, as shown in Table 4-3, Alternative Impact Comparison, in Section 4.0, Alternatives, of the Draft EIR.

Dodger Stadium Express | TSM Alternative

Under the Transportation Systems Management (TSM) Alternative, the proposed Project would not be constructed, and, instead, the existing Union Station Dodger Stadium Express service would be enhanced to increase capacity.

In order to meet service frequencies similar to the proposed Project, a minimum of 6 buses loading simultaneously would be required, which cannot be physically accommodated in the existing location for

the Union Station DSE, and an off-site loading facility would need to be constructed to accommodate the new level of bus activity. Furthermore, the existing Dodger Stadium Express service operates up to 8 buses per hour, while the TSM Alternative would require 77 buses per hour.

In addition to a new off-site loading facility, operational changes would be required on surrounding streets to accommodate the increased congestion from the TSM Alternative. Additional loading facilities would also be required at Dodger Stadium, including dedicated bus only lanes, to accommodate the increased level of Dodger Stadium Express service.

The TSM Alternative was identified as the “environmentally superior alternative” among the alternatives evaluated in the Draft EIR because it would avoid the proposed Project’s significant and unavoidable impact with respect to construction noise and vibration without the need for mitigation, and would reduce the range of impacts to the greatest extent listed in Table 4-3, Alternative Impact Comparison, in Section 4.0, Alternatives, of the Draft EIR. However, as discussed in Section 4.1.3, Project Alternatives and Conformance with Objectives, in Section 4.0, Alternatives, of the Draft EIR, the TSM Alternative would not meet the majority of the Project’s Objectives in full or in part, such as providing a direct transit connection between LAUS and the Dodger Stadium property via an aerial rapid transit system and improving connectivity for the surrounding communities by linking to the Los Angeles State Historic Park, Elysian Park, and the region’s rapidly growing regional transit system at LAUS.

Specifically, the TSM Alternative would fail to fulfill the following Project Objectives because it is not an aerial rapid transit system and otherwise does not offer a unique experience to riders, and would not enhance community connectivity or park access:

- **Objective 2:** Attract new transit riders to the Metro system through a unique experience connecting to Dodger Stadium.
- **Objective 7:** Improve transit rider experience by providing unique scenic views of the Los Angeles area to ART passengers and Dodger fans.
- **Objective 8:** Bring a world class aerial transit system to the Los Angeles area.
- **Objective 9:** Enhance community connectivity by providing first/last mile transit and pedestrian access to areas that have historically been underserved, including the Los Angeles State Historic Park and Elysian Park.
- **Objective 10:** Identify comparable, affordable, and accessible fare opportunities for community and Los Angeles State Historic Park and Elysian Park access.
- **Objective 12:** Provide a sustainable form of transit by operating the ART system with the use of zero emission electricity with battery storage backup in order to reduce GHG emissions and improve air quality.

In addition, as discussed in Section 4.1.3, Project Alternatives and Conformance with Objectives, in Section 4.0, Alternatives, of the Draft EIR, the TSM Alternative would not meet the following Project Objectives to the same extent as the proposed Project, as while it would provide a connection to Dodger Stadium, it would not provide a faster or more efficient alternative compared to the proposed Project,

and while it would transition private vehicles to DSE buses, the TSM Alternative would still operate vehicles on the roadway, thereby contributing to VMT and some congestion:

- **Objective 1:** Expand mobility options for transit riders through a direct connection between LAUS and Dodger Stadium, a regional event center.
- **Objective 3:** Improve the Dodger Stadium visitor experience by providing efficient, high-capacity, and faster alternative access to Dodger Stadium.
- **Objective 4:** Enhance safety of neighborhoods adjacent to Dodger Stadium by reducing the number of vehicles in the area.
- **Objective 5:** Reduce transportation related pollution and greenhouse gas (GHG) emissions as a result of reduced vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.
- **Objective 6:** Increase connectivity of people to the region’s public transportation hub at LAUS and the Dodger Stadium property.

The Draft EIR Provided Sufficient Analysis to Show that Expansion/Enhancement of the Existing Dodger Stadium Express Would Not Provide Similar Benefits Without Negative Impacts

Comments state that expansion and/or enhancement of the existing Dodger Stadium Express bus service would provide similar benefits of the proposed Project but without potential negative impacts. Comments further state that the Draft EIR should have analyzed the TSM Alternative as the proposed Project.

The Draft EIR included a detailed discussion of the transportation implications of the TSM Alternative on pages 4-60 through 4-63 and on pages 4-70 through 4-73, in Section 4.0, Alternatives, of the Draft EIR in order to allow meaningful evaluation, analysis, and comparison with the proposed Project. This analysis was supported by discussion with Metro’s expert tasked with managing the Dodger Stadium Express. Further, this expert is intimately familiar with contract services bus operations, including the Dodger Stadium Express and the SoFi Stadium shuttles.⁸³ As described on page 4-60, in Section 4.0, Alternatives, of the Draft EIR, 77 bus trips per hour would be needed to provide the equivalent passenger-carrying capacity of the proposed Project, a significant increase from the eight bus trips per hour that the Dodger Stadium Express currently uses. A number of issues are identified and evaluated in the Draft EIR regarding the difficulty and/or negative impacts of providing a substantial increase in Dodger Stadium Express service levels, whether as a result of the 77 bus trips per hour (equivalent to capacity of the proposed Project) or even to a lesser level of service:

- As discussed on page 4-60, of Section 4.0, Alternatives, of the Draft EIR, even at the current level of LAUS DSE operation, Metro has already moved the loading zone for the existing DSE numerous times in response to operational challenges encountered over many years of operating the Dodger Stadium Express. Metro staff have studied ways to facilitate multiple buses loading simultaneously and have found that there is insufficient curb loading capacity currently at LAUS.

⁸³ As noted on pages 4-60 and 4-62 in Section 4.0, Alternatives of the Draft EIR, the analysis was informed by personal communication with Mr. George Del Valle, Principal Transportation Planner, Metro Contract Services, on May 31, 2022.

- Loading and unloading 77 buses in a timely and efficient manner would require a substantially larger loading zone. As discussed on pages 4-60 and 4-61 and shown on Figure 4-13 on page 4-62, of Section 4.0, Alternatives, of the Draft EIR, the approximate footprint of a dedicated loading zone would need to be approximately as large as the shuttle bus loading facility at SoFi Stadium in the City of Inglewood. The Draft EIR identified the top deck of the Metro Division 13 bus maintenance facility as a potential site given its similar size.
- As discussed on page 4-61 of Section 4.0, Alternatives, of the Draft EIR, use of Division 13 would cause considerable disruption to existing Metro transit operations, which use the facility not only for Division 13 maintenance but also for bus layovers supporting bus services in Patsaouras Plaza.
- As discussed on pages 4-61 and 4-72 of Section 4.0, Alternatives, of the Draft EIR, use of Division 13 would extend the transfer walking time for passengers and would cause a substantial increase in vehicle/pedestrian conflicts since the riders of the enhanced Dodger Stadium Express (upwards of 5,000 additional pedestrians per hour) would need to cross two legs of the Cesar E. Chavez Avenue/Vignes Street intersection to transfer between the transit services at LAUS and the maintenance facility. Traffic Control Officers would be needed as mitigation for the potential increase in hazards, and increased traffic congestion and queue spillback would affect on-time performance for existing bus transit services at Patsaouras Plaza and on Cesar E. Chavez Avenue.
- Physical modifications would need to be made to the Metro Division 13 maintenance facility to accommodate the high volume of pedestrians arriving and departing.
- As stated on pages 4-62 and 4-72, of Section 4.0, Alternatives of the Draft EIR, dedicated bus lanes would be implemented on Vin Scully Avenue between Sunset Boulevard and the entrance to Dodger Stadium as part of the TSM Alternative. The existing bus-only lanes on Sunset Boulevard and Cesar E. Chavez Avenue are only in operation between 7 a.m. and 9 a.m. in the eastbound direction and between 4 p.m. and 7 p.m. in the westbound direction, Mondays through Fridays. The hours of operation of these bus-only lanes could potentially be provided to be westbound on Sunset Boulevard and Cesar E. Chavez Avenue before every game (not just weekday evening games) and eastbound on Sunset Boulevard and Cesar E. Chavez Avenue after every game. This would expedite DSE service (both for the existing DSE service and the TSM Alternative), but could also increase traffic congestion and would displace existing curb parking that is currently used by the community.

A number of comments also suggest that an expanded fleet of buses for expanded Dodger Stadium Express service would be available for other uses or local service when not needed for Dodger Stadium events. Such a system would require a substantial increase in the number of buses which, similar to expanding the fleet for an expanded DSE service, would result in a fleet of buses that would be underutilized most of the time, or regular Metro bus service that utilizes these vehicles would be disrupted every time a Dodger game or event at the stadium is held.

As discussed on page 4-63 and on page 4-71, in Section 4.0, Alternatives, of the Draft EIR, the Draft EIR concluded that, even with a substantially increased Dodger Stadium Express bus capacity, the Dodger Stadium Express's slower travel time to/from Dodger Stadium as compared to the proposed Project and the additional transfer time for riders to walk between Union Station and the maintenance facility would

render the Alternative substantially less competitive with driving time than the proposed Project, thus reducing its ridership potential compared to the proposed Project. As such, reductions in driving to Dodger Stadium and associated reductions in VMT would be less than for the proposed Project.

Electrification of Dodger Stadium Express Shuttle Buses

Comments state that the TSM Alternative in the Draft EIR did not consider electrification of shuttle buses. These comments suggest that Metro is considering transitioning its bus fleet to zero-emission buses and, therefore, would provide the same net benefits as the proposed Project. The Metro Board received and filed a board report on April 20, 2023, regarding a staff recommendation to extend the deadline for transitioning the entire bus fleet to zero-emission buses from 2030 to 2035.⁸⁴ While Metro has made significant progress in transitioning to a zero-emission bus service, the report recognizes that “the ZEB industry is still evolving and not sufficiently mature to allow for full implementation by 2030 without risk to service. Key issues include cost, grid capacity, performance (reliability, maintainability, and operability), early obsolescence, utility lead times, and supply chain issues.” Further, unlike the proposed Project, which, as discussed in Section 3.08, Greenhouse Gas Emissions, of the Draft EIR, has pledged to purchase power required for operation of the proposed Project from the City of Los Angeles Department of Water and Power (“LADWP”) through the utility’s Green Power Program, pursuant to GHG-PDF-A, Metro has not proposed obtaining the electricity for its electric buses from green sources. The Metro report discusses the potential issues with the electrical grid’s ability to provide the electricity that Metro would require for a full zero-emission bus fleet.

Regardless of whether the shuttle buses would be electrified, the operational issues associated with substantially expanding Dodger Stadium Express service discussed on pages 4-60 through 4-63 and on pages 4-70 through 4-73, in Section 4.0, Alternatives, of the Draft EIR, and in this topical response above, would remain.

Bus-Only Lanes on Vin Scully Avenue

A number of comments suggested that bus-only lanes should be provided on Vin Scully Avenue. As stated on pages 4-62 and 4-72, in Section 4.0, Alternatives of the Draft EIR, dedicated bus lanes would be implemented on Vin Scully Avenue between Sunset Boulevard and the entrance to Dodger Stadium and also within the Dodger Stadium property as part of the TSM Alternative. While this would improve Dodger Stadium Express service, this would also increase traffic congestion on Vin Scully Avenue and within the Dodger Stadium property.

Alternatives Providing Bus Service From Other Locations Would Not Materially Improve Transit Time Compared to Driving and Would Incur Substantial Costs

Comments suggest that a bus-only alternative should analyze buses from numerous remote locations throughout the Los Angeles region to and from Dodger Stadium events. Such a system would require a substantial increase in the number of buses which, similar to expanding the fleet for an expanded Dodger Stadium Express service, would result in a fleet of buses that would either be underutilized most of the time, or regular Metro bus service that utilizes these vehicles would be disrupted every time a Dodger game or event at the stadium is held. Such a service would also incur substantial costs in paid time and

⁸⁴ <https://datamade-metro-pdf-merger.s3.amazonaws.com/2023-0207.pdf>.

mileage for driving empty buses out to the remote locations before a game and back from the remote locations after a game and paid idle time during the game. Buses from a variety of remote locations would also need to travel in rush hour congestion to get to Dodger Stadium. With limited regional facilities that provide bus only lanes that these services could utilize, they would not materially improve transit travel time compared with driving.

The current Dodger Stadium Express service from the South Bay is an existing example of the type of service these comments suggest, although it is one line instead of many. Riders can board the South Bay DSE at any one of five different stations along the Harbor Transitway: Harbor Gateway Transit Center, Rosecrans Station, Harbor Freeway Station, Manchester Station, and Slauson Station. Thus, despite serving a broad area of southern Los Angeles County at stations spread across eight miles, that the service is free, and that the service travels on a priority lane within the I-110 freeway median for most of its trip, the South Bay DSE carried an average of only 415 passengers per game in 2019, which is substantially lower than the ridership of 1,895 riders per game on the LAUS Dodger Stadium Express. Based on existing ridership patterns of the Dodger Stadium Express, including the mode of access survey data collected by Metro included in Appendix N, Transportation Appendices, of the Draft EIR, the majority of Dodger Stadium Express riders take rail transit to connect with the Dodger Stadium Express, which is the key differentiator as to why the LAUS Dodger Stadium Express has higher ridership than the South Bay Dodger Stadium Express. Improving the connections between Dodger Stadium and LAUS via the proposed Project would provide the quickest, most frequent, and highest capacity transit connections for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Pedestrian Enhancement Alternative

Comments on the Draft EIR suggest that a pedestrian enhancement alternative to the proposed Project, studying the potential to improve the pedestrian experience from Chinatown to Dodger Stadium by including bike lanes, improved and widened sidewalks, and escalators and/or stairs, should have been included in the Draft EIR. Refer to Section 5.0, Corrections and Additions, of this Final EIR, for a discussion of the Pedestrian Enhancement Alternative, which was considered but dismissed from further consideration for failure to meet most of the basic Project Objectives to the same degree as the proposed Project. For instance, the Pedestrian Enhancement Alternative would not meet the Project Objectives to expand mobility options for transit riders, attract new riders to the Metro system, enhance community connectivity by providing first/last mile transit and pedestrian access to areas that have historically been underserved, including the Los Angeles State Historic Park and Elysian Park, increase connectivity to the region's public transportation hub at LAUS and the Dodger Stadium property, or to improve the Dodger Stadium visitor experience by providing efficient, high-capacity and faster alternative access to Dodger Stadium, to the same extent as the proposed Project.

The Project Objectives Do Not Artificially Narrow the Range of Alternatives Considered

Comments on the Draft EIR suggest that the Project Objectives are artificially narrow in order to preempt adoption of the TSM Alternative as the preferred alternative. The Project Objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project's fundamental purpose of providing a permanent transit connection to Dodger Stadium.

An EIR's project description must contain a statement of the project objectives, which are used by the lead agency to help it develop a reasonable range of alternatives to the proposed project to evaluate in the EIR.⁸⁵ An EIR need not present alternatives that are incompatible with the project's fundamental purpose, so a lead agency may structure the EIR alternatives analysis based on a reasonable definition of the project's underlying purpose and need not study alternatives that cannot achieve that fundamental goal. As discussed in Section 2.3.7, Purpose and Need, in Section 2.0, Project Description, of the Draft EIR, Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. The proposed Project is needed to alleviate existing congestion and associated air pollution while providing safe, zero emission, environmentally friendly, and high-capacity transit connectivity in the Project area that would reduce GHG emissions as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways. The overall purpose of the proposed Project is to provide a direct transit connection between LAUS and the Dodger Stadium property via an aerial gondola system and improve connectivity for the surrounding communities by linking to the Los Angeles State Historic Park, Elysian Park, and the neighborhoods along the proposed Project alignment and the region's rapidly growing regional transit system at LAUS. Aerial rapid transit technology is a proven, zero emission, safe, sustainable, high-capacity, and highly efficient form of transportation that would function as both a reliable rapid transit system and first/last mile connector. The proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. Alternatives that would not provide a permanent transit connection to Dodger Stadium would not achieve the proposed Project's underlying purpose to provide such a transit connection.

In defining a project's objectives, the lead agency may not adopt artificially narrow project objectives that would preclude consideration of reasonable alternatives for achieving the project's underlying purpose. The Project Objectives are designed to achieve the proposed Project's underlying purpose of providing a direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities. These objectives are not so narrow that they preclude consideration of reasonable alternatives – while alternatives for a project must be able to satisfy “most of the basic objectives of a project,” alternatives should not be excluded simply because they would impede attainment of project objectives “to some degree.”⁸⁶ The Project Objectives broadly contemplate improving neighborhood connectivity and the Dodger Stadium visitor experience, reducing vehicle congestion and associated emissions in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, improving access to Elysian Park and the Los Angeles State Historic Park, and providing a sustainable form of transit. A reasonable range of alternatives were considered as the Project Objectives are not so narrow that they preclude consideration of alternatives to the proposed Project, including the TSM Alternative. CEQA does not require that the alternatives considered meet each and every objective, and in fact, some of the alternatives considered did not. In addition, CEQA does not require that the objectives for the proposed Project be so broad to require consideration of alternatives that do not meet the project's underlying purpose.

⁸⁵ CEQA Guidelines Section 15124(b).

⁸⁶ CEQA Guidelines, Section 15126.6(a)–(b).

The Use of Design Options Does Not Render the Project Description Unstable

As discussed in Section 6.0, Design and Use Options, of the Draft EIR, five design and use options were considered to explore potential variations to various Project components in response to public comments and stakeholder feedback. Each design and use option offers a variation to the proposed Project. The design and use options are not “alternatives” within the meaning of CEQA as they address specific elements of the proposed Project and are not alternatives to the proposed Project as a whole. The design and use options are responsive to public comments and stakeholder feedback and provide flexibility for the lead agency’s decision makers to potentially adopt one or more minor variations to the components of the proposed Project should the decisionmaker determine such a minor variation is desirable as part of the proposed Project.

Section 3.0, Environmental Analysis, of the Draft EIR analyzes the proposed Project without any design and use options. Section 6.0, Design and Use Options, of the Draft EIR describes each design or use option and analyzes the environmental impacts of the proposed Project with each design or use option, performing the impact analysis relative to the respective Project component of the proposed Project.

Comments state that the inclusion of the design and use options in the Draft EIR renders the Project Description unstable. The proposed Project is described consistently throughout the entire Draft EIR, clearly identifying the proposed Project’s potential environmental impacts. In turn, Section 6.0, Design and Use Options, of the Draft EIR describes how environmental impacts from implementation of each design and use option would differ from the proposed Project’s potential environmental impacts described in the Project Description and analyzed in Section 3.0, Environmental Analysis, of the Draft EIR. By analyzing the design and use options in a separate section of the Draft EIR, the lead agency retains the flexibility to respond to stakeholder concerns related to individual components of the project while maintaining a stable project description that identifies the project’s main features and other information sufficient to foster a complete and informative evaluation of the project’s environmental impacts.⁸⁷ The design and use options studied in Section 6.0, Design and Use Options, of the Draft EIR, each present a minor variation to a component of the proposed Project, do not require different project design features or result in new or different impacts requiring different mitigation measures, and otherwise meet the same Project Objectives. The Draft EIR’s Project Description provides the required “main features” of the proposed Project, with the Design and Use Options providing minor variants to the proposed Project.

⁸⁷ CEQA Guidelines § 15124. Specifically, CEQA Guidelines Section 15124 requires a project description to include a description of the project’s location, a statement of the project’s objectives, a description of the project’s technical and environmental characteristics, a discussion of the intended uses of the EIR, and a list of the project approvals that will be required.

TOPICAL RESPONSE I

Use of Project Design Features and Plans in Mitigation Measures

Comments on the Draft EIR state that the incorporation of plans or future studies in mitigation measures results in impermissible deferral. The use of plans and future studies are commonplace measures used to tailor mitigation measures to reflect the environmental conditions at the time the potential impact would occur. Moreover, the mitigation measures requiring plans or future studies are incorporated within the proposed Project's Mitigation Monitoring and Reporting Program as mandatory elements of the proposed Project, along with other enforcement and timing mechanisms, and include specified performance standards and steps for the implementing agency to follow to achieve compliance with the specified performance standard.

Comments on the Draft EIR contend that the use of Project Design Features impermissibly obscures the Project's environmental effects. Commenters specifically point to project design features intended to provide additional environmental benefits in the Cultural Resources and Wildfire context, where the environmental impact was already determined to be less than significant. The Draft EIR disclosed the environmental impact determination prior to the implementation of the Project Design Features. The Project Design Features provide additional environmental benefits for the respective impact area and do not obscure the proposed Project's environmental effects.

The Development of Plans in Mitigation Measures Is Not Impermissible Deferral

The proposed Project's Mitigation Measures would not result in improper deferral of mitigation. CEQA Guidelines section 15126.4(a)(1)(B) confirms that mitigation measures may defer formulation of specific details regarding how to mitigate a significant impact when it is impractical or infeasible to specify the specific details of mitigation during the EIR review process, provided that the lead agency commits to implement the mitigation, adopts a specified performance standard, and identifies the types of actions that may achieve compliance with the performance standard. Future studies may be used to tailor mitigation measures to fit on-the-ground environmental conditions. The proposed Project's Mitigation Measures satisfy each of these requirements.

The Use of Future Studies or Plans in Mitigation Measures Is Appropriate Where Needed to Reflect Existing Environmental Conditions at the Time of Construction or Where Such Studies Are Impracticable at This Juncture

The proposed Project's Mitigation Measures appropriately require the development of plans or further study where the plans would reflect the current environmental conditions at the time of construction or it is impracticable to conduct the studies prior to the EIR's certification. For example, Mitigation Measure TRA-B, requiring the preparation of a construction traffic management plan that would "ensure construction activities of the concurrent related projects and associated hauling activities are managed in collaboration with one another and the proposed Project" because it is currently unknown what other construction for related projects may be occurring at the same time as the proposed Project. It is not feasible to finalize the plan at the Draft EIR stage, and the plan would be drafted based on the advanced design work and study completed for the proposed Project and the current environmental conditions at the time construction for the proposed Project would begin. Mitigation Measure TRA-B provides a precise

accounting of what the construction traffic management plan would include, as well as specific performance standards that the plan is designed to achieve, as discussed in further detail below.

Mitigation Measure TRA-C similarly is intended to reflect on-the-ground environmental conditions at the time of the proposed Project construction. Mitigation Measure TRA-C requires the preparation of a Temporary Disaster Route Plan “[p]rior to the issuance of a building permit for the proposed Project, in coordination with and subject to the approval of LADOT.”⁸⁸ This plan would be drafted based on the advanced design work and study completed for the proposed Project and the current environmental conditions at the time construction for the proposed Project would begin.

With respect to Mitigation Measures CUL-A and CUL-C through CUL-E, as acknowledged on page 3.5-2, Section 3.05, Cultural Resources, of the Draft EIR, “an archaeological resource may not be recognizable or even observable without ground-disturbing activities.” Mitigation Measures CUL-A and CUL-C through CUL-E accordingly outline actions that would be taken in the unlikely event that archaeological resources are discovered once excavation begins on-site. Excavation or other such ground disturbance prior to approval of the proposed Project to discover any potential additional resources is impracticable at this juncture.

For the same reasons, Mitigation Measure GEO-B, discussed on page 3.7-21, of Section 3.07, Geology and Soils, of the Draft EIR requires the preparation of a Paleontological Resources Monitoring and Mitigation Plan, allowing a qualified paleontologist to tailor monitoring to the on-the-ground conditions, such as the “rate of ground-disturbing activities, the material being excavated, and the depth of excavation; and if found, the abundance and type of paleontological materials” as discovered “during construction excavations into older Quaternary alluvial deposits and Miocene Puente formation deposits.” None of these actions may be taken in advance of proposed Project approval, as excavation or other such ground disturbance to discover any potential additional resources is impracticable at this juncture. As noted on page 3.7-12, of Section 3.07, Geology and Soils, of the Draft EIR, “fossils have been encountered at depths ranging from 35 to 100 feet at locations southeast and northeast of the Project site.” Accordingly, in order to potentially determine whether construction of the proposed Project would encounter paleontological resources, excavation of at least 35 feet and up to 100 feet would be required. Excavation to this depth prior to the potential approval of the proposed Project is impracticable, and would require significant disruptions in order to close portions of streets and right-of-way where the proposed Project’s foundations and columns would be located to test the areas where excavation and ground disturbing activities would occur. For reference, as noted on page 3.7-19, of Section 3.07, Geology and Soils, of the Draft EIR, “[c]onstruction work is anticipated to reach up to 125 feet in depth for installation of the piles and an excavation depth of up to 10 feet, except for at the proposed Dodger Stadium Station, which has an excavation depth of 42 feet.” Therefore, monitoring described in Mitigation Measure GEO-B is appropriately reserved as part of the construction in order to avoid the need to excavate more than once in connection with the proposed Project.

Likewise, Mitigation Measure HAZ-A would not impermissibly defer mitigation. As discussed in Section 3.09, Hazards and Hazardous Materials, Appendix K, Phase I Environmental Site Assessment, and Appendix L, Hydrology Technical Report, of the Draft EIR, the Draft EIR conducted an extensive preliminary

⁸⁸ Draft EIR, Section 3.17, Transportation, p. 3.17-69.

investigation of the proposed Project's sites to determine whether the site exhibited contamination from hazardous materials or would otherwise have impacts to groundwater. Based on this investigation, the Draft EIR concluded that additional investigation may be appropriate, although a full investigation is impracticable at this time because the Project Sponsor does not have access agreements for all the underlying properties and would have to obtain these agreements prior to testing. Moreover, it is appropriate for the Project Sponsor to test soils for contamination at the time the soil is disturbed and properly handle and remove any contaminated soil or groundwater at this time for off-site disposal and/or recycling, as outlined in Mitigation Measure HAZ-A. Nevertheless, in response to comments on the Draft EIR requesting additional clarification on the enforcement mechanisms and standards in Mitigation Measure HAZ-A, an addition to the Draft EIR has been provided to clarify that the Soil and Groundwater Management Plan shall be submitted to the LADBS for review prior to the commencement of demolition and construction activities and as a condition of the grading, construction, and/or demolition permit(s). The addition also recognizes that Mitigation Measure HAZ-A requires full compliance with all applicable local, state, and federal regulations (including but not limited to, as applicable, OSHA Safety and Health Standards, Cal/OSHA requirements, federal, state and local waste disposal regulations, SCAQMD Rule 1166, as well as any other applicable requirements of the California Department of Toxic Substances, the Los Angeles Regional Water Quality Control Board, and the City of Los Angeles) related to the identification, excavation, transportation, and disposal of hazardous materials, including those encountered in excavated soil and dewatered groundwater.

Mitigation Measure GEO-A requires the preparation of a Site-Specific Final Geotechnical Report. As discussed on page ES-50 of the Executive Summary, and page 3.7-20, of Section 3.07, Geology and Soils, of the Draft EIR, Mitigation Measure GEO-A requires the Project Sponsor to "engage a California-registered geotechnical engineer to prepare and submit a site-specific final geotechnical investigation and report to the City of Los Angeles for review, consistent with the requirements of the CBC, applicable Los Angeles amendments, and the California Geotechnical Survey Special Publication 117 (as amended)." The "submittal and approval of the final geotechnical report shall be a condition of the grading and construction permits issued by the City of Los Angeles Department of Building and Safety." Further, the "site-specific final geotechnical report shall provide a description of the geological and geotechnical conditions at the site; the findings conclusions, and mitigation recommendations for potential geologic and seismic hazards; and design-level geotechnical recommendations in support of grading and foundation design." The details of the mitigation measures are appropriately left to the time when later design work has been completed, coupled with review from qualified engineers, in compliance with pertinent codes.

Metro Has Committed to Implementing the Proposed Project's Mitigation Measures

All of the proposed Project's Mitigation Measures (and Project Design Features) are incorporated in the proposed Project's Mitigation Monitoring and Reporting Program, provided in Section 7.0, Mitigation Monitoring and Reporting Program, of this Final EIR, as mandatory elements of the proposed Project. Accordingly, Metro has committed to implementing the proposed Project's Mitigation Measures.

The Mitigation Measures also provide enforcement mechanisms for Metro or the appropriate responsible agency. (See e.g., Mitigation Measure TRA-B, Draft EIR, § 3.17, Transportation, p. 3.17-67 [requiring Construction Traffic Management Plan to be approved by the City of Los Angeles prior to the issuance of

a building permit for the proposed Project]; see also Mitigation Measure NOI-A, Draft EIR, § 3.13, Noise, p. 3.13-68 [requiring the Project Sponsor to “design a Construction Noise Management Plan to minimize the construction-related noise impacts to off-site noise-sensitive receptors” “prior to the issuance of grading permits for the proposed Project.”].)

The Mitigation Measures Outline Specific Performance Standards and Actions to Meet the Provided Performance Standard

The proposed Project’s Mitigation Measures adopt specific performance standards and outline specific actions to be implemented for Metro or the appropriate responsible agency to determine that the proposed Project has met the specified performance standard. For example, Mitigation Measure TRA-B provides that the Construction Traffic Management Plan would maintain “visibility to open pedestrian crossings” and “ensure that access will remain accessible for land uses in proximity to the Project alignment and component sites during construction.” Mitigation Measure NOI-A, discussed on page 3.13-68, of Section 3.13, Noise, of the Draft EIR, requires the preparation of a Construction Noise Management Plan “prior to the issuance of grading permits for the proposed Project” that would “provide a range of noise reduction between 5 dBA and 15 dBA.” Conditions requiring compliance with regulations are common and reasonable mitigation measures and serve as an appropriate performance standard. Mitigation Measure HAZ-A requires “methods and procedures in the Soil and Groundwater Management Plan shall be in accordance with current federal, state, and local regulations, and be protective of workers and the environment.” Refer to Section 5.0, Corrections and Additions, of the Final EIR for revisions to Mitigation Measure HAZ-A clarifying that Mitigation Measure HAZ-A requires full compliance with all applicable local, state, and federal regulations (including but not limited to, as applicable, OSHA Safety and Health Standards, Cal/OSHA requirements, federal, state and local waste disposal regulations, SCAQMD Rule 1166, as well as any other applicable requirements of the California Department of Toxic Substances, the Los Angeles Regional Water Quality Control Board, and the City of Los Angeles) related to the identification, excavation, transportation, and disposal of hazardous materials, including those encountered in excavated soil and dewatered groundwater. Mitigation Measure GEO-A requires the submittal of a “site-specific final geotechnical investigation and report to the City of Los Angeles for review, consistent with the requirements of the CBC, applicable Los Angeles amendments, and the California Geotechnical Survey Special Publication 117 (as amended).” Conditions requiring compliance with regulations are common and reasonable mitigation measures and serve as an appropriate performance standard. The “submittal and approval of the final geotechnical report shall be a condition of the grading and construction permits issued by the City of Los Angeles Department of Building and Safety.”

As such, the proposed Project would not impermissibly defer the formulation of mitigation due to the measures requiring the preparation of various plans or studies.

Plans and Studies Contemplated in Mitigation Measures Are Not Required to Be Developed During the Draft EIR Process or Prior to Project Approval

Comments state that Mitigation Measure TRA-B, which requires the implementation of the CTMP prior to the issuance of the relevant building permits, Mitigation Measure VIB-A, requiring the adoption of a Vibration Monitoring Plan prior to the issuance of a grading permit, and Mitigation Measure TRA-C, which

requires the preparation of a Temporary Disaster Route Plan prior to the issuance of a building permit for the proposed Project, impermissibly defer mitigation because the mitigation plans are not required to be adopted prior to Project approval or during the Draft EIR process. CEQA does not require these plans to be adopted prior to project approval or during the Draft EIR review process. As discussed above, CEQA recognizes that the development of plans or future studies may be appropriate to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact.

The Recognition that Certain Aspects of Mitigation Measures May Be Infeasible Does Not Violate CEQA

Comments also state that Mitigation Measures CUL-A and CUL-F are ineffective because they include the words “if feasible.” For Mitigation Measure CUL-A, this recognition that regulatory requirements will be adhered to “including . . . practices that seek to avoid and preserve state-owned historical resources, when prudent and feasible,” does not render the measure ineffective but recognizes that all regulatory requirements would be adhered to the extent necessary for the pertinent resource. Mitigation Measure CUL-A includes a long list of required measures to be included in the CRMMP. Further, the language in Mitigation Measure CUL-A requiring SHPO consultation and “practices that seek to avoid and preserve state-owned historical resources, when prudent and feasible” is verbatim from the statutory requirements of Public Resources Code section 5024(a). Consistent with the requirements of CEQA Guidelines Section 15126.4(b)(3), Mitigation Measure CUL-A and CUL-F recognize that preservation in place is the preferred manner of mitigating impacts to archaeological sites, but may not be feasible, allowing for data recovery in such circumstances. Accordingly, the recognition of “feasibility” is directly consistent with the CEQA Guidelines. Mitigation Measure CUL-F recognizes that park amenity structures “will be reconfigured to avoid and/or diminish impacts to those features as feasible.” This recognizes that the extent of archaeological features at the Los Angeles State Historic Park prior to the testing phase described in Mitigation Measure CUL-E is unknown without additional testing and ground disturbance, and it is impracticable for the measure to commit to a relocation of the amenities to avoid and/or diminish impacts without knowing the exact location of the features. Mitigation Measure CUL-E provides that the proposed Project would seek to avoid any potential archaeological features. Even if avoidance is not feasible, with the implementation of the actions described in Mitigation Measures CUL-E and CUL-F, such as outlining where and in what soils mechanical excavations may or may not be used and identifying criteria thresholds for data recovery, as well as reconfiguring the location of park amenity structures as necessary following the implementation of the measures in Mitigation Measure CUL-E, potential impacts would be less than significant.

CUL-PDF-E and WFR-PDF-A Are Not Mitigation Measures

Commenters state that CUL-PDF-E and WFR-PDF-A improperly defer mitigation. CUL-PDF-E and WFR-PDF-A are Project Design Features and are accordingly intended to provide additional environmental benefits, rather than mitigate a significant impact. These Project Design Features are incorporated into the proposed Project’s design in order to further minimize environmental impacts but do not mitigate a significant environmental impact.

Commenters state that CUL-PDF-E is intended to reduce an environmental impact. Mitigation measures are provided in MM-VIB-A and MM-VIB-B to reduce potential building damage resulting from vibration, including to the *El Grito* mural. After the imposition of these measures, there will be a less than significant vibratory impact with respect to the generation of excessive groundborne vibration or groundborne noise levels. In turn, CUL-PDF-E provides for the adoption of a Construction Monitoring Plan for the *El Grito* mural, requiring that in the event that damage to the *El Grito* mural is documented as a result of construction activities, the Project Sponsor would retain an experienced professional to carry out the repairs within 12 months of the proposed Project's completion. CUL-PDF-E is appropriately a project design feature because it is not required to mitigate any environmental impacts related to cultural resources. Construction of the proposed Project is not anticipated to result in damage that would affect the mural's cultural significance,⁸⁹ but the Draft EIR nevertheless adds a Project Design Feature to provide for monitoring of the mural and repair if any damage is caused by construction activities. This is not intended to mitigate an environmental impact, but rather to provide an additional environmental benefit.

With respect to WFR-PDF-A, the Draft EIR determined that there would be less than significant impacts with respect to Wildfire. WFR-PDF-A, discussed on page 3.20-47 of Section 3.20, Wildfire, of the Draft EIR, requires the Project Sponsor to prepare a Fire Protection Plan to "further reduce risks associated with the ignition of wildland fire." Because these measures are not intended to reduce a significant impact under CEQA, but instead to provide additional environmental benefits where impacts are already considered less than significant, CEQA requirements regarding mitigation are inapplicable.

Funding for Mitigation Measures

Comments on the Draft EIR state that the proposed Project must demonstrate proof of financing for Mitigation Measures misconstrue CEQA's requirements. CEQA requires the identification of mitigation measures that could reduce the proposed Project's potential significant environmental impacts.⁹⁰ CEQA does not require a full accounting of how each mitigation measure will be funded. The Draft EIR provided a detailed list of Mitigation Measures for the proposed Project, as outlined in Table ES-2, Summary of Environmental Impacts, of the Draft EIR.

The Project Design Features and Mitigation Measures identified and analyzed in the Draft EIR are included in the Mitigation Monitoring and Reporting Program set forth in Section 7.0, Mitigation Monitoring and Reporting Program, of this Final EIR, and would be mandatory elements of the proposed Project. The Mitigation Monitoring and Reporting Program outlines the procedures for the implementation of each Mitigation Measure identified in the Draft EIR, including the monitoring agency, the timing of implementation, monitoring frequency, and actions indicating compliance with the Mitigation Measure.

The Project's Use of Project Design Features Does Not Obscure Project Impacts

CEQA Guidelines sections 15070(b)(1) and 15126.4(a)(1)(A) specifically permit the incorporation of Project Design Features designed to reduce potential adverse impacts. Commenters state that the Project Design Features are mitigation measures in disguise, intended to obscure the proposed Project's impacts, citing to *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645 ("*Lotus*"). The Draft EIR identified

⁸⁹ Draft EIR, Section 3.13, Noise, p. 3.13-68.

⁹⁰ California Public Resources Code Section 21100(b)(3); 14 California Code of Regulations Section 15126(b)(3).

whether environmental impacts would be significant in the absence of mitigation. The proposed Project's environmental consequences were described, the need for mitigation was identified, and the sufficiency of proposed mitigation measures was considered. The Draft EIR also identified Project Design Features which would provide additional environmental benefits but which are not intended to mitigate for identified significant impacts.

Commenters state that CUL-PDF-A, CUL-PDF-B, CUL-PDF-C, CUL-PDF-D and CUL-PDF-E are mitigation measures rather than project design features. These Project Design Features are not mitigation measures to reduce potential cultural resources impacts as there are no significant or direct cultural resources impacts anticipated to the underlying resource. (See, e.g., Draft EIR, pp. 3.5-35 to 3.5-46 [discussing CUL-PDF-A, CUL-PDF-B, CUL-PDF-C, CUL-PDF-D, and CUL-PDF-E].) Within the cultural resources context, these measures are properly defined as project design features intended to provide additional environmental benefits rather than to mitigate a potential environmental impact.

Further, all of the Project Design Features and Mitigation Measures identified and analyzed in the Draft EIR are included in the Mitigation Monitoring and Reporting Program set forth in Section 7.0, Mitigation Monitoring Reporting Program, of this Final EIR, and would be mandatory elements of the proposed Project.

TOPICAL RESPONSE J

Gondola Design and Operations

Comments on the Draft EIR address the proposed Project's gondola design and operations. Commenters question whether the proposed Project would be able to achieve the operational capacity stated in the Draft EIR, including in a manner that would enable the safe and comfortable boarding of all passengers. The proposed Project would be able to carry up to approximately 5,000 passengers per hour per direction ("pphpd"). As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would comply with the accessibility requirements of the Americans with Disabilities Act.

Commenters question how the proposed Project cabins would be supplied with adequate power. Cabins would be supplied with power by means of batteries located on each cabin. Commenters also state that the proposed Project would become unsafe and inhospitable to passenger use over time. As discussed in Section 2.0, Project Description, of the Draft EIR, the system operator would perform routine maintenance on the proposed Project and would observe the overall system on a daily basis as part of the system's startup routine. Commenters also state that passengers of the proposed Project could be exposed to unsafe conditions within cabins as a result of either other passengers or the overall system's safety. As discussed in Section 2.0, Project Description, of the Draft EIR, the cabins and overall system would be equipped with security features for passenger safety within cabins.

Finally, commenters state that passengers would be rendered unsafe in the event of an emergency affecting the wider system of the proposed Project. As discussed in Section 2.0, Project Description, of the Draft EIR, an Emergency Operations Plan would be prepared as part of the proposed Project and would set forth guidelines for a wide range of scenarios. Furthermore, aerial transit systems such as the proposed Project represent one of the safest modes of transportation relative to other forms of transit.

Capacity

As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would carry up to approximately 5,000 passengers pphpd. Based on the current design, the calculated characteristics when operating at system capacity (e.g., during Dodger games or events at Dodger Stadium) would be approximately 53 cabins in service on the system. Under this scenario, the cabins would move at an approximate speed of 13.4 miles per hour with headways of approximately 23 seconds, which represents the time between cabins arriving at a station. As one hour consists of 3,600 seconds, approximately 156.5 cabins would arrive every hour (3,600 seconds / 23 seconds).

The proposed Project's Tricable Detachable Gondola system ("3S")⁹¹ cabins typically carry between 30 to 40 passengers each, depending on the exact configuration of seating and cabin amenities selected. At a capacity of 35 passengers per cabin, at 156.5 cabins per hour, 5,478 passengers would arrive at each station per hour (35 passengers per cabin x 156.5 cabins per hour). Given that the same headway applies in each direction, the total, calculated system capacity is therefore 5,478 pphpd.

⁹¹ As discussed in Section 2.0, Project Description, of the Draft EIR, the naming convention for this system is derived from the German word "seil," which translates in English to "rope." Hence, Tricable Detachable Gondola systems are known as "3S" systems due to the use of three ropes, or cables.

To account for variations in the exact configuration of seating and cabin amenities, as well as operational considerations (including, for example, fewer than 35 people boarding a cabin or cabins being either slowed or stopped in the station for boarding purposes), the proposed Project has included an approximately 10 percent reduction in capacity from 5,478 pphpd to 5,000 pphpd.

Boarding

During typical operations, as they enter a station, the cabins would slow down to a speed of roughly one foot per second (less than one mile per hour) to allow passengers to enter and exit the moving cabin. For reference, a typical walk is approximately 3.5 feet per second, as used in the California Manual of Uniform Traffic Control Devices (CA MUTCD). This cabin deceleration is achieved by detaching the cabins from the haul rope in the station. Once a cabin is detached from the haul rope, the cabin can move at a speed independent of the haul rope. If needed, a cabin could be stopped to accommodate passenger boarding. At peak operations, it is anticipated cabins would arrive in a station approximately every 23 seconds and, once a new load of passengers has boarded, the cabin would re-attach to the cable and advance to the next station.

The boarding platforms at Alameda Station, Chinatown/State Park Station, and Dodger Stadium Station have been sized to accommodate the capacity of the proposed Project. At Alameda Station and Dodger Stadium Station, a minimum of 30 linear feet would be provided for each of the unloading and loading zones. This equates to at least 30 seconds for any unloading passengers and at least another 30 seconds for loading passengers. There is a physical separation between the unloading and loading areas. Passengers would unload from cabins on one side of the boarding platform and after a physical separation, passengers would load onto cabins on the other side of the platform. Accordingly, unloading and loading passengers would be separated. Because of this separation, all passengers on one side of those stations are moving in the same direction, encouraging efficiency and order. By way of comparison, it is typical in heavy and light rail stations for passengers to board and disembark from trains on the same platform. Because the Alameda Station and Dodger Stadium Station would separate areas for unloading and boarding, these stations would see efficiency beyond what may typically be experienced at heavy and light rail stations.

At the Chinatown/State Park Station, the boarding platform would be similarly designed to accommodate the capacity of the proposed Project. The Chinatown/State Park Station would be comprised of three levels: ground, mezzanine, and boarding. The ground level would provide elevators, escalators, and stairs that would lead up to the mezzanine. The mezzanine level would provide queueing space and provide access to the boarding platform by elevators, escalators, and stairs. Approximately 15 percent of proposed Project riders to Dodger Stadium (900 passengers in 2026 and 1,500 passengers in 2042) are expected to board the system before a game or event at the Stadium at the Chinatown/State Park Station, and queues would therefore be accommodated within the Station, given this lesser boarding demand and the larger queueing capacity at the Station.

Because the station speed of the cabins would be slower than the line speed, the station speed would enable multiple cabins to be in the station at one time. Cabins would arrive every 23 seconds during peak operations and maintain this time separation. Since a cabin would spend at least 30 seconds in the unloading zone, more than one cabin would be present in an unloading zone for some of the time.

Similarly, more than one cabin would be present in the loading zone some of the time. During peak operations, multiple cabins would be loading and unloading passengers in each station at any given time.

Accessible Boarding

As discussed in Sections 2.4.3, Stations and Junctions, and 2.4.5, Gondola Cabins, in Section 2.0, Project Description, of the Draft EIR, the stations and cabins would comply with the accessibility requirements of the Americans with Disabilities Act (“ADA”).

Pathways to and from the boarding areas would be ADA compliant with redundant vertical circulation and appropriately sized passageways. The entry width and interior size of each cabin would comply with the requirements of the ADA.

The proposed Project cabins would have level boarding, which means that there would be no step from the boarding platform surface to the cabin floor. The gaps between the boarding platform and cabin floor would comply with industry standards and ADA requirements regarding both horizontal separation and vertical alignment.

If needed, cabins could be either slowed or stopped in the station for boarding purposes. Station attendants would be located within each station to assure safe boarding and to execute stops for unloading or boarding purposes, if necessary. Attendants would also provide customer interaction and observation; if a passenger needs special assistance, an attendant may either further slow or stop a cabin. A separate operator would be stationed in a control booth monitoring screens, which would show activities in each cabin and station, as well as the system controls. The time necessary to slow or stop cabins is factored into the overall system capacity of the proposed Project.

Cabin Power

Comments on the Draft EIR address the cabins of the proposed Project and how they will be supplied with adequate electrical power. As noted in Section 2.4.5, Gondola Cabins, in Section 2.0, Project Description, of the Draft EIR, the cabins are expected to have certain amenities, including HVAC, which require electrical power.

Power for the cabins is expected to be provided by batteries located on each cabin. The batteries would be charged overnight while the cabins are stored at the subterranean cabin maintenance area below the Dodger Stadium Station. In addition, during operations, the batteries would be continuously charged by the movement of the cabins along the proposed Project alignment. Multiple technologies exist to enable continuous battery charging during system operations. The battery charging technology, as well as the size and capacity of cabin batteries, will be determined as design is completed for the proposed Project.

Privacy Glass

As discussed in Section 2.4.5, Gondola Cabins, in Section 2.0, Project Description, of the Draft EIR, cabin windows can be equipped with privacy glass that can become opaque while adjacent to sensitive views, and the proposed Project would work with stakeholders adjacent to the proposed Project alignment to identify locations where the use of privacy glass would be warranted. Privacy glass is glass which has been treated to allow control of the window’s transparency. This is done by running a small electric current

through the pane of glass; when the electric current passes through the pane of glass, it changes the glass from opaque to transparent, or vice versa. The control system for the proposed Project can be programmed to turn on and off the privacy glass while cabins are adjacent to sensitive views. Considerations as to the locations along the proposed Project alignment where the privacy glass could be activated include the subject adjacent sensitive views and the vertical and horizontal distance between the proposed Project cabins and the adjacent sensitive views.

Maintenance

As noted in Section 2.7.5, Maintenance, in Section 2.0, Project Description, of the Draft EIR, maintenance activities would be performed by the operator and would include daily pre-operational inspection of the system as well as long-term maintenance activities. The operation and maintenance of the system would be closely linked since the operating schedule would be the primary driver for the maintenance needs of the proposed Project. Further, the required maintenance would affect the operating schedule. As discussed in Section 2.7.6, Safety Systems and Ancillary Elements, in Section 2.0, Project Description, of the Draft EIR, maintenance recommendations including inspection procedures and scheduled activities are required to be provided by the equipment provider and would be included in the required maintenance manual. Maintenance recommendations would be akin to those provided by a vehicle manufacturer, which include a list of recommended maintenance activities (e.g., oil change, tire rotation, etc.) and when to perform them. In addition, the inspection procedures would also include circumstances that would trigger the need for additional maintenance activities.

Rider Safety

As noted in Section 2.4.5, Gondola Cabins, in Section 2.0, Project Description, of the Draft EIR, each cabin would have a security camera on board with a feed to the control room, as well as a “push to talk” button, which would open two-way communications with the control room. Since the cameras would be monitored, there is an opportunity for operation personnel to identify developing situations and intervene verbally. Operators would have communications protocols with appropriate law enforcement and first responders.

In addition to operator-initiated communications, cabins would be equipped with “push to talk” buttons to open communications with operators. Through use of these buttons, passengers can open communications with operators at any time. Operators would then be able to respond accordingly based on established safety protocols and training, which would be developed in conjunction with first responders. In the event of a security incident taking place inside a cabin, cabins would be stopped at the next immediate station in a matter of minutes. Travel times would be approximately 2.5 minutes between Alameda Station and Chinatown/State Park Station and approximately 3.5 minutes between Chinatown/State Park Station and Dodger Stadium Station.

In stations and areas adjacent to them, attendants would also be able to observe activities or disturbances. During Dodger games and events at the Stadium, it is anticipated that either additional security or additional trained staff would be present to reduce both the probability of security issues and the response time to any such situations.

Emergency Operations

As noted in Section 2.7.7, Emergency Operations Plan, in Section 2.0, Project Description, of the Draft EIR, an Emergency Operations Plan would be prepared as part of the proposed Project and would set forth guidelines for a wide range of scenarios. The Emergency Operations Plan would include emergency response protocols and safety procedures developed in conjunction with the operator, system provider, and local authorities (e.g., LAFD and LAPD). The purpose of the Emergency Operations Plan would be to determine appropriate actions in advance of situations that could impact the operation of the proposed Project. Examples of scenarios for consideration by the Emergency Operations Plan could include fires in nearby buildings or system components, bomb threats, earthquakes or other natural disasters, medical emergencies, or a system failure of the proposed Project.

Because such scenarios could involve action by, coordination with, or participation from local agencies such as LAPD or LAFD, the Emergency Operations Plan would be developed in coordination with those agencies. Formal coordination with relevant agencies on emergency protocols would commence in future design phases of the proposed Project.

As noted in Section 2.7.6, Safety Systems and Ancillary Elements, in Section 2.0, Project Description, of the Draft EIR, the proposed Project system would incorporate redundancies and robust designs to minimize the possibility of mechanical failures which prohibit the movement of the gondola cabins. Examples of redundancies include installation of two independent motors so that if the primary motor fails, the second motor would be utilized to unload passengers from the system. Additional redundancies could include elements such as bullwheels, brakes, and conveyors. In a number of failure scenarios, it would be possible to assess the failure, switch to an alternate mode or component and proceed with operations.

For an example of how a redundancy might operate in practice, it is possible that a set of cabin doors might fail to confirm that they are locked properly. The system would initiate a stop while the cabin is still in the station and an operator would investigate. If something was simply obstructing the doors, the locking sequence could be repeated and confirmed, and the cabin and system could resume operations normally. If, however, there was a problem either with the doors or with the sensors that should confirm the locked position, the passengers in the cabin could be relocated to another cabin, and the inoperable cabin would be removed from service and repaired.

The use of these redundancies would reflect the philosophy not only that unplanned outages are inconvenient, but that the safest place for passengers is in the cabin, and that the safest way for passengers to exit cabins is at a station. However, the Emergency Operations Plan would also consider the unlikely scenario that the system and cabins cannot be moved to the nearest station and that passengers must therefore be evacuated directly from the cabins. As discussed in Section 2.7.7, Emergency Operations Plan, in Section 2.0, Project Description, of the Draft EIR, such an evacuation would involve emergency response services and would use specialized equipment such as ladder trucks, bucket trucks, or descending devices. An Evacuation Plan would be developed as part of the Emergency Operations Plan as required by industry standard ANSI B77.1 and Cal/OSHA regulations, to describe the preferred methods of evacuation based on the location of cabins, environmental conditions, and unusual terrain. The Evacuation Plan would include the required equipment and procedures for evacuation, site control, and

passenger communications. Analysis and coordinated practice of the evacuation modes would be performed in advance of opening the system. The Evacuation Plan would document the procedures, equipment and personnel necessary to evacuate the system, as well as provide for documenting training and practice. Such analysis, practice, and documentation are required by Cal/OSHA.

ANSI B77.1 requires that the Evacuation Plan include at a minimum:⁹²

- a) the definition of the line of authority in the event of an evacuation. This line of authority shall list:
 - 1) the positions responsible for determining the need for and ordering of an evacuation by use of the evacuation power unit or evacuation from carriers;
 - 2) the personnel responsible for performing the evacuation, for first aid, and for ground care of evacuated passengers.
- b) a description of the equipment necessary for evacuation and where it will be stored;
- c) provisions for adequate training in the functions performed in the evacuation process at least once each operating season. The training shall address variables including, but not limited to, the type of carriers and grips, passenger demographics, adaptive equipment, and topography as well as evacuation systems and equipment. Training shall be recorded in the evacuation log;
- d) an estimate of the time necessary for the total evacuation of each aerial lift;
- e) a description of unusual terrain, surface vegetation, and other conditions under the aerial lift and how each of these conditions will be dealt with during an evacuation;
- f) an estimate of when the evacuation should begin in the event the aerial lift becomes inoperable;
- g) provisions for communications with passengers of an inoperable aerial lift, the frequency of such communication, how soon after the aerial lift becomes inoperable such communication to the passengers will start, and the frequency of communications thereafter;
- h) the methods of evacuation to be used for the typical passenger, incapacitated passenger, common adaptive ski equipment (e.g., SMB's), and non-ambulatory passengers;
- i) provisions for communication with the evacuation teams;
- j) provisions for suspending the evacuation in the event that the aerial lift is made operable during the evacuation;
- k) provisions for control and assistance of evacuated persons until released;
- l) provision for emergency lighting for evacuations that occur in or may extend into the hours of darkness; and
- m) provisions for a post-evacuation report.

⁹² Text is quoted from ANSI B77.1-2022, 3.3.2.5.7 Evacuation.

The Evacuation Plan for the proposed Project would comply with the requirements of ANSI B77.1 as applicable to urban gondola systems and other applicable standards and requirements as determined by the City of Los Angeles, Metro, Cal/OSHA, and/or other appropriate agencies during the permitting process for the proposed Project.

Safety and Security of Gondolas and Similar Aerial Systems

As discussed in Section 2.2, ART Background, in Section 2.0, Project Description, of the Draft EIR, forms of aerial transit technology have been available and utilized for the last 100 years. Modern applications have seen the evolution of aerial transit technology as a feasible and safe mode of urban rapid transit. In addition to the numerous urban aerial transit systems referred to in Table 2-1, ART Precedents, in Section 2.0, Project Description, of the Draft EIR, one of the most widely known examples of aerial transit can be found in the thousands of aerial ropeways in ski areas across North America. At five times safer than an elevator, gondolas and other aerial systems are exceptionally safe and secure modes of transportation.⁹³ Refer also to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable urban aerial transit systems in cities around the world operate safely, efficiently, and in concert with their surrounding urban environments.

As discussed in Section 2.7.7, Emergency Operations Plan, in Section 2.0, Project Description, of the Draft EIR, system components would be equipped with security features for system safety. The gates and entrances to the stations would be locked at night and would be equipped with security features to prevent entrance by unauthorized personnel. The towers would have no publicly accessible gates or entrances and would be inaccessible to unauthorized personnel. Maintenance doors at the base of the towers would be secured at all times and only accessible by authorized personnel. The system components would be equipped with security cameras to monitor activity at stations, the junction, the towers, and in each cabin. Moreover, attendants would be present at each station during operations, and operators in the control room would monitor activity throughout the proposed Project during both operational and non-operational hours.

During operational hours, all stations would be staffed by trained personnel with the ability to prevent individuals from causing damage to the system and communicate concerns to law enforcement or the operator booth. During non-operational hours, Dodger Stadium Station would be staffed with personnel performing maintenance and other activities, and operators in the control room would monitor activities throughout the proposed Project.

The proposed Project would include the following, additional safety and security measures:

- Access-restricting Design – As proposed, stations, junction, and tower would have limited, controllable access to critical areas and components. Towers would be designed to prevent climbing, and access ladders needed for authorized employees would be located inside the towers behind locked maintenance doors. Stations would have gates and other barriers that prevent physical access to equipment within. Additional layers of security including locked doors and

⁹³ National Ski Areas Association, NSAA Ski Lift Safety Fact Sheet (2016).

gates within the restricted areas would prevent trespassing and enable the operator to coordinate the applicable response from security personnel.

- Alarms – With access limited to particular routes, doors or other access points could be alarmed to signal their opening. Motion detectors could be used to indicate when unauthorized activity is present in restricted areas.
- Active Monitoring and Training – Multiple cameras and other technology could provide visibility to and information about locations across the system. By combining training, local familiarity, alarms and other data, staff would have the situational awareness to understand and respond to unauthorized activity.

TOPICAL RESPONSE K

Signage and Lighting

Comments on the Draft EIR address the Project's proposed signage as well as lighting. The Draft EIR addressed signage and lighting in Section 3.01, Aesthetics, with supporting data provided in Appendix C, Visual Impact Assessment, of the Draft EIR.

Proposed Signage

As discussed, in Section 2.0, Project Description, of the Draft EIR, similar to other transit projects that incorporate signage, the proposed Project would include signage to support wayfinding for transit passengers, including information about transit connections and other important information to facilitate transit usage. Private funding for the proposed Project is anticipated to be supported by naming rights and sponsorship revenues, and such sponsors would be recognized in Project signage, which would be designed consistent with applicable Metro, City, and State approval requirements. Further, all signage for the proposed Project would require approvals from applicable agencies.

A Sign Concept Plan for the proposed Project was included in Appendix B of the Lighting Study, which is included as Appendix C to Appendix C, Visual Impact Assessment, of the Draft EIR. The Sign Concept Plan includes renderings of the Alameda Station, Alameda Tower, and gondola cabins showing the proposed signage. In addition, the Sign Concept Plan includes detailed drawings showing the proposed location for each sign and a signage schedule that provides:

- sign numbers;
- sign types;
- information on whether the sign is static or digital;
- information on whether the sign is illuminated or non-illuminated;
- sign design, e.g., platform mounted, hanging, wall-mounted, wrap, etc.;
- information on whether the sign is interior or exterior facing;
- sign area including the width and height; and
- description of each sign.

The Sign Concept Plan provides that across the entire proposed Project, including stations, the junction, towers, and cabins, the proposed Project is proposing approximately 61,189 square feet of signage, which would include approximately 59,889 square feet of static signage and approximately 1,300 square feet of digital signage. The digital signage would be limited to the Alameda Station and the Dodger Stadium Station. No digital signage is proposed on the exterior of the cabins. At the Alameda Station and the Dodger Stadium Station, the proposed Project proposes 400 square foot digital signs that would be interior facing for transit riders (for a total of 800 square feet, for one sign at the Alameda Station and one sign at the Dodger Stadium Station). The additional digital square footage is proposed as smaller freestanding digital displays that would be designed to activate the pedestrian environment. One would be located at Alameda Station with four located along the pedestrian connection between Dodger

Stadium Station and Dodger Stadium. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition to the naming rights signage, the proposed Project is proposing that two cabins be designated for the display of community programming graphics and that one cabin be designated for the display of artwork by local arts collaborators.

The proposed signage program is an important component of the proposed Project to support wayfinding, transit connection, and funding for the proposed Project. The type and extent of the permitted signage would support the transit use and reflect that the proposed Project provides access between the Dodger Stadium property, the surrounding communities, including Chinatown, Mission Junction, Elysian Park, and Solano Canyon, and the Los Angeles State Historic Park, to the regional transit system accessible at Los Angeles Union Station (“LAUS”). Signage would be designed to complement the proposed Project design and use and would be consistent with the existing urban condition, as illustrated in Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, which includes Key Observation Points (KOPs) updated in part to incorporate the proposed Project’s signage program, as depicted in the signage package included in the Lighting Study included in Appendix C, Visual Impact Assessment, of the Draft EIR. As discussed in Appendix C, Visual Impact Assessment, of the Draft EIR, and Section 5.0, Corrections and Additions, of the Final EIR, based on the supplemental KOPs prepared to support evaluation of the potential impacts of the proposed Project on aesthetic and visual resources, including to incorporate the proposed Project’s signage program and clarify design elements of the proposed Project, the conclusion that the proposed Project would not have a significant impact to aesthetic and visual resources remains unchanged.

As discussed in Appendix C, Visual Impact Assessment, to the Draft EIR, there is existing signage in the Project area, and the proposed Project signage would not substantially degrade the existing visual character or quality of public views. Instead, the proposed Project’s design ensures that signage would enhance the public realm. Specifically, signage for the proposed Project would be architecturally integrated into the design of the ART system, including its stations, the junction, towers, and cabins, and would be designed consistent with applicable Metro, City, and State approval requirements. In addition, consistent with the City’s Framework Element Chapter 5 Urban Form and Neighborhood Design Policy 5.8.4, signage would also be designed to be integrated with the architectural character of the surrounding buildings to convey a visually attractive character. Further, as illustrated in Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, the type and extent of proposed signage would emphasize the transit use of the proposed Project and would complement the existing and approved signage environment along the proposed Project alignment. The proposed Project’s signage would create a uniform visual identity that would connect the entire proposed Project alignment.

Sign District and Sign Regulations

As discussed on page 2-62, in Section 2.0, Project Description, of the Draft EIR it is anticipated that the proposed Project would seek a Sign District to establish a comprehensive set of sign regulations for the proposed Project consistent with applicable City requirements. The Sign District would provide limitations on the types, amounts, locations, sizes, operating hours, and illumination of permitted signs.

Regarding sign content, Los Angeles Municipal Code Section 14.4.4 prohibits signs that contain obscene matters, as defined in Section 311 of the Penal Code of the State of California. Outside of the prohibition

on obscene matters, signs have free speech protections under the First Amendment of the United States Constitution, and, accordingly, sign regulations are generally content-neutral and instead focus on time, place, and manner regulations. As noted above, the proposed Project's signage would be designed to be consistent with Metro requirements, including Metro's Advertising Content Guidelines, as applicable, which are updated from time to time.⁹⁴ Metro's Advertising Content Guidelines include a number of restrictions on advertising including prohibiting the advertising of all alcohol, tobacco, and cannabis products services and events. Metro's Advertising Content Guidelines also provide that advertising may not be displayed if its content involves: illegal activity; violence; demeaning or disparaging matter; vulgarity; obscene matter; adult entertainment and content; political endorsements; religion, negative connotations of public transit; unsafe transit behavior; content injurious to Metro's interests; or content harmful or disruptive to the transit system.

Lighting

As discussed on pages 3.1-52 and 3.1-53, in Section 3.01, Aesthetics, of the Draft EIR, Project lighting would include low-level lighting for security and wayfinding purposes adjacent to and within the stations, junction, towers, within cabins, at the vertical circulation, and areas for ticketing, fare checking, and queueing. In addition, low-level lighting to accent signage, architectural features, landscaping, adjacent pedestrian plazas, and potential mobility hubs would be installed at the stations, junction, and towers. Lighting would also be provided underneath the elevated stations and junction.

The Lighting Study analyzed the proposed Project's potential environmental impacts resulting from the Project's lighting and illuminated signage program with respect to light trespass and glare. The proposed Project's lighting design is detailed in Appendix A: Building Lighting Concept Plan of the Lighting Study and the proposed Project's illuminated signage design is detailed in Appendix B, Sign Concept Plan, of the Lighting Study. The Lighting Study analyzed the proposed Project for compliance with the Los Angeles Municipal Code, CALGreen, the Cornfield Arroyo Seco Specific Plan ("CASP"), the River Improvement Overlay (RIO) District, and the California Vehicle Code and determined that the proposed Project's impacts with respect to light trespass and glare would be less than significant.

Los Angeles State Historic Park

The Lighting Study analyzed the entire proposed Project alignment, including the Los Angeles State Historic Park. The analysis of trespass impacts to the Los Angeles State Historic Park is reflected in the analysis at VP-S4 and detailed on pages 41- 42 and 44-48 of the Lighting Study, and the analysis of glare impacts to the Los Angeles State Historic Park is reflected in the analysis at M4 and detailed on pages 49-53 of the Lighting Study. As detailed in the Lighting Study, light trespass and glare impacts to the Los Angeles State Historic Park would be less than significant.

Cabin Interior

As discussed on page 55 of the Lighting Study (and in Appendix A, Building Lighting Concept Plan, of the Lighting Study), the lighting for the proposed Project was designed to provide the necessary illumination for passengers to safely board and enjoy the proposed Project. As explained in the Building Lighting

⁹⁴ Metro's Advertising Content Guidelines are accessible at <https://www.metro.net/about/advertising-sponsorships-filming>.

Concept Plan, the illuminance design standards for the proposed Project were developed in accordance with the California Electric Code, the Illuminating Engineering Society (IES) recommendations and transit system operation standards prepared in coordination with the proposed Project's lighting, design, and gondola systems technical consultants. As it relates to the cabins, page 56 of the Lighting Study indicates that the basis of design for cabin lighting is a 5 footcandle average at the floor and a 2 footcandle minimum in the cabin. As explained on page 68 of the Lighting Study, this cabin lighting level was selected to ensure that the cabins would provide a comfortable and safe interior illumination. As further detailed on page 68 of the Lighting Study, the light source for the cabins includes concealed low level linear lights, as well as downlighting that would be used to increase the cabin lighting levels during loading and unloading and in emergency situations. These light levels would ensure safe and comfortable operation of the cabins consistent with Metro policies and recommended practice for transit systems.

TOPICAL RESPONSE L

Project Sponsor and Proposed Project Costs and Financial Analysis

Comments on the Draft EIR address or raise questions regarding the Project Sponsor and how the proposed Project would be funded. Because comments regarding the Project Sponsor and how the proposed Project would be funded do not raise substantive issues on the content of the Draft EIR, no further response is required by CEQA. Nevertheless, this topical response provides the following information.

The Project Sponsor, LA Aerial Rapid Transit Technologies LLC (“LA ARTT LLC”), was originally a subsidiary of Aerial Rapid Transit Technologies LLC (“ARTT LLC”). ARTT LLC has donated LA ARTT LLC and the proposed Project to Zero Emissions Transit (“ZET”). ZET is a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Section 4.0, Costs and Financing, of the Final EIR provides detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the Project. The proposed Project is not seeking Metro funding. In addition, no other public sources of funding have been sought or committed to the proposed Project.

Project Sponsor

In 2018, the proposed Project was proposed by Aerial Rapid Transit Technologies LLC (“ARTT LLC”), an entity created by McCourt Global. The Project Sponsor, LA Aerial Rapid Transit Technologies LLC (“LA ARTT LLC”), was originally a subsidiary of ARTT LLC. ARTT LLC has donated LA ARTT LLC and the proposed Project to Zero Emissions Transit (“ZET”), a nonprofit and supporting organization to Climate Resolve, a California nonprofit public benefit corporation. ZET’s purposes include promoting and supporting zero emissions transportation initiatives and other efforts to reduce greenhouse gas (GHG) emissions in the transportation sector and to mitigate and adapt to changes in weather and climate. These organizational purposes and activities include collaborations to champion equitable climate solutions, working on easier and safer ways to get around Los Angeles that also reduce GHG emissions, and advocating for mobility options that are sustainable, safer, and improve public health by investing in better transit and safer active transportation options for Los Angeles. To this end, ZET plans to identify and support zero-emission transportation initiatives and other projects, programs, and policies that will mitigate climate change, including the proposed Project.

ARTT LLC’s donation of LA ARTT LLC and the proposed Project includes ARTT LLC’s continued support of the proposed Project with financial support and expertise, including to reimburse Metro in its role as the Lead Agency for the EIR and funding for consultant and technical work for the EIR. As set forth in Section 8.0, List of Preparers, of the Draft EIR, and Section 9.0, List of Preparers, of the Final EIR, consultant and technical work for the EIR includes AECOM as to Draft EIR preparation and several environmental issue areas, including as to archaeology, paleontology, biological resources, geological resources, hydrology and water quality, and noise and acoustics; Kimley-Horn as Final EIR preparation and several environmental issues areas, including archeology, noise, and utilities; Fehr & Peers as to transportation; ENGEO Incorporated as to geology and soils; GPA Consulting, Teresa Grimes, and Historic Resources Group as to historical resources; Ramboll US Consulting, Inc. as to air quality/HRA, energy, and greenhouse gas

emissions; AES as to noise and vibration; Reax Engineering Inc. as to wildfire; SCJ Alliance as to gondola systems; PCL Construction Services, Inc. as to construction; Nabih Youssef Associates Structural Engineering as to structure engineering; Johnson Fain and SCJ Alliance as to Planning; RIOS as to design; Francis Krahe & Associates, Inc as to lighting; Carlberg Associates as to trees; and VMC LLC as to airspace analysis.

Costs and Financial Analysis

Section 4.0, Costs and Financing, of the Final EIR, provides detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding. The proposed Project's capital costs to construct are estimated at \$385 – 500 million and assume prevailing wages pursuant to a Project Labor Agreement. The primary source of capital funding for the proposed Project is from bond financing serviced by revenue from the proposed Project. The primary sources of revenue for the proposed Project are farebox revenues and naming rights sponsorship revenue. Proposed Project annual operations and maintenance costs are projected at approximately \$8 – 10 million per year (inclusive of capital reserve funds) and assume prevailing wages. Operation and maintenance costs are proposed to be fully funded out of proposed Project revenues.

The proposed Project is not seeking Metro funding. In addition, no other public sources of funding have been sought or committed to the proposed Project.

TOPICAL RESPONSE M

Comparable Urban Aerial Transit Systems

Comments on the Draft EIR address other urban aerial transit systems around the world. The Draft EIR discusses numerous aerial transit systems in other locations around the world that serve as precedents for the proposed Project. Like the proposed Project, comparable aerial transit systems have been shown to operate safely and efficiently and provide benefits to their surrounding communities.

Comparable Systems Enable Faster Transit and Facilitate Commerce

As discussed in Section 2.0, Project Description, of the Draft EIR, modern aerial transit systems are currently in operation in numerous urban locations around the world. These locations range from cities within the United States—e.g., Portland, Oregon and New York, New York—to cities in Asia, Europe, and South America. Such comparable systems demonstrate the versatility of aerial transit systems to operate in diverse environments and represent a sample of the numerous models for the proposed Project.

Comparable aerial transit systems in other cities and countries have brought benefits to their surrounding areas by connecting disparate neighborhoods, promoting commerce, beautifying communities, and enhancing transit system rider safety. As shown in Table 2-1, ART Precedents, in Section 2.0, Project Description, of the Draft EIR, a 3S aerial gondola system opened in 2022 in Toulouse, France (“Téléo”) and is currently operating along a 1.67-mile segment. With a cabin size of 34 people, the Toulouse system has a capacity of transporting 2,000 people per hour per direction and a ride time of 10 minutes. Annual ridership of Téléo is estimated to be 2.5 million people. Téléo connects three major economic and educational hubs of the city: Rangueil Hospital, the University Cancer Institute, and Paul Sabatier University.⁹⁵ The total employment across these three institutions represents 85,000 people.⁹⁶ Moreover, the aesthetic design of Téléo has received accolades for its integration with and enhancement of the surrounding environs, including approval by the French architectural association Bâtiments de France.⁹⁷

Recently, the “Burnaby Mountain Gondola” was proposed in British Columbia, Canada. The Burnaby Mountain Gondola is a 3S aerial gondola system proposed to connect Simon Fraser University with TransLink, the statutory authority responsible for the regional transportation network of Metro Vancouver in British Columbia, Canada. Located in British Columbia’s third-largest city and a municipality of Metro Vancouver, the Burnaby Mountain Gondola is expected to bring transportation and commercial benefits to the surrounding area. Simon Fraser University represents a major employment and economic hub in the region, and approximately 25,000 trips are made up and down Burnaby Mountain each day.⁹⁸ During peak periods, the Burnaby Mountain Gondola would depart approximately every minute and transport approximately 3,000 passengers per hour per direction.⁹⁹ Whereas currently the average length of a bus trip is between 15 and 45 minutes, the travel time on the Burnaby Mountain Gondola would be

⁹⁵ Poma. 2021. Téléo. Available at: <https://www.poma.net/en/work/teleo> (accessed September 20, 2023).

approximately six minutes.¹⁰⁰ Like the proposed Project, the Burnaby Mountain Gondola would thus enable shorter travel times for commuters and nearby residents, more frequent service, and reduced noise, traffic, and emissions for the surrounding communities.¹⁰¹

In Utah, the Utah Department of Transportation (“UDOT”) released a Final Environmental Impact Statement (“Final EIS”) in August 2022 for an integrated transportation system in Little Cottonwood Canyon, Utah.¹⁰² In the Final EIS, UDOT selected an aerial gondola system (the “Little Cottonwood Canyon Gondola”) as the preferred alternative for the transportation system. Located in a mountainous region popular for skiing, the Little Cottonwood Canyon Gondola would improve mobility along State Route (S.R.) 210 and would substantially improve average travel time from 80-85 minutes by car to 43 minutes by gondola.¹⁰³ Due to the risk of avalanches in the area, road closures for avalanche mitigation are frequent, causing up to four-hour travel delays along S.R. 210 and spillover traffic in nearby neighborhoods.¹⁰⁴ Like the proposed Project, the Little Cottonwood Canyon Gondola would thus provide benefits to local residents in offering an alternative mode of transportation along S.R. 210 for visitors, alleviating spillover traffic, easing parking burdens, and improving air quality in nearby communities.

As shown in Table 2-1, ART Precedents, in Section 2.0, Project Description, of the Draft EIR, in Bolivia, a monicable detachable gondola system (“Mi Teleférico”) connects La Paz to neighboring cities, including the mountaintop city of El Alto. With a capacity of 3,000 people per hour per direction, Mi Teleférico transports more than 230,000 people per day across its entire network and routinely operates at its peak design capacity during commuting hours between 7:00 and 9:00 A.M.¹⁰⁵ Mi Teleférico reduces trip times from over one hour by car to 10-17 minutes by cable car.¹⁰⁶ In addition, the system components of Mi Teleférico have been hailed for their ability to integrate seamlessly into the densely populated environment of La Paz, due to their compact size relative to those of other modes of public transit.¹⁰⁷

In Mexico, an aerial transit system (“Cablebus”) operates along a 5.7-mile alignment in northern Mexico City. Across 377 cabins carrying up to 10 passengers each, Cablebus can transport as many as 5,000 people per hour between its six stations.¹⁰⁸ The Cablebus system has been reported to reduce travel times in Mexico City from as much as 50 minutes by car to 19 minutes by aerial transit.¹⁰⁹ More recently, an expansion of the Cablebus system (“Cablebus 2”) began operations in 2021 in southeastern Mexico City, located in the district of Iztapalapa. Operating over nearly seven miles, Cablebus 2 can carry as many as

¹⁰⁹ Leitner. 2021. “Cablebus 2 Gondola Lift in Mexico City Now Ready for Operation.” Available at: <https://www.leitner.com/en/company/news/detail/cablebus-2-gondola-lift-in-mexico-city-now-ready-for-operation> (accessed September 20, 2023).

50,000 people per day over seven stations.¹¹⁰ Travel times via Cablebus 2 are similarly reduced by a significant margin, from up to one hour and 15 minutes by car to 36 minutes by aerial transit.¹¹¹

As shown in Table 2-1, ART Precedents, in Section 2.0, Project Description, of the Draft EIR, a monocable detachable gondola (“Mexicable”) operates along a 3-mile distance in Mexico City, Mexico. With a cabin size of 10 people, the annual ridership of Mexicable is estimated to be 7.3 million. Mexicable serves to connect the hillside municipality of Ecatepec to the broader Mexico City Metro public transit system.¹¹² Passengers of Mexicable are able to bypass the significant vehicle traffic near the Mexico-Pachuca highway, reducing travel times to 17 minutes by aerial transit from upwards of 90 minutes by car.

In Colombia, an aerial transit system (“Metrocable”) operates throughout a network that connects the innermost areas of Medellín to communities lying in the hillsides of the Aburrá Valley. Metrocable comprises an integral part of Medellín Metro, the city’s public transportation system, serving residents who commute to and from Medellín’s city center.¹¹³ Since its initial opening in 2004, Metrocable has reduced travel times throughout the city dramatically, from as much as two hours by car to 30 minutes by aerial transit.¹¹⁴ Moreover, by making transportation more accessible to outlying, disadvantaged communities, Metrocable has been found to enable greater job access, which in turn has led to higher incomes for residents with access to the Metrocable system.¹¹⁵

In Bogotá, Colombia, an aerial transit system (“TransMiCable”) operates along a 2-mile route that connects the Ciudad Bolívar District to Bogotá’s Integrated Public Transport System, the city’s public transportation system.¹¹⁶ With a capacity of 3,600 people per hour per direction, TransMiCable has one of the highest capacities among aerial transit systems around the world, reducing travel times for the approximately 20,000 daily passengers from up to one hour and 20 minutes by bus to 15 minutes by aerial transit.^{117,118} Local businesses have also benefited from the increased flow of customers, and new businesses have sprouted up as a direct result of the increased foot traffic near TransMiCable stations.¹¹⁹

Like such systems, the proposed Project would enable faster transit and facilitate commerce for businesses and consumers along the system alignment. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Just as comparable systems such as Mi Teleférico are able to operate at peak capacity during commuting hours, the proposed Project would be able to operate at its peak design

¹¹⁹ Ibid.

capacity on game days and during other events at Dodger Stadium. Given the capacity of the proposed Project, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system, which is equal to roughly 1,000,000 passengers per year at Dodger Stadium alone. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Further, in creating a new transit connection, the proposed Project would bolster commercial activity in the surrounding areas. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to, and opportunities for potential partnerships with, local businesses.

Comparable Systems Promote Public Art

Like the proposed Project, comparable urban aerial transit systems promote the creation of public art and enable opportunities for cities to collaborate with local artists to beautify their neighborhoods. In Ecatepec, Mexico City, the Mexicable has galvanized the creation of as many as 52 works of street art and sculptures surrounding the system’s alignment. Like the proposed Project, Mexicable enabled collaborations with numerous local and international artists to design public art that now line the system’s route to be viewed by passengers and local residents alike.¹²⁰ With the proliferation of public art along the Mexicable alignment, residents and local businesses have reported greater numbers of visitors and a renewed interest in Ecatepec.¹²¹ Likewise, along the route of Cablebus 2, the Iztapalapa local government has hired as many as 140 local artists to enliven the neighborhood with color, commissioning nearly 7,000 largescale pieces of public art and paintings.¹²² Colorful murals have been painted on the sides of buildings and on rooftops, making them visible to pedestrians on the ground as well as passengers in the air.¹²³ Refer to Topical Response C, Project Features, for discussion of the proposed Project’s commitment to provide opportunities to collaborate with and showcase local artists along the system alignment.

Comparable Systems Increase Safety and Reduce Crime

Other gondola systems around the world have been shown to reduce violent crime in nearby areas. In Medellín, Colombia, a study of the city’s MetroCable, an urban gondola system, showed that transit-oriented development around the system was accompanied by investments in neighborhood infrastructure.¹²⁴ Such investments were in turn associated with a 66-percent decline in the homicide rate and a 75-percent decline in resident reports of violence in neighborhoods with access to the system, demonstrating that investments in aerial transit systems can contribute to a reduction in violent crime.¹²⁵

In addition to statistical studies, residents of cities with aerial transit systems have reported a greater sense of security when riding aerial transit relative to other modes of public transportation. In Bolivia,

¹²³ Ibid.

¹²⁴ Magdalena Cerda, et al. 2012. Reducing violence by transforming neighborhoods: a natural experiment in Medellín, Colombia. Available at: <https://pubmed.ncbi.nlm.nih.gov/22472117> (accessed September 20, 2023).

¹²⁵ Ibid.

residents of La Paz have expressed that Mi Teleférico is safer than local minibuses, as the latter are frequently packed to capacity with passengers, which often include pickpockets.¹²⁶ Similarly, regular passengers of the Cablebus in Mexico City have reported that despite high incidents of theft in public transportation, they experience a greater sense of security when riding the Cablebus and thus prefer it to other transit modes.¹²⁷ And in Ecatepec, residents have expressed similar preferences to taking Mexicable over buses given how frequently bus passengers become victim to crime in the area.¹²⁸

In line with such comparable systems, as discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would be equipped with security features to ensure the safety of passengers. Each gondola cabin would have a security camera on board with a feed to the control room, as well as a “push to talk” button, which would open two-way communications with the control room. The control room would be able to address all cabins at once, or an individually selected cabin. Control room operators would have the ability to contact local security, law enforcement or other emergency response agencies as needed.

Comparable Systems Operate Safely, Efficiently, and in Concert with Adjacent Residential, Schools, and Open Space

Comments on the Draft EIR address the proximity of the proposed Project to houses, schools, and open space. Comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with their surrounding urban environments.

As shown in Table 2-1, ART Precedents, in Section 2.0, Project Description, of the Draft EIR, the Portland Aerial Tram in Portland, Oregon connects nearby medical office buildings and high-rise residential uses to the Oregon Health and Science University (OHSU) and the OHSU Hospital, operating between terminals located at Portland’s South Waterfront District and Marquam Hill. The Portland Aerial Tram flies over the residential neighborhood of Lair Hill, which is home to the South Portland Historic District, a historical residential neighborhood.¹²⁹ The Portland Aerial Tram has also provided community benefits to the surrounding area, including bike-share and mobility improvements and a pedestrian bridge connecting the Lair Hill neighborhood to South Waterfront. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first- and last-mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station.

The Portland Aerial Tram is also one of numerous aerial transit systems that operate safely in seismically active areas. Aerial transit systems routinely operate in areas with regular earthquake activity, including North American cities such as Mexico City, Mexico, South American cities such as Quito, Ecuador and Bogota, Colombia, and European and Asian cities such as Ankara and Istanbul, Türkiye. Refer to

Appendix F, Memo on Structural Engineering, of the Final EIR, for discussion of how the proposed Project would meet the rigorous safety standards of applicable standards, requirements, and building codes, including all mandated standards addressing environmental factors such as wind and seismic effects and gravity forces, to ensure structural integrity and safety.

In Mexico City, both the Mexicable and Cablebus aerial transit systems transport passengers above dense, residential areas.¹³⁰ In addition to homes and residential neighborhoods, the alignment of Mexicable also covers various nearby schools and educational facilities, servicing students who use the aerial transit system to commute to and from school.¹³¹ In Bogotá, the TransMiCable system is woven seamlessly into the fabric of the densely populated city and surrounding hillside communities. System components, including stations, are nestled among homes and public open space, and public parks have been newly built in close proximity to TransMiCable stations.¹³² In Colombia, MetroCable flies above the densely populated, mountainous city of Medellín. Moreover, as discussed above, it is due to MetroCable's close proximity to residential areas that access to economic opportunities has grown and individual incomes have risen in even the poorest areas of the city.¹³³ In Bolivia, the alignment of Mi Teleférico passes through the densest parts of La Paz and El Alto, flying above countless residences and over public parks.¹³⁴ In Toulouse, Téléo is located alongside a hospital (Rangueil Hospital), a university (Paul Sabatier University), and numerous nearby residences. Indeed, the express purpose of Téléo was to make these sites easily accessible to one another by transit. Likewise, the Burnaby Mountain Gondola would be located nearby a university (Simon Fraser University) and a residential community of 7,000 people, expected to rise to 9,000 people in the coming years.¹³⁵ Like Téléo, the Burnaby Mountain Gondola was conceived to serve the express purpose of providing access to these sites and enable convenient connections between the residences and employers along the system's alignment. Finally, as shown in Table 2-1, ART Precedents, in Section 2.0, Project Description, of the Draft EIR, a reversible tramway operates along a half-mile alignment in New York, New York, connecting Manhattan to Roosevelt Island ("Roosevelt Island Tramway"). The Roosevelt Island Tramway is located in close proximity to numerous residences and is visible from the inside of homes on both ends of the alignment.

Consistent with these precedent systems, the proposed Project would operate safely, efficiently, and in concert with the surrounding urban environment of the City of Los Angeles.

TOPICAL RESPONSE N

Environmental Justice

Comments on the Draft EIR suggested that the Draft EIR should have addressed environmental justice. Environmental justice ensures equal and equitable protection from environmental and health hazards, meaning that the burdens of pollution should not be borne by sensitive populations or communities that are already experiencing its adverse effects. The Draft EIR addressed topics related to environmental justice, including the proposed Project’s ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution. The Draft EIR also considered and analyzed the proposed Project’s consistency with land use policies related to environmental justice. The proposed Project also supports Metro’s goal of prioritizing equity opportunities as demonstrated by the proposed Project’s goals which include helping to promote public transit as an essential lever to enabling access and improving quality of life for Los Angeles County. Consistent with the recognition by the California Attorney General that compliance with CEQA itself is a tool to promote environmental justice, the Draft EIR fully analyzed and disclosed the proposed Project’s potential environmental effects, including on the surrounding communities.

Environmental Justice and the Draft EIR

Poor and marginalized communities, including communities of color, are disproportionately affected by environmental degradation, with hazardous waste facilities and other polluting industries placed inequitably near these communities. Within the United States, race is the primary determinant of environmental justice, and is recognized by the environmental justice movement as “environmental racism.” Communities of color have been battling environmental racism for decades. For example, the practice of “redlining” led to communities of color being located in areas with high levels of pollution and environmental hazards. Projects such as the proposed Project, and other investments that seek to reduce pollution within these communities disproportionately impacted by pollution, are important tools in combating environmental racism. The proposed Project – a zero-emission, high-capacity transit connector – would result in air quality benefits for the surrounding communities and would reduce greenhouse gas (GHG) emissions as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways, benefitting these communities.

The Draft EIR Addresses Environmental Justice by Considering the proposed Project’s Ability to Reduce Congestion and Emissions from On-Road Vehicles in an Area Disproportionately Burdened by Pollution

As the California Attorney General recognizes, environmental justice ensures equal and equitable protection from environmental and health hazards, meaning that the burdens of pollution should not be borne by sensitive populations or communities that are already experiencing its adverse effects.¹³⁶ The California Attorney General’s Office acknowledges that compliance with CEQA is a tool to promote environmental justice.¹³⁷ The Draft EIR complied with CEQA, and addressed topics related to environmental justice, including an analysis of the proposed Project’s potential impacts to the surrounding

¹³⁶ State of California Department of Justice, Environmental Justice, <https://oag.ca.gov/environment/justice> (accessed September 20, 2023).

¹³⁷ Ibid.

communities, concluding that the proposed Project could result in air quality benefits for the surrounding communities.

As discussed in Section 2.0, Project Description, of the Draft EIR, “the communities in the vicinity of the proposed Project alignment were identified as being in the 90 – 100 percentile of communities disproportionately burdened by multiple sources of pollution in the State.” The proposed Project itself would not exacerbate such burdens, but would provide benefits to these communities. The proposed Project – a zero-emission, high-capacity transit connector – would reduce greenhouse gas (GHG) emissions as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways, benefitting these communities.

The proposed Project would also result in air quality benefits to communities in the Project area. As discussed in Section 1.4.3, Senate Bill 44, of Section 1.0, Introduction, of the Draft EIR, the lifetime emissions of the proposed Project over its useful life (30 years based on SCAQMD’s guidance for GHG significance thresholds) would be a reduction of 166,653 MT CO₂e. In the same section, the Draft EIR notes that the lifetime VMT reduction of the proposed Project over its useful life would be 129,629,500 VMT. As discussed in Section 3.03, Air Quality, of the Draft EIR, emissions are decreased through reducing vehicle miles traveled, and the “proposed Project would result in a net reduction in criteria pollutant emissions in both 2026 (Build Out) and 2042 (Horizon Year) by reducing vehicle miles traveled and thereby decreasing emissions compared to existing conditions.”

While not applicable to the proposed Project, the proposed Project is consistent with President Biden’s recent Executive Order on Environmental Justice.¹³⁸ The Executive Order provides that “[a]dvancing environmental justice will require investing in and supporting culturally vibrant, sustainable, and resilient communities in which every person has safe, clean, and affordable options for housing, energy, and transportation.” The proposed Project is a proven, zero emission, safe, sustainable, high-capacity and highly efficient form of transportation that would function as both a reliable rapid transit system and first/last mile¹³⁹ connector. The Executive Order also requires agencies to provide information in a manner that provides meaningful access to individuals with limited English proficiency and is accessible to individuals with disabilities, and to provide technical assistance, tools, and resources to assist in facilitating meaningful and informed public participation. As discussed in detail below, the proposed Project provided project information and outreach in multiple languages reflective of the communities in the Project area, provided ADA accessibility features in public meetings, and hosted eight public meetings immediately preceding, during, and immediately following the Draft EIR public review period to facilitate meaningful and informed public participation. In addition, in June 2021, the Project Sponsor also hosted virtual community meetings to provide Project updates and solicit feedback on the proposed Project, and provided information in various languages.

¹³⁸The White House, Executive Order on Revitalizing Our Nation’s Commitment to Environmental Justice for All (April 21, 2023), available at: <https://www.whitehouse.gov/briefing-room/presidential-actions/2023/04/21/executive-order-on-revitalizing-our-nations-commitment-to-environmental-justice-for-all> (accessed September 20, 2023).

¹³⁹Metro’s First/Last Mile Policy is aimed at making it easier to travel in Los Angeles by strengthening connections between transit stations and their surrounding communities. <https://www.metro.net/about/first-last> (accessed September 20, 2023).

The Draft EIR Analyzed the Proposed Project’s Consistency with General Plan Policies Related to Environmental Justice

While the City of Los Angeles has not adopted a separate Environmental Justice Element, the City’s General Plan Framework Element establishes several health-promoting principles, including equity and environmental justice in such considerations. Similarly, the City’s Mobility Element has a strong public health focus centered around promoting sustainability and increasing access to active transportation. As provided in Table 3.11-3, Project Consistency with Applicable City of Los Angeles General Plan Policies, of the Draft EIR, the Draft EIR analyzed the proposed Project’s consistency with these policies. For example, as discussed in Section 3.11, Land Use and Planning, of the Draft EIR, the proposed Project supports Framework Element Objective 5.8 by reinforcing or encouraging the establishment of strong pedestrian orientation in the surrounding communities and facilitating multi-modal access to and from the stations with pedestrian network improvements. Consistent with this objective, the Draft EIR notes how “[t]he proposed Project would also enhance community connectivity to areas that have historically been underserved and provide pedestrian enhancements so that the areas surrounding the stations can serve as a focus of activity for the surrounding community and a focus of investment in the community.” Section 3.11, Land Use and Planning, of the Draft EIR, discusses how the proposed Project is consistent with Framework Element Policy 38, seeking to enhance neighborhood accessibility by “provid[ing] new connections to and between currently underserved neighborhoods and uses along the proposed alignment” while including a “mobility hub at the Chinatown/State Park Station where passengers would be able to access a suite of first mile and last mile multi-modal options, such as a bike share program.” In addition to facilitating a potential bike share program, the proposed Project’s cabins would accommodate bicycles, as described in Section 2.0, Project Description, of the Draft EIR. Further, the Chinatown/State Park Station location may provide bicycle access from the adjacent proposed Los Angeles River bicycle path (anticipated to open in 2027)¹⁴⁰ to the bicycle and hiking trails in Elysian Park.

The Draft EIR also analyzed the proposed Project’s consistency with the City’s Mobility Element in Section 3.17, Transportation. The proposed Project would ensure quality pedestrian access by facilitating “multi-modal access to and from the stations with pedestrian network improvements.” Such improvements would be targeted especially at the areas surrounding the proposed Dodger Stadium Station to provide a safe and efficient connection for pedestrians traveling between the station and the stadium. The proposed Project would also provide quality pedestrian access to communities surrounding Dodger Stadium further advancing the environmental justice goals of the City’s Mobility Element. A key policy initiative of the City’s Mobility Element is to “embed equity and environmental justice into the transportation policy framework, project implementation, and action programs.”¹⁴¹ Because the proposed Project would bring quality pedestrian access to areas around Dodger Stadium that previously have lacked such access, the Draft EIR concluded that the proposed Project would be consistent with the policies of the City’s Mobility Element to ensure the provision of quality pedestrian access.

¹⁴¹ Los Angeles Department of City Planning, Mobility Plan 2035, p. 14 (2016), https://planning.lacity.org/odocument/523f2a95-9d72-41d7-aba5-1972f84c1d36/Mobility_Plan_2035.pdf#page=14 (accessed September 20, 2023).

The Proposed Project Supports Metro’s Goal of Prioritizing Equity Opportunities

The proposed Project would be consistent with Metro’s equity goals. Metro’s Rapid Equity Assessment (“REA”) is a tool designed to assist Metro staff in identifying and prioritizing equity opportunities. Metro’s REA was developed in June 2020 to consider equity in urgent times, and assists Metro staff in quickly prioritizing equity opportunities, which enhance positive impacts or reduce negative consequences, and is used as a first step for Metro projects, programs, services, and decisions. Metro defines “equity” as “both an outcome and a process to address racial, socioeconomic, and gender disparities, to ensure fair and just access . . . to opportunities, including jobs, housing, education, mobility options, and healthier communities . . . [i]t requires community information and needs-based provisions, implementation, and impact of services, programs, and policies that reduce and ultimately prevent disparities.”¹⁴²

Consistent with Metro’s Rapid Equity Assessment framework, the proposed Project seeks to support Metro’s goal of prioritizing equity opportunities and will help promote public transit as an essential lever in enabling access to safe and sustainable transportation and improving quality of life for Los Angeles County.

Potential Benefits and Improving Equity Outcomes

Improved Transportation Connectivity in Metro’s EFCs

The proposed Project would improve transportation connectivity in Metro’s Equity Focused Communities (EFCs) where transportation needs are greatest.

Metro created a community designation called Equity Focus Communities (EFCs) to help identify where transportation needs are greatest. The proposed Project, which is located within the boundaries of Metro’s EFCs, would help to improve transportation in EFCs. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project aims to enhance community connectivity in these EFCs by providing first/last mile transit and pedestrian access in areas that have historically been underserved, including Los Angeles State Historic Park and Elysian Park. The proposed Project is also consistent with Metro’s First/Last Mile Strategic Plan to facilitate easy, safe, and efficient access to the regional transportation system because it would increase connectivity of people in the EFCs to the region’s public transportation hub at LAUS and the Dodger Stadium property, and more broadly improve mobility and accessibility for the region by providing a daily, high capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. In addition to facilitating transit connectivity, the proposed Project would also enhance access for riders of the ART system to parks, including Los Angeles State Historic Park and Elysian Park, thereby improving equitable access to parks. Metro also acknowledges that there is a need for improved transit options that link with the growing Metro network to meet existing and future travel demands and access to Dodger Stadium.

Therefore, as discussed in Section 2.3.8, Project Objectives, of the Draft EIR, the overall purpose of the proposed Project is to provide a direct transit connection between LAUS and the Dodger Stadium property via an aerial gondola system and improve connectivity for the surrounding communities by linking to the

¹⁴² Metro’s Rapid Equity Assessment (REA), available here:

<https://www.dropbox.com/s/790jw2sumk42ra6/Rapid%20Equity%20Assessment%20Tool.pdf?dl=0> (accessed September 20, 2023).

Los Angeles State Historic Park, Elysian Park, and the neighborhoods along the proposed Project alignment and the region's rapidly growing regional transit system at LAUS.

Air Quality Benefits

The proposed Project would also reduce vehicular congestion in and around Dodger Stadium, thereby reducing VMT and GHG emissions and resulting in air quality benefits.

The proposed Project seeks to take into account the current needs of the surrounding community, including economic barriers and social challenges with access to transit by helping to reduce vehicular congestion and associated air pollution in the Project area. As discussed in Section 2.0, Project Description, of the Draft EIR, the communities in the vicinity of the proposed Project alignment were identified as being in the 90 – 100 percentile of communities disproportionately burdened by multiple sources of pollution in the state.¹⁴³ And, as the region's population grows and resulting travel needs continue to increase, the local and regional roadway system is likely to experience greater congestion. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue, unlike other high-capacity venues in the region. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime emissions of the proposed Project over its useful life would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the proposed Project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles traveled. The proposed Project would result in a net reduction in criteria pollutant emissions by reducing vehicle miles traveled.

Affordability – Community Access Plan

As reflected in the Project Objectives provided in Section 2.3.8 of the Draft EIR, the proposed Project is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, providing connections to Metro's growing regional public transit system. Some communities along the proposed Project alignment, including William Mead Homes, include families with a median household income of <\$20,000 per year. To enhance access to the proposed Project for these communities, in addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. The graphic below demonstrates the geographic area for the Community Access Plan applicability. Moreover, under the Community Access

¹⁴³ California Office of Environmental Health Hazard Assessment, CalEnviroScreen 4.0 Map, <http://oehha.ca.gov/calenviroscreen/maps-data>.

Plan, transfers to and from the Metro regional transit system and the proposed Project would be free. The Community Access Plan would honor Metro’s numerous discount fare programs for a variety of needs (i.e., senior fares, student fares, etc.). Residents and employees of businesses located within the communities adjacent to the proposed Project alignment would only pay the rate they pay to ride the Metro system to ride the proposed Project.

Accessibility – ADA Compliance

To ensure the proposed Project overcomes barriers to access due to physical inability, the proposed Project is designed to be ADA compliant. As discussed in Section 2.0, Project Description, of the Draft EIR, the station boarding process and cabins would allow for sitting or standing, and would comply with all accessibility requirements of the Americans with Disabilities Act (“ADA”), including accommodating wheelchairs. In addition, the length and sizing of the arrival/departure platforms within station would be compliant with the accessibility requirements of the ADA. If needed, cabins could be either slowed or stopped in the station for boarding purposes. Station attendants would be located within each station to assure safe boarding and to execute stops for unloading or boarding purposes, if necessary. Attendants would also provide customer interaction and observation; if a passenger needs special assistance, an attendant may either further slow, or stop, a cabin. A separate operator would be stationed in a control booth monitoring screens, which would show activities in each cabin and station, as well as the system controls. The time necessary to slow or stop cabins is factored into the overall of system capacity of the proposed Project. Pathways to and from the boarding areas would be ADA compliant with redundant vertical circulation and appropriately sized passageways. The entry widths and interiors size of each cabin would comply with the requirements of the ADA.

Open Space Enhancements, Active Transportation Connectivity, and Sustainability Features

The proposed Project also includes features to enhance and provide additional benefits to the surrounding communities. The proposed Project would include several sustainability features and open space enhancements, including pedestrian enhancements, drought tolerant landscaping, and improvements at the Alameda Triangle, the Los Angeles State Historic Park, and along the pedestrian pathway connecting Dodger Stadium Station and Dodger Stadium. The proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first- and last-mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. The proposed Project would also improve transit access to the Los Angeles State Historic Park and Elysian Park.

Safety and Security Features

As discussed in detail in Topical Response M, Comparable Urban Aerial Transit Systems, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with their surrounding environments. For example, in Mexico City, both the Mexicable and Cablebus aerial transit systems transport passengers above dense, residential areas.¹⁴⁴ In addition to homes and residential neighborhoods, the alignment of Mexicable also covers various nearby schools and educational facilities, servicing students who use the aerial transit system to commute to and from school.¹⁴⁵ Further, residents of cities with aerial transit systems have reported a greater sense of security when riding aerial transit relative to other modes of public transportation. Regular passengers of the Cablebus in Mexico City have reported that despite high incidents of theft in public transportation, they experience a greater sense of security when riding the Cablebus and thus prefer it to other transit modes.¹⁴⁶ And in Ecatepec, residents have expressed similar preferences to taking Mexicable over buses given how frequently bus passengers become victim to crime in the area.¹⁴⁷

In line with such comparable systems, and as discussed in Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, system components would be equipped with security features for system safety. The gates and entrances to the stations would be locked at night and would be equipped with security features to prevent entrance by unauthorized personnel. The towers would have no publicly accessible gates or entrances and would be inaccessible to unauthorized personnel. Maintenance doors at the base of the towers would be secured at all times and only accessible by authorized personnel. The system components would be equipped with security cameras to monitor activity at stations, the junction, the towers, and in each cabin. Moreover, attendants would be present at each station, and a separate operator would be stationed in a control room to monitor activity throughout the proposed Project.

¹⁴⁴ Leitner, Mexico: A New Chapter in the “Ropeway Success Story.” available at: <https://www.leitner.com/en/company/news/detail/mexico-a-new-chapter-in-the-ropeway-success-story> (accessed September 20, 2023).

¹⁴⁵ ParCitypatory, Connecting the Outskirts to City Centre with Cable Cars (2019), available at: <https://parcitypatory.org/2019/06/08/mexicable> (accessed September 20, 2023).

¹⁴⁶ Mexico News Daily, Passenger numbers on Mexico City Cablebus line 78% more than expected (June 21, 2022), <https://mexiconewsdaily.com/news/passenger-numbers-on-mexico-city-cablebus-line-78-more-than-expected> (accessed September 20, 2023).

¹⁴⁷ WBUR, An Aerial Tram Is One Mexican City’s Solution To Traffic And Crime, (April 26, 2017), <https://www.wbur.org/hereandnow/2017/04/26/mexico-ecatepec-aerial-tram> (accessed September 20, 2023).

In addition, and as discussed in Topical Response K, Signage and Lighting, the proposed Project would include signage to support wayfinding for transit passengers, including information about transit connections and other important information to facilitate transit usage, and the proposed Project's lighting would include low-level lighting for security and wayfinding purposes.

Project Sponsor's Commitment to Utilizing MBE/WBE/DBE/SBE/DVBE/LGBTQ Owned Businesses¹⁴⁸

The Project Sponsor has committed to a goal of 35 percent utilization of MBEs, WBEs, DBEs, SBEs, DVBEs, and LGBTQ-owned businesses during the proposed Project's construction phase.

Utilization of Local Artists to Reflect the Unique Neighborhood Culture and History

As discussed in Section 2.0, Project Description, of the Draft EIR, and Topical Response C, Project Features, each station of the proposed Project could provide an opportunity for site-specific artwork commissioned from artists from the surrounding community, that is reflective of the unique neighborhood culture. The proposed Project has also committed to one "Art Cabin" that could feature artwork commissioned from local artists. The proposed Project would create numerous opportunities to collaborate with and showcase local artists, including convening stakeholder groups to coordinate on issues including utilization of local artists and identification of sites along the proposed Project alignment to showcase the work of local artists.

Overcoming Potential Burdens

The Proposed Project Would Not Displace Businesses

Comments on the Draft EIR address the need for housing, grocery stores, and/or healthcare facilities in the communities in the vicinity of the proposed Project alignment. The proposed Project would not preclude the development of such uses. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses along the proposed Project alignment while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to businesses along the alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. As discussed in Topical Response C, Project Features, during construction of the proposed Project, the Project Sponsor would create a Business and Community Support Program to assist local businesses affected by proposed Project construction activities. The proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including MBEs, WBEs, DBEs, SBEs, DVBE, and LGBTQ-owned businesses, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. Further, as discussed in Section 3.17, Transportation, and Section 3.11, Land Use, of the Draft EIR, multimodal access—for both local and emergency response—to local businesses, neighborhoods,

¹⁴⁸ MBE/WBE/DBE/SBE/DVBE/LGBTQ refers to minority business enterprises (MBE), women business enterprises (WBE), disadvantaged business enterprises (DBE), small business enterprise (SBE), disabled veteran business enterprises (DVBE), and LGBTQ-owned businesses.

LAUS, and the Los Angeles State Historic Park would be maintained throughout construction of the proposed Project, and disruptions to local businesses would be minimized.

The Proposed Project Would Not Displace Housing

As discussed in Section 3.14, Population and Housing, of the Draft EIR, and Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, of the Final EIR, no displacement of existing residences or housing would occur in connection with the construction and operation of the proposed Project, which would operate primarily over the public ROW and publicly owned property to minimize aerial rights requirements over private properties, taking into account existing and future adjacent land uses. The proposed Project is intended to accommodate existing and future transportation needs of the area's population. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, of the Final EIR, for an overview of the proposed Project's consistency with planned and proposed housing in the vicinity of the proposed Project. The proposed Project would therefore not preclude the development of such community-facing uses within the area.

Minimizing Aerial Rights Requirements

As discussed in Section 2.5, Proposed Project Alignment and Components, of Section 2.0, Project Description, of the Draft EIR, and illustrated in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR, the proposed Project was chosen as it maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties, taking into account existing and future adjacent land uses.

Addressing Privacy Concerns

Some commenters raise concerns about impacts to privacy of communities along the proposed Project alignment. As discussed in Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, cabin windows can be equipped with privacy glass that can become opaque while adjacent to sensitive views, and the proposed Project would work with stakeholders adjacent to the proposed Project alignment to identify locations where the use of privacy glass would be warranted. Considerations as to the locations along the proposed Project alignment where the privacy glass could be activated include the subject adjacent sensitive views and the vertical and horizontal distance between the proposed Project cabins and the adjacent sensitive views.

Community Outreach and Engagement Efforts

Metro and the Project Sponsor have conducted extensive community engagement efforts. As discussed in Appendix A, Scoping Report, of the Draft EIR and Appendix A, Public Outreach Report, of the Final EIR, these efforts include multilingual door knocking, provision of project materials and information in multiple languages, numerous public meetings with provision of materials and interpretation in multiple languages, and partnerships with various cultural, educational, and business community organizations, including Cathedral High School, the Chinese American Museum, the Italian American Museum, Chinatown businesses, and Olvera Street Merchants. Community engagement efforts also resulted in understanding the desire for projects that help promote business in the area, and to help alleviate concerns that community members had regarding traffic and parking. For example, although parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines ("TAG"), a Parking

Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project's potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified. In addition, as discussed in Section 5.0, Other CEQA Considerations, of the Draft EIR, these community engagement efforts led to stakeholder feedback that also helped inform the location for the proposed Project's Alameda Station and Chinatown/State Park Station. These locations were chosen, in part, to help direct increased foot traffic to nearby businesses and provide safe and convenience pedestrian connections to adjacent uses.

The proposed Project's outreach efforts are intended to support Metro's equity goals, including addressing parking and traffic concerns during game and event days, reducing vehicle miles traveled, and increasing transit access for underserved communities by allowing local residents and employees of businesses in the proposed Project vicinity to ride the proposed Project and transfer to/from the regional Metro transit system using their Metro system access pass at no additional cost, through the Community Access Plan.

Public outreach for the proposed Project was designed with environmental justice principles in mind – ensuring that people have fair and equal access to the planning process regardless of race, culture, national origin, disability status, or income. Public outreach was also designed to ensure compatibility with Metro's equity goals by providing community members the ability to meaningfully engage with information about the proposed Project and ask questions and provide public comments in their native languages. This ensures Metro can intentionally collaborate and listen to community experiences from all community members by removing barriers to communication and accessibility.

As discussed in Appendix A, Public Outreach Report, of the Final EIR, eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar which included toll-free dial in options and ADA accessibility features. To reflect the surrounding community, Project materials and information were provided at both the in-person meetings and on Metro's website in English, Spanish, Chinese (Traditional), and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings.

TOPICAL RESPONSE O

Response to UCLA Mobility Lab Study

Comments on the Draft EIR attached and/or referred to an analysis conducted by the UCLA Mobility Lab and issued in October 2022, which the Mobility Lab’s director referenced as “preliminary in nature” (the Mobility Lab Study).¹⁴⁹ This Topical responds to the Mobility Lab Study.

The Mobility Lab Study was issued through what appears to be a press release and does not provide supporting documentation. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project’s Draft EIR and does not appear to have been prepared for that purpose. On January 13, 2023, the Mobility Lab issued the following statement regarding the Mobility Lab Study:^{150,151}

Statement from the UCLA Mobility Lab Regarding LA Gondola Ridership Projection

The UCLA Mobility Lab is an engineering and technology lab dedicated to scientific research and innovation around mobility technologies. The lab’s data on projected transit ridership of a proposed Dodger Stadium gondola is preliminary in nature. More research would be necessary to draw conclusions about potential use of the gondola. The lab takes no view on whether the project should be built.

Responses to Items in Mobility Lab Study

Comment ML-1 UCLA Mobility Lab Study Finds Proposed Aerial Gondola to Dodger Stadium Will Do Little to Reduce Traffic and Emissions

October 24, 2022

University of California Los Angeles

Executive Summary

Los Angeles Aerial Rapid Transit (LA ART), a subsidiary of former Dodgers owner Frank McCourt’s company McCourt Global, wants to build an aerial gondola to take people from Union Station to Dodger Stadium. Promoters of the gondola claim that it will take 3,000 polluting cars off neighborhood streets and the 110 freeway before and after Dodger games, leading to a net reduction in greenhouse gas emissions.

Transportation researchers from the University of California, Los Angeles (UCLA) examined these claims using a state-of-the-art transportation simulation model and

¹⁵⁰ UCLA Mobility Lab. 2023. Statement from the UCLA Mobility Lab Regarding LA Gondola Ridership Projection. January 13, 2023. <https://mobility-lab.seas.ucla.edu> (accessed September 20, 2023).

¹⁵¹ UCLA Mobility Lab. 2023. Tweet on January 13, 2023.

https://twitter.com/ucla_its/status/1613998706851971075?s=46&t=p_Kv02sYuM0ssXk0RDXWeA (accessed September 20, 2023).

found that the gondola could reduce traffic on major roads around Dodger Stadium on the night of a sold-out game, but the impact would likely be very limited. They found that the gondola likely would take only around 608 cars off the road. The gondola is thus unlikely to significantly reduce greenhouse gas emissions and traffic overall.

Response ML-1 This comment provides a general summary of the items discussed in the Mobility Lab Study. Responses to the Mobility Lab Study are provided below. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for an overview of the proposed Project’s sponsor, Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation emissions such as the proposed Project.

Comment ML-2 Methodology

The UCLA researchers – led by Dr. Brian Yueshuai He and Dr. Jiaqi Ma in the UCLA Mobility Lab at the UCLA Samueli School of Engineering – used the “LA Sim” model they created based on activity-based travel demand and agent-based simulation models. The model is grounded in the theory of “discrete choice,” for which Daniel F. McFadden won a Nobel Prize in economics in 2000. Based on real data about road network, traffic, public transportation, and other modes of moving around the city, including walking and bicycling, LA Sim simulates the individual choices that millions of travelers will make when something changes, such as adding another form of transportation, like a gondola to the Los Angeles transportation network.

The researchers caution that this simulation only models the probable use of the gondola for a sold-out night game and further research could reveal different scenarios for a day game or double-header, for example. But the research does model the most likely scenario for fans to choose the gondola – when traffic around the stadium is likely to be most heavy. Around 85% of baseball games played at Dodger Stadium are night games, starting at 7:10pm.

Response ML-2 The Mobility Lab Study states that it used the “LA Sim” model grounded in the theory of “discrete choice” and based on real data about travel systems and behavior in the City. The transportation analysis conducted by Fehr & Peers for the Draft EIR also utilized a transportation model grounded in the theory of “discrete choice,” which forms the theoretical basis for nearly all transportation forecasting, and also based on real data about travel networks and travel behavior in the City, including specific details for the proposed Project alignment. As detailed in Section 3.17, Transportation and the Ridership Model Development Memorandum in Appendix N, Transportation Appendices, of the Draft EIR, the transportation model utilized for the transportation analysis for the Draft EIR for game day travel was a customized ridership model developed because standard regional travel demand models do not accurately represent special generators such as Dodger Stadium and do not include specialized transit modes such as the proposed Project.

Mobility Lab’s “LA Sim” model was derived from the Southern California Association of Government’s 2016 regional travel demand model for the Southern California region.¹⁵² A close inspection of Figure 1 of the Mobility Lab’s Study shows that the model does not have the detailed roadway network in the vicinity of Dodger Stadium (for example, it does not include Stadium Way, Vin Scully Avenue, Chavez Ravine Place, College Street, Bishops Road, the SR-110 ramps to/from the Dodger Stadium Downtown Gate, and the Dodger Stadium gates themselves). It may also lack the background growth factors contained in the City of Los Angeles model for the land use in the study area, as the City of Los Angeles model has the most up to date forecasts based on updates to the relevant community plans in the study area. In the Draft EIR, non-game day travel was estimated using growth factors calculated from the City of Los Angeles’ citywide travel demand model. The City of Los Angeles model is derived from the Southern California Association of Government’s regional travel demand model for the Southern California region, but with additional roadway network detail and the latest land use growth forecasts in the study area, making this model more appropriate for local area analyses.

In contrast to the Mobility Lab’s review, the Draft EIR analysis uses the customized ridership model that more accurately reflects conditions in the vicinity of Dodger Stadium. The ridership model was developed and validated to Los Angeles conditions as documented in the Ridership Model Development Memorandum, in Appendix N, Transportation Appendices, of the Draft EIR. Data specific to Dodger Stadium was utilized to develop the customized ridership model, which included Dodger Stadium attendance and Dodger Stadium Express ridership for all regular season home games in the 2019 Dodger season, zip codes of Dodger game ticket buyers, and Dodger Stadium parking costs. The customized ridership model estimated and compared driving travel times and costs to transit travel times and costs from each zip code to and from Dodger Stadium. By doing so, the ridership model for the proposed Project is a more accurate model of game and event-related travel to and from Dodger Stadium than a more generalized regional travel demand model such as the “LA Sim” model used in the Mobility Lab Study.

Given that different models were used by the Mobility Lab and in the Draft EIR, it is not surprising that results of the modeling would differ. However, the customization of the ridership modeling conducted for the proposed Project ridership model to local conditions and the use of actual data regarding Dodger Stadium fan travel patterns while developing the proposed Project ridership model (as described in the Ridership Model Development Memorandum, in Appendix N, Transportation Appendices, of the Draft EIR) render the modeling and ridership projections in the Draft EIR more complete and accurate and appropriate for use for the proposed Project.

Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and the Ridership Model

¹⁵² Accessed 5/30/2023 from <https://mobility-lab.seas.ucla.edu/research/modeling-and-control-of-dynamic-complex-systems-in-smart-cities>.

Development Memorandum in Appendix N, Transportation Appendices, of the Draft EIR.¹⁵³ Stantec is an internationally-respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR.¹⁵⁴

While the documentation of Mobility Lab’s analysis indicates that it is for a sold-out weekday evening, the Dodgers have drawn the most attendance in major league baseball for many years. In the 2019 season, which serves as the baseline year for many of the data inputs used in the ridership analysis, the Dodgers set an annual paid attendance record of 3,974,309, including 28 sellout games out of an 81 game regular season.¹⁵⁵ Congestion around Dodger Stadium is a regular occurrence for nearly every game, with sell outs or near sell outs reflecting a typical peak condition, not an occasional peak condition. Thus, high ridership levels would be expected throughout the season.

Comment ML-3 Findings

Figure 1: Traffic simulation results by the hour

- Contrary to claims from LA ART, researchers found that the gondola would not significantly reduce traffic around Dodger Stadium.** Results showed the gondola would likely slightly reduce traffic on some roads around the stadium for a sold-out night game and increase traffic on others, leading to little reduction in greenhouse gas emissions. The red lines in Figure 1 above indicate road segments that have a higher traffic volume after the proposed gondola is added to the traffic simulation. The blue lines indicate a decrease in traffic volume. According to the simulation, the total traffic volume would likely be reduced by around 0.9%

(less than 1%) on the roads surrounding the stadium if the proposed gondola is built.

Response ML-3

The graphic presented in Figure 1 of the Mobility Lab Study illustrates preliminary traffic simulation results from the Mobility Lab’s model for the highway system in the vicinity of Dodger Stadium. The transportation model roadway network shown in Figure 1, however, shows that the Mobility Lab Study and model network is missing many of the critical roadways that link to Dodger Stadium (including Stadium Way, Vin Scully Avenue, Chavez Ravine Place, College Street, Bishops Road, the SR-110 ramps to/from the Dodger Stadium Downtown Gate, and the Dodger Stadium gates themselves). This is typical for regional travel demand models designed for analysis of the regional transportation system, which by design do not include smaller subregional streets or event venues. However, the missing streets play an important role in access to/from the stadium. A more sophisticated localized analysis of traffic increases and decreases in the vicinity of Dodger Stadium should include customization of the model’s highway network to include an increased granularity of detail for the streets serving the stadium, as this network has a profound effect on congestion in the neighborhoods surrounding the stadium. The lack of roadway network customization in the Mobility Lab Study model to include the key roadways serving Dodger Stadium underreports the benefits of trip reductions around Dodger Stadium, because the roadways that access the Stadium are those where the full benefit of the proposed Project would be experienced. The omissions of these roadways from the Mobility Lab Study model renders any estimation of traffic reductions and/or increases to be incomplete and aligns with the Mobility Lab’s own statement that their forecast for the proposed Project should be considered preliminary.

It should also be noted that the LA Sim model’s estimate of traffic volume increases on roadway links are not associated with either the proposed Project or Dodger Stadium, as the Mobility Lab’s documentation indicates that riders driving to proposed Project stations were not modeled. Instead, the model is responding to the reduction in cars traveling to and from Dodger Stadium as attendees ride the proposed Project, by shifting vehicles from parallel routes or from other time periods, and communities that use those streets can now travel more easily during pre- and post-game time periods due to reductions in vehicle trips destined to Dodger Stadium as a result of the proposed Project. This would not mean that the proposed Project is ineffective in reducing vehicle miles traveled and greenhouse gas emissions since the community trips are already on the system and do not represent increases in trips, but rather vehicle trips that shift from adjacent corridors or shift in time periods of travel, thereby increasing local access and local vehicle travel opportunities for the community.

Comment ML-4

- **It’s unlikely the gondola would contribute to a significant net decrease in greenhouse gas emissions.** Approximately 608 cars would be taken off the road,

not nearly close to the 3,000 LA ART claims. Most of the people who choose the gondola in the simulation – 4,470 – board the gondola at Union Station, with another 220 passengers boarding at a station proposed to be located at Los Angeles State Historic Park near Chinatown. With only 4,690 people taking the gondola in total and of those 2,500 estimated to be regular users of the Dodger Stadium Express clean energy buses there would only be 2,190 new people taking public transportation to the game using the gondola. The average car parking at the stadium carries 3.6 people, which means that the approximate number of cars taken off the road would be around 608. The simulation only models the number of passengers connecting the gondola via public transportation, on foot or by bike. It does not model people who would drive to Union Station or Chinatown to take the gondola. However, people who drive to those stations to take the gondola would not contribute to a net reduction in traffic or greenhouse gas emissions.

Response ML-4 As discussed on page 3.17-34 and shown in Table 3.17-4 in Section 17, Transportation, of the Draft EIR, the Draft EIR estimates that 6,000 game or event attendees would ride the proposed Project to a game or event in Dodger Stadium in 2026. This total includes those who would access the proposed Project via bus transit, rail transit, private automobile, rideshare, bicycle, and walk. Of these, the Draft EIR estimates that 4,050 of the 6,000 riders in 2026 would arrive via transit/walk/bike, based on the estimated non-auto mode of access of 67.5 percent, as detailed in Appendix N, Transportation Appendices, of the Draft EIR. The Mobility Lab Study states that its simulation only models passengers connecting to the proposed Project via transit, bicycle, or walking, but does not model riders driving to access the proposed Project and estimates that 4,690 riders would ride the gondola in its simulation. This is a key distinction between the Mobility Lab Study and the ridership estimates in the Draft EIR: the Mobility Lab Study estimate of 4,690 proposed Project riders arriving via transit/walk/bike is actually higher than the number of riders in the Draft EIR that are projected to connect to the proposed Project via transit/walk/bike because it excludes park-and-ride and rideshare modes of access. The corresponding number from the Draft EIR is 4,050 of the estimated 6,000 riders in 2026 arriving via transit/walk/bike, based on the estimated non-auto mode of access of 67.5 percent, as detailed in Appendix N. Thus, the ridership projections in the Draft EIR are actually more conservative than those in the Mobility Lab Study as to the assumption of riders arriving via transit/walk/bike.

As stated on page 3.17-27, in Section 3.17, Transportation, of the Draft EIR, based on data from the 2019 regular season with an average game attendance of 48,650, the average Dodger Stadium Express ridership was 2,260 per game, with 1,845 per game for the Union Station route and 415 from the South Bay routes. The Mobility Lab Study incorrectly states that there are 2,500 estimated regular users of the Dodger Stadium Express. The overestimation of the Dodger Stadium Express ridership in the Mobility Lab Study underestimates the net benefit of the proposed Project.

The Dodger Stadium Express would not be precluded from operating by the proposed Project. While existing riders of the Union Station Dodger Stadium Express may choose to switch to the proposed Project to take advantage of its substantial travel time savings, some riders may prefer to ride the Union Station Dodger Stadium Express for other reasons (for example, if individuals have a fear of heights). Independent of the Dodger Stadium Express, the opportunities for more mobility choices through improved connections to additional public transit options created by the proposed Project are projected to increase the number of game attendees to ride public transportation. As noted above, the Mobility Lab Study underestimates proposed Project riders and overestimates the existing Dodger Stadium Express ridership, thereby underestimating the proposed Project benefits.

The Mobility Lab Study states that 608 cars would be taken off of the road, apparently based on its estimate of 2,190 new people taking transit to Dodger Stadium divided by an assumed average vehicle occupancy (AVO) of 3.6. The Draft EIR does not analyze “cars taken off the road” as it is not a CEQA transportation-related metric. The Draft EIR instead analyzes vehicle miles traveled (VMT), which is the required CEQA transportation impact metric. The estimate of the equivalent of up to 3,000 cars taken off the road quoted in the comment is not generated or used in the Draft EIR and is apparently an estimated reduction in vehicles parking at Dodger Stadium at year 2042 based on the forecast ridership of 10,000 riders per game (approximately 20 percent of total game attendees). It is not an assertion about overall vehicle reduction once those who are estimated to drive to access a proposed Project is factored in.

Given that the potential for proposed Project riders to drive to access the proposed Project is important, and some riders drive and park to access the Dodger Stadium Express today, it is not clear why the Mobility Lab model does not consider the additional riders who would drive to park in off-street parking lots near the Alameda Station or Chinatown/State Park Station to ride the proposed Project. Automobile mode of access to the proposed Project is in fact modeled in the Draft EIR, and taken into account in the VMT estimates. As detailed in the Draft EIR, the proposed Project is forecast to reduce annual VMT by 2,434,000 in the Project’s first operational year in 2026, increasing as ridership increases to an annual VMT reduction of 5,067,000 in 2042, even with automobile mode of access to the proposed Project taken into consideration. Based on an interpolation for the years between 2026 and 2042, and holding the reduction constant after 2042 until 2056, the lifetime VMT reduced by the proposed Project over its useful life (30 years based on SCAQMD’s guidance for GHG significance thresholds) would be a reduction of 129,629,500 VMT. The proposed Project would reduce GHG emissions by 3,493 metric tons of carbon dioxide equivalent per year (MT CO₂e/year) in the buildout year of 2026 and by 6,277 MT CO₂e/year in the horizon year of 2042. Based on an interpolation for the years between 2026 and 2042, and holding the reduction constant after 2042 until 2056, the lifetime emissions of the proposed Project over its useful life (30 years based on

SCAQMD’s guidance for GHG significance thresholds) would be a reduction of 166,653 MT CO₂e of GHGs.

Comment ML-5

- **The gondola would carry fewer passengers than LA ART has claimed.** LA ART originally claimed that the gondola could carry up to 5,000 passengers per hour on game days. Researchers found that the gondola is likely to carry fewer than a total of 5,000 passengers to Dodger Stadium – 4,690 according to the simulation – even when the service is provided free with a game ticket for a sold-out night game like the playoffs. In a recent parking study, LA ART revised their claim, estimating that 6,000 would ride the gondola to games by 2026, with 4,350 arriving to the gondola via public transportation. The project’s Draft Environmental Impact Report contains the same estimate, which corroborates the UCLA estimate of ridership if the gondola were in operation today.

Response ML-5

As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would carry up to approximately 5,000 people per hour per direction (pphpd) based on the system’s design capacity. Within two hours prior to the start of a game or event at Dodger Stadium, more than 10,000 people could be transported to the Stadium via the proposed Project. Given the capacity of this system, approximately 20 percent of the fans could take the proposed Project. As discussed in Section 3.17, Transportation, of the Draft EIR, the ridership model estimated that 6,000 passengers would ride the proposed Project in 2026 and 10,000 passengers would ride the proposed Project in 2042. The proposed Project did not revise the ridership; 5,000 refers to the capacity of the proposed Project per hour per direction, summarized as 5,000 pphpd, with 6,000 passengers per game estimated to ride the proposed Project in 2026 in the two hours before each game or event.

As discussed on page 3.17-34 and shown in Table 3.17-4 in Section 17, Transportation, of the Draft EIR, the Draft EIR estimates that 6,000 game or event attendees would ride the proposed Project to a game or event in Dodger Stadium in 2026. This total includes those who would access the proposed Project via bus transit, rail transit, private automobile, rideshare, bicycle, and walk. Of these, the Draft EIR estimates that 4,050 of the 6,000 riders in 2026 would arrive via transit/walk/bike, based on the estimated non-auto mode of access of 67.5 percent, as detailed in Appendix N, Transportation Appendices, of the Draft EIR.¹⁵⁶ The Mobility Lab Study estimates that 4,690 passengers would ride the proposed Project and states that it only modeled passengers that would access the proposed Project via transit, bike and walk. This number (4,690) is actually higher than the corresponding number estimated in the Draft EIR (4,050); as such, the ridership model used in the Draft EIR is actually more conservative than the Mobility Lab Study. Given the closeness of these findings, the Mobility Lab Study then states the following (emphasis added):

¹⁵⁶ The UCLA Mobility Lab Study says that the proposed Project estimated this number to be 4,350. This is not accurate. As discussed in the text, this number is estimated to be 4,050.

The project’s Draft Environmental Impact Report contains the same estimate, which **corroborates** the UCLA estimate of ridership if the gondola were in operation today.¹⁵⁷

In other words, the Mobility Lab Study only modeled proposed Project passengers accessing the proposed Project via transit, acknowledges that these estimates are similar to those in the Draft EIR, and then concludes that the Draft EIR estimates actually corroborate the Mobility Lab Study estimate. Given this, it is unclear why the Mobility Lab Study and the comments claim that the gondola would carry fewer passengers than the Draft EIR estimated for the proposed Project. Quite conversely, it would seem that this finding shows that the Mobility Lab Study actually supports the Draft EIR ridership model. In fact, as stated previously, the Mobility Lab Study estimate of 4,690 passengers arriving via transit is higher than the Draft EIR estimate of 4,050 riders arriving via transit/walk/bike.

Furthermore, the Mobility Lab Study estimate is as if the proposed Project were in operation today, whereas the Draft EIR estimates are for future years with future socioeconomic growth (leading to increased vehicle congestion on the regional roadway network) and further expansion of the regional transit system (leading to expanded transit destinations and reduced transit travel times). These factors would enhance the attractiveness of the proposed Project and are considered in the ridership model in the Draft EIR for both 2026 and 2042. All of which further suggests that the Draft EIR ridership estimates are actually conservative compared to the Mobility Lab Study estimate.

Comment ML-6

- **Fewer people would take the gondola after the game – resulting in more traffic and emissions.** In the simulation, some fans – around 2,500 – seem to switch from the free Dodger Stadium Express buses to the gondola on the way from Union Station to a sold-out game, reducing the use of that service by close to half of the passengers it has carried to playoff games in the past. But about half of those passengers – more than 1,000 – seem to switch back to the Dodger Stadium Express on the way home, perhaps to avoid having to wait for a gondola car. Only 1,380 fans take the gondola on the way home in the simulation. This suggests that fans are unlikely to wait in line for the gondola after the game, instead taking the Dodger Stadium Express or perhaps opting for a ride-share, which would increase traffic and greenhouse gas emissions after the game.

Response ML-6

The Mobility Lab Study states that the Mobility Lab simulation shows that almost half of the proposed Project riders who switch to the proposed Project from the Dodger Stadium Express to travel to a game would switch back to the Dodger Stadium Express after a game. Existing Dodger Stadium Express data suggests that there is a post-game drop-off of only around 8 percent, even though fans do wait to board the Dodger

¹⁵⁷ UCLA Mobility Lab, Study Finds Proposed Aerial Gondola to Dodger Stadium Will Do Little to Reduce Traffic and Emissions, October 24, 2022, page 4.

Stadium Express (often for a substantial length of time) after the game and even though the Dodger Stadium Express return trip to Union Station averages 20 minutes or more plus time spent waiting in line. The VMT estimates in the Draft EIR assume that this post-game drop-off shifts to rideshare, based on pre versus post-game TNC trip data for the 2019 season at Dodger Stadium. Since the proposed Project return trip to Union Station will only take seven minutes (as compared to 20 minutes or more for the Dodger Stadium Express), a substantial drop-off is not estimated in the Draft EIR modeling. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for further discussion of post-game ridership.

The comment states that fans opting to take the Dodger Stadium Express or rideshare after a game would increase traffic and greenhouse gas emissions after a game. This statement is inaccurate. Regardless of the extent to which fans may do so, the proposed Project will decrease traffic and greenhouse gas emissions after a game compared to the existing condition.

Comment ML-7

- **Few people would use the gondola as a form of transportation other than to get to or from games.** The simulated use of the gondola during the daytime before the game suggests that very few people would use it as a form of transportation outside of getting to and from games: in the simulation, only 60 people – around one gondola carload – traveled to Dodger Stadium during the day, and only 140 passengers traveled from the stadium to Chinatown or Union Station during the day.

Response ML-7

The comment implies that the modeling conducted in the Mobility Lab Study only considered travel to and from Dodger Stadium during non-game times and the low estimate of 200 persons referenced in the comment implies that the Mobility Lab Study did not consider potential market segments such as tourists. The Draft EIR projected use of the proposed Project by neighborhood transit riders, persons traveling to events at Los Angeles State Historic Park, and tourists. The Draft EIR estimates of local ridership on non-game days (or daytime before a game) also considered future socioeconomic growth, and there is a substantial amount of growth projected in the downtown and Chinatown areas, which would translate to additional local riders (see Table 4 on page 16 of 22 in the Ridership Model Development documentation in Appendix N, Transportation Appendices, of the Draft EIR). As noted on page 3.17-34 in Section 3.17, Transportation, of the Draft EIR, neighborhood transit riders, Los Angeles State Historic Park visitors, and tourists were not considered in the VMT and GHG analyses to allow for a more conservative analysis.

As discussed on pages 3.17-24 to 3.17-26, in Section 3.17, Transportation, of the Draft EIR and in Appendix N, Transportation Appendices, of the Draft EIR, ridership was modeled in the Draft EIR for five different potential rider groups for future (not just existing) background socioeconomic and transportation system conditions: Dodger

Stadium game and event attendees, Dodger Stadium employees, tourists, neighborhood riders, and Los Angeles State Historic Park (LASHP) visitors and event attendees. As discussed on pages 3.17-33 to 3.17-35 and in Table 3.17-4, in Section 3.17, and in Appendix N, depending upon the year and whether or not there is a game or event at Dodger Stadium, there could be as many as 6,000 to 10,000 game attendees, 140 Stadium employees, 1,265 to 3,570 tourists, 575 neighborhood riders, and 1,120 LASHP event attendees on a given day.

Comment ML-8

- **The model produced very similar results at different costs for a gondola trip.** LA ART previously announced that a gondola trip would cost \$15. Later, they announced that game ticket holders could ride the gondola for free. They have also said that local rides could be purchased for a standard Metro fare. The researchers modeled two scenarios: 1) \$10 for residents and free for game ticket holders, and 2) free to the public, and found very little difference in the results, indicating that residents are more likely sensitive to travel time rather than cost. One key factor is that the service area of the gondola is limited and may not attract residents to choose it for daily travel.

Response ML-8

The Mobility Lab Study states that it modeled two fare scenarios: (1) \$10 for residents and free for game ticket holders and (2) free to the public. In other words, the Mobility Lab Study only tested different costs for residents, which are by far the smallest portion of the riders. The Mobility Lab Study apparently did not test different costs for gameday fans. Since the projected amount of neighborhood riders is small, it is not surprising that the Mobility Lab Study found very little difference in the results in the two scenarios it tested.

Also, neither of the fare scenarios the Mobility Lab Study modeled for residents is the fare scenario that is proposed for the proposed Project. Refer to Topical Response C, Project Features, for a discussion of how the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. The proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first- and last-mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station.

Comment ML-9

About the Researchers

Dr. He is an Assistant Research Scientist at the UCLA Mobility Lab. He has extensive experience in big data analytics, transportation system analysis, and transportation policy evaluations. In the scope of cyber-physical systems, his research enables

interactions between the physical infrastructure and virtual cyber systems by adopting data-driven techniques to support long-term urban system planning, management, and decision-making.

Dr. Ma is an Associate Professor in the UCLA Samueli School of Engineering and Associate Director of UCLA Institute of Transportation Studies. He has led and managed many research projects funded by U.S. DOT, NSF, state DOTs, and other federal/state/local programs covering areas of smart transportation systems, such as vehicle-highway automation, Intelligent Transportation Systems (ITS), connected vehicles, shared mobility, and large-scale smart system modeling and simulation, and artificial intelligence and advanced computing applications in transportation. He is an Associate Editor of the IEEE Transactions on Intelligent Vehicles and IEEE Open Journal of Intelligent Transportation Systems and Journal of Intelligent Transportation Systems. He is Member of the Transportation Research Board (TRB) Standing Committee on Vehicle-Highway Automation, Member of TRB Standing Committee on Artificial Intelligence and Advanced Computing Applications, Member of American Society of Civil Engineers (ASCE) Connected & Autonomous Vehicles Impacts Committee, Co-Chair of the IEEE ITS Society Technical Committee on Smart Mobility and Transportation 5.0.

Response ML-9 The credentials of Dr. He and Dr. Ma are noted for the record and will be provided to the decision makers for review and consideration. As noted in the credentials in the comment, Dr. He and Dr. Ma are specialists in the areas of smart transportation systems such as cyber-physical systems, connected vehicles, and artificial intelligence applications in transportation. An internet search of their respective publications^{158,159} did not find any studies of ridership on transit systems in California.

Conclusion

As discussed above, the Mobility Lab Study was announced by press release in October 2022, but was further clarified to be preliminary by its authors in a posting on the Mobility Lab website. The ridership model, assumptions, and estimates in the Draft EIR were prepared by constructing a detailed model utilizing accepted and tested data from both regional and local (City of Los Angeles) modeling, as well as was peer reviewed by a respected international consulting firm and found to be appropriate and reasonable. Any differences between the findings in the Mobility Lab Study and the Draft EIR are therefore to be expected and are explainable. Nothing in the review of the preliminary Mobility Lab Study suggests that the ridership modeling and results in the Draft EIR are unreasonable or inappropriate for use.

TOPICAL RESPONSE P

Gondola System Noise Modeling

Comments on the Draft EIR raised questions regarding the noise model used to predict noise levels from operations of the proposed Project. As discussed in Section 3.13, Noise, of the Draft EIR, on page 3.13-24, there is no universally recognized standard methodology for predicting noise levels for gondola transportation systems. However, a targeted literature review identified a journal article, *Noise prediction models for gondola ropeway components*,¹⁶⁰ (Rossi Article) which was used to predict noise levels that would result from operations of the proposed Project.

Gondola System Background and Technology

Prior to presenting additional information on the noise model, it is useful to first provide a background on gondola system technology. As detailed in Section 2.4, Description of the Proposed Project, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would employ a Tricable Detachable Gondola system (also known as “3S”). The gondola system technology consists of stations, a non-passenger junction, towers to support the cables, and cabins.

Station and Non-Passenger Junction Cables and Ropeway Operations

The proposed Project’s 3S system would be comprised of two stationary cables (track ropes) that provide support for the running wheels of the cabins, and a third cable (haul rope) that would circulate continuously around the system. The haul rope is looped around two large sheaves (wheels with a groove for the rope). One of the large sheaves is the “drive bullwheel,” which would be located at one station/junction, and the other large sheave is the “return bullwheel,” which would be located at the opposing station/junction. The haul rope, which is the propulsion rope, is moved by the turning of the drive bullwheel. The drive bullwheel is turned by motors located at the station or junction. The return bullwheel acts like an idler wheel providing haul rope location control, but no motive power. The haul rope moves at a steady pace around the bullwheels pulling the cabins along the ropeway and in and out of each station or junction.

One haul rope loop would be for the ropeway system between Alameda Station and Broadway Junction, and one haul rope loop would be for the ropeway system between Broadway Junction and Dodger Stadium Station. For the section from Alameda Station to Broadway Junction, the drive bullwheels and associated motors and drive equipment are anticipated to be at the Broadway Junction and the return bullwheels would be located at Alameda Station. At Chinatown/State Park Station within this section, sheaves would control the haul rope. For the section from Broadway Junction to Dodger Stadium Station, the drive bullwheels and associated motors and drive equipment are anticipated to be at Dodger Stadium Station, and the return bullwheels would be located at Broadway Junction. Accordingly, the Broadway Junction would include both a drive bullwheel and a return bullwheel.

¹⁶⁰ Rossi, F. and Nicolini, A. Noise Prediction Models for Gondola Ropeway Components. *Noise Control Engineering Journal*, 59 (5), pp. 415-431, September-October 2011.

Towers

The towers for the proposed Project would be designed to support the steel cables required for the 3S system. At towers, mechanical equipment would provide rope control and maintenance functions. The track ropes are supported by the profile beams. Between the profile beams, the haul rope rides on a series of wheels, or sheaves, which maintain the rope position.

Cabins

3S Gondola system cabins carry between 30 to 40 passengers depending on the exact configuration of seating and cabin amenities selected. The cabins for the proposed Project would move at a maximum speed of 13.4 miles per hour (6 meters per second).

The Rossi Article Methodology

As discussed in the Rossi Article, noise from gondola system operations “may be not well represented by traditional noise prediction models.”¹⁶¹ Accordingly, the authors of the Rossi Article developed a noise prediction model to provide a more accurate evaluation of the noise produced by the new generation of gondola ropeways. To develop the noise prediction model, the authors conducted “a measurement campaign . . . at different short distances from gondola towers and stations.”¹⁶² The authors investigated two kinds of gondola stations: 1) stations with tensioning systems and 2) stations with underground motor units. The authors investigated three kinds of gondola towers: 1) with support sheaves, 2) with hold-down sheaves, and 3) with double acting sheaves. Based on these noise measurements from several modern aerial gondola systems, the authors established noise propagation models for station noise and tower noise. “[N]oise measurements were conducted on new generation 8-seater gondola ropeways with line speed values of 3.5 m/s and 5 m/s.”¹⁶³ However, the Rossi Article found that the station equations were also suitable for different kinds of gondola ropeways (e.g., with additional seats) and for different line speeds.

The Rossi Article then validates its noise propagation model with “further measurements conducted in random chosen points of gondola ropeway case studies, which correspond to the typical position of critical receptors.”¹⁶⁴ The Rossi Article also explains that the noise propagation model was developed “based on an impacted area with no obstacles between the noise source and the receptors.”¹⁶⁵ Specifically, “the investigated towers and stations are placed in a territory not characterized by natural or artificial noise barriers.”¹⁶⁶ In addition, the most frequent and worst case in terms of carrier load was analyzed for tower noise, and the worst case in terms of noise emissions was analyzed for station noise.¹⁶⁷

As provided in the Rossi Article in Table 6, the sound power levels for stations with underground motor units are louder than the tensioning system. The sound power level reflects the innate acoustical energy

¹⁶¹ Rossi, F. and Nicolini, A. 2011. Noise Prediction Models for Gondola Ropeway Components. *Noise Control Engineering Journal*, p. 415. Available at: https://www.researchgate.net/publication/257941072_Noise_prediction_models_for_gondola_ropeway_components. Accessed August 2023.

¹⁶⁷ *Ibid.*

generated by the operations of the station and, as a result, the sound power values do not consider factors that would affect the actual received sound pressure level at a receiver such as the source type, source dimensions, or the physical environment between the source and receiving point (e.g., distance, reflective ground, air absorption). Accordingly, the sound power levels of the underground motor unit do not reflect that the source is underground and instead reflect that the station is “powered” by a motor. Accordingly, as provided on page 3.13-26 of the Draft EIR, to provide a conservative analysis, the noise analysis for the proposed Project utilized the equations for the underground motor systems (“powered”) because of the higher sound power levels that are generated by those equations.

For towers, the Rossi Article found that hold-down sheaves are louder than support sheaves or double-acting sheaves. Accordingly, as provided on page 3.13-26 of the Draft EIR, to provide a conservative analysis, the noise analysis for the proposed Project utilized the equations for the hold-down sheaves.

As noted above, the Rossi Article equations were established based on 8-seater gondola ropeways. While the Rossi Article found that its equations were suitable for different kinds of gondola ropeways and line speeds, the noise analysis for the proposed Project took the additional step of validating the Rossi Article equations against a 3S gondola system similar to the system that would be used for the proposed Project to ensure that the Rossi Article equations could be appropriately used to predict noise levels from operations of the proposed Project. The validation process is discussed further below.

The Evaluation of Operational Noise Impacts in the Draft EIR Appropriately Relied on the Rossi Article

Based on the design of the proposed Project described above, and as discussed in Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, a 3S gondola system similar to the proposed Project was utilized in the assessment of noise impacts to validate the Rossi Article equations to ensure that the Rossi Article equations could be appropriately used to predict noise levels from operations of the proposed Project.

As provided in the Noise Measurement Detail, included in Appendix M of the Draft EIR, Leitner Poma provided operational noise measurements for a 3S gondola system. As provided in Appendix L, 3S Sound Measurements Memo, of this Final EIR, Leitner Poma updated its memorandum to provide additional detail on this 3S gondola system, which further confirms the similarities between the proposed Project and the Leitner Poma 3S gondola system.

As provided therein, the reference noise levels in Leitner Poma’s Noise Measurement Detail were taken in Tyrol, Austria at the Stubai Glacier. The system is known as the Eisgratbahn gondola. Though in Section 2.0, Project Description, of the Draft EIR, the Koblenz 3S system in Germany is listed as one of many precedent examples of aerial rapid transit systems and is an example of an urban gondola system, the Draft EIR’s assessment of noise impacts does not utilize noise data from the Koblenz 3S system. Because the Koblenz 3S system is located in an urban area, it would be harder to isolate noise levels generated from the 3S system from other urban noise sources, such as, traffic. Accordingly, taking measurements in an urban area for validation purposes is less desirable. In contrast, because the Tyrol system is not located in an urban environment and is instead located in the Alps, the measured noise source from the system was not influenced by other noise sources and nearby buildings reflecting surface. Therefore, it is easier to isolate the noise from the 3S system in Tyrol.

As provided in Appendix M, 3S Sound Measurements Memo, of this Final EIR, the Leitner Poma system in Tyrol has a number of similarities to the proposed Project. Like the proposed Project, the Tyrol system is a 3S system and measurements used for validating the Rossi Article are those using the same speed of the proposed Project at 6 meters/second. In addition, the Tyrol system has a cabin capacity of 32, which is consistent with the proposed Project's cabin capacity of 30 – 40. Finally, the system mechanics would be similar, because like the proposed Project, the Tyrol system includes an above-ground drive motor and bullwheel as well as a return bullwheel at the station where noise measurements were taken. Based on the similarities between the 3S gondola system for the proposed Project and the 3S gondola system in Tyrol, using the Tyrol system to validate the Rossi Article equations is appropriate and no adjustment to the noise predictions is needed to use the Tyrol system to validate the Rossi Article.

Certain comments on the Draft EIR express concern that the Broadway Junction would include both a drive bullwheel and a return bullwheel and therefore the noise assumptions for the junction should not be the same as the assumptions for the stations. Like the Broadway Junction the system in Tyrol includes both a drive bullwheel and a return bullwheel. Accordingly, the assumptions in the Draft EIR conservatively reflect noise associated with both a drive bullwheel and a return bullwheel at all station and junction locations. Therefore, a separate assumption for the Broadway Junction analysis is not needed.

Tables 5-3 and 5-4 of Appendix M, Noise and Vibration Technical Report, of the Draft EIR, summarize the results of the validation calculations and show the predicted noise levels using the Rossi Article equations that were selected for the proposed Project and the measured noise taken from the system in Tyrol. As shown therein, and as discussed on pages 37 through 39 of Appendix M, Noise and Vibration Technical Report, of the Draft EIR, use of the Rossi Article's equations to evaluate the proposed Project's operational noise is validated by the measured noise from the Tyrol system and results in a conservative assessment of the noise generated by the proposed Project. Specifically, as shown in Table 5-3, this comparison led to a conservative average over-prediction of 2.6 dBA across all station locations. In addition, as shown in Table 5-4 the predicted noise levels for the tower on average were within 0.2 dBA of the measured noise levels. The differences in the station and tower noise levels are within the standard engineering tolerance. Specifically, per Caltrans, model accuracy is usually sufficient when the difference between measured and model sound level is less than 3 dBA because of the inherent uncertainties in the measurements and calibration procedure.¹⁶⁸ Accordingly, use of the Rossi Article's equations to evaluate the proposed Project's operational noise was appropriately validated using a 3S gondola system that is similar to the proposed Project and use of the model has been shown to result in a conservative assessment of the noise generated by the proposed Project.

¹⁶⁸ Caltrans, Technical Noise Supplement, Section 4.4.1.6 Tolerances (September 2014).

6.3 RESPONSES TO COMMENTS

Section 6.3, Responses to Comments, includes responses to all comments received on the Draft EIR during the Draft EIR public review period. The comments and responses are organized as follows: state agencies (“S”), local agencies (“L”), groups and organizations (“GO”), individuals (“P”), and verbal and written comments received during the four Draft EIR public hearings (“PH”). Responses to comments are organized as follows:

- Section 6.3.1 Responses to Public Agencies: Contains responses to all state agencies (“S”) and local agencies (“L”) comments.
- Section 6.3.2 Responses to Groups and Organizations : Contains responses to all groups and organizations (“GO”) comments.
- Section 6.3.3 Responses to Public/Individual Comment Letters: Contains responses to all written individuals (“P”) comments.
- Section 6.3.4 Responses to Public Hearings: Contains responses to all verbal and written comments received during the four Draft EIR public hearings (“PH”).

Responses to
Public Agencies (State and Local)
Comment Letters

Comment Letter S1 – CA Department of Fish and Wildlife

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to S1

Comment S1-1 Dear Mr. Zelmer:

The California Department of Fish and Wildlife (CDFW) has reviewed the Los Angeles Aerial Rapid Transit Project (Project) Draft Environmental Impact Report (DEIR) from the Los Angeles County Metropolitan Transportation Authority (Metro). Supporting documentation for the Project includes a Biological Resource Assessment (BRA) dated October 2022. CDFW appreciates the opportunity to provide comments and recommendations regarding aspects of the Project that could affect fish and wildlife resources and be subject to CDFW’s regulatory authority under the Fish and Game Code.

Response S1-1 This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses S1-2 through S1-15.

Comment S1-2 CDFW’s Role

CDFW is California’s Trustee Agency for fish and wildlife resources and holds those resources in trust by statute for all the people of the State [Fish & Game Code, §§ 711.7, subdivision (a) & 1802; Public Resources Code, § 21070; California Environmental Quality Act (CEQA) Guidelines, § 15386, subdivision (a)]. CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect State fish and wildlife resources.

CDFW is also submitting comments as a Responsible Agency under CEQA (Public Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code, including lake and streambed alteration regulatory authority (Fish & Game Code, § 1600 et seq.). Likewise, to the extent implementation of the Project as proposed may result in “take”, as defined by State law, of any species protected under the California Endangered Species Act (CESA) (Fish & Game Code, § 2050 et seq.), or CESA-listed rare plant pursuant to the Native Plant Protection Act (NPPA; Fish & Game Code, §1900 et seq.) authorization as provided by the applicable Fish and Game Code will be required.

Response S1-2 Metro appreciates the California Department of Fish and Wildlife (CDFW) for preparing comments on the Draft EIR. This comment provides a general summary of the role and authority of the CDFW under CEQA. As noted on page 16 of Appendix E, Biological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, of the Draft EIR, “The [Biological Study Area (“BSA”)] does not include water features falling under CDFW jurisdiction.” Responses to the comments contained in this letter are provided in Responses S1-4 through S1-15.

Comment S1-3 Project Description and Summary

Objective: The Project would connect Los Angeles Union Station (LAUS) to the Dodger Stadium property via an aerial gondola system in downtown Los Angeles. The proposed 1.2-mile route would travel generally along Alameda Street, Spring Street, and Bishops Road from LAUS to Dodger Stadium, with an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. The proposed aerial gondola system would include aerial cables, passenger stations, a non-passenger junction, towers to support the aerial cables between the stations/junction, and gondola cabins for the passengers.

Location: The proposed Project would be located in the County of Los Angeles, within or adjacent to the communities of El Pueblo, Union Station, Chinatown, Mission Junction, Solano Canyon, and Elysian Park.

Comments and Recommendations

CDFW offers the comments and recommendations below to assist Metro in adequately identifying, avoiding, and/or mitigating the Project’s significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources.

Response S1-3 This comment includes a summary of the proposed Project and does not raise an environmental issue or a substantive issue on the content of the Draft EIR. Responses to the comments contained in this letter are provided below in Responses S1-4 through S1-15.

Comment S1-4 Comment #1: Operational Impacts to Birds

Issue: Project operation may impact resident and migratory bird species that move through the alignment area.

Specific impacts: The BRA states, “Potential direct impacts could include bird collisions with the proposed stations, junction, towers, cabins, and ropeway cables, or electrocution if they come in contact with an energized component of the system.” The BRA also states, “Significant impacts can occur when towers or wires are constructed in migratory corridors and obstruct the flight paths of migrant birds. This is particularly true for structures equipped with constant (rather than flashing)

lighting or reflective surfaces like glass, which tend to attract nocturnal migrants during flight and increase the probability of collision.”

Why impacts would occur: The BRA defends that Project operation will not be significant because, “The proposed Project alignment is located on a broad urbanized coastal plain, midway between the coast and the mountains, and lacks significant wetlands or similar habitats that might attract large numbers of migrants as stopover habitat. Given the lack of habitat and topographic features that would promote concentrated avian migratory activity, impacts to migrants, including nocturnal species, are not expected to be significant.”

Response S1-4

This comment provides quotes from Appendix E, Biological Resources Assessment, of the Draft EIR. Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of the Final EIR for discussion of how the risk of avian collisions with the cables or components of the proposed Project is less than significant. Design features of the proposed Project are likely to reduce the risk of avian collisions in comparison to transmission lines. First, the proposed Project’s ropeway cables would not include a shield wire, unlike transmission lines, which would be expected to reduce collision risk. Second, the tight clustering of the three ropeway cables, in conjunction with the fact that the cables would be thicker than transmission lines, would make them more visible to birds in comparison to transmission lines. Third, the proposed Project would include devices that support and maintain proper separation between the cables of 3S systems known as slack carriers, which would increase the visibility of the cables to birds. Fourth, the proposed Project would implement BIO-PDF-C in response to Recommended Potentially Feasible Mitigation Measure #2, outlined in Comment S1-6, below. The cabin windows would be designed to be non-transparent (tinted) and/or partially covered with a vinyl window film to be made visible to birds in flight. Reflective surfaces would be reduced as much as possible with opaque or translucent surfaces. Fifth, the gondola cabins travel along the cables at frequent intervals during the periods of operation, further increasing the visibility of the cables along which they are moving. Finally, the proposed Project would implement BIO-PDF-B in response to Recommended Potentially Feasible Mitigation Measure #1, outlined in Comment S1-6, below. The Project Sponsor would develop an Avian Collision Mitigation, Monitoring, and Adaptive Management Plan to address the potential for bird collisions. The Plan would include monitoring, training, adaptive management, and reporting requirements related to avian and bat injuries or mortalities. All of these aspects would make the gondola cables less likely to result in avian collisions, compared to transmission lines. Refer to Response S1-5 and S1-6 for additional discussion of how the proposed Project would not pose a collision risk to wildlife.

Comment S1-5

While the Project alignment may not be a large stopover habitat for migrant birds, there are numerous accounts, according to eBird, of many birds that utilize the

alignment area as habitat. In particular, the Los Angeles State Historic Park has a wide variety of bird species that have been accounted for, including a number of special status species such as the loggerhead shrike (*Lanius ludovicianus*) and Peregrine falcon (*Falco peregrinus*) (eBird 2022 {<https://ebird.org/hotspot/L2581057>}). Loggerhead shrike are designated California Species of Special Concern (<https://wildlife.ca.gov/Conservation/SSC>) and Peregrine falcon is a species classified as fully protected (<https://wildlife.ca.gov/Conservation/Fully-Protected>) under CDFW. Even if avian activity is not “concentrated” in this area, the DEIR does not acknowledge the numerous avian species that use the alignment area and its vicinity as habitat. Moreover, there are several locations in the surrounding alignment vicinity with a wide variety of avian species accounts, including Elysian Park, Los Angeles River, Grand Park, Echo Park, and the Silver Lake Reservoir.

Response S1-5

Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of this Final EIR for discussion of the presence of avian habitat and the potential avian use of the proposed Project area. The Draft EIR addressed impacts to biological resources, including special status bird species, in Section 3.04, Biological Resources, with supporting data provided in Appendix E of the Draft EIR. As stated on pages 3.4-12 and 3.4-13 of Section 3.04, Biological Resources, of the Draft EIR, 39 special-status wildlife species were identified by the CNDDDB database to have historically been recorded from the Los Angeles and surrounding eight quadrangles. Nine of those species were historically recorded within the biological study area (BSA) for the proposed Project. However, of the nine species with observations from within the BSA, the most recent are for bat species from 25 to 30 years ago. All other observations are 50 years old or older. Based on this publicly available data, the Draft EIR found that impacts to special status species would be less than significant with incorporation of Mitigation Measures BIO-A and BIO-B to reduce potential impacts to bats and nesting birds especially since the habitat in the area has been drastically modified so as not to be useful to special status species since the species were recorded.

As discussed in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the BSA encompasses a 500-foot buffer around the proposed Project alignment. Habitats and wildlife occurring outside of this 500-foot buffer were considered to be a sufficient distance away to not be affected by construction or operation of the proposed Project. All wildlife detected during the two initial surveys (April 1, 2020, and April 24, 2021) were noted in the Draft EIR. The surveys monitored for all wildlife, including any sensitive species. As discussed in Appendix G, out of an abundance of caution, a third field survey was performed March 23, 2023, to provide an updated habitat assessment for sensitive species and supplementary wildlife survey effort. During this visit, two biologists surveyed the BSA over a 4.5-hour period (11:00 AM to 3:30 PM) and observed 17 bird species and 2 mammal species. As determined by the biologists that conducted the additional survey, there would be no new significant

impacts nor a substantial increase in the severity of an environmental impact identified in the Draft EIR. In addition to the field surveys, as part of the preparation of the Draft EIR, an assessment of habitat suitability and a California Natural Diversity Database (CNDDDB) records search were conducted to identify records of sensitive species in the USGS Los Angeles Quadrangle, within which the BSA is located, and the surrounding eight quadrangles; an area measuring approximately 21.5 miles by 26 miles. As noted in the Draft EIR, the most recent CNDDDB record of special-status species in the BSA was from 25 years ago, with no records of federal or state-listed wildlife species in the BSA in the past 100 years.

Comment S1-6

In addition, page 48 of the BRA provides reasoning why collisions with cables will not be significant since the diameter and grouping of the cables would make them more visible. However, there is no evidence to support the claim that the diameter and grouping of the cables would prevent bird collisions to a level that is less than significant. More importantly, take is not permitted for fully protected species, so collisions must be completely prevented for these species. Additionally, there is still potential for lighting and reflective surfaces on the gondolas, stations, and towers that may attract birds and cause collisions, especially if birds are flying during low light hours. Artificial light may attract or disorient migrating birds by disrupting navigation. Resident birds and migrants are also known to collide with windows year-round, not only during migration (Ogden 1996).

Impacts to any sensitive, special status species, and/or migratory bird species should be considered significant under CEQA unless they are clearly mitigated below a level of significance. The DEIR does not provide any avoidance, minimization, or mitigation measures to prevent impacts to special status species. Inadequate avoidance, minimization, and mitigation measures for impacts to sensitive or special status species will result in the Project continuing to have a substantial adverse direct, indirect, and cumulative effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species by CDFW.

Evidence impacts would be significant: CEQA provides protection not only for ESA and CESA-listed species, but for any species including but not limited to SSC, which can be shown to meet the criteria for State listing. These SSC meet the CEQA definition of rare, threatened, or endangered species (CEQA Guidelines, § 15380). In addition, fully protected status precludes CDFW from authorizing any amount of incidental take or intentional take (including collisions and/or electrocutions associated with operational impacts) to meet any project mitigation requirement (Fish & G Code, § 3511). When projects show the potential to cause take of fully protected species, CDFW advises on appropriate measures to avoid take. Given the legal status of fully protected animals, take avoidance measures should meet very high standards of effectiveness, substantially greater than the measures to minimize take required under Incidental Take Permits. Lastly, migratory nongame native bird species are protected by international treaty under the Federal Migratory Bird Treaty Act (MBTA)

of 1918 (Code of Federal Regulations, Title 50, § 10.13). Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibit take of all birds and their active nests including raptors and other migratory nongame birds (as listed under the Federal MBTA). It is unlawful to take, possess, or needlessly destroy the nest or eggs of any raptor. The Project's operational impacts have yet to be mitigated below a significant level. Accordingly, the Project continues to have a substantial adverse effect, either directly or through habitat modifications, on avian species identified as a candidate, sensitive, or special-status species by CDFW.

Recommended Potentially Feasible Mitigation Measure(s):

Mitigation Measure #1: CDFW recommends the DEIR include measures to mitigate for collision impacts with the cables, gondola cars, stations, and towers. CDFW recommends Metro develop an Avian Collision Mitigation, Monitoring, and Adaptive Management Plan to address any bird collisions that may occur. This Plan should prescribe the following:

1. Measures to allow birds to see structures during low light hours. Artificial lighting should be eliminated where unnecessary as to prevent attracting birds or shielded down where possible. The DEIR should investigate different types of lights and lighting regimes with reference to their effect on the safety of migrating birds;
2. Measurable goals and success criteria that eliminates or reduces collisions to the maximum extent feasible. Measurable success criteria should be based on site/habitat conditions prior to Project operations. Collisions should be eliminated for fully protected species as no take can occur for these species;
3. Contingency measures if the success criteria is not met;
4. Long-term monitoring for at least 10 years;
5. Adaptive management techniques.; and
6. Annual reporting criteria and requirements.

Mitigation Measure #2: Any windows in stations, towers, or gondolas should be made visible to birds in flight. This may be achieved by using non-reflective tint or window film. Reflective surfaces should be reduced as much as possible with opaque or translucent surfaces.

Response S1-6

Refer to Response S1-5 for a discussion of surveys conducted in connection to the proposed Project, which did not indicate the presence of special-status species, and how the most recent CNDDDB record of special-status species in the BSA was from 25 years ago, with no records of federal or state-listed wildlife species in the BSA in the past 100 years. Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of the Final EIR for discussion of how the risk of avian collisions with the cables or components of the proposed Project is less than

significant. This analysis also discusses how development in the entire Los Angeles Basin provides a major source of light pollution, and there is no evidence that light in the vicinity of the proposed Project would draw migrants to the area, any more than similar lighting in other areas over the Los Angeles Basin would be expected to. In addition, lighting for the proposed Project would be low-level and primarily integrated within the architectural features. Exterior lighting would be shielded or directed toward the areas to be lit to limit spillover onto adjacent properties and off-site uses, and would meet all applicable lighting standards.

Refer to Response S1-4 for a discussion of how the proposed Project includes design features that reduce the risk of avian collisions. In addition, the proposed Project's stations and junction are designed to be open-air buildings, and accordingly do not include any windows. The proposed Project's three towers are designed as monopoles comprised of faceted structural steel panels that comprise the tower's swooping form in a neutral light-tone gray intended to conform to the surrounding urban environment and would not provide a highly metallic or mirrored finish. Accordingly, no windows are proposed for the proposed Project's towers. Because there are no windows at the proposed Project's stations, junction, and towers, Recommended Potentially Feasible Mitigation Measure #2 is inapplicable with respect to those components. As discussed above, windows on the cabins should not pose any risk to diurnal birds because they will be tinted and partially covered with a vinyl window film.

While the proposed Project would not have potentially significant impacts to sensitive, special status species, and/or migratory bird species, in response to Recommended Potentially Feasible Mitigation Measures #1 and #2 in this comment, the proposed Project would incorporate additional Project Design Features (PDFs) (BIO-PDF-B and BIO-PDF-C) to further reduce the already less than significant effects. In response to this comment requesting the proposed Project implement additional measures to protect sensitive, special status species, and/or migratory bird species, the proposed Project will implement BIO-PDF-B, requiring the development of an Avian Collision, Migration, Monitoring, and Adaptive Management Plan to address the potential for bird collisions, including the development of an adaptive management table, and BIO-PDF-C, requiring cabin windows to be designed with non-transparent (tinted) and/or partially covered with a vinyl window film to be made visible to birds in flight. Refer to Section 5.0, Corrections and Additions, of this Final EIR, for a discussion of various Project Design Features adopted in order to provide additional environmental benefits with respect to the potential for bird collisions.

Birds and bats flying in the vicinity of the proposed Project are already exposed to obstacles that present the potential for collision at heights similar to or greater than the highest-reaching proposed Project components. Such objects include buildings in downtown Los Angeles, transmission lines, the radio tower located on Radio Hill, and the eight sets of stadium lights atop Dodger Stadium. In addition, the proposed

Project towers and cables are below the heights where most nocturnal avian collision impacts occur. Most avian flight during migration occurs at thousands of feet above ground level (agl), whereas the proposed Project component heights are all below 200 feet agl. Section 3.04, Biological Resources, of the Draft EIR—as further supported in Appendix G, Supplemental Biological Resources Report, of the Final EIR—states that migrant birds would pass over the alignment, and there is potential for birds to interact with ropeway cables when flying below 175 feet agl and towers when flying below 200 feet agl. However, there is little evidence to suggest that the presence of natural features, such as the Los Angeles River or Silver Lake Reservoir, would result in concentrated migration, specifically in the proposed Project area. The Los Angeles River, which is approximately 0.5 mile east of the BSA is heavily impacted and is predominantly a concrete water-conveyance structure. The river corridor does not contain appreciable vegetation until it reaches more than 1 mile north of the proposed Project BSA. The Silver Lake Reservoir is more than 2 miles to the northwest. Waterbirds and other migrants may pass over the proposed Project en route to and from these locations, but there is no reason to believe the movement would be concentrated in the vicinity of the proposed Project (and below 200 feet agl) versus along alternate routes. Furthermore, direct movements between vegetated portions of the river and the Silver Lake Reservoir would not result in birds passing over the proposed Project alignment.

Comment S1-7 Comment #2: Impacts on Burrowing Owls

Issue: The Project may have a significant impact on burrowing owl (*Athene cunicularia*), a designated Species of Special Concern (SSC).

Specific impacts: Burrowing owls have been recorded at the Los Angeles State Historic Park. Project construction and activities may result in injury or mortality of burrowing owls and disrupt natural burrowing owl breeding behavior.

Why impacts would occur: Nest and roost burrows of the burrowing owl are commonly dug by ground squirrels (*Citellus beecheyi*). According to iNaturalist (https://www.inaturalist.org/observations?nelat=34.07240934999999&nelng=-118.22377465&place_id=any&subview=map&swlat=34.06254515000001&swlng=-118.23908605&taxon_id=180007) (2023), there have been accounts of California ground squirrel within Los Angeles State Historic Park, which can provide potential cover sites for burrowing owls. There were no surveys for burrowing owl conducted for the BRA despite the Project alignment transecting through the Los Angeles State Historic Park. The DEIR, therefore, does not provide compensatory mitigation for potential impacts to habitat for burrowing owl. In California, threat factors affecting burrowing owl populations include habitat loss, degradation, and modification. Project activities could result in potential habitat loss or disturbance for burrowing owl which would subsequently result in local extirpation of the species and contribute to local, regional, and State-wide declines of the species.

According to the DEIR, construction will take approximately 25 months. The Project may therefore temporarily impact habitat supporting burrowing owls for this length of time. However, the DEIR does not disclose how long these temporary impacts may last. Impacts to any sensitive or special status species should be considered significant under CEQA unless they are clearly mitigated below a level of significance. The DEIR does not provide mitigation for potential loss of habitat supporting burrowing owls. Inadequate avoidance, minimization, and mitigation measures for impacts to sensitive or special status species will result in the Project continuing to have a substantial adverse direct, indirect, and cumulative effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species by CDFW.

Evidence impacts would be significant: The burrowing owl is a designated SSC. An SSC is a species, subspecies, or distinct population of an animal native to California that currently satisfies one or more of the following (not necessarily mutually exclusive) criteria:

- is extirpated from the State or, in the case of birds, is extirpated in its primary season or breeding role;
- is listed as ESA-, but not CESA-, threatened, or endangered; meets the State definition of threatened or endangered but has not formally been listed;
- is experiencing, or formerly experienced, serious (nonscyclical) population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for State threatened or endangered status; and/or,
- has naturally small populations exhibiting high susceptibility to risk from any factor(s), that if realized, could lead to declines that would qualify it for CESA threatened or endangered status (CDFW 2023a).

CEQA provides protection not only for CESA-listed species, but for any species including but not limited to SSC which can be shown to meet the criteria for State listing. These SSC meet the CEQA definition of rare, threatened, or endangered species (CEQA Guidelines, § 15380). Therefore, take of SSC could require a mandatory finding of significance (CEQA Guidelines, § 15065).

Recommended Potentially Feasible Mitigation Measure(s):

Mitigation Measure #3: CDFW recommends burrowing owl protocol surveys be conducted by a qualified biologist on the Project site and within 100 feet (minimum) of the Project site where there is suitable habitat. Surveys for burrowing owls should adhere to survey methods described in CDFW's March 7, 2012, Staff Report on Burrowing Owl Mitigation (<https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=83843>) prior to issuing construction permits (CDFW 2012). In California, the burrowing owl breeding season

extends from February 1 to August 31 with some variances by geographic location and climatic conditions. Survey protocol for breeding season owl surveys states to conduct 4 survey visits: 1) at least one site visit between February 15 to April 15, and 2) a minimum of three survey visits, at least three weeks apart, between April 15 and July 15, with at least one visit after 15 June.

If burrowing owls are identified utilizing the Project site during the surveys, Metro should prepare an Impact Assessment in accordance with the 2012 Staff Report on Burrowing Owl Mitigation. Then, Metro should develop a Burrowing Owl Mitigation Plan in accordance with the 2012 Staff Report on Burrowing Owl Mitigation. Metro should contact CDFW to develop appropriate mitigation/management procedures.

Mitigation Measure #4: CDFW recommends that Metro disclose the length of time for temporary impacts to burrowing owl habitat. Based on those temporary impacts, CDFW recommends Metro mitigate for temporary and direct impacts to burrowing owl. There should be no net loss of burrowing owl habitat. Metro should set aside replacement habitat offsite for acreage of impact and number of burrows. Replacement habitat should be protected in perpetuity under a conservation easement dedicated to a local land conservancy or other appropriate entity, which should include an appropriate endowment to provide for the long-term management of mitigation lands. Mitigation Measure #5: CDFW recommends that Metro avoid using any rodenticides and second-generation anticoagulant rodenticides during Project activities.

Response S1-7

As described in Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR, burrowing owls commonly use ground squirrel burrows for nesting and roosting, and the presence of such burrows suggests that there may be potential for burrowing owl habitat. No California ground squirrels, burrowing owls, or suitable habitat for burrowing owls were detected during initial surveys. Refer to Appendix G, Supplemental Biological Resources Report, of this Final EIR, Section 5.1.2, for additional discussion of burrowing owls and burrowing owl habitat in the proposed Project area. As discussed in Appendix G, a subsequent survey of the BSA was performed on March 23, 2023, during which potentially suitable burrowing owl habitat (open, flat terrain with short vegetation) and immediately adjacent areas were surveyed for the presence of California ground squirrels or their burrows. No California ground squirrels, or burrows were visually detected in the surveyed areas. California ground squirrel vocalizations were heard on the slope between the proposed Stadium Tower and Dodger Stadium Station locations. Although this area could not be surveyed on foot, it was deemed not suitable for burrowing owls due to the presence of trees, tall ground cover vegetation, and a steep slope.

Because there is no suitable habitat for burrowing owls in the BSA, and no known occurrences of burrowing owls are documented in the BSA, the proposed Project would result in a less than significant impact related to burrowing owls. CEQA does

not require the implementation of mitigation measures where impacts would be less than significant. Nevertheless, refer to Section 5.0, Corrections and Additions, of this Final EIR, for a discussion of how the proposed Project will incorporate BIO-PDF-D in response to recommended measure MM-BIO-5 provided in this comment, requiring that the proposed Project avoid using any rodenticides and second generation anticoagulant rodenticides during Project activities.

Comment S1-8 Comment #3: Tree Removal

Issue: The Project proposes to remove 250 trees along the Project alignment.

Specific impact: The DEIR lists that one protected tree (Mexican elderberry) would require a replacement ratio of 4:1; 82 trees that are non-protected but are significant would require a replacement of 1:1; 34 street trees would be removed and would be replaced “at a ratio agreed upon during consultation with the Urban Forestry Division”; and 75 trees located on State Park Property would be replaced “on California Department of Parks and Recreation State property and private property at a 1:1 ratio”. Project activities that result in the removal of trees may cause temporary or permanent impacts to wildlife that utilize the trees as habitat.

In addition, Project activities that involve removal of trees or parts of trees have the potential to result in the spread of tree insect pests and disease into areas not currently exposed to these stressors.

Why impacts would occur: The total replacement ratio of all 250 trees to be removed along the Project alignment is currently unknown. CDFW is therefore unable to determine if these replacement ratios are sufficient in mitigating for impacts to trees removed. The lack of complete mitigation ratios for tree removal in the DEIR may result in an ultimate total net loss of trees associated with the Project activities.

Moreover, all trees on site may provide habitat for wildlife within the Project vicinity. These trees may provide adequate habitat for nesting birds and small mammals. Removal of trees on site may temporarily or permanently impact available habitat for wildlife in the area. The loss of trees should be included in the mitigation efforts.

Lastly, there is no proposed investigation and plan for managing tree pests or pathogens at the time of removal. This may result in the introduction of pests, pathogens, or diseases to areas where they previously have not been found.

Evidence impacts would be significant: The greater Los Angeles area is home to a wide variety of migratory and non-migratory species of birds that utilize the urban ecosystem. Studies have shown that street trees provide necessary foraging habitat to birds and are a critical resource to promote avian biodiversity. Feeding bird density has been shown to be positively associated with increases in density and size of street trees. In addition, there is evidence that avian species generally prefer native street-tree species and only a few nonnative tree species for foraging (Wood & Esaian 2020). CDFW is concerned that without sufficient mitigation for the loss of trees, there will

be a negative impact of wildlife species, such as birds, in the alignment area that would use these trees for potential nesting and foraging habitat.

Lastly, without a proper investigation and management plan, the Project may also result in an adverse effect, either directly or through habitat modifications, by exposing other habitats to insect and/or disease pathogens. Exposure to insect and/or disease pathogens may have a substantial adverse effect on any sensitive natural community identified in local or regional plans, policies, and regulations or by the CDFW or United States Fish and Wildlife Service (USFWS).

Recommended Potentially Feasible Mitigation Measure(s):

Mitigation Measure #6: An infectious tree disease management plan should be developed and implemented prior to initiating Project activities. All trees scheduled for removal should be inspected prior to start of those activities for contagious tree diseases including but not limited to: thousand canker fungus (<http://www.thousandcankers.com/>) (*Geosmithia morbida*), Polyphagous Shot Hole Borer (<https://ucanr.edu/sites/eskalenlab/?file=/avocado.html>) (*Euwallacea* spp.), and goldspotted oak borer (<http://ipm.ucanr.edu/PMG/PESTNOTES/pn74163.html>) (*Agrilus auroguttatus*) (TCD 2022; UCANR 2022; UCIPM 2013). To avoid the spread of infectious tree diseases, diseased trees, or any parts thereof, should not be transported from the Project site without first being treated using best available management practices relevant for each tree disease observed.

Mitigation Measure #7: Given that the DEIR does not provide justification for how the mitigation ratios presented would adequately reduce Project impacts to below a level of significance while considering temporal loss, native trees, size of trees, potential mitigation failure, or other factors, CDFW recommends replacing native trees with at least a 3:1 ratio. CDFW also recommends replacing non-native trees with at least a 1:1 ratio with native trees. CDFW concurs with the replacement ratio for the Mexican elderberry.

Recommendation #1 Phased Tree Removal: CDFW recommends Metro consider phased removal of trees (i.e., phased Project approach) in order to minimize impacts resulting from the temporal loss of trees and to provide structurally diverse tree replacement habitat while mitigation for impacts to tree removal occurs. CDFW recommends providing nesting perch structures in the interim of replacement trees being installed so as no nesting habitat is lost during construction. Perches should be installed at an appropriate distance from the work area to reduce impacts to nesting birds.

Response S1-8

Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of this Final EIR. The proposed Project would implement BIO-PDF-F, and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. Refer to

Table 4-1 of Appendix G, for discussion of applicable tree replacement requirements in the City of Los Angeles. As shown in this table, protected trees require a replacement ratio of 4:1, while significant trees require a mitigation ratio of 1:1. Removed “street trees” that occur in the public right-of-way (ROW) are to be replaced at a ratio specified by the Urban Forestry Division; typically, at a 2:1 ratio. As discussed on page 3.4-23, in Section 3.04, Biological Resources, of the Draft EIR, it is anticipated that mitigation ratios for trees on land administered or managed by responsible agencies would be agreed to as part of the approvals required for implementation of the proposed Project. The proposed Project would provide a minimum replacement ratio of 1:1 for all trees removed in the Los Angeles State Historic Park and a replacement ratio of 1:1 for significant trees removed in the State Route (SR) 110 California Department of Transportation (Caltrans) ROW.

As discussed in Appendix G, of the Final EIR, removal of certain of the trees for the proposed Project would result in a small reduction of habitat for wildlife species that depend on trees for cover, nesting, roosting, foraging, and other reasons. The magnitude of impacts to wildlife from tree removal depends on several factors, including the amount of habitat to be removed and the quality of that habitat. In the long-term, the impacts are also affected by the replacement plan for the removed trees. The quality of wildlife habitat provided by the trees proposed for removal is relatively low, given that the trees are primarily non-native tree species. Of the 26 tree species identified in the tree inventory report, 20 are considered non-native (and five of those are considered invasive). Furthermore, 122 of the 145 large trees (>8 inches DBH), and 71 of the 105 smaller trees, are non-native species. All of the 57 native trees were planted as ROW trees (12 trees) or were planted as part of a plant program in the Los Angeles State Historic Park, and 34 of these 57 trees are young, with a DBH of <8 inches. Other areas are composed of 100-percent non-native trees, often covered in non-native and invasive vines such as Kudzu (*Pueraria montana*).

The only areas of tree removal that could be potentially described as wooded habitat are the following: the small grove of Fremont cottonwood trees at the western end of the Los Angeles State Historic Park, the non-native woodland at the Stadium Tower and associated fire buffer, and the non-native woodland at the Dodger Stadium Station location. The total area of wooded habitat that would be removed in each of these areas is 0.24, 1.02, and 0.39 acres, respectively. These areas are relatively small amounts of wooded habitat, relative to the amounts available in the immediately surrounding areas, such as Elysian Park (approximately 600 acres alone, much of which is wooded), Radio Hill Gardens, Victory Memorial Grove, and Point Grand View Park.

In the short-term, the removal of trees will result in a marginal reduction of suitable tree habitat for nesting birds, roosting bats, and other wildlife in the vicinity of the proposed Project. Common wildlife species would be expected to utilize adjacent

habitats, and substantial population level impacts to common species would not be expected due to the small amount of habitat loss relative to the amount of habitat available in surrounding areas. In the long-term, the replacement of the 145 large trees proposed for removal with 242 new trees would more than offset any realized impacts associated with the proposed Project.

While the proposed Project would not have significant impacts to sensitive, special status species, and/or migratory bird species through habitat modifications, in response to Recommended Potentially Feasible Mitigation Measures #6 and #7 and Recommendation #1, the proposed Project would incorporate additional Project Design Features (PDFs) to further reduce the already less than significant effects and to provide additional environmental benefits. In response to Recommended Potentially Feasible Mitigation Measures #6 and #7 and Recommendation #1 provided in the comment, an addition to the Draft EIR has been provided to include BIO-PDF-E, requiring the inspection for the presence of contagious tree diseases on trees scheduled for removal and tree disease management if detected, BIO-PDF-F, requiring the proposed Project to comply with applicable tree replacement ratios, and BIO-PDF-G, requiring tree removal for the proposed Project to occur outside of the bird nesting season and bat maternity roosting season. These additions have been incorporated into Section 5.0, Corrections and Additions, of this Final EIR.

Comment S1-9 Additional Recommendations

Recommendation #2 Nesting Birds: CDFW concurs with the nesting bird mitigation measure BIO-B as proposed in the DEIR. However, it should be noted that the temporary halt of Project activities within nesting buffers during nesting season does not constitute effective mitigation for the purposes of offsetting Project impacts associated with habitat loss. Additional mitigation would be necessary to compensate for the removal of nesting habitat within the Project site based on acreage of impact and vegetation composition. CDFW should be consulted to determine proper mitigation for impacts to occupied habitat depending on the status of the bird species. Mitigation ratios would increase with the occurrence a California Species of Special Concern and would further increase with the occurrence of a CESA-listed species.

Response S1-9 Refer to Mitigation Measure BIO-B, provided in Section 3.4.6, Mitigation Measures, of Section 3.04, Biological Resources, of the Draft EIR, for measures that would be implemented to avoid impacts to nesting birds, including nesting buffers and other monitoring requirements. Refer to Response S1-8 for a discussion of habitat and tree removal and replacement.

Comment S1-10 Recommendation #3 Construction Fencing: CDFW recommends that any fencing used during and after the Project be constructed with materials that are not harmful to wildlife. Prohibited materials should include, but are not limited to, spikes, glass, razor, or barbed wire. Use of chain link and steel stake fence should be avoided or

minimized as this type of fencing can injure wildlife or create barriers to wildlife dispersal. All hollow posts and pipes should be capped to prevent wildlife entrapment and mortality. These structures mimic the natural cavities preferred by various bird species and other wildlife for shelter, nesting, and roosting. Raptor's talons can become entrapped within the bolt holes of metal fence stakes resulting in mortality. Metal fence stakes used on the Project site should be plugged with bolts or other plugging materials to avoid this hazard. Fences should be installed in a manner that excludes any wildlife from entering the work zone (i.e., embedded fence such that wildlife cannot enter from under the fence). Fences should not have any slack that may cause wildlife entanglement.

Response S1-10 In response to Recommendation #3, the proposed Project would incorporate BIO-PDF-H, outlining requirements for construction materials and practices to avoid attracting wildlife to the proposed Project's construction site, to further reduce the already less than significant effects and to provide additional environmental benefits.

Comment S1-11 Recommendation #4 Data: CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database [i.e., California Natural Diversity Database (CNDDDB)] which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. Accordingly, please report any special status species detected by completing and submitting CNDDDB Field Survey Forms (<https://wildlife.ca.gov/Data/CNDDDB/Submitting-Data>) (CDFW 2023b). The County should ensure the data has been properly submitted, with all data fields applicable filled out, prior to finalizing/adopting the environmental document. The data entry should also list pending development as a threat and then update this occurrence after impacts have occurred. The County should provide CDFW with confirmation of data submittal.

Response S1-11 Consistent with Recommendation #4, and in accordance with Pub. Resources Code, §21003, subd. (e), the proposed Project's qualified biologist will report all special status species (including Federal or California Threatened or Endangered species, and California Species of Special Concern) documented within the BSA during the development of the proposed Project EIR to the California Natural Diversity Database (CNDDDB) by completing and submitting CNDDDB Field Survey Forms (CDFW 2023b). The qualified biologist will ensure the data has been properly submitted, with all data fields applicable filled out. The data entry will also list pending development as a threat. The qualified biologist will update the occurrence records after impacts have occurred. The qualified biologist will provide CDFW with confirmation of data submittal prior to finalization of the proposed Project EIR.

Comment S1-12 Recommendation #5 MMRP: CDFW recommends the County update the Project's proposed Biological Resources Mitigation Measures and condition the environmental document to include mitigation measures recommended in this letter. CDFW provides comments to assist the County in developing mitigation measures that are

specific, detailed (i.e., responsible party, timing, specific actions, location), and clear for a measure to be fully enforceable and implemented successfully via a mitigation monitoring and/or reporting program (CEQA Guidelines, § 15097; Pub. Resources Code, § 21081.6). The County is welcome to coordinate with CDFW to further review and refine the Project’s mitigation measures. Per Public Resources Code section 21081.6(a)(1), CDFW has provided the County with a summary of our suggested mitigation measures and recommendations in the form of an attached Draft Mitigation and Monitoring Reporting Plan (MMRP; Attachment A).

Response S1-12 Refer to Section 7.0, Mitigation Monitoring and Reporting Program, and Table 7-1, Mitigation Monitoring and Reporting Program (MMRP), of this Final EIR, for the MMRP. The MMRP prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies. Refer to Section 5.0, Corrections and Additions, of this Final EIR, for BIO-PDF-B through BIO-PDF-H, which were added to this Final EIR in order to provide additional environmental benefits in response to the Recommended Potentially Feasible Mitigation Measures and Recommendations provided in this letter.

Comment S1-13 Filling Fees

The Project, as proposed, could have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final (Cal. Code Regs, tit. 14, § 753.5; Fish & Game Code, § 711.4; Pub. Resources Code, § 21089).

Response S1-13 The Project Sponsor will pay any required filing fees to the Los Angeles County Clerk at the time the Notice of Determination (NOD) is filed in accordance with California Code of Regulations, tit. 14, section 753.5, Fish and Game Code, section 711.4, and Public Resources Code, section 21089.

Comment S1-14 Conclusion

We appreciate the opportunity to comment on the Project to assist Metro in adequately analyzing and minimizing/mitigating impacts to biological resources. CDFW requests an opportunity to review and comment on any response that Metro has to our comments and to receive notification of any forthcoming hearing date(s) for the Project. If you have any questions or comments regarding this letter, please contact Felicia Silva, Environmental Scientist, at (562) 292-8105 or Felicia.Silva@wildlife.ca.gov.

Sincerely,

Erinn Wilson-Olgin
Environmental Program Manager I

Response S1-14

This comment provides a general conclusion regarding the comments raised in this letter. Responses to comments raised in this letter are provided in Responses S1-2 through S1-13, and in S1-15.

Comment S1-15

CDFW recommends the following language to be incorporated into a future environmental document for the Project.

Biological Resources			
	Mitigation Measure	Timing	Responsible Party
MM-BIO-1-Operational Impacts	<p>The DEIR shall include measures to mitigate for collision impacts with the cables, gondola cars, stations, and towers. Metro will develop an Avian Collision Mitigation, Monitoring, and Adaptive Management Plan to address any bird collisions that may occur. This Plan shall prescribe the following:</p> <ol style="list-style-type: none"> 1. Measures to allow birds to see structures during low light hours. Artificial lighting should be eliminated where unnecessary as to prevent attracting birds or shielded down where possible. The DEIR will investigate different types of lights and lighting regimes with reference to their effect on the safety of migrating birds; 2. Measurable goals and success criteria that eliminates or reduces collisions to the maximum extent feasible. Measurable success criteria shall be based on site/habitat conditions prior to Project operations. Collisions shall be eliminated for fully protected species as no take can occur for these species; 3. Contingency measures if the success criteria is not met; 4. Long-term monitoring for at least 10 years; 5. Adaptive management techniques.; and 6. Annual reporting criteria and requirements. 	Prior to Construction and/or ground disturbing activities	Metro
MM-BIO-2-Operational Impacts	<p>Any windows in station, tower, or gondolas will be made visible to birds in flight. This may be achieved by using non-reflective tint or window film. Reflective surfaces shall be reduced as much as possible with opaque or translucent surfaces.</p>	Prior to Construction and/or ground disturbing activities	Metro
MM-BIO-3-Burrowing Owl	<p>Burrowing owl protocol surveys shall be conducted by a qualified biologist on the Project site and within 100 feet (minimum) of the Project site where there is suitable habitat. Surveys for burrowing owls shall adhere to survey methods described in CDFW's March 7, 2012, Staff Report on Burrowing Owl Mitigation prior to issuing construction permits (CDFW 2012). In California, the burrowing owl breeding season extends from February 1 to August 31 with some variances by geographic location and climatic conditions. Survey protocol for breeding season owl surveys states to conduct 4 survey visits: 1) at least one site visit between February 15 to April 15, and 2) a minimum of three survey visits, at least three weeks apart, between April 15 and July 15, with at least one visit after 15 June.</p>	Prior to Construction and/or ground disturbing activities	Metro

Biological Resources			
	Mitigation Measure	Timing	Responsible Party
	If burrowing owls are identified utilizing the Project site during the surveys, Metro shall prepare an Impact Assessment in accordance with the 2012 Staff Report on Burrowing Owl Mitigation. Then, Metro shall develop a Burrowing Owl Mitigation Plan in accordance with the 2012 Staff Report on Burrowing Owl Mitigation. Metro shall contact CDFW to develop appropriate mitigation/management procedures. Metro shall submit a final Burrowing Owl Mitigation Plan to Metro prior to the issuing of construction permits.		
MM-BIO-4-Burrowing Owl	Metro shall disclose the length of time for temporary impacts to burrowing owl habitat. Based on those temporary impacts, Metro will mitigate for temporary and direct impacts to burrowing owl. There should be no net loss of burrowing owl habitat. Metro should set aside replacement habitat offsite for acreage of impact and number of burrows. Replacement habitat should be protected in perpetuity under a conservation easement dedicated to a local land conservancy or other appropriate entity, which should include an appropriate endowment to provide for the long-term management of mitigation lands	Prior to Construction and/or ground disturbing activities	Metro
MM-BIO-5-Burrowing Owl	Metro shall avoid using any rodenticides and second-generation anticoagulant rodenticides during Project activities.	Prior to Construction and/or ground disturbing activities	Metro
MM-BIO-6-Tree Disease Management Plan	An infectious tree disease management plan shall be developed and implemented prior to initiating Project activities. All trees scheduled for removal shall be identified and counted to provide total numbers and species type. In addition, trees scheduled for removal resulting from the Project shall be inspected for contagious tree diseases including but not limited to: thousand canker fungus (<i>Geosmithia morbida</i>), Polyphagous Shot Hole Borer (<i>Euwallacea spp.</i>), and goldspotted oak borer (<i>Agrilus auroguttatus</i>) (TCD 2020; UCANR 2020; UCIPM 2013). To avoid the spread of infectious tree diseases, diseased trees shall not be transported from the Project site without first being treated using best available management practices relevant for each tree disease observed.	Prior to Construction and/or ground disturbing activities	Metro

Biological Resources			
	Mitigation Measure	Timing	Responsible Party
MM-BIO-7-Tree Replacement	Given that the DEIR does not provide justification for how the mitigation ratios presented would adequately reduce Project impacts to below a level of significance while considering temporal loss, native trees, size of trees, potential mitigation failure, or other factors, CDFW recommends replacing native trees with at least a 3:1 ratio. CDFW also recommends replacing non-native trees with at least a 1:1 ratio with native trees. CDFW concurs with the replacement ratio for the Mexican elderberry	Prior to Construction and/or ground disturbing activities	Metro
REC-1- Phased Tree Removal	CDFW recommends Metro consider phased removal of trees (i.e., phased Project approach) in order to minimize impacts resulting from the temporal loss of trees and to provide structurally diverse tree replacement habitat while mitigation for impacts to tree removal occurs. CDFW recommends providing nesting perch structures in the interim of replacement trees being installed so as no nesting habitat is lost during construction. Perches must be installed at an appropriate distance from the work area to reduce impacts to nesting birds.	Prior to Construction and/or ground disturbing activities	Metro
REC-2-Nesting Birds	It should be noted that the temporary halt of Project activities within nesting buffers during nesting season does not constitute effective mitigation for the purposes of offsetting Project impacts associated with habitat loss. Additional mitigation would be necessary to compensate for the removal of nesting habitat within the Project site based on acreage of impact and vegetation composition. CDFW shall be consulted to determine proper mitigation for impacts to occupied habitat depending on the status of the bird species. Mitigation ratios would increase with the occurrence a California Species of Special Concern and would further increase with the occurrence of a CESA-listed species.	Prior to Construction and/or ground disturbing activities	Metro
REC-3-Fencing	CDFW recommends that any fencing used during and after the Project be constructed with materials that are not harmful to wildlife. Prohibited materials should include, but are not limited to, spikes, glass, razor, or barbed wire. Use of chain link and steel stake fence should be avoided or minimized as this type of fencing can injure wildlife or create barriers to wildlife dispersal. All hollow posts and pipes should be capped to prevent wildlife entrapment and mortality. These structures mimic the natural cavities preferred by various bird species and other wildlife for shelter, nesting, and roosting. Raptor's talons can become entrapped within the bolt holes of metal fence stakes resulting in mortality. Metal fence stakes used on the Project site should be plugged with bolts or other plugging materials to avoid this hazard.	Prior to Construction and/or ground disturbing activities	Metro

Biological Resources			
	Mitigation Measure	Timing	Responsible Party
	Fences should be installed in a manner that excludes any wildlife from entering the work zone (i.e., embedded fence such that wildlife cannot enter from under the fence). Fences should not have any slack that may cause wildlife entanglement.		
REC-4-Data	CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database [i.e. California Natural Diversity Database (CNDDDB)] which may be used to make subsequent or supplemental environmental determinations [Pub. Resources Code, § 21003, subd. (e)]. Accordingly, please report any special status species detected by completing and submitting CNDDDB Field Survey Forms (CDFW 2023b). The County should ensure the data has been properly submitted, with all data fields applicable filled out, prior to finalizing/adopting the environmental document. The data entry should also list pending development as a threat and then update this occurrence after impacts have occurred. The County should provide CDFW with confirmation of data submittal.	Prior to Construction and/or ground disturbing activities	Metro

Response S1-15 While the proposed Project would not have significant impacts to biological resources after the implementation of mitigation as identified in the Draft EIR, the proposed Project would incorporate additional Project Design Features (PDFs) to further reduce the already less than significant effects and to provide additional environmental benefits. In response to CDFW’s comments, an addition to the Draft EIR has been provided for to incorporate BIO-PDF-B through BIO-PDF-H. This addition has been incorporated into Section 5.0, Corrections and Additions, of this Final EIR.

Refer to Response S1-6 for a discussion of how the proposed Project will incorporate BIO-PDF-B and BIO-PDF-C in response to recommended measures MM-BIO-1 and MM-BIO-2 provided in this comment. Refer to Response S1-7 for a discussion of how there is no suitable habitat for burrowing owls in the BSA, and no known occurrences of burrowing owls are documented in the BSA such that the proposed Project would result in less than significant impacts related to burrowing owls, and therefore the proposed Project need not implement the recommended measures MM-BIO-3 and MM-BIO-4 provided in this comment. Refer Response S1-7 for a discussion of how the proposed Project will incorporate BIO-PDF-D in response to recommended measure MM-BIO-5 provided in this comment, requiring that the proposed Project avoid using any rodenticides and second generation anticoagulant rodenticides during Project activities. Refer to Response S1-8 for a discussion of how the proposed Project will incorporate BIO-PDF-E, BIO-PDF-F, and BIO-PDF-G in response to recommended measures MM-BIO-6, MM-BIO-7, and REC-1 provided in this comment. Refer to Mitigation Measure BIO-B, provided in Section 3.4.6, Mitigation Measures, of the Draft EIR, for measures that would be implemented to avoid impacts to nesting birds, including nesting buffers and other monitoring requirements in response to REC-2 in this comment. Refer to Response S1-10 for a discussion of how the proposed Project will incorporate BIO-PDF-H in response to REC-3 provided in this comment. Refer to Response S1-11 for a discussion of how the proposed Project’s qualified biologist will report all special status species (including Federal or California Threatened or Endangered species, and California Species of Special Concern) documented within the BSA during the development of the proposed Project EIR to the California Natural Diversity Database (CNDDDB) by completing and submitting CNDDDB Field Survey Forms (CDFW 2023b), consistent with REC-4 provided in this comment.

Comment Letter S2 – CA Department of Parks and Recreation

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to S2

Comment S2-1 Dear Mr. Zelmer,

The California Department of Parks and Recreation (State Parks) welcomes the opportunity to comment on the Draft Environmental Impact Report (DEIR) for the Los Angeles Aerial Rapid Transit Project (Project). State Parks is a State Agency as defined by the California Environmental Quality Act (CEQA) and our mission is to provide for the health, inspiration, and education of the people of California by helping preserve the state’s extraordinary biodiversity, protecting its most valued natural and cultural resources, and creating opportunities for high quality outdoor recreation.

State Parks and its partners spent more than 20 years planning, developing, and protecting the Los Angeles State Historic Park (LASHP). This park provides the city and surrounding communities with much-needed public open space and iconic views of downtown, opportunities for civic engagement and public programming on the cultural significance and diversity of greater Los Angeles, all while also protecting valuable historic resources within the urban core of Los Angeles.

The LASHP has also become a popular venue for special events, large and small, drawing visitors from all over the world. While State Parks recognizes that the Project is expected to result in numerous public benefits, including traffic reduction, better air quality, and improved transportation connectivity for the surrounding communities, all of which are consistent with the state’s broad environmental goals and supported by State Parks, it will also impact LASHP operations in significant ways, as described in more detail below.

Response S2-1 This comment provides a general introduction to the comments raised in this letter. Metro and the Project Sponsor acknowledge the more than 20 years of effort the community undertook to convert the closed rail yard at River Station to what is now the Los Angeles State Historic Park. The planning, developing, and efforts made by State Parks and its partners resulted in a park that provides the “a place to learn and to celebrate the ethnically diverse history and cultural heritage of Los Angeles” for the surrounding community, greater Los Angeles, and visitors from around the world, one that the proposed Project is designed to honor and expand upon.¹ As noted in the comment, the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel are discussed in Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air

¹ California State Department of Parks and Recreation, Los Angeles State Historic Park General Plan and Final Environmental Impact Report, June 2005, p. 68.

Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. In addition, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro's L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and park amenities. Refer to Response S2-2 for a discussion of the minimal ways the proposed Project would affect park operations. Through continued collaboration with State Parks and other stakeholders, the proposed Project benefits would outweigh those affects and would be a net benefit for visitors to the park.

Comment S2-2 The proposed project, with respect to the LASHP, includes a station for loading and unloading passengers at the southern entrance of the park, with ropeways and cabins traversing the southwestern edge of the park, connecting the LASHP station with a junction tower just outside of the park on the other side of Broadway. In total, the Project would require permanently taking approximately 0.21 acres for the physical transit station, and up to 1.87 acres of the 32-acre park (6%) that would be restricted

not only by the station, but by the overhead development and operational rights for the aerial infrastructure, including the cable ropeway, which would be suspended at just 26 feet over the park at its lowest spot. If constructed, the Project would require the demolition of park improvements in the project area, with additional areas to be impacted in the event these improvements, such as the Cargo Snack Shack concession and restrooms, are relocated to other areas of the park. Furthermore, a number of trees will need to be removed and the areas under the ropeway will need to be kept clear of vegetation and structures over a certain height, thus reducing the available park space for event organizers and public park users, potentially limiting the size and scope of future events.

Response S2-2

As discussed in Section 2.0, Project Description, Section 3.16, Recreation and Parks, and Section 5.0, Other CEQA Considerations, of the Draft EIR the proposed Project's Chinatown/State Park Station would be integrated into the southern boundary of the Los Angeles State Historic Park, and the proposed Project alignment crosses over the westernmost edge of the park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The station would have a footprint of 2,195 square feet in the park, and the station canopy would have an overhang of 9,320 square feet over the park (including the 2,195 square foot footprint in the park). The proposed Project's required horizontal aerial clearance width over the park would be 53 feet 2 inches wide with an area of approximately 59,470 square feet, plus an Additional Separation Buffer.² As shown in Figure 5-2 of the Draft EIR, more than 30 of the park's 32 acres are not beneath the proposed Project's alignment, which is above mostly hardscaped, landscaped, and grassy areas along the westernmost edge of the park. ANSI B77.1 requires the following vertical clearances: vehicles – five feet; vegetation or terrain – five feet; at-grade where pedestrians are present – eight feet; buildings – five feet; and roadways or railways – to be determined with the authority having jurisdiction. The proposed Project's vertical clearance to the bottom of the cabins would range from 26 to 53 feet with an average of approximately 40 feet from ground level over the park. Given these required clearances and the height at which the cabins would travel over the park, it will continue to be possible for most events to take place both under the majority of the alignment within the park and adjacent to the alignment. Use of more than 30 of the park's 32 acres for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. The proposed Project does not propose to demolish, nor does it need to demolish the Cargo Snack Shack concession or restrooms however, proposed Project construction would affect the current location of its outdoor seating area. The Project Sponsor would coordinate with State Parks and the concessionaire on the potential to provide alternative

² Section 3.4.6, Aerial Clearance, of Section 3.0, Project Description, of the Final EIR details the proposed Project's Additional Separation Buffer.

seating locations during construction. Refer to Section 3.17, Transportation, and Section 3.11, Land Use and Planning, of the Draft EIR, for discussion of how multimodal access—for both local and emergency response—to local businesses, neighborhoods, LAUS, and the Los Angeles State Historic Park would be maintained throughout construction of the proposed Project, and disruptions to local businesses would be minimized. Refer to Topical Response C, Project Features, for discussion of the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The proposed Project includes new park amenities, including approximately 740 square feet of new concessions, 770 square feet of new restrooms, and a 220 square foot covered breezeway connecting the new concessions and restrooms. These amenities would be operated by the Los Angeles State Historic Park and/or the operator as determined by the Los Angeles State Historic Park. The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page 3.4-23, in Section 3.04, Biological Resources of the Draft EIR, and in Appendix K.1, Updated Tree Inventory Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department, including the General Plan Amendment. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio.

Comment S2-3 As noted in the DEIR, the Project is not consistent with the LASHP General Plan, which would need to be amended prior to State Parks granting any administrative approvals. Authority for approving such state park general plan amendments rests solely with the State Park and Recreation Commission (SPRC). While the project applicant would be responsible for submitting a general plan amendment document that meets State Parks' requirements and policies for such proposals, State Parks would also be responsible for analyzing and making recommendations to the SPRC. State Parks understands that the thresholds under CEQA and the required record and analysis for a general plan amendment are different.

Response S2-3 As discussed in Section 3.11, Land Use and Planning, of the Draft EIR, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by

the State Park and Recreation Commission, which retains its independent authority related to the proposed Project. The General Plan Amendment process would include additional public processes before the Commission. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to less than significant. Refer to Topical Response F, Los Angeles State Historic Park, for discussion of how State Parks has the authority to grant the necessary approvals for the proposed Project consistent with the park's General Plan. State Parks will undertake its own review of the proposed Project when the Project Sponsor seeks approvals for its use of Los Angeles State Historic Park from State Parks, including during the General Plan Amendment process under the authority of the State Park and Recreation Commission.

Comment S2-4 However, State Parks recommends that the project applicant further analyze the following impacts in the DEIR: (1) the substantial loss of property within LASHP;

Response S2-4 Refer to Response S2-2 regarding the Chinatown/State Park Station and proposed Project alignment within the Park. As discussed in Section 3.16, Park and Recreational Facilities, of the Draft EIR, the construction and operational impacts of the proposed Project would result in less than significant impacts to the park under CEQA. The Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would overhang 9,320 square feet of the park (including the 2,195 square foot footprint). The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required horizontal aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park (~1.4 million square feet), plus an Additional Separation Buffer. While the Chinatown/State Park Station's footprint will occupy 2,195 square feet within the park, through continued collaboration with State Parks which has been ongoing and will continue through the General Plan Amendment process, the proposed Project would be fully integrated into the park such that it would add to, rather than take away from, the park's purpose and objectives. For example, in addition to the concessions, restrooms, and breezeway discussed above, the Chinatown/State Park Station would also include a mobility hub where passengers would be able to access a suite of first and last mile multi-modal options, such as a bike share program. Pedestrian access enhancements could include pedestrian improvements between Metro's L Line (Gold) Station and the Chinatown/State Park Station consistent with the Connect US Action Plan, including hardscape and landscape improvements, shade structures, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge. The Chinatown/State Park Station would provide passenger access to Chinatown, LASHP, and to nearby neighborhoods and land uses, including the Mission Junction neighborhood, which includes the William Mead Homes public housing complex. In addition, the station canopy would provide much needed shade. As discussed in

Topical Response F, Los Angeles State Historic Park, the Project Sponsor would work with State Parks through the General Plan Amendment process to develop an “Interpretation Plan” to identify unique ways to use the proposed Project to provide interpretation for the park and its history. The Interpretation Plan would help ensure that the proposed Project is a benefit to Los Angeles State Historic Park by providing visitors with, consistent with the park’s existing General Plan, an engaging and informative experience that deepens their understanding and appreciation of Los Angeles State Historic Park’s culture and history as a former transportation hub.

Comment S2-5

(2) the impairment of scenic viewsheds and high-value open space; and

Response S2-5

Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, including to the park, which would be less than significant. As discussed therein, the Draft EIR and Visual Impact Assessment specifically addressed and disclosed potential impacts on changes in the visual environment and existing viewsheds of or from the Los Angeles State Historic Park. The Draft EIR studied thirty Key Observation Points (KOPs), including nine that simulated views of or from Los Angeles State Historic Park:

- KOP 12: Looking North on Alameda Street/Spring Street from South of College Street
- KOP 15a: Looking Northeast from Spring Street adjacent to Metro L Line (Gold)
- KOP 15b: Looking Northeast from Spring Street near Southernmost Entrance to Los Angeles State Historic Park
- KOP 16a: Looking Southwest from Southwestern Portion of Los Angeles State Historic Park
- KOP 16b: Looking Southeast from the Southwestern Portion of Los Angeles State Historic Park
- KOP 17: Looking Southwest from Roundhouse within Los Angeles State Historic Park
- KOP 18: Looking Southwest from Spring Street adjacent to Los Angeles State Historic Park
- KOP 19: Looking Southwest from within Los Angeles State Historic Park
- KOP 20: Looking Southwest from North Broadway historic bridge

The Draft EIR analyzed each of these KOPs, describing the existing viewpoint along with a visual simulation of the proposed Project. With respect to views from within the park, the Draft EIR concluded that certain southwest-facing views of the downtown Los Angeles skyline, particularly close to the proposed Chinatown/State Park Station, would be partially interrupted due to the proposed Project. However,

the Draft EIR noted that these views are already partially interrupted by trees and intervening development, and the nature of the proposed Project (i.e., cables with similar characteristics to prevalent existing powerlines and cabins that are constantly moving in and out of view) means that the proposed Project would not significantly impact views from the park.

The Draft EIR concluded that the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the park.

Nevertheless, in response to this comment, the Final EIR includes additional KOPs to further analyze viewshed impacts to Los Angeles State Historic Park. Refer to Appendix H.1, Memo Regarding Preparation of KOPs, and Appendix H.2, Supplemental KOPs in Response to Comments, of this Final EIR, for a discussion of the preparation of the supplemental KOPs, and the analysis of the supplemental KOPs, respectively. As demonstrated by the analysis of the simulated views in these supplemental KOPs, views from the park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views. In addition, refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including views from a cabin over the park, providing a new and unique perspective of the park and its surroundings, including the Roundhouse Observation Deck and the exposed Zanja Madre, which is currently not visually apparent from inside the park.

The Draft EIR also analyzed the proposed Project's consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics (see pages 3.11-39 to 3.11-41). As detailed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, consistent with the General Plan's Aesthetic Goal, the proposed Project would protect and enhance scenic viewsheds and features and preserve the visitor's experience of the surrounding landscape by minimizing impacts to aesthetic resources. The proposed Project's design would incorporate appropriate urban design elements at the neighborhood level, preserve natural viewsheds of hillside areas, and protect additional open space and aesthetics resources consistent with policies from the Los Angeles State Historic Park General Plan.

The proposed Project's design and building materials would complement the architectural themes of the neighborhood and would complement the visual character of the existing buildings in the area. The Chinatown/State Parks Station's location would not block any designated scenic vistas, alter scenic resources, or block panoramic views. Additionally, potential impacts to visual quality and character are minimized by the location of the Chinatown/State Park Station, which is in the southernmost portion of the park, away from the open passive park areas (discussed further below).

The proposed Project components would consist of a modern architectural design, which would complement the existing modern style buildings in this area. In addition, the neutral light-tone gray of the proposed Project components would be consistent with modern structures in the surrounding urban environment. The new amenity building intended for use by proposed Project riders and park visitors alike are designed to reflect the scale and materiality of the existing visitor amenity buildings located within the Los Angeles State Historic Park.

Refer to Topical Response M, Comparable Urban Aerial Transit Systems for a discussion of how other urban aerial transit systems have been successfully incorporated into their surroundings, including public open space and public parks.

Further, consistent with Los Angeles State Historic Park General Plan Aesthetic Guideline 1, the Project Sponsor has taken steps to further minimize the effects of the proposed Project on the park's visual resources and high-value open space. This has included collaboration with State Parks resulting in selecting a primary alignment along the western edge of Los Angeles State Historic Park, rather than through the middle of the park, in order to reduce visual and other Park impacts. Additionally, the Project Sponsor worked with State Parks to determine the new location of the Chinatown/State Park Station to improve pedestrian flow into the park and what other improvements would further enhance the experience of visitors (e.g., increased landscaping and hardscaping, new restrooms and concession areas, etc.). This resulted in moving the station to the southernmost edge of the park.

As discussed in more detail in Topical Response F, Los Angeles State Historic Park, in response to Los Angeles State Historic Park stakeholders' comments on the proposed Project's Notice of Preparation and discussions with State Parks, numerous design considerations have been incorporated into the proposed Project to minimize the aesthetic effect of the proposed Project on the park, including reducing the size and scale of the station to be further in line with the neighborhood characteristics, integrating the existing historic granite pavers, and carefully considering the optimal location for the station.

Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction and operational noise impacts from the proposed Project, including in the Los Angeles State Historic Park. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation, and operational noise impacts would be less than significant.

Comment S2-6 (3) project impacts that will constrain and reduce the ability to utilize the LASHP for special events.

Response S2-6 Refer to Response S2-2 regarding the Chinatown/State Park Station and proposed Project alignment within the Park. As discussed in Section 5.5.2, Special Events at the Los Angeles State Historic Park, in Section 5.0, Other CEQA Considerations, of the

Draft EIR, with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the park for special events and activities that use significant airspace (e.g., concerts with tall screens and kite flying) would not be affected by the proposed Project. Additionally, other special events that do not use significant airspace (e.g., craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market) and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. In addition, the access road currently used for event set-up and breakdown would continue to be available for use. The proposed Project could affect the ability to use areas directly beneath the alignment for certain specific special event structures, however, the proposed Project alignment over the park is largely over a hill where it is difficult to stage special events, and the park does not include in their planned locations for special events. Due to the location of the proposed Project alignment, which crosses over a small portion of the park not typically used for screens and stages, and because events can still take place under the majority of the proposed Project alignment, the proposed Project does not significantly reduce the event space area within the Los Angeles State Historic Park or limit the number of people that can attend events at the park. Coordination as to operation of special events at the Los Angeles State Historic Park and the proposed Project are anticipated to be addressed in operational agreements related to the park.

Comment S2-7 Other impacts such as, but not limited to, hours of operation, design and materials of facilities, and access during construction, are also meaningful issues that will need to be discussed further during the general plan amendment process before the SPRC.

Response S2-7 Coordination as to operational issues such as hours of operation are anticipated to be addressed in operational agreements related to the park. Refer to Sections 2.0, Project Description, 3.16, Parks and Recreational Facilities, and 5.0, Other CEQA Considerations, for further discussion of operational considerations such as the dual-gate design that will ensure that park areas would not be accessible once the park is closed.

Regarding the proposed Project design and the materials used for the Chinatown/State Park Station and the park amenities, as discussed in Section 2.0, Project Description, and Appendix C, Visual Impact Assessment, of the Draft EIR, the proposed Project would not adhere to a fixed, Procrustean design across the entire system, but each individual component would be designed to weave seamlessly into the surrounding urban fabric, and the colors and material finishes of each station and junction would be chosen to be complementary to each of their respective sites. The Project Sponsor would work with State Parks and its stakeholders to select a design and materials for the Chinatown/State Park Station and the park amenities to seamlessly integrate into and complement the park's surroundings.

As discussed in Section 3.16, Parks and Recreational Facilities, of the Draft EIR, construction of the Chinatown/State Park Station would require the temporary closure of approximately 1.59 acres of the southern entrance to Los Angeles State Historic Park during the approximately 19 months construction duration for the Chinatown/State Park Station. While there would be a temporary closure, access to the park would be maintained as there are various access points (e.g., at the intersection of Sotello and North Spring Street) to Los Angeles State Historic Park. Construction of the Chinatown/State Park Station would not require any closures of areas used for recreation; however, it would affect the current location of the outdoor seating area associated with the park concessionaire. The Project Sponsor would coordinate with State Parks and the concessionaire on the potential to provide alternative seating locations during construction. Refer to Section 3.17, Transportation, and Section 3.11, Land Use and Planning, of the Draft EIR, for discussion of how multimodal access—for both local and emergency response—to local businesses, neighborhoods, LAUS, and the Los Angeles State Historic Park would be maintained throughout construction of the proposed Project, and disruptions to local businesses would be minimized. Refer to Topical Response C, Project Features, for discussion of how the Project Sponsor would create a Business and Community Support Program to assist local businesses financially affected by proposed Project construction activities.

The Project Sponsor would continue to collaborate with State Parks and other stakeholders to ensure adequate vetting and consensus around the benefits from the proposed Project.

Comment S2-8

Should the General Plan be successfully amended to include the Project, State Parks looks forward to working collaboratively with the Project team to identify appropriate operational agreements, transactional terms, and other measures needed to ensure the benefits of the Project outweigh the impacts, direct and indirect costs, and specifically, ensure that LASHP visitors' overall experiences will be improved as a result.

Sincerely,
Jason De Wall
Northern Field Division Chief
cc: Kathy Amann, Deputy Director

Response S2-8

The Project Sponsor shares State Parks' objective to ensure that Los Angeles State Historic Park visitors' overall experiences will be improved as a result of the proposed Project and believes that through continued collaboration, that objective will be met.

Comment Letter S3 – CA Department of Highway Patrol

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to S3

Comment S3-1 To whom it may concern:

I was recently requested to perform an Environmental Impact Review for a project involving the Los Angeles Aerial Rapid Transit system. Specifically, a gondola aerial system that would transport pedestrian traffic from Los Angeles Union Station to Dodger Stadium.

Response S3-1 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment S3-2

S3-2A The California Highway Patrol's interest in commenting surrounds our concern for vehicular traffic traveling on the State Route (SR) 110 freeway. Our concerns include increased traffic congestion in the area due to the visual hazard of gondola cabins, the possibly of projectiles being thrown onto the freeway from pedestrian's traveling within gondola cabins, and increased calls for service in the area of the gondola to remove objects being thrown from gondola cabins.

S3-2B Due to the aforementioned concerns, we feel this project, if approved, would adversely affect the Central Los Angeles Area and vehicular traffic within the area.

If you need further assistance, please contact the administrative sergeant, Sergeant J. Allen, at (213) 744-2231.

Sincerely,

J.I. Perry, Captain
Commander
Central Los Angeles Area

Enclosure(s)

Cc: Southern Division
Special Projects Section, Transportation Planning Unit

Response S3-2

S3-2A Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the proposed Project's design and operations, including discussion of the safety, privacy, and operations features of the proposed Project. Refer to Section 3.01, Aesthetics, and

Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, including to motorists, which would be less than significant. The methodology utilized to examine potential aesthetic impacts follows the guidance outlined in the Federal Highway Administration’s *Guidelines for the Visual Impact Assessment of Highway Projects* (2015). As discussed on page 3.1-12, viewer exposure for motorists is low due to the short duration of views and high travel speeds of vehicles. Viewer sensitivity for motorists is considered low due to the task or demand of paying careful attention to the road ahead. Moreover, as discussed on page 3.1-50, motorists traveling on SR-110 would have fleeting and/or temporary views of the Project components. Refer to Topical Response K, Signage and Lighting, for discussion of how no digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition, the bottom of cabins would be 89 feet above northbound SR-110 and 98 feet above southbound SR-110, with the gondola cables 109 feet above northbound SR-110 and 118 feet above southbound SR-110. As discussed in Section 2.0, Project Description of the Draft EIR, cabins would feature a ventilation system and sealed windows for viewing purposes, which, for security reasons, would not open. Any small ventilation panels that would be provided as a feature of the proposed Project cabins would be screened to prevent the tossing of debris from cabins. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing vehicle miles traveled.

S3-2B

This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Response S3-2A.

Comment Letter S4 – Caltrans

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of this Final EIR, for reference.

Responses to S4

Comment S4-1 Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced project. The proposed Project would connect LA Union Station to the Dodger Stadium property via an aerial gondola system with an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. The Project would provide an aerial rapid transit (ART) option for visitors to Dodger Stadium, while connecting surrounding communities, including Chinatown, Mission Junction, Elysian Park, and Solano Canyon, and the Los Angeles State Historic Park, to the regional transit system accessible at LAUS. The aerial gondola system would be approximately 1.2 miles and consist of cables, three passenger stations, a non-passenger junction, three towers, and gondola cabins. When complete, the proposed Project would have a maximum capacity of approximately 5,000 people per hour per direction, and the travel time from LAUS to Dodger Stadium would be approximately 7 minutes. The proposed Project would provide pedestrian improvements, including hardscape and landscape improvements, as well as amenities at the Los Angeles State Historic Park. The ART system has the ability to overcome grade and elevation issues between LAUS and Dodger Stadium and provide safe, zero emission, environmentally friendly, and high-capacity transit connectivity in the Project area that would reduce greenhouse gas (GHG) emissions as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways. The proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Response S4-1 This comment is noted and will be provided to the decision makers for review. Metro appreciates the California Department of Transportation (Caltrans) preparing comments on the Draft EIR. The comment includes a summary of the project description and does not address an environmental issue or raise a substantive issue regarding the content of the Draft EIR. No further response is warranted.

Comment S4-2 The nearest State facility to the proposed project is SR-110. After reviewing the DEIR, Caltrans has the following comments:

Based on the information provided, Caltrans supports Design and Use option E, as it provides a much-needed bike and pedestrian bridge connecting North Broadway to the Los Angeles Historic Park. This connection is critical to the project's success, as it will allow the residents, employees, and students north of the Metro L line tracks to access the park and its new station. This not only improves the potential ridership for the proposed project but provides a greatly enhanced active transportation network for all Californians who will ever visit, live, or work in the area. For these reasons

Caltrans would also discourage the selection of Use Option D, which would substitute the proposed Chinatown/State Park Station for a non-passenger junction. This option greatly reduces the project's effectiveness, and needlessly limits accessibility to an additional mode of travel to and from a valuable green space.

Response S4-2

This comment indicating support for the proposed Project Design and Use Option E (the Los Angeles State Historic Park Pedestrian Bridge), and lack of support for Use Option D (Chinatown/State Park Station as a Non-Passenger Junction), is noted for the record and will be provided to the decision makers for review and consideration. As discussed in Topical Response C, Project Features, while not proposed as part of the proposed Project, the Draft EIR included as Design and Use Option E an analysis of the State Park's proposed bike and pedestrian bridge. The bridge would provide important connections for students at Cathedral High School, as well as between the park and the Chinatown, Savoy, and Solano Canyon neighborhoods to support convenient access for the community. The analysis serves to provide environmental clearance for the bike and pedestrian bridge as a benefit to the Los Angeles State Historic Park, as while the bike and pedestrian bridge was mentioned in the Los Angeles State Historic Park General Plan and studied in the State Park's Bridge Feasibility Study, the bike and pedestrian bridge was never environmentally cleared. Support for the Los Angeles State Historic Park bike and pedestrian bridge would otherwise be provided as part of the proposed Project. Accordingly, the proposed Project is furthering the bike and pedestrian bridge by providing the necessary environmental clearance and support for the bridge. As discussed in Section 6.0, Design and Use Options, of the Draft EIR, as Use Option D would not include passenger access, it would not meet a majority of the proposed Project's objectives associated with the Chinatown/State Park Station. For example, Use Option D would not enhance community connectivity to the Los Angeles State Historic Park or provide comparable, affordable, and accessible fare opportunities for the community and Los Angeles State Historic Park, as the Chinatown/State Park Station is the closest in proximity to Los Angeles State Historic Park. Several comments on the Notice of Preparation requested an intermediate station closer to Chinatown to be located at the current Metro L Line (Gold) station to bring business into the commercial area and to offer another travel mode choice so as to alleviate parking problems in the area. It is also anticipated that, under the proposed Project, approximately 15 percent of passengers would access the Chinatown/State Park Station on game days or during events at the Los Angeles State Historic Park. However, under Use Option D, no station access would be provided to the core of Chinatown, the Mission Junction neighborhood, or the Los Angeles State Historic Park. Further, the Chinatown/State Park Station as a non-passenger junction under Use Option D would not enhance transit access to surrounding communities, including the Park, Chinatown, Mission Junction including William Mead Homes, Los Angeles River, and North Broadway. As such, if the Chinatown/State Park Station were to operate as a non-passenger junction under Use Option D, it would not provide transit benefits to the public.

Comment S4-3 Finally, due to the Stadium Tower’s proximity to Caltrans right-of-way and the direct aerial crossing of SR-110, the project will require extensive collaboration with Caltrans staff for various permits and design approvals. These reviews, approvals, and encroachment permits will be conducted at the time of permit application so that all concerns can be adequately addressed. If you have any questions, please contact project coordinator Anthony Higgins, at anthony.higgins@dot.ca.gov and refer to GTS# 07-LA-2020-04095.

Sincerely,

MIYA EDMONSON
IGR/CEQA Branch Chief

cc: State Clearinghouse

Response S4-3 As discussed in Section 1.0, Introduction, of the Draft EIR, and Topical Response D, Metro is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, Caltrans is a responsible agency for the proposed Project and, as discussed in Section 2.0, Project Description, of the Draft EIR, the Project Sponsor will seek review and approval from Caltrans for any required permits or approvals for the proposed Project. Metro appreciates Caltrans’ willingness to collaborate with Metro on the proposed Project.

Comment Letter S5 – Gabrieleno/Tongva San Gabriel Band of Mission Indians

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to S5

Comment S5-1 We are writing this letter out of extreme concern for the proposed LA Gondola Project. The building of the Gondola will greatly impact current open space, disturb wildlife and cause disruption at LA Historic Park. Our tribal council and local Gabrieleno Tongva Community are against this project.

Response S5-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. The Draft EIR analyzed Tribal Cultural Resources in Section 3.18, Tribal Cultural Resources. Metro consulted with California Native American Tribes as required by CEQA in accordance with Assembly Bill 52, including the Gabrieleno/Tongva San Gabriel Band of Mission Indians. Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of the Final EIR for discussion of how impacts to biological resources from construction and operations of the proposed Project would be less than significant, including in the Los Angeles State Historic Park. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the Park. Further, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro's L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. Additionally, refer to Topical Response M, Comparable Urban Aerial Transit Systems,

discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Comment S5-2 As a tribe, we have very little space within Los Angeles County to gather as community and to enjoy outdoor space. Unfortunately, the capitalistic opportunity will cause more than disruption, but it will also further damage to Mother Earth and our natural world environment.

Response S5-2 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to the Los Angeles State Historic Park. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. The proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first/last mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment S5-3 We ask you to please stop the project. The traffic, and unnecessary construction that will further the damage to our planet will not improve our lives, traffic conditions or lives as Angelino's. This proposal is just another poorly short-sighted business venture that will leave our city and county in a worse situation than what we are currently experiencing.

Sincerely,
Kimberly M. Johnson
Tribal Secretary.

Response S5-3

Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at Los Angeles Union Station (LAUS), Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. In addition, refer to Section 2.01, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefits to the surrounding communities including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment Letter L1 – Evelyn Aguilar

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to L1

Comment L1-1 South Coast AQMD staff received the Draft Environmental Impact Report (Draft EIR) for the Proposed Los Angeles Aerial Rapid Transit Project (South Coast AQMD Control Number: LAC221018-05). Staff is currently in the process of reviewing the Draft EIR. The public commenting period is from 10/17/2022 – 12/16/2022.

Response L1-1 This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Response L1-2.

Comment L1-2 Upon review of the files provided as part of the public review period, I was able to access the Draft EIR and associated Appendices on METRO’s website.

Please provide an electronic copy of any live modeling and emission calculation files (complete files, not summaries) that were used to quantify the air quality impacts from construction and/or operation of the Proposed Project as applicable, including the following:

1. CalEEMod Input Files (.csv files);
1. Live EMFAC output files;
1. Any emission calculation file(s) (live version of excel file(s); no PDF) used to calculate the Project’s emission sources;
1. AERMOD Input and Output files, including AERMOD View file(s) (.isc);
1. HARP Input and Output files and/or cancer risk calculation files (live version of excel file(s); no PDF) used to calculate cancer risk, and chronic and acute hazards from the Project;
1. Any other files related to post-processing done outside of AERMOD to calculate pollutant-specific concentrations (if applicable).

You may send the above-mentioned files via a Dropbox link in which they may be accessed and downloaded by South Coast AQMD staff by 10/27/22. Without all files and supporting documentation, South Coast AQMD staff will be unable to complete a review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.

If you have any questions regarding this request, please contact me.

Thank you,

Evelyn Aguilar

Air Quality Specialist, CEQA-IGR
Planning, Rule Development & Implementation
South Coast Air Quality Management District
21865 Copley Drive, Diamond Bar, CA 91765
Phone: 909-396-3148
E-mail: eaguiar@aqmd.gov

Response L1-2 Documents responsive to this request were provided to the South Coast Air Quality Management District on October 28, 2022.

Comment Letter L2 – City of Los Angeles, City Administrative Officer

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to L2

Comment L2-1 I am writing to comment on the Draft Environmental Impact Report (DEIR) that Metro released on the Aerial Rapid Transit Project. Specially, I am informing Metro that the properties at 901 and 903 North Main Street, Los Angeles, California, 90012 (Assessor's Parcel Number [APN] 5408-008-909) are owned by the City of Los Angeles (City) and were approved for mixed use development -- affordable housing and services -- by the Mayor and City Council in August 2019 (Council File Number: 18-0930).

Response L2-1 This comment provides a general introduction regarding the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses L2-2 through L2-3. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for a discussion of how the Homeboy Industries' anticipated housing project at 903 North Main Street was considered a related project in the Draft EIR, and accordingly the proposed Project's Alpine Tower's location considered and avoided the anticipated 903 North Main Street Homeboy Industries' housing project. The proposed Project does not impact Homeboy Industries' anticipated housing project.

Comment L2-2 The Los Angeles Housing Department currently has an Exclusive Negotiation Agreement (ENA) with Friends of Homeboy, LLC, for these properties and expects to execute the Development and Disposition Agreement no later than June 2023. The plan for these sites includes transitional housing and affordable housing with supportive services, and a community center. Because of these facts, the City does not intend to divest itself of these parcels for any use besides providing affordable housing.

Response L2-2 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing for a discussion of how the proposed Project does not impact Homeboy Industries anticipated housing project. As detailed in Topical Response E, development of housing is constrained on the portion of 901 North Main where the proposed Alpine Tower would be located due to the proximity to the Metro L Line (Gold) tracks. The proposed Alpine Tower would be located on a triangular portion of 901 North Main Street between the Metro L Line (Gold) tracks and Alameda and Alpine Streets, and this property was previously analyzed by the City of Los Angeles' City Administrative Officer, describing it as unsuitable for housing. Specifically, the City recognized that the 901 North Main Street "site is bisected by overhead tracks, which are protected by an easement to" Metro and therefore "the Metro tracks will affect the ability to develop on the site." According to the City's publicly available property information system, ZIMAS, development and

construction projects on 901 North Main Street must consult with Metro pursuant to Metro’s Adjacent Development Review process to ensure safety and avoid conflicts to transit services and operations. The process applies to work within 100 feet from Metro right-of-way, which affects most or all of the 901 North Main Street property.³ In addition, compliance with Metro’s requirements for construction design in locations adjacent to Metro’s systems further restricts the ability for development on the portion of 901 North Main Street between the Metro L Line (Gold) tracks and Alameda and Alpine Street.

Comment L2-3 Thank you for your immediate attention to this matter. If you require additional information, please contact Assistant City Administrative Officer, Yolanda Chavez, at 213-473-7522 or Yolanda.Chavez@Lacity.org.

Sincerely,

MATTHEW W. SZABO
City Administrative Officer

cc: Mayor Karen Bass
Councilmember Eunisses Hernandez, District 1
Los Angeles Housing Department

Response L2-3 This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses L2-1 through L2-2.

³ The 903 North Main Street property is also located within this area, according to ZIMAS. City of Los Angeles. 2023. ZIMAS. Available at: <https://zimas.lacity.org/>. Accessed August 2023.

Comment Letter GO1 – Historic Cultural North Neighborhood Council, Phyllis Ling

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to GO1

Comment GO1-1 A resident who only has a landline asked me to find out if he can call into the LA ART DEIR public hearing tomorrow using one of Zoom’s toll free numbers. The phone number provided is the San Jose phone number, which would cost him over 20 cents per minute for the call.

Will the toll free phone numbers work for joining the Zoom meeting?

Thanks,

Phyllis Ling

Historic Cultural North Neighborhood Council
Outreach Committee Chair • Solano Canyon Resident Representative
Email: pling.hcnnc@gmail.com
Website: hcnnc.org
Subscribe: hcnnc.org/subscribe

Response GO1-1 An email responding to this request with Zoom’s toll-free dial in numbers was sent to the commenter on December 13, 2022.

Comment Letter GO2 – CCA, Jessica Lall

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO2

Comment GO2-1 Dear Mr. Zelmer,

CCA represents over 300 businesses, non-profits and trade organizations with a shared commitment to Downtown's vibrancy and increasing opportunity in the region. We are writing in support of the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART) that would connect Union Station to Dodger Stadium. The concept offers significant potential benefits to the City of Los Angeles and the broader communities of Los Angeles County by removing cars off the road, increasing access to public transit and improving air quality. It is also a key example of next generation transportation systems that will be critically important for LA's clean air future, which will require revolutionizing transportation on a scale not seen since the introduction of automobiles. LA ART has the potential to substantially improve traffic safety and facilitate mobility, while reducing traffic congestion and fuel consumption.

Response GO2-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 2.0, Project Description, of the Draft EIR, for an overview of how the proposed Project would provide a safe, sustainable, high-capacity zero emission aerial rapid transit option for visitors to Dodger Stadium, while also providing access between Dodger Stadium, the surrounding communities, and the regional transit system accessible at LAUS. As discussed in Section 2.3.7, Purpose and Need, of the Draft EIR, Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Although forms of aerial transit technology have been available and utilized for the last 100 years, modern applications have seen the evolution of the technology as a feasible mode of urban rapid transit. As discussed in the Technology Penetration Analysis, included in Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, a large capacity for a new mode of transportation in Los Angeles will allow passengers to see the potential for other emerging innovations to be integrated into the public transit system, and the proposed Project would thus exemplify how alternative transportation technology can be integrated into a city's transportation infrastructure and will show that new technology can successfully operate in concert with other existing modes of transportation.

Comment GO2-2 The emissions reductions from this permanent transit link, with its game-day capacity of 10,000 to 12,000 Dodger Stadium visitors, could benefit local communities by replacing up to 3,000 existing car trips before and after each Dodger game and Stadium event. In addition, the project's year-round operation opportunities can increase transit access for underserved communities and increase access to parks.

Response GO2-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Response GO2-1. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response C, Project Features, and Topical Response N, Environmental Justice, for discussion of how the proposed Project would provide new connections to and between currently underserved neighborhoods and uses along the proposed alignment, including El Pueblo, Chinatown, Mission Junction, the Los Angeles State Historic Park, Elysian Park, and Solano Canyon. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Moreover, transfers to and from the Metro regional transit system and the proposed Project would be free. In addition, the Community Access Plan would honor Metro's numerous discount fare programs for a variety of needs (i.e., senior fares, students fares, etc.). Residents and employees of businesses located within the communities adjacent to the proposed Project alignment would only pay the rate they pay to ride the Metro system. To facilitate this transportation connectivity, the proposed Project would include pedestrian access enhancements including pedestrian improvements between Metro's L Line (Gold) Station and Chinatown/State Park Station consistent with the Connect US Action Plan, shade structure, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge.

Comment GO2-3 Projects like these are important in addressing climate change and as an opportunity to create local jobs and economic opportunities for our communities, which is critically important as we look to move into the pandemic recovery phase and toward the future, including planning for the 2028 Olympics in Los Angeles.

We are pleased to support the LA ART project, recognizing the significant benefits potential from a successful project, and hope the approvals can be completed to realize the LA ART project's benefits in time for the 2028 Olympics.

Sincerely,

Jessica Lall
President & CEO

Response GO2-3 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Response GO2-2 regarding the proposed Project's ability to reduce greenhouse gases through reduced vehicular travel. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would positively impact the economy by creating jobs and how the Project Sponsor has committed to a goal of 35 percent utilization of minority business enterprises (MBE), women business enterprises (WBE), disadvantaged business enterprises (DBE), small business enterprise (SBE), disabled veteran business enterprises (DVBE), and LGBTQ-owned businesses during the proposed Project's construction phase. The proposed Project will enter into a Project Labor Agreement and will work in coordination with the LA/OC Building and Construction Trades. Refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses. As discussed in Section 2.0, Project Description, of the Draft EIR, and Topical Response C, Project Features, the proposed Project creates a first/last mile transit link for residents and businesses along the proposed Project alignment while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to businesses along the alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve.

Comment Letter GO3 – Los Angeles Latino Chamber of Commerce, Darrel Saucedo

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to GO3

Comment GO3-1 I would like to go on the record, that the LALCC is recommending, that this project hire at least 35% local small diverse business, to not only construction but to provide maintenance and staff thru Local American Job centers of California (AJCC)

Darrel A. Saucedo

Chief Operating Officer

8531 Wellsford Pl., Suite E

Santa Fe Springs, CA. 90670

562-464-0880 Office : 562-464-0884 fax

562-556-6492 cell

Response GO3-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response C, Project Features, for a discussion of how the Project Sponsor has committed to a goal of 35 percent utilization of minority business enterprises (MBE), women business enterprises (WBE), disadvantaged business enterprises (DBE), small business enterprise (SBE), disabled veteran business enterprises (DVBE), and LGBTQ-owned businesses during the proposed Project's construction phase.

Comment Letter GO4 – Los Angeles Union Station Historical Society, Thomas R. Savio

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO4

Comment GO4-1 Dear Mr. Zelmer,

The Board of Directors (The Board) of the Los Angeles Union Station Historical Society (LAUSHS), a non-profit, Section 106 designated historic preservation consultant for Los Angeles Union Station (Union Station), a world recognized National Historic Landmark owned by Los Angeles County Metropolitan Transit Authority (LA Metro), has voted to formally comment against Los Angeles Aerial Rapid Transit's (LA ART) private, for-profit "gondola" (cable car system) and public land and air rights development scheme that proposes to link Union Station and LA Metro's supporting "Esplanade" project with Dodger Stadium that The Board believes is an unfair and illegal (pending a Superior Court decision) "accommodation" for LA ART. The Board believes that LA ART's proposed "futuristic-style" Union Station Terminal on Alameda Street and LA metro's supporting "Esplanade" project will blight the historic and architecturally significant west facade of Union Station, and that Union Station, its passenger trains and patrons could be physically harmed in aircraft from the nearby Los Angeles Police Department's "Hopper Memorial Heliport" airport become entangled in LA ART's overhead cables and towers. Furthermore, The Board opposes LA Metro's planned removal of all "Disabled Parking" spaces from the "Esplanade" area, without public hearings or reasonable alternatives, to accommodate a new so-called "water feature" (aka a fogging-type water fountain) which is intended to cool LA ART riders cued-up for their rides to Dodger Stadium. Moreover, the water feature would be contrary to the state's water conservation policy. (Even if the water feature recirculates, at least 10% of its water will be lost to evaporation day after day, year after year.)

Until now, The Board has steadfastly refused to take sides in the above major, multi-million-dollar development scheme. However, in The Board's opinion LA Metro and its staff have obviously taken a pro-active role supporting LA ART, a potential competitor of LA Metro's efficient "Dodger Express" motor coach service, as well as planning to "gild the lily" of Union Station with its "Esplanade" project, all "backstage," using the public land and airspace without public discussion and participation as required by LA Metro policy and law.

Response GO4-1 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO4-2 through GO4-9.

Comment GO4-2 Among the reasons for The Board’s opposition are, but not limited to:

A) LA Metro Board member Mayor Eric Garcetti, who introduced the motion to assist LA ART without public discussion or participation and to enlist LA Metro staff to “carry LA ART’s water,” i.e., facilitate it, did receive, according to public records, millions of dollars in both “behest payments” and political cash contributions from real estate and LA ART “gondola” developer Frank McCourt and/or his various entities and associates, which in The Board’s opinion, is an apparent conflict of interest. Consequently, LA Metro is being sued by the non-profit California Endowment for willfully preventing public discussion and participation in the decision to partner with LA ART.

Response GO4-2 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The public input during this period led directly to changes to the proposed Project to incorporate public feedback, including changes to the proposed Project alignment to include the intermediate Chinatown/State Park Station, redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of outreach and community engagement during the Draft EIR public review period and community engagement efforts during the preparation of the Final EIR. This comment also raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro’s sole source determination for the proposed Project.

Comment GO4-3 B) In The Board’s opinion, LA Metro Deputy Executive Officer Cory Zelmer falsified an official document—LA ART’s Draft Environmental Impact Report—by ticking-off the DEIR box that states there is no airport within two miles (or 3520 yards) of LA ART’s proposed LA ART Union Station Terminal, when he had been informed repeatedly to the contrary by The Board. The Board presented proof to Zelmer and his superior, LA Metro CEO Stephanie Wiggins, that the Los Angeles Police Department’s “Hooper Memorial Heliport”—variously described as the country’s or the world’s

busiest airport for rotary-winged aircraft (aka helicopters) –is only 880 yards from LA ART’s proposed Union Station Terminal. Furthermore, The Board reminded Zelmer and Wiggins, that according to the Los Angeles Police Department, the California Department of Transportation, the California Public Utilities Commission, the Federal Aviation Administration, and the 8th U.S. Circuit Court of Appeals, all heliports are airports, i.e., a location where any type of flying machine is serviced. The fact that some airports serve only rotary-wing aircraft while others serve both rotary-wing aircraft and fixed-wing aircraft (airplanes) does not change the fact that all “heliports” are “airports” in the eyes of the governing agencies and the Federal Courts.

Furthermore, the argument that Hooper Memorial is a police airport, not a civilian airport, and therefore not an airport as far LA ART’s DEIR is concerned, is fallacious and spurious. Any aircraft that becomes entangled in LA ART’s cables and 13-story towers and thus crashes into Union Station, its trains and patrons would cause catastrophic harm regardless had that aircraft launched from a police airport or a public airport. Simply put, LA ART’s proposed location is not safe for Union Station and Hooper Memorial Heliport airport.

“General Notice A. Safety is of the first importance in the discharge of duty.”

--Los Angeles Union Passenger Terminal Rules and Regulations

Response GO4-3

The Draft EIR addresses potential airport hazards in Section 3.09 Hazards and Hazardous Materials, Section 5.5.5, Heliports, in Section 5.0, Other CEQA Considerations, and in Appendix O, Airspace Analysis Technical Memo. The determination on page 3.9-30 of the Draft EIR – that the proposed Project alignment is not in an area covered by an airport land use plan nor located within two miles of a “public airport” – is based on facts and the specific language of CEQA’s thresholds of significance for this issue. This threshold is stated in the Draft EIR under Impact HAZ-5, which asks the question: “For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public use airport, would the project result in a safety hazard...?” The Draft EIR concludes that the proposed Project alignment is not within two miles of a “public use airport” as that term is defined under CEQA. Regardless of any distinction between heliports and airports, the Draft EIR immediately follows this conclusion with a clear disclosure that the city-owned Jay Stephen Hooper Heliport is within 0.38 miles of the proposed Project. According to the LAPD and AirNav.com¹, the Hooper Heliport is a city-owned, private use facility. As a private use facility, it does not meet the “public use airport” description in the CEQA threshold. Note that the determination is based on the distinction between public and private facilities, not the definition of “airport.” Thus, comparison to federal or state case law or regulations relying on a different definition of “airport” is irrelevant to the analysis required by CEQA. The analysis in Appendix O, Airspace Analysis Technical Memo, of the Draft EIR, is based on FAA analysis standards, and concludes with substantial evidence that construction and

operation of the proposed Project is clear of the airspace associated with the existing heliports, including the Hooper Heliport, in the proposed Project's vicinity. As such, no adverse effects related to aeronautical hazards are predicted based on these findings, and no notification is required for the proposed Project construction unless the FAA makes a specific request to the Project Sponsor. In addition, refer to Appendix I, Firefighting Helicopter Response Memo, of this Final EIR, for discussion of how helicopter flight paths would not be impeded as a result of the proposed Project.

Comment GO4-4 C) Contrary to the promises made to The Board by Stephanie Wiggins, Cory Zelmer, and LA ART, no meeting has ever been organized between them and The Board to discuss the difference of opinions concerning the nature of LAPD's Hooper Memorial Heliport airport and the proposed location for LA ART's Union Station Terminal.

Response GO4-4 Refer to Response GO4-3 for a detailed discussion of Hooper Heliport. Refer to Response GO4-5 regarding the proposed Project's Alameda Station. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period.

Comment GO4-5 D) LA Metro has forbidden The Board's examination of the only known 3-D scale model of Union Station's location because, in The Board's opinion, of a deliberate subterfuge the model dating from former Union Station owner—the Santa Fe Railway—is too old to be accurate today, and furthermore the sharing of the model with The Board would somehow be a "conflict of interest" even though The Board previously had access to the model in years past. However, The Board's use of the model does not depend on the model's age, but only the juxtaposition of Union Station with Alameda Street which has not changed appreciably since the station was opened in 1939. Consequently, at a loss for options, The Board asked LA ART to produce a 3-D scale model given its apparent resources, but LA ART has never responded. This "shadow play," in The Board's opinion, is being performed by LA Metro and LA ART to obfuscate the issues and delay public criticism of LA ART and contrary to the public weal which LA Metro is obliged to serve. Furthermore, since the model is public property, The Board's use should be permitted so it can be compared to LA ART's distorted, wide-angle, artist's renderings of its proposed Union Station Terminal with Union Station's Hispanic-Art Deco architectural style. Simply put, it is The Board's opinion that cable car rides belong in San Francisco and Disneyland, not in front of Los Angeles' world famous "Cathedral of Transportation."

Response GO4-5 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Appendix H.1, Memo Regarding Preparation of KOPs, of the Final EIR, for discussion of the methodology used to prepare the visual

simulations included in Appendix C, Visual Impact Assessment, of the Draft EIR. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. As discussed in Section 3.01, Aesthetics, of the Draft EIR, the Alameda Station's platform and canopy would include a light color scheme and warm tones, which has been designed to complement and reflect the materiality of the existing mix of adobe buildings, large Victorian commercial blocks, and Spanish Revival style buildings within the El Pueblo and Olvera Street area. In addition, the "shell" roof design provides a visual lightness with an integrated perforation pattern motif based upon the arched forms that mark openings and entries to Union Station, Pico House, and other historic buildings within El Pueblo. The proposed Project would also integrate physical and visual connections between the proposed Alameda Station and existing adjacent development, such as the new pedestrian plaza at El Pueblo. The new pedestrian plaza at El Pueblo would be open to the public and would extend view corridors between the proposed Alameda Station and existing development in a way that creates an observed visual unity.

Comment GO4-6 E) In The Board's opinion, LA ART is designed to, among other things, compete with LA Metro's "Dodger Express," a highly efficient service that could be improved if LA Metro switched to modern, environmentally friendly motor coaches that it might fund by the savings from not building its Esplanade project.

Response GO4-6 Refer to Topical Response O, Response to the UCLA Mobility Lab Study, for a discussion of how the Dodger Stadium Express would not be precluded from operating by the proposed Project. While existing riders of the Dodger Stadium Express may choose to switch to the proposed Project to take advantage of its substantial travel time savings, some riders may prefer to ride the Union Station Dodger Stadium Express for other reasons. The opportunities for more mobility choices through improved connections to additional public transit options created by the proposed Project are projected to increase the number of attendees of games or events at Dodger Stadium to ride public transportation. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. While some riders of the Dodger Stadium Express are likely motivated by traveling in more

sustainable ways than driving, the Dodger Stadium Express already uses clean natural gas (CNG) buses, which are more environmentally friendly than driving. Switching from CNG to a Zero Emissions Bus (ZEB) would have no bearing on the travel time or capacity limitations of the Dodger Stadium Express, so is not expected to materially increase the ridership of the service, and therefore would reduce fewer vehicle miles traveled (VMT) to Dodger Stadium than the proposed Project, which would operate at zero emissions, with the electrical power for the proposed Project supplied by the City of Los Angeles Department of Water and Power (LADWP) through the utility's Green Power Program, pursuant to GHG-PDF-A.

Comment GO4-7 F) Given the seasonal nature of baseball, it is also The Board's opinion that LA ART is a "Trojan Horse" proposal to facilitate year-around for-profit real estate development in Dodger Stadium's vicinity using public land and resources.

Response GO4-7 Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Comment GO4-8 G) LA Metro's proposed Esplanade project, according to LA metro employees—who wish to remain anonymous for the sake of their careers—will be funded by so-called "overlap money" that was "peeled-off" from LA Metro's defunct LINK-US project that itself was rejected because of the Board's and the public's opposition. Moreover, LA Metro has stated to The Board's Executive Director via telephone that it plans to accomplish the Esplanade project by eliminating all public parking including all "disabled parking" from the front of Union Station without public discussion or participation in violation of the Americans with Disabilities Act (ADA). Furthermore, according to a retired LA Metro staff person, the Esplanade's so-called

“water feature” (a fogging-type water fountain) will likely attract “homeless” citizens seeking showers, contrary to LA Metro’s stated policy—according to former LA Metro Union Station supervisor the late Ken Pratt—of not catering to the needs of the “homeless.” In The Board’s opinion, The Esplanade’s is designated to cool future LA ART and “Olvera Street” customers as they walk between Union Station, LA ART’s terminal and the “Hispanic-style” Olvera Street tourist attraction.

(While Olvera Street’s right-of-way and some of its structures and art works are historic, the “Olvera Street Tourist Attraction” per se was developed in the 1930s by a husband-and-wife real estate development team who went on to develop Los Angeles’ “New Chinatown Tourist Attraction.” Alas, historic Chinatown was demolished in a racist bid to rid Los Angeles of the Chinese who settled there after building the railroad to Los Angeles. Union Station was then built on top of old Chinatown’s rubble.)

Response GO4-8 Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of Metro’s LAUS Forecourt and Esplanade Improvements Project, which is not part of the proposed Project. The proposed Project does not include a water fountain in the planned LAUS Forecourt.

Comment GO4-9 Moreover, erecting the Esplanade water feature, whilst semi-desert Los Angeles is experiencing one of its worst droughts in history, flies in the face of the State of California’s policy to lessen environmental harm. One only needs to recall the classic Los Angeles-based movie “Chinatown” to understand what The Board believes is driving the related LA ART and Esplanade schemes. To paraphrase the immortal Yogi Berra: “It’s ‘Chinatown’ (*the movie*) all over again.”

Response GO4-9 Refer to Response GO4-8 for discussion of how the proposed Project does not include a water fountain in the planned LAUS Forecourt. As described on page 2-49 in Section 2.0, Project Description, of the Draft EIR, the proposed Project includes several sustainability and water efficiency measures, including drought tolerant landscaping and use of reclaimed water for irrigation where available.

Comment GO4-10 For the above reasons, but not necessarily only because of them, the Board of Directors of the Los Angeles Union Station Historical Society opposes construction of LA ART and LA Metro’s related Esplanade project in the interests of honest government, Union Station preservation, the environment and above all safety.

Respectfully,

Thomas R. Savio

Executive Director

Los Angeles Union Station Historical Society

Cc. Stephanie Wiggins, CEO, LA Metro Karen Bass, Mayor-Elect of Los Angeles

Response GO4-10 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. This

comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses GO4-2 through GO4-9.

Comment Letter GO5 – Los Angeles Chinatown Firecracker Run Committee, Inc.

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to GO5

Comment GO5-1 On behalf of the Firecracker Board of Directors, I am writing to express our support for the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Chinatown to Dodger Stadium. LA ART offers significant potential benefits to the City of Los Angeles and specifically the community of Chinatown by increasing access to public transit, improving air quality by removing cars off the road, and highlighting the businesses and culture in the area.

Response GO5-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment GO5-2 This project will improve mobility and increase access to opportunity for the local community. The LA ART represents a zero-emission permanent transit link that would provide game-day capacity of 10,000 to 12,000, replacing up to 3,000 trips before and after each Dodger game and Stadium event. It would also provide year-round operation opportunities to increase transit access for underserved communities and parks.

Response GO5-2 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities.

Comment GO5-3 In addition, by connecting Union Station to Chinatown, LA ART would create a cultural landmark that will enhance the visibility of Chinatown and increase visitors to the

business corridor. The project represents an opportunity for businesses along Broadway and across Chinatown to create partnerships with LA ART to highlight and learn more about the attractions, culture, history, and events in Chinatown.

Response GO5-3 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response C, Project Features for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The proposed Project would also provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. The proposed Project could partner, for example, with the Chinese American Museum to help in addressing visitor, educational, and customer access to the Museum. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. Refer to Topical Response C, Project Features, for discussion of how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area, which would be discussed with identified stakeholder groups. In addition, to reflect the diversity of Los Angeles, the Project Sponsor would convene stakeholder groups to identify unique ways to use the proposed Project to provide additional interpretation of the adjacent neighborhood culture and history, particularly aimed at a diverse visitor community.

Comment GO5-4 I appreciate LA ART’s diligence in working with Metro and the community to bring to life a vision for a safe, accessible transit option for the community and urge you to support this important investment for Chinatown.

Sincerely,

Raymond Su

President, Board of Directors

Los Angeles Chinatown Firecracker Run Committee, Inc.

Response GO5-4 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response N, Environmental Justice, Appendix A, Public Outreach Report, of the Final EIR, Appendix A, Scoping Report, of the Draft EIR, and Topical Response C, Project Features, for discussion of the proposed Project team’s outreach efforts to

neighborhoods along the proposed Project alignment and the proposed Project's features to enhance and provide additional benefits to the surrounding communities. Metro sought to engage with stakeholders in neighborhoods along the proposed Project alignment in each stage of the environmental review process. Input from the public, including local community stakeholders, led directly to the selection of the proposed Project alignment, including an intermediate station in Chinatown (the Chinatown/State Park Station), as well as to the redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements.

Comment GO5-5 List of Signatures in support for the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART)

#	Name	Title	City
1	Michelle Jong	Past President, Chinese Family History Group	Long Beach
2	clayton frech	CEO and Founder, Angel City Sports	Los Angeles
3	David Kent Gold	President, Bicycle Angels	Redondo beach
4	Evelyn Lee	President, Chinese Family History Group	Long Beach
5	Jose J. Hernandez	Principal, Ann Street Elementary	Los Angeles
6	Lisa Loo	Director – Community Services	San Gabriel
7	Jorge Parra Jr.	Educator	Los Angeles

Response GO5-5 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter GO6 – Asian Business Association, Dennis J. Huang

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to GO6

Comment GO6-1 As an office tenant of Chinatown for over 5 years, we like to see our community develop and advance. Having the Aerial Rapid Transit will bring more foot traffic which will help with economic development. Chinatown is very tourist friendly and walkable. We also like to see increased security and funding from this new transit to support Chinatown shops.

On behalf of our board of directors and 1200+ members, we are in full support of the LA Aerial Rapid Transit.

Dennis J. Huang

Executive Director & CEO

*A*sian *B*usiness *A*s*sociation

767 N. Hill Street, Suite 308

Los Angeles, CA 90012

(213) 628-1ABA

dennis@abala.org

www.abala.org

Response GO6-1 This comment indicating support for the proposed Project is noted and will be provided to the decision makers for review and consideration. Refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses along the proposed Project alignment while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to businesses along the alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. Refer also to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of how comparable aerial transit systems in other cities and countries have brought benefits to their surrounding areas by connecting disparate neighborhoods, promoting commerce, beautifying communities, and enhancing transit system rider safety.

Comment Letter GO7 – Climate Resolve, Kellie Hawkins Davis

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to GO7

Comment GO7-1 I support the proposed zero-emission Los Angeles Aerial Rapid Transit Project (LA ART), connecting Union Station to Dodger Stadium.

The gondola would benefit visitors to Dodger Stadium and the community by taking cars off the road, increasing access to public transit, and reducing greenhouse gas pollution. Projects like these are important in addressing climate change and improving the quality of life for Angelenos.

Sincerely,

Kellie Hawkins Davis
Climate Resolve Boardmember

Response GO7-1 This comment indicating support for the proposed Project is noted for the record and will be provided to the decision makers for review and consideration.

Comment Letter GO8 – LA Parks Alliance, John Given

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO8

Comment GO8-1 Dear Mr. Zelmer:

This letter is submitted on behalf of LA Parks Alliance¹ with respect to the above-captioned Los Angeles Aerial Rapid Transit Project (the “Project”) in response to the release of the Project’s Draft Environmental Impact Report (“Draft EIR” or “DEIR”). This letter focuses on LA Parks Alliance’s strong objection to Los Angeles County Metropolitan Transportation Authority (“Metro”) acting as lead agency for the Project’s environmental review instead of the proper lead agency, the City of Los Angeles. LA Parks Alliance will submit a more thorough comment letter regarding the Project’s inadequate environmental review before the current comment deadline in January 2023.

Footnote 1: LA Parks Alliance was formed in 2019 as a response to land use threats to LA State Historic Park. Its members are park and public space advocates. See <https://www.laparksalliance.org>.

Response GO8-1 Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of why Metro is the proper lead agency for the proposed Project and the City’s participation in the environmental review process as a CEQA responsible agency. As the agency tasked with planning, operating, and coordinating funding for the Los Angeles Region’s transportation system, Metro has primary responsibility for implementation of the proposed Project, and is the proper lead agency. Under CEQA, where two or more public agencies meet the criteria for acting as lead agency, the agency that acts first will normally serve as lead agency. (CEQA Guidelines, §15051(c).) Metro elected to serve as lead agency, and the City has not disputed this designation and has cooperated as a responsible agency.

Comment GO8-2 The City of Los Angeles Must be the Lead Agency for the Project, not Metro

Metro asserts it is the appropriate lead agency — “the public agency with the greatest responsibility for supervising or approving the project as a whole.” Metro fails to offer an explanation as to how or why it should (or even can) be considered the public agency with the greatest responsibility for supervising or approving the project. Review of the relevant statutes shows Metro cannot be the lead agency because it has insufficient authority to authorize or supervise the Project. The City of Los Angeles must be the lead agency for the Project.

Footnote 2: DEIR, p. ES-1, quoting but not specifically citing Cal. Code Regs. Tit. 14 (hereinafter CEQA Guidelines), § 15051(b).

Response GO8-2 Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority. Metro is the proper lead agency for the proposed Project. Under CEQA, a lead agency is the public agency with the greatest responsibility for supervising or approving the project as a whole.” (CEQA Guidelines, §15051(b).) Under state law, Metro has broad authority over public transportation planning and coordination for the Los Angeles region’s transportation system and is authorized to do “any and all things” to carry out these purposes. (Public Utilities Code, § 130105(f).) For the proposed Project, Metro is tasked with considering approval of all plans for design, construction, and implementation under Public Utilities Code section 130252, as well as with consideration of the written approvals to operate the proposed Project, pursuant to its authority under Public Utilities Code section 130252. Thus, Metro has primary responsibility for implementing the proposed Project and integrating it into the regional transportation system, consistent with Metro’s statutory purpose. Metro is the appropriate lead agency for the proposed Project.

Comment GO8-3 A. CEQA Requires the City of Los Angeles to be the Lead Agency for the Project

Public Resources Code section 21067 defines “lead agency” as “the public agency which has the principal responsibility for carrying out or approving a project which may have a significant effect upon the environment.” (See also CEQA Guidelines, § 15367.)

CEQA Guidelines section 15051 explains the mandatory process by which a lead agency is chosen:

Where two or more public agencies will be involved with a project, the determination of which agency will be the lead agency shall be governed by the following criteria:

(a) If the project will be carried out by a public agency, that agency shall be the lead agency even if the project would be located within the jurisdiction of another public agency.

(b) If the project is to be carried out by a nongovernmental person or entity, the lead agency shall be the public agency with the greatest responsibility for supervising or approving the project as a whole.

(1) The lead agency will normally be the agency with general governmental powers, such as a city or county, rather than an agency with a single or limited purpose such as an air pollution

control district or a district which will provide a public service or public utility to the project.

(2) Where a city prezones an area, the city will be the appropriate lead agency for any subsequent annexation of the area and should prepare the appropriate environmental document at the time of the pre zoning. The local agency formation commission shall act as a responsible agency.

(c) Where more than one public agency equally meet the criteria in subdivision (b), the agency which will act first on the project in question will normally be the lead agency.

(d) Where the provisions of subdivisions (a), (b), and (c) leave two or more public agencies with a substantial claim to be the lead agency, the public agencies may by agreement designate an agency as the lead agency. An agreement may also provide for cooperative efforts by two or more agencies by contract, joint exercise of powers, or similar devices.

Here, there are numerous public agencies that will be involved with the project. As the DEIR acknowledges, permits and other approvals will be required from the California Department of Transportation (CalTrans), California State Parks, Cal/OSHA, the City of Los Angeles, and Metro. (DEIR, pp. 2-57, 2-61 to 62.) Guidelines section 15051 therefore applies.

There is no doubt the Project will not be “carried out” by Metro. Metro tacitly admits as much by quoting CEQA Guidelines section 15051 subdivision (b) in the DEIR, which would not apply if Metro planned to carry out the project. Subdivision (a) would instead apply and Metro would be the appropriate lead agency. (DEIR, p. ES-1.) But as all available evidence shows, Metro will *not* carry out the Project.

Response GO8-3 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Response GO8-2 for a discussion of how Metro is the appropriate lead agency for the proposed Project, consistent with its statutory authority under Public Utilities Code section 13052. Refer to Section 2.0, Project Description, for an overview of the potential discretionary entitlements, reviews, and approvals required for implementation of the proposed Project. Section 2.0 outlines the various agencies that could approve aspects of the proposed Project pursuant to their regulatory and statutory authority, including Caltrans, California State Parks, Cal/OSHA, Metro, and the City of Los Angeles.

Comment GO8-4 Metro documents, created during a confidential process by which Metro determined ARTT LLC would have sole source status to construct and operate the Project, show that the Project “is envisioned to be privately designed, built, operated, maintained, funded, insured, and financed” and that “Metro does not envision taking a hands-on, prescriptive, or performance minded approach to this project, instead focusing on the

elements of the project for which Metro would be responsible.” (Response to Metro Request for Information [“Response to Metro”], Sept. 26, 2018, p. 8.)³ Thus, CEQA Guidelines section 15051 subdivision (a) does not apply.

Footnote 3: See also, Response to Metro, p. 16: “Unlike other Metro projects, the ART is a privately funded/financed, designed, built, operated, maintained, and insured transport conveyance to a private property that is open to the public. Like Dodger Stadium, the ART system will be open to the public for certain events and activities but not publicly owned. It is more akin to the Palm Springs Aerial Tram as a service provided for transportation to a specific location.”

Response GO8-4 The cited document predates the initiation of environmental review for the proposed Project and accordingly does not have any bearing on the sufficiency of the Draft EIR. Nevertheless, Metro’s statement does not suggest that Metro has absolved itself of oversight for the proposed Project as this comment and letter suggests. Metro recognizes that as the lead agency it is responsible for overseeing aspects of the proposed Project within its jurisdiction, and will exercise its independent judgment in consideration of the proposed Project, which as discussed in Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, is being proposed by Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects. Refer to Responses GO8-1 and GO8-2 for a discussion of how Metro is the appropriate lead agency for the proposed Project, consistent with its statutory authority under Public Utilities Code section 13052. As recognized by CEQA Guidelines section 15051(b), where the proposed Project would be “carried out by a nongovernmental person or entity,” such as here, where the Project Sponsor would carry out the proposed Project, “the lead agency shall be the public agency with the greatest responsibility for supervising or approving the project as a whole” or “will normally be the agency with general governmental powers.” Metro elected to serve as lead agency, and the City has cooperated as a responsible agency, including consultation in preparation of the Draft EIR. Further, Metro independently decided to act as the CEQA lead agency following the Unsolicited Proposal Process, consistent with CEQA Guidelines section 15051(b). In addition, under CEQA, where two or more public agencies meet the criteria for acting as lead agency, the agency that acts first will normally serve as lead agency. (CEQA Guidelines, §15051(c).)

Comment GO8-5 Guidelines section 15051 subdivision (b), which does apply, strongly disfavors Metro as the lead agency because Metro does not have the “greatest responsibility for supervising or approving the project as a whole.” First, in admitting that it will not take a hands-on, prescriptive approach to the Project, Metro has disavowed that it will supervise the Project’s construction.⁴ Second, Metro’s role in approving the Project will be limited. It will focus only on the Project elements for which it is responsible. (Ibid.)

According to the DEIR, Metro’s oversight is limited to three approvals:

- review and approval of Project plans for design, construction, and implementation;
- an easement or other approval to allow construction and operation of the Project within a portion of Los Angeles Union Station; and,
- an encroachment permit or other approval to allow construction and operation of the Project within Metro’s Gold Line right-of-way. (DEIR, p. 2-61.)

The first of the above approvals that will purportedly be made by Metro is properly within the jurisdiction of Cal/OSHA’s Amusement Ride & Tramway Division, not Metro. It appears the primary reason the Project proponent agreed that Metro could also review and approve its plans is because the proponent specifically requested and negotiated with Metro to serve as the lead agency, not because it believes Metro has primary authority over the design, construction, and implementation of the Project. To the contrary, as LA ART argues and LA Parks Alliance agrees, Metro clearly does not have this authority:

In response to Metro’s assertion that ART is subject to Metro approval under the requirements of the California Public Utilities Code (“CPUC), ARTT LLC agrees in general that such approval is appropriate since ARTT LLC has asked Metro to act as the Lead Agency for environmental clearance, together with assistance with the acquisition of surface land and/or aerial easements, as necessary, and the potential location of a passenger station at or near Los Angeles Union Station. We do ask Metro to recognize, however, that **aerial gondolas and tramways are regulated by the California Labor Code, Sections 7340-7357, and the detailed implementation of design, plans, and specifications falls under the jurisdiction of the Department of Industrial Relations, Division of Occupational Safety and Health (“Cal/OSHA”), which includes an Amusement Ride and Tramway Unit.**

(Response to Metro, p. 16 [emphasis added].)

Footnote 4: Nor does Metro have the authority to supervise the Project. See section D, *infra*, pp. 8-10.

Response GO8-5 Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority. Metro has discretionary authority to review and approve “[a]ll plans proposed for the design, construction, and implementation” of the proposed Project (Public Utilities Code § 130252), which will include several discretionary approvals (multiple approvals of design and construction plans, approvals and agreements contemplated in the Memorandum of Agreement and subsequent amendments, agreement to integrate fares with Metro’s fares / one tap system). This discretionary authority is considerably more broad than the individual land use and other review and approvals

to be issued by responsible agencies for the components of the proposed Project occurring within their jurisdiction. In short, Metro has “the greatest responsibility for supervising or approving the project as a whole” and is the appropriate lead agency. (CEQA Guidelines, §15051(b) [emphasis added].) Simply because other agencies have approval authority for the proposed Project, does not mean that Metro does not have the “principal responsibility” for approving or supervising the proposed Project. Indeed, CEQA recognizes that multiple agencies may have authority over a project. Therefore, CEQA includes the responsible agency process and consultation requirements in order for other agencies to provide necessary review and approval of aspects of a project. (Pub. Resources Code, §§ 21067, 21069.) The proposed Project would require review and approvals from Caltrans, State Parks, the City, and Cal/OSHA, as responsible agencies, in addition to review and approval by Metro as lead agency. Responsible agencies’ discretionary approvals required for the proposed Project are secondary to Metro’s statutory authority to review and approve transportation projects, and these other agencies were appropriately named as responsible agencies. Further, Metro engaged in required consultation with all responsible agencies during the process of preparing the Draft EIR for the proposed Project, in compliance with CEQA. The cited document predates the initiation of the CEQA review process for the proposed Project, and accordingly has no bearing on the sufficiency of the Draft EIR. No further response is warranted. Refer to Responses GO8-19 through GO8-22 for responses to comments raised in Section D to this letter.

Comment GO8-6 The DEIR acknowledges that approvals from Cal/OSHA’s Amusement Ride & Tramway Division will be required pursuant to Cal. Code Regs. Tit. 8, §§ 3150-3191, including a Certificate of Construction. (DEIR, p. 2-61.) It does not, however, mention that California law requires all passenger tramways to receive a permit pursuant to Division 5 of the California Labor Code. The DEIR is therefore incomplete and inaccurate for failing to acknowledge this additional requirement.⁵

Footnote 5: California Labor Code, § 7341: “A passenger tramway shall not be operated in any place in this state unless a permit for the operation of the tramway is issued by the division, and unless the permit remains in effect and is kept posted conspicuously in the main operating terminal of the tramway.”

Response GO8-6 As discussed in Section 2.10, Required Permits and Approvals, of the Draft EIR, “the Project EIR will provide environmental clearance as needed for all of the potential discretionary entitlements, reviews, and approvals required for implementation of the proposed Project, including, but not necessarily limited to . . . Pursuant to Title 8, California Code of Regulations sections 3150 through 3191, approvals from the Amusement Ride & Tramway Division [of Cal/OSHA], including a Certificate of Construction.” Under Labor Code Section 7341, quoted by this commenter, “[a] passenger tramway shall not be operated in any place in this state unless a permit for the operation of the tramway is issued by the division, and unless the permit remains in effect and is kept posted conspicuously in the main operating terminal of the

tramway.” ‘Division’ means the Division of Occupational Safety and Health. This is consistent with the approvals identified in the Draft EIR and is therefore not an additional requirement beyond what the Draft EIR identified.

Comment GO8-7 CEQA’s mandatory process to determine the appropriate lead agency does not permit confidential negotiations between a project proponent and its preferred public agency for the role, a perverse sort of lead agency “forum shopping.” (See *Planning & Conservation League v. Department of Water Resources* (2000) 83 Cal.App.4th 892, 906 [“PCL v. DWR”]: private party and local agency are “not at liberty to anoint” the local agency as lead agency through a private agreement.)

Response GO8-7 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Responses GO8-1 and GO8-2, for a discussion of how Metro is the appropriate lead agency for the proposed Project. Metro is the agency tasked with planning, operating, and coordinating funding for the region’s transportation system, and is the appropriate lead agency for the proposed Project, which will become an integrated part of the regional transportation system. Further, this comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro’s process and sole source determination for the proposed Project.

Comment GO8-8 Moreover, compared to Metro’s somewhat limited role with only two necessary approvals (both for use or encroachment upon Metro land), the anticipated role of the City of Los Angeles is far more extensive and complex. The DEIR identifies the necessary City approvals as likely including, but not limited to:

- a franchise agreement to operate “upon, over, under, or along any street, highway or other place in the City of Los Angeles”;
- approval of the Project design from the Cultural Affairs Commission for components located within the City’s public right-of-way;
- creation of a Specific Plan;
- adoption of a Sign District;
- a Plan Approval under the existing 1960 Dodger Stadium Conditional Use Permit;
- relief from the River Implementation Overlay District, to allow for the construction of several project components (Alameda Station, Alameda Tower, and Alpine Tower);
- relief from Cornfield Arroyo Seco Specific Plan to allow construction and operation of the Chinatown/State Park Station;

- a Development Agreement between the “Project Sponsor” and the City of Los Angeles for 20 years; and,
- “Other discretionary and ministerial permits, approvals, consultations, and coordination will or may be required, including...temporary street closure permits, demolition permits, grading permits, excavation permits, archaeological permits, encroachment permits, building permits, dewatering permits, stormwater permits, noise variances, work hour variances, haul routes, sign permits, any operational agreements...and any applicable permits or clearances related to water and/or energy infrastructure or emergency access.”

(DEIR, pp. 2-61 to 62.)

The vast majority of these “other discretionary and ministerial permits” and other approvals referenced in the DEIR will be made by the City of Los Angeles, since the 1.2-mile- long Project is proposed to be built and operated predominantly on or above City right-of-way. (DEIR, pp. 2-2 and 2-6 [Figure 2-3].)

Response GO8-8 This comment provides a general recitation and characterization of the Draft EIR. Refer to Response GO8-5 for a discussion of Metro’s role as the lead agency and how Metro’s discretionary authority is considerably more broad than individual land use and other review and approvals to be issued by responsible agencies for the components of the proposed Project occurring within their jurisdiction. Refer to Section 2.10, Required Permits and Approvals, in Section 2.0, Project Description, of the Draft EIR, for a list of required permits and approvals from responsible agencies for the proposed Project. Refer to Response GO8-5 for discussion of Metro’s consultation with responsible agencies, including the City.

Comment GO8-9 CEQA strongly prefers to confer lead agency status on an “agency with general governmental powers, such as a city or county, rather than an agency with a single or limited purpose.” (CEQA Guidelines, § 15051(b)(1).) Metro is an agency with a single purpose, albeit a very important one. But it does not have general governmental powers as the City of Los Angeles does to, for example, grant relief from City land use regulations, create a specific plan, agree to a franchise agreement for Project use of public rights-of-way, enter into a 20-year Development Agreement, or offer any of the “other discretionary and ministerial permits” and approvals necessary for the Project to be ultimately approved.

Response GO8-9 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations and the Draft EIR. Refer to Section 2.10, Required Permits and Approvals, in Section 2.0, Project Description, of the Draft EIR, for a list of required permits and approvals from responsible agencies for the proposed Project. Refer to Response GO8-5 for discussion of Metro’s role as the lead agency, and how Metro’s discretionary authority is considerably more broad than individual land use and other review and approvals to be issued by responsible agencies for the

components of the proposed Project occurring within their jurisdiction, the City's role as a responsible agency, and Metro's consultation with responsible agencies, including the City.

Comment GO8-10 As the DEIR admits, the City of Los Angeles has direct and exclusive authority over all streets in the City. (DEIR, p. 3.17-1: "All the streets in the Project study area are under the jurisdiction of the City of Los Angeles.") The required franchise agreement is key to the Project moving forward since the Project operates primarily within the City's public right-of-way. In addition, it is the City that is responsible to ensure the Project's consistency with the City's General Plan and its components, including numerous community plans and two existing specific plans, not Metro. (DEIR, pp. 3.11-8 to 3.11-13). Metro has no experience or expertise in evaluating the Project's consistency with the City's General Plan or crafting appropriate mitigation measures to address significant conflicts. The City clearly does.

Response GO8-10 This comment provides a general recitation and characterization of the Draft EIR. Refer to Response GO8-5 for discussion of the City's role as a responsible agency and Metro's consultation with responsible agencies, including the City. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a consistency analysis of the proposed Project conducted with local plans and documents, including the City of Los Angeles General Plan, including the Community Plans, Alameda District Specific Plan, Cornfield Arroyo Seco Specific Plan, City of Los Angeles Municipal Code and RIO District Ordinance. As discussed in Section 1.0, Introduction, of the Draft EIR, the City of Los Angeles is a responsible agency under CEQA for the Draft EIR and, as discussed in Section 8.0, List of Preparers, of the Draft EIR, was consulted during the preparation of the Draft EIR, including on Section 3.11, Land Use and Planning.

Comment GO8-11 The City is also entirely responsible for any changes to and conditions associated with the 1960 Dodger Stadium Conditional Use Permit, and for relief from other City land use regulations in the Project area. The City is also responsible for required "temporary street closure permits, demolition permits, grading permits, excavation permits," etc. (DEIR, p. 2-62.) Metro has no experience, expertise, or authority for a private project over these fundamental City concerns.

Response GO8-11 This comment provides a general recitation and characterization of the Draft EIR. Refer to Response GO8-5 for discussion of the City's role as a responsible agency and Metro's consultation with responsible agencies, including the City. Under CEQA, the EIR provides the necessary environmental clearance for the whole of the project, including subsequent actions by responsible agencies. A responsible agency participates in the EIR preparation process through consultation and review of the Draft EIR. As a decision-maker, the responsible agency will consider the project's environmental impacts as described in the EIR prepared by the lead agency, and then decide whether to approve the action before it. (CEQA Guidelines, § 15096(a).) Accordingly, should Metro approve the proposed Project and certify the EIR, the City would then rely on the EIR in considering the aspects of the proposed Project within

its jurisdiction. Refer to Section 2.10, Required Permits and Approvals, and Section 3.11, Land Use, of the Draft EIR, noting that, pursuant to Los Angeles Municipal Code (“LAMC”) Section 12.24.M, the Project Sponsor may seek a Plan Approval for the existing 1960 Dodger Stadium Conditional Use Permit (“CUP”) to allow Stadium Tower and Dodger Stadium Station to implement the proposed Project. CUP Condition 4 provides for collaboration “in devising mass transportation service to the Stadium site which will be sufficiently efficient to encourage patronage thereof and thus reduce the number of private automobiles driven to the Stadium events.” Refer to pages 3.11-17 through 3.11-18, of Section 3.11, Land Use, of the Draft EIR, for a discussion of the CUP’s requirements, including that “automobile parking facilities for a minimum of one (1) automobile for each 3.6 seats provided in the Stadium shall be provided and maintained on site, so a total of 15,556 parking spaces must be provided and maintained on site. There are currently a total of 18,889 parking spaces provided and maintained on site.” An analysis of the proposed Project’s consistency with the CUP and the CUP’s requirements (including how a total of 18,889 parking spaces are currently provided on the site, and a total of 15,556 are required to be provided under the CUP) is provided on page 3.11-43. As discussed in Section 1.0, Introduction, of the Draft EIR, the City of Los Angeles is a responsible agency under CEQA for the Draft EIR, and as discussed in Section 8.0, List of Preparers, of the Draft EIR, was consulted during the preparation of the Draft EIR, including on Section 3.11, Land Use and Planning.

Comment GO8-12 Metro does not have the desire (recalling that it has already disavowed Project oversight) or the necessary incentive or expertise to enforce the many Mitigation Measures associated with the Project for components not located on Metro property.⁶ This may be one reason Metro has allowed so many of the Project’s proposed Mitigation Measures to be improperly deferred, a subject that will be raised in greater detail in LA Parks Alliance’s (and likely other) comment letters regarding the inadequate DEIR.

Footnote 6: These include: Construction Traffic Management Plan [DEIR, p. ES-14], Construction Monitoring Plan (Built Resources) [DEIR, p. ES-40], Cultural Resources Monitoring and Mitigation Plan (DEIR, p. ES- 41), Archeological Testing Plan for Alameda Station (DEIR, p. ES-45), Archeological Testing Plan for LAUS Forecourt [DEIR, p. ES-47], Archeological Testing Plan for Los Angeles State Historic Park [DEIR, p. ES-48], Paleontological Resources Mitigation and Monitoring Plan [DEIR p. ES-52], Soil and Groundwater Management Plan [DEIR, p. ES-53], Construction Noise Management Plan [DEIR, p. ES- 58], Vibration Monitoring Plan [DEIR, p. ES-67], Temporary Disaster Route Plan [DEIR, p. ES-76], Utility Relocation Plan [DEIR, p. ES-79], and a Fire Protection Plan [DEIR, p. ES-80].

Response GO8-12 Contrary to this comment’s assertion, Metro has not “disavowed” oversight of the proposed Project. Refer to Section 7.0, Mitigation Monitoring and Reporting Program, and to Table 7-1, Mitigation Monitoring and Reporting Program, of the Final EIR, for

the full Mitigation Monitoring and Reporting Program for the proposed Project. The Mitigation Monitoring and Reporting Program for the proposed Project designates which agencies, including Metro, are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. CEQA does not require that a lead agency be responsible for enforcing all mitigation measures, nor could it. Refer to Response GO8-5 for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region's transportation authority and how the proposed Project would require review and approvals from Caltrans, State Parks, the City, and Cal/OSHA, as responsible agencies, in addition to review and approval by Metro as lead agency. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the mitigation measures for the proposed Project would not impermissibly defer mitigation.

Comment GO8-13 Indeed, the DEIR appears to assume that ARTT will prepare all these deferred mitigation plans, not Metro. (See, e.g., DEIR 3.13-68 [Construction Noise Management Plan to be prepared by "Project Sponsor."] Presumably, it is the City, with its direct construction permitting responsibilities, local ordinances regulating such impacts as excessive construction noise, and expertise in overseeing such plans and mitigation measures, that will perform the required oversight and, if necessary, enforcement. (See, e.g, DEIR's reliance on LA Municipal Code [i.e., the City] to enforce stormwater runoff prohibitions, pp. 3.10-6.)

Response GO8-13 Refer to Response GO8-12, for a discussion of how agencies will retain enforcement authority over mitigation for the proposed Project. As demonstrated in Section 7.0, Mitigation Monitoring and Reporting Program, and Table 7-1, Mitigation Monitoring and Reporting Program (MMRP), of the Final EIR, the Mitigation Monitoring and Reporting Program prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies. The MMRP designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. CEQA does not require that a lead agency be responsible for enforcing all mitigation measures.

Comment GO8-14 The City of Los Angeles has direct regulatory authority over approval of the majority of physical Project components, which are primarily located on or above City land or City public right of way. The City is plainly the "public agency with the greatest responsibility for supervising or approving the project as a whole" and has the "general governmental powers" necessary to make most necessary Project approvals. (CEQA Guidelines, § 15051(b).) Metro has neither the greatest responsibility over the Project nor does it have general governmental powers to make Project approvals. Its approvals are limited to only two locations: one for permission to use Metro-controlled land, and another to cross Metro-controlled airspace.

The City of Los Angeles must be the lead agency.

Response GO8-14 Refer to Responses GO8-1 through GO8-13 for a discussion of how Metro is the appropriate lead agency for the proposed Project, and the City’s role as a responsible agency for the proposed Project.

Comment GO8-15 B. CEQA Guidelines Section 15051 Subdivisions (c) and (d) are Inapplicable

CEQA Guidelines section 15051 subdivision (c) only applies “[w]here more than one public agency equally meet the criteria in subdivision (b).” It is inapplicable, as the City of Los Angeles is clearly the appropriate lead agency under subdivision (b). Even if subdivision (c) did apply, and it does not, between Metro and the City of Los Angeles it is the City that would likely “act first on the project in question” due to the many preliminary approvals necessary for a project of this scope and magnitude. (See list of City approvals required for the Project, DEIR, p. 2-61 to 2-62, and discussion supra, pp. 4-6.)⁷

Footnote 7: In fact, the City of Los Angeles already approved a Project-related permit when it issued Permit No. 22020-10000-00312 for ARTT LLC’s gondola exhibit within the Dodger Stadium parking lot. [/www.ladbsservices2.lacity.org/OnlineServices/PermitReport/PcisPermitDetail?id1=22020&id2=10000&id3=00312](http://www.ladbsservices2.lacity.org/OnlineServices/PermitReport/PcisPermitDetail?id1=22020&id2=10000&id3=00312).

Response GO8-15 This comment takes into consideration the link provided in Footnote 7. Under CEQA, where two or more public agencies meet the criteria for acting as lead agency, the agency that acts first will normally serve as lead agency. (CEQA Guidelines, §15051(c).) Metro elected to serve as lead agency, and the City has cooperated as a responsible agency, including consultation in preparation of the Draft EIR. Further, as discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project requires approvals from the City. Refer to Response GO8-5 for further discussion of discretionary approvals required for the proposed Project, including from responsible agencies. CEQA does not require a lead agency to have jurisdiction over all areas where a proposed Project may result in environmental impacts. (Pub. Resources Code, § 21067; CEQA Guidelines, § 15367.) The Draft EIR properly considered all potential impacts in the area of the proposed Project, which includes property that is in the jurisdiction of Metro, the City, State Parks, and Caltrans. Metro consulted with all responsible agencies, including the City, regarding potential impacts to their property, in compliance with CEQA. And, under the Mitigation, Monitoring and Reporting Program for the proposed Project, included in Section 7.0, Mitigation Monitoring and Reporting Program, of this Final EIR, the City would have certain enforcement authority to ensure mitigation of any potentially significant impacts that would occur on City-owned property and ROW. The fact that the City issued a ministerial permit for a gondola cabin exhibit display at the Dodger Stadium property is not evidence that the City is the appropriate lead agency for the aerial gondola system—a transportation project. As discussed in Response GO8-2, Metro is the

proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region's transportation authority.

Comment GO8-16 While the project proponent agreed in a private negotiation that Metro may also review and approve Project plans for design, construction, and implementation, as ARTT privately admitted to Metro during early discussions about the Project, the statutory duty to review and approve plans for design, construction, and implementation of an aerial tram system properly belongs to Cal/OSHA pursuant to the California Labor Code, not to Metro. (Response to Metro, p. 16, citing Labor Code, §§ 7340-7357.) Moreover, nothing in the Labor Code or other statute requires it to be the first action taken on the Project.

Response GO8-16 Refer to Response GO8-5 for discussion of how the proposed Project would require review and approvals from Caltrans, State Parks, the City, and Cal/OSHA, as responsible agencies, in addition to review and approval by Metro as lead agency, and responsible agencies' discretionary approvals required for the proposed Project are secondary to Metro's statutory authority to review and approve transportation projects, and these other agencies were appropriately named as responsible agencies. In addition, the cited document predates the initiation of environmental review for the proposed Project and accordingly does not have any bearing on the sufficiency of the Draft EIR. This comment also mischaracterizes the cited document, which requested that the Project Sponsor list potentially applicable statutes and regulations.

Section 2.0, Project Description, of the Draft EIR, sets forth potential approvals from responsible agencies such as the City, Caltrans, State Parks, and Cal/OSHA, and approvals from Metro, which will involve additional opportunities for public hearing and comment on the proposed Project. For example, Metro's discretionary authority under Section 130252 to review and approve "[a]ll plans proposed for the design, construction, and implementation" of the proposed Project involves several potentially discretionary approvals, including, for example, approvals of design and construction plans, approvals and agreements contemplated in the Memorandum of Agreement and subsequent amendments, and agreement to integrate fares with Metro's fares / one tap system. The proposed Project would comply with applicable standards, requirements, building codes, and guidelines as determined by the City of Los Angeles, Metro, and/or Cal/OSHA or the appropriate agencies/regulatory authorities during the permitting process for the proposed Project.

This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 [Jan. 9, 2023, Order Denying Petition for Writ of Mandate]. The appeal in this lawsuit was abandoned on May 26, 2023, and accordingly the Los Angeles Superior Court's decision is final.

Metro followed the prescribed process for unsolicited proposals to the Metro Office of Extraordinary Innovation (“OEI”), which involved several public meetings where the proposed Project was discussed in an open forum and otherwise made public on Metro’s website. On April 25, 2018, the Project Sponsor submitted its Unsolicited Proposal to OEI. At the April 26, 2018, Metro Board of Directors meeting, the then-Metro CEO and Chair spoke about the proposed Project during their respective reports. Metro issued a press release on this date, noting that Metro had received the proposal and would evaluate the proposal under its Phase I analysis process “within 60 days of being received” in accordance with the Unsolicited Proposal policy process, prior to then choosing whether or not to advance the proposal to the more-detailed Phase II consideration. (“Metro receives Unsolicited Proposal for aerial rapid transit between Union Station and Dodger Stadium,” Metro – The Source (April 26, 2018).)¹

Following its consideration of the proposal consistent with the OEI process, Metro sent a letter to the Project Sponsor on October 11, 2018, confirming that the proposed Project would proceed to a sole source agreement, noting that Metro was prepared to enter into exclusive negotiations on the proposed Project. Metro’s December 3, 2018 Board Box included a discussion of the OEI process, noting that the Project Sponsor met the sole source criteria and, that during the Phase I review, Metro “felt that this zero-emission mode could provide a useful, creative and fun means of accessing Dodger Stadium and Elysian Park while reducing congestion and improving air quality in the neighborhoods surrounding the Stadium” and “conducted due diligence on the feasibility of this unique partnership and assessed the costs and benefits to Metro and the public of partnering on the project.”²

At the December 6, 2018, Metro Board of Directors meeting, the then-Metro CEO and Chair provided the Metro Board with an update on the proposed Project in his CEO Report to the Board, noting that he had “signed a memo closing out the unsolicited proposal process for the Los Angeles Aerial Rapid Transit Project and advancing that project to the implementation phase” and that Metro would “continue to develop the project by entering into an exclusive negotiation with our partner, the Aerial Rapid Transit Technologies LLC.”³ On this same day, Metro issued a press release announcing that Metro and LA ART had signed a letter of intent to “formally begin the negotiations necessary” for the proposed Project and that the letter of intent “signals Metro’s interest in implementing the project and moves it from the Unsolicited Proposals evaluation stage to project development.”⁴ Metro formally concluded the Unsolicited Proposal process on December 14, 2018, determining that

⁴ Hymon, Steve. 2018. Metro and ARTT co-sign Letter of Intent to begin negotiations on developing gondola to Dodger Stadium. Available at: <https://thesource.metro.net/2018/12/06/metro-and-artt-co-sign-letter-of-intent-to-begin-negotiations-on-developing-gondola-to-dodger-stadium/#:~:text=Metro%20announced%20on%20Thursday%20that,to%20Dodgers%20Stadium%20a%20reality>. Accessed August 2023.

the proposal satisfied the Phase II criteria, and advanced the proposal to the implementation process.

Contrary to this comment’s suggestion that Metro’s OEI process occurred “privately,” as stated above, the then-Metro CEO and Chair provided the Metro Board with an update on the proposed Project on December 6, 2018 at the public Board of Directors meeting, noting that Metro was “entering into an exclusive negotiation” with LA ART. Metro’s December 3, 2018 Board Box included a discussion of the OEI process, noting that “after reviewing the Phase II proposal submitted,” the Metro “review team recommended moving forward to implementation by entering into exclusive negotiations.” Metro’s Unsolicited Proposal Policy FAQs recognizes that “Metro Board meetings are matters of public record,”⁵ and this extends to items provided within Metro’s Board Box. In addition, at the publicly-noticed April 18, 2019 Metro Executive Management Committee (“EMC”) meeting and the April 25, 2019 Metro Board meeting, Metro received and filed a status report on the proposed Project that outlined the steps for moving forward with the proposed Project, including continuing negotiations on the Memorandum of Agreement (“MOA”) between the Project Sponsor and Metro, and the CEQA process. The reports for these meetings outlined the MOA’s terms, including that Metro will act as lead agency for the proposed Project under CEQA. The reports also affirmatively acknowledge Metro’s sole source determination, stating that in 2018, “Metro formally concluded the unsolicited proposal process and began exclusive negotiations with ARTT.”

The proposed Project was also discussed at publicly-noticed Metro EMC and Board meetings on September 17, 2020, September 24, 2020, June 17, 2021, and June 24, 2021.

Metro’s consideration of the proposed Project did not occur solely behind closed doors.

Comment GO8-17 CEQA Guidelines section 15051 subdivision (d) is also inapplicable. It applies “[w]here the provisions of subdivisions (a), (b), and (c) leave two or more public agencies with a substantial claim to be the lead agency.” As discussed, here Metro does not have a substantial claim to be the lead agency because it cannot be seen as “the public agency with the greatest responsibility for supervising or approving the project as a whole,” and CEQA strongly prefers the lead agency to have “general governmental powers, such as a city or county, rather than an agency with a single or limited purpose.” (CEQA Guidelines, § 15051(b).) Metro has taken on the role by private agreement with the Project proponent and with the apparent acquiescence of the City, whose former Mayor championed the Project in his role as chair of

⁵ Los Angeles County Metropolitan Transportation Authority (LA Metro). Unsolicited Proposal Policy FAQs. Available at: https://uc17dec76f6ff009d08b76dae4be.dl.dropboxusercontent.com/cd/0/inline2/CFZWXUnLWHIFfjN-qROvNU3jzqvBjzXBeXioSlapFscbSh4sS3yTE5K6B9cI9QsU4_mfjyNaIHgc7tJB0s7hCgzFWOJ6JsyvUFisc7wh3qo90zontBx4OUGFSW-i7itNfjciBwWtZWBezBb2MQ38T5vW4-ikfEjIhHekMHqQEOfCstVFGlcwIQ45pmHwydyFy5_m03V43XzyTyDFfCltqB-c_-XJyccuYmLwG6Jy9xuQEn_izn8sdJlDqIbyFOwHu8usBh2MSLWfDjk679sg3tFQJhJXgTtQ2bYnfdGz1fYJwqXozn2gRq6_0vP7E0ZWl0SI_Syqk6vUVo88vz6AagBWicVJcbJ5ImaZuo1vWm0U6aXVAOhZJsoitE8ooY/file. Accessed September 2023.

Metro’s board of directors. Indeed, Mayor Garcetti described himself openly in a recent Metro Executive Management Committee meeting as a “pretty unabashed supporter” of the Project, which raises significant concerns over Metro’s possible precommitment to approve the Project.⁸

Footnote 8: See Joe Linton, StreetsBlogLA, Mayor Garcetti Supports Dodgers Gondola, Disses Project Skeptics Comparing Them To Mitch McConnell, Sept. 16, 2022, attached as Exhibit A, available at: <https://la.streetsblog.org/2022/09/16/mayor-garcetti-supports-dodgers-gondola-disses-project-skeptics-comparing-them-to-mitch-mcconnell/>.

Response GO8-17 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Responses GO8-5 and GO8-9 for discussion of how Metro is the appropriate lead agency for the proposed Project. Refer to Response GO8-16 for a discussion of how Metro complied with its own process before agreeing to act as lead agency for the proposed Project. As CEQA requires, Metro prepared the Draft EIR for the proposed Project in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. (See CEQA Guidelines § 15121(a).) Metro will consider whether to certify the EIR and approve the proposed Project at a public hearing in the future. Metro has not pre-committed to the proposed Project. Statements from Metro’s former Chair indicating that Metro should advance consideration of a zero-emission transit project do not amount to an action that advances the proposed Project in a manner that foreclosed alternatives or mitigation measures. Lead agencies may engage in preliminary activities designed to facilitate or otherwise encourage a project without entering into a binding commitment or approval. No such commitment has occurred.

Comment GO8-18 C. Metro’s Decision to Act as Lead Agency is Inherently Prejudicial and Taints the Environmental Review Process

Choice of lead agency is fundamentally important. “[A]lthough applicants may enter into contracts and agreements prior to the completion of the environmental review process, such contracts or agreements cannot be used to avoid the scrutiny envisioned by CEQA.” (Kings County Farm Bureau v. City of Hanford (1990) 221 Cal.App.3d 692, 737 [emphasis added].) Thus, where a local agency privately agrees with an applicant to serve as lead agency, or even where local agencies agree amongst themselves to designate one of them as lead agency, if that designation does not follow CEQA’s mandated process, it will be rejected and the environmental review document prepared by the improper lead agency discarded. (See, e.g., PCL v. DWR, 83 Cal.App.4th at 907; see also City of Sacramento v. State Water Resources Control Bd. (1992) 2 Cal.App.4th 960, 973.)

Metro (and the City of Los Angeles) should take note that CEQA forbids delegation by the properly delegated lead agency to another agency or private entity:

Neither the [California Environmental Quality Act] nor the state guidelines authorize the city council to delegate its review and consideration function to another body. Delegation is inconsistent with the purpose of the review and consideration function since it insulates the members of the council from public awareness and possible reaction to the individual members' environmental and economic values. Delegation is inconsistent with the purposes of the EIR itself."

(PCL v. DWR, 83 Cal.App.4th at 907, quoting Kleist v. City of Glendale (1976) 56 Cal. App. 3d 770, 779.) As plaintiffs successfully argued in PCL v. DWR, "appointment of the wrong lead agency taints the entire EIR process, is inherently prejudicial, and compels a fresh start with an appropriate lead agency." (Ibid.)

Metro's decision through a private agreement with ARTT LLC to take on lead agency status in the environmental review of the proposed aerial tram system is likewise prejudicial and taints the environmental review process. The only remedy is to begin anew under the direction of the properly designated lead agency, the City of Los Angeles.

Response GO8-18 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Response GO8-5 for a discussion of how Metro is the appropriate lead agency for the proposed Project, and to Response GO8-7, for a discussion of how Metro is the appropriate lead agency, including under the principles outlined in *Planning and Conservation League v. Department of Water Resources* (2000) 83 Cal.App.4th 892. Metro's receipt of funding to reimburse Metro for its efforts related to the Project from the Project Sponsor for the proposed Project does not negate Metro's authority as lead agency; it is commonplace for a project sponsor to reimburse a lead agency's efforts related to a project. Furthermore, the MOA provides that it does not constitute or evidence an approval by Metro of, or commitment of Metro to, any action for which prior environmental review is required under CEQA. This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 [Jan. 9, 2023, Order Denying Petition for Writ of Mandate]. There, the Los Angeles Superior Court upheld Metro's process and sole source determination for the proposed Project. The appeal in this lawsuit was abandoned on May 26, 2023, and accordingly the Los Angeles Superior Court's decision is final. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5.

Comment GO8-19 D. Public Utilities Code Section 130252 Does Not Change the CEQA Analysis and Neither Requires Nor Authorizes Metro to Serve as Lead Agency

The Draft EIR suggests that Public Utilities Code ("PUC") section 130252 requires the submittal, review, and approval of proposed plans to Metro for design, construction, and implementation of the Project. (DEIR, p. 2-61.) As discussed above, ARTT LLC explained to Metro that "aerial gondolas and tramways are regulated by the

California Labor Code, Sections 7340-7357, and the detailed implementation of design, plans, and specifications falls under the jurisdiction of the Department of Industrial Relations, Division of Occupational Safety and Health (“Cal/OSHA”).” (Response to Metro, p. 16.)

PUC section 130252 applies only to “public mass transit systems or projects, including exclusive public mass transit guideway systems or projects, and federal-aid and state highway projects.” (PUC § 130252(a) (emphasis added).) This project is not a public mass transit project or a mass transit guideway system.⁹ The Project is privately owned and operated and intended primarily to provide service to and from Dodger Stadium, a private sports and event venue. The DEIR admits as much: “The overall purpose of the proposed Project is to provide a direct transit connection between LAUS and the Dodger Stadium property...” (DEIR, p. 2-12.)

Footnote 9: ARTT LLC explained, and LA Parks Alliance agrees, that the gondola Project is “not a ‘transit guideway system’” and thus is not subject to PUC section 130252(a) for that reason. (Response to Metro, pp. 16-17.)

Response GO8-19 The cited document predates the initiation of environmental review for the proposed Project and accordingly does not have any bearing on the sufficiency of the Draft EIR. This comment also mischaracterizes the cited document, which requested that the Project Sponsor list potentially applicable statutes and regulations. Refer to Response GO8-16 for a discussion of how Metro complied with its own process before agreeing to act as lead agency for the proposed Project. Refer to Response GO8-2 for discussion of Metro’s statutory authority under Public Resources Code section 130252. As discussed in Topical Response A, SB 44, the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Thus, Metro is legally authorized under state law to approve the proposed Project. For the proposed Project, Metro is tasked with considering approval of all plans for design, construction, and implementation under Public Utilities Code section 130252, as well as with consideration of the written approvals to operate the proposed Project, pursuant to its authority under Public Utilities Code section 130252. Thus, Metro has primary responsibility for implementing the proposed Project and integrating it into the regional transportation system, consistent with Metro’s statutory purpose. Metro is the appropriate lead agency for the proposed Project.

Comment GO8-20 The DEIR’s repeated assertions that Project purposes include providing access to neighborhoods near Dodger Stadium and to LA State Historic Park and its surrounding neighborhoods (see, e.g., DEIR, p. ES-1) are also belied by the DEIR’s gross speculation surrounding these alleged purposes. For example, the alleged access and mobility hub at Dodger Stadium is identified only as a “potential” project component and would be subject to approval by the Dodgers. (DEIR, pp. ES-1.) “The Project Sponsor will request consideration by the Los Angeles Dodgers of the potential for the Dodger

Stadium Station to include a mobility hub where outside of game day periods, passengers would be able to access a suite of first and last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon.” (DEIR, p. ES-10 [emphasis added].)

Response GO8-20 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project’s system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. As discussed in Section 5.0, Corrections and Additions, of the Final EIR, access to Elysian Park, the City’s second largest park, comprising 575 acres, would be provided through a mobility hub at Dodger Stadium Station where passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program to access Elysian Park and other nearby neighborhoods, including Solano Canyon.

Comment GO8-21 The DEIR asserts that the “Chinatown/State Park Station location avoids adjacent private properties while maintaining transit access to surrounding communities within a half mile walkshed to transit, including the Park, Chinatown, Mission Junction including William Mead Homes, Los Angeles River, and North Broadway.” (DEIR, p. 222.) First, access from Union Station to these neighborhoods are already provided by Metro’s Gold Line Chinatown Station, which is located approximately 100 yards from the Project’s proposed Chinatown/State Park Station. Second, and perhaps more important, the use of the Project to duplicate this access via the proposed gondola outside of Dodger games and events is entirely speculative, and is based entirely on demand. “It is anticipated that the proposed Project operations would vary the number of cabins in service and speed throughout the day, based on demand.” (DEIR, p. 2-42.) Nothing in the DEIR suggests the gondola will operate on a

minimum schedule, as Metro’s Gold Line does.¹⁰ ARTT LLC or another operator could choose not to run the gondola at all if demand is insufficient.

Footnote 10: Metro’s Gold Line schedule provides weekday service on its Northbound segment from Union Station to Citrus College every 12 minutes or less for most of the day between 4am and 12:50am. The weekend schedule is the same hours, with only slightly less frequent service. See <https://www.metro.net/riding/schedules/?line=804>.

Response GO8-21 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would enhance public transit options for the park by providing passenger access to Chinatown, LASHP, and to nearby neighborhoods and land uses, including the Mission Junction neighborhood, which includes the William Mead Homes public housing complex, pedestrian access enhancements which could include pedestrian improvements between Metro’s L Line (Gold) Station and the Chinatown/State Park Station consistent with the Connect US Action Plan, including hardscape and landscape improvements, shade structures, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge. Accordingly, and as discussed in Section 3.11, Land Use and Planning, the proposed Project would provide an additional transit option that links to the existing LAUS, helping to build the resilience of the regional transportation system and increasing connectivity of people to the region’s public transportation hub at LAUS and the Dodger Stadium property. Implementation of the proposed Project would create new and improve existing transit connections not only to communities along the proposed Project alignment, but to other transit lines and stations, including the regional transit lines served by LAUS, the Chinatown Metro L Line (Gold) station, and several regional and local bus lines serving the Project Study Area. Further, compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project’s Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Comment GO8-22 Even if these currently speculative components were certain to become part of the Project, they would not magically transform it into a public mass transit system. A project owned and operated by a private person or entity for the primary purpose of providing transportation to an entirely private destination is not a public mass transit

system. As a private transportation project, and as ARTT LLC admitted in its responses to Metro, the Project is not within the scope of PUC section 130252. And even if PUC section 130252 did apply, it has very limited scope.

PUC section 130252 subdivision (a) provides that:

All plans proposed for the design, construction, and implementation of public mass transit systems or projects, including exclusive public mass transit guideway systems or projects, and federal-aid and state highway projects, shall be submitted to the commission [i.e., Metro] for approval.

But PUC section 130252 subdivision (c) substantially limits the meaning of subdivision (a): “As used in this section, “plan” means a project description and not the detailed project plans, specifications, and estimates.” (Emphasis added.) The Project applicant has privately agreed with Metro that it may also review and approve Project plans for design, construction, and implementation. (See Response to Metro, p. 16.) As already discussed, however, the primary oversight authority for detailed review of plans for design, construction, and implementation of an aerial tramway project is held by Cal/OSHA, not Metro. Moreover, the DEIR does not cite to any authority authorizing or permitting Metro to supervise the Project.

Metro’s and the DEIR’s citation of PUC section 130252 does not change the mandated CEQA process to determine the appropriate lead agency for the proposed Project.

Response GO8-22 This comment provides a general recitation and characterization of statutes and regulations and a general summary of comments raised in this letter. Responses to the comments raised in this letter are provided above in Responses GO8-1 through GO8-21. In addition, the cited document predates the initiation of environmental review for the proposed Project and accordingly does not have any bearing on the sufficiency of the Draft EIR. Under CEQA, in preparing the EIR, the lead agency must assume that the proposed project would be built in order to analyze the potential environmental impacts of the project. Accordingly, the components of the proposed Project are not “speculative” for the purposes of Metro’s environmental analysis, as this comment suggests.

Comment GO8-23 CONCLUSION

As the DEIR acknowledges, “a lead agency has an obligation to balance the economic, social, technological, legal, and other benefits of a project against its significant unavoidable impacts on the environment.” (DEIR, p. 1-2.) Metro certainly has authority as a responsible agency to consider the manner the proposed Project will relate to the important public resources over which it exercises control and oversight. But Metro is not well-situated to be the lead agency charged with the duty to make these balancing considerations over the many public resources that are not within its ambit.

Metro approvals for this Project will be required to allow construction and operation of the Project within a portion of Los Angeles Union Station and within Metro’s Gold Line right-of-way. (DEIR, p. 2-61.) It is significant that the DEIR has determined no Mitigation Measures are necessary to protect these public resources. But there are numerous Mitigation Measures proposed to protect other public resources and members of the public in the City of Los Angeles. (See footnote 5, p. 6.) The City is far better situated to act as lead agency than Metro, and since it is directly political accountable to its constituents, is better positioned to balance the alleged Project benefits against its significant unavoidable environmental impacts and ensure that Mitigation Measures to protect the people and resources of Los Angeles are properly monitored and enforced.

The City of Los Angeles must serve as lead agency for the proposed Project, not Metro.

Sincerely,

John Given

Response GO8-23 This comment provides a general conclusion regarding the comments raised in this letter. Responses to all comments contained in this letter are provided above in Responses GO8-1 through GO8-22.

Comment Letter GO9 – Los Angeles Union Station Historical Society, Thomas R. Savio

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO9

Comment GO9-1 Dear Mr. Zelmer,

The Board of Directors (The Board) of Los Angeles Union Station Historical Society (LAUSHS), a non-profit, Federal Railroad Administration Section 106 historic preservation consultant for Los Angeles Union Station (Union Station), a world recognized National Historic Landmark owned by Los Angeles County Metropolitan Transportation Authority (Metro), has voted to formally comment against Los Angeles Aerial Rapid Transit's (LAART) private, for-profit cable car line (aka "Frank McCourt's Gondola") and its public land and air rights development scheme that proposes to link Union Station and Metro's related "Esplanade-Forecourt" project with Dodger Stadium that The Board believes is contrary to Metro's public participation policy and an illegal (pending a Superior Court decision) "accommodation" for LAART. The Board believes that LAART's proposed futuristic/Carnaval-like Union Station Terminal on Alameda Street and Metro's supporting "Esplanade-Forecourt" project will blight the viewscape of the historic and architecturally significant west façade of Union Station, and that Union Station, its trains and patrons could be physically harmed if aircraft from the nearby Los Angeles Police Department's "Hooper Memorial Heliport" airport were to be entangled in LAART's overhead cables, gondolas and 13-story towers. Furthermore, The Board opposes Metro's planned removal of all "Disabled Parking" spaces from the "Esplanade-Forecourt" area, without public hearings and reasonable alternatives, to accommodate a new so-called "water feature" (a fogging-type water fountain) which would cool LAART patrons cued-up for their cable car rides to Dodger Stadium. Moreover, the water feature would be contrary to the state's water conservation policy. (Even if the water feature recirculates, at least 10% of its water will be lost to evaporation day after day, year after year.)

Until now, The Board has steadfastly refused to take sides in the above major, billionaire development scheme. However, in The Board's opinion, Metro and its staff have obviously taken a pro-active role supporting LAART, a potential competitor of Metro's efficient "Dodger Stadium Express" bus service, as well as planning to "gild the lily" of Union Station with its Esplanade-Forecourt Project, all "backstage," using public land, resources and airspace but without public participation as required by Metro policy and the law, before METRO agreed to be "engaged" by LAART.

Among the reasons for The Board's opposition are, but not limited to:

Response GO9-1 This comment indicating opposition to the proposed Project is noted and will be provided to the decision makers for review and consideration. This comment provides

a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO9-2 through GO9-8.

Comment GO9-2 A) Metro Board member, the former Mayor of Los Angeles Eric Garcetti, who originally introduced the motion for Metro to assist LAART without public participation and to enlist Metro staff to "carry LAART's water" as it were, did receive, according to public records, millions of dollars in both "behest payments" and political cash contributions from Billionaire real estate and LAART developer Frank McCourt and/or his family and various entities and associates, which in The Board's opinion, is an apparent conflict of interest. Consequently, Metro is being sued by the non-profit California Endowment for willfully preventing public participation in Metro's decision to partner with LAART. (Ironically, Metro is using public resources to defend itself, for not allowing public participation, before the Superior Court.)

Response GO9-2 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project's scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The public input during this period led directly to changes to the proposed Project to incorporate public feedback, including changes to the proposed Project alignment to include the intermediate Chinatown/State Park Station, redesign of the proposed Project stations and junction and additional pedestrian enhancements including hardscape and landscape improvements. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of outreach and community engagement during the Draft EIR public review period and community engagement efforts during the preparation of the Final EIR. This comment also raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project.

Comment GO9-3 B) In The Board's opinion, Metro Deputy Executive Officer Cory Zelmer and/or subordinates and consultants falsified an official environmental document--LAART's Draft Environmental Impact Report (DEIR)--by checking-off the DEIR box that states there is no airport within 2 miles [3520 yards] of LAART's proposed Union Station

Terminal, when he had been informed repeatedly to the contrary by The Board. Moreover, The Board presented proof to Zelmer and his superior, Metro CEO Stephanie Wiggins, that the Los Angeles Police Department's "Hooper Memorial Heliport" (variously described as the country's or the world's busiest airport for rotary-winged aircraft aka helicopters) is only 1/2 mile (880 yards) from LAART's proposed Union Station Terminal. Furthermore, The Board reminded Zelmer and Wiggins that according to the Los Angeles Police Department, the California Department of Transportation, the California Public Utilities Commission, the Federal Aviation Administration, and the 8th U.S. Circuit Court of Appeals, all heliports are airports officially defined as a location where any flying machine is serviced. The fact that some airports serve only rotary-winged aircraft (helicopters) while others serve fixed-wing aircraft (conventional-winged aircraft) does not change the fact that: all heliports are airports in the eyes of all governing agencies and the Federal Courts. Furthermore, the argument presented by Metro that Hooper Memorial is a police facility, not a civilian facility, and therefore not subject to the LAART DEIR, is illogical and fallacious. A helicopter that becomes entangled in LAART's cables, gondolas and 13-story towers and consequently crashes into Union Station, and/or its trains and patrons, could cause catastrophic harm regardless had that aircraft launched from a police facility or a public facility. Simply put, LAART's proposed location is not safe for the Union Station community and helicopters from Hooper Memorial Heliport airport. Please note, the Rules and Regulations of Los Angeles Union Passenger Terminal (Union Station's original name) has for decades declared: "General Notice A. Safety is of the first importance in the discharge of duty." Or did Metro abolish this paramount railroad safety rule when it bought Union Station?

Response GO9-3 The Draft EIR addresses potential airport hazards in Section 3.09, Hazards and Hazardous Materials, Section 5.5.5, Heliports, in Section 5.0, Other CEQA Considerations, and in Appendix O, Airspace Analysis Technical Memo. The determination on page 3.9-30 of the Draft EIR – that the proposed Project alignment is not in an area covered by an airport land use plan nor located within two miles of a "public airport" – is based on facts and the specific language of CEQA's thresholds of significance for this issue. This threshold is stated in the Draft EIR under Impact HAZ-5, which asks the question: "For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public use airport, would the project result in a safety hazard...?" The Draft EIR concludes that the proposed Project alignment is not within two miles of a "public use airport" as that term is defined under CEQA. Regardless of any distinction between heliports and airports, the Draft EIR immediately follows this conclusion with a clear disclosure that the city-owned Jay Stephen Hooper Heliport is within 0.38 miles of the proposed Project. According to the LAPD and AirNav.com¹, the Hooper Heliport is a city-owned, private use facility. As a private use facility, it does not meet the "public use airport" description in the CEQA threshold. Note that the determination is based on the distinction between public and private facilities, not the definition of "airport." Thus,

comparison to federal or state case law or regulations relying on a different definition of “airport” is irrelevant to the analysis required by CEQA. The analysis in Appendix O, Airspace Analysis Technical Memo, of the Draft EIR, is based on FAA analysis standards, and concludes with substantial evidence that construction and operation of the proposed Project is clear of the airspace associated with the existing heliports, including the Hooper Heliport, in the proposed Project's vicinity. As such, no adverse effects related to aeronautical hazards are predicted based on these findings, and no notification is required for the proposed Project construction unless the FAA makes a specific request to the Project Sponsor. In addition, refer to Appendix I, Firefighting Helicopter Response Memo, of this Final EIR, for discussion of how helicopter flight paths would not be impeded as a result of the proposed Project.

Comment GO9-4 C) Contrary to the promises made to The Board by Stephanie Wiggins, Cory Zelmer and LAART, no meeting has ever been organized between them and The Board to discuss the difference of opinions concerning the nature of LAPD's Hooper Memorial Heliport airport and the proposed location for LAART's Union Station Terminal. In fact Metro forbade The Board's examination of the only known 3-D scale model of Union Station's location because, in The Board's opinion, of a deliberate subterfuge that the model dating from former Union Station owner--the Santa Fe Railway--was too old to be accurate today, and furthermore the sharing of the model with The Board would somehow be a "conflict of interest"(?) even though The Board previously had access to the model. However, The Board's use of the model did not depend on the model's age, but only the juxtaposition of Union Station with Alameda Street which has not changed appreciably since the station was opened in 1939. Consequently, at a loss for options, The Board asked LAART to produce a 3-D scale model given its apparent resources, but LAART never responded. This "shadow play," in The Board's opinion, was being performed by LA Metro and LAART to obfuscate the issues and delay public criticism of LAART contrary to the public weal which Metro is obliged to serve. Furthermore, since the model is public property, The Board's use should have been permitted so it could be compared to LAART's distorted artist's rendering of its Futuristic/Carnaval style Alameda Street Terminal with Union Station's Hispanic-Cathedral style. Finally, after wasting The Board's time and resources for over a year, in December 2022 Metro provided to the public an aerial diagram of LAART's Alameda Terminal that is in the worst possible viewscape location--directly in front of Union Station! Cable car rides have their place but not in front of Los Angeles' world famous "Cathedral of Transportation."

Response GO9-4 Refer to Response GO9-3 for a detailed discussion of Hooper Heliport. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which

would be less than significant. Refer to Appendix H.1, Memo Regarding Preparation of KOPs, of the Final EIR, for discussion of the methodology used to prepare the visual simulations included in Appendix C, Visual Impact Assessment, of the Draft EIR. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area. As discussed in Section 3.01, Aesthetics, of the Draft EIR, the Alameda Station's platform and canopy would include a light color scheme and warm tones, which has been designed to complement and reflect the materiality of the existing mix of adobe buildings, large Victorian commercial blocks, and Spanish Revival style buildings within the El Pueblo and Olvera Street area. In addition, the "shell" roof design provides a visual lightness with an integrated perforation pattern motif based upon the arched forms that mark openings and entries to Union Station, Pico House, and other historic buildings within El Pueblo. The proposed Project would also integrate physical and visual connections between the proposed Alameda Station and existing adjacent development, such as the new pedestrian plaza at El Pueblo. The new pedestrian plaza at El Pueblo would be open to the public and would extend view corridors between the proposed Alameda Station and existing development in a way that creates an observed visual unity.

Comment GO9-5 D) In The Board's opinion, LAART is designed to compete with Metro's "Dodger Stadium Express," a highly efficient road service that could be further improved if Metro switched to modern, environmentally friendly motor coaches that might funded by the savings from not building its Esplanade-Forecourt project.

Response GO9-5 Refer to Topical Response O, Response to the UCLA Mobility Lab Study, for a discussion of how the Dodger Stadium Express would not be precluded from operating by the proposed Project. While existing riders of the Dodger Stadium Express may choose to switch to the proposed Project to take advantage of its substantial travel time savings, some riders may prefer to ride the Union Station Dodger Stadium Express for other reasons. The opportunities for more mobility choices through improved connections to additional public transit options created by the proposed Project are projected to increase the number of attendees of games or events at Dodger Stadium to ride public transportation. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives pursuant to CEQA. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction,

Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. While some riders of the Dodger Stadium Express are likely motivated by traveling in more sustainable ways than driving, the Dodger Stadium Express already uses clean natural gas (CNG) buses, which are more environmentally friendly than driving. Switching from CNG to a Zero Emissions Bus (ZEB) would have no bearing on the travel time or capacity limitations of the Dodger Stadium Express, so is not expected to materially increase the ridership of the service, and therefore would reduce fewer vehicle miles traveled (VMT) to Dodger Stadium than the proposed Project, which would operate at zero emissions, with the electrical power for the proposed Project supplied by the City of Los Angeles Department of Water and Power (LADWP) through the utility's Green Power Program, pursuant to GHG-PDF-A.

Comment GO9-6 E) Given the seasonal nature of baseball, it is also The Board's opinion that LAART is a "Trojan Horse" scheme to facilitate year-around, for-profit real estate development in Dodger Stadium's vicinity at the expense of public land and airspace, the viewscape of Union Station and safety.

Response GO9-6 Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Comment GO9-7 F) Metro's proposed Esplanade-Forecourt project, according to Metro employees--who wish to remain anonymous for the sake of their careers--will be funded by so-called "overlap money" that was "peeled-off" from Metro's defunct LINK-US project that itself was rejected because of The Board's and the public's opposition. Moreover, Metro has stated to The Board's Executive Director via telephone that ultimately the Esplanade-Forecourt project will come to fruition by a two-step process eliminating

all public parking including “disabled parking” from in front of Union Station without public comment or participation in violation of the Americans with Disabilities Act (ADA). (A disabled motorist has already filed a formal complaint with the ADA authorities against Metro’s Esplanade-Forecourt project.) Step one would be the “temporary” elimination of all Union Station west front parking for the construction vehicles needed to build the Esplanade-Forecourt project followed by step two—well there really isn’t a step two—when the project is completed the parking spaces would be left permanently removed. Not only will this negatively impact the “disabled Parking” but also the parking for Metro’s tenants the Homebound Restaurant and Brewery, TRAXX restaurant and the numerous social and artistic events that take place in the great “Ticketing Hall” which has fallen from use with computerized ticketing. Furthermore, according to a retired Metro staff person, the Esplanade’s so-called “water feature” (a fogging-type water fountain) will likely attract more “homeless” citizens seeking “showers” contrary to Metro’s stated policy—according to former Metro Union Station supervisor the late Ken Pratt—of not catering to the needs of the “homeless.” In The Board’s opinion, Metro’s Esplanade-Forecourt project is designed to cool future LAART and adjacent Olvera Street tourist attraction visitors as they saunter between Union Station, LAART and Olvera Street. (While Olvera Street’s right-of-way and some of its structures and art works are historic, the “Olvera Street tourist attraction” per se was invented in 1930 by a husband-and-wife real estate development team who went on to develop Los Angeles’ “New Chinatown tourist attraction.” (Ironically, Old Chinatown was demolished in a racist bid to rid Los Angeles of the Chinese who settled after building the railroad to Los Angeles, then Union Station was built on top of Old Chinatown’s rubble.)

Response GO9-7 Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of Metro’s LAUS Forecourt and Esplanade Improvements Project, which is not part of the proposed Project. The proposed Project does not include a water fountain in the planned LAUS Forecourt.

Comment GO9-8 G) Finally, building the Esplanade-Forecourt project’s water-feature in semi-desert Los Angeles has been experiencing one of its worst multi-year droughts in history flies in the face of the State of California’s policy to conserve dwindling water resources. One only needs to recall the classic Los Angeles-based movie “Chinatown” to understand what The Board believes is driving LAART and Esplanade-Forecourt schemes— the greed of land developers, the greed of Metro careerists and ultimately the greed of local politicians! Or, to paraphrase the immortal Yogi Berra: “It’s ‘Chinatown’ (the movie) all over again.”

Response GO9-8 Refer to Response GO9-7 for discussion of how the proposed Project does not include a water fountain in the planned LAUS Forecourt. As described on page 2-49 in Section 2.0, Project Description, of the Draft EIR, the proposed Project includes

several sustainability and water efficiency measures, including drought tolerant landscaping and use of reclaimed water for irrigation where available.

Comment GO9-9 For the above reasons, but not necessarily only because of them, the Board of Directors of the Los Angeles Union Station Historical Society opposes construction of LAART and the related Esplanade-Forecourt projects in the interests of honest government, Los Angeles Union Station preservation, the environment and above all safety.

Respectfully,

Thomas R. Savio
Executive Director
Los Angeles Union Station Historical Society

Cc: Stephanie Wiggins, Metro CEO

Response GO9-9 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses GO9-2 through GO9-8.

Comment Letter GO10 – California State Parks Foundation, Rachel Norton

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO10

Comment GO10-1 Dear Mr. Zelmer:

Thank you for allowing the opportunity to comment on the draft Environmental Impact Report for the Los Angeles Aerial Rapid Transit (LAART) project, released in October.

California State Parks Foundation is an independent, member-supported nonprofit dedicated to protecting and preserving the California state park system, for the benefit of all. Since our founding in 1969, we have endeavored to ensure that every unit of the California state park system is open, welcoming and provides a high-quality recreational experience for the public; and that the irreplaceable natural and cultural wonders of the system are stewarded for future generations to enjoy.

We have taken an interest in the LAART project because of its impact on Los Angeles State Historic Park. The proposed project would cross over the western edge of the park and include a new station adjacent to the current Chinatown station on the Metro Gold Line, as well as a junction just to the northwest on Broadway.

Response GO10-1 This comment provides a general introduction to the comments raised in the letter. Responses to the comments contained in this letter are provided below in Responses GO10-2 through GO10-6. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project's Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Comment GO10-2 Los Angeles State Historic Park formally opened in 2017 after decades of advocacy by the surrounding community – neighbors in Chinatown wanted a park and they did not rest until this green oasis was created. Today when you visit Los Angeles State Historic Park, you see people exercising and walking their dogs, relaxing on the grass, taking in the stunning view of the downtown skyline, and participating in community activities like exercise classes or arts and crafts. It is a peaceful gathering spot that provides desirable amenities to its low-income neighbors, and one that represents a true respite from its urban surroundings.

Response GO10-2 Metro and the Project Sponsor acknowledge the more than 20 years of effort the community undertook to convert the closed rail yard at River Station to what is now

the Los Angeles State Historic Park. The planning, developing, and efforts made by State Parks and its partners resulted in a park that provides the “a place to learn and to celebrate the ethnically diverse history and cultural heritage of Los Angeles” for the surrounding community, greater Los Angeles, and visitors from around the world, one that the proposed Project is designed to honor and expand upon. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project’s required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. Further, through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. Refer to Response GO10-5 for discussion of the aesthetic impacts of the proposed Project, which would be less than significant.

Comment GO10-3 We are concerned that the construction and operation impacts of the project may permanently alter the peaceful experience of the park. First, the project would require amending the General Plan for the park to include transportation as an acceptable use – a worrisome precedent for other parks in the system. Too often, parks are seen as empty spaces that can be used for infrastructure like roads and power lines. We remain absolutely committed to pushing back against that thinking whenever and wherever it occurs, because parks are already essential infrastructure for health, wealth, and quality of life.

Response GO10-3 As discussed on page ES-17 of the Executive Summary of the Draft EIR, based on the analysis contained in Section 3.0, Environmental Setting, Impacts, and Mitigation, construction of the proposed Project would result in significant and unavoidable impacts with regard to Noise and Vibration (human annoyance). As demonstrated in the Executive Summary to the Draft EIR, the proposed Project would not result in any

other significant and unavoidable construction impacts. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park.

Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project's Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less-than-significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment. Refer to Response GO10-2 for discussion of with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park would not be affected by the proposed Project.

Comment GO10-4 Noise is another concern – impacts will be unavoidable and significant during construction, which is bad enough. The draft EIR also finds that the system will generate between 61 and 64 decibels of additional noise during regular operation. This is just below levels that can affect health in the form of noise pollution, so it's another issue we'll be watching closely.

Response GO10-4 Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction noise impacts from the proposed Project. As discussed in Response GO10-3, construction of the proposed Project would result in significant and unavoidable impacts with regard to noise. Mitigation Measure NOI-A would be implemented during construction of the proposed Project, requiring a Construction Noise Management Plan to minimize construction-related

noise impacts to off-site noise-sensitive receptors, which would include the construction noise barriers. Refer to Section 2.8, Construction, and Appendix B, Construction Assumptions, of the Draft EIR, for discussion of the duration of construction for each component of the proposed Project.

This comment mischaracterizes the analysis of operational noise impacts in Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, which does not find that the proposed Project operations would generate between 61 and 64 decibels of additional noise compared to existing ambient noise levels. As demonstrated on Table 3.13-10, in Section 3.13, existing ambient noise levels in the vicinity of the proposed Project were measured based on L_{day} , L_{night} , L_{dn} , and CNEL. Existing L_{day} ambient noise levels in the Project area range from 53.6 to 69.8 dBA and existing L_{night} ambient noise levels in the Project area range from 48.7 to 65.5 dBA. As demonstrated on Tables 3.13-22, 3.13-23, 3.13-24, and 3.13-25 on pages 3.13-53 to 3.13-58 of Section 3.13, the operational noise impacts would be less than significant at all receptor locations based on the L.A. CEQA Thresholds Guide, Federal Transit Administration (FTA) guidelines, and Los Angeles Municipal Code (LAMC). Specifically, as demonstrated on Table 3.13-23 based on the LAMC analysis the proposed Project would result in an increase in ambient noise levels ranging from 0.0 to 4.1 dBA (including both $L_{eq(day)}$ and $L_{eq(night)}$). The increases are all below the 5 dBA L_{eq} LAMC threshold and no operational impact would occur under the worst-case scenario that assumed the highest line speed, cabins per hour, and queueing numbers, and nighttime operations.

In addition, refer to Responses GO17-129 and GO17-130 for discussion of the proposed Project's less than significant impact on human health associated with hearing loss, hearing damage, and sleep disturbance.

Comment GO10-5 Finally, it is very difficult to tell from the materials that have been released thus far what the impact of the proposed project will have on the park's views and vistas. While we understand that some of these concerns are beyond the scope of what is required in an Environmental Impact Report, park vistas are an important part of the experience at Los Angeles State Historic Park. We request that California State Parks and Los Angeles Metro prepare a set of visuals that show what park visitors in the southwestern third of the park would see and experience at ground level after the proposed project is constructed.

Response GO10-5 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San

Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant.. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including additional visual simulations of the Park to further analyze viewshed impacts to the Park, in response to comments received on the Draft EIR. As demonstrated by these supplemental KOPs, views from the Los Angeles State Historic Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Refer to Response S2-5. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for an evaluation of the updated and additional KOPs for the proposed Project which would not result in significant impacts, and the aesthetic impacts of the proposed Project would remain less than significant.

Comment GO10-6 Proponents of the project seem to believe that the potential of taking cars off the road is worth any potentially serious impacts to the park’s visitor experience. To us, this is a false choice – in Los Angeles, as in most urban areas in California, it is increasingly expensive to carve out additional green open spaces, even though we know that these spaces are vital to the quality of life and health of the surrounding community. We ask that you commit to additional efforts to study and fully understand the proposed project’s impact on the park’s General Plan, ambient noise and views prior to any action to approve and implement this project.

Thank you for the opportunity to offer these thoughts and concerns. I would be happy to discuss them further should you have questions.

Sincerely,

Rachel Norton
Executive Director
California State Parks Foundation

Response GO10-6 Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project’s Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed

Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. Refer to Response GO10-3 for discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan and the Los Angeles State Historic Park General Plan Amendment. Refer to Response GO10-4 for discussion of the construction and operational noise impacts from the proposed Project, which would be less than significant. Refer to Response GO10-5 for a discussion of the aesthetic impacts of the proposed Project, including to views from the Los Angeles State Historic Park, which would be less than significant.

Comment Letter GO11 – Los Angeles Union Station Historical Society, Thomas R. Savio

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO11

Comment GO11-1 Dear Mr. Zelmer,

I was present at the meeting hosted by you, and/or LA Metro, Frank McCourt, Los Angeles Aerial Rapid Transit, ClimateResolve, Cathedral High School and Does 1 to 10. I attended as the representative of the Los Angeles Union Station Historical Society (LAUSHS). Here are my recollections that in my opinion bring into question the legitimacy of the meeting:

Response GO11-1 This comment provides a general introduction to the comments raised in the letter. Responses to the comments contained in this letter are provided below in Responses GO11-2 through GO11-4.

Comment GO11-2 A) Although I arrived at Cathedral High School meeting venue at the beginning of the meeting, I was delayed by thirty minutes getting to the venue because there was no Disabled Parking in or around Cathedral High School. (This has since been confirmed by Cathedral High School staff.) Consequently, I was late because I am a Disabled Person, and since all normal street parking was occupied by residents and/or meeting participants, I was obliged to park on the sidewalk after driving about for nearly 30 minutes, in fear of not representing the views of the LAUSHS. Consequently, I waddled with cane in hand to the distance to the meeting. This, in our opinion, a reasonable person would conclude that Mr. Zelmer and/or other “hosts” do not care about providing reasonable accommodations for Disabled Persons and myself. Furthermore, it indicates to us Mr. Zelmer’s indifference to the Disabled and/or his incompetence in hosting same at the public meeting.

Response GO11-2 Refer to Topical Response N, Environmental Justice, for discussion of how public outreach for the proposed Project was designed with environmental justice principles in mind and provided opportunities for in-person and virtual meetings with toll-free dial in options and ADA accessibility features. Cathedral High School has at least five accessible parking spaces within the school campus, including within on campus parking lots accessible from Bishops Road, North Broadway and Cottage Home Road. The lots that these spaces are in were available to attendees during the January 12, 2023, public hearing. Refer to Response GO11-3 for discussion of the January 12, 2023, public hearing.

Comment GO11-3 B) When I finally entered the meeting, it had the appearance and sound of a near riot. I was told by bystanders that the spontaneous demonstration was because Mr. Zelmer and other hosts refused to take any questions of the 70 to 100 members of the local community in attendance. It is our opinion that a reasonable person might

conclude that Mr. Zelmer is incompetent in representing Metro, and LAART in a public forum.

Response GO11-3 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s opportunities for public testimony during the Draft EIR public review period. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and during the four public hearings. Comments on the Draft EIR could be submitted by email to LAART@metro.net, by mail to One Gateway Plaza, Mail Stop 99-22-6, Los Angeles, CA 90012, or over the phone by calling (213) 922-6913. Comments could also be submitted at each public hearing. At virtual public hearings, comments could be given verbally. At the two public hearings held in person, comments could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a “comment station” in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during all four public hearings, with interpretation provided in Taishanese during the final two public hearings.

During the January 12, 2023, public hearing at Cathedral High School attendees were provided with the opportunity to submit public comments either in writing on forms provided by Metro, or verbally to the court reporters at a comment station in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Shortly after the public hearing started, a group of approximately 40 protesters with “Stop the Gondola” signs entered the meeting and began speaking with amplified bullhorns, using profanity. Due to this group’s loud, prolonged protests, the court reporters and interpreters could not take verbal public comment. Metro requested that the protestors turn off their amplifier to enable the agency to continue to take verbal public comment. The protestors then began marching around the room, chanting and continuing to speak into the amplified bullhorns. Approximately 6 to 10 protestors then started to tear down poster boards, knock over easels and tables and throw materials. Metro and AECOM staff, subject matter experts, and the Project team expressed that they were physically intimidated and frightened by the damage done by the protestors, as discussed in greater detail in the February 10, 2023, memo submitted by the Project Sponsor and included as Attachment D to Appendix A, Public Outreach Report, of the Final EIR.⁶ After the protestors left, Metro staff concluded the meeting by talking to several remaining attendees. An estimated 143 attendees participated in the January 12, 2023, public hearing, and Metro received 31 verbal comments and 95 written comments on the Draft EIR. In light of the disruptions at the January 12, 2023, public hearing, Metro provided a fourth public hearing by way of a virtual public hearing held on February 8, 2023. Verbal comments made at the virtual

⁶ LA Aerial Rapid Transit Technologies LLC. 2023. Memorandum Regarding LA ART Draft EIR Public Hearing No. 3 – Consultant Experiences During Protest.

February 8, 2023 public hearing were deemed timely submitted for the purposes of the Draft EIR public review period.

Comment GO11-4 C) Furthermore, the working press and Community representatives said that they were told to ask Brother John Montgomery, Principal of Cathedral High School for answers to their questions on LAART. Brother John is not to our knowledge a credentialed transit or environmental expert. (All known nonaligned experts and the Sierra Club are against the Gondola.) Brother John then extolled to them via nationwide TV, the reasons he saw for building the Gondola, without mentioning the pertinent fact that his employer, Cathedral High School, gets significant funds from Frank McCourt, an apparent conflict of interest in our opinion.

Response GO11-4 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's Draft EIR public review period, including the January 12, 2023, public hearing held along the proposed Project alignment at Cathedral High School. The format of the January 12, 2023, public hearing was an Open House, consistent with standard Metro practice, where attendees could learn more about the proposed Project and the key analyses and conclusions of the Draft EIR, and also a public comment opportunity. Twelve stations were set up throughout the Cathedral High School Gymnasium, with ten stations focused on specific subject matter areas of the Draft EIR. Attendees could walk around to each station and ask questions to subject-matter experts about the proposed Project. Each station had large, printed boards summarizing the subject matter of that station, including: the Project Description, Aesthetics, Air Quality, GHG, and Energy, Cultural (Archaeology and Historical Resources), Parks and Recreation, Noise, Transportation, and Parking. Each station also included printed materials that attendees could review and/or take with them, including fact sheets in English, Spanish, and Chinese (Simplified) and printed copies of the presentation from the virtual public hearing in English, Spanish, Chinese (Simplified) and Chinese (Traditional). A hard copy of the Draft EIR was also available at the Summary of Impacts station for attendees to review. The meeting was staffed by Metro and AECOM staff, experts on subject matter areas including Transportation and Parking; Archaeology; Historical Resources; Air Quality, Greenhouse Gas, and Energy; Ropeway Engineering; Noise; and Aesthetics, and the Project team, who answered questions from attendees on the Draft EIR key analyses and conclusion. Neither Metro nor the Project Sponsor directed attendees to direct questions about the proposed Project to Cathedral High School staff, and meeting staff at the Welcome Table provided attendees with roadmaps for the stations around the gymnasium. Refer to Response GO11-3 for discussion of the public comment opportunity at the January 12, 2023, public hearing. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO11-5 D) Therefore, the Los Angeles Union Station Historical Society has concluded that given all the above, the legal validity of the meeting was compromised and that a new meeting should be rescheduled with a live democratic give-and-take on the issues, better crowd control and hosted by an uncompromised Metro meeting expert, not Mr. Zelmer who a reasonable person might conclude is compromised by an apparent conflict of interest in that he is a Metro employee in charge of investigating the Gondola project for the public weal whilst his salary is gifted to Metro by the Gondola’s chief antagonist Frank McCourt.

Respectfully,

/s/

Thomas R. Savio

Executive Director,

Los Angeles Union Station Historical Society

Cc. Stephanie Wiggins, Metro CEO

Response GO11-5 Refer to Responses GO11-2 through GO11-4 for discussion of the January 12, 2023, public hearing for the proposed Project’s Draft EIR. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of how, in light of the disruptions at the January 12, 2023, public hearing, Metro provided a fourth public hearing by way of a virtual public hearing held on February 8, 2023. Verbal comments made at the virtual February 8, 2023 public hearing were deemed timely submitted for the purposes of the Draft EIR public review period. Certain attendees who expressed concerns about the proposed Project nonetheless shared positive feedback with Metro for the facilitation of this public hearing, including thanking Metro for the “calm, collected, and objective facilitation of this hearing this evening,” “inviting a Toisan interpreter and obliging access needs in the meeting,” and “continuing this meeting past the time . . . to hear so many of my neighbors views.” An estimated 168 attendees participated in the February 8, 2023, continued public hearing, and Metro received 82 verbal comments on the Draft EIR. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. As is customary, the Project Sponsor is reimbursing Metro for its time on the proposed Project as the Lead Agency under CEQA.

Comment Letter GO12 – Sierra Club

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO12**Comment GO12-1** Dear Mr Zelmer:

The Sierra Club submits this letter to set forth its comments and concerns regarding the LA ART Draft EIR.

Executive Summary (“ES”) 1 Introduction: At the outset, LA Aerial Rapid Transit Technologies LLC is identified as the Project Sponsor. While neither the ownership or management of this LLC is specified in the Draft EIR, we understand from news reports¹ and multiple other sources that the project is promoted by Frank McCourt, who in turn is a 50 percent owner of the Dodger Stadium Parking Lot.

Footnote 1: Challenges Loom for gondola to Dodger Stadium planned for 2028 Olympics, LA Times 1/9/23; LA’s Transit Infrastructure Can Always Get Dumber: Meet the Gondola (<https://knock-la.com/las-dumb-gondola/>)

Response GO12-1 This comment provides a general introduction to the comments raised in the letter. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO12-2 The Introduction sets forth the conclusion that Metro is the “lead agency” and as such has the authority to approve the project and implement mitigation measures. However, significant concerns have been raised by The California Endowment and the LA Parks Alliance that Metro is not in fact the appropriate “lead agency” for the LA ART, particularly as the proposed project for the stadium parking lot is private in nature. Rather, the City of Los Angeles is the appropriate lead agency on the basis of its general governmental powers and its direct accountability to its constituents. We concur with these concerns and particularly express concerns with the dedication of Metro’s employees and significant resources to this private project.

Response GO12-2 Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority. Under CEQA, a lead agency is the public agency with the greatest responsibility for supervising or approving the project as a whole.” (CEQA Guidelines, §15051(b).) Under state law, Metro has broad authority over public transportation planning and coordination for the Los Angeles region’s transportation system and is authorized to

do “any and all things” to carry out these purposes. (Public Utilities Code, § 130105(f).) For the proposed Project, Metro is tasked with considering approval of all plans for design, construction, and implementation under Public Utilities Code section 130252, as well as with consideration of the written approvals to operate the proposed Project, pursuant to its authority under Public Utilities Code section 130252. Thus, Metro has primary responsibility for implementing the proposed Project and integrating it into the regional transportation system, consistent with Metro’s statutory purpose. The City participated in the environmental review process as a CEQA responsible agency and has cooperated in that process, including consultation in preparation of the Draft EIR. Contrary to this commenter’s assertion, CEQA does not require a lead agency to be an elected decision-making body. (See generally Pub. Resources Code, § 21067; CEQA Guidelines, § 15367.) Further, CEQA’s various requirements for consultation with agencies and for public review and comment ensures the full transparency and accountability of the lead agency. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment GO12-3 ES 2 Project Purpose/ES 5 Project Overview: There is significant doubt as to whether the LA ART would alleviate congestion and air pollution, which in turn is a fundamental premise of the Draft EIR. The UCLA Mobility Lab Study dated October 24, 2022, concludes the gondola will do little to reduce traffic and greenhouse gas emissions. We concur with the concerns raised by the study. The study also casts significant doubt on the Draft EIR Section 1.0 conclusion that LA ART is an “environmental leadership transit project” that is in turn entitled to streamlined judicial review.

Response GO12-3 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project’s Draft EIR and does not appear to have been prepared for that purpose. On

January 13, 2023, the Mobility Lab issued the following statement regarding the Mobility Lab Study:

Statement from the UCLA Mobility Lab Regarding LA Gondola Ridership Projection

The UCLA Mobility Lab is an engineering and technology lab dedicated to scientific research and innovation around mobility technologies. The lab's data on projected transit ridership of a proposed Dodger Stadium gondola is preliminary in nature. More research would be necessary to draw conclusions about potential use of the gondola. The lab takes no view on whether the project should be built.

Jiaqi Ma

Director, UCLA Mobility Lab

Faculty Associate Director, UCLA Institute of Transportation Studies

Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data. Further, Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and Appendix N, Transportation Appendices of the Draft EIR.⁷ Stantec is an internationally-respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR. Any differences between the findings in the Mobility Lab Study and the Draft EIR are therefore to be expected and are explainable. Nothing in the review of the preliminary Mobility Lab Study suggests that the ridership modeling and results in the Draft EIR are unreasonable or inappropriate for use. Refer to Topical Response A, SB 44, for discussion of the proposed Project's consistency with the requirements of Senate Bill (SB) 44. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime emissions of the proposed Project over the useful life of the Project would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the Project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles traveled. The proposed Project would result in a net reduction in criteria pollutant emissions by reducing vehicle miles traveled.

Comment GO12-4 In particular, the multiple Draft EIR references to the "5,000 people per hour" gondola capacity are refuted by the UCLA Mobility Lab Study. The Draft EIR further assumes patrons would use the gondola both before and after events.² However, the study

⁷ Stantec. 2023. Memo to Holly Rockwell Regarding Los Angeles Aerial Rapid Transit (LA ART) Project Transportation Analysis Peer Review.

(and common sense) indicate that many stadium attendees are not likely to wait for the gondola following games and concerts and will instead use the express bus or ride share services back to LAUS or to other destinations. Moreover, the “5,000 people per hour figure” gondola capacity figure does not reflect non-event day or off-season usage. The UCLA Mobility Lab Study concludes very few people would use the gondola as a form of transportation outside of travel to/from games.³ Any discussion in the Draft EIR relating to gondola ridership and the estimated reduction in vehicle miles travelled must take these two factors into account.

Footnote 2: This flawed assumption is carried through in the report’s 2026 projection of 6,000 riders and 12,000 round trips and the 2042 projection of 10,000 riders and 20,000 round trips.

Footnote 3: Excepting employees, Dodger Stadium is nearly empty on days when there is no game or concert. Park goers have found their way to Elysian Park for decades without a gondola.

Response GO12-4 Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphpd). Refer to Response GO12-3 and Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study. Specifically, refer to Response ML-5 in Topical Response O, Response to UCLA Mobility Lab Study. Within two hours prior to the start of a game or event at Dodger Stadium, more than 10,000 people could be transported to the Stadium via the proposed Project. Given the capacity of this system, approximately 20 percent of the fans could take the proposed Project. As discussed in Section 3.17, Transportation, of the Draft EIR, the ridership model estimated that 6,000 passengers would ride the proposed Project in 2026 and 10,000 passengers would ride the proposed Project in 2042. Refer to Response ML-5 in Topical Response O, Response to UCLA Mobility Lab Study and Topical Response B, Ridership Model; Pre-game and Post-game Transportation, for further discussion of post-game ridership. Post-game queues at Dodger Stadium were estimated based on assumptions about the departure patterns and estimates of walk times from the various seating areas within the stadium. Based on current behaviors, game attendees gradually start leaving the game around 30 minutes before the end of the game. While most people would leave the stadium at the end of the game, given the crowd in the stadium and the distances from the various seating locations in the stadium, it would naturally take people seated the furthest away from the Dodger Stadium Station more time to walk to the station, much like how it is currently for passengers riding the Dodger Stadium Express. In addition, gondola passengers who would rather not join the line immediately to board the proposed Project in the post-game period could visit some of the entertainment amenities at the stadium, including at the Centerfield Plaza. Regarding the queue waiting time, Dodger Stadium Express riders today wait in queues to board

the service. As discussed in Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, the queues to board, loading times, and travel times for the Dodger Stadium Express are significantly longer and more variable as compared to the proposed Project. In order to quantify the existing service time needed to transport Dodger Stadium Express riders, Fehr & Peers observed four post-game time periods during the 2023 season. These observations indicate that riders are willing to wait for substantial periods of time after a game to board the Dodger Stadium Express, despite its slower travel time and long waits between buses, supporting the concept that riders would also be willing to wait after a game to board the proposed Project with its improved level of service.

Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for discussion of how the proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. As detailed on page 3.17-35 of Section 3.17, Transportation, of the Draft EIR, the Draft EIR includes estimates of ridership for events at the Los Angeles State Historic Park, as well as for neighborhood riders on non-game days, which are lower than game day ridership estimates as noted by the commenter. As noted on page 3.17-34 of the Draft EIR, ridership on these days was not taken into account in the quantitative analysis of vehicle miles traveled (VMT) reduction benefits of the proposed Project in the Draft EIR to ensure a conservative analysis.

Elysian Park has limited transit access, and is not served by a fixed guideway transit connection. The proposed Project would improve transit access to Elysian Park, which would provide an additional high-capacity sustainable transportation option that does not exist today. As discussed in Section 5.0, Additions, of the Final EIR, the proposed Project would provide a mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first and last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon.

Comment GO12-5 The Draft EIR is also incomplete and lacking in transparency in that it is focused solely on the gondola. Neither the Purpose nor Project Overview discussions address commercial developments apparently contemplated by Mr. McCourt for the stadium parking lot or how the parking lot might ultimately be reconfigured to allow commercial development.⁴

Footnote 4: This lack of detail on the critical topic of commercial development contrasts with other topics that are covered in excruciating detail.

Response GO12-5 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station

Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. The independent utility of the proposed aerial gondola project – the first permanent transit connection to one of the region’s most visited venues– has been well established. The Dodger Stadium property is approved only for Dodger Stadium and ancillary uses and structures as set forth in the Conditional Use Permit for the Dodger Stadium property, with restrictive designations and zoning not consistent with the uses speculated by commenters. Accordingly, the Draft EIR analyzed all reasonably foreseeable development.

Comment GO12-6 We concur with the concern that the gondola is essentially a private project that is proposed to be built using public resources and over public rights-of-way and publicly owned property.

Response GO12-6 Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Section 2.5, Proposed Project Alignment and Components, and Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR for discussion of how the proposed Project maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties.

Comment GO12-7 The failure to address commercial development of the parking lot and resulting increase in traffic and greenhouse gas emissions from development renders it impossible to evaluate the overall impact of the proposed project on traffic and greenhouse emissions. Consequently, the conclusions on ES page 53 and elsewhere in the report that construction and operations of the LA ART would have a “less than significant impact” on greenhouse gas emissions are not supported.

Response GO12-7 Refer to Response GO12-5 for a discussion of how the proposed Project solely proposes an aerial gondola system and does not include other development, and, accordingly the Draft EIR analyzed all reasonably foreseeable development. Refer to Response GO12-3 and Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion

of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment GO12-8 Moreover, the LA ART does not serve any broad public purpose. The suggestion that the gondola might possibly serve communities near LAUS and Dodger Stadium is not persuasive. These communities are within walking, biking, or Dash bus ride distance of LAUS, State Historic Park and the Stadium. The communities may also be served by the Metro Micro on-demand rideshare service that is already operating in many other Los Angeles communities including the Highland Park/Eagle Rock/Glendale service zone.

Response GO12-8 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. In addition, the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project aims to enhance community connectivity in Metro-designated Equity Focused Communities by providing first/last mile transit and pedestrian access in areas that have historically been underserved, including Los Angeles State Historic Park and Elysian Park. Refer to Topical Response C, Project Features, discussing the proposed Project's potential partnerships with and benefits to local businesses. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses along the proposed Project alignment while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to businesses along the alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve.

Comment GO12-9 The Draft EIR highlights gondolas operating in various foreign countries such as Bolivia and Mexico, but it does not describe the Portland Aerial Tram or NYC’s Roosevelt Island Tramway. The Portland Aerial Tram is actually operated for the public benefit, i.e., primarily for patients, students and staff commuting year-round between two Oregon Health and Sciences University locations and incidentally for the general public.⁵ Similarly, the Roosevelt Island Tramway provides daily commuter transportation between Roosevelt Island and the Upper East Side of Manhattan and primarily serves workers. The Portland and Roosevelt Island tram services can serve as templates for Los Angeles’s broader public purposes such as transportation to our major year-round employment centers, medical facilities and already existing year-round entertainment/cultural centers and reduction of greenhouse gas emissions.

Footnote 5: See gobytram.com for information on Portland’s tram service.

Response GO12-9 Refer to Table 2-1: ART Precedents, in Section 2.0, Project Description, of the Draft EIR, for discussion of the Portland, Oregon, and Roosevelt Island, New York, reversible tramways. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. Refer to Response GO12-8 for an overview of the need for the proposed Project. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment GO12-10 ES 7 Proposed Project Alignment - Impact on State Historic Park and Views:

The City of Los Angeles should jealously guard and preserve the jewel that is State Historic Park rather than permit the diminishment of this public open space.⁶ The construction and operation of the Chinatown/State Park station on park land is at complete odds with these goals of protection and preservation. The Draft EIR contemplates at Section 2.9.4 that the Chinatown/State Park Station would have a footprint of 2,605 square feet including 2,195 square feet within the southernmost part of State Historic Park.⁷ Further, the station canopy would have an overhang of 9,320 square feet over the park. Eighty-one trees would need to be removed (including 75 from the park and six from the public right-of-way adjacent to the park) with an unspecified number of trees to be replaced.

Footnote 6: Likewise, the City should focus on preserving the El Pueblo de Los Angeles Historical Monument (also a State Park) and not permit the construction and operation of the Alameda Street terminal adjacent to this historical monument, Olvera Street and associated architectural structures.

Footnote 7: Elsewhere the Draft EIR only indicates that the Chinatown/State Park Station would be constructed “partially” within the park boundaries without specifying the square footage.

Response GO12-10 As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project’s required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page 3.4-23, in Section 3.04, Biological Resources, of the Draft EIR, and in Appendix K.1, Updated Tree Inventory Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio.

The El Pueblo de Los Angeles Historical Monument is currently a department of the City of Los Angeles.⁸ Refer to Section 3.5.4, Environmental Impacts, of the Draft EIR, for a discussion outlining the proposed Project’s potential construction and operational impacts to historic resources, including the Los Angeles Plaza Historic District (referred to as El Pueblo de Los Angeles). Construction and operational historic resources impacts associated with the proposed Project would be less than significant, including with respect to the Los Angeles Plaza Historic District.

Comment GO12-11 This assumes LA ART is able to obtain the requisite approvals from the California Department of Parks and Recreation for the proposed uses.⁸ Such approval is not feasible, as state park historic units may only include facilities that “are required for the safety, comfort, and enjoyment of the visitors, such as access, parking, water, sanitation, interpretation, and picnicking.”⁹ A gondola boarding station and tower are not required for these park visitor purposes.

Footnote 8: Draft EIR Section 2.10.

Footnote 9: Cal. Public Resources Code section 5019.59.

Response GO12-11 Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, State Parks has determined that the proposed Project would be inconsistent with the Los Angeles State Historic Park General Plan because the identified land uses in the General Plan’s Preferred Park Concept Elements did not contemplate a transit station like the proposed Project’s Chinatown/State Park Station. State Parks considers this inconsistency a potentially significant impact. Therefore, Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain an amendment to the Los Angeles State Historic Park General Plan. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Amendment. The proposed Project does not include a tower in the park. Through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms.

Comment GO12-12 The Draft EIR notes that one of the principles in the Park’s General Plan is to “Promote a ‘Touchstone Landscape’ for Reflecting on Los Angeles’ Natural and Cultural

⁸ See City of Los Angeles. 2023. Commission, El Pueblo de Los Angeles Historical Monument. Available at: <https://elpueblo.lacity.gov/commission>. Accessed July 2023. See also, California Department of Parks and Recreation. 2023. California State Parks Listing. Available at: https://www.parks.ca.gov/?page_id=21805. Accessed July 2023 (El Pueblo de Los Angeles is not included on this list).

Heritage” by making the Park a place of inspiration, reflection and appreciation of history and nature through the interpretation of the Los Angeles River.”¹⁰ Installing a massive gondola tower and station within State Historic Park for a sports stadium destination does not comport with this inspirational principle. Rather, it is an abuse of public land designated for this historic purpose and for open space values.

Footnote 10: Draft EIR Page 3.4-3.

Response GO12-12 Refer to Response GO12-10 for discussion of how the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response GO12-11 for discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan.

Comment GO12-13 We also disagree with the Draft EIR conclusions that the LA ART “would not substantially degrade the existing visual character or quality of public views . . . of the site and its surroundings and the impact would be less than significant”, particularly as these conclusions apply to State Historic Park, the Broadway Junction and Dodger Stadium.

Response GO12-13 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. The Draft EIR’s analysis of impacts to aesthetics was prepared by experts in their respective fields, as set forth in Section 8.0, List of Preparers, and intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR.

Comment GO12-14 The proposed Chinatown/State Park Station and massive three level, 98-foot tower at the station are completely at odds with the existing park entrances, landscaping, layout and amenities, which provide pedestrians and bicyclists with a beautiful, restorative atmosphere. The proposed station and the 98-foot tower would detract from the park’s stunning views of the downtown skyline¹¹ to the south and the San Gabriel and San Bernardino Mountains to the north. The Draft EIR authors concede at Page 3. 1-43 that the “Chinatown/State Park Station is a new and large visual element in the landscape, and views of residents would already be altered noticeably”.

Footnote 11: As noted in Section 2.3.4 of the Draft EIR, “[v]iews of the downtown Los Angeles are available from the majority of the Site.”

Response GO12-14 Refer to Response GO12-13 for discussion of the aesthetics analysis for the proposed Project. Refer to Response S2-5 for a discussion of the proposed Project’s consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics. Refer to Section 3.01, Aesthetics, of the Draft EIR, for discussion of how the proposed Project’s design and building materials would complement the architectural themes of the neighborhood and would complement the visual character of the existing buildings in the area. Potential impacts to visual quality and character are minimized by the location of the Chinatown/State Park Station in the southernmost portion of the park, away from the open passive park areas. The proposed Project components would consist of a modern architectural design, which would complement the existing modern style buildings in this area. In addition, the neutral light-tone gray of the proposed Project components would be consistent with modern structures in the surrounding urban environment. The new amenity building intended for use by proposed Project riders and park visitors alike are designed to reflect the scale and materiality of the existing visitor amenity buildings located within the Los Angeles State Historic Park.

Refer to Response GO12-13 for discussion of how the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant.

Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for a discussion of how other urban aerial transit systems have been successfully incorporated into their surroundings, including public open space and public parks.

Comment GO12-15 The report’s authors go on to suggest at Pages 3. 1-43 and 3. 1-46 that the noticeable alterations created by the station would not be so bad because residents and park goers would be compensated by a “potential” mobility hub, 740 square feet of new concessions, restrooms, landscaping and hardscaping, pedestrian improvements and “potential” seating. But this is no consolation at all because State Historic Park already offers all of these features including an in-park restaurant and many other restaurants easily within walking distance. The suggestion that the park’s scenic views should be

compromised for a little more landscaping and hardscaping in a beautifully landscaped/hardscaped 32-acre park is not persuasive.

Response GO12-15 This comment provides a general recitation and characterization of the Draft EIR. Refer to Responses GO12-13 and GO12-14 for discussion of the aesthetics impacts of the proposed Project, which would be less than significant. Through continued collaboration with State Parks, which has been ongoing and will continue through the Los Angeles State Historic Park General Plan Amendment process, the proposed Project would be fully integrated into the park such that it would add to, rather than take away from the park's purpose and objectives. For example, in addition to the concessions, restrooms, and breezeway discussed above, the Chinatown/State Park Station would also include a mobility hub where passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program. Pedestrian access enhancements could include pedestrian improvements between Metro's L Line (Gold) Station and the Chinatown/ State Park Station consistent with the Connect US Action Plan, including hardscape and landscape improvements, shade structures, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge. The Chinatown/State Park Station would provide passenger access to Chinatown, LASHP, and to nearby neighborhoods and land uses, including the Mission Junction neighborhood, which includes the William Mead Homes public housing complex. In addition, the station canopy would provide much needed shade. Refer to Topical Response C, Project Features, for further discussion of how the proposed Project would include a mobility hub at Chinatown/State Park Station and provide open space enhancements.

Comment GO12-16 Likewise, the Draft EIR suggestion at page 3.1-45 that "existing views of downtown from within the park are already interrupted under existing conditions by trees and intervening development" does not justify the additional massive and continuous gondola interruptions proposed by LA ART (assuming for purposes of argument only that trees constitute an interruption of the view).

Response GO12-16 Refer to Response GO12-13 for discussion of how the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant.

Comment GO12-17 Even though the Chinatown/State Park Station is proposed to allow passenger boarding, the Draft EIR makes no reference to parking for passengers boarding at the station. State Historic Park is already served by the Metro Chinatown station (located within yards of the park's beautiful main entrance!) and nearby LAUS and thus the park would not benefit much from the proposed boarding station.¹²

Footnote 12: State Historic Park and the nearby Mission Junction neighborhood would benefit from the addition of one or more pedestrian crosswalks across North Spring Street, a far less expensive and invasive solution than the gondola.

Response GO12-17 Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines (“TAG”). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project’s potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified. Through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project’s Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less.

Comment GO12-18 Moreover, the proposed alignment of the gondola directly over a long stretch of State Historic Park (and thus over park goers) and directly over and past private residences is invasive and contrary to current recreational and residential uses. The Draft EIR indicates cabins near the Broadway Junction would “be constantly moving in and out of view”¹³ and could be seen from residents and yards and from inside their residences. The resulting disturbance and intrusion to park goers and nearby residents would persist during construction and year-round, daily gondola operation.

Footnote 13: Draft EIR Page 3. 1-48.

Response GO12-18 This comment provides a general recitation and characterization of the Draft EIR. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project’s Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. The proposed Project would be

located in a densely populated, urban environment surrounded by a variety of commercial, industrial, and residential development types. In this type of environment, it is common for public transportation, such as Metro's light rail, to be located adjacent to residential uses and modern aerial transit systems in other cities, including Portland, Oregon and New York City, operate adjacent to residential uses. Nevertheless, as discussed in Topical Response J, Gondola Design and Operations and Section 2.0, Project Description, of the Draft EIR, cabin windows can be equipped with privacy glass that can become opaque while adjacent to sensitive views, and the proposed Project would work with stakeholders adjacent to the proposed Project alignment to identify locations where the use of privacy glass would be warranted. Considerations as to the locations along the proposed Project alignment where the privacy glass could be activated include the subject adjacent sensitive views and the vertical and horizontal distance between the proposed Project cabins and the adjacent sensitive views.

Comment GO12-19 The proposed 179-foot Stadium Tower and massive 37,000+ square foot Dodger Stadium Station are completely at odds with the character of Elysian Park¹⁴ and the Stadium's peaceful park setting.¹⁵ The Draft EIR does not in our view adequately address any of the foregoing concerns.

Footnote 14: As described in Section 2.3.1 of Draft EIR, Elysian Park is the oldest and second largest park in the City.

Footnote 15: Tommy Lasorda nicknamed the stadium "Blue Heaven on Earth." https://en.wikipedia.org/wiki/Dodger_Stadium.

Response GO12-19 As discussed in Section 2.0, Project Description, of the Draft EIR, Elysian Park is the second oldest and largest park in the City and features hiking trails, a bike path, and various recreational and event facilities. The Stadium Tower would be located on hillside private property north of Stadium Way between the Downtown Gate and SR-110, and would include the installation of landscaping near the base of the tower. The Dodger Stadium Station would be located on private property adjacent to Dodger Stadium in a portion of the existing parking lot in the southeast portion of the Dodger Stadium property near the Downtown Gate. The Dodger Stadium Station would include a pedestrian connection to Dodger Stadium, including hardscape and landscape improvements and potential seating, and a mobility hub to provide connectivity to Elysian Park and the surrounding communities where outside of game day periods, passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods. Thus, the proposed Project's Stadium Tower and Dodger Stadium Station would provide features that complement the character of Elysian Park and Dodger Stadium.

Refer to Section 3.01, Aesthetics, of the Draft EIR, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed

Project, which would be less than significant. As described on page 3.1-49 of the Draft EIR, the proposed locations for the Stadium Tower and Dodger Stadium Station are located within Landscape Unit 6 (LU-6). Draft EIR pages 3.1-49 through 3.1-51 include an analysis of the proposed Project's potential aesthetic impacts within LU-6, based on a series of qualitative thresholds commonly used by the FHWA for evaluating visual and aesthetic changes (Draft EIR page 3-1-31). The Dodger Stadium Station and Stadium Tower would consist of an architectural design that provides visual lightness to the form to complement the existing buildings in this area. In addition, the neutral light-tone gray colors and material finishes of the Dodger Stadium Station and Stadium Tower were selected to complement the surrounding urban environment in LU-6, and to not distract from existing visually distinct structures, such as Dodger Stadium. This analysis specifically finds that the proposed Project would not result in a substantial adverse effect to the visual character or quality of the Elysian Park open space or Dodger Stadium property. These conclusions are based on a number of factors, including: the "moderate" visual quality of the area; that the stadium is located on private (not public) property; LU-6 is an urbanized area with a mix of architectural styles and structures; Elysian Park views are currently interrupted and compromised by existing urban development and existing overhead transmission lines; the area has low to moderate view sensitivity because it is experienced primarily by visitors; and, the stadium itself is not affected by project changes. The aesthetic effects of the proposed Project are fully disclosed within the Draft EIR, and no further analysis is required.

Comment GO12-20 ES 8 System Operations; Costs?: The Draft EIR does not specify how construction or post-construction operating, security, maintenance costs and power costs would be funded and paid, even though it is specified that all these elements would be required for proposed daily operation. Apparently, this lack of specificity arises because financing has not been fully worked out.¹⁶ This of course raises the issue of whether taxpayers will end up footing these year-round costs for the McCourt family's private gain.

Footnote 16: "It remains unclear how LA ART will be funded, or how much of the price tag will be passed onto taxpayers through Metro's sponsorship." LA's Transit Infrastructure Can Always Get Dumber: Meet the Gondola (<https://knock-la.com/las-dumb-gondola/>); "Gondola operations would likely be funded largely by corporate sponsorships and tourist fares, said Nathan Click, a spokesperson for the group [Climate Resolve]. But the financing plan is still being worked out." <https://www.latimes.com/california/story/2023-01-09/challenges-loom-for-gondola-to-dodger-stadium-planned-for-the-olympics>

Response GO12-20 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Topical Response L, Project Sponsor and Proposed Project Costs

and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of this Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. Operation and maintenance costs are proposed to be fully funded out of Project revenues. No public sources of funding have been sought or committed to the proposed Project.

Comment GO12-21 ES 11 Alternatives to Reduce Significant Impacts: We concur with the Draft EIR in one respect, namely, the TSM Alternative, which contemplates enhancing the Dodger Stadium Express Service, is the Environmentally Superior Alternative, particularly when operated with zero emission buses.

Response GO12-21 Refer to Response GO12-22 for discussion of the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express, which is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives.

Comment GO12-22 However, the TSM Alternative is not addressed adequately in the Draft EIR. No doubt the existing Express Service can be expanded in size and staging locations. The operation of the massive Park and Ride and Bowl Shuttle bus service between the Hollywood Bowl and various sites in the city during the concert season (including bus only lanes) demonstrates the viability of expanding the Dodger Express Service.

Response GO12-22 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. Electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. Further, as discussed in Topical Response H, a system of buses from numerous remote locations throughout the Los Angeles region to and from Dodger Stadium events would require a substantial increase in the number of buses which,

similar to expanding the fleet for an expanded Dodger Stadium Express service, would result in a fleet of buses that would either be underutilized most of the time or regular Metro bus service that utilizes these vehicles would be disrupted every time a Dodger game or event at the stadium is held. Such a service would also incur substantial costs in paid time and mileage for driving empty buses out to the remote locations before a game and back from the remote locations after a game and paid idle time during the game. Buses from a variety of remote locations would also need to travel in rush hour congestion to get to Dodger Stadium. With limited regional facilities that provide bus only lanes that these services could utilize, they would not materially improve transit travel time compared with driving. For example, the current Dodger Stadium Express service from South Bay serves a broad area of southern Los Angeles County at stations spread across eight miles, is free, and travels on a priority lane within the I-110 freeway median for most of its trip, but the South Bay Dodger Stadium Express carried an average of only 415 passengers per game in 2019, which is substantially lower than the ridership of 1,895 riders per game on the LAUS Dodger Stadium Express. And, as discussed above, increased bus service from remote locations around Los Angeles County to and from Dodger Stadium would add to rush hour traffic and congestion.

As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts.

Comment GO12-23 Moreover, the development of an off-site loading facility for the TSM Alternative would be far less disruptive to State Historic Park and surrounding communities than the LA ART. In fact, the TSM Alternative would not have any impact on the park. As for bus lanes, Cesar Chavez and Broadway lane closures and diversions are already utilized on game days and expansion of such lanes appears viable. The LA Zoo parking lot provides an excellent bus loading/unloading location.

Response GO12-23 Refer to Response GO12-22 for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives. Refer to Section 4.0, Alternatives, of the Draft EIR, for discussion of how the Transportation Systems Management Alternative assumes a larger, off-site loading facility at Metro's Division 13 maintenance facility. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17,

Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including at the Los Angeles State Historic Park.

Comment GO12-24 The Spring Street Alignment, which contemplates the construction of a gondola station within Historic Park, is mentioned as an alternative. This alignment is unacceptable in our view, as it would destroy part of this refuge that was over 17 years in the making and block part of the open sky above the park.

Response GO12-24 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives pursuant to CEQA. The Draft EIR considered a "No Project Alternative," the Spring Street Alignment Alternative, and the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express. Similar to the proposed Project, the Spring Street Alignment Alternative would provide an ART option for visitors to Dodger Stadium, while also providing access between Dodger Stadium, the surrounding communities, and the regional transit system accessible at LAUS. The Spring Street Alignment Alternative would include three stations, a non-passenger junction, and four cable-supporting towers at various locations along the alignment. The Spring Street Alignment Alternative would include the following components in common with the proposed Project: Alameda Station, Alameda Tower, Alpine Tower, Stadium Tower, and Dodger Stadium Station. In addition to these components, the Spring Street Alignment Alternative would also include the following components that would be unique to this alternative: Spring Street Junction, State Historic Park Station, and Bishops Tower. Although the Spring Street Alignment Alternative would be consistent with the Project Objectives, it would require a larger footprint than the proposed Project within the Los Angeles State Historic Park, so it would not meet Objective 11 to "Minimize the Project's environmental footprint through the integration of sustainability and environmentally-friendly design features into the materials, construction, operations, and maintenance of the proposed Project" to the same extent as the proposed Project.

Comment GO12-25 Other transportation related alternatives that would serve to conserve energy and reduce green-house gas emissions are (i) the construction of solar panels in the stadium parking lot, (ii) the addition of electric vehicle charging stations and bike share facilities in the lot and (iii) the expansion of the Dash bus service to Elysian Park and State Historic Park. These alternatives are not mentioned in the Draft EIR, which apparently was drafted to present the gondola as the only option. It is not.

Response GO12-25 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives pursuant to CEQA. The Project Objectives were defined in order to assist Metro in

considering alternatives that achieve the proposed Project’s fundamental purpose of providing a permanent transit connection to Dodger Stadium. The Project Objectives broadly contemplate improving neighborhood connectivity and the Dodger Stadium visitor experience, reducing vehicle congestion and associated emissions in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, improving access to Elysian Park and the Los Angeles State Historic Park, and providing a sustainable form of transit. Aerial rapid transit technology has the ability to overcome grade and elevation issues between LAUS and Dodger Stadium in order to provide a direct transit connection between the two locations, and provide safe, zero emission, environmentally friendly, and high-capacity transit connectivity in the Project area that would reduce GHG emissions as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways. All of the alternatives suggested in this comment would fail to meet the proposed Project’s fundamental purpose of providing a permanent transit connection to Dodger Stadium. All of the alternatives would fail to meet many of the Project Objectives, including to expand mobility options for transit riders through a direct connection between LAUS and Dodger Stadium, to improve the Dodger Stadium visitor experience by providing efficient, high-capacity, and faster alternative access to Dodger Stadium, and to bring a world class aerial transit system to the Los Angeles area. The alternatives would otherwise fail to improve connectivity and reduce vehicle congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. While the third alternative would improve access to Elysian Park and the Los Angeles State Historic Park, it still does not meet other objectives aimed at achieving the Project’s purpose of providing a transit connection to Dodger Stadium. Thus, because the proposed Project’s fundamental purpose is to provide a permanent transit connection to Dodger Stadium, and because aerial rapid transit technology can achieve this fundamental purpose, the objectives for the proposed Project are in compliance with CEQA, which does not restrict an agency’s discretion to identify and pursue a particular project designed to meet a particular set of objectives. The proposed Project does not preclude the “alternatives” mentioned in the comment.

Comment GO12-26 ES 12 Design Options: Design and Use Option E, contemplating the construction of a pedestrian bridge in Historic Park, is attractive but clearly may be accomplished without construction of the gondola.

Response GO12-26 As discussed in Topical Response C, Project Features, while not proposed as part of the proposed Project, the Draft EIR includes an analysis of the State Park’s proposed bike and pedestrian bridge as part of Design and Use Option E. The bridge would provide important connections for students at Cathedral High School, as well as between the park and the Chinatown, Savoy, and Solano Canyon neighborhoods to support convenient access for the community. The analysis serves to provide environmental clearance for the bike and pedestrian bridge as a benefit to the Los

Angeles State Historic Park, as while the bike and pedestrian bridge was mentioned in the Los Angeles State Historic Park General Plan and studied in the State Park's Bridge Feasibility Study, the bike and pedestrian bridge was never environmentally cleared. Support for the Los Angeles State Historic Park bike and pedestrian bridge would otherwise be provided as part of the proposed Project. Accordingly, the proposed Project is furthering the bike and pedestrian bridge by providing the necessary environmental clearance and support for the bridge.

Comment GO12-27 ES 13 Summary of Environmental Impacts: Contrary to this summary, the proposed 98-foot tower at the Chinatown/State Park Station would in fact block and degrade part of the scenic vista and view of the downtown skyline that is observable from Historic Park.

Response GO12-27 Refer to Response GO12-13 for discussion of how the aesthetic impacts of the proposed Project would be less than significant, including at the Los Angeles State Historic Park, and the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant.

Comment GO12-28 In sum, the Draft EIR is incomplete and inaccurate in significant respects and lacking in transparency. It misrepresents the potential impact of the LA ART on ridership and the reduction of greenhouse gas emissions. There are better and less intrusive ways to transport people to and from Dodger Stadium, Elysian Park and surrounding communities while also preserving and even improving State Historic Park and these communities. Any gondola built within the City of Los Angeles must serve a much broader public purpose than moving passengers between LAUS and Dodger Stadium.

We welcome the opportunity to meet with you to discuss these concerns.

Sincerely,

Barbara Hensleigh

Response GO12-28 This comment provides a general conclusion regarding the comments raised in this letter. Responses to comments contained in this letter are provided above in Responses GO12-1 through GO12-27. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and

decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR.

Comment Letter GO13 – Natural Resources Defense Council (NRDC), Paulina Torres

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO13

Comment GO13-1 Dear Mr. Cory Zelmer:

We appreciate the opportunity to comment on the Draft Environmental Impact Report (DEIR) for the Los Angeles Aerial Rapid Transit Project (“Project”). These comments are on behalf of the Natural Resources Defense Council and our many thousands of members and activists throughout California. Our comments are offered to ensure Metro’s consideration of the Project complies with the California Environmental Quality Act (“CEQA”), California Code of Regulations, Title 14, § 15000 et seq. (“CEQA Guidelines”), and the Los Angeles CEQA Threshold Guide. We urge Metro to consider the issues identified below and to update the EIR to fully and accurately describe the Project and analyze its impacts.

NRDC has a vested interest in preserving the quality, character, accessibility, and enjoyment for those visiting the Los Angeles State Historic Park given our decades-long advocacy along with many other community allies to protect and create the parkland. Los Angeles State Historic Park was created after a tremendous community campaign to defeat a warehouse development plan that threatened the 32-acre open space. We offer the following comments to ensure Metro adequately considers all the impacts the Project will have on the park and adjacent downtown Los Angeles neighborhoods.

Response GO13-1 This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter provided below in Responses GO13-2 through GO13-13.

Comment GO13-2 I. The DEIR’s impact analysis is flawed and should be revised.

The DEIR appears to employ an overly broad and contradictory analytic approach that may not describe with adequate specificity the full range of significant negative impacts the Project will have on the aesthetic and cultural characteristics of the Project site and surrounding areas. As such, a court might find that the DEIR fails in its basic purpose as a useful, informational document for the public and decision makers.¹

Footnote 1: *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564.

Response GO13-2 The comment states that the Draft EIR’s impact analysis is flawed and should be revised, but does not identify a specific flaw. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. As discussed

therein, the aesthetics analysis took into account six separate landscape units, scenic vistas, scenic resources, light and glare, and shading, considering key observation points critical or representative of the visual character of the area, concluding that such impacts would be less than significant. The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to cultural resources in Section 3.05, Cultural Resources in 71 pages of detailed analysis of 12 previously identified historical resources, including two districts with multiple contributors, and 51 archaeological resources that were previously recorded within an eighth-mile of the proposed Project's Area of Direct Impacts, with eight archaeological resources identified for further analysis, with supporting data provided in the 125-page Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and in the 343-page Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project. As discussed in Section 3.05, Cultural Resources, of the Draft EIR, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. The Draft EIR's analysis of impacts to aesthetics and cultural resources was prepared by experts in their respective fields, as set forth in Section 8.0, List of Preparers, and intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts. In general, the Draft EIR includes 7,877 pages of detailed analysis from experts intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR.

Comment GO13-3 A. The DEIR's aesthetic impacts analysis should be augmented and revised.

The DEIR presents an insufficient analysis of the aesthetic impacts the Project will have on the immediate surrounding areas, particularly near Los Angeles State Historic Park. The DEIR divides the immediate vicinity of the Project alignment into six different Landscape Units that encompass the location of the Project alignment and adjacent areas beginning in the southern portion of the Project alignment and ending in the north. Of most significance, the DEIR does not sufficiently analyze the aesthetic impacts to Landscape Unit 4, which begins at the southwestern corner of Los Angeles State Historic Park. The LA CEQA Thresholds Guide notes the value of preserving sightlines to designated scenic resources or areas of visual interest from public vantage points. The DEIR acknowledges that the subjects of valued or recognized views may be focal or panoramic, including urban skylines, mountain ranges, or large bodies of water. The DEIR further acknowledges the Project's interruption to the panoramic skyline views of downtown Los Angeles from Los Angeles State Historic Park.

Response GO13-3 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. The methodology utilized to examine potential aesthetic impacts follows the guidance outlined in the Federal Highway Administration’s *Guidelines for the Visual Impact Assessment of Highway Projects* (2015). As a result of this guidance, a group of Landscape Units (LU) and Key Observation Points (KOPs) were delineated and identified based on known significant views and locations with proposed changes to the setting and subjected to review and analysis identified within the aforementioned framework. KOPs within each LU were selected based on existing knowledge of important viewsheds and through consultation with responsible agencies. Further, views and potential impacts were all analyzed using the same thresholds of significance identified by the State CEQA Guidelines and the Los Angeles CEQA Thresholds Guide.

Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Also, the location of the proposed cables and cabins would be adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The cabins would be constantly moving in and out of view, and the cables have similar characteristics to the overhead power lines that are prevalent in views in this area. As such, the proposed cables and cabins would not significantly impact views in this area. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Response S2-5 for additional discussion of the Draft EIR aesthetics analysis as it relates to the Los Angeles State Historic Park.

The Draft EIR’s analysis of impacts to aesthetics was prepared by experts in their respective fields, as set forth in Section 8.0, List of Preparers, and intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR.

Comment GO13-4 Los Angeles Historic State Park is a large open space that is in stark contrast to the dramatic skyline of downtown Los Angeles.² Sometimes referred to as the “front porch” of Los Angeles, there are no other sites that capture this welcoming view of downtown.³ Despite acknowledging the aesthetic significance of the downtown Los Angeles urban skyline, the DEIR concludes the Project will have no significant impact for a variety of unpersuasive reasons. For example, the DEIR vaguely relies on a “walkway in the park” as an area that will continue to have uninterrupted views.⁴ The DEIR further asserts that there are no significant aesthetic impacts because “existing views of downtown from other areas in the park are already interrupted under existing conditions by trees.”⁵ The mere possibility that one may potentially be able to find an area within the park where the view may be seen would not seem to negate the significant negative impact to a designated area of visual interest. CEQA does not require that a view be hindered from every possible vantage point; rather, CEQA demands an inquiry into whether the Project would have potentially significant impacts with respect to views if the Project’s development were to obstruct an existing view of a valued visual resource.⁶

Footnote 5: Id.

Footnote 6: California Code Regs., title 14, Section 15000 Appendix G.

Response GO13-4 Refer to Response GO13-3 for discussion of how the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Response S2-5 for a more detailed discussion of aesthetic impacts to the Park. The Draft EIR addressed aesthetic impacts in Section 3.01 Aesthetics with supporting data provided in Appendix C, Visual Impact Assessment of the Draft EIR. The Draft EIR and Visual Impact Assessment both specifically addressed and disclosed potential impacts on changes in the visual environment and existing viewsheds into and from within the Los Angeles State Historic Park. The Draft EIR included thirty Key Observation Points (KOPs), including nine that simulated views of or from Los Angeles State Historic Park. The Draft EIR analyzed each of these KOPs, describing the existing viewpoint along with a visual simulation of the proposed Project. With respect to views from within

the park, the Draft EIR concluded that certain southwest-facing views of the downtown Los Angeles skyline, particularly close to the proposed Chinatown/State Park Station, would be partially interrupted due to the proposed Project. However, the Draft EIR noted that these views are already partially interrupted by trees and intervening development, and the nature of the proposed Project (i.e., cables with similar characteristics to prevalent existing powerlines and cabins that are constantly moving in and out of view) means that the proposed Project would not significantly impact views from the Park. The Draft EIR concluded that the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the Park. The Final EIR includes additional KOPs to further analyze viewshed impacts to Los Angeles State Historic Park. Refer to Appendix H.1, Memorandum Regarding Preparation of KOPs, and Appendix H.2, Supplemental KOPs in Response to Comments, of this Final EIR, for a discussion of the supplemental KOPs' preparation and the supplemental KOPs, respectively. As demonstrated by these supplemental KOPs, views from the Los Angeles State Historic Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. In addition, refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including views from a cabin over the park, providing a new and unique perspective of the Park and its surroundings, including the Roundhouse Observation Deck and the exposed Zanja Madre, which is currently not visually apparent from inside the Park.

Comment GO13-5 Further, the DEIR purports to describe its consistency with the Los Angeles State Historic Park General Plan. For a project in an urban area, a significant impact to visual character or quality occurs if the project conflicts with applicable zoning regulations or other regulations governing scenic quality. The DEIR appears to contain contradictory statements regarding the Project's consistency with the Los Angeles State Historic Park General Plan. On the one hand, it states that the proposed Project must obtain an amendment to the Los Angeles State Historic Park General Plan to allow transit uses within the park. However, later in the DEIR it states that the proposed Project would be consistent with Los Angeles State Historic Park General Plan aesthetic resources goals to protect and enhance scenic viewsheds and features. Not only does the DEIR appear to lack any description of the Project's ability to protect and enhance scenic viewsheds and features, but the document also fails to acknowledge the project's existing inconsistency with the Los Angeles State Historic Park General Plan, which prohibits the very type of (transit) Project proposed.

Response GO13-5 Refer to Response GO13-3 for discussion of how the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant.. Refer to Response S2-5 for a discussion of the proposed Project's consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a

discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project's Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment.

Comment GO13-6 The DEIR also appears to minimize the significant negative visual impacts the Project will have on the surrounding area. For CEQA purposes, visual impacts in urbanized areas are assessed based on changes to views from publicly accessible locations or public views. However, in finding that the Project will have no significant impact, the DEIR states that pedestrians and motorists may have less of a personal investment in the visual appearance of the proposed Project because they are "primarily visiting and do not necessarily reside in the area." The DEIR relies on residents not being included in viewership, while simultaneously minimizing negative impacts by asserting that public viewers have "fleeting and/or temporary views" since they do not reside in the area. The DEIR posits a circular argument, obviating the possibility that pedestrians and motorists experience significant impacts since CEQA requires the Lead Agency to only consider the views of the public, then relying on the presumption that the public could never experience a significant impact since their views are temporary as non-residents. This type of reasoning would render the viewership analysis requirements of CEQA meaningless.

Response GO13-6 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. A series of visual simulations were conducted from/within Landscape Units (LU) and Key Observation Points (KOPs) that were delineated and identified based on known significant views and locations with proposed changes to the setting. Viewer groups potentially affected by the proposed Project were identified in each LU as set forth in Table 3.1-6. For example, viewer groups identified for LU 4 which includes the Park are: motorist, transit commuter, pedestrian, and recreationalist. Because visual impacts under the L.A. CEQA

Thresholds Guide are assessed based on changes to public views, the description of resident viewer groups was provided only for informational purposes as private views from residential properties are not protected under the L.A. CEQA Thresholds Guide. This description of resident viewer groups was provided for informational purposes only with the understanding that, even within different viewer groups, visitors and residents likely hold unique values regarding the significance of views within/of each individual LU, and the significance of an impact is not based solely on a project's visibility from public viewpoints. In the evaluation of aesthetics, the Draft EIR analysis considers a range of qualifying factors consistent with methods and guidance provided by the FHWA for evaluating visual impacts, as well as the CEQA Guidelines and City of Los Angeles CEQA thresholds. Accordingly, the Draft EIR's aesthetics analysis more than adequately complies with CEQA's requirements for a Draft EIR.

Comment GO13-7 CEQA requires the data in an EIR to be not only sufficient in quantity but presented in a manner calculated to adequately inform the public and decision makers.⁷ Given the inconsistencies throughout the DEIR's examination of potential aesthetic impacts, we urge Metro to include an accurate and robust analysis of the Project's aesthetics impacts, particularly as these impacts affect Los Angeles State Historic Park.

Footnote 7: Public Resources Code Section 21000 et seq.

Response GO13-7 Refer to Response GO13-3 for discussion of the Draft EIR analysis of potential aesthetic impacts from the proposed Project, which would be less than significant. Refer to Responses GO13-5 and GO13-6 for a discussion of the proposed Project's consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics as well as how the Draft EIR's analysis does not result in "inconsistencies" but appropriately analyzes potential impacts based upon the CEQA Guidelines, L.A. CEQA Thresholds Guide, and methods and guidance provided by the FHWA. The Draft EIR's analysis of impacts to aesthetics was prepared by experts in the field, as set forth in Section 8.0, List of Preparers, and intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts. Accordingly, the Draft EIR's aesthetics analysis more than adequately complies with CEQA's requirements for a Draft EIR.

Comment GO13-8 B. The DEIR's analysis of impacts to cultural resources is flawed and should be revised.

CEQA and its implementing guidelines require the evaluation of potential impacts to cultural resources.⁸ The evaluation of impacts to historical resources consists of a two-part inquiry: (1) a determination of whether the Project Site contains or is adjacent to a historically significant resource or resources and, if so; (2) a determination of whether the Project would result in a "substantial adverse change" in the significance of the resources. A "substantial adverse change" in the significance of a historical resource is an alteration that materially impairs the characteristics that convey its historical significance and justify its eligibility for listing.

Under these guidelines, the DEIR does not appear to adequately analyze the Project's impact on cultural resources. The proposed Project is located within the urbanized and developed City of Los Angeles communities of downtown, El Pueblo, Chinatown, Mission Junction, Solano Canyon, and Elysian Park. These areas are known, in part, for their rich historical and cultural resources including over thirty culturally significant buildings, sites, districts, structures, and landscapes within the immediate vicinity of the Project alignment. While the DEIR acknowledges the significant presence of cultural resources the Project may affect, it denies without explanation any significant impacts to the resources.

Footnote 8: CEQA Guidelines Section 15064.5.

Response GO13-8 Refer to Response GO13-2 for a discussion of the Draft EIR's analysis of the proposed Project's potential impacts to cultural resources. The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Refer to Response GO13-9 for a discussion of how construction and operational impacts associated with the proposed Project will not cause a "substantial adverse change" to the significance of the Los Angeles Union Station Passenger Terminal and Grounds and, therefore, impacts will be less than significant. Refer to pages 3.5-45 and 3.5-46 of Section 3.05, Cultural Resources, of the Draft EIR for a discussion of how the only direct impacts from the proposed Project to the Los Angeles Plaza Historic District (El Pueblo) would be to a non-contributing feature, the Placita de Dolores, which was constructed after the historic district was designated, and accordingly impacts would be less than significant.

Refer to pages 3.5-46 to 3.5-47 of Section 3.05, Cultural Resources, of the Draft EIR, for discussion of how the proposed Project would not significantly impact the *El Grito* mural during project construction with implementation of the recommended mitigation measures. Specifically, as discussed on pages 3.5-46 to 3.5-47, direct impacts related to vibration during construction activities will be mitigated to a less than significant level with implementation of Mitigation Measures VIB-A and VIB-B, relating to the use of vibration monitoring equipment and force adjustable ground compaction devices. Potential operational impacts to the mural would be less than significant as the physical integrity of the mural would remain intact and the mural would remain highly visible and would continue to convey its individual significance as an exceptionally important mural of high artistic value.

Refer to page 3.5-53 of Section 3.05, Cultural Resources, of the Draft EIR, for discussion of how the proposed Project would not directly impact the Los Angeles Terminal Annex Post Office. Indirect impacts may include the introduction of new visual features to the setting of the historical resource; however, these changes would not constitute a significant impact due to the setting's existing modern surroundings and substantial setback from both Alameda Street and the proposed Project.

Refer to pages 3.5-47 to 3.5-48 and 3.5-53 to 3.5-54 of Section 3.5, Cultural Resources, of the Draft EIR, for discussion of how the proposed Alameda Tower, Alpine Tower, and Chinatown/State Historic Park Station will not significantly impact historical resources in the vicinity of the proposed Project's alignment near Chinatown and Mission Junction, which include Philippe the Original, the Granite Block Paving, and the Capital Milling Company. Specifically, as discussed on pages 3.5-47 to 3.5-48 and 3.5-53 to 3.5-54, due to the physical separation of the proposed Project components from the historical resources, there is no potential for direct impacts to historical resources in the vicinity of these components. While construction of proposed Project components would temporarily introduce visual and auditory elements to the setting of Philippe the Original and the Capitol Milling Company, these indirect impacts would only occur temporarily during the construction period and, therefore, would be less than significant. Operational impacts include the introduction of new visual features to the setting of the historical resources, however, as discussed on pages 3.5-53 and 3.5-54, these changes would not substantially alter the existing setting and the historical resources would continue to convey their individual significance and their character-defining features would remain intact. Therefore, the operational impacts of the Alameda Tower, Alpine Tower, and Alameda Station would be less than significant.

Refer to pages 3.5-48 and 3.5-54 to 3.5-55 of Section 3.05, Cultural Resources, of the Draft EIR, for discussion of how the proposed Broadway Junction will not significantly impact historical resources in the vicinity of the proposed Project's alignment near Solano Canyon. There are five historical resources in the vicinity of the proposed Broadway Junction: 1035 N. Broadway, St. Peter's Italian Catholic Church, Cathedral High School, 451 E. Savoy Street, and the Charles B. Wellman Residence. The construction and operation of proposed Broadway Junction will not directly impact these historical resources as it is located a substantial distance from the historical resources in its vicinity. Indirect construction impacts would occur during only the 19-month construction period and therefore would be less than significant. While the proposed Broadway Junction would introduce new visual features to the setting of historical resources nearby, due to the existing setting, these changes would not constitute a significant impact. The historical resources would continue to convey their individual significance and their existing physical integrity and character-defining features would remain intact. Therefore, indirect operational impacts would be less than significant.

Refer to pages 3.5-48 to 3.5-49 and 3.5-56 to 3.5-57 of Section 3.05, Cultural Resources, of the Draft EIR, for discussion of how the proposed Stadium Tower and Dodger Stadium Station would not significantly impact historical resources in the vicinity of the proposed Project's alignment near Elysian Park. Construction and operation of the proposed Dodger Stadium Station will not directly or indirectly impact historical resources because there are none in the vicinity of the proposed station or construction staging area. Therefore, no impact would occur. The only historical resource in the vicinity of the proposed Stadium Tower is the Arroyo Seco Parkway Historic District. There is no potential for direct impacts to this historical resource due to the physical separation of the components of the proposed Project from the subject property. Construction would temporarily introduce visual elements to the setting of the Arroyo Seco Parkway Historic District. However, this indirect impact would occur during only the 12-month construction period and would cease after construction of the proposed Stadium Tower, and therefore, would be less than significant. Indirect operational impacts would include the introduction of new visual features to the setting of the Arroyo Seco Parkway Historic District. However, the change would not constitute a significant impact on the historical resource as the setting of the historic district overall has been altered over time by numerous improvements to SR-110, as well as adjacent new construction. The Arroyo Seco Parkway Historic District would continue to convey its significance and its existing physical integrity and character-defining features would remain intact. Therefore, the operational impact of the proposed Stadium Tower would be less than significant.

Comment GO13-9 The DEIR minimizes the Project's significant impact to the Los Angeles Union Station Passenger Terminal and Grounds, a cultural resource listed by the federal National Historic Preservation Act of 1966 and the California Register of Historical Resources. Built in 1939, Los Angeles Union Station is an architectural gem, utilizing a unique combination of Spanish Colonial Revival and Art Deco styles. Passengers, commuters, and tourists are welcomed with lush courtyards laden with orange trees, fan palms, and espalier magnolias. The DEIR describes the Project's proposed Alameda Station as "a concrete structure and platform with a barrel-arched canopy made of custom-perforated metal." The Project station would be over 75 feet above street grade, with a platform of over 30 feet above street grade. The DEIR further states: "The proposed Alameda Station would become a dominant visual feature of Alameda Street due to its size, design, and location elevated over the street. The proposed Alameda Station would be a highly visible change to the overall setting of the Los Angeles Union Station Passenger Terminal and Grounds property, which is designated for both its architectural and historical significance." Despite the assertions recognizing the visibly dominating impacts the enormous new proposed Alameda Station will have on the Los Angeles Union Station Passenger Terminal and Grounds, the DEIR inconsistently found the Project to have a less than significant impact.

We look forward to the EIR containing a thorough and accurate analysis of the Project's impacts not only on Los Angeles Union Station Passenger Terminal and Grounds, but also to the other cultural resources identified throughout the DEIR.

Response GO13-9 Refer to Section 3.05, Cultural Resources, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR), of the Draft EIR for a discussion outlining the proposed Project's potential construction and operational impacts to the Los Angeles Union Station Passenger Terminal and Grounds. While the proposed Project's Alameda Station would be a visible change to the overall setting of the historical resource, as discussed on page 16 of Appendix G, integrity of setting principally refers to the physical features within the boundary of a property but may also include the larger surroundings. However, in urban areas such as Los Angeles, the broad setting has often been changed by development that postdates the period of significance for the subject property. Thus, changes to the surrounding area (i.e., addition of the proposed Project) should only factor into the assessment of integrity if the broad setting is essential to the understanding of the property. As discussed on pages 3.5-49 and 3.5-50 of Section 3.05, Cultural Resources, of the Draft EIR, the Los Angeles Union Station Passenger Terminal and Grounds is designated for its architectural and historical significance, and the changes to the resource's setting resulting from the addition of Alameda Station would not impact its architectural significance or its ability to convey this significance. Specifically, as indicated on page 3.5-44, construction impacts will not alter the physical integrity or character-defining features of the historical resource. Also, as indicated on page 3.5-49, operational features that will have a direct impact on the property (e.g., the vertical circulation elements) will not alter the physical integrity or character-defining features of the historical resource. Further, visual alterations to the overall setting of the property will be insignificant due to prior substantial alterations to the existing setting and will not impact the significance of the historical resource nor its ability to convey its significance. Overall, construction and operational impacts associated with the proposed Project will not cause a "substantial adverse change" to the significance of this historical resource and, therefore, impacts will be less than significant.

Comment GO13-10 II. The DEIR's project description may be incomplete and may not fully analyze reasonably foreseeable activities as required by CEQA.

CEQA requires that a project be described with enough particularity that its impacts can be assessed.⁹ The relevant standard for ascertaining what constellation of activities should be deemed to be a part of the "whole of an action" of a Project is whether such activities comprise "a group of interrelated actions" that are "part of a single, coordinated endeavor."¹⁰ We are concerned that the DEIR may lack enough information to examine and evaluate the Project fully, effectively analyzing the project in a vacuum rather than including related and necessary operations, and omitting certain of the Project's foreseeable impacts.

Footnote 9: County of Inyo v. City of Los Angeles (1977) 71 Cal.App.3d 185, 192.

Footnote 10: Association for a Cleaner Environment v. Yosemite Community College Dist. (2004) 116 Cal.App.4th 629, 636.

Response GO13-10 The proposed Project is described consistently throughout the entire Draft EIR based upon the Project Description provided in Section 2.0, Project Description, of the Draft EIR, clearly identifying the proposed Project’s potential environmental impacts in Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. Accordingly, the Draft EIR analyzes the whole of this action, as well as reasonably foreseeable potential environmental impacts resulting from this action. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., CEQA Guidelines § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR.

Comment GO13-11 A. The DEIR may be lacking critically important details in its project description.

Despite our understanding that documents exist associating the Project with foreseeable commercial and residential growth at the 260-acre McCourt Global property, the DEIR omits any mention of near-future commercial activity or development plans at Dodger Stadium. CEQA prohibits a project proponent from seeking approval of a large project in smaller pieces in order to take advantage of environmental exemptions or lesser CEQA review for smaller projects.¹¹ California courts have repeatedly held that “an accurate, stable and finite project description is the sine qua non of an informative and legally sufficient [CEQA document].”¹² Absent a complete project description, courts view the environmental analysis under CEQA as impermissibly limited, thus minimizing the project’s impacts and undermining meaningful public review.¹³

California courts have articulated “general principles” for determining whether two actions are one CEQA project, including “how closely related the acts are to the

overall objective of the project,” and how closely related they are in time, physical location, and the entity undertaking the action.¹⁴ The appropriate inquiry is whether two projects are related to one another, i.e. they comprise the “whole of an action” or “coordinated endeavor.”¹⁵

Courts have found improper piecemealing when the purpose of the reviewed project is to be the first step toward future development.”¹⁶ It is both logical and reasonable to infer that the Project is soon likely to be associated with development activity given the facts surrounding Dodger Stadium and the practical effects of the Project. For example, there are 81 home games in a regular baseball season, with up to 12 post-season games. The City of Los Angeles’s Conditional Use Permit for Dodger Stadium allows a maximum of four special events per month. Even assuming additional special events, the Project is likely to be used at capacity no more than one hundred fifty days of the year. Accordingly, developing the area surrounding the Dodger Stadium Tower for entertainment, retail, and other commercial activities is a reasonable conclusion that could provide a practical basis and explanation for carrying out the Project. We recommend that the EIR be revised to consider the entirety of the Project, including all reasonably foreseeable phases, consistent with CEQA.

Footnote 14: Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora (2007) 155 Cal.App.4th 1214, 1226-1227.

Footnote 15: Id.

Footnote 16: Laurel Heights Improvement Assn., supra, 47 Cal.3d 376; Bozung v. Local Agency Formation Com. (1975) 13 Cal.3d 263; City of Antioch v. City Council (1986) 187 Cal.App.3d 1325.

Response GO13-11 Refer to Response GO13-10 for a discussion of the Project Description’s adequacy. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Further, the proposed Project addresses the need for a permanent transit connection to Dodger Stadium for Dodger games and special events at the Dodger Stadium property. Refer to Section 2.1,

Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment GO13-12 B. The DEIR should include an analysis of induced growth.

Section 15125.2(d) of the CEQA Guidelines requires a discussion of the ways in which a project could induce growth. This includes ways in which a project would foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Induced growth is any growth that exceeds planned growth and results from new development that would not have taken place without the implementation of a proposed project.

When evaluating the potential environmental impact of a project that has growth inducing effects, an agency is not excused from environmental review simply because it is unclear what future developments may take place; it must evaluate and consider the environmental effects of the “most probable development patterns.”¹⁷ In fact, even if there is uncertainty as to the precise form of development that would eventually occur, a Project is not insulated from CEQA.¹⁸

Footnote 17: Aptos Council v. Cnty. of Santa Cruz (2017) 10 Cal.Ap⁵th 266,

Footnote 18: Antioch, supra, 137 Cal.App.3d 1325, 1337.

Response GO13-12 Refer to Section 5.4, Growth-Inducing Impacts, of Section 5.0, Other CEQA Considerations, of the Draft EIR, for a discussion of the potential growth-inducing impacts of the proposed Project as required by Public Resources Code section 21100(b)(5). The Draft EIR’s growth inducing analysis considered the potential growth-inducing impacts from the proposed Project in pages 5-57 through 5-60 of the Draft EIR, concluding that construction and operation of the proposed Project would result in less than-significant growth-inducing impacts, with respect to whether the proposed Project would foster population or employment growth, or the construction of additional housing, either directly or indirectly, on both a regional and

local scale. As discussed in Section 5.4, the proposed Project does not remove obstacles to growth but instead would increase connectivity in the densely urbanized downtown Los Angeles and provide direct linkages to major residential, employment, and tourist destinations, such as LAUS, El Pueblo/Olvera Street, Chinatown, Los Angeles State Historic Park, Dodger Stadium, and Elysian Park. The Project Study Area includes a population of which approximately 25 percent of the residents in the Project Study Area utilize either public transportation or walking for commuting to work. As discussed in Section 2.0, Project Description, Dodger Stadium is one of the region's most visited venues; however, there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets, throughout the surrounding communities, and on the nearby freeways. As the region's population grows and resulting travel needs continue to increase, the local and regional roadway system is likely to experience greater congestion. When complete, the travel time from LAUS to Dodger Stadium would be approximately 7 minutes during peak operations (games/events at Dodger Stadium). Approximately 20 percent of visitors could take aerial transit connected to Metro's regional transit system. By creating a high-quality and high-capacity rapid transit connection between LAUS and Dodger Stadium, the proposed Project would provide a more viable choice in making a trip to a Dodger game or event at the stadium. Further, given that the area in the City where the proposed Project alignment is located is densely urbanized and there are existing planned developments for the area, the proposed Project would be a benefit for existing and planned uses in the area.

Comment GO13-13 It is not our position that the DEIR must analyze with significant detail every conceivable development scenario; however, the DEIR needs to analyze the impacts in relation to the most probable development patterns. Publicly available resources have revealed the possibility of future development at the site of the Project. For example, information from the Los Angeles County Recorder's Office details possible future developments at Dodger Stadium that "may include, but are not limited to (i) office buildings, (ii) hotel and exhibition facilities, (iii) residential buildings, (iv) medical buildings, (v) academic buildings, (vi) parking structures, and/or (vii) retail, dining, and entertainment facilities."¹⁹ Further, the company that owns fifty percent of the parking lot at Dodger Stadium publicized its ownership interest in the 260-acre Dodger Stadium land as a "current real estate project."²⁰ Even without the aforementioned documents evidencing potential development at Dodger Stadium, the DEIR should account for the foreseeable and probable growth inducing development impacts of the Project.

The EIR should examine ways in which the proposed Project could foster economic growth, either directly or indirectly, in the surrounding environment.

Footnote 19: “Declaration of Covenants, Conditions, Restrictions, and Easements of Chavez Ravine,” Section 14.3, Los Angeles County Recorder’s Office, Document #20120642991.

Footnote 20: “Our Company,” McCourt Globaweb.archive.org/web/20210724150915/https://www.mccourt.com/mccourt-global-overview. Accessed via The Wayback Machine.

Response GO13-13 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Mere statements on a website are not evidence that such development is currently proposed, nor are they sufficiently firm or committed to such that environmental analysis is required. No improper segmentation has occurred and the independent utility of the proposed aerial gondola project – the first permanent transit connection to one of the region’s most visited venues– has been well established. In addition, refer to Topical Response G for a discussion of how the proposed Project addresses the need for a permanent transit connection to Dodger Stadium for Dodger games and special events at the Dodger Stadium property, and how the Dodger Stadium property is approved only for Dodger Stadium and ancillary uses and structures as set forth in the Conditional Use Permit for the Dodger Stadium property, with restrictive designations and zoning not consistent with the uses speculated by commenters. Further, the adoption of the CC&Rs over a decade ago does not constitute a currently proposed development project at the Dodger Stadium property; rather, as is customary, the CC&Rs provide regulations and standards to maintain the existing stadium uses, including parking, if approvals are sought for additional improvements by the owner of the parking areas. No such development is proposed, and no environmental analysis is required of the speculations of commenters. Refer to Response GO13-12 for discussion of how the Draft EIR adequately analyzes potential growth in the Project Study Area.

Comment GO13-14 III. Conclusion

We have concerns as to whether the DEIR is adequately disclosing, analyzing, and mitigating the Project’s environmental impacts. CEQA requires that Metro’s review adequately identify and analyze the Project’s foreseeable direct, indirect, and cumulative impacts. Thank you for your consideration in this matter. We look forward to reviewing your responses to our comments.

Respectfully submitted,

Paulina Torres
Staff Attorney

Natural Resources Defense Council

Response GO13-14 This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses GO13-2 through GO13-13.

Comment Letter GO14 – LA Parks Alliance, John Given

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO14

Comment GO14-1 This letter is submitted on behalf of LA Parks Alliance¹ with respect to the above-captioned Los Angeles Aerial Rapid Transit Project (the “Project”) in response to the release of the Project’s Draft Environmental Impact Report (“Draft EIR” or “DEIR”).

Footnote 1: LA Parks Alliance was formed in 2019 as a response to land use threats to LA State Historic Park. Its members are park and public space advocates. See <https://www.laparksalliance.org>.

Response GO14-1 This comment provides a general introduction to this letter. Responses to the comments contained in this letter are provided below in Responses GO14-2 through GO14-175.

Comment GO14-2 As an initial matter, please provide me with notice of all hearings, votes, or determinations related to the proposed Project, including timely provision of notices required pursuant to Public Resources Code 21167(f).

Response GO14-2 Metro has and will continue to comply with CEQA. The commenter will be included on the list of notices required pursuant to CEQA.

Comment GO14-3 Note that LA Parks Alliance adopts and incorporates by reference all DEIR comments and objections raised by others during the environmental review process. (See Pub. Res. Code, § 21177.)

Response GO14-3 Refer to Section 6.0, Responses to Comments, of this Final EIR, for responses to all comments received on the Draft EIR.

Comment GO14-4 As explained below in detail, the Draft EIR is deficient in many respects. It is incomplete, inaccurate, misleading, and largely supported by assumptions rather than substantial evidence. Among its more serious deficiencies, some of them fatal to its use as the proposed Project’s environmental document, the DEIR misidentifies Metro as the Lead Agency, misidentifies the Project as public transportation, misidentifies the Project as eligible for SB 44, fails to identify and seek review by all required responsible and trustee agencies, assumes the Project may use state parkland for a significant part of its proposed alignment, and engages in piecemealing by ignoring reasonably foreseeable indirect physical changes in the environment due to the Project. In addition, evidence exists that an endangered species may be adversely affected, and Project approval would raise considerable concerns regarding gentrification and environmental justice.

Response GO14-4 This comment provides a general summary of the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO14-5 through GO14-175.

Comment GO14-5 At the very least, the DEIR must be revised and recirculated after its many deficiencies have been corrected. In the alternative, Metro should seriously consider terminating review of the Project at the outset since it plainly cannot be constructed as currently proposed.

Response GO14-5 This comment and the comments in this letter do not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. Refer to responses to the comments contained in this letter provided in Responses GO14-6 through GO14-175. Pursuant to CEQA, the purpose of the EIR is to provide sufficient information in order for the public and decisionmakers to meaningfully evaluate the proposed Project’s potential environmental impacts. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR.

Comment GO14-6 I. GENERAL COMMENTS

A. Arts District Community Council LA Letter of February 26, 2021

Following close of the Notice of Preparation / Project Scoping for the Project, on February 26, 2021, my office submitted a letter on behalf of Arts District Community Council LA (“ADCCLA”) objecting to Metro’s inadequate Notice of Preparation (“NOP”) issued on or about October 1, 2020. LA Parks Alliance adopts the letter as reflecting its own position on the inadequate NOP, and requests that the DEIR respond to the allegations in that letter as if fully set forth herein.² The following summarizes the February 26, 2021, letter comments and objections.

Footnote 2: The February 26, 2021, letter is attached as Exhibit A. Note that while it was submitted following the close of the formal scoping process, Metro was required to consider the comments in preparation for the Draft EIR and it is already part of the administrative record of the case. (Pub. Res. Code, § 21082.1(b).)

Response GO14-6 Metro has considered the items raised in the referenced letter. Refer to Response GO14-7 for discussion of how the NOP for the proposed Project complied with CEQA. Refer to Response GO14-10 for a discussion of how the proposed Project solely consists of an aerial rapid transit system from LAUS to Dodger Stadium. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of outreach and community

engagement during the Draft EIR public review period and community engagement efforts during the preparation of the Final EIR. Pursuant to the CEQA Guidelines, lead agencies should use a public scoping process to help define the appropriate range of issues, and the depth and breadth of the analysis to be addressed in the environmental document. As discussed in Appendix A and Section 1.0, Introduction, to the Draft EIR, the Draft EIR considered and addressed topics from public comments and questions that were received during the NOP comment period, and at the scoping meetings, related to environmental issues.

Comment GO14-7 The October 1, 2020, Notice of Preparation for the Project is legally inadequate. The appropriate remedy is a revised Notice of Preparation and recirculation with a new review and comment period for responsive and trustee agencies and members of the public. Title 14 of the California Code of Regulations (hereafter “CEQA Guidelines”) requires that an NOP “shall provide the responsible and trustee agencies, the Office of Planning and Research and county clerk with sufficient information describing the project and the potential environmental effects to enable the responsible agencies to make a meaningful response.” (CEQA Guidelines, § 15082(a)(1) (emphasis added).)

The October 1, 2020, NOP is inadequate because it fails to provide sufficient information about the probable environmental effects of the project for responsible agencies to meaningfully respond, and indeed misleads these agencies through use of vague and otherwise inaccurate descriptions of the project. For example, the NOP suggests that there may be no direct impact on LA State Historic Park by describing a direct flyover of the park by the preferred project alternatives as being “in connection with providing additional transit service adjacent to the Los Angeles State Historic Park.” (NOP, p. 2.) A reasonable interpretation by an uninformed reader of the NOP text could include that if an adjacent station is not constructed that the aerial tram would not fly directly over the park. As the February 2021 letter notes, even if the proposed Project did not encroach on and over LA State Historic Park, its development adjacent to the park would still have significant adverse impacts on the Park.

Response GO14-7 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. The proposed Project’s NOP complied with CEQA. CEQA Guidelines section 15082(a)(1) only requires an NOP to include a description of the project, location of the project (either by street address or attaching a map), and the probable environmental effects. The NOP fully complied with Section 15082(1)(a), and provided an adequate project description, the project location (including a map of the routes as well as a narrative description), and probable environmental effects. Contrary to what this comment suggests, CEQA does not require an analysis of the probable environmental effects for the proposed Project in the Notice of Preparation, as that is the role of a Draft EIR. The NOP appropriately identified the environmental areas that would be studied in further detail in the Draft EIR. Further, sufficient

information was provided in the NOP to guide the responsible agency consultation process, as the NOP provided a written project description detailing the components of the proposed aerial gondola system, the proposed route, project location and environmental setting, as well as the overall project purpose. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of the Metro’s consultation with CEQA responsible agencies following the release of the NOP. Refer to Appendix A, Scoping Report, of the Draft EIR, and Appendix A, Public Outreach Report, of the Final EIR, for documentation of notice to responsible agencies at various stages in the environmental review process.

Comment GO14-8 The NOP is also inadequate in that it fails to include a summary of the “[p]robable environmental effects of the project.” (CEQA Guidelines, § 15082(a)(1)(C).) Instead, it lists the entirety of the CEQA Guidelines Appendix G analysis categories, explaining that the Draft EIR to follow will address all of them. While that may be factually accurate, the mere listing of analysis categories to be included in a later environmental review document cannot be understood as a description of “probable environmental effects,” and does not serve to provide responsible agencies with sufficient information to make a meaningful response with respect to the scope of environmental review required. If only generalized information is provided to responsible agencies, only generalized responses will be received from them, which is insufficient to fulfill those agencies’ mandatory NOP response obligations. (See CEQA Guidelines, § 15082(b)(3): “A generalized list of concerns not related to the specific project shall not meet the requirements of this section.”)

Response GO14-8 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Response GO14-7 for discussion of how the NOP for the proposed Project complied with CEQA.

Comment GO14-9 Under CEQA, a “project” is “the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment.” (CEQA Guidelines, § 15378(a) (emphasis added)). Where multiple “activities are part of a coordinated endeavor, among the various steps which taken together obtain an objective, or otherwise related to each other, they constitute a single project for purposes of CEQA.” (County of Ventura v. City of Moorpark (2018) 24 Cal.App.5th 377, 385 [internal quotation marks and citations omitted].) “CEQA ‘cannot be avoided by chopping up proposed projects into bite-size pieces’ which, when taken individually, may have no significant adverse effect on the environment. [Citations.]” (Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora (2007) 155 Cal.App.4th 1214, 1223.) This improper practice is commonly referred to as “piecemealing.”

Response GO14-9 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Because the comment does not address an environmental

issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment GO14-10 The NOP is therefore also inadequate for its incomplete and misleading project description, which must include the readily foreseeable future development at the Dodger Stadium terminus of the Project, where development of some portion of the 260 acres around Dodger Stadium owned or controlled in part by McCourt Global (also owner of the gondola development company ARTT LLC) is plainly foreseeable. McCourt Global’s website included the following statements (published even after the NOP was released):

- “Our current real estate projects include...260 acres of land at Chavez Ravine in Los Angeles.”
- “McCourt currently owns 260 acres of land at Chavez Ravine in Los Angeles, the home of Dodgers Stadium. Among other plans for the area, McCourt will develop a cutting-edge aerial tramway from Los Angeles Union Station to Dodgers Stadium through its company, Aerial Rapid Transit Technologies.”³

Footnote 3: McCourt Global, McCourt / Our Company, last viewed / downloaded May 18, 2021, attached as part of Exhibit B (emphasis added); and McCourt Global, Real Estate Overview, Nov. 26, 2020, last viewed / screen captured Jan. 12, 2022 via “Internet Archive Wayback Machine” (<https://web.archive.org>), attached as part of Exhibit B (emphasis added), available at:

<https://web.archive.org/web/20201126121740/https://www.mccourt.com/real-estate-overview>.

But see McCourt Global, McCourt Partners Real Estate, attached as Exhibit C, available at: <https://www.mccourt.com/real-estate>, last viewed / screen captured Jan. 12, 2022 (scrubbing references to “real estate projects” and “other plans for the area” around Dodger Stadium except the LA ART project. See also lengthy discussion re Dodger Stadium “piecemealing,” *infra* pp. 26-33.

Response GO14-10 This response considers the content of Exhibits B and C to this letter, referenced in this comment. Refer to Response GO14-7 for discussion of how the NOP for the proposed Project complied with CEQA. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Mere statements on a website are not evidence that such development is currently proposed, or are sufficiently firm or committed to such that environmental analysis is required. CEQA does not require such speculation. No

improper segmentation has occurred and the independent utility of the proposed aerial gondola project – the first permanent transit connection to one of the region’s most visited venues– has been well established. Refer to Responses GO14-56 to GO14-66 for a discussion of how the Draft EIR considered all reasonably foreseeable potential impacts associated with the proposed Project.

Comment GO14-11 The failure to include any information in the NOP about this clearly foreseeable development associated with the proposed Project precluded responsible agencies and members of the public from providing meaningful responses on the “whole of the project.” This comment is expanded upon at length below, as the Draft EIR suffers from the same fatal flaw.

Response GO14-11 Refer to Response GO14-10 for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Response GO14-7 for discussion of how the NOP for the proposed Project complied with CEQA. Agencies and members of the public were not precluded from providing meaningful comments on the NOP or the Draft EIR. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during the scoping period led directly to changes to the proposed Project to incorporate public feedback.

Comment GO14-12 The February 2021 letter also criticizes the description of project alternatives, which then included only the so-called Spring Street alternative, the Broadway alternative, and the no-project alternative. The letter concludes by noting that the inadequate NOP frustrated members of the public, including members of ADCCLA. Its inadequacies interfered with their ability to provide informed comment to the lead agency, and ADCCLA requested that a revised, legally sufficient NOP be recirculated and a new comment period provided.

Response GO14-12 Refer to Response GO14-7 for a discussion of how the NOP for the proposed Project complied with CEQA. CEQA Guidelines section 15082(a)(1) only requires an NOP to include a description of the project, location of the project (either by street address or attaching a map), and the probable environmental effects. CEQA does not require a full and complete accounting of potential Project alternatives in the NOP as this comment suggests. Indeed, the NOP process is intended to allow stakeholders and members of the public to provide comments on the scope and contents of the EIR, including any potential alternatives they wish to see analyzed. Agencies and members of the public were not precluded from providing meaningful comments on the NOP

or Draft EIR. Refer to Response GO14-11 for a discussion of the discussion of the proposed Project’s public outreach during the NOP scoping period.

Comment GO14-13 Subsequently, ADCCLA, through LA Parks Alliance’s letter of December 19, 2022, asserts that Metro was improperly designated as the lead agency under CEQA, and no longer requests that Metro revise and recirculate a legally adequate NOP. Instead, because Metro cannot be designated as the lead agency pursuant to CEQA Guidelines Section 15051, both ADCCLA and LA Parks Alliance request that Metro refrain from further environmental review of the Project and instead allow the properly designated CEQA lead agency, the City of Los Angeles, to begin the environmental process anew.⁴

Footnote 4: See John P. Given, letter to Metro Deputy Executive Officer Corey Zelmer (“Objection to Metro as Lead Agency”), Dec. 19, 2022, already a part of the Project record as a comment to the DEIR, and available at <https://www.laparksalliance.org/2022/12/21/objection-to-metro-as-lead-agency/>.

Response GO14-13 Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority. Metro has discretionary authority to review and approve “[a]ll plans proposed for the design, construction, and implementation” of the proposed Project (Public Utilities Code § 130252), which will include several discretionary approvals (multiple approvals of design and construction plans, approvals and agreements contemplated in the Memorandum of Agreement and subsequent amendments, agreement to integrate fares with Metro’s fares / one tap system). This discretionary authority is considerably more broad than the individual land use and other review and approvals to be issued by responsible agencies for the components of the proposed Project occurring within their jurisdiction. In short, Metro has “the greatest responsibility for supervising or approving the project as a whole” and is the appropriate lead agency. (CEQA Guidelines, §15051(b) [emphasis added].) Simply because other agencies have approval authority for the proposed Project, does not mean that Metro does not have the “principal responsibility” for approving or supervising the proposed Project. Indeed, CEQA recognizes that multiple agencies may have authority over a project. Therefore, CEQA includes the responsible agency process and consultation requirements in order for other agencies to provide necessary review and approval of aspects of a project. (Pub. Resources Code, §§ 21067, 21069.) The proposed Project would require review and approvals from Caltrans, State Parks, the City, and Cal/OSHA, as responsible agencies, in addition to review and approval by Metro as lead agency. Responsible agencies’ discretionary approvals required for the proposed Project are secondary to Metro’s statutory authority to review and approve transportation projects, and the City and other agencies were appropriately named

as responsible agencies. Further, Metro engaged in required consultation with all responsible agencies during the process of preparing the Draft EIR for the proposed Project, in compliance with CEQA. This consultation process included meetings with Metro and the responsible agencies to discuss the scope and content of the environmental information that Metro would include in the Draft EIR (Pub. Resources Code, § 21080.4(b); CEQA Guidelines § 15104), additional consultation with the City and State Parks as Draft EIR preparers, and comments from these responsible agencies on the Draft EIR (Pub. Resources Code, § 21153(c); CEQA Guidelines, § 15086(c).) This consultation process will continue throughout the course of the environmental review process. Consultation helps ensure that the EIR includes the necessary analysis regarding environmental effects within a responsible agency’s jurisdiction to allow that agency to rely on the EIR, if ultimately certified, when considering the necessary approvals for the proposed Project that fall under its regulatory authority. As set forth in Section 2.0, Project Description, of the Draft EIR, if Metro certifies the Final EIR, each responsible agency will then conduct its own discretionary review process for the Project approvals it is responsible for. This comment references a letter from John P. Given to Metro Deputy Executive Officer Corey Zelmer (“Objection to Metro as Lead Agency”), Dec. 19, 2022. Refer to Responses GO8-1 through GO8-22 for responses to that letter.

Comment GO14-14 B. Metro Ignored Mandatory Project Review by Responsible and/or Trustee Agencies.

The “State Clearinghouse” is responsible for managing CEQA review for state agencies. (CEQA Guidelines, § 15205.) The lead agency has a mandatory duty to provide sufficient copies of an EIR to the State Clearinghouse so it may distribute them for agency review and comment for all agencies that are either “a responsible agency, trustee agency, or otherwise [have] jurisdiction by law with respect to the project” or when the project is identified “as being of statewide, regional, or areawide significance.” (Ibid., subd. (b)(2)-(3).)

The Project fits both requirements. Review is required by many state agencies, including several trustee agencies. The Project is also one of “statewide, regional, or areawide significance” under CEQA Guidelines Section 15206 as the Project is within and would substantially impact the Santa Monica Mountains Zone as defined in the Public Resources Code, which includes virtually the entire Project area. (See CEQA Guidelines, § 15206, subd. (b)(4).) Public Resources Code Section 33105 states, in relevant part (emphasis added):

Response GO14-14 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Consistent with the requirements of CEQA Guidelines section 15205(b)(2)-b(3), prior to the release of the Draft EIR, Metro submitted the required documentation of the release of the Draft EIR to the State Clearinghouse (SCH # 2020100007). Documentation of submittal of the Draft EIR to the State

Clearinghouse is available on the SB 44 website for the proposed Project.⁹ Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of the Metro’s consultation with CEQA responsible agencies. Refer to Appendix A, Scoping Report, of the Draft EIR, and Appendix A, Public Outreach Report, of the Final EIR, for documentation of notice to responsible agencies at various stages in the environmental review process. Refer to Response G014-16 for discussion of Metro’s consultation with CEQA trustee agencies.

Comment G014-15 The [Santa Monica Mountains Zone] shall also include Elysian Park and El Pueblo de Los Angeles State Historic Park and, for purposes of providing a recreational trail corridor, it shall also include hiking and equestrian trail connections and accessways between Griffith Park, Elysian Park, and El Pueblo de Los Angeles State Historic Park.

The entire Santa Monica Mountains Zone also falls within the state-designated Rim of the Valley Trail Corridor, for which a Master Plan was adopted in June 1990. (See Pub. Res. Code, §§ 33105.5, 33204.3 et seq.) The Rim of the Valley Corridor, including the entirety of the Santa Monica Mountains Zone, has been proposed to be added as a boundary adjustment to an expansion of the National Park Service’s Santa Monica Mountains Recreation Area.⁵

Among the documents provided to the public by Metro when it released the Project’s Draft EIR are a “Notice of Completion & Environmental Document Transmittal” and “Summary Form for Electronic Document Submittal.”⁶ The Notice of Completion lists a “Reviewing Agencies Checklist” to allow the lead agency to request the State Clearinghouse to distribute the Notice and Draft EIR documents to reviewing agencies so that those agencies can fulfill their CEQA comment obligations. (Notice of Completion, p. 2.) The Summary Form similarly allows the lead agency to provide a list of responsible or trustee agencies to the State Clearinghouse. (Summary Form, p. 2.)

Footnote 5: See Exhibit D, which includes: Santa Monica Mountains Conservancy (SMMC), Rim of the Valley Trail Corridor Boundary map and excerpts from Rim of the Valley Trail Corridor Master Plan; National Park Service, Rim of the Valley Unit Proposed Addition to Santa Monica Mountains National Recreation Area. SMMC’s entire ROV Master Plan is available at:

https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=&ved=2ahUKEwi1_YmO88z8AhWjKkQIHUZLCPEQFnoECAYQAQ&url=https%3A%2F%2Fsmmc.ca.gov%2Fwpcontent%2Fuploads%2F2020%2F04%2FROV-Master-Plan.pdf&usg=AOvVaw0pYr2L5XdpzX_kj982-GC6.

Footnote 6: As of December 21, 2022 the documents seem to no longer be available at Metro’s web page for the Project (<https://www.metro.net/projects/aerial-rapid->

⁹ Refer to Remainder of the Record category at <https://laartsb44.net/#!/documents>.

transit/) or in the related Dropbox file link found on that page for the DEIR and other documents. They should be a part of the Project record, but are attached as part of Exhibit E.

Response GO14-15 This comment provides a general recitation and characterization of the CEQA statute and regulations. This response considers the content of Exhibit D to this letter, referenced in this comment. Refer to Response GO14-16 for discussion of consultation with CEQA trustee agencies, including Santa Monica Mountains Conservancy. All documents for the SB 44 administrative record for the proposed Project, including State Clearinghouse Documents filed at the time the Draft EIR was released, are available on the proposed Project’s SB 44 website.¹⁰ In response to comments regarding the Rim of the Valley Trail Corridor, an addition to the Draft EIR has been provided for the Rim of the Valley Trail Corridor Master Plan. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of the Rim of the Valley Trail Corridor Master Plan. As noted therein, while the proposed Project is located within the boundaries of the Rim of the Valley Trail Corridor, the proposed Project would have no impact on the Rim of the Valley Trail, which is located north of Elysian Park, across Interstate I-5. The proposed Project would provide access to and connectivity between El Pueblo, Los Angeles State Historic Park, and Elysian Park.

Comment GO14-16 Metro failed to include at least two state agencies that should have received notice and copies of the Draft EIR on the Notice of Completion form as required. The first, the Santa Monica Mountains Conservancy (“SMMC”), is a designated trustee agency over resources within the Project area. (See Pub. Res. Code, § 33105, quoted above.)⁷ It was not listed on either State Clearinghouse Form.⁸

The second state agency Metro failed to notify, the California Department of Housing and Community Development (“HCD”), has responsibilities which include ensuring every California city (whether a general law or charter city) assesses, analyses, and plans for “an inventory of land suitable and available for residential development, including vacant sites and sites having realistic and demonstrated potential for redevelopment during the planning period to meet the locality’s housing need” for various income levels. (Cal. Gov. Code, § 65583, subd. (a)(3).) It was likewise not listed on either State Clearinghouse Form.

The Surplus Lands Act (Govt. Code sections 54220-54234) provides for a right of first refusal to other public agencies whenever a local agency proposes to dispose of surplus land. A notice of availability requirement is applicable to both the SMMC and the HCD. (Govt. Code, §§ 54222, 54230.5.) Sales and leases of surplus lands generally qualify as dispositions requiring approval of HCD before sale or lease of surplus land can be finalized. (Govt. Code, §54230.5, subd. (b)(1).)⁹ Similarly, California law requires that the sale of any property by a public agency within the Santa Monica Mountains Zone requires offering the land to the SMMC first:

¹⁰ Refer to Remainder of the Record category at <https://laartsb44.net/#!/documents>.

Footnote 7: See also, Supervising Deputy Attorney General Christina Bull Arndt, letter to Executive Director Joseph T. Edmiston, Santa Monica Mountains Conservancy, July 26, 2021, attached as Exhibit F. “The Conservancy meets the definition of a trustee agency because it is a state agency which has jurisdiction over the natural resources of the [Santa Monica Mountains] Zone, which it holds in trust for the people of California...[T]he Conservancy should be considered a trustee agency for any CEQA project which affects natural resources within the Zone.” (Exhibit F, p. 3.)

Footnote 8: Curiously, the Notice of Completion lists a similar agency, the “California Baldwin Hills Conservancy (BHC),” as a reviewing agency for the Project even though at closest Baldwin Hills is approximately seven miles distant from, and has no resources near or within, the Project area. For more information, see <http://bhc.ca.gov>.

Footnote 9: See also, HCD’s Surplus Lands Act FAQ, available at: <https://www.hcd.ca.gov/docs/planning-andcommunity-development/slafaq.pdf>.

Response GO14-16 This response considers the content of Exhibit F to this letter, referenced in this comment. Refer to Section 1.0, Introduction, of the Draft EIR, for discussion of the CEQA Responsible and Trustee Agencies. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of the Metro’s consultation with CEQA responsible agencies. Refer to Appendix A, Scoping Report, of the Draft EIR, and Appendix A, Public Outreach Report, of the Final EIR, for documentation of notice to responsible agencies at various stages in the environmental review process. Metro has complied, and will continue to comply, with the CEQA requirements for consultation with responsible agencies at each stage of the environmental review process. This consultation process has included meetings with Metro and the responsible agencies to discuss the scope of environmental review, additional consultation with the City and State Parks as Draft EIR preparers, and comments from responsible agencies on the Draft EIR. This consultation process will continue throughout the course of the environmental review process. Santa Monica Mountains Conservancy (“SMMC”) has no discretionary approval authority related to the proposed Project; however, Metro notified SMMC as a trustee agency.¹¹ CEQA defines a “trustee agency” as “a state agency that has jurisdiction by law over natural resources affected by a project, that are held in trust for the people of the State of California.” (Public Resources Code, § 21070.) Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for a discussion of the Surplus Land Act. HCD is not a responsible agency for the proposed Project as it does not have responsibility for carrying out or approving the proposed Project and does not have discretionary authority related to the proposed Project. (Public Resources Code § 21069.) Refer to

¹¹ Los Angeles County Metropolitan Transportation Authority (LA Metro). 2023. Los Angeles Aerial Rapid Transit Project Email from Cory Zelmer to info@smmc.ca.gov.

Section 2.10, Required Permits and Approvals, of the Draft EIR, which provides a list of the potential discretionary entitlements, reviews, and approvals required for implementation of the proposed Project.

Comment GO14-17 The conservancy shall have the first right of refusal on any property within the zone presently owned by a public agency and scheduled for disposal as excess lands, except where such lands are designated for acquisition as a park or recreation area by a federal, state, or local agency. The conservancy shall have the right to acquire such lands at the disposing agency's purchase price plus any administrative and management costs incurred by the disposing agency. (Pub. Res. Code, § 33207(b).)

The DEIR describes public lands within the City of Los Angeles as potential sites for several Project components. For example, “the proposed Alameda Tower, which would be constructed on the Alameda Triangle, a portion of City ROW between Alameda Street, North Main Street, and Alhambra Street.” (DEIR, p. ES-4.) “The proposed Alpine Tower would be constructed at the corner of Alameda Street and Alpine Street on city-owned property.” (Ibid.) “[T]he proposed Chinatown/State Park Station would be constructed partially on City ROW and partially within the boundaries of the Los Angeles State Historic Park.” (Ibid.)

The City of Los Angeles maintains and periodically publishes a list of declared and undeclared surplus properties that can be reviewed by registering for and then downloading them from the Department of General Services website.¹⁰ Review of recently downloaded declared and undeclared surplus properties lists discloses that none of the site described in the DEIR were listed as either declared or undeclared surplus properties when the DEIR was released.¹¹

Before the City of Los Angeles may dispose of any of the lands described in the DEIR as city-owned, under the Surplus Lands Act it must notify both SMMC and HCD that the lands are surplus and follow the appropriate legal process before it may dispose of them for the benefit of a private project, including the LA-ART gondola Project. But Metro's State Clearinghouse submissions failed to identify SMMC and HCD as responsible agencies and failed to identify SMMC as a trustee agency. There is no indication that either agency has had any notice of the Project, let alone adequate notice.

Footnote 10: See <https://gsd.lacity.org/services/integrated-asset-services/property>.

Footnote 11: See “City of Los Angeles – Surplus Declared Properties as of (12/6/2022)” and “City of Los Angeles – Surplus Undeclared Properties as of (12/6/2022)” downloaded from the General Services website on December 20, 2022, attached as Exhibit G.

Response GO14-17 This comment provides a general recitation and characterization of California law, case law, and/or regulations, and the Draft EIR. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for a

discussion of the Surplus Lands Act. Refer to Response GO14-16 for discussion of consultation with CEQA trustee agencies, including Santa Monica Mountains Conservancy and HCD. Documents for the SB 44 administrative record for the proposed Project, including State Clearinghouse Documents filed at the time the Draft EIR was released, are available on the proposed Project’s SB 44 website.¹²

Comment GO14-18 LA Parks Alliance notes that it is highly unlikely that the proposed site for the Alpine Tower Project component, described as “currently being used as non-public parking storage for City vehicles” (DEIR, p. ES-8), would be available to the proposed Project given its highly suitable location for affordable housing. Affordable housing is particularly appropriate at sites near public transit. The parcel at the proposed Alpine Tower location is approximately 700 feet from Metro’s Gold Line Chinatown station, less than half a mile from LA Union Station, and located between and at most only a few hundred feet from existing major bus route stops along Alameda Street. (See DEIR, Table 3.17-1 and Figure 3.17-2, pp. 3.17-13 to 3.17-16.)¹² If desired, bus stops could be added or re-located nearer to the parcel to be even more convenient for a future affordable housing project at the site.

There are numerous state incentives for housing opportunities near public transit. California’s Density Bonus Law, for example, allows affordable housing projects to reduce or eliminate parking, providing a major cost benefit for affordable projects. (See generally, Govt. Code, §§ 65915-65918). HCD has an Affordable Housing and Sustainable Communities Program, which “funds land-use, housing, transportation, and land preservation projects to support infill and compact development that reduce greenhouse gas (“GHG”) emissions.”¹³ The City of Los Angeles has its own Transit Oriented Communities Affordable Housing Incentive Program and Guidelines which in some respects exceeds the baseline requirements of the State Density Bonus Law. (See Los Angeles Municipal Code (“LAMC”), § 12.22 A.31.)

For the preferred alternative of the Project to proceed, it would almost certainly have to undergo a major design overhaul to relocate the Alpine Tower, as there is very little chance a tower could be constructed at the desired site given the site’s suitability for a far more urgent need with legally superior right to the site than a private gondola project. Moreover, the environmentally superior alternative, the Transportation Systems Management Alternative, remains available, and with only modest modifications could easily achieve most Project goals, leaving the proposed Alpine Tower site for its more suitable use as affordable housing.

Footnote 12: As the County’s regional transportation authority, Metro is particularly well suited to analyze the suitability of the site for affordable housing with respect to proximity of existing public transit options.

¹² Refer to Remainder of the Record category at <https://laartsb44.net/#!/documents>.

Footnote 13: For more information, see <https://www.hcd.ca.gov/grants-and-funding/programs-active/affordablehousing-and-sustainable-communities>.

Response GO14-18 This comment provides a general recitation and characterization of statutes and regulations. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing, including at the Alpine Tower’s location, and how the Alpine Tower’s location considered and avoided the anticipated 903 North Main Street Homeboy housing project. Furthermore, refer to Topical Response E for discussion of how development of housing is constrained on the portion of 901 North Main where the proposed Alpine Tower would be located due to the proximity to the Metro L Line (Gold) tracks. The proposed Alpine Tower would be located on a triangular portion of 901 North Main Street between the Metro L Line (Gold) tracks and Alameda and Alpine Streets, and this property was previously analyzed by the City of Los Angeles’ City Administrative Officer, describing it as unsuitable for housing. Compliance with Metro’s requirements for construction design in locations adjacent to Metro’s systems further restricts the ability for development on the portion of 901 North Main Street between the Metro L Line (Gold) tracks and Alameda and Alpine Street. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park.

Comment GO14-19 Metro’s failure to provide notice to SMMC and HCD requires, at the least, an immediate extension of the comment period so that these agencies have sufficient time to study the Draft EIR with respect to Project concerns related to their respective jurisdictions. The DEIR is inadequate for its failure to identify the clearance required by HCD before any of the City public land identified by the DEIR may be transferred to a private party to construct or operate the Project. It is further inadequate for failing to identify the potentially significant land use conflicts under the Surplus Lands Act and Public Resources Code related to the public interest and resources identified in those statutes. The environmental review process cannot proceed until this serious procedural error has been fully remedied.

Response GO14-19 Refer to Responses GO14-16 through GO14-18 for a discussion of Metro’s consultation with responsible and trustee agencies, including SMMC¹³ and HCD, as

¹³ Los Angeles County Metropolitan Transportation Authority (LA Metro). 2023. Los Angeles Aerial Rapid Transit Project Email from Cory Zelmer to info@smmc.ca.gov.

well as the Surplus Land Act. Compliance with the Surplus Land Act, should it apply, is separate and distinct from the CEQA environmental process and the purpose of environmental review. Refer to Appendix A, Public Outreach Report, of this Final EIR, for an overview of the Draft EIR public review period. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. No further extension is required; as discussed in Response GO14-16, the required consultation and notice has occurred.

Comment GO14-20 C. The Project is Not a Public Transit Project Eligible for SB 44 Streamlining

As discussed briefly in an earlier DEIR comment letter, the Project is not a public transit project, as it is proposed to be privately owned and operated and intended primarily to provide service to and from Dodger Stadium, a private sports and event venue.¹⁴ It is therefore not eligible for SB 44 streamlining as an environmental leadership transit project (“ELTP”) as claimed in the DEIR. (DEIR, pp. 1-4 to 1-9.) The Draft EIR is therefore inaccurate and misleading and fails as an informational document for including these false claims. Moreover, since the Project is not eligible for SB 44, any attempt by Metro to limit the exercise of project objectors’ rights under generally applicable law that does apply would violate CEQA’s strict procedural mandates and likewise allow for objectors to seek an appropriate legal remedy.

Footnote 14: See Given letter, pp. 8-10, supra p. 4 fn. 4.

Response GO14-20 This comment provides a general recitation and characterization of CEQA, including SB 44. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to the Responses for GO8 responses to the referenced letter in the footnote to this comment. As provided in Appendix R, Senate Bill 44 (Public Resources Code Section 21168.6.9), of the Draft EIR, SB 44 establishes specified procedures for the administrative and judicial review of the environmental review and approvals granted for an environmental leadership transit project, including that actions or proceedings seeking judicial review of the certification of an environmental impact report for an environmental leadership transit project or the granting of any project approval, including any appeals to the court of appeal or the Supreme Court, to be resolved, to the extent feasible, within 365 calendar days of the filing of the certified record of proceedings with the court to an action or proceeding seeking judicial review of the lead agency’s action related to an environmental leadership transit project. SB 44 accordingly does not abrogate CEQA’s requirements, but imposes timing requirements to ensure an efficient judicial review process for both petitioners and the lead agency alike. Further, Metro has complied with and will continue to comply with all of CEQA’s requirements.

Comment GO14-21 The mandatory requirements for SB 44 are found in Public Resources Code section 21168.6.9. An ELTP is a “project to construct a fixed guideway and related fixed facilities that meets all” of the conditions of subdivision (a)(1) of that statute. The first requirement is the project be a “fixed guideway operating at zero emissions.” The ELTP statute uses the federal definition for “fixed guideway” found in Chapter 53 (Public Transportation) of the United States Code. (Pub. Res. Code, § 21168.6.9, subd. (a)(2), citing 49 U.S.C. § 5302.)

Under federal law, a “fixed guideway” is precisely defined as follows:

Fixed guideway.—The term “fixed guideway” means a public transportation facility—

- (A) using and occupying a separate right-of-way for the exclusive use of public transportation;
- (B) using rail;
- (C) using a fixed catenary system;
- (D) for a passenger ferry system; or
- (E) for a bus rapid transit system.

(49 U.S.C. § 5302, subd. (8).)

The term “public transportation” used in the definition for “fixed guideway” is further defined as follows. “Public transportation:”

(A) means regular, continuing shared-ride surface transportation services that are open to the general public or open to a segment of the general public defined by age, disability, or low income; and

(B) does not include—

- (i) intercity passenger rail transportation provided by the entity described in chapter 243 (or a successor to such entity);
- (ii) intercity bus service;
- (iii) charter bus service;
- (iv) school bus service;
- (v) sightseeing service;
- (vi) courtesy shuttle service for patrons of one or more specific establishments; or
- (vii) intra-terminal or intra-facility shuttle services.

(49 U.S.C. § 5302, subd. (15).)

The proposed Project is not “public transportation” within the meaning of federal law.

Response GO14-21 This comment provides a general recitation and characterization of Senate Bill (SB) 44 and federal statutes. Refer to Topical Response A, SB 44, for discussion of the proposed Project’s consistency with the requirements of SB 44. As discussed in Topical Response A, the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Comment GO14-22 First, the Project is not a “regular, continuing shared-ride surface transportation” service. It is not “regular” and “continuing.” The Project is intended primarily to provide “a direct transit connection between LAUS and the Dodger Stadium property...” (DEIR, p. 2-12.) On non-game and non-event days, the Project would operate at the discretion of the operator, not on a regular schedule: “It is anticipated that the proposed Project operations would vary the number of cabins in service and speed throughout the day, based on demand.” (DEIR, p. 2-42 (emphasis added).) Compare this demand-based operational decision-making to the continuing and regular Gold Line and local bus route schedules, which operate each day on a published schedule without respect to day-to-day demand.

Moreover, the Project’s proposed use for other purposes, including travel to and from Dodger Stadium for use by community members in neighborhoods near Dodger Stadium are entirely speculative. See DEIR, p. ES-10: “The Project Sponsor will request consideration by the Los Angeles Dodgers of the potential for the Dodger Stadium Station to include a mobility hub where outside of game day periods, passengers would be able to access a suite of first and last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon.”

The decision to operate based on commercial demand rather than on a regular schedule, and speculative permissive use by a separate entity to allow operation on some days but not others mean the Project is not “regular” and “continuing” and therefore is not “public transportation” under applicable federal law.

Response GO14-22 Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Further, as discussed in Section 2.0, Project Description, of the Draft EIR, while the proposed Project may “vary the number of cabins in service and speed throughout the day, based on demand,” just as Metro trains and buses do, the proposed Project would operate under a pre-determined, regular operating hour schedule. As discussed in Section 5.0, Corrections and Additions, of the Final EIR, the proposed Project would provide a mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first/ last mile multi-modal options, such as a bike share program and

individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon.

Comment GO14-23 Second, the Project would not provide surface transportation at all, as it is an aerial tramway. It is designed and intended to carry its passengers above surface transportation, to entirely avoid vehicle traffic. Consideration of the project types that may be considered a “fixed guideway” is informative. (See 49 U.S.C. § 5302, subd. (8), which lists only rail, fixed catenary systems, passenger ferry systems, and bus rapid transit systems.) None are or include aerial, non-surface transportation, such as a gondola or aerial tram.

Response GO14-23 This comment provides a general recitation and characterization of the federal statutes. Refer to Topical Response A, SB 44, of the Final EIR, for discussion of how, as an aerial tramway, the proposed Project is a fixed guideway, consistent with FTA precedent.

Comment GO14-24 Third, on game and event days at Dodger Stadium, the Project would not be “open to the general public or open to a segment of the general public defined by age, disability, or low income.” The Project would prioritize Dodger ticket holder (and presumably special event use) (DEIR, p. 3.17-25) and may entirely exclude the “general public” at those times. Such limitations show the Project is not “public transportation” as defined in section 5302 subdivision (A). In fact, such limitations cause the Project to be more accurately described as a “courtesy shuttle service for patrons of one or more specific establishments,” which is specifically excluded from being considered “public transportation” under section 5302 subdivision (B).

Response GO14-24 This comment provides a general recitation and characterization of the federal statutes. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Comment GO14-25 The DEIR also describes the Project’s use for tourism. “Tourism ridership would be driven by the proposed Project capturing a share of the existing tourism market in Los Angeles, particularly for tourists to downtown Los Angeles visiting other attractions.” (DEIR, p. 3.17-25.) But “sightseeing” services for tourism are also specifically excluded from consideration as “public transportation” under relevant federal law. (49 U.S.C. § 5302, subd. (15)(B)(v).)

Response GO14-25 This comment provides a general recitation and characterization of the federal statutes. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. The proposed Project is not a sightseeing service. As discussed in Section 2.3.7, Purpose and Need, of the Draft

EIR, the proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment GO14-26 The Project is not “public transportation.”

Since the first requirement of a “fixed guideway” is that it be a “public transportation facility” the Project cannot be considered a “fixed guideway” and on that basis does not qualify for SB 44 ELTP streamlining. But even assuming the Project could be considered “public transportation,” which plainly based on a textual analysis of the federal statute it cannot be, other section 5302 requirements are also not met.

Notwithstanding the DEIR's contrary conclusion, the project would not “us[e] and occupy[] a separate right-of-way for the exclusive use of public transportation.” The DEIR claims, “the proposed Project would exclusively use and occupy the airspace above the public right-of-way through a franchise agreement with the City of Los Angeles” and “[f]or that reason, the proposed Project, as a type of aerial tramway, is properly classified as a “fixed guideway” as defined by SB 44.” (DEIR, p. 1-5) This analysis is incomplete, inaccurate, and misleading.

The Project's surface components would be built primarily (but not exclusively) within an existing City right-of-way that is used primarily by surface vehicles (DEIR, p. ES-4). Only the aerial components of the Project would be constructed and operated above that right of way, but they would also not operate exclusively in that area. The Project would use other areas in addition to the City's right of way areas for its operation. It would also use airspace above private properties, above Los Angeles State Historic Park, above Metro's Gold Line, and above the SR-110 freeway. (ES-4 to ES-7.) It's queuing areas could also be expected to use surface area space dedicated to other purposes. (See, e.g., ES-8, describing queuing areas located “in a proposed new pedestrian plaza at El Pueblo...”)

Response GO14-26 This comment provides a general recitation and characterization SB 44. Refer to Response GO14-22 for a discussion of the proposed Project is public transit. As discussed in Topical Response A, SB 44, the FTA considers aerial tramways fixed guideways for purposes of the definition in Section 5302. Federal law does not require use of exclusive rights-of-way for all components of a transit service. The proposed Project would operate primarily over the public ROW and publicly owned property to minimize aerial rights requirements over private properties, taking into account existing and future adjacent land uses. Federal law does not prohibit aerial tramways from acquiring aerial rights for portions of the separate right of way for its use.

Comment GO14-27 And the Project proposes to use significant surface area of the Los Angeles State Historic Park. (DEIR, p. 3.11-38: “The Chinatown/State Park Station would have a footprint of 2,195 square feet in the park, and the station canopy would have an overhang of 9,320 square feet over the park.”) It is evident from information included in the DEIR that the Project would not use and occupy a separate right-of-way for the exclusive use of public transportation, since it would also use spaces within several parks and other public and private spaces that are not reserved for the exclusive use of public transportation. Even the surface area of City rights-of-way where Project components would be built (and over which they would “overhang,” as the DEIR describes it, see, e.g., DEIR, pp. 2-51 to 52), are not exclusively used for public transportation, as they are roadways open for ordinary vehicle traffic.

Response GO14-27 Refer to Response GO14-26 for a discussion of how the proposed Project would primarily over the public ROW and publicly owned property to minimize aerial rights requirements over private properties. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Comment GO14-28 The DEIR fails to provide a meaningful SB 44 analysis including the Project’s anticipated use of the described ground and airspaces that are proposed to be used by the Project that are not reserved for the exclusive use of public transportation. The DEIR’s conclusory statement about only one part of the Project that uses an aerial portion of the City right-of-way is in no way adequate to show it meets all of section 5302’s requirements.

Response GO14-28 Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Public Resources Code section 21168.6.9 does not require the EIR to include an assessment of the applicability of

SB 44 to the proposed Project. Nevertheless, Section 1.4.3, Senate Bill 44, of the Draft EIR, includes an assessment of the proposed Project's compliance with SB 44.

Comment GO14-29 To complete the analysis under section 5302, the Project is not a "rail" project. It does not use a "fixed catenary system."¹⁵ It is not for a "passenger ferry system" or a "bus rapid transit system." (49 U.S.C. § 5302, subds. (8)(B)-(E).)

As the Project does not meet any of the basic requirements of relevant federal law to be considered a "fixed guideway facility" it is clearly not eligible for SB 44 streamlining status. This is, without more, sufficient to show that the Project is not eligible as an environmental leadership transit project under SB 44.¹⁶

Footnote 15: "[A] catenary is a system of overhead wires used to supply electricity to a locomotive, streetcar, or light rail vehicle which is equipped with a pantograph. The pantograph [sic] presses against the underside of the lowest overhead wire, the contact wire." Southeastern Pennsylvania Transportation Authority (SEPTA), What is a Catenary?, July 13, 2017, <https://iseptaphilly.com/blog/catenary>. The Metro Gold Line is such a system. (DEIR, p. 5-61.)

Footnote 16: Notably, and as discussed in LA Parks Alliance's earlier letter, ARTT LLC has even argued that its Project is not a "transit guideway system." See Given letter, supra note 4, p. 8, fn. 9.

Response GO14-29 This comment provides a general recitation and characterization of federal statutes. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Response GO8 for a response to the letter referenced in Footnote 16. As discussed in GO8-19, the comment cites a document predating the initiation of environmental review for the proposed Project, which accordingly has no bearing on the sufficiency of the Draft EIR. Further, for the proposed Project, Metro is tasked with approving all plans for design, construction, and implementation, as well as with providing the proposed Project written approvals to operate, pursuant to its authority under Public Utilities Code section 130252.

Comment GO14-30 But the requirement to be a "fixed guideway facility" is but one of SB 44's requirements. Among other things, the DEIR must also demonstrate that the Project "reduces emissions by no less than 50,000 metric tons of greenhouse gases directly in the corridor of the project defined in the applicable environmental document over the useful life of the project, without using offsets," "reduces no less than 30,000,000 vehicle miles traveled in the corridor of the project defined in the applicable environmental document over the useful life of the project," and that it is consistent with applicable planning and transportation strategies. (Pub. Res. Code, § 21168.6.9, subds. (1)(B)-(E).) The DEIR analysis of these additional requirements is likewise inadequate, inaccurate, and incomplete for the DEIR's failure to consider and analyze the readily foreseeable future development at the Dodger Stadium terminus of the

Project, a significant and fatal flaw which will be discussed further below.¹⁷ Dodger Stadium development would draw passenger vehicles to the Project area that are not considered in any DEIR analysis category, and invalidate all conclusions with respect to reduction of greenhouse gas emissions, vehicle miles traveled, and consistency with applicable planning and transportation strategies.

Footnote 17: See also, comments re NOP, supra pp. 2-4.

Response GO14-30 This comment provides a general recitation and characterization of SB 44. Refer to Topical Response A, SB 44, of the Final EIR, for discussion of how, as an aerial tramway, the proposed Project is a fixed guideway, consistent with FTA precedent, and how the proposed Project would operate at zero emissions, with the electrical power for the proposed Project supplied by the City of Los Angeles Department of Water and Power (LADWP) through the utility's Green Power Program, pursuant to GHG-PDF-A. Further, refer to Section 1.0, Introduction, of the Draft EIR, pages 1-4 through 1-9, for analysis of the proposed Project's compliance with SB 44. As discussed therein, the proposed Project would reduce emissions by no less than 50,000 metric tons of greenhouse gases directly in the proposed Project's corridor as defined within the EIR over the useful life of the proposed Project, and, without using offsets, the proposed Project's lifetime VMT reduction over its useful life (30 years based on SCAQMD's guidance for GHG significance thresholds) would be a reduction of greater than 30,000,000 VMT at 129,629,500 VMT saved, substantially more VMT saved than is required under SB 44. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property..

Comment GO14-31 "Full compliance with the letter of CEQA is essential to the maintenance of its important public purpose. Reviewing courts have a duty to consider the legal sufficiency of the steps taken by [administrative] agencies [citation], and we must be satisfied that these agencies have fully complied with the procedural requirements of CEQA, since only in this way can the important public purposes of CEQA be protected from subversion." (Envtl. Prot. Info. Ctr. v. Johnson (1985) 170 Cal.App.3d 604, 622-623 (citations and internal quotation marks removed, emphasis added).) The Project is not eligible for SB 44 as an environmental leadership transit project. The environmental review process must therefore follow CEQA's generally applicable procedural mandates.

Response GO14-31 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Topical Response A, SB 44, and Responses GO14-20 to GO14-30, for discussion of the proposed Project's consistency with the

requirements of Senate Bill (SB) 44. Metro has complied with and will continue to comply with CEQA's requirements.

Comment GO14-32 D. No Part of Los Angeles State Historic Park is Available for Sale or Lease for Commercial Purposes; Proposed Entitlements from California Department of Parks and Recreations to Allow Use of the Park cannot be Granted.

1. Proposed Use of Los Angeles State Historic Park.

The preferred Project alignment proposes the use of land and airspace at and above Los Angeles State Historic Park ("LASHP"). (DEIR, p. ES-4.) The DEIR describes the Project's Chinatown/State Park Station as "constructed partially on City ROW and partially within the boundaries of" LASHP, suggesting that the station is evenly shared between City land and the park. (Ibid.) The more accurate description for those who venture beyond the DEIR's executive summary, discloses that the station uses far more parkland than City ROW:

The station would have a footprint of 2,605 square feet, comprised of 410 square feet located on City ROW and 2,195 square feet in the park. The station canopy would have an overhang of 15,030 square feet, comprised of 5,710 square feet over City ROW and 9,320 square feet over the park.

(DEIR, p. 2-52.)

More than 84 percent of the station's footprint is located within the LASHP boundary, and approximately 62 percent of the station's "overhang" is located above the park. The following image, taken from DEIR Appendix Q, p. 4, shows how the Project footprint and "overhang" of the Chinatown/State Park Station are predominantly within LASHP.

Response GO14-32 This comment provides a general recitation and characterization of the Draft EIR. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework, including Public Resources Code section 5019.59, that allows the California Department of Parks and Recreation to permit the Project's use of Los Angeles State Historic Park. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of

the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. Refer to Response GO14-33 for additional information about the Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Comment GO14-33 In addition, the DEIR states that “[t]he proposed Project's required aerial clearance width over the Los Angeles State Historic Park would be 53 feet 2 inches wide with an area of approximately 59,470 square feet, plus an Additional Separation Buffer.” (DEIR, p. 2-52 (emphasis added).) While the “Additional Separation Buffer” is mentioned within the DEIR numerous times (e.g., *ibid.*), nowhere is it specifically defined. The discussion of American National Standards Institute (ANSI) Standard B77.1 (DEIR, pp. 2-18 to 2-19), clearly states that the 53 feet 2-inch width does not include the Additional Separation Buffer. Overhead images in the DEIR that show the Additional Separation Buffer likewise do not provide meaningful information about the area the buffer would occupy. (See, e.g., DEIR, Figure 2-7, p. 2-20; DEIR Appx. Q, p. 4.) The DEIR thus fails to provide the necessary information necessary to understand how much park area would be used by the Project.

Response GO14-33 Section 2.4.6, Aerial Clearance, of Section 2.0, Project Description, of the Draft EIR details that Industry standards for the design and operation of ropeways and cabins are documented in the American National Standards Institute (ANSI) Standard B77.1, which is developed in coordination with manufacturers, consumers, and regulators. ANSI B77.1 regulates vertical and horizontal clearances between the ropeway and cabins to elements such as vehicles, pedestrians, vegetation, buildings, and other structures. ANSI B77.1 provides minimum clearance requirements depending on the nature of the element and whether the clearance is vertical or horizontal. To define the width of the ropeway path which must be clear of elements, the horizontal clearance outside of the cabin paths as required by the ANSI B77.1 safety standard for passenger ropeways was used. ANSI B77.1 includes two criteria, both of which must be met, for horizontal clearance between the cabin and an adjacent element: when hanging vertically, the cabins must be no closer than five feet to any obstruction that is not part of the ropeway system; and when the cabins are tilted within a prescribed range (as from wind), the cabins must not come into contact with anything. For the proposed Project, the five-foot requirement is slightly wider than the swing requirement, so the five-foot requirement controls the design path width. The proposed Project would include five feet on each side of the vertically hanging

cabins for a required aerial clearance width of 53 feet 2 inches. The proposed Project would also include an Additional Separation Buffer. Figure 2-7 of Section 2.0, Project Description, depicts the proposed Project's anticipated aerial rights requirements and the Additional Separation Buffer. Section 3.4.6, Aerial Clearance, of Section 3.0, Project Description, of the Final EIR details the proposed Project's Additional Separation Buffer, with additional detail provided in Appendix N, Additional Separation Buffer, of the Final EIR. Based on the current design, the Additional Separation Buffer is estimated to be approximately 10 feet on each side of the required aerial clearance width based applicable standards, requirements, building codes, and guidelines. The proposed Project's Additional Separation Buffer would comply with applicable standards, requirements, building codes, and guidelines as determined by the City and Metro. The final width of the Additional Separation Buffer would be determined by the appropriate agencies during the permitting process for the proposed Project. Refer to Response GO14-32 for discussion of how, with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the park for kite flying, special events, and other passive recreational opportunities would not be affected by the proposed Project.

Comment GO14-34 The above measurements describe an area for the Project alignment, which is perhaps helpful to understand the Project when viewing it on an overhead plan view. But the Project is not flat. It will exist and operate within a 3-dimensional envelope. The DEIR fails to explain the total volume of space required by the Project to operate safely within LASHP, only noting that “[t]he aerial clearance would allow the continued use of the park, with certain limitations.” (DEIR, p. 2-52.) The DEIR fails not only to provide the necessary information to understand the volume of space used by the Project, but also to explain the specific limitations that might be imposed upon LASHP visitors as they use the park as a result of construction of the Project.

Response GO14-34 Refer to Response S2-2 regarding the Chinatown/State Park Station and Response GO14-32 for discussion of how, with the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the park for kite flying, special events, and other passive recreational opportunities would not be affected by the proposed Project.

Comment GO14-35 The DEIR does explain that certain activities, such as kite flying, would not be possible in the vicinity of the Project, and that LASHP special event spaces would need to be altered to some degree from where they might otherwise be located to accommodate the Project. (DEIR, pp. 5-60 to 5-63.) But park uses in the vicinity of the Project area, and not solely beneath the area where gondolas would continuously cross through the park's airspace, would be profoundly and adversely impacted. The DEIR fails to describe the amount of parkland area at the western edge of LASHP that is cut off, “orphaned” from the rest of the park as a narrow remainder parcel sliver. It

appears to be at least several tens of thousands of additional square feet when viewed from overhead. (See DEIR, Appx. Q, p. 4.)

Response GO14-35 This comment provides a characterization of the Draft EIR. Refer to Section 5.0, Other CEQA Considerations, for discussion of how the ability to use the vast majority of the park for kite flying would not be affected by the proposed Project and how, due to the location of the proposed Project alignment on the western edge of the park adjacent to and crossing over the existing Metro L Line (Gold), a light-rail train with an overhead catenary system, and the western pedestrian walkway within the park which has existing trees along both the west and east side of the walkway, the proposed Project does not significantly reduce the safe kite flying area within the park. The proposed Project would not cut off or orphan the western edge of the park from the rest of the park. As shown in Figure 5-2 of the Draft EIR, more than 30 of the park's 32 acres are not beneath the proposed Project's alignment. ANSI B77.1 requires the following vertical clearances: vehicles – five feet; vegetation or terrain – five feet; at-grade where pedestrians are present – eight feet; buildings – five feet; and roadways or railways – to be determined with the authority having jurisdiction. The proposed Project's vertical clearance to the bottom of the cabins would range from 26 to 53 feet with an average of approximately 40 feet from ground level over the park. Given these required clearances and the height at which the cabins would travel over the Los Angeles State Historic Park, it will continue to be possible for most events to take place both under the majority of the alignment within the park and adjacent to the alignment. Use of more than 30 of the park's 32 acres for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project.

Comment GO14-36 The DEIR describes approvals thought necessary from the California Department of Parks and Recreation on DEIR page 2-61:

Approvals determined necessary by the California Department of Parks and Recreation for the Project could include, but not necessarily be limited to:

- a. Pursuant to Government Code section 14666, an easement and/or aerial easement, to construct and operate the Project within/over the Los Angeles State Historic Park.
- b. Pursuant to Public Resources Code section 5003.17, a lease or other agreement, to construct and operate the Project within/over the Los Angeles State Historic Park.
- c. Pursuant to Public Resources Code Section 5003 and Government Code Section 14666, a right of entry, to construct the Project within/over the Los Angeles State Historic Park.

- d. Pursuant to Public Resources Code section 5002.2, an amendment to the Los Angeles State Historic Park General Plan.

As discussed in the following sections, these approvals cannot lawfully be made.

Response GO14-36 This comment provides a general recitation and characterization of the Draft EIR. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project’s use of Los Angeles State Historic Park.

Comment GO14-37 2. Legal framework

With “approval of the state agency concerned,” Government Code section 14666 allows grant of an easement or right-of-way “across real property belong to the state...for those purposes as the [Director of General Services] deems are in the interest of the state.” The state agency responsible for LA State Historic Park is our Department of Parks and Recreation (“DPR” or “Department”). (See Govt. Code, §§ 5001-5019.5.) DPR is the controlling authority for California state parks, which are “to be preserved and managed for the benefit and inspiration of all state residents and visitors to the state parks.” (Pub. Res. Code, § 5001, subds. (a)(2), (b).) The DPR’s Director “shall promote and regulate the use of the state park system in a manner that conserves the scenery, natural and historic resources, and wildlife in the individual units of the system for the enjoyment of future generations.” (Pub. Res. Code, § 5001.2 (emphasis added).)

Similarly, the Department “shall administer, protect, develop, and interpret the property under its jurisdiction for the use and enjoyment of the public.” (Pub. Res. Code, § 5003 (emphasis added).)

The DPR is “authorized to provide means of ingress and egress” to provide access to the public. (Pub. Res. Code, § 5003.5.) And the Department has done so: one ingress/egress location is conveniently located approximately 300 feet from Metro’s L Line (Gold Line) Chinatown Station, there are several gates located along Spring St. that may be opened when access is desired, and there are two vehicle entrances/exits.

But the Department is expressly limited in allowing use of parkland to provide right-of-way access to other land. The mandatory inquiry requires the Department to consider whether the land to which access is requested already has “reasonable access.” Only where reasonable access “does not exist or cannot be economically constructed outside the boundaries of the park” may DPR grant a permit for right-of-way access across state parkland. (Ibid.)¹⁸

The only reasonable interpretation of Public Resources Code Section 5003.5 paragraph two is that access provided under the conditions of this section are intended for parcels that are *actually contiguous with* a state park, and cut off from a road or highway located on the far side of parkland. (Pub. Res. Code, § 5003.5, ¶ 2,

describes an “application...for right-of-way across a state park for ingress and egress to a highway or road from their lands separated from such highway or road by the state park...” (emphasis added).

Footnote 18: Public Resources Code Section 5003.5 states, in its entirety:

The department is authorized to provide means of ingress to and egress from all state parks in order to provide ready access thereto by the public and to provide means of ingress and egress to highways and roads across state parks from lands separated from such highways and roads by state parks, and for that purpose may enter into contracts or agreements with cities, counties, and other political subdivisions of the State and with other state agencies or with persons, firms or corporations for the acquisition, construction, and maintenance of suitable roads, trails, and pathways.

When application is received by the department, other than under Section 5012, from any person, firm or corporation for right-of-way across a state park for ingress and egress to a highway or road from their lands separated from such highway or road by the state park, the department shall determine whether any reasonable access exists outside the boundaries of the park, or could be economically constructed.

Where reasonable access does not exist or cannot be economically constructed outside the boundaries of the park, the department shall grant a permit for right-of-way across the park over such route and subject to such conditions and construction and maintenance specifications as the department may determine which will cause minimum alteration to the physical features of the park and minimum interference with the use of the park by the public. The permittee shall at his own expense construct and maintain the means of ingress and egress in accordance with the terms and conditions set forth in the permit, noncompliance with which in any part shall be due cause for revocation of such permit. The department may require a permittee or permittees to allow the use of such means of ingress and egress by any other applicant whose lands are similarly situated. The department shall grant a permit for such use under terms and conditions imposed upon existing users, upon payment of a reasonable compensation for construction and maintenance of the road, by the applicant to the existing permittee, or permittees.

Response GO14-37 This comment provides a general recitation and characterization of statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project’s use of Los Angeles State Historic Park.

Comment GO14-38 The Department may also grant permits and easements to a *public agency* for public roads, for public bicycle and pedestrian trails, and for utility lines, or for “electric, gas, water, sewer, telephone, telegraph and utility lines, and pipelines and structures incidental thereto, to perform a public service or oil or gas pipelines.” (Pub. Res. Code, § 5012, subds. (a)-(d).)¹⁹ Before the DPR may lease land pursuant to Public Resources Code section 5003.17, the Director must make a finding “that the use would be

compatible with the use of the real property as a unit or part of a unit and with the sound management and conservation of resources within the unit.” (Pub. Res. Code, § 5001.65.)

Most important, and with few exceptions (all of which are inapplicable here), “[c]ommercial exploitation of resources in units of the state park system is prohibited.” (Pub. Res. Code, § 5001.65.)²⁰

Footnote 19: Subdivisions (e) and (f) of Public Resources Code section 5012, which relate to the use of state parks for small craft harbors and recreation areas and oil and gas pipelines, are not relevant.

Footnote 20: In addition to the above statutory regime, which protects our state parkland from unlawful encroachment by those who would seek to use these valuable resources for personal and commercial gain, the Park Preservation Act (Pub. Res. Code, §§ 5400-5409) forbids a public entity’s (whether city, county, city and county, etc.) acquisition of existing public parkland for nonpark purposes “unless the acquiring entity pays or transfers to the legislative body of the entity operating the park sufficient compensation or land, or both.” (Pub. Res. Code, § 5401, subd. (a).) Applicability of the Park Preservation Act will be analyzed separately below.

Response GO14-38 This comment provides a general recitation and characterization of statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project’s use of Los Angeles State Historic Park.

Comment GO14-39 3. Analysis

As discussed above and elsewhere, the proposed Project is not a public transportation project. (See discussion, *supra* pp. 8-12.) While the Project proposes that provision of new access to LA State Historic Park will be an important feature of the Project, the Park is already well-served by existing Metro service via the Gold Line Metro Station, which operates only a few hundred feet from where the Project’s proposed Chinatown/State Park Station would be located. In addition, the DEIR provides information about local bus lines operating in the Project area, including near LASHP.

“The overall purpose of the proposed Project is to provide a direct transit connection between LAUS and the Dodger Stadium property...” (DEIR, p. 2-12.) The relevant legal question to determine whether the state parkland at LASHP may be made available for the purpose of providing access to Dodger Stadium is “whether any reasonable access exists outside the boundaries of the park or could be economically constructed.” (Pub. Res. Code, § 5003.5.)

There is but one answer possible: physical access to Dodger Stadium is plentiful.

Response GO14-39 This comment provides a general recitation and characterization of statutes and regulations. Refer to Topical Response A, SB 44, for discussion of the proposed

Project's consistency with the requirements of SB 44. As discussed in Topical Response A, the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the Project's use of Los Angeles State Historic Park. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would enhance public transit options for the park by providing passenger access to Chinatown, Los Angeles State Historic Park, and to nearby neighborhoods, including the Mission Junction neighborhood, which includes the William Mead Homes public housing complex, pedestrian access enhancements which could include pedestrian improvements between Metro's L Line (Gold) Station and the Chinatown/State Park Station consistent with the Connect US Action Plan, including hardscape and landscape improvements, shade structures, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge. In addition, the station canopy would provide much needed shade. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less. Refer to Section 5.0, Other CEQA Considerations, of the Draft EIR, for a discussion of the location of the Chinatown/State Park Station, including how the proposed Project's Chinatown/State Park Station location was chosen over the other potential locations because it minimized the proposed Project's potential footprint within the Los Angeles State Historic Park and impacts to neighboring properties while maintaining transit access to the Park and surrounding communities.

Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and

businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Comment GO14-40 Dodger Stadium is not made landlocked by its proximity to LA State Historic Park—it is not even immediately adjacent to LA State Historic Park. At its nearest point to the park Dodger Stadium is more than 1,500 feet distant. It is accessible by numerous roadways and entrances, and as the DEIR notes, on game days is already served by Metro’s Dodger Stadium Express. (DEIR, p. ES-19.) Because there are already numerous entrances to Dodger Stadium, as a matter of law it must be found that “reasonable access exists outside the boundaries of [LA State Historic Park].”

LASHP is therefore neither necessary nor available to provide additional Dodger Stadium with additional access it does not need. The controlling Public Resources Code section provides no exception. Moreover, since access to Dodger Stadium already exists, no “alteration of the physical features of the park” or level of “interference with the use of the park by the public” can be justified. No part of LASHP is necessary to provide access to Dodger Stadium, and Public Resources Code section 5003.5 therefore prohibits use of the park by the Project.²¹

The DEIR states that a secondary Project purpose is to provide access to LASHP from Union Station and Dodger Stadium and local neighborhoods near Dodger Stadium. But the DPR has already provided for adequate access to LASHP. Metro’s Gold Line Chinatown Station and several bus lines already provide convenient public transportation to the park, and many people arrive by bicycle or on foot. It is noteworthy that ARTT LLC approached Metro and the Department with its proposal. DPR did not ask for help increasing park access, because it has already provided adequate access.

Footnote 21: It makes no difference under Public Resources Code section 5003.5 whether access being sought is ground-based or aerial. The statute makes no distinction between provision of ground or aerial access.

Response GO14-40 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project’s system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would

reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. The proposed Project would also improve community access to the Los Angeles State Historic Park by providing an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Refer to Response GO14-39 for discussion of public transit options for Los Angeles State Historic Park. Further, as discussed Section 2.0, Project Description, of the Draft EIR, the proposed Project could also provide pedestrian improvements between Metro's L Line (Gold) Station and the Chinatown/ State Park Station, including hardscape and landscape improvements, shade structures, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge to improve access from North Broadway to the park. These features of the proposed Project would improve access to the Los Angeles State Historic Park. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the Project's use of Los Angeles State Historic Park.

Comment GO14-41 Moreover, these alleged access enhancements are illusory and speculative. On days where there is no baseball game or other event at Dodger Stadium, the Project would operate at the discretion of the operator, not on a regular schedule. As the DEIR notes, service would vary, "based on demand." (DEIR, p. 2-42.) If demand is insufficient, nothing guarantees that the Project will operate. Likewise, travel to the Park from Dodger Stadium station for neighborhoods near Dodger Stadium is subject to private approval and is completely speculative. (DEIR, p. ES-10: "The Project Sponsor will request consideration by the Los Angeles Dodgers of the potential for the Dodger Stadium Station to include a mobility hub where outside of game day periods, passengers would be able to access a suite of first and last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon.")

Response GO14-41 Refer to Section 2.0, Project Description, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. Refer to Response GO14-22 for a discussion of how proposed Project may vary the number of cabins in service and speed throughout the day, based on demand, just as Metro trains and buses do, the proposed Project would operate under a pre-determined, regular operating hour schedule. Refer to Topical Response

F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the Project's use of Los Angeles State Historic Park. As discussed in Section 5.0, Corrections and Additions, of the Final EIR, the proposed Project would provide a mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon.

Comment GO14-42 Further, the DEIR analysis of neighborhood ridership is deeply flawed. First, as noted above it relies on the speculative availability of Dodger Stadium Station, and then arbitrarily doubles the size of the surveyed ridership area around the stadium from a half-mile walking distance to an entire mile, assuming that the same number of people who might walk half a mile would also ride bicycles up to a mile. (DEIR, p. 3.17-25.) Second, the DEIR does not analyze, or even discuss, the hilly topography of the neighborhoods surrounding Dodger Stadium that would allegedly be served by a new mobility hub, assuming it is ever built. There seems to have been no survey of potential Dodger mobility hub users to determine whether they either would walk or ride to a hub facility. Third, the park user ridership analysis assumes, without evidentiary support, that 10% of existing Gold Line users to the park would instead use the gondola, assuming there is enough demand that it is running at the time. (*Ibid.*)

Response GO14-42 Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data. As discussed in Section 5.0, Corrections and Additions, of the Final EIR, the proposed Project would provide a mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon. As discussed in Section 3.17, Transportation, of the Draft EIR, ridership for neighborhood riders was estimated by calculating the working-age people and jobs within a half-mile walking-distance of each proposed station based on a street network analysis, growth rates in population and jobs as forecast using the City of Los Angeles travel demand model, and United States Census journey to work mode split data. As discussed in Appendix N, Transportation Appendices, of the Draft EIR, the typical reasonable walking distance to high-quality fixed route transit is one half-mile, which was then calculated based on the actual street network. A one-mile biking distance for the Dodger Stadium Station was chosen for the evaluation of the Dodger Stadium Station since the mobility hub would facilitate safe and convenient connections to Elysian Park and Solano Canyon, which are beyond a half-mile walking distance. A one mile ride on a

bicycle, even with some grade change, can comfortably be made in fifteen minutes or less. Fifteen minutes is a typical planning time that many transit riders are willing to incur to reach a station, which compares with a one-half mile walking distance. This estimated time was based on the professional judgment of Fehr & Peers which prepared Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR.

The proposed Project would serve events at the Los Angeles State Historic Park. As described on page 3.17-26, in Section 3.17, Transportation, in the Draft EIR, the analysis to estimate Los Angeles State Historic Park event ridership assumed a 10 percent capture rate for rides between LAUS and the Los Angeles State Historic Park for an average sized event (ranging from craft fairs drawing 6,000 to 8,000 people per event to evening concerts drawing 12,000 to 20,000 people per event, averaging 11,200 people per event), meaning that 10 percent of the attendees would ride the proposed Project. This estimated capture rate was based on the professional judgement of Fehr & Peers which prepared Section 3.17, Transportation and Appendix N, Transportation Appendices of the Draft EIR, including the ridership model, as event attendee data were available and provided by State Parks, but event attendee mode split data were not available. However, compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the much shorter headways compared with the Metro L Line (Gold) and area bus service would result in more frequent, higher capacity transit service, and the travel time would be less. The commenter did not provide any specific data to indicate why a 10 percent capture rate should be considered an unreasonable assumption for Los Angeles State Historic Park event attendee ridership.

Furthermore, as noted on page 3.17.34 and 3.17.35 of Section 3.17, Transportation, of the Draft EIR, the proposed Project would generate neighborhood ridership that would reduce vehicle miles traveled (VMT), but to provide a more conservative analysis, only the VMT benefits of the proposed Project were calculated on Dodger Stadium game/event days. Accordingly, while the VMT for other ridership scenarios such as neighborhood riders and the Los Angeles State Historic Park users was calculated, the Draft EIR conservatively only assumes VMT reductions from Dodger Stadium game and event ridership in its analysis, including in Section 3.03, Air Quality and Section 3.08, Greenhouse Gas Emissions, of the Draft EIR. Including VMT reductions from other ridership sources analyzed (e.g., neighborhood riders, tourists) would provide additional air quality and greenhouse gas emissions reductions benefits which were conservatively not assumed in the Draft EIR's analysis. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., CEQA Guidelines, § 15124.) The Draft EIR provided sufficient information in order for the public and decisionmakers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require "a lead agency to conduct every test

or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO14-43 Finally, Public Resources Code section 5012 is not applicable to the Project with respect to the Project’s proposed use of LASHP. No public agency is requesting access for the purpose of providing roads, public bicycle or pedestrian trails, or utility lines. No request is being made for “electric, gas, water, sewer, telephone, telegraph” or other utility lines. No public or private entity is requesting use of the park for oil or gas pipelines.

The Project request is for access as a private transportation project to serve a commercial sports and entertainment venue with existing substantial access, including convenient access by public transportation (Dodger Stadium Express). While the DEIR suggests the Project would be nominally open to the public when it is operating, on Dodger game days or for special events at Dodger Stadium, Dodger ticket holders (and presumably special event patrons) would have priority access to gondola use. (DEIR, p. 3.17-25.)

As explained above, the Project is not public transportation. It is better described as a “courtesy shuttle service for patrons of one or more specific establishments” (see 42 U.S.C., § 5302 subd. (B)). In other words, the DEIR description of the Project as open to the public (except when it isn’t) doesn’t change that the gondola is a commercial private transit enterprise to benefit Dodger Stadium and whatever future development might one day be built there. “Commercial exploitation of resources in units of the state park system is prohibited.” (Pub. Res. Code, § 5001.65 (emphasis added).)

Response GO14-43 This comment provides a general recitation and characterization of the federal and state statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project’s use of Los Angeles State Historic Park. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading

up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project's system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. As noted in Section 3.17, Transportation, of the Draft EIR, on peak game attendance days, pre-purchase of timed tickets would be implemented, and game-day riders possessing a timed ticket would have priority boarding. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park.

Comment GO14-44 4. Conclusion

Based on the above, LA Parks Alliance strongly objects to any use of LASHP for the Project's private commercial use. Construction and operation of the Project within LA State Historic Park would plainly violate state law that protects units of state park system from commercial exploitation. Nor is there any exception within the relevant statutes that allows for the Director and Department to agree to unlawful commercial exploitation of LA State Historic Park to take advantage of proposed desirable Project features (for example, a mid-park bridge across the Gold Line rail to Broadway, an enhanced concession area, a mobility hub). Should the Director and Department do so, they would violate the fundamental duties set forth in Public Resources Code sections 5001, 5001.2, 5001.65, 5003, 5003.5, 5003.17, and other statutes.

The Department must manage state park units "for the benefit and inspiration of all state residents and visitors to the state parks," and the Director must conserve "the scenery, natural and historic resources, and wildlife in the individual units of the system for the enjoyment of future generations." (Pub. Res. Code, § 5001, subd. (a)(2), and § 5001.2.) Commercial use of the state parks is prohibited. (Pub. Res. Code, § 5001.65.)

The proposed Project may not lawfully use any part of LA State Historic Park for access to Dodger Stadium, including its airspace.

Response GO14-44 This comment provides a general recitation and characterization of the state statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project’s use of Los Angeles State Historic Park. Refer to Responses GO14-32 through GO14-43 for responses to comments contained in this section of this letter.

Comment GO14-45 E. The Public Park Preservation Act and Other Relevant Statutes Prohibit Use of LA State Historic Park for Non-Park Uses.

Public comments submitted during the scoping comment period show that many community members object to use of public parkland for the private commercial gondola project. A representative sample included in DEIR Appendix A follows:

- Email comment of Julie Rico, Nov. 7, 2020: I am concerned about the potential negative impacts of the proposed Los Angeles Aerial Rapid Transit project on Los Angeles State Historic Park which we view as the greatest threat to Northeast Los Angeles open space in over 20 years.
- Comment of Tom Norris, Nov. 12, 2020: “Los Angeles State Historic Park (LASHP) is a unique public open space with historical significance and strong community ownership... This is a park space that is used often by family and friends, especially now when meeting outdoors in open spaces is the only safe option during this Covid health crisis. We do not want to give our public lands over to the McCourt family!”
- Email comment of Phyllis Ling, Nov. 16, 2020: “[T]his gondola would cut through the middle of the Los Angeles State Historic Park. This project would be at the expense of the Chinatown Community, who fought hard for this open space, rather than see it turned into an industrial office park. After it was dedicated as park land, the community waited many more years for construction to be completed. And now, just as we are beginning to enjoy this open space, a private company wants to cut through the heart of the park with this massive monstrosity. This is offensive, especially as the City is making efforts to advance social equity. This public resource in a low income community must not be sacrificed to a private company for private gain.”
- Comment of Jeff Pawling, Nov. 17, 2020: “Personally, I oppose this gondola system being constructed over the Los Angeles State Historic Park. If Frank McCourt couldn’t deliver a World Series to LA, why would we deliver him a tram over a beloved and beautiful park? This EIR needs to address the exact route the proposed gondola would take over the park and how it would affect the park as a whole both during and after construction. There are simply other efficient modes of transportation that can be utilized to transport people to and from Dodger Stadium that do not involve a gondola.”

- Comment of Philip Lee, Nov. 17, 2020, who requests: “Full transparency on the rapid transit and how it affects public lands. McCourt should not be given any public land.”
- Letter comment of Los Angeles River State Park Partners, Nov. 10, 2020, p. 2: “Los Angeles State Historic Park is now a gem among the State Parks in the Los Angeles area and a national model for urban parks. But the State’s major investment that made LASHP possible may be at risk if private interests are allowed to spoil the public good represented by the park.”

Response GO14-45 This comment provides a general recitation and characterization of certain comments received during the public scoping period. Refer to Responses GO14-6 through GO14-12 for discussion of comments on the NOP for the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Public Park Preservation Act.

Comment GO14-46 In addition to the express limitations of Government Code sections 5001 through 5019.5 discussed above, the California Public Park Preservation Act and other statutes detail additional limitations on the use of California parkland resources, and in particular on state park historical units. Our legislature has enacted strict limitations on how California parklands may be used, whether by public agencies or by private actors who would exploit these precious resources.

The loss of any parkland for the benefit of the Project constitutes a significant and unavoidable environmental impact, requiring denial of the Project or selection of a feasible alternative. (Pub. Res. Code, § 21002: “The Legislature finds and declares that it is the policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives...”)

Response GO14-46 This comment provides a general recitation and characterization of the state statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Public Park Preservation Act.

Comment GO14-47 1. The Public Park Preservation Act does not authorize acquisition of public parks, including LA State Historic Park, for use by the Project.

The Public Park Preservation Act of 1971 (“Park Preservation Act” or “Act”) (Public Resources Code sections 5400–5409) forbids the acquisition of land by a public agency if the land to be acquired is already in use as a public park at the time of acquisition, “unless the acquiring entity pays or transfers to the legislative body of the entity operating the park sufficient compensation or land, or both...” (Pub. Res. Code, § 5401(a).) While the Park Preservation Act nominally restricts only public agencies, that does not mean such acquisitions are permitted by private entities or actors (since other generally applicable Public Resource Code sections already restrict these actions — see Part. I(D), supra pp. 12-18). The Park Preservation Act thus

provides no alternative vehicle for Metro (or ARTT LLC or any other entity) to acquire any portion of LA State Historic Park for the benefit of the proposed Project.

Although it is clearly not possible for ARTT LLC to acquire any portion of LA State Historic Park for the Project pursuant to the Park Preservation Act, it is nonetheless appropriate to briefly review the Act to illustrate the nature of limitations that would be imposed on public agencies were such an agency inclined to attempt use of the Act's procedures to assist the Project proponent. The DEIR is incomplete in not including this important background information to assist decisionmakers and members of the public in understanding that even a state agency could not acquire this land for the benefit of the Project.

Response GO14-47 This comment provides a general recitation and characterization of the state statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Public Park Preservation Act. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., CEQA Guidelines § 15124.) The Draft EIR provided sufficient information in order for the public and decisionmakers to meaningfully evaluate the proposed Project's potential environmental impacts.

Comment GO14-48 As noted above, the basic premise of the Park Preservation Act is explained in Public Resources Code section 5401, subdivision (a), which states in its entirety:

No city, city and county, county, public district, or agency of the state, including any division, department or agency of the state government, or public utility, shall acquire (by purchase, exchange, condemnation, or otherwise) any real property, which property is in use as a public park at the time of such acquisition, for the purpose of utilizing such property for any nonpark purpose, unless the acquiring entity pays or transfers to the legislative body of the entity operating the park sufficient compensation or land, or both, as required by the provisions of this chapter to enable the operating entity to replace the park land and the facilities thereon.

Stated differently, the Parks Preservation Act allows a California public agency (but not a private entity or actor) to acquire existing parkland and use it for a non-park purpose, so long as the "acquiring entity pays or transfers" "sufficient compensation or land, or both," to the public agency that operates the existing parkland. But this general premise operates within very strictly defined limitations, as explained in subsequent sections of the Act.

Initially, it is important to note that none of the express exceptions of the Act apply to transportation infrastructure, whether private or public. The first exception relates

to “the construction or maintenance of underground utility services.” (Pub. Res. Code, § 5402.) The second exception is for a public utility (public or private) acquiring land to provide services to the park and where the services cannot feasibly be located underground. (Pub. Res. Code, § 5403.) The third exception relates to a public utility (public or private) acquiring an interest in a waterway. (Pub. Res. Code, § 5403.5.)

Response GO14-48 This comment provides a general recitation and characterization of the state statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Public Park Preservation Act.

Comment GO14-49 Since no exception applies, a public agency might acquire land at LA State Historic Park, but only if it first provided the cost of substitute park land, actual substitute park land, or some combination of the two. But “cost of acquiring substitute park land” means providing sufficient payment to cover:

[L]and of comparable characteristics and of substantially equal size located in an area which would allow for use of the substitute park land and facilities by generally the same persons who used the existing park land and facilities, and the cost of acquiring substitute facilities of the same type and number, plus the cost of development of such substitute park land, including the placing of such substitute facilities thereon.

(Pub. Res. Code, § 5405, subd. (a).)

Likewise, “substitute park land” provided by the acquiring agency means:

[Land] of comparable characteristics and of substantially equal size located in an area which would allow for use of the substitute park land by generally the same persons who used the existing park land, and the cost of acquiring substitute facilities of the same type and number, plus the cost of development of such substitute park land, including the placing of such substitute facilities thereon.

(Pub. Res. Code, § 5405, subd. (b).)²²

The proposed Project cannot utilize the Park Preservation Act because no public agency seeks to be the “acquiring entity” of LA State Historic Park land on its behalf. The DEIR nonetheless fails as an informational document because it evaluates neither the availability nor cost of substitute park land to adequately compensate the people of California for use of public parkland that has been set aside and held in trust for their benefit. See California Public Resources Code, section 5019.91, subdivision (b):

The mission of the California State Park system is to provide for the health, inspiration, and education of the people of California by helping to preserve the state’s extraordinary biological diversity, protecting its most valued natural and cultural resources, and creating opportunities for high-quality outdoor recreation. **State parks are set aside** to protect their natural, historical, cultural,

and recreational values **in perpetuity for the people of the state.** (Emphasis added.)

Footnote 22: Any combination of exchange of substitute park land and payment to allow acquisition of new substitute park land must meet the same standard. (Pub. Res. Code, § 5405, subd. (c).)

Response GO14-49 This comment provides a general recitation and characterization of the state statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Public Park Preservation Act.

Comment GO14-50 The Park Preservation Act also allows for improvement of unacquired park land in lieu of acquiring substitute park land. (Pub. Res. Code, § 5404.) However, that alternative would still require the acquiring agency to account for and pay the entire cost in land or compensation as described in Public Resources Code section 5405. Moreover, it would only be possible where the land to be acquired is “less than 10 percent of the park land, but not more than one acre.” (Ibid.) Here, the footprint of the proposed Project’s Chinatown/State Park Station is “2,195 square feet in the park, and the station canopy would have an overhang of 9,320 square feet over the park.” (DEIR, p. 3.11-38.) This is both less than ten percent of the 32-acre park and less than an acre. But it does not account for the massive use of airspace required for the Project (almost 60,000 square feet as seen from an overhead view, a number which does not include the vague “Additional Separation Buffer”). (DEIR, p. 2-52.) The Project would therefore utilize well over an acre of LA State Historic Park land, and the “in lieu” alternative would not be available to a public agency desiring to acquire the land for a non-park purpose. (As discussed, a private entity cannot take the land at all.)

The informational value of the Park Preservation Act is to assist the public in understanding underlying limitations on the use of public parkland. Only an absolutely absurd interpretation of the statutes describing the fundamental duties, powers, and authorities of the Department of Parks and Recreation and the Director of Parks could lead one to conclude that even though no public agency can use public parkland without adequately compensating the people of California for land held in perpetuity, that the Director and Department could quietly negotiate with a private actor to allow acquisition or exchange of parkland for non-park use for only minor improvements without considering the cost and availability of “substitute park land” or calculating and obtaining that value.²³

To be clear, the Public Park Preservation Act is not applicable to the Project. It does, however, inform the propriety of a monetary or land exchange, if one were possible, or the offer of public benefits such as park improvements in exchange for use of public parkland. It provides at least one basis to consider the amount of compensation necessary to justify a private taking of land meant to be held in perpetuity by and for the people of California, assuming such a taking is permissible, which it is not. The

DEIR fails as an informational document for failing to provide this information. The DEIR acknowledges that LA State Historic Park serves “a region that has been historically limited in terms of access to parkland” (DEIR, p. 2-9), but it does not include the information necessary to allow members of the public and decisionmakers to understand the profound impacts the significant loss of public parkland at LA State Historic Park would have.²⁴

Footnote 23: As discussed, this is “land of comparable characteristics and of substantially equal size located in an area which would allow for use of the substitute park land by generally the same persons who used the existing park land, and the cost of acquiring substitute facilities of the same type and number, plus the cost of development of such substitute park land, including the placing of such substitute facilities thereon.” (Pub. Res. Code, § 5405, subd. (b).) LA Parks Alliance does not believe such land exists.

Footnote 24: While the discussion in this section is focused on the significant adverse impact and the DEIR’s lack of useful information with respect to compensation for loss of land at LA State Historic Park, LA Parks Alliance notes that it is equally applicable to El Pueblo de Los Angeles Historical Monument. See also discussion re Land Use and Planning conflicts, *infra* pp. 73-75.

Response GO14-50 This comment provides a general recitation and characterization of the state statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Public Park Preservation Act. Refer to Response GO14-33 for additional information about the Additional Separation Buffer. Refer to Response GO14-153 for a discussion of how the proposed Project would be consistent with the El Pueblo General Plan.

Comment GO14-51 2. Public Resources Code section 5019.59 prohibits use of LA State Historic Park for the Project.

There are also several Public Resources Code sections specifically relevant to the proposed Project because of its proposed use of LA State Historic Park. For example, Public Resources Code section 5019.50 requires that “[a]ll units that are...a part of the state park system...shall be classified by the State Park and Recreation Commission into one of the categories specified in [Article 1.7 of Chapter 1 of the Public Resources Code].” LA State Historic Park, as its name suggests, is classified as a “historical unit.” (Pub. Res. Code, § 5019.59; see DEIR, pp. 3.11-1 to 3.11-2, 3.11-38.)

Historical units of the state park system are expressly limited in the type and nature of development allowed within the unit. As the DEIR notes, the primary purpose of historical units is “to preserve objects of historical, archaeological, and scientific interest, and archaeological sites and places commemorating important persons or historic events.” (Pub. Res. Code, § 5019.59; DEIR, p. 3.11-38.) Under state law, development is therefore dramatically limited:

The *only facilities that may be provided* are those required for the safety, comfort, and enjoyment of the visitors, such as access, parking, water, sanitation, interpretation, and picnicking. Upon approval by the commission, lands outside the primary historic zone may be selected or acquired, developed, or operated to provide camping facilities within appropriate historical units. Upon approval by the State Park and Recreation Commission, an area outside the primary historic zone may be designated as a recreation zone to provide limited recreational opportunities that will supplement the public's enjoyment of the unit. Certain agricultural, mercantile, or other commercial activities may be permitted if those activities are a part of the history of the individual unit and any developments retain or restore historical authenticity.

(Pub. Res. Code, § 5019.59 (emphasis added).)

Response GO14-51 This comment provides a general recitation and characterization of the state statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project's use of Los Angeles State Historic Park.

Comment GO14-52 The DEIR notes that the Project conflicts with the Park's General Plan, which does not permit the Project. It provides a conclusory rationale that the park's General Plan may be revised to allow for "transit," and argues that if the General Plan is so revised the Project will then be consistent with LA State Historic Park's General Plan and with Public Resources Code section 5019.59, "which permits facilities for the comfort and enjoyment of the visitors, such as access." (DEIR, p. 3.11-42.) But the DEIR's analysis of Public Resources Code section 5019.59 is grossly incomplete, suggesting that so long as proposed development is within the list of items (access, parking, water, sanitation, interpretation, or picnicking) there is no further analysis necessary. But of course there is.

The plain text of the statute does not permit any and all development that might be made "for the comfort and enjoyment" of park visitors. Public Resources Code section 5019.59 uses the word "required" to modify and limit the type and amount of development at a state park historical unit. As already discussed, the Park has plentiful access via several entrances, and is already served by existing Metro train service and numerous bus lines. Further development to provide additional access is not required. Nothing in the DEIR provides substantial evidence to support a contrary conclusion.

Further, and as already discussed, on days where no baseball game or event is held at Dodger Stadium, the Project would operate at the discretion of the operator, not on a regular schedule. Service would vary "based on demand." (DEIR, p. 2-42.) Nothing guarantees the Project will operate daily to provide Park access. Travel to the Park from Dodger Stadium station for neighborhoods near Dodger Stadium is subject to private approval and thus completely speculative. (DEIR, p. ES-10.) And on Dodger

game or stadium event days, use of the Project to get to the Park would be secondary to ticket holders' preferred use. (DEIR, p. 3.17-25.)

Appendix N's meager analysis of ridership for users of LA State Historic Park is incomplete and entirely speculative. The DEIR provides no discussion of daily ridership use for LASHP, whether from the Project's Union Station terminus or Dodger Stadium terminus. (DEIR, Appx. N Ridership Model, pp. 13-14, 15-16.) It only analyzes ridership to special events at the Park. Even then, the Fehr & Peers Ridership Model Development report acknowledges that it is entirely based on guesswork. "No data are available for mode share of attendees travelling to events at the Park. For the purposes of this analysis, Fehr & Peers assumed a 10% mode split for attendees taking transit from Union Station." (Ibid., p. 13.)

Thus, the DEIR assumes with no apparent basis or supporting data that on special event days as many as 10% of park visitors traveling from LA Union Station to the Park would instead use the Project for access. (DEIR, p. 3.17-26.) Put another way, the DEIR acknowledges that 90% of park special event riders from Union Station would arrive some other way than the Project. If not for the Project siphoning off a small percentage of park visitors, 100% would have little difficulty in arriving via existing alternatives. Even assuming the 10% assumption were true, and no substantial evidence supports it, how does the DEIR's best case assumption concluding that 90% of visitors arriving from Union Station by means other than the Project support a conclusion that it provides required access? This is the only relevant question for development of historical unit under Public Resources Code section 5019.59.

Likewise, discussion of neighborhood ridership does not describe in any detail the number of people who would use the Project to travel from the Dodger Stadium terminus and depart at the Chinatown/State Park Station, assuming the Project even runs on non-Dodger game or event days. Using information provided in the DEIR it is impossible to conclude that a significant number of LA State Historic Park users would arrive via the Project. The analysis does not distinguish between those who depart the Project at Chinatown/State Park Station to go to the Park as opposed to other destinations. (DEIR, Appx. N Ridership Model, p. 21.) There is no substantial evidence to show the Project is required to provide access to LA State Historic Park, the mandatory finding required by Public Resources Code section 5019.59.

Response GO14-52 This comment provides a general recitation and characterization of the state statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project's use of Los Angeles State Historic Park. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan. As discussed therein, State Parks has determined that the proposed Project would be inconsistent with the Los Angeles State Historic Park General Plan because the identified land uses in the General Plan's Preferred Park Concept Elements did not

contemplate a transit station like the proposed Project's Chinatown/State Park Station. State Parks considers this inconsistency a potentially significant impact. Therefore, Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain an amendment to the Los Angeles State Historic Park General Plan. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Amendment.

Further, as discussed in Response GO14-22, refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Further, as discussed in Section 2.0, Project Description, of the Draft EIR, while the proposed Project may "vary the number of cabins in service and speed throughout the day, based on demand," just as Metro trains and buses do, the proposed Project would operate under a pre-determined, regular operating hour schedule.

Refer to Section 3.17, Transportation, of the Draft EIR, which analyzed different ridership types in order to calculate the estimated VMT for the proposed Project. As discussed in Section 3.17.3, Methodology, of the Transportation analysis, ridership estimates included "a number of distinct market segments including: Dodger Stadium game and event attendees, employees, tourists, neighborhood riders, and Los Angeles State Historic Park visitors and event attendees." In addition to Dodger Stadium game and event attendees, as discussed on page 3.17-34 in Section 3.17, Transportation of the Draft EIR, it is estimated that ridership from nearby neighborhoods would range between 200 and 575 riders (400 to 1,150 trips for round-trip), and the daily number of tourists who would ride the proposed Project is estimated to vary between 1,265 tourists and 3,370 tourists. As discussed in Section 3.17, ridership for neighborhood riders was estimated by calculating the working-age people and jobs within a half-mile walking-distance of each proposed station based on a street network analysis, growth rates in population and jobs as forecast using the City of Los Angeles travel demand model, and United States Census journey to work mode split data. As discussed on page 3.17-26, of Section 3.17, of the Draft EIR, ridership for the daily park use is included in the ridership estimates for neighborhood riders. Table 3.17-4, Proposed Project Estimated Daily Riders, provides the daily weekday riders and daily weekend riders for Dodger Stadium access, other special events, and neighborhood riders (inclusive of neighborhood/regional and daily Park access). Transit ridership by nature is related to a variety of uses. Some riders using the Chinatown/State Park Station will visit the Los Angeles State Historic Park, others will travel to and from the businesses, community uses and residences, such as the William Mead Homes, located within a ½ mile walking distance of the station. Some riders will visit multiple uses. Given the mixed use nature of transit stations, it is typical practice to estimate ridership and report it for the station area

not for individual uses. Due to the fact that the proposed Project would serve event destinations in Dodger Stadium and the Los Angeles State Historic Park, ridership estimates were prepared for both, which is why those destinations and market segments are calculated separately. The proposed Project would serve events at the Los Angeles State Historic Park. As described on page 3.17-26, the analysis to estimate Los Angeles State Historic Park event ridership assumed a 10 percent capture rate for rides between LAUS and the Los Angeles State Historic Park for an average sized event (ranging from craft fairs drawing 6,000 to 8,000 people per event to evening concerts drawing 12,000 to 20,000 people per event, averaging 11,200 people per event), meaning that 10 percent of the attendees would ride the proposed Project. This estimated capture rate was based on the professional judgement of Fehr & Peers which prepared Section 3.17, Transportation and Appendix N, Transportation Appendices of the Draft EIR, including the ridership model, as event attendee data were available and provided by State Parks, but event attendee mode split data were not available. However, compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the much shorter headways compared with the Metro L Line (Gold) and area bus service would result in more frequent, higher capacity transit service, and the travel time would be less. The commenter did not provide any specific data to indicate why a 10% capture rate should be considered an unreasonable assumption for Los Angeles State Historic Park event attendee ridership.

Refer to Section 3.17, Transportation, of the Draft EIR for a detailed discussion of potential impacts of the proposed Project on the existing surrounding communities, including an overall reduction in vehicle miles traveled (VMT). Furthermore, as noted on page 3.17-34 and 3.17-35 of Section 3.17, Transportation of the Draft EIR, the proposed Project would generate neighborhood ridership that would reduce vehicle miles traveled (VMT), but to provide a more conservative analysis, only the VMT benefits of the proposed Project was calculated on Dodger Stadium game/event days,. Accordingly, while the VMT for other ridership scenarios such as neighborhood riders and the Los Angeles State Historic Park users was calculated, the Draft EIR conservatively only assumes VMT reductions from Dodger Stadium game and event ridership in its analysis, including in Section 3.03, Air Quality and Section 3.08, Greenhouse Gas Emissions, of the Draft EIR. Including VMT reductions from other ridership sources analyzed (e.g., neighborhood riders, tourists) would provide additional air quality and greenhouse gas emissions reductions benefits which were conservatively not assumed in the Draft EIR's analysis.

Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of how the underlying factors that would influence pre-game/event and post-game/event travel conditions and ridership are built into the ridership model developed for the proposed Project based on extensive data sources and assumptions validated by data.

Comment GO14-53 An additional limitation of Public Resources Code section 5019.59 restricts commercial activities. The project is not a public transportation project. It will be privately built and operated to transport ticket holders to Dodger Stadium for baseball games and private events, a commercial activity. Commercial activities are only permitted at historic units of the state park system when they “are a part of the history of the individual unit and any developments retain or restore historical authenticity.” (Pub. Res. Code, § 5019.59.) Obviously, the Project has nothing to do with the historic identity of LA State Historic Park. Since the DEIR does not provide sufficient evidence to show that the Project is required to provide access to LA State Historic Park, it must be considered a prohibited commercial activity.

The Department of Parks and Recreation has jurisdiction over LA State Historic Park and may amend its General Plan to permit lawful activities, but it does not have the ability to modify the General Plan to allow commercial activities in violation of Public Resources Code section 5019.59. (See Pub. Res. Code, § 5001.65: “Commercial exploitation of resources in units of the state park system is prohibited.” And see Pub. Res. Code, § 5009.53: “Improvements [to state park units] that do not directly enhance the public’s enjoyment of the natural, scenic, cultural, or ecological values of the resource, which are attractions in themselves, or which are otherwise available to the public within a reasonable distance outside the park, shall not be undertaken within state parks.” (Emphasis added.))

The Department simply cannot modify the General Plan for the benefit of the Project.

Response GO14-53 This comment provides a general recitation and characterization of the state statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project’s use of Los Angeles State Historic Park. Refer to Response GO14-52 for discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan and the Los Angeles State Historic Park General Plan Amendment. Refer to Topical Response A, SB 44, for discussion of the proposed Project’s consistency with the requirements of SB 44. As discussed in Topical Response A, the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Comment GO14-54 The DEIR fails to identify the significant and unavoidable land use conflict between the Project and Public Resources Code section 5019.59. No Project alternative including an alignment on or over LA State Historic Park can be built, because the Department of Parks and Recreation may not approve a facility that is not required for access and may not approve commercial activity with no historic connection to a historical unit of the state park system.

Response GO14-54 This comment provides a general recitation and characterization of the state statutes and regulations. Refer to Topical Response F, Los Angeles State Historic Park, for a

discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project's use of Los Angeles State Historic Park. Refer to Response GO14-52 for discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan and the Los Angeles State Historic Park General Plan Amendment.

Comment GO14-55 F. Project Approval Would Pre-Commit the Future Discretion of State and Local Officials, in Conflict with the California Constitution and State and Local Law.

Proposed Project approvals with the City include a development agreement and franchise agreement. (DEIR, pp. 2-61 to 62.) Approvals for the use of airspace over LA State Historic Park, which are not lawfully available to the Project, would require an amendment to the park's general plan and an easement and/or aerial easement pursuant to Govt. Code section 14666 and a lease or other agreement under Public Resources Code section 5003.17 to allow construction and operation on and over the park. (Ibid. at p. 2-61.)

A development agreement with the City of Los Angeles would be limited to 20 years. (Ibid.) A franchise agreement with the City is limited to 21 years. (Los Angeles City Charter, § 390, subd. (c).)

Franchises of up to 40 years may be granted "for the construction and operation of subways, elevated railways and grade separated railways." (LA City Charter, § 390(c).) The Project is none of these and so is limited to a maximum length of 21 years. LA Parks Alliance notes that, unlike the secretive sole source contract awarded to ARTT LLC, before the City may grant any franchise, the City Council must "advertise its intention to grant the Franchise and shall award the Franchise to the highest responsible and responsive bidder after competitive bidding, in accordance with the procedures prescribed by ordinance governing the granting of Franchises." (Ibid., subd. (b).)

Even if the Project could lawfully obtain the necessary approvals to operate on and over LA State Historic Park, and it cannot, agreements made with the Department of Parks and Recreation may not exceed 10 years, unless a future "Joint Legislative Budget Committee" agrees with the Department's extension of the agreement (Pub. Res. Code, § 5003.17, subd. (d)(2).) Project approvals made now would therefore tie the hands of future City and state elected officials, precluding them from exercising their complete authority and discretion to choose not to renew the development agreement, franchise agreement, and lease or other agreements necessary for the project to move forward.

Given the express limitations of the public resources code to limit agreements for the use of state park resources to no more than 10 years, with extensions beyond that time made under the sole authority of a future joint legislative budget committee based on documentation to be provided by a future Director, it would be highly improper for the Department of Parks and Recreation to enter into an agreement to

construct private infrastructure that would nullify the discretion of a future Director and future members of the joint legislative budget committee. Initial approval of such a lease agreement by the current Department and Director, part of the executive branch of our state government, even assuming it is lawful in the first instance which it is not, would pre-commit the future discretion of elected legislators by creating a status quo that would be impossible to undo. The pre-commitment necessary to approve the Project for a term longer than the legislature has permitted violates basic separation of powers principles under the California Constitution and hamstring the discretion of future elected officials from disapproving the continuation of the Project.²⁵

The DEIR fails to adequately describe or engage with any of the above limitations and therefore fails as an informational document.

Footnote 25: See Cal. Const., art. III, § 3: “The powers of state government are legislative, executive, and judicial. Persons charged with the exercise of one power may not exercise either of the others except as permitted by this Constitution.” “The purpose of the [separation of powers] doctrine is to prevent one branch of government from exercising the complete power constitutionally vested in another...” (Younger v. Superior Court (1978) 21 Cal.3d 102, 117.)

Response GO14-55 This comment provides a general recitation and characterization of the state statutes and regulations and case law. The decision of any single public agency with jurisdiction over the proposed Project would have no impact on another agency’s separate independent authority related to the proposed Project, and the proposed Project would not be able to proceed if it was unable to obtain all required approvals for the proposed Project.. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the Project’s use of Los Angeles State Historic Park.

Comment GO14-56 G. The DEIR Engages in Improper Project Piecemealing by Failing to Consider or Analyze Foreseeable Development of Land Around Dodger Stadium.

1. Legal background

The California Environmental Quality Act’s definition of “project” contains one of the fundamental black letter law concepts of California environmental law: “Project’ means the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment.” (CEQA Guidelines, § 15378 (emphasis added).) “Project’ is given a broad interpretation ... to maximize protection of the environment.” (Riverwatch v. Olivenhain Mun. Water Dist. (2009) 170 Cal.App.4th 1186, 1203 (emphasis added.) Project descriptions must accurately reflect the whole of the action considered. (McQueen v Board of Dirs. (1988) 202 Cal.App.3d 1136, 1144.)

It is improper to divide a single CEQA “project” into smaller sub-projects to evade review of the entire scope of project impacts, a practice known as “piecemealing.” “CEQA ‘cannot be avoided by chopping up proposed projects into bite-sized pieces’ which, individually considered, might be found to have no significant effect on the environment.” (Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora (2007) 155 Cal.App.4th 1214, 1223.) Our courts prohibit piecemeal review, in part, to protect public participation in the decisionmaking process, requiring that members of the public and decisionmakers are adequately informed “of the environmental consequences of decisions before they are made. (Berkeley Keep Jets Over the Bay Com. v. Board of Port Cmrs. (2001) 91 Cal.App.4th 1344, 1356 [emphasis in original].)

In considering whether an EIR is legally adequate, courts look “not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.” (California Oak Foundation v. Regents of University of California (2010) 188 Cal.App.4th 227, 262, quoting CEQA Guidelines, § 15151 (emphasis added); see DEIR, p. ES-2.) However, “the fact that a particular development which now appears reasonably foreseeable may, in fact, never occur does not release it from the EIR process. [Citation.] Similarly, the fact that future development may take several forms does not excuse environmental review.” (City of Antioch v. City Council (1986) 187 Cal.App.3d 1325, 1338.)

Response GO14-56 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations, but does not raise a substantive issue on the content of the Draft EIR. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment GO14-57 2. Piecemealing concerns were raised in scoping comments; the DEIR ignored the comments and evidence of foreseeable development.

Future development of Dodger Stadium parking lots represents a “foreseeable indirect physical change in the environment” due to the proposed Project that must be considered in the environmental review process. A significant number of comments received during the Project’s scoping process raised concerns regarding foreseeable future development of land around Dodger Stadium that is currently used for parking.

For example, one scoping commenter questioned the purpose of the Project’s intermediate stop (the Chinatown/State Park Station), “[u]nless someone is planning to build a mall or entertainment complex in the area — perhaps in the freed-up Dodger parking lots? — then the additional stop is a waste of resources that will damage the biological and social environment. Are such plans afoot?”²⁶ Another wondered, “[w]hat are the plans to develop the Dodger [sic] Stadium parking lot? Will the LA ART be used year-round? Doubt this expensive system is being created just for Dodger games.”²⁷ Chinatown stakeholder King Cheung expressed suspicion of

the Project: “Why spend \$125 millions to build a gondola just to transport people to the Dodgers games? Mc Court [sic] does not own the Dodgers anymore. So it is an expense venture. What does he gain? What is his future goal? Build a downtown Disney type of entertainment center on the empty parking lots?”²⁸

In a joint letter from The California Endowment and Homeboy Industries to then-Metro CEO Phillip A. Washington and then-Los Angeles Mayor and Metro Board Chair Eric Garcetti asked simply, leaders of these vital local nonprofits asked simply: “What is the proposed future use of the vacant parking lots at Dodger Stadium caused by the Project?”²⁹

Footnote 26: Janet Owen Driggs, email to Cory Zelmer, Nov. 17, 2020, DEIR, Appx. A, pdf. p. 314.

Footnote 27: Patricia Perez, LA ART Virtual Scoping Meeting comment, Oct. 22, 2020, DEIR, Appx. A, pdf. p. 502.

Footnote 28: King Cheung, scoping comment email to laart@metro.net, Nov. 16, 2020, DEIR, Appx. A, pdf. p. 177.

Footnote 29: Dr. Robert. K. Ross, MD (The California Endowment) & Father Gregory Boyle, S.J. (Homeboy Industries), joint comment letter to Phillip A. Washington re NOP comments for LA ART Project, Nov. 16, 2020, p. 12. This letter is already part of the administrative record for the proposed Project.

Response GO14-57 This comment provides a general recitation and characterization of certain comments received during the public scoping period. Refer to Responses GO14-6 through GO14-12 for discussion of NOP comments. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. No improper segmentation has occurred and the independent utility of the proposed aerial gondola project – the first permanent transit connection to one of the region’s most visited venues – has been well established. The speculative scoping comments do not constitute evidence of a larger development plan and therefore did not require a further response. Under CEQA section 15082(b)(1), responses to the NOP are intended help the lead agency identify the significant environmental issues, alternatives, and mitigation measures that should be explored in the EIR. The scoping responses identified in this comment relate to speculative development that is not contemplated as part of the proposed Project. CEQA does not mandate that Metro consider separate projects than the one proposed simply because commenters raised the potential. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community

engagement during the Draft EIR scoping period. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during the scoping period led directly to changes to the proposed Project to incorporate public feedback.

Comment GO14-58 The question of future Dodger Stadium development was also important to Metro at one point—enough so that in asking for information about ARTT LLC’s business plan for the project, Metro explained ARTT LLC should “outline the following: ... Future plans at Dodger Stadium site.” (Los Angeles Aerial Rapid Transit, Response to Metro Request for Information, Sept. 2018, pp. 12-13.)³⁰ Just as the DEIR fails to address scoping comment concerns about development at Dodger Stadium, ARTT LLC’s response interprets the question narrowly: “The only plan for Dodger Stadium related to the ART is to provide a station on the Dodger Stadium property, together with appropriate pedestrian connections from the station to the stadium.” (Ibid., p. 13.) The DEIR makes no mention of potential development plans at Dodger Stadium, despite widespread media attention on such plans locally for well over a decade, so ARTT LLC’s strategy of interpreting the broad question narrowly seems to have worked. But it has not worked with community members who demand more information.

ARTT LLC’s narrow interpretation of Metro’s request for information makes no sense. Metro already knew from the basic premise of the Project that it would include a gondola station at or near LA Union Station and at Dodger Stadium. A reasonable interpretation of Metro’s question could thus only have been to ask about other development, in addition to the Project’s Dodger Stadium Station. Allowing ARTT LLC, owned by McCourt Global, to evade such a fundamental question is either naïve or disingenuous on Metro’s part. But even if Metro believes there are no future development plans, as lead agency under CEQA it has an independent duty to consider foreseeable indirect physical changes to the environment due to the Project.

Perhaps Metro didn’t consider Dodger Stadium parking lot development foreseeable. This is far-fetched, but not impossible.

But this is why CEQA has a scoping comment process, so community members and responsible and trustee agencies can raise their own questions and concerns, including consideration of potential indirect physical changes in the environment the lead agency may have inadvertently overlooked. (See CEQA Guidelines, § 15083.) If Metro thought Dodger Stadium development was not a reasonably foreseeable indirect change in the environment before scoping, after receiving so many scoping comments they could no longer ignore it. Yet they did.

A review of scoping comments is informative.

Commenter Susan Karat MacAdams cited a story published by the Los Angeles Times in 2012, in which Times’ writer Bill Shaikin described land-use documents associated

with the sale of the Los Angeles Dodgers from Frank McCourt to current-owner Guggenheim Baseball.³¹

MacAdams' letter quotes portions of the article highly relevant to foreseeable future development at the Dodger Stadium parking lots:

The Dodgers' new owners will pay \$14 million per year to rent the parking lots from an entity half-owned by Frank McCourt, according to **land-use documents intended to "facilitate the orderly development" of the property surrounding Dodger Stadium.** [¶] **The potential uses for the property include shops and restaurants, homes and offices, and another sports venue, according to documents obtained Friday by The Times.** The documents also discuss the **possibility of parking structures on the land...citing as examples the restaurants and clubs surrounding AT&T Park in San Francisco and Petco Park in San Diego.**

(Ibid., emphasis added.)

Footnote 30: This document should be in the administrative record of the case, but is also attached as Exhibit H.

Footnote 31: See DEIR, Appx. A, Susan Karat MacAdams letter to Cory Zelmer, Nov. 16, 2020, p. 2, citing and quoting Bill Shaikin, Dodgers' owners to pay \$14 million a year to rent parking lots from McCourt entity, LA Times, May 4, 2012, available at <https://www.latimes.com/sports/la-xpm-2012-may-04-la-sp-0505-dodgers-land-20120505-story.html>. The Shaikin article is attached as part of Exhibit I.

Response GO14-58 This comment provides a general recitation and characterization of certain comments received during the public scoping period. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro's Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. No improper segmentation has occurred and the independent utility of the proposed aerial gondola project – the first permanent transit connection to one of the region's most visited venues – has been well established. In addition, as discussed in Topical Response G, the Covenants, Conditions, Restrictions, and Easement for Chavez Ravine ("CC&Rs") alluded to in this comment as "land use documents" were adopted over a decade ago and do not constitute a currently proposed development project at the Dodger Stadium property; rather, as is customary, the CC&Rs provide regulations and standards to maintain the existing stadium uses, including parking, if approvals are sought for additional improvements by the owner of the parking areas. No such development is proposed, and no environmental analysis is required of the speculations of commenters. Refer to Response GO14-57 for a discussion of how the scoping comments do not constitute

evidence of development that should be analyzed in the Draft EIR. Moreover, the reference to the administrative record (Exhibit H) in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 is noted, but the cited document predates the initiation of environmental review for the proposed Project and accordingly does not have any bearing on the sufficiency of the Draft EIR. The unsolicited proposal process was intended to inform Metro's sole source determination to act as lead agency for the proposed Project and advance it to environmental review. Metro's sole source determination was upheld in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO14-59 Shaikin's article reports that the land-use documents were withdrawn from the Dodgers' bankruptcy proceedings after an attorney for the Times objected to the documents having been filed under seal. They were filed with the Los Angeles County Recorder's office shortly thereafter when McCourt's sale of the Dodgers to Guggenheim Baseball was made final. (Shaikin, *supra* fn. 31.)

A document entitled "Declaration of Covenants, Conditions, Restrictions and Easements for Chavez Ravine" (hereinafter "Chavez Ravine CC&Rs") is clearly one of the documents referenced in the Shaikin article, as it was executed on April 27, 2012, and recorded May 1, 2012, several days before the Shaikin article was published.³² As accurately reported by the Los Angeles Times, the agreement is intended, in part, to "facilitate the orderly development" of the Dodger Stadium parking lots (then owned by an entity named "Blue Landco LLC"). (Chavez Ravine CC&Rs, pp. 1-2 (emphasis added).) As Shaikin reported, Blue Landco LLC was co-owned by former Dodger owner McCourt and "an entity affiliated with the new team owners."³³ The agreement contemplates that Landco would gain control of the Dodger Stadium parking lot areas upon construction of parking structures, which would free up space in the parking lot areas to allow for development to occur. (Chavez Ravine CC&Rs, p. 2.) The agreement requires efforts to reduce the amount of parking utilized by Dodger Stadium patrons, including by developing what the agreement refers to as "Mass Transportation." (Ibid., pp. 26-27.) This would allow the required number of vehicle spaces to be reduced first from 19,000 to 16,500 (ibid., p. 11), and with approval of the City of Los Angeles, to below 16,500. (Ibid., pp. 11, 26-27.)

Article IV, subdivision 4.1 of the agreement lays out Blue Landco LLC's rights to pursue development of substantial commercial, residential, medical, academic, and other structures and facilities:

The Parties acknowledge that Landco, in the future, may apply for governmental approvals for future development on the Landco Parcels (the "Development"),

which Development may include, but shall not be limited to, (i) office buildings, (ii) hotel and exhibition facilities, (iii) residential buildings, (iv) medical buildings, (v) academic buildings, (vi) parking structures, and/or (vii) retail, dining and entertainment facilities.

(Ibid., p. 25.)

The Shaikin article relates substantial evidence that future development of Dodger Stadium due to the Project is not only foreseeable, but likely. This substantial evidence, without more, is sufficient to show that development of the Dodger Stadium parking lots is a “reasonably foreseeable indirect physical change in the environment” due to the Project. (See CEQA Guidelines, § 15378.) The available evidence shows such development is not only foreseeable but has actually been foreseen and planned for by former Dodger owner Mr. McCourt (who coincidentally owns or controls the Project proponent, ARTT LLC). Metro’s apparent failure to already have investigated, analyzed, and discussed the obviously foreseeable indirect physical change in the environment and its potentially significant environmental effects through the Project DEIR after receiving queries from many scoping commenters is unacceptable.

Footnote 32: Declaration of Covenants, Conditions, Restrictions and Easements for Chavez Ravine, recorded May 1, 2012, is attached as Exhibit J.

Footnote 33: Shaikin, supra note 31. While details regarding stadium and parking lot ownership are interesting, and to some degree relevant as the Project proponent is owned or controlled by McCourt, the primary relevance of the agreement in the CEQA analytic context is the foreseeability of future development of Dodger Stadium parking lots, not development of them by any particular individual or entity.

Response GO14-59 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the adoption of the CC&Rs over a decade ago does not constitute a currently proposed development project at the Dodger Stadium property; rather, as is customary, the CC&Rs provide regulations and standards to maintain the existing stadium uses, including parking, if approvals are sought for additional improvements by the owner of the parking areas. No such development is proposed, and no environmental analysis is required of the speculations of commenters. Refer to Response GO14-58 for further discussion of the CC&Rs. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO14-60 Moreover, there is far more evidence showing that Dodger Stadium development is foreseeable, much of it (including the already-cited 2012 Bill Shaikin article) publicly

known and reported on in local and national media for well over a decade, including reporting on former Dodger owner McCourt's earlier development plans:³⁴

- Bill Shaikin and David Zahniser, Dodgers to add shops, a museum, and garages, LA Times, Apr. 24, 2008, available at: <https://www.latimes.com/archives/la-xpm-2008-apr-24-sp-dodrep24-story.html> (describing a letter sent to Dodger season ticket holders regarding a plan “to transform at least part of the parking lot into an area offering dining and shopping for fans who arrive early and stay late, avoiding pregame and postgame traffic”).
- Dakota Smith, New Dodgers Stadium Reveal: We Got Trees!, Curbed Los Angeles, Apr. 24, 2008, available at: <https://la.curbed.com/2008/4/24/10572290/dodger-stadium-2> (describing a press release from former Dodger owner Frank McCourt and noting Dodger Stadium would be “a place to visit year-round to shop, dine and play”).
- Dylan Hernandez and Bill Shaikin, Stadium makeover is unveiled, LA Times, Apr. 25, 2008, available at: <https://www.latimes.com/archives/la-xpm-2008-apr-25-sp-stadium25-story.html> (describing the same \$500M project, which would occupy “about 15 acres of parking, or about 2,000 spaces”).
- On deck: Dodger Stadium Renovations (photo slideshow), LA Times, Apr. 2008, available at: <https://www.latimes.com/sports/la-dodger-stadium-improvementspg-photogallery.html> (photo slideshow documenting Frank McCourt's public unveiling of \$500M proposed Dodger renovations with elected officials, media, and beloved Dodger announced Vin Scully – see select photos in Exhibit I).³⁵
- Bill Shaikin, Rick Caruso, Joe Torre withdraw from bidding to buy Dodgers, LA Times, Feb. 23, 2012, available at: <https://www.latimes.com/archives/blogs/dodgers-now/story/2012-02-23/rickcaruso-joe-torre-withdraw-from-bidding-to-buy-dodgers> (noting that Los Angeles developer and former mayoral candidate Rick Caruso and former Dodgers manager and famed MLB executive Joe Torre withdrew from bidding on the Dodgers in early 2012 because then-owner Frank McCourt refused to include the Dodger Stadium parking lots as part of the sale. The article noted this was “the clearest evidence yet that McCourt intends to keep the lots and try to build on them.”)
- John Gittelsohn and Nadja Brandt, Stadium land seen as Dodgers key, Bloomberg News/ArkansasOnline.com, Apr. 8, 2012, available at: <https://www.arkansasonline.com/news/2012/apr/08/stadium-land-seen-dodgerskey-20120408/> (discussing Guggenheim Partners' 2012 acquisition of the Dodgers for \$2.15B, a record price for any sports team at the time; the article quotes UCLA economics professor Lee Ohanian that such a price

“didn’t make sense,” and expected that revenue to justify such a high price would come from development of the land around Dodger Stadium.)

- Roger Vincent and Ken Bensinger, Developing Chavez Ravine is likely in play for new Dodgers owner, LA Times, Apr. 16, 2012, available at <https://www.latimes.com/sports/la-xpm-2012-apr-16-la-fi-dodgers-land-20120417-story.html> (noting numerous well-known real estate developers had made bids for the team, and the \$2.15B price suggested development in the parking lot development was likely, recalling that “[f]our years ago, McCourt proposed a \$500-million plan to ring the stadium with restaurants, shops and a Dodgers museum.”).
- Adrian Glick Kudler, Everyone Betting on Dodger Stadium Land Development, Curbed Los Angeles, Apr. 17, 2012, available at: <https://la.curbed.com/2012/4/17/10379072/everyone-betting-on-dodger-stadium-land-development>.

Footnote 34: The cited articles, as well as select images from the “On deck: Dodger Stadium Renovations (photo slideshow)”, are attached as Exhibit I.

Footnote 35: Presentation materials for the “LA Dodgers Stadium Next 50” still appear on architecture firm Johnson Fain’s website at <https://johnsonfain.com/projects/architecture/commercial/la-dodgers-stadium-next-50/> (last viewed, Jan. 11, 2023). Johnson Fain’s Next 50 web page includes visualizations and descriptions of stadium improvements as well as an “[u]rban plaza surrounded by administrative office buildings,” a Dodger museum, 20,000 square foot Dodger Store, café, two 8-level 900-car parking structures, and a “Top of Park plaza.” The plaza would be “located at the highest elevation on site [and] will feature breathtaking 360 degree views spanning the Downtown skyline and Santa Monica Bay, the Santa Monica and San Gabriel Mountains, and the Dodger Stadium diamond.”

Response GO14-60 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system and is not evidence of a larger development project at the Dodger Stadium property. As discussed in Topical Response G, the “Next 50” project was proposed over 15 years ago, and did not proceed after 2008. The current owners of the Los Angeles Dodgers purchased the team and Dodger Stadium in 2012. Accordingly, the Next 50 Project is not required to be included as a related project in the Draft EIR or analyzed as part of the proposed Project in Draft EIR. Further, as discussed in Topical Response G, the purported “future” development that commenters suggest is contemplated at Dodger Stadium would require additional City designations and zoning, permits, and approvals, including potentially environmental review, that are not contemplated or

analyzed in the Draft EIR because no such development is proposed. Mere statements on a website are not evidence that such development is currently proposed, or are sufficiently firm or committed to such that environmental analysis is required. Moreover, actions from over a decade ago, and speculative comments attempting to assign a motive to such actions, do not evidence a firm and specific commitment to develop the property surrounding Dodger Stadium. The proposed Project is solely comprised of an aerial gondola system connecting LAUS to Dodger Stadium and associated improvements. Accordingly, the Draft EIR did not omit “foreseeable” development from its analysis, and CEQA expressly discourages such speculation. Refer to Response GO14-58 for further discussion of the CC&Rs. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO14-61 As discussed above, a letter submitted on behalf of Arts District Community Council of Los Angeles in February 2021 also provides Metro with substantial evidence of foreseeable development of the Dodger Stadium parking lots. (See Exhibit A, supra fn. 2.) The ADCCLA letter cites statements found on McCourt Global’s website (still present as recently as March 31, 2022), noting that McCourt Global’s “current real estate projects include...260 acres of land at Chavez Ravine in Los Angeles.” (See Exhibit B, supra fn. 3.) McCourt Global’s revised web page no longer mentions the 260 acres of Chavez Ravine as a “current real estate project.” It instead promotes the “Los Angeles Aerial Rapid Transit project” as “an opportunity for our organization to partner with community leaders and stakeholders to contribute to the region’s aggressive climate goals and promote sustainability through innovative, zero-emission mobility technology— all while improving mobility and access to Dodger Stadium.” (See Exhibit C, supra fn. 3.) But web archives show text on that page state, as recently as January 26, 2021:

McCourt currently co-owns 260 acres of land at Chavez Ravine in Los Angeles, the home of Dodgers Stadium. Among other plans for the area, McCourt will develop a cutting-edge aerial tramway from Los Angeles Union Station to Dodgers Stadium through its company, Aerial Rapid Transit Technologies. (McCourt Global, Real Estate Overview, Nov. 26, 2020, attached as part of Exhibit B, supra p. 3 fn. 3 (emphasis added).)

Metro’s choice to allow ARTT LLC to ignore Metro’s query as to development plans at Dodger Stadium during early negotiations between the two does not erase the objective reality that such development is reasonably foreseeable. The evidence is manifest that development of a portion of the Dodger Stadium parking lots is not only foreseeable but likely. The DEIR is fatally flawed for failing to consider, analyze, and explain the potentially significant environmental impacts that would result from this foreseeable development that will follow due to the Project. Under CEQA, deferring

environmental review of foreseeable indirect environmental impacts and thus deferring any and all necessary mitigations associated with those impacts is impermissible. “While foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can.” (CEQA Guidelines, § 15144.)

Response GO14-61 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system and is not evidence of a larger development project at the Dodger Stadium property for which environmental analysis of was “impermissibly deferred.” Further, as discussed in Topical Response G, the purported “future” development that commenters suggest is contemplated at Dodger Stadium would require additional City designations and zoning, permits, and approvals, including potentially environmental review, that are not contemplated or analyzed in the Draft EIR because no such development is proposed. CEQA discourages such speculation. Refer to Response GO14-10 for a discussion of how mere statements on a website do not constitute a firm commitment to potential development such that it is “foreseeable.” In addition, the unsolicited proposal process was intended to inform Metro’s sole source determination to act as lead agency for the proposed Project and advance it to environmental review. Metro’s sole source determination was upheld in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate).

Comment GO14-62 Most important, since reasonably foreseeable development at Dodger Stadium would be expected to draw many people to the Chavez Ravine site daily on non-game and non-special event days (and would also likely cause additional traffic and transportation issues on days with games and special events from drawing even more people than the approximately 56,000 fans that attend a sellout game at the stadium), the DEIR’s complete failure to consider and analyze impacts of such readily foreseeable development entirely undercuts major claims of Project benefits with respect to reduced energy usage, reduced greenhouse gas emissions, reduced vehicle miles traveled (VMT), and assertions regarding other standard environmental impact analysis categories.

In short, the Project’s environmental review process is made entirely invalid by the Draft EIR’s egregious failure to disclose, discuss, and evaluate the foreseeable development.

Response GO14-62 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project

Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR.

Comment GO14-63 Moreover, development of Dodger Stadium parking lots is not the only reasonably foreseeable use of the Project. The Project would also allow Dodger Stadium to be used as a "satellite lot" to allow people to drive to downtown Los Angeles in order to park at Dodger Stadium and use the private gondola to come down from Dodger Stadium to attend events in downtown Los Angeles sports and entertainment venues and to large events at LA State Historic Park. This injection of additional vehicles into the downtown area is also a reasonably foreseeable indirect environmental impact that is not discussed or analyzed in the DEIR.

For example, at a recent meeting of Metro's Ad Hoc 2028 Olympics Committee, the board received a staff presentation explaining how Dodger Stadium parking area had been used as satellite parking for the MLS Cup Final, scheduled at 1pm on Nov. 5, 2022, hours before USC's scheduled home football game at the Coliseum the same day.³⁶ The MLS Cup Final satellite parking utilized a private shuttle bus service which ran from 9 am to 6 pm. According to Metro, 500 car and 1,500 riders used this shuttle service. If the Project were constructed shuttle buses would not be necessary to move sports event attendees from Dodger Stadium to downtown sports venues, as patrons could use the ARTT LLC private gondola to gain access to Metro's public transit system, whether via trains or bus lines. This foreseeable use of the Project would also draw vehicle traffic to Dodger Stadium that is not accounted for by the Draft EIR.

At the Ad Hoc meeting, public commenter Phyllis Ling noted: "It sounds like you are opening the door to people using Dodger Stadium parking lot as a park and ride lot. That would be – would that be the biggest park and ride lot in the nation? That's a lot of additional Vehicle Miles Traveled into our neighborhood." She also expressed that Metro should learn the lessons from the London and Rio Olympics, which had both built gondolas for their Olympics, and that had not worked out as long-term infrastructure choice for transportation. As Ling stated: "The Rio gondola ran out of money for maintenance and is no longer running. The London gondola has hardly any local riders, it is used mostly for tourism and needs taxpayer funding to support it."³⁷ As discussed at length above, the federal definition for "public transportation" does not include services used for tourism or "sightseeing," which is specifically excluded from consideration as "public transportation" under federal law. (49 U.S.C. § 5302, subd. (15)(B)(v).)

The Ad Hoc 2028 Olympics Committee meeting presentation also included discussion of an event on October 28, 2018, known locally and nationally as the “Los Angeles Sports Equinox,” because games in every major US sports league occurred in Los Angeles on the same day: NFL (Rams), MLB (Dodgers), NBA (Clippers), NHL (Kings), and MLS (Galaxy). If the Project were built, expanded use of Dodger Stadium as a satellite (or park and ride) lot for similar high conflict sports and event days in downtown Los Angeles is a readily foreseeable physical change due to the project and would likewise be expected to draw significant vehicle traffic to Dodger Stadium, increasing greenhouse gas emissions and vehicle miles traveled.

Footnote 36: See excerpts from Metro Ad Hoc 2028 Olympics Committee Agenda – Final, Nov. 16, 2022, agenda item 6, “Mobility Lessons Learned from World Sports Events,” as well as p. 11 of a slide presentation presented at that meeting entitled “Major Events Lessons Learned,” attached as Exhibit J. Metro presents the audio and video of the Ad Hoc committee’s meeting audio/video on its media website: https://metro.granicus.com/player/clip/2413?view_id=2&redirect=true&h=461b5c8f36092ebca0c1ed190e407b21 (last viewed Jan 10, 2023). The agenda and related materials are also available at: <https://metro.legistar.com/MeetingDetail.aspx?ID=1005579&GUID=696A3208-D9CE-4B9E-8728-977FC65341C8&Options=&Search=> (last viewed Jan 10, 2023). The Metro Ad Hoc 2028 Olympics Committee meeting audio/video for this meeting must be made part of the Project’s administrative record.

Footnote 37: See link to audio/video, supra fn. 36.

Response GO14-63 The contents of Exhibit J are considered in this response. The comment suggests because Dodger Stadium was used as a park and ride for the MLS Cup final in November 2022, Dodger Stadium may similarly be used for other events. However, this was a unique situation that is not a reasonably foreseeable consequence if the proposed Project were to be constructed and implemented. The scenario described involved Major League Soccer’s championship game, the location of which was not scheduled in advance. As the commenters’ cited article notes, the Los Angeles Football Club’s (“LAFC”) Banc of California Stadium was only confirmed as the host of the MLS Cup the Sunday prior to the game, which would occur at the same time as a pre-scheduled University of Southern California football game next door at the Los Angeles Coliseum. This meant that parking within the vicinity for the football game took priority, and LAFC was required to coordinate with and obtain approval from the Los Angeles Dodgers for use of the parking lot. It is highly unlikely that such an event would repeat with any sort of frequency requiring the analysis in the EIR for the proposed Project. Even so, LAFC utilized shuttle buses from Dodger Stadium to the Banc of California Stadium, and there is no indication that the presence of the proposed Project would have increased the likelihood that Dodger Stadium would be used as a parking location for major events. In sum, the proposed Project would connect LAUS to the Dodger Stadium property via an aerial gondola system. The

proposed Project does not contemplate the use of the Dodger Stadium parking lot as a park-and-ride and nor is this use reasonably foreseeable, and accordingly, no such analysis is required. Further, based upon a review of Metro’s November 16, 2022, Ad Hoc Olympics Planning Committee meeting, no member of the Ad Hoc 2028 Olympics Committee discussed the potential for using Dodger Stadium as a parking location for the 2028 Olympics. Rather, only a single member of the public raised the possibility during public comment at the meeting. The proposed Project does not contemplate the use of the Dodger Stadium parking lot as a park-and-ride and nor is this use reasonably foreseeable, and accordingly, no such analysis is required.

Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world and their operations. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment GO14-64 Ling’s public comment also expressed surprise that the private ARTT LLC gondola project had been placed on Metro’s “Comprehensive MCP Project List.”³⁸ Following the close of public comment, in response to Ling’s comment, Ad Hoc committee chair, Supervisor Hilda L. Solis questioned its inclusion on the list as well: “You know, just a quick question for staff—I don’t recall reading in my materials that the proposed gondola was a part of this. Is that correct?” Metro staff member Ernesto Chaves responded evasively: “It’s not part of the prioritized list that is coming up in the next item.” But Ms. Ling’s comment was not that it was placed on the prioritized list, it was that it was placed on the comprehensive list, which is correct.

The “lessons learned” presentation was followed by discussion of Metro’s “2028 Games Mobility Concept Plan.” As discussed above, the Project is included on Attachment C to that agenda item. (See fn. 38, this page.) The Project’s inclusion on Metro’s “Comprehensive MCP Project List” prepared for the Olympics must be construed as a formal acknowledgement by Metro that a reasonably foreseeable

indirect physical change due to the Project is the use of Dodger Stadium parking lots as a satellite lot for Olympics event attendees. The presentation to Metro makes clear that even if Dodger Stadium is not an Olympic venue use of its parking lots for satellite lot use as in the recent MLS Cup Final is an available and perhaps desirable, more important reasonably foreseeable, option for many downtown sports venues where Olympic events will be held.³⁹ As discussed above, this foreseeable use would draw additional vehicle traffic to Dodger Stadium to utilize the private gondola, which would increase greenhouse gas emissions and vehicle miles traveled, among other potentially significant impacts, thus calling into significant question the DEIR's GHG, VMT, and other conclusions. The DEIR does not address this foreseeable indirect physical change or its potential impacts.

Footnote 38: See Comprehensive MCP Project List, p. 5, attached as Exhibit K. The list is Attachment C to agenda item 7 on the Ad Hoc 2028 Olympics Committee Nov. 16, 2022 agenda; see Exhibit J, supra fn. 36. It is available at <http://metro.legistar.com/gateway.aspx?M=F&ID=b8e94467-6e56-4687-b2bc-3d0bb08fb2fa.pdf>.

Footnote 39: See Metro presentation, Motion 42 Update: 2022 Prioritized MCP Project List, Nov. 16, 2022, p. 3 (showing a map and list of downtown Los Angeles venues), attached as Exhibit L.

Response GO14-64 The contents of Exhibit L are considered in this response. Refer to Response GO14-63 for discussion of how the proposed Project does not contemplate the use of the Dodger Stadium parking lot as a park-and-ride, nor is this use reasonably foreseeable. At Metro's November 16, 2022, Ad Hoc Olympics Planning Committee meeting, the Committee approved the 2028 Games Mobility Concept Plan – 2022 Prioritized Mobility Concept Plan Project List (Attachment A). The proposed Project was not included in the 2022 Prioritized Mobility Concept Plan Project List (Attachment A).¹⁴ The Dodgers manage the Dodger Stadium parking lot and would have to approve any deal to use the parking lot. Such an agreement is entirely separate from the proposed Project's operations, and the mere possibility that the Dodger Stadium property could be used in such a manner without any agreement in hand is simply too speculative to require the analysis in the EIR for this aerial gondola system.

Comment GO14-65 Finally, the DEIR discusses that attendees at periodic special events at LA State Historic Park could take the private Project from LA Union Station to the proposed Chinatown/State Park Station, instead of existing public transit options. The DEIR assumes without substantial evidence that it would "capture" 10 percent of such riders. (DEIR, p. 3.17-26.) But the DEIR seems to assume that LASHP special event attendees will come only from the Union Station terminus of the Project. It does not discuss or analyze the foreseeable use of the Project to allow Dodger Stadium parking lots as a potential satellite lot for LA State Historic Park special events which, like other

¹⁴ Los Angeles County Metropolitan Transportation Authority (LA Metro). 2022. 2028 Games Mobility Concept Plan (Attachment A). Available at: <https://datamade-metro-pdf-merger.s3.amazonaws.com/ad-hoc-2028-olympics-committee-6b993d455bc3.pdf>. Accessed August 2023.

foreseeable uses that would use the Dodger Stadium parking lots for a park and ride or satellite use, would draw additional vehicle traffic to the local community, increasing greenhouse gas emissions and vehicle miles traveled, among other environmental impacts.

Response GO14-65 Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Response GO14-42 for discussion of the analysis of proposed Project ridership from LAUS to the Los Angeles State Historic Park. Refer to Response GO14-64 for a discussion of how the use of the Dodger Stadium parking lot is not a reasonably foreseeable use required to be analyzed in the Draft EIR, as the Dodgers manage the Dodger Stadium parking lot and would have to approve any deal to use the parking lot. Such an agreement is entirely separate from the proposed Project's operations, and the mere possibility that the Dodger Stadium property could be used in such a manner without any agreement in hand is simply too speculative to require the analysis in the EIR for this aerial gondola system.

Comment GO14-66 Metro's inexplicable failure to disclose, discuss, and analyze the above foreseeable indirect environmental impacts of the Project cannot be corrected merely by adding additional information in the Final EIR. The purpose of an EIR is to provide the public with detailed information about a project before it is approved (Pub. Res. Code, §§ 21002.1, 21003.1) [W]hen significant new information is added to the EIR after public notice...but before certification, the EIR must be recirculated..." (Pub. Res. Code, § 21092.1; CEQA Guidelines, § 15088.5). The Draft EIR for the Project must be revised and recirculated to address the many deficiencies described in this and other comment letters so that the public has an opportunity to review and provide meaningful comment. Recirculation is required when a DEIR is "so fundamentally and basically inadequate and conclusory in nature that public comment on the draft was in effect meaningless." (Laurel Heights Improvement Assn. v. Regents of University of California (1993) 6 Cal.4th 1112, 1130.)

Response GO14-66 This comment and the comments provided in this letter do not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR.

Comment GO14-67 The DEIR's analyses in numerous impact categories is clearly incomplete and deficient for its failure to consider potentially significant impacts of the foreseeable indirect

physical change in the environment caused by likely future development at the Dodger Stadium parking lots or use of the lots as satellite for downtown Los Angeles events. These include the Project's analysis of Air Quality, Energy, Geology and Soils, Land Use and Planning, Noise, Public Services, Parks and Recreation, Transportation and Traffic, and Utilities and Service Systems, among others. Conclusions about greenhouse gas (GHG) emissions and vehicle miles traveled (VMT) are particularly suspect.

Response GO14-67 Refer to Responses GO14-56 to GO14-66 for a discussion of how the Draft EIR considered all reasonably foreseeable potential impacts associated with the proposed Project, which solely proposes an aerial gondola system. Refer to Section 3.03, Air Quality, 3.06, Energy, 3.07, Geology and Soils, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Park and Recreational Facilities, 3.17, Transportation, and 3.19, Utilities, of the Draft EIR, for an analysis of the proposed Project's potential environmental impacts. Conclusions regarding greenhouse gas emissions and vehicle miles traveled are further substantiated by information provided in technical reports; refer to Appendix J, Greenhouse Gas Emissions Technical Report and Appendix N, Transportation Appendices, of the Draft EIR.

Comment GO14-68 In addition, the failure to consider foreseeable indirect impacts completely invalidates the DEIR's Cumulative Impact and Growth-Inducing Impact Analyses. As the DEIR acknowledges: "Secondary effects of growth could result in significant, adverse environmental impacts, which could include increased demand on community public services, increased traffic and noise, degradation of air and water quality, and conversion of agricultural land and open space to developed uses." (DEIR, p. 5-57.)

Response GO14-68 Refer to Responses GO14-56 to GO14-66 for a discussion of how the Draft EIR considered all reasonably foreseeable potential impacts associated with the proposed Project, which solely proposes an aerial gondola system. This comment does not specify why the Draft EIR's cumulative impact analysis and growth inducing impact analysis, provided in Section 5.0, Other CEQA Considerations, is otherwise invalid, nor how the cited quote renders the analysis invalid. Indeed, the comment's quotation from the Draft EIR is from the background overview of growth-inducing impacts, and are not related to the analysis of the proposed Project's growth-inducing impacts. Page 5-57 of the Draft EIR also acknowledges that "[g]enerally, growth inducing projects are located in isolated, undeveloped, or underdeveloped areas, necessitating the extension of major infrastructure, such as water or sewer facilities, or roads." The proposed Project's potential growth-inducing impacts analysis is provided on pages 5-58 through 5-60 of the Draft EIR. Pursuant to CEQA section 15130(a), the Draft EIR discussed the cumulative impacts of the proposed Project with other past, present, and probable future projects in Section 5.2, Cumulative Impacts. Pursuant to CEQA Guidelines section 15125.2(d), the Draft EIR provided a discussion

of the ways in which the proposed Project could induce growth in Section 5.4, Growth-Inducing Impacts. Mere speculation from a commenter does not constitute evidence of a foreseeable impact that should have been analyzed, and no revisions to the analysis are required.

Comment GO14-69 Metro has failed to make “a good faith effort at full disclosure” of the Project’s environmental effects. (See California Oak Foundation, 188 Cal.App.4th at 262.) The entire DEIR is rendered invalid for its failure to address any impacts from the foreseeable indirect physical changes to the environment likely to be caused due to the proposed Project and must revise and recirculate the DEIR. In the alternative, Metro could instead deny the Project outright. This is the most appropriate course of action since there are superior feasible alternatives that would reduce the Project’s significant (and unavoidable) adverse environmental impacts. (See Pub. Res. Code, § 21002: “[P]ublic agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects....”)

Response GO14-69 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Responses GO14-56 to GO14-66 for a discussion of how the Draft EIR considered all reasonably foreseeable potential impacts associated with the proposed Project, which solely proposes an aerial gondola system. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR of “a good faith effort at full disclosure.” Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA. In addition, the Draft EIR identifies feasible mitigation measures to substantially lessen identified significant environmental impacts from the proposed Project, in compliance with CEQA’s requirements. As discussed in Section 4.0, Alternatives, of the Draft EIR, on page 4-15, pursuant to CEQA Guidelines section 15126.6(f)(2), the Draft EIR considered three Direct Alignment Alternatives which included alternative locations for the proposed Project but dismissed these alternatives from further detailed consideration because they would not avoid or substantially lessen significant effects of the proposed Project, would not otherwise meet the project objectives, and because the Project Sponsor would likely be unable to reasonably acquire, control, or otherwise have access to alternative sites required for the Direct Alignment Alternatives.

Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. In response to public comments, this alternative was considered but dismissed from further detailed analysis in the Final EIR because it did not meet most of the basic objectives of the proposed Project.

Comment GO14-70 II. SUBSTANTIVE COMMENTS ON IMPACT ANALYSES

The following comments are generally presented in the order addressed in the Draft EIR.

A. The Executive Summary is Incomplete and Inaccurate.

Note that some comments associated with the Executive Summary will be made within specific DEIR analysis sections following this section.

Response GO14-70 This comment provides a general introduction to comments raised in this Part II of this letter. Responses to the comments in this section of this letter are provided in Responses GO14-71 through GO14-175.

Comment GO14-71 1. CEQA requires the City of Los Angeles to serve as Lead Agency.

As discussed at length in this office’s letter on behalf of LA Parks Alliance of December 19, 2022, LA Park’s Alliance objects to Metro’s negotiated arrangement to serve as lead agency for the Project. (DEIR, p. ES-1.) The Executive Summary’s conclusory analysis that Metro is “the public agency with the greatest responsibility for supervising or approving the project is a whole” is grossly in error. Metro has not documented that it has performed the mandatory analysis pursuant to CEQA Guidelines section 15051 to determine the appropriate lead agency. Had the proper analysis been done, plainly the City of Los Angeles would be designated as the lead agency, not Metro.

Metro’s errant conclusion is presented as a *fait accompli*. This is confusing and misleading to the public (and perhaps also to some agency decisionmakers), most of whom are unlikely to understand that the determination of lead agency must follow the CEQA guidelines. If the CEQA Guidelines were followed the City of Los Angeles would be designated as lead agency, not Metro, for all the reasons discussed in the letter of December 19, 2022.

Designation of the incorrect lead agency prejudicially taints the EIR process, a fatal flaw that can only be remedied by beginning the environmental review process anew with the correct lead agency, here the City of Los Angeles. (See *Planning & Conservation League v. Department of Water Resources* (2000) 83 Cal.App.4th 892, 907.)

Response GO14-71 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Response G014-13 for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project and the City’s participation in the environmental review process as a CEQA responsible agency. As the agency tasked with planning, operating, and coordinating funding for the Los Angeles Region’s transportation system, Metro has primary responsibility for implementation of the proposed Project, and is the proper lead agency. Under CEQA, where two or more public agencies meet the criteria for acting as lead agency, the agency that acts first will normally serve as lead agency. (CEQA Guidelines, §15051(c).) Metro elected to serve as lead agency, and the City has cooperated as a responsible agency, including consultation in preparation of the Draft EIR.

Comment GO14-72 2. The number of Dodger Stadium parking spaces to be removed is not included in the DEIR.

The Executive Summary notes that “[i]mplementation of the Dodger Stadium Station would require the removal of parking spaces,” but nowhere does the DEIR detail the number of spaces permanently lost at the stadium due to implementation of the Project. (DEIR, p. ES-10; see also, DEIR, p. 2-39.) The DEIR is incomplete in not including this information.

Response GO14-72 Refer to Section 2.9.7, Dodger Stadium Station, of Section 2.0, Project Description, of the Draft EIR, which states that approximately 194 existing parking spaces would be removed to accommodate the Dodger Stadium Station, the realigned perimeter road, and the pedestrian pathway connecting the station to Dodger Stadium. Parking is not required to be analyzed under CEQA or the City’s Transportation Assessment Guidelines (“TAG”).

Comment GO14-73 3. Claims of reduced GHG emissions and reduced VMT do not consider reasonably foreseeable indirect physical changes in the environment due to the Project.

The DEIR explains in the Executive Summary and repeats many times throughout that “the proposed Project would reduce vehicle miles traveled (VMT) and congestion, leading to reduced GHG emissions and improved air quality.” (DEIR, p. ES-13.) But as discussed above, the DEIR does not consider reasonably foreseeable indirect physical changes in the environment due to the Project, such as development of Dodger Stadium parking lots, or use of those lots as a satellite or “park and ride” lot, which would likely draw many thousands of cars to Dodger Stadium. Thus, all DEIR conclusions regarding GHG, VMT, and many other analysis categories are incomplete and inaccurate and cannot be relied upon.

Response GO14-73 Refer to Responses GO14-57 through GO14-64 for a discussion of how the Draft EIR analyzed all reasonably foreseeable impacts of the proposed Project, which solely proposes an aerial gondola system. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Comment GO14-74 4. The Executive Summary’s “Summary of Public Comments” glosses over neutral and negative comments received during the scoping process.

The Executive Summary’s “Summary of Public Comments” improperly mischaracterizes the public comments received during the Project’s scoping process by minimizing all negative and neutral comments received. (DEIR, p. ES-17.) The Executive Summary describes the numerous mixed comments in one sentence: “Many community members expressed conditional support for the proposed Project with a strong interest in future Project developments.” (Ibid.) This comment seems intended to dissuade DEIR reviewers from bothering to review Appendix A, which includes hundreds of pages of comments, including not only positive and conditionally supportive, but also negative and neutral comments that would likely have informed additional public comment on the DEIR.

California’s Supreme Court has held that the environmental review process is intended “to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action.” (Laurel Heights Improvement Assn. v. Regents of the University of California (1988) 47 Cal.3d 376, 392.) “[B]efore project approval, the law presumes the lead agency is neutral and objective and that its interest is in compliance with CEQA. ... The agency’s unbiased evaluation of the environmental impacts of the applicant’s proposal is the bedrock on which the rest of the CEQA process is based.” (Golden Door Properties, LLC v. Superior Court (2020) 53 Cal.App.5th 733, 782.)

Metro falls far short of CEQA’s goals of transparency, full disclosure, and lack of bias when it grossly mischaracterizes public comments received during the scoping process and uses the DEIR as an advocacy document rather than a neutral, unbiased evaluation of the Project. Because the DEIR must be revised and recirculated (if not entirely discarded) due to its numerous fatal flaws, LA Parks Alliance urges Metro to take the opportunity to remove misleading statements that mischaracterize public comment received in any later environmental review document prepared for the Project.

Response GO14-74 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Contrary to this comment’s suggestion, CEQA does not

require the Executive Summary to provide a characterization of all comments received on the NOP. In compliance with CEQA Guidelines section 15123(b)(2), the Draft EIR identified “Areas of controversy known to the Lead Agency including issues raised by agencies and the public” on pages ES-14 through ES-17 of the Executive Summary. Further, refer to Section 1.0, Introduction, of the Draft EIR, for a summary of public comments and questions received during the NOP phase of CEQA review for the proposed Project. Refer to Attachment F in Appendix A, Scoping Report, of the Draft EIR, for copies of all written comments submitted during the public scoping period, a verbatim transcript of the comments received during the meeting, and a verbatim copy of the Q&A Box from the meeting. All comments received during the scoping process for the proposed Project are included in Appendix A to the Draft EIR. Refer to Responses GO14-6 through GO14-12 for discussion of comments received on the NOP. The Draft EIR complied with the requirements of CEQA Guidelines section 15151 to provide information, facts, and analysis to allow decision-makers to make an intelligent decision concerning the proposed Project’s environmental consequences. This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5

Comment GO14-75 5. The Executive Summary’s list of significant and unavoidable impacts is incomplete and inaccurate.

As discussed above, while the California Department of Parks and Recreation clearly has jurisdiction over LA State Historic Park, neither the Department nor the Director have unbridled authority to permit changes to state parkland that would result in a violation of state law. Since the Project may not use any portion of LA State Historic Park for all of the reasons discussed in Parts I(D) and I(E) of this letter (see pp. 12-25), the Executive Summary is incomplete and inadequate for failing to identify that impacts to LA State Historic Park are significant and unavoidable.

Response GO14-75 Refer to Topical Response F, Los Angeles State Historic Park, for discussion regarding how the California Department of Parks and Recreation has the authority to grant the necessary approvals for the proposed Project. Refer to Responses GO14-32 through GO14-54 for responses to comments raised in Parts I(D) and I(E) of this letter. The Executive Summary to the Draft EIR summarizes all potential impacts from the proposed Project set forth in Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR, in compliance with CEQA. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, State Parks has determined that the proposed Project would be inconsistent with the Los Angeles State Historic Park General Plan because the identified land uses in the General Plan’s Preferred Park Concept Elements did not contemplate a transit station like the proposed Project’s Chinatown/State Park Station. State Parks considers this inconsistency a potentially significant impact. Therefore, Mitigation Measure LUP-A

would be implemented to require the proposed Project to obtain an amendment to the Los Angeles State Historic Park General Plan. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Amendment.

Comment GO14-76 B. The DEIR’s Introduction is Incomplete and Inaccurate.

1. The DEIR fails to identify all trustee and responsible agencies.

As discussed above, Metro failed to include at least two state agencies as trustee and/or responsible agencies. (See Part. I.B., supra pp. 3-7.) As a result, DEIR section 1.3 is incomplete and inaccurate for failing to identify the Santa Monica Mountains Conservancy and California Department of Housing and Community Development. (DEIR, p. 1-2.)

Response GO14-76 Refer to Section 1.0, Introduction, of the Draft EIR for discussion of the CEQA Responsible and Trustee Agencies. Refer to Response GO14-16 for discussion of SMMC and HCD. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of the proposed Project’s consultation with CEQA responsible agencies. Refer to Appendix A, Scoping Report, of the Draft EIR, and Appendix A, Public Outreach Report, of the Final EIR, for documentation of notice to responsible agencies at various stages in the environmental review process. Metro has complied, and will continue to comply, with the CEQA requirements for consultation with responsible agencies at each stage of the environmental review process.

Comment GO14-77 2. The DEIR misidentifies the Project as eligible for SB 44.

The DEIR’s SB 44 analysis of the Project concludes that it is eligible for SB 44 streamlining as an environmental leadership transit project. (DEIR, pp. 1-4 to 1-9). However, this conclusion is incorrect for all the reasons discussed above (primarily because the project is not “public transportation” and therefore cannot be considered a “fixed guideway”). (See Part I.C., pp. 8-12.) In addition to objections already raised, the DEIR’s SB 44 analysis is also vague, inaccurate, and misleading.

First, although the Project is only 1.2 miles in length (DEIR, p. ES-1), the DEIR states: “For the purposes of SB 44, this Draft EIR defines the ‘corridor of the project’ as the area in which Dodger fans travel to and from games at Dodger Stadium, based on existing ticket sale data.” (DEIR, p. 1-4.) The DEIR is vague and ambiguous in not explaining why the “corridor of the project” is so much greater than the actual project area and suggests that the Project takes credit for GHG and VMT reductions not associated with the Project. The response to DEIR comments should explain why the

“corridor of the project” can be so vast when compared to the small actual corridor the proposed Project would occupy if constructed.

Response GO14-77 Refer to Response G014-22 for discussion of how the proposed Project complies with SB 44. As discussed in Section 1.4.3, Senate Bill 44, of the Draft EIR, the “corridor of the project” for purposes of SB 44 is “the area in which Dodger fans travel to and from games at Dodger Stadium, based on existing ticket sale data.” As explained in Section 3.17, Transportation, of the Draft EIR, VMT for the proposed Project ridership forecasting model is calculated by multiplying the number of vehicle trips by the average trip length, and average trip length is calculated using Teralytics data of approximately 2.1 million trip samples to calculate average trip lengths for weekday games (19-21 miles) and weekend games (22-25 miles). As demonstrated in Appendix N, Transportation Appendices, of the Draft EIR, in the “LA ART Mode of Access Data Considered and Estimated Future Mode of Access” table, the proposed Project ridership forecasting model assumes that 67.5 percent of riders for the proposed Project will take public transportation to LAUS to access the proposed Project via Alameda Station. The methodology for these ridership estimates is explained in detail in Section 3.17, Transportation, of the Draft EIR, on pages 3.17-24 to 3.17-26. Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and Appendix N, Transportation Appendices of the Draft EIR.¹⁵ Stantec is an internationally-respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR.

Comment GO14-78 As discussed above, the DEIR’s calculation of GHG and VMT reductions do not include consideration of reasonably foreseeable indirect physical changes in the environment (foreseeable development at Dodger Stadium parking lots as well as use of the lots for satellite parking), and therefore information provided in support of the DEIR’s SB 44 analysis of GHG and VMT is inaccurate and must be recalculated. (See DEIR, pp. 1-5 to 1-6, 1-8.) This claim is made repeatedly throughout the DEIR.

Response GO14-78 Refer to Responses GO14-57 through GO14-64 for a discussion of how the Draft EIR analyzed all reasonably foreseeable impacts of the proposed Project, which solely proposes an aerial gondola system.

Comment GO14-79 The DEIR’s consistency analysis with the Goals of Connect SoCal is inaccurate. For example, the second goal is met in part “by reducing passenger vehicle miles traveled.” (DEIR, p. 1-6.) As discussed above, the VMT calculations are incorrect due to the DEIR’s failure to consider reasonably foreseeable indirect physical changes in the environment due to the Project. Likewise, the fifth and seventh goals are met in

¹⁵ Stantec. 2023. Memo to Holly Rockwell Regarding Los Angeles Aerial Rapid Transit (LA ART) Project Transportation Analysis Peer Review.

part by assuming a reduction in net GHG due to the Project, which is also calculated without considering reasonably foreseeable indirect physical changes in the environment due the Project. (DEIR, pp. 1-6, 1-7.) The Project meets the sixth goal by relying on an entirely speculative “potential mobility hub” at Dodger Stadium, which would allegedly increase access to Elysian Park and surrounding communities. (DEIR, p. 1-7.)

The DEIR’s analysis of consistency with the eighth listed goal states that it would “leverage new transportation technologies and data-driven solutions that result in more efficient travel.” (Ibid.) There is no evidence presented in the DEIR to support this pie-in-the-sky consistency conclusion—the conclusory statement is no more than unabashed cheerleading in support of the Project.

Response GO14-79 This comment provides a general recitation and characterization of the Draft EIR. Refer to Section 1.0, Introduction, of the Draft EIR, pages 1-6 to 1-8, and Appendix N, Transportation Appendices, of the Draft EIR, for analysis of the proposed Project’s consistency with each of the goals of Connect SoCal. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is consistent with the goals of Connect SoCal, as the proposed Project would provide improved mobility, accessibility, reliability and travel choices for people traveling in Los Angeles to a major event destination (Dodger Stadium), as well as provide improved transit service to adjacent communities, and would otherwise reduce greenhouse gas emissions by reducing VMT. The proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel are discussed in Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime emissions of the proposed Project over its useful life would be a reduction of 166,653 MT CO₂e. The lifetime VMT reduction of the proposed Project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles travelled. The proposed Project would result in a net reduction in criteria pollutant emissions by reducing vehicle miles travelled. As discussed in Section 5.0, Corrections and

Additions, of the Final EIR, the proposed Project would provide a mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon. Thus, the proposed Project would provide improved mobility, accessibility, reliability and travel choices for people traveling in Los Angeles to a major event destination (Dodger Stadium), as well as provide improved transit service to adjacent communities. The proposed Project would reduce greenhouse gas emissions by reducing VMT. Accordingly, the proposed Project would be consistent with goals in Connect SoCal and is thus consistent with the applicable sustainable communities strategy and regional transportation plan, satisfying Public Resources Code sections 21168.6.9(a)(1)(D)-(E).

Comment GO14-80 The DEIR’s analysis of consistency with Connect SoCal’s ninth goal suggests that the Project will encourage housing growth. (Ibid.: “The proposed Project would encourage development of diverse housing types.”) While LA Parks Alliance believes this statement is likely true, since the DEIR fails to consider the growth-inducing impacts of the reasonably foreseeable indirect physical changes to the environment due to the failure to address future development at Dodger Stadium (which could not only include housing, but also would likely increase the number of permanent jobs in the region, which would induce housing demand), it is completely at odds with the DEIR’s later conclusion that the Project will not promote any growth in housing, whether directly or indirectly. (DEIR, p. 5-58.) The Project cannot both encourage housing while not directly or indirectly inducing growth. Metro needs to explain this internal inconsistency.

Response GO14-80 Refer to Response GO14-79 for a discussion of the proposed Project’s consistency with each of the goals of Connect SoCal. Refer to Response GO14-68 for a discussion of the proposed Project’s growth-inducing impacts analysis. Further, this comment mischaracterizes Goal Nine of Connect SoCal, as well as the Draft EIR’s analysis of the proposed Project’s consistency with this goal. In full, the Goal states: “Encourage development of diverse housing types in areas that are supported by multiple transportation options.” As discussed on page 1-7 of the Draft EIR, the proposed Project is consistent with this goal “by providing an additional transportation option for the residents and visitors in the City of Los Angeles, and enabling access between Dodger Stadium, the surrounding communities, and the regional transit system accessible at LAUS.” Therefore, the proposed Project is consistent with this goal for its ability to provide a transit connection, not housing. Further, as discussed in Table C-3, Consistency with Connect SoCal (2020-2045 Regional Transportation Plan/Sustainable Communities Strategy) of Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, Goal Nine is “not applicable to an individual transportation project.” Accordingly, the Draft EIR is not “internally inconsistent” in its discussion of the potential for growth-inducing impacts. Refer to Topical

Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property.

Comment GO14-81 The DEIR’s analysis of consistency with the tenth and final Connect SoCal goal states that the Project “would promote conservation of natural and agricultural lands and restoration of habitats by being constructed in a previously developed area, and would not impede the region’s goal of conserving land and restoring habitats.” (DEIR, p. 1-7.) This is an outrageous conclusion given that the Project seeks to use well over an acre of the Los Angeles State Historic Park for a significant portion of its alignment and would require 81 trees in and adjacent to the Park to be destroyed. On this basis alone, it is evident that the Project does not “promote conservation of natural...lands and restoration of habitats.” Further, and as discussed below, removal of 81 trees and Project-related activity at the western side of the Park removes habitat, and the Project’s gondola cable system will likely result in deadly bird strikes. These significant impacts do not “promote conservation.”

Response GO14-81 Refer to Section 1.0, Introduction, of the Draft EIR, for the proposed Project’s analysis of consistency with Connect SoCal’s goals, including to promote conservation of natural and agricultural lands and restoration of habitats by being constructed in a previously developed area, and to not impede the region’s goal of conserving land and restoring habitats. Further, as discussed in Table C-3, Consistency with Connect SoCal (2020-2045 Regional Transportation Plan/Sustainable Communities Strategy) of Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, Goal Ten is “not applicable to an individual transportation project,” but nevertheless, the proposed Project “would promote conservation of natural and agricultural lands and restoration of habitats by being constructed in a previously developed area,” and therefore “would not impede the region’s goal of conserving land and restoring habitats.” Therefore, the proposed Project is consistent with Goal Ten. Refer to Section 3.04, Biological Resources, with supporting data provided in Appendix E, Biological Resources Assessment, of the Draft EIR, for a discussion of how the proposed Project would have less than significant impacts to biological resources with mitigation. This conclusion is further substantiated by Appendix G, Supplemental Biological Resources Report, of this Final EIR. As discussed in Appendix G, while the removal of the relatively small amount of wooded habitat for the proposed Project would result in a marginal reduction of suitable tree habitat in the short-term, in the long-term, the replacement of the trees proposed in connection with the applicable tree replacement requirements (and memorialized in BIO-PDF-F) would more than offset any realized impacts associated with the proposed Project. In addition, in order to provide additional environmental benefits, the proposed Project would implement

BIO-PDF-A through BIO-PDF-H. BIO-PDF-A, which would establish a Tree Protection Zone to protect trees during construction that are not identified to be removed, but are either in the construction footprint, or in close proximity to the construction footprint, is discussed in Section 3.04 of the Draft EIR. BIO-PDF-B through BIO-PDF-H are discussed in Section 5.0, Corrections and Additions, of this Final EIR.

As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Refer to Responses GO14-134 through GO14-141 for discussion of the Draft EIR analysis of risk of avian collision.

Comment GO14-82 C. The Project Description Minimizes Project Impacts, Includes Artificially Constrained Project Objectives, and is Inaccurate, Incomplete and Misleading.

1. The project description of Los Angeles State Historic Park minimizes aesthetic, cultural, historic, and other Project impacts.

The DEIR provides general descriptions of major landmarks within the alignment of the proposed Project. Section 2.3.4 of the DEIR's Project Description provides information about Los Angeles State Historic Park. The bland description of LA State Historic Park greatly undervalues its importance as a treasured resource within both the local community it serves and to the people of California more generally.

LA State Historic Park's name was specifically chosen "in an effort to support the broad interpretive purpose of the Park in telling the whole cultural story of Los Angeles." (LASHP General Plan, p. 10 (emphasis added)).⁴⁰ As LA State Historic Park's General Plan states:

Who are Angelenos? What is Los Angeles? As noted, historian Dr. Leonard Pitt stated, "No other available 32 acres holds as much opportunity to enlighten us

about the history and culture of Los Angeles and this region...” The Park site and its surroundings have a sense of place rooted in a long history of settlement. There are opportunities for discovery and revelation based on the untold stories, some contained in the remnant material culture of the site. The tangible resources today appear to be few, but we can still hear the whispers of the past resonating in the voices of the present, proclaiming the future of the area. ... [¶]

The site has been the crossroads and hub for many peoples in the past and is still in a transportation corridor that is connected to the larger region by rail, the nearby river, and major thoroughfares. It has been the scene of discovery, adventure, and tragedy. Struggles and triumphs were part of the changing landscape of the people passing through, moving in, moving out, forced out, and returning. It is the core of a town that grew to a megalopolis with global influence that was, and still is, often veiled in myth and controversy.

On the other hand, the Park is nestled into the heart of Los Angeles’ urban core surrounded by clusters or pockets of identifiable neighborhoods and communities that have long rooted connections to the history of the city. While intimately connected to the surrounding dense urban development, the open space of the 32 acres of this site will be able to provide escape from the structure and pace of urban life.

(LASHP General Plan, pdf. p. 9 (“Sense of Place”).)

Footnote 40: California Department of Parks and Recreation, Los Angeles State Historic Park General Plan and Final Environmental Impact Report (hereafter “LASHP General Plan”), 2005, available at: <https://www.parks.ca.gov/pages/21299/files/LASHP%20General%20Plan-EIR.pdf>.

Response GO14-82 Metro and the Project Sponsor acknowledge the more than 20 years of effort the community undertook to convert the closed rail yard at River Station to what is now the Los Angeles State Historic Park. The planning, developing, and efforts made by State Parks and its partners resulted in a park that provides the “a place to learn and to celebrate the ethnically diverse history and cultural heritage of Los Angeles” for the surrounding community, greater Los Angeles, and visitors from around the world, one that the proposed Project is designed to honor and expand upon. Pursuant to CEQA Guidelines section 15124, the Draft EIR contained an accurate, stable, and consistent description of the proposed Project, with sufficient specific information about the proposed Project to allow a complete and informative evaluation and review of its environmental impacts. Section 2.0, Project Description, of the Draft EIR, included a description of all integral components of the proposed Project for the environmental analysis, enabling Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR, to fully analyze and disclose all impacts of the proposed Project, and Section 4.0, Alternatives, of the Draft EIR, to consider potential alternatives to the proposed Project. Section 2.0, Project Description, of the Draft EIR

contains the specific descriptions of the proposed Project required pursuant to CEQA Guidelines section 15124, including a description of the proposed Project’s location (Draft EIR, § 2.3), a statement of the project objectives, including the underlying purpose of the proposed Project (*id.*, § 2.3.8), a description of the project’s technical and environmental characteristics (*id.*, §§ 2.2, 2.4 to 2.9), a discussion of the intended uses of the EIR (*id.*, § 1.2), and a list of the project approvals that will be required (*id.*, § 2.10). Pursuant to Section 15165 of the CEQA Guidelines, each component of the proposed Project, e.g., each station, tower, and junction, are identified within the Draft EIR and their impacts analyzed. In addition, Section 2.0, Project Description recognizes that the proposed Project will serve different types of riders, noting that in addition to providing an aerial rapid transit option for visitors to Dodger Stadium, the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. Section 2.0 also recognizes the ancillary features of the proposed Project, including pedestrian improvements, amenities at the Los Angeles State Historic Park, and mobility hubs at both the Chinatown/State Historic Park Station and Dodger Stadium Station. The Project Description in the Draft EIR includes 62 pages of detailed descriptions of the whole of the action considered as part of the Project. In turn, the Draft EIR fully analyzes and discloses the potential environmental impacts of this proposed Project, providing mitigation as necessary for potentially significant impacts. CEQA does not require the Project Description to include the level of detail regarding surrounding “landmarks” that this comment requests.

Comment GO14-83 One of LA State Historic Park’s major features, identified by its General Plan as an “aesthetic resource,” is its iconic view of the City of Los Angeles. (*Id.*, p. 38.) “As viewed from the north, especially from the northern two-thirds of the property, the Park site is a large open space that is in stark contrast to the dramatic skyline of downtown Los Angeles. Sometimes referred to as the ‘front porch’ of the City, *there are no other sites that capture this welcoming view of downtown Los Angeles.*” (*Ibid.* (emphasis added).)

LA State Historic Park’s General Plan’s Final EIR includes Mitigation Measure Aes-1 to protect this “front porch” view of the Los Angeles skyline. It requires that those necessary facilities to be constructed at LA State Historic Park “[i]mplement design practices that reduce the overall negative aesthetic effect of new facilities.” (*Id.*, p. 122.) These design practices include use of vegetation to screen negative views, incorporating architectural site/design elements consistent with the plan, limit and direct lighting downward, and evaluating the location of structures to enhance positive views from and of the Park. (*Ibid.*)

The DEIR description of the iconic “front porch” viewshed states only that “[v]iews of downtown Los Angeles are available from the majority of the site.” This bland description seems calculated to minimize the importance of protected views of downtown Los Angeles from LA State Historic Park, and to set the table for later

minimization of the Project's significant aesthetic impacts on the Park, which are discussed further below.

Response GO14-83 Refer to Response S2-5 discussing how the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the Park. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan mitigation measure Aes-1. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, including on the Los Angeles State Historic Park, which would be less than significant. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park "visually memorable." As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project in response to comments on the Draft EIR, including at Los Angeles State Historic Park. Refer to Response S2-5 for a discussion of the proposed Project's consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics.

Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan. As discussed therein, State Parks has determined that the proposed Project would be inconsistent with the Los Angeles State Historic Park General Plan because the identified land uses in the General Plan's Preferred Park Concept Elements did not contemplate a transit station like the proposed Project's Chinatown/State Park Station. State Parks considers this inconsistency a potentially significant impact. Therefore, Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain an amendment to the Los Angeles State Historic Park General Plan. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Amendment.

Comment GO14-84 2. The project description of Dodger Stadium is incomplete.

The DEIR's one-paragraph description of Dodger Stadium is accurate, but incomplete.

The DEIR's description of Los Angeles Union Station explains the LA Union Station Master Plan "encompasses approximately 38-acres" [sic]. (DEIR, p. 2-7.) The DEIR's description of El Pueblo de Los Angeles notes that its Historic District has an area of approximately 9.5 acres. (DEIR, p. 2-8.) The DEIR's description of Los Angeles State Historic Park states that it "comprises 32 acres of open space." (DEIR, p. 2-9.)

The DEIR's description of Dodger Stadium notes the date it opened, its street address, where it is located, its seating capacity, its location relative to local freeways, and the neighborhoods located around it.

But the DEIR does not mention that Dodger Stadium is surrounded by 260 acres of parking lots. This is a curious omission, given that one of the DEIR's fatal flaws is its failure to discuss or analyze the reasonably foreseeable indirect physical change in the environment likely to occur due to the Project: the development of some portion of the 260 acres of parking lots surrounding the stadium. (See discussion Part I(G), supra pp. 26-34.)

Response GO14-84 Refer to Section 2.0, Project Description, of the Draft EIR, which includes a description of Dodger Stadium and the surrounding area, stating that Dodger Stadium is directly surrounded by surface parking. Refer to Response GO14-82 for a discussion of how the Project Description complied with CEQA's requirement to contain sufficient information about the proposed Project to allow a complete evaluation and review of its potential environmental impacts. Refer to Responses GO14-56 to GO14-66 for a discussion of how the Draft EIR considered all reasonably foreseeable potential impacts associated with the proposed Project, which solely proposes an aerial gondola system.

Comment GO14-85 3. The Project Purpose and Need section is incomplete and misleading.

The DEIR includes a brief discussion describing the need and alleged purpose of the Project. (DEIR, pp. 2-10 to 2-12.) It explains that with the potential ability to move 10,000 people within two hours prior to the start or after a game or event at Dodger Stadium, and with average Dodger Game attendance of approximately 49,000 people, the private gondola could transport approximately 20,000 fans to Dodger Stadium. (DEIR, p. 2-12.) This assertion suggests that the gondola would operate at essentially maximum capacity right out of the gate.

But the question is not how many people could use the gondola, it is how many would.

The DEIR states that if immediately constructed and operational in 2026, the initial average ridership to attend Dodge Games would only be 6,000 fans. (DEIR, pp. 3.17-34 to 3.17-35.) The Project Description is thus very misleading, grossly

overstating the initial Dodger Stadium game ridership as potentially more than even the DEIR claims—not approximately 20% of fans, but approximately 12% (that is, if the many DEIR assumptions regarding ridership are accurate).

Moreover, the DEIR’s ridership assumptions are that 100% of gondola users will use it both for arriving to and departing from Dodger Stadium. (DEIR, p. 3.17-24). But there is no chance this unsupported assumption is correct. A healthy person could walk from Dodger Stadium to Union Station in far less than the two hours it would take to transport 10,000 fans there. According to the Google Maps direction tool, a walk from Dodger Stadium to Union Station (which is flat or downhill the entire way), would take 35-37 minutes, depending on the precise route chosen.⁴¹ The DEIR estimates that 15% of riders would transfer from the Metro Gold line at its Chinatown Station. (DEIR, p. 3.17-24.) This is a considerably shorter walk from Dodger Stadium than to Union Station, only 1.2 miles, and would take only 25 minutes.⁴²

Footnote 41: Exhibit M is a Google Map page created January 9, 2023, showing two walking routes from Dodger Stadium to LA Union Station, both of approximately 1.8 miles, estimated to take between 35-37 minutes.

Footnote 42: Exhibit N is a Google Map page created January 9, 2023, showing walking routes from Dodger Stadium to the Metro Gold line Chinatown Station, the shortest of which is 1.2 miles, estimated to take approximately 25 minutes.

Response GO14-85 This comment provides a general recitation and characterization of the Draft EIR. This response takes into consideration the content of Exhibits M and N to this comment. Refer to Response GO14-82 for a discussion of how the Project Description complied with CEQA’s requirements for the project description, including the statement of objectives (describing the underlying purpose of the proposed Project). Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project’s system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close

to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for a discussion of the underlying factors that would influence pre-game/event and post-game/event travel conditions and ridership are built into the ridership model developed for the proposed Project based on extensive data sources and assumptions validated by data. As discussed in the Draft EIR, the proposed Project's ridership is anticipated to increase from 6,000 riders in the proposed Project's Opening Year (2026) to 10,000 riders in the proposed Project's Horizon Year (2042). (See, e.g., Draft EIR, § 3.17, p. 3.1-34.) Topical Response B also discusses how while there are some game attendees who currently choose to walk to and from Dodger Stadium, the walk would take approximately five to eight times as long as the ride on the proposed Project, and the path would be on a steep downward grade which does not meet Americans with Disabilities Act Accessibility Guidelines, and would be challenging for children, seniors, or people with limited physical mobility.

Refer to Topical Response N, Environmental Justice, for a discussion of the proposed Project is designed to be ADA compliant. As discussed in Section 2.0, Project Description, of the Draft EIR, the cabins allow for sitting or standing, and would be fully ADA accessible, including accommodating wheelchairs. In addition, the length and sizing of the arrival/departure platforms within station would be compliant with the accessibility requirements of the ADA. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. While this alternative would provide improved pedestrian connections compared to existing conditions, the 25 minute plus travel time from the Metro L Line (Gold) Station to the location of the proposed Dodger Stadium Station would be at least nine times greater than the three minute travel time between those two locations with the proposed Project, and this alternative would be unlikely to attract substantially more people to walk to Dodger Stadium compared to existing conditions given the travel time and the physical exertion. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project.

Comment GO14-86 For those who would not choose to wait for their turn in a post-game gondola line who cannot or prefer not to walk to the nearest Gold Line station or to Union Station, many would likely use another available alternative than stand and wait for an hour or more. Other options include a rideshare service such as Uber or Lyft, the Dodger Stadium Express bus (assuming it is still in operation), or a shorter walk to an

intermediate location, for example Sunset Boulevard, to take a rideshare vehicle or other public transportation from there.

As Metro’s precursor agency (Los Angeles County Transportation Commission) learned from the August 1990 Gruen Associates report, a gondola tramway alternative offers the lowest capacity of typically available people mover technologies, and therefore the greatest waiting times compared to other technology options.⁴³ Metro seems to have forgotten the earlier study. While the 1990 gondola option was a slightly different technology and route than the currently proposed Project, its conclusions comparing the relative waiting time among people moving technologies remains valid. The LACTC Study amplifies two important points ignored by the Project’s DEIR:

- Gondola boarding wait times far exceed wait times for other options
- Proper transportation planning requires consideration of not only the time it takes for the technology to deliver passengers from one point to another, but the total amount of time spent waiting/boarding and traveling.⁴⁴

As the LACTC Study notes, “[a]ny transit technology must accommodate a peak loading phenomenon where up to 56,000 persons enter or leave [Dodger] Stadium within a brief period of time before or after events.” (LACTC Study, p. iii.) But the DEIR never discusses the total time between Union Station and Dodger Stadium including both waiting and travel time. It only ever discusses the brief travel time. (See, e.g., DEIR, pp. ES-1, ES-3, 1-1, 2-1, 2-12, 2-42, 3.11-54, 3.11-55, 5-59.) The DEIR discusses queueing areas, but not queueing times. 10,000 patrons cannot all occupy one 30-40 passenger gondola cabin. At a rate of only 5,000 passengers per hour, if the gondola is as popular as projected (and no substantial evidence supports that it will be) the last gondola would leave Dodger Stadium approximately two hours after conclusion of a game or special event. The DEIR assumes 100% round trips (DEIR, p. 3.17-24) but fails to consider that not all patrons will be willing to wait that long. The LACTC Study, completed more than 30 years ago, did not make this fundamental error.

Footnote 43: Gruen Associates, Dodger Stadium Transit Access Study prepared for the Los Angeles County Transportation Committee (hereafter LACTC Study), Aug. 1990, pp. iii-iv, attached as Exhibit O.

Footnote 44: See LACTC Study, *supra* fn. 43, p. 30.

Response GO14-86 Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation. As described in Section 3.17, Transportation, of the Draft EIR, for purposes of the Draft EIR, the transportation analysis included the analyses required by Appendix G of the CEQA Guidelines and the City of Los Angeles Transportation Assessment Guidelines (TAG). Pedestrian queues are not required to be analyzed under CEQA or the TAG. Nevertheless, refer to Topical Response B for discussion of how post-game queues at Dodger Stadium were estimated based on

assumptions about the departure patterns and estimates of walk times from the various seating areas within the stadium. Those seated the furthest away from the Dodger Stadium Station would take more time to arrive at the Station, much like how it is currently for passengers riding the Dodger Stadium Express. In addition, passengers who would rather not join the line immediately to board the proposed Project in the post-game period could visit some of the entertainment amenities at the stadium, including at the Centerfield Plaza. As detailed in Topical Response B the queues to board, loading times, and travel times for the Dodger Stadium Express are significantly longer and more variable as compared to the proposed Project. The post-game/event queue for the proposed Project would be constantly moving as cabins would depart every 23 seconds. This is in contrast to the Dodger Stadium Express, which has much longer gaps in bus departures (from a minimum of 3 minutes to a maximum of 19 minutes spacing between bus departures based on 2023 season observations further described in Topical Response B) leading to static queues that build substantially over time as departure frequency is substantially less frequent than the proposed Project. Additionally, based on 2023 season observations, the service time from the first bus departure to the last bus departure for the Dodger Stadium Express was nearly 2 hours, with the last bus departing up to 90 minutes after the end of the game. Once all Dodger Stadium Express buses in operation depart for LAUS post game, headways spaced out due to traffic congestion and overall run time between Dodger Stadium and LAUS. The longest time between bus departures was observed to be 19 minutes. During this 19 minute time period, the passenger queue either remained static, or grew as additional riders entered the queue following their exit from Dodger Stadium.

In contrast, within the same approximately 1/3 of an hour between Dodger Stadium Express departures at its longest headway, the proposed Project could serve approximately 1,667 passengers on average ($5,000/3=1,667$), which is approximately 90 percent ($1,667/1,840$) of the average 2019 season one-way passenger load of 1,840 carried by the Union Station Dodger Stadium Express in total for an entire game.

Refer to Topical Response B for discussion of other modes of transit, including the Dodger Stadium Express, rideshare, and walking. The Draft EIR does not assume 100% round trips during a Dodger game. As discussed in Topical Response B, the ridership modeling for the proposed Project took into account that post-game/event ridership on the proposed Project would be less than pre-game ridership and incorporated the expected drop in post-game ridership compared to pre-game that is seen today for the Dodger Stadium Express. These post-game riders who do not make a return trip were assumed to switch to vehicle modes to ensure a conservative VMT analysis.

As described in Section 2.0, Project Description, of the Draft EIR, the two primary types of aerial transit used in urban environments are tramways and detachable

gondolas. As shown in Table 1 of the 1990 *Dodger Stadium Transit Access Study* (1990 Study) referenced in the comment and attached as Exhibit O to this letter¹⁶, the gondola technology evaluated in that study was a reversible tramway system consisting of two 125-passenger cars, similar to the Portland Aerial Tram in Portland, Oregon and the Roosevelt Island Tramway in New York, New York. An aerial tram system typically has two cabins that shuttle back and forth between two end terminals. The proposed Project is a detachable gondola system. An aerial gondola system includes multiple cabins that travel on a continuously circulating cable, which allows for an overall higher system capacity and ability to move more people per hour in each direction than an aerial tram. Furthermore, the proposed Project would be a modern 3S system with the capacity to move approximately 5,000 people per hour per direction with a travel time from LAUS to Dodger Stadium of seven minutes, far greater than the 2,800 persons per hour capacity estimated in the 1990 Study for the two-car reversible tramway system. As such, the two systems are not comparable, and findings in the 1990 Study comparing the tramway system to other modes as analyzed in that 33-year-old study are not relevant to the current proposed Project.

Refer to Response GO14-84 for a discussion of the need for the proposed Project. In addition, although forms of aerial transit technology have been available and utilized for the last 100 years, modern applications have seen the evolution of the technology as a feasible mode of urban rapid transit. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would have a maximum capacity of approximately 5,000 people per hour per direction, and the travel time from LAUS to Dodger Stadium would be approximately seven minutes. As discussed in Appendix D of Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, a large capacity for a new mode of transportation in Los Angeles will allow passengers to see the potential for other emerging innovations to be integrated into the public transit system. The proposed Project would thus exemplify how alternative transportation technology can be integrated into a city's transportation infrastructure and will show that new technology can successfully operate in concert with other existing modes of transportation.

Comment GO14-87 Also entirely missing from the project description's statement on the proposed Project's alleged purpose and need is any discussion of future development at Dodger Stadium. As discussed at length above, public reporting on potential development of the Dodger Stadium parking lots has been in the public realm for well over a decade, and was noted repeatedly during the Project's scoping process, yet is entirely ignored in the project description's discussion of the Project's purpose. (See discussion, supra pp. 26-33.) The effort to remove vehicles from local roadways is not likely to be significant (see UCLA Mobility Lab study, infra fn. 46). But removal of a significant number of vehicles from Dodger Stadium parking lots is likely to free up space in those

¹⁶ Gruen Associates. 1990. *Dodger Stadium Transit Access Study*. Available at: https://libraryarchives.metro.net/dpctl/lactc/dodger_stadium_access_study.pdf. Accessed August 2023.

parking lots for the foreseeable development described in the many articles attached to this comment letter. (See Exhibit I, supra fn. 34.)

The Project Description’s purpose and need section is misleading and incomplete. It omits the expected travel time between Union Station and Dodger Stadium, leaving out the very lengthy expected wait times for passengers who would use it to attend Dodger games and events, and assuming all passengers would both arrive and depart via the private gondola, as opposed to arriving via the gondola and departing by some other means. And it fails to acknowledge that the alleged goal of removing passenger vehicles from local roadways would also coincidentally remove them from the Dodger Stadium parking lot, freeing up some portion of those lots for long-planned development as earlier described.

Response GO14-87 Refer to Response GO14-82 for a discussion of how the Project Description complied with CEQA’s requirement to contain sufficient information about the proposed Project to allow a complete evaluation and review of its potential environmental impacts. Refer to Responses GO14-56 to GO14-66 for a discussion of how the Draft EIR considered all reasonably foreseeable potential impacts associated with the proposed Project, which solely proposes an aerial gondola system.

Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project’s Draft EIR, and does not appear to have been prepared for that purpose. On January 13, 2023, the Mobility Lab issued the following statement regarding the Mobility Lab Study:

Statement from the UCLA Mobility Lab Regarding LA Gondola Ridership Projection

The UCLA Mobility Lab is an engineering and technology lab dedicated to scientific research and innovation around mobility technologies. The lab’s data on projected transit ridership of a proposed Dodger Stadium gondola is preliminary in nature. More research would be necessary to draw conclusions about potential use of the gondola. The lab takes no view on whether the project should be built.

Jiaqi Ma

Director, UCLA Mobility Lab

Faculty Associate Director, UCLA Institute of Transportation Studies

Refer to Response GO14-85 for discussion of how the description of the proposed Project’s purpose and need in Section 2.0, Project Description, of the Draft EIR, is in compliance with CEQA. Refer to Response GO14-86 for discussion of queuing at stations and pre-game and post-game transportation, and other modes of transportation. Refer to Topical Response B, Ridership Model; Queuing at Stations and Pre-game and Post-game Transportation, for discussion of how four post-game time periods during the 2023 season were observed to quantify the existing service time needed to transport Dodger Stadium Express riders. As noted therein, the service time from the first bus departure to the last bus departure was nearly 2 hours,

with the last bus departing up to 90 minutes after the end of the game. These observations indicate that riders are willing to wait for substantial periods of time after a game to board the Dodger Stadium Express, despite its much slower travel time and much longer wait time between buses compared with the proposed Project, supporting the concept that riders would also be willing to wait after a game to board the proposed Project with its improved level of service and substantially higher capacity.

Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data. Refer to Appendix N, Transportation Appendices, of the Draft EIR, which details ridership model inputs, including passenger transfer wait times.

Comment GO14-88 4. The Project Objectives are artificially constrained to favor the preferred project alternative.

An EIR's project description must contain a "statement of the objectives sought by the proposed project." (CEQA Guidelines, § 15124 subd. (b).) The purpose of providing a statement of objectives is to "help the lead agency develop a reasonable range of alternatives to evaluate in the EIR" and to "aid the decision makers in preparing findings or a statement of overriding considerations, if necessary." (Ibid.; see also CEQA Guidelines, § 15126.6(c): "The range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects.") An EIR's alternatives section, informed by the statement of objectives, is part of the very "core of the EIR." (In re Bay-Delta etc. (2008) 43 Cal.4th 1143, 1162.)

Project objectives may not define a project so narrowly "as to preclude any alternative other than the Project." (We Advocate Thorough Environmental Review v. County of Siskiyou (hereafter WATER) (2022) 78 Cal.App.5th 683, 692.) "[I]f the principal project objective is simply pursuing the proposed project, then no alternative other than the proposed project would do. All competing reasonable alternatives would simply be defined out of consideration." (Ibid.) The statement of project objectives for the proposed Project charts just such an unlawful course.

The project objectives start with a recitation of the Project's overall purpose, which has at least three or four separate "overall" purposes embedded within it:

The overall purpose of the proposed Project is to provide a direct transit connection between LAUS and the Dodger Stadium property via an aerial gondola system and improve connectivity for the surrounding communities by linking to the Los Angeles State Historic Park, Elysian Park, and the neighborhoods along the proposed alignment and the region's rapidly growing regional transit system at LAUS.

(DEIR, p. 2-12.)

Here, a reasonable and sensible “overall” purpose could very well be providing a direct transit connection between LAUS and the Dodger Stadium property. That is but one overall purpose. Must that overall purpose limit feasible projects to those that are “an aerial gondola system?” Must it also “improve connectivity for the surrounding communities by linking to the Los Angeles State Historic Park,” or is that merely a clever rationale to justify taking well over an acre of LA State Historic Park for a commercial, private transit system?

Response GO14-88 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the proposed Project’s objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project’s fundamental purpose of providing a permanent transit connection to Dodger Stadium. The proposed Project’s objectives are not so narrow that they preclude consideration of reasonable alternatives – while alternatives for a project must be able to satisfy “most of the basic objectives of a project,” alternatives should not be excluded simply because they would impede attainment of project objectives “to some degree.” (CEQA Guidelines, §15126.6(a)–(b).) The proposed Project’s objectives broadly contemplate improving neighborhood connectivity and the Dodger Stadium visitor experience, reducing vehicle congestion and associated emissions in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, improving access to Elysian Park and the Los Angeles State Historic Park, and providing a sustainable form of transit. Aerial rapid transit technology has the ability to overcome grade and elevation issues between LAUS and Dodger Stadium in order to provide a direct transit connection between the two locations, and provide safe, zero emission, environmentally friendly, and high-capacity transit connectivity in the Project area that would reduce GHG emissions as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium. . Thus, because the proposed Project’s fundamental purpose is to provide a permanent transit connection to Dodger Stadium, and because aerial rapid transit technology can achieve this fundamental purpose, the objectives for the proposed Project are in compliance with CEQA, which does not restrict an agency’s discretion to identify and pursue a particular project designed to meet a particular set of objectives. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project’s Chinatown/State Park Station, and the required

clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project.

Comment GO14-89 The list of bullet-pointed project objectives that follow the DEIR’s initial “overall purpose” statement includes several impermissible objectives that are plainly intended to define out of consideration competing reasonable alternatives, limiting the number of reasonable alternatives considered. (See WATER, 78 Cal.App.5th at 692.) These include (objectionable wording is emphasized with italicization, with some parenthetical commentary):

Attract new transit riders to the Metro system through a *unique experience of an aerial transit system* connecting to Dodger Stadium. (Attracting new Metro riders through a Dodger Stadium connection need not be via aerial transit—this objective unnecessarily precludes feasible alternatives.)

Improve the Dodger Stadium visitor experience by providing *efficient, high-capacity, and faster alternative* access to Dodger Stadium. (Since the DEIR fails to include data on queueing times, it is unclear whether the preferred alternative meets this objective.)

Enhance safety of neighborhoods adjacent to Dodger Stadium by reducing the number of vehicles in the area. (Based on a report prepared for the Project proponent, many gondola users are likely to drive downtown to take the gondola, and others are likely to use rideshare services before and/or following the game.⁴⁵ It is thus unclear how well the preferred alternative meets this project objective, if at all.)

Reduce transportation related pollution and greenhouse gas (GHG) emissions as a result of reduced vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. (See preceding comment—it is unclear how well the preferred alternative meets this project objective; foreseeable indirect physical changes due to the preferred alternative would also draw additional vehicles to the Project area not considered.)

Improve transit rider experience *by providing unique scenic views of the Los Angeles area to ART passengers and Dodger fans*. (This objective unnecessarily precludes feasible alternatives.)

Bring a world class aerial transit system to the Los Angeles area. (This objective unnecessarily precludes feasible alternatives.)

Enhance community connectivity by providing first/last mile transit and pedestrian access to areas that have historically been underserved, *including the Los Angeles State Historic Park* and Elysian Park. (This objective is an attempt to justify use of public parkland for the benefit of the Project, which is impermissible under California law. See discussion, *supra* pp. 12-26.)

Identify comparable, affordable, and accessible fare opportunities for community and *Los Angeles State Historic Park* and Elysian Park access. (See preceding comment. LA State Historic Park is already well-served by public transit.)

Minimize the Project's environmental footprint through the integration of sustainability and environmentally-friendly design features into the materials, construction, operations, and maintenance of the proposed Project. (Building a project out of sustainable materials does not minimize its aesthetic, cultural, historic, and other significant impacts. This project objective is far better met by the environmentally superior alternative, which requires little, if any, permanent infrastructure to be built along the Project's 1.2-mile-long corridor, and has no meaningful aesthetic, cultural, historic, or other impacts.)

Provide a sustainable form of transit by *operating the ART system* with the use of zero emission electricity with battery storage backup in order to reduce GHG emissions and improve air quality. (The objective assumes an aerial rapid transit (ART) system, which unnecessarily precludes feasible project alternatives.)

Maximize the Project's alignment along the public ROW and *publicly owned property and minimize aerial rights requirements* over private properties, taking into account existing and future adjacent land uses. (The objective assumes an aerial rapid transit system, which unnecessarily precludes feasible project alternatives, and fails to distinguish between publicly owned property that is and is not preserved as public parkland.)

The above parenthetical objections illustrate how a substantial number of project alternatives are unnecessarily precluded by the DEIR's artificially narrow project objectives, which were plainly crafted to favor the preferred alternative aerial rapid transit system over other feasible alternatives to transport Metro riders from LA Union Station to Dodger Stadium with a stop at (within) LA State Historic Park to attempt to justify use of public parkland for the benefit of the Project.⁴⁶ It is improper to take an artificially narrow approach in crafting project objectives to ensure that the results of an alternatives analysis is only "an empty formality." (WATER, 78 Cal.App.5th at 692.)

Footnote 45: See Fehr & Peers, Los Angeles Aerial Rapid Transit Project–Parking Study (Sept. 2022 Draft), pp. 8-9. This document is already part of the administrative record for the Project, and is available at: https://www.dropbox.com/sh/trfpt09to0kp4a8/AACpn7RaYP9KN2zG7ncfAYt6a/Documents/LA%20ART%20Parking%20Study?dl=0&subfolder_nav_tracking=1.

Footnote 46: If the fundamental Project goal were to remove passenger vehicles from local roadways, there would be no proposed intermediate Chinatown/State Park Station, which encourages parking on local streets in Chinatown and at and near LA State Historic Park. Instead, gondola passengers could take the Gold Line one stop to Union Station and queue for the gondola at its Union Station terminus. This

alternative is not studied in the DEIR, perhaps because with no justification for use of LA State Historic Park’s airspace, the preferred alternative is actually not feasible.

Response GO14-89 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the proposed Project’s objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project’s fundamental purpose of providing a permanent transit connection to Dodger Stadium. Refer to Response GO14-88 for discussion of how the proposed Project’s objectives are consistent with CEQA and do not unnecessarily preclude feasible project alternatives.

The potential for other types of transit connections to attract new riders to the Metro system was studied in the Draft EIR and Final EIR, including the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express, and the Pedestrian Enhancement Alternative. Refer to Section 2.0, Project Description, of the Draft EIR and Topical Response J, Gondola Design and Operations, of the Final EIR, for discussion of the safety features of the proposed Project and how the proposed Project would carry up to approximately 5,000 passengers per hour per direction (pphd). Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how, the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of how the Pedestrian Enhancement Alternative studied in the Final EIR would have a travel time of at least nine times greater than the three-minute travel time between the Metro L Line (Gold) Station and Dodger Stadium, and would thus be unlikely to attract substantially more people to walk to Dodger Stadium compared to existing conditions given the travel time and physical exertion up the hill.

Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of how queues would be managed by efficient vertical circulation and by staff at the station and due to the nature of queue formation, the pre-game/event passenger queues at the Alameda Station in 2026 are estimated to be largely contained on the platform and only minimally extend out into the planned LAUS Forecourt. More active queue management would become more frequently needed at Alameda Station as ridership increases toward the 2042 ridership projection of 10,000 riders, but even with the maximum queue length, a person at the end of the line would wait for an estimated maximum of seven minutes before boarding the gondola cabin. Others would wait shorter durations.

Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in

traffic at the intersections closest to the proposed Project's Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project's stations. Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines ("TAG"). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project's potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified. In addition, refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel.

Refer to Responses GO14-45 through GO14-50 for discussion of the proposed Project's compliance with the Public Park Preservation Act.

The proposed Project would improve community access to the Los Angeles State Historic Park by providing an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Refer to Responses GO14-158 and GO14-161 for discussion of public transit options for Los Angeles State Historic Park. Further, as discussed Section 2.0, Project Description, of the Draft EIR, the proposed Project could also provide pedestrian improvements between Metro's L Line (Gold) Station and the Chinatown/State Park Station, including hardscape and landscape improvements, shade structures, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge to improve access from North Broadway to the park. These features of the proposed Project would improve access to the Los Angeles State Historic Park.

As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, of the Draft EIR, the proposed Project would have less than significant operational impacts. As discussed in the Executive Summary to the Draft EIR, the proposed Project would result in significant and unavoidable impacts only with regard to Construction Noise and Vibration

(human annoyance). All other construction impacts identified as significant in the Draft EIR would be reduced to less than significant with implementation of mitigation measures. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The TSM Alternative would not meet this objective because it would have higher VMT and therefore air quality and GHG emissions in comparison.

Comment GO14-90 LA Parks Alliance notes that it is the lead agency, not the project proponent, that is responsible for a project's environmental document. (Pub. Res. Code, § 21067; CEQA Guidelines, § 15050.) The proposed project objectives provided here by Metro suggests a strong precommitment to the proponent's preferred aerial tram alternative. (See *Save Tara v. City of West Hollywood* (2008) 45 Cal.4th 116, 138-139: an agency must not commit itself to particular project features "so as to effectively preclude any alternatives or mitigation measures that CEQA would otherwise require to be considered..."; see also CEQA Guidelines, 15126.6, subd. (e).)

Response GO14-90 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the proposed Project's objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project's fundamental purpose of providing a permanent transit connection to Dodger Stadium. Refer to Response G014-88 for discussion of how the proposed Project's objectives are consistent with CEQA and do not unnecessarily preclude feasible project alternatives. The case that this commenter cites is inapplicable to the proposed Project. The adoption of project objectives as required by CEQA does not constitute a pre-commitment to a project.

Comment GO14-91 The DEIR's project objectives have been artificially narrowed to favor an aerial tram alternative and should be re-crafted so as not to unnecessarily preclude other alternatives that feasibly attain most of the basic objectives of the project (focused on moving passengers from Union Station, and perhaps other locations, to Dodger Stadium) and avoid or substantially lessen the significant effects of the Project.

Response GO14-91 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the proposed Project's objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project's fundamental purpose of providing a permanent transit connection to Dodger Stadium. Refer to Response G014-88 for discussion of

how the proposed Project's objectives are consistent with CEQA and do not unnecessarily preclude feasible project alternatives. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Further, as discussed in Topical Response H, a system of buses from numerous remote locations throughout the Los Angeles region to and from Dodger Stadium events would require a substantial increase in the number of buses which, similar to expanding the fleet for an expanded Dodger Stadium Express service, would result in a fleet of buses that would either be underutilized most of the time or regular Metro bus service that utilizes these vehicles would be disrupted every time a Dodger game or event at the stadium is held. Such a service would also incur substantial costs in paid time and mileage for driving empty buses out to the remote locations before a game and back from the remote locations after a game and paid idle time during the game. Buses from a variety of remote locations would also need to travel in rush hour congestion to get to Dodger Stadium. With limited regional facilities that provide bus only lanes that these services could utilize, they would not materially improve transit travel time compared with driving. For example, the current Dodger Stadium Express service from South Bay serves a broad area of southern Los Angeles County at stations spread across eight miles, is free, and travels on a priority lane within the I-110 freeway median for most of its trip, but the South Bay Dodger Stadium Express carried an average of only 415 passengers per game in 2019, which is substantially lower than the ridership of 1,895 riders per game on the LAUS Dodger Stadium Express. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, of the Draft EIR, the proposed Project would have less than significant operational impacts. And, as discussed above, increased bus service from remote locations around Los Angeles County to and from Dodger Stadium would add to rush hour traffic and congestion.

Comment GO14-92 5. The Project alignment diagrams provide insufficient detail.

Illustrations of the proposed Project alignment found in the DEIR's project description are insufficient to allow interested members of the public to evaluate the alignment. Figure 2-7 (entitled "ANSI Requirements and Additional Separation Buffer") and Figure 2-8 (entitled "Proposed Alignment Over Public ROW/Publicly-Owned Property

and Private Property”) each use one page to show the entire Project alignment. (DEIR, pp. 2-20 to 2-21.) While they provide a generalized view of the proposed Project location, zooming in does not provide interested community members (or decisionmakers) sufficient detail to understand the alignment’s proximity to nearby buildings and other structures.

Response GO14-92 Refer to Response GO14-82 for a discussion of how the Project Description complied with CEQA’s requirement to contain sufficient information about the proposed Project to allow a complete evaluation and review of its potential environmental impacts. Section 2.5.1 of Section 2.0, Project Description, of the Draft EIR details the proposed Project’s alignment, noting that the proposed Project alignment was chosen as it maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties, taking into account existing and future adjacent land uses. Figure 2-7 in Section 2.0, Project Description, shows the proposed Project’s ANSI Requirements and Additional Separation Buffer. Section 3.4.6, Aerial Clearance, of Section 3.0, Project Description, and Appendix N, Additional Separation Buffer, of the Final EIR details the proposed Project’s Additional Separation Buffer. Figure 2-8 in Section 2.0, Project Description, shows the portions of the proposed alignment over public ROW and publicly owned property and the portions of the proposed alignment over private property, which are described more specifically in Appendix Q, Proposed Alignment Plan and Profile. Refer to Figure 2-10: Proposed Alameda Station Location, Figure 2-12: Proposed Alameda Tower Location, Figure 2-14: Proposed Alpine Tower Location, Figure 2-17: Proposed Chinatown/State Park Station Location, Figure 2-19: Proposed Broadway Junction Location, Figure 2-21: Proposed Stadium Tower Location, and Figure 2-24: Proposed Dodger Stadium Station Location, of Section 2.0, Project Description, showing each proposed Project component’s location and proximity to nearby buildings and other structures and land uses. The location of the proposed Project is also described in detail in Section 2.0, Project Description, of the Draft EIR, at pp. 2-19 to 2-41. Additional graphics for the proposed Project’s alignment profiles is provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR.-In response to comments that the graphics included in Appendix Q, Proposed Alignment Plan and Profile, are not readable due to the scale of the graphics, Appendix Q has been updated to add larger insets of several graphics. Appendix O, Supplemental Graphics of Proposed Project Plan and Profile, of this Final EIR includes larger scale version of these graphics.

Comment GO14-93 Figure 2-8 does not distinguish between types of publicly owned property—showing all publicly owned property in one color, whether public right-of-way or public parkland.

Response GO14-93 Refer to Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR, page 5, for a graphic showing respective ownership of public property and private property, which depicts California State Parks Property as distinct from City ROW, City-owned property, Metro property, Caltrans property, and private property. Refer to Response

GO14-82 for a discussion of how the Project Description complied with CEQA's requirement to contain sufficient information about the proposed Project to allow a complete evaluation and review of its potential environmental impacts.

Comment GO14-94 Referenced images found in Appendix Q are more detailed, but still provide insufficient information, and are also quite large file sizes. Metro should not presume that all members of the public have adequate computer technology at their disposal to enlarge the images by “zooming in” to study these images. Rather than providing one electronic image that may be zoomed in, the DEIR should instead (or in addition) provide an enlarged representation of both Figures 2-7 and 2-8, as well as each page found in Appendix Q, on a mapped series of images so that all interested members of the public, including those who need to view the document in hard copy as well as those who have computer access but cannot readily manipulate large files, have an opportunity to review and comment on concerns regarding the Project alignment after having reviewed adequately sized images.

Response GO14-94 As this commenter notes, additional graphics depicting the proposed Project alignment are provided in detail in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR. Further, as shown on the Notice of Availability for the Draft EIR, copies of the Draft EIR were available for public review at three separate public libraries and at the public library at Metro headquarters. As discussed in Appendix A, Public Outreach Report, of the Final EIR, hard copies of the Draft EIR were available at all in-person public meetings held by Metro during the public review period, and, at these in-person meetings, large, printed boards showing the proposed Project alignment were provided for attendees to view. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., CEQA Guidelines § 15124.) The Draft EIR provided sufficient information in order for the public and decisionmakers to meaningfully evaluate the proposed Project's potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.) Refer to Response GO14-82 for a discussion of how the Project Description complied with CEQA's requirement to contain sufficient information about the proposed Project to allow a complete evaluation and review of its potential environmental impacts. In response to comments that the graphics included in Appendix Q, Proposed Alignment Plan and Profile, are not readable due to the scale of the graphics, Appendix Q has been updated to add larger insets of several graphics. Appendix O, Supplemental Graphics of Proposed Project Plan and Profile, of this Final EIR includes larger scale version of these graphics.

Comment GO14-95 The Project alignment illustrations also do not provide adequate information about the so-called “Additional Separation Buffer.” (See discussion, *supra* p. 12.)

Response GO14-95 Refer to Response GO14-33 for discussion of the Additional Separation Buffer. Refer to Response GO14-82 for a discussion of how the Project Description complied with CEQA’s requirement to contain sufficient information about the proposed Project to allow a complete evaluation and review of its potential environmental impacts. In response to comments that the graphics included in Appendix Q, Proposed Alignment Plan and Profile, are not readable due to the scale of the graphics, Appendix Q has been updated to add larger insets of several graphics. Appendix O, Supplemental Graphics of Proposed Project Plan and Profile, of this Final EIR includes larger scale version of these graphics.

Comment GO14-96 6. Project Ridership is based on speculation, not substantial evidence.

The project description describes ridership estimates for the Project. “During peak operations, the proposed Project would carry up to approximately 5,000 people per hour per direction, and the travel time from LAUS to Dodger Stadium would be approximately seven minutes.” (DEIR, p. 2-42.) As discussed above, the Project Description misleadingly focuses not on the total time it would take to be transported from Union Station to Dodger Stadium via the Project including the wait or queueing time, but only on the travel time. In addition, the project description’s focus on alleged 2042 estimates of 5,000 people per hour per direction misleads a DEIR reviewer who may not delve further into the details. The 2026 estimated hourly users are only 3,000 per hour. (DEIR, pp. 3.17-34 to 3.17-35.)

The estimate of people allegedly moving through the system per hour also depends entirely on the configuration of gondola cabins. The DEIR discloses that gondola cabins can be configured to carry between 30 to 40 people. (DEIR, pp. ES-3, 2-2, 2-18.) A survey of the DEIR, including Appendix N (which includes discussion of the gondola ridership model), discloses that there is no discussion whether cabins will be configured to carry 30 people or 40 people, or some other number, or whether there would be a mix of cabin configurations. The number of passengers moved per hour if each cabin has 40 people is obviously significantly greater than the number that can be moved if each cabin only has 30 people.

For example, assuming the gondola system were able to operate perfectly with a 23-second headway that is never interrupted by any delay due a technical issue or passenger loading problem, the Project would move 156.5 cabins per hour. ($60 \text{ minutes} \times 60 \text{ seconds} \div 23 \approx 156.5$.) This number of cabins configured to hold 30 passengers can thus move 4,695 passengers per hour. ($156.5 \times 30 = 4,695$.) Cabins configured to hold 40 passengers can move as many as 6,260, or 33% more passengers per hour. ($156.5 \times 40 = 6,260$.) The actual cabin configuration, which the DEIR does not explain, matters a lot. These are maximal projections, assuming there is never a breakdown, never a passenger loading or other problem, and all cabins are always full.

Response GO14-96 The commenter refers to Section 2.0, Project Description, of the Draft EIR, which states the proposed Project capacity of up to approximately 5,000 people per hour per direction (pphpd) and travel time from LAUS to Dodger Stadium of approximately seven minutes. Refer to Topical Response J, Gondola Design and Operations, for details regarding the proposed Project capacity of up to approximately 5,000 pphpd. Based on the current design, the calculated characteristics when operating at system capacity (e.g., during Dodger games or events at Dodger Stadium) would be approximately 53 cabins in service on the system. Under this scenario, the cabins would move at an approximate speed of 13.4 miles per hour with headways of approximately 23 seconds, which represents the time between cabins arriving at a station. As one hour consists of 3,600 seconds, approximately 156.5 cabins would arrive every hour (3,600 seconds / 23 seconds). The proposed Project's Tricable Detachable Gondola system ("3S") cabins typically carry between 30 to 40 passengers each, depending on the exact configuration of seating and cabin amenities selected. At a capacity of 35 passengers per cabin, at 156.5 cabins per hour, 5,478 passengers would arrive at each station per hour (35 passengers per cabin x 156.5 cabins per hour). Given that the same headway applies in each direction, the total, calculated system capacity is therefore 5,478 pphpd. To account for variations in the exact configuration of seating and cabin amenities, as well as operational considerations (including, for example, fewer than 35 people boarding a cabin or cabins being either slowed or stopped in the station for boarding purposes), the proposed Project has included an approximately 10 percent reduction in capacity from 5,478 pphpd to 5,000 pphpd. Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR for the proposed Project ridership model and analysis, which takes into account travel time, as well as wait and transfer time. Assumptions about wait/transfer time are included in the columns for the example zip codes of model data. Environmental documents for transit corridor projects typically include opening year and horizon year analyses consistent with Metro and Federal Transit Administration (FTA) requirements. The commenter refers to the table summarizing ridership estimates, which are included in Section 3.17, Transportation, of the Draft EIR, and include the estimate of 6,000 riders in the anticipated opening year of 2026 and 10,000 riders in the project horizon year of 2042. These data are presented clearly in Section 3.17, Transportation, of the Draft EIR as is customary.

Comment GO14-97 Moreover, the Dodger Game Project ridership estimates are based on an untested model created specifically for the Project. (DEIR, Appx. N, pdf p. 6 (Fehr & Peers, Ridership Model Development report, Sept. 2022).) The model inexplicably seems to use data from only two zip codes for inputs, one very near Dodger Stadium (90012, 0.6 miles away) and one in South Los Angeles relatively far from Dodger Stadium (90044, 10 miles away) to model estimated Project ridership. (Ibid. pdf pp. 9-12 (Table 1: Model Inputs and Data Sources).) It is inappropriate to extrapolate from such a small amount of data to model Los Angeles's complex transportation system. (Moreover, for nearby 90012 patrons only 0.6 miles away, why would they ever wait

in line for up to two hours to return home when they could walk in ten to fifteen minutes?)

A far more reliable transportation analysis was performed by the UCLA Mobility Lab to assess claims made by the Project proponent that it would have up to 10,000 riders per Dodger Game, thereby removing up to 3,000 vehicles from Los Angeles streets:⁴⁷

The UCLA researchers — led by Dr. Brian Yueshuai He and Dr. Jiaqi Ma in the UCLA Mobility Lab at the UCLA Samueli School of Engineering — used the “LA Sim” model they created based on activity-based travel demand and agent-based simulation models. The model is grounded in the theory of “discrete choice,” for which Daniel F. McFadden won a Nobel Prize in economics in 2000. Based on real data about road network, traffic, public transportation, and other modes of moving around the city, including walking and bicycling, LA Sim simulates the individual choices that millions of travelers will make when something changes, such as adding another form of transportation, like a gondola to the Los Angeles transportation network.

(UCLA Mobility Lab report, pp. 1-2 (emphasis added).)

Using the “discrete choice” model “based on real data,” the UCLA Mobility Lab study concluded that the proposed gondola would have far fewer users, and the majority of those (2,500 of 4,690 gondola riders) would be drawn from regular users of the Dodger Stadium Express. (UCLA Mobility Lab report, p. 3.) The study concluded that only 608 vehicles would be removed from local roadways compared to current conditions, only a small fraction of the claimed vehicle reduction due to the project. (Ibid.)

Footnote 47: UCLA Mobility Lab, Study Finds Proposed Aerial Gondola to Dodger Stadium Will Do Little to Reduce Traffic and Emissions, Oct. 24, 2022, attached as Exhibit P.

Response GO14-97 Refer to Topical Response B: Ridership Model; Queuing at Stations and Pre-game and Post-game Transportation and Appendix N, Transportation Appendices, of the Draft EIR for a detailed analysis of the proposed Project’s ridership model. The comment alleges that the ridership model’s travel data were gathered from cell phone data for two zip codes. This is not accurate. As shown on Figure 1 and Table 1 on pages 3 and 4 of Appendix N-Ridership Model Development to the Draft EIR, the modeling used Dodger ticket purchases and GIS ESRI’s “Routable Network” data by zip code for all zip codes in the Southern California region from which tickets were purchased. The comment’s misperception that only two zip codes were used could possibly arise from two “examples” included in Appendix N to describe how the model produces different transit mode share results for different zip codes based on the travel time and cost characteristics associated with each individual zip code. As examples, the two sample zip codes were not intended to represent the full set of calculations from the model. The model produced custom mode share results for each of hundreds of zip codes in

the ticket purchase database. Furthermore, as discussed on page 3.17-28, in Section 3.17, Transportation of the Draft EIR, existing mobile source data collected and aggregated by Teralytics and consisting of approximately 2.1 million trip samples was used to calculate average trip length for vehicles traveling to and from Dodger Stadium on game days for zip codes within a 50-mile radius of Dodger Stadium. The sample sizes used in the analysis were robust.

Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study, noted as Exhibit P to this comment. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project’s Draft EIR, and does not appear to have been prepared for that purpose. On January 13, 2023, the Mobility Lab issued the following statement regarding the Mobility Lab Study:

Statement from the UCLA Mobility Lab Regarding LA Gondola Ridership Projection

The UCLA Mobility Lab is an engineering and technology lab dedicated to scientific research and innovation around mobility technologies. The lab’s data on projected transit ridership of a proposed Dodger Stadium gondola is preliminary in nature. More research would be necessary to draw conclusions about potential use of the gondola. The lab takes no view on whether the project should be built.

Jiaqi Ma

Director, UCLA Mobility Lab

Faculty Associate Director, UCLA Institute of Transportation Studies

Nothing in the review of the preliminary Mobility Lab Study suggests that the ridership modeling and results in the Draft EIR are unreasonable or in appropriate for use.

Moreover, Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and Appendix N, Ridership Model Development Memorandum of the Draft EIR.¹⁷ Stantec is an internationally-respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR.

Comment GO14-98 More important, only a fraction of those who would use the gondola on the way to a game would use it afterwards. “This suggests that fans are unlikely to wait in line for the gondola after the game, instead taking the Dodger Stadium Express or perhaps opting for a ride-share, which would increase traffic and greenhouse gas emissions after the game.” (Ibid., p. 4.) UCLA’s study is corroborated by LACTC’s 1990 Dodger Transit Access study, which showed that an aerial tram was the worst choice of the options then studied, because it had the longest wait times. “Any transit technology must accommodate a peak loading phenomenon where up to 56,000 persons enter

¹⁷ Stantec. 2023. Memo to Holly Rockwell Regarding Los Angeles Aerial Rapid Transit (LA ART) Project Transportation Analysis Peer Review.

or leave [Dodger] Stadium within a brief period of time before or after events.” (LACTC Study, supra fn. 43, p. iii.)

Response GO14-98 Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of post-game transportation management, including the potential for proposed Project riders to leave Dodger Stadium via other modes such as rideshare. Refer to Response GO14-97 and Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

As described in Section 2.0, Project Description, of the Draft EIR, the two primary types of aerial transit used in urban environments are tramways and detachable gondolas. As shown in Table 1 of the 1990 Dodger Stadium Transit Access Study (1990 study) referenced in the comment¹⁸, the gondola technology evaluated in that study was a reversible tramway system consisting of two 125-passenger cars, similar to the Portland Aerial Tram in Portland, Oregon and the Roosevelt Island Aerial Tramway in New York, New York. An aerial tram system typically has two cabins that shuttle back and forth between two end terminals. The proposed Project is a detachable gondola system. An aerial gondola system includes multiple cabins that travel on a continuously circulating cable, which allows for an overall higher system capacity and ability to move more people per hour in in each direction than an aerial tram. Furthermore, the proposed Project would be a modern 3S system with the capacity to move 5,000 people per hour per direction with a travel time from Los Angeles Union Station (LAUS) to Dodger Stadium of seven minutes, far greater than the 2,800 persons per hour capacity estimated in the 1990 Study for the two-car reversible tramway system. As such, the two systems are not comparable, and findings in the 1990 Study comparing the tramway system to other modes as analyzed in that 33-year-old study are not relevant to the current proposed Project.

Comment GO14-99 The project description ridership estimate focuses the reader on future conditions unlikely to ever occur, based on an unreliably speculative and untested model that inappropriately extrapolates a tiny amount of data from only two zip codes to model the entire Los Angeles transportation network. (DEIR, Appx. N, pdf pp. 9-12.) The unbiased UCLA Mobility Study uses real-world, multi-modal transportation data to reliably predict actual Project ridership.

¹⁸ Gruen Associates. 1990. Dodger Stadium Transit Access Study. Available at: https://libraryarchives.metro.net/dpctl/lactc/dodger_stadium_access_study.pdf. Accessed August 2023.

The DEIR fails as an informational document because the project description estimate of Project ridership is not based on reliable, substantial evidence, but rather on speculative assumptions.

Response GO14-99 Refer to Responses GO14-97 and GO14-98 for discussion of the proposed Project’s ridership model.

Comment GO14-100

GO14-100A 7. The DEIR’s description of Project queueing is incomplete.

The DEIR project description describes that “[q]ueueing areas would be built into and as necessary, adjacent to, each of the stations to provide a gathering place for passengers waiting to enter the stations, thereby preventing crowding of sidewalks and walkways by passengers around stations.” (DEIR, p. 2-44 (emphasis added).) This project description is not sufficiently precise to inform the public where the additional queueing areas, proposed to be built on an as-needed basis, would be located. It also does not allow commenters to examine whether the spaces proposed for queueing will be of sufficient size. These failures are particularly important because the Project plans to utilize existing public parklands to accommodate its land use needs including, apparently, for queueing.

GO14-100B For example, discussion of queueing for the Alameda Station explains some queueing for will be located “to the west north of the Placita de Dolores of El Pueblo de Los Angeles. (DEIR, p. 2-52; see also, DEIR, p. 3.2-2, providing additional description explaining that queueing would be located “in a proposed new pedestrian plaza in an area currently containing a parking and loading area for El Pueblo.”) There is no basis for the Project to simply take public parklands for its own needs. (See also discussion of El Pueblo land use conflicts, *infra* pp. 73-75.)

Response GO14-100

GO14-100A Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of for a discussion of queueing, including at the Alameda Station and the Chinatown/State Park Station. Refer to Topical Response J, Gondola Design and Operations, for additional discussion of how the boarding platforms at the Alameda Station, Chinatown/State Park Station, and Dodger Stadium Station have been sized to accommodate the capacity of the proposed Project. Queues at the Chinatown/State Park Station would be within the Station, given the lesser boarding demand and the larger queueing capacity at the Station.

GO14-100B As discussed in Section 2.0, Project Description, of the Draft EIR, vertical circulation elements (i.e. elevators, escalators, stairs) for pedestrian access to the Alameda Station, which would also serve as queueing areas to the station, would be introduced at-grade north of the Placita de Dolores in a proposed new pedestrian plaza at El Pueblo on the west in an area currently used as a parking and loading area for

El Pueblo. On the east, vertical circulation elements would be introduced at-grade from the planned LAUS Forecourt. Refer to Topical Response B, Ridership Model; Queuing at Stations and Pre-game and Post-game Transportation, for discussion of how due to the nature of queue formation, the pre-game/event passenger queues at the Alameda Station in 2026 are estimated to be largely contained on the platform and only minimally extend out into the planned LAUS Forecourt. Queueing is not expected to occur into the new pedestrian plaza at El Pueblo since the majority of riders are expected to board from the planned LAUS Forecourt. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project, and Section 2.3.8, Project Objectives, for an overview of the proposed Project's objectives. The overall purpose of the proposed Project is to provide a direct transit connection between LAUS and the Dodger Stadium property via an aerial gondola system and improve connectivity for the surrounding communities by linking to the Los Angeles State Historic Park, Elysian Park, and the neighborhoods along the proposed alignment and the region's rapidly growing regional transit system at LAUS. ART is a proven, zero emission, safe, sustainable, high-capacity, and highly efficient form of transportation that would function as both a reliable rapid transit system and first/last mile connector. The proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Refer to Section 2.5, Proposed Project Alignment and Components, with supporting data provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR for discussion of how the proposed Project maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents. Refer to Responses GO14-152 and GO14-153 for further discussion of the proposed Project's siting near El Pueblo.

Comment GO14-101 The Alameda Station queuing plan also states: "Queueing for Alameda Station would occur in the planned LAUS Forecourt area on the east side of Alameda Street." (DEIR, p. 2-44.) But while the DEIR briefly mentions the LAUS Master Plan and LAUS Forecourt and Esplanade Improvements Project, nowhere does it discuss potential conflicts with either the Master Plan or original plans for the Forecourt. (See DEIR, pp. 2-7 to 2-8.) This is especially puzzling because the Final EIR for the Forecourt and Esplanades Improvements Project from March 2018 is cited in the DEIR. (DEIR, p. 2-8, fn. 8.)

Response GO14-101 Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's coordination with Metro on the planned LAUS Forecourt. As discussed in

Section 2.0, Project Description, and on pages 3.17-39 and 3.17-43 in Section 3.17, Transportation, of the Draft EIR, the Alameda Station location, including the station location and queueing, is compatible with Metro’s existing plans at LAUS, including the Forecourt and Esplanade Project. The LAUS Forecourt and Esplanade Project was originally conceptualized in the LAUS Master Plan, and the proposed Project would not preclude their implementation. The LAUS Master Plan was a visioning document and does not include any designed or funded improvements.

Comment GO14-102 LA Parks Alliance also notes that the uniform resource locator (url) provided for the Los Angeles Union Station Master Plan (<https://www.metro.net/projects/la-union-station/>) now autoloads the web page for Metro’s LA Union Station Forecourt and Esplanades Improvement Project (<https://www.metro.net/projects/la-union-station-forecourt-and-esplanadeimprovements/>). (DEIR, p. 2-8, fn. 7.) Review of Metro’s list of project web pages (<https://www.metro.net/projects/>) discloses no website url for the LAUS Master Plan. The DEIR thus provides public commenters with no easy access to the Master Plan so they may review it for consideration of potential Project conflicts with the LAUS Master Plan.

Response GO14-102 Refer to Response GO14-101 regarding the LAUS Master Plan.¹⁹

Comment GO14-103 Further, the DEIR does not provide sufficient information as to the typical number of people expected to be queueing at any of the Project’s proposed stations. For a Project that proposes to push up to 10,000 people through a private transit system 30 to 40 people at a time for two hours, the failure to include this information is incomprehensible. Because the information is missing, there is no evidence, let alone substantial evidence, to support the DEIR’s conclusion that queueing at the proposed Chinatown/State Historic Park station can be accommodated entirely within the station structure. (DEIR, p. 3.1-42.) Review of the entire DEIR shows discussion of queueing locations. Queueing times and volume are nowhere found.

Response GO14-103 Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for a discussion of queueing, including at the Chinatown/State Park Station. As described in Section 3.17, Transportation, of the Draft EIR, for purposes of the Draft EIR, the transportation analysis included the analyses required by Appendix G of the CEQA Guidelines and the City of Los Angeles Transportation Assessment Guidelines (TAG). Pedestrian queues are not required to be analyzed under CEQA or the TAG. As such, Topical Response B is provided only for informational purposes. While not required for transportation, as discussed in Section 3.13, Noise, of the Draft EIR, estimates of passengers at stations were used for data input to evaluate operational noise. Refer to Response GO14-100A for discussion of queueing. Queues at the Chinatown/State Park Station would be accommodated within the station, given that the boarding demand would be less

¹⁹ Los Angeles County Metropolitan Transportation Authority, Los Angeles Union Station master Plan. This document is no longer available online. The Transforming Los Angeles Union Station summary is available at: <http://libraryarchives.metro.net/DPGTL/unionstation/2015-transforming-los-angeles-union-station-summary-report.pdf>. Accessed November 2023.

than at the Alameda Station (15 percent of total ridership at the Chinatown/State Park Station versus 85 percent at the Alameda Station) and the larger queueing capacity at the Chinatown/State Park Station due to the ability to accommodate a mezzanine level in the station’s design, the queue is expected to be fully accommodated within the Chinatown/State Park Station and is not anticipated to extend outside of the station.

Comment GO14-104 The DEIR fails as an informational document because the project description and DEIR do not provide the Project queueing information necessary to analyze and consider potentially significant conflicts between queueing locations and activities that would impact parklands used by and adjacent to the Project, and also because the DEIR does not discuss potential conflicts between the Project and the existing LAUS Master Plan and LAUS Forecourt and Esplanade Improvements project, the latter of which has already undergone environmental review.

Response GO14-104 Refer to Responses GO14-101 and GO14-103 for discussion of queueing at the proposed Project’s stations. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation. As described in Section 3.17, Transportation, of the Draft EIR, for purposes of the Draft EIR, the transportation analysis included the analyses required by Appendix G of the CEQA Guidelines and the City of Los Angeles Transportation Assessment Guidelines (TAG). Pedestrian queues are not required to be analyzed under CEQA or the TAG. As such, the queueing discussion in Topical Response B is provided only for informational purposes. While not required for transportation, as discussed in Section 3.13, Noise, of the Draft EIR, estimates of passengers at stations were used for data input to evaluate operational noise. Refer to Response GO14-82 for a discussion of how the Project Description complied with CEQA’s content requirements. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., CEQA Guidelines § 15124.) The Draft EIR provided sufficient information in order for the public and decisionmakers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require “a lead agency to conduct every test or perform all research, study, and experimentation recommended or demanded by commenters” and lead agencies are not required to “provide all information requested by reviewers.” (*Id.*, § 15204.)

Comment GO14-105 8. The DEIR’s project description regarding signage raises potentially significant environmental impacts that are never discussed or mitigated.

The DEIR project description notes that the “proposed Project would include signage” which “may include identification and other static signs, electronic digital displays and/or changeable message light-emitting diode (LED) boards that include both transit information and other content, which may include off-site advertising... Signage would be architecturally integrated into the design of the ART system including its stations, the junction, towers, and cabins.” (DEIR, p. 2-45 (emphasis

added).) DEIR Appendix C does not provide any additional information with details of the Project's signage program. (See DEIR, Appx. C, pdf pp. 15, 363.)

The DEIR states: "Signage would be in conformance with all applicable requirements of the Los Angeles Municipal Code (LAMC)." (Ibid.) That signage would conform to the Los Angeles Municipal Code (which is, of course, always subject to change) is not sufficient to limit its potentially significant environmental impacts along the proposed Project alignment. For example, it is not uncommon to find electronic digital displays attached to the top of ride share vehicles, notwithstanding that California law allegedly prohibits them.⁴⁸ If such signage were attached to the exterior of moving gondola cabins the aesthetic and other impacts at visually sensitive locations along the Project alignment, for example, within Los Angeles State Historic Park, would be potentially significant.

The DEIR's aesthetic impact analysis acknowledges that views of the Los Angeles skyline, considered a protected aesthetic resource in the LA State Historic Park General Plan and Final EIR (see discussion, supra p. 39), "would be partially interrupted due to the Project" without even considering impacts from possible cabin-mounted electronic digital displays. In addition, the DEIR's discussion of light and glare impacts is incomplete with no discussion of such displays, which invalidates the DEIR's conclusion that operational impacts would be less than significant. (DEIR, p. 3.1-52 to 3.1-53.) The DEIR also seems to have neglected inclusion of depictions of nighttime lighting or signage to assist the public or decision makers in assessing nighttime aesthetic or other impacts.

Footnote 48: See Cal. Vehicle Code, §§ 25400, 25950. But see, Uber dot com, Uber Out-of-Home (OOH) cartop advertising program, showing a typical cartop digital advertising display frequently seen on Los Angeles streets, available at <https://www.uber.com/us/en/about/car-advertising/> (last checked Jan. 11, 2023). A screen capture of the page depicting the cartop digital advertising display is attached as Exhibit Q.

Response GO14-105 This response takes into consideration the content of Exhibit Q, referenced in this comment. Refer to Topical Response K, Signage and Lighting, for discussion of the proposed Project's signage and lighting, with additional technical detail and information provided in the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR. The proposed Project's Sign Concept Plan included at Appendix B of the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR, provides that across the entire proposed Project, including stations, the junction, towers, and cabins, the proposed Project is proposing static signage and digital signage. The digital signage would be limited to the Alameda Station and the Dodger Stadium Station. No digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition to the naming rights signage, the proposed Project is proposing that two cabins be designated for

the display of community programming graphics and that one cabin be designated for the display of artwork by local arts collaborators. Signage would be designed to complement the proposed Project design and use and would be consistent with the existing urban condition, as illustrated in Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, which includes KOPs updated in part to incorporate the proposed Project's signage program, as depicted in the signage package included in the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR. Refer to Section 3.01, Aesthetics, and the Lighting Study, of the Draft EIR, and Section 5.0, Corrections and Additions, of the Final EIR, which includes an Analysis of Supplemental KOPs, for discussion of how the proposed Project's signage would result in less than significant impacts, including as to the Los Angeles State Historic Park. Refer to Section 3.04, Biological Resources, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of the Final EIR, for discussion of lighting with respect to biological resources, including in the Los Angeles State Historic Park. As discussed therein, lighting would be low-level and primarily integrated into the architectural features. Exterior lighting would be shielded and/or directed toward the areas to be lit, limiting spillover into adjacent habitats potentially suitable for birds and bats.

Comment GO14-106 Because the project description includes the possibility that gondola cabins, among other Project elements, may have electronic digital displays but describes virtually no details and provides no limitations on their implementation, it is impossible to assess the potentially significant adverse environmental effects of the Project to Los Angeles State Historic Park or other locations along the Project corridor. The DEIR thus fails as an informational document for failing to include information necessary to allow the public and decisionmakers to consider the Project's environmental effects and whether a mitigation measure is necessary to eliminate or limit adverse impacts.

Response GO14-106 Refer to Topical Response K, Signage and Lighting, for discussion of the proposed Project's signage and lighting, with additional technical detail and information provided in the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR. Refer to Response GO14-105 for discussion of how no digital signage is proposed on the exterior of the cabins.

Comment GO14-107 9. The Emergency Operations Plan must not be deferred.

The project description explains that an "Emergency Operations Plan would be prepared as part of the proposed Project..." (DEIR, p. 2-47.) Given that the DEIR and Project proponents repeatedly refer to the aerial tram "[a]s a breakthrough and innovative technology for the region" (DEIR, p. 1-7) it is critical that the Emergency Operations Plan not be deferred but be presented as part of the DEIR to allow for public review and comment. With not even the outline of an Emergency Operations Plan found in the DEIR, it is not possible for members of the public or decisionmakers to assess potentially significant environmental effects on public

services (police and fire) or potentially significant planning conflicts with City of Los Angeles Emergency Operations Plan. (See DEIR, p. 3.9-10 to 3.9-11.) The DEIR provides no discussion or analysis of these issues, and states only that the Project would comply with the City’s Emergency Operations Plan and Los Angeles Fire Code. (DEIR, pp. 3.15-19 to 3.15-20.) The project description is inadequate for failing to provide any further information on the Project’s Emergency Operations Plan.

Response GO14-107 Refer to Section 2.0, Project Description of the Draft EIR and Topical Response J, Safety and Gondola Operations, for a discussion of the Emergency Operations Plan. CEQA Guidelines section 15126.4 only requires mitigation for significant impacts. The proposed Project’s Emergency Operations Plan is not intended or required to mitigate a significant environmental impact. Accordingly, the development of the Emergency Operations Plan is not impermissibly “deferred” under CEQA, contrary to this comment’s suggestion. Refer to Response GO14-82 for a discussion of how the Draft EIR’s Project Description complied with all of CEQA’s content requirements. Refer to Section 3.15, Public Services, for a discussion of how the proposed Project results in less than significant operational impacts to public services, including police and fire.

Comment GO14-108 10. The project description includes the proposed Project’s improper use of public parkland as part of its “sustainability features.”

The DEIR project description of sustainability features makes numerous unsupported claims. For example, it suggests the Project will “[r]educe vehicle trips to...Elysian Park, and the Los Angeles State Historic Park.” (DEIR, p. 2-48.) As already discussed, these claims are illusory and unsupported by substantial evidence. (See discussion, supra p. 9 (potential mobility hub at Dodger Stadium) and pp. 16, 23 (LA State Historic Park ridership is assumed, not supported by substantial evidence).)

Most surprising (and tone-deaf and offensive) the project description lists the Project’s unprecedented and unlawful use of LA State Historic Park (see discussion, supra pp. 12-26) at the very top of its list of sustainable site features, lumping LA State Historic Park into the category of “publicly owned property” as if it had no special protections as a historical unit of the California State Park system. (DEIR, p. 2-49.) The sustainable site feature list also suggests, with no trace of irony, that the project is sited and designed “to minimize impacts to historic and archaeological resources, and to preserve viewsheds and local character.” (Ibid.) The sustainable site feature list also claims it will provide an “opportunity to enhance open space and green space at the Los Angeles State Historic Park.”

These Orwellian claims are audacious and unsupported. The sustainability claims disregard that the Project is in direct conflict with LA State Historic Park’s General Plan and mitigation measures of the park General Plan’s Final EIR, as well as with

state law that protects our state parks, especially historic units, from incursion by commercial interests. None of these obvious conflicts are adequately discussed or analyzed in the DEIR.

The DEIR project description misleadingly minimizes impacts to LA State Historic Park and insults the public's intelligence by referencing the devastating impacts as project benefits.

Response GO14-108 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Section 5.5.4, Location of Chinatown/State Park Station, of Section 5.0, Other CEQA Considerations, of the Draft EIR for a discussion of the siting considerations for Chinatown/State Park Station. As discussed therein, several locations were not carried forward for further examination because they required either a larger footprint within the Los Angeles State Historic Park, or would eliminate transit access to the Park. Ultimately, the proposed Project's Chinatown/ State Park Station location was chosen over the other potential locations because it minimized the proposed Project's potential footprint within the Los Angeles State Historic Park and impacts to neighboring properties while maintaining transit access to the Park and surrounding communities. As discussed in Section 2.7.8, Sustainability Features, of the Draft EIR, the list of the proposed Project's sustainability features was compiled from features included in the 2019 California Green Building Standards Code, United States Green Building Council Leadership in Energy and Environmental Design (LEED) for New Construction, and The Institute for Sustainable Infrastructure's Envision Rating System, and was categorized by sustainable sites, location/transportation/quality of life, among other categories of sustainable features. Accordingly, the list of the proposed Project's sustainability features is based on best sustainability standards and codes, and properly takes into account siting and the ability to reduce vehicle trips to the Los Angeles State Historic Park.

Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of the proposed Project's sustainability features. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefit to the surrounding community, including but not limited to sustainability features and open space enhancement. Refer to Responses GO14-39 through GO14-43, and GO14-52, for discussion of how park ridership is supported by substantial evidence in the Draft EIR. Refer to Response GO14-22 for discussion of how the proposed Project will include a mobility hub at Dodger Stadium.

Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan. As discussed therein, State Parks has determined that the proposed Project would be inconsistent with the Los Angeles State Historic Park General Plan because the identified land uses in the General Plan's Preferred Park Concept Elements did not contemplate a transit station like the proposed Project's Chinatown/State Park

Station. State Parks considers this inconsistency a potentially significant impact. Therefore, Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain an amendment to the Los Angeles State Historic Park General Plan. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Amendment.

Refer to Section 3.05, Cultural Resources, and Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, of the Draft EIR for a discussion of archaeological resources at the Los Angeles State Historic Park. As discussed in Section 3.05, the Chinatown/State Park Station footprint is entirely located within the boundary of Resource 19-003120 (consisting of the remains of the Southern Pacific Railroad's River Station). Extensive archaeological work has been conducted at the site, and when the Chinatown/State Park Station (including the construction staging area) is overlaid on an archaeological sensitivity map developed by California State Parks, it appears that the Chinatown/ State Park Station is located in an area not identified as low sensitivity for archaeological resources by State Parks. Nevertheless, with the implementation of mitigation, construction of the proposed Chinatown/State Park Station would result in a less than significant impact related to a substantial adverse change in the significance of archaeological Resource 19-003120.

The Draft EIR provided objective facts and analysis from experts in their respective fields in order for the public and decisionmakers to meaningfully evaluate the proposed Project's potential environmental impacts.

Comment GO14-109 D. The DEIR's Analysis of Aesthetic Impacts is Grossly Inadequate.

This letter focuses its primary objection to the DEIR's inadequate aesthetics impact analysis on the DEIR's minimization of adverse aesthetic impacts to Los Angeles State Historic Park. LA Parks Alliance notes, however, its strong objection to the DEIR's inadequate analysis of impacts to LA Union Station, El Pueblo de Los Angeles State Historic Park, and other parkland and public areas along the proposed Project corridor, for similar reasoning as included below in subsections D(1) and D(3), as well as for the reasons other commenters will undoubtedly provide in response to the grossly inadequate DEIR.

"A project will normally have a significant effect on the environment if it will...[h]ave a substantial, demonstrable negative aesthetic effect[.]" (Quail Botanical Gardens Foundation, Inc. v. City of Encinitas (1994) 29 Cal.App.4th 1597, 1604, quoting CEQA Guidelines, Appx. G.) "[I]t is inherent in the meaning of the word 'aesthetic' that any substantial, negative effect of a project on view and other features of beauty could constitute a 'significant' environmental impact under CEQA." (Ibid.)

The DEIR fails to adequately analyze aesthetic impacts, including visual impacts along the entire Project corridor, but especially on views of and from Los Angeles State Historic Park. As the DEIR notes, “analysis of existing visual or aesthetic resources and potential visual or aesthetic impacts can be highly subjective, dependent upon the background of the assessor and the opinions of viewers.” (DEIR, p. 3.1-29.) California courts generally agree, finding that analysis of potentially significant aesthetic impacts is not the sole province of experts. The opinion of lay persons with respect to aesthetic and certain other impacts, particularly when presented by more than just a few persons, often constitutes substantial evidence of a significant environmental impact. (See, e.g., *Ocean View Estates Homeowners Assn., Inc. v. Montecito Water Dist.* (2004) 116 Cal.App.4th 396, 402-403.)

Response GO14-109 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. The methodology utilized to examine potential aesthetic impacts follows the guidance outlined in the Federal Highway Administration’s *Guidelines for the Visual Impact Assessment of Highway Projects* (2015). As a result of this guidance, a group of Landscape Units (LU) and Key Observation Points (KOPs) were delineated and identified based on known significant views and locations with proposed changes to the setting and subjected to review and analysis identified within the aforementioned framework. Further, views and potential impacts were all analyzed using the same thresholds of significance identified by the State CEQA Guidelines and the Los Angeles CEQA Thresholds Guide. In this case, the analysis and conclusions of the Draft EIR are supported by the substantial evidence of the visual simulations, use of Federal Highway Administration (FHWA) methodology, application of clear thresholds of significance, and recognition that this urban location would be regulated by existing zoning and other regulations governing scenic quality, including proposed design standards. Refer to Appendix H.1, Memo Regarding Preparation of KOPs, of the Final EIR, for discussion of the methodology used to prepare the visual simulations included in Appendix C, Visual Impact Assessment, of the Draft EIR. Refer to Topical Response C, Project Features, discussing how the proposed Project’s design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area.

As discussed in Section 3.01, Aesthetics, of the Draft EIR, the Alameda Station’s platform and canopy would include a light color scheme and warm tones, which has been designed to complement and reflect the materiality of the existing mix of adobe buildings, large Victorian commercial blocks, and Spanish Revival style buildings within the El Pueblo and Olvera Street area. In addition, the “shell” roof

design provides a visual lightness with an integrated perforation pattern motif based upon the arched forms that mark openings and entries to Union Station, Pico House, and other historic buildings within El Pueblo. The proposed Project would also integrate physical and visual connections between the proposed Alameda Station and existing adjacent development, such as the new pedestrian plaza at El Pueblo. The new pedestrian plaza at El Pueblo would be open to the public and would extend view corridors between the proposed Alameda Station and existing development in a way that creates an observed visual unity.

As discussed in Section 3.01, Aesthetics, of the Draft EIR, certain southwest-facing views of the downtown Los Angeles skyline from Los Angeles State Historic Park, particularly views close to the proposed Chinatown/State Park Station, would be partially interrupted due to the proposed Project. However, the view from most locations in the park would remain where the view would be uninterrupted by the proposed Project. These views include looking towards downtown from the southwestern corner and from the Roundhouse platform and walkway within the park. In addition, existing views of downtown from other areas within the Park are already interrupted under existing conditions by trees and intervening development. Also, the location of the proposed cables and cabins would be adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The cabins would be constantly moving in and out of view, and the cables have similar characteristics to the overhead power lines that are prevalent in views in this area. As such, the proposed cables and cabins would not significantly impact views in this area.

The Draft EIR's analysis of impacts to aesthetics was prepared by an expert in the field, as set forth in Section 8.0, List of Preparers, and intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts. Accordingly, the Draft EIR more than adequately complies with CEQA's requirements for a Draft EIR.

Comment GO14-110 1. The DEIR's use of images is misleading and incomplete.

The DEIR minimizes the Project's aesthetic impacts through its use of misleading images sprinkled throughout the DEIR and by failing to provide necessary simulated depictions of the Project to assist the public and decision makers to fully understand its visual impacts. For example, Figure 2-5, depicting the "Illustrative Design of a Station" (DEIR, p. 2-15), shows a view of Alameda Station as seen from the LA Union Station property looking approximately northwest. Later, the DEIR shows a depiction of existing LA Union Station from an angle that appears to be the approximate reverse angle. (DEIR, p. 3.1-19, Figure 3.1-3; see also DEIR, Appx. C, pdf p. 46, Figure 4-6.) But where is the simulated view depicting the Alameda Station in front of LA Union Station?

Every simulated view of Alameda Station appears to have been selected to avoid depicting the station as obscuring views of LA Union Station in any way. (DEIR, Appx. C, Figures 5-1 through 5-11, pdf pp. 109-119.) But clearly there are views that would obstruct Union Station, or the depiction of Alameda Station in the bottom image of Appx. C, Figure 5-4, would not be possible.

Similarly, Figure 2-6 depicts the “Illustrative Design of a Tower.” (DEIR, p. 2-16.) This simulated view shows the Project’s Alameda Tower (described in the image caption as being “in the foreground”) and Alpine Tower (described as being “in the middle ground”). (Ibid.) But whether intentional or inadvertent, the simulated image’s use of “foreshortening” obscures the apparent height of the towers, making them appear far smaller than they really are. The “foreground” Alameda Tower appears shorter than an even nearer telephone pole, even though it is likely four or five times taller. The more distant Alpine Tower appears only half as tall as the Alameda Tower. When used to create whimsical photographs, foreshortening can provide an entertaining, comical effect.⁴⁹ But it can also be used to minimize the visual impact of a large structure, even if perhaps inadvertently, as it does in the DEIR.

Footnote 49: Most people are familiar with photographs depicting persons interacting in some way with a distant object, often a building. For example, a photo at the following web page depicts the leaning tower of Pisa as if it were part of a large ice cream cone being enjoyed by a visiting tourist: <https://huebliss.com/foreshortening-photography/> (last viewed Jan. 12, 2023).

Response GO14-110 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Key Observation Points (KOPs) critical or representative of the visual character of the area were identified within each Landscape Unit (LU) and utilized for before and after photorealistic and true to scale visual simulations and locations of sensitive viewers that potentially would be visually impacted by the proposed Project. KOPs within each LU were selected based on existing knowledge of important viewsheds and through consultation with responsible agencies. The Draft EIR and Visual Impact Assessment specifically addressed and disclosed potential impacts on changes in the visual environment and existing viewsheds of or from LAUS. The Draft EIR studied thirty KOPs, including 8 that simulated views of the Alameda Station location from or near LAUS:

- KOP 1: Looking East from Los Angeles Street
- KOP 2: Looking North on Alameda Street
- KOP 3: Looking Northeast from El Pueblo
- KOP 4: Looking Northwest from LAUS
- KOP 5: Looking Northeast from New Pedestrian Plaza West of Alameda Station

- KOP 6: Looking East from Avila Adobe
- KOP 7a: Looking Southeast from Olvera Street
- KOP 7b: Looking North from Cesar Chavez Avenue

The Draft EIR analyzed each of these KOPs, describing the existing viewpoint along with a visual simulation of the proposed Project. The Draft EIR concluded that the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of LAUS.

Refer to Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, for additional visual simulations of the proposed Project, in response to comments received on the Draft EIR during the public review period. Refer to Appendix H.1, Memo Regarding Preparation of View Simulations, of the Final EIR, for discussion of the methodology used to prepare the visual simulations included in Appendix C, Visual Impact Assessment, of the Draft EIR. KOPs selected for simulation will appear larger and more distinct than visual elements further in the distance even though the foreground element may be of a smaller dimension, consistent with how pedestrians experience their surrounding environment. As such, visual elements in the foreground can sometimes block the full view of visual elements at a distance even though the foreground element may be of a smaller dimension. Further, visual simulations were created to reflect the proposed project components within the existing landscape and, as such, include the existing landscape planting, buildings, and other visual elements such as open space resources, trees, and building frontages as they existed at the time the photos were taken.

Comment GO14-111 The selection of simulated views of the Project appears calculated to minimize visual impacts of the Project. For example, a depiction of the proposed pedestrian plaza at El Pueblo is at an angle showing the plaza at a great distance while depicting only a small portion of the massive station (see Figure 2-9), which the DEIR describes as “173 feet long, 109 feet wide, and 78 feet high.” (DEIR, p. 2-23.) A depiction of pedestrian improvements at the proposed Chinatown/State Park Station shows one of the few somewhat close views of the station, but from a vantage point that is almost entirely obscured by plants, pedestrians, and Project hardscape shelter elements. (Figure 2-9, DEIR, p. 2-31.) There is no other simulated view depicting the Chinatown/State Park Station in the main DEIR document. The top image of Figure 6-18 (DEIR, p. 6-33) depicts the proposed Project from the “roundhouse” area of LA State Historic Park, approximately 1,300 feet away (measured using Google maps “measure distance” feature). (See also DEIR, p. 6-30 (textual description of the simulated image).)

The only close image of Chinatown/State Park Station within Appendix C appears to be Figure 5-17. (DEIR, Appx. C, pdf p. 125.) Chinatown/State Park Station completely dominates and obscures the existing park entrance. Figure 5-18 depicts

a simulated view of Chinatown/State Park Station masked by a large tree in the foreground. (DEIR, Appx. C, pdf p. 126.) Figure 5-19 includes a depiction of the Project looking southeast from the southwestern portion of LA State Historic Park, directly beneath the eastern-most gondola cables. (DEIR, Appx. C, pdf. p. 127.) In this depiction the station can be seen, presumably because trees that would have obscured it had to be removed to avoid being too close to hanging gondola cabins. (See upper “existing” image.)

Response GO14-111 Refer to Response GO14-110 for discussion of the analysis of aesthetic impacts from the proposed Project in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, including selection of KOPs and the methodology used to prepare the KOPs described in greater detail in Appendix H.1, Memo Regarding Preparation of View Simulations, of the Final EIR. Refer to Figure 2-16 on page 2-31 of Section 2.0, Project Description, of the Draft EIR, for an illustrative design of pedestrian improvements at Chinatown/State Park Station, which depicts the Chinatown/State Park Station. The Draft EIR and Visual Impact Assessment both specifically addressed and disclosed potential impacts on changes in the visual environment and existing viewsheds into and from within the Los Angeles State Historic Park. The Draft EIR included thirty Key Observation Points (KOPs), including nine that simulated views of or from Los Angeles State Historic Park. The Draft EIR analyzed each of these KOPs, describing the existing viewpoint along with a visual simulation of the proposed Project.

Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant.

With respect to views from within the park, the Draft EIR concluded that certain southwest-facing views of the downtown Los Angeles skyline, particularly close to the proposed Chinatown/State Park Station, would be partially interrupted due to the proposed Project. However, the Draft EIR noted that these views are already

partially interrupted by trees and intervening development, and the nature of the proposed Project (i.e., cables with similar characteristics to prevalent existing powerlines and cabins that are constantly moving in and out of view) means that the proposed Project would not significantly impact views from the park. The Draft EIR concluded that the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the Park. The Final EIR includes additional KOPs to further analyze viewshed impacts to Los Angeles State Historic Park in Appendix H.2. Refer to Appendix H.1, Memorandum Regarding Preparation of KOPs, and Appendix H.2, Supplemental KOPs in Response to Comments, of this Final EIR, for a discussion of the supplemental KOPs' preparation and the supplemental KOPs, respectively. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for an evaluation of the updated and additional KOPs for the proposed Project which would not result in significant impacts, and the aesthetic impacts of the proposed Project would remain less than significant. In addition, refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including views from a cabin over the park, providing a new and unique perspective of the park and its surroundings, including the Roundhouse Observation Deck and the exposed Zanja Madre, which is currently not visually apparent from inside the park.

Comment GO14-112 But this depiction is taken at an angle that shows the Los Angeles skyline to the right of the station. Almost the entirety of LA State Historic Park would experience the station as being between the viewer and the Los Angeles skyline. Figure 5-20a depicts the station partially obscuring the Los Angeles skyline. (DEIR, Appx. C, pdf p. 128.) But this image is taken from an elevated angle, and therefore depicts the station as appearing lower on the horizon than it would if taken from the location of people on the lawn below. Figure 5-20b corrects this problem as it depicts a simulated image from a lower elevation. (DEIR, Appx. C, pdf. p. 129.) Curiously, however, even though this is described as from the same location as the previous depiction (from the roundhouse within LA State Historic Park), the entire City of Los Angeles skyline has somehow shifted several degrees to the right and is no longer partially obscured by the Chinatown/State Park Station.

Response GO14-112 As described in the KOP Figure Mapbook included in Appendix C, Visual Impact Assessment, of the Draft EIR, Figure 20a, which is KOP 17, depicts the existing viewpoint from the perspective of a pedestrian or recreationalist looking southwest towards Chinatown and downtown Los Angeles from the interior of the Los Angeles State Historic Park. Figure 20-b, which is also KOP 17, depicts the view looking southwest from the roundhouse within the park and this view is "provided at a larger scale for informational purposes only." Refer to Response GO14-110 for discussion of the analysis of aesthetic impacts from the proposed Project in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, including selection of KOPs and the methodology used to prepare the KOPs described in greater detail in Appendix H.1, Memo Regarding Preparation of View

Simulations, of the Final EIR. Refer to Response GO14-111 for discussion of how impacts to scenic or panoramic views would be less than significant. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including views from a cabin over the park, providing a new and unique perspective of the park, and its surroundings, including the Roundhouse Observation Deck and the exposed Zanja Madre, which is currently not visually apparent from inside the park.

Comment GO14-113 It is also appropriate to note that the simulated images do not always accurately portray gondola cables. The DEIR's cover image clearly shows six cables (two sets of three). (DEIR, cover page.) This is consistent with a textual description of the cable system. (DEIR, p. ES-3). But numerous simulated images show only four cables (two sets of two). (See, e.g., from the DEIR: Figure 2-6, Figure 4-10, Figure 6-14 (top image), and Figure 6-16 (bottom image); from DEIR, Appx. C: Figure 5-5, Figure 5-9, Figure 5-10, Figure 5-11, Figure 5-15, Figure 5-18, and Figure 5-19). These conflicting images, some with four gondola cables and some with six, make assessment of the visual impacts of the Project difficult to understand and assess.

Response GO14-113 Refer to Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, for additional visual simulations of the proposed Project, including simulations provided for additional clarity regarding certain design elements of the proposed Project. Refer to Appendix H.1, Memorandum Regarding Preparation of Key Observation Points, of this Final EIR, for a discussion of how the view simulations were prepared, noting that while the ropes would be 1.75 to 2.5 inches in diameter, this size is too small to be visually detectable in many of the view simulation renderings, and accordingly the ropes were modeled with a 6-inch diameter so that they would be visible. Additionally, renderings include 3 cables, though some imagery may show only 2 visible cables due to perspective.

Comment GO14-114 Finally, Figures 5-21 and 5-22 simulate additional distant views of Chinatown/State Park Station, the first from the sidewalk in front of the LA State Historic Park, the second from the Park itself. (DEIR, Appx. C, pdf pp. 130-131.) Using the Google maps measuring tool and the image key (Figure 4-4, DEIR, Appx. C, pdf p. 44) the depicted views appear to be from approximately 1,600 feet (Figure 5-21) and 2,200 feet (Figure 5-22) distant.⁵⁰

The DEIR's use of misleading images and failure to provide images that adequately convey the full scope of visual impacts along the entire Project corridor, but especially impacts associated with LA Union Station, El Pueblo de Los Angeles, and Los Angeles State Historic Park, cause it to fail as an informational document.

Footnote 50: DEIR Figure 5-23 depicts a simulated view from the "North Broadway historic bridge" at a distance of approximately 3,400 feet using the Google maps measuring tool. (DEIR, Appx. C, pdf p. 132.) The utility of depicting the Project from the No. Broadway bridge is unclear, however the massive structure of the

Chinatown/State Park Station can be easily seen even from this great distance, though it does not obscure the Los Angeles skyline from this simulated camera position.

Response GO14-114 This comment provides a general recitation and characterization of the Draft EIR. Refer to Responses GO14-110 through GO14-113 for discussion of the aesthetics analysis in the Draft EIR and aesthetics impacts of the proposed Project, which would be less than significant. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, for additional visual simulations of the proposed Project, additional visual simulations of the park to further analyze viewshed impacts to the Park, in response to comments received on the Draft EIR during the public review period. The EIR has accordingly provided sufficient information for the public and decisionmakers to meaningfully evaluate the proposed Project’s potential environmental impacts, and does not “fail as an informational document.”

Comment GO14-115 2. The DEIR ignores protections and mitigation measures imposed by the certified Final EIR for Los Angeles State Historic Park’s General Plan.

The DEIR acknowledges that the Project would have a “significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.” (DEIR, ES-58.) The DEIR asserts, however, that the essential conflict between the Project’s proposed use of land at Los Angeles State Historic Park is technical, and correctable by adoption of Mitigation Measure LUP-A which merely requires “[o]btain[ing] a Los Angeles State Historic Park General Plan Amendment.” (Ibid.) This assumption is grossly in error. Under California law, LA State Historic Park is plainly not available for the benefit of the Project. (See discussion, *supra* pp. 12-26.)

Response GO14-115 Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project’s Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to

inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment.

Comment GO14-116 More important, even if a Park General Plan amendment were available to benefit the Project, and it is not, the DEIR fails as an informational document for making little effort to describe the nature of the environmental impacts intended to be addressed by the mitigation measure. Before a mitigation measure may be proposed to address a significant environmental effect, the environmental effect must be adequately identified. (Pub. Res. Code, § 21002.1.)⁵¹ Without first understanding the complete nature of the significant effect it is not possible to assess whether a mitigation measure would reduce impacts to a level less than significant, or if another feasible mitigation measure would be superior. (See CEQA Guidelines, § 15126.4, subd. (a)(1)(B): “Where several measures are available to mitigate an impact, each should be discussed and the basis for selecting a particular measure should be identified.”)

But the DEIR does not clearly identify the Project’s significant environmental effect(s)—it only identifies the mitigation. The DEIR assumes that whatever the significant effect is, papering over it with a revised General Plan will suffice. There is thus no way to assess whether the mitigation is sufficient to reduce the significant environmental effect(s) to a level less than significant, because the nature of the impact is not adequately described.

Footnote 51: When a lead agency determines that a mitigation measure cannot be legally imposed, as Metro should have determined here, the mitigation measure need not be proposed or analyzed. (CEQA Guidelines, § 15126.4, subd. (a)(5); see discussion, supra pp. 11-25.)

Response GO14-116 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, of the Draft EIR, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. Refer to Response GO14-115 for a discussion of Mitigation Measure LUP-A. The comment suggests, without explanation, that Metro should have determined that Mitigation Measure LUP-A cannot be “legally imposed.” Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of Metro’s consultation with CEQA responsible agencies, including State Parks.

Consultation with State Parks as Draft EIR preparers occurred as part of this process, and comments from State Parks on the Draft EIR were reviewed and incorporated into the Draft EIR. As discussed in Section 3.11, Land Use and Planning, of the Draft EIR, State Parks, as a responsible agency, considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and requested Mitigation Measure LUP-A be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Accordingly, it would be improper for Metro, the lead agency, to determine that State Parks, the responsible agency, could not request a mitigation measure that is solely within the State Parks' jurisdiction. Refer to Section 7.0, Mitigation Monitoring and Reporting Program, and Table 7-1, Mitigation Monitoring and Reporting Program (MMRP), of the Final EIR. The Mitigation Monitoring and Reporting Program prescribes for agency enforcement of mitigation measures for the proposed Project. Refer to Responses GO14-32 through GO14-54 for responses to comments contained on pages 11 to 25 of this letter, as identified in footnote 54 of this comment GO14-116.

Comment GO14-117 The DEIR's aesthetics analysis summarizes the goals and guidelines of LA State Historic Park's General Plan. (DEIR, pp. 3.1-2 to 3.1-3.) While this recitation is accurate, the DEIR's analysis falls far short. As in its project description of LA State Historic Park, the DEIR's description of the park within Landscape Unit 4 fails to convey the importance of protected views of and from the Park. Lumping LA State Historic Park in with the other community visual features found in Landscape Unit 4, the DEIR concludes that the visual quality of LU-4 is "moderately low." (DEIR, p. 3.1-30.) Moreover, and as will be discussed further, LA State Historic Park's goals and guidelines are intended for use by Park facilities, and are simply not applicable to non-park structures, which have no place and are not permitted in the Park.

For its thresholds of significance, the DEIR chooses the State CEQA Guidelines Appendix G questions and employs guidance from the City of Los Angeles CEQA Threshold Guide in the analysis. (DEIR, p. 3.1-32.) While the Appendix G questions are usually considered adequate for review of a typical development project, they are not adequately responsive to the needs of a historic state park that has aesthetic resource protections already imposed by the Park General Plan and certified Final EIR, including mitigation measures put in place to protect the aesthetic and other resources identified in the Park's EIR.

Response GO14-117 This comment provides a general recitation and characterization of the Draft EIR. Refer to Response S2-5 discussing how the proposed Project would not adversely

impact or interfere with key viewpoints or the visual character of the Park. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, including on the Los Angeles State Historic Park, which would be less than significant. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project in response to comments on the Draft EIR, including at Los Angeles State Historic Park.

Refer to Response S2-5 for a discussion of the proposed Project’s consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics. The Draft EIR’s analysis of impacts to aesthetics and cultural resources was prepared by experts in their respective fields, as set forth in Section 8.0, List of Preparers, and intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR.

Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of Metro’s consultation with CEQA responsible agencies, including State Parks. Consultation with State Parks as Draft EIR preparers occurred as part of this process, and comments from State Parks on the Draft EIR were reviewed and incorporated into the Draft EIR. Refer to Appendix A, Scoping Report, of the Draft EIR, and Appendix A, Public Outreach Report, of the Final EIR, for documentation of notice to responsible agencies at various stages in the environmental review process. As discussed on page 3.1-32, of Section 3.01, Aesthetics, of the Draft EIR, the City of Los Angeles CEQA Thresholds Guide was used to provide context to the questions in Appendix G of the CEQA Guidelines. State Parks did not object to the use of this Guide to

provide context for the aesthetics and visual resources analysis, and the Draft EIR in turn provides justification for their use. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan mitigation measure Aes-1 which requires State Parks to review potential aesthetic quality impacts associated with new facilities and implement design practices that reduce those facilities' overall negative aesthetic effect. The proposed Project does not modify this mitigation measure, which applies to State Parks' actions and does not apply to the proposed Project. In any event, the Project Sponsor has been working cooperatively with State Parks to avoid or minimize impacts, including aesthetic impacts to LASHP, thus helping State Parks meet its obligations pursuant to this mitigation measure.

Comment GO14-118 The primary mode of visual analysis undertaken by the DEIR to assess operational aesthetic impacts is use of existing and simulated views of the Project taken from a series of Key Observation Points ("KOPs"). (DEIR, p. 3.1-35; see also Figure 4-1 (KOP Locations Overview), DEIR, Appx. C, pdf p. 41.) As already discussed, the locations selected for these photos seem to have been selected in a manner calculated to minimize the Project's visual impacts. (See discussion, *supra* pp. 53-55.) The DEIR also does an inadequate job explaining the selection process for KOP locations.

Response GO14-118 Refer to Response GO14-110 for discussion of the methodology used to identify KOPs for the Draft EIR's analysis of aesthetic impacts, which would be less than significant.

Comment GO14-119 The first Appendix G question asks if the Project would "have a substantial view on a scenic vista." (DEIR, p. 3.1-33.) The protected views of the Los Angeles skyline as seen from LA State Historic Park (along with numerous other important visual resources such as views of designated cultural and historic landmarks within the Project area) are largely swept aside as not technically comprising a scenic vista: "There are no designated scenic vistas present in the [Area of Potential Impact]."⁵² (DEIR, p. 3,1-33 (emphasis added).) Construction impacts are determined to be less than significant because viewers are either deemed to generally have low sensitivity "and do not necessarily have a personal investment in these views" or because views are "only minimally noticeable because of the distant aspect of that view and the presence of vegetation" or because views of mountain ranges and the Los Angeles skyline would "continue to be available to pedestrians and recreationalists through street corridors." (DEIR, p. 3.1-34.)

Footnote 52: The DEIR does at least acknowledge that some viewers might view things differently: "[V]iews of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains...could be considered scenic to certain viewers although not officially designated as such." (DEIR, p. 3.1-34.)

Response GO14-119 This comment provides a general recitation and characterization of the Draft EIR. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Topical Response M, Comparable Urban Aerial Transit Systems for a discussion of how other urban aerial transit systems have been successfully incorporated into their surroundings, including public open space and public parks.

Comment GO14-120 Operational impacts are likewise minimized: “no designated scenic vistas are present in the API.” (DEIR, p. 3.1-35.) The protected views from LA State Historic Park, and views of other cultural and historic landmarks in the Project are not individually analyzed. Lumping the entirety of the aesthetic views together allows the DEIR to dismiss them with sweeping generalizations:

While the Project would include tall visual elements, views of other scenic or panoramic views would continue to be visible from more prominent view locations, such as park areas, or other sections along local streets. In addition, the Project would comprise a very small portion of the broad urban view field. As such, the Project as viewed from public areas in each LU would not block prominent views of notable visual features.

(DEIR, p. 3.1-35.)

The DEIR continues:

Overall, the proposed Project would not significantly block scenic or panoramic views, such as views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains.” (Ibid. (emphasis added).)

The word “overall” does an awful lot of work in the above sentence. Simply put, any “analysis” that lumps a set of individual visually important views together, including

views of designated cultural and historic sites (at least one specifically protected by mitigation measures in a certified EIR, see below) instead of analyzing them for their own unique individual values, must be considered inadequate.

Response GO14-120 This comment provides a general recitation and characterization of the Draft EIR. Refer to Responses GO14-117 and GO14-119 for discussion of how the analysis of aesthetic impacts in the Draft EIR complied with CEQA, and for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Response S2-5 discussing how the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the Park. Refer to Responses GO14-109 and GO14-110 for discussion of the preparation of the aesthetics analysis for the Draft EIR, in compliance with CEQA. This commenter’s reference to analysis of “protected views” is noted but CEQA does not require an analysis of this type of view. Further, the commenter takes issue with the conclusion of the analysis of scenic views in Section 3.01, Aesthetics, of the Draft EIR, on pages 3.1-33 to 3.1-35, which includes a detailed analysis of each individual scenic vista before reaching the conclusion that is quoted. Refer also to Appendix C, Visual Impact Assessment, of the Draft EIR, which discusses individual scenic vistas in the analysis of individual KOPs.

Comment GO14-121 With respect to only LA State Historic Park, the DEIR states: “[V]iews from the Los Angeles State Historic Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views.” But as discussed above, the simulated views are entirely inadequate to convey the substantial visual impact of the Project on LA State Historic Park, as the views seem to have been selected in a manner calculated to downplay visual aesthetic impacts. Consequently, they do not provide a basis to completely evaluate aesthetic impacts.

Response GO14-121 Refer to Responses GO14-117 and GO14-119 for discussion of aesthetic impacts of the proposed Project, which would be less than significant, including to scenic vistas. Refer to Response S2-5 discussing how the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the Park.

Comment GO14-122 Of course, it is also true that courts are generally deferential to an agency’s determinations with respect to aesthetic impacts. (See, e.g., North Coast Rivers Alliance v. Marin Municipal Water Dist. Bd. of Directors (2013) 216 Cal.App.4th 614, 627.) Here that cuts against Metro’s determination for the Project, because the agency responsible for determining the aesthetic resources of Los Angeles State Historic Park, the Department of Parks and Recreation, has already well defined the park’s aesthetic resources and certified an EIR with a mitigation measure intended to protect them:

Viewsheds

As viewed from the north, especially from the northern two-thirds of the property, the Park site is a large open space that is in stark contrast to the dramatic skyline of downtown Los Angeles. Sometimes referred to as the “front porch” of the City, there are no other sites that capture this welcoming view of downtown Los Angeles.

Views of Elysian Park present a welcoming view of green hills and trees. The more distant views of the Verdugo Hills and the occasionally snow-covered San Gabriel Mountains provide vistas of natural landscapes.

In the immediate vicinity of the Park are structures with distinct architectural styles, including a variety of buildings in the Chinatown area, the Chinatown Transit Station, the Capitol Milling Company building, and the Broadway Bridge. (LASHP General Plan, pdf. pp 52-53 (emphasis added).)⁵³

The Park’s Final EIR acknowledges that it is located “in a dense urban environment,” but that fact is an additional justification to protect visual resources, including views seen from the Park, and also views seen of the Park as seen from outside its boundaries:

This Park is situated in a dense urban environment. It does, however, provide a spectacular view of the downtown Los Angeles skyline, as well as views to the nearby Elysian Park and the Verdugo Hills, open space elements that can be rare in an urban landscape. **Any changes that substantially degrade the visual experience for park visitors and others viewing the Park from adjacent property have the potential to cause significant impacts.**

(Ibid., pdf p. 121 (discussing the purpose of Mitigation Measure Aes-1) (emphasis added).)

Footnote 53: The Los Angeles State Historic Park General Plan and Final EIR was approved/certified by the State Park and Recreation Commission on June 10, 2005. (LASHP General Plan, pdf p. 125.)

Response GO14-122 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations and the Los Angeles State Historic Park General Plan and Final EIR. Refer to Responses GO14-117 and GO14-119 for a discussion of the Draft EIR’s aesthetic analysis. Refer to Response S2-5 discussing how the proposed Project would not adversely impact or interfere with key viewpoints or the visual character of the Park. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Mitigation Measure Aes-1.

Comment GO14-123 The certified Environmental Impact Report for LA State Historic Park protects these important visual resources by restricting the type, location, screening, and materials of structures permitted in the park:

Mitigation Measure Aes-1. Visual impacts can be avoided or reduced by appropriate siting, design, and selection of materials. Specific project designs will define aesthetically appropriate design features, identify visual resources, and identify optimum methods for protecting existing resources. Potential aesthetic quality impacts associated with the development of new facilities shall be reviewed at the project-level for specific facilities or management plans proposed. Mitigation measures include, but are not limited to:

- Implement design practices that reduce the overall negative aesthetic effect of new facilities, including, but not limited to:
 - Include vegetation to screen negative views, or soften the visual effect of parking areas, visitor facilities, roads, trails, or transit corridors, where appropriate;
 - Incorporate architectural site/design elements that support and are consistent with the plan vision;
 - Where night lighting is necessary, direct the lighting downward and locate new exterior lighting such that it is not highly obtrusive;
 - Evaluate the location of structures and activity areas to enhance positive views within and outside of the Park site;
 - Design and site new roads and trails to minimize grading and the visibility of cut banks and fill slopes; utilities should be placed underground where feasible;
 - Schedule construction and maintenance activities to decrease any negative impacts to visitors and adjacent property owners.

(LASHP General Plan, pdf pp. 121-122.)

Response GO14-123 This comment provides a general recitation and characterization of the Los Angeles State Historic Park General Plan and Final EIR. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Mitigation Measure Aes-1.

Comment GO14-124 Moreover, the LA State Historic Park General Plan and Final EIR created the above mitigation for application to Park structures permitted by its General Plan: “Potential installation of facilities allowed by the Plan may constitute a potentially significant aesthetic change...” (Ibid., pdf. p. 115 (emphasis added).) The General Plan and Final EIR do not contemplate mitigations for structures that are not permitted by the Park’s General Plan. “[P]otential facilities” evaluated in the General Plan and Final EIR do not provide for non-Park facilities (see *ibid.*, pdf pp. 132-133) which are not permitted in a historical unit of the state park system. (Pub. Res. Code, § 5019.59.) There is no appropriate siting or screening possible for an intruding nonpark, commercial structure in LA State Historic Park. The DEIR lists

the Park’s General Plan goals and guidelines (DEIR, pp. 3.1-2 to 3.1-3.) as if they can be applied to any structure, including non-park structures, but the General Plan goals and guidelines are intended only for permissible structures. Other structures are simply not permitted.

Response GO14-124 This comment provides a general recitation and characterization of the Los Angeles State Historic Park General Plan and Final EIR. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project’s Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment and a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project’s use of Los Angeles State Historic Park.

Comment GO14-125 As discussed above, the State Parks Commission, in approving the General Plan and certifying its Environmental Impact Report, also protected views of the Park. The DEIR’s use of City of Los Angeles CEQA Thresholds to disregard the Park’s Mitigation Measure Aes-1, which protects views of the Park from both public and private locations, thus improperly modifies an adopted mitigation measure. (See DEIR, p. 3.1-47 (analysis of LU-4 including LA State historic Park): “the operation of the proposed Project within LU-4, would not substantially degrade the existing visual character or quality of public views of the site and its surroundings, and the impact would be less than significant.”; see also DEIR, p. 3.1-47: “[V]isual impacts under the L.A. CEQA Thresholds Guide are assessed based on changes to public views.”)

This is improper. A lead agency may not cancel or modify a previously adopted mitigation measure without reviewing its continued need, explaining the change, and supporting its determination with substantial evidence. (See *Katseff v. Dept. of*

Forestry & Fire Protection (2010) 181 Cal.App. 4th 601, 614.) The appropriate lead agency to modify mitigation Aes-1 is the Department of Recreation and Parks, not Metro. But the Project EIR must explain why Aes-1 is no longer needed and appropriate to change, and support this determination with substantial evidence. Here Metro has not acknowledged the existence of the mitigation measure, let alone explained why it is no longer needed or supported its conclusion with substantial evidence.⁵⁴

Footnote 54: The DEIR notes the existence of the Park's Final EIR (see DEIR, p. 3.1-1, fn. 1), but does not mention, discuss, or analyze modifications to mitigation measures that would be necessary due to the Project. With respect to CEQA's ability to protect private views, see *Ocean View Estates Homeowners Assn., Inc. v. Montecito Water Dist.* (2004) 116 Cal.App.4th 396, 402-403

Response GO14-125 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Section 3.01, Aesthetics, with supporting information in Appendix C, Visual Impact Assessment, of the Draft EIR, for analysis of the proposed Project's potential aesthetics impacts, which would be less than significant. The comment's referenced mitigation measure (Aes-1) requires State Parks to review potential aesthetic quality impacts associated with new facilities and implement design practices that reduce those facilities' overall negative aesthetic effect. The use of a City of Los Angeles CEQA Threshold does not "disregard" or "modify" this mitigation measure, which applies to State Parks' actions and does not apply to the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Mitigation Measure Aes-1.

Comment GO14-126 The DEIR's description of gondola movement with respect to protected views of the Los Angeles skyline also minimizes the Project's aesthetic impacts. "The cabins would be constantly moving in and out of view, and the cables have similar characteristics to the overhead powerlines that are prevalent in views in this area." (DEIR, pp. 3.1-45 to 3.1-46 (emphasis added).) First, no powerlines are located directly over the top of LA State Historic Park, and gondola cables are larger than powerlines. (DEIR, p. 3.4-19). If gondola cables are both physically closer and also larger, it is logical that they will have a much greater visual impact than distant, smaller powerlines. Second, and more obviously, if gondola cabins are "constantly moving in and out of view" they will have a greater distracting visual impact, especially in the evening and at night when they are lit or display signage (particularly potential electronic digital display signage). The DEIR fails to evaluate and minimizes the visual impacts of gondola cables and cabins.

Response GO14-126 Refer to Response GO14-117 for discussion of the how the Draft EIR assessed potential visual impacts to scenic vistas in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, and the proposed Project would not

block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Section 3.01 for discussion of how the location of the proposed cables and cabins would be adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The cabins would be constantly moving in and out of view, and the cables have similar characteristics to the overhead power lines that are prevalent in views in this area. As such, the proposed cables and cabins would not significantly impact views in this area.

Refer to Topical Response M, Comparable Urban Aerial Transit Systems for a discussion of how other urban aerial transit systems have been successfully incorporated into their surroundings, including public open space and public parks. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, for additional visual simulations of the proposed Project, including simulations provided for additional clarity regarding certain design elements of the proposed Project, in response to comments received on the Draft EIR during the public review period. Refer to Appendix H.1, Memorandum Regarding Preparation of Key Observation Points, of this Final EIR, for a discussion of how the view simulations were prepared, noting that while the ropes would be 1.75 to 2.5 inches in diameter, this size is too small to be visually detectable in many of the view simulation renderings, and accordingly the ropes were modeled with a 6-inch diameter so that they would be visible. Refer to Topical Response K, Signage and Lighting, for discussion of how no digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition to the naming rights signage, the proposed Project is proposing that two cabins be designated for the display of community programming graphics and that one cabin be designated for the display of artwork by local arts collaborators. Signage would be designed to complement the proposed Project design and use and would be consistent with the existing urban condition, as illustrated in Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, which includes KOPs updated in part to incorporate the proposed Project's signage program, as depicted in the signage package included in the Lighting Study.

Comment GO14-127 The DEIR concludes not only that the Project would not have significant aesthetic impacts, but also that it would provide significant visual benefits to LA State Historic Park. (DEIR, p. 3.1-46.) This is absurd. Compare, for example, the before and after images shown in Figure 5-17 of the existing entrance at the Park's southwest corner (DEIR, Appx. C, pdf p. 125):

The proposed siting of the Project's Chinatown/State Park Station within LA State Historic Park at the Park's southwest corner (where many visitors first experience views of the park as they arrive) belies the notion that "visual changes of the proposed Project are minimized somewhat" by its southwest corner location.

Response GO14-127 This comment provides a general recitation and characterization of the Draft EIR. Refer to Response GO14-117 for discussion of the how the Draft EIR assessed potential visual impacts to scenic vistas in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, and the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. The Draft EIR discusses how the proposed Project would provide a visual benefit being near the Park by providing park amenities, a mobility hub, pedestrian improvements, and installation of hardscaping and landscaping near the southern entrance to the park, which currently just includes hardscaping. Further, the Draft EIR discusses how visual quality and character is minimized for LU-4 because the visual changes of the proposed Project are minimized somewhat by the location of the Chinatown/State Park Station, which is south of the majority of the approximately 32-acre park space. For a project in an urban area, a significant impact to visual character or quality would occur if the project would conflict with applicable zoning and other regulations governing scenic quality. The proposed Project within LU-4 would be consistent with Los Angeles State Historic Park General Plan aesthetic resources goals to protect and enhance scenic viewsheds and features, and preserve the visitor's experience of the surrounding landscape by minimizing impacts to aesthetic resources because of the siting of the Chinatown/State Park Station within the southernmost portion of the park away from the open passive park areas. Through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro's L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. Additionally, refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are

integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Comment GO14-128 As the DEIR documents, the massive Chinatown Station (DEIR, p. ES-8: “200 feet long, 80 feet wide, and 98 feet tall at its tallest point”) can be easily seen from adjacent views, which the Park’s Final EIR protects. (See, e.g., Figure 5-23, DEIR, Appx. C, pdf p. 132 (depicting a simulated view from the “North Broadway historic bridge” approximately 3,400 feet distant.) Protected views of the Park may also be visible from Elysian Park and other distant elevated locations, but the DEIR provides no simulated views. At ninety-eight feet tall, it is a certainty that Chinatown/State Park Station cannot be screened with vegetation to minimize its impact.⁵⁵

Nor does the DEIR suggest screening is needed. (But see LASHP General Plan and Final EIR, mitigation measure Aes-1, describing a general need for screening of structures within the Park.)

Close up – Chinatown/State Park Station (DEIR Appendix C Figure 5-23)

Footnote 55: LA Parks Alliance notes that Design Option C, which would be 35 feet taller than the preferred Project, would have an obviously greater impact on protected views of and from LA State Historic Park.

Response GO14-128 This comment provides a general recitation and characterization of the Draft EIR. Refer to Response GO14-117 for discussion of the how the Draft EIR assessed potential visual impacts to scenic vistas in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, and the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant.

Refer to Response GO14-127 for discussion of the aesthetic impacts of the proposed Project to the Los Angeles State Park, which would be less than significant, including to scenic vistas. The Draft EIR recognized the potential visual impact that could occur as a result of the addition of Chinatown/State Park Station, noting that its 98-foot height could alter changes to views as compared to the existing landscape. However, the analysis conducted for LU-4 explained that the design of Chinatown/State Park Station would include architectural styles, colors, and materials that are comparable and similar to the aesthetic make-up of the surrounding urban environment. The design also includes the addition Park amenities including approximately 740 square feet of concessions, 770 square feet of restrooms, and a 220 square foot covered breezeway connecting the concessions and restrooms. Pedestrian access enhancements included in the proposed Project would include pedestrian improvements between Metro's L Line (Gold) Station and the Chinatown/State Park Station, including hardscape and landscape improvements, shade structures, and potential seating. The Chinatown/State Park Station would also include the installation of landscaping and hardscaping at the southern entrance to the park along Spring Street which currently just includes hardscaping. Overall, the design would ensure the addition of Chinatown/State Park Station would not substantially degrade the existing visual quality or public views of the site and its surroundings, and the impact would be less than significant. As detailed in Section 3.01 and Appendix C, the LUs along the proposed Project alignment encompassed the location of the proposed Project alignment and the adjacent area. The existing visual character and quality, as well as the primary viewers, were determined for each LU. Locations of sensitive viewers are identified on Figures 4-2 through 4-4 of Appendix C. As noted in Appendix C, not all sensitive viewers would have views of the proposed Project or be visually impacted by the Project. KOPs within each LU were selected based on existing knowledge of important viewsheds and through consultation with responsible agencies. Recreationalists in Elysian Park are not identified as sensitive viewers of the proposed Project. Moreover, as discussed in Section 3.01, there are no designated scenic vistas present in the API. However, the Project area provides views that are considered scenic to certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. To the extent a recreationalist in Elysian Park could experience minor changes in views based on the Chinatown/State Park Station, this would be only minimally notable because of the distance aspect of that view and intervening development and the presence of vegetation. As discussed in Section 3.01, Aesthetics, of the Draft EIR, views from recreationalists within Elysian Park may experience minor changes to views of Dodger Stadium but this would be only minimally noticeable because of the distance aspect of that view and the presence of vegetation.

Refer to Topical Response M, Comparable Urban Aerial Transit Systems for a discussion of how other urban aerial transit systems have been successfully incorporated into their surroundings, including public open space and public parks.

Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Mitigation Measure Aes-1.

Refer to Section 6.0, Design and Use Options, of the Draft EIR, for discussion of Design Option C, Chinatown/State Park Station with Increased Height, which would include a 35 foot increase of the Chinatown/State Park Station for a 133 foot-tall station, included in the Draft EIR in response to stakeholder feedback who asked the Project Sponsor to consider a taller Chinatown/State Park Station to increase the height of cabins entering and exiting the station along Spring Street. Refer to Figures 6-16 through 6-18 for simulations of Design Option C compared to the proposed Project, and accompanying discussion of the aesthetic impacts of this design option, which would be less than significant.

Comment GO14-129 The discussion above does not include consideration that to install the massive Chinatown/State Park Station removal of a substantial number of trees will be necessary. The DEIR describes that the Park includes “mature trees” (DEIR, p. 3.1-24), but the only significant discussion of trees in the aesthetic impact analysis of LA State Historic Park describes how “existing views of downtown from other areas within the park are already interrupted under existing conditions by trees...,” ignoring that the trees in the Park are themselves an aesthetic resource, and entirely neglecting that 24 trees on the State Historic Park property and six street trees adjacent to the Park would be removed to allow construction of the Chinatown/State Park Station, and an additional 51 trees would be removed to accommodate the gondola alignment over the Park. (DEIR, p. 3.4-23.)

The aesthetic analysis does not consider the function of trees within the Park landscape that would be removed. For example, are they part of the Park General Plan and Final EIR mitigation that screens and softens the visual impact of adjacent urban areas using vegetation? The aesthetic analysis, in fact, entirely ignores the removal of these 81 trees. They are in the way of the Project component and alignment, so they will be removed without respect to their age, purpose, or aesthetic or habitat value. No trees can be planted in their place within the gondola alignment—they would interfere with the Project.

In a letter to the editor recently published in the Los Angeles Times, Kathleen Johnson, executive director of Los Angeles River State Parks Partners, a “cooperating association” for LA State Historic Park, justifiably refers to the gondola Project’s removal of trees and taking of parkland as an “environmental injustice.”⁵⁶ LA Parks Alliance agrees.

Footnote 56: Kathleen Johnson, Damaging a hard-won park (LA Times letter to the editor), published Jan. 11, 2023, attached as Exhibit R. (More information on LA

River State Parks Partners, including its “cooperating association” status with state parks, is available at its website: <https://www.larsppartners.org>.)

Response GO14-129 This comment provides a general recitation and characterization of the Draft EIR. Refer to Response GO14-117 for discussion of the how the Draft EIR assessed potential visual impacts to scenic vistas in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR. The Draft EIR addressed aesthetic impacts in Section 3.01, Aesthetics, with supporting data provided in Appendix C, Visual Impact Assessment of the Draft EIR, and determined that impacts would be less than significant. The Draft EIR and Visual Impact Assessment both specifically addressed and disclosed potential impacts on changes in the visual environment and existing viewsheds into and from within the Los Angeles State Historic Park. Section 3.01 includes detail regarding existing trees as part of the Local Setting and discusses tree removal and replacement. The Draft EIR includes thirty Key Observation Points (KOPs), including nine that simulate views of or from Los Angeles State Historic Park. In addition, refer to Appendix H.1, Memo Regarding Preparation of View Simulations, of the Final EIR, for a discussion of how the KOPs analyzed in the Draft EIR include the removal of landscape planting elements, including trees. Additionally, refer to Appendix H.2, Supplemental KOPs in Response to Comments, which includes additional KOPs 31 through 35 that provide additional visual simulations of Los Angeles State Historic park, including views from a cabin over the park, views of the Chinatown/State Park Station, and proposed amenities for the Park. Moreover, as discussed on page 20 of the Tree Report, which is included in Appendix E, Biological Resources Assessment, of the Draft EIR, and in Appendix K.1, Updated Tree Report, of the Final EIR, the trees within the Los Angeles State Historic Park were installed in 2016 during construction of the Park as part of a tree planting program and are not naturally occurring. Further, as described in BIO-PDF-F, the proposed Project would comply with applicable tree replacement requirements, based on the jurisdiction of the property where each tree is located, which require tree replacement at least at a 1:1 ratio.

Section 3.11, Land Use and Planning, of the Draft EIR also analyzed the proposed Project’s consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics (see pages 3.11-39 to 3.11-41). As detailed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, consistent with the General Plan’s Aesthetic Goal, the proposed Project would protect and enhance scenic viewsheds and features and preserve the visitor’s experience of the surrounding landscape by minimizing impacts to aesthetic resources. The proposed Project’s design would incorporate appropriate urban design elements at the neighborhood level, preserve natural viewsheds of hillside areas, as well as protect additional open space and aesthetics resources consistent with policies from the Los Angeles State Historic Park General Plan.

The proposed Project's design and building materials would complement the architectural themes of the neighborhood and would complement the visual character of the existing buildings in the area. The Chinatown/State Parks Station's location would not block any designated scenic vistas, alter scenic resources, or block panoramic views. Additionally, potential impacts to visual quality and character are minimized by the location of the Chinatown/State Park Station, which is in the southernmost portion of the park, away from the open passive park areas.

The proposed Project components would consist of a modern architectural design, which would complement the existing modern style buildings in this area. In addition, the neutral light-tone gray of the proposed Project components would be consistent with modern structures in the surrounding urban environment. The new amenity building intended for use by proposed Project riders and park visitors alike are designed to reflect the scale and materiality of the existing visitor amenity buildings located within the Los Angeles State Historic Park.

Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for a discussion of how other urban aerial transit systems have been successfully incorporated into their surroundings, including public open space and public parks.

Further, consistent with Los Angeles State Historic Park General Plan Aesthetic Guideline 1, the Project Sponsor has taken steps to further minimize the effects of the proposed Project on the park's visual resources and high-value open space. This has included collaboration with State Parks resulting in selecting a primary alignment along the western edge of Los Angeles State Historic Park, rather than through the middle of the park, in order to reduce visual and other Park impacts. Additionally, the Project Sponsor worked with State Parks to determine the new location of the Chinatown/State Park Station to improve pedestrian flow into the park and what other improvements would further enhance the experience of visitors (e.g., increased landscaping and hardscaping, new restrooms and concession areas, etc.). This resulted in moving the station to the southernmost edge of the park.

As discussed in more detail in Topical Response F, Los Angeles State Historic Park, in response to Los Angeles State Historic Park stakeholders' comments on the proposed Project's Notice of Preparation and discussions with State Parks, numerous design considerations have been incorporated into the proposed Project to minimize the aesthetic effect of the proposed Project on Los Angeles State Historic Park, including reducing the size and scale of the station, integrating the existing historic granite pavers, and carefully considering the optimal location for the station.

The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page

3.04-23, in Section 3.04, Biological Resources, of the Draft EIR, and in Appendix K.1, Updated Tree Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio. As discussed in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of certain trees for the proposed Project would result in a small reduction of habitat for wildlife species that depend on trees for cover, nesting, roosting, foraging, and other reasons. In the short-term, the removal of trees would result in a marginal reduction of suitable tree habitat for nesting birds, roosting bats, and other wildlife in the vicinity of the proposed Project. Common wildlife species would be expected to utilize adjacent habitats, and substantial population level impacts to common species would not be expected due to the small amount of habitat loss relatively to the amount of habitat available in surrounding areas.

This response takes into account the content of Exhibit R, referenced in this comment. Refer to Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, for discussion of the footprint of the proposed Project in the Los Angeles State Historic Park. With the small footprint of the proposed Project's Chinatown/State Park Station, and the required clearances and the height at which the cabins would cross over the Park, the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. Refer to Topical Response N, Environmental Justice, for discussion of how the proposed Project is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, providing connections to Metro's growing regional public transit system.

Comment GO14-130 3. The DEIR's analysis of Project lighting impacts is incomplete.

The DEIR includes a Lighting Study. (DEIR, Appx. C). The study is incomplete for failure to consider the totality of the Project's proposed signage program, which "may include identification and other static signs, electronic digital displays and/or changeable message light-emitting diode (LED) boards that include both transit information and other content, which may include off-site advertising... Signage would be architecturally integrated into the design of the ART system including its stations, the junction, towers, and cabins." (DEIR, p. 2-45.) The Lighting Study

neither discusses this nor provides additional information regarding the signage program.

Response GO14-130 Refer to Topical Response K, Signage and Lighting, for discussion of the proposed Project’s signage and lighting, with additional technical detail and information provided in the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR. No digital signage is proposed on the exterior of the cabins. Signage would be designed to complement the proposed Project design and use and would be consistent with the existing urban condition, as illustrated in Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, which includes KOPs updated in part to incorporate the proposed Project’s signage program, as depicted in the signage package included in the Lighting Study.

Comment GO14-131 The DEIR fails to consider the specific impacts of lighting and glare on views from and of LA State Historic Park protected aesthetic resources. As the Park’s General Plan Final EIR states: “Inappropriate lighting throughout the Park may create visual impacts. Obstructing an existing viewshed (such as the Los Angeles downtown skyline) may be considered an adverse impact.”

Thus, lighting or glare created or made worse by any Project component, including its gondola cabins, which the signage program acknowledges may include electronic digital displays integrated into the design of stations, towers, and cabins, must be considered in the DEIR. But the DEIR relies only on the City of Los Angeles municipal code, which is subject to change, to protect LA State Historic Park, even though the Park is also (and better) protected by the Park’s General Plan and Final EIR, which requires minimizing or eliminating inappropriate lighting. As Project cabins traverse the airspace of the Park lighting from within the gondola cabins, lighting from digital displays, lighting of traditional advertising, reflection of light from other sources, even unlit cabins traveling across the nighttime backlit skyline, could constitute potentially significant environmental effects of the Project. The DEIR studies none of them.

The DEIR’s lighting analysis is incomplete and therefore inadequate. The Final EIR must include a mitigation to ensure gondolas are not vehicles for electronic digital display advertising that would cause a significant light/glare impact at LA State Historic Park. (Additional criticism of the DEIR’s inadequate lighting analysis is found in Exhibit S (LPP letter), supra p. 64 fn. 59, pp. 6-7. LA Parks Alliance adopts these concerns as if fully set forth herein.)

Response GO14-131 Refer to Section 3.01, Aesthetics, and the Lighting Study included in Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the impacts to light and glare of the proposed Project, which would be less than significant. Refer to Response P708 for responses to the comments raised in Exhibit S, referenced in this comment. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for discussion of the proposed Project’s consistency with applicable Los Angeles State

Historic Park General Plan policies, including aesthetic goals to protect existing viewsheds. The Draft EIR addressed aesthetic impacts in Section 3.1 Aesthetics, with supporting data provided in Appendix C, Visual Impact Assessment, of the Draft EIR. Project lighting would include low-level lighting for security and wayfinding purposes. Exterior lighting would be shielded or directed toward the areas to be lit to limit spillover onto adjacent properties and off-site uses, and would meet all applicable Los Angeles Municipal Code lighting standards. Refer to Topical Response K, Signage and Lighting, for discussion of how there is existing signage in the Project area, and the proposed Project signage would not substantially degrade the existing visual character or quality of public views. Instead, the proposed Project's design ensures that signage would enhance the public realm. Specifically, signage for the proposed Project would be architecturally integrated into the design of the ART system, including its stations, the junction, towers, and cabins, and would be designed consistent with applicable Metro, City, and State approval requirements. No digital signage is proposed on the exterior of the cabins.

Comment GO14-132 4. The Shading Impact analysis discloses a significant but unmitigated impact at LA State Historic Park.

The DEIR describes that the LA CEQA Thresholds Guide considers shading impacts of more than three hours between the hours of 9:00 am and 3:00 pm Pacific Standard Time between late October and early April, or for more than four hours between the hours of 9:00 am and 5:00 pm Pacific Daylight Time between early April and late October, to be a significant impact. (DEIR, Appx. C, pdf p. 94.) It goes on to describe shading impacts of shade-sensitive uses during winter months at LA State Historic Park as being significant under the DEIR's threshold:

Fall shadow diagrams for the proposed Chinatown/State Park Station are depicted on Figure 72 through Figure 76 of Appendix B. A small segment of the western walkway in and near the southern entrance of Los Angeles State Historic Park would be shaded for four hours from 9:00 a.m. to 1:00 p.m. A small segment of walkways in the eastern side of the park would be shaded for four hours from 12:00 p.m. to 4:00 p.m. ...⁵⁷

[T]he proposed Chinatown/State Park Station would result in the shading of shade-sensitive uses for more than three hours between the hours of 9:00 a.m. and 4:00 p.m. Pacific Standard Time (between late October and early April) in the Winter. Small portions of the eastern and western walkways and park green space near the southern entrance of the park would be shaded by the proposed Chinatown/State Park Station in the Winter."

(Ibid., pdf p. 98.)

Despite fitting within the DEIR's chosen threshold to find a significant shading impact, the DEIR nonetheless concludes that the shadow impacts due to construction of Chinatown/State Park Station would be less than significant even

though it provides no mitigation measures to lessen the significant impact. (Ibid., pdf pp. 98-99.) The aesthetic analysis is therefore inadequate for identifying a significant impact under the threshold but determining it not to be significant, as well as for failing to propose a mitigation measure to reduce or eliminate the adverse impact.

Footnote 57: LA Parks Alliance notes that the main DEIR document neglects to mention the four-hour shading impact between 9:00 am to 1:00 pm detailed in Appendix C. (DEIR, p. 3.1-55.)

Response GO14-132 This comment provides a general recitation and characterization of the Draft EIR. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Shading is not a required analysis area under Appendix G of the CEQA Guidelines; however, a shadow analysis was conducted as part of the Visual Impact Assessment per recommendations in the L.A. CEQA Thresholds Guide, which provides that a determination of significance shall be made on a case-by-case basis, considering the factors provided in Section 3.2.2, L.A. CEQA Thresholds Guide, of the Draft EIR, including shading. As described in Section 3.01, the proposed Chinatown/State Park Station would result in the shading of shade-sensitive uses for more than three hours between the hours of 9:00 a.m. and 4:00 p.m. Pacific Standard Time (between late October and early April) in the Winter. Small portions of the eastern and western walkways and park green space near the southern entrance of the park would be shaded by the proposed Chinatown/State Park Station in the Winter. These park-related areas would be directly adjacent to the proposed station and are also considered to be a part of the proposed Project site. The Los Angeles State Historic Park is an urban park in a highly developed area and includes a total of approximately 32 acres of passive recreation including expansive additional areas of walkways and open green space for patrons to use. The relatively small areas of park walkways and green spaces that would receive shading from the proposed station are considered to be elements of the southern entrance to the park, but not routinely useable outdoor spaces. In addition, the outdoor seating area associated with the Cargo Snack Shack, which would receive shading for only two hours, currently includes an overhead shade canopy, so the proposed Project would not shade an uncovered outdoor seating area. As such, these impacts are not considered to be significant for these reasons. Also, the proposed Chinatown/State Park Station would not result in the shading of shade-sensitive uses for more than four hours between the hours of 9:00 a.m. and 5:00 p.m. Pacific Daylight Time (between early April and late October). As such, shadow impacts from the Chinatown/State Park Station would be less than significant. Because there is no significant environmental impact from shading, no mitigation is required.

Comment GO14-133 E. The DEIR’s analysis of the Project’s potentially significant impacts to biological resources is incomplete and inadequate.

The DEIR provides the essential background on the regulatory setting for protection of biological resources (DEIR, pp. 3.4-1 to 3.4-4) but nonetheless fails to perform an adequate analysis of potentially significant impacts in the Project area.

The DEIR’s wildlife survey concludes that only a limited number of bird species are found in the biological survey area, including ten common species and three non-native species. (DEIR, pp. 3.4-10 to 3.4-11.) But the DEIR limited the survey area to only “the proposed aerial alignment, stations, junctions, towers, cabins, and cables, and a 500-foot survey buffer around the alignment.” (DEIR, p. 3.4-13.) Because the Project will cause direct physical changes and also foreseeable indirect physical changes in the environment beyond the 500-foot survey buffer area, in particular in Los Angeles State Historic Park, this survey area was too small to capture the full extent of potentially significant biological resource impacts.⁵⁸

The DEIR describes two field surveys having been performed. The first survey was conducted April 1, 2020, “to document and photograph existing biological resources” and included a survey of “tall structures such as mature trees, power poles and towers, billboards, and buildings” searching for the “presence of nests.” (DEIR, p. 3.4-14.) A second “follow-up” survey was conducted on April 24, 2021, an entire year later, “to verify and record tree species occurring in the Project component footprints,” though apparently not to survey for the presence of additional wildlife species that may not have been present during the 2020 survey. (Ibid.)

The DEIR notes: “Raptor species such as red-tailed hawk, Cooper’s hawk, great horned owl, American crow, and common raven are known to use tall structures as nesting sites in urban environments.” It continues: “Red-tailed hawk were observed flying in the vicinity of Dodger Stadium during the 2021 survey.” (Ibid., p. 3.4-11 (latin species names omitted.)) The DEIR found no raptor nests but noted “[i]ndications of songbird nesting activities were detected during the 2021 survey in the Los Angeles State Historic Park.” The DEIR also stated that while “[n]o active nests were detected,” “ornamental landscaping, including mature trees throughout the [biological survey area], provide potentially suitable nesting habitat for songbirds and raptors.” (Id.) The DEIR’s summary is consistent with the full biological resource assessment found in DEIR, Appendix E. (See DEIR, Appx. E, pdf p. 44.)

A comment letter from Land Protection Partners explains why the biological survey area used by the DEIR is inadequate.⁵⁹ LA Parks Alliance adopts the Land Protection Partners letter as its own position, and requests that Metro respond to the entire letter as if fully set forth herein.

The biological survey area should have extended “up to 200 feet upward from the alignment” and included sufficient range to include birds within a reasonable distance of the alignment, since typical songbirds fly at a rate of 30 miles per hour (meaning they would cross the entire study area in “less than 23 seconds”). (LPP letter, p. 2.) It should also have not been completed in a single daytime session. The LPP letter explains that “a single daytime survey in April cannot describe the volume and diversity of migratory birds that traverse the project location at night...during spring and fall migrations,” and such a limited survey is inadequate and cannot be considered substantial evidence to support the DEIR’s conclusions. (Ibid.)

Footnote 58: See Figure 4, DEIR, Appx. E, pdf p. 26, showing the area of the biological survey area, leaving out more than half of Los Angeles State Historic Park from the survey area.

Footnote 59: Travis Longcore, Ph.D & Catherine Rich, J.D., M.A., letter to Cory Zelmer re LA Aerial Rapid Transit Project (“LPP letter”), Jan. 16, 2023, attached as Exhibit S.

Response GO14-133 Refer to Response P708 for responses to the comments raised in Exhibit S, referenced in this comment. Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of this Final EIR for discussion of impacts from the proposed Project to biological resources. As stated on pages 3.4-12 and 3.4-13 of Section 3.04 Biological Resources, of the Draft EIR, 39 special-status wildlife species were identified by the CNDDDB database to have historically been recorded from the Los Angeles and surrounding eight quadrangles. Nine of those species were historically recorded within the biological study area (BSA) for the project. However, of the nine species with observations from within the BSA, the most recent are for bat species from 25 to 30 years ago. All other observations are 50 years old or older. Based on this publicly available data, the Draft EIR found that impacts to special status species would be less than significant with incorporation of mitigation measures BIO-A and BIO-B to reduce potential impacts to bats and nesting birds especially since the habitat in the area has been drastically modified so as not to be useful to special status species since the species were recorded.

As stated on page 3.4-13, the 500-foot buffer was determined to be suitable for biological surveys as it is anticipated that indirect impacts beyond 500 feet in the existing environment would be diffuse and insignificant. As stated on page 3.4-14, a field survey was conducted on April 1, 2020, with a follow-up survey focused on tree species occurring on April 24, 2021. As discussed in Section 3.04, Biological Resources, of the Draft EIR, during the April 1, 2020, field survey, tall structures such as mature trees, power poles and towers, billboards, and buildings were scrutinized for the presence of nests and scans for wildlife activity, and potential bird nest sites were conducted using binoculars.

Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR, and Appendix G, Supplemental Biological Resources Report, of the Final EIR, for further discussion of the survey efforts in the BSA and the appropriate size of the BSA. As discussed in Appendix G, although the Draft EIR lists the species detected during the surveys, and states that these are common species, it does not conclude that the observed species are the only ones assumed to use the BSA, nor that sensitive species never occur in the BSA. Although additional surveys could increase the number of species detected, even exhaustive surveys may not result in detections of sensitive species that occur on site only occasionally. Nonetheless, a third field survey was performed March 23, 2023, to provide an updated habitat assessment for sensitive species and supplementary wildlife survey effort. During this visit, two biologists surveyed the BSA over a 4.5-hour period (11:00 AM to 3:30 PM) and observed 17 bird species and 2 mammal species. The BSA encompasses a 500-foot buffer around the proposed Project alignment. Habitats and wildlife occurring outside of this 500-foot buffer were considered to be a sufficient distance away to not be affected by construction or operation of the proposed Project.

Comment GO14-134 1. The DEIR’s analysis of potentially significant biological impacts due to bird collisions is inadequate and not supported by substantial evidence.

The DEIR minimizes the risk of operational impacts in the form of bird collisions with the proposed stations, junctions, towers, cabins, and ropeway cables, finding that “[s]ignificant impacts typically occur when towers or wires are constructed in migratory corridors and obstruct the flight paths of migrant birds.” (DEIR, p. 3.4-18.) The DEIR asserts that because the proposed Project is “not in or near a known avian migratory corridor and lacks habitat and topographic features that would promote concentrated avian migratory activity” impacts to migratory birds would be less than significant. (DEIR, pp. 3.4-18 to 3.4-19.)

The DEIR explains that collisions with resident or migrant birds using habitat areas found in the biological resource area would be able to detect and avoid collisions with larger physical components of the Project (e.g., stations, towers, and cabins). (DEIR, p. 3.4-19.) The DEIR asserts that bird strikes with gondola cable systems would be unlikely, because compared to power transmission lines, gondola cables are much larger (“1.75 to 2.5 inches in diameter” compared to only “1 to 2 inches in diameter” for transmission lines, and only “0.4 to 0.5 inches in diameter” for shield wires). (Id.)

There are two problems with this analysis. First, it appears to be unsupported by substantial evidence. Appendix E of the DEIR does cite a paper by Bernardino, et al., explaining that “[p]owerline-specific factors” such as wire diameter and the number of vertical wire levels are factors that “may provide insights about the potential for birds to collide with ropeway cables.” (DEIR, Appx. E, pdf p. 52 (emphasis added).)⁶⁰ That such factors may be relevant does not justify evading an

actual analysis of the potentially significant environmental impact of deadly bird collisions. In fact, the cited paper notes “there is comparatively little scientific evidence for power line-specific factors, namely what is the impact of the number of vertical levels, or wire height and diameter.” (Bernardino, *supra* fn. 59 (emphasis added).) This is precisely the opposite of the meaning imputed to the paper by the DEIR.

“[T]here is evidence that power line collision mortality can even lead to changes in migratory patterns and flyways.” (Bernardino, citing Palacín et al., 2017). This may explain, in part, the DEIR comment that the Project area is not on a known migratory route. The cited paper also notes “collision as the most widespread interaction” between birds and infrastructure such as the Project. The Bernardino paper explains that “virtually any aerial wire can pose an obstacle to flying birds.” (Ibid. (emphasis added).)⁶¹

Footnote 60: Citing J. Bernardino, et al., Bird collisions with power lines: State of the art and priority areas for research (hereafter “Bernardino”), *Biological Conservation*, 222: 1-13 (2018), available at: <https://www.sciencedirect.com/science/article/abs/pii/S0006320717317925>.

Footnote 61: The DEIR’s “state of the art” article (section 3.4, footnote 17) dates to 2012. The 2018 Bernardino article’s purpose is to update the state of the art on bird collisions with power lines based on much newer studies and to “identify major knowledge gaps that should be the subject of subsequent research.” (Id.)

Response GO14-134 Refer to Section 3.04 Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR. As stated on page 3.4-14, a field survey was conducted on April 1, 2020, with a follow up survey focused on tree species occurring on April 24, 2021. During the April 1, 2020, field survey, tall structures such as mature trees, power poles and towers, billboards, and buildings were scrutinized for the presence of nests and scans for wildlife activity and potential bird nest sites were conducted using binoculars. Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR, and Appendix G, Supplemental Biological Resources Report, of the Final EIR, for discussion of additional survey efforts and how the risk of avian collisions with the cables or components of the proposed Project is less than significant. Design features of the proposed Project are likely to present a lower risk of avian collisions in comparison to transmission lines. First, the proposed Project’s ropeway cables would not include a shield wire, unlike transmission lines, which would be expected to reduce collision risk. As discussed in Appendix G, shield wires are placed on transmission lines to protect the lines from lightning strikes, but in effect add an additional plane that can contribute to bird strikes. Second, the tight clustering of the three ropeway cables, in conjunction with the fact that the cables would be thicker than transmission lines, would make them more visible to birds in comparison to transmission lines. Third, the proposed Project would include devices that support

and maintain proper separation between the cables of 3S systems known as slack carriers, which would increase the visibility of the cables to birds. Fourth, the proposed Project would implement BIO-PDF-C. The cabin windows would be designed to be non-transparent (tinted) and/or partially covered with a vinyl window film to be made visible to birds in flight. Reflective surfaces would be reduced as much as possible with opaque or translucent surfaces. Fifth, the gondola cabins travel along the cables at frequent intervals during the periods of operation, further increasing the visibility of the cables along which they are moving. Finally, the proposed Project would implement BIO-PDF-B. The Project Sponsor would develop an Avian Collision Mitigation, Monitoring, and Adaptive Management Plan to address the potential for bird collisions. The Plan would include monitoring, training, adaptive management, and reporting requirements related to avian and bat injuries or mortalities. All of these aspects would make the gondola cables less likely to result in avian collisions, compared to transmission lines.

Birds and bats flying in the vicinity of the proposed Project are already exposed to obstacles that present the potential for collision at heights similar to or greater than the highest-reaching proposed Project components. Such objects include buildings in downtown Los Angeles, transmission lines, the radio tower located on Radio Hill, and the eight sets of stadium lights atop Dodger Stadium. In addition, the proposed Project towers and cables are below the heights where most nocturnal avian collision impacts occur. Most avian flight during migration occurs at thousands of feet agl, whereas the proposed Project component heights are all below 200 feet agl. Section 3.04, Biological Resources, of the Draft EIR—as further supported in Appendix G, of the Final EIR—states that migrant birds would pass over the alignment, and there is potential for birds to interact with ropeway cables when flying below 175 feet agl and towers when flying below 200 feet agl.

As discussed in Appendix G, there are limited empirical data available on avian collision with gondola cables, particularly in urban environments. A review of the literature since the publication of the Draft EIR provided no new information on this topic. However, as discussed in Appendix B to Appendix G, Memorandum from Doppelmayr Regarding Comparable System Bird Strikes, Doppelmayr USA, one of two manufacturers of 3S gondola systems in the world, noted that a similar 3S gondola project measuring about 0.5-mile long and spanning the Rhine River in an urban environment in Koblenz, Germany was recently approved for an extension of their operating permit after the first 3 years of operation, noting that no bird strikes were detected during that period.

Comment GO14-135 Second, the gondola cables are viewed by the DEIR as very large for purposes of considering their risk to bird strikes. (DEIR, p. 3.4-19.) But these very same cables are considered insignificant in the Project’s aesthetic analysis, because “they have similar characteristics to the overhead powerlines that are prevalent in views in this area. As such, the proposed cables would not significantly impact views in this

area.” (DEIR, p. 3.1-37.) The gondola cables seem to have the perfect goldilocks size: they are deemed to be small (like powerlines) when it comes to assessing their visual impact (notwithstanding that they are not in the distance, but directly overhead within LA State Historic Park), but so large (unlike powerlines) that birds will have no difficulty in seeing them.

Response GO14-135 Refer to Response GO14-134 for a discussion of the proposed Project’s design features that are likely to reduce the risk of avian collisions. Refer to Response GO14-126 for discussion of the aesthetic impacts of the cables for the proposed Project, which would be less than significant. As discussed in Appendix G, Supplemental Biological Resources Report, of the Final EIR, most birds have far higher levels of visual acuity than humans, and can resolve movement much faster than humans. Most diurnal birds have a much higher concentration of rods and cones in their eyes than humans, and their retinal structure allows for resolution of movement above 100 hertz, compared to 60 hertz for humans. Birds are therefore capable of detecting objects from much farther away than humans and can react to objects appearing in their visual field much more rapidly than humans. In addition, the cables will be approximately between 46 and 175 feet above ground level (agl), relatively far from the perspective of most humans in the vicinity of the proposed Project. For these reasons, the visual disturbance posed to humans from cables of a given diameter is not directly comparable with the detectability of the same cables to birds flying near the cables. In addition, most nocturnal avian flight occurs during migration, when birds usually fly thousands of feet above ground level, whereas the proposed Project component heights are all below 200 feet at ground level.

Comment GO14-136 In addition, it is well-known that bright lights such as those at a sports stadium like Dodger Stadium frequently attract birds.⁶² The proposed Project would be constructed between Dodger Stadium and the Los Angeles River, home to an ever-expanding presence of waterfowl and other birds. In addition, LA State Historic Park’s easternmost area very near the river provides additional habitat for birds and wildlife. As discussed above, these areas should have been included in the biological survey area but were not.

Footnote 62: See, e.g., Valerie Fellows, Dim the Lights for Birds at Night!, US Fish & Wildlife Service, Apr. 28, 2022, available at: <https://www.fws.gov/story/2022-04/dim-lights-birds-night>.

Response GO14-136 Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR for discussion of potential impacts to migratory birds during both construction and operation of the proposed Project. As stated on page 3.4-19 in Section 3.04, Biological Resources, of the Draft EIR, proposed Project lighting would be low-level and primarily integrated into the architectural features. Additionally, exterior lighting would be shielded and/or directed toward the areas to be lit, limiting spillover into adjacent habitats potentially suitable for birds and

bats. Due to the high level of exterior lighting currently present in the urbanized BSA, lighting proposed by the proposed Project is not anticipated to have an indirect impact on bird and bat species. Refer to Appendix G, Supplemental Biological Resources Report, of this Final EIR for discussion of how light in the vicinity of the proposed Project is not anticipated to attract nocturnal migrant birds any more than existing light pollution over the Los Angeles Basin. Furthermore, lighting from Dodger Stadium field lights is not expected to attract nocturnal migrant birds. If lighting at stadiums were a major attractant to birds during migration, there should be many more examples of this phenomenon, given the large number of professional sports (e.g., baseball, football, soccer), and concert events that occur at such venues at night during spring and fall migratory periods.

Comment GO14-137 The Land Protection Partners letter addresses the above points and others in far greater detail than the DEIR. The LPP letter notes that the DEIR arguments and conclusions regarding cable size, cable spacing, alleged increased visibility of three cables, relative risk compared to transmission lines, concentration of avian movement, and artificial light in the Project area, among other things, are incorrect and unsupported by substantial evidence. The letter details specific species that are particularly susceptible to collision that are found in the Project area. The letter finds that the DEIR misrepresents the scientific literature and that the Project will result in a significant number of bird kills, an impact that cannot be mitigated. (LPP letter, pp. 2-5.) Unlike the DEIR, the letter is supported by substantial evidence throughout.

Response GO14-137 Refer to Responses P708-1 through P708-19 for responses to the comment letter from Land Protection Partners referenced in this comment.

Comment GO14-138 As one example of the kind of species that might be impacted by the gondola cables, drawn towards Dodger Stadium by its bright stadium lights, last fall during the 2022 MLB playoffs between the Los Angeles Dodgers and San Diego Padres, a large goose flew onto the field, interrupting the game for a time before it was eventually captured, removed from the field, and ultimately released to an undisclosed location.

Travis Longcore, president of the Los Angeles Audubon Society and an adjunct professor at UCLA, identified the bird as a greater white-fronted goose. An article in the Los Angeles Times explained the occurrence:⁶³

[Greater white-fronted geese] are known to migrate from the Arctic tundra in Alaska, where they breed in the summer, and fly south in the fall along the Pacific, settling in the wetlands in the Central Valley of California or even farther south into Mexico, a flight pattern the birds have carried out for thousands of years, Longcore said.

The bird on Wednesday was probably following this migration pattern when it became distracted by the stadium lights that tower above Chavez Ravine, a

common obstacle for migrating birds, said Longcore, whose research includes the effects of light pollution on migratory birds.

Greater white-fronted goose from article, Wally Skaliy / Los Angeles Times

The article later continues:

Most white-fronted geese are spotted along bodies of water, such as lakes at MacArthur and Echo parks, at the L.A. River, or in the wetlands of Playa del Rey or the South Bay, Longcore said. The goose Wednesday would have been accustomed to landing in water, which would explain its hard landing on the field, he said.

Bird enthusiasts have been buzzing online in recent weeks about large flocks of greater white-fronted geese spotted throughout coastal Southern California, said Kimball Garrett, a researcher at the Natural History Museum of Los Angeles County.

The failure of the DEIR to fully evaluate the risk to migratory and other birds or to support its conclusions with substantial evidence must be corrected, and the DEIR revised and recirculated for additional public comment.

Footnote 63: See Jonah Valdez, What happened to the goose that stole all the attention at Dodgers playoff game?, LA Times, Oct. 13, 2022, available at: <https://www.latimes.com/sports/dodgers/story/2022-10-13/whathappened-to-the-geese-at-dodger-stadium-experts-say-its-a-rare-species-from-alaska>.

Response GO14-138 Refer to Response GO14-136 for discussion of how lighting from Dodger Stadium field lights is not expected to attract nocturnal migrant birds. The occurrence of the greater white-fronted goose that landed at Dodger Stadium in October 2022 is not an indication of a widespread phenomenon.

Comment GO14-139 2. The Project design is likely to result in large Rock Pigeon roosts.

As discussed in the Land Protection Partners letter, the DEIR includes depictions that show station structures with large open canopies with exposed structural beams and girders. (See, e.g., Figure 2-5, DEIR p. 2-15; cover image, DEIR, Appx. C; Figure 5-4, DEIR, Appx. C, p. A-4.) This design is “likely to result in large Rock Pigeon roosts” which is likely to necessitate “chemical and/or physical methods that would be used to exclude pigeons from roosting within these structures,” a potentially significant environmental effect of the Project that is not disclosed in the DEIR. (LPP letter, pp. 7-8.)

Response GO14-139 Refer to Appendix G, Supplemental Biological Resources Report, of this Final EIR, for discussion of methods to prevent roosting or nesting opportunities for pigeons. There are numerous non-chemical and non-lethal anti-perching devices (e.g., Nixalite® bird spikes) that can be installed to prevent birds from becoming established. Chemical methods of pigeon removal or control would be avoided. It is also worth noting that the surrounding area contains numerous potential roosting and nesting opportunities (e.g., in the nearby buildings and billboard signs), and that the stations and junction themselves would not be drawing pigeons into the area and concentrating them above current levels. Refer to Section 5.0, Corrections and Additions, as in response to comments, the proposed Project has committed to implementing BIO-PDF-D and avoid using any rodenticides and second generation anticoagulant rodenticides during Project activities. Any agreement between the proposed Project and a pest control service provider would include restrictions on the use of rodenticides and second generation anticoagulant rodenticides.

Comment GO14-140 3. The Least Bell’s Vireo, an endangered species, has been sighted in LA State Historic Park; the DEIR must re-evaluate its faulty conclusion of no Project impacts to protected wildlife species.

The DEIR states: “Because the BSA [biological survey area] has been completely disturbed during urban development and consists of roadways, sidewalks, buildings, and rail tracks, habitats preferred by regional special-status wildlife species are not present (refer to Appendix A, Table B).” (DEIR, Appx. E, pdf p. 47.) The “least Bell’s vireo” is specifically called out in the DEIR as one of 39 special-status species identified in the California Natural Diversity Database (CNDDDB) “to have historically been recorded from the Los Angeles surrounding eight quadrangles, and from a search of IPaC for the Project area.” (Ibid., pdf pp. 45-46.) The DEIR notes that “[t]here are no CNDDDB records of any federal or State-listed wildlife species from the BSA in over 100 years” and concludes: “The BSA does not provide habitat potentially suitable for any of the regional special-status wildlife species identified during the literature review. The Project area has been completely disturbed and the native habitats these species are known from have long been removed from the BSA.” (Ibid., pdf. p. 46.)

Notwithstanding the DEIR’s conclusions, a male least Bell’s vireo was recently surveyed in LA State Historic Park on May 24, 2022, by UCLA Institute of the Environment and Sustainability doctoral student, Jenny Aleman-Zometa.⁶⁴ Ms. Aleman-Zometa’s doctoral work includes researching the way birds use local parkland, particularly parks sited on former brownfields such as LA State Historic Park, to learn the beneficial impact of these parks on species diversity. Ms. Aleman-Zometa took several images and a short video of the least Bell’s vireo during her survey.

The images and video of the least Bell’s vireo have been reviewed by leading ornithologists, who confirmed the species’ identification and noted that its birdsong is evidence of a “pioneering male” beginning to use LA State Historic Park as habitat. Given this clear evidence of a protected special-status endangered species surveyed recently at LA State Historic Park, the question is what impact the proposed Project might have on this protected species listed as endangered under both state and federal law. The DEIR has not considered this question.

Least Bell’s Vireo in LA State Historic Park, May 24, 2022 / courtesy Jenny Aleman-Zometa⁶⁵

Footnote 64: Telephone interview with Jenny Aleman-Zometa, doctoral student, UCLA Institute of the Environment and Sustainability, Jan. 13, 2023. See also <https://www.ioes.ucla.edu/person/jenny-aleman-zometa/>.

Footnote 65: Full format images and video are available on request and will be temporarily available at: https://www.dropbox.com/sh/m1wzhkbf9md5g5/AADgRm_LqbwvA0imlevui3KNa?dl=0.

Response GO14-140 The Draft EIR addressed impacts to biological resources, including special status species like least Bell’s vireo, in Section 3.04, Biological Resources with supporting data provided in Appendix E, Biological Resources Assessment, of the Draft EIR. No least Bell’s Vireo were detected during the two initial surveys for the Biological Resources Assessment in the Draft EIR. As indicated on page 3.4-13 of Section 3.04, Biological Resources of the Draft EIR, an observation of least Bell’s vireo was recorded in the proposed Project area from more than 50 years ago. Based on this publicly available data, the Draft EIR found that impacts to special status species,

including least Bell's Vireo, would be less than significant with the incorporation of Mitigation Measure BIO-B to reduce potential impacts to bats and nesting birds. Further, refer to Appendix G, Supplemental Biological Resources Report, of this Final EIR for discussion of how the BSA was surveyed again on March 23, 2023 in response to this comment, and no suitable least Bell's vireo habitat was present. There is a small managed area at the eastern end of the Los Angeles State Historic Park that includes some riparian plants and a depression where water collects during wet periods. These are features consistent with least Bell's vireo breeding habitat. However, at best, this habitat would be considered marginally suitable breeding habitat for least Bell's vireos, due to the small patch size and distance to the nearest perennial water source (approximately 1,000 feet from the Los Angeles River). The patch of habitat at the eastern end of the Los Angeles State Historic Park is more than 500 feet outside of the BSA, and more than 1,000 feet away from the proposed Project alignment, where Project construction would occur. It is well beyond the distance of any expected direct or indirect impacts associated with the proposed Project. Both the CDFW (2022) and U.S. Fish and Wildlife Service ([USFWS] 2014) recommend 500-foot disturbance buffers for least Bell's vireos, with protocol surveys in suitable habitat within 500 feet of proposed construction areas. This is, in part, why the 500-foot distance was selected for the BSA. The habitat in question is more than 1,000 feet from proposed Project construction areas, and therefore no impacts to wildlife in that area are expected. Due to the absence of suitable least Bell's vireo breeding habitat in the BSA, least Bell's vireos are not expected to be present in the BSA.

Comment GO14-141 Ms. Aleman-Zometa's May 2022 survey at LA State Historic Park included observation of 35 native bird species. Within the Project alignment and 500-foot buffer she surveyed 16 species, including in the southwest part of the Park. Her survey included common species but also included migrating, wintering, and breeding bird species.

Response GO14-141 The Draft EIR addressed impacts to biological resources, including special-status wildlife species, in Section 3.04, Biological Resources, with supporting data provided in Appendix E, Biological Resources Assessment, of the Draft EIR. As stated on pages 3.4-12 and 3.4-13 of Section 3.04, Biological Resources, of the Draft EIR, a total of 39 special-status wildlife species were identified by the CNDDDB database to have historically been recorded from the Los Angeles and surrounding eight quadrangles. Nine of those species were historically recorded within the biological study area (BSA) for the proposed Project. However, of the nine species with observations from within the BSA, the most recent are for bat species from 25 to 30 years ago. All other observations are 50 years old or older. Based on this publicly available data, the Draft EIR found that impacts to special-status species would be less than significant with incorporation of Mitigation Measures BIO-A and BIO-B to reduce potential impacts to bats and nesting birds.

Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of the Final EIR for additional discussion of why the Project would not result in significant effects to migrating, wintering, or breeding bird species. As discussed in Appendix G, it is unclear from the information presented in this comment where the observations took place, and whether they were within or even near the proposed Project's BSA, and accordingly does not contradict the information provided in the Draft EIR.

Comment GO14-142 Even if the DEIR's biological survey area with a 500-foot buffer from the Project alignment were sufficient elsewhere, and it was not (see LPP letter, p. 2), it did not consider the need to expand in the area of LA State Historic Park due to direct and indirect physical changes in the environment at the Park due to the Project. Activities at LA State Historic Park that currently occur at the western side of the park in the vicinity of the proposed gondola alignment would be moved significantly eastward as a result of the Project, towards Park areas featuring significantly more wildlife habitat including, when there is sufficient rain as now, an intermittent riparian wetland area with willows and mulefat.⁶⁶ For example, the DEIR suggests that special event stages, currently located at the western edge of the Park, be moved toward the location of the Park's "Roundhouse" feature. (See DEIR, p. 5-62.) This particular suggestion is not feasible—the Roundhouse is a significant archaeological site at the Park and is inappropriate as stage location. Another location would have to be found for staging, likely further east where it is more likely to have an adverse impact on wildlife, including the endangered least Bell's vireo.

Footnote 66: That there is additional wildlife habitat at the Park's eastern side does not diminish the significant loss of habitat, including removal of 81 trees necessary for the Project as well as operation of the gondola, at the Park's western side. As Ms. Aleman-Zometa explained, "there is still a lot of diversity present at the western side of the Park where the gondola would be sited, and that will be adversely impacted."

Response GO14-142 As discussed in Appendix G, Supplemental Biological Resources Report, of the Final EIR, the area containing better quality wildlife habitat than the grassy lawns covering much of the rest of the Park are located more than 1,000 feet from the proposed Project alignment and more than 500 feet outside of the current BSA, and is accordingly located too far away from the proposed Project for construction or operation of the proposed Project to have an impact on potential habitat in this area. Moreover, the park and surrounding area is subject to high levels of disturbance on a regular basis, including concerts, music festivals, outdoor movies, and other events that regularly include high-amplitude speakers, food trucks, and large numbers of people. The habitat in the eastern end of the park is near streets with vehicular traffic, parking lots, and a walking path with regular human foot

traffic, in addition to the disturbances noted above. Therefore, birds and other wildlife using the habitat at the eastern end of the State Park should already be accustomed to high levels of disturbance. Further, Section 5.5.2, Special Events at the Los Angeles State Historic Park, of Section 5.0, Other CEQA Considerations, of the Draft EIR indicates that most events could still be held underneath or adjacent to the alignment, and that the proposed Project would not interfere with typical existing event stage locations (Figure 5-3). Therefore, it is unlikely that the proposed Project would result in a shift in park event activity towards the eastern end of the park, as the comment suggests.

Refer to Section 3.04, Biological Resources, and Appendix E, Biological Resources Assessment, of the Draft EIR and Appendix G, Supplemental Biological Resources Report, of this Final EIR for additional discussion of why 500 feet was an appropriate buffer for the EIR to consider, for discussion of the proposed Project's potential affects impacts to least Bell's vireos, and for applicable tree replacement requirements in the City of Los Angeles.

The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. As discussed on page 3.04-23, in Section 3.04, Biological Resources, of the Draft EIR, and in Appendix K.1, Updated Tree Report, and in Appendix G, Supplemental Biological Resources Report, of this Final EIR, the removal of the 75 trees within Los Angeles State Historic Park would require a permit or approval from the California Department of Parks and Recreation, and all existing trees required to be removed on California Department of Parks and Recreation property would be replaced at a minimum 1:1 ratio within the Park or as agreed to as part of the approvals required for implementation of the proposed Project from the Department. In addition, 6 trees within the public ROW located near the Los Angeles State Historic Park would be replaced at a ratio specified by the Urban Forestry Division, typically, at a 2:1 ratio. As discussed in Section 4.1.3, Impacts to Wildlife from Tree Removal, of Appendix G, the quality of wildlife habitat provided by the trees proposed for removal is relatively low, given that the trees are primarily non-native tree species. In addition, the total area of wooded habitat that would be removed at the Los Angeles State Historic Park is 0.24 acres. This area of wooded habitat is relatively small compared to the amounts available in the immediately surrounding areas, such as Elysian Park (approximately 600 acres alone, much of which is wooded), Radio Hill Gardens, Victory Memorial Grove, and Point Grand View Park. Accordingly, while the removal of trees will result in a marginal reduction of suitable tree habitat in the short-term, such habitat loss would not result in substantial population level impacts. Moreover, in the long-term, the replacement of trees proposed for removal would more than offset any realized impacts associated with the proposed Project.

Comment GO14-143 4. The DEIR fails to consider habitat and wildlife corridor impacts due to brush clearance activities at the Project’s proposed Stadium Tower.

“If a mitigation measure would cause one or more significant effects in addition to those that would be caused by the project as proposed, the effects of the mitigation measure shall be discussed...” (CEQA Guidelines, § 15126.4, subd. (a)(1)(D), citing *Stevens v. City of Glendale* (1981) 125 Cal.App.3d 986.) The DEIR describes tree removal and brush clearance activities necessary in the area surrounding the Project’s proposed Stadium Tower site. (DEIR, pp. ES-80 to ES-83 (describing Mitigation Measures WFR-1 and WFR-2).) The DEIR notes that at least 31 “significant” pursuant to City of Los Angeles regulations will be removed at the Stadium Tower site (10 significant trees for the Stadium Tower, and 21 additional significant trees for the Stadium Tower Fire Buffer Zone for Construction). (DEIR, Table 3.4-1, p. 3.4-23.)

The DEIR fails to consider whether removal of the significant trees or other brush clearance requirements may cause a potentially significant environmental effect on wildlife corridors or habitat in the Stadium Tower area. LA Parks Alliance recommends that Metro consult with the Santa Monica Mountains Conservancy as the appropriate Trustee agency with relevant expertise for wildlife corridors and habitat in the Santa Monica Mountains Zone for its advice with respect to determining whether the impact is significant, and if it is considered a significant impact, for appropriate mitigations to reduce the environmental impact to a level less than significant.⁶⁷

Footnote 67: “[T]he Conservancy should be considered a trustee agency for any CEQA project which affects natural resources within the [Santa Monica Mountains] Zone.” (Exhibit F, supra fn. 7 p. 3.)

Response GO14-143 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. The proposed Project would implement BIO-PDF-F and adhere to ordinances and requirements applicable to tree replacement, based on the corresponding jurisdiction of the property where each tree is located. Refer to pages 3.4-16 to 3.4-17, of Section 3.04, Biological Resources, of the Draft EIR, for discussion of potential habitat impacts related to tree removal and brush clearance. Refer to Table 4-1 of Appendix G, Supplemental Biological Resources Report, of the Final EIR for discussion of applicable tree replacement requirements in the City of Los Angeles. As shown in this table, protected trees require a replacement ratio of 4:1, while significant trees require a mitigation ratio of 1:1. Removed “street trees” that occur in the public right-of-way (ROW) are to be replaced at a ratio specified by the Urban Forestry Division; typically, at a 2:1 ratio. As discussed on page 3.04-23, in Section 3.04, Biological Resources, of the Draft EIR, it is anticipated that mitigation ratios for trees on land administered or managed by responsible agencies would be agreed to as part of the approvals required for implementation of the proposed Project. The proposed

Project would provide a minimum replacement ratio of 1:1 for all trees removed in the Los Angeles State Historic Park and a replacement ratio of 1:1 for all large trees removed in the State Route (SR) 110 California Department of Transportation (Caltrans) ROW. As discussed in Section 4.1.3, Impacts to Wildlife from Tree Removal and Brush Clearance, of Supplemental Biological Resources Report, the quality of wildlife habitat provided by the trees proposed for removal is relatively low, given that the trees are primarily non-native tree species. Brush cleared from the fire buffer area surrounding the Stadium Tower location would be allowed to regenerate naturally after construction, subject to applicable defensible space requirements. In addition, the total area of wooded habitat that would be removed at the Stadium Tower Site is 1.02 acres. This area of wooded habitat is relatively small compared to the amounts available in the immediately surrounding areas, such as Elysian Park (approximately 600 acres alone, much of which is wooded), Radio Hill Gardens, Victory Memorial Grove, and Point Grand View Park. Accordingly, while the removal of trees or brush will result in a marginal reduction of suitable tree habitat in the short-term, such habitat loss would not result in substantial population level impacts. Moreover, in the long-term, the replacement of trees proposed for removal would more than offset any realized impacts associated with the proposed Project. As discussed in Response GO14-16, Santa Monica Mountains Conservancy (“SMMC”) has no discretionary approval authority related to the proposed Project, however, Metro notified SMMC as a trustee agency.²⁰

Comment GO14-144 F. The Project’s Significant Historic and Cultural Impacts Must Be Properly Mitigated or Avoided.

1. Mitigation measures for sensitive cultural and historic resources are improperly deferred.

The DEIR describes many historic and cultural resources within the Project corridor that would be significantly impacted by the Project. These include Los Angeles Union Station, El Pueblo de Los Angeles Historic State Park, and Los Angeles State Historic Park, among other important resources. (DEIR, pp. 3.5-10 to 3.5-33.) The DEIR also identifies numerous important archaeological resources, which is unsurprising given the proposed Project’s location within and near areas of first human settlement in the Los Angeles region, dating back as much as 10,000 years. (LASHP General Plan, pdf. p. 29.)

As described above, the Project has obvious aesthetic impacts at many of these sites. In addition, the DEIR describes significant impacts requiring mitigations at many other sites. Mitigations are necessary to protect specific cultural and archaeological resources at El Pueblo, including the Winery, the El Grito mural, and Avila Adobe (MM-VIB-A and MM-VIB-B, DEIR, pp. ES-33, ES-36, ES-67),

²⁰ Los Angeles County Metropolitan Transportation Authority (LA Metro). 2023. Los Angeles Aerial Rapid Transit Project Email from Cory Zelmer to info@smmc.ca.gov.

archaeological resources generally (MM-CUL-A, DEIR, pp. ES-41 to ES-42, a mitigation measure relating to “all ground disturbance activities extending into native soils within known archaeological sites and other areas of high sensitivity”) and to create an “Archaeological Resource Worker Training Program” (MM-CUL-B, DEIR, p. ES-44) and “Archaeological Testing Plans” (MM-CUL-C, for Alameda Station, DEIR, p. ES-45; MM-CULD, for LA Union Station; MM-CUL-E, for Los Angeles State Historic Park, DEIR, p. ES-48). If significant resources are found pursuant to MM-CUL-E, an additional mitigation would reconfigure planned improvements at LA State Historic Park. (MM-CUL-F, DEIR, p. ES-49.)

Response GO14-144 This comment provides a general recitation and characterization of the Draft EIR. The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Refer to Section 3.5.4, Environmental Impacts, of Section 3.05, Cultural Resources, of the Draft EIR, for a discussion outlining the proposed Project’s potential construction and operational impacts to historic resources within the vicinity of the proposed Alameda Station, including the Los Angeles Union Station Passenger Terminal and Grounds and the Los Angeles Plaza Historic District (referred to as El Pueblo, and comprised of 29 resources within its boundaries, including the Avila Adobe and The Winery), the El Grito mural, and the Los Angeles Terminal Annex Post Office. As discussed in Section 3.5.4, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Refer to Section 3.05, Cultural Resources, and Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, of the Draft EIR for a discussion of archaeological resources at the Los Angeles State Historic Park. As discussed in Section 3.05, the Chinatown/State Park Station footprint is entirely located within the boundary of Resource 19-003120 (consisting of the remains of the Southern Pacific Railroad’s River Station). Extensive archaeological work has been conducted at the site, and when the Chinatown/State Park Station (including the construction staging area) is overlaid on an archaeological sensitivity map developed by California State Parks, it appears that the Chinatown/ State Park Station is located in an area not identified as low sensitivity for archaeological resources by State Parks. Nevertheless, with the implementation of mitigation, construction of the proposed Chinatown/State Park Station would result in a less than significant

impact related to a substantial adverse change in the significance of archaeological Resource 19-003120. Refer to Responses GO14-110 through GO14-127 for a discussion of the proposed Project's aesthetic impacts.

Comment GO14-145 LA Parks Alliance objects that all these mitigations are improperly deferred. Deferring mitigations is generally impermissible under CEQA. (See CEQA Guidelines, § 15126.4, subd. (a)(1)(B).) Particularly where, as here, known sensitive cultural and archaeological resources are within the impact area of the Project and could (indeed, are likely to be) harmed by construction activities, it is appropriate for mitigation measures to be fully formulated and subject to public review in advance of certification of the environmental document. To the extent that mitigation measures may require some additional study to be fully formulated, that study must occur now, before environmental review is completed and certified, and in advance of the commencement of any construction activities.

Response GO14-145 Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. With respect to Mitigation Measures CUL-A and CUL-C through CUL-E, as acknowledged on page 3.5-2, Section 3.5, Cultural Resources, of the Draft EIR, "an archaeological resource may not be recognizable or even observable without ground-disturbing activities." Mitigation Measures CUL-A and CUL-C through E accordingly outline the specific actions that would be taken under the guidance of a qualified archaeologist in accordance applicable regulatory standards and/or in consultation with the applicable authorities in the unlikely event that archaeological resources are discovered once excavation begins on-site. Excavation or other such ground disturbance prior to approval of the proposed Project to discover any potential additional resources is impracticable at this juncture.

Comment GO14-146 Given the existence of at least one feasible alternative that eliminates or lessens virtually all the Project's potentially significant and significant and unavoidable impacts (DEIR, pp. ES- 19), it would be irresponsible to construct anything within archaeologically sensitive areas until the full extent of those resources are known, and if appropriate excavated or otherwise preserved and protected on site.

Response GO14-146 The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR).

As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA. Topical Response H additionally outlines how environmental benefits of the proposed Project would not be realized through the “No Project Alternative”, and how the Transportation Systems Management Alternative, noted as the “environmentally superior” alternative, for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park.

Comment GO14-147 2. The DEIR ignored numerous NOP scoping comments urging protection of the “Monument to Sharing” artwork at LA State Historic Park

The Spring Street Alternative described in DEIR Chapter 4.0 “Alternatives” should not have been presented as a project alternative. As a project alternative that would have even greater impacts than the preferred alternative due to its location running directly through the center of Los Angeles State Historic Park, it is not an appropriate alternative, since it does not reduce environmental impacts. (*Watsonville Pilots Assn. v. City of Watsonville* (2010) 183 Cal.App.4th 1059, 1087, citing CEQA Guidelines, § 15126.6, subd. (a).)

Numerous scoping comments discussed grave concern about a public artwork known as “Monument to Sharing” located at one of the entrances to LA State Historic Park that would be damaged by the Spring Street Alternative, presented as one of two alignment alternatives during the Project’s scoping process. (See, e.g., DEIR, Appx. A, pp. 130-133, 140, 226, and 278, among others.) Despite the scoping comments, the discussion of the Spring Street Alternative does not mention aesthetic or cultural impacts to the “Monument to Sharing” artwork.

Response GO14-147 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a range of reasonable alternatives pursuant to CEQA. As discussed therein, the Spring Street Alignment Alternative would provide an ART option for visitors to Dodger Stadium, while also providing access between Dodger Stadium, the surrounding communities, and the regional transit system

accessible at LAUS. The Spring Street Alignment Alternative was included in the Draft EIR because it provides an aerial rapid transit option that would cross over the Los Angeles State Historic Park, and that maintained transit access to the Park and surrounding communities. Although the Spring Street Alignment Alternative would be consistent with the Project Objectives, it would require a larger footprint within the Los Angeles State Historic Park. As such, the Spring Street Alignment Alternative would not meet the following objective to the same extent as the proposed Project, and therefore, is considered to be only partially consistent with Objective 11 to “Minimize the Project’s environmental footprint through the integration of sustainability and environmentally-friendly design features into the materials, construction, operations, and maintenance of the proposed Project.” Consideration of the Spring Street Alignment Alternative complied with CEQA, which does not prohibit consideration of alternatives that would impede, to some degree, the attainment of the project objectives, or would be more costly. (CEQA Guidelines § 15126.6(a).) The proposed Project would not impact the Monument to Sharing, which is a grove of 32 orange trees in planters located near the Ann Street Entrance of Los Angeles State Historic Park on the south border along North Spring Street between Ann Street and Sotello Street. As discussed in Section 4.0, Alternatives, of the Draft EIR, if Metro elects to adopt the Spring Street Alternative rather than the proposed Project, and to the extent this Alternative would require relocation of the Monument to Sharing, the Project Sponsor would coordinate with State Parks and other stakeholders as to the potential relocation of the Monument to Sharing. Refer to Responses GO14-6 through GO14-12 for discussion of the comments on the NOP.

Comment GO14-148 G. Potential Dewatering May be Toxic and Require Mitigation.

The DEIR discusses groundwater conditions in the Project area as known to be toxic in the vicinity of construction activities proposed at Los Angeles State Historic Park. (DEIR, p. 3.10-26). Groundwater toxicity at other locations is “not specifically known.” (Id.) The DEIR proposes Mitigation Measure HAZ-1 (“Prepare a Soil and Groundwater Management Plan”) to address construction impacts:

The Soil and Groundwater Management Plan shall provide a summary of the environmental conditions at each Project component site, including stations and towers. The Soil and Groundwater Management Plan shall include methods and procedures for sampling and analyzing soils and/or groundwater to classify them as either hazardous or nonhazardous; and if identified as hazardous, shall include additional methods and procedures for the proper handling and removal of impacted soils and/or groundwater for off-site disposal and/or recycle. (DEIR, pp. ES-53 to ES-54.)

Response GO14-148 This comment provides a general recitation and characterization of the Draft EIR, . . . Refer to Section 3.10, Hydrology and Water Quality, of the Draft EIR, for discussion of how, based on groundwater depths, none of the proposed excavations for foundations are anticipated to encounter groundwater; however, removal of

nuisance water that seeps into boreholes during construction may be required for the pile installations at each of the components. Groundwater may be encountered during installation of piles, and any nuisance water removed would need to be analyzed prior to disposal. Refer to Section 3.10, Hydrology and Water Quality, of the Draft EIR, at pages 3.10-26 and 3.10-27 for discussion of how detections of total petroleum hydrocarbons and volatile organic compounds, including BTEX, are known to be present in groundwater at the Los Angeles State Historic Park property, and, although the groundwater quality in the remainder of the Project study area is not specifically known, it may contain elevated levels of constituents such as petroleum hydrocarbons and solvents resulting from commercial and industrial discharges, in addition to potentially elevated TDS and metals related to natural conditions. Refer to Section 3.09, Hazards and Hazardous Materials, of the Draft EIR, for discussion regarding groundwater condition and requirements set forth in Mitigation Measure HAZ-A to complete a Soil and Groundwater Management Plan. Refer to Response GO14-149 for further discussion of Mitigation Measure HAZ-A.

Comment GO14-149 The DEIR describes construction activities as potentially requiring dewatering operations if “nuisance seepage from boreholes” or from excavation activities is encountered. (DEIR, pp. 3.10-26 to 3.10-27.) The Project will require deep piles at several Project component locations likely to be lower than the water table. (See Table 2-4, DEIR, p. 2-51, describing one drilled pile location of 80 feet and five drilled pile locations of 120 feet or greater; the Dodger Stadium Station drilled piles would be only 55 feet deep.)

LA Parks Alliance notes that in the EIR for Metro’s Link Union Station, Metro proposed a series of mitigation measures to deal with dewatering operations, including dewatering for discharge of non-stormwater wastes.⁶⁸ While those proposed mitigations were also largely deferred, primarily requiring compliance with regulations and existing dewatering permits, it was Metro that would supervise and ensure that mitigations were properly enforced, not the Project’s builder (whoever that turns out to be).⁶⁹

Here, knowing of contaminated groundwater conditions very likely to exist in the Project area, Metro does not propose further groundwater testing of Project component areas to understand whether there will be a significant impact. Instead, Metro proposes deferring action until such time as hazardous conditions (i.e., significant impacts of the Project) are stumbled across during construction, long after the final EIR is certified. This is not permitted under CEQA. (CEQA Guidelines, § 15126.4, subd. (a)(1)(B).) The Project’s mitigation measures should include pre-certification groundwater testing to understand the scope of potential impact and if determined to be significant, a pre-construction mitigation that lessens the impact to a level less than significant must be imposed.

Footnote 68: See Link Union Station – Draft EIR, Executive Summary, pp. ES-xlviii to ES-xlix, available at:

<http://libraryarchives.metro.net/DPGTL/eirs/Link%20Union%20Station/2019-link-union-station-drafter-executive-summary-english.pdf>.

Footnote 69: In public statements, both ARTT LLC and Climate Resolve claim the Project will be donated to a new nonprofit, Zero Emissions Transit, which similarly has no experience building anything. See <https://www.laart.la/faq/> and <https://www.climateresolve.org/climate-resolve-launches-new-nonprofitfocused-on-zero-emission-transit-dodger-stadium-aerial-gondola-to-be-first-project/> (both last viewed Jan. 14, 2023). But in a sworn declaration of October 5, 2022, Principal Deputy Counsel, Ronald W. Stamm, Metro’s counsel of record in recent litigation asserted that “ARTT’s rights and obligations under [its agreement with Metro] cannot be assigned unless and until Metro approves the assignment...” and “[n]o assignment has been proposed yet.” (LA Sup. Ct. Case No. 22STCP01030, Declaration of Ronald W. Stamm in Support of Respondent’s and Real Party’s Joint Opposition to Motion to Augment the Record and File a First Amended Petition, par. 10, filed Oct. 6, 2022.)

Response GO14-149 Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project’s mitigation measures, including Mitigation Measure HAZ-A, are consistent with the requirements of CEQA. CEQA does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact. In addition, conditions requiring compliance with regulations are common and reasonable mitigation measures under CEQA. Mitigation Measure HAZ-A does not impermissibly defer mitigation. As discussed in Section 3.7, Geology and Soils, Appendix K, Phase I Environmental Site Assessment, and Appendix L, Hydrology Technical Report, of the Draft EIR, the Draft EIR conducted an extensive preliminary investigation of the proposed Project’s sites to determine whether the site exhibited contamination from hazardous materials or would otherwise have impacts to groundwater. Based on this investigation, the Draft EIR concluded that additional investigation may be appropriate, although a full investigation is impracticable at this time because the Project Sponsor does not have access agreements for all the underlying properties and would have to obtain these agreements prior to testing. Moreover, it is appropriate for the Project Sponsor to test soils for contamination at the time the soil is disturbed and properly handle and remove any contaminated soil or groundwater at this time for off-site disposal and/or recycling, as outlined in Mitigation Measure HAZ-A. Mitigation Measure HAZ-A otherwise provides specific performance standards and actions required pursuant to Mitigation Measure HAZ-A, namely that that the preparation of the Soil and groundwater Management Plan would occur prior to any re-grading,

decommissioning, or construction activities and as a condition of the grading, construction, and/or demolition permit(s), and would specify methods for handling and disposal in the event contaminated groundwater or soils are encountered during project construction. Contract specifications shall mandate full compliance with all applicable local, state, and federal regulations. Nevertheless, in response to comments requesting additional clarification on the enforcement mechanisms and standards in Mitigation Measure HAZ-A, an addition to the Draft EIR has been provided to clarify that the Soil and Groundwater Management Plan shall be submitted to the LADBS for review prior to the commencement of demolition and construction activities and as a condition of the grading, construction, and/or demolition permit(s). The addition also recognizes that Mitigation Measure HAZ-A requires full compliance with all applicable local, state, and federal regulations (including but not limited to, as applicable, OSHA Safety and Health Standards, Cal/OSHA requirements, federal, state and local waste disposal regulations, SCAQMD Rule 1166, as well as any other applicable requirements of the California Department of Toxic Substances, the Los Angeles Regional Water Quality Control Board, and the City of Los Angeles) related to the identification, excavation, transportation, and disposal of hazardous materials, including those encountered in excavated soil and dewatered groundwater. Refer to Section 5.0, Corrections and Additions, of the Final EIR. Refer to Section 7.0, Mitigation Monitoring and Reporting Program, and Table 7-1, Mitigation Monitoring and Reporting Program (MMRP), of the Final EIR, discussing how the Mitigation Monitoring and Reporting Program prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies. The MMRP designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro's sole source determination for the proposed Project. Records in this litigation, including the declaration referenced in this comment, speak for themselves.

Comment GO14-150 H. Land Use and Planning Conflicts are Significant and Unavoidable.

In its land use and planning analysis the DEIR states the Project will have a significant environmental effect because it conflicts with the General Plan of the Los Angeles State Historic Park, but that this impact can be made less than significant with the imposition of mitigation measure LUP-A ("Obtain a Los Angeles

State Historic Park General Plan Amendment”) to allow “transit uses” within the Park. (DEIR, pp. ES-58, 3.11-38.) But a General Plan amendment to permit this Project within LA State Historic Park is a legal impossibility. The proposed mitigation measure to obtain a General Plan amendment is for an activity that state law expressly prohibits in a California state park historic unit. (See discussion, *supra* pp. 12-26.) Here, Metro should have determined the proposed mitigation was legally infeasible. When a lead agency makes this determination, a mitigation measure need not be proposed or analyzed. (CEQA Guidelines, § 15126.4, subd. (a)(5).) There is no mitigation to lessen the impact, which is therefore significant and unavoidable.

The significant and unavoidable impact is fatal to the Project’s hope to use any portion of LA State Historic Park for a Project component or part of its aerial alignment. But this is not the only significant environmental effect from land use and planning conflicts that the DEIR fails to properly identify and analyze.

Response GO14-150 Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project’s Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment.

Comment GO14-151 1. The Project conflicts with the General Plan of El Pueblo de Los Angeles, which the City of Los Angeles must follow.

El Pueblo de Los Angeles Historical Monument “is a national and state registered Historical Monument and City-designated Historic-Cultural Monument located in downtown Los Angeles directly west of LAUS. El Pueblo is historically significant as the birthplace of the City of Los Angeles, established in September 1781 by settlers from present day northern Mexico.” (DEIR, p. 2-8.) El Pueblo includes a number of

important historical structures, including “the Avila Adobe, the City’s oldest surviving residence; Pico House, built by the last governor of California under Mexican rule, and the City’s first grand hotel; the Plaza Firehouse, the City’s first firehouse; and Our Lady Queen of Angels Catholic Church, the City’s oldest church and the only building at El Pueblo still used for its original purpose.” (Id.)

As the DEIR notes, El Pueblo was originally El Pueblo State Historic Park, a historic unit of California’s state park system created in 1953. (DEIR, p. 3.5-7.) It was transferred to the City of Los Angeles, and in 1992 a new City Department, El Pueblo de Los Angeles Historical Monument Authority Department (“El Pueblo Department”), was created to operate, manage, maintain, and control El Pueblo. (LA Admin. Code (“LAAC”), Ch. 25, art. 1, § 22.620.) The Department is overseen by the El Pueblo de Los Angeles Historical Monument Authority Commission (the “Board”). (LAAC, § 22.621.) The Board has the “power and authority to approve street lights, street and sidewalk surfaces, fixtures and other appliances and furnishings proposed to be located in or on the sidewalks, streets and ways immediately adjoining the Monument in order to maintain and enhance the ambiance and character of the Monument.” (LAAC, § 22.626.) The Board may “enter into contracts for services and leases as it deems necessary for the operation, management, maintenance and control of the Monument” within certain express limitations, but neither the Board nor Department have any power to “to acquire or sell any real property for or on behalf of itself or of the City.” (LAAC, §§ 22.627, 22.632.) The Board may not approve “master plans, development plans, and amendments thereto” without prior approval of the Los Angeles City Council and Mayor. (LAAC, § 22.634.)

Response GO14-151 This comment provides a recitation and characterization of text from the Draft EIR, but does not raise a substantive issue on the content of the Draft EIR. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted. Refer to Response GO14-153 for a discussion of how the proposed Project would be consistent with the El Pueblo General Plan.

Comment GO14-152 The DEIR also notes the existence of El Pueblo’s General Plan and the El Pueblo Department’s El Pueblo de Los Angeles Strategic Plan, which “has as one of its objectives ‘historic and asset management’” with a goal to “continue to implement and adhere to El Pueblo’s General Plan by restoring and renovating properties to their highest and best use.” (DEIR, p. 3.5-8.)

The DEIR fails to mention, however, that the City’s acquisition of El Pueblo from the State of California came with specific deed restrictions that limit the City’s actions with respect to permissible uses of El Pueblo land it acquired and holds in public trust for the people of the City and California.⁷⁰ The Quitclaim Deed restrictions require El Pueblo’s development and operation to conform to its April 11, 1980, General Plan. While the City may amend the El Pueblo general plan, in doing so the

City “shall consider the development criteria of Section 5019.59 of the Public Resources Code.” (Quitclaim Deed, condition subsequent no. 1, pp. 1-2.) This statute explicitly limits what can be constructed in a state historic park: “The only facilities that may be provided [in a state park historic unit] are those required for the safety, comfort, and enjoyment of the visitors, such as access, parking, water, sanitation, interpretation, and picnicking.” (Pub. Res. Code, § 5019.59 (emphasis added).) Failure to follow the Quitclaim Deed’s express restrictions allows a right of reversion to the State. (Quitclaim Deed, p. 2.) The DEIR fails even to mention these strict land use limitations.

Footnote 70: Quitclaim Deed between State of California and City of Los Angeles for El Pueblo de Los Angeles Historic Monument (“Quitclaim Deed”), executed Oct. 27, 1988, attached as Exhibit T.

Response GO14-152 As noted in in Section 3.05, Cultural Resources, of the Draft EIR, the City of Los Angeles signed an agreement in 1953 with the County of Los Angeles and State of California creating El Pueblo State Historic Park (El Pueblo). This agreement allowed the State to purchase most of the property comprising El Pueblo. In cooperation with the City and County, in 1980, the State prepared the El Pueblo General Plan to provide guidelines for the preservation, rehabilitation, and interpretation of the historic buildings as well as for new development within the Park. In 1992, the property within the Park was transferred to the City; in 1994, a separate department was created, and the name was changed to El Pueblo de Los Angeles Historical Monument. Page 3.5-6, in Section 3.05, Cultural Resources, of the Draft EIR, expressly discusses Public Resources Code section 5019.59. Section 3.11, Land Use and Planning, of the Draft EIR, also discusses Public Resources Code section 5019.59 on pages 3.11-1 to 3.11-2, recognizing that the “only facilities that may be provided are those required for the safety, comfort, and enjoyment of the visitors, such as access, parking, water, sanitation, interpretation, and picnicking.” As discussed further on pages 3.11-38, 3.11-39, and 3.11-42, Public Resources Code section 5019.59 permits facilities for the comfort and enjoyment of the visitors, such as access. As an initial matter, no portion of the proposed Project would touch down on any of the parcels described in the Quitclaim Deed, referenced as Exhibit T to this comment.²¹ As discussed in Section 3.11, the vertical circulation elements west of the Alameda Station would be introduced within the ROW north of the Placita de Dolores, on the west side of Alameda Street, in a proposed new pedestrian plaza in an area currently containing a parking and loading area for El Pueblo. This area was designated as City ROW prior to the execution of the Quitclaim Deed in 1990, and is not described within Exhibit A to the Quitclaim Deed, containing the legal descriptions of parcels subject to the deed. Accordingly, the provisions of the Quitclaim Deed may not apply to the proposed Project. Nevertheless, consistent with Public Resources Code section 5019.59, the proposed

²¹ State of California and City of Los Angeles. 1988. Quitclaim Deed for El Pueblo de Los Angeles Historic Monument.

Project would provide for access to El Pueblo and the Los Angeles State Historic Park, and accordingly is an allowable use under Public Resources Code section 5019.59. Moreover, as noted in the comment above, the City is only required to “consider” the development criteria of Section 5019.59 under the referenced Quitclaim Deed, and is not bound to abide by its requirements. Refer to Topical Response F, Los Angeles State Historic Park, for further discussion of Public Resources Code section 5019.59 and considerations for approval of projects within the State parks system.

As discussed in detail in Response GO14-153, the proposed Project would be consistent with the El Pueblo General Plan. The proposed Project would provide connections to and from open spaces within El Pueblo, including Los Angeles Plaza Park, via Alameda Station. The proposed Alameda Station would include new pedestrian plaza at El Pueblo north of the Placita de Dolores in an area currently used as a parking and loading area for El Pueblo and installation of landscaping and hardscape. In addition, the proposed Project would connect the El Pueblo area with other open spaces uses along the Project alignment, including the Los Angeles State Historic Park and Elysian Park.

Comment GO14-153 The DEIR describes use of El Pueblo land necessary to construct Alameda Station:

Vertical circulation elements (i.e. elevators, escalators, stairs) for pedestrian access, which would also serve as queuing areas to the station, would be introduced at-grade north of the Placita de Dolores in a proposed new pedestrian plaza at El Pueblo on the west in an area currently used as a parking and loading area for El Pueblo.

(DEIR, p. 2-23.)

These “vertical circulation elements” would be located on land within El Pueblo’s boundary that is subject to its General Plan. Since the City must follow the mandate of Public Resources Code Section 5019.59, which restricts permissible facilities at El Pueblo to only those “required for the safety, comfort, and enjoyment of the visitors” it may not construct any portion of the Project within the El Pueblo de Los Angeles Historical Monument boundary. The DEIR’s failure even to provide basic background information regarding this significant environmental impact due to a clear conflict with the El Pueblo General Plan, let alone any proposed mitigation measure to lessen its significance requires the DEIR to be revised and recirculated.^{71, 72}

Footnote 71: This assumes a mitigation is possible. As with the Project’s similar conflict with LA State Historic Park’s General Plan, the impact appears to be significant and unavoidable. (See discussion, supra p. 25.)

Footnote 72: For the record, LA Parks Alliance notes a discrepancy between an illustration of El Pueblo found in the 2016-2020 Strategic Plan and the actual El

Pueblo park boundary as the park was accepted by the City from the State of California. Page four of the Strategic Plan appears to show a small triangular cutout of El Pueblo's boundary along Alameda Street, adjacent to the Old Winery, Avila Adobe, and Placita de Dolores locations at the Historic Monument. The true park boundary as indicated on the 1980 General Plan applicable to the property and as accepted by the City has no such triangular cutout. See Quitclaim Deed, Exhibit "B" Sheet 1, pdf. p. 13; see also El Pueblo General Plan, pdf p. 6 (El Pueblo de Los Angeles State Historic Park, Drawing No. 17269, "Project Description & Vicinity"). The El Pueblo boundary along Alameda adjacent to the Project is a continuous straight line with no triangular cut out. Even if the City could provide this surplus land to the Project, SMMC has a right of first refusal under Public Resources Code section 33207(b.) (See discussion, supra pp. 6-8.)

Response GO14-153 Refer to Response GO14-152 for a discussion of the Quitclaim Deed and its applicability to the parcel where the proposed Project's Alameda Station vertical circulation elements would be located. As discussed in GO14-152, the legal descriptions for parcels governed by the Quitclaim Deed are contained in Exhibit A. The sheets provided in Exhibit B, referenced in Footnote 72, are provided for illustrative purposes and should not control over the legal descriptions provided in Exhibit A. As noted in Section 3.05, Cultural Resources, of the Draft EIR, the City of Los Angeles signed an agreement in 1953 with the County of Los Angeles and State of California creating El Pueblo State Historic Park. In cooperation with the City and County, in 1980, the State prepared the El Pueblo General Plan to provide guidelines for the preservation, rehabilitation, and interpretation of the historic buildings as well as for new development within the Park. While the proposed Project is located within the boundaries of the El Pueblo de Los Angeles General Plan, as discussed in Section 3.11, Land Use and Planning, of the Draft EIR, the vertical circulation elements west of the Alameda Station would be introduced within the ROW north of the Placita de Dolores, on the west side of Alameda Street, in a proposed new pedestrian plaza in an area currently containing a parking and loading area for El Pueblo. Although the portions of the proposed Project within the El Pueblo General Plan area would be located entirely within the public ROW, the proposed Project would still be consistent with the El Pueblo General Plan. Refer to Section 3.05 for further discussion of the El Pueblo General Plan, including policies related to the Placita de Dolores and integration with LAUS. Refer to Section 5.0, Corrections and Additions, of this Final EIR, for a discussion of the proposed Project's consistency with the applicable El Pueblo de Los Angeles General Plan goals and objectives. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan. As discussed therein, State Parks has determined that the proposed Project would be inconsistent with the Los Angeles State Historic Park General Plan because the identified land uses in the General Plan's Preferred Park Concept Elements did not contemplate a transit station like the proposed Project's Chinatown/State Park

Station. State Parks considers this inconsistency a potentially significant impact. Therefore, Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain an amendment to the Los Angeles State Historic Park General Plan. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Amendment. Accordingly, no mitigation is required for the proposed Project in relation to the El Pueblo de Los Angeles General Plan, as CEQA Guidelines section 15126.4 only requires mitigation for significant impacts.

Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for a discussion of the Surplus Land Act.

This comment does not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5.

Comment GO14-154 2. The Project conflicts and is inconsistent with numerous land use plans, policies, and regulations adopted for the purpose of avoiding or mitigating environmental effects.

The DEIR asserts the proposed Project is subject to numerous land use plans, policies, and regulations, including, but not limited to (DEIR, pp. 3.11-37 to 3.11-38):

- Los Angeles State Historic Park General Plan
- Dodger Stadium Conditional Use Permit
- City of Los Angeles General Plan, including several community plans
- City of Los Angeles RIO District Ordinance
- Cornfield Arroyo Seco Specific Plan

The DEIR performs a conclusory analysis of the above and other land use plans, policies, and regulations (see Tables 3.11-1 through 3.11-6, DEIR, pp. 3.11-39 to 3.11-73) and concludes that the only land use conflict requiring mitigation is the Project's acknowledged conflict with the LA State Historic Park General Plan. (DEIR, p. 3.11-77.) As discussed above, the Project conflict with LA State Historic Park is significant and unavoidable, and the proposed mitigation to paper over the conflict is legally infeasible. (See discussion, *supra* pp. 12-26.) Likewise, the proposed mitigation for the Project's equally clear conflict with the El Pueblo General Plan is also legally infeasible. (See discussion, *supra* pp. 73-75.)

Response GO14-154 Refer to Section 3.11, Land Use and Planning, of the Draft EIR for a discussion of the proposed Project's consistency with various land use plans, policies, and documents, including the Los Angeles State Historic Park General Plan, the 1960 Dodger Stadium CUP, the City of Los Angeles General Plan, the City of Los Angeles'

River Implementation Overlay District Ordinance, and the Cornfield Arroyo Seco Specific Plan. Section 3.11 provides approximately 40 pages of analysis of the proposed Project's consistency with the various land use plans, policies, and documents affecting the land along the proposed Project's alignment. The EIR is intended to provide environmental review for the proposed Project outlined in Section 2.10, Required Permits and Approvals, of the Draft EIR, inclusive of the City of Los Angeles' approval of a Specific Plan. Refer to Section 3.11, for a discussion of the proposed Project's consistency with various land use planning documents, including the City of Los Angeles General Plan, City of Los Angeles Zoning Code, River Implementation Overlay District, and Cornfield Arroyo Specific Plan. As discussed in Section 3.11, the Project Sponsor is seeking to create a Specific Plan as part of the proposed Project to allow for the proposed Project to be fully consistent with the surrounding zoning and to otherwise provide for the consistent application of Project design standards, limitations and operational measures, as well as relief from the Cornfield Arroyo Specific Plan and River Implementation Overlay District. Accordingly, with these approvals, the proposed Project would not conflict with the applicable land use documents at the time of Project implementation, and the impact would be less than significant. CEQA Guidelines section 15126.4 only requires mitigation for significant impacts. Refer to Response GO14-154 for discussion regarding the LASHP General Plan Amendment and associated mitigation measure. As the agency having land use authority over the park will be the Responsible Agency implementing the General Plan Amendment, there is substantial evidence that any potential inconsistencies with the General Plan will be addressed through that General Plan Amendment process. Refer to Topical Response F, Los Angeles State Historic Park for a discussion of the LASHP General Plan Amendment. Refer to Responses GO14-152 and GO14-153 for a discussion of the proposed Project's consistency with the El Pueblo General Plan.

Comment GO14-155 Without more it is evident that the Project has significant and unavoidable environmental impacts within the land use and planning analysis category. Nonetheless, this letter will briefly touch on some of the more obvious conflicts between the Project and other plans, policies, and regulations discussed in the DEIR.

Response GO14-155 This comment provides a general introduction to the comments raised in this section of this letter related to significant and unavoidable environmental impacts within the land use and planning analysis category. As identified in Section 3.11, Land Use and Planning, of the Draft EIR, a consistency analysis of the proposed Project was conducted with state, regional and local plans and documents. Additionally, as determined in Section 3.11 impacts related to Land Use and Planning from the proposed Project would be less than significant.

Comment GO14-156

GO14-156A LA Park’s Alliance notes that the land use consistency analysis includes many speculative and unsupported claims already mentioned above. For example, and as discussed above, the DEIR repeatedly describes the speculative use of Dodger Stadium Station as an access point for communities adjacent to Dodger Stadium as a Project feature even though that permissive use would require future consideration and is not guaranteed to occur or remain available, the DEIR’s ridership study is entirely speculative and not based on actual data, and the Project itself is not guaranteed to operate every day (as discussed, it will run according to demand, perhaps not at all) and provides priority to Dodger Stadium event ticket holders.

GO14-156B The DEIR also repeats that the travel time from Union Station to Dodger Stadium with the Project is only seven minutes, neglecting to provide any estimate of the total time including queuing/waiting, which is the far more relevant consideration. Any consistency analysis relying on these speculative, unsupported, and incomplete claims is necessarily misleading and inadequate.

Response GO14-156

GO14-156A Refer to Responses GO14-150 through GO14-155 for a discussion of the proposed Project’s consistency with various land use plans. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. As discussed in Section 5.0, Corrections and Additions, of the Final EIR, the proposed Project would provide a mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon. Refer to Response GO14-

143 for discussion of the proposed Project’s ridership model and the proposed Project’s operations. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project’s ridership model which is based on extensive data sources and assumptions validated by data.

GO14-156B

As described in Section 3.17, Transportation, of the Draft EIR, for purposes of the Draft EIR, the transportation analysis included the analyses required by Appendix G of the CEQA Guidelines and the City of Los Angeles Transportation Assessment Guidelines (TAG). Pedestrian queues are not required to be analyzed under CEQA or the TAG. Nevertheless, refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project’s ridership model which is based on extensive data sources and assumptions validated by data, and the management of queuing at stations, which is provided for informational purposes, and pre-game and post-game transportation. Refer to Responses GO14-97 and GO14-98 for additional discussion of the proposed Project’s ridership model.

Comment GO14-157 In addition, because the Project fails to consider the foreseeable development of parking lot areas around Dodger Stadium, any consistency analysis with respect to public services within the City of Los Angeles General Plan (especially its Framework and Land Use Elements) is incomplete and inadequate. These would include plans, goals, policies, and objectives related to police and fire service, parks, libraries, schools, and the like.

Response GO14-157 Refer to Responses GO14-150 through GO14-155 for a discussion of the proposed Project’s consistency with various land use plans. Refer to Responses GO14-56 through GO14-69 for a discussion of how the how the proposed Project solely proposes an aerial gondola system and other uses of the Dodger Stadium property are not reasonably foreseeable requiring analysis in the Draft EIR. Refer to Section 3.15, Public Services, of the Draft EIR for a discussion of how the proposed Project would result in less than significant operational impacts with respect to public services.

Comment GO14-158 Los Angeles State Historic Park General Plan

The DEIR asserts that the “The proposed Project would provide recreation opportunities in coordination with the regional recreation network by providing a connection from the Los Angeles State Historic Park to other local transit lines along the Project alignment and the regional transit system accessible at LAUS...” (DEIR, p. 3.11-39.) The Project is not itself a recreational facility, it is a private transit facility, primarily intended to move people from LA Union Station to Dodger Stadium. Though if the Project were built users could theoretically take it to LA State Historic Park, there is no substantial evidence that people will do so, because a robust public transit system already serves the Park. Ridership studies for the

Project are speculative, as are Project features to allegedly transport persons to the Park, to Elysian Park, and elsewhere other than on game days, when Dodger Stadium ticket holders will have priority.

The DEIR asserts: “The proposed Project would not interfere with the passive uses currently enjoyed at the Los Angeles State Historic Park. The proposed Project’s aerial clearance would allow the continued use of the park, with certain limitations.” (Ibid.) The second sentence negates the first. If limitations are placed on the Park’s use, the Project necessarily interferes with the Park. In fact, the Project would take well over an acre of the Park for private use, not including the remainder parcel created by the Project alignment’s intrusion at the western side of the Park. Park activities in the area of the gondola will be changed, including for major events, when event stages will be forced to find a new location in the Park (causing foreseeable significant indirect physical changes that have not been analyzed in the DEIR).

Response GO14-158 This comment provides a general recitation and characterization of the Draft EIR. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed in Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project’s required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. The majority of the area to the west of the proposed Project’s alignment in Los Angeles State Historic Park is an access road whose use will not be impacted by the proposed Project. Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices of the Draft EIR and Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed project’s ridership model which is based on extensive data sources and assumptions validated by data.

Comment GO14-159 The DEIR’s assertions regarding consistency with the Park’s aesthetic goals are adequately addressed elsewhere in this letter. The Project clearly does not “[p]rotect and enhance scenic viewsheds and features and preserve the visitor’s experience of the surrounding landscape by minimizing adverse impacts to aesthetic resources.” (DEIR, p. 3.11-39.) It does exactly the opposite, harming vital aesthetic, cultural, and historic resources that are protected by the Park’s General Plan and Final EIR document.

Response GO14-159 This comment provides a general summary of the comments raised in this letter related to aesthetic, cultural, and historical resources. Responses to these comments contained in this letter are provided above in Responses GO14-83, GO14-105, and GO14-109 through GO14-147.

Comment GO14-160 The DEIR asserts that the Project’s proposed park amenities would be a visitor benefit. (DEIR, p. 3.11-41.) The Park already has adequate concessions and other park amenities and the proposed amenities are not necessary, and would largely serve to replace existing facilities the Project would destroy. Thus, the DEIR’s assertions regarding Park Facilities Goals are specious – but for the Park’s destruction of existing facilities, development of replacement facilities would not be necessary. Project facilities are not Park facilities, they would merely be located within the Park. Under Public Resources Code section 5019.59, however, they are not permitted. Similarly, the Project is not consistent with the Park’s Education and Interpretation Goal since the Park’s goals do not relate to interpretation of non-Park structures and facilities. That the massive Chinatown/State Park Station might include an exhibit, display, public art, or interpretive display does not diminish the negative impact of its unlawful intrusion.

Response GO14-160 The proposed Project does not propose to demolish nor does it need to demolish the Cargo Snack Shack concession or restrooms. The Project Sponsor would coordinate with State Parks and the concessionaire on the potential to provide alternative seating locations during construction. Through continued collaboration with State Parks which has been ongoing and will continue through the General Plan Amendment process, the proposed Project would be fully integrated into the park such that it would add to, rather than take away from the park’s purpose and objectives. For example, in addition to the concessions, restrooms, and breezeway, the Chinatown/State Park Station would also include a mobility hub where passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program. Pedestrian access enhancements could include pedestrian improvements between Metro’s L Line (Gold) Station and the Chinatown/ State Park Station consistent with the Connect US Action Plan, including hardscape and landscape improvements, shade structures, and potential seating, as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge. The Chinatown/State Park Station would provide passenger access to Chinatown, LASHP, and to nearby neighborhoods and land uses, including

the Mission Junction neighborhood, which includes the William Mead Homes public housing complex. In addition, the station canopy would provide much needed shade. As discussed in Topical Response F, Los Angeles State Historic Park, the Project Sponsor would work with State Parks through the General Plan Amendment process to develop an “Interpretation Plan” to identify unique ways to use the proposed Project to provide interpretation for the park and its history. The Interpretation Plan would help ensure that the proposed Project is a benefit to Los Angeles State Historic Park by providing visitors with, consistent with the park’s existing General Plan, an engaging and informative experience that deepens their understanding and appreciation of Los Angeles State Historic Park’s culture and history as a former and current (should the Project be developed) transportation hub. Refer to Topical Response F, for a discussion of the legal framework that allows the California Department of Parks and Recreation to permit the Project’s use of Los Angeles State Historic Park.

Comment GO14-161 As already discussed, the Project does not assist the Park in meeting its Access and Circulation Goal. The Park’s existing access is sufficient to welcome pedestrians, cyclists, and a small number of vehicles. Public transit access is readily available through Metro’s nearby Gold Line station and on public bus lines. The Project would not “create a sense of entry and arrival at the Park” (DEIR, p. 3.11-42), it would completely obscure the Park’s existing entry. (See discussion and images, supra p. 60.) Further, additional access is not required, and the DEIR provides no substantial evidence to support that a significant number of people would use the Project for the purpose of traveling to the Park. Per the DEIR’s own study, at most 10% of visitors to special events might use the gondola to arrive, meaning 90% of visitors will not experience the “sense of entry” the Project would impose in achieving its true objective.

Response GO14-161 Refer to Response GO14-160 for a discussion of how the proposed Project will be integrated into the park and also the proposed Project’s benefits to park access. Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices of the Draft EIR and Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project’s ridership model which is based on extensive data sources and assumptions validated by data. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project’s Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less.

Comment GO14-162 Dodger Stadium Conditional Use Permit

The DEIR asserts that the Project is consistent with the Dodger Stadium Conditional Use Permit. (DEIR, 3.11-43.) But the DEIR provides analysis of exactly two of the CUP conditions (conditions 1 and 3). (Ibid.) Elsewhere, the DEIR describes that a Plan Approval for the Conditional Use Permit is necessary, while adding that

condition 4 of the CUP provides for “collaboration ‘in devising mass transportation service to the Stadium site...’” (DEIR, 2-62.) The consistency analysis describes no conflict with the CUP. But there logically must be a conflict, or at least a potential conflict, or no Plan Approval would be necessary. The DEIR’s consistency analysis is therefore incomplete and inadequate for failing to provide the necessary information to determine whether the Project is or is not consistent with the CUP.

Response GO14-162 Refer to Section 2.10, Required Permits and Approvals, and Section 3.11, Land Use, of the Draft EIR, noting that, pursuant to Los Angeles Municipal Code (“LAMC”) section 12.24.M, the Project Sponsor may seek a Plan Approval for the existing 1960 Dodger Stadium Conditional Use Permit (“CUP”) to implement the proposed Project. CUP Condition 4 provides for collaboration “in devising mass transportation service to the Stadium site which will be sufficiently efficient to encourage patronage thereof and thus reduce the number of private automobiles driven to the Stadium events.” Refer to pages 3.11-17 through 3.11-18, of Section 3.11, Land Use, of the Draft EIR, for a discussion of the CUP’s requirements. An analysis of the proposed Project’s consistency with the CUP and the CUP’s requirements is provided on page 3.11-43, identifying the pertinent requirements of the CUP. Section 3.11 also recognizes that the Plan Approval could allow for an exception from the Stadium Tower and Dodger Stadium Station site’s height district designation, as the Stadium Tower and Dodger Stadium Station would exceed these limits. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., CEQA Guidelines § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts.

Comment GO14-163 City of Los Angeles – Framework Element

The consistency analysis with the City of Los Angeles Framework Element is notable more for what it leaves out of the analysis than what it includes. The DEIR asserts that the Project is consistent with Objective 6.2 of chapter of the Framework Element. (DEIR, p. 3.11-49.) While the Project theoretically would add an additional private transit option to transport persons from Union Station to LA State Historic Park (when it is running and not prioritizing Dodger Stadium event patrons), the DEIR provides little evidence a significant number of persons will use it instead of the existing and readily available Metro Gold Line, bus lines, or other options such as walking or riding a bicycle. The proposed Project’s consistency with Objective 6.2 is therefore speculative. Consistency with the Framework Element’s Transportation policy is similarly deficient.

Response GO14-163 Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of how the underlying factors that would influence pre-game/event and post-game/event travel conditions and

ridership are built into the ridership model developed for the proposed Project based on extensive data sources and assumptions validated by data.

As identified in Section 3.11, Land Use and Planning, of the Draft EIR, a consistency analysis of the proposed Project was conducted with state, regional and local plans and documents including the City of Los Angeles Framework Element. As discussed in Section 3.11, the proposed Project would expand mobility and accessibility for transit riders in the region by providing high-capacity aerial rapid transit connecting the regional transit system at LAUS, Dodger Stadium, the Los Angeles State Historic Park, Elysian Park, and surrounding communities. Implementation of the proposed Project would create new and improve existing connections not only to communities along the Project alignment, but also to other area transit lines and stations, including the regional transit lines served by LAUS, and several regional and local bus lines serving the Project Study Area. As stated in Section 3.11, potential impacts related to Land Use and Planning from the proposed Project would be less than significant.

Comment GO14-164 The Framework Element consistency analysis omits Objective 3.17: “Maintain significant historic and architectural districts while allowing for the development of economically viable uses.” (Framework Element, Chapter 3.)⁷³

The Framework Element consistency analysis omits discussion of Goal 6A and Objective 6.1, which are particularly relevant to the numerous parks adversely impacted by the Project, particularly LA State Historic Park.

Framework Element Goal 6A: “An integrated citywide/regional public and private open space system that serves and is accessible by the City's population and is unthreatened by encroachment from other land uses.”

Framework Element Objective 6.1: Protect the City's natural settings from the encroachment of urban development, allowing for the development, use, management, and maintenance of each component of the City's natural resources to contribute to the sustainability of the region. (Framework Element, Chapter 6.)

The DEIR's reliance on speculative and unsupported claims and omission of highly relevant goals and objectives causes the Framework Element consistency analysis to be invalid.

Footnote 73: The City of Los Angeles Framework Element is currently available at: <https://planning.lacity.org/planspolicies/framework-element> (last viewed Jan. 14, 2023).

Response GO14-164 The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource

Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Refer to Section 3.05, Cultural Resources, of the Draft EIR, for discussion of City of Los Angeles General Plan objectives and policies related to the protection of archaeological, paleontological, cultural, and historic resources. As identified in Section 3.11, Land Use and Planning, of the Draft EIR, a consistency analysis of the proposed Project was conducted with state, regional and local plans and documents, including the City of Los Angeles Framework Element. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

In addition, the Chinatown/State Park Station would be located adjacent to Spring Street in the southernmost portion of the Los Angeles State Historic Park. Due to its densely developed and urbanized nature, the Project area provides little opportunity for wildlife species or other biological and other natural resources to exist. No natural habitats occur in the Biological Survey Area (BSA), and there are no Habitat Conservation Plans or Natural Community Conservation Plans that overlap with the (BSA). Due to the location of the proposed Project alignment, which crosses over a small portion of the park, the proposed Project does not significantly impact recreational area within the Los Angeles State Historic Park.

Further, as discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project

would have less than significant operational impacts, including to Los Angeles State Historic Park. Therefore, the proposed Project would be consistent with these Objectives, as the proposed Project is not a threat to encroachment upon open space, but provides an additional transit option between the region's transportation hub at LAUS and the Los Angeles State Historic Park and Elysian Park, consistent with the goal to provide an accessible and integrated open space system. The proposed Project's limited footprint in the Los Angeles State Historic Park still allows for the use of the vast majority of the Park. Further, as noted above, the proposed Project would have less than significant operational impacts with respect to Biological Resources and Parks and Recreational Facilities, and therefore would not encroach upon the City's natural resources.

Nevertheless, under CEQA Guidelines section 15125(d), an EIR must discuss "any inconsistencies between the proposed project and applicable general plans, specific plans, and regional plans," and does not require a discussion where the proposed project would be consistent with such plans. Accordingly, the Draft EIR was not required to discuss consistency with each and every plan or policy. Further, under the Planning and Zoning Law (Government Code §§ 65000-66499.58), strict conformity with all aspects of a general plan is not required. A proposed project should be considered consistent with the local general plan if it furthers one or more policies and does not obstruct other policies. As discussed in Section 3.11, Land Use and Planning, of the Draft EIR, the proposed Project would be consistent with the City of Los Angeles General Plan's applicable goals and policies, and would not otherwise obstruct the obtainment of other goals and policies.

Comment GO14-165 Central City Community Plan

Within the Project area, the Central City Community Plan touches only El Pueblo de Los Angeles Historical Monument, so it is only nominally relevant to the Project, and is largely superseded by land use regulations of the El Pueblo General Plan, with which the Project is clearly inconsistent. (See discussion, *supra* pp. 73-75.) As discussed above, the consistency analysis relies on speculative and unsupported claims regarding Project availability to community members and Project ridership and is therefore invalid. With respect to connections to LA State Historic Park, the Project allegedly provides a transit connection that is duplicative of existing robust public transit options, walking, and cycling.

Response GO14-165 Refer to pages 3.11-47 through 3.11-56 of Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project's consistency with applicable City General Plan polices, including with the Central City Community Plan policies and guidelines. As discussed on page 3.11-7, the portion of the Alameda Station located over the west side of Alameda Street and the suspended above-grade cables and cabins from Alameda Station north to Cesar E. Chavez Avenue is within the boundaries of the Central City Community Plan. Refer to Responses GO14-152 and GO14-153 for a discussion of the proposed Project's consistency with the El

Pueblo de Los Angeles General Plan. Refer to Section 3.17, Transportation and Appendix N, Transportation Appendices, of the Draft EIR and Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data. As discussed in Section 3.11, the proposed Project would expand mobility and accessibility for transit riders in the region by providing high-capacity aerial rapid transit connecting the regional transit system at LAUS, Dodger Stadium, the Los Angeles State Historic Park, Elysian Park, and surrounding communities. Implementation of the proposed Project would create new and improve existing connections not only to communities along the Project alignment, but also to other area transit lines and stations, including the regional transit lines served by LAUS, and several regional and local bus lines serving the Project Study Area. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less.

Comment GO14-166 As in the Framework Element, the Central City Community Plan Element leaves out important objectives and policies. The analysis is incomplete without considering Objective 9.2: "To provide the requisite services, housing opportunities, and community environments to allow the homeless to rejoin the workforce and lead more productive lives." The Project seeks to utilize City surplus land that would be better used for development of affordable housing and job creation and is known to conflict with longstanding community development plans in the area of the Project's Alameda and Alpine Towers. The Project is not only inconsistent with but blocks the attainment of Objective 9.2.

The Central City Community Plan also includes Objective 11-7: "To provide sufficient parking to satisfy short-term retail/business users and visitors but still find ways to encourage long-term office commuters to use alternate modes of access." Objective 11-8: "To evaluate, study and monitor current parking policies to assess parking demand as a result of changes in development trends, the growing downtown residential community and the general intensification of land use in the Central City area as surface parking lots become developed with other uses." As discussed elsewhere, the claimed benefit of high rate of public transit use for the Project and removal of vehicles from Project area roadways is speculative and highly inflated.⁷⁴ Legitimate fears of gondola users driving downtown and inundating the neighborhoods around Union Station and the LA State Historic Park have been a concern of community members since the Project was first made public. The DEIR's failure to address these legitimate concerns, which are consistent with issues identified in the Central City Community Plan by providing even a cursory analysis of the Project's consistency with Objectives 11-7 and 11-8 is puzzling.

Footnote 74: See UCLA Mobility Study, *supra* p. 48 fn. 47 (Exhibit P).

Response GO14-166 Refer to pages 3.11-47 through 3.11-56 of Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with applicable City General Plan polices, including with the Central City Community Plan policies and guidelines. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefit to the surrounding community, including but not limited to sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features.

Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR, and Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project’s ridership model which is based on extensive data sources and assumptions validated by data. Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and Appendix N, Transportation Appendices of the Draft EIR.²² Stantec is an internationally-respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR.

Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study, attached to this letter as Exhibit P. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a

Statement from the UCLA Mobility Lab Regarding LA Gondola Ridership Projection

The UCLA Mobility Lab is an engineering and technology lab dedicated to scientific research and innovation around mobility technologies. The lab’s data on projected transit ridership of a proposed Dodger Stadium gondola is preliminary in nature. More research would be necessary to draw conclusions about potential use of the gondola. The lab takes no view on whether the project should be built.

Jiaqi Ma

Director, UCLA Mobility Lab

Faculty Associate Director, UCLA Institute of Transportation Studies

²² Stantec. 2023. Memo to Holly Rockwell Regarding Los Angeles Aerial Rapid Transit (LA ART) Project Transportation Analysis Peer Review.

comment on the proposed Project’s Draft EIR, and does not appear to have been prepared for that purpose. On January 13, 2023, the Mobility Lab issued the following statement regarding the Mobility Lab Study:

Under CEQA Guidelines section 15125(d), an EIR must discuss "any inconsistencies between the proposed project and applicable general plans, specific plans, and regional plans," and does not require a discussion where the proposed project would be consistent with such plans. No analysis is required if the proposed project is consistent with the plan. Accordingly, the Draft EIR was not required to discuss consistency with each and every plan or policy. As discussed in Section 3.11, the proposed Project would be consistent with the Central City Community Plan’s applicable goals and policies, and would not otherwise obstruct the obtainment of other goals and policies.

Nevertheless, while Central City Community Plan Objective 9.2 is inapplicable to the proposed Project as an aerial rapid transit project, it would not obstruct the obtainment of this objective to provide homeless services and housing opportunities. As discussed in Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, the Alpine Tower’s location considered and avoided the anticipated 903 North Main Street Homeboy housing project and the proposed Project’s Alameda Tower would not impede The California Endowment’s potential use of the Alameda Triangle for recreational spaces. Rather, implementation of the proposed Project would provide additional access and mobility by providing a transit option to/from LAUS and Chinatown and other employment areas in downtown Los Angeles that would avoid congested local roadways and provide a transit option to Dodger Stadium on game days and for special events that would bypass typical vehicle traffic. Therefore, the proposed Project would not displace housing, but would provide a benefit to existing residents in the area.

Regarding Central City Community Plan Objectives 11-7 and 11-8, refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles, thereby encouraging alternative modes of access. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park.

Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines (“TAG”). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project’s potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As

recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations. The proposed Project is therefore consistent with Central City Community Plan Objectives 11-7 and 11-8.

Comment GO14-167 Central City North Community Plan

The Central City North Community Plan consistency analysis relies on the same speculative and unsupported claims regarding Project availability to community members and Project ridership as the Central City Community Plan and is likewise invalid. The Project’s transit connection with LA State Historic Park is duplicative of existing options and there is no substantial evidence of a need for the service for that purpose.

The discussion of Goal 12 (“Encourage alternative modes of transportation to the use of single vehicle occupant trips...”) is curious, since the primary purpose of the Project is transporting Dodger Stadium game and event patrons, and the average number of persons per vehicle to Dodger Stadium is 3.6.⁷⁵ The primary purpose of the Project would thus not reduce single vehicle occupant trips. (This point is equally applicable to Silver Lake-Echo Park-Elysian Valley Community Plan Goal 11, which is identical to Central City North’s Goal 12.)

Footnote 75: See UCLA Mobility Study (Exhibit P), p. 3; accord, Dodger Stadium Conditional Use Permit (DEIR, p. 3.11-43).

Response GO14-167 As identified in Section 3.11, Land Use and Planning, of the Draft EIR, a consistency analysis of the proposed Project was conducted with state, regional and local plans and documents including the City of Los Angeles Central City North Community Plan. Refer to Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR and Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project’s ridership model which is based on extensive data sources and assumptions validated by data. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project’s Chinatown/ State Park Station would

be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less. As discussed in Section 3.11, Land Use and Planning, of the Draft EIR, the proposed Project would expand mobility and accessibility for transit riders in the region by providing high-capacity aerial rapid transit connecting the regional transit system at LAUS, Dodger Stadium, the Los Angeles State Historic Park, Elysian Park, and surrounding communities. Implementation of the proposed Project would create new and improve existing connections not only to communities along the Project alignment, but also to other area transit lines and stations, including the regional transit lines served by LAUS, and several regional and local bus lines serving the Project Study Area. Located within a short walk to many Chinatown businesses and Metro's L Line (Gold), this Chinatown/State Park Station also addresses the goal of creating a stronger connection with the Metro L Line and would also enhance transit access to the Los Angeles State Historic Park, Mission Junction, William Mead Homes, and the Los Angeles River. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project's Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less. Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study, attached to this letter as Exhibit P. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project's Draft EIR, and does not appear to have been prepared for that purpose.

Comment GO14-168 Relevant Objectives and supporting policies omitted from the Central City North Community Plan consistency analysis include Objective 1-4: "To promote and insure the provision of adequate housing for all persons regardless of income, age, or ethnic background." As in the consistency analysis of the Central City Community Plan with its Objective 9-2, the Project is not consistent with this objective since it seeks to take City surplus land in the Community Plan area very well suited to the development of affordable housing and conveniently located near existing public transit options. The Project is also not consistent with Goal 4 and Objective 4-1, which calls for the conservation of existing recreation and park facilities. The Project would reduce available park space at LA State Historic Park by well over an acre before considering the loss of the remainder parcel to the west of the proposed Project alignment. Similarly, the Project is not consistent with Goal 5 and Objective 5-1, "[t]o preserve existing open space resources..." (Emphasis added.)

Response GO14-168 Refer to Section 3.14, Population and Housing, of the Draft EIR for a discussion of applicable policies related to housing, including from the Central City North Community Plan. As identified in Section 3.11, Land Use and Planning, of the Draft EIR, a consistency analysis of the proposed Project was conducted with state, regional and local plans and documents including the City of Los Angeles Central City North Community Plan. Refer to Topical Response E, The Proposed Project Will

Not Displace Housing or Prevent Planned Housing, for discussion of how the proposed Project will not displace housing or prevent planned housing. In addition, refer to Topical Response E for a discussion of the Surplus Land Act. Accordingly, the proposed Project would not prohibit the obtainment of Objective 1-4, and therefore is consistent with this Objective. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. Therefore, the proposed Project would be consistent with Goals 4 and 5, and Objectives 4-1 and 5-1. Under CEQA Guidelines section 15125(d), an EIR must discuss "any inconsistencies between the proposed project and applicable general plans, specific plans, and regional plans," and does not require a discussion where the proposed project would be consistent with such plans. No analysis is required if the proposed project is consistent with the plan. Accordingly, the Draft EIR was not required to discuss consistency with each and every plan or policy. As discussed in Section 3.11, the proposed Project would be consistent with the Central City North Community Plan's applicable goals and policies, and would not otherwise obstruct the obtainment of other goals and policies.

Comment GO14-169 Finally, there can be no doubt that a consistency analysis with the Central City North Community Plan cannot be considered complete without a serious discussion of Goal 17 and its supporting Objective 17-1: "To ensure that the Community's historically significant resources are protected, preserved, and/or enhanced."

Response GO14-169 As identified in Section 3.11, Land Use and Planning, of the Draft EIR, a consistency analysis of the proposed Project was conducted with state, regional and local plans and documents including the Central City North Community Plan. As discussed in Section 3.05, Cultural Resources, of the Draft EIR, Goal 17 of the Central City North Community Plan states "Preservation and restoration of cultural resources, neighborhoods, and landmarks which have historical and/or cultural significance."

Objective 17-1 states, “To ensure that the Community’s historically significant resources are protected, preserved, and/or enhanced.”

The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation.

Under CEQA Guidelines section 15125(d), an EIR must discuss “any inconsistencies between the proposed project and applicable general plans, specific plans, and regional plans,” and does not require a discussion where the proposed project would be consistent with such plans. No analysis is required if the proposed project is consistent with the plan. Accordingly, the Draft EIR was not required to discuss consistency with each and every plan or policy. As discussed in Section 3.11, the proposed Project would be consistent with the Central City North Community Plan’s applicable goals and policies, and would not otherwise obstruct the obtainment of other goals and policies, including policies related to the preservation of cultural resources, as the proposed Project’s potential impacts to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation.

Comment GO14-170 “RIO” River Improvement Overlay District

While LA Parks Alliance does not believe the Project is consistent with the RIO District, and the consistency analysis relies largely on speculative, unsupported, and incomplete information, the primary conflict with RIO that is not adequately discussed in the DEIR is with respect to the potential for light intrusion, particularly from potential electronic digital displays that are described as possible for gondola cabins. The consistency analysis should therefore be revised and recirculated for additional public review and comment.

Response GO14-170 As identified in Section 3.11, Land Use and Planning, of the Draft EIR, a consistency analysis of the proposed Project was conducted with state, regional and local plans and documents including the River Improvement Overlay District (RIO District). Specifically, the proposed Project’s consistency with the RIO District and its applicable goals and objectives is discussed on pages 3.11-68 through 3.11-73 in Section 3.11 of the Draft EIR. Project lighting would include low-level lighting for security and wayfinding purposes. Exterior lighting adjacent to stations and towers would be shielded or directed toward the areas to be lit to limit spillover onto

adjacent properties and off-site uses and would meet all applicable LAMC lighting standards. With respect to the existing RIO District guidance, and as discussed in Section 3.01, Aesthetics, the lighting of the proposed Project would exceed RIO requirements in certain locations along the alignment. However, these locations are in urban areas with existing lighting that exceeds RIO requirements, as they require higher illuminance for safety and security. Further, the proposed Project sites within the RIO are located more than 2,600 feet from the Los Angeles River, and therefore have no direct influence on the lighting within or adjacent to the Los Angeles River. In addition, the proposed Project includes a proposed Specific Plan to establish the land use regulations for the Project, including lighting standards, to ensure consistent implementation of development standards throughout the Project sites in recognition of the Project's unique characteristics, including unique opportunities for public benefits and unique constraints posed by the Project site's location which are not experienced by other sites. The RIO does not impose any limits on the size, use, height and/or setbacks of a building beyond what is restricted by the prevailing zoning and building codes. The proposed Project would not change the current uses of RIO District parcels on which the project is constructed or adjacent to. Table 3.11-6, Project Consistency with Applicable RIO District Objectives, in Section 3.11, Land Use and Planning, of the Draft EIR demonstrates how the proposed Project would be consistent with applicable objectives for the RIO District. As such, the proposed Project would not conflict with the implementation of the design guidelines under the RIO on adjacent properties. Therefore, impacts related to consistency with the RIO would be less than significant.

Comment GO14-171 Cornfield Arroyo Seco Specific Plan

The Project seeks an exception from the Cornfield Arroyo Seco Specific Plan ("CASP") and to create a Specific Plan to benefit the project and relieve it from otherwise applicable City of Los Angeles zoning regulations and to allow construction of the Chinatown/State Park Station. (DEIR, p. 3.11-63.) Though the DEIR asserts that "the provision of a station at this location would be consistent with the overall intent of the CASP..." (ibid.) that is a legal impossibility. If the Project were consistent with the CASP it would not need an exception to the CASP. (In the City of Los Angeles, a specific plan "exception" is essentially equivalent to a variance.)

Response GO14-171 As identified in Section 3.11, Land Use and Planning, of the Draft EIR, a consistency analysis of the proposed Project was conducted with state, regional and local plans and documents including the Cornfield Arroyo Seco Specific Plan (CASP). The Chinatown/State Park Station and portion of the suspended above-grade cables and cabins from West College Street to the northern boundary of the Los Angeles State Historic Park would be located within the boundaries of the CASP, which designates the park as Open Space. Although the northern portion of the

Chinatown/State Park Station would be integrated into existing State-owned park land, and, thus, is not subject to local requirements, permits, or approvals for development on this property, the Chinatown/State Park Station would still be consistent with the CASP, which allows for mobility hub amenity and transit hub amenity uses on land designated for Open Space. Additionally, the provision of a station at this location would be consistent with the overall intent of the CASP as a point of local and regional connectivity by alternative means of transportation including increased transit, pedestrian, and bicycle use, reducing vehicle trips through and within the area, all while providing an area of increasingly accessible open space. The Chinatown/State Park Station and portion of the suspended above-grade cables and cabins within the CASP would provide a new transit stop to bring residents and visitors to the existing open space and recreational opportunities within the park, keeping consistent with the plan's objectives. The Chinatown/State Park Station would include a mobility hub, where passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program, consistent with the CASP's zoning regulations.

As noted in Section 3.11, Land Use and Planning, of the Draft EIR, pursuant to Los Angeles Municipal Code (LAMC) section 11.5.7.F, the Project Sponsor is seeking an exception from the CASP to allow for the Chinatown/State Park Station. Approval of the amendment to LAMC would allow for the proposed Project to be fully consistent with the surrounding zoning, as the proposed Project is already generally consistent with the surrounding area, which includes Metro's L Line (Gold). With approval of the amendments to the zoning code, development of the Chinatown/State Park Station would not conflict with the applicable LAMC requirements at the time of Project implementation, and the impact would be less than significant.

As the lead agency, Metro is required to assume that the proposed Project would be approved, constructed, and operational in drafting the EIR. Refer to Section 2.0, Project Description, of the Draft EIR, for a list of the land use approvals that may be required for implementation of the proposed Project, including a potential exception from the CASP. These approvals are included in the proposed Project Description, and therefore Metro properly analyzed the proposed Project's environmental impacts as if the proposed Project would be approved by all applicable agencies, inclusive of these approvals.

Comment GO14-172 I. The Failure to Mitigate Temporary Loss of Access to Substantial Portions of LA State Historic Park is Impermissible.

The DEIR notes that “[c]onstruction of the Chinatown/State Park Station would require the temporary closure of approximately 1.59 acres of the southern entrance to Los Angeles State Historic Park during the approximately 19 months for the construction of the Chinatown/State Park Station.” (DEIR, p. 3.16-16.) The DEIR finds the closure is not significant, justifying its conclusion by comparing loss of this land to park patrons for more than a year and a half to the Park's occasional closure

for special events. The comparison is inapt. The DEIR's conclusion does not evince that the determination was made using "careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data." (CEQA Guidelines, § 15064, subd. (b)(1).)

Though not offered in mitigation, since the DEIR has determined the loss is not significant, Metro essentially suggests park visitors can just suck it up—go someplace else, use some other part of the Park, or perhaps just skip going to local parks until the Project is complete. This is unacceptable, especially in light of the identified significant and unavoidable noise impacts to the Park, for which no mitigation has been identified.

The DEIR is inadequate for failing to adequately analyze whether the temporary loss of 1.59 acres of LA State Historic Park near its southwest entrance is significant, and if it is significant, for failing any attempt to mitigate the significant impact.

Response GO14-172 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. The Draft EIR addresses the temporary closure of a portion of Angeles State Historic Park in Section 3.16, Parks and Recreational Facilities. As discussed on page 3.16-16 of the Draft EIR, construction of the Chinatown/State Park Station would not require any closures of areas used for recreation. The Draft EIR analyzed all potential environmental impacts to the Los Angeles State Historic Park, including in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Consideration. Refer to Section 3.16, Parks and Recreational Facilities, for a discussion of how construction of the proposed Project would result in less than significant impacts to the Los Angeles State Historic Park.

As discussed on pages 3.16-16 to 3.16-17 and 3.16-22, in Section 3.16 of the Draft EIR, while construction of the proposed Project would require a brief and temporary closure of the southernmost corner and western edge of the Los Angeles State Historic Park beneath the cables for safety purposes, other options for pedestrian access, including the provision of pedestrian detours during construction, would allow for continued pedestrian access within the Project area. In addition, park patrons would still be able to access approximately 30 acres of the 32-acre Los Angeles State Historic Park, including all the recreational areas, during construction activities within the park. In addition, regular park patrons are familiar with temporary park closures as they often occur in conjunction with concerts, fairs, and festivals that take place within the park throughout the year. It is not anticipated that construction activities at the southernmost portion of the park would increase the use in other areas of the park or at other parks and recreation

facilities such that substantial physical deterioration of the facility would occur or be accelerated as the portion where construction activities are occurring is primarily landscape and hardscape. As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers' market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park.

Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction and operational noise impacts from the proposed Project, including to the Los Angeles State Historic Park. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation. Operational noise impacts would be less than significant.

Comment GO14-173 J. The Project Alternatives Section Must be Revised to Include Additional Feasible Alternatives, Including a Revised TSM Alternative.

The DEIR identifies the Transportation Systems Management (TSM) Alternative as the Environmentally Superior Alternative, but goes to great lengths to argue the alternative meets too few project objectives to be worthy of consideration.

But this is only because the project alternatives are constrained by artificially narrow project objectives. (See discussion, *supra* pp. 43-46; see also WATER, 78 Cal.App.5th at 692.) Of the objectives the DEIR asserts the TSM alternative does not meet, four are the result of project objectives plainly chosen to favor the aerial rapid transit system over other feasible alternatives, defining the feasible TSM alternatives out of consideration (these are objectives 2, 7, 8, and 12). The DEIR's support for its conclusion that the preferred alternative meets two others is largely speculative, not based on substantial evidence, and the result of ignoring reasonably foreseeable indirect changes in the environment due to the project (these are objectives 5 and 9). The remaining two objectives could easily be met by the TSM Alternative with only minor modifications (objectives 10 and 11). (In fact,

it is unclear why Metro would not attempt to meet objective 11 in all transportation projects it considers—why would it purposely design a project alternative in a way that doesn't attempt to minimize the alternative's environmental footprint?)

The TSM Alternative's design suffers from a conveniently terrible lack of imagination considering it is proposed by one of California's largest public transportation agencies, serving the largest county (by population) in the United States, for a project that was initially proposed to Metro's "Office of Extraordinary Innovation."

The TSM Alternative should be minimally revised:

- To travel not only from LA Union Station, but from other sites Metro identifies as appropriate collection points (noting that the current DSE already operates a line directly from the South Bay);
- To use electric buses, which would eliminate GHG emissions in the Project area, the same as the preferred alternative.

Additional benefits of the revised TSM Alternative would be an expanded fleet of electric buses, which would not be required to travel within only the Project area, but which could be readily available for other uses when not needed for transit to Dodger Stadium games and events. These uses have the potential to greatly reduce VMT and GHG not only within the Project area, but over the entire Metro service area.

Response GO14-173 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the proposed Project's objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project's fundamental purpose of providing a permanent transit connection to Dodger Stadium. Refer to Response GO14-88 for discussion of how the proposed Project's objectives are consistent with CEQA and do not unnecessarily preclude feasible project alternatives. As discussed in Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. Refer to Response GO14-91 for discussion of a system of buses from numerous remote locations throughout the Los Angeles region to

and from Dodger Stadium events. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region.

Comment GO14-174 Other feasible alternatives to consider are included in the 1990 LACTC Study. (See discussion, supra p. 42 fn. 43 (Exhibit O).) Particularly worthy of consideration is the escalator/walkway option, which has a very large capacity (approaching half of the stadium capacity), relatively low cost, and low total travel time (including waiting and boarding). (Id., pdf. p. 7.)

Response GO14-174 Refer to Response GO14-86 for a detailed response to the 1990 Dodger Stadium Transit Access Study prepared by Gruen Associates for Los Angeles County Transportation Commission. Refer to Section 5.0, Corrections and Additions, of this Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. While this alternative would provide improved pedestrian connections compared to existing conditions, the 25 minute plus travel time from the Metro L Line (Gold) Station to the location of the proposed Dodger Stadium Station would be at least nine times greater than the three minute travel time between those two locations with the proposed Project, and this alternative would be unlikely to attract substantially more people to walk to Dodger Stadium compared to existing conditions given the travel time and the physical exertion. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project.

Comment GO14-175 CONCLUSION

Based on all of the above and on other comments and objections by others incorporated by reference herein, the Draft Environmental Impact Report must be revised and recirculated or the Project must be withdrawn from consideration and the environmental review terminated.

Thank you for your consideration of these comments.

Sincerely,

John Given

Response GO14-175 This comment provides a general conclusion regarding the comments raised in this letter. Responses to all comments contained in this letter are provided in Comments GO14-2 through GO14-175. This comment and the comments raised in

this letter do not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5.

Comment Letter GO15 – Homeboy Industries

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO15

Comment GO15-1 Dear Mr. Zelmer:

I am writing on behalf of Homeboy Industries in response to the Draft Environmental Impact Report (DEIR) issued by your agency for the proposed gondola from Union Station to the Dodger Stadium parking lots.

Response GO15-1 This comment provides a general introduction to the comments raised in this letter. Responses to comments contained in this letter are provided below in Responses GO15-2 through GO15-16.

Comment GO15-2 Homeboy Industries stands to be one of the most heavily impacted community stakeholders if the gondola is allowed to proceed as proposed. We will be affected with significant unmitigated environmental impacts during construction and by permanent effects on our operations.

Response GO15-2 Refer to Section 2.0, Project Description, and Appendix B, Construction Assumptions, of the Draft EIR, for discussion of the construction of the proposed Project. As discussed on page ES-17 of the Executive Summary of the Draft EIR, based on the analysis contained in Section 3.0, Environmental Setting, Impacts, and Mitigation, construction of the proposed Project would result in significant and unavoidable cumulative impacts with regard to Noise and Vibration (human annoyance). As demonstrated in the Executive Summary to the Draft EIR, the proposed Project would not result in any other significant and unavoidable construction impacts. Refer to Responses GO15-8 and GO15-9 for detailed discussion of construction noise impacts. Refer to Section 3.17, Transportation, of the Draft EIR, for discussion of the proposed Project's maintenance of local and emergency access during construction. Refer to Topical Response C, Project Features, for discussion of the Business and Community Support Program during construction of the proposed Project. The proposed Project would not result in any significant and unavoidable operational impacts.

Comment GO15-3 We refer you to our letter to Metro dated November 16, 2020 for a detailed enumeration of our original concerns. While we concur generally with other community stakeholders in their current comments on the DEIR, we would like to point out the following areas of specific concern to Homeboy.

First of all, the document refers to Homeboy Industries as an "office building." The DEIR assesses potential environmental impacts against standards applicable to commercial structures. Homeboy Industries is, in fact, much more than an office; it is a highly-venerated, community-based non-profit that is the largest gang rehabilitation and re-entry program in the world. We provide training and support for

thousands of formerly gang-involved and previously incarcerated people, allowing them to redirect their lives and become contributing members of our community.

Many of our activities take place in and around our headquarters campus at 130 Bruno Street in Los Angeles. Any analyses of the potential impacts from the gondola should take into consideration the many community meetings, job training activities, spiritual counseling and other activities that take place at this location. It is truly a “sensitive receptor.” In the near future we also hope to provide transitional housing for some of our clients on this site.

Response GO15-3 The Draft EIR analyzed the potential construction and operational impacts to Homeboy Industries in Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR. For example, refer to Section 3.03, Air Quality, of the Draft EIR, for discussion of sensitive receptors in the air quality context. In addition, refer to Section 3.13, Noise, of the Draft EIR for discussion of identification of Noise-Sensitive receptors (NSR) and Vibration-Sensitive receptors (VSR) in the noise and vibration context. As detailed in Responses GO15-8 and GO15-9, Homeboy Industries was considered a sensitive receptor for purposes of the assessment of noise and vibration impacts in Section 3.13, Noise, of the Draft EIR.

Comment GO15-4 Following the outline of the DEIR, we note these areas of greatest concern:

1. Project Description

Because of the scale of drawings, it is difficult to ascertain whether the proposed project would require an aerial easement or easement buffer on Homeboy’s current premises. Could you provide a larger scale drawing depicting where these zones might impinge.

Response GO15-4 Refer to Section 2.0, Project Description, of the Draft EIR, which details the proposed Project’s alignment, noting that the proposed Project alignment was chosen as it maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties, taking into account existing and future adjacent land uses. Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR includes additional detail and graphics as to the proposed Project alignment, including portions of the alignment over public ROW, publicly owned property, and private properties. The proposed alignment profile also is provided in Appendix Q, Proposed Alignment Plan and Profile. In response to comments that the graphics included in Appendix Q, Proposed Alignment Plan and Profile, are not readable due to the scale of the graphics, Appendix Q has been updated to add larger inlets of several graphics. Appendix O, Supplemental Graphics of Proposed Project Plan and Profile, of this Final EIR includes larger scale version of these graphic. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project would meet and anticipates exceeding the American National Standards Institute (ANSI) Standard B77.1, which regulates vertical and horizontal clearances. ANSI B77.1 includes two criteria, both of which must be met, for horizontal clearance between the cabin and

an adjacent element: when hanging vertically, the cabins must be no closer than five feet to any obstruction that is not part of the ropeway system; and when the cabins are tilted within a prescribed range (as from wind), the cabins must not come into contact with anything. For the proposed Project, the five-foot requirement is slightly wider than the swing requirement, so the five-foot requirement controls the design path width. The proposed Project would include five feet on each side of the vertically hanging cabins for a required aerial clearance width of 53 feet 2 inches. Based on the current design, the Additional Separation Buffer is estimated to be approximately 10 feet on each side of the required aerial clearance width. Figure 2-8 in Section 2.0, Project Description, of the Draft EIR, shows the portions of the proposed alignment over public ROW and publicly owned property and the portions of the proposed alignment over private property, which are described more specifically in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR. As shown on Figure 2-8 and Appendix Q, the ANSI-required aerial clearance is not above Homeboy Industries' current premises at 130 Bruno Street. The Additional Separation Buffer is an approximate width and based on the current design of the proposed Project. The edge of the Additional Separation Buffer is approximately adjacent to the property line of 130 Bruno Street, and the final width of the Additional Separation Buffer would be determined by the appropriate agencies during the permitting process for the proposed Project.

Comment GO15-5 2. Hope Village - Housing & Service Expansion in Support of Alternatives to Incarceration

Homeboy Industries is working to alleviate the housing crisis in Los Angeles and has plans to develop transitional and permanent supportive housing on land where the proposed Alpine Tower is located. Developing affordable housing and expanding our campus will support broader public and private partnerships to create "Hope Village" as an alternative to incarceration (ATI) anchored by a car first, jails last paradigm. Insofar as we can determine, the location of the gondola's Alpine Tower would significantly impair our ability to deliver housing to our clients and respond to the "State of Emergency" currently in place at the County and City levels in response to the homeless crisis; and serve as an impediment to "Hope Village" as a critical ATI strategy.

Response GO15-5 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how consistent with the Project Objectives, the proposed Project was designed in consideration of planned housing projects, including the Restorative Justice Master Plan and Hope Village Project. The proposed Project does not impact Homeboy Industries' anticipated housing project, and the Alpine Tower's location avoids the anticipated 903 North Main Street Homeboy housing project. As discussed in Topical Response E, the proposed Alpine Tower is sited on 901 North Main Street and Homeboy Industries' anticipated housing project is located on 903 North Main Street. In addition to the proposed

Project's Alpine Tower not being physically located on the site of Homeboy Industries' anticipated housing project, the minimal aerial rights required for the proposed Project do not conflict with or impact the anticipated Homeboy Industries housing project.

Comment GO15-6 3. Aesthetics

Analyses in the DEIR of visual impacts from the gondola seem to completely ignore Homeboy Industries, which operates one of the key facilities in the gondola's path. There is no doubt that a 195-foot high, awkwardly-shaped concrete tower will have a serious and permanent – and most would say incompatible – visual effect on Homeboy Industries' operations. At the very least, your analysis of Landscape Unit 3 (page 3.1.22) should describe and discuss these impacts on Homeboy Industries in particular.

Response GO15-6 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, including the Alpine Tower, which would be less than significant, and for visual simulations of the proposed Project's towers. The methodology utilized to identify visual resources/viewsheds and examine potential aesthetic impacts follows the guidance outlined in the Federal Highway Administration's *Guidelines for the Visual Impact Assessment of Highway Projects* (2015). Further, views and potential impacts were all analyzed using the same thresholds of significance identified by the State CEQA Guidelines and the Los Angeles CEQA Thresholds Guide. Part of this process was identifying and analyzing Landscape Units (LUs) and Key Observation Points (KOPs) that were delineated based on known significant views and locations with proposed changes to the setting. Specifically, Landscape Unit 3, in which Homeboy Industries is located, is addressed on pages 3.1-22 and 3.1-42 through 3.1-45 of the Draft EIR. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of the location and design of the Alpine Tower. Alpine Tower would consist of a neutral light-tone gray color scheme that would provide visual lightness to the form and their design would complement the existing buildings in this area, as well as not distract from the visually distinct Chinese architecture within this area. Refer to Topical Response C, Project Features, discussing how the proposed Project's design takes cues from the immediate neighborhood culture, including how each component of the proposed Project would be designed to complement and reflect the unique character of the surrounding area.

Comment GO15-7 Further, most CEQA analyses include a Shade and Shadow study. One would be appropriate for this project as well.

Response GO15-7 While shading is not a required analysis area in the CEQA Guidelines, a shadow analysis was conducted as part of the Visual Impact Assessment per recommendations in the L.A. CEQA Thresholds Guide. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR for the shading

analysis, which determined that shading impacts would be less than significant for construction and operational impacts. The shading analysis for the Alpine Tower is included at pages 3.1-54 of the Draft EIR, and concluded that the Alpine Tower would not result in the shading of shade-sensitive uses for more than three hours between the hours of 9:00 am and 3:00 pm Pacific Standard Time (between late October and early April), or for more than four hours between the hours of 9:00 am and 5:00 pm Pacific Daylight Time (between early April and late October). As such, shade impacts from the Alpine Tower would be less than significant. Refer to the Shade/Shadow Diagrams for the proposed Project, included in Appendix B, Shade/Shadow Diagrams, of Appendix C, Visual Impact Assessment, of the Draft EIR, for the shade/shadow assessment of the proposed Project. The shade/shadow diagrams for the Alpine Tower are on pages 39 through 57 of Appendix B, Shade/Shadow Diagrams, to Appendix C, Visual Impact Assessment, of the Draft EIR.

Comment GO15-8 4. Noise and Vibration

Analyses of these potential impacts correctly conclude that some significant impacts cannot be mitigated. We presume you will be seeking a Statement of Overriding Considerations to accept these impacts, at our expense.

With regard to noise, we are identified as NSR-7 in your analysis. We are projected to experience noise levels at 80.3 dBA during construction, 10.5 dBA higher than current ambient noise levels, described in your exhibit as sounding like a “garbage disposal at 3 feet.” You deem this tolerable for an office building. As noted above, we conduct far more than just typical office activities, and invite many members of the public to our site. You note that even 75 dBA is “clearly unacceptable,” even for office use, and that 65 dBA is “normally unacceptable” (page 3.13.48).

Response GO15-8 This comment provides a general summary of construction noise at NSR 7, as shown on page 3.13-36 of Section 3.13, Noise, of the Draft EIR. The identified noise level of 80.3 dBA is associated with the foundations and columns phase for construction of the Alpine Tower. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of noise and vibration impacts during construction of the proposed Project.

CEQA Guidelines section 15064.7(b) encourages lead agencies to adopt and publish thresholds of significance for use in determining whether environmental impacts are significant. While agencies are encouraged to adopt such thresholds of significance for general use, they are not required to do so and have the authority to determine the significance of environmental impacts on a project-by-project basis. Consistent with CEQA, Metro used the thresholds of significance from Appendix G to the CEQA Guidelines in the Draft EIR. For the analysis of noise and vibration, the Draft EIR used the thresholds of significance from Appendix G to the CEQA Guidelines and evaluated whether the proposed Project would result in the generation of a substantial temporary or permanent increase in ambient noise levels or the generation of

excessive ground-borne vibration or ground-borne noise levels. As part of this analysis the Draft EIR evaluated standards of both Metro as a Lead Agency and the City as a responsible agency. Specifically, Metro applies the FTA impact criteria for both noise and vibration. The City utilizes thresholds from the City's 2006 L.A. CEQA Thresholds Guide and the LAMC for noise, which are generally not utilized by Metro, but are included for purposes of this Draft EIR. For vibration, the City of Los Angeles also uses the FTA impact criteria. Based on the L.A. CEQA Thresholds Analysis NSR 7 (Homeboy Industries) would experience a temporary, significant noise impact during construction activities of the Alpine Tower, which, as discussed in Appendix B, Construction Assumptions, of the Draft EIR, would be approximately 11 months. As described in Section 3.13, Noise, of the Draft EIR, based on the FTA guidelines the construction activities of the Alpine Tower would not result in significant noise impacts at NSR 7 (Homeboy Industries). As discussed in Section 3.13, Noise, of the Draft EIR, for the entire duration of construction, the proposed Project shall provide an 8-foot temporary noise barrier between the construction site and NSR 7 (Homeboy Industries). With the implementation of Mitigation Measure NOI-A, the L.A. CEQA Thresholds Analysis construction noise impact during the Vertical Circulation, Hardscape, Landscape, and Interior Work phase at NSR 7 (Homeboy Industries) would be reduced to less than significant. Implementation of Mitigation Measure NOI-A would be required to reduce the L.A. CEQA Thresholds Analysis impacts at NSR 7 (Homeboy Industries), however, the L.A. CEQA Thresholds Analysis noise impacts at NSR 7 would remain significant and unavoidable during the foundations and columns and structural steel and gondola equipment erection construction phases.

CEQA requires that a Statement of Overriding Considerations be prepared if a proposed project will result in significant unmitigated environmental impacts. (CEQA Guidelines, §§ 15092(b)(2)(B).) The Statement of Overriding Considerations must set forth why any remaining significant effects on the environment found to be unavoidable under CEQA Guidelines section 15091 are acceptable due to overriding concerns as described in CEQA Guidelines section 15093. This statement would supplement the lead agency's findings required by Public Resources Code section 21081, subdivision (a), to support the lead agency's determination to proceed with a proposed project despite adverse environmental effects. Because the proposed Project would result in significant environmental impacts related to construction noise, as discussed in Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, which would not be reduced to less than significant with implementation of Mitigation Measure NOI-A, Metro would prepare a Statement of Overriding Considerations concerning this construction noise impact to supplement its Findings if it approves the proposed Project.

Comment GO15-9 In the analyses of potential vibration impacts, Homeboy Industries is VSR-11, but is not called out as a Measurement Location. Therefore, no specific information about the impacts of drilling (or driving) 120-foot deep (sic) piles adjacent to our training rooms, kitchen and restaurant is provided. Nonetheless, the DEIR concludes that

Homeboy Industries would experience significant “annoyance” from vibration, even with mitigation, during construction (page 3.13.63). A more detailed and site-specific analysis of the vibration impact on our buildings and operations would be appreciated.

Response GO15-9 As discussed in Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, and as shown in Tables 3.13-11 and 3.13-27, Homeboy Industries is identified as both a noise-sensitive receptor (NSR), and a vibration-sensitive receptor (VSR). Specifically, for the noise analysis, as shown in Table 3.12-11, Homeboy Industries is identified as NSR 7. For the vibration analysis, as shown in Table 3.13-27, Homeboy Industries is identified as VSR 11. As noted on page 71 of Appendix M of the Draft EIR, “A construction vibration impact analysis was conducted for those vibration-sensitive receptors (VSRs) that were located within approximately 200 feet of each Project component site. This distance was chosen because vibration attenuates with distance and, at 200 feet, vibration levels for the highest vibration producing equipment for construction of the proposed Project (vibratory rollers) would be less than the most restrictive vibration level (0.12 in/sec PPV) and, therefore, the Project would not impact VSRs beyond 200 feet.” As discussed on page 3.13-27 of the Draft EIR, “ground-borne vibration impacts due to the proposed Project’s construction activities were evaluated for both on-site and off-site construction activities by identifying potential vibration sources (i.e., construction equipment), estimating the vibration levels at the potentially affected receptor, and comparing the proposed Project’s activities to the applicable vibration significance thresholds. Construction-related vibration is assessed using two different metrics: 1) to assess potential structural damage from vibration and 2) to assess human annoyance from vibration.” As discussed on page 5 of Appendix M of the Draft EIR, “Ground-borne vibration levels rarely affect human health. Instead, most people consider ground-borne vibration to be an annoyance that can affect concentration or disturb sleep.” As noted on pages 3.13-13 to 3.13-15 of the Draft EIR, the evaluation of vibration impacts relied on the FTA guidelines to establish the threshold of significance for building damage and human annoyance from vibration. The FTA guidelines’ vibration criteria for building damage are listed in Table 3.13-8 of the Draft EIR. The FTA guidelines’ vibration criteria for human annoyance are listed in Table 3.13-6 of the Draft EIR. As discussed in Section 3.13, Noise, of the Draft EIR, the noise-sensitive receptors (NSRs) identified in Table 3.13-11 at various measurement locations represent existing noise conditions in a variety of locations throughout the Project area. Unlike the existing ambient noise conditions used for the noise analysis, existing vibration levels are not typically considered in the assessment of project vibration impacts, so existing vibration levels were not measured for the proposed Project, as discussed at 3.13.3.3, Existing Vibration Conditions, in Section 3.13, Noise, of the Draft EIR. Homeboy Industries is recognized as VSR-11 in Figure 3.13-27 of the Draft EIR. Additionally, the potential vibratory effects that would be experienced at Homeboy Industries during construction of the Alpine Tower are shown on

Table 3.13-28. Specifically, VSR-11 would experience vibration at 0.16 PPV in/sec (92 VdB) during construction of the Alameda Tower. This would exceed the threshold for human annoyance, but not building damage. Thus, construction vibration (human annoyance) impacts would be significant and unavoidable even with implementation of Mitigation Measures VIB-A and VIB-B. As discussed on page 3.13-72 of the Draft EIR, “[s]ince the human annoyance threshold is exceeded by common occurrences such as vehicle pass-bys during construction, there is no feasible method for mitigating human annoyance impacts. It should be noted that because the human annoyance threshold is so low it is already exceeded on roadways by existing truck trips.” The Draft EIR included a complete analysis of vibration impacts for Homeboy Industries (VSR 11) as required by CEQA.

Comment GO15-10 5. Transportation

Perhaps the largest credibility gap in the DEIR concerns automobile access and parking. It seems inconceivable that the proposed project would have no significant impact on either.

Response GO15-10 Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project, Non CEQA Transportation Assessment*, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations. This partnership could include providing a free connecting Metro or Metro bikeshare ride with a ticket for the proposed Project, or other measures to further encourage a complete transit trip. By providing efficient, high-capacity, and faster alternative access to Dodger Stadium for games and special events, however, overall vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days would be reduced by the proposed Project because of game/special event attendees shifting to riding public transit rather than driving to Dodger Stadium. Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines (“TAG”). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project’s potential to affect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City of Los Angeles and with robust feedback from community stakeholders, a parking management plan. The City of Los Angeles would implement any on-street parking management strategies identified.

Comment GO15-11 Clearly, potential construction period impacts would be manifold. We would like to see focused analyses of the impacts of proposed road closures on local streets including Alameda, Bruno, Alpine and Main.

Response GO15-11 The Draft EIR includes a detailed description of road closures and associated construction period effects on the roadway system on pages 3.17-45 to 3.17-66 of Section 3.17, Transportation. Appendix B, Construction Assumptions, of the Draft EIR includes further detail of construction assumptions, including detailed graphics that illustrate work zones and temporary closures and temporary intersection lane configurations during construction. Temporary lane closures and temporary lane configuration changes for Alameda Street, Alpine Street, and Main Street are shown. No construction period lane closures or lane configuration changes are anticipated on Bruno Street. Refer to Section 3.17, Transportation, and Section 3.11, Land Use and Planning, of the Draft EIR, for discussion of how multimodal access—for both local and emergency response—to local businesses, neighborhoods, Los Angeles Union Station (LAUS), and the Los Angeles State Historic Park would be maintained throughout construction of the proposed Project, and disruptions to local businesses would be minimized. Access to Homeboy Industries would be maintained at all times during proposed Project construction. In addition, the *Los Angeles Aerial Rapid Transit Project, Non CEQA Transportation Assessment* includes a detailed construction period transportation simulation of the road closures during the proposed Project construction. This report substantially exceeds the level of detail required by the TAG.

Comment GO15-12 Also, there is no explanation in the DEIR about where visitors to the gondola might park in our neighborhood and what the impact of moving “game day” traffic to Chinatown and its environs might cause. The traffic study in the DEIR seems purposefully oblivious to potentially severe impacts on automobile access, circulation and parking.

Response GO15-12 Refer to Response GO15-10 for discussion of the Non CEQA Transportation Assessment, including traffic congestion (i.e., circulation) and parking.

Comment GO15-13 6. Impact on Our Business Revenue

Homeboy Industries operates several social enterprises from its Bruno Street Campus including Homegirl Café, Homeboy Merchandise, and the Homeboy Bakery. We rely on these businesses to create jobs for our clients and generate revenues in support of our mission. Each of these businesses are dependent on customer foot traffic and unimpeded vehicular access. For reasons aforementioned we have significant concerns regarding the revenue impact on our businesses.

Response GO15-13 Refer to Topical Response C, Project Features, for discussion of how multimodal access—for both local and emergency response—to local businesses, neighborhoods, LAUS, and the Los Angeles State Historic Park would be maintained throughout construction of the proposed Project, and disruptions to local businesses would be

minimized. The Project Sponsor would also create a Business and Community Support Program to assist local businesses financially affected by proposed Project construction activities. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents and businesses along the proposed Project alignment while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to businesses along the alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. In addition, the proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first/ last-mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and Dodger Stadium Station, which could also drive customers to businesses along the proposed Project alignment.

Comment GO15-14 7. Financing & Use of Public Funds

We remain unclear as to how the gondola project will be financed, including the use of public funding to support the gondola's construction. We will have significant concerns with any use of public funding that would defray resources from housing and other essential services for communities in need. As of the submission of this letter, transparency related to short and long term financing of the gondola project remains elusive.

Response GO15-14 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of this Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how no funding benchmarked for housing projects or development will be used to fund or finance the proposed Project.

Comment GO15-15 8. Other Considerations

In addition to these CEQA-related concerns, we would like to raise two additional points.

First, we are clearly concerned about the permanent effects that the gondola might have on our sensitive, human-serving operations at 130 Bruno Street and on our future growth- even on the viability of our operations at this location – if the project

goes ahead as proposed. These longer-term operational and economic considerations should be discussed now, but the CEQA process may not be the best forum for resolving them.

Response GO15-15 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how consistent with the Project Objectives, the proposed Project was designed in consideration of planned housing projects, as well as with existing adjacent or potential future land uses in mind, including the Restorative Justice Master Plan and Hope Village Project and Homeboy Industries’ existing operations at 130 Bruno Street. The proposed Project will not displace housing or prevent planned housing

Comment GO15-16 Second, there is a perception in our neighborhood that the gondola is being proposed as a precursor – “pre-mitigation” perhaps – to larger plans for development on the stadium parking lots. While these plans are not in our purview to address now, we do believe that further development around the gondola end-station would exacerbate the environmental concerns we are considering at this time, and should be brought into play as part of this evaluation.

Sincerely,

Thomas J. Vozzo

Marisela Vihar, District Director for Assembly Member Wendy Carrillo

Response GO15-16 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. Commenters’ speculation or mere “perception” regarding a potential future action, without the presence of any

application or evidence of a larger project, does not require a lead agency to analyze the broader scheme or otherwise attribute motives to an applicant based on these allegations alone.

Comment Letter GO16 – Los Angeles Conservancy

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR, for reference.

Responses to GO16

Comment GO16-1 Dear Mr. Cory Zelmer:

On behalf of the Los Angeles Conservancy, I am writing to comment on the Draft Environmental Impact Report (Draft EIR) for the proposed Los Angeles Aerial Rapid Transit (LA ART) Project. In reviewing this proposed Project, the Los Angeles Conservancy has serious concerns regarding its associated and cumulative impacts, both directly and indirectly. We strongly question the purpose and need for such an undertaking as there are environmentally superior alternatives readily available and appear to be dismissed without a clear substantiation.

Response GO16-1 This comment provides a general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Response GO16-2 through GO16-25.

Comment GO16-2 The Conservancy raises concern about Metro serving as the lead agency for the California Environmental Quality Act (CEQA) process. It appears that the City of Los Angeles is better equipped and appropriate to serve in this role, and analyze potential impacts, conflicts, and identify project alternatives and appropriate mitigation measures.

Response GO16-2 Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of why Metro is the proper lead agency for the proposed Project and the City’s participation in the environmental review process as a CEQA responsible agency. As the agency tasked with planning, operating, and coordinating funding for the Los Angeles Region’s transportation system, Metro has primary responsibility for implementation of the proposed Project, and is the proper lead agency. Under CEQA, where two or more public agencies meet the criteria for acting as lead agency, the agency that acts first will normally serve as lead agency. (CEQA Guidelines, §15051(c).) Metro elected to serve as lead agency, and the City has cooperated as a responsible agency, including consultation in preparation of the Draft EIR. Refer to Response G016-20 for discussion of how the City was properly designated as a responsible agency.

Comment GO16-3 Lastly, we strongly question if there is a need for Federal review as a companion for this proposed undertaking, including Section 106 of the National Historic Preservation Act (NHPA) and Section 4(f) of the U.S. Department of Transportation Act.

Response GO16-3 This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address and environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is

warranted. As proposed, the proposed Project does not require Federal review, including Section 106 of the National Historic Preservation Act (NHPA) and Section 4(f) of the U.S. Department of Transportation Act.

Comment GO16-4 If constructed, the LA ART Project would connect Los Angeles Union Station to Dodger Stadium property via an aerial gondola system. The proposed Project would include stations at Alameda and Cesar Chavez, the southernmost entrance to the Los Angeles State Historic Park, as well as at Dodger Stadium. The LA ART gondola system would be approximately 1.2 miles and consist of cables, three passenger stations, a non-passenger junction, towers, and gondola cabins.

Response GO16-4 This comment provides a general summary of the proposed Project provided in Section 2.0, Project Description of the Draft EIR. This comment is noted and will be provided to the decision makers for review and consideration. Because the comment does not address an environmental issue or raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Comment GO16-5 I. Purpose and need for LA ART is not fully demonstrated when environmentally superior alternatives are identified and available to be implemented.

The Draft EIR analysis does not make a compelling case for the purpose and need for this Project, especially given there are other alternatives that may achieve similar results, while minimizing and avoiding the adverse effects (both direct and indirect). The stated purpose for the proposed Project is to “improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit (ART) service connecting the regional transit system at LAUS, Dodger Stadium, the Los Angeles State Historic Park, Elysian Park, and surrounding communities via three new transit stations.” However, the No Project Alternative and The Transportation Systems Management (TSM) Alternative are both found to be environmentally superior to the proposed LA ART Project.

Response GO16-5 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. The Draft EIR determined that the No Project and Transportation Systems Management Alternatives would not provide the same level

of benefits of the proposed Project such as the ability to reduce vehicle miles traveled and to air quality through reduced emissions, to energy through reduced fuel usage, to greenhouse gas emissions through reduced emissions, and to hydrology and water quality through the implementation of LID source control and BMPs to minimize water runoff and water pollution or otherwise achieve the overall Project purpose of providing a permanent and direct transit connection between the Los Angeles Union Station and the Dodger Stadium property. CEQA requires the analysis of a “No Project” alternative as well as the identification of an “environmentally superior” alternative from the range of reasonable alternatives that are evaluated, which cannot be the “No Project” alternative or the underlying project. The statutorily required identification of these alternatives does not negate the need for the proposed Project.

Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project’s system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.

Comment GO16-6 Overall, there are three project alternatives identified. These include a No Build Alternative, the Spring Street Alignment Alternative, and the TSM Alternative. The Spring Street Alignment is similar to the proposed project in that it will construct an aerial transit system. However, instead of a station at the southern end of Los Angeles State Historic Park, it would construct a station on the western edge boundary near Sotello Street. This alignment would have the same impacts as the proposed Project and therefore the Conservancy holds the same concerns.

Response GO16-6 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR’s consideration of a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA. As identified in Section 4.0, Alternatives (Table 4-1 and page 4-59), the Spring Street alternative would have similar impacts as

the proposed Project but would not meet all the proposed Project’s objectives to the same degree.

Comment GO16-7 The TSM Alternative would improve the already existing and popular Dodger Stadium Express (DSE) bus system, therefore requiring none of the aerial transit infrastructure. This alternative, as the environmentally superior alternative, would reduce all possible impacts tied to the construction and operation of an LA ART system.

Response GO16-7 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR’s consideration of a range of reasonable alternatives, properly identifying an “environmentally superior” alternative, pursuant to CEQA. Refer to Response GO16-5 for a discussion of how the Transportation Systems Management Alternative would not provide the same level of benefits as the proposed Project. The Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. While the Transportation Systems Management alternative would not have the impacts associated with the construction of an ART system, it would have operational effects that would not be present for the proposed Project, including increased vehicle queuing on city streets and increased potential for bus-pedestrian and bus-vehicle collisions, as detailed on page 4-72 and 4-73 of the Draft EIR. It is also not expected to reach the ridership of the proposed Project due to its considerably longer travel time and would therefore not have the VMT reduction benefit of the proposed Project, as described on page 4-71 of the Draft EIR.

Comment GO16-8 A key policy under the California Environmental Quality Act (CEQA) is the lead agency’s duty to “take all action necessary to provide the people of this state with historic environmental qualities and preserve for future generations examples of major periods of California history.”¹ To this end, CEQA “requires public agencies to deny approval of a project with significant adverse effects when feasible alternatives or feasible mitigation measures can substantially lessen such effects.”² The fact that an environmentally superior alternative may be more costly or fails to meet all project objectives does not necessarily render it infeasible under CEQA.³ Reasonable alternatives must be considered “even if they substantially impede the project or are more costly.”⁴ Likewise, findings of alternative feasibility or infeasibility must be supported by substantial evidence.⁵

Despite the analysis’ failure to explore an electric bus system the TSM remains the environmentally superior alternative. It is likely that new regulations in the coming years will require electric bus systems allowing the TSM to meet the zero emissions

goals for Project Objectives 5 and 12. We believe an enhanced bus route, especially on non-event days would better serve the surrounding neighborhoods and Elysian Park and therefore meet Objective 9. A more robust DSE is likely to resolve many last mile dilemmas for nearby residents and visitors.

The existing DSE is an incredible resource for Dodger fans, shuttling thousands of fans each game. The system is limited in its current ability to attract more fans because the route is underserved and busses are often packed to maximum capacity. Enhancing the system through the TSM Alternative, by offering more frequent departures and a zero emission fleet, would attract many more riders on event days and beyond. Additional stops during non-event periods provide greater access to Elysian Park and would further benefit the community by providing a more equitable mode of access.

Footnote 5: Public Resources Code § 21081.5.

Response GO16-8 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. The Draft EIR is in compliance with CEQA’s general policies related to environmental quality and consideration of alternatives to proposed actions affecting the environment, and appropriately identifies the significant effects on the environment of the proposed Project, as well as potential alternatives to the proposed Project, in Sections 3.0 and 4.0, Environmental Analysis and Alternatives, of the Draft EIR, respectively. Refer to Responses G016-5 and G016-7 regarding the Transportation Systems Management Alternative. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options for a discussion of how the Draft EIR considered a reasonable range of alternatives, and there are no feasible alternatives available which would avoid or substantially lessen the proposed Project’s significant environmental effects. Electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. As discussed in Section 2.0, Project Description, of the Draft EIR, the proposed Project creates a first/last mile transit link for residents, park uses, visitors, and businesses along the proposed Project alignment while unifying and connecting communities through transit mobility access. Refer to Topical Response C, Project Features, for discussion of the proposed Project’s features to enhance and provide additional benefit to the surrounding community, including but not limited to sustainability features and open

space enhancements, the Community Access Plan for fares, access to parks, including Elysian Park, and mobility hubs. The proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first/last mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. Refer to Topical Response N, Environmental Justice, for a discussion of how the proposed Project is consistent with Metro’s goal of prioritizing equity opportunities. The comment incorrectly characterizes California law. Pub. Resources Code § 21002 states, “The purpose of an environmental impact report is to identify the significant effects on the environment of a project, to identify alternatives to the project, and to indicate the manner in which those significant effects can be mitigated or avoided. Each public agency shall mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so. If economic, social, or other conditions make it infeasible to mitigate one or more significant effects on the environment of a project, the project may nonetheless be carried out or approved at the discretion of a public agency if the project is otherwise permissible under applicable laws and regulations.”

Per Section 15092 of the CEQA Guidelines, a public agency may decide to approve or carry out a project for which an EIR was prepared if it has determined that any remaining significant effects on the environment found to be unavoidable under Section 15091 are acceptable due to overriding concerns as described in Section 15093. CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered “acceptable.”

Comment GO16-9 II. Historic and cultural resources and view sheds will be impacted and irreparably harmed by the LA ART Project

A visual intrusion as a result of the proposed project is clearly evident. If built, the LA ART will be clearly visible and obscure the view, setting, and future overall experience of various historic places and spaces, including Union Station, El Pueblo, Los Angeles State Historic Park, and Chinatown.

The Conservancy disagrees believes the proposed project would have significant impacts to numerous historic resources by altering their historic settings and overall feeling. At the southern terminus of the project, the proposed Alameda Station would significantly impact both Union Station and El Pueblo’s historic setting and feeling. One of the most important character defining features of Union Station are the views of its primary façade along Alameda. As metro is aware, Union Station is the last major

railroad station to be built in the United States. Its gardens and patios have welcomed countless travelers to sunny California for nearly a century. In 1972, the City of Los Angeles designated Union Station Historic-Cultural Monument #101 and it was added to the National Register of Historic Places in 1980.

Response GO16-9 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant, including LAUS, El Pueblo, Chinatown, and the Los Angeles State Historic Park. Refer to Responses GO16-10 through GO16-14 for additional discussion of aesthetic impacts to LAUS and El Pueblo, which would be less than significant and for discussion of Alameda Station.

The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation.

Comment GO16-10 The imposing new LA ART station along Alameda, with passenger plazas shown extending into the National Register and HCM boundaries, would dramatically alter the visitor's experience of Union Station when walking or driving south from Cesar Chavez Avenue as well as when exiting the station. Should the project be constructed, the current setting would no longer exist. Views of Union Station's iconic palm tree lined motor court and rising clock tower would be prematurely shrouded from the north. Alameda would go from an open airy corridor to one that compresses the passerby below a massive structure that crowds the existing relationship between Union Station and El Pueblo. It is argued that the Mosaic Apartments already contribute to the erasure of this view shed, however the LA ART Project only exacerbates and amplifies this by making the impact much worse and more impactful as it encroaches onto the Public Right-Of-Way. Metro previously proposed acquiring Mosaic property and developed plans to redevelop this site and restore the full view shed to Union Station; this Project would completely foreclose this future opportunity.

Response GO16-10 Refer to Section 3.5.4, Environmental Impacts, of the Draft EIR for a discussion outlining the proposed Project's potential construction and operational impacts to historic resources within the vicinity of the proposed Alameda Station, including the Los Angeles Union Station Passenger Terminal and Grounds and the Los Angeles Plaza Historic District (referred to as El Pueblo), the *El Grito* mural, and the Los Angeles Terminal Annex Post Office. As discussed in Section 3.5.4, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than

significant. While the proposed Project's Alameda Station would be a visible change to the overall setting of the historical resource, as discussed on page 16 of Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR), of the Draft EIR, integrity of setting principally refers to the physical features within the boundary of a property but may also include the larger surroundings. However, in urban areas such as Los Angeles, the broad setting has often been changed by development that postdates the period of significance for the subject property. Thus, changes to the surrounding area (i.e., addition of the proposed Project) should only factor into the assessment of integrity if the broad setting is essential to the understanding of the property. As discussed on pages 3.5-49 and 3.5-50 of the Draft EIR, the Los Angeles Union Station Passenger Terminal and Grounds is designated for its architectural and historical significance, and the changes to the resource's setting resulting from the addition of Alameda Station would not impact its architectural significance or its ability to convey this significance. Specifically, as indicated on page 3.5-44, in Section 3.05, Cultural Resources, of the Draft EIR, construction impacts will not alter the physical integrity or character-defining features of the historical resource. Also, as indicated on page 3.5-49, operational features (i.e., vertical circulation elements) will have a direct impact on the property generally, but will not alter the physical integrity or character-defining features of the historical resource. Further, visual alterations to the overall setting of the property will be insignificant due to prior substantial alterations to the existing setting and will not impact the significance of the historical resource nor its ability to convey its significance. Overall, construction and operational impacts associated with the proposed Project will not cause a "substantial adverse change" to the significance of this historical resource and, therefore, impacts will be less than significant. In addition, Metro does not have current plans to acquire and redevelop the Mozaic property.

Comment GO16-11 In 2015, when Metro approved the Connect US Action Plan, the restoration of the Forecourt and Esplanade improvements were contemplated, as a means to strengthen the connections and "front door" between Union Station, El Pueblo and Olvera Street. As we currently understand, this project is now on hold due to consideration of the proposed Project. Not only is this delay unfortunate, the LA ART station greatly undermines this opportunity and crowds the historic resources, greatly disrupting and indirectly interrupting the feeling and setting of these spaces and their relationships to one another. Further, queueing for the Alameda Station would occur within the planned Forecourt and Esplanade area and north of the Placita de Dolores, crowding these areas and again changing the ways in which these historic, public spaces have been, currently are, and could be experienced in the future.

Response GO16-11 Metro's plans for and consideration of the LAUS Forecourt and Esplanade Improvements Project is not "on hold" due to the proposed Project, which was designed in consideration of and to be compatible with the planned LAUS Forecourt

and Esplanade Improvements Project, as discussed in Section 2.0, Project Description, of the Draft EIR. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for a discussion of how queues would be managed by efficient vertical circulation and by staff at the station and due to the nature of queue formation, the pre-game/event passenger queues at the Alameda Station in 2026 are estimated to be largely contained on the platform and only minimally extend out into the planned LAUS Forecourt.

Refer to Section 3.05, Cultural Resources, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR), of the Draft EIR, for a discussion outlining the proposed Project's potential construction and operational impacts to the Los Angeles Union Station Passenger Terminal and Grounds. The existing parking lot and planned LAUS Forecourt where vertical circulation elements would be introduced are not considered character defining features of the Los Angeles Union Station Passenger Terminal and Grounds. While the proposed Project's Alameda Station would be a visible change to the overall setting of the historical resource, as discussed on page 16 of Appendix G, integrity of setting principally refers to the physical features within the boundary of a property but may also include the larger surroundings. However, in urban areas such as Los Angeles, the broad setting has often been changed by development that postdates the period of significance for the subject property. Thus, changes to the surrounding area (i.e., addition of the proposed Project) should only factor into the assessment of integrity if the broad setting is essential to the understanding of the property. As discussed on pages 3.5-49 and 3.5-50 of the Draft EIR, the Los Angeles Union Station Passenger Terminal and Grounds is designated for its architectural and historical significance, and the changes to the resource's setting resulting from the addition of Alameda Station would not impact its architectural significance or its ability to convey this significance. Specifically, as indicated on page 3.5-44, in Section 3.05, Cultural Resources, construction impacts will not alter the physical integrity or character-defining features of the historical resource. Also, as indicated on page 3.5-49, operational features (i.e., vertical circulation elements) would have a direct impact on the property generally, but will not alter the physical integrity or character-defining features of the historical resource. Further, visual alterations to the overall setting of the property will be insignificant due to prior substantial alterations to the existing setting and will not impact the significance of the historical resource nor its ability to convey its significance. Overall, construction and operational impacts associated with the proposed Project will not cause a "substantial adverse change" to the significance of this historical resource and, therefore, impacts will be less than significant. Refer to Response GO16-13 for a discussion of the proposed Project's potential impacts to the Los Angeles Plaza Historic District. Refer to Response GO16-14 for a discussion of the proposed Project's potential impacts to Olvera Street. Refer to Response GO16-15 for a discussion of the proposed Project's potential impacts to the Placita de Dolores. Regarding the relationship between LAUS and El Pueblo,

Section 3.05, Cultural Resources, of the Draft EIR analyzes the axial connection and visual relationship between LAUS and El Pueblo. The proposed Alameda Station would be located over 100 feet north of the main axis—at the intersection of Los Angeles Street and Alameda Street—between LAUS and El Pueblo. The location is sufficiently offset so it would not interrupt the physical and visual relationship between the two historical resources. Accordingly, the important axial connection and visual relationship with the between LAUS and El Pueblo would remain.

Comment GO16-12 The renderings provided in the Draft EIR do not fully depict and illustrate the visual impacts of the proposed new station on Union Station. The siting of the renderings provided are from locations that appear to diminish them. In consultation with project team consultants, the Conservancy has requested additional renderings from various points along Alameda south of East Cesar E. Chavez Avenue, and as a pedestrian will experience leaving the primary entrance of the station and the expanse of the pedestrian plazas proposed on either side of Alameda. Due to the holidays and the deadline to comment on Draft EIR, these have not yet been provided and are not included in the draft EIR. If adequately illustrated and included in the EIR, the Conservancy believes the full range and visual impacts of the proposal station will be evident. These images should be modified and accurately depicted to show the full extent of the undertaking and impact on the broader community view shed.

Response GO16-12 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Appendix H.1, Memo Regarding Preparation of Key Observation Points (KOPs), of the Final EIR, for discussion of the methodology used to prepare the visual simulations included in Appendix C, Visual Impact Assessment, of the Draft EIR. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, for KOPs and simulations updated in part to provide additional aesthetic and visual illustrations in response to comments received on the Draft EIR during the public review period. Refer to Section 5.0, Corrections and Additions, of this Final EIR, for an analysis of the Supplemental KOPs in Response to Comments, which confirmed the Draft EIR determination that aesthetic impacts of the proposed Project would be less than significant. As discussed in Section 3.01, Aesthetics, of the Draft EIR, identification of potential aesthetic and visual impacts included the identification of Landscape Units (LU) that defined particular viewsheds and/or aesthetic settings within the proposed Project area, as well as KOPs within each LU that are representative of the visual character of the area. KOPs within each LU were selected based on existing knowledge of important viewsheds and through consultation with responsible agencies. As noted, pages 35-37, 41-42, and 55-61 in Appendix C, Visual Impact Assessment, of the Draft EIR, LU 1 extends from Arcadia Street to Cesar E. Chavez Avenue along Alameda Street and includes seven (7) KOPs, three (3) of which include views of or from LAUS along or immediately adjacent to Alameda Street south of Cesar E. Chavez Avenue (KOPs 1, 2, 4).

Comment GO16-13 The Los Angeles Plaza Historic District, better known as El Pueblo, is a collection of some of Los Angeles’s earliest historic resources dating to 1818. In 1970, the Los Angeles Plaza Park was designated as Historic-Cultural Monument (HCM) #64 and initially listed on the National Register in 1972. As shown in project renderings, the Alameda station with its wires and gondolas would be visible from various locations within the historic district.

From within the historic Avila Adobe’s courtyard, constructed in 1818 and the oldest extant building in the City, the new station stands looming overhead. The project team has stated that this view shed was already compromised by the One Gateway Plaza at Patsaouras Transit Plaza. However, this tower is not immediately adjacent to the adobe. Even with One Gateway Plaza in the far distance, visitors are allowed the ability to spatially visualize how the vista appeared at the time of its construction. Without question, the LA ART’s Alameda’s station’s proximity and scale impact this historic site much more heavily than that of the tower roughly 1,500 feet away. Today’s Avila Adobe successfully transports visitors to a time passed. With the new station, the Conservancy is confident that this would no longer be a possibility.

Response GO16-13 Refer to Section 3.05, Cultural Resources, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR), of the Draft EIR for discussion outlining the proposed Project’s potential construction and operational impacts to the Los Angeles Plaza Historic District. As discussed on pages 3.5-45 to 3.5-46 of the Draft EIR, the only direct impacts from the proposed Project would be to a non-contributing feature, the Placita de Dolores, which was constructed after the historic district was designated, and impacts would be less than significant. With respect to indirect impacts, while the proposed Project’s Alameda Station would add another non-original element to the broader setting, mere visibility of a new building, structure, or feature from certain vantage points alone would not result in an indirect impact. The proposed Project would introduce a visible new feature to the historic district’s setting, but Alameda Station, with the exception of the vertical circulation and associated alterations to the non-contributing plaza space, would be located outside of the historical resource’s boundary, and contributing buildings would retain their visual and physical relationships with one another. As stated on page 3.5-51, visual alterations within the property would be less than significant due to prior visual alterations and will not impact the significance of the historical resources nor their ability to convey their significance. Also, as stated on page 3.5-52, the only historically significant viewshed from the Avila Adobe courtyard is the visual connection to LAUS. Although the proposed Alameda Station would add another non-original element to the broader setting, as the courtyard currently includes views of a portion of the Mozaic Apartments building, a portion of LAUS, a portion of the First 5 LA building, and a portion of the LA Metro Headquarters. The visual relationship between the Avila Adobe and LAUS would still exist. The Draft EIR does not rely on the presence of the comment’s referenced “One Gateway Plaza” to reach this conclusion. Additionally,

Avila Adobe would retain its visual and physical relationships to the other contributors in the Los Angeles Plaza Historic District and would continue to convey its significance and the existing physical integrity and character-defining features of the historical resource would remain intact. Consequently, the indirect impact of the proposed Project on Avila Adobe, along with the Plaza Community Center, Plaza Substation, and The Winery, as well as the greater Los Angeles Plaza Historic District, would be less than significant.

Comment GO16-14 In Addition to the impacts at Avila Adobe, the project would be seen from other vantages including the north entrance to Olvera Street and from La Plaza. As stated previously, the station looming above the historic district would significantly impact the setting and feeling of Los Angeles’s oldest historic built environment.

Overall, the Conservancy believe the various (sighting, proximity, signage, lighting, noise and construction) and cumulative (taken as a whole) impacts to the historic view shed, including greatly altering the feeling and setting of this historic area, are highly problematic and detrimental to the overall vitality of these historic resources. We believe this requires LA ART to reconsider other locations for placement of this station, and, more importantly, viable and environmentally superior project alternatives that do not require the need for this station nor LA ART as currently envisioned.

Response GO16-14 The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to historic resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.5, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant. Refer to Section 3.5.4, Environmental Impacts, of the Draft EIR for a discussion outlining the proposed Project’s potential construction and operational impacts to historic resources within the vicinity of the proposed Alameda Station, including the Los Angeles Union Station Passenger Terminal and Grounds and the Los Angeles Plaza Historic District (referred to as El Pueblo, and comprised of 29 resources within its boundaries, including the Avila Adobe). As discussed in Section 3.5.4, the Draft EIR’s analysis concludes that all potential impacts related to historical resources (inclusive of visual impacts related to the overall setting) would be less than significant. Refer to Response GO16-13 for a discussion of how visibility of a new building, structure, or feature from certain vantage points alone would not result in an impact to a historic resource, and how prior substantial alterations to the setting render the operational impacts less than significant. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR’s consideration of a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA. In addition, as discussed in Topical Response H, Section 6.0, Design

and Use Options, the Draft EIR includes design and use options responsive to public comments and stakeholder feedback. Refer to Section 5.0, Other CEQA Considerations, of the Draft EIR, for a discussion of how the location of the Alameda Station was determined.

Comment GO16-15 III. Draft EIR does not adequately address the proposed use and transfer of public rights-of-way and lands, applicable general plans, permitted legal use, and is in conflict with Public Resources Code 5019.59

As described in the Draft EIR, the project would construct towers on the Alpine Parcel and Alameda Triangle. The former parcel being owned by the City of Los Angeles and latter being a Public right-of-way. With tower footprints at approximately 900 square feet, construction would occur on a sizeable portion of the parcels. Further, queueing for the Alameda Station would require the permanent use of public spaces for private use, including the Placita de Dolores and Union Station’s planned Forecourt and Esplanade area.

The Conservancy is concerned about the use of publicly-owned parcels for private use, as detailed in the Draft EIR. We believe the project does not adequately describe the legal authority and process by which LA ART is required to attain such rights and makes inaccurate assumptions that the City and other public entities would give up their rights to these pieces of land. When looking at the Alpine Parcel in particular, other uses such as housing would better suit this site. With close proximity to City services and employment opportunities, the site is a good candidate for new, affordable housing construction. Given the need for affordable housing and limited land by which to build, as detailed in the City of Los Angeles’ recently adopted Housing Element of the General Plan and stated Regional Housing Needs Assessment (RHNA) priorities, why then should the City give up this land for LA ART?

Response GO16-15 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project, and Section 2.3.8, Project Objectives, for an overview of the proposed Project’s objectives. The overall purpose of the proposed Project is to provide a direct transit connection between LAUS and the Dodger Stadium property via an aerial gondola system and improve connectivity for the surrounding communities by linking to the Los Angeles State Historic Park, Elysian Park, and the neighborhoods along the proposed alignment and the region’s rapidly growing regional transit system at LAUS. ART is a proven, zero emission, safe, sustainable, high-capacity, and highly efficient form of transportation that would function as both a reliable rapid transit system and first/last mile connector. The proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles.

Refer to Section 2.0, Project Description, for a discussion of how the proposed Project was designed to be consistent with Metro’s plans at LAUS, including the planned LAUS Forecourt and Esplanade Improvements Project, as well as for a list of required

permits and approvals for implementation of the proposed Project. The EIR is intended to provide environmental clearance as needed for all of the potential discretionary entitlements, reviews, and approvals required for implementation of the proposed Project.

Refer to Section 3.11, Land Use and Planning, for analysis of the proposed Project's potential impacts to land use and consistency with relevant land use plans, policies, and regulations adopted for the purpose of avoiding environmental effects. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of how nothing in Public Resources Code section 5019.59 would prohibit State Parks from issuing the necessary approvals for the Proposed Project. Refer to Topical Response B, Ridership Model; Queuing at Stations and Pre-game and Post-game Transportation, for discussion of queuing. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, and Topical Response N, Environmental Justice, for discussion of how the proposed Project will not displace housing, prevent planned housing, or preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities. As detailed in Topical Response E, development of housing is constrained on the portion of 901 North Main where the proposed Alpine Tower would be located due to the proximity to the Metro L Line (Gold) tracks. The proposed Alpine Tower would be located on a triangular portion of 901 North Main Street between the Metro L Line (Gold) tracks and Alameda and Alpine Streets, and this property was previously analyzed by the City of Los Angeles' City Administrative Officer, describing it as unsuitable for housing. Specifically, the City recognized that the 901 North Main Street "site is bisected by overhead tracks, which are protected by an easement to" Metro and therefore "the Metro tracks will affect the ability to develop on the site." According to the City's publicly available property information system, ZIMAS, development and construction projects on 901 North Main Street must consult with Metro pursuant to Metro's Adjacent Development Review process to ensure safety and avoid conflicts to transit services and operations. The process applies to work within 100 feet from Metro right-of-way, which affects most or all of the 901 North Main Street property. In addition, compliance with Metro's requirements for construction design in locations adjacent to Metro's systems further restricts the ability for development on the portion of 901 North Main Street between the Metro L Line (Gold) tracks and Alameda and Alpine Street.

Comment GO16-16 As mainly a new tourist attraction, LA ART will attract an influx of visitors that will impact the authentic, lived experience of these historic spaces and places, not just in the area of Union Station and El Pueblo, but also Chinatown and the Los Angeles State Historic Park. As part of this concern, the Conservancy also questions the wisdom, appropriateness, and process by which various public rights-of-way and lands are to be granted for permanent use (for stations, towers, air rights, and queuing) to a private LLC and undertaking of this type.

How will these specific decisions take place and when, and does Metro, the City of Los Angeles, and/or the State Park and Recreation Commission (SPRC) have the legal authority to grant this type of commercial use to a private LLC in all the proposed locations? Our understanding is this project scope does not conform to the General Plan for El Pueblo Los Angeles State Historic Park⁶ nor the Los Angeles State Historic Park.⁷ Specifically, the statute for El Pueblo states, “[a]ny proposed demolition, alteration, or encroachment on historic structures must have approval from the State Department of Parks and Recreation.” Commercial, privately-built and operated uses are generally excluded from approved activities. Therefore, the Draft EIR fails to fully identify or address this land use conflict that appears to make the preferred Project infeasible if access to these public lands (a necessity to build the Project) is not granted.

Footnote 6: Public Resources Code § 5002.2.

Footnote 7: Public Resources Code § 5019.50; 5019.59;

Response GO16-16 Refer to Response GO16-15 for discussion of the purpose of and need for the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to historic resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant.

Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, State Parks has determined that the proposed Project would be inconsistent with the Los Angeles State Historic Park General Plan because the identified land uses in the General Plan’s Preferred Park Concept Elements did not contemplate a transit station like the proposed Project’s Chinatown/State Park Station. State Parks considers this inconsistency a potentially significant impact. Therefore, Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain an amendment to the Los Angeles State Historic Park General Plan. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Amendment. Refer to Section 5.0, Corrections and Additions, of this Final EIR, for discussion of the General Plan for El Pueblo de Los Angeles State Historic Park. The El Pueblo de Los Angeles Historical

Monument is currently a department of the City of Los Angeles,²³ and the comment's cited code sections pertain to units of the State Park system. As discussed in Section 3.05, Cultural Resources, the City of Los Angeles, County of Los Angeles, and State of California signed an agreement in 1953 creating El Pueblo State Historic Park. The agreement allowed the State to purchase most of the property comprising El Pueblo State Historic Park. In 1992, the property within the Park was transferred to the City. In 1994, the Park's name was changed to El Pueblo de Los Angeles Historical Monument. The City's El Pueblo de Los Angeles Historical Monument Authority Department manages the El Pueblo de Los Angeles Historical Monument.

Comment GO16-17 The statute establishing the Los Angeles State Historic Park, for instance, is clear in stating exceptions in how private development can occur within the boundaries of the park, such as providing access, parking, sanitation, etc. Per the Draft EIR, the project would require an amendment to the State Historic Park General Plan which does not currently allow for transit on its grounds or within its air rights. The amendment would use "access" as defined in PRC 5019.59 to justify said amendment. However, the proposed private-public operating agreement would limit operation to "as needed" when no events at Dodger Stadium are being held. Therefore, the proposed agreement offers no definitive access to the park beyond scheduled Dodger Stadium events.

Because there is no guarantee that the gondola will run on days when no events are held at the stadium, the SPRC is not likely to and should not approve the amendment. With a combined land and air use of over an acre, the SPRC would be giving up a sizeable piece of the Historic Park's property to the project

Response GO16-17 Refer to Response S2-2 regarding the Chinatown/ State Park Station and proposed Project alignment within the Park. The Chinatown/ State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would overhang 9,320 square feet of the park (including the 2,195-square-foot footprint). The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project's required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park (~1.4 million square feet), plus an Additional Separation Buffer. While the Chinatown/ State Park Station's footprint will occupy 2,195 square feet within the park, through continued collaboration with State Parks, which has been ongoing and will continue through the General Plan Amendment process, the proposed Project would be fully integrated into the park

²³ See City of Los Angeles. 2023. Commission, El Pueblo de Los Angeles Historical Monument. Available at: <https://elpueblo.lacity.gov/commission>. Accessed July 2023. See also, California Department of Parks and Recreation. 2023. California State Parks Listing. Available at: https://www.parks.ca.gov/?page_id=21805. Accessed July 2023 (El Pueblo de Los Angeles is not included on this list).

such that it would add to, rather than take away from the park's purpose and objectives.

Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project's consistency with the Los Angeles State Historic Park General Plan. As discussed therein, State Parks has determined that the proposed Project would be inconsistent with the Los Angeles State Historic Park General Plan because the identified land uses in the General Plan's Preferred Park Concept Elements did not contemplate a transit station like the proposed Project's Chinatown/State Park Station. State Parks considers this inconsistency a potentially significant impact. Therefore, Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain an amendment to the Los Angeles State Historic Park General Plan. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Los Angeles State Historic Park General Plan Amendment and the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project's use of Los Angeles State Historic Park. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park.

Comment GO16-18 To reiterate, claims stating the LA ART Project will provide critical public access (thus allowing the construction of towers and a station within the park and on park lands) is not substantiated within the Draft EIR. Detailed analysis is not provided that states a clear or reliable level of service (Draft EIR states "based on demand" and "as needed") that will be provided in the future vs. only on game or special event days. The Draft EIR suggests limited access from a privately funded and operated LLC warrants the removal of public park lands. The Conservancy disagrees, and would like to see greater documentation and evidence provided to the public that can support the Draft EIRs conclusions on this issue.

Response GO16-18 Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events

at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan.

Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and Appendix N, Transportation Appendices, of the Draft EIR.²⁴ Stantec is an internationally respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project's environmental impact. (See, e.g., CEQA Guidelines § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project's potential environmental impacts.

Comment GO16-19 IV. Should the proposed project anticipate federal funding, Section 106 and Section 4(f) would be triggered and additional environmental review would be required

The Conservancy would appreciate greater clarity regarding the funding of this project. Particularly, if any federal dollars will be used in any way for LA ART's planning, development or construction. Should the applicant or lead agency access funding from these entities, the project would trigger Section 106 of the National Historic Preservation Act (NHPA) and Section 4(f) of the Department of Transportation Act. Generally federal environmental review occurs in tandem with CEQA reviews.

Section 106 of the NHPA requires federal agencies to consider the impact of their actions on historic resources. Because of this section, public agencies must assume responsibility for the consequences of their actions on historic resources and be publicly accountable for their decisions.

²⁴ Stantec. 2023. Memo to Holly Rockwell Regarding Los Angeles Aerial Rapid Transit (LA ART) Project Transportation Analysis Peer Review.

Furthermore, Section 4(f) states:

“The Secretary shall not approve any program or project which requires the use of any land from a public park, recreation area, wildlife and waterfowl refuge, or historic site unless (1) there is no feasible and prudent alternative to the use of such land, and (2) such program includes all possible planning to minimize harm to such park, recreational area, wildlife and waterfowl refuge, or historic site resulting from such use.”

Given the projected ridership, size of the station platforms, extension into the Union Station parking lot, and use of Los Angeles State Historic Park property for the Chinatown/State Park Station, it is foreseeable that additional government funds and those at the federal level will be accessed. Additionally, the Union Station forecourt and esplanade project, located in the same vicinity as the Alameda Station, had previously been granted federal funding for the future project. Should that funding contribute to the pedestrian plazas for the station in any way, it would trigger the above code sections and need for federal environmental review.

Response GO16-19 This comment provides a general recitation and characterization of federal law. As proposed, the proposed Project does not require Federal review, including Section 106 of the National Historic Preservation Act (NHPA) and Section 4(f) of the U.S. Department of Transportation Act. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment GO16-20 V. Transfer CEQA lead agency authority to the City of Los Angeles

The LA Conservancy believes the City of Los Angeles is better suited to serve as the Project’s lead agency. As planned, the City of Los Angeles would be responsible for granting the majority of the Project’s discretionary and ministerial permits and therefore is better suited for the lead agency role.

As shown in the Draft EIR, the 1.2-mile-long Project is to be built and operated predominately on or above the City’s public rights-of-way. Furthermore, the plan states that the private LLC developer would enter into a public-private operating agreement with the City of Los Angeles.

Given the numerous historic resources in the area, the City of Los Angeles is better equipped to evaluate impacts and conflicts, including those on historic resources for which is assigned the primary jurisdiction, such as El Pueblo and various Historic-Cultural Monuments (HCM). As previously stated, the historic resources within the

project area are some of the oldest and most important within the City. Therefore, a lead agency with this experience is more appropriate.

Response GO16-20 Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of why Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority. Metro is the proper lead agency for the proposed Project. Under CEQA, a lead agency is the public agency with the greatest responsibility for supervising or approving the project as a whole.” (CEQA Guidelines, §15051(b).) Under state law, Metro has broad authority over public transportation planning and coordination for the Los Angeles region’s transportation system and is authorized to do “any and all things” to carry out these purposes. (Public Utilities Code, § 130105(f).) For the proposed Project, Metro is tasked with considering approval of all plans for design, construction, and implementation under Public Utilities Code section 130252, as well as with consideration of written approvals to operate the proposed Project, pursuant to its authority under Public Utilities Code section 130252. Thus, Metro has primary responsibility for implementing the proposed Project and integrating it into the regional transportation system, consistent with Metro’s statutory purpose. While the City, along with other responsible agencies, has discretionary approval authority over some required permits and approvals for the proposed Project, Metro has discretionary authority to review and approve “[a]ll plans proposed for the design, construction, and implementation” of the proposed Project. (Public Utilities Code § 130252.) This power, vested by the State Legislature, is considerably more broad than individual land use and other review and approvals to be issued by responsible agencies for the components of the proposed Project occurring within their respective jurisdictions. The City and other responsible agencies that still retain approval authority over the aspects of the proposed Project within their jurisdiction are properly designated as responsible agencies engaged in the consultation process with Metro.

As demonstrated in Section 3.05, Cultural Resources and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR), of the Draft EIR, the Draft EIR thoroughly reviews the potential impacts to historical resources. Refer to Section 8.0, List of Preparers, of the Draft EIR, for a list of the subject-matter experts for Historic Resources who assisted in preparation of the Draft EIR, including Teresa Grimes from Historic Preservation, and Amanda Duane from GPA Consulting, who have extensive experience evaluating historic resources in the City of Los Angeles. In addition, Ken Bernstein and Lambert Giessinger with the City’s Department of Planning, Office of Historic Resources, were consulted in preparation of the Draft EIR. These subject-matter experts who assisted Metro in preparing these assessments for the Draft EIR have access to all of the same databases and informational resources as the City would, including National Register of Historic

Places, the California Register of Historic Resources, California Historical Landmarks, California Points of Interest, the California Historical Resources Inventory System (CHRIS), the South Central Coastal Information Center (SCCIC), the Los Angeles Historic-Cultural Monuments, SurveyLA, and Sanborn Fire Insurance Maps, and thus the same information is available to Metro as it is to the City or another agency.

Comment GO16-21 VI. Conclusion

The Conservancy has serious concerns regarding the construction and operation of the proposed LA ART project. To state again, we raise the following concerns regarding the Draft EIR and the proposed Project:

- I. Purpose and need for LA ART is not fully demonstrated when environmentally superior alternatives are identified and available to be implemented

Response GO16-21 This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in responses GO16-2 through GO16-20.

Comment GO16-22 II. Historic and cultural resources and view sheds will be impacted and irreparably harmed by the LA ART Project

Response GO16-22 Refer to Responses GO16-9 through GO16-14 for discussion of how potential impacts related to historical resources would be less than significant.

Comment GO16-23 III. Draft EIR does not adequately address the proposed use and transfer of Public rights-of-way and lands and their permitted legal use, and is in conflict with Public Resources Code 5019.59

Response GO16-23 Refer to Responses GO16-15 through GO16-18 for a discussion of the Los Angeles State Historic Park General Plan Amendment and the legal framework that allows the California Department of Parks and Recreation to permit the proposed Project's use of Los Angeles State Historic Park.

Comment GO16-24 IV. Should the proposed project anticipate federal funding, Section 106 and Section 4(f) would be triggered and additional environmental review would be required

Response GO16-24 Refer to Responses GO16-3 and GO16-19 for a discussion related to funding for the proposed Project and Federal review. As proposed, the proposed Project does not require Federal review, including Section 106 of the National Historic Preservation Act (NHPA) and Section 4(f) of the U.S. Department of Transportation Act.

Comment GO16-25 V. Transfer CEQA lead agency authority to the City of Los Angeles

Response GO16-25 Refer to Responses GO16-2 and GO16-20 for discussion of why Metro is the proper lead agency for the proposed Project and the City's participation in the environmental review process as a CEQA responsible agency.

Comment GO16-26 About the Los Angeles Conservancy:

The Los Angeles Conservancy is the largest local historic preservation organization in the United States, with nearly 5,000 members throughout the Los Angeles area. Established in 1978, the Conservancy works to preserve and revitalize the significant architectural and cultural heritage of Los Angeles County through advocacy and education.

Please do not hesitate to contact me at (213) 430-4203 or afine@laconservancy.org should you have any questions or concerns.

Sincerely,

Adrian Scott Fine
Senior Director of Advocacy
cc: Supervisor Hilda L Solis
Office of Mayor Karen Bass
Council District 1, Eunisses Hernandez
City of Los Angeles, Department of City Planning, Office of Historic Resources

Response GO16-26 This comment provides a general conclusion regarding the comments raised in this letter. Responses to the comments are contained in this letter provided above in Responses GO16-2 through GO16-25.

Comment Letter GO17 – The California Endowment, Chatten-Brown, Carstens & Minter LLP

The full bracketed letter is provided in Appendix C, Public Comments on the Draft EIR, of the Final EIR for reference.

Responses to GO17

Comment GO17-1 On behalf of The California Endowment (“TCE”), we submit the following comments on the Draft Environmental Impact Report (“DEIR”) prepared for the project (“Project”) proposed by Los Angeles Aerial Rapid Transit (“ARTT”).

Summary and Statement of Position.

We provide the following summary of our position, followed by a table of contents and the remainder of our letter.

Response GO17-1 This comment provides a general introduction to the comments raised in this letter. Responses to comments contained in this letter are provided below in Responses GO17-2 through GO17-153.

Comment GO17-2 Introduction & Overview: We oppose the Project and request that it be terminated immediately.

Metro should not be supporting this unsolicited private project proposed at the behest of Frank McCourt and his companies because it is not a public transportation project, but rather, a common carrier tourist attraction. Because it is a private carrier for private benefit which Metro will not own, operate, or control, this private project should not benefit from public land, air rights, or taxpayer resources—all of which will be necessary for this estimated \$300 million behemoth to become a reality. As the DEIR itself acknowledges there is a superior way to achieve the outcomes allegedly sought by this proposed project that involves public transportation—electric buses. If the Project is to be pursued, Metro should not be the lead agency - because the City of Los Angeles (“City”) is in a much better position and is more properly designated as the lead agency.

Response GO17-2 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Cost and Financing, of the Final EIR, which provides detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed

Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project and the City’s participation in the environmental review process as a CEQA responsible agency.

Comment GO17-3 The DEIR is Deficient and Must be Revised and Recirculated: The DEIR is seriously deficient. It fails to fulfill its function of informing both the public and the decision makers of the impacts of the Project, potentially feasible mitigation measures, and alternatives to the Project. As a result, it cannot provide the basis for reasoned decision-making as required by the California Environmental Quality Act (“CEQA”).

If it is pursued further, the DEIR must be corrected and recirculated. An EIR is not supposed to be a sales brochure or advertisement for a project. It is supposed to be an unbiased full disclosure document that advises the public and decision makers of the impacts of a project and how any negative impacts can and will be reduced. The DEIR presented by ARTT and Metro falls woefully short of those legal requirements for full and accurate disclosure.

Response GO17-3 This comment provides a general introduction and summary of the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO17-4 through GO17-153. This comment and the comments in this letter do not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines Section 15088.5. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR.

Comment GO17-4 The DEIR is Misleading: Sadly, omission of critical information and use of analytically misleading half-truths is a common theme throughout the EIR. Mitigation measures for the Project’s negative impacts are ineffective and explicitly deferred. It remains unclear what any unspecified future mitigation measures will entail, but the certainty and effectiveness of any proposed mitigations remain in question because the project proponent has not committed to funding any portion of the project other than initial environmental review and permitting.

Response GO17-4 This comment provides a general summary of the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO17-5 through GO17-153. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the mitigation measures for the proposed Project would not impermissibly defer mitigation and how CEQA does not require the proposed Project to provide a full accounting of how each mitigation measure will be funded.

Comment GO17-5 The Financing Plan is Missing: To date, the Project does not have a financing plan, a plan that is critical to understanding how negative impacts identified in the DEIR will be mitigated by the Project’s proponent, if they will be mitigated at all.¹ The Project’s financial plan- which the Metro board was promised would be made available before the end of September 2022- is missing altogether. Since the proponent- Frank McCourt’s company, ARTT/ McCourt Global- has only committed to funding about 3% of the entire project budget, the shortfalls in construction and operating revenues will need to be made up somewhere and it is most likely that some if not all will come from public transit funding sources- better used for public projects. The DEIR should have discussed who is responsible for the Project, its implementation, and its mitigation measures both in the short range and the long-range terms. We could discern no mention of Climate Resolve or ZET in the EIR at all. In this way, the EIR fails as a full disclosure document.

Footnote 1: Newspaper accounts reported that the gondola project was transferred to a newly-created entity named Zero Emissions Transit (ZET), which is apparently a subsidiary of Climate Resolve. However, in court documents, Metro representatives stated under perjury that the transfer had not yet occurred, and was just a non-binding statement of future intention. (Declaration Of Ronald W. Stamm In Support Of Respondent’s And Real Party’s Joint Opposition To Motion To Augment The Record And File A First Amended Petition in Los Angeles Superior Court case no. 22STCP01030, filed October 6, 2022, paragraph 10.)

Response GO17-5 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail

as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project, and operation and maintenance costs are proposed to be fully funded out of Project revenues. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require the proposed Project to provide a full accounting of how each mitigation measure will be funded.

Comment GO17-6 Unavoidable Impacts Cannot be Mitigated: Mitigation of identified negative impacts will be expensive but are critical to protect the neighborhoods and people living and working near the Project route. Traffic, air pollution, parking, noise and recreation will all have a significant impact on the local community and historic nearby landmarks. The Noise section of the DEIR identifies that there will be significant and so-called unavoidable impacts from construction equipment. This noise and vibration will affect the neighborhoods around El Pueblo and in Chinatown. The vibration will threaten the physical integrity of the El Grito Mural and the Avila Adobe. TCE offices, which are less than 100 feet from the proposed site of the Alameda tower support over 400 office workers which in addition to TCE staff include over 11 non-profit orgs in addition to another dozen groups in various stages of incubation and their staff members, as well as hundreds of non-profit and governmental visitors who participate in conferences on site on a daily basis. Homeboy Industries is also a sensitive receptor in this area and would be similarly impacts by noise and vibration. These impacts can be avoided by denying the project altogether, or choosing the environmentally superior alternative, which in the EIR is called “Transportation Systems Management” but comes down to enhancement of the Dodger Express Buses system.

Response GO17-6 As discussed on page ES-17 of the Executive Summary of the Draft EIR, based on the analysis contained in Section 3.0, Environmental Setting, Impacts, and Mitigation, construction of the proposed Project would result in significant and unavoidable impacts with regard to Noise and Vibration (human annoyance). As demonstrated in the Executive Summary to the Draft EIR, the proposed Project would not result in any other significant and unavoidable construction impacts. Per Section 15092 of the CEQA Guidelines, a public agency may decide to approve or carry out a project for which an EIR was prepared if it has determined that any remaining significant effects on the environment found to be unavoidable under Section 15091 are acceptable due to overriding concerns as described in Section 15093. CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a

proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered “acceptable.” As stated on page ES-17, in the Executive Summary, of the Draft EIR, the proposed Project would not result in any significant and unavoidable operational impacts. Refer to Responses GO17-124 through GO17-130 for a discussion of the construction and operational noise and vibration impacts from the proposed Project. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction and operational noise impacts from the proposed Project. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation. Operational noise impacts would be less than significant. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives which seek to achieve the proposed Project’s underlying purpose.

Comment GO17-7 Instead of promoting a private gondola to a private sports stadium (an amusement park ride, not actual public transit), Metro should focus on enhancing actual public transit options with its limited resources and staff and Board time.

Response GO17-7 Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Section 2.3.7, Purpose and Need, of the Draft EIR, for an overview of the need for the proposed Project. The proposed Project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit connection between the regional transit system at LAUS, Dodger Stadium, Los Angeles State Historic Park, Elysian Park, and surrounding communities via the intermediate Chinatown/State Park Station. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. The vast majority of visitors drive their personal vehicles to access the venue. These vehicles create congestion on the surface streets leading up to and around Dodger Stadium, including Sunset Boulevard/Cesar E. Chavez from LAUS and throughout the surrounding communities. Given the capacity of the proposed Project’s system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, as discussed in Topical Response C, Project Features, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. Refer to Topical Response H, The

Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between LAUS and Dodger Stadium via the proposed Project would provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities.

Comment GO17-8 The City of Los Angeles is the Appropriate Lead Agency: Because the Project is a private project and not a public transportation project, we ask that the Project review process be terminated immediately. In the alternative, Metro should transfer lead agency status to the City to complete review and processing of the gondola Project. Because decisions about this development will have profound impacts on the City and the future the quality of life of City residents, the City, not Metro, is the proper lead agency.

Response GO17-8 Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project and the City’s participation in the environmental review process as a CEQA responsible agency. While the City, along with other responsible agencies, has discretionary approval authority over some required permits and approvals for the proposed Project, Metro has discretionary authority to review and approve “[a]ll plans proposed for the design, construction, and implementation” of the proposed Project. (Public Utilities Code § 130252.) This power, vested by the State Legislature, is considerably more broad than individual land use and other review and approvals to be issued by responsible agencies for the components of the Project occurring within their respective jurisdictions. Metro has “principal authority” over the design, construction, and implementation of the proposed Project and is the appropriate lead agency.

Under CEQA, where two or more public agencies meet the criteria for acting as lead agency, the agency that acts first will normally serve as lead agency. (CEQA Guidelines, §15051(c).) Metro elected to serve as lead agency, and the City has cooperated as a responsible agency, including consultation in preparation of the Draft EIR. Further, as discussed in Section 2.0, Project Description, of the Draft EIR, the

proposed Project requires approvals from the City. Refer to Response G017-11 for further discussion of discretionary approvals required for the proposed Project, including from responsible agencies. CEQA does not require a lead agency to have jurisdiction over all areas where a proposed Project may result in environmental impacts. (Pub. Resources Code, § 21067; CEQA Guidelines, § 15367.) The City and other responsible agencies that still retain approval authority over the aspects of the proposed Project within their jurisdiction are properly designated as responsible agencies engaged in the consultation process with Metro. The Draft EIR properly considered all potential impacts in the area of the proposed Project, which includes property that is in the jurisdiction of Metro, the City, State Parks, and Caltrans. Metro consulted with all responsible agencies, including the City, regarding potential impacts to their property, in compliance with CEQA. And, under the Mitigation, Monitoring and Reporting Program for the proposed Project, included in Section 7.0, Mitigation Monitoring and Reporting Program, of this Final EIR, the City would have certain enforcement authority to ensure mitigation of any potentially significant impacts that would occur on City-owned property and ROW, as the Mitigation Monitoring and Reporting Program for the proposed Project designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. CEQA does not require that a lead agency be responsible for enforcing all mitigation measures.

Comment G017-9 As discussed below, some impacts are disclosed by the DEIR as significant and unavoidable (noise and vibration). Still other impacts are reported to be mitigated below the level of significance, but because the impact was understated, or the mitigation measure is uncertain or vague, the impacts will be significant (traffic, local air quality, cultural resources, recreation and parks, and land use). Together, these impacts are unacceptable. Projects proposed through our public entities, whether Metro or the City, should maintain and improve, not degrade, the quality of life in Los Angeles.

Response G017-9 Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project's mitigation measures complied with CEQA's requirements. As stated on page ES-17, in the Executive Summary, of the Draft EIR, proposed Project would not result in any significant and unavoidable operational impacts. Refer to Topical Response C, Project Features, for discussion of the proposed Project's features to enhance and provide additional benefit to the surrounding communities, including but not limited to, sustainability features and open space enhancements, the Community Access Plan for fares, access to parks, mobility hubs, signage, utilization of local artists for site specific artwork at each station reflective of the unique neighborhood culture, design of each component of the proposed Project to complement and reflect the unique character of the surrounding neighborhood, the Business and Community Support Program during construction, and benefits to local businesses along the proposed Project

alignment. The Project Sponsor would convene stakeholder groups to coordinate on issues related to proposed Project features. Refer to Response GO17-7 for a discussion of the proposed Project need and how the proposed Project would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days.

Refer to Response GO17-6 for a discussion of how the decision-making agency may balance benefits of a proposed project against its unavoidable environmental risks when determining whether to approve the project. When the lead agency approves a project which will result in the occurrence of significant effects, which are identified in the final EIR but are not avoided or substantially lessened, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record.” This comment otherwise provides a general summary of comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO17-11 through GO17-152.

Comment GO17-10 Conclusion: Outright denial of this Project is appropriate in view of the numerous significant, unavoidable environmental impacts of the Project and the existence of a superior, emission free, less costly and less community impactful method of achieving the stated goal of this project.

Response GO17-10 This comment indicating opposition to the proposed Project is noted for the record and will be provided to the decision makers for review and consideration. This comment provides a general summary regarding the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses GO17-2 through GO17-9 and below in GO17-11 through GO17-153. Refer to Table 2 in the Executive Summary of the Draft EIR for a summary of the proposed Project’s environmental impacts. As stated on page ES-17, in the Executive Summary, of the Draft EIR, the proposed Project would have significant construction noise and vibration (human annoyance) impacts, and the proposed Project would not result in any significant and unavoidable operational impacts. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA.

Comment GO17-11 Denial of the Project is also appropriate because Metro has no ability to approve this project because it is wholly private- not a public-private project or other type of project that may be approved by Metro for joint development with ARTT. Instead of reviewing the Project as lead agency, Metro should transfer lead agency status to the City of Los Angeles, which is required to approve a greater number of Project related actions and has a greater ability to monitor and control Project implementation in the future if it is implemented.

Response GO17-11 Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Response GO17-8 for a discussion of how Metro is the proper lead agency for the proposed Project and the City’s participation in the environmental review process as a CEQA responsible agency. Further, as discussed in Section 2.0, Project Description, the proposed Project requires approvals from the City. CEQA does not require a lead agency to issue the most discretionary approvals in order to serve as lead agency or otherwise take into account the number of discretionary approvals under each agency’s ambit. It is "the activity which is being approved and which may be subject to several discretionary approvals by governmental agencies. The term 'project' does not mean each separate governmental approval." (CEQA Guidelines, § 15378(c); *Committee for a Progressive Gilroy, supra*, 192 Cal.App.3d 847, 863.)

Comment GO17-12 The California Endowment’s complete DEIR Comment Letter follows. To assist in review of this Comment letter, we provide the following Table of Contents:

TABLE OF CONTENTS	Page No.
I. PRELIMINARY STATEMENT AND LEGAL FRAMEWORK: THE PROJECT SHOULD BE REJECTED OUTRIGHT	9
A. Preliminary Statement On Gondola Proposal and Processes	9
1. Impacts on TCE and the Community	9
2. The private Use of Public land, Public Rights of Way and Eminent Domain Power is Indefensible.....	10
3. Secretive Sole Source determination should be Voided	11
4. Sweetheart deal through Metro’s Office of Extraordinary Innovation (OEI)	12
5. Frank McCourt’s Interest Would Be Improperly Promote Above Everyone Else	12
6. An environmentally superior alternative of Electrified buses is available and should be chosen	13
7. Precedent set by gondola would be bad public policy of Private Interest Appropriation of Public Functions	13
8. The Public May be Interested in Alternative Use of the Union Station Forecourt	14
9. SB 44 Streamlining Does not Apply Because the Gondola is not a Public Transit Project. (EIR Section 1.4.3.).....	15
10. The EIR Must Address Environmental Justice Impacts Including Possible Affirmative Actions to Redress Past Discrimination	15
11. Elected Officials’ Clearly Expressed Concerns Must Be Seriously Considered	17
12. A Final Decision in TCE’s Procurement Lawsuit Against Metro May Render the Project Impossible	17

B.	Metro is not the Appropriate Lead Agency	18
1.	The Statute Cited by Metro as its Authority to Approve Or Supervise the Project Does Not Give Metro Such Authority	18
2.	The CEQA Guidelines Do Not Support Metro’s Claim to Be the Lead Agency.....	20
3.	Metro Does Not Have Appropriate Authority Over the Project	22
4.	Metro Lacks Intention to Enforce Mitigation Measures Adopted for the Project	24
C.	The DEIR Must Be Revised And Recirculated	26
D.	Denial of The Project Is Appropriate Because Of Unavoidable Adverse Impacts.....	26
E.	Outright Rejection Of The Project Is Appropriate Because Metro Has No Authorization To Pursue The Gondola Proposal.....	26
F.	The DEIR is Inadequate	27
G.	Legal Framework and Overview	27
1.	The Project Description Is Defective (Chapter 3) Because The Entire Project Has Been Piecemealed, And Reasonably Foreseeable Impacts Have Not Been Analyzed Or Disclosed.....	27
2.	Land Use/ Anticipated Uses Are Not Disclosed	35
3.	All Reasonably Foreseeable Impacts Of The Project Are Not Analyzed Or Mitigated.....	36
4.	There Is No Reliable Estimate Of The Gondola’s Lifespan.	36
5.	The Project Has Adverse Impacts That Cannot Be Mitigated Below the Level of Significance	37
6.	Some Impacts That Have Been Understated.	37
7.	Failure to Analyze Some Impacts.....	38
8.	Failure to Analyze all Feasible Mitigation Measures to Reduce Acknowledged Impacts.	38
9.	Reliance on Vague, Unenforceable, or Deferred Mitigation Measures Violates CEQA.....	38
10.	Failure to Consider a Reasonable Range of Alternatives.....	40
11.	The Project Is Inconsistent with the General Plan and Other Applicable Plans	40
II.	MAJOR SUBSTANTIVE CONCERNS: THE EIR IS FAULTY AND DEFICIENT.....	40
A.	Aesthetic Impacts, Section 3.1	40
1.	The DEIR Does Not Disclose the Full Extent of the Aesthetic Impacts	41
2.	There are Mitigation Measures Available for Impacts to Privacy ...	42
B.	Air Quality Impacts (Impacts 3.3) Will Be Significantly, Adversely Impacted by Traffic Drawn by the Gondola project	42
1.	Existing Air Quality in Downtown Los Angeles Is Already Degraded..	42
2.	Construction Emissions Would Be Significant and Must Be Mitigated to a Far Greater Extent than Currently Proposed	43

a.	More Detailed Disclosure of the Timing of Construction Emissions Is Required	43
b.	Additional Mitigation of Construction Equipment Nitrogen Oxide Emissions is Required	43
3.	Various Air Quality Analysis and Assumptions are Unsupported	44
a.	Gondola Movement Assumptions are Overstated	45
b.	Air Quality Analysis is Flawed	45
i.	Baseline Assumptions are Incorrect	45
ii.	Haul Route Air Quality Impacts Are Inaccurately Analyzed	46
iii.	Gondola Operation Benefits Are Overstated	46
iv.	Battery Backup Should Be a Mitigation measure	46
v.	The EIR Uses an Outdated AQMP	46
c.	Energy Usage is Inappropriately Analyzed and	46
C.	Historical and Cultural Resource Impacts (Section 3.5) Must Be Avoided..	49
D.	Parks and Recreational Facilities (Section 3.16) Impacts Must Be Avoided .	49
1.	The Permanent Construction of Gondola Facilities Will Negatively Impact the Park Experience	49
2.	Non-Permanent Impacts On The State Historic Park that May Be Significant Are Not Adequately Analyzed In The DEIR	49
E.	Transportation/Traffic Impacts (Section 3.17) Are Understated	50
1.	Dodger Stadium Access Study For Los Angeles County Transportation Commission	51
2.	Metro Board Executive Management Committee Report	51

9.	Shuttle Busses and Coachella Festival Illustrate Better Alternatives Are Feasible	59
10.	Summary and Conclusion	60
F.	Impact: 3.13 Noise and Groundbourne Vibration Impacts Will Be Significant and Must Be Further Mitigated	60
1.	Construction Noise is identified as Significant and Unavoidable	60
2.	Groundbourne Vibration Impacts Will be Significant	61
3.	Effects of Noise Pollution on Health Are Extensive	62
4.	The DEIR Must Evaluate Sleep Disturbance	62
5.	The DEIR Fails to Disclose Conflicts with the Los Angeles Municipal Code Noise Regulations	63

- 6. The DEIR Fails to Implement All Feasible Mitigation for Construction Impacts 63
- G. The Potential for Blight Is Not Sufficiently Analyzed 64
- H. Land Use and Planning Impacts (3.11) 65
 - 1. City of Los Angeles General Plan Conflicts 65
 - 2. The Surplus Land Act Requires Primary Consideration of Affordable Housing, Educations, and Recreation Before Private Development 66
 - 3. Use of the Union Station Forecourt Would Conflict with the Union Station Master Plan 66
 - 4. The Discussion of the Conditional Use Permit Modification for Dodger Stadium is Uninformative 67
 - 5. The Park Preservation Act Requires Replacement Land 67
 - 6. Metro’s Identification of Possible Federal Funding Makes Federal Requirements Relevant and Applicable, but the EIR Fails to Discuss Them 68
 - 7. Approval from the PUC is Needed 71
- I. Geology and Soils (Section 3.7) is Inadequate in its Analysis 71
- J. The Analysis of Alternatives (Section 4.0) is Grossly Inadequate 72
 - 1. The Project Cannot be Approved if There Are Feasible Alternatives that Would Reduce Adverse Impacts 72
 - 2. A Reasonable Range of Alternatives Must Be Considered, and Was Not 73
 - 3. Alternatives Proposed in the LACTC Study Were Summarily Rejected Without Valid Evidence 73
 - 4. The Environmentally Superior Alternative of Expanded Dodger Express Bus Usage is Feasible 74
- III. CONCLUSION 74

Response GO17-12 This comment provides a table of contents and general introduction to the comments raised in this letter. Responses to the comments contained in this letter are provided below in Responses GO17-13 through GO17-152.

Comment GO17-13 I. PRELIMINARY STATEMENT AND LEGAL FRAMEWORK: THE GONDOLA PROJECT SHOULD BE REJECTED OUTRIGHT.

A. Preliminary Statement On Gondola Proposal and Processes.

1. Impacts on TCE and the Community.

The Endowment—who will be directly impacted by this Gondola Project and its use of the surrounding land-- seeks to protect the interests of its community, and to ensure that local agencies (like Metro) comply with their own laws. (See Notice of Preparation Letter Submitted by The Endowment and Homeboy in EIR Appendix A.)

TCE’s Building Healthy Communities Initiative is focused on empowering local communities to change the conditions, policies and practices that create racial, health

and opportunity disparities in communities.² TCE is partnered with fourteen communities across California to engage in place-based community change initiatives to build healthy and safe neighborhoods for children to grow up in. Much of this work is accomplished by creating spaces for collaboration by nonprofit service providers. The Center for Healthy Communities on Alameda is such a space. TCE’s Center for Healthy Communities campus has become an anchor pillar of the region’s nonprofit community, annually hosting thousands of conference attendees to work on the wellness gaps in our community.⁵ Every year TCE welcomes over 150,000 guests to its campus. For example, during 2019, the Center for Healthy Communities Campus hosted an average of 8 conferences per day for community stakeholders such as the City of Los Angeles, the County of Los Angeles, and LA Metro. This includes over 500 Grantee conferences, 700 Government conferences, and 800 non-profit conferences annually. At TCE, we strive to continue to expand these programs and are actively planning on adding additional programming space, that will increase our daily visitor count and help to complete the vision of the campus. Completing the TCE campus will foster the development of additional community leadership, civic engagement, and transitional housing support in the community. The California Endowment’s Center for Healthy Communities represents opportunities for civic engagement and participation by the nonprofit sector in improving community well-being in the region. Completing the TCE campus is also complementary to the shared vision of a establishing a “Hope Village” for the further advancement of the community.

Footnote 2: The California Endowment <https://www.calendow.org/the-center-for-healthy-communities/los-angeles/>

Response GO17-13 Metro has and will continue to comply with its obligations under CEQA, as well as all applicable statutes, regulations, and policies. As discussed in Section 3.13, Noise, of the Draft EIR, the proposed Project would have a temporary, significant noise and vibration (human annoyance) impact on The California Endowment during construction activities of the Alameda Tower. The proposed Project would not result in any other significant and unavoidable construction or operational impacts to The California Endowment. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for a discussion of how consistent with the proposed Project objectives, the proposed Project was designed in consideration of planned housing projects, including the Restorative Justice Master Plan and Hope Village Project. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period, including the comment letters received during this period. The proposed Project is consistent with the Building Healthy Communities Initiative’s goal of improving health in underserved communities.²⁵ As discussed in Topical Response N, Environmental

²⁵ See The California Endowment. 2010. Building Healthy Communities Initiative. Available at: <https://www.buildinghealthycommunities.org/>. Accessed August 2023. The Building Healthy Communities Initiative is focused on transforming 14 of California’s communities affected by

Justice, the proposed Project has the ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution. The Draft EIR further addresses environmental justice by including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities.

Comment GO17-14 Over the last several years, The Endowment has reached out to the City to discuss the possibility of using the triangle park immediately adjacent to TCE for the benefit of the community and has regularly supported its maintenance and upkeep. This park and adjacent street were anticipated to be part of the expanded TCE campus envisioned in the Hope Village project. Given the proximity of the Project along Alameda Street to the TCE campus, it would be a significant impediment to completing the campus and expanding these community service uses.

Response GO17-14 Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for discussion of how consistent with the proposed Project objectives, the proposed Project was designed in consideration of planned housing projects, including the Restorative Justice Master Plan and Hope Village Project. Refer to Section 2.0, Project Description, of the Draft EIR, for discussion of how Alameda Tower would have a footprint of 900 square feet at the northern corner of the Alameda Triangle, a City ROW between Alameda Street North Main Street, and Alhambra Avenue, and the remaining area would continue to be maintained for pedestrian use. As discussed in Topical Response E, the Draft EIR considered proposed development projects in the vicinity of the proposed Project, using public information to the extent it was available. Table 5-1, Related Projects, in Section 5.0, Other CEQA Considerations, of the Draft EIR, lists 46 related land use development projects that are either approved or proposed—but still considered—in the Draft EIR's analysis, including certain Restorative Justice Master Plan and Hope Village projects. It would be unduly speculative for the environmental documentation to consider a related project that does not have any publicly available information and has not submitted an application for development. Refer to Section 5.0, Corrections and Additions, of the Final EIR, and Topical Response E for a discussion of how subsequent to the release of the Draft EIR, The California Endowment published its Annual Report 2023 with additional information regarding the Hope Village, noting that the Alameda Triangle could be used for recreational spaces. The proposed Project would not impair or impact The California Endowment's potential use of the Alameda Triangle for recreational spaces. As noted above, the Alameda Tower would be located on 900 square feet of the approximately 22,000 square foot Alameda Triangle. The following graphic, also provided in Section 5.0, depicts the Alameda

"health inequities into places where all people and neighborhoods thrive." In Los Angeles, these 14 communities include Boyle Heights and South Los Angeles. See The California Endowment. 2023. Building Healthy Communities: A Decade in Review. Available at: <https://www.calendow.org/learning/executive-summary>. Accessed August 2023. Accordingly, the proposed Project is located outside of the 14 communities that are the focus of the Building Healthy Communities Initiative.

Triangle, including space for both the Alameda Tower and potential recreational spaces:

Further, the proposed Project alignment travels along Alameda Street, and, as shown in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR, does not require any aerial rights over the properties that The California Endowment anticipates building its housing or community and health services. Accordingly, the proposed Project would not impede The California Endowment's anticipated housing, community and health services, or recreational spaces.

Comment GO17-15 The Gondola Project would impact historic cultural resources such as the Avila Adobe, Olvera Street, and the State Historic Park with aesthetics and noise associated with its operations and with noise and ground vibration associated with its construction. It will have aesthetic impacts as its towers and stations literally tower over neighborhoods and gondola cars transport hundreds of people past the windows and over the yards of houses. It will have traffic and transportation impacts as game attendees will drive to and park in Chinatown and Union Station neighborhoods in order to board the gondola and save on expensive Dodger parking lots. It will have recreational impacts on the State Historic Park as it takes a portion of the land and prevents use portions of the park for such beloved activities as kite flying during kite festivals.

Response GO17-15 The Draft EIR fully analyzed and addressed the proposed Project's potential impacts to historic resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR's

analysis concludes that all potential impacts related to historical resources would be less than significant. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of how the proposed Project would have less than significant operational noise impacts. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world and their integration with nearby residential and open space uses.

Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations.

As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project’s required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. Impacts to parks and recreational facilities would be less than significant.

Comment GO17-16 2. The Private Use of Public land, Rights of Way and Eminent Domain is Indefensible.

The project would involve use of aerial gondolas to transport individuals from the Forecourt of Union Station, over a public right of way, a metro line, Chinatown, a freeway, and over multiple communities, to Dodger Stadium. It would require the extensive use of public land including Metro’s Forecourt and parcels of property

owned by the City of Los Angeles along Alameda Street near Olvera Street, and state-owned property at the State Historic Park of Los Angeles. It would require use of air rights over private property, over State owned highway, and over Metro rail lines, and Los Angeles public streets.

Response GO17-16 Refer to Section 2.5, Proposed Project Alignment and Components, with supporting data provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR, for discussion of how the proposed Project maximizes alignment along the public ROW and publicly owned property and minimizes aerial rights over private properties. Refer to Topical Response C, Project Features, for discussion of how the proposed Project would provide numerous benefits to local businesses in El Pueblo, Chinatown, and other areas along the proposed Project alignment, including through potential partnerships with these businesses as well as by providing an accessible and affordable mobility option for employees and area residents.

Comment GO17-17 If private property owners do not agree to allow their property to be used for the Project, Metro might use condemnation proceedings. The use of public power, such as eminent domain by Metro to assist a private carrier is expressly contemplated in correspondence between Metro and ARTT. (AR 199- Sept. 26, 2018, Letter, p. 9 [“...it is anticipated that Metro would utilize the power provided...” including “condemnation”]).

Response GO17-17 The purpose of the Draft EIR is to inform the public and decision makers generally of the significant environmental impacts of the proposed Project. (See CEQA Guidelines §15121(a).) The focus of an EIR is the significant effects on the environment (id., §15143), not on the mechanisms for how property for a proposed project may be acquired. It is speculative at this point whether Metro would need to exercise its eminent domain authority. (See CEQA Guidelines § 15145 [CEQA does not require speculation].) If Metro decides to exercise that authority, it will be subject to the statutory processes set forth in California Code of Civil Procedure Sections 1240.10 et seq. Refer to Responses P701-3 and P701-7 for discussions of the use for eminent domain for the proposed Project and Metro’s eminent domain authority. Further, the reference to the administrative record in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 is noted, but the cited document predates the initiation of environmental review for the proposed Project and accordingly does not have any bearing on the sufficiency of the Draft EIR. In addition, this comment mischaracterizes the cited document. The Project Sponsor noted that it intended to “use its best efforts to acquire public right of way and private land and aerial easements,” but, if necessary, Metro could use its powers provided under Public Utilities Code sections 180152 or 30600, which includes the ability to acquire property by “grant, purchase, gift, devise, or lease, or by condemnation.”

Comment GO17-18

GO17-18A The Surplus Lands Act and similar provisions of law prioritize affordable housing, educational, open space and recreational use of public land above private use.

GO17-18B The Park Preservation Act, California Public Resources Code section 5400-5409, requires that any usage of designated public park land, such as would occur at the State Historic Park, must be compensated for by replacement of equal land. The EIR fails to address the Park Preservation Act.

Response GO17-18

GO17-18A Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for a discussion of the Surplus Land Act.

GO17-18B Refer to Topical Response F, Los Angeles State Historic Park, for a discussion of the Public Park Preservation Act.

Comment GO17-19 3. Secretive Sole Source determination should be Voided.

Following ARTT’s submission of a proposal in April 2018, Metro made a sole source determination in 2018- that ARTT would be the only possible provider of the gondola-without public disclosure and/or involvement or Metro Board of Directors input or approval. Metro entered a Memorandum of Agreement (“MOA”) in 2019 that restricted its ability to examine competitive proposals through an exclusive negotiating agreement (“ENA”) clause. Such sole source approval and ENA restrictions were taken in violation of Metro’s own stated policies and procedures in its internal acquisition and contracting manuals, which in turn implement state competitive bidding laws. Competitive bidding requirements are normally necessary- and required by law- for all significant public transportation projects.

All of these critical actions in matters of vital public interest, were taken administratively, without public knowledge, oversight and/or involvement—and all in direct violation of Metro’s own procurement policies.

If left unchecked, these determinations—which set the course for a major investment of tax-payer funds and direct impacts on the local community, service providers, and property owners (including The Endowment)—will proceed to the entitlement/construction phase.

Response GO17-19 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 [Jan. 9, 2023, Order Denying Petition for Writ of Mandate]. The commenter’s appeal in this lawsuit was abandoned on May 26, 2023, and accordingly the Los Angeles Superior Court’s decision is final. Refer to Response GO17-2 for a discussion of the proposed Project’s funding. Refer to Response GO17-13 for a discussion of potential impacts to The California Endowment.

Comment GO17-20 4. Sweetheart deal through Metro’s Office of Extraordinary Innovation (OEI).

While some members of the public may have heard about the Gondola Project in December 2019, Metro’s sole source determination through the Office of Extraordinary Innovation (“OEI”) was not disclosed to the public. The Endowment itself was unaware of its existence until September 2021 and only after The Endowment and other organizations sought records regarding the Gondola Project. The Gondola Project, therefore, appears to have all the earmarks of a clandestine, sweetheart deal, carefully sidestepping the significant public engagement, outreach and transparency required of all Metro public transportation projects

It simultaneously avoids the scrutiny and competitive bidding required of private projects. By fast-tracking and sole-sourcing a multi-million-dollar aerial tram through Metro’s OEI Metro deprived the public of knowledge and input regarding the Gondola Project as it proceeded through Metro’s internal review process. OEI was meant for smaller, more genuinely innovative projects- not a gondola which is not extraordinary or innovative technology in any way.

Response GO17-20 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 [Jan. 9, 2023, Order Denying Petition for Writ of Mandate).

Metro followed the prescribed process for unsolicited proposals to the Metro Office of Extraordinary Innovation (“OEI”), which involved several public meetings where the proposed Project was discussed in an open forum and otherwise made public on Metro’s website. On April 25, 2018, the Project Sponsor submitted its Unsolicited Proposal to OEI. At the April 26, 2018 Metro Board of Directors meeting, the then-Metro CEO and the Chair of Metro’s Board spoke about the proposed Project during their respective reports. Metro issued a press release on this date, noting that Metro had received the proposal and would evaluate the proposal under its Phase I analysis process “within 60 days of being received” in accordance with the Unsolicited Proposal policy process, prior to then choosing whether or not to advance the proposal to the more-detailed Phase II consideration. (“Metro receives Unsolicited Proposal for aerial rapid transit between Union Station and Dodger Stadium,” Metro – The Source (April 26, 2018).)²⁶

Following its consideration of the proposal consistent with the OEI process, Metro sent a letter to the Project Sponsor on October 11, 2018, confirming that the proposed Project would proceed to a sole source agreement, noting that Metro was prepared to enter into exclusive negotiations on the proposed Project. Metro’s December 3, 2018 Board Box included a discussion of the OEI process, noting that the Project Sponsor met the sole source criteria and, that during the Phase I review, Metro “felt that this zero-emission mode could provide a useful, creative and fun

²⁶ Hymon, Steve. 2018. Metro receives Unsolicited Proposal for aerial rapid transit between Union Station and Dodger Stadium. Available at: <https://thesource.metro.net/2018/04/26/metro-receives-unsolicited-proposal-for-aerial-rapid-transit-between-union-station-and-dodger-stadium/>. Accessed August 2023.

means of accessing Dodger Stadium and Elysian Park while reducing congestion and improving air quality in the neighborhoods surrounding the Stadium” and “conducted due diligence on the feasibility of this unique partnership and assessed the costs and benefits to Metro and the public of partnering on the project.” (December 3, 2018 Board Box Update, p. 2.)

At the December 6, 2018 Metro Board of Directors meeting, the then-Metro CEO and Chair provided the Metro Board with an update on the proposed Project in his CEO Report to the Board, noting that he had “signed a memo closing out the unsolicited proposal process for the Los Angeles Aerial Rapid Transit Project and advancing that project to the implementation phase” and that Metro would “continue to develop the project by entering into an exclusive negotiation with our partner, the Aerial Rapid Transit Technologies LLC.”²⁷ On this same day, Metro issued a press release announcing that Metro and LA ART had signed a letter of intent to “formally begin the negotiations necessary” for the Project and that the letter of intent “signals Metro’s interest in implementing the project and moves it from the Unsolicited Proposals evaluation stage to project development.” (See “Metro and ARTT co-sign Letter of Intent to begin negotiations on developing gondola to Dodger Stadium,” Metro – The Source (December 6, 2018).) Metro formally concluded the Unsolicited Proposal process on December 14, 2018, determining that the proposal satisfied the Phase II criteria, and advanced the proposal to the implementation process.

Contrary to this comment’s contentions that Metro did not publicly discuss the sole source determination, as stated above, the then-Metro CEO and Chair provided the Metro Board with an update on the Project on December 6, 2018 at the public Board of Directors meeting, noting that Metro was “entering into an exclusive negotiation” with LA ART. Metro’s December 3, 2018 Board Box included a discussion of the OEI process, noting that “after reviewing the Phase II proposal submitted,” the Metro “review team recommended moving forward to implementation by entering into exclusive negotiations.” Metro’s Unsolicited Proposal Policy FAQs recognizes that “Metro Board meetings are matters of public record,” (Unsolicited Proposal Policy FAQs, p. 4) and this extends to items provided within Metro’s Board Box. In addition, at the publicly-noticed April 18, 2019 Metro Executive Management Committee (“EMC”) meeting and the April 25, 2019 Metro Board meeting, Metro received and filed a status report on the proposed Project that outlined the steps for moving forward with the proposed Project, including continuing negotiations on the Memorandum of Agreement (“MOA”) between the Project Sponsor and Metro, and the CEQA process. The reports for these meetings outlined the MOA’s terms, including that Metro will act as lead agency for the Project under CEQA. The reports also affirmatively acknowledge Metro’s sole source determination, stating that in

²⁷ See Los Angeles County Metropolitan Transportation Authority (LA Metro). 2018. Regular Board Meeting Agenda Item 4. Available at: https://metro.granicus.com/player/clip/987?view_id=2&redirect=true&h=7b1d4fe0fe92c06e7a30b6c30ed61f65. Accessed August 2023.

2018, “Metro formally concluded the unsolicited proposal process and began exclusive negotiations with ARTT.”

The proposed Project was also discussed at the publicly noticed Metro EMC and Board meetings on September 17, 2020, September 24, 2020, June 17, 2021, and June 24, 2021.

Metro’s consideration of the proposed Project did not occur solely behind closed doors. Further, as part of early outreach to organizations along the alignment, the Project Sponsor met with The California Endowment early in the process following Metro’s determination that the proposed Project had satisfied the requirements of its Unsolicited Proposals policy to allow the proposed Project to proceed to the environmental review phase for further analysis. The Project Sponsor and The California Endowment had a Zoom meeting on April 22, 2020. Following the NOP’s release, the Project Sponsor reached out to The California Endowment to provide updates and discuss potential opportunities to collaborate. The Project Sponsor had a meeting scheduled with The California Endowment on November 13, 2020, but the meeting was canceled the night before with a note stating that “we don’t believe that a meeting is needed.” Accordingly, this statement that The California Endowment was unaware of the proposed Project until September 2021, is simply false.

Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project’s public outreach and opportunity for public testimony during the Draft EIR public review period. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period. Metro sought to engage the community in each stage of the environmental review process. Metro engaged the public in decision making for the proposed Project beginning with the public scoping period for the Draft EIR in October 2020 to receive public comment on the proposed Project’s scope of environmental review under CEQA. In June 2021, the Project Sponsor conducted two virtual public outreach meetings. The input from the public, including local community stakeholders, as well as from agencies, organizations, and interested parties, during this period led directly to changes to the proposed Project to incorporate public feedback. The Draft EIR was released on October 17, 2022, for a 60-day public review period, which Metro extended an additional 30 days for a 90-day public review period ending on January 17, 2023. Eight public meetings were held immediately preceding, during, and immediately following the Draft EIR public review period, with four held in-person in the Project area at Los Angeles Union Station and Cathedral High School, and four held virtually via Zoom webinar.

Comment GO17-21 5. Frank McCourt’s Interest Would Be Improperly Promoted Above Everyone Else.

This project would promote the interests of a single person- Frank McCourt- over the interests of the public, which would be better served by a genuine public transportation project. Gondola Project is proposed by ARTT. ARTT was created by

McCourt Global which is, in turn, controlled by Frank McCourt, the former owner of the Los Angeles Dodgers before their bankruptcy filing. McCourt continues to hold at least a half- interest in the parking lots surrounding Dodger Stadium. In 2008, he proposed extensive commercial and retail development of the parking lots in a plan called the Next 50, but those plans went nowhere when he was unable to raise the financing for them. The plans are apparent on the website of the architect who designed them for the McCourt Company. (See <https://johnsonfain.com/projects/architecture/commercial/la-dodgers-stadium-next-50/>; Enclosure 10.)

TCE has taken a stand on behalf of the broader public interest, and the interests of the local community, to ensure that community voices are heard, and that if true public transportation is needed, that Metro adhere to its own policies that seek to develop transportation with and for the public, not simply push forward an unsolicited private transportation project through a now faulty Metro process in the Office of Extraordinary Innovation.

Response GO17-21 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Response GO17-20 for a discussion of how the Los Angeles County Superior Court upheld Metro’s OEI process with respect to the proposed Project. Refer to Response GO17-7 for a discussion of the need for the proposed Project. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for a discussion of the Next 50 Project, including how the project did not proceed after 2008, and the current owners of the Los Angeles Dodgers purchased the team and Dodger Stadium in 2012. While the contents of Enclosure 10 were considered in this response, mere statements on a website are not evidence that such development is currently proposed.

Comment GO17-22 6. An environmentally superior alternative of Electrified buses is available and should be chosen.

A better, public serving transportation project might be, for example, enhancement of the Dodger Express buses with electrified buses. This possibility is identified as the Environmentally Superior Alternative in the EIR. (4-75.) Such electric buses would be available not just during the 182 days on which there is a game or event at Dodger stadium, but also available to serve the public on other days and to other destinations throughout the rest of the year. McCourt’s private gondola project line serves no other interest than conveying Dodger game ticketholders to the Stadium from Union Station and back again. This will not alleviate but will exacerbate greater traffic, pollution and congestion in the community in an around Union Station (UCLA Study)

as riders drive to Union Station to take the Gondola, thereby displacing cars from the Dodger parking lot to Chinatown and the surrounding area around Homeboy and The California Endowment.

Response GO17-22 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, of this Final EIR and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Transportation Systems Management Alternative (“TSM”) for an enhanced Dodger Stadium Express. The TSM Alternative is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Refer to Topical Response O, Response to UCLA Mobility Lab Study. Refer to Topical Response C, Project Features for discussion of the proposed Project’s features to enhance and provide additional benefits to the surrounding communities.

Refer to Response GO17-7 for a discussion of the need for the proposed Project. As discussed in Section 2.0, Project Description, of the Draft EIR, and Topical Response C, Project Features, the proposed Project creates a first/last mile transit link for residents and businesses along the proposed Project alignment while unifying and connecting communities through transit mobility access. This new mode of transportation will expand rider access to the regional transit system by attracting new visitors, including Dodgers fans, and represents an opportunity for additional visitors along the proposed Project alignment, creating economic opportunities for local businesses, including shops and restaurants, through potential partnerships that drive customers to businesses along the alignment, which, consequently, adds revenues to these small businesses in the communities the proposed Project hopes to serve. The proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. The proposed Project would provide active transportation connectivity along the proposed Project alignment through pedestrian access enhancements and first/last mile multi-modal options at the mobility hubs proposed for the Chinatown/State Park Station and the Dodger Stadium Station. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents,

workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park.

Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations. Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines (“TAG”). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project’s potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.

Comment GO17-23 7. Precedent set by gondola would be bad public policy of Private Interest Appropriation of Public Functions.

If Metro continues to participate in this gondola proposal with Frank McCourt and the companies he controls, it will undercut public confidence in Metro and in local government generally. The gondola project demonstrates that a single rich and powerful individual such as Frank McCourt can coopt the instruments of public government- and an agency as large as Metro- that is supposed to serve the public generally- and enlist that agency in meeting his private interests of building a private transportation project to the parking lots he owns at Dodger stadium.³

Footnote 3: Even if the Project allegedly will not require Metro monetary expenditures, Metro itself identified opportunity costs and other costs in its Request for Information. Metro stated that the Project would "have a cost to Metro and the people of Los Angeles County. These may include the social and political cost of acquiring property; the impacts of construction on local communities; acting as the face of the project and mediating opposition; the opportunity costs of expending limited resources and capacity; and the impact of allowing for an additional transit use on the Union Station property given the myriad of projects, both transit and

commercial, in early stages of development. To the extent that Metro will be environmentally clearing the project, claiming property, and substantially involved in other ways, the reputational risks of problems that arise on the project, such as delays, mismanagement, or operational incidents, also reflect on Metro even if Metro is not paying for the project." (Request for Information, p. 3.)

Response GO17-23 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. The reference to the administrative record in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 is noted, but because the cited document is unrelated to the substance of the Draft EIR, no further response is warranted.

Comment GO17-24 Metro has committed to use eminent domain—the taking of private land and air rights away from individual owners-- to help him achieve his goal. The former homeowners of Chavez Ravine had their homes and land taken by eminent domain. Will history repeat itself? If McCourt and the gondola project are not stopped now, it would set a precedent for further use of public agencies by private individuals to serve their private interests and enrich themselves at the expense of the public.

Response GO17-24 It is speculative at this point whether Metro would need to exercise its eminent domain authority. (See CEQA Guidelines § 15145 [CEQA does not require speculation].) If Metro decides to exercise that authority, it will be subject to the statutory processes set forth in California Code of Civil Procedure Sections 1240.10 et seq. Refer to Responses P701-3 and P701-7 for discussions of the use for eminent domain for the proposed Project and Metro's eminent domain authority. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for a discussion of Chavez Ravine. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting

zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO17-25 This project has been recognized by Metro staff as unprecedented. It is unprecedented for a reason: it is not legally authorized and is not within Metro’s jurisdiction to pursue. Billionaire Elon Musk sought to promote similar private transportation to Dodger Stadium in the guise of a public transportation project but he abandoned that effort. (<https://ballparkdigest.com/2021/04/16/musk-boring-to-dodger-stadium-dead/>). Similarly, the ARTT project should be rejected and abandoned before it progresses further with Metro.

Response GO17-25 Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority. Metro is the proper lead agency for the proposed Project. Under CEQA, a lead agency is the public agency with the greatest responsibility for supervising or approving the project as a whole.” (CEQA Guidelines, §15051(b).) Under state law, Metro has broad authority over public transportation planning and coordination for the Los Angeles region’s transportation system and is authorized to do “any and all things” to carry out these purposes. (Public Utilities Code, § 130105(f).) As discussed in Topical Response A, SB 44, the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Thus, Metro is legally authorized under state law to approve the proposed Project. For the proposed Project, pursuant to its authority under Public Utilities Code section 130252, Metro is tasked with considering approval of all plans for design, construction, and implementation, , as well as with consideration of the written approvals to operate the proposed Project. Thus, Metro has primary responsibility for implementing the proposed Project and integrating it into the regional transportation system, consistent with Metro’s statutory purpose. Metro is the appropriate lead agency for the proposed Project.

Comment GO17-26 8. Alternative Use of the Union Station Forecourt.

The proposal assumes the Union Station Forecourt would be used for the gondola project. There are much better uses possible for this public land, including continued use as public open space. If the land is available for lease, members of the public may be interested in exploring its use as supportive housing, community recreational, or educational space. The Surplus Land Act requires a prioritization of uses ahead of private interest.

If there is to be a lease of the Forecourt land, we would like notification of any Requests for Proposals or other bidding processes whether required by local, state and federal competitive bidding laws and regulations or otherwise.

Response GO17-26 As discussed in Section 2.0, Project Description, of the Draft EIR, Metro’s LAUS Forecourt and Esplanade Improvements Project is currently being developed in coordination with the City of Los Angeles and would include repurposing the existing northwestern parking lot at LAUS into a pedestrian forecourt and gathering space, as well as pedestrian and bicycle enhancements along Alameda Street and Los Angeles Street. The proposed Project would be compatible with Metro’s LAUS Forecourt and Esplanade Improvements Project, which is also included in Table 5-1, Related Projects, of Section 5.0, Other CEQA Considerations, of the Draft EIR. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for a discussion of the Surplus Land Act. As discussed on page 2-23 in Section 2.0, Project Description of the Draft EIR, the proposed Alameda Station would be located adjacent to the planned LAUS Forecourt. The Alameda Station would be located over Alameda Street and would provide vertical circulation elements (i.e., elevators, escalators, stairs) for pedestrian access from the planned LAUS Forecourt.

Comment GO17-27 9. SB 44 Streamlining Does not Apply Because the Gondola is not a Public Transit Project. (EIR Section 1.4.3.)

The DEIR contains a section asserting that SB 44 applies to the gondola project. (EIR, pp. 1-5 to 1.9). However, this is wrong and misinforms the public. As explained below and in TCE’s lawsuit and confirmed in ARTT’s application, the gondola project is not public transportation; it is a private project. As such, it is not entitled to the streamlining benefits that SB 44 provides for “public transit” projects.

The hearings held in an attempt to comply with SB 44 were not true public hearings, at which members of the public could make remarks in a public forum. Instead, they were in “science fair” format that isolated commenters and caused many members of the public to object in frustration.

([https://www.sgvtribune.com/2023/01/14/opponents-of-aerial-gondola-to-dodger-stadium-take-over-meeting-in-chinatown/.](https://www.sgvtribune.com/2023/01/14/opponents-of-aerial-gondola-to-dodger-stadium-take-over-meeting-in-chinatown/))

Response GO17-27 Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Metro held all required public meetings for SB 44, exceeding SB 44’s requirements by hosting two informational workshops and four public hearings, including the fourth public hearing held as a continuation of the third public hearing to allow an additional opportunity for attendees to provide verbal testimony due to disruptions at the third public hearing. Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the

proposed Project’s opportunities for public testimony during the Draft EIR public review period. During the public review period, comments on the Draft EIR could be submitted in writing via email or mail, by phone, and during the four Public Hearings. Comments on the Draft EIR could be submitted by email to LAART@metro.net, by mail to One Gateway Plaza, Mail Stop 99-22-6, Los Angeles, CA 90012, or over the phone by calling (213) 922-6913. Comments could also be submitted at each of the four public hearings. At virtual public hearings, comments could be given verbally. At virtual public hearings, comments could be given verbally. In light of the disruptions at the January 12, 2023, public hearing, Metro provided a fourth public hearing by way of a virtual public hearing held on February 8, 2023. Verbal comments made at the virtual February 8, 2023 public hearing were deemed timely submitted for the purposes of the Draft EIR public review period. At the two public hearings held in person, comments could be submitted either in writing on forms provided by Metro, or verbally to the court reporters who were set up at a “comment station” in the venue. Written comment forms provided instructions on how to comment on the Draft EIR in English, Spanish, and Chinese (Simplified). Interpretation was provided in English, Spanish, Mandarin, and Cantonese during all four public hearings, with interpretation provided in Taishanese during the final two public hearings. Moreover, the format of the in-person public meetings immediately preceding and during the Draft EIR public review period was an Open House, consistent with standard Metro practice, where attendees could learn more about the proposed Project and the key analyses and conclusions of the Draft EIR, and also a public comment opportunity. Twelve stations were set up throughout the Ticket Concourse, with ten stations focused on specific subject matter areas of the Draft EIR. Attendees could walk around to each station and ask questions to subject-matter experts about the Project. Each station had large, printed boards summarizing the subject matter of that station, including: the Project Description, Aesthetics, Air Quality, GHG, and Energy, Cultural (Archaeology and Historical Resources), Parks and Recreation, Noise, Transportation, and Parking. Each station also included printed materials that attendees could review and/or take with them, including fact sheets in English, Spanish, and Chinese (Simplified) and printed copies of the presentation from the Virtual Public Hearing in English, Spanish, Chinese (Simplified) and Chinese (Traditional). A hard copy of the Draft EIR was also available at the Summary of Impacts station for attendees to review during the Informational Workshop. The meeting was staffed by Metro and AECOM staff, experts on subject matter areas including Transportation and Parking; Archaeology; Historical Resources; Air Quality, Greenhouse Gas, and Energy; Ropeway Engineering; Noise; and Aesthetics, and the Project team, who answered questions from attendees on the Draft EIR key analyses and conclusions. Appendix R, SB 44, of the Draft EIR, provides the text of SB 44 (Public Resources Code § 21168.6.9), which provides under Section 21168.6.9(e)(3) that the “lead agency shall conduct an informational workshop to inform the public of the key analyses and conclusions of [the Draft EIR]” within 10 calendar days after the release of the draft environmental impact report, and, Section 21168.6.9(e)(4) requires that the lead agency “shall hold

a public hearing to receive testimony on the draft environmental impact report.” SB 44 does not contain further requirements for the content of informational workshops or public hearings. The public meetings during the Draft EIR public review period complied with SB 44.

Comment GO17-28 10. The EIR Must Address Environmental Justice Impacts Including Possible Affirmative Actions to Redress Past Discrimination.

An EIR must analyze the environmental justice impacts of a project proposal. (Golden Door Properties, LLC v. County of San Diego (2020) 50 Cal.App.5th 467, 555.) In Golden Door Properties, the trial court ruled that an EIR “failed to address environmental justice” by making “no attempt to disclose the increased health damage that could occur to the more vulnerable County residents (children, the ill, and disadvantaged communities) from the project ‘increasing nonattainment criteria pollutants’ ..., or from not requiring GHG offsets to be obtained in-County.” Similarly in the present case, the significant effects such as from construction noise and vibration (EIR, 3.13-63) will be felt most forcefully and most immediately by the nearby vulnerable communities, including many elderly non-English-speaking residents of Chinatown.

Response GO17-28 Refer to Response GO17-73 for a discussion of how the Draft EIR’s air quality and health risk analyses considered the impacts to all receptors surrounding the proposed Project, including sensitive receptors such as children, the sick, and the elderly within a quarter mile of the proposed Project. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project’s ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project’s ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project’s potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. The California Attorney General recognizes that compliance with CEQA is a tool to promote environmental justice, and the Draft EIR fully analyzed and disclosed the proposed Project’s potential environmental effects, including on the surrounding communities. The Draft EIR also analyzed the proposed Project’s consistency with General Plan policies related to environmental justice, and the proposed Project is consistent with General Plan policies related to environmental justice, including reinforcing or encouraging the establishment of strong pedestrian orientation in the surrounding communities, facilitating multi-modal access to and from the stations with pedestrian network

improvements. Further, the proposed Project is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, providing connections to Metro’s growing regional public transit system. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. The proposed Project would also operate daily in addition to Dodger games and events. Public outreach for the proposed Project was designed with environmental justice principles in mind and the proposed Project provided translated materials in four different languages, and interpretation services in five different languages, to reflect the surrounding community, and provided opportunities for in-person and virtual meetings with toll-free dial in options and ADA accessibility features. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction noise and vibration impacts from the proposed Project. On-site construction related noise impacts would be significant and unavoidable even with implementation of mitigation. Mitigation Measure NOI-A would be implemented during construction of the proposed Project, requiring a Construction Noise Management Plan to minimize construction-related noise impacts to off-site noise-sensitive receptors, which would include the construction noise barriers. Off-site construction traffic noise impacts would be less than significant during all phases of construction of the proposed Project. Vibration impacts associated with the proposed Project were analyzed in the Draft EIR both for building damage and human annoyance. With implementation of Mitigation Measures VIB-A and VIB-B during construction of Alameda Station, vibration damage impacts at the Avila Adobe, the Old Winery, and *El Grito Mural*, would be less than significant. As demonstrated in Table 3.13-28 on page 3.13-62 of Section 3.13, Noise, of the Draft EIR, the proposed Project would result in significant and unavoidable human annoyance impacts during construction of the proposed Project. Refer to Response GO17-129 and Response GO17-130 for discussion of the proposed Project’s less than significant impact on human health associated with hearing loss, hearing damage, and sleep disturbance. Noise standards, which are generally stated based on the use function of the property and not by age group, are nonetheless developed to protect sensitive populations, including seniors and children.

Comment GO17-29 The Court of Appeal in *Golden Door* cited *Ramo*, *Environmental Justice as an Essential Tool in Environmental Review Statutes: A New Look at Federal Policies and Civil Rights Protections and California's Recent Initiatives* (2013) 19 Hastings W.Nw. J. Env'tl. L. & Pol'y 41, 42 [noting that “[t]he California Attorney General's recent litigation involving ... global warming emissions[] affecting minority communities has sparked renewed interest in the relationship between environmental review laws and the doctrine of environmental justice.”].)

When the City of Los Angeles analyzed expansion of the Los Angeles International Airport, the EIR/EIS included an entire section devoted to environmental justice impacts. (https://www.lawa.org/-/media/lawa-web/lawa-our-lax/final-environmental-impact-statement/final-environmental-impact-statement--part-i/feis_eir_part1-13_040403_environmentaljustice.ashx.) Metro should do no less with regard to the gondola project.

Response GO17-29 Refer to Response GO17-28 for discussion of how the Draft EIR addresses environmental justice. The referenced EIR/EIS was drafted to comply with both CEQA and the National Environmental Policy Act (NEPA). NEPA requires the consideration of environmental justice pursuant to Executive Order 12898. The California Attorney General recognizes that compliance with CEQA is a tool to promote environmental justice, and the Draft EIR fully analyzed and disclosed the proposed Project's potential environmental effects, including on the surrounding communities.

Comment GO17-30 A legacy of discriminatory actions by government officials against minority communities was evident in the forceful eviction of people from their homes in Chavez Ravine in the 1950's in order to make room for Dodger Stadium and its parking lots. Every action Metro and the City of Los Angeles takes today must be informed by efforts to be especially sensitive to the City's diverse communities, especially in light of the discrimination of the past.

Response GO17-30 Refer to Section 5.0, Corrections and Additions, of this Final EIR, for a discussion of Chavez Ravine. Refer to Response GO17-28 for discussion of how the Draft EIR addresses environmental justice. Refer to Topical Response N, Environmental Justice, for discussion of how the proposed Project supports Metro's goal of prioritizing equity opportunities, and helps promote public transit as an essential lever in enabling access and improving quality of life for Los Angeles County.

Comment GO17-31 Translating documents into appropriate languages, especially when they discuss possible physical damage to treasures of Hispanic heritage in Los Angeles such as Avila Adobe and El Grito Mural, is a bare minimal step that Metro should undertake.

Response GO17-31 Refer to Appendix A, Public Outreach Report, of the Final EIR, for discussion of the proposed Project's public outreach immediately preceding and during the Draft EIR public review period, which included outreach materials and print advertisements in English, Spanish, Chinese (Simplified), and Chinese (Traditional), and interpretation at the eight public meetings in Spanish, Mandarin, and Cantonese, with interpretation also provided in Taishanese during the final two public meetings. The Executive Summary of the Draft EIR was also translated to Spanish, Chinese (Traditional), and Chinese (Simplified). Refer also to Topical Response N, Environmental Justice, for discussion of how public outreach for the proposed Project was designed with environmental justice principles in mind and the proposed Project provided translated materials in four different languages, and interpretation services in four different languages, to reflect the surrounding community, and provided

opportunities for in-person and virtual meetings with toll-free dial in options and ADA accessibility features. Refer to Appendix A, Scoping Report, of the Draft EIR, for discussion of outreach and community engagement during the Draft EIR scoping period, which included outreach materials in English, Spanish, and Chinese (Simplified), and interpretation in Spanish and Cantonese.

Comment GO17-32 A legacy of discriminatory actions by government officials against minority communities was also evident in the eviction of residents from ancient Chinatown near Union Station. (Encl. 4 [Administrative Civil Rights Complaint regarding Cornfields, p. 14 stating “The City and the railroads forcibly relocated the Chinatown community to its present location to build Union Station in the 1930’s.”; also <https://californiahistoricalsociety.org/blog/old-chinatown-and-the-present-union-station-transportation-land-use-race-and-class-in-pre-wwii-los-angeles/>.)

The injustice families suffered in the 1950’s era eminent domain seizures of their homes and property by local government has been extensively documented. (See <https://www.latimes.com/entertainment-arts/books/story/2020-03-31/dodgers-stealing-home-eric-nusbaum>; <https://www.zinnedproject.org/materials/chavez-ravine>; <https://laist.com/news/la-history/dodger-stadium-chavez-ravine-battle>; copies of these articles are enclosed. Encl. 3.)

Response GO17-32 Refer to Section 5.0, Corrections and Additions, of this Final EIR, for a discussion of Chavez Ravine. Refer to Topical Response N, Environmental Justice, for discussion of how no displacement of existing residences or housing would occur in connection with the construction and operation of the proposed Project, which would operate primarily over the public ROW and publicly owned property to minimize aerial rights requirements over private properties, taking into account existing and future adjacent land uses.

Comment GO17-33 The use of eminent domain⁴ to take private property from minority community members in a way that enhances private gain is similar to the historic injustice that occurred at Bruce’s Beach in Manhattan Beach. With regard to Bruce’s Beach, however, the County of Los Angeles has sought to correct the historic wrong that occurred by returning property to the Bruce family.

(<https://mitchell.lacounty.gov/los-angeles-county-completes-landmark-return-of-bruces-beach-to-the-rightful-heirs-of-charles-and-willa-bruce/>.) The wrongs done to families who lost their homes and properties through discriminatory government actions in Chavez Ravine have yet to be redressed.

Footnote 4: The use of eminent domain/condemnation power by Metro to assist the gondola is expressly contemplated in the correspondence between Metro and ARTT.

Response GO17-33 Refer to Response GO17-24 and Responses P701-3 and P701-7 for discussions of the use for eminent domain for the proposed Project and Metro’s eminent domain

authority. Refer to Section 5.0, Corrections and Additions, of this Final EIR, for a discussion of Chavez Ravine.

Comment GO17-34 11. Elected Officials’ Clearly Expressed Concerns Must Be Seriously Considered.

On September 15, 2022, the Metro Executive Committee met to receive a staff report on the status of the Gondola project. At this hearing, Los Angeles City Councilmember Hernandez who took office on December 12, 2022, reiterated concerns previously expressed at the September 15, 2022, Executive Committee hearing which were to ensure the genuine involvement of the community in a public and transparent review process for the gondola. Among her requests were for translation of relevant documents.

Additionally, Director Solis raised a number of questions and concerns at the September 15, 2022, Metro Executive Committee hearing. We have provided a transcript of the remarks of Director Solis and of Councilmember Hernandez. (Enclosure 1.)

Finally, the Board of Directors of Metro itself passed a Resolution in 2021 seeking answers to questions to avoid Unintended Consequences. A copy of that resolution is attached. (Enclosure 2.) Despite the passage of time, the Board’s questions have not completely been addressed.

Response GO17-34 Refer to Response GO17-31 for a discussion of how the Executive Summary to the Draft EIR and outreach materials were provided at both the in-person meetings in printed format, and in electronic format on Metro’s website in English, Spanish, Chinese (Traditional), and Chinese (Simplified), and how interpretation was provided in English, Spanish, Mandarin, and Cantonese during the eight public meetings, with interpretation provided in Taishanese during the final two public meetings. The reference to Enclosure 1 and Enclosure 2 are noted and will be provided to decision makers for their review. While this comment provides a characterization of these documents, the enclosed transcript and resolution speak for themselves.

Comment GO17-35 12. A Final Decision in TCE’s Procurement Lawsuit Against Metro May Render the Project Impossible.

The California Endowment brought a lawsuit (a Petition for a Writ of Mandate) in March 2022, seeking to set aside Metro’s determination to proceed with ARTT’s unsolicited proposal for a multi-million-dollar gondola project. This lawsuit was heard on January 6, 2023. A decision on this lawsuit was issued on Monday, January 9, 2023, denying the writ of mandate but that may not yet be a final decision.

Response GO17-35 This comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 [Jan. 9, 2023, Order Denying Petition for Writ of Mandate). The commenter’s appeal in this lawsuit was abandoned on May 26, 2023, and accordingly the Los Angeles Superior Court’s decision is final. Even so, the Los Angeles Superior

Court recognized that “Setting aside the MOA would not preclude Metro from completing its environmental review of the proposed project.”

Comment GO17-36 B. Metro is not the Appropriate Lead Agency.

1. The Statute Cited by Metro as its Authority to Approve or Supervise the Project Does Not Give Metro Such Authority.

The applicable statute, Public Resources Code section 21067, defines a lead agency as a public agency having the principal responsibility for carrying out or approving a project. Metro simply assumes in the DEIR that it is the lead agency, asserting that Metro has the “responsibility for supervising or approving the project as a whole” without showing under what statutory authority it has that responsibility or authority. (DEIR, p. ES-1) The truth is that because this is not a public transportation project, a public/private Metro project, or a project that Metro intends to acquire, other than possibly leasing its forecourt, Metro has no control, responsibility or authority over the project, therefore, Metro is not the proper lead agency for the Project.

The list of permits set out in the DEIR as required for the ARTT does list Public Utilities Code (PUC) section 130252 as requiring “submittal, review, and approval of proposed plans for design, construction, and implementation of the Project,” which is Metro’s responsibility. (DEIR, p. 2-61.) However, this statute does not grant Metro the degree of authority to authorize, or any authority to supervise the Project, that it claims.

PUC section 130252 applies only to “public mass transit systems or projects, including exclusive public mass transit guideway systems or projects, and federal-aid and state highway projects.” (PUC § 130252(a).) However, the Project was not proposed or approved as a public mass transit project; instead, it would be a privately owned and operated (MAR5 220) transportation system primarily serving a small fraction of the public (Dodger baseball game or event ticket holders) on a limited number of days per year. We note that ARTT itself stated in its response to Metro’s RFI that Public Utilities Code section 130252 does not apply to the Project. (MAR 207.) ARTT’s proposal to Metro for approval of the ARTT explicitly says that the gondola would be privately owned and operated.” (Id, emphasis added.) As a private transportation project, the ARTT would be outside the ambit of PUC 130252; Metro’s authority to approve it at all has not been shown.

Footnote 5: The Metro Administrative Record (“MAR”) and Supplemental Administrative Record (“SAR”) are included with a flash drive submitted with this letter. (Enclosure 8.)

Response GO17-36 As discussed in Section 2.0, Project Description, of the Draft EIR, pursuant to its statutory authority under Public Utilities Code section 130252, Metro would issue approvals related to the proposed Project’s plans for design, construction, and implementation. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public

for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Response GO17-25 for a discussion of how Metro is the appropriate lead agency for the proposed Project. The reference to the administrative record (Enclosure 8) in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 is noted, but because the cited documents are unrelated to the substance of the Draft EIR as they predate the initiation of environmental review, no further response is warranted. The contents of the referenced Enclosure 8 are available on the SB 44 website.²⁸

Comment GO17-37 Even if this were a public mass transit project, Metro would have no or only very limited authority to “supervise” the Project, as shown by both PUC sections 130252 subd. (a) and subd. (c). Subdivision (a) provides that:

All plans proposed for the design, construction, and implementation of public mass transit systems or projects, including exclusive public mass transit guideway systems or projects, and federal-aid and state highway projects, shall be submitted to the commission [here, to Metro] for approval.

(Emphasis added.) In addition, PUC 130252, subdivision (c), provides:

As used in this section, “plan” means a project description and not the detailed project plans, specifications, and estimates.

(Emphasis added.) Hence, even if Metro did have statutory authority to approve the Project, that authority would only cover approval of the overall plan for the ART, not over the myriad individual design and specifications or estimated costs; supervision of the actual construction, let alone operation, of the Project is not vested in Metro. The emphasis in the statute is on Metro ensuring that proposed transportation project plans are consistent with the Regional Transportation Plan adopted by the regional transportation planning agency (here, the Southern California Association of Governments [SCAG]), not on Metro evaluating the merits of any individual project or supervising any individual project. (PUC § 130252(a).) Metro provides no citation to authority that it may “supervise” the Project. Instead, Metro would have only such contractual rights as Metro and ARTT negotiate between them (completely out of sight of the public) to control or modify the thicket of design and construction details, features, and operational performance of the ART, details crucial to the nature and extent of the Project’s impact on the environment.

Response GO17-37 Refer to Response GO17-25 for a discussion of Metro’s role as the lead agency and responsibility for implementing the proposed Project. As required by CEQA, the EIR studies the environmental impacts of the proposed Project, including its design, construction, and operations. Certification of the EIR for the proposed Project will provide environmental clearance for the approvals set forth in Section 2.0, Project

²⁸ Refer to the Correspondence tab, search “Comments on the Draft EIR for the Los Angeles Aerial rapid Transit Project” for email attaching Enclosure 8.zip, dated January 17, 2023, at <https://laartsb44.net/#!/documents>.

Description, of the Draft EIR, including approvals from responsible agencies such as the City, Caltrans, State Parks, and Cal/OSHA, and approvals from Metro, which will involve additional opportunities for public hearing and comment on the proposed Project. For example, Metro’s discretionary authority under Section 130252 to review and approve “[a]ll plans proposed for the design, construction, and implementation” of the proposed Project does in fact involve several discretionary approvals, including, for example, multiple approvals of design and construction plans, approvals and agreements contemplated in the Memorandum of Agreement and subsequent amendments, and an agreement to integrate fares with Metro’s fares / one tap system. The proposed Project would comply with applicable standards, requirements, building codes, and guidelines as determined by the City of Los Angeles, Metro, and/or Cal/OSHA or the appropriate agencies/regulatory authorities during the permitting process for the proposed Project.

Comment GO17-38 Metro itself has repeatedly noted that the Project will not cost Metro a dime, based on ARTT’s repeated statements that it will reimburse Metro for all costs involved in acting as lead agency for the Project, and exercising eminent domain to acquire property or air rights if needed for the Project. (MAR 15.) None of ARTT’s assurances have covered post-approval actions. Obviously, Metro cannot supervise the Project’s construction or operation, or enforce mitigation measures imposed as part of the CEQA process, if it does not spend money; Metro’s insistence that it will not spend public funds on the gondola is a tacit admission that it will not – that it cannot - supervise the gondola. Since enforcement of mitigation measures is a crucial part of the role of lead agency (*Friends of Kings River v. County of Fresno* (2014) 232 Cal.App.4th 105, at 116)), and since Metro has effectively disabled itself from being able to enforce such measures, Metro cannot properly serve as lead agency.

Response GO17-38 The document cited at MAR 15 (included in the administrative record in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 and in this comment) does not stand for what the commenter uses it to assert – there is no mention of eminent domain within/at MAR 15. ARTT LLC has reimbursed Metro for staff time and costs for the proposed Project pursuant to a Memorandum of Agreement between Metro and ARTT LLC. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority.

Metro’s receipt of funding from the Project Sponsor for the proposed Project does not negate Metro’s authority as lead agency; it is commonplace for a project sponsor to reimburse a lead agency’s efforts related to a project. In other words, Metro’s authority as lead agency, and ability to supervise the proposed Project, is unrelated to whether or not it “spend[s] money.” Moreover, as demonstrated in Section 7.0, Mitigation Monitoring and Reporting Program, and Table 7-1, Mitigation Monitoring and Reporting Program (MMRP), of the Final EIR, the MMRP prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies. The MMRP designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. CEQA does not require that a lead agency be responsible for enforcing all mitigation measures.

Comment GO17-39 2. The CEQA Guidelines Do Not Support Metro’s Claim to Be the Lead Agency.

The CEQA Guidelines provide guidance on determining the lead agency for a project at section 15151. That guidance disfavors Metro. Subsection (a) provides that if a public agency will carry out the project itself, that agency will normally be the lead agency. Metro has been very clear that the agency will not carry out the gondola Project (MAR 198 [“Metro does not envision taking a hands-on, prescriptive, or performance minded approach to this project”]), and both ARTT’s Proposal and its responses to Metro’s Request for Information (RFI) repeatedly emphasize that ARTT, not Metro, will handle the design, construction, and operation of the Project. (MAR pp. 2, 15, 189, etc.) Metro does not qualify as lead agency on this count. Since Metro has also stated that it will not take a “prescriptive” role regarding the Project, it also has admitted that it will not supervise the Project.

Guidelines section 15051 provides guidance for assigning the lead agency role where one agency will not carry out the project itself. Where two or more public agencies will both have a role in approving or supervising a project, Guidelines section 15051 subd. (b) provides:

(b) If the project is to be carried out by a nongovernmental person greatest responsibility for supervising or approving the project as a whole.

Subsection (b)(1) further provides that:

(1) The lead agency will normally be the agency with general governmental powers, such as a city or county, rather than an agency with a single or limited purpose, such as an air pollution control district or a district which will provide a public service or public utility to the project.

Again, Metro itself has disavowed any role in supervising the Project; in addition, it is the very kind of agency the Guidelines disfavor: Metro is a single-purpose public

transportation agency that does not have “general governmental powers,” e.g., land use and zoning powers (except for land it owns).

In *Center for Biological Diversity v. County of San Bernardino* (2016) 247 Cal.App.4th 326, the Court of Appeal had to determine which of two agencies, the local water agency or the County, should be the lead agency for a project to pump, transfer, distribute, and store groundwater. The Court of Appeal set out the degree of participation in approving and supervising a project that was required for the single purpose water agency to claim the lead agency role. The opinion lays out in great detail the water agency’s proposed role in carrying out the project: it would obtain financing for the pumping and transfer, approve the design and construction of the wells, approve the design and construction of the pipelines and conveyance facilities, manage and oversee the project’s operation, control and operate the joint powers agency that would distribute the water, and oversee compliance with the overall plan, among several other functions. (Id. at 340-343.) In short, the court held that the water agency had the most active and extensive role in carrying out the project, and therefore was the proper lead agency. (Id., at 343.) Here, Metro’s role does not encompass planning, designing, operating, or managing the Project. It simply cannot justify its self-designation as lead agency. Instead, Metro has explicitly disavowed such an active role in carrying out or supervising the Project. (MAR 198.) Almost the only function it will carry out that the water agency in *CDB v. County of San Bernardino* performed is acquiring land.

The designation of the lead agency is vital to the EIR process, particularly due to the lead agency’s role in certifying the EIR and choosing among alternatives to the project. (*Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, at 736-737.) A court has taken the necessary step of ordering a completed EIR to be decertified and redone, where an improper lead agency had prepared and certified it. In *Planning and Conservation League v. Department of Water Resources* (200) 83 Cal.App.4th 892 (“*PCL v. DWR*”), the project was the implementation of an agreement among several water districts and the state Department of Water Resources (DWR) as to how State Water Project water would be allocated among water districts statewide in the face of serious water shortages. The EIR had been prepared and certified by one of the local water districts that would itself receive water under the agreement. / The court directed that the certification of the EIR prepared by this local agency be vacated, and that a new EIR be prepared with DWR as lead agency, because DWR had primary responsibility for managing the state’s water resources, and only the statewide agency, with its statewide view of the water situation and its power to enforce the water allocations, was the appropriate agency to prepare the EIR. (Id. at 926.) Should Metro proceed to certify the ARTT EIR as lead agency, a similar remedy would be appropriate.

Guidelines section 15051, subd. (d) provides if more than one agency “equally meet the criteria” to perform as lead agency, the agencies may designate the lead agency

by agreement.⁶ Here, ARTT requested that Metro take the lead agency role in the CEQA process and Metro agreed. This Guideline subsection does not authorize a private party and an agency to agree on a lead agency in this fashion, and they were “not at liberty to anoint” Metro as lead agency when it does not meet the regulatory criteria. (*PCL v. DWR*, 83 Cal.App.4th at 906.) The agreement, and Metro’s claim to be lead agency, are invalid.

Footnote 6: Of course, that Guideline subsection does not apply here, since Metro does not meet the criteria.

Response GO17-39 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Response GO17-25 for a discussion of how Metro is the proper lead agency for the proposed Project as it has the primary responsibility for implementing the proposed Project and integrating it into the regional transportation system, consistent with Metro’s statutory purpose. Further, Metro is responsible for the County’s regional transportation system and has considerable land use authority in the County to carry out its roles and responsibilities as the regional transportation authority. Metro is therefore not akin to a special utility district and *Center for Biological Diversity v. County of San Bernardino* (2016) 247 Cal.App.4th 326 is inapplicable. Moreover, Metro is the appropriate agency to certify the EIR and choose among alternatives to the proposed Project. In *Planning and Conservation League v. Department of Water Resources* (200) 83 Cal.App.4th 892 (“*PCL*”), the court held that the State Department of Water Resources (“DWR”) should have prepared and certified the EIR because DWR had “primary responsibility for managing the state’s water resources, and only the statewide agency, with its statewide view of the water situation and its power to enforce the water allocations, was the appropriate agency to prepare the EIR.” Like the DWR in *PCL*, Metro is the agency tasked with planning, operating, and coordinating funding for the region’s transportation system, and is the appropriate lead agency for the proposed Project, which will become an integrated part of the regional transportation system. Further, the state legislature vested Metro with broad authority to carry out its duties under the County Transportation Commissions Act (Public Utilities Code, §§ 130000, *et seq.*), which includes “achiev[ing] the operation of a coordinated and integrated transportation system which will reduce automobile usage and dependency, reduce the consumption of scarce and expensive energy fuels, and reduce the levels of automobile-related air pollution.” (*Id.*, § 130001(b).) Metro is authorized to “[d]o **any and all things** to carry” these purposes. (*Id.*, §130105(f) [emphasis added]; see also *id.* at § 130050, 130051.13, 130051.14, 30001(a).) The proposed Project has been determined to be consistent with this statutory purpose by a court, which also noted that “Metro has broad legal authority” under state law. (*The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 [Jan. 9, 2023, Order Denying Petition for Writ of Mandate], p. 8].) In addition, under CEQA, where two or more public agencies meet the criteria for acting as lead agency, the agency that acts first will normally serve as lead agency. (CEQA Guidelines, §

15051(c).) Metro elected to serve as lead agency, and this designation was not disputed by other agencies. Further, Metro independently decided to act as the CEQA lead agency following the Unsolicited Proposal Process and entered into the Memorandum of Agreement (MOA) with ARTT LLC in order to memorialize their findings and provide a process for ARTT LLC to reimburse Metro for its staff time and costs. The MOA is unrelated to CEQA and the Draft EIR. Further, this comment raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate).

Comment GO17-40 3. Metro Does Not Have the Appropriate Authority Over the Project.

As discussed above, Metro does not have principal authority for approving or supervising the Project. Other agencies have considerably more specific approval authority and would exercise considerably more supervisory authority over the Project, than Metro. Looking at the list of permits required for the Project at DEIR pp. 2-57 to 2-62, approval/supervisory authority over the Project is split among several different state and local agencies. Caltrans must issue an encroachment permit before the Project can cross any state highway or freeway (as it must do to link Union Station with Dodger Stadium); the California Department of Parks and Recreation must issue four separate easement/approvals/permits/plan amendments to allow the Project to build and operate the Chinatown Station that will be located partially on State Park land, and to allow it to cross the airspace over the Park; and the Cal/OSHA Amusement Ride and Tramway Division must examine the Project's safety and issue a Certificate allowing construction of the ropeway before the Project can operate, as well as having responsibilities to ensure safe working conditions in various aspects of the Project, including periodic tests of the operational safety of the ropeway system (DEIR, p. ES-12), emergency evacuation plans (DEIR, p. 2-47), construction activities (DEIR, p. 3.9-1), and any other phase of the Project involving worker safety.

Response GO17-40 This comment provides a general recitation and characterization of the text from the Draft EIR. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region's Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region's transportation authority. Metro has discretionary authority to review and approve "[a]ll plans proposed for the design, construction, and implementation" of the proposed Project (Public Utilities Code § 130252), which will include several discretionary approvals (multiple approvals of design and construction plans, approvals and agreements contemplated in the Memorandum of Agreement and subsequent amendments, agreement to integrate fares with Metro's fares / one tap system). This discretionary authority is considerably more broad than individual land

use and other review and approvals to be issued by responsible agencies for the components of the Project occurring within their jurisdiction. In short, Metro has “the greatest responsibility for supervising or approving the project *as a whole*” and is the appropriate lead agency. (CEQA Guidelines, § 15051(b) [emphasis added].) Simply because other agencies have approval authority for the proposed Project, does not mean that Metro does not have the “principal responsibility” for approving or supervising the proposed Project. Indeed, CEQA recognizes that multiple agencies may have authority over a project. Therefore, CEQA includes the responsible agency process and consultation requirements in order for other agencies to provide necessary review and approval of aspects of a project. (Pub. Resources Code, §§ 21067, 21069.) The proposed Project would require review and approvals from Caltrans, State Parks, the City, and Cal/OSHA, as responsible agencies, in addition to review and approval by Metro as lead agency. Responsible agencies’ discretionary approvals required for the proposed Project are secondary to Metro’s statutory authority to review and approve transportation projects, and the City and other agencies were appropriately named as responsible agencies. Further, Metro engaged in required consultation with all responsible agencies during the process of preparing the Draft EIR for the proposed Project, in compliance with CEQA. This consultation process included meetings with Metro and the responsible agencies to discuss the scope and content of the environmental information that Metro would include in the Draft EIR (Pub. Resources Code, § 21080.4(b); CEQA Guidelines § 15104), additional consultation with the City and State Parks as Draft EIR preparers, and comments from these responsible agencies on the Draft EIR (Pub. Resources Code, § 21153(c); CEQA Guidelines, § 15086(c).) This consultation process will continue throughout the course of the environmental review process. Consultation helps ensure that the EIR includes the necessary analysis regarding environmental effects within a responsible agency’s jurisdiction to allow that agency to rely on the EIR, if ultimately certified, when considering the necessary approvals for the project that fall under its regulatory authority. If Metro certifies the Final EIR, each responsible agency will then conduct its own discretionary review process for the Project approvals it is responsible for. (See Draft EIR, § 2.0, Project Description, pp. 2-57 – 2-62.)

Comment GO17-41 Finally, the City of Los Angeles has direct authority over all streets in the City (DEIR, p. 3.17-1: “All the streets in the Project study area are under the jurisdiction of the City of Los Angeles.”) This gives the City the authority to execute a franchise agreement enabling the Project to “operate, over, or along any street, highway, or other place in the City of Los Angeles,” without which agreement the Project cannot operate at all (since it travels over City streets or “other place[s]” for its entire length); and approve the design of for the Project components located within the public right-of-way. The City’s Planning Department would also be required to approve the creation of a Specific Plan to provide for consistent application of Project design standards, limitations, and operational measures, would need to approve the

creation of a Sign District to impose a comprehensive set of sign regulations on the Project site and to permit signage consistent with applicable City requirements.

Most importantly, the City must both issue permits for the Project to be built partially on City-owned land (DEIR, p. 2-61), and approve modification of the existing 1960 Dodger Stadium Conditional Use Permit (“CUP”) to allow the Stadium Tower and the Dodger Stadium Station to be built and to operate. (CUP Condition 4, at SAR 3102, provides for collaboration by “the operators of the Stadium” and municipal officials “in devising mass transportation service to the Stadium site which will be sufficiently efficient to encourage patronage thereof and thus reduce the number of private automobiles driven to the Stadium events.”)

Response GO17-41 Refer to Response GO17-40 for discussion of the City’s role as a responsible agency and Metro’s consultation with responsible agencies, including the City.

Comment GO17-42 The Project will also be built on or cross over land that is within the Alameda District Specific Plan, the Central City North Community Plan, the DTLA Community Plan (current or updated), the Central City North Specific Plan, the Silver Lake-Echo Park-Elysian Valley Community Plan, and the Chinatown Redevelopment Plan (DEIR, pp. 3.11-8 through 3.11-137), all of which are encompassed within the City’s General Plan (P. 3.17-5) and the City will be responsible for ensuring compliance by the Project with each such plan. For example, the City would be asked to waive provisions of the River Implementation Overlay District to allow the construction and operation of the Alameda and Alpine Towers and waive provisions of the Cornfield/Arroyo Seco Specific Plan to allow construction and operation of the Chinatown Station. (DEIR, p. 2-62.)

Footnote 7: See, particularly, the map at DEIR, p.3.11-8, showing only some of the varied plans and requirements to which the Project would be subject. Metro does not have the authority and expertise to evaluate and balance the requirements of all these plans, and the other plans described above, with respect to the Project. The City does.

Response GO17-42 Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for discussion of the proposed Project’s consistency with the City’s General Plan, and with other local land use plans, including the Alameda District Specific Plan, the Central City North Community Plan, the Central City North Specific Plan, the Silver Lake-Echo Park Elysian Valley Community Plan, and the Chinatown Redevelopment Plan. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project and the City’s participation in the environmental review process as a CEQA responsible agency, including consultation in preparation of the Draft EIR. Refer to Response GO17-40 for detailed discussion of the consultation process with responsible agencies.

Comment GO17-43 The final requirement listed in the DEIR as needed from the City of Los Angeles for the Project to go forward is the execution of a Development Agreement between the Project sponsor and the City that will remain in effect for twenty years.⁸ (DEIR p. 2-62.) As described in Government Code sections 65864 through 65869.5, in addition to specifying various terms and conditions binding each party, such a development agreement must “require periodic review at least every 12 months” wherein the applicant must “demonstrate good faith compliance with the terms of the agreement.” (Govt. Code § 65865.1.) While Metro has disavowed oversight of the Project, the terms that must be included in the development agreement provided for in the DEIR guarantee that the City will continue to monitor the Project at least yearly for the next twenty years. The City will also have statutory authority to enforce the development agreement, pursuant to Government Code section 65865.4 (absent specified conditions, “a development agreement shall be enforceable by any party thereto. . . .”)

Footnote 8: The requirements of the Government Code sections cited by the DEIR for development agreements are not discussed in the list of required permits; the reader is left either to guess or to ferret out the information for him/herself. This compromises the DEIR’s function both as an informative document and as a document of political accountability. (*Laurel Height Improvement Assn. v. Regents of the University of California* (1988) 47 Cal.3d 374, 392.)

Response GO17-43 Refer to Section 2.10, Required Permits and Approvals, in Section 2.0, Project Description, of the Draft EIR, for a list of required permits and approvals from Metro and other responsible agencies for the proposed Project. Refer to Response GO17-40 for a discussion of the permits and approvals required for the proposed Project, as well as Metro’s responsibilities as lead agency and the City’s role as a responsible agency. CEQA does not require an EIR to provide the full text of the Government Code sections governing Development Agreements; citation to the specific sections that govern Development Agreements are sufficient for the EIR to function as an informative document. (*Laurel Heights Improvement Assn. v. Regents of the University of California* (1988) 47 Cal.3d 376, 392.) Refer to Response GO17-39 for a discussion of Metro’s role as the lead agency and oversight for the proposed Project. Refer to Response GO17-44 for a discussion of how Metro will oversee the implementation and enforcement of certain mitigation measures for the proposed Project, as described in Section 7.0, Mitigation Monitoring and Reporting Program, of this Final EIR.

Comment GO17-44 4. Metro Lacks Intention to Enforce Mitigation Measures Adopted for the Project.

Finally, a lead agency under CEQA may not approve a project that will have significant environmental impacts unless it also adopts mitigation for those impacts or adopts an alternative project that would avoid them. (PRC § 21001, 21081.) The lead agency is responsible for adopting and enforcing mitigation measures for all significant environmental impacts that will be caused by a project and must adopt a mitigation

monitoring process to ensure that the mitigation is carried out. (CEQA Guidelines, § 15097.) The mitigation measures listed in the DEIR for the Project include a multiplicity of plans (e.g., Construction Traffic Management Plan [DEIR, p. ES-14], Construction Monitoring Plan (Built Resources) [DEIR, p. ES-40], Cultural Resources Monitoring and Mitigation Plan (DEIR, p. ES-41), Archeological Testing Plan for Alameda Station (DEIR, p. ES-45), Archeological Testing Plan for LAUS Forecourt [DEIR, p. ES-47], Archeological Testing Plan for Los Angeles State Historic Park [DEIR, p. ES-48], Paleontological Resources Mitigation and Monitoring Plan [DEIR p. ES-52], Soil and Groundwater Management Plan [DEIR, p. ES-53], Construction Noise Management Plan [DEIR, p. ES-58, Vibration Monitoring Plan [DEIR, p. ES-67, Temporary Disaster Route Plan [DEIR, p. ES-76], Utility Relocation Plan [DEIR, p. ES-79], and a Fire Protection Plan [DEIR, p. ES-80]. In addition, ARTT will need to prepare a Site-Specific Final Geotechnical Report. (DEIR, p. ES-50.) Metro, again, has stated that it “does not envision taking a hands-on, prescriptive, or performance minded approach to this project.” (MAR 198.) It can be presumed that Metro does not plan to monitor/enforce all these various mitigation plans.

The DEIR appears to assume that ARTT will prepare all these plans. (See, e.g., DEIR 3.13-68 [Construction Noise Management Plan to be prepared by “Project Sponsor.”] Presumably, it is the City, with its direct construction permitting responsibilities, local ordinances regulating such impacts as excessive construction noise and expertise in overseeing such plans and mitigation measures, that will perform the required oversight and, if necessary, enforcement. (See, e.g, DEIR’s reliance on LA Municipal Code [i.e., the City] to enforce stormwater runoff prohibitions, pp. 3.10-6.) The DEIR leans on the City of Los Angeles to enforce many, if not most of its plans to mitigate the adverse impacts of the Project.

Metro does not meet the statutory or regulatory requirements to be the lead agency for this Project, nor does it commit to performing the oversight necessary to carry out mitigation measures that will supposedly protect the environment from degradation and damage by the Project. Instead, Metro appears to have defaulted to the City to perform oversight and enforcement activities. Metro has abdicated so many of the responsibilities of a lead agency that it cannot be designated as the lead agency.

Response GO17-44 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. This comment suggests that CEQA requires denial of a project, and adoption of an alternative, if the project will result in significant and unavoidable impacts even with implementation of mitigation measures. This is incorrect. Under CEQA, an agency may approve a project with significant environmental effects that cannot be avoided or substantially lessened with mitigation by adopting a statement of overriding considerations. (CEQA Guidelines § 15043). Refer to Response GO17-148 for discussion of Metro’s consideration of a reasonable range of alternatives to the proposed Project. Refer to Section 7.0, Mitigation Monitoring and Reporting Program, and to Table 7-1, Mitigation

Monitoring and Reporting Program (“MMRP”), of the Final EIR, for the full MMRP for the proposed Project. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require the proposed Project to provide a full accounting of how each mitigation measure will be funded. The MMRP for the proposed Project designates which agencies are responsible for future enforcement of mitigation measures, based on the agency with the regulatory authority to enforce a given mitigation measure. CEQA does not require that a lead agency be responsible for enforcing all mitigation measures, nor could it.. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of how Metro is the proper lead agency for the proposed Project because Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority, and the City’s participation in the environmental review process as a CEQA responsible agency. Refer to Response GO17-40 for a discussion of the permits and approvals required for the proposed Project, as well as Metro’s responsibilities as lead agency and the City’s role as a responsible agency.

Comment GO17-45 C. The DEIR Must Be Revised And Recirculated.

The DEIR must be recirculated after information is added to make it legally adequate. It will not be possible to rely upon the response to comments because the DEIR is so deficient as to render public comment “in effect meaningless.” (Laurel Heights I, supra, 6 Cal.4th at 1130.) The purpose of an EIR is to provide the public with detailed information about a project before it is approved. (Pub. Resources Code §§ 21002.1; 21003.1.) “[W]hen significant new information is added to the EIR after public notice is given of the availability of the DEIR, but before certification, the EIR must be recirculated for public review. . . .” (CEQA Guidelines § 15088.5; Pub. Resources Code § 21092.1.) After the information to address the deficiencies identified here and by other public comments is added, a revised DEIR must be recirculated.

D. Denial Of The Project Is Appropriate Because Of Unavoidable Adverse Impacts.

Under California law a proposed project with adverse impacts must be denied if there are feasible alternatives or mitigation measures available that would reduce the project’s significant adverse environmental impacts. (Pub. Resources Code § 21002.) Such is the case here. Thus, because a denial is appropriate under CEQA, and would allow study of better alternatives.

Response GO17-45 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Response GO17-149 for discussion of how Metro’s consideration of alternatives to the proposed Project complied with CEQA. This comment and the comments in this letter do not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5.

Comment GO17-46 E. Outright Rejection Of The Project Is Appropriate Because Metro Has No Authorization To Pursue The Gondola Proposal.

Metro has no jurisdiction to proceed with the gondola project at all. No environmental review is required at all for a project that a public agency rejects outright. The Project must be rejected outright. As a private project⁹ to a single destination, this Project is a common carrier, similar to the Palm Springs Tram which is a tourist ride and does not meet the statutory requirements for a public transportation project [49 U.S.C. § 5302 subd. (15)]. In order to confer upon this wholly private project the benefits of non-competition, use of public land, access to eminent domain powers, and fast-track project approval consideration it must be a true public transportation project primarily benefitting the taxpaying public. The mere proximity and potential coordination between a private project and an existing public transportation hub such as Union Station does not turn a private transportation project into public transportation. For example, if the private funicular, Angel’s Flight, happened to abut a Metro stop, that would not be sufficient for that private transportation project to be considered a public transportation project—the Gondola Project is no different.

Footnote 9: A “private project” is defined as “a project which will be carried out by a person other than a governmental agency, but the project will need a discretionary approval from one or more governmental agencies” for a contract or lease. (Cal. Code Regs. Tit. 14 section 15377.)

Response GO17-46 This comment provides a general recitation and characterization of regulations. Refer to Topical Response A, SB 44, for discussion of the proposed Project as a public transportation project. The proposed Project is a public transit project because it will be open to the general public for service at regular, scheduled operating hours, operating daily to serve existing residents, workers, park users and visitors to Los Angeles. Refer to Response GO17-40 for a discussion of why Metro is the proper lead agency for the proposed Project. Metro has primary responsibility for implementation of the proposed Project as the region’s transportation authority.

Comment GO17-47 F. The EIR is Inadequate

There are numerous major concerns TCE has with the document that has been released for public review. “The EIR is intended to furnish both the road map and the environmental price tag for a project, so that the decision maker and the public both know, before the journey begins, just where the journey will lead, and how much they--and the environment--will have to give up in order to take that journey.” (Natural Resources Defense Council, Inc. v. City of Los Angeles (2002) 103 Cal.App.4th 268, 271.) In this case, critical information is missing from the analysis of numerous impacts. In too many ways, the DEIR understates the impacts that are analyzed, apparently for no other reason than to avoid imposing the cost of mitigating them on the developer. Further, the mitigation measures that are proposed are often deferred

and unenforceable, and many feasible mitigation measures have not been considered.

Response GO17-47 This comment provides a general summary of the comments raised in this letter. Responses to the comments contained in this letter are provided above in Responses GO17-2 through GO17-46, and below in Responses GO17-48 through GO17-153. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the mitigation measures for the proposed Project complied with CEQA and do not impermissibly defer mitigation.

Comment GO17-48 G. Legal Framework And Overview.

1. The Project Description Is Defective (Chapter 3) Because The Project Has Been Piecemealed, And Reasonably Foreseeable Impacts Have Not Been Analyzed Or Disclosed.

ARTT was formed by McCourt Global, which is controlled by Frank McCourt (Mccourt). (SAR 2992-92; AR 806, 3116, 3152.) McCourt Global also owns or controls a 50% interest in the parking lots around Dodger Stadium, an interest he kept when he sold interests in them to the Guggenheim Partners, and that McCourt Global holds through the Chavez Ravine Land Company (hereafter, “Landco.” (The California Endowment v. Metro, Los Angeles Superior Court case no. 22STCP01030, First Amended Petition, ¶ 32.)

The land surrounding Dodger Stadium, known as Chavez Ravine, represents a large financial opportunity for the owner if the land is developed for more profitable businesses than its current use. Currently, it is used for surface parking, chiefly for Dodger games and events at Dodger Stadium. The company proposing the gondola — Los Angeles Aerial Rapid Transit — makes no mention of future development plans. However, the Covenants, Conditions and Restrictions (CCR) agreed to by the Dodgers’ owners and Landco in 2012 (SAR 3054) explicitly provide for development of the parking areas wholly or partially owned by Landco. Article IV of the CCRs is entitled “Regulation of Development,” and is wholly devoted to setting parameters for the eventual development of the Landco lands. (SAR 3026-3207) Section 4.1 of the CCRs provides:

The Parties acknowledge that Landco, in the future, may apply for governmental approvals for future development on the Landco Parcels (the “Development”), which Development may include, but shall not be limited to, (i) office buildings, (ii) hotel and exhibition facilities, (iii) residential buildings, (iv) medical buildings, (v) academic buildings, (vi) parking structures, and/or (vii) retail, dining and entertainment facilities.

(SAR 3026.) The remainder of Article IV is devoted to placing restrictions on the future development as to design, signage, preservation of access to the Stadium, etc. (SAR 3026-28.)

Article V of the CCRs is solely devoted to specifying the ownership, permissible use, and potential ownership transfer of parking capacity at and around Dodger Stadium. In Section 5.1.1, Landco grants to the Dodgers an easement to use not less than 16,500 parking spaces on Landco's land (called "Required Parking Spaces") for the benefit of the Stadium. Section 5.1.1 also recognizes that the existing parking at the Stadium contains approximately 19,000 spaces, with the spaces in excess of the required 16,500 called "Additional Parking Spaces." The CCRs provide that the Dodgers may use the Additional Spaces, subject to six-months' notice from Landco that it wants some or all of the Additional Parking Spaces back.

Section 5.1.2 provides that Landco may also reclaim ownership and use of some of the 16,500 Required Parking spaces, but only if some form of "mass transportation, including, without limitation, a subway or light rail" is built. If this mass transportation is constructed, Landco will have the right to provide fewer than the 16,500 Required Parking Spaces for use by the Dodgers. (SAR 3028-29.) The maximum amount of that reduction is not specified in the CCRs, but the Conditional Use Permit for the entire parcel (Stadium and surrounding land) specifies that one parking space should be provided for every 3.6 seats in Dodger Stadium. (SAR 3101.) Since the Stadium is capped at 56,000 seats, at least 15,555 parking spaces must be made available. ($56,000 \div 3.6 = 15,555.56$.) Since the parties to the CCRs provided for 16,500 of Required Parking Spaces with the possibility of diminution, there is flexibility for reduction below the Required Parking Spaces number.

The upshot is that at least 2,500 existing parking spaces in excess of the 16,500 Required Parking Spaces ($19,000 - 16,500 = 2,500$) are available to Landco upon six months' notice, and more could be available if some form of mass transit is built to serve Dodger Stadium. Landco's owner, Frank McCourt, long had plans for an ambitious retail and entertainment complex around the Stadium. Those plans are evident in Mr. McCourt's "Next 50" plan, which was unveiled in 2012 when he owned the Dodgers, and in court documents during the bankruptcy proceedings that forced him to sell the team. (SAR 3189-91.) Mr. McCourt publicly stated that he planned to create a plaza with shops and restaurants, and to create a Dodger museum. (SAR 3183-85.) Mr. McCourt failed to secure funding for "Next 50," but the agreements revealed in the bankruptcy proceeding (still in force) provide insight into the relationship between the proposed gondola and McCourt's plans to develop the parking lots around Dodger Stadium. The various public statements made by Mr. McCourt, together with the meticulously drafted CCRs that allow his Landco to free up hundreds of acres of land now used for parking if a mass transit service is created that could potentially move thousands of persons per hour to and from Chavez Ravine, make it reasonably foreseeable that development will occur around Dodger Stadium. (*Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209 ["The California Supreme Court set forth a piecemealing test in Laurel Heights.

Response GO17-48 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. No improper segmentation has occurred and the independent utility of the proposed aerial gondola project – the first permanent transit connection to one of the region’s most visited venues– has been well established. Further, as discussed in Topical Response G, the adoption of the Covenants, Conditions, and Restrictions (“CC&Rs”) over a decade ago does not constitute a currently proposed development project at the Dodger Stadium property; rather, as is customary, the CC&Rs provide regulations and standards to maintain the existing stadium uses, including parking, if approvals are sought for additional improvements by the owner of the parking areas. No such development is proposed, and no environmental analysis is required of the speculations of commenters. As discussed in Topical Response G, the “Next 50” project was proposed over 15 years ago and did not proceed after 2008. The current owners of the Los Angeles Dodgers purchased the team and Dodger Stadium in 2012. Accordingly, the Next 50 Project is not required to be included as a related project in the Draft EIR or analyzed as part of the proposed Project in the Draft EIR. Further, as discussed in Topical Response G, the purported “future” development that commenters suggest is contemplated at Dodger Stadium would require additional City designations and zoning, permits, and approvals, including potentially environmental review, that are not contemplated or analyzed in the Draft EIR because no such development is proposed. Moreover, actions from over a decade ago, and speculative comments attempting to assign a motive to such actions, do not evidence a firm and specific commitment to develop the property surrounding Dodger Stadium. The proposed Project is solely comprised of an aerial gondola system connecting LAUS to Dodger Stadium and associated improvements. Accordingly, the Draft EIR did not omit “foreseeable” development from its analysis, and CEQA expressly discourages such speculation.

Further, the proposed Project will not reduce the number of parking spaces required under the CC&Rs. As discussed in Section 2.0, Project Description, of the Draft EIR, implementation of the Dodger Stadium Station would require the permanent removal of approximately 194 existing parking spaces, and therefore the proposed Project would not reduce the number of “Required Parking Spaces” under the CC&Rs because over 16,500 parking spaces would remain.

Comment GO17-49 ‘We hold that an EIR must include an analysis of the environmental effects of future expansion or other action if: (1) it is a reasonably foreseeable consequence of the initial project; and (2) the future expansion or action will be significant in that it will likely change the scope or nature of the initial project or its environmental effects.’ (Laurel Heights, supra, 47 Cal.3d at p. 396.) Under this standard, the facts of each case will determine whether and to what extent an EIR must analyze future expansion or other action.”

The specific facts of this case make it not only reasonably foreseeable, but reasonably likely that the proposed Project is a mechanism to allow Landco to take full possession of a large chunk of what are now parking lots around Dodger Stadium. The gondola project makes little or no economic sense without a major development at Dodger Stadium, which a gondola, as a mass transit project, could facilitate. There are only 81 home games in the regular baseball season. Even adding a maximum of 12 post-season games, a couple of exhibition games, a maximum of four special events a month permitted under the Conditional Use Permit issued by the City of Los Angeles for the stadium (SAR 3104), and the Los Angeles Marathon, at most the gondola is likely to be used at or near capacity on only 144 days per year. Unless, that is, the Dodger Stadium parking lots are developed as the entertainment, retail, and hospitality district like L.A. Live as Frank McCourt has long envisioned.

Response GO17-49 Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other developments unrelated to the existing stadium uses on the Dodger Stadium property. Refer to Response GO17-7 for an overview of the need for the proposed Project. Refer to Section 2.1, Overview of the Project, of the Draft EIR, discussing how the proposed Project would operate daily to serve existing residents, workers, park users, and visitors to Los Angeles. As discussed on page 2-42, in Section 2.0, Project Description, of the Draft EIR, the proposed Project would provide service to all pre-season, regular season, and post-season Los Angeles Dodger games and any special events (e.g., concerts, the Los Angeles Marathon) at the Dodger Stadium property. The proposed Project would also provide service to events at the Los Angeles State Historic Park. In addition to providing service on game and special event days at Dodger Stadium and events at the Los Angeles State Historic Park, it is anticipated that the proposed Project would also provide daily service between 6:00am to 12:00am, for the surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost

under the Community Access Plan. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO17-50 In 2004, Frank McCourt bought the Los Angeles Dodgers from NewsCorp for \$430 million. The purchase was financed primarily with loans, with over a third of the purchase price lent directly from NewsCorp. At the time of Mr. McCourt’s purchase, no specific plans for development of the parking lots surrounding the stadium were made public. However, on April 25, 2008, Mr. McCourt unveiled a sprawling development plan for the stadium itself and the surrounding parking lot areas. Marketed as the “Next 50” plan, the proposed development was slated to include a Dodger museum, a Dodger retail store, office space, and two new parking structures. (SAR 3189-91.) In addition, the project was advertised as a green initiative, including the addition of 2,000 trees in the area around the stadium. The development was expected to cost \$500 million, more than McCourt’s purchase price for the team.

The “Next 50” plan would have turned the stadium into a retail and entertainment venue to attract customers outside of game times and game days, and expanding the use of Chavez Ravine beyond baseball. Photographs of Mr. McCourt presenting a scale model of development plans at a press conference beside then Mayor of Los Angeles Antonio Villaraigosa showed the proposed changes, including large, terraced plazas lined with trees and new buildings outside of the stadium. Mr. McCourt’s planned development was designed to make use of the parking lots surrounding the stadium to increase the economic productivity of the land and turn Chavez Ravine into a year-round destination.

As part of his plans for the “Next 50” development, Mr. McCourt discussed a desire to connect Dodger Stadium to public transit, saying he “hoped local leaders would ‘tweak and adjust subway lines’ to add a Dodger Stadium stop and provide ‘bus access in the interim.’” Then-city-council member Ed Reyes further endorsed connecting the development to new public transit lines, saying that the “renovation ‘hopefully can stimulate a whole new transit system that gets us in and out of this great place.’” In developing plans for additions to Dodger Stadium and the surrounding land, Mr. McCourt clearly identified expanded public transit options as increasing potential visitors as well as revenue in new retail and entertainment destinations. This, again, makes his very public development plans for Chavez Ravine reasonably foreseeable if the gondola is built.

Under Mr. McCourt’s ownership the Dodgers fell deep into debt, ultimately filing for bankruptcy on June 27, 2011. In addition to bankruptcy court conflicts with Major League Baseball, Mr. McCourt was ordered to pay \$150 million in a divorce settlement. The “Next 50” development never materialized, as Mr. McCourt failed to secure funding.

After several rounds of negotiations, a group led by Magic Johnson and financed by Guggenheim Partners won the bid to purchase the Dodgers for \$2 billion. As part of the deal, Guggenheim Partners entered into a venture with a McCourt entity to jointly own the stadium parking lots.

The terms of the parking lot sale and any potential future development of the land around the stadium were filed under court seal as part of the supplement to the Dodger’s chapter 11 bankruptcy plan on April 6, 2012, in United States Bankruptcy Court for the District of Delaware, case number 11-12010 (KG). With nine sections totaling 139 pages, the exhibit is titled the “Declaration of Covenants, Conditions, Restrictions, and Easements for Chavez Ravine,” consisting of 93 pages of terms and agreements relating to the current usage and future development of Chavez Ravine. The exhibit was subsequently recorded by the Los Angeles County Recorder’s Office, so it runs with the land at Dodger Stadium.

The bankruptcy exhibit shows that Guggenheim Partners pays \$14 million a year to the McCourt entity Blue Landco LLC to rent the stadium parking lots. The document also details possible future developments that “may include but are not limited to (i) office buildings, (ii) hotel and exhibition facilities, (iii) residential buildings, (iv) medical buildings, (v) academic buildings, (vi) parking structures, and/or (vii) retail, dining, and entertainment facilities.” The document includes a provision stating that Guggenheim Partners agrees “to cooperate with Landco, and to take all steps reasonably requested by Landco, in connection with the general plan of improvement and development of the Landco Parcels,” and “not to oppose, or to interfere in any fashion (including, without limitation, by speaking out at public hearings) with any efforts by Landco to complete development of the Landco Parcels.”(SAR 3049) The CCRs also state at Article II, section 2.1.1 that “[t]he Parties hereby acknowledge and agree that it is contemplated that portions of the Landco Parcels will be developed for other purposes, including potentially in connection with other sports-related development opportunities.” This provision effectively grants Landco the sole discretion to attempt to develop the stadium parking lot lands, including with such projects as the Gondola Project station at Dodger Stadium. ARTT which did not exist at the time of the Declaration of Covenants, Conditions, Restrictions, and Easements for Chavez Ravine (CCR’s), has no role and no rights in these CCR’s.

Response GO17-50 Refer to Response GO17-48 for a discussion of how the proposed Project solely proposes an aerial gondola system, the CC&Rs, and the “Next 50” project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO17-51 Further, the use of “will be developed,” rather than “may be developed” in Article II, section 2.1.1 (as cited above) indicates that this development is more than

hypothetical; it is already contemplated and planned for. As *Whitman v. Board of Supervisors* (1979) 88 Cal.App.3d. 397 held concerning a permit for an oil pipeline:

The record before us reflects that the construction of the pipeline was, from the very beginning, within the contemplation of [the project proponent] should its well prove productive. Although admittedly contingent on the happening of certain occurrences, the pipeline was, nevertheless part of [the] overall plan for the project and could have been discussed in the EIR in at least general terms.

(*Id.* at pp. 414–415.)

Here, the facts clearly show that construction of retail or entertainment facilities at Chavez Ravine was kept as an option for future development. It was, and is, reasonably foreseeable, and should be analyzed in the EIR.

Response GO17-51 This comment provides a general recitation and characterization of case law. Refer to Response GO17-48 for a discussion of how the proposed Project solely proposes an aerial gondola system, the CC&Rs, and the “Next 50” project. As discussed in Response GO17-48, the proposed Project is solely comprised of an aerial gondola system connecting LAUS to Dodger Stadium and associated improvements. Accordingly, the Draft EIR did not omit “foreseeable” development from its analysis, and CEQA expressly discourages the speculative analysis that this comment requests.

Comment GO17-52 An additional section of the CCRs states that “in connection to any Mass Transportation... Landco shall have the right to provide less than the 16,500 Required Parking Spaces.” This would allow for developments in the parking lots that could significantly reduce the number of parking spaces if the developments were completed after or concurrent with the addition of a mass transit connection to Dodger Stadium. Under this agreement, construction of the proposed Project, connecting the stadium to the transit hub at Union Station could enable Mr. McCourt’s vision for additional development in Chavez Ravine to be realized. In *John R. Lawson Rock & Oil* (21018) 20 Cal.App.5th 77, at 98, the Court of Appeal held that “agency action approving or opening the way for a future development can be part of a project and can trigger CEQA even if the action takes place prior to planning or approval of all the specific features of the planned development.” [Citation omitted.] Here, the gondola would open the way for development of Landco’s parking lots by satisfying the CCRs’ condition that parking requirements could be significantly reduced if mass transit were in place at Dodger Stadium. See, also, *Bozung v. LAFCo*, where our Supreme Court held that the removal of an obstacle to contemplated development – in that case, annexation of land to a city – rendered the development a reasonably foreseeable impact of approval for the annexation of the land. Here, construction of the gondola would remove an obstacle to additional development at Chavez Ravine.

As the facts show, construction of the gondola is intimately connected to the future development at Chavez Ravine and is therefore one unified project. McCourt Global’s

website at one point trumpeted its ownership interest in the 260-acre Chavez Ravine land as a “current real estate project” (emphasis added) during the pendency of Metro’s consideration of the gondola proposal. That statement appeared on the website through at least October 2021, although it appears to have been removed from the website once the company began facing significant opposition to its proposed gondola project.’

Response GO17-52 This comment provides a general recitation and characterization of case law. As discussed in Response GO17-48 and Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, the proposed Project is solely comprised of an aerial gondola system connecting LAUS to Dodger Stadium and associated improvements. As discussed in Topical Response G, neither the Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property. No improper segmentation has occurred and the independent utility of the proposed aerial gondola project – the first permanent transit connection to one of the region’s most visited venues– has been well established. Mere statements on a website are not evidence that such development is currently proposed, nor are they sufficiently firm or committed to such that environmental analysis is required. Refer to Response GO17-48 for a discussion of how the proposed Project would not reduce the number of required parking spots under the CC&Rs.

Comment GO17-53 On April 26, 2018, Aerial Rapid Transit Technologies LLC (ARTT) submitted an unsolicited proposal to Metro for an aerial gondola from Union Station to Dodger Stadium that it calls Los Angeles Aerial Rapid Transit or “LA ART.” ARTT was founded by Drew McCourt, Frank McCourt’s son. The company at one time claimed that the estimated \$125 million project, which estimate is now \$300 million (<https://www.dailynews.com/2023/01/10/controversial-proposed-aerial-gondola-to-dodger-stadium-wins-a-court-victory/>), will be privately funded by Frank McCourt’s investment firm and others.

The Gondola Project, as proposed, seems intended to function as a loss-leader for the future development of parking lots at Dodger Stadium. The proposed Project makes no economic sense on its own merits, but it does make sense as a necessary part of a larger development scheme. The economic infeasibility of the gondola as a stand-alone project is highlighted both by the utter failure of ARTT to provide a proforma or other economic data for the proposed Project after the CEQA process would be complete; there is no evidence that the gondola would generate enough revenue to support its own maintenance and operation, let alone to service any debt incurred to finance it. While the original proposal stated that “farebox revenue can finance the Project,” no proof was advanced or exists in the current record to show that this is true. Moreover, the current website claims that the Gondola will be free for those

attending Dodger games—which further supports the idea that the Gondola is part of a larger project not included in this EIR. We note that in the original gondola proposal, fares were not specified, but “ARTT LLC envisions that a round trip ride on ART will cost less than the average parking costs at the stadium.” (MAR 226.) Now, however, ARTT’s website states in its FAQ:

Just like the Dodger Stadium Express [Metro’s bus service from Union Station to Dodger Stadium on game days], the aerial gondola will be free to ride for anyone attending a game at Dodger Stadium, which will maximize the air quality benefits from the project and encourage transit ridership.

Response GO17-53 As discussed in Response GO17-48 and Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, the proposed Project is solely comprised of an aerial gondola system connecting LAUS to Dodger Stadium and associated improvements. As discussed in Topical Response G, neither the Project Sponsor nor any other applicant has applied for other developments unrelated to the existing stadium uses on the Dodger Stadium property. No improper segmentation has occurred and the independent utility of the proposed aerial gondola project – the first permanent transit connection to one of the region’s most visited venues– has been well established. Refer to Response GO17-48 for a discussion of how the proposed Project would not reduce the number of required parking spots under the CC&Rs. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project.

Comment GO17-54 The FAQ also states:

In June 2021, LA ART announced that it had proposed to Metro the creation of a Community Access Program for local residents and businesses to use the LA ART system. This encourages daily use of this zero-emission project by local community members, in addition to the event-day periods when ridership will be prioritized for Dodger game attendees. Outside these times, local residents and employees of businesses in the LA ART vicinity could utilize the aerial gondola using an individual Metro fare or their Metro system access pass at no additional cost.

(<https://www.laart.la/faq/>; last accessed 11/28/22.)

These new plans show that the farebox will probably not be a source of significant revenue, since so many, probably most, riders will ride at no additional cost to their

Dodger ticket or the usual Metro fare. ARTT’s original proposal also made vague suggestions that sale of naming rights and of advertising would provide revenue (MAR 226 [“In-cabin and in-station advertising opportunities are a part of ARTT LLC’s business model and may or may not be packaged with an overall system sponsorship agreement”]), but no figures are given or even hinted at. The plain truth is that the gondola has never been shown to be self-supporting. Because the gondola Project did not pencil out on its own economics when proposed, it did not qualify for a sole source determination from Metro. ARTT has produced no substantial evidence in the DEIR to justify the assumption that it will be self-supporting now. The logical conclusion is that the proposed Project’s losses will be compensated for by other, future development. In short, it is a loss-leader. Such future development is reasonably foreseeable, even if not actually proposed yet, and must be examined by the DEIR as part of the proposed Project.

Response GO17-54 CEQA does not require extensive detail beyond that needed for evaluation and review of the proposed Project’s environmental impact. (See, e.g., CEQA Guidelines § 15124.) The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. CEQA does not require information related to the funding or financing for a proposed Project. Nevertheless, refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. No public sources of funding have been sought or committed to the proposed Project. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the Project Sponsor nor any other applicant has applied for other developments unrelated to the existing stadium uses on the Dodger Stadium property. This comment also raises issues that were litigated and decided in *The California Endowment v. Los Angeles County Metropolitan Transportation Authority*, Case No. 22STCP01030 (Jan. 9, 2023, Order Denying Petition for Writ of Mandate). There, the Los Angeles Superior Court upheld Metro’s sole source determination for the proposed Project, and this decision is final following the commenter’s abandonment of their appeal on May 26, 2023.

Comment GO17-55 Finally, the DEIR does not appear to examine the impacts of transferring ownership of the ARTT to a non-profit organization. The change of Project sponsor from a for-profit company that claims to have access to private capital that would fund construction of the gondola to a newly-formed non-profit entity, Zero Emission Transit (<https://www.climateresolve.org/climate-resolve-launches-new-nonprofit->

focused-on-zero-emission-transit-dodger-stadium-aerial-gondola-to-be-first-project/#:~:text=LOS%20ANGELES%20%E2%80%93%20Leading%20environmental%20nonprofit,in%20the%20Los%20Angeles%20region; last accessed 11-28-22) for which no such access to private capital has been shown, radically alters the nature and qualities of the proposed Project and must be fully disclosed and analyzed. For one thing, the transfer of the proposed Project to a non-profit with no track record and unknown resources will materially change the level of deferred mitigation that can be considered feasible for the significant Project impacts. How will a non-profit organization, or whoever takes over the Project from ARTT, pay for the deferred mitigation?

Response GO17-55 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. ARTT LLC's donation of LA ARTT LLC and the proposed Project includes ARTT LLC's continued support of the proposed Project with financial support and expertise, including funding for consultant and technical work for the EIR. As set forth in Section 8.0, List of Preparers, of the Draft EIR, and Section 9.0, List of Preparers, of the Final EIR, consultant and technical work for the EIR would include analysis by a team of qualified experts, consultants, and engineers, including Fehr & Peers as to transportation; SCJ Alliance as to gondola systems; PCL Construction Services, Inc. as to construction; and Nabih Youssef Associates Structural Engineering as to structure engineering. Refer to Topical Response A, SB 44, for discussion of how the proposed Project is public transportation because it will be open to the general public for service at regular, scheduled operating times, operating daily to serve existing residents, workers, park users, and visitors to Los Angeles. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the mitigation measures for the proposed Project do not impermissibly defer mitigation, as well as how CEQA does not require the proposed Project to provide a full accounting of how each mitigation measure will be funded.

Comment GO17-56 In all the above aspects, the Project Description is inadequate.

Response GO17-56 This comment provides a general conclusion regarding the comments raised in Comments GO17-48 through GO17-55. Responses to these comments contained in this letter are provided above in Responses GO17-48 through GO17-55.

Comment GO17-57

GO17-57A 2. Land Use/ Anticipated Uses Are Not Disclosed.

The EIR states the City of Los Angeles will need to enter into a 20-year development agreement pursuant to Government Code sections 65864 through 65869.5 (EIR, p. 2-62.) Such a development agreement may not be approved because it would not be consistent with the City of Los Angeles General Plan. The proposal of the gondola requires far more input from the City of Los Angeles as the brief listing in the anticipated uses section makes clear.

GO17-57B The DEIR should address the handling of ARTT end-of-life and dismantling. If the project proponent or its successors go bankrupt, which is a real possibility given the history of the funder of the project proponent, the City of Los Angeles and Metro may be saddled with the responsibility for either continuing to operate the gondola system or dismantling the towers and stations. To guard against this eventuality, a performance bond should be posted by the project proponent, to the benefit of the City of Los Angeles and Metro, which may be used in the event project cleanup or winding down falls on the shoulders of the public.

Response GO17-57

GO17-57A Refer to Section 2.10, Required Permits and Approvals, in Section 2.0, Project Description, of the Draft EIR, for a list of permits and approvals from responsible agencies that could be required for implementation of the proposed Project. Refer to Section 3.11, Land Use, of the Draft EIR, for a discussion of the proposed Project's consistency with the City of Los Angeles General Plan. Consistent with CEQA Guidelines section 15096(a) and Public Resources Code sections 21104, 21153(c), and 21069, the City of Los Angeles, as a responsible agency, will rely on the information in the EIR to consider the aspects of the proposed Project within its jurisdiction. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region's Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of the proposed Project's consultation with CEQA responsible agencies, including the City of Los Angeles. Refer to Appendix A, Scoping Report, of the Draft EIR, and Appendix A, Public Outreach Report, of the Final EIR, for documentation of notice to responsible agencies at various stages in the environmental review process. Metro has complied, and will continue to comply, with the CEQA requirements for consultation with responsible agencies at each stage of the environmental review process. This consultation process has included meetings with Metro and the responsible agencies to discuss the scope of environmental review, and the City of Los Angeles has engaged in this consultation process to ensure that the EIR included the information necessary for the City of Los Angeles to consider the aspects of the proposed Project within its jurisdiction.

GO17-57B Refer to Response GO17-133 for a discussion of how CEQA does not require speculation as to possible future environmental consequences, such as the potential that the proposed Project would not continue operations. Refer to Topical Response

L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project.

Comment GO17-58 3. All Reasonably Foreseeable Impacts Of The Project Are Not Analyzed Or Mitigated.

CEQA requires that all reasonably foreseeable impacts of a project must be identified, analyzed, disclosed, and if they are significant, mitigated. (Laurel Heights.) Both direct and indirect impacts must be addressed. (Guidelines § Guidelines § 15382.) Here, the Project description has been artificially truncated to limit the potentially significant impacts the DEIR discloses and for which it offers mitigation.

Response GO17-58 Section 2.0, Project Description, of the Draft EIR, includes 62 pages of detailed descriptions of the whole of the action considered as part of the proposed Project. In turn, the Draft EIR fully analyzes and discloses the potential environmental impacts of this proposed Project, providing mitigation as necessary for potentially significant impacts. The Draft EIR includes 7,877 pages of detailed analysis from experts in their respective fields, intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project’s potential environmental impacts, as well as a shorter executive summary that explains the analysis and conclusions in clean and simple language. Accordingly, the Draft EIR more than adequately complies with CEQA’s requirements for a Draft EIR.

Comment GO17-59 4. There Is No Reliable Estimate Of The Gondola’s Lifespan.

The truncation begins with an assumption of a 30-year lifespan for the proposed Project, backed with no engineering or commercial data, but seemingly based solely on the South Coast Air Management District (SCAQMD)’s draft threshold for significance on GHG emissions recommendations for amortization of GHG emissions from construction of industrial projects by spreading such emissions over an assumed life of 30 years.¹⁰ (DEIR, pp. 1-5, 1-6.) There is no further justification for use of a 30-year lifetime for the gondola in the DEIR. The SCAQMD letter to Metro responding to the NOP did not specifically recommend use of this lifespan for the proposed Project, nor does TCE believe that such use is justified. The gondola’s lifespan was not estimated in the original proposal; there is only a vague statement that “[o]ur goal is for the system to operate for the full useful life of the mechanical system and it will be replaced with a comparable system of the latest state of the art at that time.” (MAR [p.41 of RFI.) No information on the “full useful life of the mechanical system” is provided.

The SCAQMD guidance does not explicitly apply to transportation projects, only to industrial, residential, and commercial projects. (See Guidance at p. 3-18. Nor does the DEIR justify using the 30-year project life for the gondola. Since the operational life of the gondola will determine the extent and magnitude of its public benefits and its environmental impacts, the DEIR should provide a fully justified estimate of the

gondola's useful life, supported by substantial evidence. As *Pfieffer v. City of Sunnyvale City Council* (2011) 200 Cal.App.4th 1552, at 1561-62 holds: "The EIR's function is to ensure that government officials who decide to build or approve a project do so with a full understanding of the environmental consequences and, equally important, that the public is assured that those consequences have been taken into account. [Citation.] For the EIR to serve these goals it must present information in such a manner that the foreseeable impacts of pursuing the project can actually be understood and weighed, and the public must be given an adequate opportunity to comment on that presentation before the decision to go forward is made." The public does not yet have that opportunity here.

Footnote 10: SCAQMD's Board did not formally adopt this draft proposal.

Response GO17-59 This comment provides a general recitation and characterization of case law. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. Refer to Sections 3.03, Air Quality, and 3.08, Greenhouse Gas Emissions, of the Draft EIR, for a discussion of how the proposed Project would not result in a significant impact with respect to either air quality or greenhouse gas emissions. The commenter questions the assumption of the lifespan of the proposed Project, but the commenter does not identify how this question could contribute to a significant impact related to air quality and greenhouse gas emissions. Rather, the proposed Project's benefits to air quality and greenhouse gas emissions are expected to increase over time. Thus, a longer expected lifespan would only serve to improve upon the environmental benefits discussed on pages 1-5 and 1-6 of Section 1.0, Introduction, of the Draft EIR, as each year the proposed Project operates, there are additional benefits to GHG due to the reduced emissions from passenger vehicles. For purposes of the GHG analysis, the Draft EIR followed the industry standard approach common for EIRs and consistent with SCAQMD guidance to amortize construction emissions over an assumed 30-year project life. Even if a longer proposed Project life were assumed, the proposed Project would not result in increased emissions compared to those analyzed in the Draft EIR.²⁹

²⁹ There are numerous examples of aerial transit systems operating for more than 30 years. For example, the Mt. Pilatus Aerial Cableway "Dragon Ride" opened in 1956 in Switzerland, and has been operating continuously with the exception of brief periods of closure for modernization efforts. It was renovated in 1983 and again in 2015. See Pilatus. 2023. Aerial Cableway Dragon Ride Facts. Available at: <https://www.pilatus.ch/en/discover/aerial-cableway/aerial-cableway-dragon-ride>. Accessed June 2023. The Banff Sulphur Mountain Gondola opened in 1959 in Canada, and has been operating continuously with the exception of brief periods of closure for modernization efforts. See Banff Adventures. 2016. Reaching to the Sky - The Historic Banff Gondola. Available at: <https://www.banffadventures.com/News/ArtMID/461/ArticleID/37/Reaching-to-the-Sky-The-Historic-Banff-Gondola>. Accessed June 2023. The Roosevelt Island Tramway opened in 1976, and has been operating continuously with the exception of brief periods of closure for modernization efforts. See Roosevelt Island Operating Corporation. 2023. Tram History. Available at: <https://rioc.ny.gov/168/Tram->

as an innovative transportation project that helps reduce vehicle miles traveled (VMT). The approach to amortize the construction emissions assuming a 30-year lifespan following the SCAQMD guidance is appropriate for the Draft EIR to quantify the proposed Project's potential GHG impacts.

Comment GO17-60 5. The Project Has Adverse Impacts That Cannot Be Mitigated Below the Level of Significance.

The EIR admits that vibration impacts of construction of the project will be significant and unavoidable. The best way to avoid these impacts is to deny the project altogether, and to choose the environmentally superior alternative.

Response GO17-60 Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the vibration impacts associated with human annoyance from construction of the proposed Project, which would be significant and unavoidable during construction of the proposed Project, even with implementation of Mitigation Measures VIB-A and VIB-B. As discussed on page 3.13-72 of the Draft EIR, “[s]ince the human annoyance threshold is exceeded by common occurrences such as vehicle pass-bys during construction, there is no feasible method for mitigating human annoyance impacts. It should be noted that because the human annoyance threshold is so low it is already exceeded on roadways by existing truck trips.” Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Draft EIR's consideration of a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA. As discussed in Topical Response H, the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project's underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park.

Comment GO17-61 6. Some Impacts That Have Been Understated.

“CEQA is essentially an environmental full disclosure statute, and the DEIR is the method by which this disclosure is made.” (Rural Landowners Assn. v. City Council (1983) 143 Cal.App.3d 1013, 1020.) “In many respects the EIR is the heart of CEQA.” (County of Inyo v. Yorty (1973) 32 Cal.App.3d 795, 810.) The purpose of an EIR “is to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment, . . .” (Pub. Resources Code § 21061; emphasis added.) Contrary to these principles, numerous of the impacts that are analyzed in the DEIR are understated. For example, the DEIR dramatically understates the traffic impacts of the Project.

Response GO17-61 This comment provides a general recitation and characterization of federal statutes, case law, and regulations. Refer to Section 3.0, Environmental Setting, Impacts, and Mitigation, of the Draft EIR, for an overview of how the Draft EIR analyzed 20 environmental issue areas with detailed analyses, presenting evidence that is based on scientific and factual data about the cause-and-effect relationship between the proposed Project and potential changes in the environment. The Draft EIR ascertained the magnitude, duration, extent, frequency, range, or other parameters of a potential impact to the extent possible to provide facts in support of finding whether the impacts of the proposed Project would meet or exceed the established significance criteria. In determining whether impacts may be significant, all the potential effects, including direct effects and reasonably foreseeable indirect effects, are considered in the Draft EIR. Refer to Section 3.17, Transportation, of the Draft EIR, for a discussion of the proposed Project’s potential transportation impacts. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects..

Comment GO17-62 7. Failure to Analyze Some Impacts.

An EIR must analyze all potentially significant impacts of a proposed project on the environment. (Public Resources Code § 21082.2(a).)

8. Failure to Analyze all Feasible Mitigation Measures to Reduce Acknowledged Impacts.

Many potential mitigation measures are not even considered. For example, the DEIR assumes State Historic Park Impacts will be mitigated by amendment of the Park Masterplan. However, the EIR does not address mitigation by creating additional park space elsewhere or expanding the Park to compensate for lost acreage and usage or other feasible mitigation measures since the EIR incorrectly assumes State Historic Park impacts will be mitigated below a level of significance.

Response GO17-62 As discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project’s Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that

were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment.

Comment GO17-63 9. Reliance on Vague, Unenforceable, or Deferred Mitigation Measures Violates CEQA.

Mitigation measures must be required in, or incorporated into, a project. (Pub. Resources Code § 21081 (a)(1); Federation of Hillside and Canyon Assoc. v. City of Los Angeles (2000) 83 Cal.App.4th 1252, 1261.) Deferral of the analysis of the feasibility and adoption of mitigation measures violates CEQA. (Sundstrom v. County of Mendocino (1988) 202 Cal.App.3d 296, 306-308.) Again and again, the DEIR relies upon deferred mitigation and mere compliance with regulations.

The mitigation measures listed in the DEIR for the Project include a multiplicity of plans, for example the following:

Construction Traffic Management Plan [DEIR, p. ES-14], Construction Monitoring Plan (Built Resources) [DEIR, p. ES-40], Cultural Resources Monitoring and Mitigation Plan (DEIR, p. ES-41), Archeological Testing Plan for Alameda Station (DEIR, p. ES-45), Archeological Testing Plan for LAUS Forecourt [DEIR, p. ES-47], Archeological Testing Plan for Los Angeles State Historic Park [DEIR, p. ES-48], Paleontological Resources Mitigation and Monitoring Plan [DEIR p. ES-52], Soil and Groundwater Management Plan [DEIR, p. ES-53], Construction Noise Management Plan [DEIR, p. ES-58], Vibration Monitoring Plan [DEIR, p. ES-67], Temporary Disaster Route Plan [DEIR, p. ES-76], Utility Relocation Plan [DEIR, p. ES-79], and a Fire Protection Plan [DEIR, p. ES-80]. In addition, ARTT will need to prepare a Site-Specific Final Geotechnical Report. (DEIR, p. ES-50.)

However, these plans should already be prepared and available for public review now with the EIR, not deferred to a non-public process after project review.

Response GO17-63 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project's use of mitigation measures is consistent with the requirements of CEQA and how CEQA

does not require plans and studies contemplated in mitigation measures to be developed during the Draft EIR process or prior to project approval, and recognizes that the development of plans or future studies may be appropriate in order to reflect on-the-ground conditions at the time the potential impact may occur, as well as further developments in proposed Project design during the post-entitlement phase. This allows the mitigation to be appropriately tailored to the potential impact.

Comment GO17-64 The archeological testing plans for the Forecourt, Alameda Station, and the State Historic Park in particular must not be deferred. In 1999, when archeological investigation was conducted on land that would eventually become the State Historic Park, following the City’s attempt to claim there would be no archeological impacts, extensive evidence of historic resources was found including bricks from the original Zanja Madre. (See “History Buffs’ Find May Threaten Plans for Plan for Site”; <https://www.latimes.com/archives/la-xpm-2000-apr-27-me-24078-story.html>.)

In 2011, when archeological testing was conducted at La Plaza construction site at Main Street and Republic, near Olvera Street, an entire cemetery was found that had not been known before. (See “Cemetery found under L.A. construction site” <https://abc7.com/archive/7890955/>.)

Deferring archeological investigation of the Forecourt, the State Historic Park, and the Alameda Station until after Project approval in this context, where prior underground construction activity has nearly destroyed important evidence of history, would be unconscionable and would violate CEQA.

Response GO17-64 The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). Refer to page 37 of Appendix G for a discussion of the records search conducted in connection with the analysis for the proposed Project, noting one 2011 and two 2015 studies regarding the Los Angeles Plaza Cemetery referenced in this comment. Accordingly, this archaeological resource was considered in the analysis for the proposed Project. (See also, Draft EIR, Appendix G, p. 40 [including Resource No. 19-004218, Los Angeles Plaza Cemetery].) As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources, would be less than significant, and all potential impacts related to archaeological resources, including the Zanja Madre and archaeological resources in the vicinity of the proposed Project’s Alameda Station and the Los Angeles State Historic Park, would be either less than significant or reduced to less than significant with mitigation, such as archaeological testing plans. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how the proposed Project’s use of mitigation measures and project design features is consistent with the requirements of CEQA. The use of plans in mitigation measures does not constitute impermissible deferral.

Such actions are commonplace under CEQA where additional study is required but is not appropriate or otherwise feasible at the time of CEQA review (for example, where ground disturbance and excavation is infeasible prior to project approval). With respect to Mitigation Measure-CUL-A and Mitigation Measure-CUL-C through Mitigation Measure-CUL-E, as recognized on page 3.5-2, Section 3.05, Cultural Resources, of the Draft EIR, “an archaeological resource may not be recognizable or even observable without ground-disturbing activities.” Mitigation Measure-CUL-A and Mitigation Measure-CUL-C through E accordingly outline actions that would be taken in the unlikely event that archaeological resources are discovered once excavation begins on-site. Excavation or other such ground disturbance prior to approval of the proposed Project to discover any potential additional resources is impracticable at this juncture.

Comment GO17-65 Mitigation measures are ineffective where they rely on the Project proponent to take various steps or ensure measures are carried out. The Project Proponent, ARTT, has committed to funding no more than 3% of the Project budget related to environmental review and permitting. So without funding commitment to implementation of the Project’s mitigation measures, none of them are likely to be carried out or effective.

Response GO17-65 Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project’s capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for discussion of how CEQA does not require the proposed Project to provide a full accounting of how each mitigation measure will be funded.

Comment GO17-66 10. Failure to Consider a Reasonable Range of Alternatives.

The alternatives section has been described as the “core” of the EIR (Citizens of Goleta Valley v. Board of Supervisors (1990) 52 Cal.3d 553, 564), and an adequate EIR must describe a reasonable range of alternatives. (Laurel Heights Improvement Association v. Regents of the University of California (1993) 47 Cal.3d 376.) Unfortunately, the DEIR fails miserably in this regard. The DEIR rejects, without substantial evidence, the feasibility of alternatives such as enhanced bus service or a system of escalators or people movers. This is so, even though the DEIR acknowledges that the enhanced bus service is the environmentally superior option.

Response GO17-66 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA. CEQA Guidelines section 15126.6(a) explains that an EIR must include a “reasonable range” of alternatives to the project “which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project.” Likewise, CEQA Guidelines section 15126.6(f)(2)(A) further clarifies that an EIR is not required to analyze alternatives that would not eliminate or substantially reduce significant adverse effects. An agency’s selection and consideration of alternatives is governed by a “rule of reason.” (CEQA Guidelines, § 15126.6(a).) As discussed in Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, and Section 4.0, Alternatives, of the Draft EIR, the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. This alternative was considered but dismissed from further detailed analysis because it did not meet most of the basic objectives of the proposed Project. The Draft EIR provides sufficient analysis of each alternative and substantial evidence supports the Draft EIR’s dismissal from further detailed analysis or recognition that the considered alternative may not meet basic project objectives.

Comment GO17-67 11. The Project Is Inconsistent with the General Plan and Other Applicable Plans.

A general plan is the “constitution for future development.” (DeVita v. Napa (1995) 9 Cal.4th 763, 773.) “[T]he requirement of consistency is the linchpin of California’s land use and development laws. It is the principle which infused the concept of planned growth with the force of law.” (Debottari v. City of Norco (1985) 171 Cal.App.3d 1204, 1213.)

As discussed in more detail below, the proposed Project impermissibly conflicts with the State Historic Park Master Plan and the LA Union Station Development Plan, and other plans of general applicability. For example, the Project is within the jurisdiction

of the Santa Monica Mountains Conservancy, but the applicable plan is not even mentioned or analyzed.

Response GO17-67 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. The Draft EIR addressed land use in Section 3.11, Land Use and Planning, of the Draft EIR. Refer to Section 3.11 for a discussion of the proposed Project’s consistency with the Los Angeles State Historic Park General Plan. As discussed therein, the proposed Project’s Chinatown/State Park Station would be consistent with the goals and guidelines of the Los Angeles State Historic Park General Plan, including those that focus on recreation, aesthetics, interpretation, and access and circulation and thus would not conflict with its goals, policies, and objectives that were adopted for the purpose of avoiding or mitigating an environmental effect. However, State Parks considers there to be an inconsistency between the proposed Project and the Los Angeles State Historic Park General Plan and therefore a potentially significant impact because the Los Angeles State Historic Park General Plan does not identify transit as a use for the Park. Mitigation Measure LUP-A would be implemented to require the proposed Project to obtain a Los Angeles State Historic Park General Plan Amendment. The General Plan Amendment is subject to the review and approval by the State Park Commission, which retains its independent authority related to the proposed Project. With implementation of Mitigation Measure LUP-A, impacts related to inconsistencies with the Los Angeles State Historic Park General Plan would be reduced to a less than significant level. Refer to Topical Response F, Los Angeles State Historic Park, for additional discussion of the Los Angeles State Historic Park General Plan Amendment. To the extent the reference to the “LA Union Station Development Plan” refers to the Union Station Master Plan, responses regarding the Union Station Master Plan are provided in Response GO17-138. Santa Monica Mountains Conservancy (“SMMC”) has no discretionary approval authority related to the proposed Project; however, Metro notified SMMC as a trustee agency.³¹ Refer to Section 5.0, Corrections and Additions, of the Final EIR, for a discussion of the Rim of the Valley Trail Corridor Master Plan, published by the SMMC.

Comment GO17-68 II. MAJOR SUBSTANTIVE CONCERNS: THE EIR IS FAULTY AND DEFICIENT.

The following comments are listed in the order in which the subject appears, rather than the priority given to them by TCE.

Response GO17-68 This comment provides a general introduction to comments raised in this section of this letter. Responses to the comments in this section of the letter are provided below in Responses GO17-69 through GO17-153.

Comment GO17-69 A. Aesthetic Impacts, Section 3.1 Is Misleading and Uninformative.

The Project will have numerous aesthetic impacts, including impacts to views of the historic SHP and surrounding hills. These impacts must be properly analyzed and all

³¹ Los Angeles County Metropolitan Transportation Authority (LA Metro). 2023. Los Angeles Aerial Rapid Transit Project Email from Cory Zelmer to info@smmc.ca.gov.

feasible mitigation measures should be imposed or alternatives should be adopted to lessen this significant impact.

“[A]ny substantial, negative effect of a project on view and other features of beauty could constitute a "significant" environmental impact under CEQA.” (Quail Botanical Gardens Foundation, Inc. v. City of Encinitas (1994) 29 Cal.App.4th 1597, 1604.) According to the California Court of Appeal, lay opinions that articulate the basis of the opinion can constitute substantial evidence of a negative aesthetic impact. (Ocean View Estates Homeowners Assoc., Inc. v. Montecito Water District (2004) 116 Cal.App.4th 396, 402.) Expert testimony on the matter is not required because the overall aesthetic impact of a project is a subjective matter for which personal observations are sufficient evidence of the impact. (Id.; Oro Fine Gold Mining Corp. v. County of El Dorado (1990) 225 Cal.App.3d 872, 882.)

Response GO17-69 This comment provides a general recitation and characterization of CEQA case law. Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Regarding scenic vistas, as analyzed in the Draft EIR, there are no designated scenic vistas present in the area of potential impact. However, the Project area provides views that are considered scenic by certain viewers, including views of the downtown Los Angeles skyline, LAUS, El Pueblo, Los Angeles State Historic Park, Arroyo Seco Parkway, Dodger Stadium, and the mountains that make up the Transverse Ranges, including the San Gabriel and San Bernardino Mountains. Specifically, as it pertains to Los Angeles State Historic Park, the open views of the Park, as well as the view of the downtown Los Angeles skyline, make the Park “visually memorable.” As discussed in Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, views considered to be scenic locally would not be substantially impacted. In addition, while views from the Park toward the surrounding existing urban landscape exhibit various visual values, and the proposed Project would not substantially impact these views as shown in the simulated views. Therefore, the proposed Project would not block any designated scenic views, alter a designated scenic area, or block panoramic views, and impacts to scenic or panoramic views would be less than significant. Refer to Appendix C, Visual Impact Assessment, for detailed discussion about the implementation and results of the visual simulation of the proposed Project using Key Observation Points (KOPs) critical or representative of the visual character of the area within each Landscape Unit (LU) utilized for before and after photorealistic and true to scale visual simulations and locations of sensitive viewers that potentially would be visually impacted by the proposed Project. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, for additional visual simulations of the proposed Project, including at Los Angeles State Historic Park. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for an evaluation of the updated and additional KOPs for the proposed Project which would not result in significant impacts, and the aesthetic impacts of the proposed Project would remain less than significant. Refer to Response S2-5 for a discussion of the

proposed Project's consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics.

Comment GO17-70 1. The DEIR Does Not Disclose the Full Extent of the Aesthetic Impacts.

In its discussion of aesthetic impacts, the DEIR focuses faraway simulations. Appendix C does not present a reasonable disclosure of the impacts that will occur and instead provides a document of advocacy attempting to present gondola tower and station impacts in the best light possible.

The DEIR fails as an informational document for using images that seem intended to minimize impacts. Some examples include:

Figure 2-6 (DEIR, p. 2-16), where a background 195-foot-tall gondola tower looks modest in height compared to foreground telephone poles and buildings;

Figure 2-7 (DEIR, p. 2-20), where even zooming in the overhead image it is impossible to tell the real impact and conflicts between the project easement and buffer;

Figure 2-8 (DEIR, p. 2-21), where the proposed alignment doesn't differentiate between public right-of-way and LASHP when discussing public and private property, completely minimizing park impacts;

Figure 4-7 (DEIR, p. 4-34), where the image diminishes the nature of the visual impact on LAHSP, but still shows the downtown view is almost completely obscured (note that the LASHP General Plan protects that view).

The Key Observation Point locations seem to have been chosen in order to minimize visual impacts rather than fully disclose them.

Response GO17-70 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Identification of potential aesthetic and visual impacts included the identification of Landscape Units (LU) that defined particular viewsheds and/or aesthetic settings within the Project area, as well as Key Observation Points (KOPs) within each LU that are representative of the visual character of the area. KOPs within each LU were selected based on existing knowledge of important viewsheds and through consultation with responsible agencies, including KOPs selected for consideration of impacts to the Los Angeles State Historic Park. Refer to Appendix H.1, Memo Regarding Preparation of KOPs, of the Final EIR, for discussion of the methodology used to prepare the visual simulations included in Appendix C, Visual Impact Assessment, of the Draft EIR. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, of the Final EIR, for KOPs and simulations updated in part to provide additional aesthetic and visual illustrations. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for an evaluation of the updated and additional KOPs for the proposed Project which would not result in significant impacts, and the aesthetic impacts of the proposed Project would remain less than

significant. Figure 2-6 of the Draft EIR depicts Alameda Tower in the foreground and Alpine Tower in the middle ground, looking north on Alameda Street from Main Street. As discussed in Appendix C, Visual Impact Assessment, which includes Figure 2-6 as KOP 9, this shows the simulated viewpoint from the perspective of a pedestrian looking along Alameda Street from the public sidewalk at the southwestern corner of Alameda Street and Main Street, just south of Ord Street. In the simulated view, the proposed Alameda Tower, Alpine Tower, cabin, and cables in the center are the prominent features in the view, and the proposed Chinatown/State Park Station is visible in the distance in the center of the view, beyond the Metro L Line (Gold) elevated ROW. As discussed above, visual simulations were created to show the pedestrian eye level vantage point within photographs and, as such, visual elements in the foreground of the KOP will appear larger than visual elements further in the distance even though the foreground element may be of a smaller dimension, consistent with how pedestrians experience their surrounding environment.

Figure 2-7 of the Draft EIR depicts the proposed Project's anticipated ANSI aerial rights requirements and the Additional Separation Buffer, with the ANSI aerial rights requirements in dark grey and the Additional Separation Buffer in light grey. There are no conflicts between these requirements as the Additional Separation Buffer is in addition to the ANSI aerial rights requirements. Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR, includes additional figures depicting the proposed Project's anticipated aerial rights requirements and the Additional Separation Buffer. Refer to Appendix N, Additional Separation Buffer, of the Final EIR, for information regarding the Additional Separation Buffer. Similarly, Figure 2-8 of the Draft EIR depicts the Proposed Alignment Over Public ROW/Publicly Owned Property and Private Property, with the public right of way and publicly owned property in teal, private property in purple, and the additional separation buffer in light grey. The additional detail this comment requests is provided on page 5 of Appendix Q, depicting portions of the proposed alignment over the California State Parks property in light green, along with other City, Metro, Caltrans, and privately owned property in their own distinct colors. Accordingly, the Draft EIR clearly shows the distinction between ROW and State Parks property. Figure 4-7 of the Draft EIR depicts the existing and simulated view of the State Historic Park Station, cables, and cabins, included as a component of the Spring Street Alignment Alternative, looking at this station southwest from within the Los Angeles State Historic Park at the Spring Street Junction. This view included in Section 4.0, Alternatives, of the Draft EIR, in the analysis of the Spring Street Alignment Alternative, is consistent with KOP 19 selected for the aesthetics analysis of the proposed Project.

Refer to Appendix O, Supplemental Graphics of Proposed Alignment Plan and Profile, of this Final EIR, for supplemental graphics as to the proposed Project alignment plan and profile, provided in response to comments on the Draft EIR for informational purposes, as larger scale insets of the graphics originally provided in Appendix Q, Proposed Alignment Plan and Profile, of the Draft EIR.

Refer to Response GO17-69 for discussion of how impacts to scenic or panoramic views would be less than significant. Refer to Response S2-5 for a discussion of the proposed Project's consistency with Goals and Guidelines from the Los Angeles State Historic Park General Plan that relate to aesthetics.

Comment GO17-71 Of course, more troubling are the depictions that were not included. The Aesthetic Impact section fails to address the foreseeable use of gondola cars as mobile and possibly electronic billboards advertising on behalf of any purchasers of such flying billboard space. The foreseeable use of gondola tower and station inside and outside space for advertising signage is not addressed or limited in any way.

Response GO17-71 Refer to Section 3.01, Aesthetics, and Appendix C, Visual Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant. Refer to Topical Response K, Signage and Lighting, for a discussion of the proposed Project's signage. The proposed Project's Sign Concept Plan included as Appendix B of the Lighting Study, which is included in Appendix C, Visual Impact Assessment, of the Draft EIR, provides that across the entire proposed Project, including stations, the junction, towers, and cabins, the proposed Project is proposing static signage and digital signage. The digital signage would be limited to the Alameda Station and the Dodger Stadium Station. No digital signage is proposed on the exterior of the cabins. Signage proposed for the exterior of the cabins is static non-illuminated naming rights signage. In addition to the naming rights signage, the proposed Project is proposing that two cabins be designated for the display of community programming graphics and that one cabin be designated for the display of artwork by local art collaborators. Refer to Appendix H.2, Supplemental KOPs in Response to Comments, for additional visual simulations of the proposed Project, including simulations provided for additional clarity regarding certain design elements of the proposed Project, including signage. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for an evaluation of the updated and additional KOPs for the proposed Project which would not result in significant impacts, and the aesthetic impacts of the proposed Project would remain less than significant.

Comment GO17-72 2. There Are Mitigation Measures Available for Impacts to Privacy.

As discussed above, when there are available mitigation measures or alternatives that would lessen the impacts of a project. There are several aesthetic impacts the DEIR should be viewed as significant but the EIR does not acknowledge these impacts.

Response GO17-72 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a range of reasonable alternatives, properly identifying an "environmentally superior" alternative and analyzing a "No Project" alternative, pursuant to CEQA. In addition, the Draft EIR identifies feasible mitigation measures to substantially lessen identified significant environmental impacts from the proposed Project, in compliance with CEQA's requirements. Refer to Section 3.01, Aesthetics, and Appendix C, Visual

Impact Assessment, of the Draft EIR, for discussion of the aesthetic impacts of the proposed Project, which would be less than significant and therefore no mitigation measures are required pursuant to CEQA. Refer to Response GO17-70 for discussion of the Draft EIR's analysis of aesthetic impacts of the proposed Project. In the evaluation of aesthetics, the Draft EIR analysis considers a range of qualifying factors consistent with methods and guidance provided by the Federal Highway Administration (FHWA) for evaluating visual impacts, as well as the CEQA Guidelines and City of Los Angeles CEQA thresholds. The Draft EIR's analysis of impacts to aesthetics was prepared by experts in the field, as set forth in Section 8.0, List of Preparers, and intended to provide the public and decision makers the information that they need to meaningfully consider the proposed Project's potential environmental impacts. Accordingly, the Draft EIR's aesthetics analysis more than adequately complies with CEQA's requirements for a Draft EIR. Refer to Topical Response M, Comparable Urban Aerial Transit Systems, discussing how, like the proposed Project, comparable aerial transit systems in cities around the world are integrated with their surrounding urban environments. In particular, comparable aerial transit systems in other locations demonstrate that such systems can operate safely, efficiently, and in concert with nearby residential and open space uses, including parks and other recreational facilities. The proposed Project would be located in a densely-populated, urban environment surrounded by a variety of commercial, industrial, and residential development types. In this type of environment, it is common for public transportation, such as Metro's light rail, to be located adjacent to residential uses and modern aerial transit systems in other cities, including Portland, Oregon and New York City, operate adjacent to residential uses. Nevertheless, as discussed in Topical Response J, Gondola Design and Operations and Section 2.0, Project Description, of the Draft EIR, cabin windows can be equipped with privacy glass that can become opaque while adjacent to sensitive views, and the proposed Project would work with stakeholders adjacent to the proposed Project alignment to identify locations where the use of privacy glass would be warranted. Considerations as to the locations along the proposed Project alignment where the privacy glass could be activated include the subject adjacent sensitive views and the vertical and horizontal distance between the proposed Project cabins and the adjacent sensitive views.

Comment GO17-73 B. Impact 3.3: Air Quality Will Be Significantly, Adversely Impacted by Traffic Drawn by the Gondola Project.

1. Existing Air Quality in Downtown Los Angeles Is Already Degraded.

As a court has noted in connection with a proposed commercial development project in the Central Valley:

It is well known that air pollution adversely affects human respiratory health. (See, e.g., Bustillo, Smog Harms Children's Lungs for Life, Study Finds, L.A. Times (Sept. 9, 2004).) Emergency rooms crowded with wheezing sufferers are sad but

common sights in the San Joaquin Valley and elsewhere. Air quality indexes are published daily in local newspapers, schools monitor air quality and restrict outdoor play when it is especially poor and the public is warned to limit their activities on days when air quality is particularly bad.

(Bakersfield Citizens for Local Control v. City of Bakersfield (2004) 124 Cal.App.4th 1184, 1219.)

The entire air basin surrounding Los Angeles is designated as a federal-level extreme nonattainment area for ozone, meaning that federal ambient air quality standards are not expected to be met for more than 17 years, and as a serious nonattainment area for CO and PM10. The area is also a federal-level nonattainment area for NOx and PM2.5, as designated by the U.S. EPA. The Basin is a state-level extreme nonattainment area for ozone, and is a state-level nonattainment area for PM2.5 and PM10.

In addition to the impacts that unhealthy levels of pollutants will have on the general population, this Project will cause particularly severe damage to the health of sensitive receptors such as children, the sick, and the elderly within a quarter mile from new traffic patterns in the area.

A Health Risk Assessment (“HRA”) should be done because of the new traffic that would be attracted to the area of the Chinatown Station and Union Station.

Local CO2 hotspots from localized congestion could be created and must be analyzed.

Response GO17-73 This comment provides a general recitation and characterization of case law and regulations. Refer to Section 3.03, Air Quality (which includes a CO hotspots analysis), Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, and Appendix N, Transportation Appendices, for a discussion of the proposed Project’s potential air quality and transportation impacts. As discussed therein, the proposed Project would reduce vehicular travel, and therefore would improve air quality through the reduction in vehicular emissions. Further, the air quality and health risk analyses in Section 3.03 and Appendix D, consider the impacts to all receptors surrounding the proposed Project, including sensitive receptors such as children, the sick, and the elderly within a quarter mile of the proposed Project.

The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby

reducing VMT and air quality related emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime VMT reduction of the project would be a reduction of 129,629,500 VMT, and emissions are decreased through reducing vehicle miles traveled. As discussed in Section 1.0, Introduction, of the Draft EIR, the proposed Project would reduce GHG emissions by 3,493 metric tons of carbon dioxide equivalent per year (MT CO₂e/year) in the buildout year of 2026 and by 6,277 MT CO₂e/year in the horizon year of 2042. The lifetime emissions of the proposed Project over its useful life would be a reduction of greater than 50,000 metric tons of GHGs at 166,653 MT CO₂e. Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project's ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution, and including an analysis of the proposed Project's potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. The comment appears to request a CO hotspot analysis. This analysis was provided in Section 3.03, Air Quality, of the Draft EIR, and discussed on pages 3.3-26 and 3.3-27. To the extent the comment is in regard CO₂ (a Greenhouse Gas), the Draft EIR comprehensively evaluates GHG in Section 3.08, Greenhouse Gas Emissions, and Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR.

Comment GO17-74 2. Construction Emissions Would Be Significant and Must Be Mitigated to a Far Greater Extent than Currently Proposed.

a. More Detailed Disclosure of the Timing of Construction Emissions Is Required.

The DEIR fails to address the significant truck traffic that will be required to haul dirt. It also fails to address the additional noise and pollution that would be associated with that traffic.

There should be a disclosure of the length of the anticipated construction period. The EIR fails to describe mitigations to reduce the concentration of emissions, noise, trash and pollution during construction.

Response GO17-74 Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Appendix D, Air Quality/Health Risk Assessment Technical Report, and Appendix J, Greenhouse Gas Emissions Technical Report, of the Draft EIR, for discussion of the proposed Project's air quality and greenhouse gas emissions impacts, including related to construction, concluding that the proposed Project would not result in significant impacts. The Draft EIR analyzed air quality impacts, including those related to emissions from haul truck trips during construction, in accordance with applicable SCAQMD guidance and using CalEEMod[®], the most current air quality model endorsed by the SCAQMD and the California Air Pollution Control Officers Association. The CalEEMod[®] model was developed by SCAQMD in coordination with other California air districts and is recommended for use by SCAQMD. Sources of the

model's calculation methodologies and default data include SCAQMD-specific emission factors, USEPA AP-42 emission factors, EMFAC2021 for vehicular emissions, and studies commissioned by the California Energy Commission and California Department of Resources Recycling and Recovery (CalRecycle). Based on this analysis, the Draft EIR concludes that the proposed Project will not cause an exceedance to any SCAQMD significance, including construction emissions.

The comment incorrectly states that the Draft EIR failed to address truck traffic to haul dirt. The Draft EIR addressed construction assumptions in Section 2.8, Construction, of Section 2.0, Project Description, with additional detail in Table 4-1, Construction Schedule, of Appendix D, Air Quality / Health Risk Assessment Technical Report, of the Draft EIR. Table 4-1 provides substantial evidence for the duration of construction activity and construction phases. The tables of Appendix D provide detailed explanation of the analyses conducted in the Draft EIR and constitute substantial evidence for the proposed Project. Contained as part of this analysis is evaluation of the truck traffic to haul dirt. Specifically, hauling emissions are summarized in Table A.1-2c of Appendix D for each construction activity, and assumptions for hauling trips are provided in Section 4.3.2 and Table 4-4 of Appendix D. As described in Section 3.3.4 of the Draft EIR, the calculated construction emissions would not exceed the SCAQMD mass daily significance thresholds nor create significant health risk (see also Tables ES-1, ES-2, and ES-3 of Appendix D of the Draft EIR), and thus no mitigation measures are required.

The comment also incorrectly suggests that the Draft EIR did not disclose the length of the anticipated construction period. The construction period is described in Section 2.8, Construction, of Section 2.0, Project Description, with additional technical details included in Appendix B, Construction Assumptions and Appendix D of the Draft EIR. The Draft EIR relied on this construction period information when assessing the proposed Project's potential construction impacts.

Refer to Response GO17-75 for a discussion of proposed Project commitments to further reduce emissions from construction. In addition, as discussed in BIO-PDF-H, in Section 5.0, Corrections and Additions, of the Final EIR, all construction workers will be educated and instructed on best practices regarding daily trash clean-up. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction noise impacts from the proposed Project. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation. The comment incorrectly claims that the Draft EIR does not analyze noise associated with construction traffic. The Draft EIR addressed noise associated with construction traffic in Section 3.13, Noise, with supporting data provided in Appendix M, of the Draft EIR. As discussed on page 3.13-51 through 3.13-52, construction traffic noise has been analyzed along haul routes serving the Project areas and increases in traffic noise compared to existing conditions would be less than 0.6 dBA along Alameda Street, Spring Street, Broadway,

and Bishops Road, which would be below a barely perceptible increase. Therefore, the Project would not result in significant increases in traffic noise during construction.

Comment GO17-75 b. Additional Mitigation of Construction Equipment Nitrogen Oxide Emissions is Required.

Every feasible mitigation measure possible must be taken to reduce construction emissions.

Response GO17-75 Refer to Section 3.03, Air Quality, and Appendix D, Air Quality/Health Risk Assessment Technical Report of the Draft EIR, for discussion of the proposed Project's air quality impacts. The Draft EIR analyzed air quality impacts, including those related to nitrogen oxide emissions, in accordance with applicable SCAQMD guidance and using CalEEMod, the most current air quality model endorsed by the SCAQMD and the California Air Pollution Control Officers Association. The CalEEMod® model was developed by SCAQMD in coordination with other California air districts and is recommended for use by SCAQMD. Sources of the model's calculation methodologies and default data include SCAQMD-specific emission factors, USEPA AP-42 emission factors, EMFAC2021 for vehicular emissions, and studies commissioned by the California Energy Commission (CEC) and California Department of Resources Recycling and Recovery (CalRecycle). Based on this analysis, the Draft EIR concludes that the proposed Project would not cause an exceedance to any SCAQMD significance, including NOx emissions. As a result, the proposed Project would not result in any significant air quality impacts.

The comment suggests that mitigation is required to address construction emissions, but construction emissions are less than significant, and therefore no mitigation measures are required, as described in Section 3.3.4 of the Draft EIR. The proposed Project previously committed to the following to further reduce emissions from construction:

- Use of Tier 4 construction equipment for equipment greater than 50 horsepower (AIR-PDF-A)
- Use of selected electrified construction equipment
- Shuttling of construction workers to reduce emissions from individual worker vehicle traffic
- Compliance with SCAQMD Rule 403 regarding fugitive dust by watering active construction areas at least two times daily to minimize fugitive dust emissions

Comment GO17-76 The DEIR should require use of Best Available Control Technology for the construction phase. Further, measures that should be analyzed and adopted if feasible include:

- Prohibit construction vehicles from idling in excess of five minutes.

- Construction contractors should be required to use alternative clean fuel, such as electric or compressed natural gas-powered construction equipment with oxidation catalysts, instead of gasoline- or diesel-powered engines.
- Where diesel equipment has to be used because there are no practical alternatives, the construction contractors should use low-sulfur diesel, as defined in SCAQMD Rule 431.2, i.e., diesel with a sulfur content of 15 ppm by weight or less. The low-sulfur diesel has the potential to reduce NOx emissions by 50 percent.
- Use aqueous or emulsified diesel fuel for construction equipment. Aqueous diesel fuels have received interim verification by the California Air Resources Board and show a reduction of 16 percent in NOx and 60 percent in PM10 from diesel exhaust.
- Require the use of electricity from power poles instead of temporary diesel- or gasoline-powered generators.
- Require the use of newer, lower-emitting trucks to transport construction workers, equipment and material to and from construction sites.
- Limit the hours of operation of one or more pieces of construction equipment.
- Metro should require the Project proponent to investigate the availability of construction equipment retrofitted with particulate filters and give preference to contractors with relatively modern construction equipment that are or could be retrofitted with diesel particulate filters.

Response GO17-76 Refer to Section 3.03, Air Quality, and Appendix D, Air Quality/Health Risk Assessment Technical Report, of the Draft EIR, for discussion of how the proposed Project would not result in significant air quality impacts during construction. As discussed in Response GO17-75, the Draft EIR analyzed air quality impacts, including construction emissions, in accordance with applicable SCAQMD guidance and using CalEEMod, the most current air quality model endorsed by the SCAQMD and the California Air Pollution Control Officers Association, and determined that the proposed Project would not exceed any SCAQMD significance thresholds. Therefore, the proposed Project would not result in significant air quality impacts during construction and mitigation measures were not required, as described in Section 3.3.4.

This comment has listed various approaches that can be used to reduce emissions from construction equipment and construction vehicles. As summarized in Response GO17-75, the construction emissions are less than significant, and therefore no mitigation measures are required. The proposed Project has committed to several of these measures, including:

- Use of Tier 4 construction equipment for equipment greater than 50 horsepower (AIR-PDF-A)
- Use of selected electrified construction equipment

- Shuttling of construction workers to reduce emissions from individual worker vehicle traffic

Further, several of the suggestions are also incorporated into the proposed Project by default by nature of being existing regulations. These include:

- CARB Airborne Toxic Control Measure (ATCM) to Limit Diesel-Fueled Commercial Motor Vehicle Idling
- SCAQMD Rule 431.2 – Sulfur Content of Liquid Fuels
- California Advanced Clean Trucks

The proposed Project's construction emissions are less than significant and no further additional measures are required.

Comment GO17-77 3. Various Air Quality Analyses and Assumptions are Unsupported.

Air Quality experts EAI have reviewed the DEIR and have the following comments. (A copy of the EAI analysis is attached- Enclosure 6).

a. Gondola Movement Assumptions are Overstated.

The Draft EIR indicates that the tramway will move 5,000 people per hour, with 30-40 people per gondola. If that is correct, a total of approximately 143 gondolas per hour would be needed (35 people x 143 gondolas = 5,005 people). To transport that many gondolas, a gondola would need to arrive, load and leave every 20 to 30 seconds. Each time a gondola arrives at Dodger Stadium, it would also have to empty every 20 to 30 seconds. This timing does not allow for the additional time required for children, the elderly or persons with disabilities who may need more time and assistance. Consequently, the numbers stated in the DEIR, are wildly overstated and likely impossible to achieve. These overly aggressive assumptions lead to an overestimate of the number of people that would use the ARTT as an alternative to driving vehicles or using other forms of transportation. Even at this highly unlikely maximum utilization rate, Dodger patrons who leave the game at its conclusion may have to wait as long as an hour or more for their return trip to Union Station—leaving many patrons stranded and possibly calling for an Uber or Lyft rather than waiting for the Gondola—essentially undercutting the “emission-free” claims of the proponents. Compare this to the Hollywood Bowl that has busses waiting in the wings to immediately transport thousands of guests to parking lots throughout the city and county as opposed to just one fixed location.

Response GO17-77 Refer to Response GO17-187 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI). Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of how post-game queues at Dodger Stadium were estimated based on assumptions about the departure patterns and estimates of walk times from the various seating areas within the stadium. Based on current behaviors, game attendees gradually start leaving the game around 30

minutes before the end of the game. While most people would leave the stadium at the end of the game, given the crowd in the stadium and the distances from the various seating locations in the stadium, it would naturally take people seated the furthest away from the Dodger Stadium Station more time to walk to the station, much like how it is currently for passengers riding the Dodger Stadium Express. In addition, gondola passengers who would rather not join the line immediately to board the proposed Project in the post-game period could visit some of the entertainment amenities at the stadium, including at the Centerfield Plaza. Regarding the queue waiting time, Dodger Stadium Express riders today wait in queues to board the service. As discussed in Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, the queues to board, loading times, and travel times for the Dodger Stadium Express are significantly longer and more variable as compared to the proposed Project. In order to quantify the existing service time needed to transport Dodger Stadium Express riders, Fehr & Peers observed four post-game time periods during the 2023 season. These observations indicate that riders are willing to wait for substantial periods of time after a game to board the Dodger Stadium Express, despite its slower travel time and long waits between buses, supporting the concept that riders would also be willing to wait after a game to board the proposed Project with its improved level of service.

Comment GO17-78 b. Air Quality Analysis is Flawed.

i. Baseline Assumptions are Incorrect.

The air quality and GHG emission benefits of the project have been overstated. The mobile emissions take credit for non-Project (regulatory) related emissions reductions for future years. This misrepresents the actual impacts of the proposed Project. It mistakenly credits the proposed Project with emissions reductions that are not created by the proposed Project. Instead, the analysis should have used the same basis (emissions factors) to show the real impacts from the proposed Project, without influence from external sources (e.g., unrelated regulations).

Response GO17-78 Refer to Response GO17-188 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI).

Comment GO17-79 ii. Haul Route Air Quality Impacts Are Inaccurately Analyzed.

The haul trips to move soil during construction activities were based on 20 miles per trip. If any hazardous soil is encountered during the excavation, the mileage could be grossly inadequate since contaminated soil needs to be hauled to a hazardous waste facility, the closest of which is Clean Harbors in Buttonwillow, California approximately 140 miles from Union Station. Further, it is likely that the project construction team would know the distances to the landfills that will be used for clean soil so these should be disclosed. The likely landfills for clean soil in the area are the Azusa (21.7 miles from Union Station), Chiquita Canyon (40 miles from Union Station), and Simi Valley Landfills (42 miles from Union Station). The air quality impacts

associated with these construction activities must be revised and updated with accurate assumptions.

Response GO17-79 Refer to Response GO17-189 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI) .

Comment GO17-80 iii. Gondola Operation Benefits Are Overstated.

Emissions for the gondola operations are shown as a negative number (Table 4-8 of Appendix J), which is disingenuous. It would be understandable to calculate the potential emissions from the electricity use then apply GHG credits for a mitigation measure, but showing the value as a negative number implies the proposed Project is generating the GHG credits, which is false.

Response GO17-80 Refer to Response GO17-190 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI),

Comment GO17-81 iv. Battery Backup Should Be a Mitigation Measure.

Emissions for the backup battery system are shown as a negative number (Table 4-10 of Appendix J). The same logic applies. The proposed Project is not generating GHG credits for using backup batteries. Using battery power instead of diesel should be a required mitigation measure.

Response GO17-81 Refer to Response GO17-190 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI).

Comment GO17-82 v. The EIR Uses an Outdated AQMP.

The DEIR relies on the 2016 AQMP, which is outdated. The 2022 AQMP has been approved by the SCAQMD Governing Board on December 2, 2022. (Appendix D).

Response GO17-82 Refer to Response GO17-191 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI).

Comment GO17-83 c. Energy Usage is Inappropriately Analyzed and Mitigated.

Appendix H Energy Technical Report (page 22). The Draft EIR indicates that electricity will be supplied using the LADWP's Green Power Program, indicating that the primary electricity for the project would come from renewable energy sources. As this is one of the primary ways the project is minimizing increases in GHG emissions, an enforceable mitigation measure must be provided to ensure this project assumption is enforced.

Response GO17-83 Refer to Response GO17-192 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI) .

Comment GO17-84 Section 3.0 of the Draft EIR indicates that the environmental setting is the physical conditions in the vicinity of the proposed project at the time of publication of the Notice of Preparation (NOP), which was October 1, 2020. However, data used to

calculate baseline conditions varies. For example, 2019 was considered to be the baseline conditions for the energy analysis (see page 3.6-13). The Draft EIR must explain the appropriate environmental setting and why the impact analysis for different resources used different years. Further data regarding the existing fuel consumption was based on 2016 data, which is at least 8 years old (see page 3.6-13) and not consistent with the release of the NOP.

Response GO17-84 Refer to Response GO17-193 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI).

Comment GO17-85

GO17-85A The DEIR indicates that construction would result in a demand of approximately 864,544 kWh of electricity. (Page 3.6-15.) Please provide the assumptions used to calculate the electricity use during construction.

GO17-85B The DEIR states that the Project’s construction electricity use represents a small percentage of regional estimates for the LADWP. (DEIR page 3.6-15 and Appendix H.) It further states that: “The CEC estimates that energy demand in the LADWP planning area will increase to approximately 27,000 to 28,000 GWh in the 2024 to 2026 timeframe, meaning the proposed “project’s demand contribution in that period would be approximately 0.002 percent of the projected demand.” (see DEIR page 3.6-15). According to the footnote, the peak demand for LADWP is based on a CEC reference from 2016 and used data from 2015. With the move toward renewables and the problems that the electricity grid had maintaining electricity during peak demand periods in 2022, more recent data should be used. Further, for the same reason, the DEIR should explain whether the LADWP has excess RENEWABLE electricity available for the proposed project. Per the DEIR assumptions, it is assumed that all electricity use associated with the operation on the project will be renewable. A mitigation measure should be developed to enforce this assumption.

GO17-85C Further, the DEIR indicates that the peak demand in the LADWP planning area is expected to reach 6,400 to 6,500 MW in the 2024 to 2026 timeframe. Please note that the LADWP reports that the record peak demand was 6,502 MW on August 31, 2017.¹¹ Therefore this peak demand has already been reached and the data provided in the DEIR is not valid, likely because the information used for the baseline is outdated. The potential energy impacts are significant as LADWP does not currently have the excess electrical supply capacity to provide electricity to the proposed project.

Footnote 11: LADWP Facts and Figures.

https://www.ladwp.com/ladwp/faces/ladwp/aboutus/a-power/a-pfactandfigures?_adf.ctrl-state=10n9mool8q_4&_afLoop=494270252036354

Response GO17-85

- GO17-85A** Refer to Response GO17-194 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI).
- GO17-85B** Refer to Response GO17-195 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI).
- GO17-85C** Refer to Response GO17-196 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI).

Comment GO17-86 Further evidence of the use of an inappropriate baseline is the Proclamation of a State of Emergency signed by Governor Gavin Newsom on August 31, 2022. The Proclamation declared that immediate action was required to reduce the strain on the energy infrastructure and increase energy capacity during the Extreme Heat Event (late August through early September 2022). The California Independent System Operator (CASIO) forecasted high electric demand due to the extreme heat event with peak load projected to exceed 48,000 MW and which would exceed the available electricity.¹² Further, this event was classified as an “emergency event” which allowed existing portable generators (including diesel generators) to operate under emergency conditions, regardless of any permit conditions.

Footnote 12: <https://www.gov.ca.gov/wp-content/uploads/2022/08/8.31.22-Heat-Proclamation.pdf?emrc=78e3fc>

Response GO17-86 Refer to Response GO17-197 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI).

Comment GO17-87 The DEIR indicates that the proposed project would result in electricity demand of approximately 6.9 GWh/year and dismisses the impact because the electricity increase would be 0.002 percent of the projected statewide demand in 2026. (Page 3.6-16.) However, currently the electricity production is not sufficient to meet current demands during peak electricity use periods (e.g., hot summer months). The DEIR should compare the proposed project’s electricity use with the current electricity generation by LADWP, since LADWP will supply electricity to the project beginning in 2026 first. There is currently not sufficient electricity to power the grid during high or extreme heat periods. The impacts on the electricity system should not only be compared to the projected electricity production in 2042 (which may or may not actually occur).

Response GO17-87 Refer to Response GO17-198 in Enclosure 6 to Letter GO17 from Environmental Audit, Inc (EAI).

Comment GO17-88 C. Historical and Cultural Resource Impacts (Section 3.5) Must Be Avoided.

The impacts to the State Historic Park, El Pueblo, and Los Angeles Union Station must be avoided. We agree with comments from the California State Parks Rangers Association (CSPRA), the Los Angeles Conservancy, the California State Parks

Foundation, and Los Angeles Union Station Historical Society (LAUSHS) on these issues.

Response GO17-88 The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to cultural resources, including the Los Angeles State Historic Park, El Pueblo, and LAUS in Section 3.05, Cultural Resources, with supporting data provided in Appendix F, Archaeological and Paleontological Resources Assessment for the Los Angeles Aerial Rapid Transit Project, and Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant, and all potential impacts related to archaeological resources would be either less than significant or reduced to less than significant with mitigation. Refer to Responses to GO28 (California State Parks Rangers Association), GO16 (The Los Angeles Conservancy), GO10 (the California State Parks Foundation), and GO9 and GO11 (the Los Angeles Union Station Historical Society) for responses to the comment letters raised in this comment.

Comment GO17-89 D. Parks and Recreational Facilities (Section 3.16) Impacts Must Be Avoided.

1. The Permanent Construction of Gondola Facilities Will Negatively Impact the Park Experience.

The State Historic Park serves as a rare refuge in the urban environment for relaxation and recreation. The Gondola associated facilities will physically intrude on this refuge space. No portion of the State Historic Park should be taken for gondola facilities. The gondola lines should not be planned to pass over the State Historic Park airspace.

Response GO17-89 As discussed in Section 2.0, Project Description, Section 3.16, Parks and Recreational Facilities, and Section 5.0, Other CEQA Considerations, of the Draft EIR, the Chinatown/State Park Station would have a footprint of 2,195 square feet in the Los Angeles State Historic Park (~.1% of the total 32-acre park), and the station canopy would have an overhang of 9,320 square feet over the park. The proposed Project alignment crosses over the westernmost edge of the Los Angeles State Historic Park, adjacent to the existing Metro L Line (Gold) and the associated overhead catenary system. The proposed Project’s required aerial clearance would be located above approximately 59,470 square feet of the total 32-acre park, plus an Additional Separation Buffer. ANSI B77.1 requires a vertical clearance of eight feet above grade where pedestrians are present. The proposed Project’s vertical clearance to the bottom of the cabins would range from 26 to 53 feet with an average of approximately 40 feet from ground level over the park. With the required clearances and the height at which the cabins would cross over the Los Angeles State Historic Park, the ability to use the vast majority of the Park for kite flying, special events (e.g., concerts, craft fairs, partnership events, 5K/10K runs, workshops, cultural festivals, and the farmers’ market), and other passive recreational opportunities (e.g., picnicking, jogging, walking, and informal play) would not be affected by the

proposed Project. Refer to Response S2-4 for additional discussion regarding the ability of uses to continue at the park. The proposed Project has less than significant impacts to parks and recreational facilities.

Comment GO17-90 2. Non-Permanent Impacts On The State Historic Park that May Be Significant Are Not Adequately Analyzed In The DEIR.

CEQA requires that every significant environmental impact from a proposed project must be identified, analyzed, reported to the public, and mitigated to the extent feasible. (Pub. Resources Code § 21002, 21081.) The Guidelines make clear that an impact does not have to be permanent to be significant; Guidelines § 15065(d)(1) cites “dust, noise, and traffic of heavy equipment” from construction as potentially significant, and construction is by definition temporary.

Here, the DEIR acknowledges that “[c]onstruction of the Chinatown/State Park Station would require the temporary closure of approximately 1.59 acres of the southern entrance to Los Angeles State Historic Park during the approximately 19 months for the construction of the Chinatown/State Park Station.” (DEIR, p. 3.16-16.) The DEIR also admits that “Construction of the Chinatown/State Park Station would temporarily fence off portions of the park, generate dust and noise, and introduce heavy construction equipment into the area, which may potentially discourage people from using certain portions of the park, disrupt events occurring at the park, or increase the use of the open portions of the park.” (Id.) The DEIR finds such impacts to be less than significant, on grounds that park visitors already experience disruption from special events at the State Historic Park, such as concerts and festivals; also, visitors could still use 30 acres of the Park during construction of the Station, and will only have to put up with the condition for nineteen months. (DEIR, p. 3.16-17.) No mitigation for the loss of park space is proposed or even explored.

The DEIR’s reasoning is flawed and inconsistent with CEQA’s requirements. When it suggests that park patrons will just take the loss of Park space in stride, the DEIR effectively places the responsibility for mitigating this impact on the park visitors themselves and their fully justifiable expectations for a park, not on the proposed Project.

Response GO17-90 This comment provides a general recitation and characterization of the Draft EIR. The Draft EIR analyzed all potential environmental impacts to the Los Angeles State Historic Park, including in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations. Refer to Section 3.16, Parks and Recreational Facilities, for a discussion of how construction of the proposed

Project would result in less than significant impacts to the Los Angeles State Historic Park. As discussed on pages 3.16-16 to 3.16-17 and 3.16-22, while construction of the proposed Project would require a brief and temporary closure of the southernmost corner and western edge of the Los Angeles State Historic Park beneath the cables for safety purposes, other options for pedestrian access, including the provision of pedestrian detours during construction, would allow for continued pedestrian access within the Project area. In addition, park patrons would still be able to access approximately 30 acres of the 32-acre Los Angeles State Historic Park, including all the recreational areas, during construction activities within the park. In addition, regular park patrons are familiar with temporary park closures as they often occur in conjunction with concerts, fairs, and festivals that take place within the park throughout the year. It is not anticipated that construction activities at the southernmost portion of the park would increase the use in other areas of the park or at other parks and recreation facilities such that substantial physical deterioration of the facility would occur or be accelerated as the portion where construction activities are occurring is primarily landscape and hardscape. Refer to Response GO17-89 for additional discussion of how the ability to use the vast majority of the Park would not be affected by the proposed Project.

Comment GO17-91 The DEIR has already found construction noise levels to be significant and unavoidable at the State Historic Park. (DEIR, p. 3.3-18, 3.13-75). It now equates the disruptions of a few days-long festivals each year with over a year and a half of partial Park loss. Park visitors who are already suffering significant noise levels should also simply adapt and make do with the Park area that is not lost to them, the DEIR implies. But the Guidelines provide that dust and noise may constitute significant impacts; by analogy, the deprivation of park acreage to the public may also be significant, and the DEIR must analyze and report this impact instead of minimizing and dismissing it.

Response GO17-91 This comment provides a general recitation and characterization of the Draft EIR. Refer to Responses GO17-89 and GO17-90 for a discussion of the Draft EIR's analysis of impacts to Los Angeles State Historic Park and how the ability to use the vast majority of the Park would not be affected by the proposed Project. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction and operational noise impacts from the proposed Project, including to the Los Angeles State Historic Park. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation. Mitigation Measure NOI-A would be implemented during construction of the proposed Project, requiring a Construction Noise Management Plan to minimize construction-related noise impacts to off-site noise-sensitive receptors, which would include the construction noise barriers. Operational noise impacts would be less than significant.

Comment GO17-92 It is a fundamental principle of CEQA that the significance of an impact may depend upon the setting, that "an activity which may not be significant in an urban area may

be significant in a rural area.” (Guidelines § 15064(b)(1).) Here, the extended loss of even a part of the State Historical Park, one of the few oases of green and peace in the bustle and pollution of downtown Los Angeles for nineteen months (or more) may be significant, even if losing an equivalent portion of the urban landscape elsewhere in downtown might not be. This is especially true when one considers that this is a private project that the public is being asked to sacrifice public land, resources and airspace for, and now even state park property. The DEIR must analyze this impact and mitigate it at this site, for this impact.

Response GO17-92 The Draft EIR analyzed all potential environmental impacts to the Los Angeles State Historic Park, including in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations. As discussed on page 3.16-16 of the Draft EIR, construction of the Chinatown/State Park Station would not require any closures of areas used for recreation. Refer to Response GO17-89 for additional discussion of how the ability to use the vast majority of the Park would not be affected by the proposed Project.

Comment GO17-93 E. Transportation/Traffic Impacts (Section 3.17) Are Understated and Not Sufficiently Mitigated.

Traffic expert Tom Brohard has examined certain portions of the EIR and made the following observations.

1. Dodger Stadium Access Study For Los Angeles County Transportation Commission

Over 30 years ago in August 1990, the Los Angeles County Transportation Commission, the County transportation agency that preceded Metro, retained Gruen Associates with Gannett Fleming to evaluate alternative connections to move people efficiently to and from Dodger Stadium. The enclosed “Dodger Stadium Access Study” evaluated various technologies including shuttle buses, automated guideway transit, light rail transit, gondola tramways, and walkways and escalators.

Six different characteristics were evaluated and compared for the five different technologies as shown in Table 1 of the Study. Table 3 compared boarding and travel time for the different alternatives, with the gondola tram taking an average of 92 minutes and 60-person shuttle buses taking about 43 minutes per passenger, less than half of the time required per passenger for the Gondola trams. The capacity of the shuttle bus system was estimated at 7,200 passengers per hour, over 2.5 times greater than what the gondola system could provide. The aerial gondola system was found to take more than twice as long as the shuttle buses, and shuttle buses were found to move more than double the number of people.

Of the different alternatives evaluated, the gondola was found to have the lowest capacity of any of the systems considered and would have the least positive impact on traffic and congestion. The gondola system then and now is more for sightseeing and entertainment and is not an effective way to move people between places that are 1.2 miles apart.

Response GO17-93 Refer to Response GO17-155 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-94 2. Metro Board Executive Management Committee Report

The September 15, 2022, Metro Board Executive Management Committee Informational Report, Los Angeles Aerial Rapid Transit Project Update, discussed various topics including the traffic studies to be prepared for the Proposed Project. Page 4 states “A separate Project Access, Circulation and Construction Transportation Study will be prepared in accordance with the non-CEQA analysis required by the City of Los Angeles Transportation Assessment Guidelines. This separate technical report will evaluate the Project’s potential effects on the intersection level of service.”

This study was to be prepared as required and in accordance with the LADOT Transportation Assessment Guidelines issued in August 2022, including potential impacts on intersection level of service. The contents of the analysis are found in Section 3.3, Project Access Safety and Circulation Evaluation. This report was not included in the Draft EIR or Appendix N. Furthermore, this analysis has not been shared with the public. It should have been made available for review and comment.

Response GO17-94 Refer to Response GO17-156 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-95 3. Draft Environmental Impact Report – Executive Summary

The Project Purpose on Page ES-1 states “The proposed project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit service connecting the regional transit system at LAUS, Dodger Stadium, the Los Angeles State Historic Park, Elysian Park, and the surrounding communities via three new transit stations... The Proposed Project is needed to alleviate existing congestion and associated air pollution...as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways...”

Both of these statements, as well as many others throughout the Draft EIR, are made without foundation and/or documentation to support them in the Draft EIR or in the technical Appendices. They exaggerate even a best-case scenario that could most optimistically occur.

Response GO17-95 Refer to Response GO17-157 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-96 Access to State Historic Park: Such access is already available via Metro’s Gold line which is just one stop from Union station on an already existing line—so the Gondola does not provide any additional benefits, in fact, Metro riders will have to leave the station (instead of just transferring within the station) to walk to the Gondola station, potentially pay an added fare (note Metro would have to negotiate this with the private owners of the Gondola) to get to the State Historic Park which they can already reach via Metro or by walking.

Access to Elysian Park: The proposed Gondola Stop is at the furthest end of the Dodger Stadium parking lot which is far from Elysian Park. Families seeking to picnic at the park will not likely be taking their chairs, equipment and coolers on the Gondola to the park. As with most of the rest of this project, the claim that the Gondola will serve park goers is a red herring to deflect from the sole purpose of the Gondola which is to benefit Mr. McCourt’s plans for the development of Dodger Stadium as previously discussed.

Response GO17-96 Refer to Topical Response F, Los Angeles State Historic Park, for discussion of how the proposed Project would provide additional benefits to Los Angeles State Historic Park. Compared to the Metro L Line (Gold), accessible at the Chinatown Station, the proposed Project’s Chinatown/State Park Station would be closer to the Los Angeles State Historic Park, the shorter headways would result in more frequent service, and the travel time would be less. Through collaboration with State Parks, the proposed Project has been designed to provide additional benefits to the Los Angeles State Historic Park, including pedestrian improvements between Metro’s L Line (Gold) and the park, and integration of the Chinatown/State Park Station into the southern boundary of the park with hardscape and landscape enhancements, a mobility hub, and other park amenities including concessions, restrooms, and a breezeway connecting the concessions and restrooms. As discussed in Section 5.0, Corrections and Additions, of this Final EIR, the proposed Project would provide a mobility hub at the Dodger Stadium property to provide connectivity to Elysian Park and the surrounding communities. Outside of game day periods, passengers would be able to access a suite of first/last mile multi-modal options, such as a bike share program and individual bike lockers, to access Elysian Park and other nearby neighborhoods, including Solano Canyon. As discussed in Section 2.0, Project Description, of the Draft EIR, Elysian Park is the oldest and second largest park in the City and features hiking trails, a bike path, horseshoe pits, picnic tables, restroom facilities, and other public amenities. The proposed Project would enhance community connectivity by providing first/last mile transit and pedestrian access to areas that have historically been underserved, including the Los Angeles State Historic Park and Elysian Park. Refer to Topical Response G, No Improper Project Segmentation: The Proposed Project Is Intended to Create a Transit Connection from Metro’s Union Station Transportation Hub via an Aerial Gondola System to the Dodger Stadium Property, for a discussion of how the proposed Project solely proposes an aerial gondola system. The proposed Project does not include other development, and neither the

Project Sponsor nor any other applicant has applied for other development unrelated to the existing stadium uses on the Dodger Stadium property.

Comment GO17-97 Page ES-16 provides a listing of comments from various public agencies. Interestingly enough, no comments are listed as being from the City of Los Angeles Department of Transportation. This lack of response from LADOT is unique in my extensive experience in peer reviews of transportation aspects of various projects in the City of Los Angeles over the last several decades.

With direction from LADOT and as outlined in the LADOT Transportation Assessment Guidelines, a detailed Memorandum of Understanding outlining the methodology and approach to the transportation analysis is typically developed by the Draft EIR transportation consultant. This document is then reviewed, approved, and signed off by both LADOT and the Draft EIR transportation consultant before the transportation analysis begins. There is no evidence that such a Memorandum of Understanding was ever developed, reviewed and approved by both LADOT and by the Draft EIR transportation consultant.

Response GO17-97 Refer to Response GO17-158 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-98 Transportation Mitigation Measure TRA-A on Page ES-72 recommends “visibility enhancements for the Alameda Tower and Chinatown/State Park Station” but then states “visibility enhancement features could include high visibility crosswalk treatments, advance crossing warning signs, flashing beacons, upgraded lighting, and new or upgraded traffic controls such as traffic signals and all-way stops and right turn on red restrictions and channelization of pedestrians to marked crosswalks via fencing. The mitigation measure would be implemented during the construction phase and would be completed prior to proposed Project operations.”

The laundry list provided gives many different possible mitigation measures, but no study or analysis has been conducted to determine which may be appropriate or inappropriate. For example, it is not possible to install traffic signals and all-way stops at the same intersection. The possible mitigation measures must be analyzed now to determine what is needed and warranted. Waiting until some future time to decide what will or will not be done constitutes deferred mitigation, and any such mitigation will not be timely or effective. Deferred mitigation is contrary to professional traffic engineering and transportation planning principles as well as CEQA, the California Environmental Quality Act.

Response GO17-98 Refer to Response GO17-159 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-99 Transportation Mitigation Measure TRA-B on Pages ES-73 to Page ES-76 provides more of the same deferred analyses in its discussion. The Construction Traffic Management Plan offers several possible measures but then defers to City of

Los Angeles approvals before implementation. The City of Los Angeles always requires a Construction Traffic Management Plan and there is nothing special or unique here. As one of several examples, “Existing yellow crossings... shall be evaluated in coordination with LADOT to determine if crossing guards should be assigned on days/times when detours are active, the proposed Project shall fund crossing guards during morning school arrival and afternoon school departure periods... If school crossings along detour routes are unsignalized, temporary traffic signals will be evaluated in coordination with LADOT and would be implemented by the proposed Project if deemed necessary.” Once again, possible mitigation measures are proposed but no measures are actually studied or planned. TCE will be particularly affected by construction—as stated in TCE’s NOP comment letter in Appendix A of the EIR. TCE provides free public conference meeting space to non-profit and governmental organization throughout the County. This Project would seriously and severely disrupt TCE’s operations as well as those of tenants in the building and visitors.

The Draft EIR must analyze potential mitigation measures now and determine which are needed and warranted rather than publish yet another laundry list of possible measures which have not been studied or evaluated.

Response GO17-99 Refer to Response GO17-160 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates. Refer to Response GO17-13 for a discussion of how the proposed Project would have temporary, significant noise and vibration (human annoyance) impacts on The California Endowment during construction activities of the Alameda Tower. The proposed Project would not result in any other significant and unavoidable construction or operational impacts to The California Endowment.

Comment GO17-100 4. Draft Environmental Impact Report – Chapter 2 – Project Description

The Purpose and Need Section beginning on Page 2-10 states the Dodger Stadium Express buses carry approximately 1,850 riders on average per game. Page 2-12 states “Within two hours prior to the start and after a game or event at Dodger Stadium, more than 10,000 people could be transported to the stadium by the Proposed Project. The average attendance at a Dodger game was approximately 49,000 for the 2019 season. Given the capacity of the system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system.”

This statement is theoretical at best for conditions after a game since very few fans will be willing to wait more than one hour with other transportation options available including Dodger Express Bus as well as Uber/Lyft/Taxi. The UCLA Mobility Lab Study discussed further below found that the Proposed Gondola Project would carry only about 2,200 passengers at most and would transport only 1,380 people after a baseball game.

Response GO17-100 Refer to Response GO17-161 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-101 The loading and unloading of gondola cars are briefly discussed on Page 2-17. However, there is no description or illustration of how passengers would access the gondola cars from the Metro L Line (Gold), how passengers would access the gondolas from ground level, or how passengers would cross Spring Street. Each of these omissions raises significant traffic safety concerns for pedestrians trying to reach and use the proposed gondola system.

Response GO17-101 Refer to Response GO17-162 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-102 Figure 2-27 on Page 2-54 illustrates the location of the proposed gondola support tower within the Alameda Triangle just south of Alhambra Avenue. From that illustration, it does not appear to be possible to provide adequate stopping sight distance through the tower supports for the westbound dedicated left turn lane and the westbound left turn/right turn lane. The Draft EIR must describe how potentially conflicting motorists will be able to see each other through the solid tower support framework.

Response GO17-102 Refer to Response GO17-163 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-103 Page 2-61 does not indicate the requirements to coordinate with and obtain approval from LADOT during construction as well as during operation of the proposed project. The City of Los Angeles has jurisdiction over the roadways that will be impacted, and the Proposed Project must work closely with the City's Department of Transportation by obtaining all required permits and following each of the permit requirements.

Response GO17-103 Refer to Response GO17-164 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-104 5. Draft Environmental Impact Report - Chapter 3.17 – Transportation

Page 7 repeats that the City of Los Angeles Transportation Assessment Guidelines as noted in the Board memo would be followed. The current edition of the LADOT TAG was issued in August 2022. However, the required level of service analysis and comparisons were not included in either the Draft EIR or Appendix N, and this study has not been made available for public review and comment.

Response GO17-104 Refer to Response GO17-156 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-105 The estimates of neighborhood riders and walkers on Page 26 do not appear to consider the topography vertical rise of 200 to 300 feet up to Dodger Stadium in the walkable and bikeable forecasts. The steep slopes of the streets and pathways discourage walking and biking. The estimates of neighborhood riders of the gondola

are significantly overstated and must be reduced to account for the steep topography.

Response GO17-105 Refer to Response GO17-166 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-106 Page 27 states that the vehicle miles traveled (VMT) calculations are based on data collected in Year 2019, but there is no evidence or cross-checking to support that these values are “current” or correct.

Response GO17-106 Refer to Response GO17-167 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-107 Page 32 indicates the Proposed Project will result in only one change to intersection geometrics by shortening the northbound left turn lane from Alameda Street to Cesar Chavez Avenue by 150'. Shortening of this left turn lane by almost half, from 320 feet to 170 feet, which will result in traffic waiting to turn left backing out of the shorter left turn lane, stopping in the through lane, and significantly increasing the potential for rear end collisions. This left turn lane is also signed as a primary route to reach Dodger Stadium. The capacity of this left turn lane will be cut in half, creating the need for other mitigation to accommodate the high northbound left turn demand.

Response GO17-107 Refer to Response GO17-168 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-108 Page 40 incorrectly states that the 35 MPH posted speed limit on Alameda Street equates to 250 feet of stopping sight distance at the marked crosswalk at Alamed Station.

The 7th Edition of “A Policy on Geometric Design of Highways and Streets 2018 The Green Book” published by the American Association of State Highway and Transportation Officials (AASHTO) is the definitive resource of stopping sight distance. This publication is used by Caltrans as well as all local jurisdictions in California. Traffic engineers and transportation planners understand that stopping sight distance is based upon the design speed of the roadway under review, a speed which is typically 10 MPH higher than the posted speed limit. Stopping sight distance for a 45 MPH design speed is 360 feet, not 250 feet, as shown in Table 3-1 on Page 3-4, Stopping Sight Distance on Level Roadways. Other measures to provide 360 feet of stopping sight distance are required.

All other discussions of stopping sight distance must be modified to reflect the use of the design speed which is typically 10 MPH higher than the posted speed limit and that requires additional stopping sight distance accordingly.

Response GO17-108 Refer to Response GO17-169 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-109 Page 41 recommends prohibiting right turns on red at the Alameda Tower as a mitigation measure. “No Right Turn On Red” is not an effective mitigation measure as it does not guarantee safety for pedestrian crossings as vehicles may violate the posted right turn on red prohibition and they are then faced with a condition involving inadequate stopping sight distance.

Response GO17-109 Refer to Response GO17-170 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-110 Page 67 states that Mitigation Measures TRA-A will provide visibility enhancements at Alameda Tower and Chinatown Station but does not discuss what mitigation measures are recommended at these locations. The discussion should be expanded to describe the mitigation measure as has been done for Mitigation Measure TRA-B immediately following.

Response GO17-110 Refer to Response GO17-159 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-111 Other mitigation measures are deferred and may not be timely as required. To be effective and complete, potential mitigation measures identified on the various laundry lists must be studied and evaluated in the Draft EIR, with specific mitigation measures identified.

Response GO17-111 Refer to Response GO17-159 and GO17-160 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-112 6. FEHR & Peers Ridership Modeling (Appendix N of Draft EIR)

Table 5 on Page 21 of Ridership Modeling in Appendix N of the Draft EIR estimates 6,000 game attendees would ride the gondola in 2026. Daily tourist riders on the gondola are estimated to be 1,270 per day on game days and 2,575 per day on non-game days. These forecasts are significantly higher than those presented in the other reports such as the Dodger Stadium Access Study discussed earlier in this letter and in the UCLA Mobility Lab Study discussed later in this letter.

Response GO17-112 Refer to Response GO17-173 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-113 7. FEHR & Peers Draft Parking Study September 2022

Page 1 states “Detailed analysis of traffic associated with the proposed project are separately being evaluated in a non-CEQA transportation assessment in accordance with the City of Los Angeles Transportation Assessment Guidelines. This would involve calculation of level of service and delay at intersections (pre VMT), but these calculations and results are not found in the Draft EIR or in Appendix N.

Response GO17-113 Refer to Response GO17-156 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-114 Pages 2 and 3 indicate that the Chinatown/State Park Station “could” include pedestrian improvements between Metro’s L Line (Gold) Station and the Chinatown/State Park Station as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge.” Specific improvements need to be identified now (see Page 42 of Chapter 3.17) and included within the mitigation measures proposed in the Draft EIR.

Response GO17-114 Refer to Response GO17-175 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-115 Page 10 states that a parking management plan will be developed before operation of the Proposed Project. Doing this at some future time rather than during the Draft EIR constitutes deferred mitigation by stating “Parking management strategies and specific implementation steps will be further detailed in a parking management plan prepared in the future in collaboration with the City of Los Angeles, who would be the implementor of any on-street parking management strategies... However, because the detailed parking management implementation plan will be reliant on completion of construction documents and the final operating plan, it will follow the completion of the environmental process for the proposed project.” Parking management is critical to understanding the impacts of this project, the failure to clearly articulate how Mr. McCourt and ARTT intends to manage the displacement of cars from Dodger Stadium to the Chinatown community must be clearly articulated and a mitigation plan provided for comment. This is a matter of environmental justice as stated previously. The fact that no plan for parking mitigation was presented is yet another reason why this Project may not go forward.

Response GO17-115 Refer to Response GO17-176 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, for discussion of the Project Sponsor and donation to Zero Emissions Transit, a nonprofit organization dedicated to supporting zero emissions transportation programs, policies, and projects, such as the proposed Project. Traffic congestion is not required to be analyzed under CEQA in the Draft EIR following the implementation of Senate Bill 743, which designated “vehicle miles traveled” as the method for assessing transportation impacts on the environment for CEQA projects. Refer to the *Los Angeles Aerial Rapid Transit Project Non-CEQA Transportation Assessment*, which found that there could be localized increases in traffic at the intersections closest to the proposed Project’s Alameda Station and Chinatown/State Park Station due to some riders choosing to park and ride or take Uber/Lyft and recommended the proposed Project work with Metro to identify a transit partnership for the proposed Project riders to further encourage them to take transit, walk, or bike to the proposed Project’s stations. Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines (“TAG”). Nevertheless, the Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the

proposed Project’s potential to effect parking conditions around the Alameda Station and Chinatown/State Park Station. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified.. Accordingly, because parking and congestion are not considered impacts under CEQA, no mitigation is required, as CEQA Guidelines Section 15126.4 only requires mitigation for significant impacts. Nevertheless, refer to the proposed Project’s Preliminary Parking Management Plan.³²

Comment GO17-116 8. UCLA Mobility Lab – October 24, 2022 Study

A study using current modeling techniques recently completed by two UCLA researchers found that the gondola system could slightly reduce traffic on major roads around Dodger Stadium on the night of a sold-out baseball game, but that impact would likely be very limited. The study found that the gondola would likely take only around 608 cars off the road and that minor change would be unlikely to significantly reduce greenhouse gas emissions and traffic overall.

Response GO17-116 Refer to Response GO17-177 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-117 Other findings of the UCLA Mobility Lab Study are as follows:

a) Contrary to the Draft EIR, the gondola system would not significantly reduce traffic or greenhouse gas emissions around Dodger Stadium.

Response GO17-117 Refer to Response GO17-178 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-118 b) The gondola system would carry fewer passengers than the Draft EIR claims. About 4,690 passengers would take public transportation on game days. Of these, the model predicted 2,500 would use the Dodger Stadium Express buses, meaning that only 2,190 new passengers would take the gondola system. Doubling the number of buses would more than accommodate passengers that could be expected to ride the gondola.

Response GO17-118 Refer to Response GO17-179 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-119 c) Fewer people would take the gondola after the game resulting in more traffic and emissions. The model disclosed about 2,500 passengers switching from the free Dodger Stadium Express buses to the gondola to the stadium, and about 1,000 fans switched back to the shuttle buses after the game. Only about 1,380 fans were

³² Fehr & Peers. 2023. Los Angeles Aerial Rapid Transit Project, Parking Management Implementation Plan.

forecast to use the gondola after the game as they would have to wait in long lines to use the gondola.

Response GO17-119 Refer to Response GO17-180 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-120 d) Very few people were predicted to use the gondola for transportation other than getting to or from the games. Only 60 people, about one gondola carload, were forecast to travel to Dodger Stadium during the day, and only about 140 passengers would travel from Dodger Stadium to Chinatown or Union Station during the day.

Response GO17-120 Refer to Response GO17-181 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-121 9. Shuttle Buses and the Coachella Festival Illustrate Better Alternatives Are Feasible.

Many large destination venues choose to use shuttle buses because of the flexibility of expanding or contracting according to need. The fixed catenary system is limited both as to capacity and to location. As City Transportation Engineer for the City of Indio for 15 years, Tom Brohard was deeply involved in getting patrons to and from the Coachella Festival over two weekends in April each year. Shuttle buses from across California and adjoining states were contracted to travel various pre-planned routes throughout the Coachella Valley to and from the festival grounds each of the three days. Coachella successfully used shuttle busses to transport one-third of 250,000 festival attendees—with pre-planned routes and dedicated lanes on festival days—such a public system could also be developed for Dodger stadium games and events.

The successful transportation program developed by the festival promoter, Goldenvoice, split the attendees into three separate but approximately equal groups. These included those who arrived the day before and camped at the site until the day after the festival ended, those who commuted daily to and from the site using Uber/Lyft/taxi, and those who rode Festival provided shuttle buses from hotels to and from the venue each day.

About one-third of the 250,000 daily festival attendees used the shuttle buses, with separated priority lanes on City streets for the shuttle buses near the festival site leading to a designated area within the festival site for shuttle bus loading and unloading. This system involved rapid turnover within the Festival shuttle bus lot with buses quickly filling empty bus parking stalls, loading/unloading passengers, and departing.

Response GO17-121 Refer to Response GO17-182 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how improving the connection between LAUS and Dodger Stadium via the proposed Project would

provide the quickest, most frequent, and highest capacity transit connection for the greatest number of riders traveling to Dodger Stadium to have the most travel time competitive transit trips from more locations in the region, especially when compared to alternatives providing a bus service from other locations. The comment states that the fixed catenary system is limited as to capacity and to location but that shuttle buses have the flexibility to expand or contract according to need. The proposed Project has the flexibility to expand or contract capacity according to need by adding or removing cabins from the system. While true that it is limited in regards to location, so are the locations of the primary destinations (Dodger Stadium and Elysian Park) which the proposed Project is intended to serve.

Comment GO17-122 10. Summary and Conclusion

When it was evaluated over 30 years ago, the gondola finished last in comparison with five other transportation alternatives to serve Dodger Stadium. Such a comparison today ends up with similar results.

Response GO17-122 Refer to Response GO17-183 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates

Comment GO17-123 The proposed Gondola is better suited for sightseeing rather than being an effective transportation measure to move large volumes of people in short periods of time. Shuttle buses together with Uber/Lyft/taxi services now serve Dodger Stadium well at a fraction of the cost. An expansion of the shuttle bus operation between Dodger Stadium Express in lieu of the proposed gondola system would efficiently meet the demand to transport people in a cost-effective manner on game days and on special event days.

Response GO17-123 Refer to Response GO17-184 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-124 The omissions and errors summarized and detailed throughout this letter require that each of these issues and items be reanalyzed and reevaluated through additional study before the Proposed Project is considered further by Metro.

Response GO17-124 Refer to Response GO17-185 in Enclosure 5 to Letter GO17 from Tom Brohard and Associates.

Comment GO17-125 F. Impact 3.13: Noise and Groundbourne Vibration Impacts Will Be Significant and Must Be Further Mitigated.

1. Construction Noise is Identified as Significant and Unavoidable.

The EIR identifies the fact that construction equipment noise impacts on sensitive receptors will be significant and unavoidable. (EIR, p. 3.13-31). Such impacts can be avoided by disapproving the Project.

It is not sufficient for purposes of CEQA that the DEIR merely acknowledge the significant impacts. Rather, the DEIR must propose meaningful mitigation measures and alternatives that would avoid or reduce the impact as much as possible.

The construction of noise barriers is one mitigation measure that should be considered and incorporated as appropriate. Other possible noise abatement measures include traffic management measures, creating buffer zones, planting vegetation, and installing noise insulation in buildings.

Insulating buildings can greatly reduce construction noise, especially when windows are sealed and cracks and other openings are filled. Such measures must be adopted to reduce impacts on adjacent buildings.

Response GO17-125 Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction noise impacts from the proposed Project. As detailed therein, on-site construction related noise impacts would be significant and unavoidable even with implementation of mitigation, and off-site construction traffic noise impacts would be less than significant during all phase of construction of the proposed Project. Consistent with CEQA Guidelines Section 15162.4, the Draft EIR considered and imposed all feasible mitigation, and CEQA does not require the discussion of ineffective or infeasible mitigation measures. Mitigation Measure NOI-A would be implemented during construction of the proposed Project, requiring a Construction Noise Management Plan to minimize construction-related noise impacts to off-site noise-sensitive receptors, which would include noise barriers, maintenance of equipment, avoidance of unnecessary equipment idling, the use of electrical equipment where practicable, and locating equipment away from noise-sensitive receptors to the extent feasible. Noise barriers were designed and placed in collaboration with the construction contractor based on the location of noise producing equipment in relation to the sensitive receptors, as well as the physical constraints of the proposed Project site and the proposed Project phase. Details on the noise barriers at each location of the proposed Project stations, towers, and junction are provided on pages 3.13-68 to 3.13-71 in Section 3.13, Noise, of the Draft EIR, with noise barriers ranging in height from eight to 24 feet tall. No other feasible mitigation is available to further reduce construction noise. Although trees and vegetation can contribute to noise reduction, the effectiveness of tree barriers vary based on the density and width of vegetation. Reductions of 6 to 10 dB can be achieved where a dense belt of trees combined with shrubs are 15 and 30 meters wide (approximately 50 to 98 feet wide) and reductions of 5 to 10 dB can be achieved with a dense belt of trees only (with no shrubs providing ground cover) between 15 and 30 meters wide (approximately 50 to 98 feet wide).³³ There is insufficient space along the proposed Project alignment to provide up to 98 feet of vegetation serving as a buffer between proposed Project construction and sensitive

³³ Dobson, Martin & Jo Ryan. 2000. Trees & Shrubs for Noise Control. Available at: <https://www.trees.org.uk/Trees.org.uk/files/8c/8c69f212-a82e-424b-96d1-c8ff6dc02403.pdf>. Accessed March 2023.

receptors. The proposed temporary noise barriers would provide similar and, in some cases, greater reductions in construction noise as dense vegetation and noise barriers would require less space. In addition, construction noise impacts would be temporary, and the noise created by the planting of such vegetative buffers would likely result in similar noise levels as proposed Project construction. Therefore, the use of vegetative buffers is not feasible. With respect to building insulation, typical building constructions/systems (in warm climate) provide a noise reduction of 12 dBA with windows open and up to 24 dBA for building constructions/systems with windows closed.³⁴ Therefore, existing buildings provide exterior-to-interior noise attenuation that is not accounted for in the analysis of noise impacts in the Draft EIR. Potential upgrades to building insulation or windows are generally only considered as potential noise mitigation where a project results in significant operational noise impacts because the installation of building upgrades would result in additional construction. This additional construction could result in even greater impacts to sensitive receptors due to the use of equipment and construction activity within currently occupied dwelling units. Proposed project operations would not result in significant noise impacts and the secondary impacts resulting from installation of building insulation upgrades would outweigh any benefit to reducing construction noise impacts. Therefore, insulating existing buildings to reduce construction noise impacts is not a feasible mitigation strategy.

Comment GO17-126 2. Groundborne Vibration Impacts Will be Significant.

The DEIR states that groundborne vibration impacts are significant and unavoidable. (EIR, p. 3.13-62.)

The EIR proposes to require non-vibrating equipment or hand tools if operations occur within 26 feet of the Avila Adobe, El Grito Mural, or The Old Winery structure. (EIR, p. 3.13-73) There is no showing these measures are feasible or would effectively reduce the vibration impacts.

The DEIR thus fails to propose effective mitigation measures for noise and vibration impacts.

Metro must seek to approve a Statement of Overriding Considerations to accept these impacts but cannot do so when there are feasible mitigation measures that have not been adopted and an environmentally superior alternative (enhanced Dodger Express Buses) that is feasible.

³⁴ United States Environmental Protection Agency (USEPA/EPA). 1974. Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety. Available at: <https://nepis.epa.gov/Exe/ZyNET.exe/2000L3LN.TXT?ZyActionD=ZyDocument&Client=EPA&Index=Prior+to+1976&Docs=&Query=&Time=&EndTime=&SearchMethod=1&TocRestrict=n&Toc=&TocEntry=&QField=&QFieldYear=&QFieldMonth=&QFieldDay=&IntQFieldOp=0&ExtQFieldOp=0&XmlQuery=&File=D%3A%5Czyfiles%5CIndex%20Data%5C70thru75%5Ctxt%5C00000001%5C2000L3LN.txt&User=ANONYMOUS&Password=anonymous&SortMethod=h%7C-&MaximumDocuments=1&FuzzyDegree=0&ImageQuality=r75g8/r75g8/x150y150g16/i425&Display=hpfr&DefSeekPage=x&SearchBack=ZyActionL&Back=ZyActionS&BackDesc=Results%20page&MaximumPages=1&ZyEntry=1&SeekPage=x&ZyPURL>. Accessed August 2023. The noise reduction for building in warm climate was selected as a conservative analysis, as the noise reduction for building for cold climate is higher, i.e., 12 dBA for warm climate and 17 dBA for cold climate.

Response GO17-126 Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the vibration impacts from construction of the proposed Project. Potential vibration impacts resulting from the proposed Project are associated only with construction of the proposed Project; no vibration impacts were identified for operation of the proposed Project. Vibration impacts associated with construction of the proposed Project were analyzed in the Draft EIR both for building damage and human annoyance. CEQA only requires the discussion of mitigation measures that the lead agency determines are feasible and would be effective. The use of non-vibrating equipment or hand tools for construction operations within 26 feet of Avila Adobe, *El Grito* mural wall, and The Old Winery was determined to be feasible and effective in consultation with the Project's construction contractor. For instance, instead of using vibratory rollers the Project's construction contractor could use hand tampers. As explained in detail at pages 3.13-72 to 3.13-73 of Section 3.13, Noise, of the Draft EIR, Mitigation Measure VIB-A requires placement of vibration monitoring equipment approximately 26 feet away from Avila Adobe, *El Grito* mural wall, and The Old Winery by a qualified professional for real-time vibration monitoring for construction work at Alameda Station requiring heavy equipment or ground compaction devices, and this equipment would notify the construction crew if vibration levels are within 0.1 PPV, in/sec, of the vibration damage threshold so that the construction crew could modify the construction equipment to ensure that the vibration damage threshold is not exceeded. Mitigation Measure VIB-B requires that, for construction work occurring at Alameda Station, at a distance of 26 feet or more from the Avila Adobe, *El Grito* Mural and the Old Winery, any ground compacting equipment, including vibratory rollers and plate compactors, shall be calibrated onsite prior to use to ensure vibration levels remain below the assumed reference level of 0.21 PPV, in/sec, at 25 feet and, if the ground compacting equipment cannot achieve the assumed reference level, equipment with less than 0.21 PPV, in/sec, at 25 feet, non-vibrating equipment, or hand tools, would be required for ground compaction activities. In addition, any ground compaction or excavation/drilling operations within 26 feet of Avila Adobe, *El Grito* Mural or The Old Winery structures must be completed with non-vibrating equipment or hand tools. Refer to Appendix M, Noise and Vibration Technical Report, of the Draft EIR, Tables 6-11 and 6-12, for technical assessment of the impact thresholds for Avila Adobe, *El Grito* Mural, and The Old Winery structures and demonstration of the effectiveness of Mitigation Measures VIB-A and VIB-B. With implementation of Mitigation Measures VIB-A and VIB-B during construction of Alameda Station, vibration damage impacts at the Avila Adobe, the Old Winery, and *El Grito* Mural, would be less than significant.

Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to

meet most of the Project Objectives, which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Refer to Response GO17-132 for discussion of how the proposed Project adopted feasible mitigation measures to minimize construction noise to the maximum extent feasible. No additional feasible mitigation measures are required, and this comment does not raise any feasible mitigation measures that are considerably different from those already analyzed in the Draft EIR.

Comment GO17-127 With regard to noise, Homeboy Industries is identified as NSR-7 in your analysis. Projected noise levels would be 80.3 dBA during construction, 10.5 dBA higher than current ambient noise levels. The EIR notes that even 75 dBA is “clearly unacceptable,” even for office use, and that 65 dBA is “normally unacceptable” (page 3.13-48).

Response GO17-127 This comment provides a general characterization of construction noise at NSR 7 (Homeboy Industries), as shown on page 3.13-36 of the Draft EIR. The identified noise level of 80.3 dBA is associated with the foundations and columns phase for construction of the Alpine Tower. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of noise and vibration impacts during construction of the proposed Project. Based on the L.A. CEQA Thresholds Analysis, NSR 7 (Homeboy Industries) would experience a temporary, significant noise impact during construction activities of the Alpine Tower, the duration of which is discussed in Appendix B, Construction Assumptions, of the Draft EIR. As described in Section 3.13, Noise, of the Draft EIR, based on the FTA Manual the construction activities of the Alpine Tower would not result in significant noise impacts at NSR 7 (Homeboy Industries). As discussed in Section 3.13, Noise, of the Draft EIR, for the entire duration of construction, the proposed Project shall provide an 8-foot temporary noise barrier between the construction site and NSR 7 (Homeboy Industries). With the implementation of Mitigation Measure NOI-A, the L.A. CEQA Thresholds Analysis construction noise impact during the Vertical Circulation, Hardscape, Landscape, and Interior Work phase at NSR 7 (Homeboy Industries), would be reduced to less than significant. Implementation of Mitigation Measure NOI-A would be required to reduce the L.A. CEQA Thresholds Analysis impacts at NSR 7 (Homeboy Industries), however, the L.A. CEQA Thresholds Analysis noise impacts at NSR 7 would remain significant and unavoidable during the foundations and columns and structural steel and gondola equipment erection construction phases.

Comment GO17-128 In the analyses of potential vibration impacts, Homeboy is VSR-11, but is not called out as a Measurement Location. Therefore, no specific information about the impacts of drilling (or driving) 120-foot deep (sic) piles is provided. Nonetheless, the DEIR concludes that Homeboy would experience significant “annoyance” from vibration,

even with mitigation, during construction (EIR, page 3.13-63). TCE, whose property is less than 100 feet from the proposed Alameda triangle tower, would also be affected by noise and vibration but is not even identified in the table of sensitive receptors. (EIR, p. 3.13-20.) The Alameda Triangle parcel would be less than 100 feet from TCE's compound but TCE is not recognized at all. This omission must be rectified. Calling such significant impacts mere "annoyance" impacts understates the severity of such impacts. A more detailed and site-specific analysis of the vibration impact on these buildings and operations is required.

Response GO17-128 As discussed in Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, and as shown in Tables 3.13-11 and 3.13-27, Homeboy Industries and The California Endowment are identified as noise and vibration sensitive receptors. Specifically, for the noise analysis, as shown in Table 3.12-11, Homeboy Industries is identified as NSR 7 and The California Endowment is identified as NSR 4. For the vibration analysis, as shown in Table 3.13-27, Homeboy Industries is identified as VSR 11 and The California Endowment is identified as VSR 7.

As noted on page 71 of Appendix M of the Draft EIR, "A construction vibration impact analysis was conducted for those vibration-sensitive receptors (VSRs) that were located within approximately 200 feet of each Project component site. This distance was chosen because vibration attenuates with distance and, at 200 feet, vibration levels for the highest vibration producing equipment for construction of the proposed Project (vibratory rollers) would be less than the most restrictive vibration level (0.12 in/sec PPV) and, therefore, the Project would not impact VSRs beyond 200 feet." As discussed on page 3.13-27 of the Draft EIR, "ground-borne vibration impacts due to the proposed Project's construction activities were evaluated for both on-site and off-site construction activities by identifying potential vibration sources (i.e., construction equipment), estimating the vibration levels at the potentially affected receptor, and comparing the proposed Project's activities to the applicable vibration significance thresholds. Construction-related vibration is assessed using two different metrics: 1) to assess potential structural damage from vibration and; 2) to assess human annoyance from vibration." As discussed on page 5 of Appendix M of the Draft EIR, "Ground-borne vibration levels rarely affect human health. Instead, most people consider ground-borne vibration to be an annoyance that can affect concentration or disturb sleep." As noted on pages 3.13-13 to 3.13-15 of the Draft EIR, the evaluation of vibration impacts relied on the Federal Transit Administration (FTA) guidelines to establish the threshold of significance for building damage and human annoyance from vibration. The FTA guidelines' vibration criteria for building damage are listed in Table 3.13-8 of the Draft EIR. The FTA guidelines' vibration criteria for human annoyance are listed in Table 3.13-6 of the Draft EIR. As discussed in Section 3.13, Noise, of the Draft EIR, the noise-sensitive receptors (NSRs) identified in Table 3.13-11 at various measurement locations represent existing noise conditions in a variety of locations throughout the Project area. Unlike the existing ambient noise

conditions used for the noise analysis, existing vibration levels are not typically considered in the assessment of project vibration impacts, so existing vibration levels were not measured for the proposed Project, as discussed at 3.13.3.3, Existing Vibration Conditions in Section 3.13, Noise, of the Draft EIR.

The California Endowment is recognized as a vibratory sensitive receptor (VSR 7) in Figure 3.13-27 of the Draft EIR. Additionally, the potential vibratory effects that would be experienced at VSR 7 during construction of the Alameda Tower are shown on Table 3.13-28. Specifically, VSR 7 would experience vibration at 0.06 PPV in/sec (83 VdB) during excavation work and street work associated with construction of the Alameda Tower. This would exceed the threshold for human annoyance, but not building damage. Homeboy Industries is recognized as a vibratory sensitive receptor (VSR 11) in Figure 3.13-27 of the Draft EIR. Additionally, the potential vibratory effects that would be experienced at Homeboy Industries during construction of the Alpine Tower are shown on Table 3.13-28. Specifically, VSR 11 would experience vibration at 0.16 PPV in/sec (92 VdB) during construction of the Alameda Tower. This would exceed the threshold for human annoyance, but not building damage.

The Draft EIR included a complete analysis of vibration impacts for Homeboy Industries (VSR 11) and The California Endowment (VSR 7) as required by CEQA.

Comment GO17-129 3. Effects of Noise Pollution on Health Are Extensive.

“[T]hrough CEQA, the public has a statutorily protected interest in quieter noise environments.” (Berkeley Keep Jets Over the Bay Committee v. Board of Port Com’rs (2001) 91 Cal.App.4th 1344, 1380.) Despite this clear mandate to analyze noise impacts, the DEIR omits a discussion of the extensive health impacts of noise exposure, as required by CEQA (Cf. Sierra Club v. County of Fresno (2018) 6 Cal.5th 502, 521).

Excess noise pollution can cause hearing damage and loss. Loud noise, either experienced as a single event or continuously over time, can damage cells in the inner ear that detect sound and help transmit information on sound to the brain. (https://www.cdc.gov/nceh/hearing_loss/how_does_loud_noise_cause_hearing_loss.html, incorporated by reference.) Damage to these receptor cells is permanent and cannot be repaired. (Ibid.) Such damage can make it difficult to hear, including causing difficulties in understanding speech. (Ibid.)

Sound level is measured in dBA. (<https://www.nonoise.org/library/suter/suter.htm#physical>, incorporated by reference.) In 1974 the EPA recommended that the equivalent A-weighted sound level over 24 hours ($L_{eq(24)}$) be no greater than 70 dBA to ensure an adequate margin of safety to prevent hearing loss and damage. (<https://nonoise.org/library/levels74/levels74.htm>, incorporated by reference.) To prevent interference with activities and annoyance, the EPA recommended a day-

night average sound level no greater than 45 dBA for indoors and 55 dBA for outdoors.

The DEIR must relate these health impacts of excessive noise exposure to the Project's significant noise impacts.

Response G017-129 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. The comment raises concerns with the effect of noise exposure on health with a focus on hearing loss and hearing damage. Los Angeles Municipal Code (LAMC) Noise Regulation Section 111.00 provides that “[i]t is hereby declared to be the policy of the City to prohibit unnecessary, excessive and annoying noises from all sources subject to its police power. At certain levels noises are detrimental to the health and welfare of the citizenry and in the public interests shall be systematically proscribed.” Consistent with the understanding that noise can be detrimental to health and welfare, the Draft EIR addressed noise in Section 3.13, Noise, with supporting data provided in Appendix M, Noise and Vibration Technical Report, of the Draft EIR. An analysis of noise impacts consistent with the Los Angeles Municipal Code (“LAMC”) Noise Regulation was addressed on pages 3.13-49 to 3.12-50 for construction related impacts and on pages 3.13-53 to 3.13-56 for operational related impacts. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation. Operational noise impacts would be less than significant at all receptor locations. Refer to Response G017-130 for an additional discussion of compliance with the LAMC Noise Regulations.

In addition to the LAMC Noise Regulation, the Occupational Safety and Health Administration (OSHA), the State's Division of Occupational Safety and Health (also known as Cal/OSHA), and Environmental Protection Agency (EPA) have adopted regulations regarding noise exposure to address health impacts from noise including hearing loss and hearing damage. Specifically, OSHA and Cal/OSHA have adopted regulations designed to protect workers against the effects of occupational noise exposure. The OSHA and Cal/OSHA regulations limit the permissible noise exposure to an average of 90 dBA (L_{eq}) over an 8-hour period.³⁵ In addition, the Environmental Protection Agency (EPA) has identified a 24-hour average exposure level of 70 dBA for environmental noise (i.e., general outdoor noise sources, including; transportation, construction, mechanical, people) to protect potential hearing loss. This EPA-recommended noise level includes a margin of safety and is based on steady noise exposure of 24 hours per day over a period of 40 years.³⁶ While not specific to

³⁵ Occupational Safety and Health Administration (OSHA). 2008. Standard 1910.95 Occupational Noise Exposure. Available at: <https://www.osha.gov/laws-regs/regulations/standardnumber/1910/1910.95>. Accessed August 2023. See Occupational Safety and Health Administration (OSHA). Standard 5096 Exposure Limits for Noise. Available at: <https://www.dir.ca.gov/title8/5096.html>. Accessed August 2023.

³⁶ United States Environmental Protection Agency (USEPA/EPA). 1981. Noise Effects Handbook: A Desk Reference to Health and Welfare Effects of Noise. Available at: <https://nepis.epa.gov/Exe/ZyNET.exe/91000OAJ.TXT?ZyActionD=ZyDocument&Client=EPA&Index=1981+Thru+1985&Docs=&Query=&Time=&EndTime=&SearchMethod=1&TocRestrict=n&Toc=&TocEntry=&QField=&QFieldYear=&QFieldMonth=&QFieldDay=&IntQFieldOp=0&ExtQFI>

hearing damage or hearing loss, in 1974, the EPA also recommended a day-night average sound level (L_{dn}) of no greater than 45 dBA for indoors and 55 dBA for outdoors, to prevent interference with activities and annoyance.³⁷ This day-night average recommendation is generally applied to impacts from operations and not construction.

During construction, as provided in Table 3.13-17 in Section 3.13, Noise, of the Draft EIR, the estimated noise levels associated with the proposed Project's construction activities with implementation of Mitigation Measure NOI-A would be below 90 dBA at all off-site noise sensitive receptors, except for receptors NSR-2 (El Pueblo) and NSR-3 (Mozaic Apartments upper levels). The estimated noise levels at receptors NSR-2 and NSR 3-would be up to 91.8 dBA due to construction activities at Alameda Station, which would exceed the OSHA and Cal/OSHA noise exposure limit if construction activities were to occur at this level for a continuous 8 hours. However, it is not anticipated that noise from construction of the proposed Project would exceed the OSHA and Cal/OSHA noise exposure limit for a continuous 8 hours. As discussed on page 3.13-32 in Section 3.13, Noise, of the Draft EIR, for each construction phase, the worst-case simultaneous equipment mix was analyzed to evaluate the peak-noise levels. It is not anticipated that the peak-noise level would occur for a continuous 8-hour period. Therefore, over an 8-hour period it is not anticipated that the average noise level would exceed 90 dBA (L_{eq}) at any noise sensitive receptors. In addition, it is not anticipated that any individual would be located at a noise sensitive receptor for a continuous 8-hour period during construction activities. NSR-2 (El Pueblo) is located at the perimeter of El Pueblo closest to construction activities. NSR-3 (Mozaic Apartments upper levels) is located on the balcony of the apartment building. It is not anticipated that an individual would be at the perimeter of El Pueblo or outside on the apartment balcony for 8 continuous hours during construction activities. Per EPA, typical building constructions / systems (in warm climate) provide a noise reduction of 12 dBA with windows open and up to 24 dBA for building constructions / systems with windows closed.³⁸ Therefore, with

Accessed August 2023.</p>
</div>
<div data-bbox=)

the standard noise reduction from buildings, the noise level within the interior of NSR-3 would not exceed 90 dBA (L_{eq}).

As provided in Table 3.13-17 of the Draft EIR, the proposed Project's construction noise levels would be higher than the EPA 70 dBA long-term (24 hours per day for 40 years) noise exposure limit for some of the receptor locations. However, construction activities would not extend over a 24-hour period for 40 years. Instead, as discussed in Section 2.8, Construction, and Appendix B, Construction Assumptions, of the Draft EIR, construction activities are anticipated to occur over an approximately 8-hour workday for 25 months. Refer to Table 2-4, Proposed Project Construction Details, for discussion of the duration of construction for each component of the proposed Project. In addition, construction noise when averaged over a 24-hour period would be approximately 4.8 dBA lower than the levels shown in Table 3.13-17 of the Draft EIR. Therefore, people in the vicinity of the proposed Project would not be exposed to the construction noise levels for the long-term period provided in the EPA guidelines.

Therefore, based on the above, people in the vicinity of the proposed Project site would not be exposed to construction noise levels, which would exceed the OSHA, Cal/OSHA and EPA guidelines.

As provided in Table 3.13-26 of the Draft EIR, the cumulative operational noise impacts associated with noise from stations, towers, queuing, and cabins would result in less than significant impacts. Provided in Table 1 below are daytime composite noise levels developed based on Table 3.13-23, LAMC Operational Noise Impact Analysis, and Table 3.13-25, Proposed Gondola Cabin Noise, from Section 3.13, Noise, of the Draft EIR. The subset of Noise Sensitive Receptors provided below were conservatively selected as those most likely to be impacted by the cabins either because of the distance from the Noise Sensitive Receptors to the cabin or the existing nighttime noise levels. Impacts at all other Noise Sensitive Receptors would be less than those provided in Table 1 below. As provided in Table 1, the composite noise levels associated with operations of the proposed Project would range from 44.6 dBA at NSR-7 to 59.4 dBA at NSR-3. Importantly, these noise levels are all below the existing ambient noise levels which range from 56.1 dBA to 69.8 dBA. These noise levels are below the OSHA and Cal/OSHA regulation limiting noise exposure to an average of 90 dBA (L_{eq}) over an 8-hour period. The noise levels are also below the EPA 24-hour average noise exposure level of 70 dBA.

tionL&Back=ZyActionS&BackDesc=Results%20page&MaximumPages=1&ZyEntry=1&SeekPage=x&ZyPURL. Accessed August 2023. The noise reduction for a building in a warm climate was selected as a conservative analysis, as the noise reduction for a building in a cold climate is higher, i.e., 12 dB for warm climate and 17 dB for cold climate.

Table 1 – Daytime Estimated Gondola Noise Levels at the Interior of Off-Site Noise Sensitive Receptors

Noise Sensitive Receptor ^a	Daytime Ambient Noise Levels, ^b dBA L _{eq} A	Daytime Gondola System Operation Noise Levels, ^c dBA L _{eq} B	Gondola Cabin Noise Levels, ^d dBA L _{eq} C	Composite Daytime Noise Levels, ^e dBA L _{eq} D=B+C
NSR-3	69.0	41.2	59.3	59.4
NSR-5	65.6	33.9	50.2	50.3
NSR-6	69.0	36.6	45.2	45.8
NSR-7	69.8	33.1	44.3	44.6
NSR-8	64.7	43.4	57.8	58.0
NSR-9	61.1	29.0	49.1	49.1
NSR-13S	67.7	30.7	45.9	46.0
NSR-14S	58.7	33.1	54.5	54.5
NSR-17N	56.1	41.2	55.1	55.3

Notes:

^a The NSRs included in this evaluation were conservatively selected as those most likely to be impacted by the cabins either because of the distance from the NSR to the cabin or the existing nighttime noise levels. Impacts at all other NSRs would be less than those analyzed here.

^b Source: Draft EIR Table 3.13-11

^c Source: Draft EIR Table 3.13-23, daytime operation.

^d Source: Draft EIR Table 3.13-25

^e Estimated noise levels due to proposed Project operation only and do not include existing ambient noise levels.

As provided in Table 3.12-22 of the Draft EIR, the estimated noise levels from the proposed Project in terms of CNEL ranged from 41.6 CNEL at receptor NSR-18 to 63.1 CNEL at receptor NSR-3. It should be noted that the day-night average sound level (L_{dn}) is a 24-hour average sound level, similar to the CNEL 24-hour average sound level.³⁹ Although, the proposed Project noise levels would be higher than the EPA recommended 55 dBA (L_{dn}) to prevent interference with activities and annoyance for outdoors, the proposed Project noise levels are well below the existing ambient noise levels, i.e., 59.6 CNEL at receptor NSR-18 and 72.7 CNEL at receptor NSR-3. Because the noise levels are below existing ambient, noise from proposed Project operations would not result in measurable noise increases for indoors or outdoors. As such, the proposed Project would not result in a significant impact when compared to the EPA recommended exterior and interior noise limits to prevent interference with activities and annoyance.

Refer to Response G017-130 for discussion of how a single event noise analysis was conducted for the proposed Project.

³⁹ Day-night average sound level (L_{dn}) is a 24-hour average noise levels with a +10 dBA adjustment for nighttime (between 10pm and 7am) noise levels. It is similar to the CNEL 24-hour average sound level, but without the +5 dB adjustment for the evening hours (between 7pm and 10pm). Generally, L_{dn} levels are within 1 dBA of CNEL levels.

Comment GO17-130 4. The DEIR Must Evaluate Sleep Disturbance.

Excessive sound level can have a profound health impact by disturbing sleep. Sleep disturbance is considered “the most deleterious non-auditory effect of environmental noise exposure . . . because undisturbed sleep of a sufficient length is needed for daytime alertness and performance, quality of life, and health.” (Basner et al., Auditory and Non-Auditory Effects of Noise on Health (2014) 383 Lancet 1325, 1329.) Repeated sleep disturbance can change sleep structure, including “delayed sleep onset and early awakenings, reduced deep (slow-wave) and rapid eye movement sleep, and an increase in time spent awake and in superficial sleep stages.” (Id. At 1330.) The short-term effects of sleep disturbance include “impaired mood, subjectively and objectively increased daytime sleepiness, and impaired cognitive performance.” (Ibid.) Exposure to noise during sleep “may increase blood pressure, heart rate, and finger pulse amplitude as well as body movements.” (Stansfeld and Matheson, Noise Pollution: Non-Auditory Effects on Health (2003) 68 Brit. Med. Bull. 243, 244.) In 1974, the EPA observed that a nighttime portion of a day-night average sound level of approximately 32 dB should protect against sleep interference. (<https://nonoise.org/library/levels74/levels74.htm>, p. 28.)

Despite the potential for these harmful impacts, the DEIR fails to sufficiently analyze sleep disturbance and disclose the Project’s risks of sleep disturbance to the public and decisionmakers. The DEIR is required to analyze and disclose “the nature and the magnitude” of the Project’s potential impact on sleep disturbance and must connect the potential health impacts of sleep disturbance to the noise impacts from the Project. (Friant Ranch, supra, 6 Cal.5th 502, 519–21.) The Project will be running for sporting events that will run as late as midnight or later, and with spectators filing out afterwards, may not clear out until much later. The DEIR provides no analysis of single event nighttime noise levels to evaluate these impacts. (Berkeley Keep Jets, supra, 91 Cal.App.4th 1344, 1372-82 [EIR that failed to study impacts of single event noise levels was inadequate].)

Response GO17-130 This comment provides a general recitation and characterization of CEQA case law. The comment raises concerns that the proposed Project would result in sleep disturbance. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction and operational noise impacts from the proposed Project. As detailed therein, construction related noise impacts would be significant and unavoidable even with implementation of mitigation. However, as discussed on page 2-51 in Section 2.0, Project Description, of the Draft EIR, construction activities would be limited to daytime hours, pursuant to the Los Angeles Municipal Code. Therefore, the proposed Project would not result in nighttime construction impacts and therefore construction of the proposed Project would not result in nighttime sleep disturbance. Regarding operations of the proposed Project, as shown in Table 3.13-26 on page 3.13-58 in Section 3.13, Noise and Vibration, of the Draft EIR, operational noise impacts of the proposed Project

would be less than significant and, as detailed in Tables 3.13-23 and 3.13-25, the operational noise analysis included an analysis that evaluated nighttime noise levels.

The proposed Project would operate with less than significant impacts from operational noise and would typically not be in operation from 12:00 am to 6:00 a.m. Nevertheless, a sleep disturbance analysis including a single event noise analysis (SEL) related to operations of the proposed Project was performed for the Final EIR in response to the comment and is described in further detail below.

The comment also includes a reference to a 1974 EPA document, which indicated that limiting the nighttime noise level to approximately 32 dB, should in most cases, protect against sleep interference. However, the EPA updated its noise levels for sleep disturbance in a 1981 EPA document, which specifies levels for two components of sleep, falling asleep and awakening.⁴⁰ As provided in that more recent document, noise levels of 40 to 50 dBA could result in difficulty in falling asleep for some people, and noise levels of 70 dBA or higher would likely result in awakening.⁴¹ The analysis of potential sleep disturbance provided below is based on the more recent 1981 EPA document.

Per EPA, typical building constructions / systems (in warm climates) provide a noise reduction of 12 dBA with windows open and up to 24 dBA for building constructions / systems with windows closed.⁴² Therefore, potential sleep disturbance associated with falling asleep could occur if the exterior noise levels exceed 52 dBA (with windows open) and 64 dBA (with windows closed), based on the conservative EPA lower range of 40 dBA.

As provided in Table 3.13-26, included in Section 3.13, Noise, of the Draft EIR, the cumulative operational noise impacts associated with noise from stations, towers, queuing, and cabins would result in less than significant impacts. Provided in Table 2 below are nighttime composite noise levels developed based on Table 3.13-23, LAMC Operational Noise Impact Analysis, and Table 3.13-25, Proposed Gondola Cabin Noise, included in Section 3.13. The subset of Noise Sensitive Receptors provided

<https://nepis.epa.gov/Exe/ZyNET.exe/2000L3LN.TXT?ZyActionD=ZyDocument&Client=EPA&Index=Prior+to+1976&Docs=&Query=&Time=&EndTime=&SearchMethod=1&TocRestrict=n&Toc=&TocEntry=&QField=&QFieldYear=&QFieldMonth=&QFieldDay=&IntQFieldOp=0&ExtQFieldOp=0&XmlQuery=&File=D%3A%5Czyfiles%5CIndex%20Data%5C70thru75%5CTxt%5C00000001%5C2000L3LN.txt&User=ANONYMOUS&Password=anonymous&SortMethod=h%7C-&MaximumDocuments=1&FuzzyDegree=0&ImageQuality=r75g8/r75g8/x150y150g16/i425&Display=hpfr&DefSeekPage=x&SearchBack=ZyActionL&Back=ZyActionS&BackDesc=Results%20page&MaximumPages=1&ZyEntry=1&SeekPage=x&ZyPURL>. Accessed August 2023. The noise reduction for building in warm climate was selected as a conservative analysis, as the noise reduction for building for cold climate is higher, i.e., 12 dB for warm climate and 17 dB for cold climate.

below were conservatively selected as those most likely to be impacted by the cabins either because of the distance from the Noise Sensitive Receptors to the cabin or the existing nighttime noise levels. Impacts at all other Noise Sensitive Receptors would be less than those provided in Table 2 below.

As provided in Table 2 below, the composite estimated noise levels at the interior of the off-site noise sensitive receptors would be below both the EPA lower range of 40 dBA noise level for falling asleep, as well as the 70 dBA noise level for awakening, with the windows closed. With the windows open, the estimated interior noise levels would be below the EPA lower range 40 dBA at all Noise Sensitive Receptors except NSR-3 (Mozaic Apartments) and NSR-8 (Future Residential Development), which would fall within the noise levels of 40 to 50 dBA, which the EPA has identified could result in difficulty in falling asleep for some people. However, as indicated in Table 2, the estimated noise levels at NSR-3 (Mozaic Apartments) and NSR-8 (Future Residential Development) would be well below the existing nighttime ambient noise levels. Therefore, the noise levels from the proposed Project would not result in any measurable noise increase at NSR-3 (Mozaic Apartments) and NSR-8 (Future Residential Development) and therefore it is not anticipated that the noise levels from the proposed Project would result in any sleep disturbance associated with falling asleep. Therefore, based on the EPA guidance, the proposed Project would have a less than significant impact on sleep disturbance.

Table 2 – Nighttime Estimated Gondola Noise Levels at the Interior of Off-Site Noise Sensitive Receptors

Noise Sensitive Receptor ^a	Nighttime Ambient Noise Levels ^b dBA L _{eq} A	Nighttime Gondola System Operation Noise Levels ^c dBA L _{eq} B	Gondola Cabin Noise Levels ^d dBA L _{eq} C	Composite Nighttime Noise Levels dBA L _{eq} D=B+C	Building Noise Reduction with Windows Open/Windows Closed dBA L _{eq} E	Estimated Noise Levels Inside the Building during Nighttime Hours with Windows Open/Windows Closed ^e dBA L _{eq} D-E
NSR-3	65.5	55.3	41.2	55.5	12.0/24.0	43.5/31.5
NSR-5	64.9	46.4	33.9	46.6	12.0/24.0	34.6/22.6
NSR-6	64.1	41.4	36.6	42.6	12.0/24.0	30.6/18.6
NSR-7	65.1	40.5	33.1	41.2	12.0/24.0	29.2/17.2
NSR-8	64.4	53.8	43.4	54.2	12.0/24.0	42.2/30.2
NSR-9	56.5	45.0	29.0	45.1	12.0/24.0	33.1/21.1
NSR-13S	63.6	41.7	30.7	42.0	12.0/24.0	30.0/18.0

Notes:

^a The NSRs included in this evaluation were conservatively selected as those most likely to be impacted by the cabins either because of the distance from the NSR to the cabin or the existing nighttime noise levels. Impacts at all other NSRs would be less than those analyzed here.

^b Source: Draft EIR Table 3.13-11

^c Source: Draft EIR Table 3.13-23, nighttime operation.

^d Source: Draft EIR Table 3.13-25

^e Estimated noise levels due to project operation only and do not include existing ambient noise levels.

In addition, and as discussed in Response GO17-129, a noise analysis was conducted to evaluate potential sleep disturbance using the Sound Exposure Level (SEL) acoustic metric, which evaluates single event noise levels. SEL represents the total acoustic energy of an individual noise event as if that event has occurred within a one-second time period. SEL captures both the level (magnitude) and the duration of a sound event in a single numerical quantity, by summing all the noise energy from an event into one second. For the proposed Project the SEL analysis is designed to address potential sleep disturbance due to individual cabins passing by. An SEL analysis with respect to potential sleep disturbance is mainly used for aviation related noise sources and there are currently no noise standards, or limits, to address gondola noise impacts on sleep (sleep disturbance) using SEL. Accordingly, the SEL noise threshold from the LAX South Airfield Improvement Project EIR (LAX EIR)⁴³ was used to evaluate potential sleep disturbance for the proposed Project. The LAX EIR provided that a noise impact would occur when an aircraft single event would produce levels at or above 81 dBA SEL inside a residence.⁴⁴ Table 3 below provides the estimated SEL at the interior of the off-site noise sensitive receptors due to a cabin passing, with windows open and closed. As indicated in Table 3, the maximum estimated SEL inside a noise sensitive use due to the cabin passing by would be 57.1 dBA (SEL) with window open and 45.1 dBA (SEL) with window closed at NSR-3 (Mozaic Apartments), which would be well below the 81 dBA (SEL) interior noise limits. Therefore, based on the SEL metric, noise from the proposed Project would have a less than significant impact on sleep disturbance.

Table 3 – Estimated Project SEL Noise Levels at the Interior of Off-Site Noise Sensitive Receptors

Noise Sensitive Receptor	Estimated Noise Levels Inside the Building with Windows Open/ Windows Closed, dBA (L _{eq})	Estimated SEL inside the building Due to Gondola Operation with Windows Open/ Windows Closed, ^a dBA (SEL)	Interior Noise Threshold for Sleep Disturbance, dBA (SEL)
NSR-3	43.5/31.5	57.1/45.1	81.0
NSR-5	34.6/22.6	48.3/36.3	81.0

⁴³ City of Los Angeles. 2005. South Airfield Improvement Project Project-Level Tiered Draft Environmental Impact Report (DEIR). Available at: <https://www.lawa.org/en/lawa-our-lax/environmental-documents/documents-certified/south-airfield-improvement-project>. Accessed August 2023.

⁴⁴ *Id.* at IV-154. LAX Project EIR, although the Berkeley Jets ruling directed that the significance of single event noise effects be addressed in an EIR for aviation related noise, the Court of Appeal noted that the CEQA Guidelines adopt site-sensitive thresholds of significance for noise, recognizing that “[a]n ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting.” (*Berkeley Keep Jets over the Bay Committee v. Bd. of Port Commissioners* (2001) 111 Cal.Rptr.2d 598, 625-626 [citation omitted]).

NSR-6	30.6/18.6	44.3/32.3	81.0
NSR-7	29.2/17.2	42.8/40.8	81.0
NSR-8	42.2/30.2	55.8/43.8	81.0
NSR-9	33.1/21.1	46.7/34.7	81.0
NSR-13S	30.0/18.0	43.6/31.6	81.0
NSR-14S	38.6/6.6	52.2/40.2	81.0
NSR-17N	39.3/27.3	52.9/40.9	81.0
Notes:			
^a SEL was calculated based on a 23-second cabin headway. ¹² $SEL = L_{eq} + 10 \cdot \log(\text{duration in seconds})$, for example, SEL at NSR 3 = $43.5 + 10 \cdot \log(23) = 57.1$.			

Comment GO17-131 5. The DEIR Fails to Disclose Conflicts with the Los Angeles Municipal Code Noise Regulations.

Section 111.00 of the Los Angeles Municipal Code states, “[i]t is hereby declared to be the policy of the City to prohibit unnecessary, excessive and annoying noises from all sources subject to its police power. At certain levels noises are detrimental to the health and welfare of the citizenry and in the public interests shall be systematically proscribed.” (Emphasis added.) Despite this strong policy, the Project will have significant impacts related to construction noise. If Metro were to approve the Project without mitigating these noise impacts, the Project would certainly run counter to this policy.

Response GO17-131 This comment provides a general recitation and characterization of the Los Angeles Municipal Code. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction and operational noise impacts from the proposed Project. As detailed therein, on-site construction related noise impacts would be significant and unavoidable even with implementation of mitigation, and off-site construction traffic noise impacts would be less than significant during all phase of construction of the proposed Project, operational noise impacts would be less than significant. Section 3.13 includes an analysis of the construction noise impacts using the LAMC Noise Regulations under LAMC Section 112.05 which establishes that a maximum allowable noise level for construction equipment within 500 feet of any residential zone is 75 dBA when measured at 50 feet from the noise source. As discussed on pages. 3.13-49 to 3.13-50 and 3.13.73 of the Draft EIR, under the LAMC analysis, with implementation of Mitigation Measure NOI-A, construction equipment would generate noise greater than 75 dBA at a distance of 50 feet resulting in significant and unavoidable impact for all construction phases. The noise levels generated at specific sensitive receptors by construction phase with mitigation measures are provided in Table 3.13-17. Refer to Section 2.0, Project Description, and Appendix B, Construction Assumptions, of the Draft EIR, for discussion of the duration of construction for each component of the proposed Project. Mitigation Measure NOI-A would be implemented during construction of the proposed Project, requiring a Construction Noise Management

Plan to minimize construction-related noise impacts to off-site noise-sensitive receptors, which would include noise barriers discussed in detail at Response G017-125. Section 3.13, Noise, of the Draft EIR, also includes an analysis of the operational noise impacts using the LAMC Noise Regulations as discussed on page 3.13-53, and Table 3.13-23 on page 3.13-55. As demonstrated on Table 3.13-23, under the LAMC analysis using the worst-case scenario, the proposed Project operations would not result in noise levels above the applicable LAMC thresholds, and impacts would be less than significant. Consistent with CEQA Guidelines section 15162.4, the Draft EIR considered and imposed all feasible mitigation, and CEQA does not require the discussion of ineffective or infeasible mitigation measures.

Comment G017-132 6. The DEIR Fails to Implement All Feasible Mitigation for Construction Impacts.

The DEIR is required to consider and adopt all feasible mitigation measures. (King & Gardiner Farms, LLC v. County of Kern (2020) 45 Cal.App.5th 814, 852, 866, 869.) The following mitigation measures must be considered:

- Locating or parking all stationary construction equipment as far from sensitive receptors as possible, and directing emitted noise away from sensitive receptors.
- Verifying that construction equipment has properly operating and maintained mufflers.
- Limiting operation hours to daytime hours on weekdays.
- Replacing gas- and diesel-powered equipment with electric equipment to reduce the noise impacts associated with operation of that equipment.

Response G017-132 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Section 3.13, Noise, and Appendix M, Noise and Vibration Technical Report, of the Draft EIR, for discussion of the construction noise impacts from the proposed Project. As discussed on page 2-51 in Section 2.0, Project Description, of the Draft EIR, construction activities would be consistent with the City's allowable construction hours of Monday through Friday between 7:00 a.m. to 9:00 p.m. and Saturdays and National Holidays between 8:00 a.m. to 6:00 p.m. As noted on page 3.13-71 in Section 3.13, Mitigation Measure NOI-A requires, in part, the following:

- **Equipment Maintenance:** Construction equipment shall be properly maintained per manufacturer's specifications to prevent noise due to worn or improperly maintained parts and shall be fitted with the best available noise suppression devices (i.e., mufflers, lagging, and/or motor enclosures). All impact tools shall be shrouded or shielded, and all intake and exhaust ports on power equipment shall be muffled or shielded.

- **Electrical Sources:** When possible, on-site electrical sources shall be used to power equipment rather than diesel generators.
- **Sensitive Uses:** Fixed and/or stationary equipment (e.g., generators, compressors, concrete mixers) shall be located away from noise-sensitive receptors.

Therefore, the mitigation suggested in the comment was evaluated and incorporated into the proposed Project to the maximum extent feasible. With implementation of Mitigation Measure NOI-A, construction noise has been minimized to the maximum extent feasible. No additional feasible mitigation measures are required, and this comment does not raise any feasible mitigation measures that are considerably different from those already analyzed in the Draft EIR.

Comment GO17-133 G. The Potential for Blight Is Not Sufficiently Analyzed.

The DEIR was required to analyze the potential for the creation of blight. In reviewing the sufficiency of two EIRs for shopping center projects in Bakersfield, a court stated:

[E]xperts are now warning about land use decisions that cause a chain reaction of store closures and long-term vacancies, ultimately destroying existing neighborhoods and leaving decaying shells in their wake. . . . We . . . agree that CEQA requires analysis of the shopping centers' individual and cumulative potential to indirectly cause urban decay.

(Bakersfield Citizens for Local Control v. City of Bakersfield (2004) 124 Cal.App.4th 1184, 1204.)

ARTT has committed only to funding the environmental review portion of the gondola project.

What happens if the gondola is constructed but there is insufficient funding for operations and maintenance of the gondola?

The possibility that the gondola would be left standing idle, thus contributing to blight must be addressed. For example, a bond should be required to be posted for removal of gondola equipment in the same way mine operators are required to post cleanup bonds to ensure their operations are not abandoned and thrown upon the public to be cleaned up.

Response GO17-133 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provide detail as to the proposed Project's capital, operation, and maintenance costs and planned sources of funding, recognizing that the proposed Project's capital funding would primarily be sourced from bond financing serviced by revenue from the proposed Project. CEQA does not require speculation as to possible future environmental consequences, such as the potential that the

proposed Project would not continue operations, and the Draft EIR need not analyze uncertain, hypothetical future events.

Comment GO17-134 H. Land Use and Planning Impacts (Section 3.11) Will Be Significant But are Not Acknowledged.

1. City of Los Angeles General Plan Conflicts.

The City of Los Angeles will not be able to approve requested entitlements because they conflict with various policies of the City of Los Angeles General Plan. The EIR identifies the Los Angeles General Plan (EIR, p. 3.11-5) but fails to identify the conflicts with this plan. The proposed Project impermissibly conflicts with General Plan policies. State law requires that, because a general plan is the “constitution” for the City’s future development, any decision affecting land use and development must be consistent with the General Plan. (Citizens of Goleta Valley v. Board of Supervisors, supra, 52 Cal.3d at 570-71 [“[T]he propriety of virtually any local decision affecting land use and development depends upon consistency with the applicable general plan and its elements.”].) As the “‘constitution for future development’ . . . [the General Plan is] ‘located at the top of ‘the hierarchy of local government law regulating land use’ . . .” (DeVita v. Napa (1995) 9 Cal.4th 763, 773.) A General Plan is more than an “exhortation”, it is a “commandment.” (Debottari v. City of Norco (1985) 171 Cal.App.3d 1204, 1211.) “[T]he requirement of consistency is the linchpin of California’s land use and development laws. It is the principle which infused the concept of planned growth with the force of law.” (Id. at 1213.)

Response GO17-134 Refer to Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the proposed Project’s consistency with the City of Los Angeles’ General Plan. This comment does not specify what City of Los Angeles General Plan policies the commenter believes the proposed Project is in conflict with, and no further response is warranted. This comment otherwise provides a general recitation and characterization of CEQA case law.

Comment GO17-135 The Project would also be built on or cross over land that is within the Alameda District Specific Plan, the Central City North Community Plan, the DTLA Community Plan (current or updated), the Central City North Specific Plan, the Silver Lake-Echo Park-Elysian Valley Community Plan, and the Chinatown Redevelopment Plan (DEIR, pp. 3.11-8 through 3.11-1313), and the City of Los Angeles will be responsible for ensuring compliance by the Project with each such plan. For example, the City would have to waive provisions of the River Implementation Overlay District to allow the construction and operation of the Alameda and Alpine Towers and waive provisions of the Cornfield/Arroyo Seco Specific Plan to allow construction and operation of the Chinatown Station. (DEIR, p. 2-62.) However, there is no indication that the City would be amenable to such waivers. Therefore, these conflicts must be identified as significant and avoided.

Footnote 13: See, particularly, the map at DEIR, p.3.11-8, showing only some of the varied plans and requirements to which the Project would be subject. Metro does not have the authority and expertise to evaluate and balance the requirements of all these plans, and the other plans described above, with respect to the Project. The City does.

Response GO17-135 Refer to Response GO17-42 for a discussion of the proposed Project’s land use consistency analysis and consultation with responsible agencies, including the City of Los Angeles.

Comment GO17-136 While CEQA permits a responsible agency to rely on a lead agency’s CEQA document, the City of Los Angeles and other responsible agencies must comply with CEQA “by considering the EIR or negative declaration prepared by the Lead Agency and by reaching its own conclusions on whether and how to approve the project involved.” (14 CCR § 15096(a).) The City of Los Angeles will retain responsibility for mitigating or avoiding the direct or indirect environmental impacts of the portions of the project that it approves. (14 CCR § 15096(g)(1).)

The EIR may not assume that the City of Los Angeles will waive these conflicts or override these policies. Therefore, the EIR must analyze these as significant impacts within the jurisdiction of another agency.

Response GO17-136 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Response GO17-42 for a discussion of the proposed Project’s land use consistency analysis and consultation with responsible agencies, including the City of Los Angeles. As the lead agency, Metro is required to assume that the proposed Project would be approved, constructed, and operational in drafting the EIR. Refer to Section 2.0, Project Description, for a list of the land use approvals that may be required for implementation of the proposed Project. These approvals are included in the proposed Project Description, and therefore Metro properly analyzed the proposed Project’s environmental impacts as if the proposed Project would be approved by all applicable agencies, inclusive of these approvals.

Comment GO17-137 2. The Surplus Land Act Requires Primary Consideration of Affordable Housing, Education, and Recreation Before Private Development.

Metro and the City of Los Angeles must comply with the Surplus Lands Act (SLA) in any potential disposition of publicly owned land. The Department of Housing and Community Development (HCD) has stated the SLA (Government Code sections 54220-54234) “is a ‘right of first refusal’ law that requires all local agencies to offer surplus land for sale or lease to affordable home developers and certain other entities before selling or leasing the land to any other individual or entity.... Any time a local agency disposes of land, it must follow the SLA unless the land qualifies as exempt surplus land. Dispositions include both sales and leases.” All dispositions of surplus land must be approved by HCD before the sale or lease can be finalized. (Gov. Code, § 54230.5, subd. (b)(1).)

HCD is not listed among agencies where approval is required, but it should be. It should have been consulted as a Responsible Agency.

Response GO17-137 This comment provides a provides a general recitation and characterization of the California statutes, case law, and regulations. Refer to Topical Response E, The Proposed Project Will Not Displace Housing or Prevent Planned Housing, for a discussion of the Surplus Land Act. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project As the Region’s Transportation Authority; Metro Named and Consulted With the Applicable Responsible Agencies, for discussion of the proposed Project’s consultation with CEQA responsible agencies. Refer to Appendix A, Scoping Report, of the Draft EIR, and Appendix A, Public Outreach Report, of the Final EIR, for documentation of notice to responsible agencies at various stages in the environmental review process. Metro has complied, and will continue to comply, with the CEQA requirements for consultation with responsible agencies at each stage of the environmental review process. HCD is not a responsible agency for the proposed Project as it does not have responsibility for carrying out or approving the proposed Project and does not have discretionary authority related to the proposed Project. (Public Resources Code § 21069.)

Comment GO17-138 3. Use of the Union Station Forecourt Would Conflict with the Union Station Master Plan.

The EIR Land Use section (Section 3.11) completely fails to identify the Los Angeles Union Station Master Plan. See <https://www.laconservancy.org/issues/union-station-master-plan>. This Master Plan “encompasses approximately 38 acres, including the 161,000 square-foot terminal building, outdoor patios, and railroad tracks. In 1996, the approved Alameda District Specific Plan established development rights that now allow Metro to build up to 5.9 million square feet of new construction.” (Ibid.) “In 2018, Metro released its Final Environmental Impact Report and its Final Environmental Impact Statement in 2020 for the Union Station Master Plan. Construction of the future high-speed rail concourse, planned to begin at the end of the decade, will occur at the rear of the property without significant adverse impacts to the historic train station. The Los Angeles Conservancy has advocated for preserving Union Station’s integrity since 1995 and was involved with the current Master Plan process.”

As identified in the Los Angeles Union Station Historical Society letter sent to Metro on November 22, 2022, which we incorporate by reference, ARTT’s “proposed ‘futuristic-style’ Union Station Terminal on Alameda Street and LA Metro’s supporting ‘Esplanade’ project will blight the historic and architecturally significant west façade of Union Station...”

Response GO17-138 This comment incorporates by reference Comment Letter GO4. Refer to Letter GO4 for responses to that letter. Refer to Section 2.3.2, Los Angeles Union Station, of Section 2.0, Project Description, of the Draft EIR, for discussion of the LAUS Master

Plan, including its programmatic goals for LAUS and the proposed development of the LAUS Forecourt and Esplanade Improvements Project. Refer to Section 3.11.3, Environmental Impacts, and Tables 3.11-1 through 3.11-6 of the Draft EIR, for discussion of the proposed Project’s consistency with applicable land use plans, policies, and regulations. The Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to historic resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant.

Comment GO17-139 4. The Discussion of the Conditional Use Permit Modification for Dodger Stadium is Uninformative.

The CUP for Dodger Stadium will have to be modified. The EIR mentions the CUP, but no copy is provided nor sufficient information about its current baseline requirements, such as how many parking spaces are required to be provided, is given.

Response GO17-139 Refer to Section 2.10, Required Permits and Approvals, and Section 3.11, Land Use and Planning, of the Draft EIR, noting that, pursuant to LAMC Section 12.24.M, the Project Sponsor may seek a Plan Approval for the existing 1960 Dodger Stadium Conditional Use Permit (“CUP”) to allow Stadium Tower and Dodger Stadium Station to implement the proposed Project. CUP Condition 4 provides for collaboration “in devising mass transportation service to the Stadium site which will be sufficiently efficient to encourage patronage thereof and thus reduce the number of private automobiles driven to the Stadium events.” Refer to pages 3.11-17 through 3.11-18, of Section 3.11, Land Use and Planning, of the Draft EIR, for a discussion of the CUP’s requirements, including that “automobile parking facilities for a minimum of one (1) automobile for each 3.6 seats provided in the Stadium shall be provided and maintained on site’, so a total of 15,556 parking spaces must be provided and maintained on site. There are currently a total of 18,889 parking spaces provided and maintained on site.” An analysis of the proposed Project’s consistency with the CUP and the CUP’s requirements (including how a total of 18,889 parking spaces are currently provided on the site, and a total of 15,556 are required to be provided under the CUP) is provided on page 3.11-43. The Draft EIR provided sufficient information in order for the public and decision makers to meaningfully evaluate the proposed Project’s potential environmental impacts. In addition, the CUP, which is referenced in Section 3.11, Land Use and Planning, of the Draft EIR, was provided on the proposed Project’s SB 44 website under the 3.11 Land Use Category concurrently with the release of the Draft EIR on October 17, 2022.⁴⁵

Comment GO17-140 5. The Park Preservation Act Requires Replacement Land.

⁴⁵ City of Los Angeles Department of City Planning Office of Zoning Administrator. 1960. Z.A. Case No. 15430. Dodger Baseball Stadium Site – Chavez Ravine Area (Dodger Stadium Conditional Use Permit).

The Park Preservation Act- which is not mentioned in the EIR-requires the replacement of land that is taken from park use. Any land used by the Project that is part of the State Historic Park must be replaced with parkland elsewhere.

Response GO17-140 Refer to Topical Response F, Los Angeles State Historic Park for a discussion of the Public Park Preservation Act.

Comment GO17-141 6. Metro’s Identification of Possible Federal and State Funding Makes Federal Requirements Relevant and Applicable, but the EIR Fails to Discuss Them.

Metro has placed the gondola project on its comprehensive list of projects to consider for state and federal funding for the Olympics. (<http://metro.legistar1.com/metro/attachments/b8e94467-6e56-4687-b2bc-3d0bb08fb2fa.pdf>, page 5.) If federal funding is sought for the gondola, Metro must comply with federal requirements, many of which are relevant and would prevent approval of the Project.

Furthermore, federal funding requires compliance with the National Environmental Policy Act (NEPA), the National Historic Preservation Act, including requirements for section 106 consultation for impacts to historic resources, and compliance with section 4(f) of the Department of Transportation Act, which prohibits usage of historic property or park land for transportation projects. Metro must also comply with the Civil Rights Act, which prohibits approval of projects that have discriminatory impacts. Metro must also comply with California’s Government Code section 11135.¹⁴

Section 4(f) of the Department of Transportation (DOT) Act is one of the most stringent federal environmental and historic preservation statutes ever enacted by Congress. The statute explicitly prohibits the Secretary of Transportation from approving any project that requires the “use” of historic sites, unless (1) there is no “prudent and feasible” alternative to the use of the sites, and (2) “all possible planning” has been taken to minimize harm to the sites. (28 U.S.C. § 138; 49 U.S.C. § 303(c).) Section 4(f) imposes a substantive constraint on the exercise of agency discretion. Section 4(f) operates as a “plain and explicit bar to the use of federal funds” for transportation projects that would use historic sites or parkland; “only the most unusual situations are exempted.” (Citizens to Preserve Overton Park v. Volpe, 401 U.S. 402, 411 (1972).) Indeed, the language of Section 4(f) shows that Congress intended the protection of historic sites and parkland to be given “paramount importance” in the planning of transportation projects. (Id. at 412-13.)

Footnote 14: 14 Government Code section 11135 provides:

“(a) No person in the State of California shall, on the basis of sex, race, color, religion, ancestry, national origin, ethnic group identification, age, mental disability, physical disability, medical condition, genetic information, marital status, or sexual orientation, be unlawfully denied full and equal access to the benefits of, or be unlawfully subjected to discrimination under, any program or

activity that is conducted, operated, or administered by the state or by any state agency, is funded directly by the state, or receives any financial assistance from the state.”

The gondola Project would disparately impact the communities along the gondola route so its unavoidable impacts may not be overridden and approved without violating section 11135.

Response GO17-141 This comment provides a general recitation and characterization of the statutes and regulations. At Metro’s November 16, 2022 Ad Hoc Olympics Planning Committee meeting, the Committee approved the 2028 Games Mobility Concept Plan – 2022 Prioritized Mobility Concept Plan Project List (Attachment A).⁴⁶ The proposed Project was not included in the 2022 Prioritized Mobility Concept Plan Project List (Attachment A). As proposed, the proposed Project does not require Federal review, including under the National Environmental Policy Act (NEPA), Section 106 of the National Historic Preservation Act (NHPA) and Section 4(f) of the U.S. Department of Transportation Act. Refer to Topical Response L, Project Sponsor and Proposed Project Costs and Financial Analysis, and Section 4.0, Costs and Financing, of the Final EIR, which provides detail as to the proposed Project’s capital, operation, and maintenance costs and planned sources of funding.

Nevertheless, the Draft EIR fully analyzed and addressed the proposed Project’s potential impacts to historic resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project. As discussed in Section 3.05, the Draft EIR’s analysis concludes that all potential impacts related to historical resources would be less than significant. And, as discussed in Sections 3.01, Aesthetics, 3.04, Biological Resources, 3.05, Cultural Resources, 3.06, Energy, 3.07, Geology and Soils, 3.09, Hazards and Hazardous Materials, 3.10, Hydrology and Water Quality, 3.11, Land Use and Planning, 3.13, Noise, 3.15, Public Services, 3.16, Parks and Recreational Facilities, 3.17, Transportation, 3.18, Tribal Cultural Resources, 3.19, Utilities and Service Systems, 3.20, Wildfire, and 5.0, Other CEQA Considerations, the proposed Project would have less than significant operational impacts, including to Los Angeles State Historic Park. Further, the proposed Project would comply with Government Code section 11135, as applicable.

Refer to Topical Response N, Environmental Justice, for discussion of how the Draft EIR addresses environmental justice by considering the proposed Project’s ability to reduce congestion and emissions from on-road vehicles in an area disproportionately burdened by pollution and including an analysis of the proposed Project’s potential impacts to the surrounding community, concluding that the proposed Project could result in air quality benefits for the surrounding communities. The proposed Project supports Metro’s goal of prioritizing equity opportunities, and helps promote public

⁴⁶ Los Angeles County Metropolitan Transportation Authority (LA Metro). 2022. 2028 Games Mobility Concept Plan (Attachment A). Available at: <https://datamade-metro-pdf-merger.s3.amazonaws.com/ad-hoc-2028-olympics-committee-6b993d455bc3.pdf>. Accessed August 2023.

transit as an essential lever in enabling access and improving quality of life for Los Angeles County. Further, the Draft EIR analyzed the proposed Project's consistency with General Plan policies related to environmental justice, and the proposed Project is consistent with General Plan policies related to environmental justice, including by reinforcing or encouraging the establishment of strong pedestrian orientation in the surrounding communities and facilitating multi-modal access to and from the stations with pedestrian network improvements, and by ensuring quality pedestrian access by facilitating multi-modal access to and from the stations with pedestrian network improvements. The proposed Project is designed to extend affordable, regional access and mobility options to the communities adjacent to the proposed Project alignment, providing connections to Metro's growing regional public transit system. The proposed Project would be free to ride for anyone with a ticket to a Dodgers game. In addition, the proposed Project would allow all residents, employees, and businesses located close to the proposed Project to ride the gondola using their Metro fare at no additional cost under the Community Access Plan. In addition, public outreach for the proposed Project was designed with environmental justice principles in mind and the proposed Project provided translated materials in four different languages, and interpretation services in five different languages, to reflect the surrounding community, and provided opportunities for in-person and virtual meetings with toll-free dial in options and ADA accessibility features. The proposed Project would not preclude development of uses including housing, grocery stores, and/or healthcare facilities in the surrounding communities, and would itself address a need for a permanent transit connection to one of the region's most visited venues and would benefit the surrounding community by alleviating existing congestion on surrounding neighborhood streets, arterial roadways, and freeways, thereby reducing associated air pollution and improving safety. No displacement of existing residences or housing would occur in connection with the construction and operation of the proposed Project, which would operate primarily over the public ROW and publicly owned property to minimize aerial rights requirements over private properties, taking into account existing and future adjacent land uses.

Comment GO17-142 Metro should prepare a combined EIR/EIS to satisfy both state and federal environmental review requirements. Such an EIR/EIS could potentially be used for federal approvals that are or become necessary such as a federal conformity determination by EPA (the Project must be consistent with the Regional Transportation Plan), an approval of non-interference with airport traffic by FAA (the LAUSHS has asserted the Project is within close proximity of a heliport which is considered an airport for purposes of FAA review), or a determination of absence of impacts to historic/cultural properties of federal significance.

Additionally, stakeholders in the National Historic Preservation Act section 106 process such as the Los Angeles Union Station Historic Society (LAUSHS) must be identified and coordinated with to avoid section 106 impacts.

Response GO17-142 As proposed, the proposed Project does not require Federal review, including under the National Environmental Policy Act (NEPA) or Section 106 of the National Historic Preservation Act (NHPA). The Draft EIR addresses potential airport hazards in Section 3.09, Hazards and Hazardous Materials, Section 5.5.5, Heliports, in Section 5.0, Other CEQA Considerations, and Appendix O, Airspace Analysis Technical Memo. The Draft EIR concludes that the proposed Project alignment is not within two miles of a “public use airport” as that term is defined under CEQA. Regardless of any distinction between heliports and airports, the Draft EIR immediately follows this conclusion with a clear disclosure that the city-owned Jay Stephen Hooper Heliport is within 0.38 miles of the proposed Project. According to the LAPD and AirNav.com, the Hooper Heliport is a city-owned, *private use* facility. As a private use facility, it does not meet the “*public use airport*” description in the CEQA threshold of significance for this issue included in Section 3.09, Hazards and Hazardous Materials, under Impact HAZ-5. Refer to Draft EIR Appendix O, Airspace Analysis Technical Memo. The analysis in Appendix O, Airspace Analysis Technical Memo, of the Draft EIR, is based on FAA analysis standards, concludes with substantial evidence that construction and operation of the proposed Project is clear of the airspace associated with the existing heliports in the proposed Project's vicinity. As such, no adverse effects related to aeronautical hazards are predicted based on these findings, and no notification is required for the proposed Project construction unless the FAA makes a specific request to the Project Sponsor. In addition, refer to Appendix I, Airspace Analysis Comment Response for the Los Angeles Aerial Rapid Transit Project, of the Final EIR, for discussion of how helicopter flight paths would not be impeded as a result of the proposed Project. Refer to Response GO17-143 for further discussion of the National Historic Preservation Act.

Comment GO17-143 Under the National Historic Preservation Act, a project may not be approved if feasible alternatives will avoid historic resource impacts.

Response GO17-143 As proposed, the proposed Project does not require Federal review, including under Section 106 of the National Historic Preservation Act (NHPA). NHPA Section 106 requires a federal agency to take into account the effect of its undertaking on historic properties prior to the federal agency action at issue, *see* 54 U.S.C. § 306108, which is implemented through the Section 106 consultation process as provided in 36 C.F.R. Part 800. The NHPA does not require absolute avoidance of impacts to historic properties based on consideration of feasible alternatives. Nevertheless, the Draft EIR fully analyzed and addressed the proposed Project's potential impacts to historic resources in Section 3.05, Cultural Resources, with supporting data provided in Appendix G, Historical Resource Technical Report for the Los Angeles Aerial Rapid Transit Project (HRTR). As discussed in Section 3.05, the Draft EIR's analysis concludes that all potential impacts related to historical resources would be less than significant.

Comment GO17-144 The National Historic Preservation Act (NHPA) states the policy of the United States is to “provide leadership in the preservation of the historic property of the United States.” (54 U.S.C.A. § 300101.) Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on historic properties and to afford the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment. The four-step Section 106 review process set forth in the ACHP’s regulations, “Protection of Historic Properties” (36 CFR Part 800) outlines a four-step process that ensures that the federal agency considers effects, including: (1) establishing the undertaking, (2) identifying and evaluating historic properties, (3) assessing effects, and (4) resolving any adverse effects. These steps are to be carried out sequentially and ensure that consulting parties consider alternatives to avoid adverse effects on historic properties. Consultation with all consulting parties is necessary to develop avoidance alternatives.

Response GO17-144 Refer to Response GO17-143 for discussion of the NHPA.

Comment GO17-145 Section 4(f) of the Department of Transportation (DOT) Act is one of the most stringent federal environmental and historic preservation statutes ever enacted by Congress. The statute explicitly prohibits the Secretary of Transportation from approving any project that requires the “use” of historic sites, unless (1) there is no “prudent and feasible” alternative to the use of the sites, and (2) “all possible planning” has been taken to minimize harm to the sites. (28 U.S.C. § 138; 49 U.S.C. §303(c).) Section 4(f) imposes a substantive constraint on the exercise of agency discretion. Section 4(f) operates as a “plain and explicit bar to the use of federal funds” for transportation projects that would use historic sites; “only the most unusual situations are exempted.” (Citizens to Preserve Overton Park v. Volpe, 401 U.S. 402, 411 (1972).) Indeed, the language of Section 4(f) shows that Congress intended the protection of historic sites to be given “paramount importance” in the planning of transportation projects. (Id. at 412-13.)

The circumstances under which an avoidance alternative can be rejected as not “feasible and prudent” have been very narrowly defined by the Supreme Court in the Overton Park case. The Secretary is not permitted to “engage in a wide-ranging balancing of competing interests.” (Id. at 413.) An avoidance alternative is “infeasible” only if it cannot be built “as a matter of sound engineering.” (Id. at 411.) And in order to find an avoidance alternative “not prudent” under Section 4(f), the Secretary must find that “truly unusual factors” are present, or that “alternative routes present unique problems,” or that the “cost or community disruption” resulting from the avoidance alternative would reach “extraordinary magnitudes.” (Id.) Without such a showing, even the asserted “need” for the project cannot suffice to rule out alternatives that would avoid using protected sites. (See Stop H-3 Ass’n v. Dole, 740 F.2d 1442, 1450-58 (9th Cir. 1984), cert. denied, 471 U.S. 1108 (1985).)

Code of Federal Regulations Title 23 section §774.3 regarding Section 4(f) approvals states:

The Administration may not approve the use, as defined in §774.17, of Section 4(f) property unless a determination is made under paragraph (a) or (b) of this section.

(a) The Administration determines that:

(1) There is no feasible and prudent avoidance alternative, as defined in §774.17, to the use of land from the property; and (2) The action includes all possible planning, as defined in §774.17, to minimize harm to the property resulting from such use; (23 C.F.R. §774.3.)

As courts have explained the historic review process created by NHPA and its implementing regulations:

Under NHPA, a federal agency must make a reasonable and good faith effort to identify historic properties, 36 C.F.R. § 800.4(b); determine whether identified properties are eligible for listing on the National Register based on criteria in 36 C.F.R. § 60.4; assess the effects of the undertaking on any eligible historic properties found, 36 C.F.R. §§ 800.4(c), 800.5, 800.9(a); determine whether the effect will be adverse, 36 C.F.R. §§ 800.5(c), 800.9(b); and avoid or mitigate any adverse effects, 36 C.F.R. §§ 800.8(e), 800.9(c).

(Muckleshoot Indian Tribe v. U.S. Forest Service (9th Cir. 1999) 177 F.3d 800, 805.)

Therefore, prioritizing avoidance of impacts to historic properties is not only a regulatory requirement but a statutory requirement of NHPA and Section 4(f).

Response GO17-145 This comment provides a general recitation and characterization of federal statutes, case law, and regulations. Refer to Response GO17-141 for a discussion of how as proposed, the proposed Project does not require Federal review, including under the National Environmental Policy Act (NEPA), Section 106 of the National Historic Preservation Act (NHPA) and Section 4(f) of the U.S. Department of Transportation Act.

Comment GO17-146 7. Approval from the PUC is Needed.

ARTT has apparently taken the position that PUC approval is not needed. The gondola project crosses over the Gold Line in two places- near the Alpine Tower and near the State Historic Park. The Public Utilities Commission (PUC) would be a responsible agency because the Project would cross over and above railroad tracks. Thus, PUC review and approvals are required, with proper public notice and full public hearing processes must be provided.

Response GO17-146 Refer to Section 2.10, Required Permits and Approvals, in Section 2.0, Project Description, of the Draft EIR, for a list of responsible agencies identified for the proposed Project. The Public Utilities Commission (“CPUC”) is not a responsible agency for the proposed Project as it does not have responsibility for carrying out or

approving the proposed Project and does not have discretionary authority related to the proposed Project.

Comment GO17-147 I. Geology and Soils (Section 3.7) is Inadequate in its Analysis.

The EIR states that the project and stations and towers “would be in an area mapped as potentially subject to liquefaction.” (EIR, p. 3.7-17.) The mitigation for this is adherence to emergency plan protocols but that is inadequate in an earthquake zone.

This is important to TCE as portions of the Project, with its multi-ton gondola cars suspended on wires on a proposed tower the Alameda triangle adjacent to TCE, could buckle during an earthquake—placing the lives of passengers and TCE office staff, grantees, and visitors in danger.

Response GO17-147 Refer to Section 3.07, Geology and Soils, with supporting data provided in Appendix I, Geotechnical Document in Support of the Environmental Impact Report, for a discussion of how the proposed Project’s potential impacts in relation to existing geology, soils, and seismic conditions in the proposed Project study area would be less than significant with mitigation. The proposed Project would be constructed in accordance with applicable standards, requirements, and building codes, which would ensure structural integrity and safe construction. Mitigation Measure GEO-A would require the development of a site-specific geotechnical investigation and report. The geotechnical investigation and report would include geotechnical recommendations for project design and construction based on grading conditions and foundation capacities, including an evaluation of risk of settlement in the fill, subsidence, and liquefaction. Additionally, the geotechnical report would include recommended measures such as site stabilization to reduce potential impacts related to expansive soils and soil corrosivity, subsidence, liquefaction, differential settlement, slope instability, or other potential ground failures induced by the proposed Project. With compliance to existing standards and codes and implementation of Mitigation Measure GEO-A, impacts related to unstable soils, landslides, lateral spreading, subsidence, liquefaction, or collapse during construction of the proposed Project would be reduced to less than significant. Refer to Appendix F, Memo on Structural Engineering, for a discussion of how advanced computer analysis modeling has been used in developing the structural concepts and will be further employed along with advanced site-specific ground motions earthquake simulations to verify that the safety standards are met.

Comment GO17-148 J. The Analysis of Alternatives (Section 4.0) is Grossly Inadequate.

The EIR admits that the environmentally superior alternative is the Transportation Systems Management Alternative. (EIR, p. 4-75 to 4-76.) However, the EIR then asserts that it would create more Vehicle Miles Traveled and not provide the same level of benefits. (EIR, p. 4-75.) The Transportation Systems Management Alternative can be augmented to reduce Vehicle Miles Traveled and to provide the benefits that would allegedly be lost. The Dodger Express bus fleet could be expanded and

converted to electric buses with more pickup and dropoff locations throughout the County and near the Stadium such as at the Los Angeles Zoo.

Response GO17-148 This comment provides a general recitation and characterization of the Draft EIR. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express is unlikely to achieve the same level of ridership as the proposed Project, and otherwise fails to meet most of the Project Objectives, which seek to achieve the proposed Project’s underlying purpose of providing a permanent direct transit connection between LAUS and the Dodger Stadium property and improving connectivity for surrounding communities, including Chinatown, Mission Junction, Elysian Park, Solano Canyon, and the Los Angeles State Historic Park. Electrification of the Dodger Stadium Express buses would not negate the operational issues associated with substantially expanding the Dodger Stadium Express. Further, as discussed in Topical Response H, a system of buses from numerous remote locations throughout the Los Angeles region to and from Dodger Stadium events would require a substantial increase in the number of buses which, similar to expanding the fleet for an expanded Dodger Stadium Express service, would result in a fleet of buses that would either be underutilized most of the time or regular Metro bus service that utilizes these vehicles would be disrupted every time a Dodger game or event at the stadium is held. Such a service would also incur substantial costs in paid time and mileage for driving empty buses out to the remote locations before a game and back from the remote locations after a game and paid idle time during the game. Buses from a variety of remote locations would also need to travel in rush hour congestion to get to Dodger Stadium. With limited regional facilities that provide bus only lanes that these services could utilize, they would not materially improve transit travel time compared with driving. For example, the current Dodger Stadium Express service from South Bay serves a broad area of southern Los Angeles County at stations spread across eight miles, is free, and travels on a priority lane within the I-110 freeway median for most of its trip, but the South Bay Dodger Stadium Express carried an average of only 415 passengers per game in 2019, which is substantially lower than the ridership of 1,895 riders per game on the LAUS Dodger Stadium Express.

Comment GO17-149 1. The Project Cannot be Approved if There Are Feasible Alternatives that Would Reduce Adverse Impacts.

CEQA prohibits approval of projects with adverse environmental impacts if there are feasible alternatives. (Pub. Resources Code § 21002; Guidelines § 15021(a)(2).) The CEQA Guidelines require an agency to “Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved.” In order to implement this policy, the Guidelines specify that:

A public agency may approve a project even though the project would cause a significant effect on the environment if the agency makes a fully informed and publicly disclosed decision that:

(a) There is no feasible way to lessen or avoid the significant effect...”

(Guidelines § 15043, emphasis added.) More specifically, the Guidelines provide:

If the lead agency concludes that no feasible alternative locations exist, it must disclose the reasons for this conclusion, and should include the reasons in the EIR.

(Guidelines § 15126.6(f)(2)(B).)

Response GO17-149 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations, but does not raise a substantive issue on the content of the Draft EIR. This comment suggests that CEQA requires the denial of a project if there are alternatives available. CEQA is not so rigid. Under CEQA, an agency must consider a “reasonable range” of potentially feasible alternatives to a project, or to the project’s location, “which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project.” (CEQA Guidelines § 15126.6(a); see also *id.*, § 13053.5(a).) The CEQA Guidelines also provide several factors a lead agency may consider regarding the feasibility of an alternative, including “site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context), and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (or the site is already owned by the proponent).” (CEQA Guidelines § 15126.6(d).) Further, CEQA allows a lead agency to exercise its discretion to decline to analyze an alternative if the alternative is “infeasible” or if it would fail to “meet most of the basic project objectives.” (See, e.g., CEQA Guidelines § 15126.6(c).) Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA. In addition, the Draft EIR identifies feasible mitigation measures to substantially lessen identified significant environmental impacts from the proposed Project, in compliance with CEQA’s requirements. As discussed in Section 4.0, Alternatives, of the Draft EIR, on page 4-15, pursuant to CEQA Guidelines section 15126.6(f)(2), the Draft EIR considered three Direct Alignment Alternatives which included alternative locations for the proposed Project, but dismissed these alternatives from further detailed consideration because they would not avoid or substantially lessen significant effects of the proposed Project, would not otherwise meet the project objectives, and because the Project Sponsor would likely be unable to reasonable acquire, control, or otherwise have access to alternative sites required for the Direct Alignment Alternatives.

Comment GO17-150 2. A Reasonable Range of Alternatives Must Be Considered, and Was Not.

Metro has a duty under CEQA to evaluate a reasonable range of alternatives to the Project. (Laurel Heights I, *supra*, 47 Cal.3d at 400.) As the California Supreme Court has stated:

Under CEQA, the public agency bears the burden of affirmatively demonstrating that . . . the agency’s approval of the proposed project followed meaningful consideration of alternatives and mitigation measures.

(*Mountain Lion Foundation v. Fish and Game Commission* (1997) 16 Cal.4th 105, 134, emphasis added; accord *Village Laguna of Laguna Beach v. Board of Supervisors* (1982) 134 Cal.App.3d 1022, 1035.) As the Court has said, while an EIR is “the heart of CEQA” the “core of an EIR is the mitigation and alternatives sections.” (*Citizens of Goleta Valley v. Bd. Of Supervisors* (1990) 52 Cal.3d 553, 564 (“Goleta II”).) Preparation of an adequate EIR with analysis of a reasonable range of alternatives is crucial to CEQA’s substantive mandate to prevent significant avoidable damage to the environment when alternatives or mitigation measures are feasible. (Guidelines § 15002(a)(3).)

Response GO17-150 This comment provides a general recitation and characterization of the CEQA statute, case law, and regulations. Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the Draft EIR considered a range of reasonable alternatives, properly identifying an “environmentally superior” alternative and analyzing a “No Project” alternative, pursuant to CEQA. Refer to Response GO17-149 for discussion of the alternatives considered in the Draft EIR and compliance with CEQA.

Comment GO17-151 3. Alternatives Proposed in the LACTC Study Were Summarily Rejected Without Valid Evidence.

Alternatives were raised in the Los Angeles County Transportation Commission (LACTC) study but are rejected as infeasible or not studied at all (EIR, p. 4-9), without substantial evidence to support those conclusions. Other alternatives are rejected for failing to meet the unduly specific and narrow Project objectives. When the public offers reasonable alternatives to the proposed Project, Metro should provide a meaningful analysis of them. (Pub. Res. Code § 21091(d)(2)(B); Guidelines § 15088(c); *Berkeley Jets, supra*, 91 Cal.App.4th at 1367.)

An EIR cannot define the Project objectives in a manner that essentially is limited to the proposed Project. Further, with the exception of the mandatory “no project” objective, the alternatives that are considered appear designed to be rejected.

While “An EIR need not consider every conceivable alternative to a project, ‘it must consider ‘a reasonable range of potentially feasible alternatives...’” (Guidelines § 15126.6(a), emphasis added.) “The range of feasible alternatives [for an EIR] shall be selected and discussed in a manner to foster meaningful public participation and

informed decision making.” (Guidelines ' 15126.6 (f).) “[T]he discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.” (Guidelines § 15126.6(b).)

Response GO17-151 Refer to Response GO17-155 for a detailed response to the 1990 *Dodger Stadium Transit Access Study* prepared by Gruen Associates for the Los Angeles County Transportation Commission.

Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how the proposed Project’s objectives were defined in order to assist Metro in considering alternatives that achieve the proposed Project’s fundamental purpose of providing a permanent transit connection to Dodger Stadium. The proposed Project’s objectives are not so narrow that they preclude consideration of reasonable alternatives – while alternatives for a project must be able to satisfy “most of the basic objectives of a project,” alternatives should not be excluded simply because they would impede attainment of project objectives “to some degree.” (CEQA Guidelines, §15126.6(a)–(b).) The proposed Project’s objectives broadly contemplate improving neighborhood connectivity and the Dodger Stadium visitor experience, reducing vehicle congestion and associated emissions in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, improving access to Elysian Park and the Los Angeles State Historic Park, and providing a sustainable form of transit. Aerial rapid transit technology has the ability to overcome grade and elevation issues between LAUS and Dodger Stadium in order to provide a direct transit connection between the two locations, and provide safe, zero emission, environmentally friendly, and high-capacity transit connectivity in the Project area that would reduce GHG emissions as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways. Thus, because the proposed Project’s fundamental purpose is to provide a permanent transit connection to Dodger Stadium, and because aerial rapid transit technology can achieve this fundamental purpose, the objectives for the proposed Project are in compliance with CEQA, which does not restrict an agency’s discretion to identify and pursue a particular project designed to meet a particular set of objectives.

Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, for discussion of how, as required by CEQA, the alternatives analysis included evaluation of the No Project Alternative in order to determine the consequences of not implementing the proposed Project. (See CEQA Guidelines § 15126.6(e).) CEQA also requires that an EIR identify one “environmentally superior alternative” from the range of reasonable alternatives that are evaluated; the “environmentally superior alternative” cannot be the “No Project”

alternative or the underlying project. The Draft EIR considered a “No Project Alternative,” the Spring Street Alignment Alternative, and the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express. Evaluation of each of the alternatives included a description of the alternative, the environmental impacts of the alternative before and after implementation of reasonable mitigation measures for each environmental topic area, and the environmental impacts of each alternative as compared to the proposed Project, followed by a general discussion of the extent to which the underlying purpose and project objectives are obtained by the alternative. Further, in compliance with CEQA Guidelines section 15126.6(c), Section 4.2.1, Alternatives Considered but Dismissed from Detailed Analysis, of the Draft EIR, identifies alternatives that the Lead Agency considered but dismissed as infeasible during the scoping process, providing the reasons underlying this determination. Section 4.2.1 considered five potential alternatives, including alignment and station location alternatives and direct alignment alternatives. In accordance with CEQA Guidelines section 15126.6(f)(2), the Draft EIR declined to carry forward an analysis of the alternative locations studied in the direct alignment alternatives, as such alternatives failed to avoid significant environmental impacts and otherwise would not meet the basic project objectives, and the Project Sponsor would likely be unable to reasonably acquire, control, or otherwise have access to alternative sites required for the direct alignment alternatives. The Draft EIR adequately identifies and analyzes a reasonable range of alternatives in full compliance with CEQA’s requirements. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for discussion of a Pedestrian Enhancement Alternative to the proposed Project in which the proposed Project would not be constructed, and instead an enhanced pedestrian walkway and vertical circulation elements would be constructed to improve the safety, comfort, and accessibility of walking between the Metro L Line (Gold) Station and Dodger Stadium. In response to public comments, this alternative was considered but dismissed from further detailed analysis in the Final EIR because it did not meet most of the basic objectives of the proposed Project.

Comment GO17-152 4. The Environmentally Superior Alternative of Expanded Dodger Express Bus Usage is Feasible.

The EIR attempts to argue that most project objectives cannot be met through expanding Dodger Express bus service because of alleged difficulties with expanding bus service. (EIR, pp. 4-60 to 4-62.) This view is unsupported. Alleged difficulties with expanding bus service can be overcome with flexible alternative locations rather than relying entirely on locations such as using Division 13 maintenance facility (p. 4-61) or Patsaouras Plaza and the West Portal (p. 4-60). Other sites for possible bus service connections should be identified and utilized. The Dodger Express bus already transports game attendees directly from the South Bay. Other service lines can be added.

Response GO17-152 Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options, of this Final EIR and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express. Refer to Response GO17-148 for additional discussion of expansion of the Dodger Stadium Express to remote locations.

Comment GO17-153 III. CONCLUSION.

Metro should reject the Project to focus resources on true public transportation such as electric bus service. If the Project is pursued it should be transferred to the City of Los Angeles for review.

The DEIR is so deficient that Metro must prepare a new DEIR and recirculate it for public and public agency comments if it wants to proceed with consideration of the Project.

Please notify us of any hearing or the issuance of any findings or permits related to this matter. We also ask that you preserve all records and communications related to development of any property related to the Project in accordance with the requirements of *Golden Door Properties, LLC v. County of San Diego*, (2020) 50 Cal.App.5th 467.

Sincerely,

Douglas P. Carstens

Response GO17-153 This comment provides a general conclusion regarding the comments raised in this letter. Responses to comments contained in this letter are provided above in Responses GO17-2 through GO17-152. Refer to Topical Response D, Metro Is the Proper Lead Agency for the Proposed Project as the Region’s Transportation Authority; Metro Named and Consulted with the Applicable Responsible Agencies, for discussion of why Metro is the proper lead agency for the proposed Project and the City’s participation in the environmental review process as a CEQA responsible agency. This comment and the comments raised in this letter do not raise any significant new information requiring recirculation of the Draft EIR prior to certification pursuant to CEQA Guidelines section 15088.5. Further, Metro will comply with the requirements of CEQA, including Public Resources Code Section 21168.6.9, which includes requirements for the content of the proposed Project’s record of proceedings.

Comment GO17-154 Enclosure 5

Dear Mr. Carstens:

Tom Brohard, P.E., has reviewed the transportation portions of the October 2022 Draft Environmental Impact Report (Draft EIR) for the Los Angeles Aerial Rapid Transit (LAART) Project in the City of Los Angeles prepared by AECOM for the Los Angeles County Metropolitan Transportation Authority (Metro). The Proposed Project

includes a 1.2-mile aerial gondola system connecting Los Angeles Union Station (LAUS) and Dodger Stadium, with an intermediate station at the Los Angeles State Historic Park and Elysian Park. Sections of the Draft EIR which I have reviewed include:

- ES – Executive Summary
- Chapter 1 – Introduction
- Chapter 2 – Project Description
- Chapter 3.17 – Transportation
- Appendix A – NOP Scoping Report and Attachments
- Appendix N – Transportation Appendices

Various reports and documents relating to transportation improvements for Dodger Stadium as well as quantification of available parking in the area listed below have been reviewed and are enclosed as noted:

- August 1990 Dodger Stadium Access Study prepared by Gruen Associates for the Los Angeles County Transportation Commission
- September 15, 2022 Metro Executive Management Committee Report for Agenda Number 21 regarding the LAART Project
- October 24, 2022 UCLA Study Regarding the Proposed Project

Education and Experience

Since receiving a Bachelor of Science in Engineering from Duke University in Durham, North Carolina in 1969, I have gained over 50 years of professional traffic engineering and transportation planning experience. I am licensed as a Professional Civil Engineer both in California and Hawaii and as a Professional Traffic Engineer in California, I formed Tom Brohard and Associates in 2000 and have served many diverse communities as the City Traffic Engineer and/or the Transportation Planner. During my career in both the public and private sectors, I have reviewed numerous environmental documents and traffic studies for various projects as shown in a brief summary of my experience in the enclosed resume.

Response GO17-154 This comment provides a general introduction to the comments raised in Enclosure 5 to Letter GO17. Responses to the comments contained in Enclosure 5 to Letter GO17 are provided below in Responses GO17-155 through GO17-185.

Comment GO17-155 Traffic and Transportation Issues

Based on the information in the October 2022 Draft Environmental Impact Report (Draft EIR) for the Los Angeles Aerial Rapid Transit (LAART) Project, and with consideration for the other various reports and documents related to access to and from Dodger Stadium, each of the following traffic and transportation issues must be fully addressed and evaluated further before Metro takes additional cation on the proposed Project:

1) Dodger Stadium Access Study

Over 30 years ago in August 1990, the Los Angeles County Transportation Commission, the County transportation agency that preceded Metro, retained Gruen Associates with Gannett Fleming to evaluate alternative connections to move people efficiently to and from Dodger Stadium. The enclosed “Dodger Stadium Access Study” evaluated various technologies including shuttle buses, automated guideway transit, light rail transit, gondola tramways, and walkways and escalators.

Six different characters were evaluated and compared for the five different technologies as shown in Table 1 of the Study. Table 3 compared boarding and travel time for the different alternatives, with the gondola tram taking an average of 92 minutes and 60-person shuttle buses taking about 43 minutes per passenger, less than half of the time required per passenger for the Gondola trams. The capacity of the shuttle bus system was estimated at 7,200 passengers per hours, over 2.5 times greater than what the gondola system could provide. The aerial gondola system was found to take more than twice as long as the shuttle buses, and shuttle buses were found to move more than double the number of people.

Of the different alternatives evaluated, the gondola was found to have the lowest capacity of any of the systems considered and would have the least positive impact on traffic and congestion. The gondola system then and now is more for sightseeing and entertainment and is not an effective way to move people between places that are 1.2 miles apart.

Response GO17-155 As described in Section 2.0, Project Description, of the Draft EIR, the two primary types of aerial transit used in urban environments are tramways and detachable gondolas. As shown in Table 1 of the 1990 *Dodger Stadium Transit Access Study* (1990 Study) referenced in the comment⁴⁷, the gondola technology evaluated in that study was a reversible tramway system consisting of two 125-passenger cars, similar to the Portland Aerial Tram in Portland, Oregon and the Roosevelt Island Tramway in New York, New York. An aerial tram system typically has two cabins that shuttle back and forth between two end terminals. The proposed Project is a detachable gondola system. An aerial gondola system includes multiple cabins that travel on a continuously circulating cable, which allows for an overall higher system capacity and ability to move more people per hour in each direction than an aerial tram. Furthermore, the proposed Project would be a modern 3S system with the capacity to move approximately 5,000 people per hour per direction with a travel time from LAUS to Dodger Stadium of seven minutes, far greater than the 2,800 persons per hour capacity estimated in the 1990 Study for the two-car reversible tramway system. As such, the two systems are not comparable, and findings in the 1990 Study comparing the tramway system to other modes as analyzed in that 33-year-old study are not relevant to the current proposed Project.

⁴⁷ Gruen Associates. 1990. *Dodger Stadium Transit Access Study*. Available at: https://libraryarchives.metro.net/dpctl/lactc/dodger_stadium_access_study.pdf. Accessed August 2023.

Regarding the comment that a gondola system is not an effective way to move people between places that are 1.2 miles apart, similar modern 3S systems are in use for urban transit systems in a number of cities around the world including Koblenz, Germany, Phu Quoc, Vietnam, and Toulouse, France, across distances ranging from 0.55 to 1.67 miles (see Table 2-1 on page 2-4 in Section 2.0, Project Description of the Draft EIR). Refer to Topical Response M, Comparable Urban Aerial Transit Systems, for discussion of comparable aerial transit systems in cities around the world and their operations.

Refer to Topical Response H, The Draft EIR Considered an Appropriate Range of Alternatives and Design Options and Section 4.0, Alternatives, of the Draft EIR, for a discussion of the Transportation Systems Management Alternative for an enhanced Dodger Stadium Express. The Draft EIR concluded that, even with a substantially increased Dodger Stadium Express bus capacity, the Dodger Stadium Express's slower travel time to/from Dodger Stadium as compared to the proposed Project and the additional transfer time for riders to walk between LAUS and the Metro Division 13 maintenance facility would render the Alternative substantially less competitive with driving time than the proposed Project, thus reducing its ridership potential compared to the proposed Project.

Comment GO17-156 2) Metro Board Executive Management Committee Report

The September 15, 2022 Metro Board Executive Management Committee Informational Report, Los Angeles Aerial Rapid Transit Project Update, discussed various topics including the traffic studies to be prepared for the Proposed Project. Page 4 states "A separate Project Access, Circulation and Construction Transportation Study will be prepared in accordance with the non-CEQA analysis required by the City of Los Angeles Transportation Assessment Guidelines. This separate technical report will evaluate the Project's potential effects on the intersection level of service."

This study was to be prepared as required and in accordance with the LADOT Transportation Assessment Guidelines issued in August 2022, including potential impacts on intersection level of service. The contents of the analysis are found in Section 3.3, Project Access Safety and Circulation Evaluation. This report was not included in the Draft EIR or Appendix N. Furthermore, this analysis has not been shared with the public or otherwise been made available for review and comment.

Response GO17-156 A report entitled *Los Angeles Aerial Rapid Transit Project, Non CEQA Transportation Assessment*⁴⁸ was prepared for the proposed Project in accordance with the LADOT *Transportation Assessment Guidelines* (TAG) and as stated in the Metro Board Executive Management Committee Informational Report. As set forth in the TAG, the Assessment includes non-CEQA transportation analysis related to access, circulation, construction, and cut through traffic.

⁴⁸ Fehr & Peers. 2022. Los Angeles Aerial Rapid Transit Project, Non CEQA Transportation Assessment.

Since the Assessment addresses non-CEQA effects of the proposed Project, it is not required to be included in the Draft EIR. The Assessment was made available for public review in September 2022 on the proposed Project's SB 44 website, which is linked via Metro's LA ART website.

Comment GO17-157 3) Draft Environmental Impact Report – Executive Summary

a) The Project Purpose on Page ES-1 states “The proposed project would improve mobility and accessibility for the region by providing a daily, high-capacity aerial rapid transit service connecting the regional transit system at LAUS, Dodger Stadium, the Los Angeles state Historic Park, Elysian Park, and the surrounding communities via three new transit stations...The Proposed Project is needed to alleviate existing congestion and associated air pollution...as a result of reduced vehicular congestion in and around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways...”

Both of these statements, as well as many others throughout the Draft EIR, are made without foundation and/or documentation to support them in the Draft EIR or in the technical Appendices. They exaggerate even a best-case scenario that could most optimistically occur.

Response GO17-157 This comment provides a general recitation and characterization of the Draft EIR. Refer to Section 3.03, Air Quality, Section 3.08, Greenhouse Gas Emissions, Section 3.17, Transportation, Appendix D, Air Quality/Health Risk Assessment Technical Report, Appendix J, Greenhouse Gas Emissions Technical Report, and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel, to improve air quality through reduced emissions, and to reduce greenhouse gas emissions through reduced vehicular travel. The proposed Project would improve mobility and accessibility for the region by connecting LAUS to Dodger Stadium via an aerial gondola system, including an intermediate station at the southernmost entrance of the Los Angeles State Historic Park. Dodger Stadium draws large regional crowds, with approximately 100 baseball games and other events each year, but there are no permanent transit connections to the venue. Given the capacity of this system, approximately 20 percent of the fans could take aerial transit connected to Metro's regional transit system. This would reduce vehicular congestion in and around Dodger Stadium, on neighborhood streets, arterial roadways, and freeways during game and special event days, thereby reducing VMT and GHG emissions. Accordingly, the proposed Project would result in air quality benefits to the surrounding communities. The lifetime emissions of the proposed Project over its useful life would be a reduction of 166,653 MT CO_{2e}. The lifetime VMT reduction of the project would be a reduction of 129,629,500 VMT. Emissions are decreased through reducing vehicle miles traveled. The proposed Project would result in a net reduction in criteria pollutant emissions by reducing vehicle miles traveled.

Comment GO17-158 b) Page ES-16 provides a listing of comments from various public agencies. Interestingly enough, no comments are listed as being from the City of Los Angeles Department of Transportation. This lack of response from LADOT is unique in my extensive experience in my peer reviews of transportation aspects of various projects in the City of Los Angeles over the last several decades.

With direction from LADOT and as outlined in the LADOT Transportation Assessment Guidelines, a detailed Memorandum of Understanding outlining the methodology and approach to the transportation analysis is typically developed by the Draft EIR transportation consultant. This document is then reviewed, approved, and signed off by both LADOT and the Draft EIR transportation consultant before the transportation analysis begins. There is no evidence that such a Memorandum of Understanding was ever developed, reviewed and approved by both LADOT and by the Draft EIR transportation consultant.

Response GO17-158 This comment provides a general recitation and characterization of the Draft EIR. Pages ES-14 through ES-17 of the Draft EIR includes a Summary of Agency and Special District Comments in response to the Notice of Preparation (NOP) for the Draft EIR. As discussed in Section 1.0, Introduction, of the Draft EIR, the City of Los Angeles is a responsible agency under CEQA for the Draft EIR and, as discussed in Section 8.0, List of Preparers of the Draft EIR, was consulted during the preparation of the Draft EIR, including LADOT. Regarding LADOT, a Transportation Assessment Memorandum of Understanding (“MOU”) was prepared and approved by LADOT in accordance with LADOT’s procedures and *Transportation Assessment Guidelines*. The MOU is included as Appendix A to the report entitled *Los Angeles Aerial Rapid Transit Project, Non CEQA Transportation Assessment*, made available for public review in September 2022 on the proposed Project’s SB 44 website, which is linked via Metro’s LA ART website. In addition, LADOT issued a memorandum regarding the Transportation Assessment for the Proposed Los Angeles Aerial Rapid Transit Project Located Between Union Station and Dodger Stadium on September 27, 2022, which is also linked via Metro’s LA ART website.⁴⁹

Comment GO17-159 c) Transportation Mitigation Measure TRA-A on Page ES-72 recommends “visibility enhancements for the Alameda Tower and Chinatown/State Park Station” but then states “visibility enhancement features could include high visibility crosswalk treatments, advance crossing warning signs, flashing beacons, upgraded lighting, and new or upgraded traffic controls such as traffic signals and all-way stops and right turn on red restrictions and channelization of pedestrians to marked crosswalks via fencing. The mitigation measure would be implemented during the construction phase and would be completed prior to proposed Project operations.”

The laundry list provided gives many different possible mitigation measures, but no study or analysis has been conducted to determine which may be appropriate or

⁴⁹ Los Angeles Department of Transportation. 2022. Transportation Assessment for the Proposed Los Angeles Aerial Rapid Transit Project Located Between Union Station and Dodger Stadium.

inappropriate. For example, it is not possible to install traffic signals and all-way stops at the same intersection. The possible mitigation measures must be analyzed now to determine what is needed and warranted. Waiting until some future time to decide what will or will not be done constitutes deferred mitigation, and any such mitigation will not be timely or effective. Deferred mitigation is contrary to professional traffic engineering and transportation planning principles as well as CEQA, the California Environmental Quality Act.

Response GO17-159 Mitigation Measure TRA-A was originally written to permit flexibility in the ultimate measures to be taken prior to further development of the proposed Project design. However, the necessary mitigation at each location was further identified and is discussed on pages 3.17-41 and 3.17-42 in Section 3.17, Transportation, of the Draft EIR. As stated on page 3.17-41, the specific mitigation at the Alameda Tower is prohibiting right turns on red from westbound Alhambra Avenue to northbound Alameda Street. As stated on page 3.17-42, the specific mitigation at the Chinatown/State Park Station is channelization of pedestrians to the crosswalk where visibility is sufficient. In response to comments suggesting that Mitigation Measure TRA-A did not clearly define the visibility enhancements for the proposed Project, Mitigation Measure TRA-A has been revised to identify the necessary mitigation for each location, consistent with the analysis in the Draft EIR. Refer to Section 5.0, Corrections and Additions, of the Final EIR, for revisions to Mitigation Measure TRA-A, identifying visibility enhancements the proposed Project would design during construction and complete prior to proposed Project operations at Alameda Tower and Chinatown/State Park Station. In addition, for consistency with best practices, the proposed Project has committed to implementing TRA-PDF-A, added to the final EIR, in Section 5.0, Corrections and Additions, to further enhance pedestrian visibility at the Chinatown/State Park Station. As described in TRA-PDF-A, the proposed Project would stripe a high visibility crosswalk and add upgraded lighting for the driveway crossing south of the Los Angeles State Historic Park.

Comment GO17-160 d) Transportation Mitigation Measure TRA-B on Pages ES-73 to Page ES-76 provides more of the same deferred analyses in its discussion. The Construction Traffic Management Plan offers several possible measures but then defers to City of Los Angeles approvals before implementation. The City of Los Angeles always requires a Construction Traffic Management Plan and there is nothing special or unique here.

As one of several examples, “Existing yellow crossings...shall be evaluated in coordination with LADOT to determine if crossing guards should be assigned on days/times when detours are active, the proposed Project shall fund crossing guards during morning school arrival and afternoon school departure periods... If school crossings along detour routes are unsignalized, temporary traffic signals will be evaluated in coordination with LADOT and would be implemented by the proposed Project if deemed necessary.” Once again, possible mitigation measures are proposed but no measures are actually studied or planned.

The Draft EIR must analyze potential mitigation measures now and determine which are needed and warranted rather than publish yet another laundry list of possible measures which have not been studied or evaluated.

Response GO17-160 Refer to Topical Response I, Use of Project Design Features and Plans in Mitigation Measures, for a discussion of how the use of plans in mitigation measures would not constitute impermissible deferral. Such actions are commonplace under CEQA where additional study is required but is not appropriate or otherwise feasible at the time of CEQA review. As the comment recognizes, it is true that the City of Los Angeles always requires a Construction Traffic Management Plan (CTMP); Mitigation Measure TRA-B requires exactly that. Such plans are routinely developed post-entitlement when projects are in design and such items as the potential to which construction may encroach into the public right-of-way, how long and what times of day that might occur, etc., become known. Accordingly, the CTMP would reflect the advanced project design and the current environmental conditions at the time of construction. Environmental impact reports for projects in the City of Los Angeles typically include development and implementation of a CTMP as either a mitigation measure or a project design feature, but the actual CTMP itself is not developed prior to nor included in the EIR. Mitigation Measure TRA-B in the Draft EIR is precisely in concert with the manner in which CTMPs are required for projects in the City of Los Angeles and provides a precise accounting of what actions may be included in the CTMP as well as performance standards that the CTMP is designed to achieve. It is not deferred mitigation.

Comment GO17-161 4) Draft Environmental Impact Report – Chapter 2 – Project Description

The Purpose and Need Section beginning on Page 2-10 states the Dodger Stadium Express buses carry approximately 1,850 riders on average per game. Page 2-12 states “Within two hours prior to the start and after a game or event at Dodger Stadium, more than 10,000 people could be transported to the stadium by the Proposed Project. The average attendance at a Dodger game was approximately 49,000 for the 2019 season. Given the capacity of the system, approximately 20 percent of the fans could take aerial transit connected to Metro’s regional transit system.”

This statement is theoretical at best for conditions after a game since very few fans will be willing to wait more than one hour with other transportation options available including Dodger Express Bus as well as Uber/Lyft/Taxi. The UCLA Mobility Lab Study discussed further below found that the Proposed Gondola Project would carry only about 2,200 passengers at most and would transport only 1,380 people after a baseball game.

Response GO17-161

This comment provides a general recitation and characterization of the Draft EIR. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for a detailed discussion of post-game/event transportation, including post-game/event ridership, wait times, and the proposed

Project versus other modes such as the Dodger Stadium Express, rideshare, and walking. Refer to Topical Response O, Response to UCLA Mobility Lab Study, for detailed responses to the items in the Mobility Lab Study. The Mobility Lab Study was not submitted by its authors at the Mobility Lab as a comment on the proposed Project’s Draft EIR, and does not appear to have been prepared for that purpose. On January 13, 2023, the Mobility Lab issued the following statement regarding the Mobility Lab Study.^{50,51}

Statement from the UCLA Mobility Lab Regarding LA Gondola Ridership Projection

The UCLA Mobility Lab is an engineering and technology lab dedicated to scientific research and innovation around mobility technologies. The lab’s data on projected transit ridership of a proposed Dodger Stadium gondola is preliminary in nature. More research would be necessary to draw conclusions about potential use of the gondola. The lab takes no view on whether the project should be built.

Jiaqi Ma

Director, UCLA Mobility Lab

Faculty Associate Director, UCLA Institute of Transportation Studies

Post-game queues at Dodger Stadium were estimated based on assumptions about the departure patterns and estimates of walk times from the various seating areas within the stadium. Based on current behaviors, game attendees gradually start leaving the game around 30 minutes before the end of the game. While most people would leave the stadium at the end of the game, given the crowd in the stadium and the distances from the various seating locations in the stadium, it would naturally take people seated the furthest away from the Dodger Stadium Station more time to walk to the station, much like how it is currently for passengers riding the Dodger Stadium Express. In addition, gondola passengers who would rather not join the line immediately to board the proposed Project in the post-game period could visit some of the entertainment amenities at the stadium, including at the Centerfield Plaza. Regarding the queue waiting time, Dodger Stadium Express riders today wait in queues to board the service. As discussed in Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, the queues to board, loading times, and travel times for the Dodger Stadium Express are significantly longer and more variable as compared to the proposed Project. In order to quantify the existing service time needed to transport Dodger Stadium Express riders, Fehr & Peers observed four post-game time periods during the 2023 season. These observations indicate that riders are willing to wait for substantial periods of time after a game to board the Dodger Stadium Express, despite its slower travel time and long waits between buses, supporting the concept that riders would also be willing to wait after a game to board the proposed Project with its improved level of service. Further, as discussed in Topical Response B, the post-game/event queue for

⁵⁰ UCLA Mobility Lab. 2023. Statement from the UCLA Mobility Lab Regarding LA Gondola Ridership Projection. Available at: <https://mobility-lab.seas.ucla.edu/>. Accessed September 2023.

⁵¹ UCLA Mobility Lab. 2023. Tweet on January 13, 2023. https://twitter.com/ucla_its/status/1613998706851971075?s=46&t=p_Kv02sYuM0ssXk0RDXWeA. Accessed September 2023.

the proposed Project would be constantly moving as cabins would depart every 23 seconds. Based on 2019 season data, there is an approximate 8 percent reduction in post-game riders of the Dodger Stadium Express on weekday evenings compared to pre-game. The proposed Project model assumed this same reduction for the post-game ridership estimates for the proposed Project. To be conservative, the full reduction of post-game ridership is assumed to shift to TNCs, which are estimated to generate more VMT than private vehicle trips due to the VMT generated by the driver traveling to the pick-up location at Dodger Stadium.

Comment GO17-162 b) The loading and unloading of gondola cars are briefly discussed on Page 2-17. However, there is no description or illustration of how passengers would access the gondola cars from the Metro L Line (Gold), how passengers would access the gondolas from ground level, or how passengers would cross Spring Street. Each of these omissions raises significant traffic safety concerns for pedestrians trying to reach and use the proposed gondola system.

Response GO17-162 The Metro L Line (Gold) Chinatown Station and the proposed Project's Chinatown/State Park Station will both be located on the west side of Spring Street north of College Street. As indicated on page 2-28 and on Figure 2-16 on page 2-31, in Section 2.0, Project Description, of the Draft EIR, passengers would walk between the Metro L Line and the proposed Project's Chinatown/State Park Station via a sidewalk along the west side of Spring Street and would not need to cross Spring Street. Moreover, the Project proposes pedestrian access enhancements, which could include pedestrian improvements between Metro's L Line (Gold) Station and Chinatown/State Park Station consistent with the Connect US Action Plan, including hardscape and landscape improvements, shade structures, and potential seating. As stated on page 2-28, in Section 2.0, Project Description, of the Draft EIR, "Access to the boarding platform would be from the mezzanine via elevators and stairs. Comprised of three levels, elevators and stairs from the ground level would lead up to a mezzanine, 27 feet above-grade, and ramps for the queuing area would lead up to the boarding platform." Refer to Section 5.0 Corrections and Additions for a discussion of how, in order to provide additional environmental benefits and as a best practice to further enhance pedestrian visibility, the proposed Project would incorporate TRA-PDF-A, which would stripe a high visibility crosswalk and provide upgraded lighting for the driveway crossing south of the Los Angeles State Historic Park.

Comment GO17-163 c) Figure 2-27 on Page 2-54 illustrates the location of the proposed gondola support tower within the Alameda Triangle just south of Alhambra Avenue. From that illustration, it does not appear to be possible to provide adequate stopping sight distance through the tower supports for the westbound dedicated left turn lane and the westbound left turn/right turn lane. The Draft EIR must describe how potentially conflicting motorists will be able to see each other through the solid tower support framework.

Response GO17-163 An evaluation of sight distances at the intersection of Alameda Street and Alhambra Avenue with the Alameda Tower is provided on page 3.17-41, in Section 3.17, Transportation, of the Draft EIR. The Draft EIR concluded that impacts would be less than significant with implementation of the visibility enhancements described under Mitigation Measure TRA-A, by implementing a westbound no right turn on red restriction. This would alleviate potential visibility issues associated with operation of the Alameda Tower by prohibiting vehicles from making a westbound right turn on red. Refer to Response GO17-159 for a discussion of Mitigation Measure TRA-A.

Comment GO17-164 d) Page 2-61 does not indicate the requirements to coordinate with and obtain approval from LADOT during construction as well as during operation for the proposed project. The City of Los Angeles has jurisdiction over the roadways that will be impacted, and the Proposed Project must work closely with the City’s Department of Transportation by obtaining all required permits and following each of the permit requirements.

Response GO17-164 As detailed in Section 3.17, Transportation of the Draft EIR, Mitigation Measures TRA-A, TRA-B and TRA-C must be reviewed and approved by the City. Refer to Section 7.0, Mitigation Monitoring and Reporting Program, of the Final EIR, which prescribes for agency enforcement of mitigation measures for the proposed Project, which will ensure supervision by the various responsible agencies, including the City.

Comment GO17-165 5) Draft Environmental Impact Report – Chapter 3.17 – Transportation

a) Page 7 repeats that the City of Los Angeles Transportation Assessment Guidelines as noted in the Board memo would be followed. The current edition of the LADOT TAG was issued in August 2022. However, the required level of service analysis and comparisons were not included in either the Draft EIR or Appendix N, and this study has not been made available for public review and comment.

Response GO17-165 Refer to Response GO17-156 for discussion of the *Los Angeles Aerial Rapid Transit Project, Non CEQA Transportation Assessment*.

Comment GO17-166 b) The estimates of neighborhood riders and walkers on Page 26 do not appear to consider the topography vertical rise of 200 to 300 feet up to Dodger Stadium in the walkable and bikeable forecasts. The steep slopes of the streets and pathways discourage walking and biking. The estimates of neighborhood riders of the gondola are significantly overstated and must be reduced to account for the steep topography.

Response GO17-166 As noted on page 2-1 in Section 2.0, Project Description, of the Draft EIR, the proposed Project has the ability to overcome grade and elevation issues between LAUS and Dodger Stadium and provide safe, zero emission, environmentally friendly, and high-capacity transit connectivity in the Project area that would reduce greenhouse gas (GHG) emissions as a result of reduced vehicular congestion in and

around Dodger Stadium and on neighborhood streets, arterial roadways, and freeways. It is precisely the topography and vertical rise that would be addressed by the proposed Project, providing access between the Dodger Stadium property, the surrounding communities, including Chinatown, Mission Junction, Elysian Park, and Solano Canyon, and the Los Angeles State Historic Park, to the regional transit system accessible at LAUS, including for those walking or biking. As shown in Table 3.17-4 on page 3.17-35, in Section 3.17, Transportation, of the Draft EIR, the neighborhood rider estimates range from 720 on weekends in 2026 to 1,625 on weekdays at 2042 and take into account US Census journey to work data, population and employment in the area, and the presence of other transit services. Additionally, as detailed on page 3.17-34, neighborhood riders are not factored into the VMT reduction estimates of the proposed Project for a more conservative analysis and have no bearing on the quantitative analysis or conclusions about the VMT and air quality and greenhouse gas benefits of the proposed Project in the Draft EIR.

Comment GO17-167 c) Page 27 states that the vehicle miles traveled (VMT) calculations are based on data collected in Year 2019, but there is no evidence or cross checking to support that these values are “current” or correct.

Response GO17-167 Due to the COVID-19 pandemic, the 2019 Major League Baseball season was the most recent season at the time of the Notice of Preparation for the Draft EIR and while the Draft EIR was under preparation that included a full season of games at Dodger Stadium. Therefore, as noted in Section 3.17, Transportation, of the Draft EIR, data regarding game attendance from the 2019 season was used in the estimation of VMT.

Comment GO17-168 d) Page 32 indicates the Proposed Project will result in only one change to intersection geometrics by shortening the northbound left turn lane from Alameda Street to Cesar Chavez Avenue by 150'. Shortening of this left turn lane from 320 feet to 170 feet will result in traffic waiting to turn left backing out of the shorter left turn lane, stopping in the through lane, and significantly increasing the potential for rear end collisions. This left turn lane is also signed as a primary route to reach Dodger Stadium. The capacity of this left turn lane will be cut in half, creating the need for other mitigation to accommodate the high northbound left turn demand.

Response GO17-168 As stated in Section 3.17, Transportation, of the Draft EIR, the main change to the existing street system would be to shorten the northbound left turn from Alameda Street onto Cesar E. Chavez Avenue by approximately 140 to 150 feet. All other proposed Project components would be located out of the roadway network and would not affect roadway capacity. Queue spillback beyond storage pockets is a common existing condition at major urban intersections during peak periods in the City of Los Angeles. Speed differential on roadways is the key driver in the potential for increased frequency and severe vehicular collisions that would occur associated with queue spillback. Downtown Los Angeles roadways, including Alameda Street, are generally congested and move below speed limits during peak periods, thereby

reducing the potential for collisions associated with queue spillback. Mobile device travel data provider Wejo was used to determine average weekday and weekend travel speeds from 2019. Weekday average travel speeds on northbound Alameda Street was 14.5 miles per hour in 2019, and weekend average travel speeds was 13 miles per hour.

Per the City of Los Angeles Transportation Assessment Guidelines (TAG), queue spillback is considered a Non-CEQA transportation metric, as it relates to vehicle operations, and it can be addressed by operational adjustments to signal timings. Queueing for northbound Alameda Street is largely affected by queueing on westbound Cesar E. Chavez Avenue, with capacity for the northbound left turn pocket metered by the capacity of the westbound receiving lanes on Cesar E. Chavez Avenue, which are limited due to the 125-foot storage capacity between the intersections of Main Street & Cesar E. Chavez Avenue, and Alameda Street & Cesar E. Chavez Avenue. Adjustments to the signal timing could be made for westbound Cesar E. Chavez Avenue at Main Street, and for the northbound left turn phase at Alameda Street & Cesar E. Chavez Avenue to serve vehicle demand with the reduced turn pocket length to minimize queue spillback.

Comment GO17-169 e) Page 40 incorrectly states that the 35 MPH posted speed limit on Alameda Street equates to 250 feet of stopping sight distance at the marked crosswalk at Alameda Station.

The 7th Edition of “A Policy on Geometric Design of Highways and Streets 2018 The Green Book” published by the American Association of State Highway and Transportation Officials (AASHTO) is the definitive resource of stopping sight distance. This publication is used by Caltrans as well as all local jurisdictions in California. Traffic engineers and transportation planners understand that stopping sight distance is based upon the design speed of the roadway under review, a speed which is typically 210 MPH higher than the posted speed limit. Stopping sight distance for a 45 MPH design speed is 360 feet, not 250 feet, as shown in Table 3-1 on Page 3-4, Stopping Sight Distance on level Roadways. Other measures to provide 360 feet of stopping sight distance are required.

All other discussions of stopping sight distance must be modified to reflect the use of the design speed which is typically 10 MPH higher than the posted speed limit and that requires additional stopping sight distance accordingly.

Response GO17-169 Both the *A Policy on Geometric Design of Highways and Streets* by AASHTO⁵² and the *Highway Design Manual* by Caltrans⁵³ explain that design speed is dependent on the characteristics of the roadway and the context of the surrounding area. Table 101.2, Vehicular Design Speed, in Caltrans’ *Highway Design Manual* provides that

⁵² American Association of State Highway and Transportation Officials (AASHTO). 2018. *A Policy on Geometric Design of Highways and Streets*. Available at: <https://store.transportation.org/Common/DownloadContentFiles?id=1776>. Accessed August 2023.

⁵³ California Department of Transportation (Caltrans). 2020. *Highway Design Manual*, 7th Edition. Available at: <https://dot.ca.gov/programs/design/manual-highway-design-manual-hdm>. Accessed August 2023.

design speeds for urban arterials that are main streets in regional/community centers shall be between 30 and 40 miles per hour (mph) and that design speeds for urban arterials in downtowns and city centers shall be 30 mph (note that Caltrans' use of the word "shall" makes the guidance in Table 101.2 mandatory). AASHTO states that urban arterial streets should be designed to permit running speeds of 20 to 45 mph, with speeds in the lower portion of this range applicable to local and collector streets and to arterial streets through more crowded business areas while speeds in the high portion of the range apply to high-type arterials in outlying suburban areas. The context of the streets in the Union Station and Chinatown areas in the vicinity of the Project's proposed Alameda Station is a urban downtown/regional center business area. Both suggest that use of 35 mph to determine stopping distance is appropriate as it is within the range mandated by Caltrans for urban regional/community centers, higher than the Caltrans guidance for urban arterials in downtowns and city centers, and on the higher side of the range suggested by AASHTO for urban arterial streets.

Comment GO17-170 f) Page 41 recommends prohibiting right turns on red at the Alameda Tower as a mitigation measure. "No Right Turn On Red" is not an effective mitigation measure as it does not guarantee safety for pedestrian crossings as vehicles may violate the posted right turn on red prohibition and they are then faced with a condition involving inadequate stopping sight distance.

Response GO17-170 As discussed on page 3.17-41, in Section 3.17, Transportation, of the Draft EIR, impacts would be less than significant with implementation of the visibility enhancements described under Mitigation Measure TRA-A, primarily by implementing a westbound no right turn on red restriction. This would alleviate potential visibility issues associated with operation of the Alameda Tower by prohibiting vehicles from making a westbound right turn on red. This Mitigation Measure is not a recommendation regarding potential vehicle and pedestrian conflict; rather, it is recommended to alleviate potential visibility issues for vehicles traveling northbound on Alameda Street. No right turn on red restrictions are commonly used at locations with potential visibility issues. Refer to Response GO17-159 for further discussion of Mitigation Measure TRA-A.

Comment GO17-171 g) Page 67 states that Mitigation Measures TRA-A will provide visibility enhancements at Alameda Tower and Chinatown Station but does not discuss what mitigation measures are recommended at these locations. The discussion should be expanded to describe the mitigation measure as has been done for Mitigation Measure TRA-B immediately following.

Response GO17-171 Refer to Response GO17-159 for discussion of Mitigation Measures TRA-A and TRA-B.

Comment GO17-172 h) Other mitigation measures are deferred and may not be timely as required. To be effective and complete, potential mitigation measures identified on the various

laundry lists must be studied and evaluated in the Draft EIR, with specific mitigation measures identified.

Response GO17-172 Refer to Responses GO17-159 and GO17-160 for discussion of how the use of plans in mitigation measures would not constitute impermissible deferral.

Comment GO17-173 6) Fehr & Peers Ridership Modeling (Appendix N of the Draft EIR)

Table 5 on Page 21 of Ridership Modeling in Appendix N of the Draft EIR estimates 6,000 game attendees would ride the gondola in 2026. Daily tourist riders on the gondola are estimated to be 1,270 per day on game days and 2,575 per day on non-game days. These forecasts are significantly higher than those presented in the other reports such as the Dodger Stadium Access Study discussed earlier in this letter and in the UCLA Mobility Lab Study discussed later in this letter.

Response GO17-173 Refer to Section 3.17, Transportation and Appendix N, Transportation Appendices, of the Draft EIR, for discussion of the proposed Project's ability to reduce vehicular travel. Refer to Topical Response B, Ridership Model; Queueing at Stations and Pre-game and Post-game Transportation, for discussion of the proposed Project's ridership model which is based on extensive data sources and assumptions validated by data. Metro hired Stantec to peer review the transportation analyses conducted for the proposed Project, including Section 3.17, Transportation, and Appendix N, Transportation Appendices of the Draft EIR.⁵⁴ Stantec is an internationally-respected global design and delivery firm that provides transportation engineering and planning services among its many service lines. Stantec concluded that the proposed Project ridership forecasting model and the model inputs and data sources were credible, defensible, and appropriate to use for the analysis and that they agreed with the ridership forecasts in the Draft EIR. As discussed in Response GO17-155, 1990 *Dodger Stadium Transit Access Study* prepared by Gruen Associates for the Los Angeles County Transportation Commission was prepared 33 years ago and evaluated a tramway, which is a different type of aerial technology than the proposed Project, which is a detachable 3S gondola with a capacity of 5,000 people per hour per direction. Comparisons between the two are not relevant. Refer to Topical Response O, Response to UCLA Mobility Lab Study, for a detailed response to the UCLA Study.

Comment GO17-174 7) Fehr & Peers Draft Parking Study September 2022

a) Page 1 states "Detailed analysis of traffic associated with the proposed project are separately being evaluated in a non-CEQA transportation assessment in accordance with the City of Los Angeles Transportation Assessment Guidelines. This would involve calculation of level of service and delay at intersections (pre VMT), but these calculations and results are not found in the Draft EIR or in Appendix N.

⁵⁴ Stantec. 2023. Memo to Holly Rockwell Regarding Los Angeles Aerial Rapid Transit (LA ART) Project Transportation Analysis Peer Review.

Response GO17-174 Refer to Response GO17-156 for discussion of the *Los Angeles Aerial Rapid Transit Project, Non CEQA Transportation Assessment*.

Comment GO17-175 b) Pages 2 and 3 indicate that the Chinatown/State Park Station “could” include pedestrian improvements between Metro’s L Line (Gold) Station and the Chinatown/State Park Station as well as support for the future Los Angeles State Historic Park bike and pedestrian bridge.” Specific improvements need to be identified now (see Page 42 of Chapter 3.17) and included within the mitigation measures proposed in the Draft EIR.

Response GO17-175 Refer to Response GO17-162 regarding the pedestrian improvements between the Metro L (Gold) Line and the proposed Project’s Chinatown/State Park Station. The pedestrian improvements are included as a feature of the proposed Project, and discussed as such in Section 2.0, Project Description; they are not required to mitigate any impacts related to construction and operation of the proposed Project.

Section 6.0, Design and Use Options, of the Draft EIR, includes Design and Use Option E, an analysis of State Parks’ proposed Pedestrian Bridge at the Los Angeles State Historic Park. The analysis serves to provide environmental clearance for the bike and pedestrian bridge as a benefit to the Los Angeles State Historic Park, and while the bike and pedestrian bridge was mentioned in the Los Angeles State Historic Park General Plan and studied in the State Park’s Bridge Feasibility Study, the bike and pedestrian bridge was never environmentally cleared. Support for the Los Angeles State Historic Park bike and pedestrian bridge would otherwise be provided as part of the proposed Project. Accordingly, the proposed Project is furthering the bike and pedestrian bridge by providing the necessary environmental clearance and support for the bridge. Design and Use Option E is not required to mitigate any potential significant impacts related to construction or operation of the proposed Project.

Comment GO17-176 c) Page 10 states that a parking management plan will be developed before operation of the Proposed Project. Doing this at some future time rather than during the Draft EIR constitutes deferred mitigation by stating “Parking management strategies and specific implementation steps will be further detailed in a parking management plan prepared in the future in collaboration with the City of Los Angeles, who will be the implementor of any on-street parking management strategies... However, because the detailed parking management implementation plan will be reliant on completion of construction documents and the final operating plan, it will follow the completion of the environmental process for the proposed project.”

Response GO17-176 Parking is not required to be analyzed under CEQA or the Transportation Assessment Guidelines (“TAG”). However, parking is a key concern to the communities where proposed Project stations would be sited, as well as for decision makers. The Parking Study was prepared to provide additional information to the community and decision makers about existing parking conditions and the proposed Project’s potential to effect parking conditions around the Alameda Station and

Chinatown/State Park Station. The Parking Study determined that even with the addition of proposed Project vehicles parking in the area studied, publicly available parking on a game day would still be substantial, with an estimated 43 percent parking occupancy across the two half-mile station walksheds, and over 3,900 off-street parking spaces available to the community. As recommended in the Parking Study, the Project Sponsor will prepare, in collaboration with the City, and with robust feedback from community stakeholders, a parking management plan. The City would implement any on-street parking management strategies identified. In addition, a document providing a general outline of a typical parking management plan and potential strategies has been prepared. Because the Parking Study and, accordingly, the parking management plan are not required under CEQA or the TAG, no mitigation is required, as CEQA Guidelines section 15126.4 only requires mitigation for significant impacts. Accordingly, there is no “deferral” of mitigation. Nevertheless, refer to the proposed Project’s Preliminary Parking Management Plan.⁵⁵

Comment GO17-177 8) UCLA Mobility Lab – October 24, 2022 Study

A study using current modeling techniques recently completed by two UCLA researchers found that the gondola system could slightly reduce traffic on major roads around Dodger Stadium on the night of a sold-out baseball game, but that impact would likely be very limited. The study found that the gondola would likely take only around 608 cars off the road and that minor change would be unlikely to significantly reduce greenhouse gas emissions and traffic overall.
